There were 121 female respondents in managerial positions participating in the research. Ninety-five of them (78.51%) were employed in local Slovak companies and 25 (20.66%) were employed in foreign companies (for detailed demographic data see Tab 1. and Fig 1.). When *compared* to male managers, the female group represented just 21.99% in Slovak companies and a bigger portion (31.65%) in foreign companies. Generally, compared for each subgroup individually, there was a tendency to see more female managers among a younger age group – people younger than 30 years of age (with 35.94% of the age group) than in older groups where female managers made just over one fifth of the particular respondent group. The proportion of females also increased with decreasing tenure – even though low tenure groups had generally smaller number of respondents than the groups of managers with more years spent with the organization. In terms of managerial position within the company, the strongest representation of females was in middle management position, although when compared by age and position, most top managers are among younger women (relative to their male counterparts) and middle and line managers are on the contrary older employees. However, we can observe an interesting staffing difference when we compare the ratios of female/male representation in managerial positions in Slovak companies and in foreign companies (for more detail see Table 2.). Actually, the proportion of females increases with position in foreign companies, from 27.27% in line management to 39.13% in top management, and in every category it claims larger share than proportion of females in any given category in Slovak companies. In Slovak companies, the largest proportion of female managers is in middle management positions (25.73%). The biggest gap in female managerial representation can be observed in top management positions in Slovakia, where the female representation is just 16.30%. Moreover, very few young women (under the age of 30) can be found in Slovak companies – total number of five, while the numbers of young female managers and young male managers are balanced in foreign companies, 18 and 19 respectively.

TABLE 1. COMPARISON OF FEMALE/ MALE DEMOGRAPHICS

		FEMALE **(121; 23.63%)**	MALE **(390; 76.17%)**	TOTAL **(512; 100%)**
Slovak		95 (21.99%)	336 (77.78%)	432 (99.87%)
Foreign		25 (31.65%)	54 (68.35%)	79 (100%)
Top management		24 (20.87%)	91 (79.13%)	115 (100%)
Middle management		54 (26.34%)	151 (73.66%)	205 (100%)
Line management		43 (22.63%)	147 (77.37%)	190 (100%)
Age	less than 30	23 (35.94%)	41 (64.06%)	64 (100%)
	31 – 45	40 (21.05%)	150 (78.95%)	190 (100%)
	45 and more	58 (22.66%)	198 (77.34%)	256 (100%)
Tenure	less than 1 year	13 (39.39%)	20 (60.61%)	33 (100%)

45 and more	57 (24.26%)	178 (75.74%)	1 (8.3%)	11 (91.67%)

Questionnaire Analysis

Due to the nature of collected data, we have decided to test the Hypothesis 1 and Hypothesis 2 by analyzing the collected data in a two-step approach. First we have clustered related responses and then conducted the analysis of clusters using the Frequency Procedure, followed by the Chi-Square test and checking for Phi Coefficient to determine the significance of relationship between the clusters of data. We have used this analysis for the responses in the second part of the questionnaire with statements that were to be evaluated on a five point Lickert scale.

To test the Hypothesis 3, we have used a simple analysis in questions that could not be clustered and that analyzed performance appraisal.

Data Clustering

For the purpose of analysis, we have clustered the questions from the second part of the questionnaire by grouping the related responses together into 4 clusters; delegation, empowerment, decision-making and managerial style. These categories capture the basic concepts of managerial work and to further understand the approach to managerial work, we have also compared the pairs of clusters. The clusters separately would suggest the attitudes of managers towards their subordinates and how they perceive their own work, however if there is a relationship among the couples of clusters then the particular tendency is reinforced.

For the purpose of this study to *empower* is to pass decision-making to others. Within an organization, this often means passing the decision-making to a lower level of the hierarchy; it encourages initiative and responsibility of subordinates and reflects a level of trust towards the subordinates. An "empowering" manager, with a controlling role, is involved only when work is finished, yet he/she is perceived as open to help when needed. The cluster *delegation* depicts the managerial concept of assigning tasks; it is a part of day-to-day work and stems from the formal authority of the respondent. This cluster reflects the attitude of the respondents both towards their subordinates and the assigned goals as well as the attitude towards receiving assignments from their superior. In this cluster, we have included such questions dealing with the everyday practice of assigning as well as controlling tasks, the level of independence and formality of the style of managers towards their subordinates. Delegation also reflects initiative/passivity in the relationship between a manager and a subordinate. The next set of clusters that we have analyzed dealt with the way respondents approach decision making and analyzing what are the respondents' attitudes to their job. Thus the cluster *decision-making* deals with the degree of consultative style in decision-making. The decision-making cluster focuses on the degree of consultation and involvement of subordinates in the process rather than judging the nature of the decisions managers make. This cluster also examines whether the respondents are being consulted by their superiors and whether they perceive they are involved in decision-making. The cluster *"Managerial style"* addresses the general perceptions of the respondent as to what is expected from them and what is the role a manager. This cluster reflects the values of respondents that underline their overall managerial style how they view their relationship towards their superiors as well as subordinates and whether they are interested at all in learning how their subordinates perceive them.

In each cluster, the answers around the values of '1' and '2' indicate that the respondent does not agree with the particular statement, answers around opposite values of '4' and '5' suggest agreement with the statements –

and in this particular analysis, high responses show open communication and trust, more empowerment and more flexibility. In each cluster, there is a [control] statement that can be considered opposite to the others, so the responses were logically inverted. In order to cluster the responses, we have reversed the numerical values so if the answer was '5', we have assigned it '1', if the answer was '4' we have assigned it '2', and so on.

Following, we have computed the responses and assigned values '1' (never) through '5' (always) to the whole cluster according to the following key. If there are 4 questions in a cluster, then sum of answers in value '4' -- '5' is assigned value '1'; if there are 6 questions in a cluster, then sum of answers in value of '6' – '8' is assigned value '1'; and so on (for an illustration, see table 3). It is possible to consider the assigned values representative of the clusters.

TABLE 3. ASSIGNING VALUE TO CLUSTERS (EXAMPLE)

EMPOWERMENT (4 questions)		**EMPLOYEE DELEGATION (6 questions)**	
Sum of responses from Lickert Scale	Assigned Cluster value	Sum of responses from Lickert Scale	Assigned Cluster value
4-5	1	6-9	1
6-9	2	10-14	2
10-14	3	15-21	3
15-18	4	22-26	4
19 - 20	5	27-30	5

In the second step, we have analyzed the clusters using first the Frequency Procedure to see what is the co-dependence between the clusters. Then we have tested the results through Chi-Square test, the probability of which should be <0.05 to be considered significant; and Phi Coefficient the value of which should be >0.5 to show significance.

When comparing total data of the clusters *employee delegation* and *empowerment* we have seen strong relationship between the two on the values of '3' (usually) and '4' (almost always), when 346 responses of value '3' in *employee delegation* have been divided between value '3' and '4' in Empowerment, 166 and 180 respectively. Both Chi-Square probability and Phi-Coefficient value show significance (see Table 4). Overall, this shows moderate, yet positive, tendency of managers to delegate assignments and responsibilities to their subordinates and to empower and trust their employees, the respondents tend to believe that their subordinates are independent, can be trusted with decisions (albeit more with routine than with non-routine ones) and generally, they both provide and receive quite large autonomy in their work.

When separating the data into the subgroups of male and female managers, we can observe a significant difference in the responses. Phi-coefficient shows value of 0.9352 (and significance) and is an indicator of co-dependence in the sample of female managers. Seventy-eight of the respondents assigned value '3' for Delegation that they split for values '3' and '4' in *empowerment*, 43 and 35 respectively. This suggests that there is a relationship between the level of trust female managers exhibit towards their subordinates and the degree to which they engage their subordinates. Data shows that female managers delegate the routine decisions on their subordinates and that the subordinates do not need to be constantly monitored, leaving them greater autonomy, yet are approachable when subordinates need help or assistance. They also indicate that their subordinates do not hesitate and seek advice or assistance from their manager.

On the contrary, the data of male managers show Phi-coefficient 0.3524 which means there is no significance in the relationship of the two clusters and that their preference towards either empowerment or delegation cannot be predicted by either dimension. Still, the largest number of responses (268) gathers at value '3' in *delegation* split between values of '3' and '4', 123 and 145 respectively. This suggests that male managers also prefer to let routine decisions to be made by subordinates and that their subordinates do not expect that they are passively told what to do. However, the degree to which they do let subordinates work independently does not suggest the level of trust they demonstrate towards their subordinates.

These results support Hypothesis 1 that female managers would use empowerment and delegation more as a part of their managerial style than their male counterparts.

TABLE 4. CHI-SQUARE AND PHI-COEFFICIENT VALUES FOR ANALYZED CLUSTERS

	EMPOWERMENT/EMPLOYEE DELEGATION	
	Chi-Square Probability	**Phi Coefficient Value**
Total data	<.0001	0.6377
Female managers	<.0001	0.9352
Male managers	<.0001	0.3524

When comparing total data of the clusters *decision-making* and *managerial style* we have seen strong relationship on the value of '3' (usually), when 333 responses of value '3' in *decision-making* have also circled value '3' in *managerial style*. Another 37 respondents have indicated value '4' (almost always) in decision-making and value '3' in managerial style. However, these are rather careful expressions of respondents and the Phi Coefficient does not show support for the relationship between the two sets of clusters, as its value should be bigger than 0.5.

From previous analysis, we have come to the conclusion, that generally the managers are both goal-oriented and people-oriented – they stress the importance of achieving results and taking care of the subordinates, being interested in their personal problems when assessing performance; and the orientation was stronger for female managers than for male managers[12]. However, this analysis does not show significant relationship between the style of management and preference towards decision-making (Table 5). Phi Coefficient for neither female managers nor male managers shows significant relationship, even though the female group shows a slightly larger co-dependence of the two clusters. Most responses of female managers are grouped in the value of '3' for both clusters (76 responses out of 121) indicating that the respondents believe their relationship with their subordinates (as well as their superiors) is professional and friendly. The respondents also demonstrate interest in learning what their subordinates think of their actions, and they balance their understanding of the needs of subordinates with achieving goals.

These results only partly confirm the Hypothesis 2 that female respondents would be more consultative in decision-making. While, the tendency is stronger for women than men, it is not significant enough to draw satisfactory conclusions.

TABLE 5. CHI-SQUARE AND PHI-COEFFICIENT VALUES FOR ANALYZED CLUSTERS

	DECISION-MAKING/MANAGERIAL STYLE	
	Chi-Square Probability	**Phi Coefficient Value**
Total data	<.0001	0.26
Female managers	<.0091	0.4256
Male managers	<.0234	0.1702

A job of a manager comprises two roles: formal and informal. The way people behave in these roles might change and while some managers can be friendly yet strict and professional, other managers are biased, favoring those whom they like (similar-to-me error) or exhibit cowardice or are unable to give negative feedback (leniency error). Concerning managerial style, we believe that it is also important to examine the formal part of managerial communication represented in a form of performance appraisal. Thus we have examined what are the attitudes of managers towards a performance evaluation session, whether they believe it is motivational and what is their understanding of the manager's role during performance appraisal. Performance appraisal is a formal part of interaction between managers and subordinates, it involves at least assessing past work performance of subordinates and often it includes also the setting of further goals or designing training and development programs. If it is to be motivational, it is necessary it to be impersonal, factual, objective and executed in a timely way[13].

In Slovak companies, performance appraisal is in some form regularly performed[14], however we also wanted to know what is the individual [subjective] understanding of the function and how the managers understand their "ideal" role during the session[15]. So the question in the questionnaire was stated hypothetically (see Table 6). In this part of the questionnaire, the respondents could indicate more than one correct answer and thus portray themselves more clearly. Generally, both male and female managers believe that performance appraisal can be motivational and most of them agreed that they should evaluate the subordinates in a factual, non-biased way. However, there is a difference between male and female managers when it comes to what extra information a manager should be interested in. More female managers indicate that their role is to provide subordinates with both positive and negative feedback (although male managers also strongly indicate this response). The interesting difference is in the need of the managers to show interest the their subordinates' personal problems and in their relationships at the workplace. Male managers show a stronger desire to investigate their subordinates' personal problems and express the need to understand the relationships of their subordinate (the value here is almost double that of female managers). The reason why female managers focus on "hard" objective data might be that they do not want to give the ratees a reason to complain about bias and they want to give a perception of procedural fairness. Focusing on goals and evaluating in a factual way may support the sense of justice and also may be a way for female managers to accommodate the masculine role with which the job of a manager is frequently associated. The preference to give both positive and negative feedback can even underline the feeling of impersonality, yet fair treatment. It is interesting to note that it is male managers who try to be more personal, understanding and exhibit willingness to learn about personal lives of employees.

Hypothesis 3 is supported and we can conclude that female managers exhibit more egalitarian, impersonal approach when formally assessing their subordinates.

TABLE 6. PERCEPTION OF MANAGERIAL ROLE DURING PERFORMANCE APPRAISAL

IN YOUR OPINION, DURING PERFORMANCE APPRAISAL EVALUATION, THE MANAGER SHOULD*		
	FEMALE **(N =121)**	MALE **(N = 390)**
a) evaluate goals	14 (11.57%)	36 (9.23%)
b) show interest in personal problems of subordinates	9 (7.44%)	45 (11.45%)
c) evaluate matter-of-factedly	76 (62.81%)	278 (71.28%)
d) show interest in the relationships among subordinates	13 (10.74%)	77 (19.74%)
e) provide both positive and negative feedback	52 (42.98%)	150 (38.46%)
I CONSIDER PERFORMANCE APPRAISAL TO BE A MOTIVATIONAL FACTOR		
Never	2 (1.65%)	7 (1.79%)
Rarely	8 (6.61%)	18 (4.62%)
Sometimes	16 (13.22%)	40 (10.26%)
Usually	35 (28.93%)	133 (34.10%)
Always	60 (49.59%)	192 (49.23%)

* the respondents could mark more than one answer

Discussion and Limitations

The presented paper discusses gender differences in managerial style. The research is based on the respondents' own responses, so there is no subordinates' perception of the actual style of the managers. This is actually a self-portrait of the respondents and as such it indicates the differences in priorities and understanding of managerial role of female and male managers. The beliefs and assumptions lead to behavior, so it is safe to predict that reported differences in style of management are also demonstrated in actual behavior of the managers. However, in the future it will be useful to design a study that would examine the beliefs of managers and perceptions of the subordinates and seek to portray managerial style from the side of those who are managed to confirm the self-perception of managers.

Generally, we can conclude that there is a degree of female under-representation in managerial positions. When compared to male managers solely, women make up one third in foreign companies and only one fifth of managers in local Slovak companies. When compared to the percentage of females actively working the disparity is even larger.

Female managers as a group in the sample were younger women with lower span of organizational tenure. Foreign companies show a better balance in promoting women into managerial positions than local companies; however, this may be also an indicator of the unbalance of the industries in the sample: most local companies in the sample operate in the production area (chemicals, engineering, metallurgy) or transportation and these are usually male dominated industries.

Upon analysis, we can conclude that female managers use participative style of management, trusting their subordinates and letting them work independently, yet they are more open for consultations than their male counterparts. While male managers also demonstrated a tendency to delegate and empower their subordinates, there was no significant link between the two aspects of managerial style. This makes male managers less consistent in the way they manage their subordinates. They may actually be more distant from the employees, yet they still maintain professional and friendly relationship with their subordinates. On the other hand, female managers hold a more impersonal stance when engaged in the formal role of assessing the performance of their subordinates. It is the male managers who believe that during performance assessment, a manager should be interested in personal lives of his subordinates and their interpersonal relationships at the workplace. This can be for two reasons: 1) female managers may not believe this is important during the performance appraisal because they separate formal communication from informal one and thus believe it is not appropriate nor professional to mix personal with formal assessment, they may fear that they would be judged by their subordinates as favoring certain people or not being fair; 2) female managers, thanks to the cooperative style of management, already know their employees well and want to fit the masculine role of a manager that requires them to be a fair judge during performance appraisal. In any case, focusing strictly on work performance can be a drawback as it may make it difficult for female managers to provide the employees with training and development programs to improve in the future or to eliminate problem spots within a team of employees.

Conclusions

From the presented analysis, we can conclude that gender is a variable in defining managerial style. The style of female managers is more co-operative and consultative, female managers tend to delegate and empower more than their male counterparts. On the other hand, when engaged in formal evaluation, female managers believe they need to be judging solely the performance of the employees and do not find it relevant to inquire about private problems of their employees or about their relations with other colleagues. They prefer to remain neutral when evaluating others and providing them with official feedback. When comparing preference of decision-making style of male and female managers, data does not show significant difference between the two groups.

It can be concluded that in the environment where women have a tradition of active employment but where they just recently started to assume managerial positions and working in the external environment that is changing rapidly, female managers assume a more formal, impersonal attitude when engaged in assessment and evaluation of their subordinates but they are trusting and empowering managers. There is still a dual attitude of female managers, differentiating between everyday, more informal situations in which they are cooperative and open to their subordinates and the formal settings during which they tend to assume the “masculine” role of a strict, goal-oriented manager.

Cross-Cultural Management in International Companies in Central-Eastern Europe: Case of Slovenia and Slovakia

Marina Banovic
University of Udine, Italy
Lubica Bajzíková
Comenius University in Bratislava, Slovak Republic

Abstract

Central European countries enter the second decade of their transition. During the 1990's all Central European countries took great strides in establishing functional democratic systems and integrating themselves politically and economically with the rest of the world. There were major accomplishments in the complicated process of economic restructuring and Central European economies' integration into world markets. Some of the economies experienced growth after recession, but some of them are still in a developing stage. The entry of foreign companies, either as joint ventures, or as 100% investments, is among the measures that may lead to recovery. As all of them must rely on local workforce, totally or partially, they face the problem of intercultural management, which is becoming a central issue for the managerial practices in operative FDI in Central-Eastern European countries. The diversity of values, attitudes and approaches between expatriates, who usually cover higher organizational ranks in the international company, and locals, may be a sizeable danger to development. It could provoke internal conflict situations, leading to negative business results and even to failure of international operations. There could be two types of problems: the endogenous one, i.e. the problem of intercultural diversity management within the company, and the exogenous one, regarding the relationships between company management and the local environment. Therefore, we would like to investigate, whether the effort of recognizing and facing such kinds of conflicts, can be, in the first place, managed, and, in the second place, even exploited in order to create a competitive advantage for the company. Our research will attempt to find out what is actually happening in the European joint ventures in Central-Eastern nations. In other words, do they recognize the problem, do they manage it properly, and are they able to transform it in an opportunity?

Introduction

In order for the transitional process of Central European Countries to be successful, it is essential that large, previously state-owned socialist companies learn to operate under the newly – created market conditions. With the entrance into the EU, and as a consequence of the global situation, the area of Central-Eastern Europe[1] is destined to grow in importance. It is an evaluation of the world scenario that does not appear as exaggerated. If we look at the world situation, we can see that the Middle East has problems to live with what is known as "modern" culture[2]. The same thing may be said for South America, though in this second case the "cultural gap" seems less severe. The Far East is probably the only non-Western part of the world, which keeps pace with the development. But, even there some preoccupations emerge, such as deflagrations of integralist origin, extending their tentacles also to this direction, difficulties of financial recovery, civil rights, and the like. Furthermore, Africa is an area of the world that is especially difficult to evaluate.

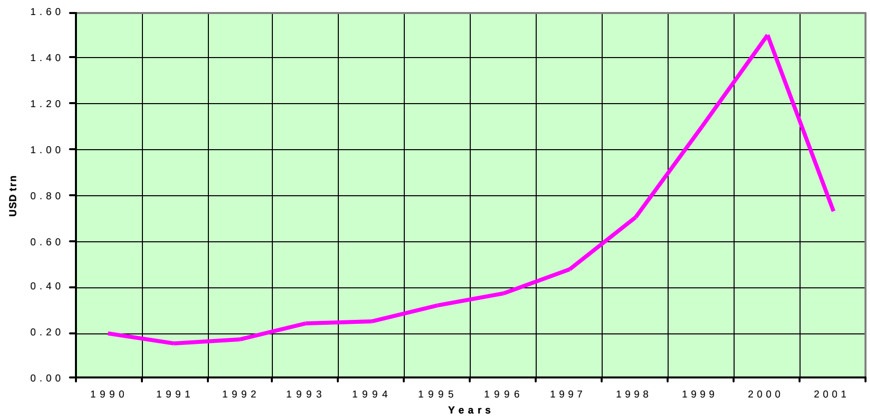

FIG. 1: WORLD FDI INFLOWS, USD TRN

The countries of Central-Eastern Europe, particularly those close to the EU border, remain an island of a relatively positive potential development. We can see it from the data in Figure 1, showing the flow of direct foreign investments [FDI][3], between 1990 and 2001 in the world as a whole. It is easy to observe the constant growth until the peak of 2000 and the subsequent crash in 2001. This was probably influenced by the September 11th attacks, or by the more general recession, hitting the world economy after the explosion of the technological bubble and the corporate scandals in the USA.

Economists state that in times of crisis economic fundaments emerge: companies or countries which are able to oppose resistance to the crisis strengthen their economic “immunity system”.

An analysis of the negative peak of 2001 per geographic area results in data shown in Table 1.

TAB. 1: FDI IN THE VARIOUS WORLD AREAS IN 2001[4]

Geographic areas	Funds USD billions	Change % 2000/2001
EU	320	-60
North America	150	-59
Asia	100	-24
Latin America	80	-11
CEE	25	+2
Africa	20	+97
World	695	-54

The only areas of growth in FDI in this two-year period have been those of Africa and of Central-Eastern Europe. In the African case there have been few big projects[5], which have almost doubled the FDI from one year to the other, whereas in the CEE area, a large number of small investments came into the area, marking it an almost unique example which was able to escape the 2001 world recession[6].

Conventional wisdom holds that FDI will be an important force for change, reconstruction and growth in the Central and Eastern European countries[7]. The authors of one report also argue that economic growth and FDI inflows are closely related in CEE economies. They argue accelerated economic growth and economic growth leads to more FDI, in a various circle[8].

The countries of Central-Eastern Europe therefore, must dispose of something basic which is pushing forward the number of investments. In order to understand better what it could be, we will quote some considerations, taken from the autobiography of the corporate CEO, Ferdinand Piëch, the man who saved Volkswagen from the destiny now threatening Italian Fiat[9] and others[10]. In the past, the German company has purchased various foreign brands, aiming at the market expansion strategy. Among them we can list Skoda, in the Czech Republic, a factory in Bratislava, Slovakia, built during the old regime, but until then unutilised, SEAT, Spain, a factory in Mexico and others. Piëch states that whereas in Germany the manpower had a share of 26 – 27 % on the final cost of the product, in the Czech Republic the same data added to less than 3%. The advantage "had to be transformed in a price advantage, aiming at building a strong and healthy market position". From the same text[11], another interesting statement is the following one, related to a comparison between two Volkswagen locations, Mexico and Slovakia: "Mexico turned in the meanwhile in one of the most expensive locations. The share of the manpower cost on the final product is much higher than in Bratislava". Moreover, Piëch evidences another important aspect: the personnel employed in Bratislava for assembly work was highly technically educated, instead of uneducated manpower, as in some other parts of the world. Actually, this fact has a strong influence on the quality of the operations carried out.

This last statement throws an even clearer light on the data of Table 1: the countries of Central-Eastern Europe represent an area of low-cost, and in the same time, of high quality labour[12].

These are the facts which support notion that in the future Companies also for the future a powerful push will move toward locations of international operations in the countries of Central-Eastern Europe. This will assume a growing role for the development of investments, either productive, or of other kind. As a matter of fact, the economic development will improve quality of life of those populations, raise income total, demand and markets.

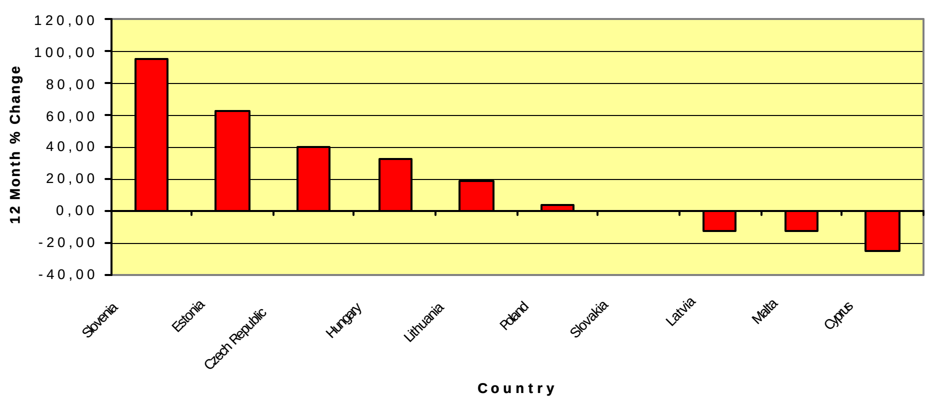

FIG. 2: EMERGING EUROPE: 12-MONTH STOCK MARKET RETURNSOURCE: IHT, OCTOBER 29, 2002, HSBC, BLOOMBERG.

The above considerations are strengthened also by Figure 2, showing the results obtained by portfolio investments in the stock exchanges of the countries new entrants in the EU in 2002, most of them from the Central-Eastern European region. Remarkable to that regard are the results obtained by the investors especially in Slovenia, Estonia, Czech Republic and Hungary.

FDI inflows to CEE countries [CEECs] soared to record levels. In 1995, the region accounted for 5% of world inflows, compared with only 1% in 1991. CEECs' share of total FDI inflows accounted for 3%-4% between 1995-1998[13]. This growth was driven not only by waves of privatisation, but also by economic recovery in some countries, especially in CEFTA. According to some estimates, CEE as a region has the potential to attract 10% of world FDI inflows; however, currently FDI inflows to CEECs remain low when compared to the world as a whole.

But we must not think that in the countries of Central-Eastern Europe this is overwhelming. In fact, the FDI rate, even though positive, as we can see from Table 1, represents only the 3.59 % of the world total in 2001.

The strongest proponents of FDI's role in CEECs [see Dunning 1993, p. 20] argue that multinational enterprises supply many of the necessary ingredients for economic growth, the reshaping of attitudes toward work and wealth creation, the redesigning of the business and legal framework, etc. [Paliwoda, 1997, p. 27]. In addition, the Central and Eastern European nations are seeking to regenerate their economies quickly, a task in which FDI plays a pivotal role. There are many articles written about the role of FDI in transitional economies. While it may be accurate to assert that the highest level of restructuring are to be found in enterprises that have FDI, the precise nature of restructuring and change in these companies at the firm level, as well as their impact an other local companies and their functional environment, have not yet been described and analysed in any systematic fashion. Case studies of enterprises with FDI are common: these usually describe the changes, conflicts and results after the entry of a foreign investor into a previously state-owned company [see for example Fogel, 1995; Nilsson, 1996].

Some authors point out that foreign investors should be more aware of the unique conditions in CEECs, particularly of the obstacles to organizations change which include such internal factors as unfavourable employee or managerial attitudes and incompetence, and external parries the legal environment and structures for corporate governance [Petrice, 1995]. On the other hand, several authors, especially from CEECs, have a different perspective: they try to evaluate the positive and negative impact of FDI on indigenous companies, and they do not pay attention to local obstacles [Blazova and Valent, 1995; Outrata et al. 1996; Bajzikova and Svobodova, 1998]. The obstacles, which seem to influence most the expansion of the FDI in Central-Eastern Europe are two:

1. The inheritance of the old regimes, with their hurdles to the free development of entrepreneurship,
2. The cultural differences between East and West.

The first problem was very much present at the beginning of the process of economic transition from plan to market economy. We can see it from Fig.3, showing the per capita GDP pattern in the countries of Central-Eastern Europe after transition.

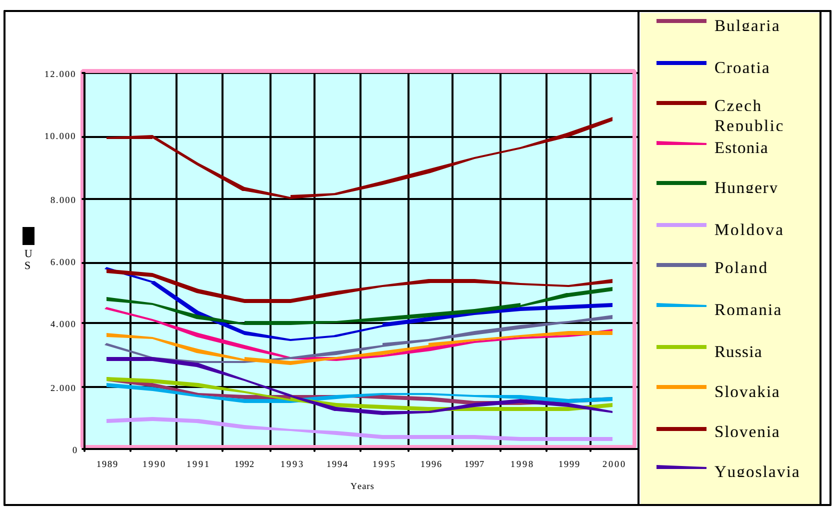

FIG. 3: PER CAPITA GDP IN THE TRANSITION PERIOD

While some of those economies started to grow after the initial slump, showing their detachment from the old ways, others are still in a stalling position.

The standard of political stability and economic performance are considered to be the most important incentives for foreign investors, especially when large investment projects are involved that require a politically reliable and economically effective environment over the long run. Surveys among western investors have shown that political and financial certainty in making decisions on investments in CEECs is the most important factor.

It seems the problem of the cultural difference is the cause. Therefore, it is difficult that it could be easily removed in the short period. As a consequence, investors directed toward those countries will have to consider this aspect as a constant environmental characteristic, to be confronted with opportune adaptation strategies.

Because of confidentiality of our sources, we can illustrate the real situation by the following example. An important Italian holding inherited, from a failed Austrian partner, a factory in a country of Central-Eastern Europe. The plant was in a pretty good shape, employing a workforce of 250. In order to manage the situation, the new owners decided to send to the spot an Italian "pro-consul" with directing powers. The Director was not able to communicate his intentions to the personnel, entering into conflict with his immediate subordinates. The local employees appeared to him as an aboulic mass with low interest for business benchmarking, even though their existence depended on it. Eventually the management results were so bad that the ownership decided to shut down the "venture". Before this last step, the owners were convinced for a last trial, introducing a new person in the company, also of Italian origin, but with a decade of experience in international business. This person was to act as a "cultural bridge" between the Italian ownership, the local management and labour. The result was immediately remarkable: after a short time the factory was on track again, exhibiting a good productivity and quality. Moreover, the company grew, reaching an employment level of almost 1,500. The factory is nowadays the "hard core" of the whole industrial group. Its products are sold on world markets with western brand and "griffe", but in the back of it, and as a guarantee, there is the solid productive position in Central-Eastern Europe.

What measures did the new manager utilize in order to get such results? After analysing the facts, it is possible to find out that he used a whole series of measures, [the details of which we cannot describe here] because of confidentiality. They consisted mainly in representing the reasons of the various groups, bridging the needs and the cultural points of view of owners and labour in order of reaching corporate goals.

The person is certainly exceptional, as it is shown by data and results. In a certain sense, it is possible to state, that his defect is his uniqueness. It is not possible to think that all the companies which will want or must transfer their activities in the countries of Central-Eastern Europe will be able to use "bridge" persons of the same kind. Hence, there is a need that the techniques used by the manager of this and similar case studies, are made available to all managers who would need them in order to manage with success the cultural diversity problem in mixed managerial groups.

If we turn to a more general point of view, we can state that the diversity of values, attitudes and approaches between expatriates, who cover higher organizational ranks in the international company and locals, represents a concrete menace for the development of the corporation, and may indeed provoke situations of internal conflict, leading to negative results and sometimes failures to international operation.

There could be two kinds of problems: an endogenous problem, i.e., a problem of managing the intercultural diversity within the company, and an exogenous one, regarding the relationship between the company management and the local environment. With the SWOT[14] method, an inventive management is sometimes able to transform the environmental threats in opportunities for the company.

The task of this research consists in investigating, if the effort of knowing and challenging this kind of conflict can be, in first place managed and in second place, exploited, to the scope of creating a competitive advantage for companies with foreign investments in the countries of Central-Eastern Europe.

The bibliographic research, in the initial stage of the project, has shown that the largest part of the available literature[15] in the area of the management of cultural diversities is of USA origin[16]. As the environmental variables in the USA and in Europe bear different characteristics, the models present in the existing bibliography must be adapted to the European reality, in this case to the one existing in Central-Eastern Europe[17].

The field research, which was carried out afterwards[18], has had an exploratory character until now. For example, the first stage was oriented to detect and describe specific characteristics of the phenomenon, which we have defined as impact of cultural differences on the business performance in the countries of Central-Eastern Europe.

The main research hypotheses are the following ones:

Hypothesis 1

The performance of the international companies employing local workforce depends on cultural diversity. Managing culturally diverse workforce represents a threat for the success of the operations. This threat can be transformed into competitive advantage for the company, if *management of the cultural diversity* is developed as a part of strategic management of the company.

Hypothesis 1.1

Management of foreign companies in countries of Central-Eastern Europe does recognize the problem of cultural diversity in the international business.

Hypothesis 1.2

Management of foreign companies in countries of Central-Eastern Europe is able to manage the problem of cultural diversity in the international business.

Hypothesis 1.3

Management of foreign companies in countries of Central-Eastern Europe is able to create a specific competitive advantage, starting from the cultural diversity in the international business.

Hypothesis 2

The role of company leaders is crucial for the success of the international operations assigned to them. Between the different leading capacities the manager of international operations must accept two characteristics important to this research: recognition of cultural differences and competence in treating them.

For the purpose of gathering data on the subject, we decided to use as research instrument the survey method based on two types of questionnaires, the first one oriented on general directors of companies, the second one dedicated to local managers positioned at lower managerial ranks.

The final version of the questionnaire for general directors is organized around the following points:

TAB. 2: STRUCTURE OF THE QUESTIONNAIRE FOR GENERAL MANAGERS

I Manager data: General data Data on foreign managers Data on local managers
II Company data General data Data on the relationship company – environment
III Data on the management of human resources General policy on HR Data on management of cultural differences
IV Direct questions

In the first stage of the field research we lead face-to-face interviews with general directors.The first period the surveys were carried out was during the period of June-July and October 2002 in Slovenia, a country chosen for evident reasons of geographic proximity. But the research is being extended; we are trying to include other countries of Central-Eastern Europe. The second period of research was realized in Slovakia during November 2002-January 2003.

The questionnaire for local managers consists of 15 closed questions. The first part was dedicated to the career background and the schooling level of the managers, whereas the second one was centred on management of cultural diversities. In each company we made available also three questionnaires for local managers. The local managers, who are positioned on lower levels of the managerial structure, have been asked to return the questionnaires after answering the formulated questions. To obtain comparisons about the management of cultural differences, the scope included both the general directors as well as other local lower-ranking managers.

The result of the analysis of the data gathered represents the base for a subsequent expansion of the research problem.

The obtained record of cases is very diverse, and tends to scatter in a series of individual “stories” with spotted characteristics. But applying a generalization trial, it seems possible to evidence, within the various “cases”, some common features: there are three groups of factors influencing the management of cultural diversities in international companies:

1. The origin of the mother company [country of origin of the equity];
2. The personal sensibility of the top management regarding cultural diversity;
3. Sector of activity.

As far as the first point is concerned it looks like if cultural differences between locals [Slovenes, Slovaks] and Germans [Austrians] are smaller than those observed between locals and citizens of the Mediterranean countries. It seems easier to overcome the communication and trust barriers between German or Austrian investors and local workforce [Slovene]. For instance, German and Austrian investors try to introduce “a common organizational spirit”, with the aim of improving the loyalty of workers toward the company. Among the non-financial motivational instruments commonly used in international operations, they use socialization methods, such as outdoor socialising, Christmas and Easter gatherings with the members of the worker families, and so on.

It is possible to state that the South European investors [particularly Italians and French] adopt a more ethnocentric approach of management to their investments in countries of Central-Eastern Europe [Slovenia, Slovakia], whereas those of Western Europe, in particular Germans and Austrians, implement more frequently a polycentric and in some cases, even geocentric approach in the management of their international activities.

This fact is illustrated by the data indicating the assignment of key positions of the international operations: 80% of the key positions of the companies which are connected with Latin countries are covered by employees of the mother company, whereas the companies originating in Western Europe trust them by only 11%.

Our result regarding the cultural characteristics of the workforce taken into consideration can be synthetically expressed as in Table 3:

TAB. 3: CULTURAL CHARACTERISTICS OF THE SLOVENE WORKFORCE

Favourable characteristics of the Slovene workforce	**Unfavourable characteristics of the Slovene workforce**
Disposition to learn	Low risk propensity
Good executors	Low responsibility propensity
Easy integration in diverse work environments	Low bargaining propensity
Good technical and linguistic capacities	Scarce managerial capabilities

TAB. 4: CULTURAL CHARACTERISTIC OF THE SLOVAK WORKFORCE

Favourable characteristics of the Slovak workforce	**Unfavourable characteristics of the Slovak workforce**
Disposition to learn	Middle risk
Good executors	High responsibility
Good technical skills	Moderate bargaining
Good languages skills	Moderate managerial capabilities

If we analyse the Slovene cultural identity applying the five cultural dimensions proposed by Hofstede,

and compare them to the results which he obtained for Mediterranean and Austro/German nations, the outcome is
the one illustrated in Table 5.

TAB.5: HOFSTEDE CULTURAL DIMENSIONS APPLIED TO THE THREE NATIONS

Dimensions of the national culture	SLO	LAT	AU – GER	SK
Power distance	High	Middle	Low	High/Middle
Individualism	Low	High	Middle	Middle
Masculinity	Low	Middle	High	Low
Propensity for uncertainty	Low	Low	Middle	Middle
Orientation to the long term	Middle	Low	Middle	Middle

Regarding the second research hypothesis, it seems that research confirms it fairly. Top management is seen as a bridge between two realties, e.g. the mother and the local company. By carrying out the delicate role of bridging the barriers caused by cultural diversity, three types of managers are devised:

?? Bi-cultural managers;
?? Managers with significant foreign experience;
?? Managers with little or no experience in international environment.

The managers, who by birth belong to two cultures, are the most sensible to the problem of cultural diversity. Many were born and grew up in border regions between the two countries, and have close relatives or even parents originating from the culture of the other country, Slovenia. They have experienced the influence of two cultures from birth, or from their youngest age. As a consequence, for them the presence of the two cultures is a daily occurrence. They possess a natural sensibility for the problem of cultural diversity, which they transmit daily to the working environment. In other words, their long experience with the two cultures helps them to have a more natural and more effective approach toward this kind of problematic.

The managers, who are part of the second group, either have a significant background in the international activity, or simply, are living abroad. This means that the majority of them, in some way, have experienced the impact of cultural diversity. Therefore, they put in the field a significant effort in order to understand the culture they were introduced to by the foreign task. The effort is not based on specific techniques developed in order to manage the diversity, but on intuition.

The third group of managers is employed in the international operations for the first time. This means that when they are for the first time living abroad, they do not attempt to understand different living and working conditions. This is closely related to the cultural shock experienced at the moment they enter the foreign country, Slovenia, or Slovakia either alone, or with families. Similar is the situations for managers who are daily commuting between the mother and the work country [Slovenia]. It is a not so rare situation in the examined case, due to the dimension and geographic position of Slovenia.

A third factor determining the degree of attention given to the cultural diversity is bound to the business sector where the company is operating. For instance, the situation is very different in manufacture or in retail sector. In the first case the only objective of the company is managing workforce in order to improve productivity. In this case the management of cultural diversity has a role, which is limited to the task of improving productive efficiency of employees. In the second case there is also the problem of product assortment and of connected services that are to be managed in order to satisfy local consumers. In this case there is a double pressure on management of cultural diversity, asking for a more sophisticated effort. The transfered company's culture, management, and incentive structure has been more problematic than the transfer of technology [cases of Slovakia]. A refusal to agree with management systems, culture and conditions, together with others factors caused a dramatic employment decline [more than twice]. After four years, productivity increased dramatically [from 130 units of output per employee in 1992 to 660 units in 1998, and to 1500 in 2000]. Great emphasis is placed on the system of profit sharing [wages depend on company profit] and system of worker recognition based on individual productivity, flexibility, etc. One reason for the productivity increase results from precisely these factors.

At the end we can formulate the following considerations of general character:

The cultural diversity is an important characteristic of FDI in countries of Central-Eastern Europe [Slovenia, Slovakia]. Many managers do not recognize it, or consider only its negative impact. Some managers try to manage it, only to prevent possible conflicts. Only in few cases the managers try to obtain a competitive advantage from this situation. Management of cultural diversity asks for a remarkable effort, especially by the top management. The results can be expected only in the medium or long term. Therefore, management of cultural diversity should be an integral part of strategic business planning of the company. There is a remarkable need for formulation of concrete management techniques in order to manage cultural diversity.

Taking into account the above considerations, a model can be designed for creating competitive advantage in international companies in countries of Central-Eastern Europe. It is based on the following preliminary considerations: a managerial team in order to run well must eliminate stress and if possible, also create job satisfaction among actors. This goal can be reached only if each person does the role for which he or she is most talented and specialized. Taking into account the data in Tables 3,4, and 5 it would appear that competitive advantage could be reached initially by mixed managerial teams in CEE countries, formed by expatriates and locals, [if expatriates take the burden of the basic decisions and bargaining], and locals who execute the bulk of the routine activity. With time these roles could change. This research has arrived at certain conclusions, which can also serve as a background for the future research investigation.

Virtual Teams: A Matter of Performance and Effectiveness

Raquel Castaño
Mauricio Gonzalez
ITESM-Campus Monterrey, Mexico

Abstract

Change is not only inevitable, but has vastly accelerated in pace and complexity; changes in communication technologies have facilitated information transmission around the world and it now enables geographically dispersed groups of people to work together on projects. These are virtual teams that communicate via telephone, fax, interactive televised conferences, and computer mediated devices. Computer mediated communication (CMC) is the most commonly studied form of virtual groups (Gonzalez and Burke, 2000). In these types of groups, participants interact using CMC devices such as e-mail, voice mail, and videoconferencing. Thus, recognizing that a new form of group work has evolved, this paper intends to review the research that has been done to explore the factors that lead to, as well as those which limit, the success of a virtual team. Specifically; this review will address cohesiveness, heterogeneity, and motivation as issues that affect the performance and effectiveness of virtual groups.

The Applications of the Concepts of Work Group, Team, Group Performance and Group Effectiveness in Virtual Groups

The Difference between Work Group and Team

Guzzo and Dickson (1996) state that a "work group is made up of individuals who see themselves and who are seen by others as a social entity, are interdependent because of the tasks they perform as members of a group, are embedded in one or more social systems (e.g. community, organization), and perform tasks that affect others (such as customers or coworkers)". Forsyth (1999) asserts that "teams" are specialized types of work groups; these groups stress cooperation among members, higher levels of structure and coordination, cohesion, and goal attainment. Guzzo and Dickson (1996) suggest that groups become "teams" when they develop a sense of shared commitment and strive for synergy among members.

The words "team" and "group" will be used interchangeably in this review; recognizing, that there may be degrees of difference, rather than fundamental divergences, in the meanings implied by these terms. For the purpose of this paper the definition of a "virtual team" will include distance groups that collaborate on projects by communicating mainly through computer mediated devices.

The Difference between Group Performance and Group Effectiveness

There has been confusion in the literature regarding the definition of effectiveness. In a general sense, effectiveness is conceptualized as the effect of performance (Gonzalez and Burke, 2000). Commonly, group effectiveness is measured in terms of outcomes that are aggregated from the individual to the group level. Sundstrom et al. (1990) cited from Gonzalez and Burke (2000) state that effectiveness in groups is indicated by a) group-produced outputs (quantity, quality or speed), b) the consequences a group has for its members, or c) the enhancement of a team's capability to perform effectively in the future. Given the variety of indicators of effectiveness, the relevant issue is to select a perspective of effectiveness and its causes that is fundamental, basic, and central to a variety of approaches. The effectiveness of virtual groups has been typically measured with respect to the quantity of ideas produced by participants in brainstorming tasks, the time spent in accomplishing the task, or an assessment of the quality of ideas (Sproull and Kiesler, 1991). Other outcomes that have been examined are the extent to which the groups can accomplished complex tasks or whether not consensus can be reached (Buzaglo and Wheelan 1999; Campion and Medsker 1996).

Maznevski and Chudoba (2000) state that "understanding virtual team effectiveness requires a complete description of process and structure, of technology and social systems, and of the interaction among these dimensions over time" (p. 489). For the purpose of this paper, effectiveness will be defined as the quality of a specified output that results from the group's performance.

Are Face to Face Groups More Effective than Virtual Groups?

Whether virtual groups or face to face groups are superior in task performance appears to depend on the task. Guzzo and Dickson (1996) state that computer mediated groups appear superior at generating ideas but face to face groups appear superior on problem-solving tasks and tasks requiring the resolution of conflicts. However, these authors also recognize that a large part of the effect of computer technology in groups may be due to the structure of the task imposed by the use of computer technology, rather than other aspects of the electronic medium. The increased structure of the task--whether by computers, or by no technological means--seems to enhance group processes. Although task type is often proposed to moderate the relationship between a medium and its effect on performance there does not seem to be a consistent pattern of task types for which communications technology is better or worse. Maznevski & Chudoba (2000) propose that a combination of media including face-to-face outperforms one without face-to-face.

Guzzo and Dickinson (1996) state that the continuing spread of computerization has been accompanied by an expansion of research on groups that use computers in their work. They state that this research has in large part focused on comparing computer mediated group meetings with non-computer mediated meetings and, where work is done by groups, on idea generation and choice making. Research should not focus anymore on comparing face-to face groups to virtual groups; that could have been an important issue ten years ago. But now the main focus should be in trying to understand the interaction between process, structure, technology and performance in specific group environments.

Factors that Influence Task Performance and Effectiveness in Virtual Groups

Cohesiveness

Cohesion is the strength of the bonds linking individual members to one another and to their group as a whole and that makes them commit to the group (Forsyth, 1999). According to Zaccaro (1991), cohesion is a multidimensional variable that consists of different factors, binding social forces, a sense of unity, attractions to individuals members and the group itself, and the group's ability to work as a team are all components of cohesiveness (Foresyth, 1999).

A Review of cohesiveness research (Guzzo and Shea , 1992) revealed a positive association between cohesion and performance. As cohesion increases, the internal dynamics of the group intensify; and this may provoke that people are more ready to accept the group's goals, decisions, and norms. One noteworthy aspect is that even though cohesive groups usually outperform less cohesive groups, this relationship between cohesion and performance is strongest when members are committed to the group's tasks. Indeed, if a group’s norms do not encourage high productivity, cohesiveness and effectiveness are not positively related (Forsyth, 1999). Also, this author states that performance causes changes in cohesiveness; groups that succeed tend to become more cohesive, and groups that fail tend to become less cohesive. In summary, cohesion may not be a sufficient condition for effective groups, but it is a necessary one. Without cohesion, feedback would not be accepted, norms would never develop, and groups could not retain their members.

Cohesiveness in the Context of Virtual Groups

The literature reviewed suggests that special attention should be paid to the components of group cohesion for achieving effectiveness in a virtual team. As suggested by Guzzo & Shea (1992), creating interventions that promote interpersonal attraction and task cohesion can lead to improvements in collective efficacy, and subsequently to enhanced performance and effectiveness of virtual groups. The interventions could take the form of a) training programs, especially in the use of computers and distance collaboration technology; so the participants can become familiarized with the communication mean, and therefore be attracted to the task, b) meeting face-to-face in the early existence of the group, so that a shared view of the task may be developed (Maznevski and Chudoba, 2000), and c) interactive meetings throughout the project via videoconferencing (a substitute for the face to face interaction) that may help accelerate the socialization process and build group cohesion (Gonzalez and Burke, 2000). Cohesion builds more slowly in virtual groups than in a face-to face group, so the interventions (actions) proposed in this section might prove useful for achieving cohesion and thus also effectiveness in virtual groups.

Group Heterogeneity

Guzzo and Dickson (1996) define heterogeneity in a group as the mix of personalities, gender, attitudes, and background or experience factors. The extent to which team effectiveness is affected by the heterogeneity among members is a complicated matter. Jackson et al. (1995) cited from Guzzo and Dickson (1996) reviewed and summarized empirical evidence from a number of related disciplines about the link between diversity (that is, within group heterogeneity) and team effectiveness. Their findings reveal that heterogeneity is positively related to the creativity and the decision-making effectiveness of teams; specifically when generating alternative solutions to a problem and applying a range of perspectives in analyzing business problems. Although evidence supporting the value of member heterogeneity for team performance is clearest in the domains of creative and intellective tasks. In addition to the above evidence, Jehn, Northcraft and Neale (1999) suggest that for a team to be effective, members should have high information diversity, which refers to differences in knowledge bases and perspectives that members bring to the group, and low value diversity, which occurs when members of a workgroup differ in terms of what they think the group's real task, goal, target, or mission should be. These authors also state that value diversity becomes more important as a predictor of group performance over time, while age and gender diversity become less relevant over time. Thus, it seems that certain types of similarities are more important than others. Specifically, the diversity associated with values, and not social category, is the one that causes the biggest problems and has the greatest potential for enhancing both workgroup performance and morale.

The composition of a group can affect its structure, dynamics, or performance in a variety of ways. Jehn, Northcraft and Neale (1999) state that a review of forty years of diversity research concluded that there are no consistent main effects of diversity on organizational performance. Researchers have studied these effects, but only few have conceptualized group composition broadly. Moreland and Levine (1992) recognize that there has been little theoretical integration of work involving different characteristics. These authors propose to develop a model of those effects that both describe and explain the causal role of group composition in various aspects of group life. One possible way could be to include different contextual aspects (task and organizational characteristics) and different types of diversity (psychographic and demographic). In the following section, heterogeneity in the context of virtual groups will be discussed.

Heterogeneity in the Context of Virtual Groups

According to the literature reviewed, the "natural" diversity present in virtual groups may represent an opportunity to share different information and to apply a wide range of perspectives when analyzing a specific problem. Maznevski and Chudoba (2000) state that "[heterogeneous] groups offer high potential for performance on complex tasks but often fail to realize that potential" (p.476). These authors state that a virtual team's composition may be an influential structural characteristic, and integration processes are likely keys to performance. The integration process includes relationship building to develop a shared view of the task and strong, trusting relationships among each member of the group.

Kahai and Cooper (1999) suggest that to develop a shared view of the task, management interventions, as well as computer-mediated communication systems can be designed to increase task-oriented communication and reduce negative socioemotional communication. Those managerial interventions could include the establishment of ground rules that inhibit negative socioemotional communication while promoting task-oriented communication.

On the other hand, "virtual team trust" is essential for a group of diverse individuals to develop into a fully functioning team. According to Mayer, Davis and Schooman´s (1995) cited from Javernpaa, Knoll and Leidner (1998, p. 26), "trust is the willingness of a party to be vulnerable to the actions of another party based on the expectation that the other will perform a particular action important to the trustor, irrespective of the ability to monitor or control that other party, " For practicing virtual teams, an interesting finding suggests that high-trust teams exhibit "swift trust", which is defined as a form of depersonalized action, with less emphasis on feeling, commitment, and exchange; and more emphasis on action and the task (Javernpaa, Knoll and Leidner, 1998 p. 21). "Swift trust" enables members to take action, and this action will help the team maintain trust and deal with uncertainty, ambiguity, and vulnerability while working on complex interdependent tasks with strangers in a situation of high time pressure.

For practicing virtual teams the literature reviewed suggests a number of strategies that might work to enforce trust. These strategies include: a) rotating leadership (allowing for members to be leaders in their particular area of skill may reduce the dependency on any particular person); b) task goal clarity, role division, and specificity (discussing the goals of the assignments to a great extent may give the team a sense of reduced vulnerability); and c) frequent interaction with detailed responses to prior messages (to reduce ambiguity and uncertainty) (Javernpaa, Knoll and Leidner, 1998) Research on trust in virtual teams is a wide open field and future research may focus in verifying current findings and more rigorously understanding the means to attain and maintain it.

Motivation

Motivation is a relevant factor that affects the effectiveness in team jobs, just like it does in individual jobs. In a general way, motivation is shown by a persistent dedication of effort, energy, and commitment to a group task, it is a vital ingredient that can transform a collection of individuals into a true working unit (Boiney, 1998). The particular issues related to group motivation that will be addressed in this section are: expectancies, goals, interdependency and group potency. Classic expectancy-value theories of motivation suggest that two factors determine group members´ level of motivation: their expectations about reaching a goal and the value of the goal (Forsyth, 1999 ; Crisson, Seta and Seta, 1995). Motivation is greatest when people think that the goal is within their reach (expectations are high) and they consider the goal to be valuable. Motivation diminishes if expectations are low or individuals do not value the goal.

In general, according to Forsyth (1999), group members work harder when: a) they are personally interested in the group´s tasks; b) they feel that their contributions to the group are indispensable; c) they feel others will not free ride; d) when they feel the group's goals are clear and challenging, and; e) they are confident in their group's ability to reach its goals (collective efficacy).

Another noteworthy theme related to motivation is interdependence, which comes from the work of Guzzo and Shea (1992); in which they emphasize that interdependency is the defining characteristic of teams, and is related to effectiveness because interdependent tasks may be completed more efficiently in the context of a group. Interdependency may work also to increase motivation by enhancing the sense of shared responsibility for, and reward value of, group accomplishment.

Finally, another issue related to motivation is "group potency", which was introduced by Guzzo and Shea (1992). These authors define group potency as the group's collective belief that it can be effective. They differentiated the construct from other related constructs (e.g. collective efficacy) and reviewed evidence that the strength of this motivational belief significantly predicted group effectiveness in customer service and other domains. Group potency is considered to be task general and not as task specific as collective efficacy. That is, group potency has been used to assess groups with long-term interactions that engage in several tasks or activities (Gonzalez and Burke, 2000). Motivation in the context of virtual groups will be discussed in the following section.

Motivation in the Context of Virtual Groups

The perceived complexity of operating through Computer Mediated Communication (CMC) itself may affect motivation in distance collaboration groups. More specifically, the literature reviewed (Kahai and Cooper, 1999: Guzzo and Dickson, 1996; Guzzo and Shea, 1992) states that accomplishing tasks through distance collaboration groups takes longer than in face to face situations since decisions tend to be more polarized and people may face problems reaching consensus. Thus, the organizational challenge is first to effectively create the virtual teams and, second, to overcome the inherent resistance that inevitably accompanies large-scale innovation.

Importantly, providing adequate training (in terms of both technical and team skills), and adequate managerial support (in terms of resources, information, and encouragement) may motivate participants to become familiarized with the communication means and therefore to be more attracted to the task. Research has shown that on line communication must be much more explicit than verbal interactions, and that geographical separation amplifies the need for explicitness (Nunamaker, Briggs, Mittleman, Vogel, and Balthazard 1997). Another aspect that can affect motivation in a virtual group is that electronic communication can provide group members with too much stimulation, with the result that a flood of information to process overwhelms group members.

The use of internet or other means of distance interaction may constitute in itself a difficult task to perform: so, by feeling comfortable with the means of interaction, team members may be more attracted to the task and also confident of their ability to work in this setting, which in turn may contribute to increased motivation and commitment. Additionally, Crisson, Seta and Seta (1995) propose that linking rewards to the accomplishment of such tasks would increment the "perceived value" of the work and possibly would motivate people in the group to expend more effort and to be more committed. Future research could focus on analyzing the effectiveness of different types of rewards for different types of tasks and groups.

Especially interesting in this review was the empirical evidence found by Early (1994) cited from Guzzo and Dickens (1996) about the role of individualism-collectivism (a culture based individual difference) in shaping the impact of motivational training for individuals. Group-focused training was found to have a stronger impact on collectivistic individuals, and self-focused training was found to have a greater impact on individualists. An important issue to consider in the case of Mexico (collectivistic culture).

Conclusions and Options for Future Research

Virtual groups, as a new creative method of collaboration, offers several challenges for their effective implementations in organizations: first, they require an understanding of group process variables that affect the performance of these new forms of workgroups, so that effective actions can be taken; and second, an understanding of how to overcome the inherent resistance that inevitably accompanies large scale innovation. Gu zzo and Dickson (1996) recognize that although the first studies of electronically mediated teams were done more than twenty years ago, the pace of research on such teams has accelerated in recent years. These authors suggest that research on virtual groups should apart from the tradition of comparing those groups to face-to-face groups. Future research should accept such groups in their own terms and focus instead on contrasting technologies and on team effectiveness under different ways of utilizing available technology. Guzzo and Dickson (1996) state that "from a practical point of view we need more research on how to maximize team effectiveness with new technologies; and from a theoretical point of view we need better insights and explanations of the drivers of the dynamics of team performance and effectiveness under such technologies" (p.333). In addition, Maznevski and Chudoba (2000) recognize that empirical research on virtual teams is limited to a few studies on specific elements of virtual team process and state that "the simple conclusions from single studies do not provide a well-integrated understanding of virtual team process and performance" (p. 476). As stated previously in this review, research on virtual teams is a wide open field and future research may focus in verifying current findings and more rigorously pretend to understand the factors that lead to, as well as those which limit their effectiveness.

This paper reviewed cohesiveness, heterogeneity and motivation as critical issues that affect the performance and effectiveness of virtual groups; proposing actions (interventions) aimed at improving team effectiveness. Guzzo and Dickson (1996) in their review of team's performance and effectiveness concluded that three critical points exist for intervening to enhance team effectiveness. One is the "design" of the group that includes such things as specification of membership, of member roles and methods of their coordination, and of goals (e.g. group composition). The second is the "process" element that includes both social process in groups (e.g. cohesiveness) and task processes (e.g. rules of task performance); and the third point is the "context," which means team performance can be raised by changing the conditions in which team perform (e.g. leadership and motivation). Guzzo and Dickson (1996) conclude that the element with the most consistent research support for affecting team performance is the "context". In fact, these authors conclude that the greatest changes in team effectiveness are most likely to be realized when changes in teams organizational context are supported by the appropriate team design and process. Maznevski and Chudoba (2000) state that "understanding virtual team effectiveness requires a complete description of process and structure, of technology and social systems, and of the interaction among these dimensions over time" (p.489).

Mainly, the suggested topics for future research in this area are related to the issue that the literature reviewed tends to present a lack of consideration of the "context" in which the virtual group operates (e.g. culture, environment, organization, and task). Thus, future research could be aimed at studying in different contexts how the issues analyzed in this paper could vary in their importance and relationship to group performance and group effectiveness. Especially interesting would be to study those issues in a collectivistic culture like Mexico. Other specific questions for future research might be related to the topic of task cohesion, which according to the literature reviewed, appears to be importantly related to virtual team effectiveness. The proposed research questions in this area are: a) who types of training programs work better to build task cohesion? b) Which factors lead to develop task cohesion? And, c) Does meeting face-to face in the early existence of the group and having interactive meetings throughout the project via video-conferencing really help to develop task cohesion? Finally, it would be interesting to explore the following issues related to heterogeneity and motivation in virtual groups: a) How does the "natural" diversity present among members in virtual groups can be effectively managed?; b) How can trust be assessed and maintained in virtual groups ? And, c) Which types of motivational rewards work best to enhance performance in virtual groups?

Technology-based group communication will continue to thrive and researchers will have to make an effort to keep up with the pace of these changes. Research will be needed on how to maximize team effectiveness with these new technologies. An important issue to be considered is that, regardless of the enthusiasm or skepticism that virtual groups have provoked; organizations require to challenge the traditional assumptions about the way they operate, and need to gain a more profound understanding of the human side of this technological revolution.

> "…Though there is a revolution afoot, there is still more much to Learn…it is too early to tell who will succeed and who will fail in the Long run…"
> (Kanter, 2000)

Competitive Excellence in the Supply Chain

Dayr Reis
Leticia Peña
University of Wisconsin-La Crosse, USA

Abstract

Competitive pressure forces companies to exert themselves in order to survive and grow. When competition is severe, only excellent companies survive. Competitive excellence derives from managerial excellence. With the globalization of markets, managers have turned to the creation of world-class supply chain operations, and the philosophies, approaches, tools, and technologies to assure excellence. Globalization changes the fabric of competition in a market and imposes new and more exacting requirements on companies and their supply chains. A firm competing in an international market is doing battle with the very best in the world. The realization that in a global market, a company must achieve excellence on five critical competitive requirements, namely, quality, cost, flexibility, innovation, and customer service has created a paradigm by which supply chain operations will be judged. This paper explores how companies can pursue competitive excellence in their supply chain operations by all paying attention to the five critical components referred above.

Introduction

The competitive environment has changed dramatically over the last three decades. The key concept to emerge over the last decade and present one is *globalization*. As the number of competitors increases, more and more firms attempt to improve their position, which puts pressure for continuous improvement on each competitor.

The existence of a large number of high caliber competitors depends on market scope. Market scope can be placed into three categories: Local, national, and international/global.

A local market exists when industrial and commercial activities are confined to a particular region of a country. Nearly all companies emerge as competitors in local markets.

Markets are national in scope when their products are manufactured and distributed within the boundaries of a given nation.

When production can be undertaken anywhere in the world and the product can be economically distributed and consumed anywhere else, the market can be said to be global in scope.

Production tends to be concentrated in a few international production centers and further globalization multiplies these centers. Globalization brings these competitively robust production centers into head-on competition with one another. Automobiles, pharmaceuticals, electronics, chemicals, petrochemicals, farm machinery, and civil aviation are all examples of global industries.

The global market represents the ultimate level of competition intensity. There is a persistent trend toward deeper globalization of markets that are already international in scope and also toward the increasing globalization of local and national markets.

Factors Propelling Globalization

The trend toward progressive and deepening globalization is irreversible, because it is powered by fundamental, deeply entrenched social, economic, and technological forces which are restructuring the world economic system. Here are some of the factors that are propelling globalization.

Economics of communication. Modern transportation technology and large-scale transportation have generated substantial reduction in transport cost on a global basis. Containerization and multi-modal transportation are some innovations that drastically reduced transportation cost. In most sectors of economic activity, transportation cost and effectiveness have ceased to be a barrier to trade.

Recognition of the advantages of international trade. Economic science has now firmly accepted the idea that healthy international competition energizes national economies. Protectionism saps the competitive energy from national companies and causes them to become more and more inefficient and saddled with obsolete technology.

Economic performance of free enterprise economies. To the extent that free enterprise is proved to be a superior economic philosophy, it inexorably legitimizes liberalized trade.

Sustained global industrialization. Although poverty persists in many countries, industrialization is spreading across the world. International diffusion of technology, better education and a more complete and tested body of knowledge on management of development means that more and more countries are becoming industrialized.

Competitive Requirements of Global Markets

A company competing in an international market is doing battle with the very best of the world. One would naturally expect that the world-s best are all producing superior quality. Evolution to an international market weeds out inferior quality products. Companies that cannot constantly improve quality fall victim to international competition.

The customer gives high priority to quality but is not indifferent to cost. Precisely because the customer has a large number of products to choose from, he or she can pay more attention to cost or price. A global market is dominated by the lowest cost producers. In order to survive in a global market, a company must produce superior quality and maintain a favorable cost position.

Competitive flexibility, that is, the ability to change competitive position quickly and to redeploys resources in response to competitive threats or opportunities is now a key strategic requirement.

A global market is an uncertain one. Companies survive in an uncertain market by constant improvement, innovation, and creative destruction. Global markets belong to innovative companies.

Finally, globalization puts real power in the hands of the customer. The forces that are shaping the market are also shifting the balance of power in the customer's favor. The ability to serve the customer is a critical requirement for long-term survival, no matter the market.

As a market evolves from local to global, the competitive requirements of quality, cost, flexibility, innovation, and customer service become tougher. The classical trade-offs between the five competitive requirements are replaced by symbioses whereby the performance of each competitive requirement must create better leverage to perform the other.

The supply chain encompasses all activities associated with the flow and transformation of goods from the raw material stage to the end user, as well as the associated information flows (Handfield and Nichols, 1999).

The function of supply chain management is to: (1) Focus suppliers on improvements in quality, consistency, and usage, (2) use supplier resources to create new product or service features for a business customer with faster cycle time to market, and (3) manage all materials and reduce cost.

This paper will focus on how a company can pursue competitive excellence in its supply chain operation, on all five requirements of quality, cost, flexibility, innovation, and customer satisfaction simultaneously. The next section deals with the quality imperative.

The Quality Imperative

It is not surprising that the globalization wave that began in the late 1960s was paralleled by a quality wave. The customer in an international market can choose among a large number of high quality products. The global market functions in such a way as to force companies to produce ever higher quality levels.

Quality came to the forefront of management thinking in the 1970s and 1980s because international competitive pressures were weeding out companies whose products were not up to world standards or were severely penalizing those companies that were lagging behind the world leaders.

Search for Perfection

Excellent companies are driven by the search for competitive perfection. These companies and their employees are always searching for the perfect product, service, and production without errors, and products without defects.

It is this deeply ingrained belief that perfection must be sought that keeps the world –class organization learning and stretching to improve further. Companies that are searching for perfection keep looking for and finding ways to improve. One is struck by the fact that the world's best corporations keep improving their products and production systems. Improvement becomes routine, a way of life. Toyota receives 750,000 suggestions for improvement from its employees every year and implements an average of 40% of them. This means that roughly 1,000 suggestions for improvement are being implemented every day, and the rate has been rising over the last ten years. Continuous improvement takes the company closer and closer to perfection.

Quality in the Supply Chain

Quality is influenced by vendors in an important way. A company cannot improve on the quality delivered by its vendors except at great expense and effort. Vendor quality cannot be improved by in-coming inspection since inspection merely confirms the quality that already exists in purchased materials.

Toyota has received worldwide acclaim for its quality. Toyota spends eighty cents of every sales dollar on purchased parts. Intuition would lead us to conclude that 80% of Toyota quality is made or assured by Toyota suppliers. The strong emphasis that Toyota puts on developing very strong, quality-conscious suppliers and on insisting that all suppliers believe that vendor impact on per unit product costs is as high as vendor influence on quality.

Companies that are being managed to produce superior quality generally do business with suppliers that produce superior quality. The techniques and approaches that give a supplier decisive competitive advantages through its production systems are available to every company. Total Quality Management (TQM), Just-in-Time (JIT), Total Productive Maintenance (TPM), Business Process Reengineering (BPR), and lately, Six Sigma **all** focus on improving or radically changing the process, and on the perfect execution and mastery of basic management principles.

The challenge is to place those technologies within the framework of long-term development of the supplier capabilities.

Quality Certification

Certification verifies that suppliers operate effective processes by focusing on the outputs of those processes especially regarding quality. Evaluators look for clearly documented sequences of activities under tight management control. Certification identifies suppliers that can reliably meet quality delivery, cost, and flexibility targets. Supplier certification programs often conduct site visits by representatives from operations, management, purchasing, engineering, and cost accounting. This site visit studies such processes as:

?? Material handling systems
?? Capacity and production-planning systems
?? Scheduling and shop-floor control systems
?? Preventive maintenance programs
?? Product design systems
?? Quality management
?? Database management procedures
?? Housekeeping routines

The evaluation teams reviews available documentation for completeness and accuracy. They assess control procedures, evaluate specific statistics, and ask employees about process and corrective procedures.

International certification for ISO 9000 is also imperative if our suppliers want to be in the world market. ISO 900 standards are currently recognized in about 100 countries including Japan. They are not engineering standards for measurement, terminology, test methods, or product specifications. They are quality system process standards that guide a company's performance of specified reforms in the areas of design, development, production, installation, and service. They are based on the premise that certain generic characteristics of management practices can be standardized and that well designed, well implemented, and carefully managed quality systems provide confidence that the outputs will meet customer expectations and requirements. In the next section we discuss competitive requirements of excellence in the supply chain.

The Cost Advantage

The value that a company creates is measured by the amount that buyers are willing to pay for a product or service. A business is profitable if the value it creates exceeds the cost of performing the value activities (Porter, 1997).

Cost is always a crucial factor in a customer's decision to buy a product or service. Low cost comes from superior efficiency. Cost represents the monetary value of the resources consumed in producing a good or service. Efficiency measures how well the transformation activities that were undertaken to produce the good or service were organized, coordinated, planned, controlled, and otherwise managed. Low cost can be attained and converted into competitive advantage if the company achieves the following conditions:

?? Perform all value-adding activities more efficiently than its rivals

?? Perform front-end activities such as research, development, and engineering in such a way that they enhance the efficiency with which downstream activities are performed

?? Link into efficient suppliers, thereby using them as a source of cost advantage

?? Eliminate all useless or non-value-adding activities (waste).

Traditionally, economies of scale and market share were seen as the major source of cost advantage. However, it is now known that large scale is no guarantee that costs will be low, because scale increases complexity and bureaucracy, which are major sources of inefficiency.

Eliminating Waste in the Supply Chain

Supply Chain Management is designed to maximize the value of dollars spent in purchases, materials, and services (Riggers and Robertson, 1998).

Every activity performed by an industrial or commercial enterprise in the supply chain is potentially a source of cost advantage. The first line of attack in a strategy to reduce cost is to identify and eliminate all competitively useless activities, that is, those that add to cost without creating value for the customer. Wasteful activities should be easy to eliminate once they are identified and viewed as waste. A basic just-in-time (JIT) principle is:

$$\text{Actual Cost} = \text{True Cost} + \text{Waste}$$

How does one arrive at the true cost? The true cost comes from trouble-free operations of the best technology available, and is a potential or target that must be rigorously pursued by management. The following are some examples of waste elimination that could be undertaken in the supply chain.

Waste of Overproduction. Producing more than what has been sold or is immediately to be sold creates inventories that are a plague! Overproduction occurs either because known demand is produced ahead of time or because production is done in the hope that future demand will deplete what has been produced.

For a business that has a strong seasonal sales pattern, an overstocking strategy could be the least-cost option. However, one has to carefully evaluate the level of overproduction to see whether it is profitable given the extent to which sales are seasonal.

Much better results can be achieved by investing a little bit more in market analysis and forecasting so as to find out what demand is likely to be. If a company cannot develop a reasonably good idea as to what the demand for its products is likely to be a few months into the future, either it does not understand its market or the product is a very bad one. Overproducing will not solve these problems.

Waste Due to Overbuying. Overbuying results from either buying too much (more than is immediately necessary) or buying too early.

Buying larger quantities than necessary is usually justified on the basis that high fixed transportation and ordering costs as well as quantity discounts on large purchase lot sizes generate substantial savings. These arguments are based on false notions of cost where inventory holding cost – and the negative impact of inventory – are often totally ignored.

The performance analysis and control system used by most companies is also responsible for this kind of thinking. Purchasing managers are hardly ever evaluated on the cost of holding inventory!

Marketing sometimes puts pressures on production to accept last minute changes in promised delivery dates, while rush orders and specials seem to be the rule rather than the exception. The results are a master schedule that cannot be planned, controlled, and executed reliably, creating deterioration in customer service.

Overbuying is also done to protect against unreliable vendor performance. A well-planned and executed supplier development program not only broadens the supplier base but also stimulates existing vendors to improve their performance.

Waste Due to Work-in-Process (WIP). Actually, very little of what is referred to as WIP is in fact in process. 99.9% of what is traditionally referred to as WIP is work that is not being processed, but just lying idle between two operations. Tremendous improvements in operating efficiently can be gained by managing to reduce WIP inventory. WIP inventory adds uselessly to the lead-time that can be promised to customers. Moreover, WIP inventory hides in-process quality and machine reliability problems. Eliminating WIP inventory is a necessary step in the pursuit of total quality, efficiency, and customer service. The most powerful set of tools available to the company that wants to bring about reduction in inventory is Just-in-Time (JIT) programming.

Waste Due to Transportation. There are two categories of transportation. There is external transportation that links a company to its suppliers and customers, and internal transportation that links various stages in the company's own manufacturing and distribution systems.

Waste in external transportation partly derives from poor plant and warehouse location decisions and supplier choice. Plants, warehouses, and supplies that are located far from markets can add substantially to transport time and cost.

Waste in internal transportation is more amenable to managerial action. Conveyors, AGVs, and other glamorous technologies only serve to hide waste and perpetuate it. When management decides to build a large plant in order to achieve scale economies and low cost, it is in fact creating high fixed costs, large lot production, and high levels of WIP, raw materials, and finished goods inventories. When WIP is excessive, the space that it uses increases the distance between work centers that would otherwise be close or physically integrated. Transporting goods between these works centers requires conveyors. But conveyors are not the ideal because they are one stage removed form direct physical process integration. If one were to eliminate or significantly reduce the WIP, very few conveyors would be necessary to achieve process integration.

Waste of Human Resources. People are the most precious and versatile resource that any organization can have. Companies that tolerate, ignore, or do not try their utmost to eliminate waste in human resources are building their future in questionable premises.

Douglas McGregor gave us some lasting ideas that are still relevant today (McGregor, 1960). According to McGregor, every manager makes a core set of assumptions about human nature which conditions all managerial actions in human re source management (HRM). He placed these assumptions at opposite ends of a scale and called one set Theory X and the other Theory Y. Theory X views people as being innately lazy, irresponsible, shunning authority, desiring to be controlled and motivated by money. Managers should use close supervision and a strong authoritarian style of management. Punishment should be dispensed when goals are not met. It is management by fear, by being tough.

Theory Y takes the opposite view that people are naturally industrious, that they seek responsibility, authority, and autonomy and that they are intrinsically motivated to look for challenging work. Management must be participative and collaborative, rewarding people with recognition and other positive reinforcements, and avoiding punishment. Management must manage by being liked, by being good.

When one makes assumptions like those adopted by Theory X, one gets hung up on labor idle time and variance reports (even though labor is not more than 10-15% of the total cost in our days) and ignore the real significant issues.

Theory Y shows the need to mobilize the labor force into creative action, to have people to use their creative thinking potential to the full.

This is employee self-management in action, and every company that is achieving superiority in the world scene has simply learned to do it better than its competitors. Waste in HR is waste in using the creative power of the total human being individually and in a group setting. It is the most vicious and wasteful waste. Idle time is a non-issue or at least a very insignificant one.

Waste Due to Excessive Overhead. Waste in the HR leads to waste due to overhead. Overhead exists because top management is trying to put a head (supervisor) over a worker that it assumes has no head or simply does not know how to use it. When management creates numerous levels of staff and supervisors in an unproductive work force, it sets the stage for creating a vicious circle of self-fulfilling prophecies. Many companies create staff where the only reason for existence is to coordinate and communicate with other staff.

Workers that are well trained, motivated, and encouraged to be autonomous do not need myriads of supervisors looking over their shoulders. The more workers are supervised, the less they have time for productive, creative work. A manager who has to supervise four people in an eight-hour workday must spend two hours supervising each and robs his subordinates of the precious hours of time that could be deployed creatively to do the job better. Workers will need little or no supervision when management shows confidence in their creative abilities and trains them accordingly.

Waste Due to Bureaucracy. Bureaucracy is created by management obsessed with control. According to Parkinson's Law, work increases to fill the time allocated for it. There is another consequence of Parkinson's Law. The absolute amount of useful work decreases as the amount of useless works increases. It has been universally observed that management (bad management) naturally gravitates toward report writing, implementation of formal procedures and rules, documentation, and the creation of committees, all of these under unnecessary deadlines. To accomplish all the above, a formal bureaucratic structure becomes embedded in the simple informal and flexible structure that have been the hallmarks of entrepreneurial organizations. Bureaucracy has become endemic to many companies, even those that achieved world-class status. In many companies, managers spend better than half of their time attending meetings and another big chunk of time filling out forms, writing, or reading reports. Companies today are awash in reports, memos, and procedural manuals. There are numerous cases where executives spend days poring over volumes of reports written by staff in an effort to solve a problem and the information upon which the final decision is based was contained on a single page.

Bureaucracy is the enemy of flexibility and speed of response to performance signals, and so, it must be significantly reduced or eliminated.

Waste in Equipment and Facilities. Waste in equipment is caused by long set-up (changeover) times, unplanned downtime, quality problems (in process), slow or no feedback on equipment abnormalities, and poor operation, policies and worker training. When technology is changing rapidly, it is difficult to find any piece of equipment that will not be obsolete after five years, if there is not a strong preventive maintenance and revamp program. All these causes of waste in equipment can respond to managerial actions to eliminate them. The estimate for American industry is around 30% waste in equipment. Imagine the impact on the key financial performance parameters of a company, if its investment in equipment was cut by 30 percent. Depreciation charges, asset turnover, breakeven point and equipment related costs such as maintenance would decrease. The 30% could be used in other businesses or a 30% increase in sales could be achieved with little or no capital expenditure. Many companies would double their profits if they increased capacity utilization by 30 %.

Waste Due to Bad Quality. Quality was covered before in this paper and therefore, we will not elaborate on its negative consequences further. Suffice it to say that once one has understood what waste is, it becomes clear that every defect is a waste. The only acceptable level of defects is zero and the only quality cost minimization strategy is rigorous bad quality prevention.

Let us now turn to address issues of flexibility in the supply chain.

Competitive Flexibility in the Supply Chain

A company in a global market is often required to redeploy resources quickly so as to respond to competitive threats or opportunities. In international markets, response times are short because there are many world-class competitors that are able to quickly exploit a company's strategic weaknesses.

Largely in the 1980s, manufacturing organizations grew increasingly more flexible and responsive to modify existing products and processes in response to customer needs. And, in response to ever-changing customer needs, new products and processes were quickly developed.

One example in the automobile market illustrates the point. Up to the mid 1970s, Volkswagen in Germany was manufacturing world-quality cars in its chosen segments and the company was also cost/price competitive. The company's position as an international automobile manufacturer was solid.

During the late 1970s, the major Japanese manufacturers made the necessary strides to improve quality. Moreover, they were also more efficient producers, and were therefore able to deliver better quality at a lower price in the same market segment where Volkswagen competed. In addition, spiraling wage rates in West Germany during the 1970s and 1980s caused Volkswagen to become a relatively high cost producer of car in its market niche. Although the company's quality did not worsen, an unfavorable cost position, coupled with improved Japanese quality meant that it was no longer able to deliver acceptable value to its customers. Its market share tumbled and since the mid 1980s, the company embarked upon a massive restructuring program to cut costs. Volkswagen management became acutely aware that they had to find ways to keep the cost of their cars in line with major world-class competitors.

The notion that the car market is an oligopoly flies in the face of reality. GM, Ford, and Daimler Chrysler are fighting the battle of their lives for survival. In the case of automobiles, the three oligopolistic markets in North America, Europe, and Japan link to form a fiercely competitive market. The concepts of monopoly and oligopoly appear to lose much of their significance when applied to a global market.

Flexibility is necessary because an international market is fundamentally uncertain. There are many widely dispersed competitors, each stretching to improve or retrench its position in the market.

Breakthroughs are more frequent. The sheer number of competitive moves is such that they cannot be anticipated so as to plan preemptive attacks. The point must be emphasized: a global market is an uncertain one.

Companies survive in an uncertain market by continuous improvement, innovation, and creative destruction. In the next section we turn to the competitive requirement of innovation in the supply chain.

Innovate or Perish

Innovation is a company response to actual or potential changes in the marketplace. The faster the pace of change, the more there is a need for the company to innovate.

Innovation is a proven strategy to deal with uncertainty where future market and technology developments cannot be anticipated with reasonable certainty. The only logical response is to innovate. To move forward, a company must generate research, develop, and try untested ideas. The first company that has some evidence that a new idea has merit can reap the benefits of being the first to implement the suggestions. Competitive excellence can be attained only if top management creates the internal environment–values, organizational structures, compensation and promotion systems, performance measurements, and evaluation policies-that will encourage people to generate and experiment with new ideas and also gives them the resources and authority to test and bring them to fruition if possible.

Innovativeness in the Supply Chain. Innovativeness, desire to improve, and a fiercely competitive spirit come naturally to vendors that put emphasis on satisfying the customer. Innovation is stimulated by the will to increase value for customers and to keep doing so as long as the vendor is in the chosen market.

A vendor that stops innovating very quickly loses the ability to keep delivery the best quality at the lowest possible price. Companies that are in business for the long haul will only choose vendors that will likely be in business in the long run.

Excellent vendors then, pursue quality improvement with relentless zeal. They drive hard to surpass customer reprints and will sometimes lead their customers in quality improvement.

The first question a company should ask about a vendor is not whether the price is low, but whether all its resources are marshaled to produce to exacting quality standards all the time and every time.

The Powerful Customer

Globalization puts real power in the hands of the customer. Managerial actions that produce lasting and sustainable competitive advantage or superior performance must be driven by the desire to satisfy the customer. All companies that have achieved competitive supremacy have made the customer the heart and soul of the business. There can be no enduring competitive excellence without the constant and permanent concern to attract, satisfy, and keep the customer. The business must exist for the customer and it must make total customer satisfaction its ultimate goal.

The world's best-managed corporations come to understand their customers and try to understand them better and better. For these companies, customer service is not a platitude for broken promises, but rather a conscious, deliberate effort to solve the customer's real or perceived problems.

In depth customer orientation shows up as total customer management. The company sees its job as more than merely selling a product. Much effort and resources are invested in understanding the customer's needs before the sale and in solving problems that come up after the sale. In the world-class company, the customer service department deals with and solves only a fraction of the problems that come up, because the whole business is involved with the customer. Customer consciousness and orientation permeate every organizational structure and are deeply embedded in the corporate philosophy and value system.

Tying it All Together

The realization that a company in a global market must achieve excellence in the five critical competitive requirements of quality, cost, flexibility, innovation, and customer service has created the need for a paradigm that links these requirements, resolves the apparent contradictions, and highlights the symbiotic relationship between/among them. The paradigm is Time-Based Competition (TBC). TBC is predicated on the notion that time is the most significant, overarching competitive requirement in any market, and that, at the most fundamental level, competitive means the ability to do things faster than one's competitors. TBC makes a direct and strong link between time compression and improvement in the critical competitive requirement of quality, cost, innovation, flexibility, and service. The whole organization must be made to focus on time as the major source of competitive advantage. A company is time-based competitive when the drive to compress time permeates all its structures, strategies, internal processes, systems, and policies. The performance measurement and reporting systems should include times as a significant measure of strategic and managerial performance.

H. James Harrington, in Business Process Improvement: The Breakthrough Strategy for Total Quality Productivity and Competitiveness, developed a process for reducing cycle-time in the supply chain of six steps; (1) Establish a cycle-time reduction team, (2) develop an understanding of the given supply chain process and current cycle-time performance, (3) identify opportunities for cycle-time reduction, (4) develop and implement recommendations for cycle-time reduction, (5) measure process cycle-time performance, and (6) conduct continuous improvement efforts for process cycle-time reduction efforts.

The benefit of being a time-based competitor is felt both internally and externally. The external benefits are: higher quality, quicker customer response, technologically advanced products and better cash flow. The internal benefits are: simplified organizations, shorter planning loops, increased responsiveness, better communication, coordination, and cooperation between functions.

Conclusion

The world's best companies have demonstrated that there is no inherent irreconcilable conflict between the requirements imposed by a severely competitive market. The conventional thinking can be made to stand on its head of a company sets out to pursue excellence on all competitive fronts simultaneously.

The key word in global competition is excellence. Excellence in the supply chain comes about when superior quality is used as a weapon to d rive costs down and when innovation and continuous improvement are agents for pushing quality up. Moreover, competitive excellence views innovation as the mechanism by which flexibility is sought.

In an innovative corporation, technological change is a habit and innovation the norm. Finally, corporations that are serious about customer service deliver everything they promise and promise nothing that they cannot deliver. The company must listen to its customers and solve customer-related problems with the utmost urgency, rather than be the problem or a major source of headaches for the customer.

Singapore's Foray into Bangalore, India: In Pursuit of Location Specific Advantages

Amrit Vaidyanath
Angad Singh Ahluwalia
Caroline Yeoh
Singapore Management University, Singapore

Abstract

Singapore's regionalization stratagem led to the establishment of industrial parks in China, India and several South-East Asia countries. The strategic intent behind these overseas projects was two-fold: exporting Singapore's competencies such as management know-how, technological capabilities and corrupt-free administration to regions where such positive factors were lacking and secondly, exploiting comparative advantages that each region had to offer. This paper complements our research on Singapore's flagship projects in Indonesia and China, by investigating the foray into India, through the technology park in Bangalore. It evaluates the location-specific benefits that the site has to offer, primarily in terms of abundant and low-cost labour resources. This study is enhanced by in-depth case studies of a cross-section of companies in the park. It finds that, while location-specific merits abound, much of these have not translated to direct benefits to Singapore, largely due to socio-political problems that continue to plague the host environment.

Introduction

Despite its resource-constrained domestic environment, Singapore has achieved significant economic growth by focusing on its core-competencies. Singapore's infrastructural abilities, technological know-how and favourable reputation among foreign companies, coupled with its constant economic reform programs played a significant role in attracting foreign direct investment into the city-state. Such a move started as early as the mid-1960s which saw the beginnings of the Singapore government's aggressive approach to woo foreign MNCs to fuel the city state's economic development (Chia, 1986; Pang, 1987). However, while much of Singapore's initial growth relied upon such inflow of foreign investment, a reversal of trend was being observed by the mid 1980s. Rapid economic growth and liberalization of foreign investment controls in the Asian region presented Singapore with foreign investment opportunities for developing its external economy, locally knows as the 'second wing'. This second wing offered immense opportunities in the form of location-specific resource advantages that were either limited or totally absent in the city-state. Singapore sought to counter is own resource-deficient status by leveraging on such advantageous economic resources of neighbouring countries.

The regionalization program saw the establishment of industrial parks in the region that simulated a 'Singapore-styled' business environment in the emerging economies (Perry and Yeoh, 2000; Sitathan, 2002). Regionalization was intended to create economic space for local and Singapore-based multinationals to redistribute their resource-dependent operations, and to upgrade their operations in Singapore to higher-end activities, utilizing the unique set of benefits and competencies offered by each location. Designed to accommodate resource-dependant operations' of firms, it was envisaged that these industrial parks would enhance the competitiveness of Singapore-based companies that redistribute particular operations to reap location advantages from the regional sites. This not only enhances the cost-competitiveness of firms, but develops Singapore as a high-value investment hub with strategic linkages to resource-abundant locations in the region. To augment the location advantages of the strategic sites, Singapore lends its reputation and competitive strengths in infrastructural development and management to the regional sites.

To provide the context for this discussion, the theoretical considerations underpinning the project in Bangalore are sketched in the next section. The following section takes a closer look at the progress of the International Tech Park (ITPL), and examines the challenges confronting this flagship project. The analyses were further reinforced by in-depth case studies of the Park's tenants. The final section considers the implications of the new evidence to Singapore's broader regionalization initiative.

Theoretical Considerations

Dunning's Investment Development Path

Singapore's move towards regions outside its shores accompanied by heavy outward foreign direct investment, after being at the receiving end of substantial foreign investment into the country for more than two decades can be explained by Dunning's Investment Development Path (IDP). Dunning (1981, 1986) and Narula (1996) argue that a country's net outward investment (NOI, outward FDI minus inward FDI) is systematically related to its economic development. The IDP conceptualises a U-shaped relation between economic development and a county's net outward investment position. It suggests that countries tend to go through five main stages of development, that is, there are consistently observable patterns of structural change congruent with development, and these changes have systematic relations with patterns of FDI.

As economic development takes place, net inward direct investment will first grow and then decline. In the earliest phase of such inward capital flows, a country's infrastructure will be inadequate to support such inward investment. However, such investment will not only be supported but will continue to increase as economic growth occurs. A parallel can be drawn between the above description and Singapore's developmental period during its first two decades of existence (from the mid-1960s to the mid-1980s). The city-state experienced a similar increase in inward investments with an increasing growth rate. In fact, its long-established stratagem of economic development through foreign direct investments is well documented (Chia, 1986, Pang, 1987, Yeung, 2001).

Dunning also states that such inward investment will help create firm-specific assets that would allow outward direct investment. However, in backward regions it will take longer to accumulate such assets in order to initiate any kind of outward capital flow (Caves, 1996; Dunning, 1988). Over time, learning-by-doing will this process to evolve and outward FDI will emerge. Invariably, with the reversal of trend propelling investments outward, the country will experience an erosion of its absolute cost competitiveness, thus reducing the incentive for inward investment and further increasing the incentive for outward investment. The scenario in Singapore followed the same trend with rising business costs in the mid-1980s crippling the island and diminishing its cost competitiveness. However, with the city-state becoming wealthier it looked to channel its financial resources in the form of outward investments in order to retain its competitiveness. Such a move manifested in its regionalization strategy. This growth in outward investments demonstrates Singapore's determination in strengthening her economic prospects and further advancing in her economic development process. This growth in outward direct investments is evidenced in Table 1.

TABLE 1: SINGAPORE'S TOTAL DIRECT INVESTMENT ABROAD BY DESTINATION
(MILLIONS OF S$, STOCK AS AT YEAR-END)

The Eclectic Paradigm

The subsequent and inevitable outward investment of any growing economy aims to procure, among other benefits, location-specific advantages in the host country, for the investing country. Dunning's IDP characterises economic development with the net outward investment position of the country and correlates government policy with economic development in determining the pattern of competitive advantages of foreign investors relative to those of local firms (ownership advantages or the O-advantage), relative competitiveness of local bound resources and capability of the country (location advantages, or the L-advantage), and the propensity of foreign and local firms to utilise the ownership advantages internally rather than through markets (internalisation advantages, or the I-advantage). Dunning's Eclectic Paradigm explains the above OLI model.

According to Eclectic Paradigm, foreign investment will occur only if it is advantageous to combine spatially transferable intermediate products produced in the home country, with at least some immobile factor endowments or other intermediate products in another country (Dunning, 1988). Simply put, the OLI-model must be satisfied. In other words, there needs to be a balance between the three criteria. Dunning goes so far as to comment that the OLI triad of variables may be likened to a three-legged stool, each leg supportive of the other and the stool is only functional if the three legs are evenly balanced (Dunning, 1998). In so far as the third leg completes this balancing it may be regarded as the most important. Given such a diagnosis, what comes across clearly is how the location-specific advantages associated with the Indian venture form the third leg of the stool, being the single-most important reason for Singapore's foray into India.

Traditional location theories dealt with asset-exploring activities which were designed to maximize the firms' current efficiency whilst identifying the transaction costs and benefits of neighbouring activities. Contemporary theories postulate that in locating their activities within a limited spatial area, firms maximize the benefits of dynamic learning economies at the same time minimizing transaction costs associated with space (Dunning (edited), 2000). Firms' strategic choice of location reflects twin aims; to not only transfer their resources to the host countries, but gain access to the available strategic assets as well (Lecraw, 1993; Chen and Chen, 1998; Dunning, 1995; Makino and Delios, 1996; van Hoesel, 1999; Frost, 2001). A tabulated form of the different types of FDI is shown in Table 2 and how these influence the location of MNEs' value-added activities.

TABLE 2: TYPES OF FOREIGN DIRECT INVESTMENT

Type of FDI	Some Variables Influencing Location of MNE Activities
A. Resource Seeking	1. Local opportunities for upgrading quality of resources and the processing and transportation of their output. 2. Availability of local partners to jointly promote knowledge and/or capital-intensive resource exploitation
B. Market Seeking	1. Mostly large and growing domestic markets and adjacent regional markets (e.g., NAFTA, EU etc). 2. Availability and price of skilled and professional labour. 3. Presence and competitiveness of related firms. E.g., leading industrial suppliers. 4. Quality of national and local infrastructure, and institutional competence. 5. Less spatially related market distortions but increased role of agglomerative spatial economies and local service support facilities. 6. Macroeconomic and macro-organizational policies as pursued by host governments. 7. Increased need for presence close to users in knowledge-intensive sectors. 8. Growing importance of promotional activities by regional or local development agencies.
C. Efficiency Seeking	1. More emphasis placed on B 2, 3, 4, 5, and 7 above, especially for knowledge-intensive and integrated MNEs activities. E.g., R&D and some office functions. 2. Increased role of governments in removing obstacles to restructuring economic activity and facilitating the upgrading of human resources by appropriate educational and training programs. 3. Ability of specialized spatial clusters. E.g.: Science and industrial parks, service support systems, etc; and of specialized factor inputs. Opportunities of new initiatives by

	investing firms; and entrepreneurial environment and one which encourages competitiveness enhancing cooperation within and between firms.
D. Strategic Asset Seeking	1. Growing geographical dispersion of knowledge-based assets and need of firms to harness such assets from foreign locations makes this a more important motive for FDI. 2. The price and availability of "synergistic" assets to foreign investors. 3. Opportunities offered (often by particular sub-national spatial units) for exchange of localized tacit knowledge, ideas and interactive learning. 4. Access to different cultures, institutions and systems; and different consumer demands and preferences.

Regionalization: Establishment of the Indian Presence

The regionalization endeavour witnessed the growth of Singaporean industrial parks in numerous countries such as Indonesia, China, Vietnam and India. However, this paper will focus on the latest regionalization venture in Bangalore, India. The move into India was initiated in 1994 and the timing could not have been better. The early 1990s saw India throwing her doors open to foreign investment as part of a determined liberalization procedure in order to boost economic growth, akin to what Singapore had done in its early years of development. Singapore's response was positive and led to the setting up of the International Technology Park (ITPL) in Bangalore, the country's IT capital.

Singapore hoped to gain a lot from the tremendous location specific advantages that India put forward. The cheap and plenteous availability of both skilled and unskilled labour, the abundant land resources, espoused with the cooperative and encouraging attitude of the Indian government would definitely translate into a myriad of advantages for the city-state, if it were to relocate some of its operations in India. The Singapore government not only recognised this golden opportunity, but saw something more in an Indian park than it had seen in some of its already established parks. The information technology boom accompanied by the vast disposal of IT facilities and highly-skilled software specialists presented Singapore an avenue for building a technology park wherein high-end activities could take place. Hence, while other parks engage primarily in manufacturing or "operations" activities, ITPL has provided Singapore with the unique set of advantages that blends low-cost and high-end activities at the same time.

The next section of the paper delves further into the International Tech Park at Bangalore, India, giving a detailed description of its functioning and characteristics. A micro-level analysis involving in-depth case studies of five in-house multi-national companies at ITPL are also presented.

International Technology Park Limited

Based on the perception that Singapore agencies have advantages in infrastructural development, ITPL was initiated as a real estate development in India. Located 18km away from Bangalore in India's Silicon Valley [i], ITPL is substantially different from the other industrial-township projects in Indonesia, China and Vietnam. While ITPL was set up with narrow objectives, using the basis that Singapore agencies have an advantage in infrastructural development in India, the other parks had a political objective to demonstrate the strength of the 'Singapore development model' and its transferability to other Asian environments. Another significant difference is the predominance of service and support operations in ITPL, as opposed to manufacturing operations in other industrial townships in Asia.

ITPL, launched in 1994, is the newest of Singapore's investments and is a forerunner for the new generation of Singapore-developed industrial parks in India. The idea was mooted by Singapore's Prime Minister Goh Chok Tong and India's Premier, P.V. Narasimha Rao, in 1992. Construction commenced in September 1994, and the park was officially inaugurated in 2000.The partners in the ITPL project are a Singapore consortium of companies[ii] led by Ascendas International, the Tata Group (India's largest business conglomerate) and the Karnataka state government in a 40-40-20 arrangement. The Karnataka state government has since reduced its stake to 6 percent, while the Singapore consortium and the Tata Group have increased their respective stakes to 47 percent each.

ITPL was marketed as an environment that “cuts through the red tape and bottlenecks that are a part of India’s infrastructure and operating environment” (*The Straits Times, August 8, 1999*). ITPL was slated to provide total business space solutions to multinationals and other conglomerates, within a state-of-the-art technology park. The park’s development consists of 2 phases. Phase 1, which includes the Discoverer, Creator and Innovator blocks, with built-up office, production and retail space, adopts the Singapore-styled, integrated ‘work, live and play’ concept. ITPL’s futuristic design comes complete with numerous amenities, facilities and support services, and includes residential apartments and penthouses. More distinctively, ITPL guarantees uninterrupted power supply and telecommunication facilities, immediate-occupancy business incubator space, and the formulaic ‘one-stop’ service. Phase 2, comprising the Explorer building, a replica of the Innovator, Built-To-Suit (BTS) facilities, is due for completion in early 2004. This phase will add a total area of 350,000 square feet to ITPL’s current built-up area of 1.6 million square feet. ITPL also houses the Indian Institute of Information Technology, which provides professional and skilled manpower for the park’s tenants.

ITPL’s first development phase is fully committed. The earliest clients included SAP Labs, First Ring and 24/7. The first 39 tenants started their operations in 1999, and created some 2000 jobs. To-date, there are 100 confirmed tenants, of which 93 are operational with 8500 employees (Table 3).

More than half the tenants are wholly or partially foreign-owned firms, and more than 70 percent are in software development, integrated circuit design, research and development and precision technology (Tables 5). ITPL’s tenants include global players like AT&T, IBM, Motorola, Sony, Texas Instruments, Citicorp and Thomas Cook. Operating profits have been registered, and ITPL is projected to break even within the next 4 years.

ITPL's competitive advantages as an investment location have been discussed. However, the update has relied primarily on secondary data from official publications, press reports, etc. This stock-take cannot adequately reflect the differential impact of various pull factors on the investment decision of different types of investors (e.g. local or foreign), or the differential impact of different types of constraints on the operations of firms with different characteristics (e.g. ownership type, market orientation, establishment size). To obtain firm-level data, on-site surveys and interviews were conducted in December 2002 and May 2003. The next section presents case studies of five multinational companies in ITPL.

Case Studies

The companies were selected to reflect ITPL's diversity, and for their considerable presence in the park. The semi-structured interviews were designed to gather information on the push-pull factors that influenced the firms' decision to locate in ITPL. Other questions pertaining to the companies' views on the facilities and services in the park were culled from the open-ended questions. The characteristics of the firms are summarized in Table 6.

TABLE 6: SUMMARY INFORMATION ON CASE STUDY FIRMS

Company	A	B	C	D	E
Country	Japan	U.S.A.	U.K.	U.S.A.	Germany

Case A– Manufacturing Services

Company A is a Japanese based company specializing in manufacturing machine tools and is one of the largest machining centres in Asia. The company has numerous centres in Germany, US, China, Brazil and Mexico, with the largest and most important ones located at Singapore and Japan.

The company, currently located in Bangalore at the Export Promotional Zone is a completely Singapore owned venture initiated to support its operations in Singapore. Operations at the Indian centre primarily circumscribe around marketing services and application, light machining and unit assembly providing support to major operations at the Singapore unit.

Company A initially operated in a small office in Jayanagar in Bangalore city in 1994. When ITPL began operations in 1997, Company A was one of the first tenants when it moved into the newly opened tech park in the same year. ITPL was the obvious choice for the Company A to set up its office due to the infrastructural advantages and the quality assurance promised by the 'Singapore Park'. Company A boasts the status of being the first and only manufacturing company located at the park. Taking office space at the Creator block, manufacturing was limited to demonstrations to customers and unit assembly supporting its head office in Singapore.

Nearing five years of operations in ITPL, Company A vacated its ITPL location and moved into its new complex within the Export Promotional Zone, in close proximity to ITPL in 2002. This move saw ITPL convert its Creator block, initially a unit for manufacturing companies, to a world class office space. The prime reason for Company A's departure was its need for a cheaper and large area (10 -15 hectares) as opposed to ITPL's space restricted, expensive facility. One of the prime reasons why Company A was setup in India was to take advantage of the cost benefits that were lacking in Singapore and Japan. ITPL rentals would negate this advantage. ITPL rents are considered extremely high for manufacturing units, and are just about manageable for short incumbent periods for larger companies such as Company A. This is because such companies operate on low margins (approximately 10%) and require large amounts of space. Hence, when ITPL no longer proved suitable for the fast-growing manufacturing concern, it opted to move out.

Case B- Business Process Outsourcing

An American firm, company B is involved with e-services. Head quartered in Los Gatos, California and with operations at ITPL, the company is acknowledged as the industry standard provider in customer support services and solutions to Global 500 companies. It was founded by an experienced management team with proven expertise in delivering large-scale mission-critical customer support programs.

ITPL is highly suited for the company's operations. With its facilities catering to small and medium enterprises engaged in R&D and the service sector, the park has become a nesting ground for a large number of firms involved in Business Process Outsourcing (BPO). Located at the 'Creator' building of ITPL, company B is one of many such companies. Today, it has become one of ITPL's established tenants employing 800 employees, occupying 60,000 square feet. Company B has been operating at the ITPL since April 2000.

Company B's prime operations at ITPL include real-time customer service management and technical support to foreign firms. In fact, the facility in ITPL is the largest call centre in the state of Karnataka. Catering to customers such as AltaVista, the company has conducted successful programs such as outbound telemarketing, inbound phone customer service, inbound phone technical service, with service areas spanning countries worldwide, particularly in the U.S and Europe.

Operating globally, primarily through one-on-one telephone services and web based customer assistance, 24-hour connectivity and service is a necessity for the Company. The ITPL facility meets all expectations on this front. The regular power supply, the 24-hour speedy connectivity and the plug and play services of ITPL all combine to form the unique selling proposition of the park that continues to attract a plethora of companies in the BPO industry.

An added advantage is seen in the fact that the city of Bangalore abounds with excellent schools and universities. This coupled with the high standard of education, serves as a continuous source of English-speaking-skilled employment for the call centres located in the park. The company sees this pool of potential employees as an added advantage in carrying out its operations in ITPL.

Case C – Travel and Financial Services

Company C is one of the world's leading international travel and financial services groups and serves over 20 million customers a year. It provides services at 4,500 locations in more than 100 countries and employs over 20,000 people.

Establishing itself in India as early as in 1881, today, the company's Indian subsidiary has a network of 54 locations in 16 cities across India and is the largest travel and financial services group in the country. Foreign exchange, corporate travel, leisure holidays, travel insurance and credit cards form the core activities of the company.

Company C is one of the very few companies that was approached by the ITPL management itself to set up shop at the park. On the management's behest, the company acquired an office within the park's premises largely to provide money-changing activity. Its core operations within the park, therefore, include ticketing and foreign exchange services.

Compared to some of the other tenants, company C seems a smaller entity with only 5 employees for its office in the park. However, it has managed to secure a large customer base largely due to the fact that it is the only tenant providing such services within the park. Moreover, the company also caters to an increasing number of firms outside the park who find it convenient to visit its office in the park, which is in close proximity, instead of approaching its other branches placed in the city-centre.

Case D - Business Process Outsourcing

Incorporated in May 1999 as a 100% subsidiary of the Virginia-based parent company, Company D spreads over 42,000 square feet of ITPL office space and employs 12,000 employees. The American parent is considered a frontrunner in integrating the expanding capabilities of information technology, telecommunications and the internet, by providing services such as voice-based services, internet services, back-office functions, and interactive teleservices.

Similar to Company B, Company D's operations within the park largely focus on Business Process Outsourcing, which include both inbound and outbound customer care. As a result of its medium size and the nature of its operations, the company seems unlikely to procure additional office space in the near future. The company, therefore considers itself to be well suited for the park.

As in the case of other companies in the same industry, Company D, too, cites the permanent power supply, 24-hour connectivity and supporting infrastructure as the vital factors that prompted it to situate in the park. This is because 24-hour customer support is expected from Company D's overseas clients. The company also employs a sizeable portion of the IT graduates that Bangalore churns out every year.

In addition to the above, according to a company official, the firm perceives ITPL's excellent and professional support services and maintenance programs as a huge advantage that gives it an added edge over its peers that are located elsewhere. Such benefits have been the direct result of the Singaporean styled management. However, the company has expressed reservation over the numerous other call centres making their way into ITPL to make use of the same advantages, which escalates into other problems such as heightened competition, further sharing of resources and the "the pool of entry level people getting smaller".

Case E - Inter-Enterprise Software

Company E is a well-known and highly reputed software firm. A wholly-owned subsidiary of an international software giant, it carries out similar operations as its German parent, that of providing collaborative business solutions and development of software. Its parent company is considered the world leader in the provision of business solutions and high quality software for all types of industries and markets and enjoys the position of being the world's largest inter-enterprise software company and the world's third largest independent software supplier over all, employing over 28,000 employees in over 50 countries. Initially an autonomous German IT company, operating in the Koramangala district in the city of Bangalore, company E was bought over by the aforementioned parent company in 1998. The change in ownership also saw a shift in location into ITPL. With operations of other companies at ITPL beginning only in late 1997, the company's establishment in 1998 made it one of the first occupiers. Today, company E is one of the largest tenants in the park, in terms of space occupancy, covering about 100,000 square feet (9,000 square metres). Even before moving into ITPL, the company had considered other city locations which were comparatively cheaper in terms of rentals, offering on-fourth of ITPL's rate. However, despite these other attractive locales, the company chose ITPL chiefly due to the some indispensable benefits that ITPL proffered, these being, regular power supply, state-of-the-art infrastructure, convenient and fast setting up facilities and excellent communication channels. In fact, while justifying the company's choice of ITPL, a company official had this to say: "For any company, ITPL provides excellent operating facilities, which brings about an increase in revenue. This increase in revenue is larger than the increase in costs (in terms of rent)". The company primarily undertakes software development activities within the park and functions as a 100% export unit. All its exports go to Germany.

After four years of operations, the company has decided to move out of ITPL. The decision was attributed to the company's rapid expansion, growing form a company of 70 employees to 500 employees in the span of the four years spent in the park. Ideally suited for small and medium scale enterprises, ITPL has been unable to accommodate the company's growing size and as a result space constraints within the park proved to be single-most important reason for the company to move out. With the aim of expanding its operations, the company seeks to move into a larger outlet. With rapid expansion, not only is there the need to move into larger premises, but the need to avail of economies of scale. ITPL, with its expensive rents thus proves highly uneconomical for a company seeking to enjoy economies of scale. All these reason contributed to its shift into an expansive new campus of 15 acres in area within the Export Promotional Zone itself, a stone's throw away from the park. Additionally, moving out of a multi-tenanted place into an individual complex allows the company to establish its own identity. However, given ITPL's unique advantages and the image and branding associated with it , Company E has still retained come office space park's new BTS (Built-To-Suit) facilities.

Discussion

It must be noted that ITPL's provision of a large number of the above-mentioned location-specific advantages can be attributed to the unique style of the park's concept that incorporates both the local Indian advantage as well as the exported Singaporean advantage. With India opening its economy to foreign nationals, there has been a flood of multi-nationals coming into the country to exploit local resources particularly in the form of cheap and abundant labour. Companies like Company B and Company D, who operate call centres using a large number of Indian graduates, cited the availability of such cheap and plenteous labour as providing them with an edge over call centres in other regions. Of course, India's liberalization policy also serves to provide immense opportunities to such MNCs who are looking to enter the growing and untapped Indian market. In fact for company C, which is in the travel and financial service sector, having a large market to cater is key, since it operates on relatively low margins. It cites the vast Indian market as the most attractive factor that led to its establishment in India. Hence, resource-seeking and market-seeking motives act as primary drivers behind the decisions of such MNCs to begin operations in India.

However, while India presents lucrative opportunities, numerous problems continue to plague its environment. These include: unreliable infrastructure, extensive red-tapism, corruption and inefficiency that continue to prove to be deterrents to incoming foreign nationals. Moreover, the initial government support which served as attractive factor during the beginning of the venture has diminished. This is indicated in its reduced stake in the project. It is with the objectives to counter such inadequacies that Singapore embarked on the ITPL project. The Singapore side has attained considerable success with ITPL by providing companies, (Indian, Singapore-based, and foreign companies) with infrastructural facilities, technology and efficiency that are characteristic of Singapore's business environment. Hence, ITPL also serves companies in search for efficient-seeking location-specific advantages. Company E perceives this technological and efficiency-based advantage as one that contributes enormously in its software development activities.

Dunnings' Eclectic Paradigm has also been extended to deliberations on the presence of immobile clusters of complementary value-added activities (Markusen, 1996) and the transactional benefits of spatial proximity. Dunning (2000) contends that the greater the degree of knowledge intensity of a particular activity, the easier it is for labour to migrate across regions or countries, the lower the distance related costs, and the more firms engage in FDI and alliance-related activities to augment, rather than exploit, their existing assets, then the more likely is it that national and micro regional economies will develop specialized centres of excellence. ITPL is gradually developing into such a specialized centre wherein high-value added activities are taking place. The statistic of more than half the number of tenants in the software and R&D sectors bears testimony to this. As firms' core competencies become increasingly knowledge-intensive the location in which firms locate their production, organization and use of assets emerges as a critical competitive advantage (Dunning, 2000). MNEs continue to seek locations (economic and institutional facilities) that are best utilizing their core competencies (Dunning, 1998).

Conclusion

ITPL proves to be a refreshing change in Singapore's series of overseas investments. It showcases a unique blend of high-value added activities performed at comparatively lower costs. The park has attained considerable success in furnishing Singapore with location-specific advantages. However, as mentioned in the above section, the location specific advantages don't come without numerous other limitations. Singapore's presence in the park thus goes a long way in eliminating many of these limitations so as to provide companies looking to settle at ITPL with an advantageous location. Hence, it is a combination of the proffered Singaporean experience and country-specific comparative advantages that help to attract corporations to ITPL.

Singapore's Positive Reputation:

ITPL's success hinges on the "Singapore-styled design and management" reputation. In a country where corporate image is of immense importance the Singapore presence contributes tremendously in enhancing this image. The city-state is world renowned for its management skills, disciplined efficiency and corruption-free administration. The effects of al these strengths can be seen at ITPL, where considerable premium is placed on the Singapore presence. As a result, the park has successfully leveraged on this reputation of reliable infrastructure to motivate companies to relocate to these areas where such facilities are anomaly. The park has been attracting investors with its formulaic one-stop service within a self-sufficient, self-contained environment, which is unburdened by inefficient administration. For example, ITPL is being used by many tenants to establish their brand-image, as there is prestige associated with being located in, what is locally known as, the "Singapore Park[iii]".

India's Location Advantage:

ITPL has provided considerable location-specific comparative advantage in terms cheap and plentiful labour. Its contribution also extends to the nature of labour provided that enable high value-added activities within the park, making readily available high-quality software developers and IT personnel, as well as a pool of competent graduates, for various operations within the park. India has been one of the biggest beneficiaries of the global shift of high-wage professional jobs to low-cost countries (Straits Times, August 2003). The supply of qualified, English speaking professionals at lower costs has given the country an edge in wooing foreign companies. The global economy today is increasingly based on low-cost labour which is being exploited by MNCs. In fact, the Singapore government has constantly recognised this low-cost competitiveness offered by countries like India which doubles as a potential and a threat. With liberalization efforts favouring the entry of MNCs in India, the government support and the influence of inter-governmental relations cannot be ignored. ITPL shares the characteristic of active government involvement, with the Indian counterparts being the Karnataka state government and the Tata Group, which, though private, is well connected with the authorities. The strategic alliances between Singapore's government-linked companies, and its counterparts in the regional sites, were instrumental in mobilizing the resources to complete these multi-million projects. Finally it must be noted that the sprouting of numerous other parks not only in India, but also in the vicinity as ITPL – parks such as Software Tech Park and Electronic City – has heightened the competition amongst these parks in trying to attract foreign enterprises. However, ITPL's differentiating factor lies in its Singapore connection which proves to be an important marketing edge over technology parks in the country.

The power became organization,
and organization was installed in subjects.
Subjects are the power in the organization. *Javier Uriz Urzainqui*

Abstract

Working together effectively bringing human resources in a methodic way, and trying to reach the same goals is what we call an *organization*. There is no doubt that success of culture and civilization is in good part the result of organizations, in as far as humankind events refers. Organization has a lot to see with human needs and characteristics, and as Javier Uriz (1994: 113) says: "it is a methodic and protector cosmos: Defines 'us'; guides energies and aggressiveness of the most ambitious members; and gives everybody the possibility to reach goals". That is how during the first years of life, in the social and familiar ambits, we identify ourselves as "we" in front of "others"; during adolescence the "I" comes out weakening the "we" and, in adult life the "we" strengthens in the context of organizations as we become a part of them and assume the sense of belonging we had since our home life. It means the will to establish a formal order. If we deeply examine the purposes that make possible to create and operate any organization, since the most basic and simple as can be the family up to the most complex multinational, they will always be for satisfying human needs that are impossible to reach by the lonely man. This concept applies for everyone, from the ones in the top of the organization to the center teams and the ones who operate in the inferior level.

Introduction

The organization is supposed to exist for the welfare of those who make decisions, the ones who interpret them and the ones who work on them. In a word, it is for one and each of its members. The formal established order, the form of an organization – the structure with its parts – has the purpose to anticipate and, in a certain way, to establish how people must behave in order to reach the goals and objectives in common; however, it must not be done without previously considering the next three factors:

a) The characteristics of human behavior.
b) The inter relationship that comes out among individuals and structure, and vice versa.
c) The production of structure from the strategic planning and, in this case, NO vice versa.

The directors or managers who decide the organizational structure of the institution or enterprise should consider, in a wide way, how is the whole organization structured, as well as taking care of all details in the integrating elements. All this considering that the bureaucracy (with its consequent clumsiness and slowness), or the efficiency of the whole institution, passive life, failure and inefficiency, – or even its death – or strength, efficient work, and success…life, will depend on such structure. [1]

Parts of organizational structure design.

When the structure is set and drew or displayed in a flow chart, the organizations and the individuals' welfare is being decided. These are far-reaching decisions which affect the institution's efficiency and efficacy as well as the people, their jobs, their functions, responsibilities, feelings and motivations; in a word, the whole organizational culture. These decisions will always refer to the next four orders:

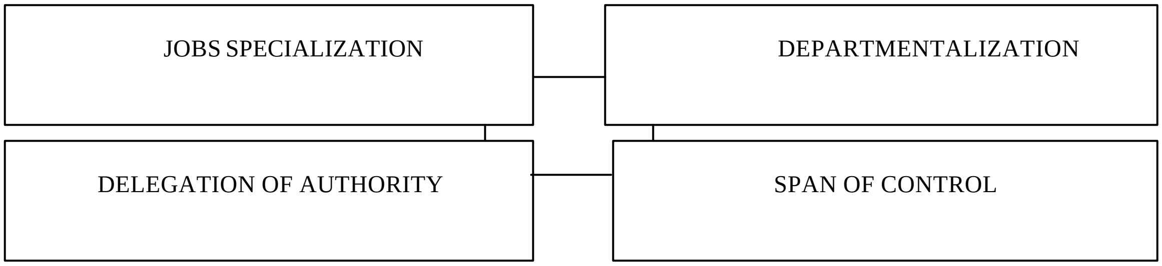

CHART 1

Let us quickly explain these four parts of structure in an organization and some of the important factors, as if we know them it will be easier to judge any organization.

Jobs Specialization

It's the most common and visible factor in giant enterprises and less evident in small and middle enterprises [2] (PyMES for initials in Spanish) and does not require much presentation. The organizations are mainly composed of a set of positions and employments with different degrees of specialization. It is appropriate to comment two opposite poles of continuum that are present in the employment specialization organization. A) Looking for benefits in dividing the job, the decision will be between the scientific impersonal administration, which makes it complex and produces a possible sophisticated image, on one side; B) and on the other side, the artistic or familiar, which qualifies it like simple and makes it looks natural.

Delegation of Authority

The ability to congruently make decisions according to rules in an organization is known as authority. That is to say, when we talk about authority we refer to the authentic power an individual has according to his/her position in the organized social structure. It implies an organization, a hierarchic order, a competition range or field where such authority is applied. To have specific rules and patterns, to separate the position from its property. Authority endures a conception and a style in the use of power: it can be distributed in all the structure or retained in hands of a few managers. If we go through the organization flow chart and the attributions in the use of power we will be able to see if it is centralized, where it is centralized, or if there is a balance in its distribution. It can be schematically represented by a line, a *continuum*. When power is not centralized, the ability to decide and act is given without previous authorization of the immediate boss or superior manager. This way of working authorizes bosses in lower levels to decide how to identify and solve problems. On the other side of *continuum*, we have centralization which means that power is concentrated in one or few managers making it necessary to ask for authorizations, multiple signatures, and more papers. [3] This structure comes to a bottle neck for decisions and bureaucratic ways are the same old thing.

JOBS SPECIALIZATION	
LOW	HIGH
DELEGATION OF AUTHORITHY	
NON CENTRALIZED	CENTRALIZED
DEPARTMENTALIZATION	
HETEROGENEOUS	HOMOGENEOUS
SPAN OF CONTROL	
WIDE	NARROW

CHART 2: CONTINUUM OF ORGANIZATIONAL STRUCTURE PARTS

In many leader organizations , the exit key is to solve the problem of power combining a minimum centralized capital decisions – in highest levels they only retain a few and very important focused in the organization's values -, and most of the decisions are decentralized and delegated. Concerning the use of power in organizations it is worth to comment two elements that can profitably coexist. The first one, on the other part is structural.

A) The control chain. It appears in relations between superiors and subordinates, from the highest to the lowest positions. It clearly specifies to whom everyone has to report, as his/her "on line" authority and manages communication at all levels. Usually the employee must report to only one person. When the relation directly contributes to the organization's, the department's, or the section's objectives and the superior manager has direct authority on the employee it is called "on line." When the relation only assists, recommends, suggests or advises the on line position, then it is the called "staff" due to the fact that it does not have power of control.

B) Nowadays organizations often use "empowerment" which we could translate into Spanish as "empoderdamiento" or "potenciamiento", or "fortalecimiento del poder". It consists in training both basic and operative employees in the production or in services, so they can have knowledge of more areas and develop more activities than those they normally do. At the same time, it prepares them to use power and make decisions without previous superior's authorization. The empowerment process can be used by the boss to increase subordinates' power. It is a process with the purpose of fortifying self - effectiveness and self esteem feelings among members of a group or an organization. It starts identifying and overcoming obstacles to increase power in certain members of the organization. The means used to reach this goal are: training, authority and functions delegating, providing information and the necessary resources. This way production, process control, and the need of quality become a part in everybody's work. Everything that improves quality and fulfillment is authorized. Empowerment is an important part on any total quality administrative program, as it diminishes outside motivations and extrinsic incentives and, cooperates to build the environment and the competitive organizational culture required by contemporary globalization.

Departmentalization

Department distribution is the structural result of joining tasks and jobs according to a logical base. Logical basis can be simple or complex. Simple are structures coming out from department division by functions, by products, by clients or consumers or by geographic distribution. They are complex when more than one logical base is used as it happens with the combined structure and with the one organized by techniques.

?? *Department distribution by functions, with logic rationality focused in specialization* has a better functioning when there is a steady atmosphere in the organization. It requires a solid control of techniques and operation. Communication could suffer and become the most vulnerable factor in the organization.

- ✍ *Department distribution with logic rationality base focused in the product* enables employees to apply their own skills and abilities. It is expensive because it needs one administrator or manager by product and there is a risk to be unnecessarily duplicated; for that reason, the giants such as General Motors (cars, etc.) or Procter and Gamble (Crest, Camay, Salvo, Ivory, Tide, etc.) use this kind of structure.
- ✍ *Department distribution with logic rationality established on the type of client* is logically guided to fill the client's or consumer's needs. A good example of this are the banks. The risk is to create many staffs to support the actions of the different departments in a first level bank.
- ✍ *Department distribution with logic rationality based on geographic distribution* is done when the organization has offices in many regions or in the whole country, or even in other countries and the clients' needs and characteristics are different. Offices, that have the power and the necessary authority to solve problems, are opened to attend each region or area.
- ✍ *Department distribution with combined logic rationality* is one of the mostly used because it is realistic. Takes advantage of interdisciplinary systems that can assemble their small structures to simultaneously attend services, client's needs, products, and geographic distribution. It frequently takes advantage of formal and informal social chains. They brake the barriers that classically separate departments and even the physical spaces become more common to operate the multidisciplinary

systems or for special projects. The executives usually share spaces with their employees and are available for all of them. It helps to reduce time in implementation and solution of projects.

- *Department distribution with organization by techniques as the logic rationality base* is in connection with development of products for specific dates or precise coordinated situations in space and time. It is temporarily created to reach the specific project "X" and the members team are specialists, or also multidisciplinary experts, as in the previous *combined logic base*. It does not properly have a structure by departments, but by projects and the employees rotate. The leader of project "A" can just collaborate on project "C". Between one project and another the ones who are free go back to the "excellence center office" for training, for being up-dated or for doing some other short tasks.

*** One of the most interesting examples of *combined logic rational base* is Hewlett-Packard. Its organizational structure is plain and very different from the pyramidal. Its opened and fellowship organizational culture seems to be one of the most motivating and attractive.

CHART 3

***The model of *logic rationality base by techniques* is the one of Hallmark Cards, which works in connection with the making products technique for special and precise situations such as the festivities of the annual calendar.

CHART 4

Span of control

It is usually the last decision taken when designing the structure, even though it is transcendent for the organizational culture. The control section is the jurisdictional space or place of which any boss is responsible. It consists on the number of people reporting to a leader, a boss, an administrator or a supervisor. It can be wide, - the flow chart is then plain - when many employees report to a same boss. It can be narrow if the boss has a small group of employees. There is not a formula to determine the ideal number of control sections, it depends on the boss' experience, on his/her personal qualities or on the intrinsic nature of positions or jobs he/she coordinates or supervises. Nowadays organizations tend toward the wideness of control sections to plain the structure so that decisions do not have to go up many administrative levels.

Importance and Parameters of Organizational Structure

As we have be seen, decisions that determine how to constitute the four essential parts of a structure in an organization or institution are fundamental, as fulfillment of all management and operative personnel depend directly on them. The highest level administrators cannot take their flow chart development superficially as it affects the whole organization. Many directors admit that, in contemporary world, their organization is clumsy, inflexible, and therefore, slow in adequate answers to challenges or innovations they face in the real world and their clients ask for. However, they frequently blame and say it is the personnel's fault as they are inept and don't know how to develop the proper strategies or services, they lack competitiveness, they are not motivated and they don't really feel as a part of the family. Be careful! The above mentioned points are the main problems of the organizational structure.

The structural organization must be consistent with strategic planning. It specifies the objectives and time to achieve them. The organizational structure specifies who must reach a goal and how to do it. Unfortunately many organizations try new strategies with an old fashioned organizational structure. When job is of poor quality, in time, product or service, we probably have a structure problem. Conflicts among departments or groups are suggesting a structure problem. There can be differences in objectives and poor knowing of the organization's mission, of its strategic goals, its plans to short, medium or long term. It is almost sure that the problem is structural if there is no good coordination among departments, if there is slowness to adapt, or they have arguments into changes, if responsibilities are not well established, or if the middle level bosses are asking about the main goals they must reach.

Organizational structure problems can be a disaster for the whole organization and risks its mission and strategic planning. The most frequent problems are: A) It can become a collection of departments or independent groups trying to achieve their own objectives with no coordination among groups. B) The strategies are given by the organization's structure, instead of making that strategic planning be the structure's factor. C) If the structure is the one that defines the strategic plans, then only the compatible strategies will seem to be acceptable, and one of the main administration principles will be lacking: strategic planning determines the organizational structure. It is important to consider that for the employee the way to see the job, the behavior, and the vision he has about the bosses is the image of the structure given by the organization.

There are three parameters easily identified which allow us to make an exact diagnosis about a good functioning structure in any organization, and find the differences with other forms of organizational structure. They are: formalization, centralization, and complexity.

Formalization

Can be pointed out as the degree of inflexibility or flexibility that describes any organization. This parameter says that in an organization communications as well as the normally applied procedures must be available, written down, and known by the whole staff to consult them when needed. In general, a professional and more systematic administration can be more formal, while a familiar or artisan is more flexible and less formal. In this sense the organizations that are interested in empowerment are less formal or rigid.

Centralization

As previously mentioned, this parameter, that separates centralization on one side of continuum and power delegating on the opposite pole measures whether ability to decide is concentrated or not in the whole organization Most of the modern organizations leave apart the extremes and try to combine centralization with power delegating. They have created different successful formulas.

Complexity

The complexity parameter rules the number of job titles and departments. As organizations grow up the jobs are naturally divided and more departments are created. Departments can be responsible of different or even dissimilar matters. However, if inside the organization there is high specialization, department distribution by product, with direct attention to clients, geographic distribution services and short or narrow control sections, the administration will complicate. It is implicit that as more complex is an organization more complicated its administration. Nevertheless, there exist organizations that have solved this problem making their units independent, providing authority —early empowerment—, standardizing quality since the control of row materials, regulating processes with a meticulous hygiene, the quickly distribution of products so they can arrive fresh to remote access places. And, first of all, trusting, preparing and promoting personnel's development as they are part of his/her own family and the company great family. This is what Bimbo the Mexican enterprise opened since the 40's, has been constantly doing with success.

People Integration in the Organization

I will finally talk about culture of relationship and cooperation inside the organizations. I know that what I am going to expose is not for the great public, because it is not usual in organizations; however, I am convinced that is the way to transform the labor world into a better world.

A) Nowadays practically all of us live being a part of many organizations where we participate and develop different activities, sometimes simultaneously, and we are always us, even tough we go from one to another. From birth to death we form a part of organizations and it seems natural sometimes since one point of view this is true and sometimes since another one, not so much— due to the universal tendency to gregariousness that makes the isolated or lonely individual to be an exception. It is truth that organization, education and human ability development have been the essential solution for nations' development. (Because of the topic chosen in this paper I cannot extend on education, that I do believe is fundamental for the future of a country).

This planet has become a dense web of organizations that put rhythm to life, where some traditions lighten and current postmodernism announces, in part, due to new webs' presence, that were maybe already here, but unseen, or the traditional ones evolve and get new forms up to the point to seem unprecedented.

B) With transcontinental and autochthonous cultures, since many centuries ago we certainly count on wealthy historical roots and multiple cultures of permanent active integration; however for my subject no doubt Greeks and Romans provided us with research of excellence and humanity perfection the first. And with the art of organization and the empire of the law the second. I must admit that inheritors are not always conscious of the legacy received, its development and improvement. Even they —we— have also historically failed.

C) The integration of people in an organization is ruled by the organizational structure; even though, we do not notice, as we have mentioned in previous paragraphs. However, the hierarchy is what remains in the structure, which in most cases is transferred by the common procedure beings from the strongest, the one who has the power to the submission of the weakest. In organizations we call it power; but, in my opinion, this traditional vision is only partial. Stability in an organization is given thanks to a hierarchic structure that has become civilized through centuries, taking out aggressive conducts of the "strong" or "machos" in delicate schemes of the same dominium power. The organization has created social structural spaces where struggle can be divergent or bivalent. The last one is a struggle among people in superior – inferior – superior and lateral hierarchic levels. At the same time aggressiveness and will of power is determined in achieving certain objectives. The divergent is divided in: i) Hierarchic levels argue and fight among them like persons and the objectives and goals are forgotten or put in contrary. ii) Or they dedicate effort, aggressiveness and will of power and joint together to achieve objectives and reach goals. They do not fight against no one in particular.

D) Cooperation is the solution to this dilemma and it is given when two or more individuals get the responsibility to reach the goals they have in common and that they know no one could fulfill by him or herself alone. Their objective is common and so accepted by each one. They joint knowledge, abilities and skills to serve the team and each one does his/her part of the job. They coordinate efforts to help and support each other according to their time and talent. The most important ingredient in this cooperative is related: consciously accepted the interaction. For cooperation inside any organization knowledge, abilities and skills are not as important as acceptation and understanding to the others, which includes emotional intelligence focused on positive attitudes toward the other members of the team, to prevent arrogance and even get a dose of good mood.

E) Energy can then be concentrated, a truly synergy from the design and planning, from changing ideas with no false modesty; no comments, gestures or actions that can make somebody uncomfortably or upset. Go through operation and implementation of common actions, socialize actively your knowledge, skills and abilities or talent of your own working field to help the team get the objectives which have been set and decided by all members. If you can reach the cooperation level all efforts will be prized: the same structure, hierarchy and even the organizational visible elements usually seem to disappear, and what come forth is a group of people interested in affective and active relationships not only to each other among them, but with the whole organization. As it is commonly said "they will feel a part of the great family". They have grown up (out) to the compromise. It seems to me that the best symptom of a well working organizational structure is to be out of sight. I think that in the human body when you are healthy you don't feel your skeleton, muscles or nerves. But get ill and you see!

F) When I was younger and sports amateur I discovered that great figures in collective sports like soccer football, basketball, baseball, volleyball and so on, there always were the arrogant "stars" and you had to treat them with "gloves" so they could leave individualism apart and play with and for the team. When I took care of a soccer football team in the school where I used to work in Mexico City, I decided to choose players with not so many abilities but with a positive attitude towards the team and me, and not the supposed crack. I worked integrating them as a team who plays to have fun and win with no doubt of their effectiveness. They were so enthusiastic that we finished unbeatable champions in the Football League to which we were members. I learned what "wearing the shirt, the cap" means! And since then I have put it in practice with fruitful results every time I was the boss.

End Notes

1 The experience we have in Mexico about bureaucracy and bureaucratization is not pleasant at all. The corruption and inefficacy we have carried with them along the last decades are very unfortunate, up to a point that is despicable. However, Max Weber (1864 – 1920) considered at his time that bureaucracy was the prevailing organization in society due to its efficiency understanding it as the formal organizational structure with rules, based in job specialization, with a hierarchic authority, rigid promotions and selective nominations. If this characteristics were fulfilled we would really had another image that would be a paradigmatic ideal.

2 PYMES : Pequeñas y medianas empresas, in Spanish ; i.e.: Small & middle enterprises

3 In Public Administration decentralized is understood as the transference of a part of the authority & power from the Supreme Government of the State into various corporations or offices, providing them with jurisdictional personality and the logic resources for those duties. Sometimes those offices are outside of México City, sometimes that transference is given to the governments of the 32 mexican states level or to municipalities. On the other hand, the desconcentración —in Spanish—, may be translated by spreading or dispersing parts of the Federal State administration, making space or distance from the Federal District where the Federal Government seats, due to pragmatic reasons, but the Government keeps centralized the personality and power of the authority.

University of Prešov, Slovak Republic

Abstract

There are still many problems in the transitional economies in central Europe shifting from previous communist regime – especially also in human resource management area. This study deals with the human resources in the Slovak Republic Police Corps. The focus of the research is on the present state of the Slovak Republic Police Corps. In addition, the future expectations of the policemen in Slovak Republic have received a great deal of attention. The analysis is based on relative number analysis and correlation analysis of empirical data. The results of the analysis have crucial implications regarding fluctuations and labor turnover in the Slovak Republic Police Corps. The expectation is that the research results from this study would help initiate changes in the area of human resource management and improve the performance of the human resource management activities in Slovak police corps as well as in related areas.

The importance of human resources management in police corps is evident in the present times. Transitional processes in eastern and middle Europe following the shift from previous communist regime to democracy have special implications in human resources in public sector, especially in police corps.

The human resources management in police corps has several goals, one of the most important and final goal is to improve the quality of a public service – police service. For example G. A. Cole (1997) presents more detailed view on personnel policies and improving factors in organization [1].

Many specialists (for example Edward E. Lawner, 1999) emphasize, that involvement or commitment – oriented approaches to design and management of organizations are an increasingly popular solution to the motivation and performance challenges faced by today's companies. The advantages of the involvement approach are said to include higher quality of services; increased job satisfaction and motivation; less absenteeism, and staff turnover; better decision making; improved problem solving and decreased management overheads [2].

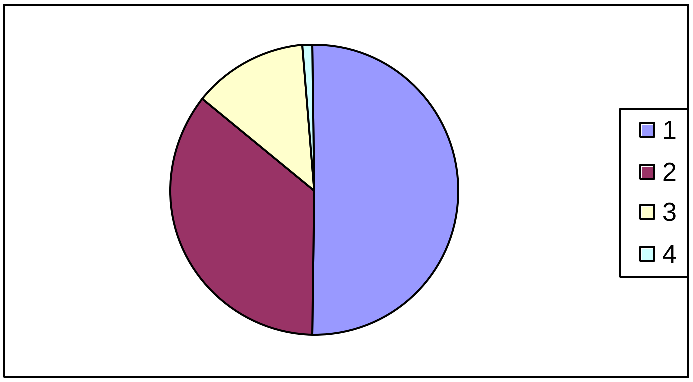
To improve the quality of human resources we must research the present state in that area.

The main aim of the study was to make an analysis of the current situation in the Slovak Republic constabulary and its perspectives in view of its members. The dates of research were November 2002 through January 2003.

We did research on members of the Slovak Republic constabulary with 3 districts selected by random selection from the Slovak Republic districts. Data collection methods included designing of questionnaire. A variety of question types, e.g., scale-type questions, closed, semi-open, open questions were used in the questionnaire. Processing methods were based on relative number analysis and correlation analysis.

1. Sample Structure

The poll was focused on the SR constabulary members in the districts of Poprad and Stará Lubovna, and Prešov. The anonymous questionnaire used for data collection included 27 questions. The first three of them were of the classificatory type. Questions 4 – 27 pertained directly to the research. The number of respondents was 422. The questionnaire return rate amounted to about 95%.
The respondent structure by age was as reflected in Fig.1.



1 20-30 years of age
2 31 – 40 years of age
3 41 – 50 years of age
4 51 – 65 years of age

FIG. 1: THE RESPONDENT STRUCTURE BY AGE.

Following table Tab.1 shows some details of researched sample, received answers, proportions etc. The respondent structure by service period is shown in the Tab. 2. The respondent structure by service type is included in table Tab.3.

TAB. 1: THE RESPONDENT STRUCTURE BY AGE

The respondent structure by age				
Age	20-30 years	31 – 40 years	41 – 50 years	51 – 65 years
Answers received	204	147	53	18
Total number	422	422	422	422
%	48,3	34,8	12,5	4,3

TAB. 2: THE RESPONDENT STRUCTURE BY SERVICE PERIOD WAS AS FOLLOWS:

The respondent structure by service period				
Service period	up to 6 years of service	up to 15 years of service	up to 25 years of service	more then 25 years of service
Answers received	123	198	63	38
Total number	422	422	422	422
%	29,1	46,9	14,9	9,0

TAB. 3: THE RESPONDENT STRUCTURE BY SERVICE TYPE WAS AS FOLLOWS:

The respondent structure by service type				
Service type	public order police	criminal police	traffic police	other
Answers received	272	59	37	54
Total number	422	422	422	422
%	64,4	14,0	8,8	12,8

II. Evaluation of the answers

The relative number analysis enabled us to draw the following highly interesting conclusions:
The first research question, i.e., the forth questionnaire question **"To what degree have your reasons for joining the SR constabulary been confirmed in the actual service?"** was answered as "definitely yes" and "rather yes" by 78% respondents in total, which indicates the prevalence of positive answers.

As for the question examining three main reasons for joining the constabulary, the highest relative numbers were obtained for the following answers: **"opportunity to work with people"** (42.4%), "diversity of activities" (38.6%), and "social significance (importance) of this job" (35.3%).

An important research output was obtained by **correlation analysis** zeroed in on the possible correlation between the answers to questions 4 and 25, i.e. the questions of the following type:

"You have been with the constabulary for quite a long time now. Hence, can you assess the extent to which the main reasons for joining the constabulary have been confirmed in your actual service?" The following answers were offered as options: 1. Definitely yes, 2. rather yes, 3. rather no, 4. definitely no, 5. I can't assess it. The question **"If you were to take a decision now, would you become a policeman again?"** could be answered as follows: 1. definitely yes, 2. rather yes, 3. rather no, 4. definitely no, 5. I can't assess it.

Importantly, there is a correlation between the answers examined, with the calculated correlation coefficient for the whole sample being $r = 0.312$. By implication, there is a significant interrelation between the confirmed reasons for joining the SR constabulary, on the one hand, and the respondents' preference of the constabulary in the case of a repeated decision-making process.

The highest relative number of respondents answered the question **"Are there any opportunities for and are you interested in further education"** with "yes, there are opportunities and I am interested in further university education" (37.2%), officers' college (22.2%), and "university education for policemen".

The question concerning **working conditions and the superordination/subordination** (question 8) was chiefly answered as "I find the job interesting" (54.9%), "my superordinate is up to the managing position" (47.3%), and "I find my work important and useful" (37.9 %).

Question 9 is based on **four significance levels in the individual areas**. Better working conditions, higher social certainty of this occupation – improved human resource strategy and better financial stimulation were of **great significance**. More attractive job content, better moral stimulation, and improved free-time conditions were viewed as **partially significant**. Better free-time conditions, clarification of the meaning of police activities and of social significance of their work, and more attractive work content fall within the category of **low significance**. **No significance** was attributed to improved free-time conditions, higher attractiveness of police work content, and improved health-security and recreation opportunities for policemen and their families.

The ranking of **the most important police staff performance-supporting factors** is the following: 1. possibility to spend one's time with his/her family, 2. financial remuneration, 3. human relations. In addition, the following factors affect the performance in a positive way: insisting on responsibility for one's work, 2. satisfying work, 3. the need to be beneficial to the society. The following factors have no effects: 1. promotion in one's rank, 2. opportunity to exercise powers, 3. promotion in one's position. Rather negative effects upon the performance were attributed to 1. Appreciation of one's work, 2. Opportunity to exercise powers, in combination with the income, 3. Financial remuneration. Negative effects were attributed to 1. Appreciation of one's work, 2. Management quality, 3. Opportunity to exercise powers.

The largest number of the respondents answered question 11 inquiring about the respondents' satisfaction with their working conditions as follows 1. neither satisfied nor unsatisfied, 2. rather satisfied, 3. very unsatisfied.

III. Correlation analysis

Another significant issue concerned the correlation between the answers to question 11 and question 15, i.e., the question of the following type: **"How are you satisfied with your working conditions?"** The range of possible answers was as follows: 1. very satisfied, 2. rather satisfied, 3. neither satisfied nor unsatisfied, 4. rather unsatisfied,

5. very unsatisfied. The options for the question **“How are you satisfied with your current income”** included 1. Very satisfied, 2. Rather satisfied, 3. Somewhat satisfied 4. Rather unsatisfied, 5. Very unsatisfied.

The correlation analysis has confirmed the correlation between the answers to the two above mentioned questions, with the calculated correlation coefficient for the whole sample **r = 0.424162**. It implies significant interrelation between the degree of satisfaction with working conditions in the SR constabulary and the degree of satisfaction with incomes at the SR constabulary.

IV. The Other Results of the Analysis

The ranking of the answers to question 12 **“What should be improved in your working conditions in your view?”** was as follows: 1. More effective powers and better legislative measures, 2. Material, technical, and social conditions – equipment (computers, accoutrement, transmitter, car, fuel), 3. Financial, moral appreciation from the superordinate, 4. Improved working conditions – building renovation, purchase of new furniture (cabinets, chairs), 5. Human resources – the most important aspects:

- human relations, superordinate vs. subordinate
- improved organization
- relations to other constabularies, especially to their staff
- improved social and security conditions for the employees and their families
- improved information flow
- changes in the system of work
- improved management and command quality
- elimination of senseless commands
- possibility to work with people
- more relaxation (more sleep)
- boarding conditions
- inspection
- more time for paperwork
- self-realization
- economic sufficiency
- loyalty, team spirit
- elimination of fluctuation

6. reduced red tape
7. increased income
8. higher qualification
9. improved morale – also in respect of the citizens
10. reduced corruption
11. better training, i.e., its professional level, further education, and participation in educational courses
12. increased staff number
13. the diagram does not indicate the cancellation of the bar-code as Point 13. It represents 3.3% of all respondents.

The majority of respondents answered the question concerning the improvement of working conditions as follows: 1. Material, technical, and social conditions – equipment (computers, accoutrement, transmitter, car, fuel), 2. Human resources, 3. Increased income.

Question 13 concerning **“the degree of coping with the conditions of life (as a policeman)”** yielded the following answers: 1. I got used to them and have no problems in coping with them, 2. They cause me difficulties, however, I can cope with them, 3. I do not find the conditions to be difficult.

Question 14 **“To what extent can the situation in the individual constabulary areas be improved?”** was answered as follows: 1. material and technical working condition, 2. available powers, 3. unbiased assessment of the constabulary work by the mass media. The “**partial improvement**” option was answered as follows: 1. my professional ability, 2. human relations, 3. the level and efficiency of meetings. The answers within the category of **“No improvements required”** were as follows: 1. Service discipline standards and rules, relations between older and younger employees, the contemporary policeman uniforms.

The answers to **“How are you satisfied with your income”** were ranked as follows: 1. middling satisfied, 2. highly unsatis fied, 3. rather satisfied.

The answers to **“How do you imagine your future in the constabulary”** were ranked as follows: 1. I wish to stay at the constabulary, 2. I wish to stay at the constabulary, however, in a different kind of service, 3. I have not considered this issue yet.

The answers to **“What do you find inconvenient in your work”** were ranked in the individual categories as follows:

Most inconvenient: 1. paperwork, 2. psychical stress, 3. meetings.

Partly inconvenient: 1. meetings, 2. risking one’s health and life, 3. legal responsibility for the police actions.

No objections: 1. field work, 2. physical demands, 3. Operating computers.

The degree of satisfaction **“with the material and technical conditions”**:

Very satisfied: 1. uniform as a means of representation in public, 2. computer technology, 3. accoutrements with regard to weather conditions.

Rather satisfied: 1. uniform as a means of representation in public, 2. accoutrements with regard to weather conditions, 3. hygiene and sanitary facilities.

Somewhat satisfied: 1. uniform as ameans of representation in public, 2. accoutrements with regard to weather conditions, 3. hygiene and sanitary facilities.

Rather unsatisfied: 1. accoutrements with regard to weather conditions, 2. vehicles, 3. technical facilities.

Very unsatisfied: 1. vehicles, 2. technical facilities, 3. computer technology.

The answers to question 19 **“Realistic career perspectives”** were ranked in the individual categories as follows:

Yes: 1. promotion in rank, 2. promotion in one’s position, 3. transfer to a financially more attractive job.

Rather Yes: 1. promotion in rank, 2. promotion in one’s position, 3. transfer to a financially more attractive job.

Rather No: 1. transfer to a more attractive kind of service, 2. transfer to a financially more attractive job, 3. promotion to a higher service position.

No: 1. promotion to a higher service position, 2. transfer to a more attractive kind of service, 3. transfer to a more attractive kind of service.

I do not know: 1. transfer to amore attractive kind of service, 2. promotion to a higher service position, 3. transfer to a financially more attractive job.

The most frequent answers to **“What is your view of your future career as apoliceman?”** were the following: 1. I wish to stay with the constabulary as long as I feel I am useful, 2. I wish to stay with the constabulary until the end of my productive age, 3. I can leave the constabulary depending on the circumstances, however, no sooner than I can claim the pension.

The respondents are mo st frequently 1. Rather satisfied, 2. Rather unsatisfied, 3. Very unsatisfied with their respective **service position**.

Question 22 **“What is the development of your social status?”** was most frequently answered as follows: 1. negative 2. Unchanged, 3. Positive.

Question 23 **“Have you experienced any negative citizens’ attitudes to the constabulary?”** was most frequently answered as follows: 1. Yes, quite frequently, 2. Yes, exceptionally, 3. Yes, permanently.

Question 24, **“How do you perceive the negative attitudes of the public to the constabulary?”** was most frequently answered as follows: 1. I do not care, 2. It hurts me, however, I can cope with it, 3. I am disgusted at it and can hardly cope with it.

The question **“If you were to take adecision now, would you become apoliceman again?”** was most frequently answered as follows: 1. rather yes, 2. rather no, 3. definitely yes.

Question 26 **"Are you satisfied with your professional career?"** was most frequently answered as follows: 1. middling satisfied, 2. rather satisfied, 3. rather unsatisfied.

The following answers occurred for the open question (27) "**In your own words, express the facts pertaining to your professional career at the constabulary which were not covered by this questionnaire and which you find highly important!"**:

1. no promotion chances
2. lack of appreciation
3. corruption – favouritism
4. useless red tape
5. assessment by citizens
6. technical facilities
7. legislation and powers
8. human resources
9. better financial remuneration
10. education opportunities
11. improved discipline and observing the laws also by the constabulary
12. improved working conditions
13. decisions of the superordinate contradicting the law
14. changes in the job position tables
15. the questionnaire is inappropriate
16. nothing can be added, no comments
17. the questionnaire will not result in any changes
18. unsatisfied with one's work at the constabulary
19. a larger number of policemen with university education needed
20. the respondent agrees with the questions
21. the respondent does not agree with the questions
22. increased number of policemen.

The most frequent answers included: 1. human resources, 2. nothing can be added, no comments, 3. better financial remuneration.

The most important factors in the field of human resources include:

- human relations, superordinate vs. subordinate
- better organization
- relations to other constabularies, especially to their staff
- improved social and security conditions for the employees and their families
- improved information flow
- changes in the system of work
- improved management and command quality
- elimination of senseless commands
- possibility to work with people
- more relaxation (sleep)
- boarding conditions
- inspection
- more time for paperwork
- self-realization
- economic sufficiency
- loyalty, team spirit
- elimination of fluctuation

In conclusion, we hope the measures reflecting the research results will be implemented in the shortest possible time.

There are personnel policies, which can contribute to change the situation in human resources also in such organization as police corps [3].

Human resource managers in Slovak police must use all motivational tools for maximizing work satisfaction of policemen. As the research showed - there are many barriers and remnants from previous regime [4]. Many traditional values in Slovak police were destroyed. But the improvement in that area is necessary and it is upon us to bring in these improvements. This indeed is the aim of the Slovak personnel managers in police corps.

Mexico: The Challenges of Human Development

Ignacio Medina
ITESO and Universidad de Guadalajara, Mexico

Abstract

We offer here the vision of development not only as economic growth and income redistribution (conceived both in a simultaneous way) but through the concept of Human Development, elaborated by the United Nations Organization (UNO) in some official documents. With data of the UNO, an application of the Index of Human Development (IDH) is done to the situation of Mexico, keeping in mind the growth of the GDP, the income average per capita, the elements of health and education, the democratic component and the indispensable vision of the culture.

Introduction

In many social essays of the twentieth century, the efforts of development have concentrated on the promotion of growth and economic expansion, elevating the quantitative levels of the Gross Development Product (GDP) of the countries and subsequently the possibilities of greater incomes for the population. This happened even in the approaches of the UNO. Nevertheless, in real, it has been verified that the increment of the national product per capita does not produce automatically a greater welfare of the persons; although it is an important element for the prosperity in a single country but is not the only one.

In the specific case of Mexico, we know that the country is the ninth economy of the world in September of the 2002, focusing only the GDP, but in the Human Development concept of the UNO, we appear in the place number 54 (IDH-ONU. Newspaper Público, August 8, 2002). In many cases, the growth occurs but causing a bad distribution of the benefits, increasing tremendously the differences among few people who are wealthy and many who are poor.

In this text, we know the importance of the economic growth and stability but with other characteristics in the same significance, if we want to visualize a true development for Mexico in the future. It is not good to seek first the economic growth and then expect as necessary consequence the distribution of the wealth; we can reduce development neither to the economic growth neither to the income per capita, but we should get other determinant elements of the human life as health, education, citizen participation in democratic institutions and even the culture. We offer a more suggestive approach when we formulate that the development is an effect of a democratic political system, and therefore we center our attention in some fundamental ingredients of such system.

1. Growth tendencies in Mexico

After the serious crisis in Mexico in 1994-95, the country has been experiencing stable indices of growth in the macroeconomic figures, in spite of certain moments of deceleration as it was in 2001 and 2002, when the north-American recession dragged us to an almost scarce growth during those years.

According to the numbers of the INEGI, the GDP (nominal value) gotten at the end of 2001, was 627 billion dollars; there was 558.962 billion dollars during the year 2000; it signified a growth of 12.17% from one year to another. Continuing with the math, it meant that the annual income average by Mexican inhabitant reached the figure of 6,119 dollars, in spite of the fall of the economy during the 2001. It must be emphasized the ascending rhythm of the annual income average that had been of 4,904 dollars in 1999, and 5,831 dollars in 2000.

We can keep in mind also the emphasis in controlling inflation, because we recall the year 1987 when we had the highest rate of inflation in our history (154%) and also the tremendous crisis of 1995 with an elevation of prices near 100%. In this sense, if we are arriving at the rate of 5% of inflation in Mexico, it has to be considered like an appropriate condition of stability for the course of the country.

With these objective data and the tendency in the evolution of production and the markets toward the next 25 years in the XXIth century, the specialists have indicated that in the international framework, in agreement with the volume of its production, the most important countries will be China (with the 26% of the GDP in theworld), United States (with the 21%), the European Union (with the 20%), India and Japan (with the 13%), Brazil and Mexico (with the 7.3% of the GDP world). (Cfr. Aguilar Ruben, Newspaper El Universal, 2002).

At present, by the size of its production, Mexico is the ninth economy of the world; the World Bank thus has recognized it, and the President Fox has expressed it in its second report of government. As empirical data, it cannot be contradicted, and one must take into account as somewhat outstanding, although, as we maintain, it cannot be the determinant element in the development problems.

Still it exists and is found in governmental officials documents the paradigm of the development based only in the economic growth: it is supposed that all the social energy should be promoted to produce a cake increasingly bigger; there is no case giving importance to the redistribution of wealth if we do not have growth, because it means to redistribute the misery; all the investments should be productive in order to increase the wealth of the nation; in a natural process and in a long time of time, we will get slowly but firmly the benefits for all the population, first with the crumbs falling from the table and later with the participation of all in the national wealth.

So much the World Bank (BM) as the International Monetary Fund (IMF) they utilized for a great deal of time only the monetary and economic indicators to measure the development. Nevertheless, nobody can show the direct relation between the economic growth and the distribution; the two strategies should be presented as indispensable in a simultaneous way if we call it development. Because of it, we have to advance toward a second definition of the concept: growth with distribution, where the defenders of this position "adopt the principle that the just distribution –the abolition of the massive poverty and of the large inequalities concerning wealth- cannot be derived from processes of falling crumbs neither of politics of charity. They maintain that so much the equity as the growth should be planned like direct goals of the strategy of development" (Goulet and Kwan, 1989: 35-6).

2. Some contradictions

All we can be surprised about the power of the Mexican economy based on the previous figures when we observe problems of poverty, technological dependence, bad urban infrastructure, crisis in the rural production, etc. It carries us, in the first place, to redefine in a radical way the concept of development, not reducing it only to the quantity of the national GDP.

The first element call our attention is that, in the same levels of mathematics, when we consider the income average by inhabitant in Mexico (6,119 annual dollars at the end of 2001), the rank of the country falls –being the ninth world economy with respect to the GDP- we are placed in number 29. This is because the GDP in each country is divided among the number of inhabitants; the is the income average; therefore, depending on the inhabitants of each country in relation to the GDP, the rank varies.

The highest GDP per capita in the contemporary world is found in Norway: 36,219 annual dollars; later come the United States, Swiss and Japan. In the case of Mexico, is interesting to analyze the comparison with its associates in the North American Free Trade Agreement (NAFTA) : United States has an 35,835 dollars annual income average by inhabitant while Canada has 22,572. One must celebrate that Mexico has now that GDP per capita annual of 6,119 dollars, but the distance with its associates is from one to four with Canada and from one to six with the United States.

As it can be seen, the income average per capita express a great deal more than only the quantitative data of the GDP; but, even so, that theoretical distribution of the wealth among the number of inhabitants continues hiding the factual reality of how is distributed the income and how the social benefits are distributed. In order to distribute, it is necessary to grow, but we have to stand out that the alone quantitative growth does not produce distribution of the social wealth; it can exist an intense dynamics of growth and simultaneously a great dynamics of concentration of the income.

One of the contradictions that more is calling our attention is the contrast among the wealth of a country (by its GDP, or by the income average per capita) and the empirical reality of the badly distribution of the income. It is a fact recognized in many regions of the world, as the World Bank says: "in Latin America, Asia and Africa at the south of the Sahara, the poor number of persons has not left to enlarge" (World Bank, 2001: 3). This reality in large levels of poverty exists vis a vis groups that concentrate the wealth, and carries us to abandon the conception of a development based exclusively in the economic growth; the most solid contemporary theories carry us to conceive growth and distribution of the social wealth as two necessary faces in the development; still now, some analysis offer the theory of the "leak": first it is necessary to grow and, after that, late or early the fall of crumbs will come to the people in the redistribution of wealth. We maintain that the development implies necessary and simultaneously politics of growth and politics of distribution, if we consider the most minimum social approach of justice.

In Mexico, numerous debates on the size of the poverty have been existed; but is indisputable its existence. Though, on this point one must continue analyzing and debating, we can take the last agreement of the Mexican government of Vicente Fox, on August 2002, with other analysts in the academic world and from the private enterprise, distinguishing three levels of poverty: they arrived at the conclusion that in Mexico 23 million inhabitants are in an extreme situation; we had 32 millions if we take the medium situation of poverty; and finally they were recognized 53 million Mexicans (including the two previous levels) that suffer the "poverty of patrimony" (persons without sufficient incomes to satisfy the daily needs of food, dress, footwear, dwelling, health, public transportation, education. ..). If this is so, then, in the year 2000, more than half the population had some level of poverty in Mexico. Subsequently, in an interview televised in CNI, the secretary Josefina Vázquez affirmed that, in the best of the cases, the Mexican government would be able to aspire, at the end of its six-year period, to diminish from 53 to 44 the millions of poor people in the country.

This situation must be seen vis a vis the level of concentration of wealth; we are going to show one example based on the data of the American magazine Forbes. This magazine, year with year, brings to light data on the richest men of the world, brought to light at the beginning of the 2002: on 2001, 12 Mexicans were in the list of the called super rich, those persons whose fortune elevates at more than one billion dollars. The businessman Carlos Slim, owner of Telephones of Mexico (TELMEX), was maintained like the richest man in Mexico and Latin America with a fortune of 11.5 billion dollars, placed in the rank 17 of the wealthiest men of all the planet. Some other Mexicans inside the same category are the following: Jerónimo Arango (shareholder of Wal Mart, with 3,7 billion dollars), Lorenzo Zambrano (of Cemex, with 2.8 billion dollars), Eugenio Heron Laguerea (2.3 billion dollars), Roberto Hernández (1.8 billion dollars), Alfredo Harp Helú (1.3 billion dollars), etc.

In all the societies in history there has been this division between poor and rich, but in the contemporary world with modernization, industrialization and globalization, what aggravates and makes more scandalous the situation is this unjust and close contact between those who have big money and too much wealth and all those that do not have the indispensable thing to live and scarcely survive, constituting a more extensive world of poverty and extreme poverty.

3. The human development concept

If the development himself is not reduced only to economic growth, many would be able to think that the complement of the distribution of wealth would fill then, in a complete way, the definition of the concept. But we have to advance to a third definition that we are adopting in this article: for the people, the benefits of the growth are determined so much by its quality as by its quantity, by productive and distributive aspects. Some of the most frequent human aspirations are to enjoy a healthy and long life, to get the suitable knowledge to get by in a successful way and to assure an encouraging and worthy conditions of life for the family. Of the same way, the human being seeks to be free to elect among several options; to participate actively in the public life; to transmit to their children a sufficient capital of resources; to develop his personality, initiative and responsibility to be an actor that determines the course of his existence in an environment of liberty and justice.

"The priority task of the development no longer consists of achieving the maximum or the optimum total growth but in satisfying a basic assembly of needs.. This assembly of needs includes goods and services relating to the nutrition, health, dwelling, education and employment.. The Basic Human model of Needs incorporates two elements more in its recommendations: emphasis in the self-sufficiency, local and national, and preference for the solution of problems with a style that permits the participation" (Goulet and Kwan, 1989: 37). Nutrition, health, reproduction, education, cultural identity, political liberty, social participation, institutional efficiency and environmental quality are important ingredients of the quality of life, that are shown in the capacity of the persons to live in a way that more esteem. For the execution of these yearnings it is a central, but not exclusive element, the disposition of a stable and sufficient income.

From this perspective, the human development places the persons, with their needs and legitimate expectations, in the center of the efforts of the development. It would be able to formulate a universal objective: to promote the capacities of all the human beings so that they have the opportunity to enjoy the type of life that more value, multiply their capacity and to be able to direct responsibly their existence; but the development, then, would have to see with other elements that have to see also with the politics and the culture.

According to various documents of the United Nations, the new human concept of development implies the following things:

- A basic demand of equity, banishing the discrimination.
- The ingredient of the sustainability, understood like the extension of the notion of equity applied to the next generations.
- The creation of capacities and opportunities for the population, intimately connected with institutional elements that would facilitate them; because of it, the conquest of a greater general welfare is associate to the construction of a democratic political framework of institutions that encourage the citizen participation.

This human vision of the development is not limited to the economic aspects, but it extends to the environmental, political, cultural, and social spheres. The economic growth continues to be an indispensable element; one must complete it with an effective social politics to eradicate the poverty; it has to be complemented with the upper goal of a harmonic welfare general, certain levels of citizen participation and a respectful use of the natural resources, thinking in the future generations. Since 1990, the Program of the United Nations for the Development (PNUD) publishes annually a world Report (Report on Human Development) that analyzes different dimensions of the problem, from the perspective of the human development. These documents have been offering a new globalized framework very suggestive that always one must keep in mind when we speak on the processes of the development in the different countries: the major success was the incorporation of social dimensions of the poverty, trying to measure and to compare the development among the nations, mainly taking into account the life hope indicators, alphabetization, employment and income per capita.

Understanding the human development as an enlargement process of opportunities for all the persons, we begin with the recognition that it is in the framework of the options created by the society that the persons can enjoy the opportunities offered and can face the risks of life in better conditions. The human concept of development covers multiple dimensions of the life of the persons and of the social groups: family, social, environmental, economic and political.

A true development cannot sacrifice the persons or their natural environment in the search of the economic growth. If this growth is not translated in the broad satisfaction of the needs of the people and in the respect of their natural environment, any success will be of a meager duration; the increase of the general welfare and the conservation of the environmental potential constitute indispensable structural conditions to maintain the economic progress.

Defining the persons as the basic objective of the processes of development and centering the attention in the needs, hopes, capacities and options of the people, the human development covers an extensive fan of the human aspirations. These are not reduced to the alone economic availability of resources, but include a great diversity of benefits, so much materials as intangible, that contribute to welfare and happiness. The options valued by the people differ according to the historic context and vary through the years, arriving even to be unlimited. Therefore, with some basic and general considerations on the human development, we can say that there are three essential capacities; without them, nobody count on many options to satisfy other aspirations. Thus, a way to measure the human level of development of a population can be given based on the following three capacities:

1) The longevity as the experience of a healthy and long life.
2) The educational achievement as the capacity to acquire the suitable knowledge.
3) A standard of living in which people can get the necessary resources to live their existence.

This implies some programs in diverse areas: an effort focused to improve the social conditions of the poorest; prevention of the avoidable deaths; the programs of reduction of the illiteracy; to seek a greater incorporation of children, girls, adolescents and young to educational system; to assure that the growth gives benefits to all the population. For it, also it is basic to count on a healthy people, distributed in adequate way in the territory, so that the population imbalances, in one or another geographical zone, do not signify environmental risks for their inhabitants.

Trying to do a synthesis, it would be able to say that the Human Development can be structured in the following axes of action:

1) Equity: translate the economic growth in general welfare
2) The educational framework: creation and extension of the adequate knowledge in the population
3) Competitiveness: capacity to maintain and to enlarge the participation in the markets, elevating at the same time the standard of living of the population.
4) Sustainability: the enjoyment of the land and the social wealth produced should be planned to be extended to the future generations.
5) Governability: growing political participation of the citizens in the democratic framework of institutions.

"Human Development is that process by which the person is done subject and effective beneficiary of the changes under way. According to the World report of the PNUD, it signifies an environment in which the persons can do fully reality their possibilities and to live in creative and productive way according to their needs and interests. A precision: the Human Development opens a perspective, this is, does not imply some model of development but a way to focus the social life" (UNO, 2002: 16).

4. The democratic component of the development.

An element to which it has not been given the proper importance in the processing of the development is the construction of the democracy and the state of law. The underdevelopment does not only consist in a poverty situation, understood like economic lack of resources; as it recognizes the World Bank the "poverty is also vulnerability and incapacity to be heard, and lack of representation" (World Bank, 2001: 23). The consolidation, therefore, of a democratic political order, with an active participation of the citizens, is also integral part of the human development. In such sense, the construction of a participative democracy and a state of law in Mexico presents advances in some fields, but also shows a situation still very fragile.

The political modernization especially in the democratic constitution of our societies has two essential aspects: first, the vote and the electoral systems, that should guarantee each time the better emission of the votes and the final results so that the population can count on authorities fully legitimized by the majority of the population; second, the citizen participation beyond the electoral moments in order to influence constantly in the elaboration and execution of the public decisions, what implies a constant organization of the citizens in multiple interests without depending necessarily in the protection of the State.

This vision of the human development is essential in order to get a social climate of greater security and confidence for all the persons, what signifies the construction of a democratic political order with participation of the citizenship in the management and public decisions. In this manner the sense of commitment will grow because the know that they belong to the society in which they live.

In Latin America, since the decade of the 1980s, we lived a process of removal of the dictatorial and authoritarian states governed by the military; in these decades, at the end of the XXth century, the continent has been seen covered with civil governments arisen from electoral processes. The Summits of the Americas (Miami 1994, Santiago of Chile 1998, Quebec 2001) have come to say, under the initiative of Washington, that the whole continent is "democratic", with the exception of Cuba, the only country not been invited to such summits. Under this vision, it seems then that the democratic development has arrived to Latin America, keeping in mind the only criterion of electoral execution of processes, taking aside other important elements of the analysis.

For Mexico, that did not suffer that Latin-American type of dictatorships of military type, the analysis of democratic transition has also applied recently, due to the political alternation in the Republic presidency, on july 2000, after many decades of domination of a one political party, the Institutional Revolutionary Party (PRI), in the national life. The now president Vicente Fox, of the ruler National Action Party (PAN), has come to affirm that Mexico passed already the phase of transition and has entered to the consolidation of its democracy since the presidential change in 2000.

But this analysis of the Mexican democracy is not wise. The governments of the PRI were not democratic, even in the unique environment of the electoral processes; there was the weakness of the laws in this matter and the constant practice of fraud lived in numerous moments of the political life. If we reduce democracy to the electoral processes, then the democratic transition has finished; but if democracy, as Alain Touraine says, we define it like an inner process where exists the respect to the fundamental rights (including the respect of vote, as one of many), where the representation of interests in the political system exists and where it has been institutionalized the citizen participation processes, then the transition has not concluded in the moment when it begins to exist the credible and more legitimate elections. "A great diversity of states exists whose action respects one alone of these principles destroying the other two. None of these states can be called democratic, as can neither be those ones that do not do more than organizing some relatively open elections" (Touraine, 1994: 353).

Mexico had a significant period of economic growth since the years of 1940s until the end of the decade of 1960, a phase that officially was called "a stabilizing development" and that people knew like the period of the "Mexican miracle"; the most important criterion to speak of the development in Mexico in that moment was the continued economic growth of GDP in an annual average of 6%; the salaries of many people grew up; it was maintained the stability of change between the Mexican peso and the dollar. But the time itself destroyed the illusion of the Mexican industrial development: the crisis of 1976, 1981, 1987 and that of 1994 were a painful show of the weak of the word development. But those same crisis were accompanied by the called process of transition to the democracy with a strong citizen participation, that has had a significant moment in the political alternation in the presidency in the year 2000. These advances in the transition process are the same that give us the possibility to impact now directly in the economic development because we know that democracy is directly associated with the human development. In the United Nations, Mark Malloc, the administrative general of the PNUD, speaking about the human development, he has said: "the politics is as important as the economy" (Newspaper Publico, 8 August 2002). In a radical way, we would be able to say that "the development is not the cause, is the consequence of the democracy" (Touraine, 1994: 335); this means that only a strategy discussed and approved between the government and the citizens organizations, making a pact among all the political forces can carry to surpass the previous phases of the development in the country.

This last position permits us to surpass with clarity the old formulations of the development linked only to the economic growth, and even those that consider the growth linked to the distribution of the wealth. The human development that we seek has certainly an economic component (growth and distribution) but is necessary to emphasize the social ingredient in health, education, dwelling, etc. And with it, it is necessary to emphasize also the aforesaid political cultural dimension in democratic institutions that permits to take the social forces to a pact cooked by a consensus relating to the strategies for development. This last it is what the United Nations keep in mind when speak of the good governance as key for the development.

5. The cultural dimension

During the XXth century, particularly for Latin America, through the CEPAL, it has been insisted about the underdevelopment only like an economic problem of delay situated in the under level of the productive forces of specific countries. Subsequently, the theory of the Dependence insisted in the political fight of coordination among the nations of the to world periphery to improve the commercial exchange levels with the metropolitan countries. The governments of the industrialized nations, at the end of the XXth century, have come to incorporate a democratic clause (although at times understood only as electoral processes) as indispensable element in the programs of development. But the UNO, in the transition to the XXIth century, has begun to emphasize a new component that had not been given the proper importance: "The human development contains necessarily a concern for the culture –the way in which persons decide to live together-, because the social sensation of cohesion based on the culture and in the shared values and beliefs is what expresses the individual human development. If the people live well together, if people cooperate in a way that become mutually enriched, they expand their individual options. In this way, the human development concerns not only for the people as individuals, but besides for the way in which they interact and cooperate in the communities" (UNO, 2002: 17, citing a document of the PNUD, 1996).

The PNUD study on the Human Development in Chile 2002 is an extremely interesting example in relation to the role of the culture in our contemporary societies. The analysis is done on Chile but from the perspective of the culture; the titles of the 6 parts that integrate the report are suggestive: "The importance of the culture", "the Chilean thing: an inheritance questioned", "Changes in the cultural production: new settings, new languages", "A map of the cultural field", "The personal life of a changing society", "A diversity dissociated". The main object of the study coordinated by Norbert Lechner is "the private way in which a society experiences its contact and the way in which imagines it and represents" (UNO 2002:37).

If the Human Development is a way to focus the social life, we would be able to have a double tension: on the one hand, the possibility to universalize certain elements of the human being in the contemporary societies that make possible an empirical measurement and, on the other hand, the need to affirm that neither the goals neither the media for the development should be taken from the model of one single country; the inner force comes from the dynamism of the system of values in a specific society (traditions, locality, ...). The contradiction among universal values and local values stands out nowadays in a astonishing way when we face the diverse processes of globalization; we should say that the two levels, the global one and the localities, are interrelated constantly in all the contemporary societies.

One of those interrelation areas is the collective imagination of the social groups, where, in parallel way to the political and economic changes in the society, diverse projects stay together on what is or should be a specific country, advancing from a historic status to another. Gramsci, for example, was right when presented the importance of the ideological superstructure, conforming an educational plan as revolutionary action of the masses even when these did not be still in the control of the State, or when being the masses in the control of the State these had not reached an appropriate ideological level for the changes in the new society. In other words, we could say that the abandonment of the underdevelopment itself would not be achieved neither only with the economic changes neither with the political ones but when the population could get his collective imagination according with the real characteristics in a specific society they want.

One of the areas of the culture is the representation of the collective imaginary where the diverse social groups are situated in order to valued themselves living in their specific history. "A collective imaginary is the ideal or symbolic assembly of representations by which is defined the fundament, the motor and the sense of the living together among the members of a group or a society. The collective imaginary is not an illusion neither a fantasy. It is, on the contrary, a real phenomenon. Every society projects an image of itself and through that imaginary it is recognized like a collective group" (UNO, 2002: 38). One of the fundamental tasks of each society is to forge its own imaginary relating to the following historic situation that the people wants to build; when a consensus is created on what the main groups of a society want (that is another of the aspects of the democracy beyond the electoral processes), it is created the need of a new social pact that will make possible the political commitment for the transition. No model of development can be imposed authoritatively and, because of it, the creation of consensus and pacts around the possible imaginary of a specific transition becomes the fundamental aspect of the process. And there is the importance of the culture in the processes of development: “there are new ways of coexistence that demand new imaginary that represent them. And, in another way, there are transformations of the imaginary that motivate and orient new experiences of living together” (UNO, 2002: 38).

Gilberto Giménez, speaking about the social processes of transformation, dedicates a special focus to the “creative imagination” of the subjects and groups, considering it exactly like a motor for the social change, using the concept of “utopia” not in an alienating way but giving it the possibility of transcending the immediacy of the perception of the present, exploring the world of the possible with an innovative attitude; this is also what Ernst Bloch calls “creative hope”, when the social groups, going from the imagination provided by the present situation, agree to fight in the execution of the possible in the near future of the society.

We return now to the concept of culture given by the UNO as the way in which the society experiences its contact and the characteristics as it imagines and represents itself, and then also we return to reaffirm the centrality of the culture in the processes of development when we analyze the concrete situations that different societies live: their specific ways they want to run going from one phase to another in order to reach upper stadiums. In this sense, one of the big challenges for Mexico, after the political alternation achieved in the presidency on 2000, is to translate the advances of the democratic system in programs that affect positively the conditions of life of the population; and this itself will not be achieved but with the construction of a participative citizen culture beyond the electoral processes.

6. The measure of the human development in Mexico

Since 1990, the PNUD has carried out numerous efforts to approach the measurement of the human development, combining diverse criteria in a single indicator, the Index of Human Development (IDH).

This agenda for the human development is a great challenge, more extensive and complex than those simple instruments used to build the measurement index. Nevertheless, they permit to present specific goals in order to evaluate the impact of politics focused to establish the minimum bases on which to build a fair State, offering better conditions of welfare for all.

The contrast among different data is what explains why Mexico, with the criteria of the IDH-UNO is found in 2002 in the place number 54: “The IDH is integrated from three data: hope of life, education level and income level. The country with highest hope of life is Norway with 78.4 years. The partners of Mexico in the TLC occupy the third place in the world level: Canada with 78.0 years and the United States, in rank six, with 76.8 years. Mexico is found in the 51 place with 72.4 years. In Latin America Argentina, Uruguay, Chile and Costa Rica have a better position than Mexico. The educational level average of Mexico is 7.5 years while the U.S. and Canada passes the ten years. In Latin America, one more time, the countries already cited surpass the level Mexico has. Mexico is the ninth economy of the world, but it is the 29th in terms of the income per capita and we go down to the 54 rank, speaking about the level of human development; this does not do more than showing the contradictions and inequity of a society like Mexico, surpassed in Latin America only by the reality of Brazil that results still more scandalous. The Mexicans that voted for the alternation in the presidency in 2000, they did it not only to be get rid of an authoritarian and corrupt regime but in the search to obtain better standards of living for them and their families. That is the content of the change” (Aguilar Ruben. Newspaper El Universal. June 1, 2002).

It is, besides, illustrative to do a comparison among Latin-American countries. Mexico is found in the place number 54 in the Human index of Development of the UNO, but in that list, Costa Rica appears in the place number 43, Uruguay in the number 40 and Chile in the place 38; even various Caribbean countries appear above Mexico. The cases of these Latin-American countries are significant because, being in the same context of our region and being countries with smaller economic potential that Mexico, they come to surpass us inside the measurement done by the UNO.

Costa Rica is a small country of Central America with near 4 million inhabitants, in an under level of industrialization, with a deep democratic tradition, with a population with high levels of education, with a still considerable median class, with state institutions that have survived to the processes of privatization and that redistribute great part of the national wealth in the population, with large natural reserves cared and maintained in benefit of the ecology of all the planet. Some of these elements can illustrate the reasons by which the UNO has considered that Costa Rica has a better human development that Mexico.

On the other hand, Chile represents a notable advance in the IDH during the last decade of the XXth century, taking mainly some hints as the longevity of people, the educational level, the income level, the parity or disparity among the regions inside the country; “in the last decade, the special IDH for Chile was increased from 0.69 in 1990 to 0.749 in 2000. It signified that the country reduced in a 19% the distance that separates it from the ideal proposed as full Human Development. In the same period, all the regions of the country enlarged its Human level of Development in a considerable way” (UNO, 2002: 298). It is necessary to keep in mind, besides, the slow but notable advances in the consolidation of a democratic system in the decade of the 1990s.

Mexico took a very large step with the political alternation in the presidency of the Republic in 2000, and counts surely on a great economic potential; but the challenges of the human development are enormous so much in the field of the inequality of the distribution of the wealth as in the cultural and political environment; in fact, we do not reach still to have a consensus of the main political forces, a new social pact for improving in the human development; instead, it seems that we continue with the inertia of all inherited in passed decades, because the country has not taken decisive advances in the execution of a State reform.

In Mexico, another fundamental element to consider is the transparency in the institutional operation and the fight against corruption. What to do, for example, in a key point of a democratic system as it is the battle against the corruption? The inheritance left by the State party state (PRI) is burdensome: in 1999, the International organization of Transparency, in 99 analyzed countries, put us a scoring of 3.4 points, keeping in mind that the optimum qualification is 10 and the worst one is 0 (International Transparency. Berlin. October 1999). It is a similar situation in many countries of the continent: “the Latin-American countries are found charged not only by the poverty and the inequity but also by the weakness of the empire of the law, that is to say, the guarantee that the citizens and any business receive an impartial deal and well done on the part of the government, of the justice and of other institutions” (Economist, No. 8170, 05/13/2000:34). But in matter of transparency, although we can understand that Denmark is the country who had the best qualification, inside Latin America countries as Chile, Costa Rica, Peru, Uruguay and Brazil, they were catalogued above Mexico. It is a brutal inheritance with which we live; it is not the system alone that favors the illegality but also big part of the population we live in a generalized corruption culture that all we seem to accept as given almost for always.

Besides, if today we present ourselves in the search of better phases in our processes of development, one of the fundamental challenges is in the creation of a citizen participation culture where we can represent us in the search of consensus required by the country at the present and the next period during the XXIth century.

Not only the UNO but also even other international agencies as the World Bank (BM) or the International Monetary Fund (IMF) have stated with plenty of clarity that the way to fight the social deficit and the poverty in the different countries foes from the design of public policy and of governmental managements; in this design begin, we know the increasingly importance of the citizens organizations and the international pressures. In this sense, only the existence of a democratic political system (with various characteristics beyond the legitimate electoral execution of processes) can guarantee a better one design of the public policy, understanding that the citizens organizations have institutions that permit them to elevate their voices and to participate in the pacts among the different political forces; it signifies also a separation with the prevailing political culture during the XXth century, when every welfare depended on the power of the State. The perspectives of development for the future will depend then in a collective agreement, that they will have to be built among political forces and citizens organizations; the development of Mexico arises then from the institutional need of construction of a democratic political system, with a national pact with all the political forces in a reform of the State, and –the hardest-, with the creation of a political culture capable to build a collective imaginary of the possible country we want.

Skill Shortages, Training Needs and HRD Strategies of MNC's in Mexico

Laura Iturbide
Universidad Anáhuac, Mexico

Abstract

This study, which has been carried out as part of the project "Skill Shortages, Training Needs and HRD Strategies of MNC´s in APEC Economies", examines important factors of this type of firms, through a survey of MNC's operating in Mexico. The experiences of MNC´s recollected in Mexico are very valuable in order to shed light in how these companies are developing appropriate knowledge management systems, by understanding specifically how they are coping with skill shortages and their role in upgrading them in order to face competition. Key issues are discussed such as: the extent of labour and skill shortages faced by these firms, current and future training needs and their human resource management, as well as their human resource management techniques. Gender issues are also highlighted in this paper. The findings are compared with the results obtained by MNC´s in other APEC members.

1. Survey Sample

The survey sample covered 625 multinational companies (MNC's), within four industries –manufacturing, banking and finance, insurance and business services; operating in eight APEC economies: Chile (30), Indonesia (61), Malaysia (100), Mexico (61), The Philippines (81), Singapore (111), Chinese Taipei (100) and Thailand (76).

With respect to industry distribution, the results from Mexico were very similar to average for all countries: 50% in Manufacturing; 10% in Banking; 36% in Business Services; and 3% in Insurance. These data were the closest to average among all participants. It can be said that the sample distribution is not too far from actual distribution: among the top 50 foreign companies in Mexico, 37 (74%) belong to Manufacturing and 13 (26%) to Business Services.

In terms of organizational size, the 501+ category has the largest percentage of companies among all categories, for the four industries analyzed in the survey. The 3rd and 4th categories together (more than 100 employees) concentrate more than 60% of the companies, in each industry. In Manufacturing and in Insurance, the figure is above 90%. These results are in line with the Official Business Classification according to the Number of Workers and Line of Business, that consider a company to be large in Industry when it has more than 501 employees and more than 101 employees in Services. MNCs are, in general, large companies in Mexico.

The percentage of large companies in Mexican data (3rd and 4th categories) is largest among all participants.

2. MNCs profile in the countries – Regionalization and Globalization trends

In the 1989-1994 period it was decided to take the structural reforms started years earlier to a more thorough level in Mexico. Trade opening, direct foreign investments, deregulation and privatization, and financial reform made the core of the adjustment program in line with the economic stabilization program.

Deregulating foreign investment portfolios allowed for an excessive affluence of foreign financial resources resulting in growing appreciation of the real peso exchange rate. This made more difficult the link between major exporters and domestic vendors. More and more intermediate goods were imported, hindering the massive emergence of Mexican exporters and exacerbating a situation where substituting Mexican consumer goods for foreign purchases made the economy less dynamic.

Many small and medium sized companies were forced out of business. Also a wave of mergers and acquisitions took place among Mexican companies, making in some cases, large corporatives mostly oriented to the external market (although it is also true for Mexico that an increasing number of small and medium enterprises from abroad are establishing). Thus a reduced dynamic export sector coexist with a large segment of a stagnant economy.

While average for all economies range between 75% and 90%, Mexican figures range between 50% and 60%. Among foreign parents, 75% of these reside in the Americas (mainly US) and 25% in Europe. There are none in Asia, Australia or S. Africa. Above result is very similar to Chile's, but very different from other participants, in which Asia is a very important residence of foreign parents. Mexican results are very consistent with the origin of Foreign Direct Investment: 66% from the US and 25% from Europe.

The survey indicates that by Industry, Manufacturing shows the largest extent of expatriation, while it is almost nonexistent in Banking & Finance. By Occupation, the largest extent is shown by managers, followed by production, while it is nil in Sales and nonexistent in Service. It is important to highlight, however that the extent of expatriation in Mexico is below average for all participants, in all industries and in all occupations, except in Manufacturing / Production. Certain kinds of specialized labour are very scarce in Mexico, so the above results are self explanatory due to highly technical work.

To raise the quality of labour, the government has increased its efforts to improve the domestic educational system. Financial resources allocated to education account for 6% of GDP and the purpose of the Secretariat of Public Education is to reach a 9 year basic education level to close the gap between the quality of domestic labour and the requirements in developed countries.

At the same time, companies are expected to participate in developing their labour. To this end, labour legislation included in 1978 a demand for businessmen to provide their employees with on the job training. The Secretariat of Labour and Social Welfare is in charge of promoting on the job training through different programs. At the same time, the Secretariat helps in joining the job supply and demand through the National Employment System (Banamex, 1998). To a great extent, applying these active policies to the labour market is geared to compensating for the absence of an employment insurance system.

In spite of efforts made by both the private sector and the Government, the population served by systems to train on the job is small. Accordingly, the results showed that the training level in Mexico is below average from all participants.

Developmental Trends of MNC's

By Industry, Manufacturing shows the largest percentage of output exported while Banking & Finance and Insurance export none. Such a thing, is reasonable mainly after the financial crisis in 1994. The banking system is focused in reinforcing its process and return in a healthy manner to intermediate the market and diversify its services.

Nine years after the crisis, Mexican commercial banks are starting to lend to the private sector. In 2000 it was 70% less in real terms, in comparison with 1994. Mainly US and European (especially Spanish) financial institutions have acquired significant stakes in the Mexican commercial banks and insurance companies, so recoverage is envisaged in the immediate future. It can be also said that the ability to raise capital has given Mexico's largest firms access to peso and foreign currencies, and has given multinational companies a significant competitive advantage with respect from the less favoured firms. That's why in spite of a strong peso, in the last few years, the export rate growth continued to maintain dynamic until 2000. Nowadays, the US economy slowdown has had an impact on it.

Mexico is among the ten most important exporting countries of the world, in absolute terms. Although compared with other APEC members ("mature and cubs" tigers), the percentage of exports with respect to GDP is low. Mexico presents one of the lowest percentages of output exported, only above those of Chile's and Malaysia's and well below those of the remaining Asian nations.

Developmental trend – expression of interest in expansion of business

For the participating countries, this indicator is shown to have an important positive correlation (around 60%) with both the size of the economy (Total GDP) and the level of imports, in both the Manufacturing and the Business Services Sectors. In the Banking & Finance and the Insurance Sectors, the main correlation is found with the per-capita GDP and is around –30%.

Since among participating countries, Mexico is the largest economy and among the three largest regarding exports and imports (after Singapore and Taiwan), but rather small in per-capita terms, because of above correlations Mexico tops the list in each industry and is well above average.

"Cautiously optimist" is probably the term that best describes the outlook among business people in Mexico for the years to come (AMCHAM, 2000: 21). This is the result of the changes that Mexico has experienced lately: politically and economically, that have resulted in positive expectations for the future, in spite of the problems it is experiencing in this moment.

3. The extent of skill shortages in MNCs

In Mexico, employing contractors is an extended business practice, firms more and more are trying to focus on their core businesses. The research of MNC's in Mexico reveals that the percentage of companies employing contractors is third largest in all industries, after Chile and Malaysia and well above average. All companies in Manufacturing and Insurance employ some form of contracting. Figure is above 90% in Services and above 66% in Banking & Finance.

The type of work most often contracted is related to Maintenance, as in almost all companies surveyed in all member economies, and specialized work reported as Others. Actually, Mexican figures are highest among all countries for those categories. In Security, Clerical and IT/Communication, Mexican figures are average, while they are well below average in Marketing and Production.

Regarding IT skills, the time required to recruit IT staff is similar to average for all countries and rather homogeneous among different occupations. Manufacturing and Services seem to take a little longer for the recruitment process than Banking and Insurance, with exception of network consultants (over 16 weeks to recruit).
Above results may be indicative of a certain level of shortage of IT skills. However, high reliance on Maintenance contracted work is probably related more to convenience than to an existing shortage of skills.

Summarizing, it has been recognized in Mexico that companies do not find professionals as at a pitfall when starting or expanding their activities. Although a relatively high percentage of companies (53%) in the survey experienced difficulty in the recruitment of professional staff, rather, it is more the case that describe Iradale and Mitchell (1995: 1), that there is a mismatch between skills required by industry and those currently available within labour force. This can explain why in Mexico the shortage of managerial skills are more prominent than other more developed APEC economies.

The perception of a negative impact of skills shortages in Mexico, by Industry, correlates negatively very highly, almost –100%, with the rest of the surveyed economies. Consequently, it is lower than average in both Manufacturing and Business Services and above it in Banking & Finance and Insurance.
In general, there is neither indication of a severe skill shortage nor a negative impact on growth.

4. Current and future training needs for skill and management development in APEC

Definitely, skill deficiencies is a factor that has exerted a negative influence for business expansion. This is especially true in the Northern States of Mexico, that are very tied to the US economy and in general to the external sector ("in-bond" activities take place mainly in this region).

Areas of training improvement

The survey shows that the skill with the largest need of improvement is management, with more than 70% of companies indicating it. Other important skills in this regard are: planning & problem solving (65%); communication (61%) and technical (46%) (Table 1).

By occupation, the main area is the training needs of New Professional and Technical Staff, with more than 90% of firms indicating medium to high needs. The requirements are similar for the 4 different industries. The needs for New Managerial Staff are almost as high though a little lower.

The more relevant aspects of training improvement are both the amount available and the cost of training, with 35% of companies indicating this.
In summary, management-related skills are the most important, along with the training needs of new staff in all its areas.

Evaluation of effectiveness of training programs provided by business and government

The participation in Government training programs is very small (17%), lowest among all countries. The perception of the effectiveness of these programs by participating companies is that they are moderately successful, regardless of the industry.

The main reasons for the small participation in these programs, are that they are mostly unknown to the companies and, when known, they are considered as vague and ill-suited for specific and well-defined purposes and rather general. On the other hand, the participation in group training is high: 50% or more for the sample and above average in all industries but Insurance.

5. HRM and International HR issues

Staffing plan

In the past, the staff expansion in Mexico was larger than the average for all countries.

This expansion was rather homogeneous among the occupations analyzed in the survey and particularly strong within the Manufacturing and Services industries.

This is in line with the rather strong growth experienced in the Mexican Economy during the last year, when a large percentage of the companies expanded and required larger staffs, as a result.

For the future, there is the expectation that all occupation staffs will grow, except Managers. The expected growth in Mexico will exceed that of the average country.

Recruitment methods

Private agencies and Transfers were the most significant channels of managerial recruitment by MNC's in Mexico. The former was especially important in Business Services and Insurance, while the latter was top in Manufacturing and Banking & Finance.

Media, the most important means of recruitment for managerial staff in all economies and industries in the survey, was seldom used in the Mexican case, not being used at all neither in Banking & Finance nor in Insurance (Table 2).

For the recruitment of Professional staff, the most frequently used method was the use of schools in all sectors, particularly in the Insurance industry, where all firms used it in the past. Internet, "word of mouth" and transfers were second in importance, very similar among themselves.

Again, the situation was very different from the average for all economies, where the main method was Media, followed by Internet (Table 3).

For recruiting other types of staff, Schools and Internet were the most important methods of recruitment. "Word of mouth" was specially important for the Insurance sectors. Again Media, the most important method of recruitment for the average of all economies and industries, was seldom used in the Mexican case.

Difficulty in recruitment of certain categories of staff

In Mexico, most industries found difficulties in recruiting professionals, except the Banking & Finance Sector that reported the recruitment of sales staff as the one having the biggest difficulties. The situation in Mexico was similar to the average of all the economies in the survey (Table 4).

Most of the MNC's surveyed in Mexico considered Professionals to be the occupation where they will have the greatest difficulty in recruitment in the future. On the contrary, clerical was the occupation thought by MNC's that will have the least difficulties.Again, this situation was similar to the average of all economies and industries in the survey (Table 5).

Regarding the time needed for staff recruitment, IT Maintenance, IT Technician and System Analyst were the occupations showing the smallest required amount of time. On the opposite side, the recruitment of Net Consultants took the longest in the Insurance Industry (Table 6).

Dynamics of outsourcing

The most important reason for outsourcing for all the MNC's surveyed is related to having more flexibility, except for the business services, where outsourcing is used as cost saver. These results are in line with the other APEC economies. Lack of skills was classified as the least important reason to hire external services (Table 7).

Staff turnover – managerial compared with other categories of staff

67.35% of the enterprises reported a staff turnover rate less than 5%. The highest rate is found in Professionals, while the lowest is in Managers.

Mexican turnover rates are lower than average for all economies / industries found in the survey (Table 8).

Total and average training expenditure to measure the extend of training taken place in Firms

The survey data showed that the Insurance sector has the highest expenditure in training. Manufacturing industry expends, on average, more in managers; Banking & Finance in clerical staff; business services and insurance companies in professional and technical staff, due to their stronger requirements in specialized personnel (Table 9).

Training methods or programs

Most of the surveyed MNC's used off-job training methods. This is in line with the emergence of a variety of alliances between enterprises training centers and universities. Corporate Universities appeared as the most preferred mode for outsourcing in training. The main objective of Corporate University establishment is to teach and learn from internal experiences in the business work.

Training through governmental bodies and employers group

Among the countries that took part of the survey, Mexican companies reported the lowest percent of use of Government Training Programs. This issue has already been discussed in the paper. Only 20% of firms in Manufacturing and in Banking & Finance said that had used those programs; 9% in Services and none in Insurance. These results are much lower than the averages for all economies, where the percentage ranges from 27.5% in Insurance to 47% in Manufacturing.

6. Gender issues

Occupational segregation

In the last ten years, an increasing number of women are incorporating in the labour market (40% approximately of the Economic Active Population are female). More older female (30 years and up) are participating in activities especially linked to the "in-bond" plants.

Two main characteristics in the Mexican labour market, is that female participation is more frequent in partial time jobs, due to their family duties. Also they earn, in average, ¾ of men's wages and the open unemployment rate among women is higher than the ones for men, 2.5% vs. 2.2%, respectively (STPS, 1999). The lack of sufficient family income in Mexico will continue demanding a great involvement of female labour and early incorporation into productive activities, which of course have severe impacts on school average of the labour force.

The participation of women in employment is among the lowest for all countries in every occupation analyzed in the survey, but Professionals. By industry, female employment tend to be lower in Manufacturing than in the other 3 industries, specially in managerial and production positions (Table 10).

Above results are in line with the historical low participation of women in employment due to, among other things, cultural and social influences. This has been particularly true at the directive and managerial levels and in technical and scientific activities.

It is true, that economically active population in Mexico, will not continue growing by increasing male share (economic active population/population older than 12 years), but by expanding the female one. In fact, among the OECD countries, Mexico shows the smallest shares, only comparables with Turkey and other countries of the south of Europe (OECD, 1997: 87). In Mexico female share is 38% compared to 70% in USA and 65.3% in Canada.

7. Recommendations

From the analysis of the survey, it can be said that in order to achieve greater productivity and quality that leads to greater specialization and a better organizational climate in such a competitive world, enterprises have to invest in human capital. In Mexico more and more companies are looking to be certified as meeting available standards that a knowledge-based economy requires. MNC's, as well as other firms, need to develop a clear Human Resource policy.

Regarding the participation of the Mexican Government in training programs for addressing skill shortages, it can be said that in has been very limited, much lower than in the other economies surveyed in the study. Lack of knowledge about these programs, as well as the generalized perception that they are rather vague and do not address the most pressing needs in the firms, are often cited as the main reason for such a result.

Since there is an important potential for those governmental programs for improving labor skills, the Government should make an important effort to have firms know about those programs and, at the same time, discuss widely with those same firms and related institutions in order to figure exactly what are the needs that should be addressed and prepare very precise training programs that will help overcome the detected skills shortages. The role of the Government should be a very active one in this regard.

This survey has been able to identify some of the most important training needs for the MNC's in Mexico. Among them, the following can be mentioned: I) Management; II) Planning and problem solving; III) Communications.

In order to address and improve those skill shortages, effective education and training measures must be used, in order to make an optimal use of the scarce resources devoted to this end.

The results of this survey, indicates that Group training can be an effective method for training personnel and help overcome skill shortages.

Another method that has proved its effectiveness in Mexico for training purposes, is the use of Cases, to address specific problematic situations. This method is well received since it is perceived as a specific one, able to cope with "real" situations, as opposed to only "theoretical" aspects, that is often one of the reasons cited for a program to be unsuccessful.

Finally, it must be noted that off-job training methods have proved to be the most effective for the Mexican case. In such a case, training devices as "Corporate Universities" seem to be adequate means for addressing the needs of training in Mexican enterprises.

Human Development Investment in Mexico: Selected Indicators and Some Reflections

Rogelio Huerta Rosas
Ricardo Pérez Mora
Gabriel Arturo Sánchez de Aparicio y Benítez
Universidad de Guadalajara, Mexico

Abstract

This paper, considering the human development situation in Mexico, highlights education expenditures as a real investment. At least the public speech recognizes and talks about the human factor in development and its importance as a conditional requirement for any country that wants to attain a sustainable development. You can find that in our country we are far from being consistent with what is said and what is actually done.

We begin by briefly exposing some of the main theoretical approaches that focuses on the educational budget as an investment instead of an expense. Who are the involved actors and what are theirs roles. In the second part we deal with the meaning of this educational investment and discussing other issues. It brings selected international and national data to make both international and national comparisons about what Mexico has done and what it is currently being done in the area of educational investment. We may be proud for the quantitative success achieved in Mexico during the second part of the Twentieth Century, however in quality aspects there is still much lacking. Next we present a selected short summary of data collected on 20 of the top 100 public and private enterprises in Mexico. This data is used to analyze what organizations are currently doing for its member human development. Expenditures in education must be considered an investment— in all the ways— for the national agenda if we truly believe that the human factor is directly linked to the present and future sustainable development and progress of Mexico. It is our wish that these basic thoughts will become a platform for a deeper dialogue concerning what we are currently doing, and what we hope and need to achieve for the common welfare for the citizens of our future.

Introduction

At least in the speech, there is no doubt in the fact that everybody accepts that the human factor is essential for sustainable development of countries. But, is such truth taken into consideration in public and private investments? Even when development and progress of a nation depend on multiple factors, they are closely linked with people's quality, their knowledge, their skills, abilities and life styles. In public policies of several countries around the world the human factor has been a priorit, to promote education and development of people.

Even though education is considered as "a central element for growth and economic and social development and even for the expansion of the more accepted and compatible equity levels with democratic cohabitation" (Aguilar Broughton, 1999), it is facing an essential problem. The economic problem, the struggle for necessary resources which are not enough to face the needs and that will always be competing against other social priorities as well as with private interests. It is then the moment to ask how important (or income-producing) is to assign resources for this matter. We are interested in some reflections about the concept "education as an investment"; and, in reviewing with some recent data, if in Mexico (mainly referring to state and private enterprises) there has been a real policy, in assigning resources for such matter.We center this paper in the concept of education as an investment. We will analyse some theoretical contributions and other data to make the resources assigning visible.

1. Theoretical Contributions. Some Considerations

Scholars contributions have been important - mainly in the education economy field – to generate a vision of education as an investment more than as an expense. If, in economic terms [1], we understand inversion as "using the capital with the hope to obtain a benefit, that will be measured in money and that will allow us to keep the invested capital, to produce an income for the investor and do social labour" (Hermoso, 1997:80), we can then classify in two the possible analysis axes of an investment: the first one is interested in knowing what is expected with such investment, where must the benefits be and with which possibilities. The second axe asks who are the actors that participate in resources planning, programming, administration and expenditures.

Three focusing about the investment purposes.

a) A first focusing is in the micro level – individuals – it has the purpose to find correlations in education, work, job and salary and its final purpose is to find the possible correlations between scholar preparation and possibilities of job and social movement. (Cfr. Fermoso 1997:165) b) The second focusing is the productivist, interested in measuring the possibility to generate resources regarding the given costs. The concern about this focusing is to come trough education to the economical growth and, in this matter, we find coincidences in studies where education has a strategic roll for the economical growth of countries (Psacharopoulos, 1996) [2]. As there are opinions in favor of such argument (Cfr Fermoso 1997:125-140) there are also issues that recognize the good points, but point out that there have been politicians, planning people, and employers who have exaggerated in the education roll. "Certainly education is only a factor, even though a very important one, in a set of conditions that determine productivity and economic competitiveness : also other ones like delinquency levels, social benefits, political participation, health and so on. Education has a wide impact on each of these areas, if there are the necessary support conditions and factors". (Levin and Kelley 1996:202) Anyway there is a coincidence in the fact that it is a very important factor. In this we find the analysis of residual factor and cost—benefit like analytic techniques searching "quantified causal relations with which behaviors that rule economic phenomena can be predicted" (Moreno, 1998:68.) In this perspective we can set the ongoing lift made by the permanent education, taken it to speed up economical growth. The permanent education acquires a dimension of a strategic investment that carries movement of various kinds of agents: educational system, private trainees, employers and salary representatives (UNESCO 1996:77). Nevertheless, it is not possible to ask educational systems to form manual labour for a steady industrial employment; it is necessary to form people for innovation, people that are able to accept changes, to adapt themselves to a world that is changing day by day and to dominate such change (UNESCO 1966:78) c) At last the third focusing refers to the possibility to achieve more than the economic growth, the development and progress of countries through education investment. We find this concern in Delors' Report from the UNESCO. The focusing comes from a premise that the simple economic growth objective is not enough to guarantee human development (UNESCO 1966:85). There exist two reasons why it is in certain manner put in doubt: not only due to its unequal character, but also due to the high costs regarding employment and environment. These are, no doubt, the deadlocks to where a production model inevitably conduces. The ones that with the years have made the United Nations specialized bureaux to consider development in a more extent way which goes beyond the economic order and includes ethic, cultural, and ecological dimension.

The PNUD (United Nations Program for Development) in its first report about human development (1990) proposed that the leading process to extend people's options is considered human development. It mentions three essential options for people, these are: being able to have a long and healthy life; being able to learn; and being able to have the necessary resources to enjoy a good level of life. If people does not have those essential options, they lack many other opportunities.[3] This program also points out that the economical development concept is much more extensive than the one in the established theories about economic development. It mentions the characteristics of such focusing to confront them with that of human development. The model of economical growth is among them and it refers to the PNB (Gross Domestic Product) increase instead of the human life conditions improvement. When we consider human resources development, we are talking that human beings are handled as an input in production process: a mean and not an aim . In Social Welfare focusing human beings are considered as beneficiaries and not as changing agents in the development process. The basic needs focusing are set in providing some fringed population groups with goods and material services, instead of doing it with all spheres. In the other hand in the human development concept is the production and distribution of products and the extension and improvement of human ability. Human Development includes the mentioned focusing, but surpasses them. In Human Development all social issues are analysed – namely as economical growth, commerce, employment, political freedom or cultural values – from the human being point of view. Therefore, Human Development is focused in extending human options in both industrialized and developing countries (PNUD report on Human Development 1995 cf. by UNESCO 1996) recent studies as the ones of the OCDE (2002), give a positive impact of education in development. The Human Development trend more than any other option appears the only possible option (Moreno: 91)

1.1 Protagonists

The second main axe has brought polemics about who is responsible - or who might be interested – in investing on education. The state?, or the private sector?, at all levels and, in all cases?. As a best way of development, there are scholars who emphasize that the state is obliged to provide education, not only in basic levels but up to professional via public universities and research. (cfr. Riveros Cornejo, 2000) On the other hand, authors like Nicholas Barr (1996), who considers that financing might not be trusted only to one mechanism. He suggests a series of alternative politics for financing such as loans, private financing, research contracts, and commercial activities for institutions as well as for students. In as far as educative investment of enterprises concerns, the Economy Nobel Award 1992, Gary S. Becker (1993) points out that the roll of enterprises and the training in job positions is generally misconceived. The author mentions that unfortunately there are few trusting statistics about total investment of knowledge and techniques acquired on a job. But evidences - as he affirms - suggest that such investments can be as important as learning acquisition investments in schools. (Becker, 1993:103.) Finally, also talking about human capital investment that the enterprise makes and in the dilemma of who must pay for education, we find authors such as Masanori Hashimoto (1996) who argues that investment and profit must be shared; so to say, the employee must help the employer with costs and fees to be able to share benefits too.

2. Mexico in the International Context

2.1 Investment in human capital development

As it has been said, today, more than a few years ago, there is a consensus that interdependence in education, growth and social-economic development go beyond the own field, especially in an emerging country as ours. The new thing in the golden triangle they conform, is that the educated human factor be there, be accepted and have naturalization card as the main active in a family, organization, institution, a country, or the whole world. There is no doubt that we all accept, at least in the speech, that the human factor is an essential requirement for sustainable development. That truth, is it considered in investments? Let us see something in the international panorama. According to basic statistics comparison (Source: OCDE, Economic Studies: Mexico, July 2000) the common Mexican Government expense in 1997 according to the next chart which includes the mentioned OCDE study, and includes, in our country's case Public Sector and Public Enterprises was, only an 8% of the GDP (PIB = Gross Domestic Product for initials in Spanish.) If we carefully go through the next chart (No.1) and order the GDP percentages, we were in the last place of member countries alphabetically ordered in a descendant vertical order starting on the left upper corner. The other countries' data also refers to 1997, except when other date is expressed in parenthesis.

Source: OCED Economic studies 1999-2000: Mexico, final appendix: basic statistics, international comparisons.

Fortunately there have been some changes and numbers have gone up; not only in Mexico but in the whole OCED. During the year 2000 in countries members of the OCED public expense reached an average of 45% in GDP. Sweden and Greece are up 50%; in Mexico, even it advanced, public expense was less than the half media, contributing only with 20%. (OCDE Economic Studies: México 2000).[4]

In this same report dedicated to Mexico, in the third part under the title Development of Human Capital as a Priority other interesting data about education investment are exposed.[5]

?? The average investment of GDP for education was 5%

?? Mexico invested 4.8% of GDP. It was on the 23th. place, between Ireland and Korea. There was a total of 32 countries.

?? The one that invested the most was Sweden with a 7% of GDP

?? The difference resulting in Mexico's scholar population, as one of the biggest in the OCDE - approximately 1/3 (30 million) of total population is registered in the SEN (Sistema Educativo Nacional, Domestic Education System) – and takes one of the lowest places in the GDP percentage provided for education.

?? Let us make reference to education equity that is officially one of the national education objectives. The authors of this report say, as anyone can confirm, that in Mexico the opportunity cost and the probability to comply with scholar cycle continues being "closely linked to parents income level."[6]

Delors Report to UNESCO (1996) confirms the human development basis, when he proposes to lead education to make scholars : 1) learn to know; 2) to do; 3) to live with others; 4) and to be, and he calls them "The Four Pillars of Education."[7] With that purpose, the first thing we must change in Mexico is the attitude and the way we see public budget as an "expense" and consider it as an authentic investment in human capital. Instead of looking at public budget as a lost of money and with no profit we must see it in a new way: discover the middle and long term profits hidden on it. With a new key prospect for poverty, which increased in the last decades we have regretted: education enrichment gives the best answer to poverty and the generalized low self esteem in Mexican people. Consequently our international competitiveness will never go beyond what we are, our principles, culture, education and the knowledge we can achieve through education that is within everybody's reach. An educated nation will have more participation and will be more critic. The developed talent is the only matter that will change people and will allow them to contribute to the change and the national progress. To be convinced of that means a radical change in concepts and attitudes on the authorities and social leaders : to firmly believe in Mexicans, in their permanent education, in their capacity to grow and develop trough a better general education system. That is the only way for Mexicans to have a promising future.[8]

2.2 National Education System. Cross section

According to data in the National Education Program 2001-2006, the investment, in 2001, reached 6.2% of GDP, with a tripartite participation, as represented in chart No. 2 (Source: National Education Program 2001-2006:66) : The Federal Government contributed with 4.2%, the State Governments and Municipalities 0.8%, (entirely a total of 5%,) and Private Sector 1

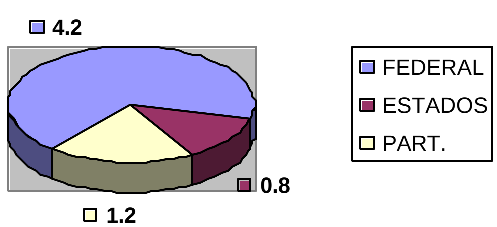

CHART 2. EDUCATION INVESTMENT IN PROPORTION TO GDP. YEAR 2001

In the national global group, pupils, teachers and educational institutions support is divided as represented in chart 3, in a small 12.5% on the Private sector and in a major part of 87.5% by Public support. (PNE 2001-2006:68).

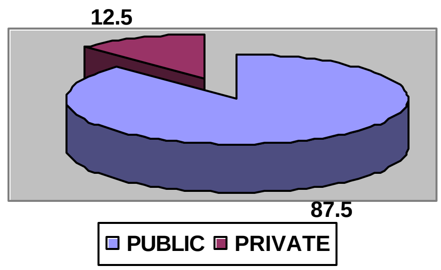

CHART 3. SUPPORT BY SECTORS

This data is not exactly reflected in the GDP percentages, because if examined by education levels it is not homogeneous. Furthermore, as shown in chart 4, there is a growth or decrease, depending on how it is seen, proportionally inverse in both ways of the scale. While Private sector only maintains 7.7% of basic education, the Public sector maintains 92.3%. Public education diminishes to 78.7% in middle education and Private sector participation is almost tripled to 21.3%. Private investment goes up and reaches a 30.3% in superior levels and the Public reduces to the remaining 69.7%.

	BASIC	MIDDL	HIGH	GRAD
Public	92.3	78.7	69.7	59.4
Private	7.7	21.3	30.3	40.6

CHART 4. INVESTMENT COMPARISON BY EDUCATIONAL LEVELS

In this last level grade studies is registered. In this matter Public sub system has 59.5% of enrollment, while Private sub system reaches 40.6%. In the same document it is mentioned that "pupils' federal expense also shows important differences among federal entities…reproduces national inequality instead of balancing it…"; or makes it clear that "a high portion of resources…very often more than 90%, goes for personal services. For this reason the remaining resources are not enough to cover operation expenses, and for the investments that a high quality education requires." (PNE 2001-2006:66)

2.3 Some Educational Offering Parameters 1950-2000

As a comparison background, let us say that in the late 20's last century, the scholar average of the country's As a comparison background, let us say that in the late 20's last century, the scholar average of the country'sinhabitants was just 1 year and illiteracy went by the 65% (PNE 2002-2006:57.)

For the year 1950, when the national census went up to 25.8 million inhabitants, the National Educational System had 3.25 million students, which means 12.59% of the total. In round numbers we can say that the scholarity rate was 1 of each 8 inhabitants (SEP Public Education Department, 1999). Twenty years later, in

1970, the country had 48.2 million, with a rate of inter census growth of 3.2 (Gómez López, 1997:21) from them 11.5 million were registered in Mexican schools of all types and levels, what makes 23.92%, or in round numbers comes out that a little more of 1 o each 4 inhabitants (PNE 2001-2006: 58)

According to the most recent census data, in 2000 we were 97.4 million inhabitants. The scholar enrolment went up to 29.7 million; needles to say that 30.46% or in round numbers 1 of each 3 inhabitants (PNE 2001-2006:58.), were n the National Education System : This can be seen in chart 5:

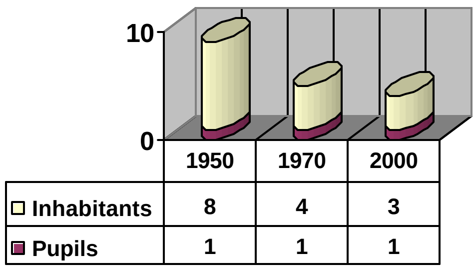

CHART 5. COMPARISON BETWEEN REGISTER AND POPULATION

Indeed, during the second half of the XX century, together with demographic growth, the country has made great efforts to highly extend educational offer. Certainly there are students, spaces, institutions, schools, programs, etc. of excellent quality; but plainly estimated it national education media —7.8— and the lost of students who started the first grade of Elementary School and followed to when they finished the Third Education level is a call in pro to improve the investment in qualitative issues. (Papua Nesrala:100.)

3. Bussiness Investment in Mexico, in as Far as Training and Development Concerns

We want to comment some points about the special number of magazine Mundo Ejecutivo (Executive World) where the100 enterprises that more invest in Mexico are studied (Mundo Ejecutivo, 2003.) In order to face global reality, enterprises see investment as a main and essential allied for their present and future. Those who invest in Mexico – national or foreign capitals – believe it is as a priority for good functioning to invest in the next matters: 1) Training and Development of Human resources 2) Technological Development and research 3) Technological and Informatics Systems, 4) Modernization and Equipment, 5) Installed Capacity Expansion, 6) Acquisitions, 7) International presence, and 8) Marketing.

The 100 enterprises that invested more in Mexico,[9] during 1997-2001 represented 29.5% and 70.5% Public and Private Enterprises, respectively. The investment surpassed the140 billion dollars – 80% by Mexican corporations. As can be foreseen, for the period 2002-2006 that proportion will considerably vary up to a major investment of Public Enterprises, that is estimated to represent 51.9%, while the Private Enterprises will represent 48.1%. Unfortunately, it is a matter of concern that during the same period 1997-2001 less than 1% of enterprises' total expense was assigned to Development and Education of Human resources, as this is the most important strategic activity. For investments planned for the period 2002-2006 (estimated in near of 150 billion dollars for the mentioned 100 enterprises that more invest in Mexico) the expense for Technological Development and Research Activities, Marketing, and Human Resources Education is not displayed.Regarding investment in Human Resources Development and Education, in Mexico, neither the Government nor the Private Sector have invested enough to create professionals and high quality workforce. According to the speech, most of the enterprises believe people are their principal active ; however, the expense assigned for their permanent education is disregarded and mostly used for training and development. This expense is not more than 1% of the annual investment budget, even for the 100 enterprises that more invest in Mexico –including PEMEX that was highlighted with 15% of the total invested by all of them; even though its expense for this matter was only a 0.6% of its total investment.

The one distinguished was Microsoft, as it designated 62% of investment to Human Resources Education. Another enterprises that also designate a good proportion of resources for this so important activity are: The Coca-Cola Company (Mexico), Grupo Comercial Mexicana, Grupo Bimbo, Grupo Modelo and Cemex, among others. This enterprises are an example to make clear that investing in Human Development is so important that they were allowed to generate jobs and, at the same time, to increase their incomes, their revenues and production flux by employee. As it is shown on chart 6:

TABLE 6. ENTERPRISES THAT MAKE MORE INVESTMENTS: THE FIRST 20

Enterprises that invest more in Development and Training of Human Resources				
	1997-2001			
ENTERPRISE	Total amount in MDD	% of the amount	Net income in 2001 MMD	Average increase 1997-2001
Petróleos Mexicanos	186.0	0.6	46,465.4	5.6

Source: Mundo Ejecutivo, March 2003

The need to establish conditions and strengthen mechanisms so educational and productive sectors can effectively communicate and cooperate with each other will be more urgent each day. In modern societies, establishing a system to create and accumulate work competition in schools and enterprises is a priority, as globalisation has strong competition and the only way to face the international challenge is raising the quantity and quality of Human Resources. (Llamas Huitron, et al: 2000:395-396) Wasting of talent and human development, has a very high cost. A country that is set aside from generation, reading, interpretation and making use of information and knowledge has not an outstanding range in the global planet nor in the concert of the third millennium nations. To really consider it as an investment and not just an expense or wastefulness, we must obtain healthy effects, changes, reorientations. That promotion and development of the human factor really be number one's priority. We hope that this going over is good to orientate and stimulate the ones who decide distribution of Public and Private Investment in order to consider it as follows: Investment in pursuit of better horizons for national welfare.

The Relevance of Reference Groups for Mexican Americans

María Eugenia Pérez
Tulane University, USA

Abstract

Reference groups are an important element in the diffusion process of innovations. Understanding the needs that reference groups satisfy for individuals and the reasons why certain groups become relevant can be useful for introducers of innovations. National-cultural differences as the ones reflected in Hofstede's Individualism Index, translate into behavioral differences between members of collectivistic and individualistic cultures. How relevant are reference groups for Mexican Americans? The conducted literature review revealed US Hispanics' reliance on family members and peers, as reference groups, to satisfy a need for information and guidance. But do Mexican Americans and Mexicans use reference groups similarly? An interesting possibility for future research would be to conduct a comparative study between Mexicans and second and third generations of Mexican Americans' consumer patterns, diffusion processes and usage of reference groups. The published literature on Hispanics, and Mexican Americans in particular, could be used as a departing point to design this cross-cultural study.

The Diffusion Process

Consumers nowadays are confronted with an almost continuous process of decision making concerning the adoption of innovations. New products, new services and new concepts push one another to obtain consumers' attention and acceptance. The degree to which an individual adopts an innovation has to do with the innovation's particular characteristics, the adopter's profile and the environmental influences upon the decision-maker. The market has a higher probability of accepting a new product that is perceived as having advantages over existing products, is compatible with the values and beliefs of potential consumers, has a relatively low complexity degree, is easy to try, and when its benefits are easy to observe and communicate. (Hisrich, 1991). However, the socioeconomic characteristics, personality variables and communication behavior of potential customers have an important role in the degree to which an innovation becomes a success. These factors affect the stages of the Innovation Decision Process: knowledge, persuasion, decision, implementation and confirmation. (Schiffman and Kanuk, 1997).

During these stages, as the potential consumer becomes aware of the existence of the product, searches for guidance and evaluates alternatives, different sources of information become relevant. Among these, personal sources of information, or reference groups, play a fundamental role in the diffusion process. Understanding how individuals use reference groups can make it easier for marketers to communicate relevant information to potential consumers; thus facilitating the introduction process of innovations.

The concept of reference groups

"A reference group is any person or group that serves as a point of comparison (or reference) for an individual in forming either general or specific values, attitudes, or behavior". (Schiffman p.323)
The relevance people give to particular reference groups varies to a certain degree with their life cycle. During childhood, the family constitutes the most important source of information and establishes the foundation for values and attitudes. "Intra-family communication can influence brand preferences and loyalties, information search and examination patterns, media reliance, price sensitivity, and adherence to price-quality beliefs" (Rao, Childers, and Dutta, 1991, cited by Childers and Rao, 1992, p.199). However, as a child begins to grow, friends, social class, subcultures and culture as a whole, become salient.

Differences also occur when cross-cultural behavior is analyzed. For example, Childers & Rao (1992), found in an intercultural study comparing the importance of reference groups behavior between communalistic and individualistic societies, that family (vs. peer group), exerts a wider, stronger influence on the buying decision processes for consumers in Thailand than for consumers in the US. Furthermore, not all reference groups are considered worth of imitation by individuals, some are used as a criterion of what tastes, conducts, and attitudes to avoid. People are exposed to many groups during their lifetimes, but those groups, whose standards influence them seriously, become reference groups. "Consumer groups…are composed of people a consumer chooses to provide guidelines for his or her behavior; often, they are people with whom the consumer shares other background characteristics, such as cultural values, demographic subcultures, or lifestyles. Consumers choose those reference groups that provide them with the information, the power and resources, and the image they can use to complete the consumer purchase activities."(Wells, 1996, p.220)

Schiffman and Lazar Kanuk (1997, p.326) affirm that the degree of influence that a reference group exerts on the behavior of a person, is related to the information and experience possessed, to the credibility, attractiveness, and power of the reference group and the conspicuousness of the product. Low experienced individuals, when confronted with a decision making process will consult referents with the knowledge and expertise to help them make decisions. However, reference groups not only provide guidance and support, in certain situations they act as powerful enforcers of inner-group conformity. The person who belongs, identifies, or wants to belong to a group, must display choices and behaviors approved by the group in order to avoid rejection, or even punishment.

Kelley (1947) makes a distinction between "comparative reference groups" (those including public figures, like athletes and entertainment stars, who might not be personally known by an individual, but which establish standards), and "normative reference groups" (those in which family members, teachers and peers contribute to define norms, attitudes and values). Although comparative reference groups offer an interesting and important avenue of research, this study will limit itself to the analysis of the interaction between normative reference groups and its members.

Can differences in beliefs, attitudes and behaviors be attributed to national-cultural origins?

A large amount of published studies confirms this. Among them, I would like to use Hofstede's "Culture's Consequences" as a basis for analysis. In his impressive ecological study with a sample of 116,000 questionnaires, from 40 countries, in a lapse of 7 years, Hofstede confirmed theories established by other scientists and developed his own model to explain national-cultural differences. The author developed four indexes to use as the axes of his research: the Power Distance Index (related to Mulder's Power Distance Reduction Theory, 1976, 1977), the Uncertainty Avoidance Index, the Individualism Index, and the Masculinity Index. He analyzed the answers of the applied questionnaires to classify 40 countries in accordance with either high or low levels of conformity with respect to each of the indexes. Hofstede concluded that there were significant differences when measuring country responses for each of the four indexes, and developed clusters of countries with similar outcomes by index, and by indexes' combinations. For the purpose of this analysis I will only include the comparison between the results obtained by the US and Mexico. These results confirm that there are relevant national-cultural differences in three of the indexes (power distance, uncertainty avoidance, and individualism) between the two countries. There is not a considerable difference, when observing the values of the two countries with respect to the Masculinity Index. A table showing the values obtained per index by the United States and Mexico, and the value of the media of the 39 analyzed countries is presented next in Fig.1.

	POWER DISTANCE INDEX	UNCERTAINTY AVOIDANCE INDEX	INDIVIDUALISM INDEX	MASCULINITY INDEX
USA	40	36	91	62
MEXICO	81	86	30	69
MEAN OF 39 COUNTRIES	51	64	51	51

FIG. 1

How do Mexican-origin immigrants adapt to a culture, like the one in the US, which has a set of values so different from their own? Can reference groups help them to cope with the demands of their new reality?

The cultural dimension individualism-collectivism will be used as the basis for this study. Although the other two dimensions that show significant differences between the American and Mexican cultures (power distance, uncertainty avoidance), are certainly relevant, the scope of this analysis and the availability of published studies guided me towards the individualism dimension. Reference groups exist inside and outside of formal organizations, their informality allows them to flourish in the realm of social, personal relationships. Hofstede's findings related to the Individualism Index could be used also to understand processes that take place away of a working situation. When he describes the values of societies with low scores on individualism, like the Mexican society, he uses among others, the following findings: "In society, people are born into extended families or clans which protect them in exchange for loyalty. "We" consciousness. Collectivity orientation. Identity is based in the social system. Emphasis on belonging to organization; membership ideal. Organizations and clans to which one belongs invade private life; opinions are predetermined. Belief in group decisions." (Hofstede, 1984, p.171).

All these beliefs naturally agree with the usage of groups as sources of information, guidance and support. In summary, they agree with the usage of reference groups. It could be questioned if the author's findings from a survey of 1968 and another from 1972 are still valid. I would like to cite the results of two recently published studies, which validate Hofstede's findings. First, Dugan, Peterson and Leung (1998, p.259), showed in a study conducted among inhabitants of 23 countries, that Hofstede's cultural dimensions of individualism-collectivism and power distance continue to be highly valid after more than 20 years of having been generated. "The sources of this and several other recent studies in predicting and finding relationships between measures derived from Hofstede's data, which was collected in the sixties and early seventies, and data collected more than 20 years later, provides strong evidence for the durability of country-level cultural differences". In a second study, Merritt (2000), questions how applicable Hofstede's dimensions of national culture are, when used to analyze differences among commercial airline pilots flying in the 1990s. The author conducted a study that rendered significant replication correlations for all four of Hofstede's indexes, and concluded that: "The study confirms that the effects of national culture can be seen over and above the professional pilot culture…." (p.297).

Among other studies analyzing the effects that differences in national-cultural origins produce in beliefs, attitudes and behaviors, I would like to cite several that focus on the differences between collectivism and individualism: "In communalistic societies (which typically comprise extended families), individuals tend to identify more closely with their family than with outsiders, whereas the opposite would prevail in individualistic societies (which typically comprise nuclear families)" (Childers & Rao, 1992, p.199). "When people are guided by a socioemotional relational orientation, their effort and attention are directed toward the interpersonal climate of the situation, and they strive to maintain social harmony….for Latinos, emphasis on socioemotional aspects is compatible with efficiency and success." (Sanchez-Burks, Nisbett, and Ybarra, 2000, p. 174, p. 187). " … in collectivistic cultures, individuals tend to belong to a few select in-groups determined by membership in groups such as families and friendship circles, and the relationship of individuals to their in-groups tends to be stable over time" (Triandis, Bontempo, Villareal, Asia, & Lucca, 1988,). All these studies confirm Hofstede's conclusions, and point towards the relevance of the study, not only of differences between collective oriented and individualistic oriented cultures, but of the implications of the typical behaviors in the context of either type of culture.

Mexican Americans' cultural characteristics

Hofstede's research analyzes cultural differences between countries. However, Mexican Americans are a subculture within the US culture. Could it be valid to infer that the cultural trait of collectivism, characteristic of the Mexican culture, is also an important element in this subculture? Several authors have affirmatively answered this question. "The Mexican American extended family has been described as including: primary kin extended kin, and close friends and neighbors (Griffith & Villavicencio, 1985, cited by Patterson and Marsiglia, 2000, p.25). Mexican American and other Latino cultures stress cooperation, collectiveness, and strong intergenerational family ties" (Comas-Dilaz & Minrath, 1987; Harrison, Wodarski & Thyer, 1992; Smart & Smart, 1991; Smart & Smart, 1995, cited by Patterson and Marsiglia, 2000, p.25). At the center of this collective oriented cultural trait is the concept of the family. However, this is a much wider concept than the nuclear family concept prevailing in more individualistic cultures. Not only are distant relatives, of all ages, included in the family net, but close friends are incorporated into the family through different mechanisms. Godfathers and godmothers, by their participation in the baptism of a baby become emotionally entangled with the family for the rest of their lives. Moreover, not only them, but their family is also interwoven with the other family in this new social and emotional fabric. Neighbors or coworkers who have helped the family end being seen as part of it. So, the binding net of the family is extended. "The family is seen as a problem-solving unit that extends beyond blood relations. This kinship network encompasses a deep sense of obligation by its members to each other for economic assistance, encouragement, and support" (Gomez, 1987, cited by Patterson and Marsiglia, 2000, p.25)." Mexican Americans and other Latinos have also been found to rely on relatives more often than European Americans for emotional support and to regard familial support for emotional problems as superior to all others types of support" (Keefe, Padilla, & Carlos, 1979, cited by Patterson and Marsiglia, 2000, p.25).

When referring to Mexican Americans cultural characteristics, one must realize that a generalization is being made in assuming that even people who might share the Spanish language, some traditional family values, the catholic religion, and Mexican ancestors, are alike. One might find people showing different degrees of affiliation with respect to their subculture. People can be proud or disdainful of their origins. Deshpande, Hoyer, and Donthu (1986) found relevant differences among Mexican Americans levels of ethnic identification. The authors emphasize the need to use a "subjectivist" perspective of ethnicity, that is, one in which individuals describe their attitudes and the degree to which they feel as part of a subculture, instead of being included in it by the observation of demographic data, like race and surname. Following this line of thought Flores Niemann, Romero, Arredondo and Rodríguez (1999) published their study "What does it mean to be Mexican? In which they report the results of a qualitative research conducted among Mexican Americans concluding that: "People's social constructions of what it means to be members of their ethnic groups speak to their experiences and social realities. Results of this study indicate that for low-acculturated first- and second-generation US Mexicans and Mexican Americans, this reality is shaped by complex forces that include culture, aspects of ethnicity, and discrimination as well as realities that do not fit neatly into a given typology or organizational structure"(p.59). More in-depth analysis could contribute to a better understanding of the affiliation process, and the identification of similar consumer traits shared by members of a particular subculture.

Use of Reference Groups by Hispanics and Mexican Americans in Particular

The terms "Hispanics" and "Mexican Americans" are sometimes used in the literature as synonyms, but this is not accurate. In a paper published in American Demographics in 1993, the authors mention in the abstract, that "Hispanic Americans are a united market in some ways, but not in others. Those who share the same language, culture, religion, and television programs can be approached as a single market, but economic, political, and other differences divide the market into several distinct segments". Mexican Americans are a subgroup of a larger group; US Hispanics, which also includes people originally from Puerto Rico, El Salvador, Argentina and any other Spanish speaking country. Although the subgroup of interest for this study is the Mexican American, this section will use both terms when citing relevant literature. "In the process of the construction of social identities, the social groups that individuals compare themselves with are of crucial importance. Identity formation rests on the process of social comparison…." (Sümer, 1998, p.120). Hispanics, the same as other ethnic subcultures, use reference groups, especially normative groups like family and peers, to help them define who they are. This can be especially salient for minorities embedded in a powerful main stream culture, as the one in the US. As formal education and media are used by the main culture as tools to reach social homogeneity, members of minorities who do not identify themselves fully with the images of the main culture, may seek the advice and guidance of those nearer and more similar to themselves. Reference groups can also be used for pragmatic, more immediate purposes. The Journal of Advertising Research published in 1992 an interesting anonymous study, in which the specific buying and information gathering behavior of Mexican Americans was researched. The authors cite a study (Loudon and Della

Bitta, 1979), in which Hispanics are presented as fashion-conscious and gregarious, and having a tendency to buy brands that their parents bought. They concluded that: “Spanish-language Hispanics were found to have a significantly higher propensity to ask for product information from their family members and coworkers” (p.58). These behaviors reflect the Hispanics’ reliance on family members and peers, as reference groups, to satisfy a need for information and guidance.

Do Mexican Americans and Mexicans use Reference Groups in the Same Way?

In order to be able to answer this question, an initial answer should be provided to the question: Are Mexicans and Mexican Americans alike? The answer depends on whether Mexican Americans belong to a first, second, or subsequent generations. As Valentine explains: “With each passing generation, evidence suggests that Mexican Americans in the United States tend to assimilate more fully into the dominant society….” (2000, p.107). Factors like the geographical vicinity with Mexico and the increasingly lower costs of communication technologies between the two countries allow first generation migrants to keep in touch with their families, friends, and traditions on a frequent basis. It is a common practice for first generation migrants to travel to Mexico to celebrate Christmas at their hometowns; it is also common practice to send periodical amounts of money to family members left behind. But as families establish in a permanent way in the United States, and their children attend school and become fluent in the English language, their contact with America’s main stream culture affects them, and their identification with the Spanish language, and the beliefs and traditions of Mexico diminishes. Furthermore, Wallendorf and Reilly found that: “Contrary to the predictions based on the traditional model of assimilation, the results suggest that Mexican-American consumption patterns are not a simple blending of Mexican and Anglo patterns. Mexican-American consumption patterns indicate the emergence of a unique cultural style” (1983, p.198). This new subculture expresses itself in different behavior patterns. For example, Mexican Americans develop a way of speaking in which they mix words and language construction patterns of English and Spanish, in a way that it becomes difficult for English speakers or Spanish speakers to fully understand them. They also evolve from traditional Mexican food, adding to old recipes the ingredients commonly found in American food markets, thus creating a different “cuisine”. Therefore, an interesting possibility for future research would be to conduct a comparative study between Mexicans and second and third generations of Mexican Americans’ consumer patterns, diffusion processes and usage of reference groups. The published literature on Hispanics, and Mexican Americans in particular, could be used as a departing point to design this cross-cultural study.

Conclusions

Human behavior is sometimes difficult to understand, and almost always difficult to predict. It is Complicated by man’s gregarious nature. As groups develop, complex interrelations inside the groups, between different groups, and groups and individuals, become salient. From a Marketing point of view, the understanding of consumer behavior is essential. What motivates potential consumers to adopt an innovation, reject a new concept or recommend a new service? If the only answer to these questions were personal experience, reality would be simpler. However, others’ behaviors and opinions affect potential consumers, especially when this information comes from people who are relevant for the potential consumer. Therefore, the understanding of how reference groups are used by decision takers becomes important. Complexity increases when the cross-cultural dimension is added to the problem, and when Marketers become interested in a particular segment of consumers a deep analysis to understand what factors act as motivators is necessary. Ortega y Gasset, the Spanish philosopher, said: “I am myself and my circumstances”. This maxim may be useful to remember when studying cross-cultural consumer behavior. This paper constitutes an initial effort to understand the interrelationship between reference groups and a specific subculture, the Mexican Americans. The possibility to transpose these findings to the Mexican culture opens an interesting avenue for future research.

Human Capital Management in Malaysia: Preparing for Future Challenges

Ahmad Fawzi Mohd Basri
Universiti Utara Malaysia, Malaysia

Abstract

The economic growth and rapid industrial development has made Malaysia as one of the most open economies in the world. The last 30 years had seen the growth of industry particularly in the manufacturing sector plays a central role in the Malaysia's industrialization process. During the Fifth Malaysia Plan (1986-1990), the Industrial Master Plan (IMP) was launched, and the manufacturing sector was reorganized from a domestic-oriented sector to one export oriented.

Malaysia is striving to achieve an industrialized and developed nation by year 2020. The last thirty years (1970-1990) had seen the growth of industry particularly the manufacturing sector which is playing a central role in the nation's industrialization process. During the Fifth Malaysia Plan (1986-1990), the Industrial Master Plan (IMP) was launched, and the manufacturing sector was reorganized from a domestic-oriented sector to one export oriented. Together, the service sector and information technology sector are currently contributing to the economic development of Malaysia. Continuous strategic efforts and programs on industrial development, human resource development, business, government, education, economic and social strategies had been addressed, formulated, design and redesign and implemented in all facets of Malaysia Master Plans. The New Millennium sees Malaysia transforms from agriculture – based economy (1960s) to manufacturing or P-economy (1970s -1900s) and later transforms into knowledge-based economy or K-economy (2000- 2020).

The New Economy

In the New Economy, we foresee changes in our all works of life. This is mainly due to changing economic, social, political, and technology environment facing by the nation. In economic environment, issues relating to opportunity and threats of globalization, liberalization, WTO, AFTA and k-economy are deliberated at numerous meetings and dialogues. At the societal level, changes in values, work attitude and life styles, skill and educational requirement, changing demographic patterns of the work force increase complexity. At the same time, the political stability, the legislations, business rules and regulations, human rights and environmental policies in each nation and region are carefully analyzed by the investors to ensure their economic objectives are achieved. In the area of technology, the rapid development of ICT architecture and infrastructure contributes to the economic and business growth and social development. Malaysia is the case in point. This paper seeks to inform human resource management and development imperatives in attaining the national competitiveness in the New Economy.

For a newly emerging industrialized and fast growing economy like Malaysia, the human resource development policy is found to be an important agenda in the national master plan of the country. Issues relating to demand and supply of skilled labor, enhancement of workers' positive values, provision of relevant human resource training and education, creation of thinking and creative society and improvement of ICT literacy rates are important for economic growth and sustainable development in the competitive environment of the New Economy. Subsequently, the human resource development planning and strategies are formulated and action plan are outlined at various phases of development. The human resource imperatives related to supply and demand of productive, competitive and competent workforce for sustainable economic growth and development are addressed.

In any county, the industry culture differs among industries in terms of their specific environment such as the stakeholders, the degree of competition, the products and services produced, the types of markets (customers), the strategies, the types of technology used and ownership. Given such diversified and differentiated industry characteristics of each industry, each industry requires different and combined types of human resource management practices because of differences in job responsibilities, role, activities, expectations of results produced. In the case of manufacturing and service sector , it is perceived to be a "competitive business" environment that requires entrepreneurial philosophy and efficient production and management systems. Product and service quality, production and operation costs seem crucial to the financial performance of the firms. Thus, the strengths and weaknesses, threats and opportunities of the firms need to be analyzed and recognized giving the economic, political, technological and social development that have taken place. Thus, in a global business environment, the business competition requires " e-generation" managers, entrepreneurs and workers. Thus the human resource imperatives, i.e. supply of skilled and competent workforce, liberal organisation structure, productivity-based compensation systems, competency-based training and positive work culture and values are ways of achieving organizational and national competitive advantage in the New Economy.

In Malaysia, the two crucial issues with the quality of manpower are labor productivity and national competitiveness. The situation has prompted the government as well as the investors to turn to capital intensive projects and in turn creates a high demand for trained and skill workforce in science and technology, in particular. Hence human resource development is vital to the country's economic, industrial and technological development. The field of industrial relations is being called upon to give its best because the New Economy is predicted to be led by information and communication technology (ICT) and the role of human resource remains central.

Professional Labor Demand and Supply

Malaysia is a multiracial nation where the major groups comprised of Malays, Chinese and Indians. (See Table 1-3). The employment growth is presented in Table 4.

TABLE 1: POPULATION IN MALAYSIA YEAR 2000

Conclusion

In Malaysia, the composition of the work force has changed overtime because of factors such as equal opportunities and the growth of white-collar and service occupations. The significance of these changes is the impact they have on the work place, including the provision of equitable compensation. At the same time different people have different needs, and it is not easy to accommodate everyone. The challenge for management is working out what can be done to address the situation by meeting as far as practical, employee diverse needs. Contended that today employees are asking for more personal choices and additional benefits, a response to these changing needs has been the introduction of numerous innovative benefits.

All in all, the New - Economy and globalization have shown that the government, the private sector and the societal interests, concerns and reaction to the development of information technology and telecommunication. The development and the importance of production technology, information technology and telecommunication is reflected by the increased efficiency and productivity in the governmental systems, in the manufacturing, engineering and process industries and as well as in the financial and other service-related industries. In Malaysia, the rapid growth of industrialization and in information and telecommunication sector is not only changing the work-life of both the public and the private but also the life styles of Malaysian society.

Personalities Having Tolerance of Uncertainty

Tiina Hautala
University of Vaasa, Finland

Abstract

The purpose of this study is to find out which personalities have characteristics and attitudes which prefer entrepreneurship. Qualities which are measured are: Tolerance of Uncertainty, Willingness to Stand out from the Crowd, Wanting Harmony with Others, Believing in Destiny, and Having Control of one's Own Life. Personality is measured by Myers-Brigss Type Indicator. The sample consists of 283 business students. The results indicated, for example, that ENTP (extravert-intuitive-thinking-perceiving), ENTJ (extravert-intuitive-thinking-judging) and ENFJ (extravert-intuitive-feeling-judging) are high on risk-tolerance, whereas ISTJ's (introvert-sensing-thinking-judging) risk-tolerance is low. These risk-tolerant personalities would be potential as new entrepreneurs, so the education and the information of entrepreneurship should be directed especially to them. Personalities having low entrepreneurial qualities should be given more encouragement and different kinds of education of entrepreneurship in order to motivate them to see the possibilities of entrepreneurship.

Introduction

In Finland, as well as in many other welfare states, it is crucial to get new entrepreneurs on purpose to create new jobs. When trying to get new entrepreneurs, the educational system should take into account different personalities. Some personalities are by nature more inclined towards an entrepreneurial career, while others need more encouragement and maybe a different kind of educational support. Entrepreneurs' personality has been studied by some of the researchers and mostly the definitions such as novelty, risk, initiative and independence are included in the entrepreneurs' characteristics [5]. When considering successful entrepreneurs, they are typically considered personalities with aggressiveness, ambition, need for achievement and internal locus of control [see for example 11]. However, there are only a few studies which have been made of Myers-Briggs Type Indicator and entrepreneurs ([9], (10]). MBTI is one of the most used indicator when studying personality, and it has gained a strong position in organizational settings (teams, superior-subordinate relationships, organizational behavior etc.) ([2], [6], [7]) thus it is surprising that in research on entrepreneurs MBTI has not yet been very commonly used.

This study focuses on the personality of students and their entrepreneurial qualities concentrating on the Tolerance of Uncertainty, Willingness to Stand out from the Crowd, Wanting Harmony with Others, Believing in Destiny, and Having Control of One's Own Life. The purpose is to find out if there are connections with personality of students with these entrepreneurial characteristics. These entrepreneurial qualities are selected by reviewing earlier studies and partially applying Rotter's definition of the locus of control. Locus of control is one of the commonly used theories in entrepreneurship. With regard to the locus of control an individual can be seen as internal or external. An internal control expectation is usually associated with entrepreneurial characteristics [see e.g. short review 4].

Personality is examined here with Myers-Briggs Type Indicator (MBTI). MBTI includes 16 types, which are formed from 8 different bipolar preferences. These preferences are: Extraversion (E) - Introversion (I), Sensing (S) - iNtuition (N), Thinking (T) - Feeling (F) and Judging (J) – Perceiving (P). Extraverts focus primarily on people and objects whereas Introverts focus their energy on the inner world; concepts, ideas and internal experiences.

Sensing people concentrate on observable facts or happenings through one or more of the five senses whereas iNtuitives concentrate on meanings, relationships, and/or possibilities that have been worked out beyond the reach of the conscious mind. Persons who are more inclined to Thinking decide impersonally on the basis of logical consequences and Feeling persons decide on the basis of personal or social values. Judging people prefer decisiveness and closure, while Perceiving persons prefer flexibility and spontaneity. Each person is better user other bipolar preference than other; from these stronger preferences come up personality type that includes four-letter (preferences) [7]. Descriptions of each of the sixteen types are in Table 1.

Table 1: DESCRIPTIONS OF EACH PERSONALITY TYPES [8]

ESTJ	Realistic and practical, matter-of fact type. Likes to organize and manage.
ESTP	Quick in action. Enjoys everything that comes up. Likes action and mechanical things. Flexible and tolerant.
ISTP	Cool, looks at things from outside. Quiet and reserved. Logical, analyses things with humor.
ISTJ	Serious, quite and thorough. Good ability to concentrate; shows thoroughness.
ISFJ	Quiet, friendly, respectful. Good at taking all details into account. Loyal, considerate.
ISFP	Withdrawn, quiet and friendly, sensitive. Modest of ability. Does not like conflicts. Enjoys the moment, and tryies to avoid working with hurry.
ESFP	Enjoys company, approving, friendly. Enjoys everything and get others to enjoy everything as well. Likes action. Enthusiastic. Remembers more easily facts than theories.
ESFJ	Softhearted, talkative, popular, respectful. At his best in co-operation. Active member of committees.
INFJ	Persistence, individuality, and willingness to do everything necessary is the key to enable his success.
INFP	Full of enthusiastism and loyality, but does not speek before he knows one well. Likes to learn. Friendly, but not necessarily social.
ENFP	Warmly enthusiatic, lively, inventory. Has good imagination. Almost possible to do everything that is interesting to him.
ENFJ	Understanding, respectful. Takes others' feelings into account. Social, popular and sympathetic.
INTJ	Individual. Wants his own ideas and projects. Has an ability to organize work. Sceptical, critical, independent and sometimes stubborn.
INTP	Quite and reserved. Enjoys theoretical and scientific goals. Solves problems logically and analytically. Mainly interested in ideas, but not so much interested in social life.
ENTP	Quick, inventory, good at plenty of things. Straight and ready to act. Likes challenges, but dislikes routines.
ENTJ	Strong will, straight and decisive. Manager of activities. Sometimes more selfassured than earlier experience would demand.

Methods

Sample

The sample included 283 business students of the University of Vaasa. There were some more males (50,9%) than females. As regards personality type, most of the respondents were ESTJs (20,9%), ENTJs (13,1%), ISTJs (9,9%) or

ESFJs (9,9%). The rarest types in the sample were INTJs (1,4%), ISTPs (1,4%) and INFJs (1,8%). The distribution of personality types and preferences in the sample is illustrated in the Table 2.

Whole data

Instruments

In the questionnaire, the characteristics and attitudes towards entrepreneurship were measured by 14 items. These items concerned respondents' thoughts, for example, new ideas, changes, risks and willingness to stand out. From these items five factors (Varimax) were obtained: Tolerance of Uncertainty, Willingness to Stand Out from the Crowd, Wanting Harmony with Others, Believing in Destiny, and Having Control of one's Own Life. All of the factors had adequate reliability ranging from 0.49 (at Control of one's Own Life) to 0.67 (at Tolerance of Uncertainty).

Tolerance of Uncertainty contains items such as "I am afraid of taking risks", "In my experience the changes will mean only problems" and "I am often so unsure, that I can not act". In the Willingness to Stand out from the Crowd, the topics were for example "I do not want to stand out from others with my personal thoughts or ideas", " I do not tell my craziest ideas to others". In these matters, high ratings of the responses of the respondents mean low tolerance of uncertainty and low willingness to stand out from crowd.

The third factor Wanting Harmony with Others, is described with questions such as "If I want to succeed, I should not irritate other people", "If I want to get my plans to function, I make sure that they suit others' wishes as well. The Believing-in-Destiny factor contains for example convictions like: "My things go as they are going", "It is a question of destiny, how I will manage in life". The last factor; Having Control of one's Own Life, contains the beliefs such as "I can, mostly, decide myself what will happen to me in this life", and "I try to get my ideas to function, even if there would be resistance from other people".

Personality was measured using the Finnish research version form F of the Myers-Briggs Type Indicator (MBTI). The construct validity and reliability of this Finnish research F-version of MBTI has been proved during a validation process of several years [see e.g. 3]. According to Järlström [3] the internal consistency (Pearson's correlation coefficients) was .65 to .76 and (Cronbach's coefficient alpha) was .79 to .86.

Results

When looking at the personality and the different characteristics the following results occurred (see Table 3). The significant differences (at level 0.001) occurred in Tolerance of Uncertainty and Willingness to Stand out from the Crowd (post-hoc results in Table 4).

According to the Post-hoc tests the significant differences occurred in Tolerance of Uncertainty between ISTJ with ENFJ; ISTJ with ENTP and ISTJ with ENTJ. ISTJ was among those who had the weakest capability to handle the uncertainty. With ISTJ there was also other introvert types among the four weakest in this factor: INTJ, INFJ and ISFJ. Most capable to handle the uncertainty were these three extraverted types: ENTP, ENFJ and ENTJ, among them the ENFP also had high results in this field.

The Post-hoc test indicated that the significant differences in Willingness to Stand Out from the Crown, were between ESTJ and ENFP; ISTJ and ESTJ; ISTJ and ENFJ; ISTJ and ENFP; ISTJ and INTP; ISTJ and ENTP and finally ISTJ and ENTJ. The most Willing to Stand Out were types INTP, ENFP, ESTP, ENFJ and ENTP. Among the lowest in Willingness to stand out were INTJ, ISTJ, ISTP, ISFJ and ESTJ.

Even if there were no significant differences in the other three parts, some guiding information can be gained from these results. In the Wanting Harmony with Others, the lowest were ISFPs and ENFPs. The types who most wanted harmony were ESFJ, ISTJ, ISTP, ESTJ, ENFJ and INFJ. The types mostly Believing in Destiny were ISTP and ISFJ. The weakest belief in destiny had ENTP and ESFP. Having a sense of Controlling one's Own Life had mostly ENFJ, ISFP and ENTJ. Weakest sense of Controlling of one's Own Life was with ISFJ and ISTJ.

Table 3: OVERALL RESULTS (NOT SIGNIFICANT)

	High	Low
Tolerance of Uncertainty	ENTP, ENFJ, ENFP, ENTJ, ESTP	INTJ, INFJ, ISTJ, ISFJ
Willingness to Stand out from the Crowd	INTP, ENFP, ESTP, ENFJ, ENTP	INTJ, ISTJ, ISTP, ISFJ
Wanting Harmony with Others	ESFJ, ISTJ, ISTP, ESTJ	ISFP, ENFP, INTP, ESTP, ENTJ, INFP
Believing in Destiny	ISTP, ISFJ, INFP, INFJ	ENTP, ESFP, ISFP, ENFP
Having Control of one's Own Life	ENFJ, ISFP, ENTJ, ESFJ	ISFJ, ISTJ,INFJ, INFP

Table 4: RESULTS OF THE POST-HOC ANALYSES

Tolerance of Uncertainty (sig. 0.000)	
ISTJ < ENFJ	p. <0.05
ISTJ < ENTP	p. <0.05
ISTJ < ENTJ	p. <0.05
Willingness to Stand out from the Crowd (sig. 0.000)	
ESTJ< ENFP	p. <0.05
ISTJ < ESTP	p. <0.05
ISTJ < ENFJ	p. <0.05
ISTJ < ENFP	p. <0.01
ISTJ < INTP	p. <0.05
ISTJ < ENTP	p. <0.01
ISTJ < ENTJ	p. <0.01

Conclusions

These results indicated that certain personality types have by nature qualities, characteristics and attitudes that have been regarded as essential to entrepreneurs. Even if statistically significant results occurred in two areas of the questionnaire, some tendencies can be seen from other parts as well. ENTP, ENFJ, ENFP, ENTJ and ESTP are types that have high Tolerance of Uncertainty. Four of them were extraverted-intuitive (EN) types who are action-oriented innovators [7]. These types might be so used to action, that the steady moments get them to feel bored and some amounts of uncertainty will only make their lives more exciting. Willingness to Stand out from the Crowd was shown by types INTP, ENFP, ESTP, ENFP and ENTP. They are all perceiving (P) types, who are spontaneous, flexible and adventurous. Not necessarily wanting harmony, but being what they are, were types such as ISFP, ENFP, INTP, ESTP, ENTJ and INFP. Most of them were again perceiving types, except ENTJ. Types who were not believing in destiny were ENTP, ESFP, ISFP and ENFP types. Again they were all perceiving types.

ENFJ, ISFP, ENTJ and ESFP were types that thought that they have control of their own lives. In this part they were also judging types. Judging types want to control their schedule, like routines, and are not so flexible as perceiving types.

In the light of these results the most potential new entrepreneurs are types like ENFP, ENTP, ENFJ, ENTJ, ISFP and INTP. They are more extraverted, intuitive, thinking and perceiving types than their counterparts. Extraverted people like to be in action, intuitives are good at "hunches" and having new ideas, thinking types are logical and rational, and perceiving types are flexible, independent and capable of taking risks [8]. It may be mentioned, that perceiving types are overrepresented among prisoners too [1].

ENFPs and ENTPs are quite near to each other and so are ENFJs and ENTJs as well. The only difference is preference thinking/feeling. ENFJs and ENTJs are more managerially oriented because of their skill to organize. It has been said that ENTJs are born managers; this can be seen in their high amounts among the managers ([7], [8]). ENFPs, ENTPs and INTPs appreciate individuality and they have a high need of independence. These may be their main reasons to start own their company, whereas ENTJs and ENFJs are most probably attracted by entrepreneurship because of their high ambition. ISFPs like to do concrete things and like independence as well, thus they most probably start first small, for example handicraft companies.

The Impact of the Values of Top Managers upon their Subordinates' Values

Krista Tuulik
Ruth Alas
Estonian Business School, Estonia

Abstract

Psychologists, sociologists, economists, management scholars, as well as other researchers from other disciplines have been attempting to find answers to two fundamental questions: how to make workers appreciate the methods used to manage/lead them; and how to induce them to act in their owners, managers/leaders favour. One key factor, which has been talked about, is values and especially shared values. If the employees and their managers have common/shared values the working together would be at least emotionally easier.

Introduction and background of research problem

Intensive global competition, higher customer expectations and greater focus on quality have resulted in much greater requirements placed upon employees today than decades ago (Quinn and Spreitzer 1997). This pressure may seem especially high for employees from former soviet countries, because these demands are fundamentally different to those made under the Soviet regime. During this period the soviet state was responsible for guaranteeing work for everyone and so enterprises were internally overstaffed and passive and work places were over-secured (Liuhto 1999: 16). According to Edwards and Lawrence (2000), the emergent change to processes in transforming countries can only be truly understood by examining the constitutive practices of individuals and groups at the local micro levels of the economic system. Research in countries going through transformation has shown that the transfer of knowledge from market-economy practices often fails because of institutional and cultural tensions and conflict (Clark and Geppert 2002).

The research problem is, how values held by managers influence their subordinates' commitment, effectiveness and satisfaction. A conceptual framework for the study will be presented followed by the results of empirical study in Estonian companies.

The post-communist transformation provides settings, which are in the process of being demolished, that are very different in their characteristics and within which discontinuities are more fundamental and change is less constrained by institutional frameworks. In this paper transformation has been seen as a social process of fundamental political, economic and cultural change to structures and values at all levels of society. Therefore the author applies institutionalism in order to understand the behaviour of organisations.

Estonia, the smallest of Baltic states, had practiced democracy and market economy and enjoyed living standards comparable to the Scandinavian nations already before unlawful incorporation into Soviet Union in 1940 (Zamascikov 1978). Although wages, income, housing and productivity in Baltic republics were higher than in the rest of European republics of SU (Gregory 1987). Soviet occupation had brought significant decline in the standards of living (Misiunas 1983). Soviet regime was successful in eliminating private enterprise but what did not disappear was a dim sense of having lost something valuable. This sense was anchored in a Protestant work ethic that was much more deeply rooted than Lutheranism itself and was felt to be part of the besieged national culture (Taagepera, 1993).

Estonia was a forefront of reforms in SU. Radical reforms in Estonia started in 1987-88 when a group of theoreticians and practitioners debated the idea of economic autonomy for Estonia. In 1990 an important change occurred in the strategic aim of the reforms in Estonia: economic autonomy was replaced by independent statehood and the restoration of a market economy. The transition to a market economy was supported by the re-establishment of independence in august 1991.

The process of economic reform was radical and quick. The beginning of 90-ies was the serious decline in the Estonian economy, GDP declined about 14% in 1991, 18% in 1992 and 2% in 1993. In 1994 GDP finally started to grow (Rajasalu 1995).

Research results from Estonian organisations indicate that this specific environment during the Soviet era had an impact on peoples' value system. A survey of values conducted in the second half of the nineties indicated that Estonian business students underestimated social values when compared with Finnish students (Ennulo and Türnpuu 2001). These researchers found this typical for representatives of post-socialist countries in comparison with representatives from countries without a socialist experience (ibid. 342).

The research problem is, how values held by managers influence their subordinates' commitment, effectiveness and satisfaction. A conceptual framework for the study will be presented followed by the results of empirical study in Estonian companies.

Theoretical bases

In the introductory speech of 10th Chemintz East Forum which was titled The End of Transformation (2003) professor R. Lang proposed the model to describe, how society influences individual values during transition in Central and East Europe (Figure 1).

Transformation has been described as social transience – a process, in which a complex set of normative and operating principles, embodied in historical structures, systems and practices becomes replaced by another unknown set, providing its members with a very ambiguous and uncertain period (Clark and Soulsby 1999:18).

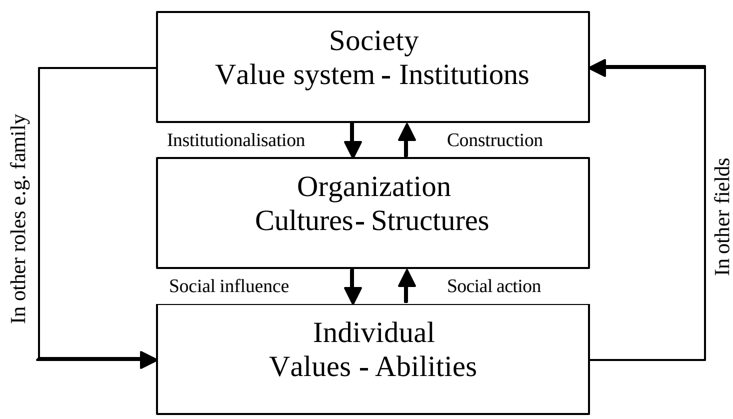

FIGURE 1 DIFFERENT LEVELS OF TRANSFORMATION OF VALUES. SOURCE: LANG 2003.

According to the institutional perspective, the functioning of organisations can be described using the open-system approach, in which the organisation may be seen as answering the challenges of a new environment. Institutions find expression in society through social constructions: formal institutions at the macro level in a market economy include private property and the free market; formal institutions at the micro level are organisations. Individual organisations are under the technical and normative influence of institutionalised environments.

Institutions could be seen from both the structural and social perspective. From the structural viewpoint institutions exist as institutionalised forms of 'external social constraints'. From the social perspective institutions can be understood as operating to enforce behavioural definition, which may take the form of either 'cultural accounts' or 'cultural rules'. This means that institutions are accounts of how the social world works and embody normative principles and social values (Meyer et al 1994:24).

Socio-economic transformation, at both macro and micro levels, could be understood as institutional change, from both the structural and social perspective, embracing both structures and social values. The elements of an institution may lose credibility and need redefining – the processes of *deinstitutionalisation* and *reinstitutionalisation* take place.

From this institutional view, social transformation may be interpreted as the period between the effective demise of one institutional system and the point at which another institutional system has been established and accepted on new cognitive and normative grounds. Such circumstances create acute social and psychological problems for the social actors and this period has been called *social transience* (Clark and Soulsby 1999:40).

According to social scientists, behaviour is a function of the meaning of a given situation. Participants in social events bring to them prior meanings and stereotypes, which can be understood only in a historical and cultural context (Sahlins 1985). Organisational climate and culture scholars have been concerned with how the sense-making process, the filtration, processing and attachment of meaning in organisations, occurs (Schneider 2000). Sense-making is an emergent process (Weick 2001) and is to some extent institutionalised.

The history of research into organisational culture is the history of how a field dominated by scholars steeped in psychology and sociology has learned from cultural anthropology (Ashkanasy et al 2000). Discourse about organisational culture has come to be about the way an organisational context shapes the meanings and actions of organisational members.

In cross-cultural management studies term ‘Culture’ is used as an explanatory variable to explain the differences between employee behaviours and attitudes as well as management practices. Generally, culture is used by social scientists to refer to a set of parameters that differentiate collectives from each other in meaningful ways. Collectives thus differentiated are regarded as distinct cultures (House et al, 1996).

Management is the process of getting things done through (other) people. In order to manage, one has to know “the things” that must be done and one has to know the people who have to do it. Understanding people means understanding their backgrounds – from which present and future behaviour can be predicted. A useful way to look at people in organisations is in terms of the socialisation they have received before joining the organisation and the socialisation they receive at work. Differences in socialisation explain why equally gifted persons will act quite differently in a given situation. In the socialisation process, four elements of culture are transferred (from superficial to deep) symbols, heroes, rituals and values (Pucik et al 1993: 140).

Values are “constructs representing generalised behaviours or states of affairs that are considered by the individual to be important (Yukl 2001: 133). In work-place settings values can affect decisions about whether to join an organisation, organisational commitment, relationships with co-workers, and decisions about leaving an organisation. It is important for leaders that it be possible for individuals in the same working unit to have considerably different values, especially since values cannot be seen directly, but only inferred on the basis of people’s behaviour (Yukl 2001: 134).

Values represent the deepest level of culture. They are broad feelings, often unconscious and not discussible, about what is good and what is evil, beautiful or ugly, rational or irrational, normal or abnormal, natural or paradoxical, decent or indecent. These feelings are present in most of the members of a culture, or at least in those persons who occupy pivotal positions (Pucik et al 1993: 141).

According to Milton Rokeach, a leading researcher into values, a value is “an enduring belief that a specific mode of conduct or end-state of existence is personally or socially preferable to an opposite or converse mode of conduct or end state of existence.” Rokeach (1973) defines an individual value system as an “enduring organisation of beliefs concerning preferable modes of conduct or end-states of existence along a continuum of relative importance. Rokeach divided values into instrumental and terminal values. Instrumental values are alternative behaviours or means by which we achieve desired ends (terminal values). Terminal values are end-states or goals the individual would like to achieve during his/her lifetime, basically, what life is all about.

Managers have to be aware of three types of value conflict in themselves and their co-workers – intrapersonal, interpersonal and individual-organisation value conflict (Pucik et al. 1993: 143).

While values represent global beliefs that influence behaviour across all situations, attitudes relate only to behaviour directed toward specific objects or situations. An attitude is defined as “ a learned predisposition to respond in a consistently favourable or unfavourable manner with respect to a given object. Attitudes tend to be consistent over time and across related situations. Values and attitudes are generally in harmony, but not always. Because our cultural backgrounds and experiences vary, our attitudes and behaviour also vary. Attitudes are translated into behaviour via behavioural intentions (Pucik 1993: 143).

According to Massey (1979), each person's values reflect contributions made by diverse inputs, including family, peers, the education system, the media, science and technology, geography and current events. Although one's values can change throughout one's life, they are relatively firmly established by young adulthood.

Ashkanasy (2000) writes that one issue of major concentration in the values literature has to do with distinction between values (in the general sense) and work values – a concept that implies the existence of particular sets of values that govern employee work behavior, in all of its forms. Most conceptions and definitions of work values are consistent of most general definitions of values in the broader sense, but they focus on work, work behavior and work related outcomes.

GLOBE research project specifies connections between societal culture and organizational culture.

Gobe research project

In Calgary in 1994 at the international meeting of Globe Country Co-Investigators, and based on the discussion and deliberation of 84 social scientists and management scholars representing 56 countries, a definition of leadership was formulated as follows: 'Leadership is the ability of an individual to influence, motivate, and enable others to contribute toward the effectiveness and success of the organisation of which they are members' (House et al. 1996).

The specific criteria used to differentiate collectivities (cultures) usually depend on the preferences of the investigators and the issues under investigation, and tend to reflect the discipline of the investigator. For the GLOBE research program culture was defined as the common experiences of individuals, which result in shared motives, values, beliefs, identities, and interpretations (meanings) of significant events (House et al. 1996).

For the purposes of the GLOBE research programme, culture is operationally defined as the use of measures reflecting two kinds of cultural manifestations:

a) The commonality (agreement) among the members of the collectivity with respect to the attributes (values, beliefs, etc) of culture.
b) The commonality of observed and reported practices by entities such as families, work organisations, economic and legal systems and political institutions.

The theoretical basis that guides the GLOBE research is an integrated construct of several theories. A diagram of this integrated theory is presented in Figure 2.

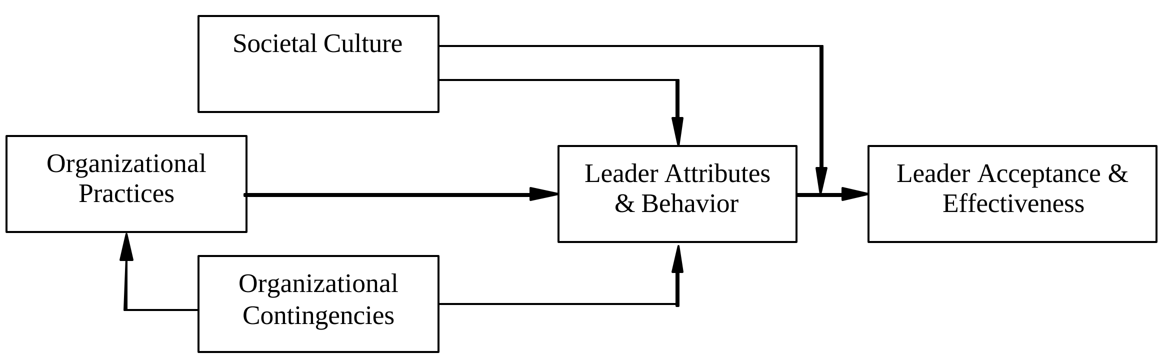

FIGURE 2:HEORETICAL MODEL OF RESEARCH. SOURCE: HOUSE ET AL. 1996: 6.

The integrated theory consists of the following assertions:

1) Cultural values and beliefs provide incentives, cues, guidance, constraints and reinforcements for selected behaviours and practices.
2) The implicit motives that are stressed in the culture result in the differential social learning of implicit motives by members of the culture.
3) Jointly, the dominant cultural values, beliefs, assumptions, and implicit motives endorsed by cultures give shared meaning to leader attributes and behaviour and organisational practices. They provide meaning in the sense that selected behaviours and organisational practices are understood in a particular way in each culture.
4) The shared meaning, values, beliefs and motives take on the status of norms, which are socially learned, communicated, and enforced by members of the culture. These norms are cultural level variables that guide individual behaviour and the evaluation of such behaviour.

According to Koopman (2002) the result must, where Central and Eastern Europe is concerned, be placed in the context of recent history. Their results provide some evidence that preferred leadership styles vary according to culture. Clusters of European countries that share similar cultural values were shown to also share similar leadership prototypes (Brodbeck et al. 1999).

The Empirical Study in Estonian Organizations

The authors formulated the following research questions:

1) Do managers/leaders have common, that is, shared values with their subordinates?
2) Are the values of subordinates related to the motivation of subordinates?
3) Are the values of managers/leaders values related with the motivation of subordinates?

During the second half of 2001 Estonia (and the author of this article) joined phase II of the Cross Cultural CEO Leadership Study carried out by Robert J. House and his colleagues of the Global Leadership and Organisational Behaviour Effectiveness Research Program (GLOBE). GLOBE is a long-term project directed toward the development of systematic knowledge concerning how societal and organisational cultures and subcultures affect leadership and organisational practices.

The design of the Cross Cultural CEO project required 20 CEOs from entrepreneurial firms and 20 CEOs from non-entrepreneurial firms or larger organisations. Heads of divisions in domestic companies were not considered CEOs and did not qualify to be included in the sample.

In 2001 more than 60 companies were visited. Complete research kits, including interviews, CEO questionnaires and all the required questionnaires for subordinates (2 from type c, d, e), were returned from 40 companies. This data was sent to the University of Pennsylvania for further investigation related to the subject of cultural differences and leadership. More than 240 questionnaires were completed by subordinates in addition to the 40 questionnaires completed by the CEOs.

The study involved interviewing the CEOs; the interviews were recorded on audiotape and transcribed onto written protocols. Questionnaires were also administered to at least those subordinates immediately below the chief executives.

30 % of the data gathered during the field research did not meet the requirements of the Cross Cultural CEO project. The main reason for this was that some of the questionnaires distributed to the subordinates did not come back.

Results

Connections that were discovered between the values held by managers and the values and motivation of their subordinates were in some cases interesting, in some cases predictable and in some cases confusing.

Firstly, a cluster analysis of the values was conducted and based on this the values could be divided into four major groups as follows:

a) values related to the welfare of society;
b) values related to the short-term welfare of the organisation;
c) values related to the long-term welfare of the organisation;
d) values related to religion and supernatural powers.

Results according to received clusters are shown in Table 1.

TABLE 1. CLUSTERS OF VALUES

Cluster	Value	Mean CEOs	Std. Deviation	Mean Subord.	Std. Deviation
Welfare of Society	Economic welfare of the nation	4,15	1,04	3,99	1,24
	Economic welfare of the local	4,33	1,11	4,14	1,17
	community	3,61	1,47	3,67	1,35
	Effect on female employees	3,12	1,30	3,20	1,40
	Effect on minority employees	**3,80**		**3,75**	
Long term welfare of the organisation	Employee relations (well-being, safety, working conditions)	5,18	0,10	5,28	1,04
	Effect on relationships with other organisations	5,07	0,82	5,07	0,97
	Effect on the environment	4,53	1,12	4,30	1,25
	Ethical considerations	5,09	1,16	5,05	1,28
	Employee professional growth and development	5,18	0,85	5,28	1,02
	Effect on long-term competitive ability of the organisation	5,6	0,86	5,43	1,07
		5,11		**5,07**	
Short term welfare of the organisation	Effect on product quality	5,59	1,09	5,77	1,04
	Effect on sales volumes	5,33	1,06	5,49	1,48
	Effect on firm profitability	5,73	0,89	5,56	1,13
	Cost control	5,31	1,01	5,31	0,94
	Customer satisfaction	5,96	1,23	6,09	0,96
		5,58		**5,64**	
Religion	Pleasing, respecting, not offending a divine being (god, idol)	2,44	1,62	2,30	1,43
	Effect on supernatural forces	1,54	0,91	1,58	1,06
		1,99		**1,94**	

Note: the scores are given on scale from 1 to 7

The most important values for the CEOs of Estonian companies were values related to short-term welfare (on the seven-point scale m=5,58) followed by long term welfare values (m=5,11) and those related to the welfare of society (m=3,8). Least important were values related to religion (m=1,9).

When we compared the mean values of the two groups – managers/leaders and their subordinates – it turned out that their rating of the importance of values in each group was practically the same. The fact that there is no difference is theoretically a good grounding for establishing leader acceptance and effective outcomes.

The result of the comparison of managers and subordinate values are shown in Table 2.

TABLE 2. VALUES SHARED BY SUBORDINATES AND THEIR MANAGERS/LEADERS

Values of Subordinates	Values of Managers	
Cost control	Effect on the long term competitive ability of the organisation	0,223
Values of Subordinates	Values of Managers	
	and business, for example suppliers, government agencies, strategic alliances	
Customer satisfaction	Employee professional growth and development	0,213
	Effect on the long term competitive ability of the organisation	0,167
	Effect on the environment	0,146
Employee relations issues such as employee well-being, safety, working conditions	Effect on the long term competitive ability of the organisation	0,195
	Employee professional growth and development	0,175
	Employee relations issues such as employee well-being, safety, working conditions	0,165
Contributions to the economic welfare of the nation	Contributions to the economic welfare of the nation	0,322
	Employee relations issues such as employee well-being, safety, working conditions	0,211
The welfare of the local community	Contributions to the economic welfare of the nation	0,232
	The welfare of the local community	0,210
	Employee relations issues such as employee well-being, safety, working conditions	0,183
Employee professional growth and development	Employee professional growth and development	0,250
Pleasing, respecting, not offending a divine being - a god or an idol for example	Pleasing, respecting, not offending a divine being – a god or an idol for example	0,197
Effect on the environment	Effect on the environment	0,189
	Contributions to the economic welfare of the nation	0,158
Ethical considerations	Employee professional growth and development	0,174
	Ethical considerations	0,167
Effect on firm’s profitability	Effect on firm’s profitability	0,207
	Effect on the long term competitive ability of the organisation	0,189
Effect on product quality	Ethical considerations	0,225
	Customer satisfaction	0,193
	Effect on the long term competitive ability of the organisation	0,184
	Employee professional growth and development	0,180
	Effect on firm’s profitability	0,153
Effect on sales volume	Effect on firm’s profitability	0,24

For answer to the first research question – Do managers have common or shared values with their subordinates? – the following correlations were found. The most significant connection was the shared values concerning *contributions to the economic welfare of the nation* (r = .322). This was followed by *employee professional growth and development* (r = .250) and then *the welfare of the local community* (r = .210).

In adittion to the previous question about shared values we investegated how the managers/leaders were perceived by their subordinates. And as a result we can say that, in Estonian context we can not talk about leadership yet. At the moment, Estonian CEOs are characterised as managers. The subordinates see them as directive information sources (see Table 3), but do not yet see them as leaders.

TABLE 3. HOW SUBORDINATES PERCEIVE THEIR MANAGERS

Perception	Mean	Perception	Mean
1. Directive	5,53	5. Shows self-confidence Administratively	5,24
2. Information Source	5,45	6. Effective	5,24
3. Communicator	5,35	7. Follower Confidence	5,24
4. Visionary	5,30		

Note: The scores given are on a scale from 1 to 7

While conducting research into the values held by subordinates and their levels of motivation (2) the following observations were noted. Satisfied customers and high sales volumes are the things that motivate personnel the most. One reason for this could be that their monthly salary or bonus is directly connected with sales (r= .251) and sales figures are definitely related to the existence or non-existence of satisfied customers (r= .250). It is also logical that when product quality (r= .231) is taken as a motivator there cannot be satisfied customers or high volume sales if the goods sold are of an unacceptable quality (See Table 4).

TABLE 4. CONNECTIONS BETWEEN VALUES HELD BY SUBORDINATES AND THEIR MOTIVATION LEVEL.

Values held by subordinates	r	Values held by subordinates	r
1. Customer satisfaction	0,251	7. The welfare of the local community	0,172
2. Effect on sales volume	0,250	8. Effect on the long term competitive ability	0,168
3. Effect on product quality	0,231	9. Employee professional growth and development	0,162
4. Effect on female employees	0,191	10. Cost control	0,151
5. Effect on relationships with other organisations	0,179	11. Effect on the firm's profitability	0,151
6. Contribution to the economic welfare of the nation	0,177	12. Ethical considerations	0,150

One interesting thing that was proven as the result of this research was that values held by managers are practically not connected to the motivation levels of their subordinates at all. There was only one value held by managers that was in positive correlation with the motivation of their subordinates and that was – *Effect on relationships with other organisations with which you do serious business* – for example suppliers, government agencies, strategic alliances (r = .161). However, even this connection was quite low.

When we analyse the values held by managers and the way they are perceived by their subordinates we find many connections. In Table 5 the most important connections can be seen and from them it seems that most of the correlations are related to the value attributed to cost control by managers. This could be related to the fact that at the moment, after ten years of experience with a free market economy, we have reached that turning point where the efficiency and final result of a company does not depend so much on sales but on cost control. If we go back to Clusters of Values (see Table 1) and look what was important for the CEOs of Estonian companies – values related with the short term welfare of the organization where belongs also cost control. Cost control is perceived by subordinates as autonomous autocrat who has to be at least diplomat to get things done or can be described by integrity. CEO is not perceived as humane or power sharing or charismatic person. As we discussed before Estonians are not jet seeing values behind short-term effects, what cost control definitely is, and may be we even do not need charismatic, future oriented leaders jet but diplomatic managers are enough and which is useful also in process of doing business with other organizations

When talking about being ethical, then a manager even if he/she is still not a leader has to be fair which is perceived also by the subordinates while economic welfare of the nation is related with the fact of being communicative and human person.

TABLE 5. THE VALUES HELD BY MANAGERS AND THEIR SUBORDINATE'S PERCEPTION OF THEM

	r>0		r<0
Cost Control			
Autonomous	0,258	Humane	0,298
Autocratic	0,216	Power Sharing	0,295

		Intellectually stimulating	0,202
		Team oriented	0,156
Effect on relationships with other organisations with which you do serious business			
Diplomatic	0,203	Indirect	0,346
Bureaucratic	0,248		

Conclusions

The most important values for the CEOs of Estonian companies during transition period from centrally planned economy to free market economy were values related to short-term welfare followed by long term welfare values and those related to the welfare of society. Least important were values related to religion.

This kind of rating of values is probably connected with the fact that during the period of transition the main aim of the management of companies is to ensure short term results – profit – achieved by sales and cost control. When talking about sales we need a satisfied customer and this is achieved via quality products.

After the short-term welfare of an enterprise, of course, comes the long-term welfare. To provide a continuous, long-term competitive advantage new variables such as employee relations, inter-organisational relations, environmental protection and ethical aspects gain importance.

When we draw some parallels with results of World Value Survey (Inglehart 1998) we can also see the fact that Estonians are interested in short tem results as for example salary and they do not have "dreams" about working hard. The issue of belief has also the same result in World Value Survey as in our research.

When we compared the mean values of the two groups – managers/leaders and their subordinates – it turned out that their rating of the importance of values in each group was practically the same. The fact that there is no difference is theoretically a good grounding for establishing leader acceptance and effective outcomes.

The current study indicates that managers' values do not have a direct impact on subordinates' motivation during transition from centrally planned economy to free market economy in Estonian society. But managers' values influence subordinate motivation through mediating variables. Managers' values are transferred to subordinates and those values held by subordinates correlate with subordinate motivation. Also, values held by managers have an impact on the perceptions subordinates have about their managers and these perceptions correlate with subordinate motivation. Also the subordinates' own value estimations influence their perception of their superiors, which in turn, influences subordinate motivation.

The main conclusion of this research is that values held by Estonian leaders do not affect subordinate motivation directly, but indirectly through the values held by their subordinates and how their subordinates perceive their leaders.

Victim and Non-Victim Responses to Anti-Bullying Practices

Joanne D. Leck
University of Ottawa, Canada
Bella L. Galperin
Rollins College, USA

Abstract

Despite many tragic events resulting from workplace bullying, there has been little empirical research on identifying means to eradicate it. Research has focused primarily on measuring the frequency of workplace bullying and on recommending individual and organizational anti-bullying practices. Whether or not these strategies work, however, is unknown. This paper examines the perceived effectiveness of organizational and individual responses to bullying from both the victim's and non-victim's perspective. Results suggest that victims (as opposed to non-victims) are more likely to perceive that the bullying climate in their organization is tolerant and that passive individual responses to bullying (e.g., doing nothing) are less harmful than more active responses (e.g., reporting it). Victims also appear to be less confident that practices such as zero-tolerance programs and anonymous hotlines (i.e., practices widely encouraged) are effective anti-bullying strategies. The results presented are drawn from a large survey sample as well as several in-depth interviews.

Introduction

Workplace bullying is generally defined as the intentional and repeated unpleasant behavior of an individual onto another, less powerful individual [25]. Bullying includes verbal and physical behaviors ranging from hurtful teasing, taunting, humiliation, and physical aggression. Some of the most common bullying behaviors include intimidating, excluding, setting impossible deadlines, belittling and angering subordinates [21]. Bullies engage in four types of bullying behavior [21]: 1) they bully by intimidating, criticizing and being rude; 2) they bully through the work and deadlines they have assigned; 3) they bully by engaging in childish behaviors such as teasing and mimicking; and, 4) they bully using physical means.

There are many other terms used to describe worker mistreatment, such as violence [5], aggression [24], abuse [20], tyranny [3], incivility [8], deviance [12, 32], antisocial behavior [13], harassment [10, 11] and dysfunctional behavior [16]. Bullying can be distinguished from other forms of mistreatment by considering three important criteria. First, there must be an imbalance in power between the bully and their victims (e.g., a boss has legitimate, reward and punishment power over his subordinates). Secondly, the unpleasant behaviors must occur repeatedly over time (a behavior that occurs only once is not considered bullying). Lastly, the behavior must be intended to do harm (e.g., repeatedly yelling at your employee in front of his/her peers is intended to embarrass).

Although the last couple of decades of research on bullying has been limited to school-age children and schoolyard bullying [2,6,7,15,17,25,27,31,35], interest and research on workplace bullying is growing rapidly. This is partly due the organizational and social costs associated with bullying as well as the extensive media attention of tragic events (e.g., such as the shooting rampage of Pierre Lebrun at OC Transpo [22].) Because research on workplace bullying is still in its infancy, empirical research on workplace bullying has focused primarily on measuring the frequency of workplace bullying and on identifying the possible causes of workplace bullying. There is much variance in reported frequencies. For instance, research conducted in Danish workplaces reported that approximately 2% of all employees are bullied at work [19]. Another study reported that 8.8% of European business professionals are bullied "once in a while'' and 1.6% are bullied on a weekly basis [33]. Yet another study conducted in the UK reported that as large as 53% of employees felt that they had been bullied at work at some time in their life [29]. A recent Canadian study reported that about 16% of all subjects reported being bullied at least on a monthly basis and about 6% reported being bullied at least on a weekly basis [21]. However, when provided with a list of what is generally considered to be bullying behaviors, about 58% indicated that they had endured at least one of these behaviors on a monthly basis and 25% indicated that they were victims of at least three of these behaviors per month.

Because bullying is intended to do harm, it is not surprising that victims are more likely to be stressed and suffer from stress-related symptoms, such as decreased productivity, decreased satisfaction and increased absenteeism [5]. Bullying has a direct effect on the organization's bottom line and as a consequence there is abundant advice on how to tackle workplace bullying in the literature [9,11,18,19,30]. For instance, bullying can be prevented by conducting reference checks prior to hiring, establishing codes of conduct, providing assertiveness/sensitivity training and adopting zero-tolerance policies. Bully bosses can be identified by introducing anonymous hotlines, investigating areas with high turnover and absenteeism, and conducting exit interviews. Bullying can be stopped by disciplining bullies and giving HR greater power to act on bullies. Victims are advised to document the transgressions, practice assertiveness and seek outside help. Many organizations have incorporated this advice by adopting zero-tolerance policies, providing employees with diverse means to report transgressions and giving the Human Resources department more power to investigate and discipline workplace bullies.

Despite the abundant advice given to organizations, little is known about how effective these organizational and individual practices are in managing, reducing and eliminating bullying, however. Further, it is unknown if victims and non-victims perceive the effectiveness of these practices similarly. The purpose of this research is therefore to examine how both victims and non-victims perceive the bullying climate of their organization and the effectiveness of individual and organizational anti-bullying practices.

Methodology

Sample

The final sample consisted of 474 subjects (36% male) ranging in age from 18 to 60 years (mean = 24.2 years, s.d. = 5 years). Twenty-one percent of all subjects were members of a visible minority group and 76% were single. Participants were asked by a research assistant to participate in a study about bullying at the beginning of evening undergraduate classes at the School of Management, University of Ottawa. Students were informed that participation was voluntary and that their responses were anonymous and confidential. The response rate was 71 percent. Only surveys completed by participants who were currently working at least 20 hours per week were retained for the study. The questionnaire took about 15 minutes to complete.

Respondents were also invited to provide their contact information if they wished to participate in a follow-up in-depth interview. Thirty-seven subjects (7.6%) indicated that they would like to be interviewed and provided their name and contact information. Of the thirty-seven, fifteen were interviewed (the others could not be reached or had changed their minds). Subjects were asked to talk about their latest bullying incident and to describe what had happened and how they had reacted. The interviewer did not interject except to ask prompting questions such as "what did you do next?" and clarifying questions such as "could you be more specific?" The interviews were tape-recorded and transcribed. Each interview lasted about twenty minutes.

Measures

The survey consisted of four sections. The first section measured the frequency with which subjects had been bullied at work by their bosses. Subjects were provided with a definition of workplace bullying and were asked to indicate how often they had been bullied. Bullying was defined as the "*intentional and repeated unpleasant behavior of an individual onto another less powerful individual*"**.** Subjects were asked to rate the frequency of bullying by checking one of five choices; daily, weekly, monthly, yearly or never. Following this general question, subjects were asked to indicate how frequently they were victims of thirty-four more specific bullying behaviors. These bullying behaviors were compiled from an extensive review of the literature that strictly dealt with bullying [1,4,10,11,15,29,30]. Sample items include '*my boss intimidates me,*' '*my boss physically harms me*' and '*my boss sets unrealistic or impossible deadlines for work.*' These too were rated either daily, weekly, monthly, yearly or never. Although there is some variance in the literature about how frequently bullying has to occur to be considered bullying, most authors agree that bullying on a monthly basis is the minimum. We chose to use this standard as well. Therefore, if a subject indicated that he/she was bullied (according to the definition) at least once a month, he/she was considered to be a bully victim, resulting in a victim sample of 76 (16% of the sample). The remaining 398 were classified as non-victims (note that skewed samples are typical in research on violence and that the skewed nature should be considered when interpreting results). The number of bullying acts a victim was subjected to on a monthly basis was used to measure the frequency of bullying. The second section of the survey assessed the bullying climate of the subject's organization. Subjects were asked to indicate the extent to which they agreed or disagreed with ten statements describing their organization's tolerance and reaction to bullying. Sample items include '*my organization condemns bullying,*' '*it is useless to file complaints*' and '*bullies are punished for their actions*'. Items were combined to form a Bullying Tolerance Climate scale and was highly reliable (Cronbach Alpha=.82). The third section of the questionnaire was designed to assess the perceived effectiveness of a variety of anti-bullying strategies. Subjects were asked to evaluate effectiveness using a five-point scale (1-make things a lot better, 2-make things somewhat better, 3-make no difference, 4-make things somewhat worse, 5-make things a lot worse). The first sixteen items focused on individual (i.e., victim) anti-bullying practices; the subsequent 19 items focused on organization level anti-bullying practices. Items were based on a list of anti-bullying recommendations cited in the literature [14,15,19,20,23,26]. The last section collected demographic data such as age, gender, marital status, visible minority status, years of employment, hours worked per week, and employment sector.

Results

Victim and Non-Victim Perceptions of their Organization's Bullying Climate

Victims and non-victims perceive their organization's attitude towards bullying very differently (see Table 1). Victims were significantly more likely to disagree that their organization condemned and punished bullying than non-victims (BULLYING TOLERANCE CLIMATE, F=104.39, p<.001). In fact, on average, non-victims slightly agreed that the bullying climate of their organization was one that did not tolerate bullying (mean=3.15, s.d.=0.8). Although it is possible that all the victims were employed at more tolerant organizations and that non-victims were employed at less tolerant organizations, it is more likely that victims and non-victims perceive their organizations differently. Victims also indicated that they were less comfortable filing complaints (F=34.93, p<.001); as a consequence, victims may be less likely to report bullying or discuss their concerns with their employer.

TABLE 1- VICTIM AND NON-VICTIM PERCEPTIONS OF ORGANIZATION'S BULLYING CLIMATE

Perception of Bullying Climate	Non-Victims Mean	s.d.	Victims Mean	s.d.	F
The organization I work for condemns bullying	3.58	1.3	2.70	1.3	27.88
Bullies are punished for their actions	3.20	1.2	2.36	1.2	31.11
Senior management is indifferent to my complaints	2.37	1.2	3.24	1.2	33.44
The human resources department is indifferent to bullying	2.34	1.1	3.18	1.2	34.68
I feel comfortable about filing a complaint	3.34	1.4	2.34	1.3	34.93
There is no point in me filing complaints	2.27	1.3	3.32	1.5	40.89
I would fear that I might be blamed if I were to admit I was bullied	1.96	1.1	3.08	1.4	58.02
No actions are taken against bullying	2.04	1.2	3.11	1.3	50.28
I would not fear any repercussions if I were to bully another worker	1.91	1.2	2.37	1.3	9.25
Bullying is accepted by my organization	1.60	1.0	2.63	1.3	58.56
BULLYING TOLERANCE CLIMATE	3.15	0.8	2.24	0.7	104.39

Note: 1-Strongly disagree, 2-somewhat disagree, 3-neither agree nor disagree, 4-somewhat agree, 5-strongly agree; all significant to p<.001.

Perceived Effectiveness of Organizational Responses to Bullying

Victims and non-victims also differ in the way they evaluate the effectiveness of a variety of organizational anti-bullying strategies. Table 2 provides the top ten most effective anti-bullying strategies as perceived by non-victims (the rank that each strategy received among victims is included in rightmost column). Table 3 parallels Table 2 and lists the top ten anti-bullying strategies from the victim's perspective. Bolded items indicate that the perception of the effectiveness of those strategies that differed significantly between victims and non-victims. Both victims and non-victims indicated that they believed that the most effective means of responding to bullying was to provide a clear communication of an anti-bullying climate (e.g., the organization should make it clear that bullying is not tolerated, new employees should be notified that bullying is not tolerated) and to provide greater resources and power to the human resources department (e.g., human resources should have the needed tools to address bullying). Note that the top three anti-bullying strategies are the same for both victims and non-victims. The major difference between victims and non-victims was in the way they evaluated specific programs designed to tackle bullying. Non-victims felt significantly more strongly than victims that practices such as Zero-Tolerance Programs ($F=14.6$, $p<.001$) and Anonymous hotlines ($F=18.8$, $p<.001$) were effective. These programs are widely recommended in the literature as critical to the success of bully-free climates. If victims are weary of them, however, it is unclear if these programs are reaching their intended audience and if other means are needed. Non-victims also felt significantly more strongly than victims that a more direct approach (i.e., bully bosses should be told that their behavior is unacceptable) was appropriate ($F=4.00$, $p<.05$).

TABLE 2: ANTI-BULLYING PRACTICES EFFECTIVENESS: NON-VICTIM'S PERSPECTIVE

Top Ten Perceived Most Effective Anti-Bullying Practices (Non-Victim)	Mean	s.d.	Rank Victim
1. The organization should make it clear that bullying is not tolerated	1.52	0.72	3
2. Human resources should have the needed tools to address bullying	1.54	0.66	2
3. New employees should be notified that bullying is not tolerated	1.57	0.73	1
4. Bully bosses should receive supervisory training to build their people skills in order to prevent bullying	1.70	0.75	6
5. Bully bosses should be told that their behavior is unacceptable	**1.71**	**0.85**	**9**
6. Human resources should give more importance to addressing bullying	1.73	0.70	5
7. Exit interviews should be conducted in order to find out why people have quit their jobs	1.75	0.74	4
8. Zero-Tolerance Workplace Bullying System	**1.76**	**0.73**	**11**
9. An anonymous hotline to report bullying incidents	**1.78**	**0.77**	**17**
10. Performance evaluations should be conducted in order to detect bullying	1.81	0.76	10

Note: 1-make things a lot better, 2-make things somewhat better, 3-make no difference, 4-makes things somewhat worse, 5-make things a lot worse

TABLE 3: ANTI-BULLYING PRACTICES EFFECTIVENESS: VICTIM'S PERSPECTIVE

Top Ten Most Perceived Effective Anti-Bullying Practices (Victim)	Mean	s.d.	Rank (Non-Victims)
1. New employees should be notified that bullying is not tolerated	1.64	0.76	3
2. Human resources should have the needed tools to address bullying	1.65	0.70	2
3. The organization should make it clear that bullying is not tolerated	1.68	0.89	1
4. Exit interviews should be conducted in order to find out why people have quit their jobs	1.74	0.71	7
5. Human resources should give more importance to addressing bullying	1.76	0.71	6
6. Bully bosses should receive supervisory training to build their people skills in order to prevent bullying	1.79	0.82	4
7. Give more freedom to human resources for dealing with bullying	1.89	0.62	12
8. Bosses should be rewarded for treating their employees fairly	1.92	0.95	13
9. Bully bosses should be told that their behavior is unacceptable	**1.93**	**1.04**	**5**
10. Performance evaluations should be conducted in order to detect bullying	1.93	0.81	10

Note: 1-make things a lot better, 2-make things somewhat better, 3-make no difference, 4-makes things somewhat worse, 5-make things a lot worse

Non-Victim and Victim Responses to Bullying

Table 4 summarizes how victims and non-victims evaluate the benefit of a variety of bullying responses. The first column provides the mean difference between the evaluation of victims and non-victims; a negative score indicates that victims feel that the reaction is less harmful than do non-victims, a positive score indicates the reverse. On the one hand, victims believed that passive strategies such as staying away from work ($F=15.79$, $p<.001$), keeping quiet ($F=7.43$, $p<.01$), and laughing it off ($F=5.00$, $p<.05$) was significantly more effective in dealing with bullying than did non-victims. On the other hand, non-victims felt that more vocal and pro-active measures, such as finding other people who are bullied in order to gather evidence (4.55, $p<.05$), putting the bully on notice that his/her actions will not be tolerated ($F=4.49$, $p<.05$) , discussing the situation with others (e.g., lawyer, $F=6.00$, $p<.05$); colleagues, $F=6.78$, $p<.05$; and Human Resources, $F=25.71$, $p<.001$) and fighting back ($F=3.93$, $p<.05$), were significantly more effective.

The victim's belief that passive reactions to bullying is more effective (or less harmful) is also correlated with the frequency of abuse. Victim's experiencing more abuse were more likely to report a preference for staying away from work ($r=-.15$, $p<.001$), keeping quiet ($r=-.16$, $p<.001$), laughing it off ($r=-.10$, $p<.05$) and avoiding the place where bullying happens ($r=-10$, $p<.05$). At the same time, they were less likely to document the behaviour ($r=.12$, $p<.05$), gather other evidence ($r=.12$, $p<.05$) or discuss it with others (lawyer, $r=.11$, $p<.05$; colleagues, $r=.13$, $p<.001$; HR department, $r=.25$, $p<.001$). In fact, discussing the matter with the HR department produced the greatest discrepancy between victim's and non-victim's evaluation.

TABLE 4 – VICTIM AND NON-VICTIM RESPONSES TO BULLYING

Bullying Response	Mean diff. btw victim & non-victims	F-test	Correlation with frequency of bullying(R)	Victim Mean(s.d)	Non-Victim Mean(s.d.)
Stay away from work	-.59	15.79***	-.15**	3.30 (1.3)	3.89 (1.2)
Keep Quiet	-.43	7.43**	-.16**	3.11 (1.2)	3.54 (1.2)
Laugh it off	-.33	5.00*	-.10*	2.80 (1.1)	3.13 (1.1)
Avoid place where bullying happens	-.21	2.43	-.10*	2.42 (1.0)	2.63 (1.1)
Do nothing	-.18	2.29	-.08	3.70 (1.0)	3.88 (1.0)
Retaliate	-.08	0.33	-.02	3.91 (1.0)	3.99 (1.2)
Talk your way out of situation	.00	0.01	-.02	2.92 (1.2)	2.92 (1.1)
Make threats to quit	.00	0.01	-.01	3.37 (0.9)	3.37 (0.9)

Fight back	.33	3.93*	.06	3.45 (1.3)	3.12 (1.3)
Discuss it with human resources department	.58	25.71***	.25**	2.52(1.1)	1.95 (0.9)

Note: 1-Make things a lot better, 2-Make things somewhat better, 3-make no difference, 4-make things somewhat worse, 5-make things a lot worse

To further shed light on how victims respond to bullying, responses from the follow-up interview study were summarized. When subjects were asked to describe how they reacted to a bullying incident, they responded as follows:

1. "I kept doing this broken record technique and stating that this was coming sort of unexpectedly and that this was an inappropriate time to discuss it and that I wasn't prepared to talk about it and that if they'd like to schedule another time where we could sit down and talk further about it that I'd be happy to do it."

2. "Well I focussed on doing my job and I was looking for something else because I know that I was in a no-win situation. My motivation originally was that if I could just keep doing things really excellent and achieving the results that they were looking for, I'd have to win them over eventually but it was just never going to happen."
3. "I would just click into a mode of thinking that this had really nothing to do with me, it had to do with other issues."
4. "I would keep a sense of humour about it. I would picture them like cartoon characters with an axe in their head."
5. "My philosophy is that we are all put here to get along so find a way to get along. If it means bending or if it means biting your tongue or if it means a lot of things, then do them."
6. "At one point the I said that I was going to go smoke because I couldn't take it anymore. I punched the metal door on the way out."
7. "It used to really upset me but it got to the point where now I just don't say OK and go on because I know it's not personal."
8. "So what I have to do is that I have to be very careful of the way I say things to him. I have to be very careful because he's always on his defensive and he's always afraid of being attacked and he lies."
9. "And I'm at the point where I can't anymore. I've had several bullying situations and I've tried to settle these situations but it hasn't changed anything. So at the point where I'm at I prefer to leave."
10. "It was one of these situations where I was really young and foolish and thought I was responsible. So I actually had never told anybody."
11. "If we see her coming down the hall we just pick up the phone and pretend that we're calling someone. Or we say that we are really busy and don't have time to talk about this, you know. Or just hope that someone call for you at that moment when she walks in the office."
12. "I had spoken about the problem with the general manager and I had explained to her how it was impossible to talk with him. She tried talking with him but the only thing that happened is that he'd act all nice and so she wouldn't understand why the employees were complaining. Now for them we were just complainers."
13. "I've tried going to the manager of human resources but that did nothing. She believed the supervisor. They were supposed to put up meetings and stuff to try to fix the situation but the employers are nice for a week after and then they go back."
14. "So we look out for each other. If he walks in and starts talking about somebody then another person will make a comment telling him, well you know, 'look there are friends among us, keep your mouth shut.'"
15. "So my reaction was to yell even louder and to swear at him in front of the clients. He called his assistant so that she could continue to supervise while we went to finish our discussion in his office. We fixed our differences and everything was OK."

Of the fifteen interviews, eleven engaged in some form of avoidance behaviour, two indicated that they had tried unsuccessfully to get help from outside their department, one indicated that the victims reacted by forming alliances with another and one last victim responded in kind (i.e., bullied back). Clearly the literature's recommendations are not working as intended.

Discussion and Conclusions

These results suggest that victims perceive that outside help, such as HR, could (or would) not help them with their bully boss. This means that even if the organization were equipped with a variety of anti-bullying programs and practices, it is unclear if they would reach their intended audience; that is the victims themselves! Also, these results suggest that non-victims believe that they would deal with bullying in a more active and assertive way (and more in line with the literature). Evidently, experience with bullying changes this opinion. Clearly, a new approach to help victims is needed.

It may not be realistic for organizations to enforce a zero-tolerance anti-bullying policy or to remove the bully. One reason for this is that workplace bullies are frequently very successful and productive employees; they get the job done. Consequently, little motivates employers to remove these individuals. Further, successful bullies frequently occupy positions of power and are inherently 'fireproof''. Bullying occurs too frequently and its costs are too high to be ignored, however. Shifting the emphasis to training victims to better cope with and handle their bully boss is a practical alternative and would give employees the tools needed to better manage their daily lives.

Although research on workplace bullying is relatively recent, research on schoolyard bullying is much more extensive. It is well documented that children find it difficult to tell an authority figure that they are being bullied. Consequently, training school children to cope with bullies has existed for at few decades. Some of the most common advice is summarized in Table 5[2,6,7,15,17,25,27,31,35].

Parallels to the workplace setting can be easily made. Employees can be provided with assertiveness training. More opportunities to form teams, alliances, clubs and friendships should be provided; there is 'power in numbers' in organizations too. Being able to 'tell someone' should be reiterated, especially to those who may have lost faith in human resources. Finally, it may be helpful for employees to know that it may be easier to cope with a bully boss by keeping a sense of humor about it (note that one of our interviewees used this as a coping mechanism), empathizing with the bully (e.g., my boss is under pressure), walking away or giving them what they want; at least until the bullying situation is remedied through other means.

TABLE 5 - COPING STRATEGIES FOR SCHOOLYARD VICTIMS

1. Practice assertive body language (e.g., walk tall).
2. Develop self-confidence (e.g., through sports).
3. Form friendships, join clubs (power in numbers).
4. Tell someone.
5. Assert yourself verbally (e.g., say NO).
6. Use "I" statements to personalize the demand (e.g., I don't want to do this).
7. Use humor as a counter-attack.
8. Walk away, don't fight back.
9. Give them what they want.
10. Remember that bullies have feelings too.

A Comparison of Communication Satisfaction and Organizational Commitment among Public and Private Sector Employees in Malaysia

Che Su binti Mustaffa
Hassan Abu Bakar
Universiti Utara Malaysia, Malaysia

Abstract

This study focuses on the relationship between organizational communication satisfaction and organizational commitment in public and private organizations in Malaysia. Data were collected using the Downs's (1990) Communication Satisfaction Questionnaire and Organizational Commitment Questionnaire by Meyer and Allen (1990). A total of 319 respondents from private sector and 309 respondents from public sector were involved in the study.

Results of this study indicated that there exists an explicit positive relationship between communication satisfaction and employees' organizational commitment. Also, there is evidence of significant differences in terms of communication satisfaction among public and private employees. Based on the set of results, this study highlights the importance of recognizing that communication satisfaction which are multi-dimensional. Each dimension may affect organizational commitment differently.

Introduction

The importance of communication in the functioning of any organization is well established. Bernard (1938) refers to communication as the "nerve system" of the organization. Organizational communication has been studied from different perspectives with relative success in producing theoretical model that can help us to have better understanding of its nature and functions. Over the past two decades, the construct of communication satisfaction and organizational commitment have been the important variables of interest to organizational communication researchers (Clampitt & Downs, 1987; Putti, Aryee, & Phua, 1990) and yet few studies have focused directly on the relationship between these two organizational variables.

Problem Statement

People communicate to satisfy interpersonal needs, which, in turns, influence their communication choices and behaviors (Rubin & Rubin, 1992). In essence, then, people have motives for communicating. Since communication practices and organizational commitment attitudes are important processes in organizations, there is a need for the study of there two dimensions within organizations. Moreover, there is a need to study the relationship between these two variables in the context of public and private sector. A review of literature reveals that in fact there is a lack of research on the relationship between communication satisfaction and organizational commitment. Therefore, the relationship that is believed to exist between these two variables is more implied than demonstrated. On the other hand, the study of the relationship between communication satisfaction and organizational commitment is particularly important since it is believed that the implication of the findings of such research may have a significant impact on managerial activities and organizational effectiveness.

In order to fulfill this need for studying the relationship between communication satisfaction and organizational commitment, a major thrust of research has been recently initiated by Downs (1989). The purpose of this new research trend in organizational communication is to examine the relationship between communication satisfaction and organizational commitment in various cultures. The Potvin (1991) study in the United States and the Downs (1991) study in Australia were two of the first reported studies of research in this area. The present study, which has studied the nature of the relationship between communication satisfaction and organizational commitment in Malaysia, is part of this research thrust.

The purpose of this study is also to review some of the many arguments about the differences (and similarities) between public and private organizations in Malaysia. It is not always clear, however, how these differences are attributable to differences in the personnel systems -and attendant rewards and sanctions- of the respective sectors or whether the people who choose to work in the private sector are, as a whole, somewhat unlike those choosing to work in the public sector (Bozeman, 1989).

Communication Satisfaction

The term “communication satisfaction” was first introduced by Level (1959) in his analysis of human communication in an urban bank. Redding (1978) reported that the term communication satisfaction has been used “to refer to the over-all degree of satisfaction an employee perceives in his total communication environment.” A relatively new and successful research stream in organizational communication (Crino & White, 1981) has attempted to conceptualize and operationalize a construct labeled communication satisfaction by Downs and Hazen (1973). The construct of communication satisfaction has become an accepted part of the organizational communication literature over the last 20 years (Clampitt & Downs, 1987). Many studies have been built on the Downs – Hazen Communication Satisfaction Questionnaire and those have resulted in the creation of a new and successful research stream. The findings of the various studies revealed that: 1) the construct of communication satisfaction is multidimensional; 2) the Communication Satisfaction Questionnaire has proven to be a useful tool for organizational diagnosis in a wide range of organizations; 3) communication satisfaction links to the end-product variables of job satisfaction and productivity, and 4) the communication satisfaction construct is effective in explaining job satisfaction and productivity (Clampitt & Downs, 1987).

Organizational Commitment

Organizational commitment has been of more recent interest to organizational communication researcher over the past two decades (Putti, Aryee & Phua, 1990). This interest in commitment stemmed from its demonstrated linkafe with variables that had an influence on organizational effectiveness such as absenteeism, turnover and job performance. According to Putti, Aryee, and Phua (1990), most of these studies about the antecedents and consequences of commitment focused primarily on structural, individual, and role-related variables (Mowday, Porter & Steers, 1982). As a consequence, the organizational processes have been ignored as potential determinants of commitment. One such organizational process is communication and the members’ satisfaction with communication relationships (Putti, Aryee, & Phua, 1990).

Commitment is an attitude or behavior, although Mowday, Porter, and Steers (1982) suggest both are linked in that each reinforces the other. Buchanan (1974) defines commitment as an employee’s adoption of the organization’s values (identification), involvement (psychological immersion) and loyalty (affection/attachment). Others see commitment as the extent to which employees (a) contribute to the organization’s well being (Mowday, Porter, & Steers, 1979), (b) share in managerially promoted organizational images (Tredwell & Harrison (1974), or (c) are partners in a social exchange idea in that each giver to other (Eisenberger, Fasolo & Davis -LaMastro, 1990).

In 1990 the effective and continuance commitment subscales (Meyer & Allen, 1984) were supplemented by the normative subscale (Allen & Meyer, 1990; Meyer & Allen, 1991) to form the three-aspect concept of organizational commitment. Three main issues have emerged concerning the subscales. First is the reliability and uni-dimensionality of the subscales. Second, significant correlations between the subscales suggest they are not independent dimensions of commitment. Third, the dominance of the affective component in terms of effects.

McGee and Ford (1987) questioned the structure of the affective and continuance factors in their study of 350 faculty members from Canada and the United States. Factor analysis identified four factors, three with loadings over .40. The items for continuance commitment loaded on two separate factors. Correlations between these factors and the affective factor were significant and signed opposite for each factor in contrast to weak correlations when the single continuance factor was examined by Meyer and Allen (1984).

In other research, the three subscales were found to have high reliability and supportive factor analysis (Ward & Davis, 1995; Benkhoff, 1997) although, because of the level of correlation between the affective and normative commitment subscales, questions have been raised about their uni-dimensionality (Allen & Meyer, 1990; Shore & Wayne, 1993). Using a revised normative commitment scale, Meyer, Allen, and Smith (1993) identified an unexpectedly strong correlation with affective commitment that could not clearly be linked to revisions in the scale or to the sample context. One possible explanation is that as employment has generally become less secure over the last decade or so, normative commitment has become less related to principles and more dependent on levels of affective commitment.

In summary, although the Meyer and Allen commitment scale shows promise in their measurement of organizational commitment, the form of commitment expressed by factors and the independence of the constructs are not clear. Meyer, Allen, and Gellatly (1991) indicated that the three-component model may not represent a unitary construct or include the only relevant components of commitment. However, in their later examination of construct validity of the scales, Meyer and Allen (1996) argued that sufficient research evidence exist to support the use of three factors based on the scale even though it is not clear that the continuance commitment scale is a uni-dimensional construct.

Significance of the Study

This study, which is descriptive and exploratory in its nature, has some specific features that makes it unique:

1. It represents the first endeavor to investigate how Malaysian employees conceptualize the two organizational constructs of communication satisfaction and organizational commitment.
2. It illustrates the first attempt to investigate the relationship between communication satisfaction and organizational commitment in Malaysia.

Operational Definition

Communication satisfaction

Several definitions of the term "communication satisfaction" have been provided by researchers since it was first introduced by Level (1959). The first definitions of communication satisfaction emphasized the uni-dimensionality of the construct. Thayer (1969) defined the term as the personal satisfaction a person experiences when communication successfully. Redding (1978) in an analysis of several studies, reported that the term communication satisfaction was used "to refer to the over-all degree of satisfaction an employee perceives the total communication environment." More recently Downs and Hazen (1977) attempted to study whether or not communication satisfaction was a multidimensional rather than a uni-dimensional construct. The results of their research indicated that "communication satisfaction" was a multidimensional construct. Based on these findings, the Downs and Hazen study (1977) defined the term as "an individual's satisfaction with various aspects of communication in his organization."

Communication satisfaction for the purpose of this study is defined as individual satisfaction with various aspects of communication in an organization as measured by the Communication Satisfaction Questionnaire (Downs, 1977,1989). Such various aspects of Communication Satisfaction construct are: 1) Organizational Perspective, 2) Personal Feedback, 3) Organizational Integration, 4) Supervisor Communication, 5) Communication Climate, 6) Horizontal Communication, 7) Media Quality, 8) Subordinate Communication, 9) Top Management Communication, and 10) Interdepartmental Communication.

1) Organizational Perspective is the broadest kind of information about the organization as a whole. It includes the notification about changes, the organization's financial standing, and the overall policies and goals of the organization.

2) Personal feedback is concerned with the need of the workers to know how they are being judged and how their performance is being appraised.

3) Organization Integration revolves around the degree to which individuals receive information about their immediate environment. Items include the degree of satisfaction which employees experience with information about departmental plans, the requirements of their job, and some personnel news.

4) Supervisor Communication includes both the upward and downward aspects of communicating with superiors. Three of the principal items are the extent to which supervisors listen and pay attention, and the extent to which superiors are open to ideas, the extent to which supervisors listen and pay attention, and the extent to which superiors and supervisors offer guidance to their employees in solving job-related problems.

5) Communication Climate reflects communication about the organizational and personal levels. It includes items such as the extent to which communication in an organization motivates and stimulates workers to meet organizational goals and the extent to which it makes them identify with the organization. It also includes estimates of whether or not peoples' attitudes towards communicating are healthy for an organization.

6) Horizontal Communication concerns the extent to which horizontal and informal communication is accurate and free flowing. This factor also includes satisfaction with the activeness of the grapevine.

7) Media Quality deals with the extent to which meeting are well organized and written directives are short and clear, and the degree to which the amount of communication is about right.

8) Subordinate Communication focuses on upward and downward communication with subordinates. Only workers in supervisory positions respond to these items which include subordinate responsiveness to downward communication, and the extent to which subordinates initiate upward communication.

9) Top Management Communication evaluates the communication of top management with organization members. This factor includes items about top management attitudes towards openness to new ideas, caring, and willingness to listen.

10) Interdepartmental Communication deals with the communication that is needed between the different departments of the organization in order to facilitate the efficiency of the organization. It includes items about problem solving, teamwork, and communication among managers.

Organizational commitment

Employee commitment is defined as the individual's desire to remain as a member of his or her work-related interest groups. Employee commitment encompasses the domains of organizational commitment, professional commitment, and professional association (union) commitment. In their comprehensive review of commitment in the workplace, Meyer and Allen (1997) offer several directions for future research. First, they suggest that additional research is needed to identify the antecedents that are associated with the multiple domains of employee commitment. To date, previous research on commitment has predominantly focused on an employee's commitment to his or her organization (e.g., Levy & Williams, 1998; Shore & Wayne, 1993).

Meyer and Allen (1997) believed that the relationship between human resource practices and employee commitment should be examined more fully. They asserted, "by understanding how commitment develops, practitioners will be in a better position to anticipate the impact of a particular policy or practice even if it has not yet been the subject of empirical research" (p. 110). The dynamic nature of human resource management in recent decades also affirms the need for more research in this area.

Organizational commitment for the purpose of this study is defined as the relative strength of an individuals' identification with the goals of values of the organization, his or her willingness to help the organization achieve its goals, and his/her strong desire to maintain membership in the organization, specifically it is measured by composite scores on the Organizational Commitment Instrument.

Review of the Literature

The importance of communication in organizational functioning has been stated by many organizational theorists (Ruch, 1989). As a result of its importance, organizational communication is a topic which has received considerable attention in recent years. Even though communication satisfaction is a relatively new construct in the field of organizational communication, many researches have been directed towards determining the relationship between communication satisfaction and other organizational variables. Over 25 different studies, theses, and dissertations, have used the Communication Satisfaction Questionnaire to analyze organizational communication.

A 1977 study by Thiry, which used a sample of 1,160 Kansas nurses, was one of the first to make use of the Communication Satisfaction Questionnaire. The respondents were asked to indicate whether they were satisfied with their present communication practices. The areas of the greatest satisfaction were Subordinate Communication and Supervisor Communication, and the area of the least satisfaction were Personal Feedback and Communication Climate. Pincus (1986) used a modified version of the Communication Satisfaction Questionnaire to study 327 nurses in an urban mid-Atlantic teaching hospital. A new factor of Top Management Communication was added to the other eight communication satisfaction factors. These nurses did not express as much communication satisfaction as did those in the findings of Thiry's (1977) study. The most highly rated factors were Supervisor Communication and Horizontal Communication, and the lowest rated were organizational Perspective and Top Management Communication.

Varona (1988) studied two private sector printing organizations in Guatemala with a sample of 122 employees from one and 45 employees from the other. The employees in both of these companies were generally satisfied with their communication practices. Subordinate Communication, Organizational Integration, and Supervisor Communication were the factors with which the employees were most satisfied. Horizontal Communication, Personal Feedback, and Organizational Perspective were the factors with which employees were least satisfied.

According to Clampitt & Downs (1987), the findings of research regarding communication satisfaction can be summarized as follows:

1. The communication satisfaction construct is multi-dimensional.
2. The communication satisfaction questionnaire has proven to be a useful tool for organizational diagnosis in a wide range of organizations.
3. The studies reviewed indicate that there are definite areas of greatest and least communication satisfaction, although for most part employees are not dissatisfied with organizational communication.
4. Demographic variables provided relatively poor explanations of the level of communication satisfaction.
5. There appear to be some indication that employees in managerial roles are more satisfied with communication that those who are not. However, no clear discernible difference can be detected between employees of profit and nonprofit organizations.
6. Communication satisfaction links significantly to the end-product variables of job satisfaction and productivity.
7. The communication satisfaction construct is more effective than productivity in explaining job satisfaction.
8. There are no clear and strong patterns of relationship between CSQ factors and the end-product variables in these studies. These relationships would probably be contingent on the type of organization and industry in which employees work. The correlation between the eight communication satisfaction factors and job satisfaction was found to be particularly significant while the communication satisfaction/productivity relationship was not clear and strong.

As for organizational commitment, the term commitment has been variously and extensively defined, measured, and researched but it continues to draw criticism for lack of precision and for concept redundancy (Reichers, 1985). The construct of organizational commitment has been researched extensively over the past two decades. These studies have demonstrated the relationship between commitment and several other organizational variables such as absenteeism, leadership style, communication openness and job performance. Recently, the importance of communication in developing commitment has been a major theoretical issue. Some of the pensioner studies that have attempted to investigate the relationship between communication satisfaction and organizational commitment are also revised in this section.

Putti, Aryee, and Phua (1990) examined the relationship between Communication Relationship Satisfaction and organizational commitment in research conducted in a Singapore company with 122 white collar Chinese employees. Result indicated that top management communication, supervisor relationship and global CRS had significant correlations with organizational commitment. Potvin's (1991) also concluded that there was a definite positive relationship between communication satisfaction and employees' organizational commitment. The strongest correlations appeared between commitment composites and communication climate, and the lowest correlations were between commitment factors and organizational perspectives. The Subordinate communication factor also produced fairly low correlations. She also concluded that demographic variables seemed to have no explanatory power with regard to commitment levels.

Downs (1991) studied the relationship between Communication Satisfaction and Organizational Commitment in two Australian organizations. The sample consists of 95 subjects (faculty and staff) of an institute of a higher education and of 100 subjects from a manufacturing firm. The main conclusion of this study is a positive relationship existed between communication satisfaction and organizational commitment. Second, the exact relationship between communication dimensions and levels of commitment varied somewhat across organizations. Third, the relationship with Supervisors, Personal Feedback, and Communication Climate were the strongest communication predictors of organizational commitment.

Methodology

This study was conducted in the following steps. (1) The communication satisfaction and organizational commitment instruments were selected for collecting the data; (2) The instruments were translated into Malay Language (Bahasa Malaysia); (3) The instruments were pre-tested; (4) Data were collected form a public and private organizations; and, 5) Data were analyzed using correlation, t-test, and multiple regression.

Instruments

The instruments used for this study were 1) Downs' 1990 Communication Satisfaction Questionnaire (CSQ) and Meyer and Allen Organizational Commitment Instrument.

Communication Satisfaction Questionnaire: The communication satisfaction questionnaire is an instrument that was developed by Downs and Hazen (1977) a revised version by Downs (1990), The questionnaire was constructed to indicate level of satisfaction of respondents with fifty-two items using a one to seven point scale which ranged between "very satisfaction" and "very unsatisfied". Two additional questions referred to changed experienced in job satisfaction and productivity. Two open-ended questions asked for suggestions to improve communication satisfaction and productivity.

Commitment: To determine factors related to organizational commitment, the concept of organizational commitment must be clearly defined. One commonly used definition of organizational commitment was developed by Porter et al. (1974). In their definition, three factors of organizational commitment were identified: a strong belief in and acceptance of the organization's goals and values, a willingness to exert considerable effort on behalf of the organization, and a strong desire to remain in the organization. A fifteen-item organizational commitment questionnaire (OCQ) was developed to measure organizational commitment based on this definition.

Allen and Meyer (1990) separated organizational commitment into three components: affective, continuance and normative. The affective component refers to the employee's emotional attachment to, identification with, and involvement in the organization. The continuance component refers to commitment based on the costs that the employee associates with leaving the organization. The normative component refers to the employee's feelings of obligation to remain with the organization. Allen and Meyer (1990) developed a twenty-four-item scale to measure the three components of organizational commitment.

Hypotheses

Based on the prior research findings, for the purpose of present study several hypotheses are generated. The first hypotheses concerned with the direction and strength of the relationship between communication satisfaction and organizational commitment.

H1: There is a significant and positive relationship between organizational communication satisfaction and organizational commitment.
H2: There is different levels of organizational communications satisfaction among private and public sector employees.
H3: There is different levels of organizational commitment among private and public sector employees.

Procedure

Collectively, a total of 850 questionnaires were sent to public organization and 830 questionnaires were sent to private organization. A total of 317 questionnaires from public sector and 325 from private sector were returned, yielding a 40 percent return rate.

Respondents

The majority of the respondents were male (57.60%, n=317 in public sector; 55.70%,n=307 in private sector). Most of the respondents were married (84.60% in private sector; 81.43% in public sector). A total of 88.40% of the respondents in private sector and 78.53 % of the respondents in the public sector were Malays. Respondents reported their work experiences was slightly over than 13 years (58.2 % in public sector; 54.4% in private sector). In term of academic qualification, approximately 59.75% in private sector and 49.84% in private sector had earned Malaysia Certification of Examination (Sijil Pelajaran Malaysia) and below.

Results and Discussion

Data were analyzed by a Pearson Correlation. Hypothesis 1 addressed the relationship between organizational communication satisfaction and organizational commitment. Results of a Pearson Correlation revealed a significant and positive relationship between the two variables in the private($r=.54$, $p< 0.05$) and public organization ($r=.77$; $p < 0.01$). The higher the quality of communication satisfaction, the greater organizational commitment among the employees at the public and private sectors in Malaysia. This suggests that people who are satisfied with their organizational communication will also be committed to the organization.

There is a significant and positive relationship between every communication satisfaction dimensions and organizational commitment. For private sector, the dimension that correlates higher with organizational commitment is Media Quality. This is followed by Supervisor Communication, Horizontal/Informal Communication and Communication Climate. For public sector, Media Quality also becomes the highest dimension that correlate with organizational commitment. This is followed by Organizational Intergration, Subordinates Communication and Horizontal/Informal Communication.

TABLE1: CORRELATION BETWEEN COMMUNICATION SATISFACTION DIMENSIONS AND ORGANIZATIONAL COMMITMENT

Dimensions	Private Sector r*	Public Sector r*
Organizational Integration	.39	.68
Subordinates Communication	.38	.61
Horizontal/Informal Comm.	.47	.61
Media Quality	.55	.69
Satisfaction with Superiors	.39	.62
Personal Feedback	.38	.60
Organizational Perspective	.30	.57
Communication Climate	.46	.67
Supervisory Communication	.51	.65

Note: * $p < 0.01$

Hypothesis 2 tested the differences of communication satisfaction among public and private organizations. Results of t-test revealed a significant difference between public and private organization in terms of communication satisfaction (Table 2).

Hypothesis 3 examined the differences of organizational commitment among public and private sector employees. Results of t-test revealed a significant difference between public and private employees in term of their organizational commitment (Table 2)

TABLE 2: T-TEST FOR DIFFERENCES IN COMMUNICATION SATISFACTION, JOB SATISFACTION AND ORGANIZATIONAL COMMITMENT IN PUBLIC AND PRIVATE SECTOR

Variables	Sector	n	Mean	Std. Dev	t-value	Sig.
Communication Satisfaction	Public	306	130.16	26.94	8.23	.00
	Private	319	112.86	21.88		
Organizational Commitment	Public	306	70.97	14.07	3.81	.00
	Private	319	66.21	16.99		

Discussion and Conclusion

Hetch (1978) noted that the study of communication satisfaction is of importance to the communication field. Hetch also suggested that communication satisfaction is an outcome of communication behaviors and thus, serve as the basic for a holistic theoretical approaches to the field. In organizational settings, communication has been consistently found to be crucial to job satisfaction, task performance, productivity, and commitment (Clompitt & Downs, 1993; Pincus, 1986). Given that communication satisfaction is vital to organizational life, the present study makes a valuable contribution to the extent relationships.

As predicted, communication satisfaction positively affected subordinates perceived organizational commitment. The higher the quality of communication satisfaction, the more subordinates reported higher level of organizational commitment. These finding are consistent with the theoretical perspective and empirical discoveries of communication satisfaction studies.

Findings reported in this study have important practical and theoretical implications to increase overall level of organizational commitment among their subordinates, superior should offer opportunities to develop and maintain higher quality of organizational communication.

Meyer and Allen (1990) suggested that organizational commitment is greatly influenced by employee's perceptions of achievement, recognition, attraction of the work itself, responsibility and advancement. Further, more organizational commitment is closely tied to communication satisfaction. Thus in order to enhance their subordinates perception of communication satisfaction, superior should work on ways in which they can improve the quality of communication with subordinates.

Subordinates too, can learn about and actively enjoy in communication behaviors that positively affect the quality of organizational communication with their superior. By improving the quality of organizational with superior, subordinates' are likely to experience more informal and formal rewards and interact with their superior within a more open communication environment for example greater feedback opportunities in decision making, information sharing, and the like, and, thus, experience more satisfying communication at the workplace.

The study also found that there is a difference in terms of communication satisfaction and organizational commitment among public and private sector employees in Malaysia. The communication satisfaction and organizational commitment is higher for public sector employees compared to private sector employees. This is due to public organizations allegedly differ from private organizations in that public and private employees, on the whole, have different attitudes about their work and somewhat different incentive structures (Bozeman, 1989).

As with all research, the present study has limitations. For instance, the respondents consist of those who work in public and private sector in Malaysia. Therefore, findings from this study may not be generalized to draw conclusions on all multinational organizations operating in Malaysia. Care should be excercised when generalizing the results from the present study.

Any social relationship including the superior-subordinate relationship is not marked by smooth continuity. (Duck & Pittman, 1994). Instead, such relationships are exposed to everyday "ups and downs" and undergo stressful situation. Accordingly, subordinates communication will likely fluctuate over time. Thus, as Pincus (1986) emphasized, future study should employ longitudinal research designs to delineate routine and non-routine communication behaviors in differing organizational commitment. Also, additional research should identify other variables within other communication organizational context that affect and are affected by communication satisfaction in the workplace.

Conclusions

The above findings, however, must be interpreted with caution because the current study has limitations. The study is restricted to service organization only. Therefore, generalizing the results reported in this paper to other sectors (such as manufacturing company) should be done cautiously. Furthermore, this study is constrained to Malaysia. It is possible that public sectors in other countries differ from their Malaysia counterparts. This may be so because of legal and regulatory constraints and economic policies or structures that might differ among countries. Thus, it might not be possible to generalize the findings in this study to others. Future research may be designed to compare the findings in this study with findings that relate to industries in other countries.

The Determinants of Poverty in Mexico: 2002

Jorge Garza-Rodríguez
University of Monterrey, Mexico

Abstract

This study examines the determinants or correlates of poverty in México. The data used in the study come from the 2002 National Survey of Income and Expenditures of Households.

Using the official extreme poverty line, a logistic regression model was estimated based on this data, with the probability of a household being extremely poor as the dependent variable and a set of economic and demographic variables as the explanatory variables. It was found that the variables that are positively correlated with the probability of being poor are: having a female household head, size of the household, living in a rural area, household head working in agriculture, working without remuneration and having a self-employed household head. Variables that are negatively correlated with the probability of being poor are: education level, age of the household head and whether the occupation of the household head is being a small entrepreneur or not.

1. Introduction

Poverty in Mexico is widespread and pervasive. According to official Mexican Government estimates [Cortés, Fernando; Hernández, Daniel; Hernández, Enrique; Székely, Miguel; Vera, Hadid. 2002], 52.7 million people were living in poverty in 2002, which represents 51.7 percent of the Mexican population. Extreme poverty affected 20.7 million people, equivalent to 20.7 percent of the total population.

The high poverty rates prevalent in the country are a reflection of both low incomes and an unequal income distribution. Mexico has one of the more unequal income distributions in the world. According to the World Bank [1999], only eleven countries in the world have a worse income distribution than Mexico. This feature of the Mexican economy is not new; it has been one of its distinct characteristics for a long time. According to Székely [1998] income distribution in Mexico improved between the years of 1950 and 1984, but then worsened after that year. The Gini coefficient decreased from 0.52 in 1950 to 0.44 in 1984 but then increased to 0.49 in 1992 and increased even further to around 0.52 during the rest of the nineties.

During the 1980's and 1990's, the period in which income distribution has become more unequal, the Mexican economy experienced a deep transformation which involved a major shift in the development model that the country had been following until the 1970´s. Important manifestations of this change were the macroeconomic stabilization programs that were implemented, the process of trade liberalization, the privatization of state-owned enterprises and banks, deregulation and the reduction or elimination of barriers to foreign investment in important sectors of the economy since 1988.

After these reforms, the Mexican economy started to grow consistently, although slowly, from 1987 until 1994. However, after a series of political events, including the appearance of a guerilla movement in the south of the country and the assassination of the Institutional Revolutionary Party presidential candidate, the Mexican economy entered one of the most profound crises in recent history. Gross Domestic Product fell 6.2 percent in 1995 and the peso lost half its value against the dollar. The real minimum wage fell by 13 percent, while real private consumption decreased 9.6 percent. Although the economy eventually recovered during 1996, the gains were not enough to compensate for the losses that occurred during 1994. Thus, per capita real GDP was still 4.8 percent lower in 1996 as compared to 1994, average real wages were 22 percent lower than in 1994 and real private consumption was 7.5 percent below the 1994 figure. During the 1994-1996 period there was a slight improvement in income distribution in the country. The Gini Index decreased from 0.5338 in 1994 to 0.5191 in 1996. The income share of the lowest three deciles increased slightly and the share of the highest decile decreased. However, a closer look at the income distribution reveals that the persons situated in the lowest three percentiles of the distribution, the poorest of the poor, reduced their share during the period.

According to the estimates obtained by Garza-Rodríguez [2000], both moderate and extreme poverty increased in Mexico during the 1994-1996 period, and both the depth as well as the severity of poverty also increased in the same period. Although the author did not decompose the poverty changes as due to decrease in income and the worsening of income distribution, it is possible that both factors played a role in the increase in poverty levels that occurred during the period. Thus, although the Gini coefficient declined during the period, indicating a reduction in income inequality, the Lorenz curves for the two years intersect in the lower percentiles of income, which indicates that the income share of the poorest of the poor decreased during the period.

The poverty profiles constructed by the author for both years indicate that although poverty is predominantly rural in Mexico (60 percent of the rural population was poor in 1996), urban poverty more than doubled during the period, from 9 percent of urban population in 1994 to 21 percent in 1996. This indicates that although poverty alleviation programs should concentrate in the rural sector, the urban sector should not be neglected when designing and implementing policies to mitigate poverty.

Another variable that the poverty profiles suggested as an important determinant of poverty was the level of education of the household head. In both years considered in the study, poverty incidence was higher the lower the level of instruction of the household head. For example, 58 percent of the number of people living in households headed by persons with no instruction was poor in 1996, while only 2.7 percent of the number of people living in households headed by persons with at least a year of college was poor in the same year.

Suggesting a strong correlation between poverty and occupation of the household head, poverty incidence is higher for households whose head works in a rural occupation or in a domestic occupation and it is lower for households whose head works in a professional occupation or in a middle level occupation.

The poverty profiles also showed that poverty rates are higher for households with the following characteristics: they live in rural areas, have more than five family members, their head has a low level of education and works in the primary sector or in a domestic occupation.

To test the hypothesis about the determinants or correlates of poverty we use a logistic regression with the dependent variable being the dichotomous variable of whether the household is extremely poor (1) or is not extremely poor (0). The explanatory variables considered in the analysis were: gender, age, education, the occupation of the household head, and size and location (rural or urban) of the household.

The paper is organized as follows: Section 2 reviews the literature and main empirical findings about the determinants of poverty in several countries and in Mexico; Section 3 describes the ENIGH 2002 Survey as well as the selection of variables from the Survey that will be used in this study. Section 4 presents the results of the multivariate analysis to explore the determinants of poverty in Mexico based on the 2002 ENIGH dataset. Finally, Section 5 proposes some conclusions based on the analysis developed in this study.

1.1 Studies about the Determinants of Poverty

Although the construction of poverty profiles is useful because it allows us to know whether poverty is increasing or decreasing as well as the changes in the composition of the population in poverty, poverty profiles do not throw much light about the causes of poverty. They only provide a description of poverty according to several economic, demographic or social characteristics, but do not go in depth as to look for the underlying causes of differences in poverty rates across population groups and/or across time.

However, while the literature on poverty measurement is by now relatively developed and abundant, there are very few studies dealing with finding the determinants or causes of poverty. In general, these studies have used different methodologies, including ordinary least square regression where the dependent variable is continuous, logistic regression where the dependent variable is binary, and quantile regressions where the dependent variable is income.

In one of the first studies about the determinants of poverty, Kyereme and Thorbecke [1991] estimated a cross-section regression model for Ghana, using the 1974-1975 Ghana Household Budget Survey. In their model, the dependent variable was the total calorie gap for each household in the Survey and the explanatory variables were a set of economic, demographic and geographic location variables. They found that income and education of the household are inversely related to household calorie gap. Rodríguez and Smith [1994] used a logistic regression model to estimate the effects of different economic and demographic variables on the probability of a household being in poverty in Costa Rica. The data they used was from a national household-income survey carried out in

1986. Among other results, the authors found that the probability of being in poverty is higher the lower the level of education and the higher the child dependency ratio, as well as for families living in rural areas.

Coulombe and McKay [1996] used multivariate analysis to analyze the determinants of poverty in Mauritania based on household survey data for 1990. They estimated a multinomial logit model for the probability of being in poverty depending on household-specific economic and demographic explanatory variables. The authors found that low education, living in a rural area and a high burden of dependence significantly increase the probability of a household being poor.

1.2 Studies about the Determinants of Poverty in Mexico

Studies about the determinants of poverty in Mexico are few, and they use different methodological approaches.

Cortés [1997], using the ENIGH 1992, estimates a logistic regression of the probability of being poor as a function of several economic, demographic and location variables. He finds that the probability of being poor decreases with the number of years of education and increases with the burden of dependency and if the household is located in a rural area.

Székely [1998], using a different approach and based on the 1984, 1989 and 1992 Surveys reaches the conclusion that lack of education is the single most important factor in explaining poverty in the country. Other variables that he found as directly related to poverty are: household size, living in a rural area, and occupational disparities.

2. Description of the Data

2.1. Description of the Survey

This paper uses the information contained in the micro data from the National Survey of Incomes and Expenditures of Households (ENIGH) for 2002, carried out in that year by the Instituto Nacional de Estadistica, Geografia e Informatica (INEGI), Mexico´s national institute of statistics. The ENIGH surveys are carried out by INEGI every two years since 1992 and they are comparable since they follow the same methodology.

The surveys' sampling unit is the house and the unit of analysis is the household. The household and its members can be classified according to various socio-economic and demographic characteristics such as income and occupational characteristics, the physical characteristics of the residence and the services available to the residents of the household.

The characteristics included in the Survey are the following (and refer to the household residents): kinship relationship with the household head, gender, age, instruction level attained, school attendance, literacy status, and type of school attended.

The economic transactions considered in the surveys are current transactions and financial or capital transactions. Current transactions include current income and current expenditures. Current income includes both monetary and non-monetary income (in-kind payments) received by household members during the reference period. The income concept registered in the surveys is net income, after deducting taxes, social security payments, union payments or other deductions. Current monetary income includes the following sources: wages, entrepeneurial income, rents, incomes from cooperatives, transfer payments and other current income. Non-monetary income comprises: auto-consumption (household production consumed in the household), in-kind payments, gifts, and the imputed rent from owner-occupied housing.

The Survey is statistically representative at the national level and at the urban and rural level, which implies that it is not possible to obtain inferences at the state level.

The Surveys include information about expansion factors for each selected house, and they are equal to the inverse of the probability of selection. In this sense, the expansion factor for each selected house indicates the number of houses that each house represents in the total population of dwelling units.

2.2. Poverty Line used in this Study

The poverty line used in this study is the official "food poverty line", which could be interpreted as an extreme poverty line. This poverty line (measured at prices of the year 2000) is equal to 15.4 pesos per person per day for rural areas and 20.9 pesos per person per day for urban areas. This is the income necessary to purchase a minimum food bundle that satisfies the minimal nutritional requirements. Therefore, persons with income below this level are considered extremely poor since they do not have the income to buy enough food to satisfy their nutritional requirements.

3. Econometric Model

3.1. Introduction

Garza-Rodríguez [2000] analyzed the evolution of poverty levels and poverty profiles during the period 1994-1996. He looked at the issue of what happened to poverty during the period as well as what happened to the composition of the poor according to several demographic and socioeconomic characteristics. This knowledge can be useful since it allows us to know whether poverty is increasing or decreasing as well as the changes in the composition of the poor. However, it does not provide us with much insight about the causes of poverty. For example, is poverty higher in rural areas only because education attainment is low and family size is high in rural areas or is poverty high in rural areas even if we control for those variables?

While the literature on the measurement of poverty is relatively abundant, studies about the determinants or causes of poverty are scarce. However, it is precisely in this area where research can be most useful, since the main causes of poverty need to be understood in order to be able to design the most efficient policies to reduce it.

There are several approaches that can be taken in the analysis of the causes of poverty. If we follow the income approach, poverty can be thought as being caused by lack of income, which in turn can be caused by reduced command of economic resources available to the household. Thus, in general terms, poverty can be thought as being due to the limited amount of assets owned by the poor and to the low productivity of these assets.

Many variables can be considered as the determinants of income, and thus, of poverty. We can divide these variables into two general areas: the characteristics associated with the income generating potential of individuals and the characteristics associated with the geographic context in which the individual lives. The first kind of characteristics would include, for example, the assets owned by the individual, both physical and human, while the second type of characteristics would include, for example, the place in which the individual lives (urban or rural). However, there are severe problems in determining the direction of causality. Does poverty cause the characteristic or is it the presence of a given characteristic which causes poverty?. An example of this problem is whether poverty causes large households or a large household causes poverty. It is necessary to determine the direction of causality, but this is a difficult task that has not been solved yet due among other things to the unavailability of better data, especially panel data in developing countries. What we will try to do in this study is to get an approximation about the determinants of poverty, even if they could more properly be called the correlates of poverty.

We also need to separate the effects of correlates. For example, if we find that poverty is highly correlated with rural location, and rural location is highly correlated with low education, then we need to know how much poverty is due to rural location and how much is due to low education. We approach this problem through the use of multivariate analysis, using a logistic regression. In order to explore the correlates of poverty with the variables thought to be important in explaining poverty a logistic regression model was estimated, with the dependent variable being the dichotomous variable of whether the household is extremely poor (1) or not extremely poor (0). The explanatory variables considered in the analysis were: gender, age, education and position in occupation of the household head, and size and location (rural or urban) of the household.

In this model, the response variable is binary, taking only two values, 1 if the household is extremely poor, 0 if not.

$$\text{Prob}(Y = 1) = \frac{e^{\beta' x}}{1 + e^{\beta' x}}$$

The probability of being extremely poor depends on a set of variables $\mathbf{x}$ so that:

$$\text{Prob}(Y = 1) = F(\beta' \mathbf{x}), \qquad \textbf{(1)}$$

$$\text{Prob}(Y = 0) = 1 - F(\beta' \mathbf{x}) \qquad \textbf{(2)}$$

Using the logistic distribution we have:

(3)

(4)

E[y | x] ? 0[1 - F(ß ' x)] ? 1[F(ß ' x)]
? F(ß ' x)

Where ? represents the logistic cumulative distribution function.
Then the probability model is the regression:

(5)
(6)

3.2. Empirical Results

The estimated regression is shown in Table 1. Except for the variables of being an entrepreneur or a member of a cooperative, all of the coefficients in the regression are significantly different from zero at the 95 percent confidence level. The variables that are positively correlated with the probability of being poor are: being a female household head, size of the household, living in a rural area, working in agriculture, working without remuneration and being self-employed. The variables that are negatively correlated with the probability of being poor are: having at least one year of primary education, having completed primary education, having at least a year of secondary education, having at least a year of preparatory school (senior high school) and having at least a year of college. Besides education, other variables negatively correlated with poverty are age of the household head and being a small entrepreneur.

The

variables in Table 4 are defined as follows:

Dependent Variable:

POBALIM	Binary variable indicating whether a household is below the extreme poverty line or not (1 if extremely poor, zero if not).

Independent Variables:

FEMALE	Binary variable indicating whether the household head is female or male (1 if female, zero if male).
RURAL	Binary variable indicating whether a household is located in a rural area (less than 15,000) or in an urban area (1 if located in rural area, zero if not).
HHSIZE	Size of the household.
AGE	Age of the household head.
AGWORKER	Binary variable indicating whether the household head works in agriculture or not.
WHOPMTWORKER	Binary variable indicating whether the household head receives payment or not.
COOPMEMBER	Binary variable indicating whether the household head works as a member of a cooperative or not.
SELFEMPLOYED	Binary variable indicating whether the household head is self-employed or works in the household without receiving remuneration or not.
SMALLENTRPNR	Binary variable indicating whether the household head is a small entrepreneur (employing from 1 to 5 workers) or not.
ENTREPENEUR	Binary variable indicating whether the household head is a large entrepreneur (employing more than 5 workers) or not.
INCELEM	Binary variable indicating whether the household head has incomplete elementary education or not.
COMPELEM	Binary variable indicating whether the household head has completed elementary education or not.
ATLSOMEHS	Binary variable indicating whether the household head has at least a year of high school or not.
ATLSOMEPREP	Binary variable indicating whether the household head has at least a year of senior high school or not.
ATLSOMEUNIV	Binary variable indicating whether the household head has at least a year of college or not.

3.3 Marginal Effects and Odds Ratios

Since the logistic model is not linear, the marginal effects of each independent variable on the dependent variable are not constant but are dependent on the values of the independent variables (Greene, 1993). For the logistic distribution we have:

$$\frac{d\Lambda[\boldsymbol{\beta}'\mathbf{x}]}{d(\boldsymbol{\beta}'\mathbf{x})} = \frac{e^{\beta'x}}{(1+e^{\beta'x})^2} = \Lambda(\boldsymbol{\beta}'\mathbf{x})[1-\Lambda(\boldsymbol{\beta}'\mathbf{x})]\boldsymbol{\beta} \qquad \textbf{(7)}$$

Thus, as opposed to the linear regression case, it is not possible to interpret the estimated parameters as the effect of the independent variables upon poverty. However, it is possible to compute the marginal effects evaluating expression (7) at some interesting values of the independent variables, such as the means of the continuous independent variables and for some given values of the binary variables. This is the procedure we will use in the next sub-sections to draw graphs showing the effect of the independent variables on poverty.

Another way to analyze the effects of the independent variables upon the probability of being poor is by looking at the change of the odds ratio as the independent variables change. The odds ratio is defined as the ratio of the probability of being poor divided by the probability of not being poor. Table 2 shows the odd ratios for each independent variable as well as its corresponding standard error and confidence intervals, with the variables' labels being the same as in Table 4.1

TABLE 2. ODDS RATIOS ESTIMATES OF POVERTY DETERMINANTS

Logit estimates	Number of obs	=	13727
	LR chi2(15)	=	3461.91
	Prob > chi2	=	0.0000
Log likelihood = -4919.9798	Pseudo R2	=	0.2603

SELFEMPLOYED	2.48913	.1549159	14.65	0.000	2.203289 2.812055
SMALLENTRPNR	.6367946	.1035595	-2.78	0.006	.4629901 .8758447
ENTREPENEUR	.9133534	.3795089	-0.22	0.827	.4045338 2.062163
INCELEM	.4918647	.0360487	-9.68	0.000	.4260505 .5678455
COMPLEM	.3135309	.026338	-13.81	0.000	.265935 .3696453
ATLSOMEHS	.2061812	.0193256	-16.85	0.000	.1715794 .2477611
ATLSOMEPREP	.0984982	.0147575	-15.47	0.000	.0734339 .1321173
ATLSOMEUNIV	.0360126	.0081944	-14.61	0.000	.0230553 .0562522

As can be seen in the Table, the variables FEMALE, HHSIZE, RURAL, AGWORKER, WHOPMTWORKER and SELFEMPLOYED have odd ratios greater than one, which means that these variables are positively correlated with the probability of being poor.

On the contrary, the variables AGE, SMALLENTRPNR, INCELEM, COMPELEM, ATLSOMEHS, ATLSOMEPREP and ATLSOMEUNIV all have odd ratios lower than one, which means that these variables are negatively correlated with the probability of being poor.

The confidence interval for the odd ratios of COOPMEMBER and ENTREPENEUR includes the number one, which means that these variables have no statistically significant effect on the probability of poverty.

3.4. Poverty and Gender

Several studies have discussed the phenomenon of the feminization of poverty, which is said to exist if poverty is more prevalent among female-headed households than among male-headed households. This situation might be due to the presence of discrimination against women in the labor market, or it might be due to the fact that women tend to have lower education than men and therefore they are paid lower salaries. Using a different methodology than the one used in this chapter, Székely [1998] found no evidence that female-headed households are more likely to be poor than male-headed households. Using a logistic regression and the 1992 National Survey of Income and Expenditures, Cortés [1997] finds that the probability of being poor decreases by six percent if the household is headed by a woman.

Looking at the results of the logistic regression estimated above, it can be seen that the probability of being poor increases if the household head is female, although the marginal effect of this variable is relatively small.

Figure 1 shows the probability of being poor for male and for female-headed households. This graph is drawn based on the following assumptions about the values of the independent variables: the household head is 43.9 years old (the sample mean for this variable), the household is located in a urban area (63.5 percent of the households in the sample are located in a urban area), the household's head did not complete elementary education (the most representative education level of household heads in the sample) and the household head occupation is "not agricultural worker" (55.4 percent of the sample) .

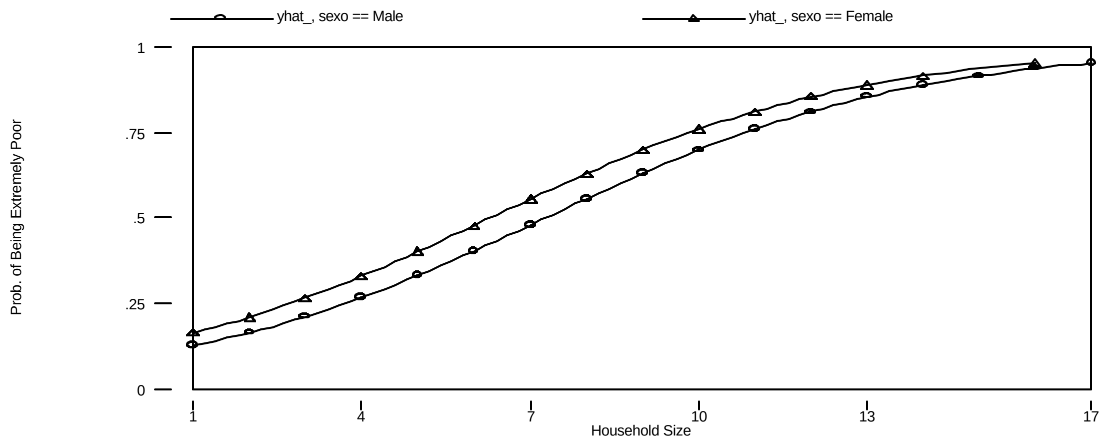

FIGURE 1. PROBABILITY OF BEING POOR AND GENDER OF THE HEAD

3.5. Poverty and Age

It is argued that poverty increases at old age as the productivity of the individual decreases and the individual has few savings to compensate for this loss of productivity and income. This is more likely to be the case in developing countries, where savings are low because of low income. However, the relationship between age and poverty might not be linear, as we would expect that incomes would be low at relatively young age, increase at middle age and then decrease again. Therefore, according to life-cycle theories we would expect to find that poverty is relatively high at young ages, decreases during middle age and then increases again at old age.

For the case of Mexico and based on the 1984, 1989 and 1992 Surveys, Székely [1998] finds that age of the head is not relevant in explaining poverty. However, using the 2002 survey and the methodology developed above we found that age of the head is statistically significant in explaining poverty, although the effect is not very strong, since as can be seen in Table 2 above, an increase of one year in the age of the head decreases the odds of being poor by only 3.6 percent.

As Figure 2 shows, the probability of being poor decreases with age. This graph is drawn based on the following assumptions about the values of the independent variables: household size is 4.1 members (the mean for this variable in the sample), the household head is male (80 percent of the households in the sample are headed by men) the household is located in a urban area, the household's head did not complete elementary education, and the household head occupation is "not agricultural worker"

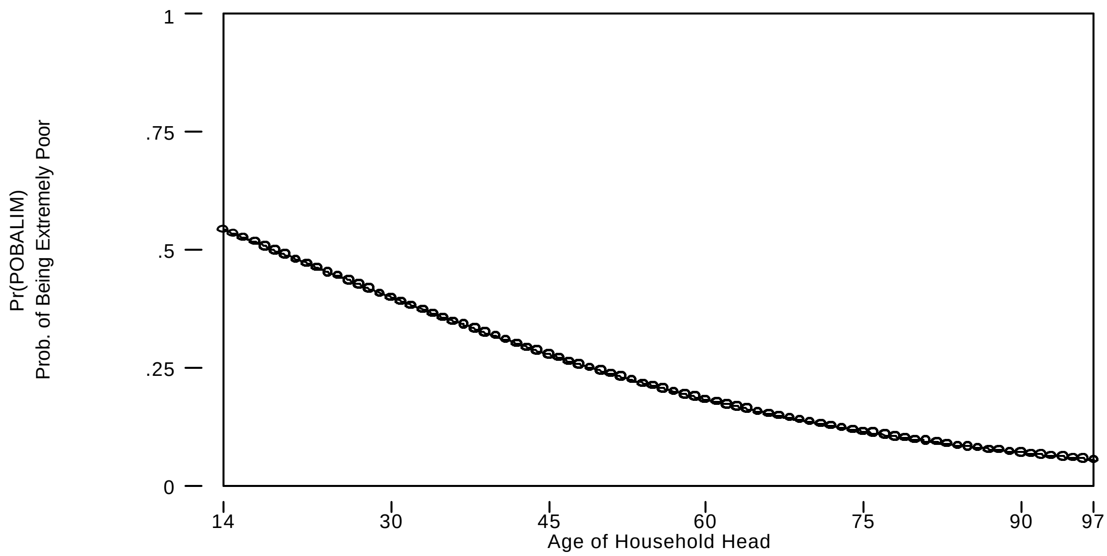

FIGURE 2 PROBABILITY OF BEING POOR AND AGE

3.6. Poverty and Household Size

Large households tend to be associated with poverty [World Bank (1991a,b), Lanjouw and Ravallion (1994)]. The absence of well developed social security systems and low savings in developing countries will tend to increase fertility rates, especially among the poor, in order for the parents to have some economic support from the children when parents reach old age. It might be rational for them to increase the number of children in order to increase the probability that they will get support when they get old. High infant mortality rates among the poor will tend to provoke excess replacement births or births to insure against high infant and child mortality, which will increase household size [Schultz, 1981].

For Mexico's case Székely [1998], using the 1984, 1989 and 1992 Surveys, found that household size is relevant in explaining poverty, while Cortés [1997], based on the 1992 Survey, found a direct relationship between poverty and the burden of dependency. Using the 1996 data, we obtained similar results since, as can be seen in Table 4.2 above, an increase of one in the size of the household increases the odds of being poor by 41 percent**.**

Fig. 3 shows the probability of being poor as the size of the household increases from its minimum to its maximum, assuming that the independent variables take the following values: the household head is 43.9 years old, the household head is male the household is located in a urban area, the household's head did not complete elementary education , and the household head occupation is "not agricultural worker".

It can be seen in Fig. 3 that the effect of a change in household size upon the probability of being extremely poor is pronounced, and that this effect increases relatively rapidly up to a household size of around 10 members and then increases less rapidly up to the maximum household size of 17. Since 95 percent of households have between 1 and 9 members, the first part of the curve is the most relevant, which implies that household size has a strong correlation with poverty in Mexico,

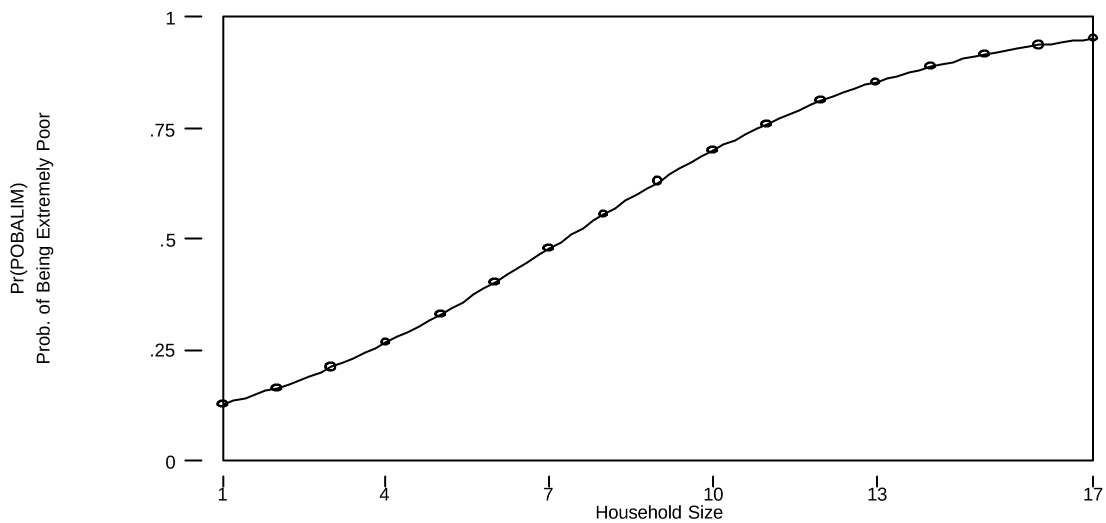

FIGURE 3 PROBABILITY OF BEING POOR AND SIZE OF THE HOUSEHOLD.

3.7. Poverty and Rural-Urban Location

One of the most salient facts about poverty in developing countries is that it is higher in rural areas than in urban areas. The World Bank [1990] reports that the rural poverty rate was higher than the urban poverty rates for many developing countries during the 1980's. For example, in Kenya the rural poverty rate was six times the urban poverty rate, while in Mexico it was 30 percent higher during the same period. Although there may be problems associated to determining the direction of causality, several variables might explain why poverty is higher in rural areas than in urban areas. First, rural areas are heavily dependent on agricultural production, which in developing countries is characterized by low labor productivity and therefore low incomes. Second, historically government policy has been biased against rural areas, including price policy, educational policy, housing, and public services in general. Third, natural disasters such as drought or flooding tend to affect rural areas more heavily than they affect urban areas, and although at first we might think that these phenomena would only affect transient poverty they affect the stock of capital of the communities which in turn have a permanent adverse effect on poverty rates.

By constructing a poverty profile using the 1984 Survey, Levy [1994] concludes that poverty in Mexico is a predominantly rural phenomenon characterized by higher poverty rates in rural areas than urban areas. Cortés [1997] finds that the probability of being poor increases if the household is located in a rural area. Székely [1998] also concludes that rural-urban location is statistically significant as a cause of poverty in Mexico.

Our own estimates using the logistic regression for the 2002 survey indicate that rural location has a statistically significant positive effect on the probability of being poor. As shown in Table 2, the odds of being poor for a household located in a rural area are more than twice the odds of an urban household.

Fig. 4.4 shows the effect of the size of the household and rural/urban location of the household upon the probability of being poor assuming that the independent variables take the following values: the household head is 43.9 years old, the household is located in a urban area the household's head did not complete elementary education and the household head occupation is "not agricultural worker".

It can be seen from the graph that the probability of being poor is significantly higher for a household located in a rural area than for one located in an urban area.

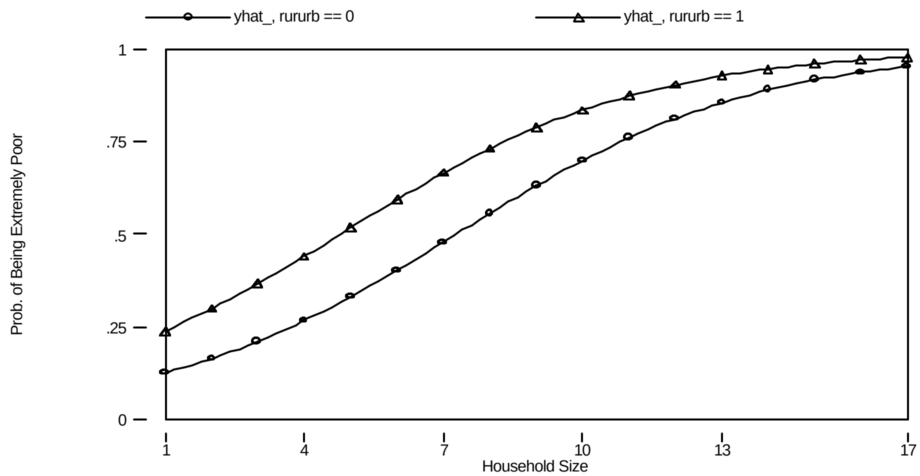

Figure 4. PROBABILITY OF BEING POOR AND RURAL/URBAN LOCATION.

3.8. Poverty and Position in Occupation

Position in occupation of the household head has a high correlation with poverty because positions which require low amounts of capital, either human or physical, will be associated with low earnings and therefore with higher poverty rates. In our model we found that working in agriculture, working without remuneration and being self-employed worker increases the probability of being poor, while being a small entrepreneur decreases such probability. Fig. 5 shows the effect of the position in occupation variable on the probability of poverty, based on the following assumptions about the values of the independent variables: household head is 43.9 years old, the household head is male, the household is located in a urban area, and the household's head did not complete elementary education. It can be seen from the graph that the probability of being poor is higher for households heads working without remuneration and for heads working in an agricultural occupation and it is lower for households whose head is a small entrepreneur.

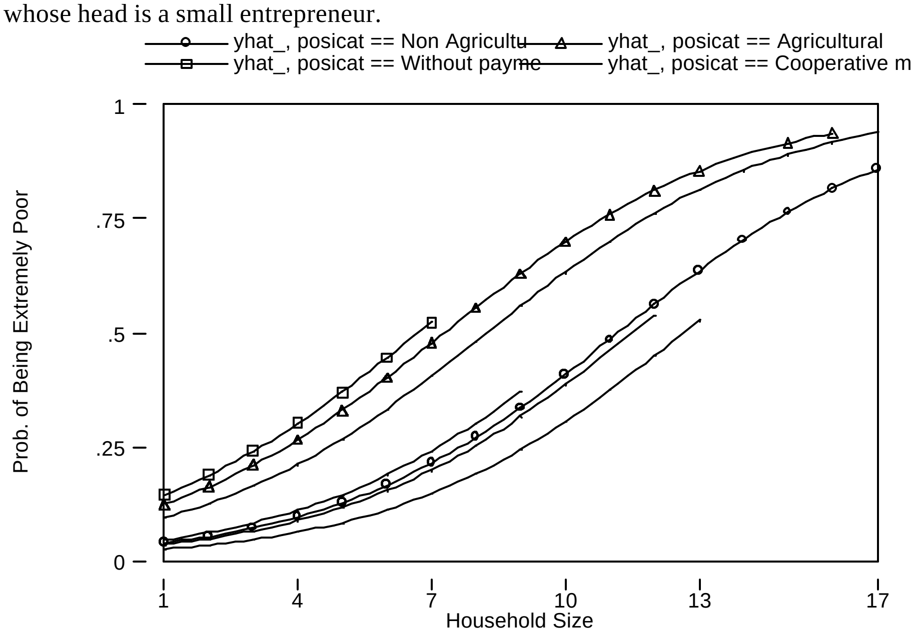

FIGURE 5 PROBABILITY OF BEING POOR AND POSITION IN OCCUPATION

3.9. Poverty and Education

There is generalized evidence in household surveys and censuses that education is positively correlated with earnings [Schultz (1988); Psacharopoulous (1985); Blaug (1976)]. Higher earnings in turn are associated to lower poverty levels.

Education increases the stock of human capital, which in turn increases labor productivity and wages. Since labor is by far the most important asset of the poor, increasing the education of the poor will tend to reduce poverty. Thus, we might think of low education as one of the most important causes of poverty. In fact, there seems to be a vicious circle of poverty in that low education leads to poverty and poverty leads to low education. The poor are not able to afford their education, even if it is publicly provided, because of the high opportunity cost that they face. Many times they cannot attend school because they have to work to survive.

Both Székely [1998] and Cortés [1997] found that education is negatively correlated with poverty in Mexico. Székely reaches the conclusion that education is the single most important factor in explaining poverty in the country. The regression estimated in this chapter also finds that education has a significant effect on the probability of being poor.

Fig. 6 shows the effect of the level of education on the probability of poverty, assuming that the other independent variables take the following values: the household head is 43.9 years old, the household head is male, the household is located in a urban area, and the household head occupation is "not agricultural worker".

Fig. 6 shows that the probability of being poor decreases as the level of education increases.

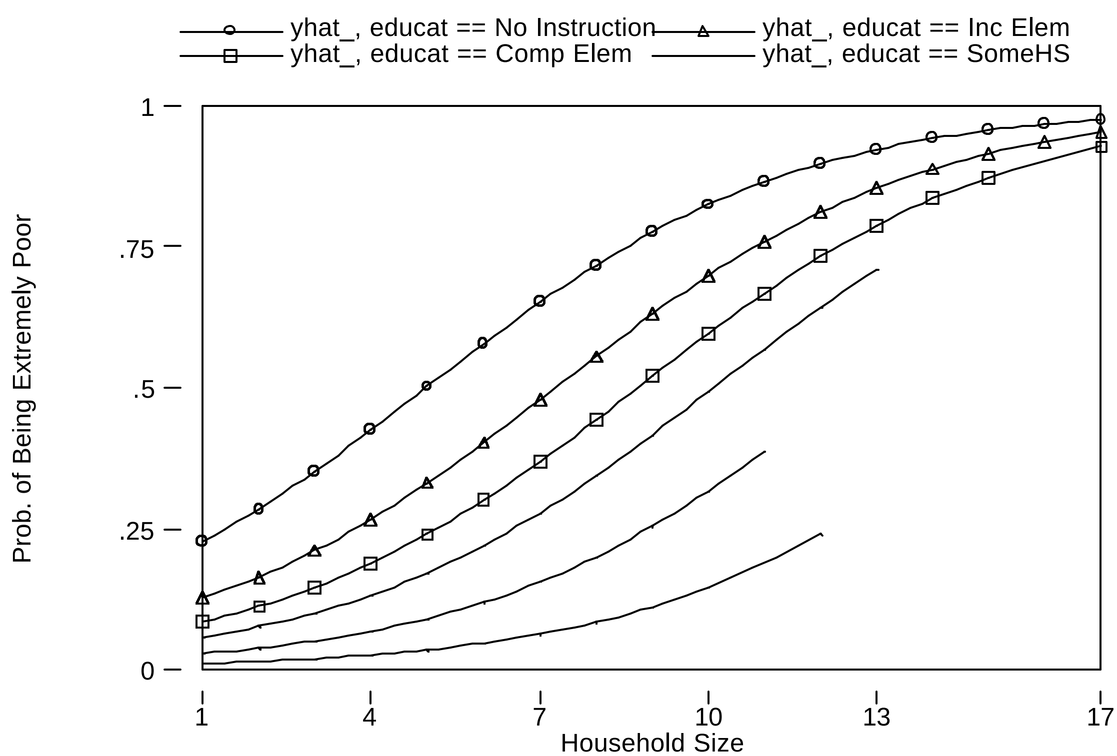

FIGURE 6   PROBABILITY OF BEING POOR AND EDUCATION

3.10. Summary of Findings

The estimates from the logistic model estimated in this chapter indicate that the probability of poverty is higher for female-headed households, for households whose head has a low level of education and for households located in rural areas. Other variables that increase the probability of being poor are the size of the household and if the household head works in agriculture or is self-employed.

4. Conclusions

Reflecting the results obtained by Garza-Rodriguez [2000] in the construction of poverty profiles, the multivariate analysis developed in this study shows that the variables that are positively correlated with the probability of being poor are: size of the household, living in a rural area, working in an agricultural occupation, having a female household headship, having a not remunerated occupation and being self-employed.

The multivariate analysis shows that increases in educational attainment have an important impact on reducing the probability that a household is poor. The five binary variables for education representing increasing levels of educational achievement show that as educational achievement increases, the probability of being poor decreases.

The logistic model shows that a rural family has a high probability of being poor. Even when controlling for education, the size of the household, and the other independent variables in the regression equation, the rural/urban variable is statistically significant and this variable increases the odds of a household being poor significantly. We can only speculate what factors, in addition to poor education and a large household, result in rural poverty. The migration from rural to urban areas is probably selective of the most ambitious and entrepreneurial persons, leaving the less ambitious and less entrepreneurial household heads in the rural areas. These household heads are more likely to be poor.

Government policy also may contribute to rural poverty beyond the effect of poor education by providing fewer resources to rural residents for services such as medical care and by policies that reduce the incentives to increase agricultural production. Poor medical care, which includes problems in the delivery of contraceptive supplies and services, may contribute to the larger household size in rural areas [Chen, Jain-Shing A.; Hicks, W. Whitney; Johnson, S.R.; Rodriguez, Raymundo C., 1990].

Suggestions for further research include the construction of poverty profiles at the state and regional levels, but this task could only be possible if INEGI expands the ENIGH Surveys to make them representative at the state and regional levels. Likewise, the availability of panel data is badly needed in order to be able to construct better models of the determinants of poverty in Mexico.

Urban Health Insurance System Reform in China

Xiaohui Liu
University of International Business and Economics (UIBE), China

Abstract

In 1998, the Chinese government began to carry out the urban health insurance system reform program nationwide. The contents of this article can be divided into four parts: first of all, a theoretical discussion is given about the reasons why the government attach importance to the medical insurance system reform; secondly, a description is given about the historic background and detailed contents for China's urban health insurance system reform; and finally, an analysis is given about the existing problems in the process of China's urban health insurance system reform, including the increase of medical expenses, the increase of personal health expenditure, and risks of the medical insurance fund, etc. This article concludes that in order to minimize consumers' health risks, it is necessary to further improve the urban health insurance system.

1. Introduction

In 1993, the State Council of China decided to initiate a reform program on the Government Insurance Scheme and Labour Insurance Scheme in China that had been in existence for over 40 years, and to implement an urban health insurance system. On January 1, 1995, the State Council started the experimental health insurance reform program in some cities. In 1998, the Chinese government began to carry out the urban health insurance system reform program on a nationwide basis.

The contents of this article can be divided into four parts: first of all, a theoretical discussion is given about the reasons why the government attach importance to the health insurance system reform; secondly, a description is given about the historic background and detailed contents for China's urban medical insurance system reform; and finally, an analysis is given about the existing issues in the process of China's urban medical insurance system reform, including the increase of medical expenses, the increase of percentage of the medical expenses paid by individual consumers, and risks of the medical insurance fund, etc. This article concludes that in order to minimize consumers' risks in the area of medical services, it is also necessary to further improve the urban medical insurance system.

2. Reasons why the government attach importance to the health insurance system reform-a theoretical review

Unlike other products such as foods, houses, etc., medical services have unique requirements with the following characteristics [5]: Firstly, the demand for medical services is discrete, sporadic, and unpredictable, so it is very hard to make sure that you have the ability to pay when you need to buy the medical service; Secondly, for consumers, especially those consumers who are inpatients or suffer chronic illness, the cost of the health care service may be very expensive; Thirdly, many poor people do not have the ability to pay for medical services, however they have greater needs for medical services due to the fact of their lower level of living standard, lack of proper nutritional elements, etc. Sometimes, an illness can result in a poor man completely losing the capacity of making a living.

Given the special nature of the medical services demand and the fact that most consumers are risk averse, [3], it is necessary to provide consumers with health care insurance policies to help them spread and share the risks and increase their expected utility.

In reality, governments of many countries carry out reforms on health insurance systems primarily for three major purposes: to reduce the risks of consumers, to utilize the resources more efficiently, and to achieve the goal of equity.

2.1 Reduction of consumer risks

The health insurance system can reduce the payment risks of consumers, because a health insurance policy can help consumers spread the risks over their life time and avoid the situation that they have to make payment in a lump sum; and on the other hand, the health insurance system can pool the risks among members of our community so that risks can be shared between the young and the old, the poor and the rich, the relatively healthy population and the relatively unhealthy population.

2.2 Market failure in the health insurance sector

The existence of information asymmetry is the major factor that leads to market failure. Firstly, the existence of information asymmetry can cause moral hazard [2].

Moral hazard is primarily reflected in two aspects. On the one hand, since the signing of an insurance policy contract is based on the health expenditure rather than the health needs of the people, some consumers may have an incentive to over-consume medical services after purchasing their insurance policies; on the other hand, some consumers may, after purchasing their health insurance policies, lack the protective precaution awareness and behavior to prevent risks from happening, thus leading to increased likelihood of risks taking place. The presence of moral hazards can force the insurance companies to reduce the supply of health insurance, thus leading to the result that the supply of health insurance cannot reach the Pareto optimum level.

Secondly, the existence of information asymmetry can cause adverse selection [1]. The individuals facing the insurance companies could be classified into two groups: the high-risk individuals (greater possibility of getting ill and more finance risks) and the low-risk individuals (they show smaller possibility of becoming ill and less finance risks). When there are several insurance policies available on the marketplace, the insurance companies can charge higher prices against the high-risk individuals and charge lower prices against the low risk individuals, all individuals will have some health insurance. However, when there is only one health insurance policy available on the marketplace, the insurance companies can only set up a same universal price against individuals having different levels of risks. As a result, individuals with low risk will have to exit the insurance market, and insurance companies will also likely incur losses. In reality, governments of many countries will provide the high-risk individuals with some health insurance programs.

2.3 Equity

Different people will face different health risks, the people facing greater health risks will need more medical services, thus resulting in a reduction of their available budget set. In practice, uniform pricing of insurance policies across individuals can make redistribution from low risks to high risks. Of course, if private insurance companies impose uniform prices, adverse selection will be inevitable. In this case, intervention by the government will be necessary.

3. China’s urban health insurance system reform

3.1 Background of China’s urban medical insurance system reform

China’s urban medical security system was originally established during early 1950’s.

In 1951, China began to implement the Labor insurance Scheme1, and the purpose of this scheme was to cover the health insurance for the workers at state owned enterprises and their dependents. All the medical expenses incurred were completely reimbursed by their employers.

In 1952, China began to provide the Government Insurance Scheme for government employees, university teachers and student2 The Government Insurance Scheme was government-financed insurance and people covered by it can get free medical services.

Strictly speaking, both Government Insurance Scheme and the labour Insurance Scheme are only welfare systems instead of insurance systems. During the early years after the birth of new China, the two schemes had indeed allowed some urban consumers to enjoy free or cheap medical services. By the end of 1997, there were about 178 million people covered by the Government Insurance Scheme in China.3

As time moves on, however, the drawbacks of the schemes become exposed. First, the goal of equity could not be achieved. The coverage is limited both in the Government Insurance Scheme and in the Labour Insurance Scheme. By 1993, there were only 172 million people across China covered by the Government Insurance Scheme. A large number of the urban population had to pay medical services out of their pocket.

Furthermore, given the significant differences between individual enterprises in such areas as the industry characteristics, number of workers, and operating conditions, the finance burdens of different enterprises are different, and the workers' wage rates are also different. For some enterprises with deficit, it was becoming increasingly difficult for them to pay the medical bills for their workers.

Second, the moral hazards became prevalent. As a universal health care financing system, the free medical service system and the labour medical insurance system allowed consumers to obtain medical services for free. As a result, the moral hazards became prevalent. People had incentives to over consume medical services. When a person was covered by one of the two systems, all the family members could have a chance to get free medicines. This not only led to the waste of the medical resources, but also increased the financial burdens on both the government and the enterprise.

During the period 1978-1997, the medical costs of workers in China increased from 2.7 billion yuan RMB to 77.4 billion yuan, showing a sharp rise of 28 times and an annual growth of about 19%, while the nationwide financial revenue during the same time only increased by 6.6 times, equivalent to annual growth of roughly 11%. The growth speed of medical costs of workers had been faster than that of the financial revenue.4

In order to solve the above problems mentioned above, the State Council in 1993 decided to reform the two insurance schemes, and implement a health insurance system for urban employees. On January 1, 1995, the Chinese government carried out an initial experimental reform program in areas like Zhenjiang City, Jiangsu Province, and then in 1996 further expanded experimental reform programs in 56 cities around China. In 1998, the State Council issued the "Decision of the State Council on Establishing the Basic Medical Insurance System for Urban Workers", started a nationwide reform on the urban health insurance system.

3.2 Main contents of urban health insurance system reform

According to the "Decision of the State Council on Establishing the health Insurance System for Urban Employees" issued in 1998, the urban medical insurance system reform in China primarily includes the following contents:

First, the goal of reform is to make all the urban employers and their employees to participate in the basic medical insurance system, and to provide the primary medical services for urban consumers.

Second, both the employers and their employees should pay for the health insurance premium. The ratio of payment by the employers will be about 6% of employees' wage income, and that by their employees will be basically 2% of their wage income.

Third, the health insurance fund will be comprised of the social insurance fund and personal medical saving accounts. The premium paid by employees will be entirely debited into their personal saving accounts. The premium paid by employers will be divided into two portions, where one portion will be used to establish social insurance fund, and the other portion will be debited into personal medical accounts. Both the principal and interests of medical accounts will belong to the ownership of individual employees, and can be settled, transferred, utilized, and succeeded.

Fourth, the reimbursement standard and the maximum reimbursement limit of social health insurance fund are set. Medical expense will be paid by medical saving account or out of employees' pocket when it is below the reimbursement standard. The medical expense both above the reimbursement standard and below the maximum reimbursement limit will be mainly paid from the social health insurance fund ,and the employee will also need to undertake a certain percentage. The medical bills greater than the maximum reimbursement limit can be resolved and paid through other means like commercial insurance providers.

Fifth, retired employees who are now members of the medical insurance system don't need to pay any medical insurance premium.

Sixth, it is allowed to establish complementary medical insurance programs in enterprises. The new urban workers-oriented medical insurance system allows more people to have the chance to participate in the social medical insurance system, and can resolve the moral hazards problem to a large extent. By the end of 2002, many cities and towns in China implemented the medical insurance system, which was participated in by 94 million people, including 69.26 million in-service employees and 24.74 million retired workers,[5] amounting to 37.9% of urban employees and 18.7% of urban population in China.[6]

4. Some comments on China's urban health insurance reform

China's urban insurance system is not perfect, and there are some shortages with it. First: the number of people covered by the urban health insurance system is limited. At present, there are still a large number of urban people not being covered in the urban medical insurance system, so they have to pay their medical expense out of their pocket, and have to face and undertake big health risks. The people not covered by the urban medical insurance system primarily include the following four groups: Employees' dependents and students; Workers under formal employment conditions, such as township enterprises and their employees, people work in the urban private enterprise, etc., which are usually not covered in practical although they indeed are within the coverage according to governmental regulations; Workers at some state-owned enterprises with financial deficit, some of them are not covered in the system due to their inability to pay the premium, although they are indeed within the coverage; Urban residents covered by the minimum income assurance program according to relevant regulations.

Second, since the reform on the medical insurance system has not changed the traditional fee-for-service practice, medical expenditure rises rapidly.

Doctors know more information than consumers do on the reasons of an illness, the effectiveness of the treatment plans, etc. In this case, the method of payment for medical services will to a large extent affect the medical expenditure. In China, most hospitals have been pursuing the fee-for service practice, which entices both hospitals and doctors to generate the motive to increase supply of medical services and make more money. This leads to the phenomenon of doctor-induced demand, i.e. the doctors attempt to increase their own income by prescribing some simply unnecessary medicines or expensive medicines or recommending the patients to do some unnecessary expensive examination.

For example, the average medical expense per outpatient in general hospital of Health Sector increased from 39.9 yuan in 1995 to 99.6 yuan in 2002, showing a growth rate of 149.6%; and the average medical expense per inpatient in general hospitals of health sector increased from 1667.8 yuan in 1995 to 3597.7 yuan in 2002, growing 115.7%.[7] Table 1 shows the consumer price index and the price index of medical services in China.

TABLE 1 CONSUMER PRICE INDEX (PRECEDING YEAR=100)

	1995	**1996**	**1997**	**1998**	**1999**	**2001**
Consumer Price Index	117.1	108.3	102.8	99.2	98.6	100.7
Medical Articles	111.3	109.3	104.7	102.8	100.9	100.3
Health Care Services	111.1	112.4	122.9	117.2	111.7	110.5

Resource: National Statistics Bureau in China

As shown in Table 1, the consumer price index has been initially increasing year-on-year since 1995, but the annual growth rate is less than 8%. Since 1998, the consumer price index began to decrease, and did not gain any slight rise until 2001; however, the price index of medical services has been increasing each year at a growth rate over 10%, and even gained a sharp rise of 22.9% in 1997 than that of the previous year.

From mid August 2002 to the end of October 2002, in order to obtain a true understanding about the comments and evaluations of Chinese residents on the prices of medical services, the China Economic Prospect Monitoring and Measurement Center did a questionnaire survey on over 700 permanent residents in Beijing, Shanghai, and Guangzhou. 66.8% of the consumers surveyed believed that the current prices of medical services were relatively higher; 17.6% and 65.8% of all respondents were very worried or worried about the high expenses they will have to pay in the future for medical services and medicines[8]. Obviously, the increasing prices of medical services and the increasing medical expenses have already become an important consideration that consumers are increasingly worried about.

Third, the personal health expenditure rises rapidly. In the Government Insurance Scheme and the Labour Insurance Scheme, consumers did not need to pay any or only needed to pay a little medical expense. In contrast, the consumers covered by the urban medical insurance system will have to pay more for medical services. On the one hand, this will reduce “moral hazards” problem of excessively abusing medical services resources. But, one the other hand, this will lead to more economic burdens on the consumers with lower wage income, especially the outpatients with the chronic illness (according to the regulations in many cities, the outpatient expenses have to be paid out of their medical accounts or directly out of their pockets) and inpatients with severe disease.

As shown in Table 2, since the 1990’s, the percentage of personal health care expenses in the overall health care expenditure has been rapidly increasing. In 1995, the total expenditure of personal medical expenses in China was 34.52 billion yuan, amounting to 38.8% of the total expenditure of medical expenses; in 2001, the total personal medical expenditure was 311.33 billion yuan, amounting to 60.5% of the total expenditure of medical expenses.

TABLE 2 HEALTH EXPENDITURE IN CHINA

	1991	1995	2001
Total Health Expenditure (100 million yuan)	888.6	2257.8	5150.3
Government Health Expenditure	202.3	383.1	800.6
Social Health Expenditure	341.1	739.7	1236.4
Personal Health Expenditure	345.2	1135.0	3113.3
% of Health Expenditure	100.0	100.0	100.0
Government Health Expenditure	22.8	17.0	15.5
Social Health Expenditure	38.4	32.7	24.0
Personal Health Expenditure	38.8	50.3	60.5

Resource: Ministry of Health in China

Today, China is still a developing country, and the income of Chinese people is still low. The implementation of personal medical accounts can only work as a mechanism for risk spreading rather than for risk pooling. The increasingly growing personal expenditure is therefore much more against the original purpose of reducing risks with the social insurance system.

Fourth, the aging population is bringing risks to health insurance fund in China. At present, many people covered by the urban health insurance system in China are old people. The reasons can be divided into two aspects: First, the life expectancy of the Chinese population continues to become longer in line with growth of the social economy, improvement of people’s living standard, and advances of medical technology, thus leading to the quite significant phenomenon of aging population. The percentage of the elderly people aged 65 and above in the total population increased from 4.4% in 1953 to 7% in 2000, as shown in Table 3.

TABLE 3 NUMBER OF POPULATION ON NATIONAL POPULATION CENSUS

	1953	1964	1982	1990	2000
Mainland in China (million people)	582.603417	694.581759	1008.175288	1133.682501	1265.830000
% of Population By Age Group					
0-14	36.3	40.7	33.6	27.7	22.9
15-64	59.3	55.7	61.5	66.7	70.1
65+	4.4	3.6	4.9	5.6	7.0

Resource: National statistics bureau in China

Second, the percentage of in-service employees covered by the insurance policy continues to decrease relatively, in line with the deepening reform on the corporate ownership system and the adjustment of the industrial structure, which have resulted in restructuring, reorganizations, mergers, and even bankruptcies of some state-owned enterprises, thus further leading to early retirement of some active workers and employees and increase of the unemployed people.

In Zhenjiang City, for example, which is one of the first to implement the experimental reform program on the medical insurance system, from 1995 to 2001, the percentage of active employees covered by the total insurance policy dropped from 79.92% to 71.63%, while the percentage of retired workers and employees rose from 19.01% to 27.4%.9 It is worthy of notice that the absolute number of active workers and employees also decreased from 216644 people in 1995 to 200152 people in 2001.

TABLE4 NUMBER OF WORKERS PARTICIPATING SOCIAL INSURANCE IN ZHENJIANG CITY

	1995	1997	1998	1999	2000	2001
Total people (thousand people)	273.583	279.333	275.112	262.284	263.882	279.423
In-service workers (thousand people)	216.644	218.146	210.324	197.065	194.560	200.152
% of total people	79.2	78.1	76.45	75.13	73.73	71.63
Retired workers	52.011	58.283	61.976	62.429	66.601	76.564
% of total people	19.01	20.87	22.53	23.80	25.24	27.40

The number of retired workers continues to increase, and this will create a negative impact on collection of the money for the medical insurance fund, because it is the active workers and employees who are paying premium for the medical insurance fund and retirees do not need to pay anything for this insurance fund in China. on the other hand, this will also cause the demand for the medical insurance fund to grow, because retirees have a higher incidence of diseases. This will pose very great pressure and risks on the income and expenses of the medical insurance fund. In 2001 alone, a total of 48.42% of the total medical insurance fund was used by those retirees in Zhenjiang City who amounted to only 27.67% of the total insurance policy subscribers population, as shown in Table 5.

TABLE 5 ZHENJIANG CITY 2001 MEDICAL EXPENSES STRUCTURE

	Total medical expenses	Medical expense per capita	Expense Structure (%)	Population Structure (%)
In-serviceworkers(yuan)	134713666	673.05	51.58	72.33
Retiredworkers(yuan)	126457399	1651.66	48.42	27.67
Total(yuan)	261171065	943.82	100.00	100.00

It is necessary for the government to expand the coverage of urban health insurance and to allow more young people to take part in the social insurance program in order to make the social insurance system work better.

5. Conclusions

The key objectives of health scheme in a country include: to introduce and establish a medical services utilization system that is highly efficient in the community; to pool risks among the individuals; to spread risk in the life time of a person; and to allocate resources as needed.

Today, the reform on the medical insurance system for urban workers and employees in China can not share and spread risks for consumers very well, and there exists fund risks. The government should expand the coverage of the insurance policy, allow more urban people, especially young people, to be able to participate in the health insurance system. The governments should also design and develop different health insurance policies to meet the needs of different people.

Industry Strategy Meets Civil Society in Asia: Confronting Regulation of Cross-Border Media

Amos Owen Thomas
Griffith University, Australia

Abstract

In many post-colonial countries, domestic television has long neglected cultural minorities which transnational television subsequently successfully targeted. Characteristically, governments in Asia have sought to dominate domestic television and control access to transborder television out of nationalism and paternalism. But audiences and entrepreneurs have circumvented such policies, aiding the phenomenal growth of the cross-border medium. Over the 1990s the domestic television industry throughout Asia was transformed by this new competition, and belated media deregulation seems to have led to alliances between big business and political power. This paper seeks to demonstrate that such developments have been primarily commercially and technology driven, and calls for a greater role of public ethics and civil society in formulating media policy.

Introduction

Many Asian governments view the state as constituting or at least incorporating civil society, and thus co-opting its socio-political groupings in a paternalistic manner. The media then are seen as subservient to the cause of nation-building as defined by government, and in many countries domestic public television was pressed into service of this cause. Even satellite television was harnessed to reach the remote corners of far-flung national territories nationalistic development programming. Thus most governments in Asia have felt threatened by the advent of transborder television and endeavoured via various means to control access to it. The countries most threatened were those which had the strongest ideological commitments to national cultural and political integration, and/or centralist social and economic planning.

Realising that their various current media regulations had failed to achieve sufficient control over citizens' access to foreign broadcasts, some governments have gone on to make concessions towards or to collude with the transnational satellite broadcasters. While some other countries simply conceded defeat by default, a rare few have welcomed the newer media, even fostering thus the renaissance of civil society last seen in their struggle for independence from colonial powers. Deregulation of the media is one of the key symptoms of the relentless economic and political globalisation that has been much in evidence in Asia as worldwide at the turn of the 21st century. Consequently there has been abdication of control by government to private enterprise, whether national or transnational. Given the latter's agenda of targeting audiences via palatable content to advertisers, there seems little promise of it nurturing, much less championing, civil society in Asia.

Framing the Issues

The notion of civil society draws from rich traditions in Western political philosophy dating from the 18th century concerning the existence of a social collectivity beyond the state. Naturally it has gained a new momentum in the post-Cold War era brought about not by confrontations between opposing states, but the undermining of nation-states by non-government social movements. In Central Europe, civil society even came to provide the legitimacy for new post-communist governments, while being rediscovered in Western nations where it was assumed to be sustained by democracy, yet has been eroded by institutional politics. Thus Seligman (1992) presses for a contemporary renaissance of the core concept of an ethical vision of social life independent of the state, amidst competing definitions of civil society towards the end of the 20th century. Yet the idea of commonality is difficult to reconcile with the ethnic heterogeneity in Central Europe or individualism of Western societies. Taking a Marxist perspective that this an over-reaction to the theory of the state, Neocleous (1996) argues that the distinction between state and civil society is false, if not redundant, citing Foucault in support of his view. Schecter (1994) elaborates that Marx saw production as the primary activity of civil society and advocated democratic decision-making in the local workplace so as to reconcile the roles of citizen and worker. Leninist-Stalinist objectives of rapid industrialisation led to the melding of capitalist forms of organisation with socialist planning. But the consequent mismanagement, bureaucracy, repression, disenfranchising of the people and eventual downfall of communist societies, the answer lies neither in free-market capitalism, social democracy nor market socialism. Schecter believes that social democracy is incompatible with capitalist production and that what is needed is a democratically-controlled economy within civil society. If this is also based largely on local-scale production and community control with transparency and consultation, there is hope no-growth economies, reduced consumption and ecological sustainability

In much of present-day Asia, as in Eastern Europe of the past, civil society is subsumed under the state as the site where the contradictions of individual freedoms and social order are reconciled. Since gaining their independence from colonialism in the 1950s and 60s, most countries were concerned about maintaing tight control over all areas of the nation. As such, the media, often public or private were co-opted into the service of the nation-state, rather than being allowed to be a means by which civil society might influence social-political policy. Characterised as it is by concentration of power, intimidation of political parties, restriction on political discourse and media controls, authoritariansim finds the idea of a healthy civil society anathema. In Africa, Healey and Robinson (1992) found little evidence of public policy resulting from competitive lobbies for resources with the state providing a neutral arena as in the West. Even when authoritarian regimes were gradually replaced in Latin America, Africa and Asia, democratisation of the media was not as forthcoming as the expanded media were often under the control of businesses driven by market imperatives if not also the agenda of political-economic elites.

The dominant capitalist ethic in the world economy values primarily the financial utility of socio-political organisation and economic exchange as measured by market prices. Famed for advocating of free-enterprise, economist Friedman (1981) argued that corporations inevitably act morally when they seek to maximise profit within the law and ethical norms overseen by a benign government. But this normative stockholder theory has not been borne out in recent times, and is far from the only alternative in business ethics. In a dissenting opinion, Freeman (1997) believed that corporations have responsibilities not just to their shareholders but all other stakeholders. These include customers, employees, communities and other individuals and groups to whom the corporation has a moral duty which he believed ought to be made a legal obligation by society. But in Humber's (2002) view, this approach provides little direction to corporations faced with the problem of identifying stakeholders and evaluating relative claims to priority. The stakeholder issue is even more problematic in the context of the transborder broadcast industry where it might include global include advertisers, program producers, ratings agencies, conglomerate shareholders, business alliance partners, community/citizen groups, non-government organisations, government departments and media-cultural policy-making bodies among others.

Dependency in Development

Under early space treaties the benefits of outer space were meant to be shared by all countries, in reality they have accrued largely to developed countries rather than the developing countries. This is because the former's commercial satellite businesses often applied pressure via their governments on the ITU, as regulator of global telecommunications, for satellite orbital slots. Besides it is difficult for ITU to allocate slots equitably because there are multiple users of each commercial satellite, each of different corporate citizenship, and also because some territories such as Hong Kong are not signatories to the space agreement. Countries like Indonesia, India and China which have used their own satellites in their assigned orbital slots to enhance their social and economic development are well within their rights. But many other countries, such as the Pacific island nations, are in no position economically to utilise effectively any slots they are entitled to but are often persuaded by business interests in the West to lobby for slots and then sublease these to them for commercial television and telecommunications purposes.

Even before the era of transnational television, communications satellites for national development purposes were recommended to the governments of Third World countries. This was done in India and Indonesia by First World governments or their surrogate IGOs, usually at the lobbying of their MNCs. But the purported benefits of national integration, administrative effectiveness, provision of educational services and of news/information, and their deliverability, may be questioned. For it is doubtful whether the medium of domestic satellite television could realistically overcome the need for local autonomy, bureaucratic centralism and inefficiencies inherited from colonial powers, and general deficiencies of finances, trained personnel and support equipment which are often characteristic of developing countries. Extensive research funded in the 1970s and 80s by the governments and their donors/sponsors did seem to reveal some positive social and economic change with the use of satellites. But the reality was more often that the somewhat minuscule change might have been achieved more cost-effectively by alternative communications media, including less glamorous traditional forms. The low cost of the latter though would have meant they could be utilised by various civil society groups and less amenable to control by the national government. So even the public broadcasters of Asia were in a dependency relationship with the First World and its MNCs for technology, well prior to the arrival of commercial transnational television via satellite and cable.

Controls versus Concessions

National governments are by their very definition nationalistic and therefore invariably fear the intrusion into their political environment of transnational satellite television over which they have little influence or control. Based on the perceived threat to its national culture, each country in the East Asia region has sought to adapt in differing ways to the intrusion of transnational satellite television. The controls exercised by governments have ranged from 'active suppression' to 'liberal access', and as evidenced in the case-studies in this book as other publications in the past decade shifts in policy have been made by Asian countries over time. A prime response of Asian governments has been some deregulation of their terrestrial-domestic television industries, as seen in Indonesia, Taiwan and Thailand, either in anticipation of transnational satellite television or in forced response to overwhelming competition from them. Subsequent political upheavals in these countries have seen these newer media play a growing role in civil society as independent information sources, for a for social debate and watchdogs, the proverbial fourth estate. In the more politically conservative countries, the preferred option has been the expansion and diversification of the government-owned or controlled media, as in the PRC, Malaysia and Singapore. While the more liberal countries such as the Philippines, Thailand and now Indonesia seem content to let market forces prevail, others like Korea and Hong Kong have adopted a 'wait-and-see' attitude, though clearly biased towards the more conservative alternative of regulation. In any case government control over access grows increasingly difficult with technological advances, such as greater power of direct-broadcast satellites making dishes for reception smaller and less detectable, and the increased streaming of television broadcasts over the Internet via broadband cable.

The consistent growth in transnational satellite television viewership, in those countries which do permit access to it, does not seem to be at the expense of domestic terrestrial television watching. Neither does advertising revenue for domestic broadcasters seem to be declining in the region, possibly due to the high economic growth among many East Asian nations except for the brief economic crisis in the late 1990s. The effectiveness of transnational satellite television in attracting domestic audiences seems to involve any single factor but the interaction of multiple factors. These include the quality of terrestrial programming versus satellite programming, cultural and linguistic barriers and pathways, access costs for consumers, economic affluence, among many others. Thus regulation may be a poor predictor of the impact of transnational satellite television, in recognition of which many governments in Asia have since deregulated their television industries. While some governments hold on to their regulations or make further pronouncements on control, most of these fail to implement them or try to, except erratically. A union of public broadcasters in the region recommended a set of ethical guidelines for transnational satellite broadcasters (Gunewardena, 1997). This call for respect of social, political and other values of the countries into which they broadcast has been largely ignored as irrelevant. With few exceptions this quasi-liberalisation in East Asian nation-states seems motivated by their push for integration into the capitalist world-economy and resignation to massive technological change in communications, rather than enlightened concerns for providing independent information, public media space or freedom of expression to diverse social groups within their societies.

Cosmopolitan or Contextualised

Transnational broadcasts in world languages such as English which StarTV provided initially and which BBC or CNN continue to are able to attract only minuscule audiences across Asia. These comprise largely expatriate executives or an urban cosmopolitan elite who are able to relate to the content and be comfortable with the language. In contrast, domestic television channels, whether public or commercial, tend to attract far larger audiences in any single Asian country than pan-Asian ones via satellite, with very few exceptions. This is simply because any country's cultural milieu invariably affects the role that television plays in it and its appeal to particular segments or the broader population. Transnational satellite broadcasters such as CNBC, HBO and Discovery realised quite soon after their entry into the Asian market that in order to command significant audiences in each country and thus attract advertisers, they had to localise or at least culturally contextualise their programming somewhat. Domestic broadcasters then discovered that in order to beat the transnationals or at least not suffer significant erosion of their audiences, they had to upgrade the quality of their locally-produced and imported programming. Another strategy was to provide or emphasise sub-national ethnic programming which the transnationals may not have expertise in doing. This is something that public domestic broadcasters have been averse to doing, as in the case of DD in India, CCTV in China or TVRI in Indonesia, because of their political mandate as public broadcasters to promote national cultural integration. The more established domestic commercial broadcasters also saw little need to in their pursuit of audience shares in a mass market, although some latter domestic commercial broadcasters and the public broadcaster DD in India have found success in catering to niche language and cultural audiences.

Transnational satellite television took off in the urban metropolitan areas of India and Taiwan because it was compatible with pre-existing practices of watching unregulated cable television. Hence the new medium could be trialed at low cost in contrast to the situation in Indonesia and Hong Kong for instance, where expensive satellite dishes or pay-TV cable had to be installed. Furthermore, transnational satellite television programming represented a quantum leap in quality over the existing programming fare on domestic television in these countries. So it represented a relative advantage to potential adopters who could observe this for themselves in advance through their social networks. Early adopters of transnational satellite television in all of these countries were culturally 'cosmopolitans' rather than 'locals', and generally financially better-off. Since it has spread to the rural towns of Asia where the audiences are largely represented by small entrepreneurs and/or landowners, a process doubtless aided by the increasing cultural contextualisation of the programming and breadth of channels. Whether transnational satellite television will become the medium of choice for the wider civil society has yet to be seen, though that is somewhat in doubt.

Symbiosis amidst Plurality

Any listing of the major transnational television broadcasters and satellite platforms in Asia at the turn of the 21st century makes quite evident that the field is dominated by MNCs, whether regional or global. Even where the satellites are owned by national governments or corporations owned by them, as for instance Indonesia's Palapa satellites, or IGOs such as Intelsat, most of the television channels they carry are commercial and owned by domestic and transnational broadcasters, a trend that continues unabated. Other satellites are owned or part-owned by regional or domestic conglomerates, such as AsiaSat, Apstar, Thaicom and Measat satellites. With few exceptions such as the cases of India and China, the satellites are constructed by First World MNCs to the specifications of their Asian owners and their potential broadcaster clients, and launched at facilities owned by First World governments or consortia of them. Some satellite owners and even manufacturers are diversifying into the business of programming and channel establishment, in other words expanding from hardware into software. Although on the surface, broadcasters from within the Asia region are holding their own against the transnationals, even beating them at their own game, the reality is of continued domination of the industry's hardware and software markets by MNCs from the First World. In any case most of the domestic or regional broadcasters or satellite owners have connections with or participation by government, dominant political party, armed forces or other important domestic power bases. As such they are not necessarily vehicles for reflecting the aspirations of the various societies within the nation-state.

Despite their sometimes competing business agendas and unwillingness to acknowledge dependence on one another, a symbiotic relationship could be said to exist between transnational satellite channels and domestic cable television networks. Redistribution of television signals to cable networks was the first major use of satellites to be made by the television industry in the US and continues to be a prime factor in the utilisation of broadcast satellites in Asia. Often the growth of ad hoc, localised and unregulated cable networks are symptomatic of the civil society's rejection of the government's political or cultural hegemony via the media. Extensive pirating of signals by individuals and illegal cable operators using satellite dish-antennae in countries such as Taiwan and India, has necessitated the scrambling of signals by many transnational satellite broadcasters in Asia, and again involves utilising technologies patented and so controlled by Western corporations. Although technology for direct broadcast satellites (DBS) has been in existence for decades and in Asia for half a decade now, it has not gained widespread acceptance in the marketplace due to the higher cost of reception via satellite dishes for consumers. Some Asian countries such as Singapore, Indonesia and Taiwan have adapted cable television for pay-TV purposes in their attempts to regulate access to transnational broadcasts. But usually these government attempts to regulate the multitude of small domestic cable networks have been via issuing a limited number of licenses. The resultant industry consolidation has usually opened the door to foreign MNCs to form multi-service operations (MSOs) in joint-ventures or strategic alliances with domestic or regional corporations, medium or large, usually with strong political and economic ties within each country.

Reflections and Discussion

Most national cultural policies devised by paternalistic governments are driven by fears of Western cultural homogenisation, or more specifically 'Americanization', as much in Asia as in Europe, Latin America and Africa. Liberalisation of media industry has been a concomitant of political change as evident most dramatically in Taiwan, Indonesia and Korea, and less so in many other countries (Kitley, 2002). Although East and South Asia did not have the extensive civil society-led revolutions of Eastern Europe, the television industry has undergone a significant transition of sorts, largely commercially and technology driven. Increasingly, policy-makers in Asia have come to recognise that their countries cannot develop without contact with other cultures, and so urge the reinforcing of their own cultures through producing quality television programs domestically to counter consumerist influences of transnational programming. But then their upgraded domestic television programming is often a clone of the global, and no less consumerist in its values, or culturally imperialist in other ways. Furthermore, programming directions on domestic television channels sometimes reflect the cultural hegemony of the country's urban politico-economic elite drawn from a dominant ethnic or minority subcultural group within that country. In other words, there is often as much media imperialism exercised within a country than from without.

It remains unclear whether morality can be legislated and what ethical system should adopted in multicultural developing countries such as those in Asia. Christians et al (1991) advocate a framework for ethical reasoning in the media but acknowledge its dependence on largely Western traditions of moral philosophy. Vogel (1996) bemoans the fact the focus of much research has been on the role of civil society on government policy, while tending to neglect its effect directly on corporations. In a global economy dominated by multinational corporations, Mark-Ungericht (2001) thinks it inevitable that civil society networks will emerge to influence the way business is conducted. While this sort of enforced dialogue has proven ef our issues, there is less evidence of civil society impact in the arena of media diversity and freedoms, particularly fective with environmental and lab against global media corporations as well as government-controlled commercialised media. The cost of utilising satellite television broadcasting is prohibitive to non-government organisations (NGOs) and civil society groups within each nation-state. Though with the increasing de-massification of electronic media, there remains hope that someday it might be possible for transnational social movements to utilise them for broadcast as they already do the Internet.

The Role of International Exchange Programs To Promote Diversity on College Campuses: A Case Study

David E. Ault
Southern Illinois University, USA
Kathryn Martell
Montclair State University,USA

Abstract

In response to recent Court decisions, many US colleges and universities are energetically seeking ways to increase the diversity of their student bodies. Through recruitment and other policies, their goal is to develop a student body in which students, as the result of every day interactions with their colleagues, come into contact with individuals with backgrounds that are different from those met through previous experiences. While the focus of many of these university efforts in the US has been the inclusion of greater numbers of native -born, naturalized, or resident minorities in the student bodies, one could argue just as effectively that, given the position of the United States in the global political economy, student bodies should contain significant representatives from countries outside the United States. The purpose of this paper is to discuss the role, development, and implementation of effective international exchange programs involving faculty, staff, and students can play to promote campus diversity using examples from the experience of Southern Illinois University to illustrate key points.

I. Introduction

Ever since the Bakke [6] and subsequent cases involving the issue of the constitutionality of affirmative action programs, colleges and universities have sought ways of developing admissions programs that would permit them to identify, recruit, and admit legally individuals with specific ethnic or other identifiable characteristics. In its majority opinions in the University of Michigan cases (Gratz v.Bollinger and Grutter v. Bollinger), the Supreme Court accepted the Creation of a Diverse Student Body as a legitimate, that is, legally acceptable criteria for establishing admission criteria. [5,6]

The Creation of a Diverse Student Body doctrine argues that a college or university, especially a publicly supported college or university, has a responsibility, perhaps, even a legal duty, to develop and implement admissions policies and criteria that diversify its student population.[1] Admission policies such as that of the University of Michigan which was the subject of the 2003 Supreme Court decision provide explicit consideration of such factors as ethnic background, residence, and proposed major when deciding to accept or reject a prospective applicant. By explicitly considering such factors, the university intends to create a student body in which the typical member, as the result of every day interactions with his or her colleagues, comes into contact, presumably fairly frequent contact, with individuals with backgrounds that are different, sometimes substantially different, from those met through previous experiences. As a result of such exposures in the classroom and less formal settings, the typical student will develop a greater understanding, tolerance, and ability to cope effectively with individuals from backgrounds that are different from those in which the individual was raised and educated prior to his or her attending a college or university.

While the focus of the creation of a diverse student population argument has been on the inclusion of greater numbers of native-born, naturalized, or resident minorities in the student bodies of US college and universities than would occur if special admission programs did not exist, one could argue just as effectively, if not more so, that, given the position of the United States in the global political economy, student bodies should contain significant representatives from countries outside the United States. Further, in order to broaden the educational backgrounds of its student body, a college or university ought to create programs that encourage its faculty and students to spend time outside the United States in order to bring the results of those experiences back to the classroom and other campus activities.

Given that the United States is the world's largest economy, accounting for approximately 15% of global GDP, is the third largest country by population, and, at least at present, the world's only designated superpower with respect to political and military influence, it would seem logical that the curricula of its educational systems would stress the development of cross-cultural and other forms of education that would create a citizenry that was well-versed in its understanding of the cultural, political, and economic systems of the rest of the world. That Business Schools recognize the importance of international issues is evidenced by a recent survey that found that 81% of the participating schools included a specific reference to the international business environment in their mission statements. [2] Of course, there have been so many studies done since the launch of Sputnik that point to the conclusion that the average US citizen knows less about what is happening in the rest of the world than the average citizen of any other developed country in the world. This information is now essentially so well documented that it is accepted as common knowledge.

While many have lamented the narrowness of the US perspective, for most of our history such a national-centric focus has not hindered its leaders and politicians from constructing and implementing fairly effective foreign and international economic policies. That era, however, may be rapidly drawing to a close. The role on the US in a post-Cold War world is not the same as the role played by the US since the end of WWII. In fact, one may have to go back at least the end of WWI or perhaps the 12th Century to find a global political situation such as that which has developed since the fall of the Berlin Wall. The US role in the global economy is also evolving in a way that requires an understanding of the relationships of the US to the rest of the world that has not existed for at least a century. The emergence of the Chinese economy with the likelihood that the US economy will actually be the second largest economy in the world within the next ten years are creating trends and forces of change that few US business and political leaders fully understand. This narrow perspective, however, has consequences that are difficult to predict. In our efforts to rebuild Iraq, a U. S. military noted that the lack of even rudimentary understanding of Middle East politics, cultures, and religions was a real hindrance in doing the small, simple things required to make nation building a success [6]. A recent study by the American Council of Education concluded that the US has a "dangerous" shortage of experts on non-European cultures and that 75 percent of Americans believe that higher education has a responsibility to incorporate global awareness into the college curriculum so that graduates have at least an awareness of international issues, events, and other cultures [3].

Every college or university curriculum has a general education component. The purpose of that general or liberal education component is to provide the knowledge and skills that a college graduate will use as the foundation for his or her ability to function as an informed citizen of the United States for the rest of his or her life. This portion takes up approximately one third to one half of the total credit that one must earn to complete the requirements for his or her degree. The creation of a diversity in the student body can play an important role in supporting the mission of the general education curriculum by permitting the student to apply and see live examples of the concepts and principles discussed in various classes. In a world that is increasingly complex, it would appear that the definition of an appropriately diverse student body would include an adequate number of students who have lived outside of the US. Universities serving geographic areas with relatively low levels of diversity may have to employ a number of strategies to accomplish this goal.

The purpose of this paper is to discuss the role, development, and implementation of effective international exchange programs involving faculty, staff, and students to promote campus diversity using examples from the experience of Southern Illinois University to illustrate key points. The role and importance of such programs is discussed in Part I. The history and nature of the programs offered by SIUE are described in Part II. Conclusions that may be drawn from these experiences are presented in Part III. The effects of recent changes in administration and budgets on the commitments necessary to make such programs work are the subjects of an epilogue to this paper.

II. The Importance and Role of International Exchange Programs in the Curricula of Public Colleges and Universities

In its Bakke and University of Michigan decisions, the Supreme Court stated that colleges and universities have a compelling interest to create diverse student bodies. The interest is so strong that, under carefully defined conditions, it is permissible for colleges and universities to use criteria and methods that, if applied under differing circumstances or purposes, would be illegal.[2] While it is clear that the court intended its remarks to address the issue of the admissions criteria used by colleges and universities, especially those that are supported from state and local government funds, the issue of the what constitutes a diverse student body goes beyond simply assuring that certain minority groups are represented in adequate numbers in the student body of a given college or university.

The first question that must be addressed is: What constitutes a diverse student body? To answer this question, one must first state the university goal or objectivity that is to be addressed by developing a diverse student body. Then one must be define diversity in a way that can be operationalized. This will then determine the groups that one wants represented in the student body and will begin to address the question of what must the distribution of students by category by to achieve the goal of having a diverse student body. Should, for example, the number of Asian-Americans be roughly equivalent to the percentage of Asian-Americans in the state's population or, because the Chinese economy is becoming more and more important to the health of the US economy, should the number of Asians, particularly those of Chinese ethnicity, be such that virtually every student on campus will have at least one class per year with an Asian student?

The answer to questions such as these depends largely on the goal that led the institution to determine that having a diverse student body was an important element in the strategy to achieve its larger goals and objectives. If the compelling interests of the United States that are mentioned in the Supreme Court opinions are related to producing citizens that can function more effectively in the world of the 21st Century, one would argue that a diverse student body is one in which the likelihood of any random student having at least one class per some time period is such that it is virtually certain that the student will have such contact. One can then determine the minimum number of students that one must have in a given category. Once this target or goal has been established, a recruitment, admissions, and retention can be developed to move towards the targets required to create a diverse student body.

In addressing this compelling interest that will be achieved by creating diverse college student populations, exactly what constitutes a diverse student body must be confronted. Does a student body that consists only of US residents from various backgrounds for which targets have been created constitute the diversity that meets the nation's compelling interest? It would seem that the student body ought to reflect the situations that the student is likely to encounter upon the completion of his or her degree requirements.

Given that virtually every business in the United States, regardless of size or location, will either buy goods and services produced in another country, sell its goods or services to some entity in another country, or be owned by a foreign parent, it would seem that a student body that does not have students generated through some type of international exchange program would not have an adequately diverse student body. Most college graduates are going to have contact and have to deal with foreign citizens in order to earn a living even if he or she never leaves the US. Further, can a campus really meet the compelling interest criteria if it does not provide the opportunity for its students to learn and apply their coursework in countries outside the United States? While one would not expect every student to study abroad, at the very least, colleges and universities must provide an environment that brings students into contact with others who have lived abroad in order to build the cross-cultural skills that are needed to be successful in the 21st Century.

This, however, is not the end to the list of questions that must be addressed before one can determine if the campus's student body is adequately diverse. Another question that must be addressed is the question of: Can the student body really be diverse if the faculty is not? In order for the student body to be diverse in a way that meets the Court's compelling national interest, can all students, regardless of their backgrounds, by taught by a faculty that is of a homogeneous background and no international experience? In other words, is a diverse student body sufficient to achieve the national compelling interest associated with diversity?

While the answers to these questions may very from campus to campus, one thing is certain: creating a diverse student body goes beyond simply making certain that there are a certain number of students and, perhaps, faculty in categories that are defined by Human Resources. In answering the questions, it is doubtful that a college or university can achieve its goal of a diverse student body that produces graduates prepared to be effective and employees in the 21st Century without developing an international exchange program that includes opportunities for faculty and staff as well as students.

III. The International Exchange Programs of Southern Illinois University Edwardsville

Southern Illinois University Edwardsville is a metropolitan campus of Southern Illinois University. Located in the eastern part of the St. Louis metropolitan area, SIUE serves the most populous region in Illinois south of I-80. The majority of its students are still first generation college students who come from lower or middle-income families that live and work in counties that are still largely rural. The student body is relatively homogeneous with respect to ethnicity, for 85 percent of the undergraduates are Caucasian/Non-Hispanic and 96 percent were born in the United States. Further, 70 percent indicated that, prior to attending SIUE, they had had little or no exposure to foreign-born citizens.

As was the case with most institutions, one of the earliest offices established by SIUE was an International Student Affairs Office. The primary purpose of this office, however, was to address the needs and concerns of foreign nationals who chose to pursue degree programs at SIUE. Until the late 1980s, there was virtually no interest among the SIUE students in studying abroad nor in foreign students studying at SIUE to complete coursework that would be applied to degrees at a home institution.

This began to change in the late 1980s for the following reasons. First, the American Assembly of Collegiate Schools of Business made exposure to the international aspects of the global business community mandatory in its accreditation standards. The student body at SIUE began to evolve with the construction of residence halls on campus. The faculty of the Department of Foreign Languages and Literature began to encourage its students to major or minor in a professional discipline, especially business, and to study outside the United States. The combined effect of these trends was to increase interest in internationalizing the business curriculum.

Developing an effective program to promote faculty and student exchanges is a key priority for institutions seeking to internationalize their campus environments. There are two fundamental approaches that a college or university may use when it wishes to establish international student and faculty exchange programs. The first is to create an umbrella or shell agreement that is normally negotiated between representatives of the chief executive officers of the respective institutions and signed by the chief executive officers. These agreements typically state that the campuses will assist in making the arrangements for students and faculty to study on the host institution’s campus on an as-needed basis. If, for example, a student at the parent institution would like to study at the host institution, the student would contact the International Programs Office at the parent institution (he or she might contact the host institution directly) to obtain the name of the appropriate persons at the host institution. Arrangements for the students to study at the host institution would be made between the student and representatives of the host institution. Colleges and universities taking this approach frequently have a large number of international exchange agreements, most of which are dormant for a number of years.

The second approach is for the institution to cultivate a limited number of exchange agreements that are based largely on the interpersonal interactions between the individuals who will be most directly involved with the creation and implementation of the agreements that while signed by the chief executive officers of the institution are administered within the colleges and departments that run the programs around which the agreements are signed. These agreements are generally focused on encouraging students to study in specific disciplines. The success of these agreements depends on the strength of the interpersonal relationships between the parties that administer the agreements on the respective campuses. The number of such agreements that can be sustained by a given campus during a specific time period is limited. The amount of activity undertaken under such agreements is likely to be much greater than the amount of activity present when international exchanges are characterized by umbrella agreements.

The Southern Illinois University system used both approaches. In developing its international exchange programs, the campus at Carbondale, Illinois, sought to negotiate and sign umbrella agreements. By the early 1990s, SIUC had such agreements with over 160 colleges and universities located outside the United States.

SIUE chose to use the second approach simply because the opportunity to create international student and faculty exchange programs arose as the result of personal contacts between faculty of SIUE and faculty of institutions seeking such agreements. In late 1987, a German Professor at the University of Hamburg established, with funding from private investors, a private School of Business to fill a void in the German educational system. At the time, there were virtually no federal, state, or privately supported higher education institutions that offered a curriculum similar to that of AACSB-accredited institutions in the US and Canada. In order to provide the opportunity for the baccalaureate and masters students in these programs to study overseas, the Professor contacted a colleague of his at SIUE to determine if an exchange agreement was possible.

At virtually the same time, the director of international programs at Sheffield Polytechnic University in Sheffield, England, while on a trip to the United States to complete negotiations on a agreement with Northern Arizona University contacted several SIUE to ask for a meeting to discuss the possibility of such an agreement with SIUE. Because the curricula at Sheffield were limited to Engineering and Business, the agreement would cover only business programs.

After meetings between the proponents of the German and Sheffield programs and the Dean of the School of Business at SIUE, exchange agreements were negotiated, signed, and implemented in 1988. Because Sheffield had agreements with similar campuses in Europe, contacts were then made by representatives from Haarlem Polytechnic in the Netherlands and Ecole Superieur des Sciences Commerciales d'Angers (ESSCA) in France. In each case, the contracts and agreements were negotiated directly between the directors of the international business programs at each of the foreign institutions and the Dean of the SIUE School of Business.

In July 1993, a team of faculty from the Toluca campus of the Monterrey Institute of Technology made a visit to several campuses in the Midwest seeking exchange agreements that would permit its students and faculty to study or teach in the US. One of those meetings was arranged by the Dean of the School of Engineering at SIUE, for the Toluca campus only offered degrees in business administration and engineering. As a result of an invitation issued by the Director General of ITESM-Toluca, the School of Business sent a contingent of five (the Dean, Associate Dean, Assistant Dean, who spoke fluent Spanish, an MIS Professor, and the Chair of the Management Department) to Toluca in January 1994. As the result of that visit, the two campuses signed an exchange agreement that was implemented in 1995.

All of these agreements were based on principles contained in the agreement originally negotiated with Sheffield-Hallam University in 1988. The agreement contained a number of key points that led to the success of SIUE's exchange agreements. The key points were as follows:

(1) Students pay tuition at the parent institution for the credit that they will earn as the result of enrollment or participation in the coursework in which they enroll at the host institution. This eliminates any issues that might arise as the result of the transfer of credit earned at one institution to meet the degree requirements of another institution. Using materials provided by the host institution, the student meets with his or her academic advisor at the parent institution to determine the courses in which the student will enroll at the host institution and how those courses will be used to meet his or her degree requirements. The appropriate staff of the host institution is then informed of the coursework in which the student is to be enrolled about his or her arrival at the host institution. The student can alter that schedule but only with the permission of his or her parent institution advisor so that the manner in which the change will be used to meet the parent degree requirements is determined in advance of the student's completing the coursework. The student's grades are determined by the instructors of the coursework taken at the host institution.

    If, as anticipated, the number of students from each institution is approximately the same, the extent to which one institution may be subsidizing the students of the other is small. In the case of SIUE, the president of the institution recognized that it might take a few years before the interest in study abroad programs would offset the anticipated inflow of students from our partners. He, however, believed that the benefits of the programs outweighed the relatively small loss in tuition that would result.

(2) All other fees and costs such as those for housing, other living expenses, books, and other course materials would be paid to the host institution. From this perspective, the exchange student was treated no differently than the native students of the host institution.
(3) The host institution would facilitate the enrollment of exchange students from the time that the student enrolled in coursework under the exchange program until the student had completed the coursework and returned home. To the extent possible, this has resulted in the treatment of exchange students as native students taking coursework at the host institution.

Because the Haarlem Polytechnic and ESSCA required that students enrolled in certain of their degree programs spend at least a semester studying abroad, SIUE received 10-12 students per year almost immediately. The flow of students from Sheffield was much smaller, typically one or two students per year. The agreement with the German International Business School began with two students seeking the SIUE MBA. This, however, grew to approximately 10 students per year before the agreement was terminated in 1994 with a reorganization of the IBS. By the mid-1990s, the SIUE School of Business was sending five to six students per year overseas. Another two to three students from other parts of the university also took advantage of the exchange agreements developed by the School to study overseas.

One of the concerns that had to be addressed was the reluctance on the part of SIUE students to consider study abroad programs. The typical SIUE student had done very little traveling. Travel outside the United States was viewed as too exotic, threatening, and literally foreign for them. Further, most students worked to provide the funds used to defray part, if not all, of their educational expenses. Few felt that they could afford to study abroad for a semester or longer. Students were more amenable, however, to the idea of organized short-term study abroad trips that included other students as well as faculty.[3]

In discussions with the faculty and staff of ITESM-Toluca in 1994 and early 1995, SIUE developed a two-week, total emersion program for its students in Central Mexico. The program was constructed as follows:

(1) For approximately half of the day during the week, usually in the mornings, the students would participate in seminars on Mexican culture, history, business practices, law, and economy taught in English by the faculty of ITESM.
(2) In the afternoon, the students would tour various Mexican businesses ranging from small shoe factories to the Mexican operations of multinational firms such as Daimler Chrysler, BMW, and Coca Cola.
(3) On the evenings and weekends, the students would meet with their counterparts from the Toluca campus to experience life as a university student in Mexico as well as see some of the central Mexico, including communities such as Taxco and Villa de Bravo.
(4) ITESM provided the housing for the students while SIUE paid for the other expenses associated with the program.

The program was originally funded by a $12,000 grant from the SIUE Excellence in Undergraduate Education program to send up to eight students and two faculty to the campus of ITESM-Toluca for two weeks in summer 1995. The funds from this program are used to encourage educational innovations or to permit the faculty to experiment with ideas before seeking university approval for curriculum or program changes. Using these funds, the School could pay for the participant's airfare, lodging, and other expenses except about one half of the student's meals and entertainment. The out-of-pocket costs to the students were typically $400.00 for the two-week period. The financial support for the program, its two-week intensive format between the summer and fall terms, and SIUE faculty participation dealt effectively with the major impediments to participation in exchange programs: cost, disruption of jobs, and concern over travel, especially outside the US. By April 1st, the School had received 15 applications for its 8 student positions. Of the eight students selected, one had to withdraw for personal reasons shortly before the group left for Mexico.[4]

Students had to apply to participate and be prepared to write papers on their anticipated experiences prior to going on the trip. This was followed by a paper discussing the effects of their actual experiences on these perceptions. Completion of the requirements and enrollment in the program permitted the student to earn 3.0 semester hours of credit. The applications were screened by a group of faculty. The program was originally designed to accommodate up to 8 students. By 2000, the program had been expanded to accommodate 15 students.

The success of the Mexican Study Abroad program led to the creation of other two-week programs in England (Sheffield and London during Spring Break), China (May), and Germany (Leipzig and Hannover during Spring Break) and a three-week program for MBA students in France (May of each year). These programs have also led to two to three week community service programs in Costa Rica and Mexico. While some students pay all of their costs of participation, the School still provides scholarships that defray most of the expenses of these trips. The funds for these trips have been raised from contributions to the School by donors interested in supporting international exchange programs and the proceeds from its annual Golf Outing.

As a result, since 2000, annually approximately 50 SIUE School of Business and another 20-25 other students spend between two and three weeks in total emersion programs. The School of Business annual receives 25-30 students from its partner institutions that study at SIUE for one to two semesters. The School also receives 10 to 30 students from ITESM-Toluca who take courses during a five-week summer session.[5] The summer session curricula were adjusted in 1998 to maximize the contact between SIUE and ITESM students. Activities were arranged so that the ITESM students had contact with SIUE students outside of class as well.

In addition to the students participating in the short exchange programs, approximately five to six SIUE students now spend one or two semesters studying abroad. Most of these students study either in England or in the Netherlands where coursework is offered in English. One or two students will study in France, Mexico, or Spain where coursework is taught primarily in French or Spanish.[6] Effective with classes offered in fall 2004, participation in one of the School's international exchange programs will be required of all students wishing to specialize in International Business in the BSBA program. Students must earn at least 3.0 credits through a foreign exchange program to complete the baccalaureate with this formal specialization.

In order to create an institutional culture that provides adequate depth and breadth to the discussion of the international aspects of business education, the School also realized that it would have to encourage faculty participation in programs that broadened their understanding of the international environment. In addition to sending faculty to attend various seminars sponsored by the AACSB and the federally funded Centers for International Business Education and Research (CIBER)[7], the School of Business sought to establish faculty exchange opportunities with its partners. One of these arrangements has proved to be successful. The other programs that were devised have been less so.

The School originally wanted to develop a program with its partners in which at least one of its faculty members would teach at a partner institution for a semester while a faculty member from that institution would teach at SIUE. The faculty members and their families would exchange houses, transportation, and other forms of support for the period. In the original plan, each faculty member would remain formally on the payroll of his or her parent institution to avoid the issues of contracts and salaries. In the Spring 1995, two faculty from SIUE went to France, one to teach at ESSCA while the other taught at Universite Catholique de l'Ouest, while a husband-wife from ESSCA and Catholique, accompanied by their two children, taught at SIUE in the School of Business and the Foreign Language Department. While this exchange was quite successful and led to two SIUE students studying in France simultaneously, the logistics have proved too difficult to achieve the objective of having at a one for one faculty exchange each year. Although there have been several attempts to arrange subsequent exchanges, all have failed primarily for three reasons: (a) The differences in academic calendars, (b) Finding a faculty match that does not leave one institution with the problem of finding a replacement for a faculty member who teaches upper division and graduate level courses, and (c) Personal reasons involving relocating family members that could not be resolved..

A second approach to providing the opportunity for faculty to acquire some international experience has been more successful. ESSCA, prior to signing its agreement with SIUE, had been experimenting with an approach in which it invited faculty and other experts to the campus in the week prior to Christmas to deliver essentially a short course on a topic to be defined and agreed upon by the institution and the faculty member. The course would meet for three to five days and afford the student the opportunity to earn additional academic credit while permitting ESSCA to bring expertise to the campus that it would not normally be able to do for the typical semester or academic year.

The opportunity to spend a week to two weeks in France proved to be quite attractive to SIUE faculty. This led to the development of a program in which a faculty member from SIUE goes to France in late fall to teach a seminar on a topic that is agreed upon by ESSCA and the faculty member. A faculty member from ESSCA comes to the SIUE campus in the Spring Semester to deliver a series of lectures on related to topics to several classes offered on the SIUE campus. The parent campus pays the airfare of the faculty member while the host campus pays all other expenses associated with the program.

The program has led to similar exchanges although periodic exchanges with faculty involving our partners in the Netherlands, the United Kingdom, and Germany. This exchange led to two other types of experiences. Haarlem Polytechnic, using funds from a donor created an International Education Week in which it invited faculty from five to seven international partners to make presentations to faculty and students on themes related to international business. The following year, SIUE hosted a similar international education week. A second two-year cycle of this program was completed in 1998-9 and 1999-2000.

Contacts made during these sessions, the ESSCA exchanges, and the Mexican summer study tour led to another type of exchange. Using a grant from the US Department of Education, faculty at Sheffield and ITESM-Toluca partnered with SIUE faculty in a program in which the students enrolled in similar classes at SIUE and the partner institution would essentially be integrated into a common course. Depending upon the level of the students and the nature of the course, the students were formed into teams. On some occasions the teams were composed of home institution students who essentially competed with students from the other institution in addressing certain assignments. On other occasions, the teams were composed of students from both campuses. At least once during the course, the students met in a video conference to present their results. On one occasion, the teleconference took place between students in the United Kingdom and those in the US.

These courses forced the students to deal with cultural issues, time differentials, different decision-making styles, and differences in communication. The students used a variety of internet-based services to communicate with one another or to present ideas that were being discussed in the class sessions held on each campus. The students also learned how to cope with the problems created by technologies that are innovative, for the best laid plans for videoconferences can be altered by circumstances such as sunspots that occur without much warning and over which the student has no control. Students were not the only beneficiaries of the program. The close collaboration required of the teaching faculty members enhanced their own cross-cultural skills.

A final activity was designed to increase the number of faculty participating in student study-abroad trips. In addition to the five faculty members that were involved in the organizing and teaching of the study abroad trips, 12 additional faculty members participated in the programs that led to study in China, France, Mexico, and the UK. Faculty with little international experience who were teaching courses that could be enhanced by adding an international dimension received funding to participate in the program. They received the same benefits that the students received from their total immersion in that the experiences were then incorporated into their teaching. Faculty and students developed friendships on the host institution campuses that led to the hosting of students and faculty from those institutions when they came to SIUE.

By the academic year 2001, the SIUE School of Business had developed a series of exchange programs that:

(1) Provided up to 50 students per year the opportunity to study overseas for a period of two to three weeks at very little cost to them,
(2) Provided those students who wished to study abroad for a semester or a year the opportunity to do so at five institutions in Europe, one in Mexico, and two institutions in China as though they were enrolled for credit on the SIUE campus using their standard financial aid packages.
(3) Brought 25 to 30 students enrolled at partner institutions to study at SIUE for one to two semesters. These students enrolled in three to five third and fourth year courses. This means that virtually every SIUE junior and senior is enrolled in a least one course in which an exchange student is enrolled.
(4) Brought 10 to 30 Mexican undergraduate students to study for five weeks during the summer. During this stay the students would meet with the SIUE students who would be going to Mexico for two weeks in August.
(5) Provided at least one SIUE faculty member the opportunity to teach overseas for one to two weeks while bringing at least one faculty member to the SIUE campus to teach and participate in coursework for a period of a week.

(6) Provided students enrolled in a senior level International Management course with the opportunity to work for one semester with students enrolled in a similar course on the campus of a college or university outside the United States. Students in the MBA program and other senior level courses had periodic opportunities to participate in this format as well.
(7) Provided three to five faculty per year with the opportunity to spend two to three weeks studying the business culture and institutions of at least one other country.
(8) Attracted the attention of donors and other School constituencies.

By the beginning of the 21st Century, the School of Business had made significant strides towards creating a culture in which the international aspects of the business environment were integrated into the design and implementation of its curricula and degree requirements. Approximately one third of the faculty had participated in some form of exchange. Student participation in exchange programs had increased 30 fold, and hundreds of other SIUE students met foreign-born students or native-born students who had studied abroad in their classes and other campus activities. By fall 2003, approximately 3.8 percent of the students enrolled at SIUE were international students, a figure that compares favorably to the national average of 4.3 percent.[8] The Curriculum Committee of the School had accepted a faculty recommendation that students seeking the International Business Specialization had to have some international experience and at least 2.5 years of a college-level foreign language coursework. New faculty were recruited with the understanding that they were at least encouraged to acquire some international experience prior to being granted tenure and promotion. A perceptible number of students had some international experience and each junior and senior student took at least one course in which an exchange student was enrolled.

IV. Conclusions

During the decade of the 1990s, SIUE developed a reasonably comprehensive, mutually reinforcing set of exchange programs that led increased in a substantive way the diversity of its student body and faculty. The experience led to the following conclusions about the development of international exchange programs and the roles that they may play on the campuses of regional and metropolitan colleges and universities:

International exchange programs must be tailored to fit the mission, goals, and character of the college or university. A program that works very well at a private institution or a large research oriented university is not likely to work as effectively at a regional or metropolitan, publicly supported university. The attempt by SIUE School of Business to develop a faculty exchange program in which at least one of its faculty would teach overseas for a semester in exchange for a professor from one of its partner annually failed primarily because the faculties of the School and its partners were not sufficiently large to find an appropriate match. Such a program is much better suited to a college or university in which the faculties are very large. Furthermore, the short-term study abroad trips were designed to fits the needs of a relatively parochial, lower-income student body. Student issues related to study abroad in private and/or more cosmopolitan universities may be quite different. The international exchange program must play a well-defined role in assisting the college or university in addressing its mission and goals. The program must be a part of the culture of the institution if it is to be more than simply a part of the "things" that a college or university offers because colleges and universities are expected to offer such opportunities. If the university culture does not believe that international exchange programs are part of its core activities, the programs will never develop to become more than secondary or tangential parts of the university. In the 21st Century, a campus can never really claim to have a diverse student body or faculty if it does not have a healthy international exchange program that insures that its student population is exposed to international students and that its students have realistic opportunities, that is, opportunities that are affordable and available in some depth and breadth, to study abroad.

International exchange programs are like friendships, if fact, most effective international exchange programs are based upon the friendships that develop as a result of the agreements. Effective exchange agreements at most regional colleges and universities require that they be administered by a person who is committed to the programs. The program's principals must consider their participation in the programs to be more than simply a job or part of their jobs. The key personnel must believe that exchange programs are a core activity of the department, school or college, and university.

Exchange programs require a lot of work and the commitment of sufficient resources to make the programs function effectively. In that sense, effective international exchange programs are like good friendships. Both require commitment on the part of both parties to do those things that are necessary to maintain and strengthen the bonds between the parties. Effective exchange programs, for example, require that key personnel visit the partner institutions at least once per year. Such visits serve several purposes. The parties are introduced or reintroduced to key administrators so that those persons are reminded that the programs are active and the partner remains committed to them. Key personnel are able to meet with prospective exchange students and staff to answer their questions directly. Difficult issues are easier to discuss and resolve in face-to-face conversations than over distance and several time zones. Effective exchange agreements require that the parties know and trust one another. The formal language of an agreement does little to insure its success if there is no one on each side of the agreement that is committed to making the program work. Problems are resolved efficiently when a party at one institution feels comfortable simply picking up the phone or sending an urgent e-mail knowing that the person at the other partner institution will work to resolve the problem in a timely manner because he or she has a personal commitment to, not only the program, but to the friend who has made the request. International exchange programs are, in fact, an illustration of one of the key points made in every international management class. In international business, formal contracts mean far less to successful business dealings than friendships. Friends trust one another, that is, each must be confident that the partner would not knowingly mistreat the other. Strong international exchange programs are based on mutual trust and friendship. Without these key ingredients, most international exchange programs will fail. Like some friendships, some exchange agreements are not meant to last forever. Just as friends part ways, institutions may end exchange agreements because the goals and objectives of the parties for such programs have diverged. This happened to the agreement that SIUE had with the IBS in Germany. When the board of the IBS decided to change Chief Executive Officers and to alter its mission, the exchange program with SIUE no longer seemed appropriate and was terminated by mutual agreement. When a key person leaves an institution, it may be difficult to form a subsequent friendship that will retain the mutual trust required for the program to remain viable.

The mutual respect and trust engendered by friendship also leads to the experimentation and innovation that permits exchange programs to add value to the educational programs of the institution. Such friendships can lead to scholarship that benefits both parties and institutions. The resources available to faculty increase in ways that are not always obvious. In the end, the friendships lead to greater depth and breadth to the number of students and faculty who take advantage of the opportunities afforded by the programs.

International exchange programs must become a part of the culture of the unit, school, and university, that is, effective programs must be able to transcend changes in personnel and the commitment to the programs must be transmitted from one generation of faculty and staff to the next. New employees must know and become convinced that knowledge of and participation as appropriate to the position in exchange programs is expected. It is not unreasonable, even at a regional or metropolitan university, to require that a probationary faculty member acquire some international experience in order to be granted promotion and tenure. The institution must provide the opportunities to meet this criterion but the requirement is not unreasonable, especially if the faculty member teaches courses within an international business program or with international content.

Even if the diversity of the faculty, staff, and students on a university community were not the central focus of recent Supreme Court cases, one would be hard pressed to argue that, at least in certain disciplines such as those of business and social sciences, exposure to international perspectives and practices is essential to the education of students majoring in one or more of those disciplines. It is hard to argue that a business student with only minimal understanding of the international business environment is prepared for a business-related career in the 21st Century.

Yet, one still hears arguments from politicians, average citizens, and others that the resources of a publicly-supported college or university should not be "wasted" on international exchange programs. The taxpayers' funds should go only to educate the children of and citizens of the state. The illogic and irrationality of such arguments need not be discussed further. The fact that they persist is a comment on the nature of politics and the quality of the educational background of the average citizen more than it is a comment on philosophical rationale for taxpayer-supported post-secondary education. Unfortunately, however, because such views persist and higher education is a convenient target for the politician who wishes to divert attention from other problems and issues, the role of international exchange programs will come under periodic scrutiny and be the subject of comment and criticism.

This provides the rationale for creating and implementing international exchange programs that are clearly related to the mission and goals of the institution and that such programs become part of the culture of the institution.

End Notes

[1] The basis for this argument is found in the opinion that Justice Powell wrote in the *Bakke* case. In developing its criteria for admissions to its Law School, the University of Michigan had argued that ethnic origin (race) served a compelling interest in creating the diverse student body desired by the Board of Regents of the University of Michigan. In writing for the majority, Justice O'Connor argued that the *Bakke* case established a "binding precedent" that justified the use of racial preference in granting admission to various programs offered by the university. The Court also rejected the equating of a "critical mass" of students with certain qualifications to a quota. See *Bakke* and *Grutter*.

[2] See Justice Powell's opinion in the *Bakke* case for the origins of this argument.

[3] When the exchange agreements were first signed, students on financial aid were told that they could not use their financial aid to pay for study abroad programs. This interpretation turned out to be inaccurate, especially when it was noted that the students paid tuition to SIUE for the credit earned as the result of their participation in such programs. Reinterpretation of the rules governing other types of grants now permit students to use those funds to pay for expenses incurred while studying abroad.

[4] The first group consisted of two men and five women of which three of the women were African-American. One of the male students spoke fluent Spanish. The program has always tended to attract more women than men with approximately 70 percent of the participants being women.

[5] The Mexican students who study at SIUE in the summer are the direct result of the two-week August program that sends SIUE students to ITESM-Toluca. The costs of the two programs are such that bilateral participation essentially offsets the costs incurred by each program. There is very little transfer of funds between the campuses as the result of the bilateral nature of the program eliminating concerns about international transfers of funds and exchange rate fluctuations.

[6] SIUE has no formal Exchange agreement with a Spanish university. Students who wish to study in Spain make arrangements to do so through the Spanish faculty of the Department of Foreign Language and Literature. The students enrolled in these programs do have to deal with the transfer credit problem as well as other problems that can arise when there is no formal agreement in place.

[7] Southern Illinois University Carbondale and the University of Memphis were awarded one of the original CIBER centers. This co-sponsorship proved to be difficult to manage resulting in the movement of this Center to the campus of the University of Memphis.

Using a Course Management System
to Enhance Traditional Teaching of Business Courses

Eleanor J. Flanigan
Richard Peterson
Montclair State University, USA

Abstract

This paper shows the use of a CMS to augment a traditionally taught course. It explains the process used to develop case problems in business courses with student involvement through discussion in groups on-line. Some relevant features in Blackboard, a specific CMS, that could be used to make the case problem easier to access and solve is explained.

The question arises: Are challenges more easily met by traditional classroom management techniques or by more automated course management systems? The focus of the paper is to show the value of hybrid courses to maximize quality classroom time. Documents for peripheral activities are prepared and stored in Blackboard. Such activities include case production and distribution, creating groups, creating relevant external links, posting announcements and setting benchmarks. The emphasis is on the value of the approach using both technology and face-to-face interaction as contrasted with the amount of effort expended to implement it.

Background

This paper focuses on two methods, the case method and follow-up discussion, as examples of some commonly used techniques that instructors use in the classroom in order to teach, review, assess, or reinforce concepts in business classes. A description of case development is followed by factors to be considered in using the discussion method. The paper then explains how to enhance, supplement, or replace these traditional methods by using a course management system (CMS). Blackboard is the CMS chosen for this paper as it is representative of the systems currently available to both educational institutions and to businesses.

Both technical and non-technical classes can benefit by using a CMS. The model class for this paper is a technical course in Computer Applications in Business, one that is taught traditionally with lecture, demonstration, and application usually conducted in a self-contained classroom or lab environment. Outside work includes case problems, Internet research, data collection, and original integrated projects. Some in-class activities along with hands-on application of software include small-group collaboration, case problem discussion, peer-to-peer assistance, and oral presentations. This paper uses the Computer Applications class as a hybrid class, employing face-to-face interaction in a three-hour weekly class as well as being augmented with Blackboard course management system.

The aim of this paper is to show how a traditionally taught class was energized by using the features of Blackboard CMS to support the case method and discussion. It describes the components of these methods and then show how these are supplemented, enhanced, or replaced by the CMS. The underlying premise of the paper is that most instructors are acutely aware of the importance of the quality of the time spent in the classroom. Therefore, having an auxiliary technological aid such as a course management system could be of great benefit for instruction as well as using peripheral activities. These include such typical classroom housekeeping chores such as announcements, explaining assignments, distributing handouts, copying documents, and document storage.

Case Method Background

The terms case method and case study are sometimes used interchangeably. Case study or case report means the in-depth analysis of a problem, with no necessary implications for practice. The case method in contrast, as developed by Langdell of Harvard's Law School in the 1880s, refers to the method of instruction based on real-life examples. There is no field of study that cannot benefit from this broader definition of the case method.

Using case method as an umbrella encompasses looking at all aspects of actual living experiences, whereas case study allows the analysis of either real or contrived situations: There are benefits to the educational process using both techniques. Instructors do much time-consuming research to find corporate examples, with all the jumble of factors that go into any real-life situations. It takes numerous hours to center the focus on important aspects so that student-analyzers can use their time and talents most effectively. It is vital to frame the structure of the actual experience so that students do not get bogged down in extraneous details or digress into relatively minor areas.

In case studies the instructor can use more latitude when constructing the situation. One case may contain elements of many real-life situations or of fictional problems experienced by any typical business. Studies can be shaped to include situations particular to small companies so that students can appreciate the complexity of that type of business. Working with larger companies or with very large departments within a corporation may show a broad variety of situations. Constructing composite cases allows the instructor to take certain liberties with typical situations. Whereas an actual company's experience must be reported as it happened, the fictional or composite case can add to or strip away facts.

Using the broader definition of case method allows for its use in a variety of business courses, technical as well as non-technical. The course in computer applications used in this presentation employs numerous cases directly related to solving specific short- or long-term problems in business. Since the emphasis is on using software as a tool to making decisions, each case focuses on the situation related to various software features. For example, a case may be constructed to employ whatever features are being studied. In database study, for example, fields from various tables may be needed for a query of the file. So the students must recognize how to set up relationships and then to use interrelated tables as needed.

Components of Case work

There are three parts of case study: the case description, the analysis of the problem or situation, and the follow up with a report and/or discussion.

Case Description

The instructor may choose to use cases from a variety of sources or may create original ones. Traditional college textbooks provide constructed cases to fit the content of active chapters. Third-party sources such as Harvard Business Review publish topical cases for use in various fields of business: management, information technology, marketing, or advertising, for example. Professional teams can design cases which can take years to prepare. Pigors and Pigors [6] note that the Harvard case studies, although well known for their extensiveness and excellent quality of research, may be too detailed and time-consuming depending on the academic level in which they are used.

Many conventional sources for constructing shorter case studies are available in the day-to-day activities of any institution. The imaginative mind could construct viable business cases from minutes of meetings, policy documents, or institutional reports. Because these cases are constructed for the student learner or reader, the instructor should be careful to match the experience level of the case to the reader. Unfamiliar terms or concepts should be either avoided or explained. However, some challenges should be worked into the case in order to stretch the student readers' imagination and critical thinking.

In constructing case problems the format is most important. It should focus on problems which have complexity and which can elicit a variety of views from the readers. Other than describing a real or imagined business problem to use with students who may have limited knowledge of the business world, there is another purpose for using the case method. This goal is to help to hone analytical skills to name the problems, identify alternative solutions, and discern the possible consequences of various solutions.

The degree of complexity is what separates the full case method and report from simpler problem-solving exercises. In shorter less complex cases the problem may be immediately identified, and the steps to solve the case may be listed. Instructors have a choice of cases depending on the context of the problem within their course topic.

According to Marsick [4] the case problem must match the interests of the readers and should be relevant to their experience level. Facts about the problem should accompany the environmental context: a description of the broader organization's work or products, its clients, or special conditions which may be relevant to understanding the problem. Adding realistic details helps to put the reader into the situation itself. Using visual images through videos or references to films or television also helps to put the reader within the problem.

For example, when dealing with cases using databases that involves an inventory of an electronics store, it helps to have students imagine standing in the local electronics retail store. Students can offer specific names of local stores and their layouts. From that vantage they then can hone in on one particular device—cell phones, DVD players, PDAs or any other device of particular interest to them. It is not unusual for students to relate to this scenario since many of them work as clerks or managers in stores of this type.

Information included in the case can be tailored to fit a specific solution or encompass several paths. Several groups may then work on the case and arrive at different views or solutions.

If the instructor so chooses, the report may be followed up with a description of the actual solution of the problem. This could be used to compare or to contrast with the results the student readers have devised.

Case Analysis

Student analysis of cases in computer applications entails searching for pertinent facts within the complex problem or situation and then discerning which features of the software to use to find a solution. As the complexity of cases increase, so do the possibilities of solutions. Helping students to focus means directing them to keep to the relevant facts and avoid excessive digression or speculation.

Case analysis can be aided by leading questions or notes that help readers in order to determine specific solutions. In other cases they could suggest solutions that the readers have to analyze the process used to justify how these various solutions may have been reached. All case problems do not have to be self-contained. Some cases can be used as springboards to encourage or demand further research either off- or on-line. Research on an inventory problem in a database course can include identification of a certain product suggested by the case.

For example, in the case of the electronics store inventory stated above, students could choose one specific device that they are particularly interested in. From that could flow the examination of a similar real-life product. A selection of cell phones could be researched, naming popular brands and accessing those brands on the Internet. Database fields constructed may include size, power, internal specifications, external peripherals, and price. Having several students exploring various products within the same general department of the electronics store can result not only in categorizing the inventory but also allocating space needed for the products.

The goal of case analysis is to sharpen students' analytical skills as well as to project them vicariously into a professional setting. Students could take on the character roles suggested in the case. Since case complexity causes divergent thought about what may be the "right" solution, students may also learn that making decisions in realistic business situations is not so simple. It may show them that others have strong arguments to justify their solutions and that negotiation skills learned are as important as arriving at the "right" answer. They may also discover that there is no such solution as the "right" one.

Case Discussion

Another component of the case method is the discussion. If the case is sufficiently complex, the analysis and suggested solutions may go far beyond one or two answers. There are several ways to work with discussion following the case analysis: one-on-one with the instructor, small or large group work with two-to-five students, or full-class participation. Each of these has benefits and drawbacks.

One-on-one Discussion

Depending on time constraints the individual interaction of the instructor and the student could yield many benefits. Some students have never had a direct conversation in which their answers are used as springboards for the next comments or questions. Some have never interacted that closely with a professor. Although this could be intimidating, it could also stimulate quiet students to express themselves in a closed environment of an office, away from judgmental or more vociferous class members.

The instructor may also use the Socratic method, drawing answers by direct questioning and then building on them. Another approach would be for the student to begin the case analysis and respond to questions from the instructor during the presentation for further clarification. A third approach would be for the student to present the full analysis and then discuss concepts or variations on the solution.

Groups of Two-to-Five Students

This can be carried out during or before a class session. The mode in which the small group meets can be face-to-face, through e-mail, or through the CMS which will be described at length later in this paper. If the analysis stage includes specific questions to lead the discussion, each participant should have answers or points to consider ready prior to the discussion. Otherwise, the participants are left with an open-ended approach to the discussion.

Inexperienced students who do not have opportunities for group discussions may benefit from more experienced students. The groups must decide on their mode of discussion and their various roles—as leader, as questioner, as devil's advocate, as negotiator, as summarizer, and as recorder. If the group is too small for these roles to be distinct, the instructor can point out that the functions of these roles can be combined. Thus small group discussion includes both an examination of and exposure to the process of sharing in a group as well as the actual steps needed for each student to present the analysis for discussion by the group.

Full-class Discussion

This mode can be used either alone or as a consequence of the small-group discussions. Large group discussions expose students to a variety of perspectives. They can reflect on their own conclusions found in another student's statements. Students are often able to reaffirm their own analysis or conclusions after sharing these with others.

The overarching purpose of discussion, according to Brookfield [2], is to help learners to explore their experiences or conclusions so that they become more critical thinkers. This method helps them to become aware of nuances in cases they are working on. It shows them the value of being flexible and open-minded, accepting other's statements or else honing their debating skills. If two groups differ in their conclusions after working on the same case, the in-class discussion gives them a chance to clarify their processes.

Although Legge [3] proposes that "discussion is most appropriate to those subjects concerned with controversial issues about which there are different but equally tenable opinions" (p. 78), there is room for other topics for discussion. For example, there are cases in Computer Applications which indeed have correct answers as in mathematics. There may be numerous ways to arrive at these definite answers, however. So discussion of these processes is valuable in that there may be more efficient paths to the conclusion. If there is only one way to arrive at the conclusion and there is only one right answer, as in many business cases involving software, then the students still can learn from one another.

Preparation

The instructor should prepare the students for the group discussion experience and not just presume that this activity comes naturally within an academic environment. Skills are needed to keep the discussion focused, to be sure all students are involved meaningfully, and to be sure that all components of the case are handled.

Prior instruction to prepare students for discussion include notifying them of specific questions which must be answered first by individuals, then by assimilation into one group answer. Students may decide to offer majority/minority views in the event there is division on several acceptable answers. Other preparation involves meeting their group's members, either face-to-face or on-line as well as knowing what criteria will be used to assess their participation in the discussion. The CMS system is helpful here in that one document containing rubrics can be kept on the site for frequent reference.

Criteria for Analysis of Discussion

A specific set of rubrics should be given to the class. Self-analysis should be the first order of business. Let each student read the criteria for grades from the rubric list and then assign an objective grade to him/herself. Those students who take the experience seriously may use this rating as a wake-up call. Others will at least realize that there will be an accounting for their contributions or lack thereof in the discussions. An example of a discussion rubric for business case problems follows in Fig. 1. Other suggestions for creation of rubrics can be found at: http://school.discovery.com/schrockguide.

A or A-	Completed case problem prior to entering discussion Read and understood reading material peripheral to the case Discussed case fully with group members Was self-motivated to study and solve case Took initiative in discussion topic Shared and discussed external material relevant to the case Responded readily to discussion in class or in Blackboard Participated in discussion with insight and enthusiasm Offered help and support to other group members Visited site and participated daily
B+ or B	Partially completed case problem prior to entering discussion Became familiar with reading material peripheral to the case Discussed case intermittently with group members Needed grade or deadline motivation to study and solve case Participated in discussion when others presented ideas Researched external material relevant to the case Helped others in the group when requested Visited site and participated frequently
C+ or C	Read and completed some of the case problem prior to entering discussion Skimmed reading material if it was required Discussed case at times with group members Motivated by immediacy of deadline Listened to others rather than offering solutions to case Clarified answers or comments of others but gave no original insight Did no research for external material relevant to the case Occasionally visited site and participated sporadically
F	Rarely or never visited site for case discussion Neglected to participate in discussions in class or in Blackboard Did not read or complete the case Was not a significant presence in the solution of the case Gave no support to other members of the group

FIG 1. DISCUSSION RUBRIC FOR BUSINESS CASE PROBLEMS

Members of the group will rate themselves and others using the same criteria. This should give an incentive to students, as they realize that their contribution allows the discussion to move forward meaningfully. In the event that students are reluctant to rate others, the instructor can make the process more neutral while still maintaining some degree of student rating responsibility. For example, instead of the conventional "A", "B", etc. or "1", "2", etc. rating systems, the students might give qualitative word ratings such as "Extremely Helpful", "Very Good Contributor", "OK", "Sometimes Helpful", "Rarely Helpful", "No Comment".

Other ideas for rating members of the group's participation and contribution may include evaluating each student with a numeric rating, such as 1=Most Helpful, 2=Next, etc. The instructor will use the rubric to assign grades in conjunction with the group input.

When conducted correctly, discussion is not especially easy. Students should be alerted that their opinions and thought processes will be exposed to others in their group with the opportunity for disagreement or dissention. They must attend to the opinions and thought processes of each of the other members of the group. Discussion places the responsibility for the success of the activity in their hands. Contributions are expected from each member of the group with the concomitant possibility of trying to interpret confusing or poorly stated thoughts. Participants can learn how to work with a variety of personalities and levels of awareness. It is valuable for students to listen to and compromise with others in the group, trying to come to some agreed-upon answers from those who may have more insight or who may understand the problem more clearly than others.

Working collaboratively is one of the goals most business classes try to incorporate in anticipation of the experiences students will have when employed in the business world. It is hoped that shorter but more frequent experiences the students have in the classroom will prepare them for the challenges they will have when employed.

Using the Course Management System to Augment Case Analysis and Discussion

Now that the cases have been developed and the students have been prepared for the discussion method, there are many features in Blackboard and other CMSs which allow for efficient delivery and interaction. Using these many powerful features allows time spent in the classroom to be more content-oriented as some of the traditional housekeeping chores can be shunted off to the system.

Preparation time can be spent on designing auxiliary slides, arranging quality handouts, designing review quizzes, and creating meaningful assignments, all of which can be uploaded to the CMS. These can be made available to the students at the appropriate times.

Production and Distribution

One problem faced by instructors in traditional classes is the production and distribution of the cases. Handouts in a classroom with the case printed for each student is the usual distribution method. Inevitably some students do not receive the case either due to being absent or having lost the paper. Instructors may find themselves bogged down with carrying all their files to each class to accommodate these students. The amount of paperwork necessary for developing and distributing cases is sizable.

There are features in Blackboard CMS which speed up the process of both case construction and distribution of cases to the students. Case construction is aided by using Course Packs available from textbook vendors. These packages are available from the vendor after the texts have been adopted by the institution. The course pack is downloaded to the CMS administrator who in turn exports it to the designated courses. Most course packs assume total coverage of certain CMS features, so the instructor should be aware that additional items may have to be restored or created in these affected features.

The following section describes some of the features most commonly used to conduct a class in Computer Applications as a hybrid course. Using both face-to-face instruction and interaction with Blackboard resources allow for greater quality time in the weekly classroom meetings. Fig. 2 shows the selections available to the student in Blackboard.

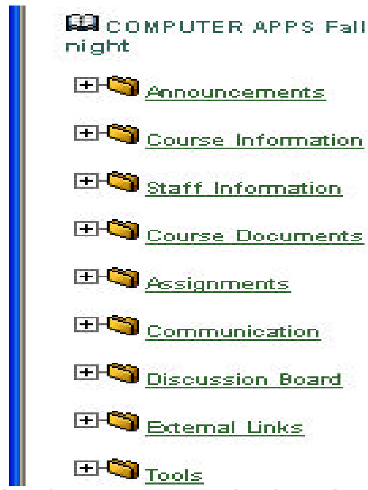

FIG 2. STUDENT BUTTON SELECTIONS

Announcement—alerts student that there has been a change in the site. Add an item to state that there is a new case as of a certain date. Direct the student to choose the appropriate button to access the case and get directions.

Course Information—stores the course outline for frequent reference for structure of course, goals, texts, and grading criteria.

Course Documents—store the case by browsing from the source computer where the instructor has composed the case as shown in Fig. 3. Give noted instructions for the student to download in the event the case is a packaged file that needs to be unzipped. The document containing the rubric for evaluation discussions can be uploaded and stored in this section.

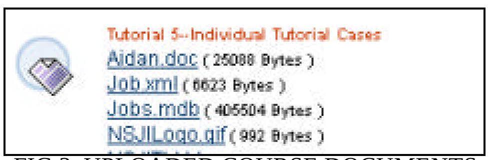

FIG 3. UPLOADED COURSE DOCUMENTS

Staff Information—shows instructor and student assistants, through imported photos and hyperlinks, contact information, office hours, or lab times.

Assignments—examples of specific directions as shown in Fig. 4. Instructor states details of assignments for those who missed class or need further explanation. Documents needed for the discussion phase of the process could be uploaded to this section.

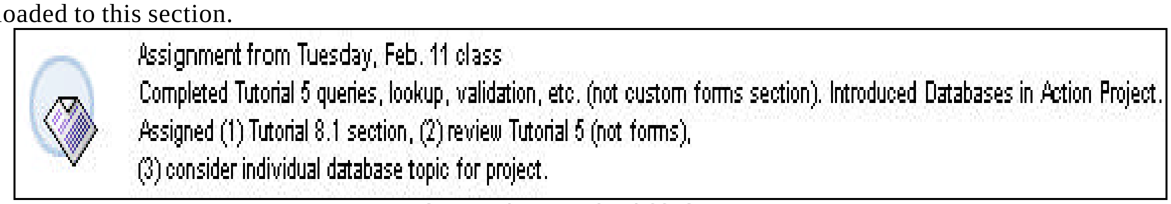

FIG. 4 EXAMPLE OF ASSIGNMENT

Communication—shows a variety of communication features as shown in Fig. 5. Many of them hyperlink to other resources.

FIG 5. COMMUNICATION FEATURES

Discussion Boards—show how new forums are created and the process used for threading discussions. Practice this feature in the classroom with small groups and questions that require at least 6-8 interactions on one topic. Practice while the students are interfacing in the classroom so that they know how to begin new topics related to the questions.

Group Pages—show the members of the groups set up by the instructor as shown in Fig. 6, privileges granted, and e-mail addresses for each member.

FIG 6. STUDENT GROUPS AND PRIVILEGES

Digital Drop-box—allows students to upload and send a file to the instructor only. Instructor examines document and sends it back via the same procedure.

Calendar—keeps a record of the day the case was posted as well as the due date or any benchmarks for noting the progress of the case as shown in Fig. 7.

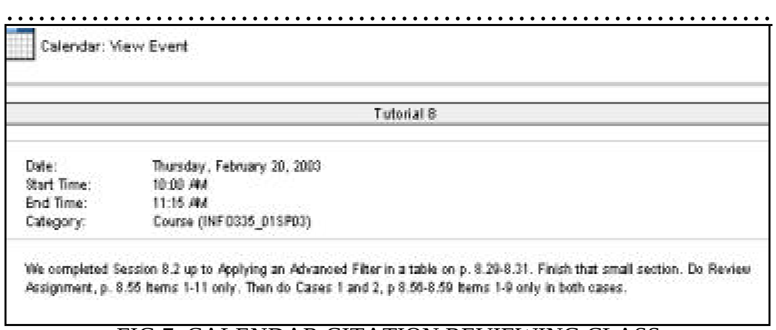

FIG 7. CALENDAR CITATION REVIEWING CLASS

Assessments (quizzes and tests)—allows both objective and subjective questions. Instructor should direct students to be specific in their answers. For example, cite if it is preferable to type dollar signs or if numbers should be rounded off.

Gradebook—shows results of the automatic grading of the assessment. Instructor can make manual adjustments.

External Links—connect to any Web site, for example, as shown in Fig. 8, for additional data, graphics, or reinforcement.

FIG. 8 SAMPLES OF EXTERNAL LINKS

Video clips—show expository or motivational clips. Some suggested sources are interviews with corporate mentors, segments from television business shows (with permission), views of a variety of corporate and business settings, or visits to database supervisors.

Summary

Learning, especially in the university, requires many things to go right if creativity and knowledge are to be fostered in students. Antecedent conditions to the learning process must be addressed, including learning styles of students, multi-modality of the instructional media, and preparation of the instructor and instructional materials. Similarly, transactions that seem to lead to learning include ready access to instructional materials, student time-on-task, sequencing, and constructive feedback. Aligning even some of these factors for a successful outcome is challenging to most educators.

In order to mesh effective teaching with technology to achieve efficient, effective instruction, this paper illustrates Blackboard to bolster the argument that good teaching and good technology are good fits. This paper shows the use of a CMS to augment a traditionally taught course to try to answer the question of effective use of technology in the classroom. Its focus is on the case method and follow-up discussion. The CMS Blackboard features which were used in the case method and discussion were illustrated.

It is hoped that the methods shown here will benefit those who are debating the benefits of using a course management system. The additional preparation of instructional materials and the work involved outside of class on both the instructor's and students' parts may lead to greater efficiency and more effective use of classroom time.

On Globalizing Management Training: The Role for Business Schools

Vishwanath V. Baba
McMaster University, Canada

Abstract

Globalization is a powerful new force that is shaping today's business environment. While there are many diverse definitions of globalization as there are people taking positions for or against globalization, it is important for us here to focus on the commonalities that are relevant to the practice of management. In line with the conference theme of managing business in a volatile environment and that of balancing local and global challenges, this paper details the demands of globalization for management training and the efforts by business schools to meet those demands. Specifically, the paper argues for a globally portable theory of management based on core competencies, which at the same time, is also sensitive to cultural and contextual contingencies. A model of management training leading to global managerial competence is offered. Specific strategies for business schools and their global implications for management training are discussed.

Introduction

Globalization is a powerful new force that is shaping today's business environment. While there are many diverse definitions of globalization as there are people taking positions for or against globalization, it is important here to focus on the commonalities that are relevant to management. More than anything else, globalization has created one common market for the world's goods and services. Gone are the days when local production serviced local markets and the process repeated itself endlessly around the globe, across sovereign markets in sovereign states. Business schools in those sovereign states provided well-trained managers to meet the expectations of those sovereign markets and manage the firms that serviced those markets. The theory and practice of management driving this process were pretty much localized as well. For example, enterprise management looked and felt very different in China and Vietnam, two countries the author has first hand knowledge of, during the pre-globalization era. There was little comparability between management models of the East and the West. Even within what is conveniently grouped as "eastern" and "western" economies, there were substantial differences in management practice. Now globalization has brought the world under one common economic umbrella (Fischer, 2003). This calls for a general theory of management along with novel approaches and innovative strategies to manage the diversity of expectations and the multitude of interests effectively. Universal core competencies have now become the trademark of globalization.

The management of enterprise under these conditions has acquired a new meaning. In order to manage the process of globalization we need "global" managers. How should we educate them? What should we train them in? What bodies of knowledge are needed to become a successful global manager? How should we organize these bodies of knowledge? What about skills? What are the mechanisms by which we raise managerial competence? In a globalizing world, not only goods and services are portable but so also is knowledge (Moitra & Wensley, 2002). How do we ensure that our global managers possess the knowledge and skills that are globally portable? And what sort of knowledge is globally portable? These are important questions needing thoughtful responses. Arguably, the global enterprises turn to business schools to provide them with the research, education, training and ongoing development.

While the broad goal of business education is to create wealth, it is accomplished through the acquisition of certain core competencies in management. They include learning to assign appropriate value to goods and services and exchange them in the market place at the right price with the right degree of promotion. Managers also learn to maximize return to stake holders through optimal allocation of resources to meet certain goals. They use appropriate strategy and structures to motivate people, provide leadership, build and manage teams, resolve conflicts and at the end of the day, move the organization toward meeting its objectives. Typically, a student of management is equipped with these skills through a systematic exposure to a curriculum dealing with accounting, marketing, finance, operations management, business strategy and organizational behavior. This approach worked well in the pre-globalization period. Now globalization has placed new demands on an old curriculum.

Increasingly business schools are being asked to generate new models for stimulating growth and channeling investment. We are expected to advance knowledge that would promote international trade and facilitate global services. Our students need to become experts in the diffusion of technology. They should be able to transfer knowledge, which would contribute to sustainable development and equitable distribution of wealth. In order to do these things effectively, the global managers must not only possess the more traditional cognitive intelligence but emotional, and cultural intelligences as well (Boyatzis, Stubbs & Taylor, 2002). The notion of multiple intelligence has become more relevant for management training in the globalized environment. It calls for not just old-fashioned “smarts” but emotional robustness and cultural sensitivity to deal with people in different contexts and from different cultures (Early, 2003). In the globalized world, business acumen and managerial competence have become much more pluralistic.

Pluralism poses a peculiar challenge to the practice of management. More than ever before, globalization calls for management skills that are portable and effective in a plurality of contexts and cultures. All of a sudden, we are forced to revisit the very nature of management. Is management a profession like engineering and medicine, with a core body of knowledge that applies pretty much to all situations, embellished, of course by knowledge of local conditions, but essentially portable. Surely, the accent can be placed either on the commonality or on the difference depending upon the situation. Typically for example, there is a core body of knowledge that all physicians or engineers must acquire regardless of where they train. At the same time, someone going to medical school in a tropical country gets greater exposure and training in the treatment of tropical diseases compared to the one going to medical school in the temperate zone. Similarly, for someone going to engineering school, empirical approaches to soil mechanics and foundation engineering change depending upon the geography, but the principles remain the same. In other words, soils differ but the principles of mechanics endure. The question is should management training be anchored around a core body of knowledge driven by certain universal principles? Or should management be treated as a profession like law, substantially localized where the bulk of the training is oriented toward the specific laws of the land where one chooses to practice.

Modeling Management Styles

These questions have serious implications for management training in the context of globalization (Baba, 2002). The model of management now being used to train managers has much in common with the model that is used to train other professionals such as physicians, and engineers. The model suggests that managerial competence is an interactive function of three distinct bodies of knowledge: 1. knowledge generated through research and codified in our texts, journals, and professional magazines; 2. the knowledge that is acquired through experience in management practice; and 3. the knowledge of contexts and situations where one manages. While the model acknowledges that one may possess substantial amount of any or all of this knowledge, it does not guarantee that one has acquired the competence needed to practice management. On the contrary, it is indeed possible that no competence is gained with the mere presence of these bodies of knowledge.

What is needed here is a system that allows for these three bodies of knowledge to interact and inform each other. This is precisely where the training that business schools provide adds value. As shown in Figure 1, managerial competence accrues due to the inter-penetration of the three distinct bodies of knowledge.

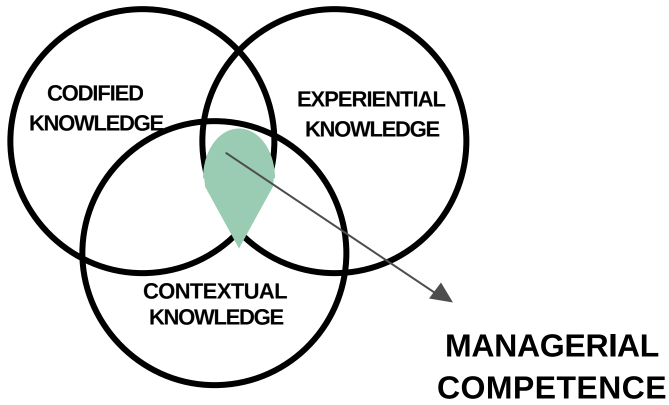

Figure 1. MODEL OF MANAGERIAL COMPETENCE

One becomes managerially competent when one interprets his or her experiences as well as others, in light of the codified knowledge of facts, models, and theories with sensitivity to the context in which it is played out.

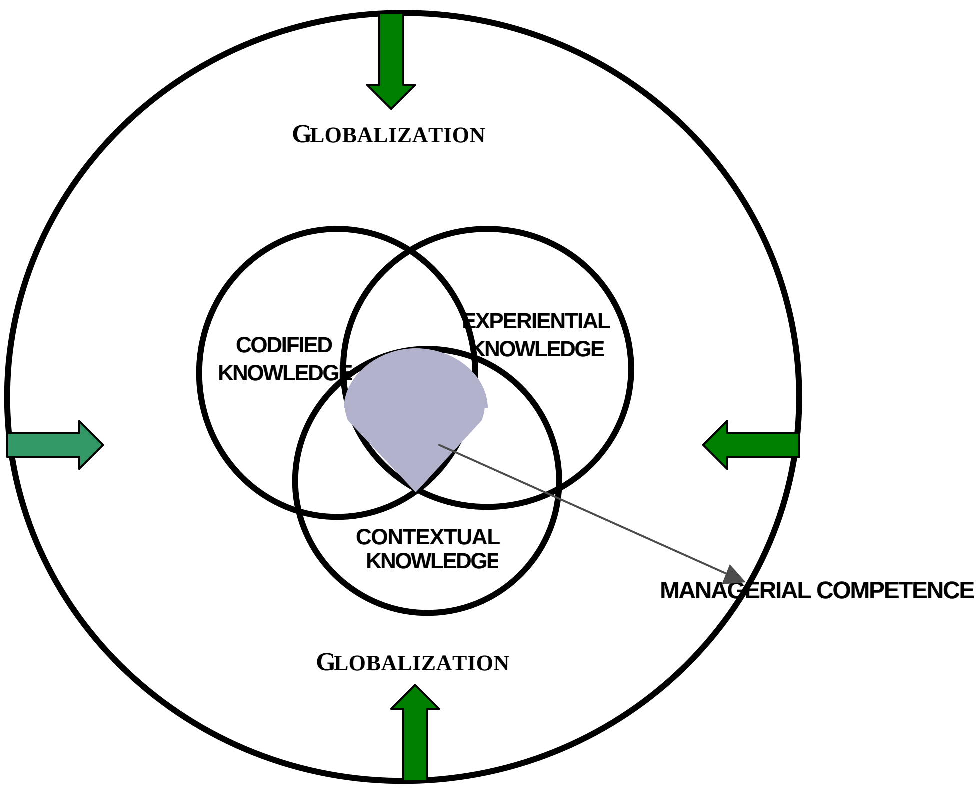

Figure 2. MODEL OF GLOBALIZATION AND MANAGERIAL COMPETENCE

Therefore it is imperative that trainers of managers need to constantly evoke and engender the fusion of these three bodies of knowledge in the classrooms and training facilities. And if the training were to be effective, they should, through pedagogical, strategic, and selective devices, bring the three bodies of knowledge into sequentially tighter relief. What it does is that it expands the area of managerial competence among the trainees. Now, such devices as one may choose to train managers for the global environment, should have the globalization paradigm as the uber-rubric as shown in Figure 2. This is how managerial competence is made relevant to the context of globalization.

The next step takes the process from training to development. Having ensured that the trainee has acquired the cognitive, emotional, and cultural competencies to manage globally, the trainee moves from the classroom to the locale of his or her managerial practice. Here is where the proverbial rubber meets the road. The trainee has an opportunity to apply what he has learnt in a new context, which is quite possibly global, and pick up the skill and facility to practice management effectively. It also affords him or her to adapt and tailor the training to the situation. Once again, the manager experiences the fusion of knowledge, experience, and context, which reinforces the learning, and affords confidence. The competent manager has now become a confident one. From here, the road to managerial effectiveness is short. More importantly, the manager has learnt to learn and the training is giving way to development. He or she is competent to go anywhere and is confident of managing successfully wherever he or she is. The trainee has now developed sound global managerial judgment. What makes management a profession is the fact that in the final analysis, it is the exercise of judgment that matters, although such judgment is well honed through rigorous training and development. It is much the same as in all professions – they are anything but formulaic.

In essence what is suggested here is that the globalization of the world economy calls for globalization of management research, education, and training. That is the only way we could be sure of a steady supply of competent managers around the globe to steer the forces of globalization toward the common good. What is to follow will detail how this needs to be carried out among the business schools with the help of professional associations, chambers of commerce and national governments.

In a rapidly globalizing environment, business schools are increasingly facing the tension between professional standardization and cultural pluralism. They need to train managers who have the core competencies to manage anywhere, and to manage any organization. At the same time, they also need to sensitize their students to the relevance of culture and context for managerial effectiveness. The challenge is to treat them as two sides of the same management coin.

In fact, globalization has forced us, to articulate certain abstract, universal, core principles that would contribute toward a globally portable general theory of management that can give rise to a plurality of models, which are culture sensitive and context specific. The core body of knowledge becomes more robust when enveloped by a theory and as a result, offers empirical synergy in modeling management phenomenon.

This means that we have to work toward a shared view of global commerce and its goals, a shared theory of business, and a shared understanding of the components and processes that constitute global business. It will eventually take us toward a shared theory of management mentioned earlier that will incorporate the context – cultural, economic, political, social, and temporal – within the theory. The final step is to acquire sophistication in developing context-, and content-specific models of management that are needed for the actual conduct of business.

If we are to develop and detail knowledge that is relevant to global management, we need to engage in a lot of empirical research that adds global breadth and conceptual depth to our understanding of business. This research will contribute to a body of knowledge codified for our use in our textbooks and journals. This indeed will form the basis for management education and training.

As for experiential knowledge, what business schools must do is to identify and document a managerial experience profile that is globally relevant. Then, they should recruit both students and faculty who will add breadth and depth to this profile. They function in the classrooms as resource providers. Intellectual and managerial traffic, engineered carefully to maximize experiential knowledge in the classroom is something that business schools can pursue to the benefit of both the students and the resident faculty.

In fact, many business schools in Canada look for requisite variety in terms of the experience profile while recruiting prospective MBA students so that they can inform each other and benefit from each other. The goal is to increase the surface area of the experiential knowledge component of the Venn diagram in Figure 1. It is nevertheless important to keep in mind that increasing the surface area may be necessary to enhance managerial competence but does not deliver it automatically. One needs to bring it in to closer relief with the codified and situational knowledge clusters to achieve enhanced competence. What one needs to do here is to maximize experience along multiple dimensions such as geographic, sectoral, and professional.

As for situational knowledge, what we need is to ensure that the business classrooms have participants with special knowledge of contexts and situations that add unique value to the training mission. We should endeavor to incorporate within the teaching material, knowledge about different cultural, political, social, and situational knowledge that is relevant to global management. As before, the aim here is to increase the surface area of the situational knowledge component of the Venn diagram shown in Figure 1. However, we also need to ensure that it is brought into tighter relief with the rest of the Venn circles in order to have tangible gains in managerial competence.

Finally, as Figure 2 suggests, the paradigmatic lever to bring these three bodies of knowledge closer during the training program is the notion of globalization. Every component in the educational and training program for managers must incorporate within its body of knowledge potential answers to the questions such as what is the theory of globalization that drives the management-training program? What is the relevance of what one had just learnt to globalization? How can the trainee manage better in a globalized environment with the knowledge and skills that he or she is being trained in? What is global about the material being exposed in the training program? How portable are the theories in a global context? How readily do they lend themselves to empirical modeling in different contexts? And to practical applications? This precisely is the role of the uber-rubric or the enveloping circle depicting globalization in Figure 2.

It exerts pressure to seek answers to these questions. The answers may not be readily articulate or even coherent. However, that is not indeed the expectation. The expectation is merely to raise the consciousness of the students and trainees to the notion of globalization and its relevance to management. These are seeds of learning that are sure to grow with time and nurturing.

So far we have laid the groundwork for globalizing management training. The motivation comes from the demands of global commerce to train and develop managers for the global enterprises. The role of business schools is indeed to provide that training. In order to do that, they have to understand the impact of culture on management and incorporate that understanding in their training programs. As scholars of management, we also need to develop models of global optimization and fine-tune a portable theory of management with a view toward contributing meaningfully to international management development.

Suggested Strategies

The next step here is to outline specific strategies that business schools could follow in order to make the management education and training they offer globally relevant. These are presented in Table 1.

TABLE 1. STRATEGIES FOR GLOBAL MANAGERIAL COMPETENCE

Strategies for global managerial competence		
Codified knowledge	**Experiential knowledge**	**Situational knowledge**
Core body of knowledge	Experiential diversity in student body	Globalization of curriculum
Portable theory	Experiential diversity in faculty	International site visits
Context specific models	Use of global managers in the class room	International partnerships and global expert panels
Comprehensive joint empirical research	Executives in residence	International student and faculty exchange programs
Texts incorporating research	Industry professorship	International student internships
Research based training material	Global business cases	International industry sabbaticals
		Off-shore management development programs

These strategies, in a general sense, follow the model outlined in Figure 2. In other words, the strategies contribute toward making the bodies of codified knowledge, experiential knowledge, and situational knowledge globally relevant. More specifically, they focus on the mechanisms to broaden the scope of these bodies of knowledge and bring them into closer relief so as to enhance global managerial competence.

Codified knowledge

The role that business schools play in this area has the potential for maximal impact. Business schools along with global national and international associations of management such as the International Federation of Societies and Associations of Management (IFSAM) can work toward identifying a globally relevant core body of knowledge in management and contribute toward the development of a portable theory of management. In addition, through joint conferences, symposia and workshops, business schools can engage other schools, professional associations, and global industry groups such as the national and international chambers of commerce toward contextually relevant model building and globally comprehensive empirical research. National governments through their research funding agencies can earmark funds for management research of this nature. In fact, the Social Sciences and Humanities Research Council of Canada (SSHRC) has indeed identified globalization and its impact as a national research priority and has set aside funds for generating research-based knowledge on globalization. The business schools should incorporate the knowledge thus gained in the training material that they develop and deliver. Once they have tested them out, the more enduring knowledge coming out of that that process can become the baseline material for globally useful textbooks on management.

Experiential knowledge

The approach here is predicated on the notion that requisite variety is optimally useful in enhancing experiential knowledge. The strategy for business schools to follow here is to ensure experiential diversity among the student body and among the faculty who train them. This strategy has implications for recruiting both students and faculty. The objective here is to maximize opportunities for learning from each other. The approach is to facilitate the training in a manner where each participant's experience becomes everyone else's. In addition, business schools must actively pursue practicing managers in global enterprises to come and share their experiences in the classroom as guest lecturers. Ongoing mechanisms such as executives-in-residence and industry professorships entrench requisite variety, and allows for the full exploitation of experiential knowledge vailable in the community. Finally, the experience profiles of faculty, students, and visiting executives can also be utilized toward developing business cases that can further contribute to the effective globalization of management training.

Situational knowledge

As in the previous case, the plan here hinges on the notion that exposure to a variety of situations and contexts and interpreting the best practice of management in light of that knowledge allows for effective management training. An important step here is to globalize the management curriculum. This is also where accreditation bodies like the Association for the Advancement of Collegiate Schools of Business International (AACSBI) and EFMD (European Federation for Management Development) can help. They could enforce global relevance and international portability in the curricula of business schools. This would ensure the commonality of a core body of knowledge that all accredited management education programs would incorporate in their training schemes. A popular way by which many business schools operationalize the globalization of the curriculum is to incorporate an international tour and site visits as part of the program requirements. Students and faculty choose a particular area of the globe to concentrate and then organize a visit to that country, which includes both business and cultural exposures. This gives the students a first hand knowledge of the context in which global organizations function.

Other mechanisms by which the situational knowledge is made available to students and trainees of management include the formation of international partnership with other business schools around the globe. One could also extend such linkages to global industry associations and international chambers of commerce. Such partnerships will make relevant situational knowledge readily available to all partners. More importantly, they make each other aware of changes taking place in their respective environments. This can be further operationalized through the formation of a global expert panel on various topics on management, which consists of both faculty and practicing managers trans-globally drawn from the partnering schools and organizations with the mandate to update knowledge – textual, experiential and situational.

Related strategies include international exchange programs and international internships for students, and an international visiting scholars program for faculty. Business schools could also encourage their faculty to take their sabbaticals in global organizations so that they can expand their profiles of both experiential and situational knowledge to the benefit of future trainees. Another approach that many business schools use to round out the situational knowledge of their trainees is to offer off-shore management development programs including an Executive MBA with on-campus visits where students in both programs have an opportunity to learn from each other (Baba & Dadgostar, 2003).

Once again, it is important to stress that global managerial competence can be accomplished only by bringing these three bodies of knowledge into closer interaction through the common optic of globalization. Globalization is a strand that should be woven through the fabric of management training. Pluralistic learning models, innovative pedagogy, global class rooms facilitated by information technology can all become patterns in the fabric, making it both unique and useful.

Conclusion

In summary, this paper outlines the demands of globalization for management education and training. In line with the conference theme of managing business in a volatile environment and that of balancing local and global challenges, this paper details the efforts by business schools to meet those demands. Specifically, the paper argues for a globally portable theory of management based on core competencies, which at the same time, is also sensitive to cultural and contextual contingencies. A model of management training leading to global managerial competence is offered. Specific strategies for business schools and their global implications for management training are discussed.

Abstract

In the new millennium, organizations begin to pay attention to knowledge management and how a knowledge-based organization can gain competitive advantages in the competitive environment. Organizations must be more innovative, more agile, and smarter in order to compete in this twenty-first century world. Those organizations that cannot learn, adapt, and change will not survive in this new millennium. So the leaders of the organizations must be progressive to create added value and generate value from knowledge assets in their organizations. The assets of the companies are categorized into tangible asset and intangible asset. Tangible asset such as property, equipment, plant, inventory, and financial capital are considered the most fundamental company asset. Intangible assets are knowledge, brand, and relationship with the customer. Apparently, most of the organizations still focus on their tangible assets because tangible assets are objectively evaluated quite easily. For instance, the financial statement is used to reflect whether the company makes profit in their business or otherwise. However, without related knowledge and skills in the business -related field of the workforce, the company won't be able to succeed. In this study of knowledge conversion practices in three manufacturing and one service firms, it was discovered that not all knowledge conversion practices were fully implemented in these four firms. These knowledge conversion practices were: socialization, externalization, combination, internalization. One-way ANOVA test showed there were significant differences among four firms in terms of socialization, combination and internalization.

Introduction

Knowledge management has become an important tool in staying ahead in the competitive environment. Often, organizations are taking a great interest on the idea of knowledge management and many of the organizations implement these programs in their organizations. The external forces such as globalization have force the organizations to speed up their technological innovation processes and to exploit the synergetic properties intangible assets Besides, the market globalization has reinforced the organizations the need to differentiate, to exploit the advantages derived from selective integration of core competence and to lever intangible assets (Bustamante, 1999).

It has been suggested that the success of business in an increasingly competitive marketplace depends critically on the quality of management which those organizations apply to their key business processes (Macintosh, Fily & Kingston 1999). With related knowledge it will allow the organizations to exploit the opportunities in the market and toward competitive treats. For example, the supply chain in a manufacturing environment depends on knowledge in diverse areas including raw material planning, manufacturing process and distribution of finished goods. Thus, the supply chain management is one of the most important strategic aspects of operations which encompasses many related functions. It will help the organizations to make decision on: from whom to buy the materials; where to locate facilities; how to transport goods and services; and how to distribute them in the most cost-effective, timely manner. According to Drucker (1999), the highly successful Japanese companies such as Honda, Canon, Matsushita, NEC, Sharp, and Koa make their companies more competitive in the competitive environments. The key to success of these companies are their ability in managing their creation of new knowledge.

Knowledge management has existed for many years, but only within the past few years it has gained noteworthy attention (Audrey and Robert, 2001). Many organizations are now pursuing knowledge management strategy because they believe that knowledge management is the central to their ability to grow and compete (APQC, 1999). According to Harrison (2000), the survival and innovation of companies are nowadays not only dependent on the knowledge they have but on the ability to generate new strategically valuable knowledge. Thus, the organizations must be able to use their knowledge resources to produce goods and services in order to increase their products at higher value. All in all, the capabilities and sustainable competitive advantage of one organization come from its continuously developing existing resources and capabilities, creating new resources and its ability to response to the market change.

What Is Knowledge?

According to Zelenny (2001), knowledge is the primary form of capital for the organizations. All other forms are dependent derived, only secondary to knowledge. For example, if we have a peace of land, without the knowledge how could we develop and make added value to that peace of land? So individuals need knowledge to help them to create innovation, which can help them to generate and increase the value their tangible asset. With the related knowledge, such piece of land can be developed as an industrial zone, a business center, a condominium and many others that can create added value to the land. As such, the company needs to recognize that knowledge is an asset, to be looked after used, and be valued like any other assets. Consequently, every company needs a policy of knowledge management (Bagshaw, 2000) that will help the company to ultimate their assets in order to become more competitive among the competitors.

It is however very difficult to define knowledge because of its intangible and fuzzy nature. It is the major problem for us to delimit the concept of knowledge. What is knowledge for one person can be information for the other (Bhatt, 2002). At present, there are numerous definitions of knowledge, but none seem to be universally appropriate, as these definitions depend on the context in which they are used (Bender and Fish, 2000, quoted in Sveiby, 1997). Since knowledge is "everything", it can be an encyclopedia that concerns the facts about the world. It also can be social, i.e. telling people about when to use the encyclopedia, a procedural knowledge (Alvesson and Karreman, 2001). Marakas (1999) also agreed that knowledge is an organized combination of ideas, rules and procedures.

Knowledge is characterized by information, a capacity and an attitude which is very important because all these three factors are equal and require sufficient attention. Knowledge is also said the result of multitude of factors: experience, skills, culture, character, personality, feelings, etc (Beijerse , 2000, p.164).

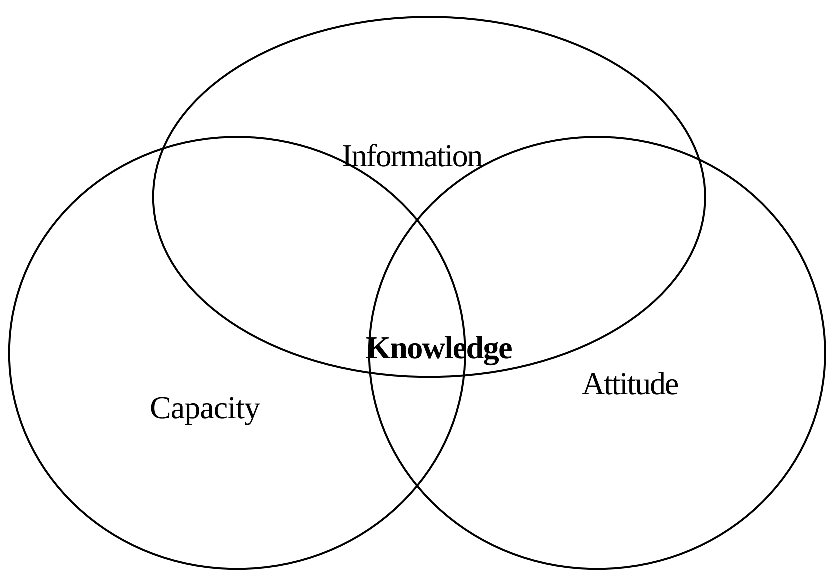

Figure 1 Three facets of knowledge Beijerse, 2000

From the above Figure 1, it shows that knowledge forms by three characters: information, capacity and attitude.

Information

Knowledge is an amount of information what is necessary to function and achieve. It is very hard to define what the information is. The information must easily accessible within the organization and accessible for everyone.

Capacity

The capacity is to make information from data and to transform it into useful information. This capacity such as creativity interprets and acts. With this knowledge, it will allow us tapping into and developing that which people are good, what are called their core competencies.

Attitude

Knowledge is an attitude. It is the attitude that make people want to think, interpret and act. It is important to stimulate people's curiosity and innovation to innovate

Standards Australia (2001, p.18) provided conceptual definition of each term summarizing a wide literature, combined with a working definition in knowledge management framework, which is data information, knowledge and wisdom (Clarke and Rollo, 2001, quoted Standards Australia 2001, p.18). This is shown in Figure 2 below.

I

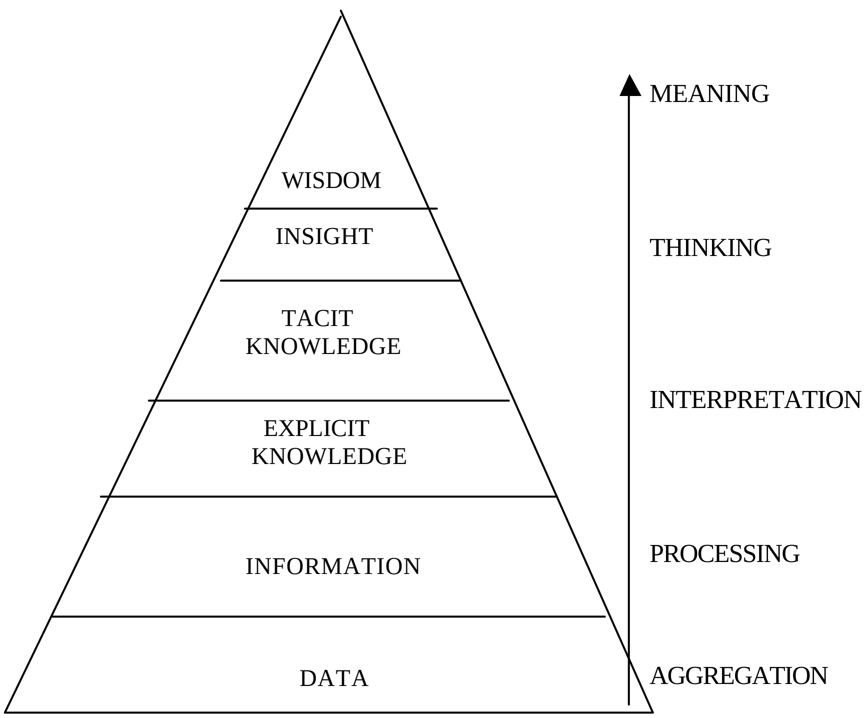

FIGURE 2 Data, Information and Knowledge, Standard Australia 2001

Nonaka and Takeuchi (1995), discuss four modes of knowledge in their models that discuss the distinction between tacit and explicit in four basic patterns for creating knowledge in any organizations.

Socialization: From Tacit Knowledge to Tacit Knowledge

Socialization is the process of sharing experiences, and creates tacit knowledge such as shared mental and technical skills. The tacit knowledge is acquired directly from others without using language such as observation, imitation, and practice. "On-the-job training' is one of the basically principles to acquire tacit knowledge. The key to acquire tacit knowledge is sharing experiences among the members in the organization. They shared their knowledge and experiences through brainstorming session, informal meeting, gathering and resort, meet at outside workplace, drinking, sharing meals and many others. They can discuss and critic on the topic they discuss. Beside they can acquire the tacit knowledge from their customer. Interaction between the products developers and customers will help them shared their knowledge and create new ideas for improvement.

Externalization: From Tacit Knowledge to Explicit Knowledge

Externalization is the process that makes the personal or tacit knowledge into explicit form such as metaphors, analogies, hypothesis and models. The externalization mode of knowledge conversation can be seen in the process of concept creation and conversation or collective reflection. Normally the method that is frequently used to create concept is to combine deduction and induction approach. Externalization holds the key to knowledge creation, because it creates new, explicit concept from tacit knowledge. Example, in the externalization, a metaphor is used to perceive and intuitive and to understand one thing by imaging another thing symbolically.

Combination: From Explicit Knowledge to Explicit Knowledge

Combination is the process of systemizing concepts into a knowledge system. In this stage, individuals exchange and combine knowledge through documents, meeting, telephone conversation, or computerized communication networks. The new knowledge can be created through configuration of existing information such as sorting, adding, combining, and categorizing of explicit knowledge. Combination is the process of knowledge creation that can carry out in formal education and training at school such as MBA education at a university. Other example, the managers break down and operationalizes the corporate vision, business or product concepts. They create the new concepts through networking of codified information and knowledge such as using computerizing communication networks and large-scale databases facilitate as a mode of knowledge conversation.

Internalization: From Explicit Knowledge to Tacit Knowledge

Internalization is a process of embodying explicit knowledge into tacit knowledge. This can happen through 'learning by doing'. Example, the experienced workers internalize their working experiences and make use of their know-how and learning for R&D projects in the company. The explicit knowledge becomes tacit knowledge when knowledge is verbalized or diagrammed into documents, manuals, or oral stories. When the individuals read this information, it will help the individuals enrich their tacit knowledge through documentations. The documentation will transfer the explicit knowledge to the individual indirectly in order to help them experiencing the experience of other people. Internalization also can happen when individuals reading or listening to a success story of some members of their organizations. It will make them feel the realism and essence of the story. They past experience of the successful members in the organization may help them change the explicit knowledge into tacit knowledge.

Objectives of the Study

Knowledge management programs sometimes failed in the organization. The occurrence of the knowledge management practices problems in the organizations had led to many of the organizations are not fully practiced all the knowledge management and knowledge conversion in their organizations. One of the reasons is that most organizations still measure their company performance based on the tangible capital they spend on, the economic returns from those investment and they can't realize the value of their intangible capital, i.e. knowledge. Besides, there are organizations which do no have initiatives to encourage their employees to practice knowledge management in their organizations. Against this background, using the Knowledge Management framework in Figure 2 (Standard Australia 2001), this study seeks: to investigate which knowledge conversion practices are fully practiced? The knowledge conversion practices are: socialization, externalization, combination, internalization.

Significance of Study

Knowledge management is very important to the organizations because knowledge is essential to the development of the organizations. Knowledge is the factor that the organizations distinguish themselves from their competitor.

Knowledge will also help the organizations to increase their profitability, productivity, and competitive advantages. This study on knowledge conversion practices in organizations will help the organizations to fully utilize the knowledge and the skills of their employees, to capture their ideas that contribute to their organizations. This study also helps the organizations in exploiting their intellectual capital effectively by using the most appropriate methods for transforming the requisite intellectual capital to the best form needed in the challenging market. After all, knowledge is characterized by information, a capacity and an attitude which is very important because that all three of these factor are equal and sufficient attention.

Methodology

This study was on knowledge management practices in four selected firms in Malaysia: three manufacturing firms and one services firm. The study investigated the gaps between the organizations which participate knowledge conversion practices in their organizations.

Tacit Knowledge To Tacit Knowledge (Socialization), Tacit Knowledge To Explicit Knowledge (Externalization)
Explicit Knowledge To Explicit Knowledge (Combination), Explicit Knowledge To Tacit Knowledge (Internalization)

The questionnaires were adapted from Filius et al. (2000), Beijerse (2000). The close-ended questionnaires using five-point Likert scale to indicate the respondent's extent of their answer, (5= completely agree, to 1= completely disagree) were distributed to the representative according to their managerial levels: top management, middle management, and supervisors. Mean scores of the knowledge management dimensions are used to indicate the knowledge management practices in each of the organization. One-Way ANOVA test was used to test the significant differences of knowledge conversion practices among four firms. The obtained data from the respondents is analyzed by using SPSS 11.0. The secondary data obtained from books reviews, articles, journals and website. The secondary data provides additional sources to support the results of the research. All of the questionnaires were distributed to the four selected organizations were successfully collected back from the organizations. This meant that 100% of the questionnaires were collected back from the respondents from the selected organizations. It was found that the respondents gave the positive feedback in this study. They were also willing to share their knowledge and opinions regarding the knowledge conversion practices in their organizations.

Findings

This research analysis aimed to investigate the extent of knowledge management practices and gap in the selected company. Twelve sets of questionnaires have distributed to the four selected companies. Three staff members of each organization from different position are invited to participate in this study. Mainly they are top management, middle management and supervisors. Table 1 and Table 2 show the samples of firms and respondents

TABLE 1 NUMBER OF RESPONDENTS BY COMPANY

	Firm Types	Size (employees)
Firm A	Assembly and technical platting services	850
Firm B	Packaging, Testing and 'turnkey" services	2,275
Firm C	Computer Systems	2,000
Firm D	Telecommunication services	1,123

Company

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Company A	3	25.0	25.0	25.0
	Company B	3	25.0	25.0	50.0
	CompanyC	3	25.0	25.0	75.0
	Company D	3	25.0	25.0	100.0
	Total	12	100.0	100.0	

TABLE 2 NUMBER OF RESPONDENT BY POSITION

Position

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Top management	4	33.3	33.3	33.3
	middle management	4	33.3	33.3	66.7
	supervisor	4	33.3	33.3	100.0
	Total	12	100.0	100.0	

Knowledge Conversion by Companies

From the Table 3, the conversion of knowledge practices from explicit knowledge to explicit showed the mean score of 3.60 is the highest among the four items in knowledge conversions. Socialization of knowledge mean = 3.58 is second higher after combination knowledge follows by externalization of knowledge =3.51, and internalization of knowledge =3.51.

TABLE 3 KNOWLEDGE CONVERSION PRACTICES BY COMPANIES

	Company A	Company B	Company C	Company D	Mean
Tacit Knowledge To Tacit Knowledge (Socialization)	**3.64**	**2.98**	**3.80**	**3.90**	**3.58**
Tacit Knowledge To Explicit Knowledge (Externalization)	**3.48**	**3.43**	**3.48**	**3.67**	**3.51**
Explicit Knowledge To Explicit Knowledge (Combination)	**3.33**	**3.27**	**3.90**	**3.90**	**3.60**
Explicit Knowledge To Tacit Knowledge (Internalization)	**3.22**	**2.67**	**3.53**	**3.69**	**3.28**

1.1. Socialization: Tacit Knowledge to Tacit Knowledge

In the socialization of knowledge practices, for Company D the mean score= 3.90 is the highest among the four companies. Company C mean= 3.80 was the second highest after Company D follow by Company A mean=3.64 and Company B mean= 2.98. The mean gap in socialization of knowledge for Company B with Company D was higher if compare with Company A and Company C. The mean gap between Company B and Company D was 0.92.

On the other hand, the mean gap between Company C and Company D was 0.10, and the mean gap between Company A and Company D was 0.26. The mean gap for Company B is higher compared with Company A and Company C.

TABLE 4 ONE WAY ANOVA FOR SOCIALIZATION OF KNOWLEDGE PRACTICES AND COMPANIES

ANOVA

Socialization:From Tacit Knowledge To Tacit Knowledge

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	1.580	3	.527	11.797	.003
Within Groups	.357	8	.045		
Total	1.937	11			

There were significantly differences between socialization of knowledge practices or tacit knowledge to tacit knowledge with companies. One-way ANOVA test showed F=11.797 and P>0.05. The result showed there were significant differences among four firms.

1.2. Externalization: Tacit Knowledge to Explicit Knowledge

We found that in the externalization of knowledge practices, the companies mean in this item are very closed within each other in between 3.43 to 3.70. Of the four companies, Company D mean =3.67 was the highest in the externalization of knowledge practices. On the other hand, Company B mean =3.43 was the lowest among the four companies. There were two companies scored the same mean= 3.48. There were Company A and Company C. The mean gap among these four companies are smaller and less than 0.25. The mean gap between Company D and Company B is 0.24, and the mean gap for Company A and Company C were equal to 0.19 when compared with Company D.

TABLE 5 ONE WAY ANOVA FOR EXTERNALIZATION OF KNOWLEDGE PRACTICES AND COMPANIES

ANOVA

Externalization: From Tacit Knowledge To Explicit Knowledge

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	.100	3	.033	.187	.902
Within Groups	1.429	8	.179		
Total	1.529	11			

One-way ANOVA was used to test whether externalization of knowledge practices significantly differences with companies. From the above result F=0.187 and p>0.05, found that there were no significant differences between externalization of knowledge practices and companies.

1.3. Combination: Explicit Knowledge to Explicit Knowledge

Company C and Company D scores the same and highest mean 3.90 in knowledge combination practices among the four companies. Company A mean 3.33 is second highest after Company C and Company D. Company B mean 3.27 is the lowest among the four companies.

TABLE 6 ONE-WAY ANOVA FOR COMBINATION OF KNOWLEDGE PRACTICES AND COMPANIES

ANOVA

Combination: From Explicit Knowledge To Explicit Knowledge

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	1.087	3	.362	4.179	.047
Within Groups	.693	8	.087		
Total	1.780	11			

To test whether there were significantly differences between combination of knowledge practices and companies, the result showed that $F=4.179$ and $p>0.05$ and that there were significant differences between combination of knowledge practices and companies.

1.4. Internalization: Explicit Knowledge to Tacit Knowledge

Company D scores the highest mean 3.69 among of the four selected companies in the internalization of knowledge practices. On the other hand, Company B mean= 2.67 was the lowest among the four companies. Company C mean =3.53 was the second higher after Company D follow by Company A 3.22. The mean scores gap between Company B and Company D was high if compared with other companies. The gap between Company B and Company D was 1.02. On the other hand, Company A and Company C mean gap when compared with Company D were 0.47 and 0.16 respectively.

TABLE7 ONE-WAY ANOVA FOR INTERNALIZATION OF KNOWLEDGE PRACTICES AND COMPANIES

ANOVA

Internalization:From Explicit Knowledge To Tacit Knowledge

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	1.838	3	.613	8.207	.008
Within Groups	.597	8	.075		
Total	2.435	11			

In order to test whether they are significantly differences between internalization of knowledge practices and companies, one-way ANOVA test showed the result of $F=8.207$ and $p>0.05$. Thus, there were significant differences between internalization of knowledge and companies.

Conclusion

Explicit Knowledge and Tacit Knowledge

Knowledge can be conceptualized as tacit knowledge and as explicit knowledge (Gupta, Lyer, and Aronson, 2000). Explicit knowledge is based on universally accepted and objective criteria. It has the character of public good and easy to code and transfer. According to Hedlund (1994), explicit or articulate knowledge is specific as being writing, drawings and computer programs. It means that its can expresses as a word of number, in the form of hard data, scientific formulas, manuals, computers file, documents, patents and standardized procedures or universal starting points that can easily be transferred and spread (Beijerse, 2000).

Explicit knowledge can resides in formulae, textbooks or technical document (Lee and Yang, 2000). It is also can share the knowledge through printing, electronic methods and other formal means. Besides explicit knowledge is carefully codified, stored in a hierarchy of databases that can be reused to solve many similar types of problem (Smith, 2001). According to Emin civi (2000), explicit knowledge can be expressed in words and numbers and shared in the form of data, scientific formula, specification and manual. It can migrate in the business community, and be accessible for the most company regardless of their cooperatitive activity. This codified and stored explicit knowledge can be accessed and used easily by anyone in the organizations.

Polanyi (1962) defined tacit knowledge as the knowledge that is non-verbalizable, intuitive, and unarticulated. Tacit knowledge usually in the domain of subjective, cognitive experiential learning, whereas explicit knowledge deals with more objectives, rational, and technical knowledge (data, policies, procedures, software, documents etc) (Gupta, Lyer, and Aronson, et al., 2000). Badaracco (1991) conceives of tacit knowledge as existing in individuals or groups of individuals. He refers to such knowledge in individuals and social groups as embedded knowledge.

Tacit knowledge is learned through collaborative experience and it is difficult to articulate, formalize, and communicate (Nonaka and Takeuchi, 1995). Tacit knowledge is the knowledge in a person's head that is often difficult to describe and transfer. It includes lessons learned, know-how, judgments, rule of thumb, and intuition (Grayson and O'Dell, 1998). Tacit knowledge is the skills and "know-how, we have inside each of us that cannot be easily shared (Lim, 1999).

Tacit knowledge is deeply rooted in an individual's actions and experienced as well as ideas, values or emotions. Tacit knowledge can be classified into two dimensions, which is technical and the cognitive dimensions. The technical dimension encompasses information and expertise in relation to "know-how" and the cognitive dimensions consists of mental models, beliefs, value, schema, and ideals (Gore and Gore, 1999).

The results of this study showed that the extent of knowledge conversion among the four companies are different between each other. All in all, not all four companies fully practiced those four categories of knowledge conversions.

Limitation of the Study

This is a case study that attempts to explore knowledge conversion practices. The results of this research do not reflect an overall actual situation in all companies in Malaysia. It is hope that further rigorous research in knowledge management practices in Malaysian-based companies are conducted. we can know the extent and the weakness we are, so we can improve it through the research.

Online Learning: Crossing of Boundaries Courses
A Mexican-UK Comparative Case Study Analysis

Martha Burkle
Sandra Meredith
Monterrey Institute of Technologies ITESM, Mexico

Abstract

Although e-learning has been an important topic within education and training for more than a decade, it is probably fair to say that the development of this style of learning is still evolving. Using data from two research projects, one carried out in the UK and one in Mexico, this paper focuses upon four elements that most affect the learner experience and ultimate success of teaching practice. These elements, which need to be taken into consideration when developing e-learning courses, are listed as: the delivery of the pedagogic method of virtual learning itself, the role of the instructor, the software used, and the experience of team teaching. Base on the two case studies, this paper analyses the strengths and weaknesses of elearning through the lenses of the elements listed above. Although the researchers involved do not reach any final conclusions, the paper emphasizes the importance to analyze the learner experience when embarking in online learning. The research found that once the student is engaged in the elearning experience, the pathway to successful learning is established.

Introduction

The use of information and communication technologies (ICT) in the delivery of education has major implications for lecturers, learners and higher education institutions (HEI). Whilst there is potential for major benefits for all concerned, it also continues to set a challenge for providers to develop new strategies for teaching and learning and raises fundamental questions about the learning process. Within the UK, a debate still flourishes on whether electronically-based education will enhance student learning and be more cost effective for institutions or pose a risk in both financial and pedagogic terms (Bacshich &Ash, 1999, Sloman, 2001). As van der Wende (2001) points out, regarding the implementation and effects of ICTs, a variety of differing views and opinions have emerged. One end of the spectrum perceives ICTs as “really changing education”, while there is an opposite view that ICT has “little effect”. But what is the opinion of those most affected by this revolution namely the learners? And how can such information be used to inform and support international cooperation in allowing full maturity of the e-learning industry to evolve?

Literature Review

E-learning has yet to be widely accepted as the term to describe technologised learning in all its forms. Authors agree that a single definition for eLearning has yet to be found (Selinger & Pearson, 1999; Sloman 2001; CIPD report; 2001; Rosenburg, 2001). A range of terms such as ‘tele-learning’ (Collis, 1996), ‘telematics’ (Selinger & Pearson, 1999), ‘online learning’ (Salmon; 2000), ‘distributed learning’ (Bates 2000), ‘flexible learning’ (Collis & Moonan, 2001), may all point to a similarly conceived educational experience.

The concept of e-learning suffers from the fact that it has numerous definitions and interpretations. Deciding upon which definition fully encapsulates the concept is not an easy task. At a basic level it can be defined as the use of technology to delivery or support learning. E-learning bridges distance, but goes beyond anything that conventional distance learning offers (e.g. through correspondence or CD ROM courses). For Rosenberg (2001) it is based upon three fundamental criteria:

1. It is networked, capable of instant updating, storage/retrieval, distribution and sharing of instruction and information.
2. It is delivered to the end-user via a computer – using standard internet technology

3. It focuses on the broadest view of learning – learning solutions that go beyond the traditional paradigm of training

This definition appears to be endorsed by other (McFadzean & McKenzie 2001; Salmon & Giles 1998) who describe the learning through computer-mediated communication (CMC) as the transmission or reception of information through a networked computer system using Web-based or collaborative software.

Collaborative learning occurs when learners use this technology to interact with each other and to gain access to a wide variety of resources. It is the potential it offers to learners for collaborative working and in accessing an almost infinite, reconfigurable and constantly updated information source, perhaps structured around a core course delivered by lecturers/facilitators that constitutes the major strength of e-learning. However, when developing electronically delivered courses tapping into the learner experience to gain an understanding of the weaknesses must be given equal consideration as the strengths (Bruffee, 1999).

In linking issues which have appeared in the literature with the empirical findings, the four following categories have emerged:

1. Strengths and weaknesses of e-learning courses
2. Instructor and student interaction
3. Different models of learning delivery
4. Experience of team teaching

And these specific issues will be discussed below.

Strengths and weaknesses of virtual learning

There is a perception that the use of ICT in education will be of benefit in higher education institutions. However, good use of ICTs is failing to occur because of a lack of comprehensive policies and strategies. Courses run using ICTs tend to be isolated experiments and pockets of good practice and are not part of a whole university based plan. (Collis, 2001). Literature on the subject (Appleborne, 1999; Bates, 1995; Harasim, 1994) suggest the following as major strengths and weaknesses.

Strengths	***Weaknesses***
Knowledge Generation: The instructor becomes a facilitator in the educational process. The learner takes responsibility to retrieve information and knowledge and use facilitator's guidance in a meaningful way.	Work overload occurs on part of students in having to access information themselves and through working more independently.
Collaborative learning: The learners develop together original thought as they build their own knowledge and meaning.	Time restrictions, culture differences and other difficulties have been found when distance students need to engage in collaborative learning with distance partners
Customised approach which focuses learning and administration on student rather than institutional needs	In many traditional universities there still exists a lack of institutional vision-policy for the integration of ICTs into teaching programmes. Leads to a discrepancy in the quality of learning experience.
Close relationship between learning and the work, leisure, professional or other requirements of the student	When the process of learning takes place in a work environment, difficulties of time compatibility were found among students
Universities would be forced to develop better products	Traditional universities are by nature collegial and zealous defenders of their culture and traditions
Universities have adopted a focused student-centred approach rather than having a curriculum, instructor and course orientation.	Universities are not taking sufficient account of the changing nature or the student body and the flexibility in learning they now demand.
New educational markets that will cut across age groups and national boundaries	Global competition poses a threat to institutions unwilling or unable to participate in the e-learning revolution

Instructors and students interaction

Perhaps the most important factor that e-learning has brought to the instructor – student relationship is the level of flexibility of interaction and communication. Instructors are freed from both time and geographic constraint and are able to contact students whenever they wish, from wherever they wish, answer questions and even mark and give results of assignments. For the students, the possibility of accessing the instructor through e-mail or other asynchronous software allows them to organize their time schedule. Learners can save communications, forward messages to other students, contact and communicate with the instructor when he/she is away. Distance and time are rapidly becoming irrelevant in the teaching process and hence no longer a barrier to the learner or the instructor.

Different Models of learning delivery – computer conferencing and website

Online learning could be delivered through the use of different course authoring tools, such as WebCT or Blackboard or in combination of other computer-mediated technologies, such as computer conferencing (Pallof & Pratt, 2001). Computer conferencing capacitates the development of a time and location-independent learning environment that with the use of images and sound may simulate educational interactions, both cognitive and affective, that occur on-campus. Harasim (1990) underlines that computer conferencing has found important practical application in education, including delivery of university and graduate credit courses. Computer conferencing was first employed for educational delivery in 1982 (Freenberg, 1987).

Experience of team teaching

Johns (1996) underlines the importance for “new model universities” to operate in a variety of partnerships. In fact one of the key differences between traditional modes of teaching and virtual ones, is the fact that a virtual (online) lecture is produced by a team. This team is formed by a group of people who are in charge of the different elements to design an electronic course, such as the instructor, the website designer, the instructional designer, etc. By doing team teaching, the instructor is not longer the ‘knowledge holder’ as he/she shares this knowledge not only with the team but also with the learners.

Students and instructors use of the Internet for virtual learning

The access and use of the Internet that e-learning provides represents for the learner a possibility of interaction with different sorts of activities provided by the website. Groups come together outside the university environment and share workplace tools. Furthermore, the Internet provides learners with different sorts of software and different source of information that facilitates the course enrichment and the interaction with distance colleagues.

As Harasim suggests, apart from enhancing and expanding educational access, “computer-mediated communications suggest significant potential for effective new learning and research interactions”. (Harasim, 1994).

Students may connect, using the Internet, with experts in their field of study, other universities, and learning communities, or discussion groups that have form around interest in the area under study. As they do this, their ability to use these skills while working in other course areas also increases. (Paloff & Pratt 2001).

Empirical evidence
The Mexican experience.

Research was carried on in Mexico at the Monterrey Institute of Technologies (ITESM) during August - November 2000, and October 2001. The ITESM is a Mexican private university with 30 campuses in Mexico and 9 other countries in Latin America. Founded in 1943 by a group of Mexican entrepreneurs, computers were incorporated in their teaching process since 1997.

The ITESM as a university using technologies is innovative as it does not only use one technology at a time (TV, video, computers…) but uses multiple technologies simultaneously, covering more than 70,000 students. The ITESM is the only Mexican university massively applying the use of computers into their teaching model. This use of computers seeks the interaction between lecturers and learners through a computer mediated learning process. Undergraduate students receive their lectures through a mixed mode that combines teleconferencing lectures with website courses. Registered students in the first and second year of their bachelor degrees, use a mixed face-to-face and computer-supported mode while registered students at the third and fourth year cohorts use a combine on-line/teleconferencing mode.

Open- ended interviews were conducted with both distance students and virtual lecturers in the Department of Engineering and Computer Sciences and the Department of Management and Business. Students were asked about their skills and confidence to use computers, their interaction with the distance instructor, their participation in on-line learning, engagement and motivation in collaborative work and future benefits of the use of technologies in the workplace.

Strengths and weaknesses of virtual learning

Even though lecturers and students stated that the teleconferencing/online mode demands from them more work, they both agreed regarding the advantages that this kind of teaching and learning brings compare to traditional modes. Similar findings to those of Linda Harasim (1994) showed that not only the fact that in the new model lecturers are now considered more like facilitators and not like knowledge holders, but also the possibility of students to access an enormous amount of information was underlined as important. Furthermore, students in this model engaged in collaborative work activities with their distance partners and participated in group discussion.

Instructors and students interaction

Technologies' presence in the lecture room was considered of vital importance regarding the possibility of interaction between the virtual lecturer and the student. In the so-called "virtual lecture room", students received a lecture from a distance instructor who would transmit it through teleconference. Inside the lecture room, students will have a TV monitor with a satellite connection to the remote site, a computer with connection to the Internet and a telephone line. Therefore communication with the lecturer was seen as permanent as students may contact their instructors through e-mail as often as they needed to, either during the lecture itself, or after it. Most of the interviewed instructors agreed that their distant students value a permanent contact with them. However, distance students complained that the interaction with their lecturers was not as efficient as it should be and that virtual lecturers should attend the work of more than five hundred students at once.

Different Models of learning delivery – teleconferencing and website

At the ITESM, a mixed mode to learning delivery was used. The lecture was transmitted in a computer conferencing mode and students accessed the course materials through a website. Students spent 3 hours a week inside a virtual room where they received the satellite transmission of the lecture and complemented this session with readings and research done in the web. Furthermore, they also engage in collaborative activities with distance colleagues through the use of this web.

The experience of team-teaching in a virtual mode

In the case of the ITESM this team was formed by the lecture him/herself, one or two instructional designers, two or three tutor lecturers and course' facilitators in each campus. The lecturer responsible for the course is no longer working on their own. Most of the interviewed lecturers agreed that even though working within a team was challenging for them (because they have to develop innovative pedagogic techniques), it was an enriching experience that made them realized their new role in the distance lecture room. As lecturers stated, in order to work in team they have to complement each other regarding the knowledge of the field they are teaching. They emphasised the importance of co-operative working.

Students' and lecturers' use of the Internet for teaching and learning

All of the interviewed distance lecturers and students agreed that the Internet played a crucial role in the process of teaching and learning in this teleconferencing/online mode. Apart from the web content, distance lecturers placed several links to other relevant sites where students could find interesting information regarding their courses. Furthermore, students use permanently research engines to look for information relevant to their courses. The interviewed distance lecturers underlined the importance that the process of innovating hardware and software had in the improvement of a virtual lecture. Both lecturers and students stated that the use of electronic methods of interaction - like ICQ or chat spaces – made possible the synchronic and asynchronic interaction between students and their distance lecturers.

The UK experience

The Centre for Research in Innovation Management (CENTRIM) is a research department located in the University of Brighton in the UK, a university catering for twelve thousand students. CENTRIM, in collaboration with eight other universities and organisations within the UK, was responsible for developing and delivery of two courses Training in Supply Chain Management and Training in Innovation Management Europe (TISCAM and TIME) as part of an e-learning research project funded by the European Union. Each course consisted of ten modules of learning, each module having ten units to be covered over a period of 10-20 weeks.

CENTRIM took the opportunity to approach the project from a variety of different levels. Firstly, it was an experimental learning process for all concerned in the creation of electronic learning materials; secondly, it was research oriented, designed to test out the methods of authoring and gaining an understanding of the learner experience in work-based situations; and thirdly the project could be seen in terms of a collaborative innovation process, whereby each partner was playing their part and integrating their skills in the creation of a 'new product'.

The writing and developing of the learning materials began in 1998 and the delivery stage took place between 2000-2001. In all 28 learners agreed to undertake the courses and were willing to be debriefed following this experience. The learners were all from small and medium-sized manufacturing companies. They were a self-selecting group, responding to information disseminated via government agencies. Learners were interviewed using a interview schedule which included questions on learner's background, responsibilities, previous training pattern and learning style. Informants were asked about their motivation for participating in on-line learning, personal development aims and benefits that they hoped to gain. Their experience of understanding this process of learning was considered, including obtaining permission, difficulties, learning patterns and emotions experienced as they interacted with a computer rather than a human being.

Strengths and weaknesses of virtual learning

As a piece of research the TISCAM/TIME projects were valuable in revealing the strengths and weaknesses in embarking upon the e-learning route. Firstly, it became very apparent that a great deal of background preparation has to be very rigorously carried out to ensure learners receive effective and valuable experience. The technological aspects appeared a priority in the first stance, but in retrospect the research team began to realise that some understanding of learners needs, how best they learn, levels of IT skills and patterns of learning must first take place. In other words learner needs should inform technology and software used and not vice versa.

Estimate of tutor support per learner was also difficult to predict and learner requirements varied greatly. Especially in the early stages each learner requires a great deal of support, both for negotiating the technology and the course content. Ensuring sufficient and fast support response was found to be very resource intensive. Theoretically, the fact that tutors were available at the other side of the email was seen as very positive, but in reality this could be overwhelming for the tutors concerned.

Instructors and students interaction

A weakness in the TISCAM project was the failure to give an adequate level of tutor support to learners. Although it was hoped that learners would experience a process of more or less self-managed learning by entering a virtual classroom, interacting with a community of teachers and learners in order to meet individual or organizational learning and development needs (due to problems with technology and management of the project) this was not fully achieved. But the need for interactive communications, with tutors and with other learners, was highlighted by almost all students. This problem was mitigated somewhat by the fact that each SME had small groups of learners, who supported each other and benefited greatly by discussing problems and ideas during work time. Even though some learners were following different courses, within the same companies, they were sharing the same experience, and problems arouse to which all learner could relate, which contributed to an effective working environment.

Different Models of learning delivery – teleconferencing and website

It was decided that the learning modules would all be designed and developed for full on-line delivery. Working alongside the universities who were responsible for the course content, was an IT company who designed the website and placed the course material on the internet and was in charge of maintenance and changes to the text. Each unit of the course was made up by the core text, case studies, additional articles and materials, exercises and assessments, as well as hyperlinks to live sites, chatrooms for students collaborative work and email to tutors and IT company.

Experience of team teaching

The TISCAM/TIME project was supported by a team of academics. It was important that each partner felt part of the team and able to exploit this relationship to ensure effectiveness of the group. The project was supported by technicians and academics who provided covering authoring guidelines, guidelines for learners, learner support systems, tutor, mentor and facilitator guidelines and the role of Regional Delivery Centres (Oliver 1999, Anderson and Oliver 1999).

Students and instructors use of the Internet for virtual learning

In general the UK learners found that it was easy to start following the on-line courses, but difficult to continue and actually complete them. There were many reasons for this, and as may be expect with an experimental research project, where the technology is being simultaneously developed, some were due to technical 'teething-troubles'. Five specific issues emerged:

- ?? Critical moments – when problems occur with technology and learner is unable to solve
- ?? Seamlessness - ensuring that the technology, media and content work together so that the learner feels that the experience is seamless rather than disjointed
- ?? Support - ensuring that learner feels adequately supported in the learning process both on content and technology
- ?? Language – Is the language used and style adopted 'right' for the learner?
- ?? Fit – does the use of technology and course content fit into the learners broader programme for personal development?

Conclusions/Recommendations

The first thing that comes from the learner experience is that embarking on on-line delivery emphasises the complexity involved in such projects. In particular, it is crucial that training is provided for both tutors and learners to ensure the learners receive effective and valuable experience (background preparation). Failure to engage students in a positive way from the outset can lead to disillusionment, and failure to complete the course. Once the student is engaged, and understands the value and potential for accessing a vast world of information through the use of the Internet, the pathway to successful learning is established.

Multicultural Issues in Study Abroad Contexts

Mary Emily Call
Montclair State University, USA

Abstract

The continued growth of international business attests to the fact that businesses need people who can function in other cultures. One of the best ways to be successful abroad is to experience another culture by living and working or studying in that culture. Living abroad usually requires proficiency in the language of the host culture; however, while proficiency is a necessary condition for participating in daily life, it is not sufficient for success. To succeed, guests in other cultures also need a practical knowledge of the implications of their actions in the host culture. Since many people who plan careers in international business travel to other countries to study and learn about multicultural issues, it is vital that they learn about cultural contrasts that may thwart them. This presentation focuses on study abroad programs and the kinds of cultural differences that students may encounter in higher education in other countries.

Introduction

The continued growth of international business attests to the fact that businesses need—and will continue to need—people who know how to function effectively in other cultures. One of the most efficient ways to prepare for success abroad is to experience another culture first-hand by living and working or studying in that culture. Living abroad usually requires proficiency in the language of the host culture; however, while language proficiency is a necessary condition for participating in daily life, it is not sufficient for business, academic, or interpersonal success. To succeed in any of these arenas, guests in other cultures must also have a practical knowledge of the implications of their actions in the cultural milieu in which they are living. Since many young people who plan careers in international business travel to other countries to study and to learn about multicultural issues, it is vital that they become attuned to cultural differences that may thwart the unwary. This study describes an ongoing investigation into the kinds of cultural differences that students in study abroad programs may encounter as they embark upon academic work in cultural settings different from their own.

When people take up temporary residence in another country, it is almost inevitable that they will encounter some misunderstandings as they go about daily life in the host culture. As an example of a cultural contrast, let me relate a situation that I recently encountered. During the spring of 2003, I had the great good fortune to be assigned as a Fulbright Senior Scholar at Comenius University in Bratislava, Slovakia, where I taught Psycholinguistics to a group of students in their fourth year of studies. I met the students every Monday morning and, as I do in the United States, I opened each class by "throwing out" general questions to the students about information that had been presented in the last class. I did this for three reasons: 1) to refocus the students' attention on the topic, 2) to give them an opportunity to ask questions about the last class and 3) to serve as a point of departure for that day's discussion. My expectation was that students would quickly raise their hands so I could call on one of them to answer my question. To my surprise, I had a very hard time persuading the students to answer the questions, which were quite general and easy to answer. Even though their English was excellent, I began to wonder whether or not they had understood the material presented in the previous lesson. I labored on for several weeks trying to pry answers out of the students, then, when I was talking to the dean about another matter, I happened to mention my frustration in getting the students to participate. The dean looked at me with a puzzled expression, and then said that if he were a student in that class, he would feel as if I were examining him, so he would hesitate to take a chance on answering incorrectly! I was dumbfounded at this explanation, but quickly realized that I had been making a cultural mistake! Had I realized that I was expected to give a formal lecture about the day's topic and not conduct the class as a discussion, as I do in the United States, I would have known that such questions were not part of the schema for classroom interaction.

This story, which describes a misunderstanding in educational culture, points up the need to prepare students for similar cultural encounters. However, in preparing students for higher education in another country, most study abroad programs focus almost exclusively on making sure that prospective students have the requisite level of language proficiency to participate successfully in their courses. In fact, study abroad opportunities are often made available only to students who have attained at least an intermediate level of language proficiency [4]. It is thought that students with lower proficiencies will not derive sufficient benefit from an experience abroad that is focused on a topic other than the language, itself. While home institutions understand that students must have this language prerequisite, they generally assume that the educational culture in the host country will be similar to that in the native culture. Thus, students with at least intermediate proficiency in the target language are expected to have few problems in courses taught through the medium of that language. As my story indicates, this is rarely the case. Students, who embark on coursework in the host culture equipped only with their own cultural expectations of educational practices, will be baffled, or worse, by their interactions with professors and peers. If they are to maximize their experiences, these people must understand what is expected of them *in their role as students in the target culture*. This includes becoming familiar with information about such topics as interacting effectively with peers and instructors, presenting written work in an appropriate way, and taking tests, which may be given in unexpected formats.

Focus of the Study

When we compare educational systems across cultures, it is natural to ask questions that are large in scope, such as:

- Who is educated? Everyone? Or just a subset of the population?
- What kinds of things are taught? For example, is practical knowledge valued over the study of theory?
- How is education accomplished? Do students partake in formal schooling? Or are skills learned via apprenticeships?
- Should new information be memorized? Or should it be assimilated and used creatively to solve problems?

Important and interesting as these questions may be, answering them is beyond the scope of the present study. The current investigation focuses on identifying areas where international students may not know the "rules of the game" — in this case the rules that govern interaction between students and their instructors and students and their classmates. If students don't know these rules, they are unable to interact successfully with their professors and peers and they are put at a great academic disadvantage. This may result in their study abroad experience being less rewarding than expected or in their terminating the experience early. Furnham and Bochner [6] characterize international students as "sojourners," that is, people who spend an extended period of time in another culture, who are in need of culture learning (learning the afore-mentioned rules) to navigate situations that they find difficult. Interactions in educational settings often constitute such difficult situations; however, discovering information about what to do or avoid doing is not always easy. Current information about contrasts in classroom "rules" across cultures has been largely confined to anecdotal references embedded in articles on other topics [3, 7, 8, 9, 10, 11] and has not been organized and presented in any systematic way. That this information is not readily available poses a problem for culture-learners (and those who would train them).

The Study

The present study is designed to gather and bring together in a systematic way information about areas where cultures can contrast in educational settings. To do this, this study poses the following research questions: Where do contrasts in academic culture manifest themselves? What are the characteristics of these contrasts? It was expected that generalizations would emerge in several areas: In-class instructor-student interactions and student-student interactions; out-of-class instructor-student interactions and student-student interactions; cultural expectations for people in the role of student; cultural expectations for people in the role of instructor, and expected formats for tests and written work.

In order to gather data to answer these research questions, an approach based on ethnographic methods (interviews, observation, and participant-observation) was adopted [11]. This approach, which draws on information gathered from different sources, allows triangulated information to be analyzed and made accessible to student culture-learners and to those charged with preparing them for international study. This approach will also serve to produce a grounded theory of classroom culture in which generalizations that emerge when the data are analyzed can be used not only to train student sojourners but also to provide a theoretical framework for future research [11].

Relevant data were gathered from many different sources: interviews with international students in the US, interviews with North American professors teaching international students; interviews with North American students studying abroad, observation of colleagues who were working with international students or in international contexts, and finally, observations made by the researcher during a career of working with English as a Second Language (ESL) students in the US and of teaching and learning in countries outside the US.

The interviews with international students were structured and touched on topics such as contrasts between appropriate student behavior in the US and in the student's home culture, contrasts between appropriate professor behavior in the US and in the home culture, contrasts in expectations for homework, office hours, examinations, etc. Finally, in the hope of eliciting contrasts in educational culture that were not apparent to the researcher, each interview included an opportunity for the student to offer advice to someone from his/her country who was planning to come to the US to study.

Interviews with North American colleagues were less structured, but focused largely on problems that they had encountered in dealing with international students. Some of the information elicited from these instructors concerned the students' language ability; however, since this was not cultural information, it was not used in the present analysis. In these conversations, inappropriate behavior, not contrasts between home and host culture, was the topic of discussion. Many of the instructors' perceptions of inappropriate behavior had to do with student's academic work and their demeanor in and out of the classroom.

Similar to the interviews with international students in the US, the interviews with US students living abroad were also designed to elicit information about student and professor behavior that contrasted with their experiences in the US.

Observations of classrooms were made in the US and abroad. During observations in the US, the researcher endeavored to record typical classroom behavior for teachers and students. Observations made abroad shed light on contrasts between US classroom culture and classroom culture in other countries.

Finally, observations made by the researcher during almost thirty years of working with ESL students in the US and of living and working abroad were included in the data pool.

After the data were collected, they were pooled and analyzed. Items that appeared only once in the data were deemed idiosyncratic and not included in the final analysis. Items that appeared twice or more were noted and grouped into areas of commonality. Several such areas emerged from this analysis: Characteristics of students, characteristics of classes, characteristics of interactions within the classroom, instructor behavior in the classroom, student behavior in the classroom, characteristics of evaluation procedures, instructor behavior outside the classroom, student behavior outside the classroom, cultural expectations for instructors, cultural expectations for students, instructor-student relationships, and student-student relationships. Each category (elaborated below) is characterized by several features that were drawn from the data. Sometimes these features are binary; but, most often, they are best described as continua, with appropriate values for different cultures occupying different points on a particular continuum. The following descriptions of the categories are followed by the characteristic features that emerged from this set of data.

Results

The following categories emerged from an analysis of the data gathered in the interviews and observations described above.

Characteristics of Students

In this category, factors such as age, sex, and social status were noted. In many countries, university students are all of traditional age; people who have followed another career path do not return to the university for coursework later in life. In other countries, people continue to take university courses throughout their lives — sometimes to change careers and sometimes for personal edification. Some students expressed surprise that older students attended the same classes as traditional age students did, creating a student group of widely varying ages. Similarly, in many countries, men and women study together in the same classrooms and may have teachers of either sex; however, in other countries, classes are composed of the same sex — men and women do not study together or have teachers of the opposite sex. Some students reported that it required an adjustment to interact with the opposite sex in the classroom. Finally, in many countries, education is available only to the social or intellectual elite; the latter must demonstrate their status by passing tests at various stages of their lives. Still others educate (or bar from higher education) members of a particular ethnicity or religion.

Age: traditional age < — > all ages

Sex: both sexes/one or the other

Other Demographic Characteristics: elite group (social, ethnic, religious, intellectual, etc.) < — > all inclusive group (regardless of social class, ethnicity, religion, test scores, etc.)

Characteristics of Classes

Typical class size is a variable that can surprise international students. Students from countries where classes are usually large may find themselves put "on the spot" in classes that are smaller than they are used to. On the other hand, students who are used to small classes and a great deal of interaction with the instructor may find themselves "lost in the crowd" in larger classes. These feelings can be unsettling and cause students' academic work to suffer.

The degree of formality that is appropriate in the classroom can also fluctuate from culture to culture and may be a source of problems for international students. In many cultures, the classroom is a very formal place where students and instructors[i] dress in conservative clothing (sometimes uniforms) and comport themselves in formal ways. Instructors in these cultures are generally addressed using titles and any interaction between the instructor and the student is characterized by use of formal language. Many of the international students interviewed for this study expressed surprise at the informality of their North American classrooms. When students from less formal cultures enroll in classes in formal cultures, they are likely to commit errors that will cause them to be seen as lacking proper manners.

Size: large (over 50) < — > small (under 50)

Formality: very formal < — > informal

Clothing: very formal clothing (sometimes a uniform) is worn by teachers and students < — > informal

Terms of Address (student to instructors): title only < — > first name (Possibilities: title only, title + last name; last name, title + first name; first name [and patronymic])

Terms of Address (instructor to students): no name < — > first name (Possibilities: the equivalent of English "you"; title + last name; last name only; title + first name; first name only)

Pronoun used in address (in languages that distinguish between formal and informal "you") (student to instructor): (Possibilities: formal "you" + honorific; formal "you"; informal "you")

Pronoun used in address (in languages that distinguish between formal and informal "you") (instructor to student): (possibilities: formal "you"/ informal "you")

Self-reference (in languages that have several different forms for English "I") (student to instructor): neutral < — >self-deprecating

Posture: very formal < — > very informal

Students stand when the instructor enters the classroom. < — > Students remain seated when the instructor enters the classroom.

Students sit with their feet on the floor. < — > Students may assume very informal positions, including putting their feet on unoccupied chairs.

Characteristics of Interactions in the Classroom

Interaction in the classroom can be characterized by the type of exchanges that takes place between the instructor and the students. In some cultures, teachers are expected to present formal lectures that do not admit of interruptions from the students. In other cultures, students may interrupt the instructor to ask questions or to make comments — even comments that challenge what the instructor is saying. If students who are used to asking questions and disagreeing with the instructor find themselves in a classroom where their questions are unwelcome, they put themselves at a disadvantage.

In classes where discussion is encouraged, the rules for participation vary. Sometimes the instructor asks a general question to stimulate talk about a particular topic. This, in itself, may be difficult for students who are expecting lectures and not discussions. In some classrooms, students are expected to signal, usually by raising their hands, that they would like to talk. In these cases, it is the teacher who controls who may speak and when. In these cultures, one person "has the floor" at a time and no one else is supposed to be talking at the same time. In other cultures, discussions are freewheeling with no signals for a desire to comment, which can result in many students talking at the same time. International students in the US, who were used to participating in discussions without waiting to be recognized, expressed embarrassment when they were asked to wait their turn.

Another area in which classroom interaction can differ is in the use of group activities. In many cultures, instructors are expected to be the dominant figures during class, while group problem-solving activities may be the focus in many classes in other cultures. If students are not used to group work, they are unlikely to know the "rules" of participation and be ostracized by their host culture peers.

Students are free to ask questions during the lecture/presentation. < — > Students shouldn't ask questions, they should speak only when spoken to by the instructor.

Method of conducting the class: lecture < — > discussion

In discussion classrooms

Instructor asks questions and expects students to volunteer to answer. Yes/No

Students signal that they want to talk by raising their hands. < — > Students talk only when they have something to say.

Instructor controls discussion by calling on students one at a time. < — > Students answer all at once.

Students express strong opinions and argue with each other. < — > Students participate, but don't express strong opinions.

Students may openly disagree with what the instructor is saying. < — > Students are not expected to disagree with the instructor.

There is group work during the class. < — > There is no group work during the class.

Instructor Behavior in the Classroom

The behavior of instructors can also be a source of confusion for international students. For example, in some cultures, the instructor takes roll; in others, class attendance is not mandatory. One international student from a culture where attendance is not mandatory failed all his courses at a North American university because he came to class only on the first day. In some cultures, instructors close (and occasionally lock) their classroom doors once the class has begun; in others, classroom doors remain open during the class, allowing late-arriving students to enter without fanfare.

In some cultures, the instructor assigns readings in a text book or other source; in others, students are expected to obtain all the information they need from the lecture or presentation during the class. Several students interviewed for this study expressed surprise at the long reading assignments they received in North American universities.

The instructor may make himself/herself available to the students after the class is over, or there may be very little interaction between the instructor and the students.

If international students whose educational culture is at one end of these continua encounter instructors from the other end, the potential exists for many misunderstandings that are potentially damaging to the student's academic progress to occur.

Attendance: Instructor takes roll. < — > Attendance is not compulsory.

Admittance to class:

Instructor closes door when class begins. < — > Door is usually left open.

People who come after the door is closed must knock to be admitted by the instructor.

< — > People can enter quietly without the instructor's permission or notice.

Instructor provides a syllabus for the class. < — > No syllabus is provided or expected.

Instructor does not assign a text or reading outside of class; students are expected to find the information they need to learn in the lecture/presentation. < — > Instructor uses a text (or other source) and makes assignments that students are expected to read before coming to class.

Instructor's lectures/presentations show continuity with preceding classes. < — > Lectures/presentations are self-contained and are not dependent on what preceded them or what will follow.

Academic work outside of class:

Instructor assigns homework (reading and/or writing). < — > No homework is given.

Instructor assumes that students have read and prepared for class. < — > No assumptions about students' prior familiarity with the material are made.

Instructor stops to talk to students after the class is over. < — > Instructor leaves the classroom before the students and does not interact with them.

Instructor may eat or drink during the lecture/presentation. < — > Instructor may not eat or drink during the lecture/presentation.

Student behavior in the Classroom

Appropriate behavior for students may be similarly elusive for international students. In some cultures, students are expected to take a very passive role in the classroom, while in others; students are expected to participate actively in the class by coming to class prepared (having read the homework assignment), asking questions, and taking part in group activities. This can be a difficult transition for international students from cultures in which the role for students is to be silent. In addition, there are various classroom etiquette rules that govern appropriate student behavior toward the instructor and the other students. For example, waiting until the instructor has left the classroom before leaving.

Students are willing to volunteer to answer the questions the instructor asks to begin the discussion. < — > Students are unwilling to answer the questions the instructor asks to begin the discussion.

Students are silent when the instructor or another student is talking. < — > Students feel free to carry on private conversations while the instructor or another student is talking.

Students may ask questions during the presentation/lecture. < — > Students may speak only when spoken to.

Students come to class having done the assigned homework. < — > Students come to class without having done the assigned homework.

Students are not supposed to laugh during class. < — > Students may laugh during class when it is appropriate.

Students who arrive late to class must ask permission to enter. < — > Students who arrive late to class should enter as quietly as possible.

Students enter and leave the classroom without asking permission. < — > Students remain in the classroom during the entire class.

If the hour for the end of class has passed and the instructor is still teaching, students: begin to pack up their things in preparation for leaving in order to send a signal to the instructor.

< — > wait until the instructor realizes that the class is running overtime and don't try to signal that the hour is late.

Students wait for the instructor to leave before they leave. < — > Students leave when the class is over.

Characteristics of Evaluation Procedure

Testing is ubiquitous, but the format in which it is administered differs from culture to culture and can confuse international students. Students who are not accustomed to taking tests when they have not prepared for them may be unpleasantly surprised when they discover that they must take the test on the date the instructor designates — and that they have only one opportunity to pass. Students who are used to taking oral examinations may be discomfited if they have to write their answers — and *vice versa*. Students from some cultures may not understand what to do with objective-format examinations, for example, multiple choice questions, especially those that require students to use machine-scorable answer sheets. In addition, sanctions for the use of inappropriate materials or for communicating with other students during the examination may differ from the student's home culture. Violating an academic integrity convention can have disastrous effects on a student's academic progress and, in some cases, may result in his/her dismissal from the university.

Students take tests whether they are prepared or not. < — > Students are not required to take tests for which they feel unprepared.

Instructors give tests and quizzes during the term in addition to the final examination. < — > Instructors give only a final examination.

Instructors leave students alone while they are taking a test. < — > Instructors do not leave students alone while they are taking a test.

Students surreptitiously use materials (books and notes) that are forbidden during a test. < — > Students do not use forbidden materials during a test.

Students communicate with one another during a test. < — > Students do not communicate with one another during a test.

Examinations are oral. < — > Examinations are written.

Examination questions require students to write short essays. < — > Examination questions require students to respond with short or one-word answers.

Examinations are given in multiple choice format. < — > Examinations require students to supply answers.

Instructors use answer sheets that can be machine-scored. < — > Instructors do not use machine-scorable answer sheets.

Instructors require students to use examination booklets. < — > Instructors do not require students to use examination booklets.

Students write their names on the top of their examination papers before they begin to work. < — > Students write their names at the end of their examinations after they have finished.

Students offer their instructors gifts, especially when they need a recommendation or a good grade. < — > Students don't offer their instructors gifts.

Instructor Behavior outside the Classroom

An instructor's behavior out of the classroom may also cause confusion for international students. In some cultures, instructors make themselves available outside of class hours; in others, they do not concern themselves with students as individuals. It is to be expected that students from cultures where there is frequent interaction with instructors outside the classroom may make mistakes when placed in a culture where such contact is not the norm.

Office Hours:

Instructors hold office hours. < — > Instructors don't hold office hours.

Students assume that they may visit instructors during office hours. < — > When an instructor is in his/her office, he/she is too busy to talk to students.

Instructors are available for students when they are not in their offices, for example, when they are walking across campus. < — > Instructors are available only during their office hours.

Students need an appointment to talk to the instructor. < — > The instructor is available during office hours without appointments.

Instructors are interested in students' progress. < — > Instructors are indifferent to students' progress.

Instructors prepare materials, like review questions, to help students understand. < — > Instructors do not prepare materials to help students understand.

Instructors are flexible and understanding of student's problems with deadlines. < — > Instructors are not willing to make concessions if students have problems meeting deadlines.

Instructors accept gifts from students. < — > Instructors do not accept gifts from students.

Student Behavior outside the Classroom

Similarly, expectations for student behavior vary from culture to culture. Often students are expected to be conscientious and do their out-of-class assignments individually; other times, students share their work with others and their assignments do not reflect individual effort. This can be confusing for international students who may be asked by other students to share work in what may seem an inappropriate way. In other cultures, inappropriate sharing of work may result in loss of credit for having "cheated."

Students share their written homework assignments with each other, so that only one or two actually do the work. < — > Students do their own homework assignments.

Students form study groups among themselves. < — > Students work by themselves.

Cultural Expectations for Instructors

Each culture has expectations for people who fill the role of instructor; for example, they may be seen as being responsible for their students' success or even as the students' surrogate parent and expected to offer advice about life in general. If international students expect something from their instructors that is not part of the host cultural expectation, they will be confused.

Instructors are responsible for the success of their students. < — > Students are responsible for their own success.

Instructors are seen as dispensers of knowledge. < — > Instructors are seen as resources to help students learn.

Instructors are expected to retest students who fail. < — > Instructors give one test and students who fail do not receive another chance.

Instructors are to assume an almost parental role in the students' lives. < — > Instructors do not offer guidance in any arena other than the students' education.

Cultural Expectations for Students

Similarly, each culture has expectations for people who fill the role of university students. For example, they may be expected to know how to write a paper or take an oral test. In many cultures, there is an expectation that students will not use the work of other people without documentation; however, this idea (called *plagiarism* in English) is by no means universal. When students for whom this is not a cultural expectation use others' ideas without documentation, they may be strongly censured in the host culture.

University students should know how to write academic papers. < — > University students have no need to write academic papers.

Students should use citations when they use the work of others in their writing. < — > Students may freely borrow from the work of others without documenting the source.

Students who do not use citations when they use the work of others in their writing are subject to academic censure. < — > No penalties are connected with using others' work without documenting the source.

Instructor-Student Relationships

The relationship between instructors and students also varies from culture to culture. Sometimes instructors are quite friendly with students and sometimes, they are distant. Instructors may see themselves as resources for their students, or they may see themselves as dispensers of knowledge. These values, if they are not similar to those in the home culture, may cause problems for student sojourners

Instructors are friendly with students. < — > There is a great social distance between instructors and students.

Instructors interact with students frequently on an informal basis. < — > Instructors do not interact with students outside of class and office hours.

Instructors see themselves as resources for students. < — > Instructors see themselves as experts in the field who present knowledge for the students' edification.

Students are very apologetic or obsequious in their relationship with the instructor. < — > A relationship of mutual respect exists between the instructor and the students

Student-Student Relationships

The degree of friendliness among students in the host culture may also confuse international students. Students may be friendlier with each other than the international student expects, or conversely, not as friendly as in the home culture. An international student who expects a close relationship with his/her peers may be disappointed.

Students form a cohesive group and help each other succeed. < — > Students are cordial, but do not collaborate.

Each student is part of a group that is following the same program and all students in the group are enrolled in the same classes. < — > Each student is taking a different array of classes.

Applications of these results

The insights into cultural contrasts that emerge from this set of data can be used to inform the preparation of students who plan to spend a semester or longer in another culture. While it does not give specific guidelines about particular cultures, it provides a framework to guide attempts to compare and contrast two different cultures.

Ideally, using this framework would help those charged with preparing students for an international experience to compare the home culture with the host culture. Such an analysis would help determine how different classroom experiences in the host culture are likely to be for the students. If the two cultures differ greatly on the continua described in the framework, it is likely that students will have more trouble negotiating the educational process than if the cultures are fairly similar. Furnham and Bochner [5], using the Culture-Distance Index devised by Babiker, *et al*. [2], found that the difficulties faced by student sojourners were directly related to the differences between the home and the host cultures. If prospective international students can learn about potential cultural "hot spots" before they encounter them, they might learn to navigate the new culture more efficiently.

Care should be taken, however, not to ignore aspects of the home or host culture that does not fit into the framework as it is presently conceived. It should be remembered that this is a work-in-progress and that new areas of commonality and new features are certain to manifest themselves as the framework is used and more data are gathered. Similarly, users of the framework should not perform superhuman feats to find something in the host culture that can be considered relevant to every item on the framework — it may be that some aspects of educational culture mentioned in the framework are not salient in the culture under consideration.

While the present investigation does not provide specific guidelines for a particular culture, prospective international students may do well to follow the principles of navigating a new culture set forth by Nancy Adler [1]. Adler makes four general recommendations: 1) Be aware that you don't know the rules of the culture. Don't be afraid to ask questions and listen; also, remember that behavior that may seem strange to you makes sense to the people who are doing it. Try to see reality from their perspective and you will learn something valuable about the host culture. 2) Assume that things are different until you have reason to assume that things are "just like home." This stance will force you to pay attention and listen to what is being said and not project home culture rules onto host culture situations. 3) Make guesses about what you're experiencing; don't jump to conclusions quickly. You may see that there are several explanations for behavior that is mysterious to you and it will take time to discover which is the appropriate one. 4) Find something in the host culture (for example, a sport) that you enjoy doing and participate. These recommendations constitute sound advice for a successful sojourn.

Implications for Future Studies

The framework that emerged from this investigation into contrasts in education cultures can also be used as a tool for analyzing additional data from future interviews and observations. As more and more contrasts are elicited from international students and the instructors who teach them, new commonalities are expected to emerge that will augment this framework. It should be remembered, however, that this study is only a beginning and that the framework that emerged is subject to change when new data warrant it. Indeed, the framework itself may be altered to accommodate new data more efficiently. Similarly, the characteristic features of each category in the framework will be elaborated upon and refined as additional data become available. This will give us a better picture of what international students may face when they embark on an educational encounter in another culture.

Conclusion

This investigation, in which contrasts in educational culture have been studied, constitutes a beginning of the systematic investigation of this topic of culture. The results have applications for the preparation of international students and implications for future investigations into classroom culture. As more and more data are gathered and analyzed, it is expected that our insights into this fascinating topic will become sharper and that these new insights will inform our training of potential international students.

In our shrinking world, it is becoming more and more important for students whose goal is a career in international business to become familiar with the culture in which they will be studying.

End Notes

[i] The word "instructor" has been used throughout these descriptions because the word "professor" often has different connotations in different cultures. For example, in the US every university level instructor can be called "professor;" while in other countries there are only a few "professors" in each department and many "lecturers" who are equivalent to "professors" in the North American sense. In working with international students, it seemed that "instructor" was a more neutral term than "professor". Similarly, the word "teacher" was avoided as it often carries the connotation of high school teacher.

Managerial Skills and Organizational Climate in Educational Services Sector

B.K. Punia

Maharishi Dayanand University, India
Vandana Punia
Chaudhary Devi Lal University, India

Abstract

The business environment conditions are likely to witness more volatility in the coming years. To balance the local and global challenges, the economies are relying more on the service sector throughout the globe including India. The educational service comes at the core while setting the pace for the rest of the sector. Education services such as intangible and evaluation of the same are normally obtained by judging the content and the delivery system where precise standardization is much difficult. Competitive advantage and professional excellence in turn fundamentally depends upon the skills of the educational manager/administrator and the prevailing climate within. The findings of the study reveal that in this service sector problems are largely solved by using cognition and logic, and conflicts are handled with a positive bent of mind by collaboration style. The climate has been found communicative enough with realistic performance standards, a well-defined reward system, democratic structure and participative goal setting; making it commitment driven. The interaction between the two is more significant on collective basis instead of individual basis where the mediating variables play a dominant role in the performance.

The Backdrop

The business environment conditions are likely to witness more volatility in the coming years. To balance the local and global challenges the economies are relying more on the service sector. Even the fastest growing segment of the US economy and other developed nations are dominated by services. In the Indian economy today the domination of the sector can be testified from the fact where it contributes more than half of our national income. Service is the fastest growing sector witnessing an annual growth of 8% per year. In such a situation of precariousness, gaining competitive advantage and professional excellence will be the major guiding forces in all type of organizations including the services sector. Within the services sector educational services comes at the core while setting the pace for rest of the sector. Education as a service can be said to be fulfilling the need for learning, acquiring knowledge – providing an intangible benefit (increment in knowledge, aptitude, professional expertise, skills) procured with the help of a tangible (infrastructure) and intangible (faculty expertise and learning) means, where the buyer of service does not get any ownership (Ravi Shanker, 2002). Education, like most 'pure' services, is intangible and evaluation of the same where it is normally obtained by judging service content and the service delivery system and where precise standardization is much difficult as it procured as a shopping service or specialty service. More so whether a service is bought for instrumental motive (i.e. as a means to an end) or for an expressive motive (as an end in itself) may provide useful framework for service designers (Swan and Pruden, 1977). Irrespective of any design or framework, competitive advantage and professional excellence fundamentally depends upon the skills of the educational manager/administrator and the climate prevailing within the organization. This continuum encouraged the authors to carry out the present research. The ensuing sections bring out the conceptual framework of managerial skills and organizational climate, scope and methodology, and results of the study.

The Thematic Framework

Conceptually the term 'skill' means the ability to complete the specific task successfully. It is an acquired or learned ability to translate knowledge into performance. It is important to remember that the individuals are not universally competent. Key component of ability include task-relevant education (formal and informal training that facilitates the successful completion of the specific task); task-relevant experience (prior work experience that contributes to the successful completion of the task); and task-relevant skills (proficiencies that enhance the successful completion of the task) (Hersey and Blanchard, 1995). Here the skill occupies a prime seat as if the individual has an ability problem, solutions may include specific training and coaching; but to develop skills the individual requires an attitude which can be learned overnight. An educational administrator has to analyze the performance of his fellow colleagues, and has to confirm whether they have the knowledge, skills, and experience for task performance. This very analysis requires an administrator to be full of many managerial skills which can broadly be classified as skills according to levels of management i.e. technical skills, human and conceptual skills, and skills according to the managerial functions i.e. planning, organizing, leading, and controlling. Within this gamut of two categories, there are certain skills which are more important for an educational manager and that is why in the present study only three managerial skills viz. problem solving styles, locus of control and conflict handling styles have been studied.

Climate for any organization can be equated with personality of a person. As every human being has a unique personality, it is the same way with every organization having a distinctive climate. Organizational climate is a set of attributes specific to a particular organization that may be induced from the way that organization deals with its members and its environment. For the individual members within the organization, climate takes the form of a set of attitudes and expectancies which describe the organization in terms of both static characteristics (such as degree of autonomy) and behavior outcome and outcome-outcome contingencies (John P. Campbell, 1970).

An organization survives and thrives due to prevailing climate. When employees of the organization are well aware and follow the rights, rituals, and policies of the organization they are bound to develop a sense of belongingness and become better performers. The climate of the organization is generally reflected in the attitude of seniors towards their subordinates and the consequent perception of rightness among the subordinates. In turn climate of the organization is also affected by almost everything that occurs in the organization making it a dynamic system concept. In an organization people come from heterogeneous streams with varying personal cultures, traditions, thinking and methods of working. It is often felt that one individual may influence the climate little bit but the group of individuals have a multiplier effect and absorption of these diverse individual sub-cultures may affect the prevailing climate. The same way incoming employees may also have to change their traditions, thinking and work methods to be a better fit in the organization. Thus the climate of an organization is developed and communicated through the organizational behavior system. A renowned behavioral scientist, Richard M. Hodgetts (1991) has classified organizational climate into two major categories and compared the organizational climate with an iceberg whose one part being on the surface is visible whereas the other being under the water is not visible. The visible part that can be measured mainly include structure of hierarchy, goals and objectives of the organization, performance standards and evaluation process, technological state of operation etc. The invisible and unquantifiable comprise of subjective areas like supportiveness, employees' feelings and attitudes, values, morals, personal and social interaction with peers, subordinates and seniors, and a sense of job satisfaction. Both of these categories have been shown as under in the form of an iceberg. Thus organizational climate as such is not a unified concept rather a mix of many more related activities. The important components that collectively represent the climate of an organization mainly include members' orientation, interpersonal relationships, individual autonomy and freedom, degree of control, type of structure, management orientation/style, reward system, communication, conflict management, degree of trust and influence, and risk taking environment of the organization. Some of these components are the overt factors and measurable while the others are covert factors and cannot be quantified. Based upon the responses of the employees the organization can go for a change in the climate if desired so that the organization can boast of having the best organizational climate amongst its competitors.

Literature Review

Different behavioral thinkers have given their opinion on different aspects of the subject. Though there was not a single study in direct consonance of the present topic yet these were of definite help for further exploration of the area and a very select from the related studies have been presented in the present part of the study. Katz (1974) has viewed that successful managers are indeed electric in that they must possess and be skilled in technical, human and conceptual areas of organizational life. Technical knowledge and skills include understanding and being proficient in using a specific activity and technique and usually required more at the operative level. Conceptual knowledge and skills include having the ability to visualize the enterprise as a whole, to see the 'big picture' to envision all the functions involved in a given situation. To conceptualize requires imagination, broad knowledge, and mental capacity to conceive abstract ideas. It is this conceptual requirement that enables an executive to recognize the interrelationships and relative value of the various factors intertwined in a managerial problem and hence required more at the top level managerial position. Human skills as the name suggests include the ability to work with others and to win cooperation from people in the work group. The managers with human knowledge and skills understand and recognize what adjustments or changes in these views might be made as a result of working with associates, and required everywhere irrespective of the managerial level.

Anand Sarup (1997) in his thought provoking article has raised certain issues for educational planners. The author has stressed that majority people take education as a means essentially of imparting, knowledge and skills mainly for enhancing the employability of participants. At the same time the factors like global competition, balance of trade and inflow of capital and technology are fast becoming the determinants of economic performance as well as work opportunities. This all situation can be observed like a crystal ball as characterized by an increasingly rapid rate of change. By the time one adjusts to a new reality, it is overtaken by a still newer reality. Therefore the administrators of the future need to be multi-skill personalities. In this multi-skilled personalities wake they have to be jack of all managerial skills but they have to be master in 'change management skill' particularly.

Satpathy (2000) has suggested a distinct type of managerial skill development profile for the future managers. In his thought provoking article has given Vedic Model of skill development. The findings are in relation to knowledge industry which in its broadest sense is an industry wherein the employees can decide in their own as to what is wrong and what is right using their knowledge base, and for that matter education is a much stronger knowledge industry. The author is of the opinion that in the coming years India will become an economic superpower mainly due to its vast intellectual resource and great heritage. The creativity of Indians will make India self-reliant and economically sound. Therefore, importance of Indian philosophy to build up future organizations to be of world class is highly relevant. If lessons on sound management from *Bhagawad Geeta* are incorporated in the management discipline the skills can be much performing and rewarding for Indian managers.

Bajaj (2001) has highlighted the paradigm shift in management of colleges and stressed that due to all around changing environment, education cannot be an exception to such changes. In such a situation of turbulence the principal has a definite role in running the college and that he is the catalyst in pushing the academic ideals for which the college stands for. In the context of challenges of change there has to be a paradigm shift in his style of leadership and functioning. He is an interactive institution as such and the undisputed kingpin of the system who has to make use of all available assets and technological inputs in the institution under his control and stay transparent, committed, and unidirectional in managing the college. He has to combine vision with commonality, dissolve untouchability syndrome of elite and offer new ethos based on interactive freedom and sharing of ideas in the spirit of democracy. The principal has to be alive to the needs of the students and teachers through a participatory mode of management while also ensuring maintenance of quality and standards. That is how through the new skills of the principal the institution can answer the social responsibility call and change this period of transition into an era of fulfillment and turn out students who are confident to face the world.

Young (1976) attempted to assess the actual and ideal social climate of an undergraduate social science class for educator, and also to utilize the information to structure a subsequent class on the same topic. It was hypothesized that a classroom climate more closely approaching an 'ideal' one would facilitate better course appreciation, involvement, and attendance. Modifications in the course of social climate as suggested by 'Class A' markedly improved the social climate of ‘Class B’ as reported by class members. Improved congruence between real and ideal climates was linked to significantly greater appreciation of class functioning, class content, overall course appreciation, and greater class attendance. As students reported similar amount of task orientation in each class, it was argued that the class room social climate may contribute an independent and malleable feature of the classroom setting which an instructor can use to his/her advantage.

Tripathi (1980) in her doctoral research work has studied organizational climate and teachers attitudes. The study discovered that majority institutions fall in closed range climate and private institutes emphasize more on production as compared to government institutions. Attitudinal means of the teachers of closed climate institutions do not differ significantly from teachers of the institutions paternal climate on most of the dimensions of teacher attitudes. Under controlled climate, factor of ‘intimacy’ correlates significantly positively with teacher-attitude towards ‘classroom teaching’, and familiar climate factor ‘disengagement’ shows significant negative relationship with attitudinal factor of ‘classroom teaching’. Under paternal climate there exists highly significant negative relationship between climate dimension of ‘hindrance’ and attitude towards ‘child-centered practices’, ‘educational process’ and ‘pupils’.

Srivastava (2001) conducted a study to explore the strength of organizational culture and its relationship with organizational performance, perceived effectiveness and success among managers. The sample for the study consisted of one hundred and fifty executives from six private sector organizations. The study measured the strength of culture, perceived effectiveness, and success among managers using a structured interview comprising of some objective indicators for performance, pay, and promotions. The study has revealed a positive correlation between organizational culture, organizational performance, individual effectiveness, and success. Organizations having a strong culture performed better as compared to organizations with a weak culture. The study also brought out significant differences in the perception of role incumbents across hierarchy for all the variables. The results suggest that the culture of the organization has its effect on organizational and individual performance. Top management should endeavor to inculcate core values and beliefs among employees by adopting certain organizational practices resulting in better individual and organizational performance and make sure that these are widely shared and upheld by its members.

Shivakumar (2002) has attempted to understand the concept of change, organizational culture, organizational development interventions vis-à-vis the rational for organizational development interventions, to implement and sustain a culture of change, with emphasis on educational institutions. The author is of the view that in this era of change uncertainty seems to be the order of the day. In order to survive the organizations are trying to implement radical transformational changes and educational institutions are not exception to it. If any educational institution wishes to make a mark and create a name for itself, it will have to adopt the universal formula of innovation, technological development, and customer orientation. To have a culture of performance, the educational institutions are bound to adopt modern techniques of organizational development in the form of Sensitivity Training, Team Building, Survey Feedback, Grid Training and Management by Objectives.

Objectives and Methodology

Academic institutions all over the world have been established to provide societal development in respect of knowledge and brainpower enhancement of the people. These institutions are supposed to be centers of thinking, learning, and academic training to contribute significantly to the refinement of perception and cultivation of scientific temper. Needless to say that even in the turbulent years of transition, educational institutions are still endeavoring to provide high talent manpower for economic and industrial development, scholarship and research. This significant role of academic institutions had been in practice since the early civilization of human race as in the ancient times, the countries, which were supposed to be culturally, socially, and economically developed, used to be guided by their academic stalwarts and academic institutions. These institutions used to provide thinkers and selfless advisors too many rulers and even dynasties, and here the role of institution head was considered to be ultimate.

The academic environment of the day has become more dynamic as never before in the context of information explosion and as a consequence of expansion of facilities at different levels and on account of its contextual relevance, more so when it has to respond to global competition. On one hand the academic institutions have to encourage academic citizenship with focus on human resource development, while on the other they have to cope with the challenges such as the urge for excellence, better performance, up-gradation of skills, accessibility with mass education, IT revolution, increasing accessibility, resource crunch, teachers' empowerment, activism appraisal, research and consultancy, autonomy and accountability, commercialization and student support services, bureaucratic interferences, undue interferences of uninformed managements in academic activities, and mounting expectations from all interest groups. This type of environment has created multifarious challenges for the institution heads and calls for multi-managerial skills to cope up with the challenges. As an administrator, a college principal has to interact with people of diverse backgrounds with different positions on one pretext or the other, and it is here where the skills of the principal can create a difference.

Gone are the days when the college principals could work in an autocratic manner as today they have to work in the context of a sweeping awareness of rights without any corresponding enforcement of discipline, duties and other obligations and hence have to be more careful and democratic. From the extensive review of literature though not presented in full here the researchers could not trace even a single study which is directly inconsonance with the title of the present investigation as none of the studies reveal the Managerial skills required for effective educational administrators, organizational climate prevailing and desired in the educational service sector and interaction of managerial skills with organizational climate. Thus, there exists a considerable gap on this aspect and the need for research was felt fulfilling the above mentioned variance and that too in the fast changing academic environment. It is believed that the present research will address the abovementioned areas and will benefit the educational managers to frame the plans and policies for the present incumbents and prospective administrators to enable them to cope up with the changing environment, apart from generating and strengthening a new field of knowledge. The present investigation has been carried out to study the problem solving styles, the conflict handling styles, and locus of control among educational administrators The type of organisational climate prevailing and interaction of the same with the above mentioned skills has also been examined. The study falls in descriptive-cum-exploratory research design and makes extensive use of primary data. The primary data has been gathered with the help of a well-compiled questionnaire based upon four different scales developed by various researchers. The sample size has been curtailed to one hundred educational administrators working as principal in different colleges of Haryana state, by applying convenience sampling technique. The data so collected has been analyzed with the help of need based statistical techniques encompassing mean score, standard deviation, $?^2$ test and F-test (ANOVA), and findings of the same have been presented henceforth.

Findings on Managerial Skills

Change is the normal, natural and inevitable phenomenon in every organization and educational institutions as such cannot be exception to it. Administrators of this competitive and demanding century have a job to do which is considerably different from their predecessors. The role as a college principal is a glorious and challenging assignment due to the quantum of authority exercised by him. But the proven ability as a teacher does not guarantee an effective administration. One might fail in the new role of administrator and bring chaos in the organization. The success here in fact depends upon whether or not one has managerial skills and how does the person put to use these skills. In fact the challenges of an administrator start from the very day one occupy the chair and starts planning for betterment. Organizations are getting complex everyday and problems are bound to appear. In such a situation administrators with good managerial skills keep the problems at arms length and even if the problem arises it is sorted out by logical thinking. In spite of best efforts of the principal some problems remain unsolved or partially unsolved and may take the form of conflicts putting a further challenge for the administrator. Resistance to change is the basic human nature, which further leads to organizational conflicts that need to be handled by the administrators by safeguarding the well being of all the interest groups. Thus the people in the administrative posts in educational institutions have to be all rounder, maybe in it is technical aspect i.e. teaching assignment, human aspect i.e. dealing with the people or it is conceptual skill part i.e. dealing with future and translating the organizational goals in to reality. Administration of well educated and enlightened elites of the society make the job more challenging when compared with other administrators, and requiring multi-skilled personalities in educational administrators. The Table – 1 presents the various managerial skills available in the educational administrators of the state.

Table I

Conflict Handling Style	12.83	2.97	3.99	9.49	11.37	3.49 (.05 Level) 5.95 (.05 Level)

Problem Solving Skills

The educational administrators of the day are confronted by diverse type of problems and they have to gather and evaluate the information for solution of the problem. Generally the information is gathered through sensation or intuition, and the same is processed by thinking or feeling. Individuals gather data either through processing the facts and details in the environment in a very methodical fashion – *sensation* types – or through global visualization of what the sense depicts – *intuition* types. The sensation type administrators, depend on a lot of information to assess the situation, are pragmatic and down to earth, and concentrate on the present time. The intuitive type, on the other hand, relies on hunches and non-verbal cues, simultaneously considers several alternatives and quickly discards the non-viable ones, is very imaginative, and is more futuristically oriented. Administrators evaluate and make judgments either in an impersonal and objective fashion – the *thinking* types – or in a more personal and subjective manner – the *feeling* types. The thinking type administrators make systematic enquiries, are unemotional, and highly analytical and rational in making decisions. The feeling type administrators place much reliance on human feelings and emotions, are very empathic, sentimental, and try to read between the lines while evaluating situations. The thinking type administrators feel comfortable when logic and good analysis are the bases of decision-making, and are generally unemotional and not very sensitive to the feelings of others. Feeling type administrators enjoy pleasing others, dislike telling people unpleasant things and heavily emphasize the human aspects of dealing with organizational matters. Based upon the above two categories with two variables each, the exact problem solving styles of educational administrators have been studied. The results of the Table – 1 unfold that the administrators of the day gather information on sensation basis and not by intuition, which infuse objectivity in the information collection. Further they analyze the information by cognition i.e. by thinking not by heart i.e. by feeling.

This shows very logical and sound problem solving styles of the administrators and thus can be inferred that educational administrators are highly sensational and thinking oriented and not governed by intuition and feelings due to their score being much below even from the lower control limit. Further these findings are also confirmed by the application of F-test (ANOVA) at 95 percent confidence level.

Locus of Control

The concept of locus of control denotes whether a person believes that they are in control of events, or events control them. Those who have a high internal locus of control believe that they control and shape the course of events in their lives, while those who have a high external locus of control tend to believe that events occur purely by chance or because of factors beyond their own control. Internals, as compared to externals, seek more job related information, try to influence others more at work, more actively seek opportunities for advancement, and rely more on their abilities and judgment at work.

Results of the Table – 1 reveal the state of internal locus of control amongst the educational administrators. As per the results 67 percent of them believe that they control their destiny themselves whereas the other 33 percent believe more in luck or chance and attribute their attainments to luck or chance factor. When the data was testified at 95 percent confidence limit around mean, majority of the administrators have been found with higher internal locus of control. However the standard deviation of 14.35 depicts that some of the educational administrators are having maximum variations on the variable of locus of control. For further authenticity of the results F-test (ANOVA) has been applied, and the obtained value has been found greater than the table value of the same at both levels of significance. Thus the entire discussion given as above testifies that the majority educational administrators of the day have moderate to high internal locus of control and consider themselves more as self-made and believing in their own competencies, and less being governed by destiny.

Conflict Handling Skills

The ability to handle conflicts is undoubtedly one of the most important interpersonal skills an administrator needs. The term conflict refers to perceived incompatible differences resulting in some form of interference or opposition. Whether the differences are real or not is irrelevant. Traditional view on conflict is that conflicts are bad and must be avoided, but human relations views on conflicts consider them a natural and inevitable outcome in any organization. Most recent, the interaction’s view on conflicts proposes not only that conflicts can be a positive force, but also that some conflicts are absolutely necessary for an organization to perform effectively. Hence an administrator should promote and encourage functional conflicts, and should manage and handle dysfunctional conflicts. Understanding and implementation of conflict resolution tools largely depends upon the possession of skills by an administrator. Generally an administrator has five conflict handling options i.e. avoidance, accommodation, forcing, compromise, and collaboration. All the conflicts do not require assertive action rather sometimes conflicts also need to be avoided in a situation when it is trivial, and emotions are running high and time is needed for conflicting parties to cool down. But large segment of conflict handling styles fall in the rest of the four categories.

It can be examined from the Table – 1 that none of the conflict handling styles of the administrators fall in high or low category rather all the scores fall either in moderately high or moderately low category. The results of the table envisage that administrators largely go for collaboration style of conflict handling with a very positive approach of ‘I win, you win’. It is typically characterized by open and honest discussion among the parties. Second popular conflict handling style of the administrators has been discovered as dominating/forcing style with an approach of ‘I win, you lose’. In this style the administrator uses his formal authority to resolve a dispute. Forcing works well when one need a quick resolution on important issues where unpopular actions must be taken, and commitment by others to the solution is not crucial. Compromise and accommodation have been found comparatively least preferred conflict handling styles amongst the administrators as the score in these both categories is less than the mean score which itself is the testimony of the least applied conflict handling styles. At 95 percent significance level around the mean, only three conflict-handling styles could fall in the range and finding the accommodating style i.e. ‘I lose, you win’ a very rarely applied style of conflict handling. The results of $?^2$ test reveals that the observed value is less than the table value, and hence supporting the scale. When further tested by applying F test (ANOVA) to test the authenticity of the above results the same have been in tune discussed as above.

Findings on Organizational Climate

People are affected by the culture and climate in which they live. For example, a person growing up in a middle-class family may be taught the values, beliefs, and expected behavior common to that family, and the same is true for organizational participants. The society has a social climate; a workplace has an organizational climate. When people join an organization, they bring with them the values and beliefs they have been taught. Quite often, these values and beliefs are insufficient for helping the individual succeed in the organization. The person needs to learn how the particular enterprise operates and it is here where the organizational climate has a great role to play. Impact of climate on organization’s performance and effectiveness is both functional as well as dysfunctional. Talking about the later, it may be stated that culture/climate leads to “group think”, and may turn out to be collective blind spots, and resistance to change and innovation. Organizational climate basically reflects a person’s perception of the organization to which he belongs, and encompasses the set of characteristics and factors influencing their behaviors. Thus organizational climate is not a unitary concept rather a composite of many factors. An organization has a structure; it reflects class relation; it has roles; ownership is defined in definite terms. The various elements of an organization contribute to the psychological environment of the same. The various factors influencing the organizational climate mainly include eleven aspects like communication, performance standards, support system, warmth, responsibility, reward system, identity, conflict resolution, participation in decision-making, structure, and motivation level. With regard to the results of these different variables a very positive picture has emerged and all the variables have been found contributing significantly for a performing organisational climate as depicted in Table – II.

Table II
ORGANIZATIONAL CLIMATE IN THE EDUCATIONAL SERVICE SECTOR

Climate Dimension	Group Mean	Standard Deviation
Performance Standards	3.57	0.46
Communication Flow	3.56	0.45
Reward System	3.50	0.68
Responsibility	3.35	0.58
Conflict Resolution	3.68	0.47
Organizational Structure	3.03	0.86
Motivation	3.87	0.43
Decision-making Process	3.48	0.26
Organizational Support System	3.51	0.35
Warmth	3.37	0.70
Identity Problem	3.90	0.38

The results of the Table – II envisage the very positive views of the educational administrators on the types of climate prevailing within their respective institutions. On majority of the eleven variable group mean has been found more 3.5 with very less standard deviation revealing a very dazzling picture of climate. However, views of the respondent unfolds that the organizational structure in the educational institutions is not unidirectional. At some places it indicates at the working contrary to the principle of span of management, at other it signifies the value of rules and regulations, and on some of the occasions, the precedents overtakes the rules, policies and procedures. The group mean of 3.03 also does not point out a complete democratic structure; rather it depicts a mixture of democratic and bureaucratic structure. Like wise, on responsibility and warmth variables, though state of affairs is much performing yet with a good scope for improvement. Motivation and identity problem are the two variables which have recorded a very encouraging picture of the organisational climate. The prevailing organisational climate is communicative enough with realistic performance standards, and a well-defined reward system. In this service sector people feel and perform their responsibility, and the human relation environment has been found quite conducive where the administrators encourage largely democratic structure and participative goal setting to make the atmosphere motivational one. People in the sector work as a team, making the employees more committed to their organization and profession as well. As a whole the overall representation of organisational climate in the educational service sector has been found quite encouraging and performing.

Findings on Interactional Analysis

In fact decisive significance of the present study lies in studying the interaction between managerial skills of the administrators and the organizational climate they are working in. Though these two are the distinct research problems which can be carried out at independent levels yet in the present section of the investigation the researcher has made an effort for the interactional analysis in a composite way. Managerial skills in itself are a very vast area of study and encompass soft skills, their core competencies, technical skills, human skills, and conceptual skills. In the educational institutions an administrator is expected to have a reasonable amount of all the skills. Organizational climate on the other hand is an umbrella term and includes each and every aspect of organizational functioning, which may affect or get affected from the individuals working in the organisation. To study the interaction among these variables first the researchers have tried to study the relationship of scales on pair basis i.e. managerial skills' interaction with organizational climate and thereafter the interaction has been attempted between the two.

The interaction between managerial skills and organisational climate has been found out through interaction table of measures and by applying ANOVA (Table – III and Table – IV). The organisational climate has been grouped in to three categories i.e. performing climate, average climate and poor climate. The interaction table of measures of managerial skills and organisational climate (Table – III) reveals that apex level of organisational climate can enhance the level of various managerial skills and similarly a poor score on climate can hamper the performance of managerial skills. The table further envisages that organisational climate has highest bearing upon the administrators' conflict handling styles i.e. in relation to the poor organisational climate, conflict handling skills of the administrators are affected much. Further the problem solving skills of the administrators are not affected much irrespective of the level of organisational climate, and the same has a moderate impact on locus of control.

Table III
MEASURES OF MANAGERIAL SKILLS AND ORGANIZATIONAL CLIMATE
(INTERACTIONAL TABLE)

Managerial Skills / Levels of Climate	Problem Solving Styles	Locus of Control	Conflict Handling Styles
Performing	25.2	32.7	16.4
Average	25.5	21.2	15.5
Poor	23.0	14.2	9.2

The interaction table has been further analyzed by applying ANOVA to study the interactive effect of various levels of organisational climate and various measures of managerial skills (Table – IV). The findings of the same bring out a significant interaction between overall managerial skills and organisational climate because the observed value of F is higher i.e. 3.56 as compared to its table value 2.15 (.05) and 2.94 (.01). Since the observed value is greater than the table values at both the levels of significance that supports the above mentioned discussion that there is a significant interaction between managerial skills and organizational climate. To authenticate the above findings, ANOVA has been applied to study the interaction between individual managerial skills and overall organisational climate (Table – IV) and the results have been found inconsonance with the above outcome. Locus of control and conflict handling styles of the administrators have found significant interaction with organisational climate at both the levels of significance, but interaction between problem solving skills of the administrators and the organisational climate has been found insignificant at both the levels of significance.

Table IV
MEASURES OF MANAGERIAL SKILLS AND ORGANIZATIONAL CLIMATE
(ANOVA TABLE)

Interactional Analysis	Value of F		Level of Significance
	Obtained Value	Table Value	
Problem Solving Styles x Organizational Climate	0.20	4.26 (.05) 8.02 (.01)	Insignificant at both the levels
Locus of Control x Organizational Climate	13.38	4.26 (.05) 8.02 (.01)	Significant at both the levels
Conflict Handling Styles x Organizational Climate	43.00	4.26 (.05) 8.02 (.01)	Significant at both the levels
Overall Managerial Skills x Organizational Climate	3.56	2.15 (.05) 2.94 (.01)	Significant at both the levels

Conclusion

In fine it can be concluded that administrators in the educational service sector largely solve the problems by use of cognition and logic, and have a moderate to higher amount of internal locus of control. While handling the conflicts they attempt to handle the same with a positive bent of mind i.e. collaboration style, and on failure only resort to alternative styles. The climate in which the administrators are showing their skills is communicative enough with realistic performance standards, and a well-defined reward system. In this service sector people feel and perform their responsibility, and the human relation environment has been found quite conductive where the administrators encourage largely democratic structure and participative goal setting to make the atmosphere motivational one. People in the sector work as a team, making the employees more committed to their organization and profession as well. Further the interaction between the two aspects is more significant in institution building when both work together instead of a pair basis where the mediating variables play a dominant role in the performance.

The Seize (Capture) of the State: A Chilean Perspective

Cristina Castillo Gatica
Ramón A. Ramos Arriagada
Juan A. Serón Alumini
Universidad de Santiago de Chile, Chile

Abstract

Chile, being one of the countries selected as a model to be followed as an example of a successful open market economy, is an example of how the State can be captured and re-directed in order to favor a few big investors. According to Transparency International however, Chile is still the less corrupted country in Latin America. Evidences are that the corruption process is present, making it necessary to introduce urgent correction measures.

The purpose of this paper is to analyze the Chilean situation, disclose the corruption procedures used by unscrupulous persons, companies and political agents and others, protecting their selves under the globalization umbrella. There are some cases demonstrating that the Chilean State has reached a high level of capture from domestic and foreign interests. By identifying the illegal or illegitimate operations, signaling the weakness of the system and procedures used to obtain illegitimate profits, it is possible to call the attention on the need to minimize two types of damage: to the national Treasury, and to the less favored people with the wealth distribution.

Introduction

The concept of "Seize the State" is very new. The germinal document containing the concept is "*Civil Liberties, Democracy and the Performance of Government Projects*[1]. Besides introducing the term and its implications, the authors linked it in a chain where globalization-governance-corruption-wealth distribution-poverty was the connecting links. The fatherhood of the term is associated to Daniel Kaufmann, Head of the Governance, Regulations and Finance Group, belonging to the World Bank Institute. However, it was documents such as *Corruption and Institutional Reform: the Power of the Empiric Evidence*[2], *Seize the State, Seize the Day: State Capture, Corruption and Influence in Transition*[3], and *The Governance is Essential*[4], which definitively posed the recently developed term. In spite of the fact that the *seize of the state* is an accepted concept already, it does not mean that it is widely known or that it belong to the public domain, due to its novelty.

Seize of the state is defined as "*the attempts made by companies to exert influence in law promulgations, State regulations and policies, in exchange of illegal payments – under privacy terms - made to state employees*[5]". Authors establish a difference between *corruption*, applying it to misusing a state position in order to obtain personal benefits, and *fraud*, which is applied when the same illegitimate activity occurs in the private sector.

Corruption is not a consequence of modern life. There exists evidence that corruption was a part of the way of living in civilizations as old as the ancient Egypt, Babylon, Greece and Rome. Even the Bible and Koran contain specific references to this phenomenon[6]. However, nowadays corruption has suffered a significant increase due the neo-liberal ideology which is the basis for market globalization. Under this ideology, all kinds of ruling meaning a blockade to the market freedom forces, must be minimized or eliminated in order to reach economic success. The philosophy of *the invisible hand of market* acting to correct any deviation that market actors could generate has relegated State to a minor role. The huge transnational companies can and (in fact they exert) pressure on small countries until the point they can even participate in the ruling and laws promulgation favoring them[7]. Unfortunately, Chile is a country where the power of transnational companies on State can be verified[8].

Governance and Corruption

Governance followers and agents have had a close look on corruption affecting state institutions. Among the publications in Spanish dedicated to analyze the corruption phenomenon, the *Governance, Novedades en la Web*, issued by the Institut Internacional de Gobernabilitat de Catalunya, IIGC, are outstanding. Besides, the World Bank holds a wide data base on the *governance* subject which can be accessed by four different ways[9],[10]

The Governance is composed by the following factors: a) Government election, supervision and substitution process, and accountancy mechanisms; b) Government ability of efficiently managed public resources; to elaborate the setting up and implement policies and laws to take care of development and people welfare, and c) To gain respect from the citizens and the State towards institutions predominating the national economic and social relationships. All these measures are quantified by international indicators. One of the most important indicators; is the level of corruption existing in the country[11].

According to World Bank "*corruption flourishes where policies creates an incentive for it, and institutions whose mission is to restrictive it, are weak. Diagnosing corruption helps any country to understand deficiencies in their policies and institutions, likewise to design an strategy to fortifies the State performance*[12]"

Corruption can assume a variety of formats: misuse of public money, robbery to the State; bribes to avoid denounces on price increase of goods or services sold to the State, or to decrease the quality of these goods or services; bribes to gain monopoly power in the market or in the goods or service acquisition; seizing properties belonging to the State, and a long list of etceteras. It is necessary to mention that if corruption did not exist, enterprises would have to pay the proper level of taxes they are really due to pay.

Because reality regarding corruption is other than normal, countries governments perceive reduced income in relationship to what they should receive, or suffers losses on the national wealth belonging to all the citizens. Whatever the ways used to default the State, the result is that poorest experiment a reduction on their chances to obtain some benefits from the State, or to obtain some help from the government to ideally acquire the education or health level necessary to alleviate their situation by their own. This situation can be clearly noticed by analyzing the percentage of the national budget devoted to Education and Health services in many countries of the world. Sadly to say, that the situation becomes worst as time goes by.

The seize of the State means the increasing predominant role of private interest over general interest, in a trend which is not confined to small and less developed countries only. The persistent denial of the United States' President to sign the so called *Kyoto Treaty* (in spite of the fact that signing was one of the most important commitments of George C. Bush while he was a candidate to the White House), could be one example. Once elected President, George C. Bush denied signing it, arguing that *"doing it would affect the United States economy"*. Prior to this statement made through the communication media, the same media has been publishing that the USA industrial leaders claim against any rule imposing a reduction in the pollution problem caused by them. It is widely known that the USA industry is the biggest polluter in the world. It is not necessary to emphasize: the power exerted by USA industrial leaders on their President to avoid him accomplishing his commitment on this subject.

To put an end to this part of the study: worldwide, the comments upon the true reasons for the war against Iraq, is that all was a maneuver to allow a couple of USA companies take control on Iraq oil. If this intrigue proves to be effective (and it seems so), the world would be in presence of the biggest example of how the most powerful State was seized to serve the economic interest of a handful of people.

The Seize of the Chilean State: Recent Corruption Cases

Most of the Chilean citizens have been stroked by recent events involving private agents and state institutions, in the framework of the so called "seize of the state". There exists a big concern among the population mainly because corruption actions have meant a big loss for the Chilean state, and because those are events to which Chile, as a country, has not been used to. According to Transparency International[13], Chile is not the less corrupted country in Latin America only, but one of the less corrupted countries in the world.

Generally speaking, during the last period there have been different private and state companies involved in political and administrative situations where ethics has been compromised. The impact in the Chilean society has been contradictory, and the consequences in the short and long run are hardly to anticipate. However, what is clear in these moments is that those abnormal situations have provoked a collapse at a political-institutional level, with a serious impact in the political development of the country, which have forced the highest government authorities to define a strategy aimed to correct all current or future ethical deviations, in order to preserve the continuity of democratic model.

One of the domestic financial scandals, demanding government intervention[14], affected the Public Structure, of the Transport and Telecommunication Minister (MOP), and the Environmental and Territorial Management Enterprise (GATE Inc.). Now, to design a new prevention and control strategy as the one required under these circumstances, requires a complete knowledge on the variety of facts intervening in the wrongdoings and how they impacted the political and democratic systems.

Recent researches reinforced the idea that the absence of mechanisms and solid instruments of democratic basis provoke serious distortions in the State agenda, and the administrative processes which accompany it. And here is where the phenomenon of *the seize of the state* appears in the horizon[15]. There is no doubt that the scandals occurred in Chile that will be synthesized later, represents "one attempt done by a company to influence in the law promulgation and in the government policies and ruling, in exchange of illegitimate payments towards State agents, under a private agreement". In other words, the State has been seized to serve private interests.

The degree to which the State is seized, and the results of the capture, determines the configuration of corruption or fraud acts, according to the character of State or private agent that individuals or entities involved could have. Under this context, Political bodies and Politicians play an outstanding role, whether as direct accountable of what happens at government level under their responsibility, or because they are ethically accountable for all what happens in the democratic environment where they exert their activities[16].

To illustrate the previous statements, it is useful to mention part of Joan Prats` lecture titled "Ethics on Political Performance"[17] during a Seminar held in Belo Horizonte, Brazil, during July 3-4, 2003[18]: "The Law-abiding State does not always advance; sometimes it goes backwards. The same occurs with government corruption and efficiency indicators…, the confidence on political and legal institutions and interpersonal trust have dramatically fallen"

It is obvious that bad political practices, and consequently bad politicians, provoke deep ruptures within democratic institutions. Therefore, the image of the political processes is damaged by wrongdoings weakening the whole structure upon which the democratic system is built.

According to Joan Prats´article, "a bad politician does not really know the reality, he deforms it, introduces false images, creating phony illusions, fear and hopes. They do not transform governance patterns: they are skilled operators of popularized political parties, fragmented and of a low institutionalization. They know how to manage them selves in the sewer of political funding, as to manage the electoral client nets; they assign employment in the state positions under patrimony administrations, manage congress occasional majorities and do transactions with legislators ballots, act as brokers between private sector and laws and ruling promulgations, they decide on biddings where state money is spent, or in privatizations; and they negotiate benefits and exemptions."

The aspects mentioned above point out the need to identify those factors decreasing, the efficiency of governance and democracy, moreover if we take in consideration that in the Latin American region "current democracies float on a deep inequality, and sometimes in a big ethnic and cultural inequity; in the middle of imperfect markets problematically linked to global markets, which emphasize inequality, upon civil and political cultures with a low democratic basis, and plagued by "democrats by default"[19]

MOP- GATE scandal antecedents

In spite of the efforts done by the Chilean political and institutional authorities to avoid this situation that compromises the governance stability, and consequently, the democratic process, there has been a complex situation where, surprisingly, two completely different versions of the same facts try to gain citizen favorable opinions. On one side, the facts have been regarded as one legitimate and plausible way to increase citizen welfare. The other view is that the so called "MOP-GATE case" deserves the title of *national scandal*. Facts are the following:

Through the strange case of one criminal claim introduced by a secretary in the Chilean Justice system, the whole situation reached the mass media. The secretary claimed she suffered a street assault while walking to a bank to deposit a huge amount of money belonging to Gestión Ambiental y Territorial, Sociedad Anónima (GATE

Company). The *assault* finally resulted in auto-robbery, but it prompted the disclosure of a series of irregularities in GATE Company, because the guilty secretary denounced that GATE was a façade organization, whose mission was to hide "political money".

GATE was founded in July 1997, as a closely held corporation. Its mission was to provide services of assessment to labor, watering and environmental business problems, and to development analysis, design and implementation to engineer projects. GATE was awarded with the bidding to perform the personal outsourcing and other assessorship services for a total amount of $ 1,725,000,000, Chilean currency (that is equivalent to US$ 2.430.000), asked by the Public Structure Minister. Through a public report, GATE itself pointed out that they had been hired due to the huge amount of tasks that General Franchising Coordination (CGC). This unit depending from MOP had to perform as a result of the expanded number of franchised projects. The activities performed by GATE were: to prepare, review and evaluate antecedents regarding environmental and territorial analysis; legal, taxes, informatics, financial, communications and administrative matters, besides providing services and commodities ranging from office supplies until transport and communications.

An investigation discovered that there was a complex net of a hidden system of wage payments to beneficiate Public Structure and Transport Minister's employees. This way, they received extra wages. Explanations were that the system had the objective to remunerate- according to market level – high level and experienced professionals, whom otherwise would not accept to work for a State entity. Such professionals were required in order to start an ambitious highway and public structures plan, under the private concessions pushed by the Chilean Government.

The first contracts were signed between 1998 and 1999. In a first review, the Republic General Comptrollership pronounced that the payments were legal in its origin, but in 2001 after a second analysis, they were rejected because the committed amounts were not in accordance with the amounts actually paid. Among the irregular facts discovered, was that about 40 Public Structure Minister Officials received extra fees paid by the private GATE Company to perform tasks that were part of their normal activity within the Ministry. Moreover, the investigation did not arrive to any conclusion certifying that these tasks had been actually performed. The same happened with additional environment evaluation assessment contracts signed between GATE and the Public Structure Minister.

The following Table presents a brief summary of the contracts signed between GATE and the Minister of Public Infrastructure (MOP):

TABLE 1. MOP-GATE CONTRACTS
(CHILEAN CURRENCY; US$ 1 = $700)

	AMOUNT	DATE	OBJECTIVE	PERIOD
1	$35.000.000	SEPTEMBER 16, 1998	ANALYSIS AND ASSESSMENT TO DESIGN A PROCEDURE MANUAL FOR ENVIRONMENT CARE IN FRANCHISED HIGHWAYS	6 MONTHS
2	$48.175.000	OCTOBER 8, 1998	SUPPORT TO THE GENERAL COORDINATION OF FRANCHISED CONSTRUCTION, GENERAL PUBLIC INFRASTRUCTURE DIRECTION, IN THEIR ADMINISTRATIVE AND SERVICES ACTIVITIES.	5 MONTHS
3	$15.000.000	DECEMBER 18, 1998	REVIEW OF NORTH ACCESS TO CONCEPCIÓN CITY PROJECT. COMPENSATION PAYMENTS FOR NON INCLUDED TASKS IN THE ORIGINAL FRANCHISING PROJECT.	10 DAYS
4	$49.400.000	MARCH 1, 1999	SUPPORT TO THE EXECUTIVE UNIT OF EXPROPRIATIONS FOR FRANCHISED CGC PROJECTS, IN THEIR ADMINISTRATIVE AND SERVICES ACTIVITIES.	N.A.
5	$49.044.524	JUNE 4, 1999	TO PERFORM SEVERAL ACTIVITIES PROVIDING INFORMATION ON FRANCHISED PROJECTS;	4 MONTHS

			INFORMATION GENERATION AND EXCHANGE AT NATIONAL AND INTERNATIONAL LEVEL.	
6	$966.000.000	SEPTEMBER 13, 1999	SUPPORT TASKS FOR CGC.	12 MONTHS
7	$39.000.000	DECEMBER 6, 1999	DESIGN AND PRINTING OF AN INDEPENDENT ENVIRONMENTAL AUDITING PROCEDURES MANUAL FOR ROUTE 5 FRANCHISING, SANTIAGO-TALCA SECTION	45 DAYS
8	$49.500.000	JULY 18, 2000	ENVIRONMENTAL ANALYSIS	90 DAYS

In Fig. 1 below, there is a representation of how the complex income-disbursements mechanism existing between GATE and the Minister operated.

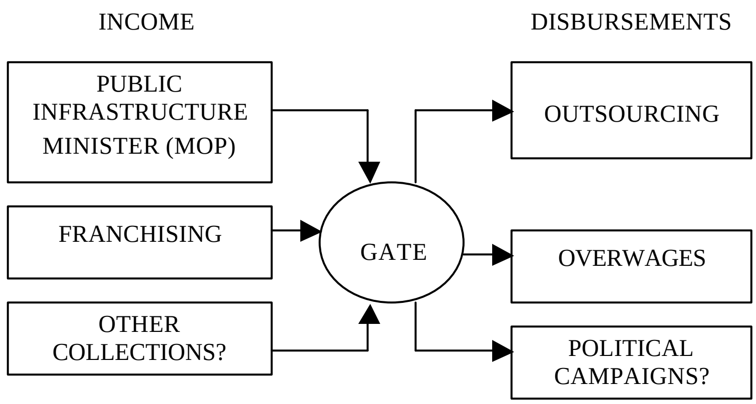

FIG. 1. MOP–GATE-CIADE CASE; INCOME-DISBURSEMENTS RELATIONSHIP[20]

According to Minister Authorities, payments made to GATE were applied to fund operational expenses of the Franchising Coordination, which did not have its own budget, and had a payroll of 4 full time employees only. The remaining required personnel hired on a temporal basis, and received honorariums instead of wages. The same system was used to hire Minister, officials. Although the actual reason for these payments is still under legal investigation, three possible answers have been stated:

1) Payments were an indirect method to fund the Franchising unit.
2) Payments were an uncovered way to fund political campaigns favoring government candidates.
3) Payments were an uncovered way to pay for privilege information that would help GATE win the Minister Infrastructure construction bids.

Besides the previous facts, by analyzing the GATE accounting documentation, several payments were discovered to compensate some never clarified "expenses" made by the Minister. It is suspected that these particular payments were just electoral contributions favoring government candidates.

Around mid 2001, the Public Infrastructure Minister nullified the contract with GATE, invoking cost reasons, and assigned it to the Institute of Economics, Universidad de Chile. However, the irregular payments to state officials continued, and new investigations are on the way, but now headed by both, The Republic General Comptrollership and the Chilean regular legal system.

In a very recent development, the Judge in charge of the judicial procedure, stated[21]:

1. Participation in this case included state agencies, and private and state individuals.
2. The facts analyzed during the legal process could configure a fraud and swindle against the Chilean Treasury, behavior penalized under articles 239 and 468 of the Chilean Penal Code.
3. There are assumptions of persons exerting state employments, whom used their position to inflate consultant services to pay amounts not authorized by the State. Among these payments there were

additional honorariums and fees in favor of people not included in the official payrolls. These payments mean a robbery to the Chilean Patrimony.

4. Additionally and jointly to the previous maneuver, people whom were not state employees colluded with State officials to inflate consulting fees, or facilitating their firms title with the same purposes, completely aware that the services would not be rendered by the "hired" firm.

Conclusion

After reviewing one of the cases recently occurred in Chile, where the seize of the state maneuver is clear, many conclusions are possible to obtain. Among them:

1) Taking into account that ethical code we apply to orientate our behavior derivates from the culture our society environment we live in, the more an individual goes deep into society, more complex are the rules that she/he must observe. In the same vein, the highest the hierarchal position an individual reaches it is more likely for him or her to face ethical dilemmas while deciding among opposed interests. Decisions must harmonize personal, group, public, organization and country interests. This is why the "guilty mistakes" corruption activities or misconduct in general, coming from high position government authorities, are inexcusable.
2) The corruption scandals disclosed affects a country worldly known – through International Transparency Agency several reports - as the less corrupted country in Latin America, and one of the less corrupted countries of the world, including a number of developed countries. On these bases, it is easy to deduct what the situation should be in those countries considered as corrupted.
3) The last developments in the reported Chilean cases have demonstrated that they are not completely illegal. But, it is equally possible to say they are not legal either. There are some gaps in the laws allowing "interpretations" which put the authors of the wrongdoings in a legal "no man's land", away from where the law can reach them.
4) The seize of the state is acting in Chile, through unscrupulous state employees, and fortunately the corresponding information has reached the citizens knowledge on time (GATE scandal). Administration failed since controls were in site, but because negligence or corrupted officials were in charge to reinforce it. The portrayed case could have been avoided if the respective State entities or agents had duly accomplished his/her duties. It has not been proved yet, but is supposed that bribes could have exerted its pervasive influence on them.

The phenomenon called *Seize of the state* is still under study not only regarding their characteristics, but mainly about their effects and future consequences. Until now their advance has been headed by the Group of Governance, Regulation and Finance of the World Bank Institute. The subject is important enough to deserve further research from Govemance specialists, and from researchers from different study fields, whom could help to clarify this worrying and relevant new problem, in order to propose solutions.

The World Bank, given its nature, has assigned maximum relevance to the economic impact upon the seize of the state, and put some attention on their social effects (poverty increasing, wealth distribution inequity and environmental damage, for instance). However, this institution has not gone deeper in the phenomenon explanation.

In absence of a satisfactory general answer, some voices have claimed that the seize of the state is just another unwanted product of globalization and neo liberal economic philosophical application. This creates a situation where a more careful analysis is urgently required: the reaction could be from the massive population excluded from a global wealth distribution. Demonstrations against World Commerce Organization were small at beginning, but they started growing thereafter, and right now nobody knows what the future could bring on this subject. Anomy is already present in some societies, and when this decomposition of the social fabric starts deteriorating the consequences can be extremely dangerous.

The most important effect of all these illegitimate procedures have been the lack of confidence that citizens have experienced against state agencies procedures, and on the politicians activities. In other words, there has been mayor damage to the political system and its institutions. Consequences on political authorities are an image of credibility seriously eroded, and doubts on their ability as leaders and persons able to guide and sustain democracy on an institutional basis. Another of the unwanted results is the high risk that skilled and efficient professionals working for the State quit the system, and that new professionals willing to work for the State feel repulsion to do it, because of the danger of damaging his/her personal reputation.

In summary, the worst effect from all these happenings is the loss of confidence from citizens on state institutions, including the ability to exert a minimum of control on the institutions devoted to provide common welfare. The uncertainty created after this scandal (and others not mentioned here) is now a phenomenon appearing each time someone accuses the state institutions or government authorities of wrongdoings, no matter if afterwards procedures discover that nothing abnormal have occurred.

Furthermore, it is amazing to realize that almost every agent in charge of reinforcing the Chilean laws, in the sense of protecting the national interest over the foreign ones, have been ready to admit their failures, but claiming innocence on the basis of the same law they were supposed to obey. In many cases, highly educated university professionals declared themselves *unable* to distinguish the difference between tax elusion and tax evasion, provoking a severe damage to the Chilean economy.

Finally, if political and opinion leaders, university scholars and citizens worry about the phenomenon of the capture of the state and its consequences, it is very likely that state agencies be reinforced and strengthened to stop corruption, repair negative effects that globalization has brought and enhance the positive ones. If these goals are reached, what actually would be obtained is nothing less than to give to social equity the importance it really deserves.

Accounting Information in the Context of Internationalization: Theory and Practice of Slovene Companies on Markets of Former Yugoslavia

Marko Hocevar
Maja Zaman
Simon Cadež
University of Ljubljana, Slovenia

Abstract

In the second half of the nineties the internationalization of Slovene companies started to expand into more and more active forms. Export business was complemented by increased foreign direct investment either as joint ventures or as independent investment into existing or newly established companies. Disregarding the chosen internationalization strategy, support from information function is crucial to its success. In this article the role of accounting function [as central part of information subsystem] in internationalization process will be presented. We believe that managers of Slovene companies do not use accounting information for control over their operations on markets of former Yugoslavia adequately. In case of exporting, accounting information represent basis for decision-making related to determination of prices, terms of payment and evaluation of sales. The importance of accounting information is further increased in companies that choose investment approach to internationalization. In addition to international transfer pricing issues, which are related to diverse tax legislation and tax rates in different countries, accounting information represent the basis of control over business activities and evaluation of foreign subsidiaries and their management on the markets of former Yugoslavia.

In the process of globalization the strategy of internationalization has become one of the strategies that top management devotes most of its attention to. A company without a strong strategy of entry to foreign markets is a myopic company, characterized by unplanned, ad hoc solutions to changing market conditions, increase of competition on foreign markets in particular. Such an approach, referred to as "selling" approach by Jaklic [9], can not be part of successful integration into globalization flows. Coordinate performance of all business functions is necessary and the only way to achieve it is by adequate use of information for decision-making, prepared by accounting department of a company.

In the first part of the article the phase model of internationalization will be presented. We argue that Slovene companies that enter the markets of former Yugoslavia use this model as their entry mode. The results of the research entitled "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia" show, that majority of Slovene companies (65 out of 119) are already present on these markets. Only 29 of them operate through subsidiaries, established on these markets, while others concentrate on export business. The fact that Slovene companies gradually increase their involvement in markets of former Yugoslavia is further supported by the fact that 23 companies, which currently export, plan at least one foreign direct investment in at least one of the markets of former Yugoslavia in the next three years and that 20 companies, which already own subsidiaries in these markets plan at least one new investment in the next three years.

In the second part of the article we demonstrate, why importance of accounting information for control over activities on markets of former Yugoslavia increases with level of involvement into these markets. One of the main tasks of accounting function is preparation of accurate and important information for internal users [managers] for decision-making related to purchase, sales, finance, human resources and production functions. Increased involvement into a particular market raises importance of accounting information related to determination of selling prices, maintenance of financial discipline of buyers, evaluation of sales, foreign subsidiaries and their management. Neglecting such information, which results in decision-making by instinct, therefore leads to taking sub-optimal decisions and deterioration of business results. Hypotheses, which were used to test to what extent decisions, related to activities on markets of former Yugoslavia, are based on accounting information, are placed in the center of the second part of the article. Related to accounting information for decision-making in *foreign* business environments, our research complements research of Slovene authors [5, 10] who point out inadequate use of accounting information for management decision-making in Slovene companies. In the closing part of the article main conclusions, resulting from our research, will be presented.

Internationalization as a Process

International comparative advantages, related to foreign direct investments, changed in the nineties, when low costs of labor and natural resources started to loose importance. On the other hand, importance of highly educated workforce and development of infrastructure started to increase. As consequence of this turnabout, the trend of increasing foreign direct investment in North America, Far East and the European Union re-appeared [11]. From the viewpoint of "western capital" the markets of former Yugoslavia started to internationalize too late. In addition to familiarity with business environment, culture and recognition of trademarks in the region, this was an additional reason for Slovene companies to perceive high opportunities on these markets. Theory of gradual internationalization into foreign markets derives from Scandinavian school and is predominantly based on international studies of Swedish researchers. The theory points out two internationalization processes that run in predictable sequence:

- gradual penetration in new markets, starting with markets with low cultural distance and slow approach to more demanding markets and markets with high cultural distance;
- gradual involvement in and dependence upon particular markets;

Both processes are based on assumption of risk-averseness and are related to the learning process. In the first case, the company can use knowledge, gained on one market, to enter the next market. In the second case, the company can decrease risk, related to higher internationalization stages, with use of newly acquired knowledge on particular market.

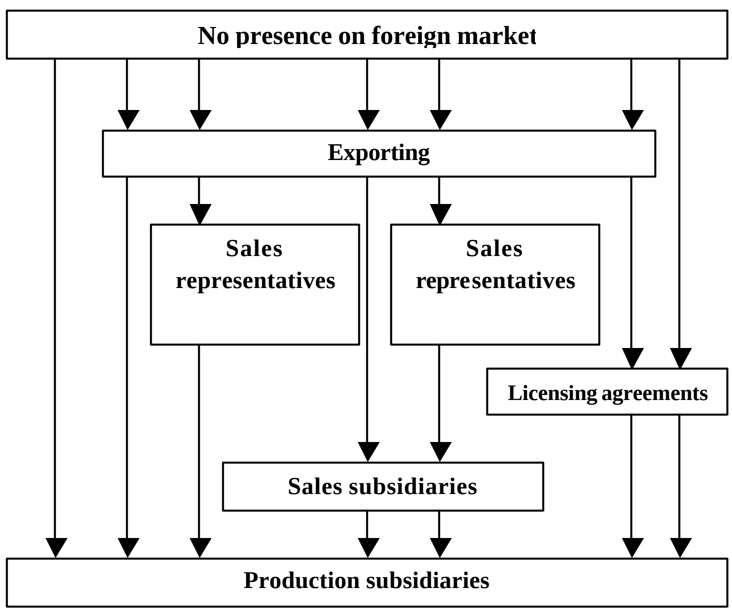

FIG. 1: DIFFERENT MODES OF INCREASING INVOLVEMENT ON FOREIGN MARKET

[3]

In continuation we present two extreme strategies of entry: exporting and foreign direct investments. By doing this, we investigate similarities with strategies of entry of Slovene companies on markets of former Yugoslavia and factors which influence these two strategies. After that we will relate both entry modes to crucial accounting information for control over activities on markets of former Yugoslavia.

Export strategy

Exporting represents the simplest form of presence on foreign markets. Although it minimizes fixed costs, such costs [making contacts with potential buyers, negotiating prices, organizing transportation, transforming products, advertising costs etc.] are still so high, that the realized contribution margin does often not cover fixed costs related to transaction. Consequently, low level of export is often not economically warranted.

Due to high price elasticity, which arises from low levels of income, increase of prices as consequence of transportation costs and duties have a strong negative effect on sales. Existing deficit in balance of payments results in additional non-duty barriers for Slovene exporters, and the problem increases with the value of exports.

Foreign direct investment in foreign subsidiaries

In transition economies, governments have to make a choice between increasing level of foreign direct investment, in order to overcome the problems of lack of local capital, access to new technologies and managerial know-how on one hand, and keeping level of such investments low, in order to avoid criticism of selling out national properties to foreigners on the other hand. In Croatia, Bosnia, and Macedonia the legislation is supportive to foreign direct investment. Although foreign direct investment is a risky form of presence on foreign market, the level of risk varies with types of investment:

Joint venture as a form of co-operation between two or more business partners has evolved relatively late. Its development is related to increased costs of research and development, decreasing lifecycles of products, decreasing time from first conception to launch of new products and lack of financing. Due to these trends, the companies were forced to give up complete control over all business functions. The characteristic of the joint venture strategy is the establishment of a new company, which is legally separated from both [all] partners, who share the ownership, management and control over its operations. Two principal advantages of this strategy are conformity with demands of local governments, demanding participation of local capital in foreign direct investments and decreased risk, related to involvement in a particular market. The risk can be further reduced if the partners have already co-operated in the past. Familiarity with the partner, its abilities, business ethics, culture and existing personal contacts represent an additional factor of lowering risk through the joint venture strategy.

Foreign subsidiaries in 100 % ownership are the most risky form of presence on foreign markets. The most usual reason for such entry strategy is presence of some specific component [such as specific managerial know-how] that could be lost in licensing agreement or joint venture strategy. On the other hand the cost of such strategy is higher and in case of deterioration of market conditions the company takes over all the risk and can not easily withdraw from the market. Operating through foreign subsidiaries is related to issues such as diverse tax legislations and related problem of international transfer prices as well as evaluation of subsidiaries and their managements.

In the next section we focus on importance of accounting information in control over operations on markets of former Yugoslavia. Such information is prepared by management accounting that encompasses a wide specter of techniques for solving managerial problems. Hansen and Mowen [8] distinguish three main areas of management accounting:

- determination of cost prices of products and services,
- preparation of information for management decision-making and
- preparation of information for planning and control [including evaluation];

The Role of Accounting Information in Control over Operations on Markets of Former Yugoslavia

Importance of accounting information increases with dependence on particular foreign market. In the beginning phase of entry on a foreign market, the company adopts to existing market conditions by setting prices on the level of prevailing market prices or below market prices to increase market share. Accounting information related to cost prices of products are of secondary importance, because strive for gaining market share prevails. Increased dependence upon the market results in closer control over profitability of such operations. Recognition of trademarks allows the company to differentiate from its competitors and following market prices or setting prices below them is no longer necessary. On the long term the price has to cover full cost and allow for an appropriate profit rate. Importance of accounting function, that prepares information basis for pricing decisions, is therefore increased with dependence upon foreign market (measured by the proportion of sales, realized on a particular foreign market, in total sales]) Our first hypothesis is therefore:

> **Importance of accounting information for decision-making related to pricing policy increases with increased dependence upon markets of former Yugoslavia: in the beginning, prices are set at level of prevailing market prices or below market prices; when companies become more involve d into foreign markets, prices are set at full cost, increased by calculative profit.**

We asked the managers of Slovene companies on what basis prices on former Yugoslav markets were being determined. For comparison we were also interested, how these were determined on markets of the European Union. An encouraging conclusion, that can be drawn from Figure 2 is, that prices on markets of former Yugoslavia are set predominantly on full cost plus profit. There are also a number of companies that set prices at level of prevailing market prices but without information on relationship between such prices and cost we can not conclude whether such prices allow for realization of profit. Number of companies that set prices at level of production or even variable cost is low, but it is important to point out that almost 20 % of Slovene companies on the EU markets only cover production costs although they realize 2/5 of their sales on these markets. One possible explanation for this poor result is that recognized trademarks of Slovene companies allow for higher prices on markets of former Yugoslavia.

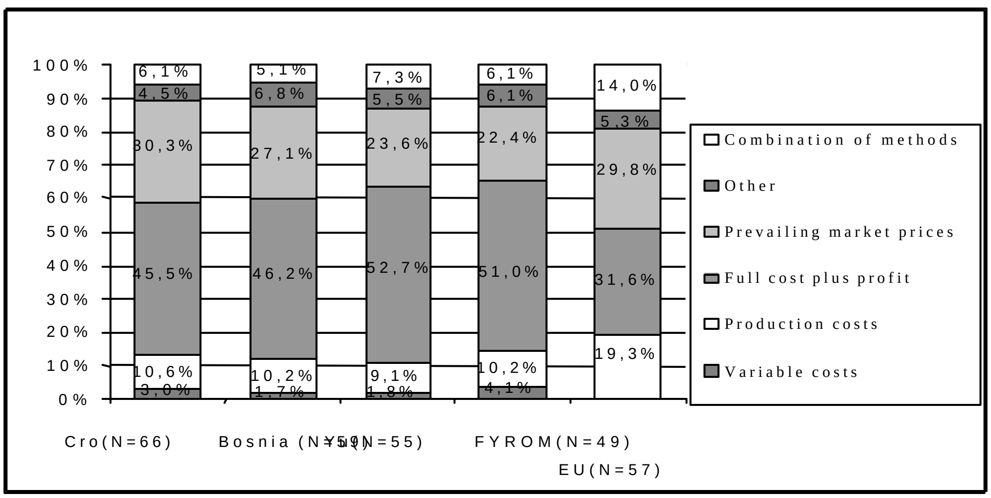

FIGURE 2: BASiS FOR DETERMINATION OF PRICES ON MARKETS OF FORMER YUGOSLAVIA AND THE EU MARKETS

Source: Research "Behavior of Slovene companies and strategies of entry into markets of foreign Yugoslavia", 2001

As we have explained, the price has to cover full cost and allow for an adequate profit in the long run. One would therefore expect that companies, which are more dependent upon a particular market, set prices at full cost level more frequently. All companies in the sample that do business on markets of former Yugoslavia were split into two groups. Companies that set prices on basis of accounting information at full cost were placed into group 1. Companies that use any other pricing basis were placed into group 2. According to our hypothesis we expect, that companies from group 1 are more dependent upon particular markets than companies from group 2. Dependence upon particular market was measured by sales, realized on the market, related to total sales in year 2000. Results are presented in table 1. In order to generalize the conclusion, the t-test for comparison of two arithmetic means of independent samples was used. The following supposition was tested [4]

H_0: $?_1 = ?_2$
H_1: $?_1$? $?_2$

TABLE 1: ANALYSIS OF RELATIONS BETWEEN BASES USED TO SET PRICED AND DEPENDENCE UPON INDIVIDUAL MARKETS (COMPARISON OF TWO ARITHMETIC MEANS OF INDEPENDENT SAMPLES)

	Croatia	Bosnia	Yugoslavia	FYROM	EU
N	63	55	51	46	55
Number of companies in group 1[a)]	29	28	28	24	19
Number of companies in group 2[a)]	34	27	23	22	36
Average % of sales from group 1[b)]	5.31	3.08	0.89	2.54	32.77
Average % of sales from group 2[b)]	7.41	3.73	3.38	1.93	40.45
t-test for comparison of two arithmetic means	0.866	0.541	1.992	-0.444	1.008
Confidence level (2-tail)	0.390	0.590	0.058	0.659	0.318

[a)] Companies that set selling prices at level of full cost were included in group 1, companies that set prices at all other levels are included in group 2.
[b)] Average % of sales is calculated as % of sales on particular market, related to total sales in year 2000.
Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

The data does not allow confirming our hypothesis. Although characteristic relationship between dependence upon the market and level of prices exists in case of the Yugoslav market, the relationship is just the opposite of the expected one: growing share of sales on this market results in lower level of full cost pricing. Although not characteristic, this [reverse] relationship was also noticed in case of Croatia, Bosnia and the EU. The expected relationship was only found in Macedonia where increased level of sales results in more frequent use of full cost pricing. On basis of these results we can not conclude that Slovene companies have built precise pricing strategies on markets of former Yugoslavia.

In addition to pricing, some financial policies are also related to level of involvement into particular markets. One such example is the measures taken to assure financial discipline. For example, the strategy that focuses on increasing market share, leads to increased sales on target market. In this case, realized income represents the most important information. In this period, when the level of sales is still relatively low and when the relations with buyers are still being established, drastic measures when dealing with non-payers are not appropriate for three reasons: 1) because sales related to individual buyers are low, 2) buyers still need time to form their own markets and 3) because financial discipline of buyers is not yet well known and it is therefore not appropriate to take serious measures because opportunity cost of such action could be too high. As market share increases, financial discipline of buyers becomes increasingly important. Strive for increased sales gives place to paid realization as main goal. Because poor financial discipline of an individual buyer is more and more reflected in company's profitability, appropriate measures, such as decrease or complete suspension of supply, legal charges or approval of new supplies on basis of prepayment only, should be taken. At the same time, alternative buyers who could take over its existing share of sales should be sought. Our second hypothesis is therefore:

Importance of accounting information regarding financial discipline of buyers increases with dependence upon markets of former Yugoslavia. The measures taken in case of poor financial discipline become stricter with increased level of sales on these markets.

Probably the best information that shows the level of financial discipline of buyers is yearly percentage of write-offs. First insight into information on the level of write-offs [shown in table 2] draws to the conclusion that Slovene companies do not face very serious problems regarding poor financial discipline on markets of former Yugoslavia. But as it turns out, this is partly the consequence of caution related to terms of payment. Many companies demand prepayments or bank guarantees that, to the highest extent, decrease the level of risk.

TABLE 2: LEVELS OF RECEIVABLES THAT WERE WRITTEN OFF ON MARKETS OF FORMER YUGOSLAVIA AND THE EU IN YEAR 2000

	Croatia	Bosnia	Yugoslavia	FYROM	EU
N	63	58	55	53	59
Number of companies with no write-offs in year 2000	85.7%	87.9%	92.7%	94.3%	66.1%
Maximum percentage of write-offs in year 2000	10.0%	10.0%	90.0%	25.3%	15.0%
Average percentage of write-offs in year 2000	0.49%	0.32%	1.79%	0.50%	0.78%

Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

Dealing with payment problems, the companies can use diverse measures. We asked Slovene managers how important they found the following four measures: 1) decreased supplies, 2) complete suspension of supplies, 3) legal charges and 4) reporting bad experience to other companies; We asked them to mark to what extent they agree with use of these measures on a scale ranging from 1 to 5 [1 – I strongly disagree, 5 – I strongly agree]. The results show that managers prefer legal charges [arithmetic mean 3.62] followed by complete suspension of supplies [arithmetic mean 3.59] and decreased supplies [arithmetic mean 3.49]. They do not find reporting bad experience to other companies particularly important [arithmetic mean 2.37].
Because financial discipline is becoming more important as dependence upon a market increases, we expect a more intensive use of all four measures. Dependence upon a market was again measured by sales, realized on the market, related to total sales. To investigate the relationship between dependence upon a market and importance of measures against bad financial discipline we used the regression analysis and the following model [Churchill, 1995, pg. 892].

$$\mathbf{Y_i = a + bX_i + e_i}$$

Where:
Y: measure against bad financial discipline [decreased supplies, complete suspension of supplies, legal charges and reporting bad experience to other companies]
X: share of sales, realized on a particular market, related to total sales

Because there are four measures and one independent variable, we made four regression analyses. While all four measures have relatively normal distribution, this is not the case with the share of sales. This variable has a pointed distribution and is asymmetric to the left. Results are presented in table 3.

TABLE 3: REGRESSION ANALYSIS OF MEASURES AGAINST BAD FINANCIAL DISCIPLINE RELATED TO DEPENDENCE UPON MARKETS

	Model 1	Model 2	Model 3	Model 4
Dependent variable	Decreased supplies	Complete suspension of supplies	Legal charges	Reporting to other companies
N	64	65	65	64
R^2	0.030	0.018	0.012	0.006
Constant [a]	3.732 [0.000]	3.455 [0.000]	3.733 [0.000]	2.448 [0.000]
Coefficient [b]	-0.016 [0.168]	0.011 [0.289]	-0.009 [0.374]	-0.006 [0.539]

Numbers in parentheses are the 2-tail confidence levels for constant and regression coefficient.
Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

The analysis of data did not point out any characteristic relationships between measures against bad financial discipline and dependence upon markets. As opposed to our expectations we found that the relationship is actually reversed: increased dependence upon a particular market leads to decreased importance of measures against bad financial discipline. This [reverse] relationship was found in three cases [decreased supplies, legal charges and reporting bad experience to other companies] while the expected relationship was only found in one case [complete suspension of supplies]. What causes such behavior of the management is probably high dependence upon markets and related fear of lost sales, which results from the fact which search for new buyers, who would take over the lost sales, is a time-consuming, expensive and risky process.

Increase of sales is also related to evaluation measures. As it derives from the first two hypotheses, profitability of sales is pushed aside in the first period, when strategy of increasing market share prevails. Evaluation measures are therefore closely related to level of sales. In the second period, when the share of sales on a particular market grows, the success of business activities reflects through profit measures [net income, contribution margin and similar]. Our third hypothesis is:

> **Increased dependence upon markets of the former Yugoslavia, results in increased use of accounting information in evaluation process. When level of sales is low, the principal evaluation measure is level of sales. As level of sales grows, profitability measures become increasingly important.**

Slovene companies use different evaluation measures to evaluate their operations on markets of former Yugoslavia. We asked the managers to mark on the scale ranging from 1 to 5 [1 – not important, 5 – very important], how important they find four financial measures to evaluate their operations: level of sales, paid realization, contribution margin and profit. The results show that the most important measure was paid realization [arithmetic mean 4.56], followed by contribution margin and profit [arithmetic means 4.11 and 4.10 respectively]. The level of sales was mentioned as least important measure [arithmetic mean 3.36]. The attention attributed to paid realization leads to the conclusion that managers are aware of risks related to financial discipline on these markets.

According to our hypothesis, we expect that increasing sales lead to more intensive use of net income and contribution margin as evaluation measures. Again, level of sales on a market, related to total sales, was used to measure dependence upon a market. To study relationship between dependence and evaluation measures we used the regression analysis and the following model [4]:

$$\mathbf{Y_i = a + bX_i + e_i}$$

Where:
Y: importance of evaluation measure [level of sales, paid realization, contribution margin and profit]
X: share of sales, realized on a particular market, related to total sales

Because there are four evaluation measures and only one independent variable we carried out four regression analyses. Except for the paid realization measure, which is asymmetric to the right, the distributions of other variables are normal. Results are presented in table 4.

TABLE 4: REGRESSION ANALYSIS OF IMPORTANCE OF EVALUATION MEASURES RELATED TO DEPENDENCE UPON MARKETS

	Model 1	Model 2	Model 3	Model 4
Dependent variable	Level of sales	Paid realization	Contribution margin	Profit
N	68	68	67	68
R^2	0.024	0.015	0.043	0.000
Constant (a)	3.233 (0.000)	4.500 (0.000)	4.011 (0.000)	4.095 (0.000)
Coefficient (b)	0.011 (0.207)	0.005 (0.319)	0.011 (0.091)	0.001 (0.934)

Numbers in parentheses are the 2-tail confidence levels for constant and regression coefficient.
Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

The analysis showed that with increasing level of sales all four evaluation measures were becoming increasingly important. Generalization of this conclusion is only possible for the "contribution margin" measure and even in this case a wider confidence level of 10 % has to be used. We can therefore conclude that the importance of contribution margin increases with level of sales, which is in conformity with our hypothesis.

Importance of Accounting Information for Control over Subsidiaries on Markets of Former Yugoslavia

In comparison with exporting, foreign subsidiaries provide Slovene companies with some specific opportunities. At the same time, operating through subsidiaries calls for more complex information basis for decision-making and performance evaluation. Out of 119 companies that took part in our research, 29 operate through subsidiaries on at least one of the markets of former Yugoslavia. 23 of these have at least one subsidiary in Croatia, 18 in Bosnia, 12 in FYROM and only 6 in Yugoslavia.

We have already mentioned that the internationalization strategy through subsidiaries is riskier than the export strategy. Higher risk is related mostly to incapability to reallocate invested assets into alternative uses in case of unexpected unfavorable circumstances [such as deterioration of economic conditions, changed legislation and similar]. On the other hand, this strategy is related to some competitive advantages that influence establishment of foreign subsidiaries and have positive effect on profit of Slovene Mother Company. These advantages are related to: 1) decrease or complete avoidance of custom duties if the company reallocates production function to their foreign subsidiary and uses local suppliers, 2) decrease of world taxes paid if tax levels in host countries are lower than Slovene tax rate and 3) increase of financial discipline because through centralized financial function the Slovene mother company can supplement lack of financial knowledge and other experience.

Establishment of subsidiaries on markets of former Yugoslavia is related to strive for decreasing customs duties.

We asked the managers of Slovene companies to what extent custom duties influence entry costs to enter markets of former Yugoslavia. They marked their answers on a scale ranging from 1 to 5, where 1 represents low entry costs and 5 represents high entry costs. The question was asked to all the companies from the sample, including those that do not do any business on these markets. The managers perceived highest entry costs on the Yugoslav market [arithmetic mean 3.38]. In other three countries the average grade is below the mean of the scale and does not point to important entry costs [arithmetic means were 2.75 for FYROM, 2.70 for Bosnia and 2.68 for Croatia]. Next, we excluded the companies with no operations on these markets and the results have not changed much. It is interesting to point out that for all four markets the arithmetic means increased [Yugoslavia 3.61; FYROM 279; Bosnia 2.83; Croatia 2.71].

Next, we investigated whether establishment of subsidiaries was related to strive for decreasing customs duties. The companies were split into two groups. Companies with foreign subsidiaries were placed into group 1. Companies that operate on particular markets but have no subsidiaries on these markets were placed into group 2. According to our hypothesis we expect that the companies from group 1 perceive higher entry costs than companies from group 2. Higher perceived entry costs can be viewed as one of the reasons for establishment of subsidiaries on these markets. To generalize the conclusion we used the t-test for comparison of two arithmetic means for independent samples. The following supposition was tested [4]:

H_0: $?_1 = ?_2$
H_1: $?_1\ ?\ ?_2$

TABLE 5: ANALYSIS OF RELATIONSHIP BETWEEN PERCEIVED LEVEL OF CUSTOM DUTIES AND PRESENCE OF SUBSIDIARIES (COMPARISON OF TWO ARITHMETIC MEANS OF INDEPENDENT SAMPLES)

	Croatia	Bosnia	Yugoslavia	FYROM
N	66	60	54	53
Number of companies with subsidiaries (group 1)	22	17	4	10
Number of companies without subsidiaries (group 2)	44	43	50	43
Custom duties represent a high entry barrier (group 1)	3.18	3.12	4.25	3.20
Custom duties represent a high entry barrier (group 2)	2.48	2.72	3.56	2.70
t-test for comparison of two arithmetic means	-1.849	-1.206	-2.235	-1.018
Confidence level (2-tail)	0.069	0.233	0.061	0.313

Source: Research “Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia”, 2001.

Results in table 5 are in conformity with our hypothesis and show the following: companies that operate through subsidiaries perceive [on average] custom duties as an important entry cost. The average on all four markets is above the mean of the scale. On the other hand, companies that export to the markets in question perceive custom duties as less important cost. Because presence of subsidiaries allows for decreasing custom duties, we can conclude that this was one of the reasons of their establishment.

Operating through subsidiaries decreases risk related to financial discipline.

Similar to previous analysis we split the companies into two groups. Companies with subsidiaries in particular markets were placed into group 1. Companies without subsidiaries were placed into group 2. We expect that companies from group 1 have fewer problems with financial discipline of their buyers than companies from group 2. Results are presented in table 6. To generalize the conclusion we used the t-test for comparison of two arithmetic means for independent samples. The following supposition was tested [4]:

H_0: $?_1 = ?_2$
H_1: $?_1\ ?\ ?_2$

TABLE 6: ANALYSIS OF RELATIONSHIP BETWEEN OPERATING THROUGH SUBSIDIARIES AND AMOUNT OF WRITE-OFFS (COMPARISON OF TWO ARITHMETIC MEANS OF INDEPENDENT SAMPLES)

	Croatia	Bosnia	Yugoslavia	FYROM
N	63	58	54	53
Number of companies with subsidiaries (group 1)	22	18	6	11
Number of companies without subsidiaries (group 2)	41	40	48	42

Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

The results show that Slovene companies that operate through subsidiaries in Yugoslavia and FYROM wrote off less receivables [this relation was expected], whereas the relation was reversed in case of Croatia and Bosnia. Any generalization to the whole population is not possible, because none of the mentioned relations was characteristic. Increasing financial discipline is therefore not one of the main reasons for establishment of subsidiaries on markets of former Yugoslavia. An interesting finding is that in year 2000 Slovene companies from our sample did not write off a single dollar in Yugoslavia and Macedonia. The reason for this is of course not strong financial discipline on these markets but awareness of the risk [five out of six companies that operate through subsidiaries in Yugoslavia requested prepayment for purchases].

Organization units of a company can be viewed as different types of responsibility centers. Categorization of responsibility centers in Slovenia is related to Slovene Accounting Standard 20 that distinguishes the following responsibility centers [12]:

- cost responsibility center
- income responsibility center
- profit center
- investment center

In first case, the head of the responsibility center is only responsible for costs, in the second her responsibility is focused on income, in profit center both cost and income are the head's responsibility and in investment center the head is not only responsible for profit but for return on investment as well. Except in some specific cases [for example when production facility is considered a cost responsibility center] subsidiaries are usually treated as income centers. Their income has to cover all costs and allow for realization of an adequate return on investment. The results showed that Slovene companies bear this theoretical recommendation in mind. 23 out of 26 companies that operate through subsidiaries on markets of former Yugoslavia answered that they used return on investment as evaluation measure for their subsidiaries. The issue of differentiation between performance of a subsidiary as organization unit and performance of its management is very popular in domestic and international literature [Hocevar 1995, Iqbal et al. 1997, Holzer 1994, Belkaoui 1991, Appleyard et al. 1990]. Regarding performance evaluation we were particularly interested whether Slovene companies that operate through subsidiaries distinguish between the two.

Performance evaluation of a subsidiary represents a basis for decisions related to further investment or disinvestments related to the particular unit. For this reason all cost and all income that is directly connected to operations of the subsidiary as well as the part of indirect cost allocated from mother company [such as research and development or similar] has to be considered in evaluation process. On the other hand, evaluation of the management has to take into consideration specific circumstances in which the subsidiary operates. Both, costs and income are influenced by diverse uncontrollable factors. Such categories should therefore not be included in performance evaluation. Only controllable cost and income should be considered. Although the subsidiary realized high profit, it is not always the case that also its management was successful. If high profit derives from an uncontrollable factor such as exchange rate changes, this part of profit should not be reflected in manager's performance evaluation.

The next hypothesis derives from distinction between performance of subsidiary and its management:

All cost and income are considered in performance evaluation of subsidiary, whereas uncontrollable factors are excluded from performance evaluation of management.

We asked the managers whether profit, used for evaluation of subsidiaries on one hand and management on the other, was calculated differently or not. We listed four different costs that are uncontrollable for the management and asked them to specify which of them were considered in calculation of profit. According to theoretical recommendations we expect that the uncontrollable costs will not be included in manager's performance evaluation.

TABLE 7: COSTS INCLUDED OR EXCLUDED FROM PROFIT, USED TO EVALUATE PERFORMANCE OF A SUBSIDIARY AND ITS MANAGEMENT

	Evaluation of subsidiary		Evaluation of management	
Costs, inluded in calculation of profit	Yes	No	Yes	No
- Interests paid	17	8	14	10
- Indirect costs, allocated from mother company	11	14	12	12
- Exchange rate differences	17	8	15	9
- Licensing fees and other cost, paid to mother ompany	11	13	11	12

Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

Results in table 7 are in complete discordance with theory and our hypothesis. In majority of cases, companies use same profit disregarding whether they use it to evaluate performance of the subsidiary or its management.

In the context of performance evaluation another important issue is the problem of international transfer prices. Disagreements between Mother Company and its subsidiaries are most frequently related to transfer prices. The problems are particularly evident in case of internal transfers between profit or investment centers, because transfer prices are an example of a zero-sum game: increased profit of the selling unit [by x] decreases profit of the buyer [by x]. In international environment an additional issue is custom duties and tax rates that vary from country to country. In table 8, information on transfers from Slovene mother companies to their subsidiaries on markets of former Yugoslavia is presented.

TABLE 8: SHARE OF INTERNAL TRANSFERS FROM SLOVENE MOTHER COMPANIES TO THEIR SUBSIDIARIES ON MARKETS OF FORMER YUGOSLAVIA

	Croatia	Bosnia	Yugoslavia	FYROM
Number of companies with subsidiaries	23	18	6	12
Average % of sales of Slovene companies to subsidiaries on partiular market	4.64% (20)	3.11% (16)	0.06% (5)	1.33% (11)
Maximum % of sales	11.60	20.00	0.21	4.00
Minimum % of sales	0	0	0	0

Numbers in parentheses represent the number of valid answers.

Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

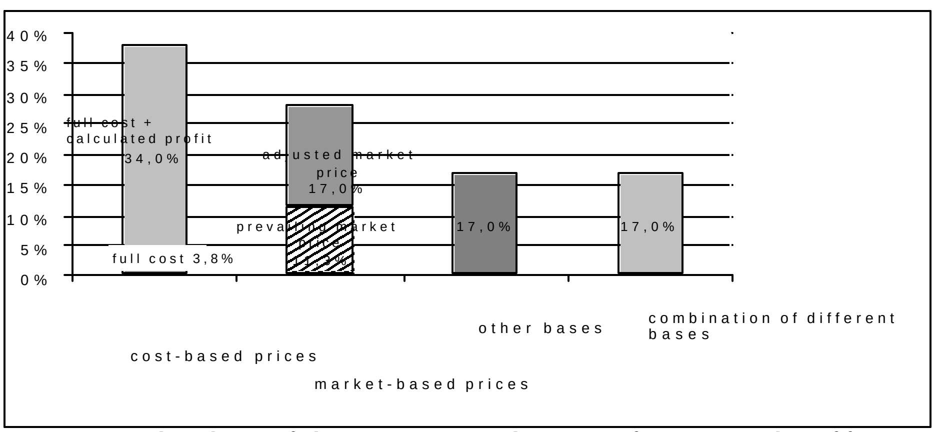
Results in table 8 show that Slovene companies are not overly dependent upon their sales to subsidiaries. The largest share of sales is related to subsidiaries in Croatia and Bosnia where Slovene companies realize most sales on markets of former Yugoslavia.

Companies can choose between different bases for determination of transfer prices. The basis can be cost or prevailing market prices, but other methods such as negotiated prices are also known. Use of prevailing or adjusted market price [i.e. prevailing price reduced by sales-related costs] encourages competitive behavior of subsidiaries. If transfer prices lead to competitive conditions within the firm, unadjusted profit measures can be used in performance evaluation. Striving for minimization of world taxes paid, multinational companies often use transfer prices as a tool for distribution of profit from countries with higher tax rates to those with lower rates. In such case, when transfer prices are not based on market prices, influence of such "manipulated" transfer prices should be excluded from performance evaluation. Conflict of interest between Mother Company and subsidiaries can also be reduced by taking effects of transfer prices into consideration in the evaluation process.

In contrast to factors that are only uncontrollable for the management, influence of transfer prices should be excluded from both, subsidiary and management performance measures! If this is not done, a subsidiary, that operates in a country with a high tax rate and operates with a loss due to manipulated transfer prices, will be evaluated as unsuccessful. Such evaluation will give an unfavorable sign for future investment decisions. Such [unadjusted] performance evaluation measures do not take into consideration additional profit that was gained by other subsidiaries and/or mother company. The next hypothesis is therefore:

If transfer prices between Mother Company and its subsidiaries on markets of former Yugoslavia are not based on market prices, effects of such transfer prices are excluded from performance evaluation of subsidiaries and their management.

Slovene companies use very diverse bases for determination of international transfer prices [figure 3]. Transfer prices on basis of cost prevail and are used by 38 % of companies [majority of the companies that use costs in calculation of transfer prices set them at level of full cost increased by calculative profit, whereas minority sets these prices at level of full cost]. A high number of companies [28 %] use market prices as base for transfer price determination. Adjusted market prices are used more frequently than unadjusted, which means that companies are aware of the fact that selling within the company is "cheaper" than selling on the market. 17 % of companies use other bases [negotiated prices or mathematically calculated prices] and remaining 17 % use a combination of different transfer price bases.



Source: Research "Behavior of Slovene companies and strategies of entry into markets of former Yugoslavia", 2001.

FIGURE 3: FREQUENCY OF DIFFERENT TRANSFER PRICE METHODS USED TO EVALUATE TRANSFERS FROM SLOVENE MOTHER COMPANIES TO THEIR FOREIGN SUBSIDIARIES

Our next question was whether [in accordance to theoretical recommendations] Slovene companies eliminate impact of transfer prices on profit if these are not set at level of prevailing market prices. There are a number of possibilities how to eliminate this effect. Three such options were listed and we asked the managers which one [if any] they used:

1) dual accounting [one set for external and second set for internal reporting]
2) consideration of transfer price effects in budgeting process [the subsidiary can be evaluated as successful although it is operating with loss as long as this loss is a consequence of transfer prices and has been projected in the budget]
3) approximation of transfer prices to prevailing market prices

Companies that set transfer prices at level of market prices do not need to carry out any adjustments in evaluation process. These companies, according to our expectations, answered that no adjustments in evaluation process were made. On the other hand, effects of transfer prices are not dealt with appropriately in companies in which cost and other bases are used in transfer pricing decisions. Effects are not being eliminated in evaluation process, which can lead to taking sub-optimal investment decisions and decrease motivation of local managers. 81 % of these companies do not use dual accounting nor consider transfer price effects in budgeting process. Among 16 companies that use such transfer pricing bases, only one uses dual accounting and only 2 companies consider transfer price effects in the budgeting process.

Conclusion

Independence of Slovenia and related economic and political changes have to a great extent altered the role of accounting information for decision-making in Slovene companies. The business environment of Slovene companies became riskier than it was before transition into market economy. Such environment requires flexible organization structures and fast decision-making which is only possible if appropriate information base for decision-making exists. Accounting information is an important part of information that management needs to decrease business risks and take appropriate decisions.

The main goal of this article was to study to what extent Slovene companies use accounting information to control their operations on markets of former Yugoslavia. Our main supposition was that such information was not adequately used. Markets of former Yugoslavia are interesting to Slovene companies for geographic proximity and historic relations. The research showed that majority of companies are already present on these markets and that they gradually proceed to higher internationalization levels. In the first part of the analysis, all companies that are present on markets of former Yugoslavia were studied. In the second part, we focused on companies that operate through subsidiaries. The first part of analysis focused on how increased dependence upon markets of former Yugoslavia increased importance of accounting information related to:

1) determination of prices
2) measures used to achieve financial discipline and
3) evaluation of operations.

The study showed that majority of companies set their prices at level of full cost plus calculative profit. The comparison to prices set on the EU markets proved that higher prices are reached on markets of former Yugoslavia. Recognition of trademarks is one of the most important factors that allow for such selling price difference. The results did not prove our hypothesis that companies that were more dependent upon a particular market set prices at "cost plus" level more frequently. There are at least two possible reasons for that: 1) the pricing policy is not well established or 2) dependence of some companies is already too high for an independent pricing policy.

Increased dependence upon particular markets [customers] leads to increased importance of accounting information to ensure financial discipline. Among different measures, used to ensure adequate financial discipline, Slovene managers prefer legal charges, followed by complete suspension of supplies and decreased supplies. They do not find reporting bad experience to other companies particularly important. This leads to conclusion that Slovene companies do not share risks related to operations on markets of former Yugoslavia. The research did not show any characteristic relationship between dependence upon particular markets [buyers] and measures used to ensure financial discipline. In contrast to expectations, the results showed that as level of sales increases, financial discipline measures are used less frequently. This conclusion can also be related to the previous finding, regarding increased dependence upon individual buyers.

Among performance evaluation measures, Slovene companies find paid realization most important, followed by contribution margin and profit. Level of sales was not found very important. Importance of paid realization derives from awareness of financial discipline related risks. Another finding was that importance of contribution margin increases with increased sales on these markets. This can have positive effects on one hand, because increasing contribution margin results in higher profits. But on the other hand it can be "dangerous" for long-term success if the company satisfies itself with covering variable costs only [7].

In the second part of our analysis we studied if:

1) establishing foreign subsidiaries is related to perception of high custom duties
2) operations through subsidiaries increase financial discipline
3) evaluation of manager's performance is distinguished from performance of subsidiary as organization unit and
4) effects of transfer prices are appropriately considered in performance evaluation process.

Slovene managers estimated that custom duties are highest in Yugoslavia and that they represent an important entry cost to this market. On other three markets, these are not considered as important. An interesting finding was that companies, which operate through subsidiaries, perceive higher entry costs on all four markets. This leads to conclusion that this was one of the reasons for establishment of subsidiaries.

Results show that the wish to increase financial discipline is not one of the main reasons for establishing foreign subsidiaries. The expected relationship, i.e. companies with foreign subsidiaries achieve higher level of financial discipline, measured with total write-offs, was only found in case of Yugoslavia and FYROM. On these two markets there were no write-offs, but this is mostly consequence of the fact that five out of six companies that operate through subsidiaries in Yugoslavia requested prepayment for purchases.

Performance evaluation measures of managers must be based on controllable factors. We studied whether uncontrollable costs such as interests, allocated indirect costs, foreign exchange gains/losses and licensing costs, were eliminated from calculation of profit, used to evaluate manager's performance. As it turned out, majority of companies use the same profit to evaluate performance of both, subsidiaries and their management. Performance evaluation system, which does not distinguish between controllable and uncontrollable factors, results in sub-optimal decisions related to investment decisions and management's motivation.

Slovene companies use different bases to determine international transfer prices. These are most frequently set at level of cost or market prices. Of major concern is the fact that majority of companies do not take effects of transfer prices in consideration in performance evaluation process. Three possible consequences are inaccurate insight in performance of subsidiaries and management, taking sub-optimal investment decisions and decreased motivation.

Problems of Implementing International Accounting Standards in a Transition Economy: A Case Study of Russia

Robert W. McGee
Barry University, USA
Galina G. Preobragenskaya
Locia, Russia

Abstract

In 2002, the Russian Prime Minister announced that all Russian companies and banks must prepare their financial statements in accordance with IAS starting January 1, 2004. Implementing that decision will not be easy, for a variety of reasons. Not all IAS have been translated into Russian. Many Russian accountants are not sufficiently familiar with IAS to implement them. Some Russian universities have only recently started teaching IAS and the continuing education programs of the various Russian accounting associations are not yet prepared to offer comprehensive courses on IAS. Current Russian accounting standards conflict with IAS in several important ways and these conflicts will not be resolved in the near future. This paper reviews the literature on this subject and incorporates the results of interviews conducted of Russian accounting firms, enterprises and university professors in July and August 2003.

Introduction

As transition economies go through the process of shedding their centrally planned accounting model and replacing it with a market oriented model such as IAS they face a number of problems. Very few people know the new rules, since IAS must first be translated into their language. Accountants who can read IAS in the original English have a competitive advantage in this regard, but trying to fully exploit this advantage may be frustrating if potential clients or employers do not place much value on IAS.

There is also an inertia barrier to overcome. It is difficult to change the status quo. Accountants and managers who have been using the old system for 20 or 30 years do not want to change because they feel comfortable with the system they learned in school or on the job when they were young. Those individuals also happen to be the people who are now in charge of enterprises and accounting departments, so their approval must be had before any new system can be adopted and implemented.

A number of countries that have started this conversion process have experienced similar problems. No one knows the new rules but there is nowhere to go to take classes to learn the new rules because no one can be found to teach the new knowledge. Most universities do not have qualified professors and most accounting firms do not have anyone who has been trained in the new rules. Yet the governments in these countries often pass laws with deadlines, stating that the new rules must be adopted by some certain date.

What results when this happens is that the new rules cannot be implemented according to the government's schedule because nobody knows how to implement them. A new set of problems result from this top-down approach to accounting reform. Various ways have been tried to alleviate or solve the problems that result from adopting new accounting rules. Some have worked better than others. This paper examines the Russian case, which is still in the process of transformation.

Review of the Literature

Much has been written about International Accounting Standards (IAS), International Standards on Auditing (ISA), accounting harmonization, accounting education and accounting reform in transition economies in recent years. A few books and articles have focused on accounting reform in Russia.

The classic book in the sub field of accounting reform in Russia is by Enthoven [8]. This book discusses the Russian accounting system, management accounting, auditing, taxation and accounting education. A few years before that, Enthoven [9] published a book on doing business in Russia and other former Soviet republics that dealt with accounting issues. This latter book was very popular among accounting practitioners who were doing business in the former Soviet Union, since it was one of the few major sources of accounting information on Russia at the time it was published.

Bailey [2] published a long historical study of Russian accounting going back to the thirteenth century. Shama and McMahan [57] discuss the historical development of accounting in Russia from Tsarist times to communism and also how perestroika will change the nature of accounting in Russia and other East European countries. Motyka [44] discusses the impact of Western Europe on accounting development in tsarist Russia prior to 1800. Lebow and Tondkar [33] discuss the development of accounting in the Soviet Union and its effectiveness. Two decades before that, Campbell [3] published a book containing a series of essays on Soviet accounting problems. Campbell [4] also did a long and detailed study of depreciation under the Soviet accounting system. Horwitz [23] discusses some of the philosophical and historical literature on accounting in a socialist regime and focuses his attention on depreciation and cost.

An early study by Mills and Brown [39] discusses how shifting from a production model to a profitability accounting model would help Soviet enterprise managers make decisions that would increase the efficiency of their firms and help them to better allocate resources. In a similar vein, Thornton [59] discusses changes in the way the Soviets accounted for factor costs over a twenty-five year period. A study by Scott [55] states that Soviet accounting after the 1965 reforms started to place more emphasis on enterprise profitability, which helped move the Soviet economy closer to a Western market model.

Other authors have also touched on this theme. Horwitz [22] discussed the effect that decentralization has on the management accounting control system. Chastain [5] described how the Soviet accounting system was not able to keep up with the needs of enterprise managers. He also assesses the implications of that inability for the accounting profession.

Gorlick has done several studies on the Soviet accounting system. In one study he discusses the historical development and problems of uniform accounting [17]. In another he discusses planning and control [18]. In an earlier study he discussed the difference in accounting measurements between the Soviet Union and the United States and the advantages and disadvantages of their profitability measurements [17].

Richard [49] wrote a book chapter that discussed communist accounting systems in Eastern Europe in general and in the Soviet Union in particular. Garrod and McLeay [16] edited a book on accounting in transition economies, which provides a good introduction to many of the issues involved in attempting to convert the accounting system from a central planning model to a market model. In one of the chapters in that book, Jaruga [27] describes the changing accounting function in socialist countries, which is now mainly of historical interest.

Turk and Garrod [61] discuss the lessons Slovenia learned when it began the process of changing to International Accounting Standards. The Slovenian experience is not unlike the Russian experience in many ways. Preobragenskaya and McGee did research on the relationship between IAS and foreign direct investment in Russia [46] and on the state of auditing in Russia [47]. Their FDI study concluded that the lack of credibility of Russian financial statements was hampering inflows of foreign capital. Their audit study found that the state of auditing in Russia is not yet up to western standards.

A few studies have been made on accounting education in Eastern Europe or the former Soviet Union. According to one scholar, Houghton Mifflin’s 1300-page Principles of Accounting was the first Western accounting text sold in the Soviet Union [7]. It was translated and distributed by Finansy I Statistika, Moscow’s government owned publisher. Kobrack and Feldman [28] speculated whether the reform process in the Soviet economy could create a new market for accounting textbooks. McGee has written about educating accounting professors in Bosnia & Herzegovina [37] and reforming accounting education in Armenia [38].

There are several sources of information on recent developments in accounting reform in Russia. The International Center for Accounting Reform in Moscow [www.icar.ru/] publishes the ICAR Newsletter [24]. The World Bank publishes Transition Newsletter [60], which gives current information about various aspects of market reforms in transition economies, including accounting reform in Russia. The Russian websites of the Big-Four accounting firms also have current information and, in some cases, publications.

The Deloitte & Touche Russian website [www.deloitte.ru] has an e-library link that contains a variety of items on various aspects of doing business in Russia. It has a Doing Business in Russia Online Guide, which includes much information on accounting and tax topics. It has several newsletters that address accounting, tax and legislative issues on various countries, including Russia. Russia - Legislative News [52] is a monthly newsletter that contains accounting and tax items. Legislative Tracking [34] is a daily publication that keeps readers abreast of Russian pending legislation.

Ernst & Young publishes An EYe on Russia [1], a monthly newsletter on current business, accounting and tax issues. It also has a Russian Legislation website [53] that contains downloadable documents on Russian accounting, tax and related legislation that have been translated into English.

The KPMG Russian website [www.kpmg.ru] has several good publications, including Doing Business in Russia [29] and Russia – Tax Overview [30]. It also has the GAAP 2001 [14] and 2002 [13] studies.

The PricewaterhouseCoopers website [www.pwcglobal.com/ru] has several publications pertaining to Russia, including Doing Business in the Russian Federation [48]. There are also a number of short articles by PWC partners and others on various aspects of accounting reform in Russia, including an excellent article by Leonid Schneidman [54] on the long road to IAS adoption. The PWC site also has the GAAP reports for 2002 [13], 2001 [14] and 2000 [15] available for downloading in several languages.

Some publications have compared the accounting standards in various countries to IAS. The most thorough study is GAAP 2001 [14], a joint publication of several large international accounting firms, which makes comparisons for 62 countries, including Russia. Several of the Big-Four accounting firm websites have a link to this study. The International Forum of Accountancy Development website [www.ifad.net] has published this study in interactive format. There is also a GAAP Comparison 2000 study [15] that provides comparisons for 52 countries and a small 2002 update titled GAAP 2002 Convergence [13] that provides data on 59 countries. Street [58] (2002) has written a summary of the GAAP 2001 study [14].

The internet also has information on corporate governance in Russia. One good source is the Independent Directors Association website [www.independentdirector.ru], which contains much up to date information on corporate governance in Russia. It publishes Independent Director, a quarterly review and has also published The Code of Conduct of Independent Directors [6] and The Independent Directors Association Charter [26], both of which are published in the Spring 2003 issue. The Organisation for Economic Cooperation and Development (OECD) website also has current and relevant information on corporate governance in Russia [www.oecd.org]. The Russian Code of Corporate Conduct can be accessed from several websites, including the Deloitte & Touche Russian website [www.deloitte.ru].

Methodology

The first stage in the preparation of this paper was a thorough review of the literature on accounting reform in general and accounting reform in Russia and other transition economies in particular, with special attention being paid to the literature that discussed the adoption and implementation of IAS. As the literature was being reviewed, the authors started compiling a tentative list of questions to ask Russian accounting experts on various aspects of accounting reform in Russia. This list was sent to the individuals to be interviewed several weeks prior to the interviews.

After the list of questions was compiled, the next step was to identify and contact individuals who were experts in some aspect of the present state of Russian accounting, which was done through a combination of website searches, telephone calls in both Russia and the United States and e-mail communications. It was difficult to contact some individuals, especially at Russian universities, because they were away on summer holiday. However, a sufficient number of experts with diverse backgrounds on various aspects of accounting reform in Russia were able to be contacted and interviewed to make the project worthwhile. Once experts were identified, initial contact was made and interviews were scheduled. On-site interviews took place during July and August 2003 in St. Petersburg, Moscow and Omsk. Telephone interviews were also conducted with individuals located in Washington, DC and Geneva, Switzerland. Individuals from the following institutions participated in the on-site interviews:

Deloitte & Touche, Moscow office [www.deloitte.ru]
KPMG, Moscow office [www.kpmg.ru]
KPMG, St. Petersburg office [www.kpmg.ru]
PricewaterhouseCoopers, Moscow office [www.pwcglobal.com/ru]
Ajour, a Russian auditing and consulting firm, Moscow [www.ajour.ru]
PKF (MKD), a Russian audit and consulting firm, St. Petersburg office [www.mcd-pkf.com]
Independent Directors Association, Moscow [www.independentdirector.ru]
MDM Group, Moscow [www.mdmgroup.ru]
St. Petersburg State Polytechnical University [www.spbstu.ru]
St. Petersburg State Railway University (a.k.a. Petersburg State Transport University) [www.pgups.ru]
Timiryazev Agricultural Academy, Moscow [www.timacad.ru]
Hock Accountancy Training, Moscow office [www.hocktraining.com]
Omsk State University [www.omsu.omskreg.ru]
Omsk State Institute of Service [www.omsk.net.ru/education/vuz/servis/main.htm]

The information gathered from these interviews was combined with information that was already published and available. While much of the information gathered during the course of the interviews confirmed what the existing literature already said, much new information was gathered that filled in the gaps in the existing literature and extended and updated prior studies in several important ways.

Problems of Implementing IAS

Accounting in Russia

Accounting has a long history in Russia [2, 57], going back at least to the thirteenth century, through the time of the tsars and through the communist era. The Russian accounting system started shifting away from the centrally planned, socialist model as early as the 1960s [27, 39, 55, 59]. The pace accelerated with perestroika and the collapse of the Soviet Union, which began in the late 1980s. Some scholars have gone on record as saying the reason for the collapse of the Soviet Union was because of the inability to allocate resources efficiently under a socialist accounting system [50, 56]. Ludwig von Mises, an Austrian scholar who later taught at New York University, predicted the collapse as early as the 1920s [40, 41, 42, 43]. His prediction sparked the socialist calculation debate of the 1930s [20, 21, 31, 32, 35, 36]. Polanyi [45] agreed with Mises that the problem of economic calculation is insoluble in a centrally planned economy but proposed to solve the problem by means of "a functionally organized socialist transition-economy."

Whatever the reason(s) for the collapse of the Soviet Union, there has been a worldwide movement on the part of formerly centrally planned economies to move away from the top-down, centrally planned accounting model and toward a bottom-up market model. Russia started to make the transition by deciding to adopt and implement IAS. Although Russia chose to adopt and implement IAS several years ago, there are still some glitches in the system.

Until recently, deducting the cost of an IAS audit was not allowed by the Russian tax code [10], which took some of the incentive away from having such an audit. Russian accountants and auditors are not sufficiently well versed in IAS to implement them, with a few exceptions. There is a widespread perception on the part of accountants who work for the large international accounting firms that none of the Russian accounting firms, even the biggest ones, are able to provide high quality serving regarding IAS. The large international accounting firms, mostly the Big-Four, have rushed in to fill the gap to provide the services and expertise that the local Russian firms cannot provide. This capturing of market share by the big firms has caused some resentment on the part of the smaller Russian firms. It has also given some Russian accounting firms an inferiority complex, since they know they do not have the resources or expertise to compete against the international firms. Russian accounting firms have lost some large clients to the Big-Four. However, some of their big clients later returned, partly because of cost considerations.

Russian accountants and auditors who were trained under the old system need to learn the new system and many of them have not. Some of them, especially the older ones, are actively resisting the change. Some Russian accountants and professors, even at the top, insist that they use or teach IAS, even though they have never read them. There is the widespread perception that Russian Accounting Standards (RAS) either are the same as IAS or are just as good. In fact, there are major differences. RAS are more form over substance, whereas IAS are more substance over form.

There is also the perception that IAS are not needed, either because the RAS are just as good as IAS or because there is no demand for IAS. There is a grain of truth to the lack of demand argument. Until a few years ago, the only reason most firms prepared financial statements was to provide information to the tax authorities. Some firms still prepare financial statements just for the tax authorities. However, the trend now is away from having a monopsony (single user) of accounting information, especially with the large Russian firms, since they need to go to the international capital markets for funds to expand or stay afloat. Foreign investors demand to see financial statements prepared using either IAS or GAAP as a condition of talking seriously about investing in a Russian company.

Although the trend is to place more emphasis on the needs of shareholders and potential investors and less on the needs of tax authorities, not all Russian accountants and managers feel this way. Most accountants who work for the big international accounting firms, and many of their clients, now recognize the goal of financial statements is to provide information to shareholders, not the tax authorities. This change in attitude and perception started to take place around 1999 or 2000.

This change in attitude has not yet filtered down to the smaller firms and enterprises. Although the big accounting firms and an increasing number of large enterprises now recognize that the main audience for the financial statements they prepare are shareholders, the smaller Russian companies still think that accounting information is only for the tax authorities. Some CEOs at larger companies still think this way.

This attitude is reinforced by the Russian tax authorities themselves, who often could not care less to see any financial statements based on IAS. The Russian tax rules are different from IAS, so why bother to look at financial statements that are prepared using IAS? They want to look only at statements prepared using RAS. One of the partners interviewed at one of the international accounting firms said he was tired of having to sign off on two sets of financial statements, one based on RAS and one based on either IAS or GAAP. He longed for the day when he would need to sign off on only one set of statements. He also confided that such a day is likely far off, since statutory accounting still requires the use of RAS and this rule is unlikely to change any time soon.

Not all Russian enterprises that are trying to attract foreign capital are using IAS. Some of them are using U.S. GAAP. One of the deciding factors that enters into the decision to use one or the other set of internationally recognized financial reporting standards has to do with which capital market the enterprise wants to tap into. If they are targeting the United States capital market, they often decide to use U.S. GAAP. Those who decide to tap into the European capital market often choose IAS. Russian enterprises used to prefer U.S. GAAP to IAS because they wanted to list their shares in New York. The trend is now toward IAS because of the Enron and Arthur Andersen scandals. However, not all firms are shifting to IAS. The subsidiaries of the many U.S. firms in Russia prefer GAAP, so it appears that there will be a need for GAAP-trained accountants for the foreseeable future.

The interviews revealed that there is a bit of standards shopping going on on the part of some Russian enterprises. In one case, an enterprise would have had a multimillion deferred tax liability using one set of standards, whereas their tax liability using the other set of standards would have been zero. One set of rules would have treated the book tax difference as a permanent difference whereas the other standards would have treated the difference as a timing difference, and thus subject to deferral. Not surprisingly, the enterprise chose to use the set of standards that did not result in a tax liability.

Some Russian audit firms will agree to sign anything, including an audit report, lest they lose a client. Or at least that is the perception. Unfortunately, there may be some truth to this perception. Russian business culture is different than Western business culture in this respect. Three generations of communist governments and the accompanying corruption that went with it have made people cynical. Many people simply do not believe that financial statements signed by a Russian audit firm are as credible as statements signed by a Western audit firm [51].

One solution to this dilemma would be to establish a strong private sector accounting organization like the American Institute of Certified Public Accountants (AICPA) [www.aicpa.org] or one of its British counterparts that is capable of policing its members and giving much needed moral support to the Russian audit firms that do not want to give into the pressure to sign audit opinions when financial statements are not of sufficiently high quality. This solution was proposed both by the Russian firms that were interviewed and by some members of the Big-Four. Unfortunately, no such private sector accounting organization currently exists and none are on the horizon. There are a number of small, politically weak accounting organizations, but they do not have the authority, power or incentive to do the policing job or to provide the moral authority needed to support the honest Russian audit firms that want to do the right thing.

It is encouraging that Russian accountants have identified the problem and have a good idea of where the solution might lie. The next step is to find a way to achieve the desired result. That will not be easy, at least for the immediate future, since the Russian accounting profession, in the Western sense of that term, is in its infancy stage. There is no recent history of private sector institution building in Russia and the other former communist countries. The only institution was the State, and in some cases, the church. Private sector institutions will need to be created and grow in size and strength, and that process will take time, perhaps a generation or more.

Some of the individuals interviewed pointed out that part of the problem is that the professional accounting organizations that do exist have a bias in favor of the status quo. So do Russian bureaucrats. Milton and Rose Friedman discussed this inertia problem in theoretical terms several years ago [12]. One of the interviewees said that the people in these accounting organizations do not know anything about IAS, that they do not have the required skills and that changing to IAS could put them out of a job.

Outside help is available for strengthening these private sector accounting associations. George Soros and his various foundations have recognized the need to build and strengthen private institutions and have allocated millions of dollars toward this goal. The various USAID and Tacis accounting reform projects include an institution building component in their projects. The problem with some of these institution building projects is that they turn out to be top-down. The local accountants and existing accounting organizations need to be convinced that they need to build such institutions. The institution building process would go faster and smoother and would be more successful if the process were demand driven, with the demand emanating from the grass roots rather than from some international organization that offers to drop money and consultants on the problem.

Another structural problem with Russian accounting is the Russian mindset. Under the old centrally planned system, accountants were really bookkeepers. They didn’t have to make decisions. Their job was just to make journal entries. There was no such thing as exercising professional judgment. Where a decision had to be made, their solution was to look for some rule that told them what to do. The new rules, whether IAS or GAAP, require the exercise of professional judgment and many Russian accountants do not feel comfortable. They would prefer to find some rule in a book that instructs them on how to do everything and they resist adopting the new rules. This structural bump in the road to the adoption and implementation of market based accounting rules will be worn down with time, but it will take perhaps a generation or more before Russian accountants think the same way as Western accountants in regard to this approach to decision making.

Several government ministries are involved in accounting reform. Unfortunately, they do not always think the same way. In fact, their approaches to accounting reform are drastically different. The Ministry of Economic Development and Trade is strong on policy formation but does not have much power over policy implementation. Its approach is bottom-up. The Finance Ministry, on the other hand, prefers a top-down approach, similar in structure to the old centrally planned Soviet system. Westerners feel more comfortable dealing with the Ministry of Economic Development and Trade, since Western accountants also prefer a bottom-up approach.

However, these two ministries are not the only government agencies that are involved in accounting reform. The Russian Securities Commission and the Central Bank also play a role. In 2002 the Association of Russian Entrepreneurs also became involved in accounting reform. But no one is in charge. There is no leadership. There is no central direction to accounting reform. It is almost like all of these institutions are groping in the dark. While some government ministries demonstrate an interest in accounting reform, they are unable to answer questions because of a lack of expertise.

There is no force driving accounting reform, from an organizational perspective. No organization wants to protect both accounting and the public interest. The pressure to reform accounting in Russia is coming from the market. Russian enterprises that want to raise capital, either by debt or equity financing, need to have statements prepared either according to IAS or GAAP. Potential investors demand it. That is the factor that is causing the change, not some government bureaucracy that dictates policy and rules from on high.

Most of the largest companies, like Gasprom, Aeroflot, metallurgical plants, electricity plants, etc., including 80 percent of the biggest companies and 95 percent of banks prepare financial statements based either on IAS or U.S. GAAP. The real driver of accounting reform is the large companies. They are doing it in spite of government inaction. The market is solving the problem without government.

IAS in Russia

Accounting is part of the legislative system. That is a problem because Russia will never have true IAS if government has to legislate it. There will always be a lag and style and language problems. The original plan by the Russian Finance Ministry in 1998 was to adopt all IAS by 2000. That did not happen. The new target for full adoption and implementation is 2004, at least in the case of banks and publicly traded companies. However, that target is also unlikely to be met. In fact, not a single accountant interviewed thought that IAS would be fully adopted and implemented by 2004. One accountant estimated that full implementation would take ten years.

Even though Russia is in the process of adopting IAS, it has not adopted all of the international accounting standards, and it has no immediate plans to adopt the standards it has not already adopted. It has not adopted the standards on impairment, financial instruments or hyperinflation. There are good reasons for not adopting each of these standards.

In the case of the standard on impairment, many Russian companies and their accountants do not want to apply the impairment rules because many companies have assets that are overvalued. Applying the impairment standard would cause the asset side of the balance sheet to shrink, considerably in many cases, and they do not want that to happen. In extreme cases, a company that appears healthy could appear to be insolvent if the impairment rules were applied. This hesitancy is not unique to Russia. The same situation exists in Republika Srpska, the Serbian part of Bosnia, and in other formerly centrally planned economies.

Perhaps the main reason why the standard on financial instruments has not been adopted is lack of demand. Very few Russian enterprises use complex financial instruments, and the ones that do are already applying the IAS or U.S. GAAP on this topic. Also, this standard is difficult to understand and many Russian accountants are not eager to make the effort to learn a standard that they probably will not use in the foreseeable future.

The IAS on hyperinflation is not needed, or at least that is the perception of many Russian accountants, because Russia's inflation rate has fallen below the threshold needed to trigger the hyperinflation standard. Russia's cumulative inflation over the most recent three years has been about 90 percent, and the threshold for using the hyperinflation standard is 100 percent. But the 100 percent test is only one of five items on the IAS list of possibilities. Russian companies do their planning in dollars, not rubles. If the ruble is not being used to make management decisions, a strong argument can be made that the hyperinflation accounting rules should be used even if the inflation rate does not hit the 100 percent minimum threshold.

Another point that could be made about Russia's adoption of IAS is that even the standards that have been adopted may not always be IAS. For example, the IAS on income taxes that Russia adopted is the old version of that standard, not the new one. This fact is known within much of the Russian accounting community but may not be as well known outside of Russia. Another, less well known fact about Russia's adoption of IAS is that the Russian version of the standards that have been adopted are not mere translations of the English language originals. In many cases they are abbreviated, simplified versions of the original English language IAS. RAS tend to be much shorter, more detailed and conceptual. They cover a fraction of the content of IAS. Often the differences between RAS and IAS are not large or important. However, the difference may be substantial, such as in the area of accruals principles.

Many studies have been made that compare RAS to IAS, or that list the Russian accounting standards that are on the same topics as the IAS. The GAAP 2000 [15] and GAAP 2001 [14] studies are perhaps the most famous and most accessible, since they were done by reputable firms and since they are available on the internet in several languages. PricewaterhouseCoopers updated the GAAP 2001 study in its *Doing Business in the Russian Federation* publication [48]. A summary of that update is shown in Table 1. This table compares the rules that were in force on March 15, 2003.

TABLE 1. DIFFERENCES BETWEEN RUSSIAN ACCOUNTING STANDARDS AND INTERNATIONAL ACCOUNTING STANDARDS

Russian accounting may differ from that required by IAS because of the absence of specific Russian rules on recognition and measurement in the following areas:	
- the classification of business combinations between acquisitions and unitings of interest	IAS 22.8
- provisions in the context of business combinations accounted for as acquisitions	IAS 22.31
- consolidation of special purpose entities	SIC 12
- the restatement of financial statements of a company reporting in the currency of a hyperinflationary economy in terms of the measuring unit current as of the balance sheet date	IAS 29.8
- the translation of the financial statements of hyperinflationary subsidiaries	IAS 21.36
- the treatment of accumulated deferred exchange differences on disposal of a foreign entity	IAS 21.37
- derecognition of financial assets	IAS 39.35
- the recognition of operating lease incentives	IAS 17.25; SIC 15
- accounting for defined benefit pension plans and some other types of employee benefits	IAS 19.52
- accounting for an issuer's financial instruments	IAS 32.18/23
- hedge accounting for derivatives	IAS 39.142
- the treatment of exchange differences resulting from severe devaluation or depreciation of a currency	IAS 21.21; SIC 11
There are no specific rules requiring disclosures of:	
- a primary statement of changes in equity	IAS 1.7
- a primary statement of cash flows; and the notion and definition of cash equivalents, and detailed guidance on the preparation of cash flow statements	IAS 7
- the FIFO or current cost of inventories valued on a LIFO basis	IAS 2.36
- the fair values of financial assets and liabilities	IAS 32.77
- the fair values of investment properties	IAS 40.69
- related parties information except by certain reporting companies with a specific legal form (joint stock companies); the definition of a related party is a narrower one, based on legislation	IAS 24.1-4
- certain segment information (e.g. a reconciliation between the information by reportable segment and the aggregated information in financial statements, significant non-cash expenses, other than depreciation and amortization, that were included in segment expense and, therefore, deducted in measuring segment result – for each reportable segment)	IAS 14.61/67
There are inconsistencies between Russian rules and IAS that could lead to differences for many enterprises in certain areas. Under Russian rules:	
- goodwill is calculated by reference to the book values of acquired net assets	IAS 22.40
- proportionate consolidation may be used for subsidiaries in which the parent has 50 percent or less of the voting power	IAS 27.15
- revaluation of property, plant and equipment is allowed but gives different results than IAS and need not be kept up-to-date	IAS 16.29
- the useful life of property, plant and equipment is usually determined using periods prescribed by the government for tax purposes, which are longer than those for which the assets are expected to be used, but in practice the management of a company sets the periods in the accounting policy	IAS 16.6/41
- if investment properties are revalued, they are still depreciated	IAS 40.27
- if investment properties are revalued, the gains and losses are not required to be taken to the income statement	IAS 40.28
- finance leases are generally defined in legal terms and the right of capitalization is given to a lessor or a lessee by the Contract	IAS 17.3/12.28
- lessors recognize finance lease income differently	IAS 17.30

- the completed contract method can be used for the recognition of revenues on construction contracts when the outcome of a construction contract can be estimated reliably	IAS 11.22
- trading, available-for-sale and derivative financial assets are not recognized at fair value	IAS 39.69
- trading and derivative liabilities are not recognized at fair value	IAS 39.93
- any financial investments are not required to be carried at fair value	IAS 39
- provisions can be established more widely or less widely than under IAS, and there is no requirement for discounting	IAS 37.14/45
- own (treasury) shares are shown as assets	SIC 16
- classification of cash flows between investing and financing activities in the cash flow statement may be different from IAS	IAS 7.6/16/17
- cash flow statements reconcile to cash rather than to cash and cash equivalents	IAS 7.45
- the correction of fundamental errors is included in the determination of the net profit or loss for the reporting period, but separate disclosure and pro-forma restated comparative information are not required	IAS 8.34/38
- revenue recognition rules do not differentiate between exchanges of goods of similar nature and value and exchanges of dissimilar goods, and do not discuss adjustment for the amount of cash or cash equivalents transferred in exchanges for dissimilar goods	IAS 18.12; IAS 16.21/22
- the definition of extraordinary items is broader	IAS 8.6/12
In certain enterprises, these other issues could lead to differences from IAS:	
- some parent companies do not prepare consolidated financial statements	IAS 27.7/11
- in the definition of control, it is not required that the ability to govern decision-making be accompanied by the objective of obtaining benefits from the entity's activities	IAS 27.6
- certain subsidiaries may be excluded from consolidation beyond those referred to in IAS	IAS 27.13
- a subsidiary that is a bank may be excluded from consolidation if it is dissimilar from the rest of the group	IAS 27.14
- certain set-up costs that have been paid by a company's founder can be capitalized	IAS 38.57
- internally generated brands and similar items can be capitalized if the enterprise has an exclusive legal right	IAS 38.51
- inventories are generally carried at cost rather than at the lower of cost and net realizable value; this is often not an important difference because of inflation	IAS 2.6
- the realizable value of inventories can be measured without deduction of selling costs	IAS 2.6
- certain overheads in addition to those related to production can be capitalized	IAS 2.7

These studies list the differences between RAS and IAS. The problem with these lists, which is not revealed in any of these publications but was discovered during the course of the interviews, is that these compiled lists of differences do not include mention of any RAS that is an abbreviated, simplified version of the English language IAS. For example, if the English version of IAS 99 is 80 pages long and the RAS on that topic is 10 pages long, IAS 99 is not included in the list of differences, even though the Russian standard is clearly not identical to the international standard. Thus, these comparative lists are deceptive because they do not reflect the true and total differences between RAS and IAS. The list is relatively short, and many items on the list are for items that are inconsequential, leading an unsophisticated reader to believe that the differences between RAS and IAS are small, when in fact the differences can be quite large for certain standards.

Another problem with making comparisons between RAS and IAS or GAAP is historical. IAS has a historical base. International standards are based on more than 100 years of Anglo accounting evolution. Because of that, much is understood but not stated. The Russian accounting system has no such long history. So making such lists and comparisons is dangerous, in the sense that it can be misleading.

There are differences of interpretation and emphasis even within the Western market economies that have adopted IAS or some similar set of rules. For example, a German accountant and a British accountant could interpret the same rule differently for cultural reasons. Germans are more conservative and would tend to make provisions that British accountants might not make. Germans provide for everything; Russians provide for nothing.

Some of the individuals interviewed stressed the point that RAS will never be identical to IAS. They will never be a mere translation, even if every word in every IAS is translated directly into Russian. That is because Russian culture and Russian thought processes come into play. The way Russian accountants interpret the rules will always be different than the way an English accountant will interpret the language contained in the various international standards.

One reason for the differing interpretations is because of conflicts in definitions. IAS contains definitions for a great many terms. So does the Russian Civil Code. But the Civil Code definitions are often different from the IAS definitions. What is a Russian accountant to do when confronted with these differences? These differences have caused arguments with clients in the past. These definitional problems will not go away in the near future if for no other reason than because the Duma has more important things to do than expend a lot of effort harmonizing accounting definitions with the already existing Civil Code definitions. This problem would be nonexistent if the accounting rules were formulated in the private sector, but they are not.

Another reason why RAS will never be identical to IAS is because there is a timing lag between the time a new IAS is issued in the UK and the time that new IAS is translated into Russian and adopted as part of the Russian accounting rules. This lag could be overcome if the Russian Duma (Parliament) made it a rule that all new international accounting standards will automatically and immediately become part of the Russian rules. However, the Duma will never make such a rule, for reasons of national pride and sovereignty. So the lag will be permanent, even though there is a theoretical solution that would correct this lag.

The degree to which the Russian accounting community understands IAS depends on several factors. The Russian translation of the original English version of the standards was not available until late 1998. The translation was mediocre, in some respects. Part of the problem was because there were no Russian terms to convey some of the concepts. In other cases, the Russian translators simply used the wrong word or said things in such a way as to make the sentence or phrase unintelligible. In at least one case, the translator left out the word "not," with the result that the Russian version of the standard instructed the reader to do something, when in fact the rule said *not* to do something. These kinds of mistakes and imperfections are to be expected the first time a technical document is translated, especially in cases where no terms exist for some of the words and ideas that need to be translated.

The Russian accountants who cannot read English are limited to reading the Russian translation of IAS. That places them at a competitive disadvantage, for the reasons mentioned above. The Russian translation is mediocre in some places and in other places is downright incorrect. The Russian speaking accountant has no way of knowing how accurate the reading of a particular sentence or paragraph might be, but must rely on what is written because there is no other alternative. Russian accountants who were educated in a university that did not teach IAS have a problem reading IAS in any language because the standards contain concepts that the Russian accountant was never exposed to during the years at the university. Such accountants must learn the new rules as best they can, either by self-study or by attending some lectures or seminars on the various topics.

The interviews revealed that the Big-Four accounting firms have found a way around this translation problem, which gives them another competitive advantage over the local Russian firms. The Big-Four have a tendency to hire people who speak English, and at least one of the Big-Four will not hire anyone who does not speak, read and write English. The accountants who work for these firms refer to the original English version of IAS and do not even read the Russian version, except perhaps as a secondary reference. Thus, they avoid all of the problems that are inherent in relying on the Russian translation.

Another advantage that the Big-Four firms have over their Russian-only brethren is the IAS materials their various affiliate firms have developed over the years. The Big-Four branches in the United States, the UK and elsewhere have, over the years, developed a great deal of reading materials and some case studies that address many of the questions and problems that pop up when accountants try to apply IAS. These materials are available to the employees of the accounting firm and also to their clients. The Big-Four firms also have regularly scheduled educational programs for their employees and clients, whereas the other Russian firms may or may not have such programs.

This wealth of educational material gives the Big-Four accounting firms an additional advantage over their Russian competitors. They can offer their clients an education that most Russian accounting firms cannot compete with. Much of the client training they provide is free. The training that they do charge for is offered at a very reasonable price. One reason for the low price is because many Russian enterprises cannot afford to pay New York or London prices. Another reason has to do with Russian culture. Russians are accustomed to getting free education. They do not see the need to pay high prices for education. This attitude affects the ability of the large accounting firms to charge a price that is high enough to meet their costs.

Another problem with the implementation of IAS that the interviews revealed is that the Russian accounting community operates as a two-tier system. The accountants who work in Moscow, St. Petersburg and a few of the other large cities are more knowledgeable about IAS than the accountants who do not work in the large metropolitan centers. The big city accountants have more and better access to accounting materials and courses that will help them to keep current with recent developments, or even to become familiar with the basics of IAS. Accountants in the outlying regions do not have this kind of resource at their disposal. Perhaps they have internet access, which would enable them to tap into some pertinent information that is available on the net, but even internet access is not as good outside of the big cities as it is within them. However, much of the information available on the internet is useless if the accountant cannot read English, since there is much information available in English that is not available in Russian. Also, the Big-Four accounting firms do not have offices in the smaller Russian cities, so the infrastructure they carried with them to Moscow and St. Petersburg is almost totally absent outside of those two cities.

Another reason why the accountants in the outlying regions are not as knowledgeable about IAS as are the big city accountants is due to differences in demand. Most clients that need statements prepared according to IAS are in Moscow or St. Petersburg. A few big enterprises are scattered around other parts of Russia, mostly in the bigger cities. The accountants who service smaller clients have little or no need to know IAS, so they do not take the time to learn them. The result is a two-tier system where the accountants and the employees who work for their clients know at least something about IAS, whereas their counterparts in the outlying regions know less, or perhaps nothing about IAS.

This situation is unlikely to change soon. Some accountants, and even university professors who live in the regions have never seen the Russian translation of IAS and have not seen any Russian accounting books that discuss IAS.

The drive to adopt and implement IAS is coming more from the market than from the Russian government. Although the government is pushing for adoption and implementation of IAS, the force that is really motivating Russian enterprises to use IAS is the carrot of foreign capital. Foreign investors simply refuse to consider making loans or investing in a Russian company that does not prepare its financial statements using either IAS or GAAP. Russian enterprises are also under pressure from the international investing community to have their statements audited by a large foreign audit firm such as one of the Big-Four. So the process of adopting and implementing IAS is more of a bottom-up system than a top-down system. The market is causing the changes to be made where they need to be made and it is doing it faster and better than what could be accomplished by mere government decrees.

Another interesting facet of Russian accounting that the interviews revealed was how Russian accounting firms and enterprises are dealing with the new disclosure requirements. IAS and GAAP both require much more disclosure than what Russians are accustomed to providing. Many Russian executives and accountants feel uncomfortable providing so much disclosure. Russian culture, even before the communist era, produced a closed mouth society, at least as far as revealing information to bureaucrats, government officials and the general public was concerned [11].

Disclosure is new to the Russians and some of them do not know how to deal with it. Financial statement disclosure is sometimes more detailed than in the West, but the quality is often lower. Russian accountants tend to disclose information that has little or no value. They sometimes report extraneous information because they do not understand what is relevant for disclosure purposes. They do not always know what information is important to potential foreign investors, so they report what they are most familiar with. They provide financial statement ratios, disclose the number of employees, and so forth but sometimes leave out information that foreign investors might want to know. Some Russian financial statements are flooded with information that is of little or no use for investment decision making purposes.

Concluding Comments

As a partner in one of the large international accounting firms stated, the three most important factors that international investors consider are who their partner is, whether the financial statements are transparent and whether the statements were prepared using either IAS or GAAP. Foreign investors are not at all interested in reading statements prepared using RAS, not only because they are not well versed in RAS, but also because they do not believe that the Russian statutory accounting rules provide good accounting information. Accounting reform is an essential ingredient of economic independence.

Then there is the problem of what is called black cash. Not all transactions are recorded. The Russians have devised ingenious ways to evade taxes. Applying IAS or GAAP to a company's books will not solve this problem if some important transactions are never included in the books. President Putin has instituted a low flat corporate (24%) and individual (13%) income tax, which will take away some of the incentive for playing tax evasion games, but tax rates that are low by European standards will not totally end the practice, since tax evasion is seen as not only a way to reduce taxes but also as a game.

Another question is how long it will take the rest of Russia to catch up to Moscow and St. Petersburg, in terms of the level of sophistication of financial reporting and in terms of accounting education. The only thing that can be said for sure is that it will take a long time. The process is market driven. Specific enterprises and regions will catch up as the market demands quality financial information. The speed with which the various regions will approach the Moscow – St. Petersburg standard will depend on whether international investors have an interest in investing in a particular enterprise or region, and on whether that enterprise is interested enough in attracting foreign capital to prepare its financial statements using some internationally accepted standard like IAS or GAAP.

Another structural problem that needs to be overcome is the lack of knowledge of IAS on the part of the clients that retain the services of the large accounting firms. One partner who was interviewed revealed that only two of the accountants at one of the top Russian enterprises had any knowledge of IAS whatsoever. This low level of knowledge makes it more difficult for any accounting firm to provide the proper services. Over time, this problem will shrink in importance, as the accounting firms train their clients and as a new crop of accounting graduates take their places in the accounting departments of these enterprises. But this process takes time.

There was some disagreement as to whether the level of accounting education would improve faster in accounting firms or in universities. The professors who were interviewed in St. Petersburg and Moscow thought that accounting education would improve faster in the universities. The reason they gave is that their professors are also engaged as outside consultants and they bring their knowledge into the classrooms.

But practitioners responded differently to this question. Especially in the case of the large international firms, there was the perception that the materials they provided for instruction and the resources they had to draw upon were of superior quality to those available in universities. Also, it could be mentioned again that the materials the international firms use for their training are often in English, whereas university materials are in Russian, so the universities have a translation problem to deal with that the big firms do not have to face. When this point was raised in the course of the interviews with university professors, they replied that this inherent weakness could be overcome by the professors, who would correct any mistakes in the course materials. But while this may be true in some cases, it probably is not true in all cases, especially in those cases where the professor is not able to read IAS in the original English. In such cases, the professors will have to rely on the Russian translation, and they are likely to repeat the mistakes that are contained in the translated materials.

It will take a long time to fully implement IAS in Russia. The process is ongoing. However, it will happen, at least to some extent. If government continues to dominate the rulemaking process, RAS will never be identical to IAS, for the several reasons mentioned above. But if the market takes over, Russian enterprises that want to attract foreign capital will prepare their financial statement using IAS anyway. Government involvement in the standard setting process will merely serve to complicate accounting and make it more expensive.

Mechanism of Mandatory Fiscal Audit and the Ownership Concentration in Mexico

Arturo Lara
Harmen Simons
ITESM Campus Monterrey, Mexico

Abstract

Our research extends existing models of asymmetric information in the auditing process in two ways. First, we include government as a third player making audited financial statements for fiscal purposes a legal requirement. We also consider different levels of concentration of ownership. We argue that both factors may induce managers to issue fraudulent sets of information, which, in turn, affects audit risk. In this study we set dominant strategies for both the firm SAT and the independent fiscal auditor under the mechanism of mandatory fiscal audit [1].

Introduction

Government is an important stakeholder in the financial results of a firm. In Mexico an important part of the government income derives from corporate taxes. The legal figure of a mandatory auditor's report that forces firms with a income over US$250,000 to have their financial statements examined by an independent fiscal auditor [2] attest to the importance of this source of income (and the firm's incentive to evade them). The auditor is authorized by Mexico's Tax Administration Service SAT (Servicio de Administración Tributaria,) and has to issue an opinion as to the veracity of the financial statements and the fiscal situation of the firm. This mechanism presents obvious costs to the firm.
This document is made up of three sections, section I comments related Literature, section II describes the model, and section III concludes with a discussion on the results.

Section I

Much has been written on the Principal-Agent problem between the managers of the firm and its stockholders. Managers possess generally superior information about a firm's operations. However, because their incentives are not always perfectly aligned with those of the other stakeholders in the firm (i.e. stockholders and government) management may not be willing to reveal all of their relevant information voluntarily and truthfully.

In Mexico, this situation is altered in one important way: Many firms are family-owned or controlled. This concentration of decision-making power makes the principal-agent problem less acute but if anything, enhances the incentives to minimize tax payments. However, as ownership becomes more dispersed and family control weakens, the interests of both government and outside investors become more aligned in their needs for truthful revelation of information.

The paper shows how the existing scheme of sanctions in Mexico is heavily skewed against the auditor, i.e. the auditor is liable award fines for mistakes and/or negligence in the auditing process and is subject to scrutiny by the state. However, there are no legal sanctions attached to a firm trying to hide or only partially reveal relevant information or otherwise misleading the auditor. Therefore the firm has a strong incentive to manipulate the information in its favor. Either the manipulation is detected which implies only paying the full and fair amount in taxes, or it goes undetected implying the firm will be certified and thus the probability of being audited directly by the tax authorities is reduced substantially. For example, as the audit is mandatory and involves a cost to the firm, the firm has an incentive to try to reduce the amount of taxes payable so as to, at the very least, cover the costs of the mandatory audit.

In the physics, the resulting vector of two or more vectors with different directions and forces shows clearly to the sum and subtraction of efforts. Those vectors are characterized to have two fundamental elements: effort and direction. Suil Pae and Seung-Wean Yoo 2001 show in their model elements like, the level of investment in systems of internal control and the auditors' legal liability, influence in the effort level that she applied to her engagement. Brayan Cloyd 1997, in his study shows evidence about the importance of accountability and the auditors' previous knowledge on specialized fiscal aspects. These elements have influence in the application of auditors' efforts on the field of information search. Paul Newman, Evelyn Patterson and Reed Smith 2001, establish that the managers have private information and beforehand they know the standard procedures that the auditors will apply when reviewing the financial information. Fiscal profit is a function of the financial profit and when revealing one the other is revealed inevitably. Kenneth J. Klassen 1997 mentions in his investigation, managers frequently encounter situations involving a trade-off between financial reporting a tax incentives reporting. On the other hand this author also show that the concentration in the ownership influences in the magnitude of the income reveled by firms in divesting operation. Frank B. Gigler and Thomas Hemmer 2001, develops theory where they demonstrate that the managers have private information and they are willing to revel unless stockholders give them the right incentive. John Evans, Lynn Hannan, Ranjani Krishnan and Donald Moser 2001, demonstrate how the managers are able to lie if they have opportunity to obtain gains when doing it. Jefrey Wilks 2002 and Hun-Tong So and Karim Jamal 2001, show how human factors can effect the audit's process focused to gather evidence fails. Joseph Carcello and Ferry Neal 2000 undertook a study where they show how the audit committees can push the auditor in order to influence in her opinion.

Inside the theory of incentives - as principal-agent - it says to us that the participants in a labor relation or under specific contract will direct their efforts in direction of their own interest. However, when this theory is not new, its application in audit mechanisms has not been full applied. In our model we show that the audit efforts must be greater under a scheme of mandatory fiscal audit.

In a mechanism of audit with the correct aligned incentives, the interested one in validating the information of a firm, it is the one who must contract the services of the auditor. Under a scheme of voluntary audit [2] if the stockholder wishes to test the veracity of the information, he must contracts the auditor. In case that the stockholder loses interest in verify the information, it is not reasonable to hire an auditor and pay her fees. This becomes true when stockholder can observe all completely the fiscal and financial information, and as a consequence there is no asymmetric information.

For practical effects the taxable income is derived from the financial income, therefore fiscal income is a function of financial income. When the managers reveal the financial income it reveals inevitably the taxable income to SAT.

In 1991 under the presidential mandate of Carlos Salinas de Gortari, he gives origin to an initiative of reform to the Fiscal Code of the Federation (CFF) this Code regulates the legal framework of other fiscal laws. This reform changed dramatically the audit market. This initiative approved by the congress has the purpose of forcing to sector of Mexican firms, with medium and high administrative capacity to be audited by fiscal purposes by Authorized Public Accountant [ ]. This reform was inserted in the article 32-A of the CFF and it is enforced until to day.

The problem of asymmetric information between the three participants in the Mexican audit mechanism - proprietors, government (SAT) and auditor - with respect to the manager, places to SAT and the stockholder under the same perspective of the incentives, they want that the financial set issued by the manager reveals trustworthy information of the firm to calculate their participation in the gains or the firm. It is critical for the model assume that the figure of manager and stockholder and SAT are different people or institutions with interests not necessarily common.

Section II

The ownership concentration could be measured in continuous form by a concentration index

$$s_i ? \frac{x_i}{? x_i}$$

$$h(s) ? \overset{n}{\underset{i ? 1}{?}} s_i^2$$

$$0 ? h(s) ? 1$$

i is the stockholder or block of stockholders, where it is the participation in the income of the firm and $h(s)$ is the ownership concentration index of the firm to be audited. As $h(s)$ tends to zero the ownership concentration become atomized, and on the inverse when it tends to one. Ownership will have concentrated by a single stockholder or block of stockholders.

Nevertheless in our model we used just two levels of ownership concentration, h_L for low, and h_H for a high concentration in a single stockholder or group of stockholders with same interests. Under a fiscal audit scheme, the fraction of the cash flows generated by the firm that go to the stockholders is:

$$?_S ? \tilde{x}(1 ? ?)(1 ? ?) \text{ where } \tilde{x} ? 0 \qquad (1)$$

$\tilde{x}$ is the cash flow base of distribution among the stockholders, manager, and SAT. This amount has already deduced the audit cost.

$?$ is the fiscal tax rate.

$?$ is the fraction of the cash flows that go to the manager as a part of their compensation.

The fraction of the cash flows generated by the firm that belongs to the SAT is $?_G$:

$$?_G ? \tilde{x}(?) \qquad (2)$$

The fraction of the cash flows generated by the firm that belongs to the manager is:

$$?_M ? ? \tilde{x}(1 ? ?) \qquad (3)$$

The variable part of the compensation of the manager is only the critical one, and that gives the incentives to deliver dishonest information to outsiders in some cases. Given equation 1, 2 and 3 we can infer:

$$?_M ? ?_S ? ?_G ? \tilde{x}$$

$$?_M ? f(\tilde{x}) ? f'(\tilde{x}) ? 0$$

$$x(1 ? ?) ? ?_M ? ?_S$$

$$?_M ? ? [\tilde{x}(1 ? ?)] ? ?_S ? 1 ? ? [\tilde{x}(1 ? ?)]$$

When the firm type is h_L the figure of manager and stockholder is clearly separated. This implies a high degree of asymmetric information between stockholders and managers. As a result of this asymmetry of information, and in combination with the equation (3), the manager always will have incentives to lie revealing greater x than the really one the firm generates. This way the manager gets a greater participation from the real x. On the other hand, the auditor is not sanctioned by the SAT because the firm will have paid taxes in excess at the end of the period. Expressing the gross gains without sanctions, we have the following equation.

$$g_M ? ? ?(1 ? ?)(x_F ? x_T)? \text{ donde } ?x_F ? x_T ? ? 0 \quad (4)$$

x_F is the income reported by the manager under a set of fraudulent information.

x_T is the correct amount under a set of reasonably well operated information.

g_M is the additional gross gain obtained by the manager to lie and to reveal the greater x that real one.

In the state of type h_L the manager's incentive goes against the stockholder interest, since a great and false x transfer a greater part of the cash flows to the SAT and the manager harming stockholder's cash flow participation, then the stockholder cooperates with the independent fiscal auditor to validate x. the auditor when to reveal the real x assures for the SAT participation of the cash flow according to the law, and the stockholder receives the right part of real x.

On the other hand, when concentration of ownership is h_H, stockholders and Manager are practically a same person or institution. The only gain that persists is the stockholder gain. Then stockholder tries to extract the greater cash flow it is possible.

$$g_S ? g_M$$

$$g_S ? (1 ? ?)?? ?x_T ? x_F ?? \text{ donde } x_T ? x_F \quad (5)$$

Where:

g_S is the additional gross gain obtained by the stockholder-manager to lie and to reveal an x minor to the real one.

In the rest of this paper we will refer just as a manager. This because the stockholder practically becomes manager in firms type h_H, and we will make the distinction only when the managers of the different types of firms will be comparing themselves. Also we will talk about a single g like the fraudulent gross gain:

$$g ? g_S$$

Under the scheme of mandatory fiscal audit, the fiscal report emitted by the independent fiscal auditor includes in all the cases the computation of $x?$, in order to inform to SAT about the tax that was given voluntarily to the SAT by the manager. The independent fiscal auditor in all the cases is contracted by the stockholders, and they select the auditor with the experience and reputation that considers advisable to its interests. As long as the auditor fulfills the SAT's entire requirement to be an authorized fiscal auditor.

When the firm is type h_H, $?$ it tends to a value near zero, and the incentives to lie about x are reversed in cooperation with a firm type h_L. These incentives are showed in the equation (1). As consequence manager could issue a fraudulent set of information that it contains smaller x than the real one. Additionally the manager plays this game with the probability distribution of deceiving the auditor by means of the issue of a set of fraudulent information, and that this set of fraudulent information will be certified. Additionally the manager measures the probability of being detected by the process of revision of the SAT.

For practical effects, we analyze the firm when is critical for the auditor and SAT. That is when the firm is type h_L, because it is the unique type of firm that its managers have incentives against the interests of the SAT, and might intent to make gains diminishing the payment of taxes. This case could lead in sanctions for the auditor and firm in case that the job of the auditor issue a wrong report that harm SAT interest and that report will be reviewed by SAT and it detects the illicit gain of the manager.

Considering the possible sanctions that the law could impose to the managers we have:

That if $g ? S_M$ the incentives are conserved by the manager to lie and to issue a set of fraudulent information.

Where S_M is the present value of the sanction.

We have then the following model:

Assumptions of the model

The model operates in a market where firms are under a mandatory mechanism of Fiscal Audit. The firms that are not under this mechanism do not audit they set of information voluntarily for fiscal effects.

Fiscal income is a function of the financial income and when it is revealing one the other is revealed inevitably, due to an easy procedure of conciliation between both.

The audit costs are constant and it is a fix costs for the firm. These costs do not have in practical form an alternative application since the law forces the firms to cover them.

The costs *C* that the SAT incurs in its revisions are relevant because destining the cost of a revision must have the benefit to recover omitted tax and sanctions. Something else generates a loss to SAT. The departments of revisions of the SAT work under cost-benefit scheme. Applying its resources of revision under the criterion to review companies with high probability that it issued a set of fraudulent information and as a consequence it omitted payments of taxes.

Sanctions are those that apply the Mexican government through the SAT, when it find underpayments of taxes. Those sanctions are directed to auditor and the manager in specific cases. It is not part of the model the sanctions among individuals due to unfulfilled contracts.

The manager mainly perceives his compensation from a fraction the value of financial income made. The fix compensation is so small that it does not change nor it influences in the incentives created by the variable compensation.

The audit market this made up of a large supply of fiscal audit services, so that the firm has the negotiation power to contract an independent fiscal auditor without restrictions. This does not imply to have damage by an increase in the fees of the fiscal auditor.

The firm is not forced to contract the same independent fiscal auditor in consecutive periods. In other words the firm has the option to change it at the end of each audit.

It only exist two levels of ownership concentration: h_H that is high and h_L that is low. These levels of concentration are perfectly observable by all the agents.

The process of audit under the mandatory regime occurs in three steps. First the set of information by the manager is issued. Second an independent fiscal auditor audit the set of information and issue a report to stockholders and SAT. Third the SAT selects a sample of all the received reports to find taxes omitted by the manager and not detected by the auditor. It award sanctions to the auditor and the manager. These fines are independent of the collection of the omitted taxes. The scheme of sanctions is showed in the following figure:

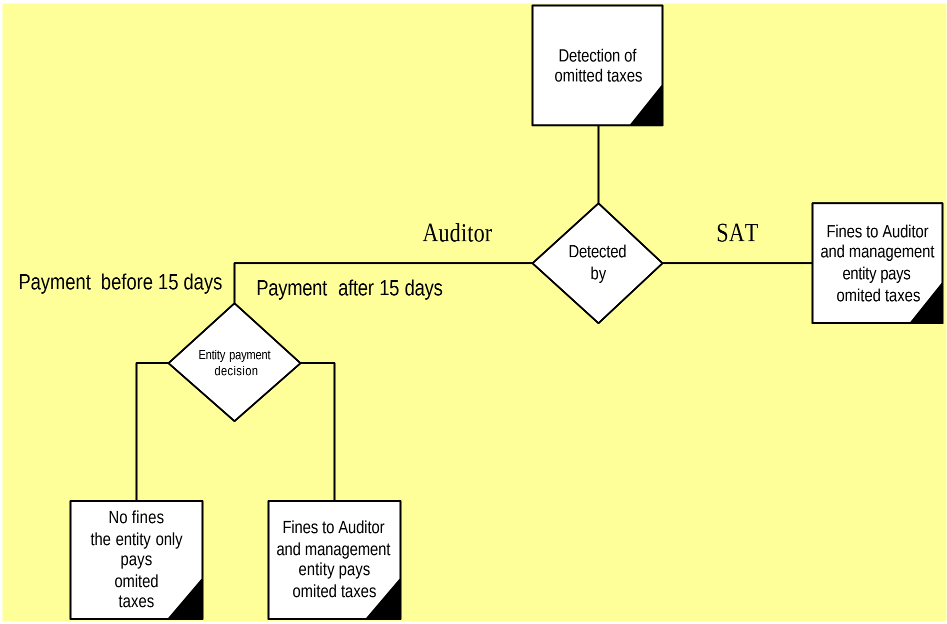

Fig. 1

If we considered a Game where a subject firm to mandatory audit can be type h_L or h_H it is forced by the law contracts an independent auditor to issues a report that includes the payment of the taxes $x?$. The auditee issues a True set of financial information I_T or one false one I_F and reveals it to the auditor for its examination. The auditor examines the information applies his standard procedures and issue a report with his opinion on the taxes paid by the firm. This he can be unqualified R_U or adverse R_A. In case of a R_U report the SAT observes the report of the auditor and decides to review it or no. A report R_A contains the tax omitted by the auditee represented by g . In this case the 15 day rule is applied [3]. In case that the auditor issues a R_U report, the SAT can review it with a probability $?$ and a probability of $1? ?$ of not reviewing it. In case the auditor issues a R_U that comes from an I_T, it is not critical the revision of the SAT since neither auditor nor for the auditee award sanction. S_A It comes only when R_U it comes from I_F and is reviewed by the SAT.

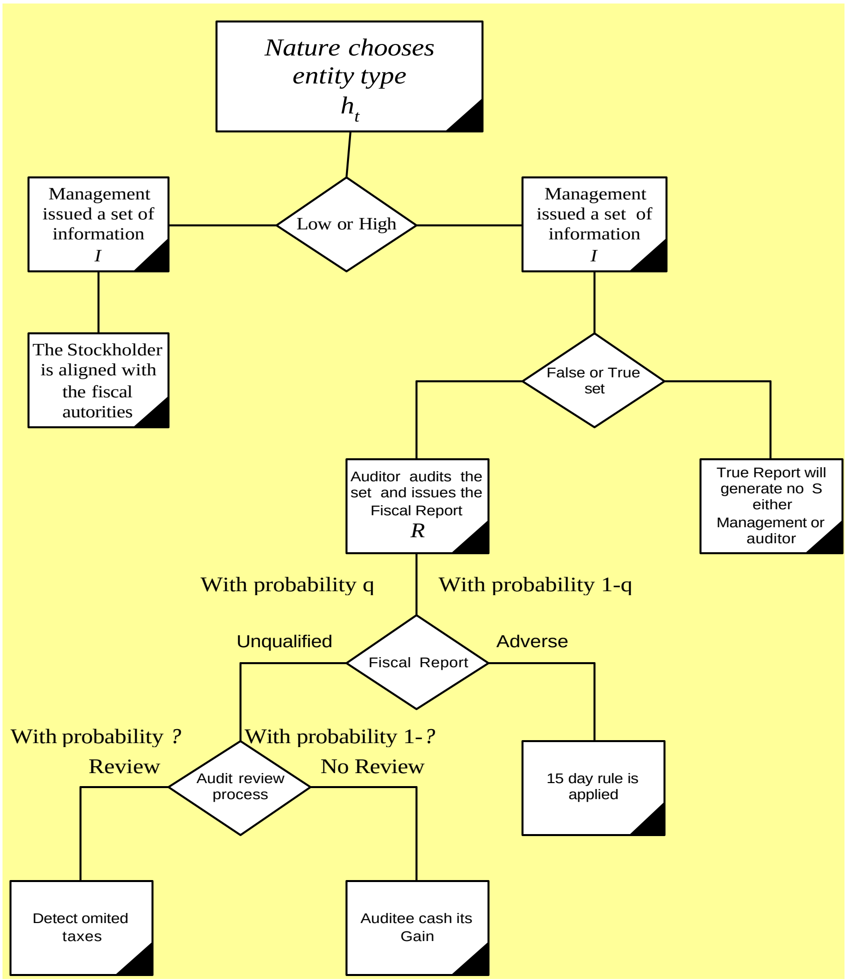

Fig 2

Set the process of the mandatory mechanism of audit; we can analyze the different strategies from each one of the participants. For the firm the set of strategies are formed by the types of reports that can issue: $Strartegy_{Entity} ? \{I_T, I_F\}$. While the SAT its strategies available once the independent fiscal auditor issues his report is to review or not to review the report of the auditor: $Strartegy_{SAT} ? \{\mathrm{Re}\,view, No\ \mathrm{Re}\,view\}$. Figure 3 shows payoffs for each one of them.

PAYOFF TABLE

Entity

SAT	I_F	I_T
Review	S-C,-S	-C,0
No review	-S-g+C, g	0,0

Fig 3

It is Prudent to mention that g cannot be a loss for the firm or a gain for the SAT because g is an amount that beforehand had to be paid by the firm and to be received by the SAT.
Payoff is represented in pure strategy, nevertheless can be added to the assumption that the SAT knows the probabilistic distribution with which the firm could issue a set of fraudulent information. This would turn the th game as mixed strategies.
Since the economic benefit of the program of revision of the SAT this set by:

$$g ? S ? C$$

Figure 4 shows a table of payoffs from the perspective of the independent fiscal auditor and the firm. Where clearly show how the dominant strategy of the auditor is to detect. The previous happen because no of the remaining strategies in combination with those of the firm, grants the security to him of not being sanctioned.

PAYOFF TABLE

Entity

AUDITOR	I_F	I_T
Detect	0,0	0,0
No Detect	$?S_A, \; g ? (g ? S_M)$	0,0

Fig 4

In case they are combined a fraudulent report and that the auditor does not detect, this subject to be sanctioned with an firm and the independent fiscal auditor expected value $? S_A$ to obtain a gain with probability $(1 ? ?)$ and a sanction with probability $?$. If the firm can observe the penalty that him can be imposed, and knows the probability of being detected by the SAT. Its dominant strategy will be to lie if:

$$g \; ? \; ?(g \; ? \; S_A)$$

The auditor has a greater audit risk, if we considered that their procedures of audit are always fairly the same for any entity type and these are not designed to be applied in different basis on fraudulent reports.

Section III

Discussion

While the Mexican SAT agency does not increase the sanctions for the firm by the simple fact to issue a fraudulent report and that it is detected by the auditor, creates incentives sufficient to try to deceive the auditor and to obtain fraudulent gains by means of fiscal evasion. Sufficient elements in the audit market exist to infer other inefficiencies in the scheme of mandatory fiscal audit associated with the price of the audit received by the auditor and the contingent debt that acquires when audit firms with incentives to lie. But the heterogeneity in the quality of the services of audit even allows the firms to select auditors who increase the probability of issuing an unqualified report when he had to be to adverse.

The strategy of the SAT to obtain the greater collection of omitted taxes with the limited resources that it has, will be to oriented a greater number of revisions to reports of independent fiscal auditors from firms of high ownership concentration. This will be able to probably offer the best combination between cost-benefit due to revisions.

The SAT will have to analyze the variables around the fiscal audit mechanism to make it socially just and efficient.

Abstract

This paper discusses the current state of IT outsourcing at the global scale. It analyzes the current controversies/debates on whether the global outsourcing meets the stated cost savings objectives. The paper argues that the global IT outsourcing is going to be a dominant phenomenon for the next 5 to 10 years and that there would be plenty of opportunities for countries like Mexico in the area. The paper provides a brief summary of the state of the Mexican IT industry with the objective of identifying the opportunities for the Mexican IT companies in the outsourcing area. Then, the paper presents a selection framework that an outsourcing company can use to prepare itself to enter in this market. Finally, the paper discusses the steps Mexico can take to provide its IT industry a better IT infrastructure so as to improve their prospects to succeed in this global endeavor.

Introduction

Global Outsourcing (also known as offshore sourcing) has become a common phenomenon in the IT world. India, propelled by its skilled IT labor force and lower wages, is undoubtedly the leader in providing outsourced services. Other countries - China, Philippines, Ireland , Mexico, Romania, Australia, South Africa, to name a few - are trying to build an IT services sector to exploit the outsourcing market. The client companies (customers), mainly located in high wages Western countries (mainly, USA and Western European Countries), are looking for, in addition to reducing the costs, diversification in order to reduce any political or business risk resulting from depending on one company or one region. Also, Companies are experiencing the shortcomings of the "follow the sun" strategy in selecting an outsourcing company. The day and night time difference is causing stress on the domestic employees. There is already a talk of "near-sourcing", i.e, using a company located in the neighborhood of the client company. There lies the opportunity for Mexico to capture the business outsourced by US companies. Mexico provides sttong talent at lower cost close to the United States [1]. In fact, the leading Indian IT companies, in anticipation of this trend, have already opened their offices in Mexico and Canada.

The work presented in this paper is part of the ongoing research on the global (offshore) outsourcing that the author is pursuing. This paper focuses on the current position of Mexico in the IT outsourcing, what Mexico has to offer, what it lacks and what it can do to be ready to exploit the next phase of outsourcing - BPO (Business Process Outsourcing). The remainder of the paper is organized as follows: Section 2 discusses the current IT outsourcing market and its future direction; Section 3 presents the current debate on whether offshore outsourcing delivers the promised cost savings; Section 4 analyzes the state of the Mexican IT industry and its current position in offshore outsourcing; Section 5 presents a framework that an IT company can use to prepare itself for entering the outsourcing market; finally, Section 6 presents a summary of the main points of the paper.

IT Outsourcing Market

With the power of telecommunications, it is now possible to access skills for almost everything - from answering the telephone to developing computer systems - at a fraction (10% - 20%) of the costs in the USA. The U.S. market for outsourcing is expected to grow at an average of 13.6% annually between 2001 and 2005. Forrester Research, the IT analysts, predicts that offshore outsourcing to India from the US will grow by 25 % in 2003. In November 2002, Forrester estimated that the number of US IT jobs going offshore would rise from 27,000 in 2000 to a cumulative total of 472,000 by 2015. In the Western Europe the market for offshore outsourcing will grow by 40 per cent this year, according to Gartner, while Ovum Holway, the leading industry analyst company specializing in the performance of the UK software and IT Service (S/ITS) industry, forecasts that by 2006 between 20,000 and 25,000 UK jobs will be lost as IT work is moved offshore. The Indian software and services industry, whose export revenues were worth about $9.5bn in 2002-03, accounts for 90 % of global offshore IT business. According to a survey by Deloitte Consulting, the world's top 100 financial institutions will make annual cost savings of $138bn in the next five years by moving operations to offshore locations, resulting in the loss of 2 million jobs in financial services in western countries. All the above data has been extracted from a special report in Financial Times [2].

While one can debate the accuracy of these estimates, it is clear that there will be a tremendous opportunity over the next 5 to 10 years for low wages, high skilled countries. Undoubtedly, Mexico should be a player along with the countries such as India and China. Even though the loss of jobs is provoking resistance [3] to the offshore outsourcing in the client companies, there is strong evidence that the offshore outsourcing are making many industries competitive and thus saving overall more jobs (mostly, non-IT jobs) than are lost by outsourcing. .

In response to the outsourcing threat, the leading incumbents (IBM, EDS, CSC, Accenture, etc) in the IT outsourcing market are scrambling to keep up by setting up facilities in India and other offshore locations. This has made the Indian IT market tight - skills are in demand, salaries and overheads have gone up. Smaller incumbent IT companies are seeking alternate locations. Governments of China. Philippines, Brazil, Mexico, Malaysia, the former Soviet states and countries in Eastern Europe are promoting the development of the infrastructure and skills to deliver offshore IT services. According to Forrester's Stephanie Moore. China is not yet a suitable location for North American and European companies. "The market is too immature and problems associated with this immaturity - the lack of English language skills, the legal and regulatory environment, the lack of intellectual property laws - make China too risky today." Once again, this is an opportunity for Mexico.

In terms of longer term prospects, the offshore outsourcing in the USA is expected to continue. The USA will experience a labor shortage of 5.6 million by 2010 due to the graying of American work force [4], and hence the USA will need outsourcing to make up for the shortage.

The Future of Outsourcing - BPO

According to a survey of the InformationWeek 500 companies conducted by Information Week magazine and reported in its October 20, 2003 issue, "2 in 5 companies report they are outsourcing business functions, including 43% of health-care and medical, 42% of banking and financial services, 32% of manufacturing and 29% of IT sites that participated in the study."

Prudential, GE and Citigroup are among scores of companies outsourcing to India not just "safe" back-office jobs, but increasingly high margin tasks such as actuarial analysis. The consequence is that India's IT-enabled services (ITES) sector is set to continue its recent annual growth rate of 60 per cent plus this year, and emerge as a powerful source of job creation. Nasscom, the Indian industry group, says 1 million ITES jobs will be created by 2008 in India [5].

The driving force is the increasingly tough business environment in the west. The pressure to remove costs is forcing companies not only to consider Indian companies for IT jobs that might typically have gone to an IT global major; clients are also embracing outsourcing in general and India in particular. The appeal is initially costs; India's graduate level staff cost a fraction of their western counterparts. But this wage factor is increasingly overshadowed by the productivity and efficiency gains. Typical is introducing systems that reduce the number of errors on, say, a credit card application. This reduces the time spent on a potential client and the cost of capturing potential new business. In summary, the cost savings, increased productivity and efficiency gains are driving the movement toward the outsourcing of business processes in the services (financial and others) sectors [6].

The Global Automotive Practice of management consultancy firm AT Kearney found in a survey of 40 Automobile executives in North America that 90% of them intended to move non-manufacturing processes to low-cost offshore locations. The most popular destinations for the migration of business processing activities found were India (with 24 per cent executives voting in its favor), China (15 per cent), Mexico (13 per cent), Brazil (10 per cent) and Czech Republic (8 per cent) [7]. "India is clearly the destination of choice for business processing services across all industries. There are tens of thousands of well-educated, English-speaking and highly motivated engineering, IT, and accounting professionals in India with the skills and capabilities auto manufacturers and suppliers need for offshore business processing," Mr Nagi Palle, co-author of the research and a principal at AT Kearney said.

While India certainly has a lead, there would be a plenty of opportunities for Mexico, provided it can offer the same level of IT infrastructure and skills set.

IT Offshore Outsourcing Controversies

Are the savings for real?

In a recent much published report, "Hidden Cost of IT Outsourcing" [8], it is reported that many companies come short in realizing the promised cost savings. Indeed, offshore IT outsourcing can be a lot more complicated than moving traditional manufacturing operations overseas. IT quality (or the lack of) is much more difficult to gauge. IT being an integral part of every business process requires a greater degree of knowledge transfer and management. On paper, it looks extremely attractive. A Russian programmer charges 80% less than an American. But when you parse it all out, the total cost of offshoring a given IT job is generally comparable to getting the work done domestically, says Tom Weakland, a partner at management consultancy Diamond Cluster. It's just that few companies are aware of these real costs. "Most companies can't accurately measure their productivity and costs prior to and after outsourcing," says Weakland. " "Most look just at wages."

It is claimed that programs developed offshore have a lot more software bugs than software programmed domestically -- usually 35% to 40% more. Costs add up even when offshoring is done right. Many companies tend to send expatriates to set up their operations abroad -- and their wages usually run high. There are cost of additional executive travel and the cost of extensive training in language and culture. Also, there is the cost and inconvenience of managing offshore crews resulting from different time zones.

To tap into this disillusionment, some small U.S. companies, such as RTTS, a privately held test-automation consultant, are offering competitive rates to lure back business from offshore companies. "It's the same model as India, but there are no time-zone and language issues to deal with," explains Bill Hayduk, director of professional services for RTTS. "Customers going offshore aren't happy with the quality they're getting. So we think there's a big opportunity for us." Herein lies another opportunity for Mexican IT companies to partner with companies like RTTS and share the pie.

Counter View: Outsourcing's Benefits Too Much To Ignore!:

According to AMR Research, the number of IT companies that outsource will jump from 20% to 50% in three years. "Cost savings from outsourcing are too compelling to ignore [9]…" Network advances in security, leased lines, VPN technology and storage all contribute to making offshore outsourcing painless for the experienced IT manager who may have a tight budget "Almost everyone who does a first offshore [job], has a problem," Travis says. "The second and third attempts gradually get better." The culprit is often a bad process that existed at home and subsequently outsourced.

Mexico’s IT Industry & Its Current Position in Outsourcing.

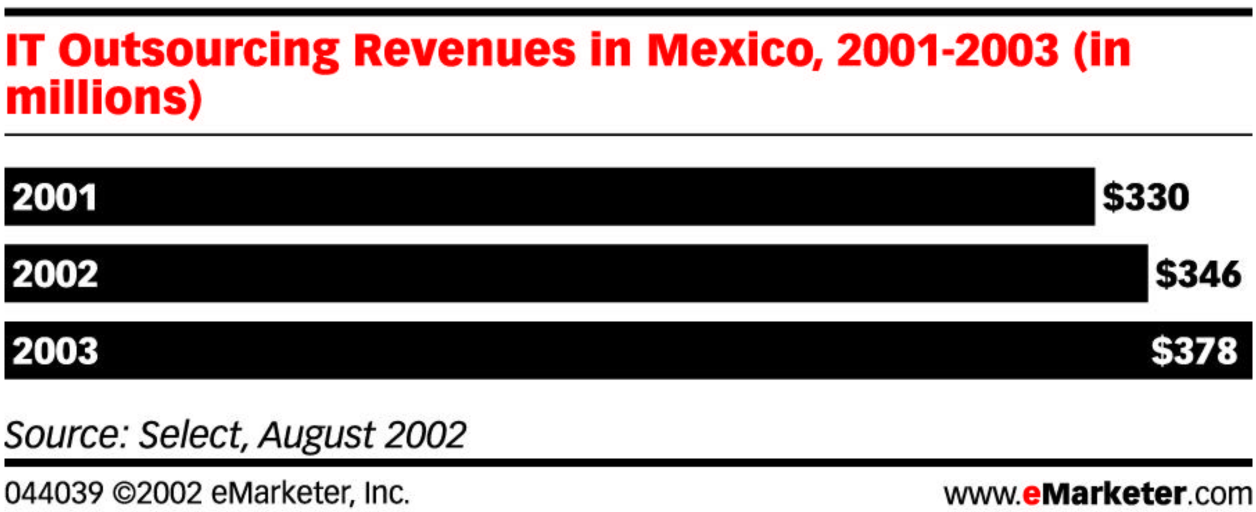
Mexico's IT Industry: According to a report by Unteagra-Trani [10], there are approximately 500 software development companies in Mexico. Foreign software developers supply more than 80 percent of packaged software to the Mexican market. However, excellent opportunities exist for customized software in Mexico, as imports account for only 10 percent of the market. Softek, Hildebrand and EDS are the largest developers of customized software in Mexico.

The report states that in 2002, "enrollment in IT programs accounted for 10 percent of total enrollment in Mexican universities. During the past three years, IT enrollment in universities has grown more than 10 percent annually. Approximately 153,000 students enrolled in university IT programs in 2000, a 14.5 percent increase from enrollment in 1998. In addition, nearly 309,000 students registered in community college IT programs the same year."

Mexico encourages cooperation between university IT programs and the private sector. The Center for Design Innovation (CDI), a software development company, and the Instituto Tecnológicoy de Estudios Superiores de Monterrey (ITESM), have an alliance to provide to students and teachers practical training. The Progress

University Program in Mexico offers software and training to universities at no cost, in return for university use and promotion of Progress-based courses. As of 2001, more than 8,000 students have graduated from the Progress program in Mexico.

Outsourcing in Mexico: Mexican outsourcing companies have so far, by and large, failed in convincing US companies to outsource operations in Mexico. Mexico's IT outsourcing revenues are presented in the figure below. More than the numbers being low, the more disturbing trend - there is not much growth over the least three years. A recent story in New York Daily News dated January 20, 2003 reported that "companies like GE, Oracle, British Airways, …Ford, Citigroup and Microsoft are outsourcing thousands of jobs to India, attracted by an educated workforce of 250 million English speakers and lower costs." The article went on to cite a Forrester Research report that said " Over the next 15 years, 3.3 million services industry jobs and $136 billion in wages will move offshore to countries like India, Russia, China and the Philippines." The notable omission is Mexico.



The CIO Magazine, however, recently (August 2003) rated Mexico as an "up and comer" in outsourced IT services. It stated that the success of companies such as SoftTek and Hildebrando was a good sign for the future. The North American Free Trade Agreement (Nafta) ought to make it easier for American companies to do business in Mexico than in other developing countries that may offer similar cost savings. With growing US concern about political stability and terrorism threats else where, it appears that Mexico offers a way to outsource "near shore", rather than offshore. SoftTek, based in Monterey, Mexico, for example, offers what it calls a "near-shore delivery services model" that it claims can combine "the quality, responsiveness and flexibility normally associated with domestic outsourcers with the cost-savings of an offshore development facility".

Meanwhile, Mexico is gaining near-term outsourcing success in call center operations designed to meet the growing needs of US Hispanic consumers. The London-based Datamonitor research organization, states in a report (April 2003) Opportunities in Caribbean and Latin American Call Centre Markets to 2007: "Mexico will claim the fastest growing market for outsourced 'agent positions' through 2007, driven in large part by the efforts of outsourcers attempting to service the Spanish-speaking population in the US." It appears Hispanic Teleservices is winning business for its Mexican operations. Only last September, the company announced the addition of a second contact centre, in Monterrey, that has a capacity of 540 call centre operators and is designed to operate around the clock.

Near shoring: an opportunity for Mexico

Indian IT firms are finding nearshore centers a useful vehicle to develop new business. Uruguay, Canada, Mexico are fast becoming hot destinations for Indian software firms to set up centers as these locations provide easy access to the US. TCS, another Indian IT company, has centers in Uruguay, Hungary, China and Australia and is planning to open a center in Chile. The nearshore approach gives Indian firms the ability to front-end customer engagements that require presence in the same time zones while doing other development/ maintenance work to India.

In near shore operations, Mexico faces competition from Canada [11]. Both Canada or Mexico can offer significant economic advantages with lower risks and greater geographic and cultural accessibility. Canada, given the language and cultural affinity to US, is very attractive to many US firms for outsourcing applications work offshore. Moreover, the two legal systems work well together, making it easier to protect intellectual property. Mexico, however, has the cost advantage. Since many nearshore operations involve local hiring (some Indian companies use 80:20 rule in favor of local hires), there is an opportunity for Mexico to create new jobs.

In the longer term, Mexico's IT industry has another revenue source - the internal IT outsourcing. So far, only 10% of the Mexican companies have outsourced their IT operations.

The next section discusses a framework that has been used by client companies in preparing for outsourcing and in selecting an offshore outsourcing partner. The understanding of this framework is essential for the **Mexican** IT companies to prepare themselves for entering this market

Outsourcing Company/ Region Selection Framework

The selection framework used in this paper consists of examining (1) the driving forces for outsourcing – tactical vs. strategic, (2) the process used to decide what to outsource, (3) selection of the operational model – inter-workings of the in-house staff and outsourced-staff, (4) the process to select offshore vendors and region , (5) the quality of contract negotiations – thoroughness, risk analysis and contingency planning, (6) quality of execution and program management – team formation, transition, knowledge transfer, work and relationship management, (7) and the quality of results – SLA's conformance, customer satisfaction.

The components of the above framework have been discussed in the literature on outsourcing. Most of the material is available in the leading trade (IT) magazines (Information Week, MIS, etc.), financial sections of leading newspapers (Financial Times, WSJ, NYT, etc.) and IT journals (Optimize for example). A selected bibliography [12 through 17] is provided at the end of this paper. Most of the material has been around in the context of developing business strategies (core competencies), contract negotiations, risk management, program management, and cultural aspects of doing business in a foreign country. It is being reapplied to outsourcing. The practical challenge here is in how well these ideas are applied to a given outsourcing situation and then executed to achieve the results.

Driving Forces

There are two types of driving forces that motivate a company to outsource – strategic and operational. Strategic goals include being able to react to market conditions quickly, being able to bring a product in a shorter interval, ability to compete for new business. Operational goals include reduction of costs, increased margins and control of products while ensuring the quality of work. Even though it is a cliche to be strategic, often companies who are fighting for survival must focus, in a short term, on operational goals such as lower costs.

Process of deciding what to Outsource

Fundamentally, a company ought to outsource what it cannot do well or can get it done cheaper or what will bring other profitable business in-house. The first has to do with the lack of core-competency; the second has to do with the inefficiency of in-house operations; and, the third is a by-product of partnering with the outsourcing vendor. First of all, let's understand what not to outsource. One should almost never outsource processes or functions that involve interactions with customers. If you give the impression that customer issues are not important enough to warrant your attention, customer will sooner or later find someone who does. This is contrary to current practices of outsourcing call centers or product support functions. If one must (for cost savings), companies ought to have an overseas captive center that is an extension of the company as opposed to giving it to an outsourced center.

One ought to examine all the functions of a system development life cycle (SDLC) from two angles - the potential relative (to in-house) value created if outsourced and the relative higher risk that outsourcing brings to the table. The functions that yield most value and present least risk are the candidates for outsourcing. Typically, in the software industry, software coding and testing functions fall in this category.

Selection of the Operational Model

This is one of the most neglected parts of planning for outsourcing, often relegated to the time when for all practical purposes decision to outsource to a particular company has been made. Current practices can be grouped into three models – autonomous operations, partial autonomous and staff extension model. In the first model, the vendor is doing all or majority of the phases of a project and there is very little interference from the customer company (that outsourced the project). The pros of this model include reduced need for local (in-house) staff and shifting of the risk for project overruns to the vendors. The cons are loss of control and loss of know-how. In general, this model is suitable for non-strategic, final stages of the life cycle projects. In the second model, some project phases are outsourced while others are being done in-house. This model requires a great deal of cooperation between the two staff as well a high quality of knowledge transfer. Proper documentation and training are a must for the success of this model. The pros and cons of this model are similar to the first model on a varying scale. This model is suitable for well defined projects whose components have well defined interfaces. In the last model, vendor staff works as an extension of the in-house staff. This poses its own challenges in terms of accountability and manageability of work. The pros of this model is that it keeps the knowledge base at home, it is easier to adapt to rapidly changing requirements and it is less threatening to the local staff. This model is more suitable for strategic projects.

Process to Select Outsourcing Vendor and Region

Simply stated, the vendor must have a track record of core competency in the functions you want to outsource. It must have a stable skilled work force. It must be economically viable – its survival cannot depend on just one or two projects. It must understand the business and customer issues (even though it may not be directly involved with your customer). It must understand the client company's **language and culture**. Its employees must demonstrate the sensitivity to local staff's feelings (which can be often hostile as some of them might be losing their jobs). The vendor must be located in a **region** that is **politically stable**, has an ample **supply of highly trained workers** and the **telecommunications infrastructure** needed. It is a good practice to issue an RFI (Request for Information) that seeks this kind of information about a potential vendor. Caution here is not just to go for the lowest cost vendor, but to look at the total picture with a special eye for identifying the risk (of not getting things done, of company going into bankruptcy, of company 's failure to retain skilled staff).

Mexico as a region meets many of these requirements, even though there are some questions about the proficiency of English and rigor of its computer science/engineering programs. The physical proximity with the USA and same time zones are big pluses. There might be some cultural issues. When the author of this paper visited Mexico City for business a few years ago, he was surprised at the reluctance of Mexican counterparts in speaking English.

Quality of Contract Negotiation

Literature is abundant on this topic. In addition to a well defined statement of work (SOW) that should include the normal governance (management) process, one must put contingency (handling of the unexpected) clauses and risk mitigation clauses. The contingency clauses ought to include an immediate upper management (from both companies) review, right to obtain outside expert assistance and step-in rights that include potential termination of outsourced work and taking over by the in-house staff. It is a good idea to talk about termination rights in the beginning while both parties are in a spirit of cooperation. If work needs to be terminated before completion, the client company must ensure that the works gets completed without putting the company in a financial jeopardy. Under risk mitigation, the contract must address no-compete clause, intellectual property protection, data integrity, security and employee turnover.

Quality of Execution and Program Management

All wonderful planning and contract negotiations go to waste if they are not executed properly by both parties. Key requirements for successful execution are putting a top notch management team on both sides (program/project managers, technical managers and technical leads), selecting people with the right skills, transition activities that kick-off the outsourced work, insuring that knowledge transfer is taking place, and finally, making sure that tasks are happening or finding out quickly when they are not (happening). A common mistake companies make that team members are selected based on their organizations rather than their skills. The overall program manager has to be from the client company. He or she must have visibility in the outsourcing company so that the right people are selected in the teams. Also, the team members must be trained in cultural sensitivities – with a focus on improving their communication effectiveness.

Quality of Results

The challenge here is how to be able to see quality (or the lack of it) from a distance. As part of quality planning (quality by design), the program manager must insure that the outsourced company follows quality processes such as those based on ISO9001 or CMM5. Do not just depend on the fact that the company has these certifications. Ask for a quick audit. Also, define service level agreements (SLAs) for each stage of the project (initiation, interim and final). Define defect density, response time, defect fix time thresholds. Monitor the intermediate milestones and above all have periodic operational reviews.

Concluding Remarks

It is very clear that Mexico has a very small piece of the total offshore IT outsourcing pie, even though the Mexican government has taken steps to build the infrastructure (IT training incentives, telecom facilities, economic incentives, etc). This paper postulates certain drivers that could prepare Mexico to be the country of choice for IT "nearshore" outsourcing for the US market, undoubtedly the largest market. Mexico's real competitors in this are Canada and some neighboring South American countries. Two negatives, whether real or perceived, that need to be abolished are the lack of English proficiency and the less rigorous computer science/ engineering programs. The third element, even though sensitive to talk about and hard to change, is the cultural stereotyping that exists in the USA about Mexico. Further work is needed to demonstrate if and which of these factors are indeed enablers or inhibitors.

Firm Competitiveness and the Challenges of Globalization: Selected Case Studies from the IT Industry in Malaysia

Sayed Mushtaq Hussain
Universiti Utara Malalysia, Malaysia

Abstract

The Globalization process has increased competitive pressures on firms. In today's open and liberalized world, firms rather than nations have become the main players, bringing economic progress and development to the people. As such, their 'competitiveness' is of prime concern to all stakeholders, including the government and the people of a nation.

The process of globalization is expected to continue with technological progress and economic development. The ICT costs, one of the prime movers of globalization, will further go down and the financial liberalization will increase. Trade in services will also increase with further liberalization of the world economy. All of this will bring new opportunities for trade and investment, value creation, and market development. At the same time, globalization will increase competition and pose a challenge for firms to survive and prosper in the new (and fast changing) technological and business environment. This challenge seems to be the greatest for ICT-based industries, where the process of globalization is more smooth and rapid.

The purpose of this paper is to identify some of the major factors, which contribute to the 'firm competitiveness' and propose strategies, which may enhance firm competitiveness in developing countries. Case studies for the Malaysian IT industry are used to provide a specific context for a well-globalized economy from the developing world.

Introduction

Globalization, coupled with technological change, has altered the environment in which firms operate. In the open and liberalized global economy, firm 'competitiveness' has become a major challenge. This challenge is quite serious to developing countries, which are still in their early stages of development and lack a strong technological and business foundation.

The process of globalization is continuing at a fairly rapid pace due to the technological developments, which are taking place today in the world. Further, economic integration and liberalization of trade and investment are expected with economic growth and development of financial markets. The ICT-based industries show greater impact of globalization – both in terms of imports and export of IT products and services, as compared to other industries. This is attributable to the low costs involved in carrying out trade in information goods and the ever-increasing range of products and services, which are being produced by the ICT industries.

Malaysia is one of the fast integrators in the world economy. The country has adopted an open policy to foreign trade and investment and made remarkable progress in infrastructure development, economic growth, technology acquisition and development, education, and exports. Malaysia is also trying to promote Information and Communication Technologies (ICTs) as a means to bring about socio-economic change and to create business activities for the new economy. Multimedia Super Corridor (MSC) was established in 1996 to create the necessary physical and technological infrastructure to attract ICT investors and world-class operators. The MSC is located in Kuala Lumpur – which provides modern urban living conditions and is a hub for commercial and industrial activities in the country.

Although the programmers to promote ICTs in Malaysia are relatively young, the achievements made so far are quite impressive. By mid-May 2003, about 900 companies were granted the MSC status, which entitles them to a wide range of incentives and facilities for investment and business operations (see *Appendix* on the MSC). Out of the total of 900, about 742 companies were operational. The MDC Impact Survey [11] recorded a workforce of 21,270, 86% of this being knowledge workers. About 43% of the companies were engaged in local business only, while 57% have export business. In terms of value, however, local business was dominant, accounting for 82.5% of the total sales (estimated at US$ 1.5-1.8 billion). The key success factors for the MSC have been the heavy investments in infrastructure, excellent support services to the IT community, low cost of doing business, and modern and diverse urban environment.

The ICT-based industries in Malaysia are by and large composed of small and medium size firms. About 71% of the firms covered under the MDC Impact Survey [11] have paid-up capital of less than RM1.0 million (equivalent to about US$263,000).

As noted, local business remains the main driving force for the Malaysian ICT industries. More regional and international business is hoped for in the future. Global developments, however, indicate many disquieting factors, which may pose a challenge to the firm competitiveness in Malaysia. Some of these are the dramatic technological developments, which are taking place in the world as well as the increasing competition from the old and the new players. For Malaysia to continue with its success, regional/international businesses are important. To achieve this, a lot more has to be done to attract and retain world-class companies as well as improve the 'competitiveness' of the local companies.

The purpose of this paper is to identify some of the major factors, which contribute to the 'firm competitiveness' and propose strategies and programmes, which may enhance firm competitiveness for the Malaysian IT Industry.

Firm Competitiveness and Its determinants

Firm Competitiveness

Firm competitiveness has been defined as the 'ability to produce goods and services that meet the test of international competition, while the citizens enjoy a standard of living that is both rising and sustainable' – definition by Laura D'Andrea Tyson: quoted by Samitha Fawzy [4, p.1]. Other definitions are similar, though some emphasize 'productivity' growth of one firm relative to the others as firm competitiveness.

Definition of firm competitiveness may differ, but there is a consensus among experts that competitiveness of firms, industries, regions and nations is an important feature of the world economy. It not only affects the pattern of production, investment and trade, but also influences the relative standard of living of many countries.

Firm competitiveness somewhat differs from the competitiveness of nations – it is basically a zero sum game. Firms gain at the expense of other firms when competing. Also, when firms are not competitive, they will be out of business, though countries may still exist (probably in poverty and under economic distress).

In the competitive business world, firm competitiveness has become more complex as firms may compete in price, quality and customer services. To acquire competitive edge, the firms have to be concerned about –

- *Quality and Reliability – show a strong commitment to quality, flexibility, design, reliability, and accessibility.*
- *Technology, Organization and Market – combine technology, managerial entrepreneurship, employee skills, business organization, and software to service markets and interact with customers and suppliers.*
- *International Standards – follow/observe international standards for product safety, health and environment, corporate governance, etc*

Business Environment

Outside the firm, the national business environment substantially influences firm's ability to compete. The national business environment can have positive effects if it encourages competition among firms and provides incentives for investment, innovation, and enterprise.

Role of the Government

The role of the government is particularly important in providing the basic infrastructure and favourable business environment. Macroeconomic stability, rule of law and fair practices, transparency and accountability, pro-business and private sector orientation, simple administrative rules and procedures are some of the important requirements for creating favourable conditions for business and investment. These factors help to reduce business risks and lower the cost of doing business.

Globalization and Firm Competitiveness

Globalization is affecting firm competitiveness in many ways. It affects, through exports as well as imports. Exports compel firms to meet the competition at the international level. National markets become global as these are opened to international competitors through imports. Globalization of an industry take place when a firm produces in one country (to gain cost advantage) and sell in several countries, creating competition for all the firms in the industry.

Globalization may also affect the firm directly if the firm's value chain is decomposed and dispersed around the world to gain cost and market advantage. As a result, globalization contributes to the development of a global marketplace with intense competition. At the same time, the dispersal of the production activities helps firms to be cost-effective by benefiting from the differences in factors costs and quality. Globalization has also encouraged 'outsourcing' and broadened the options for transportation, warehousing and marketing. With careful production planning and logistics management, firm's competitiveness can be improved substantially with the 'new' economies of globalization.

The globalization of markets, industries and firms has made cost a critical element of competition. Larger firms are likely to benefit more in view of their ability to have economies of scale and scope as well as reap the 'new economies of globalization' due to their size-advantage to spend, invest, and coordinate worldwide operations. However, in their search for larger markets and opportunities, they tend to leave behind many unattended and unsatisfied market segments. These can be effectively exploited by smaller firms, which have the necessary flexibility to respond to the smaller, and more neglected market opportunities (i.e. niche markets). To exploit this potential, highly sophisticated strategic analyses of markets/industries are needed. Small and medium sized firms lack the necessary expertise and financial resources to undertake this task. However, the governments can play a useful role in filling this gap and supporting the small and medium enterprises.

Networking and Alliances

Firm's competitiveness can be substantially improved through networking and forming alliances. These can be used in research and development (R&D) for new products, create new markets, learning, and meeting customer needs. Two or more companies collaborate and complement each other, using their best competencies. Firms should develop a mechanism for improving innovation capacity through collaborative projects with network members.

Innovation Capacity

With the recent technological revolution, technology has become the most important factor determining the competitiveness of firms and industries. Firms with strong innovation capacity have a better chance to cope up with technological change and maintain (and even improve) its competitiveness. Innovation, in its broad sense, is defined any newly developed idea. It includes – both improved technology and better methods of doing things. Innovations may be manifested in new products or services, improved quality, new ways of production, packaging, marketing or distribution, new supply sources, new organization or systems [13, p. 149]. Innovation capacity refers to a continuous improvement of the overall capacity of firms to generate innovation for developing new products to meet market needs. The innovation capacity heavily depends on the continuous supply of innovation resources (i.e. skilled and technical staff, R&D activity, leadership and culture) and the accumulation of innovation knowledge. Organizational environment plays a crucial role in developing innovation capacity. Hierarchical organizational structures are found inadequate for building innovation capacity to meet the challenges of globalization, i.e. customization of product development and global linkages of product markets.

Learning

Knowledge is a strategic asset of a firm. Learning in a learning organization can be a source of competitive advantage. With networking and relational clusters, firms have better prospects of learning from one another. It improves competitiveness and is difficult to emulate by competitors [2, p.1].

Knowledge is generally dispersed – within the organization and outside. Both the external and intrafirm knowledge is needed to be integrated with a view to improving the firm competitiveness in the market. This requires a proper technology management effort, which can generate key firm competitive advantage, when guided by a market orientation [7, p.2].

Perspective on Firm Competitiveness – Selected Case Studies – IT Industry in Malaysia

The basic information on the Multimedia Super Corridor (MSC), provided in the *Appendix*, clearly shows that the ICT industry in Malaysia is dominated by small and medium size enterprises, while the bulk of the business is local.

The world-class companies (45, by September 2003) are composed of both foreign and local enterprises, though the number of foreign companies in this category is quite large. The total sales for the MSC companies are estimated at RM6-7 billion (or US$1.5-1.8 billion). If allowance is made for the imported equipment and purchased inputs by the MSC companies, the value-added may be around 30-40% (or US$0.5-0.6 billion), which is still small from international standards.

Judging by the progress made by the MSC – status companies, the trends look very impressive. The number of MSC companies and the number of k-workers doubled in three-year period (2000-mid 2003), as shown in the following-

Particulars	1997	2000	2003*
K-workers (no.)	1,946	9,842	18,922
MSC- status companies (no.)	94	429	901
Sales (RM billion)	n.a.	3.93	6.16

*Mid-May

Further success, however, will depend on the growth of IT-related business. The growth prospects of the domestic business depend on the performance of the Malaysian economy and the 'mega' projects, originating from the public and private sectors. Judging by the present economic situation, the growth prospects for the domestic business can at best be rated modest. Thus the IT-industries will have to look for business expansion in the regional and international markets. This will surely mean more competition for the Malaysian ICT industries. It will also require considerable innovation effort on the part of Malaysian companies to develop/adapt products to meet the needs of the regional and international markets.

Given the structure of the ICT-based industries (*SMEs* being dominant) and the major involvement of companies in domestic business under considerable government support/patronage, most of the local firms will face a challenge to their competitiveness.

To get a first hand assessment of the issues and problems on the ground, a study was made of 7 companies (listed in Table1) in June/July 2003. The selection of the companies was based on their reputation of being successful and dynamic enterprises. Special consideration was, however, given to the size distribution of the sample to reflect the industry structure. Four firms belong to the *SME*s category. One firm (Oracle) is a foreign subsidiary and one firm (MIMOS) is large and had considerable government support in the past.

Personal interviews were arranged with the Senior Management of the sample companies to discuss company's ownership structure, business activities and employment. The sample companies were also asked to give their views on globalization, firm competitiveness vis-à-vis other companies at home and abroad, problems faced and suggestions to strengthen the IT-based industries in Malaysia.

In addition to the seven sample companies, meetings were held with the Multimedia Development Corporation (MDC) with a view to ascertaining their perspective on the MSC companies and the future of IT-business in the short and medium term. Two Divisions of the MDC, namely Research and Development and Client Services were involved in providing the required information. Generally speaking, the response from the private and public sectors was extremely good. Although the sample is selective, it is believed that we have covered a good cross-section of firms from the Multimedia Super Corridor (MSC), which is the hub for the IT- based industries in Malaysia.

The results of study are briefly summarized as follows:

- *Financing* – small and medium IT-based companies face 'financing' problem to various degrees. Large companies are able to manage financing of their activities/projects without much difficulty.
- *Research & Development* – there is a gap in R&D. A large number of companies are not research minded and lack R&D facilities. In view of the absence/weakness of R&D, the long-run viability/sustainability of

many companies is an issue. Large and some medium size companies have R&D units and also rely on partners/principals for support.

- *K-Workers* – K-workers are in easy availability. But experienced and more specialized K-workers are in short supply. This is being tackled by hiring foreign workers.
- *Education* – IT- education and training emphasizes 'quantity'. There is a need to improve the 'quality' of education and training. English language skills are relatively weak among the local IT graduates.
- *Business Environment* – domestic market is not free and fully competitive. This retards the development of efficiency and dynamism in the industry.
- *Business Expertise* – Many local companies (particularly *SMEs*) lack business and managerial expertise. It adversely affects the development of the commercial aspects of the IT-related businesses.
- *International Business* – international business is mainly carried out by a small number of dynamic players. Institutional support for international business is rather weak.
- *Institutional Focus* – Institutional framework and government programmes are focused on infrastructure development, investment promotion, education and client services. Focus on people and innovation system is inadequate.
- *Venture Capital* – the MDC has a subsidiary providing venture capital to MSC companies. Many companies report problems in finding finance for their projects.
- *Outlook* – most *SMEs* are not 'forward looking' and do not see the challenges posed by the rapid globalization process and changing ICT-technologies. Companies are also not aware of the changing business models, resulting from the technological advancement and globalization.
- *Innovation System* – innovation system and policy are weak to create incentives and motivation for the industry to go for innovations in a big way. This affects the firm/industry competitiveness.
- *Infrastructure and Client Services* – most companies are satisfied with the excellent physical and technological infrastructure in the MSC area. Client services rendered by the MDC are well recognized. Regular dialogue sessions between the MDC and IT-companies provide a good mechanism to link the Government and the private sector.
- *Ownership and Management Structure* – most IT Companies are under individual proprietorship, partnership or have private limited company status. Management structures are highly personalized, and in some cases, are run as family businesses. As such, management standards and practices vary widely. Well-qualified and dynamic k-workers prefer working in more modern and well-managed companies.

Firm Competitiveness in Malaysian IT Industry – Strategies for Enhancement

In this section, strategies and programmes are proposed to enhance the 'firm competitiveness' in the Malaysian IT industry. Some of the measures are of general nature and can be applied to other types of industries as well.

Financing Support

IT-based firms have peculiar financing requirements. High-risk new technologies/business ventures pose problems of uncertainty and are not easy to evaluate and select. Knowledge workers and *SMEs* who may come up with innovative project ideas have very little or no tangible assets to offer as collateral. Bank –based financing which relies on intensive project appraisal and tangible securities, does not suit the IT-innovators and business start-ups. Venture capital type of financing is more suited to them.

In Malaysia, venture capital markets exists, but are not as developed as the bank - based financing. Thus, there is a need to further develop the venture capital market and make it more receptive to new business ideas and ventures. Government support is essential to make the venture capital work for the benefit of the IT industry.

It is not only the availability of funds, which makes venture capital effective and useful to the Industry. It is the right attitude and high business and technical expertise, which make the venture capital institutions more effective and successful in achieving their mission.

Information Support

Globalization and the IT-based industries are going through constant change – technologies, products, markets, business environment, customer needs and preferences, are all changing. The technological and business information, at home and abroad, is vast and complex. The *SMEs* and local IT-based companies are handicapped by the lack of full information about their businesses and technologies. For *SMEs* to function efficiently and innovate, basic information on present and future developments is essential.

At present, the *SMEs* in the IT-industry are operating with limited information about international markets and technologies, which are in the offing. Firm's ability to develop competitiveness on a sustainable basis is adversely affected. To fill this gap, the government should take steps to conduct specialized/strategic studies with the help of experts and provide the relevant infomation to the industry for guidance. The public-private partnership in this endeavour would be very useful.

Innovation System and Policy

The Asian development model has emphasized factor accumulation and technology transfer (through capital goods, FDI and licensing) as a means of achieving economic growth. The model has been successful in generating high rates of GDP growth. But, in the long run, the Asian economic model may not generate economic growth unless factor productivity improves. Some analyst has rightly emphasized the need to shift the policy emphasis from factor accumulation to technical change, from emulation to innovation, and from perspiration to inspiration [3, p.15]. It is noted that the contribution of Total Factor Productivity (TFP) to GDP growth was only 20-36% in some of the Asian countries compared to 50-80% recorded for developed countries. The TFP comes from technology and technical change – which are the result of innovation activity.

Due to the development strategies of the past, most of the public sector institutions are geared to investment promotion. FDI and technology purchases received high priority. As a result, the indigenous innovation system and policy focus lagged behind. To advance the development process further, the need to improve the innovation systems is very urgent, as the globalization process does not help to take the developing countries to and across the technology frontier.

Malaysia also followed the Asian model and has shown excellent progress. Further impetus will however come by raising the TFP, through the development of science and technology and an efficient and effective innovation system. The need for a properly working innovation system is even greater in the IT-based industries, which are becoming more competitive with globalization and technological advancement. For this purpose, firm level and state level actions are required.

Education and Training

In the IT- related industries, the most important ingredient for success is the K-workers. Greater investments are needed in intangible assets (R&D, technology, managerial, entrepreneurial, and employee skills, business organization, market development, and software) to gain flexibility and long-term competitiveness [4, p.7]. The *SMEs* lack resources to invest in people, R&D, and market development. All of these investments have externalities, which makes it less attractive for a small firm to invest. The government should provide support to *SMEs* to undertake these activities and increase their intangible assets and further accumulate IT-related business knowledge. Special strategies and programmes should be evolved to help *SMEs* acquire knowledge and train their workforce.

The general education and training system should also be oriented towards 'quality' and 'specialized skills' needed by the IT industry. A strong link up between the IT-based industries and academic/training institutions is needed to further improve the standards and make education and training activity more relevant for the industry.

Networking & Alliances

Networking and business alliances are extremely important for developing countries in order to pool resources and create economies of scale. Regional and international networking and alliances are particularly useful in business and enterprise development, R&D activities, science and technology and market development. *SMEs* in the IT-related industry can greatly benefit from networking and strategic alliances for technology acquisition, R&D, learning, product development, and marketing. Regional blocs such as the ASEAN should cooperate in preparing member countries for global business development in key industries.

Search for Talent

Well-trained and skilled workforce is essential for the IT-based industries. Malaysia has earmarked substantial resources for education and training. The availability of IT graduates is quite easy. However, more skilled and experienced K-workers are in short supply. The government has adopted a relatively open policy on foreign technical and professional workers. This has helped the industry to meet its short-term requirements.

The industry also needs successful and dynamic entrepreneurs and IT-related experts. To attract this category of people, greater effort is needed to search for talent and offer adequate incentives to attract them on a long-term basis.

Role of the Government

The government has a crucial role to play in enhancing the competitiveness of firms and industry. Government should ensure that markets work efficiently and, in the case of any market failure, remedial actions are taken in time. Firms need clear and simple rules. A stable macroeconomic environment, efficient institutions, and elimination of red tape, are essential to creating a favourable business environment for the firms to operate and grow.

The government should rely more on the private sector and play only a facilitating role. In the context of IT industry, supportive role is needed in conducting studies and organizing consultancies, knowledge acquisition and development, export promotion, and strengthening education and training. Public-private sector partnership should be encouraged to meet the challenges of globalization. The government also has a role to encourage networks/alliances for the development of science and technology, human resources, and markets in the region and outside.

Institutions

The institutions relating to the development activity are geared to investment promotion, development administration and economic growth. Malaysia has already made significant progress in achieving these objectives. As a way forward, the development model for Malaysia should change in favour of building a science and technological base, innovation capacity, business development, exports, and human resources, and efficient markets. For this, the institutions need to change their orientation and strategies. Also the operational capabilities will have to be restructured and further strengthened.

Focus on the Firm

Business development strategies at the firm/industry level are generally lacking in developing countries. Most strategies and programmes are macro/sectoral in nature and aim at attracting investment or promoting industrial development. Fiscal and monetary policies are well suited to create a favouable environment for business and industry, but are inadequate to assist business development at the firm level. Since the firms in developing countries are not at par with MNCs in developed countries, it is important to introduce strategies and programmes to strengthen promising firms and promote well-selected businesses for the global market. Innovative programmes and strategies and new business support models are needed for this purpose.

TABLE 1: BASIC INFORMATION ON ICT COMPANIES SELECTED FOR STUDY

	Name	Employ-ment	Type of Business	Size	Market	R&D Facility	Ownership	Source of Technology
1	eSmart Systems Sdn Bhd (Malaysia)	15	Internet based business – E-commerce Service/ service providers	Small	Mainly local; some regional component (niche market – software for golf courses)	NIL	Private limited company	Own
2	Sapura Advanced Systems Sdn Bhd (Malaysia)	1,000	Group of companies - multiple business. ICT products services and	Large	85-90% local 10% foreign diversified business	R&D unit in each type of business	Private limited company	Own/ purchased

			solutions					
3	Lotus Engineering Malaysia Sdn Bhd	150	Design engineering	Medium	Mainly local	R&D company	Private limited company	Own/head-quarters
4	Smart Global Network (M) Sdn Bhd (Malaysia)	10	Internet service provider	Small	Local (niche market – value added services)	NIL	Private limited company	Vendors/ own
5	Xybase MSC Sdn Bhd (Malaysia)	300	Software development/ applications	Medium	80% local 20% foreign (niche market – airport IT)	R&D Section	Private limited company	Own/ partners
6	MIMOS Berhad (Malaysia)	1,000	Software development/ business applications	Large	90% local 10% foreign	Applied R&D	Private limited company	Own/ partners
7	Oracle MSC Sdn Bhd (USA)	150	Software development/ training/ consultancy	Large	Local	NIL	Private limited company	HQ/regiona l support

Appendix: Multimedia Super Corridor, Kuala Lumpur (Malaysia)

The Multimedia Super Corridor (MSC) was established in 1996 'to *provide a comprehensive world-class ICT-enabled working and living environment to catalyze the development of a knowledge-based economy'*. The enabling environment and incentives were designed to attract leading global web shapers to use MSC as a hub as well as spawn both local and foreign SMEs. Briefly, the Multimedia Super Corridor has the following features -

Vision: To make Malaysia as an ICT hub in the Region

Concept: A facility to attract dominant ICT firms and make it a place for facilitating the development of small and medium enterprises (*SMEs*).

Key drivers: World leading MNCs, local companies and start-up development.

Desired Outputs: High value jobs, export-driven growth, value created from new ICT ventures, and enhanced national productivity and competitiveness

Location: Kuala Lumpur - consisting of *five* cyber cities/centres, namely Cyberjaya, Technology Park Malaysia, University Putra Malaysia - Malaysian Technology Development Corporation (UUM-MTDC), Kuala Lumpur City Centre and KL Tower. Cyberjaya is designed and developed for living as well as working in a multimedia environment.

Facilities:

Physical-Infrastructure: World class physical infrastructure - roads, electricity, water, transport network (both road and air)

Technological Infr.-

- Fibre coverage of MSC
- Broadband services
- Performance guarantee
- Open multimedia network for easy interconnect
- Policy for universal access, local content development, equitable access to ICT products, life-long learning opportunities
- E-Village for multimedia and content development
- Internet Desa Programme
- R&D Centre

Financial - RM500 million ICT Fund MSC Venture Corporation (MSC-VC) established in 1999 to assist MSC-status and potential MSC-status companies (RM120 million)

Incentives:

- Competitive telecom tariffs
- 100% ownership for MSC status companies
- Unrestricted employment of local and foreign knowledge workers
- No internal censorship
- MSC infrastructure contracts for leading MSC companies
- MSC status companies to enjoy no income tax up to 10 years or 100 per cent investment tax allowance and no duties on multimedia equipment

Legal Framework:

- Copyright (Amendment) Act (1997) - protection of IPR
- Digital Signature Act (1997) - verification
- Computer Crimes Act (1997) - check the misuse of computers
- Telemedicine Act (1997) - framework for telemedical series
- Communications and Multimedia Act (1998) - regulatory framework for ICT industries

Flagship Projects:

Seven flagship projects were introduced to provide business opportunities for private sector participation and boost the quick development of the MSC.

- Electronic Government
- Smart schools
- Multipurpose cards
- Telehealth
- Research & Development clusters
- Technopreneur Development
- Borderless marketing (e-business)

Administering Agency: Multimedia Development Corporation (MDC). It serves as the 'one-stop super shop'.

MSC-status companies:

Number -	895 (23/9/03) 895 (23/9/03)	World class companies 45
Ownership -	Local 68%	Foreign 30% JV 2%

Technology Focus - Software Development
Internet-based Business
Content Development
Incubation/SI/Consult
Education & Training
Hardware Eng., Design
Others

		1997	2000	2003
Employment:	K-workers	1,946	9,842	18,290
	Total workers	2,190	11,911	21,270

Key Challenges: Sustaining MSC as a preferred location & regional hub for ICT development; continuous investment in HRD – key to long-term development; assisting companies to become globally competitive

Reform Initiatives, Telecommunications and Economic Growth in Selected Asian Countries: An Econometric Analysis

Chandana Chakraborty
Montclair State University, USA.

Abstract

Utilizing Granger-Causality tests within a panel cointegration framework, this paper examines the possibility of a two-way link between telecommunications infrastructure and growth in a panel of selected Asian countries. In addition, it investigates the role of telecommunications reforms, especially, privatization of state-owned Telecom providers, in explaining the aforesaid relationship.

The results of the analysis suggest that there exists, in Asia, a long run cointegrated relationship between the two variables of telecommunication infrastructure and economic growth after allowing for short run adjustments between the two variables. Also, for the entire panel of Asian countries, causality between the two variables appears to be bi-directional. The direction of causality, however, varies between countries with high and low degrees of telecommunications privatization. For highly privatized countries, the causality runs both from telecommunications to growth and growth to telecommunications. However, the two variables fail to reinforce each other for countries that are yet to achieve significant privatization. Causality for this latter group of countries runs only from telecommunications to growth reflecting a weaker income effect in the absence of privatization.

Introduction

The close link between public infrastructure investment and economic growth has been established in the literature since early 1980s[1]. In the recent past, Canning (1998) and Canning and Pedroni (1999) have fine-tuned the conclusions on this link by using sophisticated econometric techniques that rules out the possibility of spurious correlation between the variables. Having reached a consensus on the positive growth impact of public infrastructure investment, scholars and researchers are now shifting their attention to one specific component of infrastructure investment, namely, telecommunications investment, with the expectation that the growth impact of telecommunications infrastructure investment will be much higher compared to that of any other type of infrastructure investment. Based on the findings of the existing literature, it is now widely believed that telecommunications infrastructure investment drives economic growth by creating network externalities, reducing transaction costs, and increasing productivity. In addition, it enhances growth by generating demand for telecommunications related products and services[2].

While there are quite a few studies on telecommunications infrastructure, only a few of those have critically examined the impact of telecommunications investment on growth measured in terms of real GDP (GDP from hereafter). The rest of the studies, places more emphasis on examining the impact of telecommunications reforms on its performance. The branch of the literature directed towards telecommunications impact of growth including Roller and Waverman (2001), Greenstein and Spiller (1996), Lichtenberg (1995) and Norton (1992) suggest that investment in telecommunications infrastructure impacts GDP significantly. Being devoid of a stationarity test on the time series used in these analyses, such results, however, are not indicative at all of a causal link between the two variables of Telecommunications investment and GDP. None of the cited studies except Roller and Waverman (2001) chose to address the issue of a possible causal link. In examining the link, the latter study utilized a joint equation system that endogenizes the telecommunications investment. The findings of the study suggest that there exists a one-way causal link between the two variables running from telecommunications to GDP. Further, the results indicate that the strength of the causality is dependent on the presence of a critical mass of telecommunications infrastructure in the study region or country.

The branch of the literature directed towards examining the impact of telecommunications policy includes the following. Fink, Mattoo, and Rathindran (2002), Wallsten (2002; 2001; 2000; 1999), Li, Qiang and Xu (2001), Boyland and Nicoletti (2000), Li and Xu (2000), Noll (2000), Petrazzini and Clark (1996), Wellenius and Stern (1995), and Megginson, et al (1994). Evidence from these studies suggest a strong association between competition and telecommunications performance measured in terms of number of telephone mainlines, connection capacity and price of telephone service. The findings on the effect of privatization of telecom providers are mixed. While many find that privatization lead to significant improvements in telecommunications service, a few suggest that privatization without regulation fails to improve performance. The latter group, however, finds a significant association between privatization and performance when privatization is combined with independent regulators.

While all the cited studies provide important insights into the relationship between telecommunications investment, GDP and reform efforts, they reflect no serious efforts in understanding the two-way causality between telecommunications investment and GDP. The two-way causality stems from the fact that while telecommunications investment enhances economic growth through network externalities, increased growth creates demand for telecommunication access through income effects. This paper takes the first step in exploring the two-way causality between telecommunications infrastructure and GDP for a panel of 12 Asian countries. A panel cointegration technique developed by Pedroni (1995, 1997) provides the analytical framework for this investigation. The chosen framework allows for a test of long run cointegrated relationship between telecommunications infrastructure and GDP and provides an error correction model to capture the causal link between the cointegrated variables. Taking note of the fact that most of the developing countries, including the Asian economies, have undertaken serious privatization efforts in their telecommunications sector since late 1980s, the paper also examines the changes in the causal relationship between the referred variables, if any, under high and low degree of privatization.

The results of the cointegration analysis suggest that telecommunications infrastructure and GDP are indeed cointegrated in the long run. A classification of countries with high and low share of private holdings in the telecommunications sector yields that the causality between telecommunications infrastructure and GDP are bi-directional for the countries with high degree of privatization in the telecommunications sector. For countries with low degree of privatization, causality runs only from telecommunications infrastructure to GDP. This evidently suggests that by keeping the income effect weaker, lack of privatization efforts prevents telecommunications infrastructure and economic growth to reinforce each other.

The rest of the paper is organized in the following manner. The section that follows discusses the data set utilized in the analysis. Section 3 presents the broad trends in the growth rates of telecommunications infrastructure and GDP for the selected panel of countries. Section 4 reports the results of the empirical analysis. A brief conclusion is included in section 6.

Data Description

The panel used in this paper includes 12 Asian countries and the study period spans from 1975 through 2000. A sub-regional breakdown of these countries is given in table 1. As is evident from the table, the list includes all the developing countries in the Asian region except, Vietnam, Cambodia, Myanmar and Nepal. To keep symmetry in the data set, these countries were excluded from the study list. The relevance of the chosen time period for the data set lies in its ability to capture the transition from nationalized monopoly telecommunications firms to partial or full privatization telecommunications sector holdings.

The variable telecommunications infrastructure in the data set represents mainlines access per 100 inhabitants, or teledensity rate (TDR hereafter)) as it is popularly known. TDR essentially measures the stock of telecommunications infrastructure as opposed to telecommunications investment. However, traditionally, the use of TDR is preferred over telecommunications investment because as suggested by Roller and Waverman (2001), “consumers demand telecommunications infrastructure, not telecommunications investment per se”. The GDP series represents annual real GDP measured in 1995 Dollars. Annual series for TDR and GDP for each of the countries and for each of the referred years have been collected from the World Development Indicators data base published by the World Bank in 2001.

TABLE 1: LIST OF ASIAN COUNTRIES

Sub-Region	Countries
East Asia	China Hong Kong Korea
South East Asia	Indonesia Malaysia Philippines Singapore Thailand
South Asia	Bangladesh India Pakistan Sri Lanka

Degree of privatization in the telecommunications sector has been measured with shares of private holdings in telecommunications firms in each country. Available data indicate that the average share of private holdings in the telecommunications sector is about 40 % in the Asian region. Consequently, countries with higher than 40% holdings have been categorized as ones with highly privatized telecommunications sector; countries that reflect less than 40% private holdings have been identified as those with non-privatized telecommunications sector. The data on private shares in the Telecommunications sector have been collected from the International Telecommunication Union or ITU for short.

Broad Trends in Telecommunications Infrastructure and Growth

Utilizing the data set, estimates for annual average growth rates of real GDP and TDR have been computed to summarize the trends in the selected countries. Table 2 reports the sub-period breakdowns of the growth rates for these two variables. In order to examine the impact of telecommunications reforms over the past two decades while controlling for the Asian Crisis, the study period has been divided into the following three sub-periods; 1975-1985, 1985-1995, and 1995-2000.

TABLE 2: GROWTH RATES OF GDP AND TDR FOR ASIAN COUNTRIES (PERCENTAGES)

Countries	GDP			TDR		
	1975-1985	1985-1995	1995-2000	1975-1985	1985-1995	1995-2000
China	8.14	10.13	8.62	0.11	2.76	14.88
Hong Kong	8.04	5.90	3.59	12.08	20.23	10.22
South Korea	6.76	8.30	5.62	11.80	24.86	16.90
Indonesia	6.18	7.14	5.57	0.19	1.23	3.08
Malaysia	6.33	7.45	5.70	4.34	9.99	8.92
Philippines	2.24	2.49	3.75	0.25	1.01	3.92
Singapore	6.72	7.85	6.66	18.30	12.17	14.75
Thailand	6.11	9.06	1.92	0.65	4.53	7.32
Bangladesh	4.35	4.22	5.16	0.06	0.12	0.22
India	3.91	5.76	6.06	0.16	0.83	3.57
Pakistan	5.91	5.53	3.44	0.17	1.09	1.20
Sri Lanka	4.64	4.48	5.12	0.21	0.57	5.07
Average	5.78	6.53	5.10	4.03	6.62	7.51

The data indicates that the stock of telecommunications infrastructure grew at a rapid pace throughout Asia since 1985 recording an average growth rate of 6.62 and 7.51 percent for 1985-1995 and 1995-2000 respectively. Also, average GDP growth rate reached its peak at 6.53 percent during the period 1985-1995. The reduced growth rate of 5.10 percent in the following period is perhaps indicative of the deleterious effect of the Asian Financial Crisis. It is interesting to note that despite this reduced growth rate, TDR recorded its highest growth rate during the same period. Whether this paradox can be explained by the increased internal efficiency resulting from intense privatization efforts undertaken by the selected countries during this period remains yet to be tested.

Overall, real GDP for the Asian countries reflects a strong positive association with TDR. The correlation coefficient between the two variables is 0.98.

Empirical Results

As has been mentioned at the outset, the positive association between GDP and TDR referred in the earlier section can be misleading because of possible unit roots in the two variables. To test the nature of association between the two variables while avoiding any spurious correlation, the empirical investigation in this paper follows the three steps suggested in Basu, Chakraborty and Reagle (2003). We begin by testing for non-stationarity in the two variables of GDP and TDR. Prompted by the existence of unit roots in the time series, we test for long run cointegrated relation between two variables at the second step of estimation using the panel cointegration technique developed by Pedroni (1995, 1997). Granted the long run relationship, we explore the causal link between the two variables by testing for granger causality at the final step.

Test of Unit Roots

The panel data technique referred above has appealed to the researchers because of its weak restrictions. It captures country specific effects and allows for heterogeneity in the direction and magnitude of the parameters across the panel. In addition, it provides a great degree of flexibility in model selection. The included alternatives range from model with a constant and a deterministic trend to model with no constant and no trend. Within each model there is opportunity to test for common time effects.

Following earlier works in the literature we test for both trend stationarity and mean stationarity for the two variables of GDP and TDR. Also, we control for time effects common to all countries (t= 1975-2000) within each model. Consequently, the models of interest are: model with a trend and common time effect (M1); model with a trend and no time effect (M2); model with no trend and common time effect (M3); and, model with no trend and no time effect (m4). With a null of non-stationarity, the test is a residual based test that explores the performance of four different statistics. Together, these four statistics reflect a combination of the tests used by Levin-Lin (1993) and Im, Pesaran and Shin (1997). While the first two statistics are non-parametric rho-statistic, the last two are parametric ADF t-statistics. Sets of these four statistics for each of the four models examined have been reported in table 3.

The first two rows under each model report the panel unit root statistics for GDP and TDR at the levels. Given that the left tail of the normal distribution is used to reject the null hypothesis, the positive values reported in these rows consistently fail to reject the null across different models.

The last two rows under each model report the panel unit root statistics for first differences of GDP and TDR. The large negative values for the statistics indicate rejection of the null of non-stationarity at 1% level for all models. It may, therefore be concluded that the two variables of GDP and TDR are unit root variables of order one, or, U (1) for short.

Test for Panel Cointegration

At the second step of our estimation, we look for a long run relationship between GDP and TDR using the panel cointegration technique developed by Pedroni (1995, 1997). This technique is a significant improvement over conventional cointegration tests applied on a single country series. While pooling data to determine the common long run relationship, it allows the cointegrating vectors to vary across the members of the panel.

The cointegration relationship we estimate has the following specific form.

$TDR_{it} = ?_{i} + ?_{t} + ?_{i}\, gdp_{it} + ?_{it}$ (1)

Where ? $_i$ refers to country effects and ? $_t$ refers to trend effects. ? $_{it}$ is the estimated residual indicating deviations from the long run relationship. With a null of no cointegration, the panel cointegration test is essentially a test of unit roots in the estimated residuals of the panel. Pedroni (1997) refers to seven different statistics for this test. Of these seven statistics, the first four are known as panel cointegration statistics; the last three are group mean panel cointegration statistics. In the presence of a cointegrating relation, the residuals are expected to be stationary. A positive value for the first statistic and large negative values for the remaining six statistics allows rejection of the null of no cointegration. All of these seven statistics under different model specifications are reported in table 4. The statistics for all different model specifications suggest rejection of the null at 1% level. We, therefore, conclude that the two unit root variables TDR and GDP are cointegrated in the long run.

TABLE 3: TEST OF UNIT ROOTS FOR GDP AND TDR

Variables	Levin-Lin Rho-stat	Levin-Lin t-Rho-stat	Levin-Lin ADF stat	IPS ADF stat
Model: M_1				
TDR	4.4206	1.6140	-0.5681	0.5127
GDP	2.7537	0.9327	0.4423	1.4281

Group PP-stat	-4.4023	-3.8135	-3.6937	-3.4528
Group ADF-stat	-4.0749	-5.8136	-3.0426	-5.1491

Test of Causality

The panel cointegration test reported above simply suggests that GDP and TDR are cointegrated in the long run. It does not reflect any causal link between the two variables. Neither does it offer any indication about the direction of such causal link. At the third and final step of estimation, we utilize an error correction model to test for Granger causality in the long run relationship following[3].

Granger causality itself is a two-step procedure. The first step relates to the estimation of the residual from the long run relationship. Incorporating the residual as a right hand side variable, the short run error correction model is estimated at the second step. Defining the error term from equation (1) to be e_{it}, the dynamic error correction model of our interest has the following form.

$$? TDR_{it} = ?_{1i} + ?_{1i} e_{i\,t-1} + ??_{11i} ? TDR_{i,t-1} + ?_{12i} ? TDR_{i,t-2} + ?_{13i} ? GDP_{i,t-1} + ?_{14i} ? GDP_{i,t-2} + u_{1it}$$

$$? GDP_{it} = ?_{2i} + ?_{2i} e_{i\,t-1} + ??_{21i} ? TDR_{i,t-1} + ?_{22i} ? TDR_{i,t-2} + ?_{23i} ? GDP_{i,t-1} + ?_{24i} ? GDP_{i,t-2} + u_{2it} \qquad (2)$$

As is evident from equation (2), the chosen vector error correction model involves k=2 lags. The parameters in equation (2) have important long run and short run implications for our purpose. The implications are as follows.

$?_{1i}$ = long run effect of GDP on TDR

$?_{2i}$ = long run effect of TDR on GDP

$?_{13i}$ and $?_{14i}$ = short run Granger Causality running from GDP to TDR

$?_{21i}$ and $?_{22i}$ = short run Granger Causality running from TDR to GDP

While the long run effects define movements along the path of a steady state equilibrium relation ship between GDP and TDR, the short run impacts simply reflect how the variables adjust in response to a random shock. Stated differently, the short run effects show how each variable in the defined cointegration model responds or corrects itself to the residual or error from the cointegrated relation. In this sense, the short run effects are transitory. Following Basu, Chakraborty and Reagle (2003) we use a standard F test to estimate the error correction model defined in equation (2). With a null of no causality, the precise direction of Granger Causality can be detected by using the F test to determine how significantly the coefficients for the above referred parameters differ from zero.

TABLE 5: RESULTS OF FULL PANEL CAUSALITY TEST

Null Hypothesis	Long-Run	Short-Run
Ho: GDP does not cause TDR	F=2.58	F=2.68
Ho: TDR does not cause GDP	F=10.2	F=1.77
Critical Value	F critical=1.55	F critical =1.38

The results of the F test for both long run and short run causality are reported in table 5. As is apparent from the table, the null hypotheses of no long run causality and no short run causality for the two cases considered are rejected at the 1% level. The full panel reflects bi-directional causality between GDP and TDR for both long and short run.

Impact of Privatization in the Telecommunications Sector

Although the full panel reflects bi-directional causality, the nature and direction of causality are likely to vary between the members of the panel that differ in terms of attained degree of privatization in the state-owned telecommunications sector. To capture the impact of varying privatization efforts, if any, we create sub groups of countries with high and low degree of privatization at the final stage of our analysis. The sub groups are defined on the basis of an index of privatization. With data on share of private holdings for developing countries, we computed a developing country average of private share by weighing the shares with individual TDRs.. We then formed the sub groups of countries with high and low degree of privatization by identifying the former group as one with countries reporting higher than the average share of private holdings.

The two-step Granger Causality test was repeated for each group of countries to detect the differential impact of privatization. The results of the tests are reported in table 6. The reported results do show difference in long and short run causality between the two country groups. For countries with a high degree of privatization, the causality is bi-directional both in the short and long run. For countries with a low degree of privatization, causality runs only from TDR to GDP. While there is a weak causality from GDP to TDR (at the 10% level) in the short run, long run causality in similar direction is rejected at all levels.

Table 6: PANEL CAUSALITY TEST WITH INDEX OF PRIVATIZATION IN TELECOMMUNICATIONS SECTOR

Null hypothesis	High degree of privatization		Low degree of privatization	
	Long Run	Short Run	Long Run	Short Run
Ho: GDP does not cause TDR	F= 4.61	F= 2.71	F=0.21	F= 1.55
Ho: TDR does not cause GDP	F=6.78	F= 1.84	F=6.99	F=2.47
Critical Value	F critical= 2.79	F critical=2.19	F critical = 3.17	F critical = 2.07

Conclusion

The link between telecommunications infrastructure and economic growth is gaining increasing importance in the literature. While many researchers have documented the link, the direction of causality between the variables has rarely been addressed. Utilizing Granger Causality within the framework of a panel cointegration model, the results of this paper suggest the existence of a long run equilibrium relation between GDP and TDR for a panel of Asian countries.

The presence of the cointegration relation raises the question about the direction of causality between the two variables and its long and short run dynamics. This paper uses the two-step Granger causality test to address that issue. Results from this test indicate that the causality for the full panel is bi-directional in the long run as well as in the short run. To gauge the impact of privatization efforts undertaken by the panel members since late 1980s, the paper repeats the Granger Causality test for created country subgroups identified by high and low degree of privation. The results from the repeat Granger causality test indicate that for countries with high degree of privatization, causality is bi-directional. For countries with low degree of privatization, causality runs only from TDR to GDP.

Issues and Challenges of The Malaysian Internet Payment System

Ku Ruhana Ku-Mahamud, Razman Mat Tahar
Ida Harlina Ikhwan Nasir
Universiti Utara Malaysia, Malaysia

Abstract

The Internet Payment System (IPS) is the latest means of doing financial transactions over the Internet. However, its inefficient usage among Internet users has become a prime hindrance for Malaysian utilizing the IPS despite the advantages and benefits it generates for users. Although many efforts have been made to make this as a secure and practical payment system, the use of IPS in Malaysia is decreasing. This paper discusses the issues and challenges of the IPS industry in Malaysia. Expected issues and challenges on IPS can be classified as customer, merchant, IPS provider, Internet service provider, financial institution and the government. A case study on the Cybank, an IPS pioneer in Malaysia, was done using the simulation modeling to evaluate the Cybank performance.

Introduction

There is no question that electronic commerce is changing the way we work and live, but is it making the economy more efficient? According to [8], e-commerce could have an overpowering effect on Malaysia's economy. To be more specific, in this Internet era, Malaysia could be at a more competitive edge when dealing with Internet businesses or Internet commerce. [7] Also said that like other major technological breakthroughs of the past, Internet commerce has the potential to bring the market economy a step closer to its theoretical potential.

IPS is any conventional or new payment system, which enables financial transactions to be made securely from one organization or individual to another over the Internet [8]. IPS is represented in digital form when commencing a transaction over the Internet, after the actual cash has been credited into one's Internet account. Digital form is also known as digital money or e-cash. A customer who can be an individual or a company, and is interested to do online financial transaction or shop on the Internet, must be connected either to an IPS supplier's website or a merchant that uses an IPS on his website. This means the website must be commerce-enabled. Both the customer's and merchant's request to clear the transaction will be handled by a third party or system better known as the IPS.

The benefits of utilizing the IPS, which stands, as an interactive mean of doing financial transactions through the Internet are convenient to use, can be done anytime from anywhere and is becoming more secured from time to time. It is also the new way of integrating commercial services to an electronic marketplace, which is the Internet, especially for small and medium enterprises (SME) to compete at the international level.

The benefits again are partitioned into three categories: advantages of payment distribution, online financial communication and easier financial operation. For instance on the advantages of the payment distribution, a greater availability of uncommon purchases, exotic, international products not sold locally [9] can be done despite the geographical factor. The purchases can be done online without having to think of the communication barriers like the time zone or working days that these suppliers may not be around. Easier financial operation would mean that the management of a specific product account is done automatically by the IPS although there are many products that are displayed on the website. Besides those services, the IPS is also a mean for private purchases and small amount of purchases (micropayment) unlike the usage of credit cards, which has a minimum amount to use.

This paper reviews the issues and challenges that will occur on the entities that make up the IPS industry while using the IPS. A case study on the Cybank was done using simulation modeling to evaluate the performance of its IPS. This paper is organized as follows. Section 2 describes the IPS in Malaysia while the case study on Cybank is explained in section 3. Section 4 provides the issues and challenges of the IPS followed by conclusion in section 5.

Internet Payment System in Malaysia

There are about 2.2 million Internet users throughout Malaysia and this number will grow exponentially with time [1]. This implies that about 10% of the Malaysian citizen uses the Internet and are computer literate and their capability to compete in this globalization era. An efficiency survey on the usage of IPS, which was conducted on 2,200 potential Internet shoppers by [3], shows that only 10% of the sample is utilizing this facility. This indicates a low awareness about the benefits of utilizing the IPS among them. The other 90% of the sample are still in impediment towards the idea of changing to a more convenient way of doing financial transactions. Several reasons have been highlighted in respond to this aversion and among them are the unsecured reasons, slower response time and non-automated authorization procedures that have to be executed manually or off-the-Internet to execute a transaction. Time is gold to these potential IPS users although they know that the procedures taken by these IPSs are important to secure a transaction, but this performance degradation will demoralize them. If this scenario continues, Malaysia will not be able to generate a faster domestic sector that can enhance the economy due to lack of usage and investment, although the Malaysian Budget for year 2002 has reported that the government will take firm actions to ensure domestic demand is fulfilled [6].

An example of an IPS pioneer in Malaysia is the Cybank system that is being managed by Oxford Media Sdn. Bhd., a subsidiary of Sateras Berhad. The customer, the merchant and the IPS are connected through the Internet, which is being handled by Internet service provider (ISP). There are a few ISPs that provide Internet connection in Malaysia and among the gigantic ones are Telekom Malaysia Berhad and Mimos Berhad.

Besides communication through the Internet, transaction off-the-Internet also occurs when the IPS is linked directly to the Intranet of a back-end banking system or a credit card system. This is due to the security procedures that must be followed in order to protect forgery of credit cards or intrusion of banking instructions. This off-the-Internet transaction is a 'must phase' for customers who wants to deposit his/her money in an Internet account. A better illustration on how the IPS works in the e-commerce industry in Malaysia is shown in Fig. 1. However, this diagram does not apply to other countries because their IPS can easily be connected to the banking systems through the Internet and their IPS vendors are also willing to take the risks of charge-backs if credit card forgeries occur.

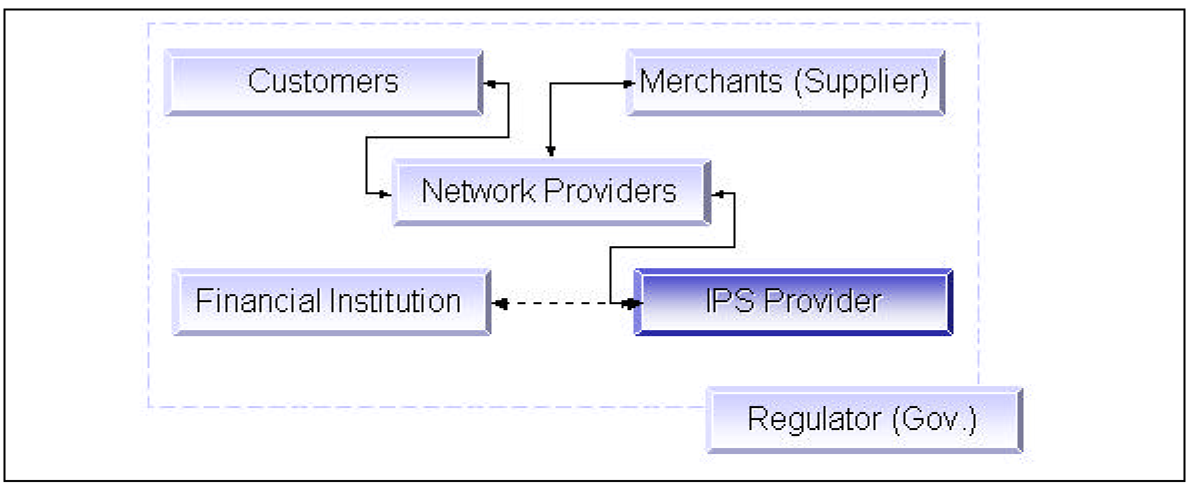

FIG. 1: GENERAL FLOW OF THE INTERNET COMMERCE INDUSTRY

The diagram also shows the responsibility of government in controlling and monitoring the flow of the whole Internet commerce industry either transparently or indistinctly.

The Cybank System Case Study

Cybank offers a global IPS that includes five services namely opening an account, adding cash, purchasing, transferring and withdrawal. With all the security guarantees and benefits that can be gained from Cybank, expectations were high that Malaysian public would favourably utilize Cybank. However, Cybank management reports that the usage of Cybank is on the decreasing. The need to find out the problem is important in order to improve its performance thus attracts more customers. Therefore, a simulation model was built to understand its potential and very nature. Simulation has been proven as a reliable modeling method that can imitate the behavior of complex transaction system as the IPS and this is also to avoid from tampering with the actual Cybank system.

The simulation model was designed and built in Arena. The model contains five subsystems, where each subsystem represents one of the five services offered. Data used was collected through observation and from historical records. The accuracy of the built model was validated where the simulated output was compared with the actual data. Table 1 shows the output of the throughput using simulation compared with the historical data and it seem that they are in good agreement. The higher difference for the withdrawal case is because the value is considered small and therefore creates a high percentage value.

The simulation output reveals that the adding cash section has the worst problem where the bottleneck seems to occurs. The average time taken at this section is 60.98 hours to do bank transfer request. This section is not automated yet, where it served by 2 customer service staffs. Their job is to inspect manually with external banks on the deposit that has been declared transacted by the customer via the given transaction identification. The task usually takes very long to complete because it has been done manually. The resource utilization indicates a value of 0.95.

Withdrawal on the other hand takes about 13.6 minutes. Purchasing department on the other hand takes only 3.34 minutes to complete while transfer request only required 1.3 minutes.

TABLE 1: DIFFERENCE OF THROUGHPUT BY CYBANK MODEL & HISTORICAL DATA

Service Type	Simulation Output	Historical Data	Difference (%)
Open Account	575	560	2.608
Transfer	140.41	150	6.825
Purchase	851.42	840	1.341
Withdrawal (Bank)	8.41	7.2	16
Add Cash (Bank)	33.16	35	5.527

The simulation shows that the Cybank system experiencing a serious bottleneck at two section, i.e. add cash and withdrawal. The problems at add cash will not resolve unless the section will be automated and not done manually as practice currently. Interpretation of the simulated output on the performance of the Cybank system indicates low utilization of the resources. Customers have to spend a long time due to Internet's response time and the lengthy adding cash processing time. As a result users were not motivated in utilizing the system due to its bad performance. To overcome this setback, we must look at the issues and challenges that must be faced by every entity that are related to the IPS industry.

Issues and Challenges

As Internet businesses continue to grow, profound effects in method of payment and economic theory and policy will rise. By 2003, experts of the United States of America estimate that electronic commerce will comprise 10% of their GDP. Further, they predict that Internet business activity will continue to increase after that [11]. The same will most probably happen to Malaysia since our economy is also affected by the USA's economy. The expected issues and challenges on IPS can be classified as customer, merchant, IPS provider, ISP, financial institution and the government.

Customer

Malaysian citizens or foreigners that have had exciting and satisfactory experience while using the Malaysian IPS should continue to use this service because they are the main contributor to a faster-growing economy. The domestic and foreign demand can be catered in more effective and efficient way. These individuals should start telling others the advantages of spending more and faster with the IPS, besides being able to create productive and knowledgeable Malaysian citizens.

However, for those who have had bad experience using the Malaysian IPS either concerning trust, security and privacy or too much hassle while operating it, should start sending comments directly to these IPS vendors to ensure that their services is upgraded to cater the responsive needs of the customers. The fear to continue using the IPS will give a negative impact because reduction to an accelerated economy will take place.

For those who have not had any experience and would like to try using the IPS, should always ensure that the company operating the said IPS are local companies, so as to ensure that their transaction is in safe hands. For these potential IPS users, the government's support or recommendation would mean a safer try-out for them.

For individuals that want to add cash into their IPS account but do not have credit cards, using the IPS seems like a no entry zone to them. However, there are other alternatives that have been offered and among them are the use of cash, bank transfers and other deposit means. When customers are occupied with easier means to use the IPS, more customers will be willing to use this great facility and purchase anything on the Internet as seldom or whenever they want. Having the privacy to purchase any extraordinary thing adds the need to utilize the IPS.

There are customers that do not know where to use these IPSs. In other words, the website that offers the same IPS that the customer is using is unknown to the customer. However, there are good IPSs which is locally managed by Malaysian companies that state the merchants' URL addresses for the convenience of its customers and as a value added service to every merchant in promoting their website.

Merchant

While using the IPS will add promotion to their website, the fear of incurring high cost pertaining to the use of IPS always occur. The total amount of paying a marketing, sale and accounting staff is more than the cost of doing business on the Internet itself. Internet commerce reduces the sales cost for such companies to negligible proportions like the cost of a storefront, middleman and other accrued cost that can be bypassed. Additionally, sales tax has not been present and is still an open issue in some countries [4]. Adding to this great news, recently the Malaysian government announced a waive of 10% tax on SME that does Internet business. The Prime Minister who is also the Finance Minister has suggested that Malaysia is lucky for having diversified economical structure [6] where the marketing and selling effort for all types of businesses can be applied on the Internet. Consequently, local companies that ventures Internet commerce will achieve higher profits.

This method of doing sales and marketing at the customer's leisure, insures that marketing will not be wasted on uninterested customers since it can be assumed that anyone who finds the website for a specific product has a predisposed interest in the product. In addition, collection of payment, which can be done online using the IPS will secure this selling point [9].

The IPS also facilitates micro payment services. This means even a one-cent product can be sold on the Internet without having to think on the effort that must be put into those minor transactions. Merchants will also have better account management since a product account is created automatically for every product that is displayed on the merchant's website.

An attractive commerce-enabled website with a good IPS must be built. Many problems in setting up a commerce-enabled website will occur but many local IPS vendors are willing to do it at a minimum cost or even free for these merchants. This initial investment for its set up and minimal overhead for its maintenance will make the business relatively cost effective.

More investment can be done to upgrade the quality of offered products or services so that the Malaysian merchants can be at par with other international suppliers. Furthermore, the operational costs of most Malaysian-made products are lower compared to other countries. Its uniqueness gives a better advantage for the Malaysian merchants to sell their products and secure international business. Foreign and local customers will have access to a greater variety of goods and services, greater ability to compare prices and paying it in order to secure an order [5].

This excellent and structured way of marketing, selling, collecting payment and managing accounts through the Internet is a must technology for Malaysian merchants. This will secure their Internet business, which includes penetrating the global market. Malaysia will have a boost in its economy since the local and foreign demand and supply chain will increase when exchange of cash between entities becomes more intense and the flow of foreign currency into our country also increase.

Internet Payment System Provider

Looking at the customers' and merchants' need which must be fulfilled, it is clear that these IPS provider must ensure that priority to enhance the areas of trust, security and privacy is very high. Hence, to develop trust for an IPS would simply mean involving unproblematic repetition of a process [2], such as when adding cash into an IPS account, which has been proven time consuming from the built Cybank simulation model. Although the off-the-Internet communication part is for security purposes, this will eventually create service dissatisfaction due to the time consuming factor. In other words, if a person can easily operate the IPS without adverse consequences, he/she will be more likely to use the IPS again. Therefore, building confidence in IPS consumption ultimately links to the issue of security, or ensuring a flawless transaction processing. In addition, the many ways of adding cash into an Internet account besides the usage of credit card must also be catered to promote the usage of IPS for non credit card holders.

The effort to link IPS directly to banks would be one of the solutions. A stronger and more distributed local IPS, can be generated and utilized at the international level. Here, the IPS provider itself will gain profit from the small charges that they make from the high usage of its system. As more business transaction takes place on the Internet, higher demand on the most comprehensive IPS will rise. Thus, more research and development must be done to ensure the continuation of a world-class quality IPS besides overcoming the intermittently rising problems. Other countries have fully automated the flow of Internet commerce it shouldn't be a problem for local IPS to follow, unless it involves the rules and regulation that the Malaysian government has stipulated. Obviously investment in this area is high but with the help of local academic institutions and private sectors that carry out research in this area, things will be simpler. More skilled Malaysian workers must also be employed to maintain and do enhancement work on the IPS.

Internet Service Provider

The exponential growth of Internet users in Malaysia will become faster as the need to utilize the IPS grow when every Malaysian realizes the benefit and advantage that he/she can gain from the IPS. More potential customers will access the Internet to shop, pay utilities or do financial transfers and more businesses will start venturing the Internet, build their website and utilize the maximum space that a hosting server allows. As a result, communication back and forth through the Internet will increase, in and out of the country, so the need of a higher bandwidth will be necessary to cater the responsive needs of these entities.

ISP will gain more business when more bandwidth is used and created thus generating a faster economy when they have to spend more on the effort of laying more cables, getting more communication and technical workers and enhancing the capability or usability of those bandwidth. Additional servers has to be purchased for the rising demand of hosting services due to the increasing number of businesses that venture Internet commerce. More money has to be spent and this obviously requires larger capital hence comes the need of loans.

Financial Institution

Banks should be more approachable and receptive when application of loans are submitted, with regards to the need of upgrading physical technological infrastructure which will help in the development of a more knowledgeable and efficient society. The chain of purchasing and selling by the customers and merchants and from the need of a better bandwidth will obviously profit the bank thus creating a faster growing economy.

Banks and credit card companies should also take the challenge of hooking their financial system to the Internet through these IPSs, though immense investment has to be done on restructuring the operations of their financial system, which involves gaining license from the National Bank of Malaysia. The logic is that, the IPS, which also has very reliable and proven security will be able to act as a firewall between the back-end of the financial system and the Internet, when considering the high possibility of Internet threats and attack. Consequently, the time consuming factor when customers request to withdraw physical cash from their bank accounts or credit cards, and add them into their Internet accounts, can be minimized due to the automatic clearance that can be done on the Internet itself. This tremendous change will create extraordinary interest among Malaysians especially those without credit cards, to explore the IPS and do financial transactions over the Internet. But most importantly is the government's role in ensuring that the usage of IPS will give a better impact to the economy.

Government

Being the citizen of Malaysia that trust and support its government, any recommendation or suggestion by the higher authorities will be pursued. For that reason, it is very important for the Malaysian government to study, support and recommend the use of IPS, which could trigger public's interest. However, there has been little guarantee or support from the Malaysian government on the security or capability of these local IPSs. As a result, the distribution of these IPSs are not widespread and are not recognized by banks making it worse for these IPS vendors to maintain this excellent technology and do wondrous enhancement on it. Therefore, government has to learn this technology and invest in promoting the benefits of IPS to the public through advertisement or education. Electronic or printed media can be used to convey theoretical input while practical training on government servants must be done as pilot implementation. Either administration staff or the laborers, every unit must be supplemented with this type of knowledge to operate the government's financial system, which will also be hooked up to the IPS. Besides being efficient in managerial matters, the accounting unit's burden to track the account is also lessen thus they would be able to look at other important accounting matters. As more government people start to use the IPS, the efficiency and productivity of our government will become better thus part of the electronic government flagship from the Vision 2020 can be achieved.

More research and development in the security, privacy and other IPS area must also be done, as government prepares scholarships for academician or students of local and private universities.

Conclusion

The unique benefits of the IPS make Internet an indispensable medium for commerce today. The Internet, which acts as a virtual marketplace is an arena for the exchange of both information and goods while the IPS secures the financial transactions that is done though it. The significance of this study comes in seriously for Malaysia since we know that communication through the Internet is an intrinsic part of any Internet business transaction. Furthermore, all statistics forecast a growth in Internet businesses. As Internet commerce begins to have a larger contribution to the overall consumption of the world, economic institutions will profoundly change. The changes in methods of payment, the science of economics, and the ways government can control Internet commerce will now be considered.

A more knowledgeable and productive society will also emerge through the six entities that contribute to the growth of Internet commerce. The IPS's societal importance on the Internet commerce industry will drive Malaysians to establish organizations, laws and currency necessary to secure the safety and efficiency of economic activity. In return, Malaysia will be able to benefit from the vast growth of a promising future and ensure Malaysia's survival in the rivalry globalization and liberalization era.

The Mexican E- Consumer: An Examination of the Key Factors in the Buying Process

Silvia González
Carmina Cavazos
Tecnologico de Monterrey, Mexico

Abstract

In Mexico, established businesses have started to implement electronic commerce as a way to add value to their marketing mix. However, e-commerce and marketing are areas that need further research to fully understand its mechanism and performance in the marketplace. The managers responsible to develop those strategies most of the times do not have the updated information of the real composition of their target segment. In this study, we will identify the factors that influence in the Mexican e-commerce buying decisions. A qualitative study was used with an e-mail sample of 593 students from a private university in the north part of Mexico. The results suggest that Mexican e-commerce buying decisions are influenced by the individual's mistrust in electronic commerce, brand loyalty, product demand, logistic issues, language skills, and demographic variables. The present research concludes with managerial recommendations.

Introduction

Nowadays, for developed countries, advances in information technologies are very common. In Mexico, electronic commerce has grown to be considered an important sector of the economy. This growth in the economy sector can be divided into two main areas. First, new businesses, aware of the benefits that information technologies offer, have implemented electronic commerce as part of their business unit strategic objectives since their beginning. Secondly, established businesses have started to implement electronic commerce as a way to add to their marketing mix. In this case, focus has been set on adapting traditional channels of distribution to their electronic commerce activities. In doing so, established businesses are unifying the efforts of the marketing mix to be congruent with the present business strategy. E-commerce and marketing are new areas for some organizations and these areas need further research to fully understand its mechanism and performance in the market. That is the way that the company will effectively face their competitors and fulfill a diversification in their chosen market. Although a synergy is what is required in order to have a strong and balanced marketing strategy, the managers responsible to develop those strategies most of the times do not have the updated information of the real composition of their target segment. A detail analysis of the target consumer and its buying behavior is important to fully co-penetrate business strategy with business performance.

It is in this line of reasoning that we present a typology of the Mexican electronic consumer (e-consumer) behavior. In doing so, we will identify the factors that influence the Mexican e-commerce buying decisions. A qualitative study was used with a sample of 593 students from a private university located in the north part of Mexico, divided in two different samples: sample one, those consumers whom have bought goods through the internet; sample two, consumers who have not bought on the internet. The results suggest that Mexican e-commerce buying decisions are influenced by the individual's mistrust in electronic commerce. Others factors that have an influence in the Mexican consumers' buying behavior are brand loyalty, product demand, logistic issues involved in the fulfillment of the e-commerce encounter and experience with the product. The demographic variables that have an impact in the variables mentioned above are sex, age, education, and second language (English) skills. The present research concludes with managerial recommendations about growth strategies that will influence the buying behavior of the consumer when using electronic commerce.

Conceptual Background

In the past decades, the business world has gone through some important changes regarding the way in which consumers do their shopping of products and services. These changes are due to the increasing use of Internet as a tool for buying and selling goods and services in the market. Internet has been defined as a global structure of information (Peterson, Balasubramanian, and Bronnenberg, 1997) or as a massive, global network (Hoffman, Novak, y Chatterjee, 2002), however all the definitions agreed to consider the Internet as an efficient medium for the access, organization, and communication of information between people and organizations. Extending this concept to the commercial transactions with electronic media and technology, we have reached to the e-commerce definition (Chircu y Kauffman, 2000).

E-commerce has various types of relationships: Business to business (B2B), consumer-to-consumer (C2C), consumer to business (C2B), and business to consumer (B2C) which is one of the most popular in the US. In contrast, in Mexico the main presence has been in the B2B transactions. Some estimates for electronic trade in Mexico pointed out 2 billion in 2003 of which only 600 million might be for consumer trade (Greenberg, 2000) in the present study we will focus only in B2C transactions.

Numerous investigations and theoretical conceptualizations are due to the strong popularity of the E-commerce worldwide, having the application to e-commerce strategies as one of the most researched areas. For example, Hoffman and Novak (1997) describe the e-commerce as a new marketing paradigm that can lead to a market in which cooperation would be more beneficial than competition, and to share information more fruitful than information control. Wind and Mahajan (1999) pointed out the importance of changing the marketing practices in this digital revolution, emphasizing on the agility and flexibility as key principles in the development of strategies.
Meanwhile, Peterson et al (1997) examined the Internet potential to reduce costs rather than generating profits. Evans and Wurster (1999) studied the competitive advantages.

Other line of research has been the study of inherent traits of e-commerce; Yadav and Varadarajan (2000) explore the user's role in the modifications of content and format in the actual environment. This is the way they defined interactivity. On the other hand, the intermediaries role has also been studied (Gosh, 1998; Chircu and Kauffman, 2000) and it has been though that cybermediaries might increase the market efficiency by creating scale and scope economies. In addition, the possible channel conflicts have been analyzed (Shaffer y Zettelmeyer, 1999).
Regarding consumers, new topics have been investigated. Like importance of the brand and trust on the Internet (Urban, Sultan y Qualls, 2000), price sensibility (Lynch y Ariely, 2000; Degeratu, Rangaswamy y Wu, 1999), buying process decision-making (Häubl y Trifts, 2000), and the factors that have impact on the shopping experience on the internet (Vellido, Lisboa y Meehan, 2000).

The buying process of a potential costumer is one the topics that cause great expectations among retailers, because their success and even survival depend on the knowledge of the market and the way their costumers react to different strategies. The results of the investigations cited above are of great importance for the US market, because is there where most of the studies have been conducted. The great amount of information about the Internet that has been produced has been very useful for store managers and businesspersons allowing them to design better-planned strategies since it vital information obtained from the US market. However, this information is not useful for businesspersons interested in the Mexican market, where the socio-economic situation and culture are quite different. In Mexico, the e-commerce is growing at a fast rate, but investigations on the Mexican market are scarce. Consequently, the decisions taken by executives in the Mexican market are merely intuitive or based in data coming from other markets. Therefore, the primary goal of this study is to increase the understanding of the Mexican e-consumer.

Internet in México

Study the development of the Internet in Mexico is not an easy task. There is a paucity of studies in the area and the data reported in them pointed out in several directions, this situation makes even harder the organizational decision making regarding e-commerce. Officially, the first organizations to be connected to the Internet were ITESM and UNAM in 1987. Universities were followed by other organizations like the government and businesses.
The number of Internet users reported in 2000 in Mexico was 2.6 million. The forecast of annual growth for the year 2000 was 37% (Select-IDC, 2001a). However, CETNET News (2000) published an estimate of 1.7 million for the same year, and a study of Net Value (Jones, 2000) limited the amount to 571,000 users for the same period. The

INEGI (National Institute of Statistics, Geography, and Informatics) reported data from 1995 to 2000, showing 2,712,000 users for the year 2000 (INEGI, 2000).

Without a doubt internet is growing in Mexico, even though it has not reached the level of other developed countries. For 2002, it was estimated that a 1.34% of the Mexican population was Internet users (Curry, James and Kenney, 2002). This is very low, comparing to the US or Japan. Anyhow, different forecast can be found about the Internet growth for the Mexican market. This is shown in Table 1.

TABLE 1: ESTIMATES OF INTERNET USERS (IN MILLIONS) IN MEXICO

Year	**Users (Millions)**	**Source**
2002	4.2	Curry, James, and Kenney, 2002
2003	26.0	Mindshare, 2000
2003	7.5	Curry, James, and Kenney, 2002
2004	9.2	Select-IDC, 2001[a]
2005	5.0	CNET News, 2000

According to data published by the INEGI (2000) organized in activity sectors in 1997, the area with the most rapid growth in personal computers connected to the Internet were business with a 55.67%, followed by households with a 17.75% , education with a 13.04% and the government with a 2.54%. Nevertheless, households and businesses have an annual growth index of 82% and 79% respectively. Data reported by INEGI is shown in the table 2. .

TABLE 2: INTERNET USERS BY SECTOR OF ACTIVITY 1995-2000 (THOUSANDS)

Sector	**1995**	**1996**	**1997**	**1998**	**1999**	**2000**
Government	3	5	14	31	167	193
Households	10	29	141	297	478	1,006
Education	33	69	142	154	166	276
Business	48	84	299	740	1,010	1,177
Total	94	187	596	1,222	1,821	2,712

E-commerce in Mexico

Mexican e-commerce has been growing rapidly. In spite of several factors like limited infrastructure, high access costs, and low credit card penetration and a common misperception that Latin America countries are not ready for e-commerce, in 2000, Mexico was in the second position in retail e-commerce after Brazil and followed by Argentina. According to a report from e-Marketer, a research firm from New York, Latin America electronic commerce might represent five percent of the internet users worldwide by 2003 and Mexico could reach 107 billion in e-commerce trade (Greenberg, 2000). Several factors might help to support the growth of the B2C e-commerce in Mexico. First, before 2000, all contractual agreements in Mexico required a physical signature. In that year, Mexican government approved a new law where internet purchases orders are considered binding contracts, electronic transactions are required to comply with existing commerce and advertising standards, copies of the transactions must kept for 10 years, and electronic consumers data are kept confidential (Greenberg, 2000). Second, per-call phone charges and cable modem services, a proliferation of cyber cafes, large organizations, particularly universities, providing free access to their students, and prices decline in computers and components (Curry, Contreras, and Kenney, 2002). Some of the factors that still need attention are the high service costs, low phone line density, poor telephone service quality, and an inefficient public postal service (Curry, Contreras, and Kenney, 2002).

Mexican E-Consumer

Methodology

For the present research, a previous study was conducted among 100 students to determine the products that they usually get from the Internet. The products most bought were electronics and books, which the results are shown in table 3.

TABLE 3: PRODUCTS BOUGHT BY INTERNET

Product	Percentage
Electronics	16
Books	16
Clothing	14
CD’s /DVD	13
Tickets	7
Software/Games	5
Collectibles	5
Air tickets	5
Sport Goods	4
Reservations	4
Groceries	4
Gifts	3
Flowers	2
Magazines	1
Watches	1

Because of the nature of the sample, students (undergraduate and graduate), books were chosen for the study. An e-mail list of students from a private college in Northeastern Mexico was obtained. An invitation was sent to the sample with a link that took them to the questionnaire. 593 responses were received.

Results

The results shown 390 cases in which consumers did not buy in the Internet their books and they bought them at local libraries instead. There were 191 consumers who reported that they did buy on the Internet, and 124 bought at an American website. (Amazon, Barnes & Noble, Publisher web sites), 67 bought them in Mexican websites (Sanborns, Submarino, Gandhi, Delfos, DeCompras, Book Shop, and Publisher`s web sites), and 12 cases of no response.

Traditional Consumers

The amount of participants that reported a negative response towards the Internet shopping was of 390.The reasons given to explain why they choose to get them in morter and brick bookstores are shown in table 4.

TABLE 4. REASONS WHY PARTICIPANTS DO NOT BUY IN THE INTERNET

Lack of Trust	21.2 %
Local bookstore preference	19.0 %
Book available in local bookstore.	17.9 %
No Credit Card	14.2%
Enjoyment in the book display	5.6 %
Immediate delivery	4.6 %
Cost	4.0 %
Do not buy books at all	3.8 %
Not yet	3.4 %
Not interested	2.1 %
Dislike the experience	1.6 %
Previous bad experience and bad service	1.6 %

Electronic Consumers

Of the consumers that did make an electronic shopping, 65% of them shopped in Amazon.com, and the 35% in other on-line bookstores (Barnes & Noble, Sanborns, Submarino, Gandhi y otras). The reasons they expressed for their Internet preference were: The book was available online only; the company's reputation, topics, author, delivery time, service, price, positive experience, and the easy process are among the most important factors. Participants were asked to distribute 100 points to grade the importance of each factor in terms of buying decision. Results are shown in table 5.

TABLE 5: IMPORTANCE OF THE FACTORS IN THE DECISION PROCESS.

Factors in the decision process	**Weight (means)**
Book was available online only	25.35
Easy process	15.99
Reputation	15.32
Delivery time	10.69
Service	10.06
Topics	8.81
Positive past experience	8.79
Price	7.62
Author	3.94
Others	1.61

When the participants were questioned about why the like to buy on an electronic site their main responses were based on convenience, they said it is easy, save time, or they can buy at any time. The results are shown in Table 6.

In respect to the demographic variables of gender, age, education, income, and language skills, the results were the following: It was found that gender, age, education, and language skills (English) are related with the e-shopping behavior, while income does not. These aspects will be described below briefly.

TABLE 6: REASONS WHY I LIKE TO BUY ELECTRONICALLY

I like to shop electronically because:	**Percentage (More than one answer)**
It is Simple	71.8
Save time	67.7
I can buy any time	67.7
It is convenient	62.1
Compare product and prices	54.8
Immediate Information about the products	53.2
Variety	50.0
Additional services	18.5

Gender

The 43.3% of men stated they bought books through the Internet, while just the 22.9% of women did.

Age

The 60.9% of the participants in the age range from 30 to 34 do buy through the Internet. This percentage is significantly larger than the rest of the categories, 17% in the range from 18 to 24, and 39% in ages 25 to 29. The difference among the percentages for the rest of the categories was not significant.

Education

It was found that with higher education level, the greater the likelihood to buy through the Internet. Among the undergraduate students, only 10% bought electronically, while the participants with a college degree percentage were of 40%, and the graduate students reported 43%.

English
Similar results were found with second language skills (English). The greater the English level, the higher probability of buying through the Internet. Those who mentioned to have a 41 to 60% of English, only the 19.3% bought books electronically. From the 61-80% of English speakers segment, the percentage was 27.1% and the ones who reported an 81-90% of language skills, the percentage was high 35.1%, and for who had complete domain over English as a second language (91-100%) the percentage was even higher 44.3%.

Discussion

The main reason for not buying books over the net is related with the lack of trust to the website. This explains mainly as the unwillingness to provide personal information like credit card numbers through this medium and the misuse that could be given to that information. Other related reason for this lack of trust is the perceived risk that, once a product is paid, it will not be delivered. In general, the Internet was not considered a safe medium for commercial transactions.

The personal attention and advices from the salespersons are the key elements that make them prefer traditional stores. Another important factor is that large amounts of Mexican population do not have credit card access. Other factors mentioned were related to the logistics and costs of the goods. It is interesting noticing that only a small percentage of the respondents reported bad past experiences during internet shopping.

Next, we will discuss some strategies that might be considered to overcome these barriers to the development of the e-commerce and how could they be applied to Mexico.

Strategies

Trust
As the results show, trust is one of the elements that have an impact on the Mexican buying behavior. In order to provide the user with an environment that could provide the basis for trust building and creating a relationship with the Mexican consumer, it is important that we take into account the types of consumers that are acquiring products through the electronic market. Are Mexican consumers innovators, early adopters, late adopters lagging behind? Are the Mexican consumers choosing the e-markets because of an impulse, emergency, commodity, convenience, or luxury buy? Although the type of consumer is important, trust is an element that has to be part of both sides, the company that provides its products/services on the electronic market and the Mexican consumer.

The electronic commerce is one opportunity to promote exchange and to build relationships, mainly because there is an increasing rate of technological change and diffusion, the substantial changes in information technology result in an information-rich, computation rich, and communication rich organizational environment (Bettis and Hitt, 1995). In addition, there is an increase in knowledge intensity and the emergence of positive feedback.

According to Gurbaxani and Whang (1991) the Internet model is based on the agency and transaction cost theory. The former views the firm as a nexus of contracts among self-interested individuals and later assumes that the firm exists because various transactions markets costs are minimized when the firm bypasses the market and coordinates production itself. In other words, the internet model is one that can promote the growth of trust in the users due to the nature of the transactions and the participants involved. Trust has the potential to develop with the increase and repeated use of the media for consumption purposes. It is hardly unlikely that trust will have an impact on sporadic consumers.

On the other hand, trust building and maintenance must be the objective of the company. According to Morgan and Hunt (1994), relationship marketing is establishing, developing, and maintaining successful relational exchanges. This relational exchange involves commitment, trust, and satisfaction. For companies that offer their products on the Internet, it is important to know and control these elements in order to have a better performance, measured as sales. Cultural barriers will always exist, but it is in the best interest of the companies providing products on the electronic markets to assure that the information that is about to receive from the consumer will be used only on behalf of the consumer (e.g. credit card information, buying behavior, comments and feedback). If the companies that are into e-commerce realized which elements are embedded in the sales transaction, they could view this process as a relationship-marketing paradigm, and develop strategies to that specific market.

Product

Many factors will influence a consumer's decision to shop electronically versus in-store. Alba et al. (1997) found that the growth in the use of e-commerce depends on a vast selection of products, product screening, product reliability and product comparison available to the Mexican consumers. In our research, the products that were thought of being bought using e-commerce had the characteristic to be part of the shopping goods products classification. Several marketing researchers as Kotler, Lamb et al. and Pride and Ferrel have researched this classification.

Some of the elements of this classification refer to the consumer in an effort to select and purchase the product, compares products on such bases as suitability, quality, price, and style. For this product category, it is expected that consumers will prefer retailers that freely provide such information and make cross shopping easy; therefore, isolationist vendors could be bypassed in the search process. In the Mexican context, the importance of search engines that are able to pull the variety of products into the consumer's attentions is vital. Language barriers must be minimized in order for the consumer to get a vast variety of products that will satisfy their needs. When being exposed to a great variety of products, the consumer also learns about them, and gets involved in the process, lending to increased use and potential electronic consumption. By providing more information to consumers with minimal search cost, manufacturers and retailers with differentiated offerings will have a greater opportunity to educate consumers about the unique benefits they offer, and consumers will find it easier to access and compare the offerings of firms competing on price.

Since there is not really a specific type of Mexican consumer in the electronic market, such inherent consumer heterogeneity suggests that any retail format can dominate all segments of consumers. Instead, product specificity will determine which products are more likely to be traded and consumed using an electronic format.

E-commerce Service Encounter

In the electronic markets, the Mexican consumer is looking for an alternative to satisfy his/her needs. Thus, cooperation from both the consumer and the provider requires an active participation in the relationship to achieve mutual benefits. The trust fostered in dedication-based relationship maintenance is conducive to coordinated, cooperative behavior (Pruitt, 1981). Furthermore, Berry and Bendapudi (2003) concluded that relationship maintenance is important in keeping customers. The possibility exists that customers might lessen its interest for the company or product, but still will be less likely to leave and search for another. In the Mexican context, emphasis should be made on developing this interaction between consumer-product/company. Relationship enhancement the customer makes investments in the relationship; this may depend upon the basis on which they maintain their relationships with service providers.

Another important element that should be taking into account is what the switching level is for the Mexican e-commerce consumer. Keaveney (1995) concluded that consumer-switching behavior involves the price of the product in question, inconveniencies with the product, failures with the core service, failure with the service encounter and failure in responses from the employees, competitive issues, ethical problems, and involuntary factors. Her major premise lays in the fact that companies must deal with behaviors and actions and with the willingness to be loyal. In regards to the e-commerce arena, technology plays an important role in enhancing the service encounter with the consumer. Nevertheless, if these elements are incorporated in the encounter and are clearly appreciated by the Mexican consumer, the positive result will have the possibility to create a relationship with the Mexican consumer.

Customer experience is also a key factor in the service encounter. As we mentioned earlier, in this present research, the product into considerations were mainly those that were classified as shopping goods. It is inherit in this classification that the consumer has previous experience with them and is in the process of make a selection through comparison. Thus, previous experience by the Mexican consumer with the product will play an important factor in the selection of the media to buy. If the Mexican consumer incorporates the previous experience with the product in the e-commerce setting, the degree of experience, the result of that experience and the overall satisfaction will play a key role in selecting e-commerce as a media to buy. Thus, these elements must be taken into consideration.

Conclusion and Further Research

The Mexican consumer in particular is important to take into account as a retrospective look at how marketing can be a potential value in enhancing the process of creating new marketing knowledge that could benefit companies in their strategic process for their electronic markets. By understanding the barriers and blocks to the process of electronic consumption, marketers should be able to learn something about how to make it work more effectively in regional markets. Support should be provided for basic technical and non-technical reviews of new concepts, findings, and techniques in the dynamics of electronic markets so the Mexican consumer could follow the trends and adapt those to the products that have the potential to make a match. The conclusion here is that we hope for greater sensitivity to concerns for the state of the Mexican consumer behavior towards the electronic markets.

Opportunities for further research are in the lines that Alba et al (1997) mention of what would be the fundamental changes that can occur in information processing of the Mexican's consumer choices and behavior, how do content and presentation of the product information affect Mexican's consumers' willingness to make choices without directly experiencing the product and ease on the trust factor, and how will Mexican consumers react to the collection of detailed information about their needs and purchase behavior? In addition, in the lines on product and e-commerce, we will find a new research area that investigates the various elements of product and its categories. In the product development area, the several research areas will be whether the consumer (or buyer in B2B markets) has knowledge of the characteristics of the product and what the consumer behavior approaches towards it are. What are the kinds of products that are more feasible to be exchanged or transacted through the e-markets? What is the pattern of buying behavior of those products and what are the distribution issues of them.

In the brand area, the research will be toward what is the degree of brand recognition. Is it possible to create and develop a brand that applies to the global and unidentified segment of the e-market participants? What are the ways in which the firm can capitalize on the bran equity that will be formed? In the package area, what is the relevance of package in e-markets? What is the impact on R&D in package development for e-market products? This research can benefit from the construct of organizational memory, since one of the benefits of e-markets is the interactivity and flow of information between users. The challenges that presents this construct is the way the firms will manage such amount of information and what will be the financial repercussions of them in the firm's performance.

Corporate Governance & Institutional Framework

Exploring the Impact of Corporate Governance System on the International Strategies of SMEs

Cristiana Compagno
Daniel Pittino
Francesca Visintin
University of Udine, Italy

Abstract

Several theoretical and empirical works have demonstrated that corporate entrepreneurship is fundamental to achieve sustainable competitive advantage in the firms facing turbulent environments. One of the factors that can influence corporate entrepreneurship is the corporate governance system. The relationship between corporate governance and corporate entrepreneurship has particular characteristics in SMEs, where the association among governance structure, strategic leaders and firm performance is more pronounced [Daily et al., 2002]. In this paper we attempt to explore the relationship between CG and CE in SMEs using international venturing as dependent variables. Internalisation of SMEs can in fact be considered as a CE activity. Our main hypotheses are that structure of ownership and governance bodies can influence the internationalisation strategies, and that environmental dynamism acts as a moderating variable of these relationships.

Corporate Governance and Corporate Entrepreneurship

Corporate entrepreneurship [CE] is defined in the seminal work of Miller [1983] as the capacity of a firm to engage in product-market innovation, to undertake risky ventures and to come up with proactive strategies. Various authors have subsequently focused their attention on the ways of creating new businesses within established firms to build up long-term competitive advantages. The study of CE has thus become an integral part of the strategic management literature. Several researchers have analysed forms, antecedents, and effects of CE activities; some authors have emphasized the product/process and technological dimensions of these activities [Covin and Slevin, 1991; Burgelman, 1991], while others have highlighted aspects such as entry in new markets [Lumpkin and Dess, 1989] and strategic change [Guth and Ginsberg, 1990, Dess, Lumpkin and McGee, 1999].

Empirical evidence suggests that corporate entrepreneurship can improve organizational growth and profitability [Zahra, 1991, 1993; Zahra & Covin, 1995]. Moreover, it has been argued that entrepreneurship at the firm level can enrich a company's performance by fostering organizational learning and creating new knowledge that becomes a foundation for building new competencies or revitalizing existing ones. Learning in CE activities entails the acquisition of new technical, social, and organizational skills [Zahra, 1999].

Previous research has showed that the determinants of CE are both external and internal; while external factors are related to environmental traits, such as competitive dynamics and institutional context; internal factors refer to the “entrepreneurial posture” of the organization [Covin and Slevin, 1991]. The literature has widely recognized that it is difficult to create a fit between entrepreneurial activities, characterized by ambiguity, risk taking propensity and innovation, and organizational structure, created to ensure control and efficiency. Various authors tried to define the managerial, structural and cognitive variables that can stimulate entrepreneurship within an organization [see for example Jelinek and Litterer, 1999; Hjort and Johanisson, 1994]

One important variable that can influence the entrepreneurial posture of a firm is the corporate governance system [Zahra, 1996]. We define corporate governance system as the system through which firms are directed, controlled and made accountable towards their stakeholders [Cadbury, 1994; OECD, 1999]. The concepts of control and accountability refer to the functions of monitoring and evaluation of the managerial behaviour, to ensure that top executives pursue the interests of the main stakeholders; the notion of direction includes the functions of strategic goal setting and definition of the long term objectives of the firm. The influence of corporate governance on corporate entrepreneurship and, in particular, on strategic change, has been mainly analysed studying the role of the board of directors [Hill and Snell, 1991; Baysinger et al., 1991, Goodstein et al., 1994; Zahra, 1996; Stiles, 2001; Golden and Zajac, 2001]. These researches are grounded on various theoretical perspectives; the main arguments come from agency theory, resource dependency theory and upper echelons theory. According to agency theory, board enhances corporate entrepreneurship ensuring that firm resources are allocated efficiently to areas necessary to long term advantage and superior performance [Zahra and Pearce, 1989]. Resource Dependency Theory suggests that the survival and success of the firm depend upon the ability to build up networks of relationships and obtain critical resources from the external environment [Pfeffer and Salancik, 1978]; thus, boards can influence entrepreneurship by including people that brings innovative competences and new strategic insights to the organization [George et al., 2001]. Upper echelons theory studies boards as the main decision making groups, whose role is shaping the firm's strategy [Hambrick and Mason, 1984; Hambrick and Finkelstein, 1996; Forbes and Milliken, 1999]. A basic assumption of the upper echelons model is that demographic characteristics are systematically related to the psychological, cultural and cognitive elements of the firm leaders.

Research using this theoretical framework has linked the demographic characteristics and/or the demographic diversity of the "managerial elites" to a variety of organisational outcomes including: financial performance [Keck, 1991; Hambrick and D'Aveni, 1992; Michel and Hambrick, 1992;], strategy [Finkelstein and Hambrick, 1990; Michel and Hambrick, 1992; Pegels, Song and Jang, 2000], strategic change [Grimm and Smith, 1992; Wiersema and Bantel, 1992] and organisational innovation [Bantel and Jackson, 1989; Smith et al. 1993]

The relationship between governance and entrepreneurship shows particular features in small and medium enterprises, where exists a high degree of overlap between ownership and management functions. In addiction, small firms are in the vast majority family firms, where the ownership, governance and management functions are held by one or more families, linked one another by parental ties or strong alliances [Corbett, 1995]

To understand and explain the influence of CG on CE in small and medium enterprises, theoretical suggestions need to be adjusted to fit the specific characteristics of these firms. For example, agency problems are often strongly reduced by family relationships that act as a source of trust and commitment [Mc Conaughy, Mc Conaughy et al., 2001] and work as a powerful mean to align the interests of stakeholders, providing effective allocation of resources to reach long term objectives.

The arguments of Resource Dependence Theory can be applied to the presence of non family members in the board; these outside directors can promote innovations in the entrepreneurial culture and help overcoming the resistances to change that often characterize family firms [Salvato, 1999; Johanisson, Huse, 2000, Gabrielsson et al., 2002].

Moreover, upper echelons theory is particularly suitable to analyse the strategic role of the board in SMEs, because board members are often involved in the daily management and have direct and frequent contacts with the other executives, thus the role of the governing body in shaping and evaluating strategy is reinforced [Daily et al., 2002].

Recent empirical work focusing on SMEs has adopted these perspectives, analysing the impact of the governance system [in terms of both ownership structure and board functions] on entrepreneurial posture and behaviour of firms, measured through proactiveness, risk taking propensity, product innovation [Gabrielsson, 2002; Salvato, Marchisio, Corbetta, 2002; Salvato, 2000; Zahra, Neubaum, Huse, 2000] and specific innovative activities in organization and strategies [Nordqvist, Brunnige, 2001; Compagno, Pittino, 2001, Corbetta, Gnan, Montemerlo, 2001]. These studies have confirmed the importance of CE in building the competitive advantage, especially within small firms facing fast changing and dynamic environments.

Internationalisation as CE activity

Despite the lack of attention by the international business theories, the internationalisation of small firms is an important phenomenon in Europe. It has been estimated that over 40% of European small and medium firms work with foreign partners[i]. Small and medium enterprises adopt a huge variety of international strategies, ranging from export processes to partnerships, joint ventures and direct investments. There are several reasons why small firms should do international business; some of them are:

- access to new markets and social networks
- access to new technologies and human skills
- attainment of a stronger position towards customers and/or suppliers
- access to production capacity and financial capital
- enrichment of the entrepreneurial culture

The empirical literature has classified the factors that lead to internationalisation of SMEs in three groups [Donckels, 2001:

Personal traits of the entrepreneur[s]: general attitude towards collaboration, openness towards the international scene, specific knowledge and experience; willingness to delegate.

Organizational characteristics*:* variety of strategic options and product-market combinations; availability of financial resources; ownership structure; change-oriented corporate culture.

Environmental and institutional factors: favourable network position [in particular, complementarily with large enterprises within firm networks]; presence of supportive infrastructures such as Chambers of Commerce, Entrepreneurial Associations, regional development agencies; active role of political and administrative authorities at various hierarchical levels [local, regional, national, European].

The first and second group of determinants, i.e. the “internal factors”, are strongly linked with the entrepreneurial posture of the firm; Internationalisation strategies can be defined as corporate entrepreneurship activities because they require risk taking behaviour with regard to investment decisions and strategic actions, proactive action towards the competitors, product and market innovation. These are some of the elements included by Covin and Slevin [1991] in their definition of entrepreneurial posture.

Moreover, internationalisation is often the result of a high openness to change by the firm leadership. It is well known that small and medium firms often demonstrate a resistance to change that limits their competitiveness: internationalisation requires a cultural change by the leadership and implies a learning process from the external environment that enrich the entrepreneurial and managerial culture and know how and creates new knowledge [Minguzzi and Passaro, 1999]. The learning processes in the internationalisation strategies are evident among the small firms that adopt the so called “new forms of internationalisation”, such as partnerships, non equity agreements, joint ventures, etc.

As we pointed out in the previous paragraph, this knowledge creating and competence enhancing effect is one of the main implications of the corporate entrepreneurship activities [Zahra, 1999]. Zahra, Neubaum and Huse [2000] have also employed the international venturing activity as one of the indices defining the overall entrepreneurial activities in medium sized established firms.

The link between internationalisation and CE is also confirmed by empirical data at the macro level. For example, a broad survey conducted among the Italian SMEs showed that almost all the firms that adopt internationalisation strategies have recently introduced process and/or product innovations[ii].

Corporate Governance and Internationalisation

The studies that analyse the internal determinants of internationalisation often adopt a resource based view [see for example Westhead, Wright, Ucbasaran, 2001; Habberson and Williams, 1999]. The same perspective should be assumed if we want to analyse the relationship between corporate governance and internationalisation.

In fact, the corporate governance system is at the same time a set of resources and a way to allocate the resources themselves. It is a set of resources because in the governance bodies we can find subjects that provide financial capital, in terms of equity and debt, and human capital, in terms of entrepreneurship, technical and managerial competences, decisional ability and network relations. On the other hand the governance system may also be intended as a way to organize resources. Using the language of the resource based view; Corporate Governance can be therefore viewed as a "Dynamic Capability" [Teece, Pisano, Shuen, 1997], because it represents the principal lever to move and combine resources and competences inside the firm, to pursue long term objectives.

In our perspective, we assume that the corporate governance system influences the “quality” of the internationalisation process of the small firm, especially in terms of adoption of advanced forms of internationalisation such as: partnerships, joint ventures, foreign direct investments.

The first governance variable that can affect the internationalisation strategy is the ownership structure. Empirical research suggests that the evolution of the internationalisation strategy in SMEs is positively related to the number of owners: the opening of the ownership structure provides major financial resources and increases the risk propensity. This effect however is less pronounced in the smallest firms [Becchetti and Gonzales, 2001].

It has been also demonstrated that the presence of family relationships between owners has a positive effect in controlling managerial entrenchment and agency costs, promoting long term commitment and an efficient allocation of resources within the firm [Bekaert and Harvey, 2000; Stulz, 1999; Mc Conaughy, 2001]. This is a factor that can stimulate investments in internationalisation. On the other hand, concentration of the ownership exclusively in the hands of the family can lead to risk aversion and discourage innovative strategies; thus, the optimal ownership configuration should have, in addition to the controlling family, other non-family investors. For example for the machine tool sector, Visintin [2001] shows that opening the ownership to non family members increases the likelihood to innovate, but this happens up to a certain level of opening.

On the basis of this argument we can formulate the following:

Hypothesis 1: The presence of non family owners in addition to the controlling family in small and medium enterprises positively influences the adoption of advanced forms of internationalisation

International strategy can also be influenced by the structure and roles of the main governance bodies. We refer to the “governance bodies” and not simply to the Board of Directors because in SMEs the Board is often composed by people that are directly involved in the daily management of the firm, thus the members of the board and the other top executives [where present] should be considered as parts of the same strategic decision-making structure. Moreover, the sole board composition in SMEs does not provide us with useful information about the “strategic direction functions”, because in these firms boards are often constituted only to accomplish legal requirements.

In previous empirical studies it has been observed that the features of strategic decision making groups of the small and medium enterprises can impede internationalisation [Gallo et al., 2002] because these groups are in many cases characterized by strong cultural homogeneity and low receptivity to change. We may argue that groups with opposite characteristics are more inclined to adopt international strategies. According to Upper Echelons Theory, creativity and receptivity to change are dependant on the homogeneity/heterogeneity in the demographic traits of the strategic decision making group. Homogeneity is “an aggregate level index of interpersonal similarity along one, or several, dimensions” [Murray, 1989 pg. 126]. The members of a homogenous team are usually of a similar age, they have the same organizational tenure, and they have similar career backgrounds. A homogenous team is, above all, able to achieve a consensus on decisions, since the members have shared values and culture [Priem, 1990; Pegels, Song and Yang, 2000]. In family firms, the central figure of the entrepreneur generates a strongly homogenous firm culture. Homogenous team presents continuity in the decision-making process, language and values integration, easy communication and problem-solving.

Nevertheless, homogenous teams can also determine a high level of conformism, a feeling of invincibility, a strong groupthink effect and a lack of “information-sharing” [Grandori, 1999].

Heterogeneous teams have the opposite traits. The cognitive base of a heterogeneous team has a fundamental diversity. The team tends to use information from a wide range of sources and employs various methods and perspectives to interpret the reality. A diversity of values in the group results in a high level of complexity and a low level of consensus. Consequently, there is an increase in "the search of information, the perception that change is feasible and the momentum for change" [Dutton and Duncan, 1987].

In the strategic decision making groups of SMEs, the active presence of non family members can be an important factor of heterogeneity as it enhances the learning processes, the willingness to take risks and the propensity towards innovation, that are necessary to pursue advanced international strategies. Moreover, the presence of non family members is also important in a Resource dependency perspective, because it provides useful links to the external environment.

We can synthesize the previous arguments in the following:

Hypothesis 2: The presence of non family members in the strategic decision making groups of SMEs positively influences the adoption of advanced forms of internationalisation**.**

Studies assuming a contingency perspective introduce the environmental dynamism as a moderating variable of the relationship between the characteristics of the strategic decision making groups and the adoption of effective strategies [Fig.1] [Priem, 1990; Knight et al., 1999]. Perfect homogeneity-consensus situations or perfect heterogeneity-disagreement situations are not desirable in any kind of environment, but these researches show how more homogeneous teams, where there is a high level of consensus during the decision process tend to adopt effective strategies in stable environments, whereas groups with higher heterogeneity are more suitable to operate in turbulent and discontinuous environments [Hambrick and Mason, 1984; Pegels, Song and Yang, 2000].We have previously pointed out that CE activities and, therefore, international strategies depend upon internal and external conditions. We can assume an external factor, such as the degree of environmental turbulence, as a moderator of the relationship between structure of the strategic decision making groups of SMEs and adoption of advanced internationalization strategies.

Hypothesis 3: The positive relationship between heterogeneity in strategic decision making groups and adoption of advanced international strategies is more pronounced in turbulent and dynamic environments.

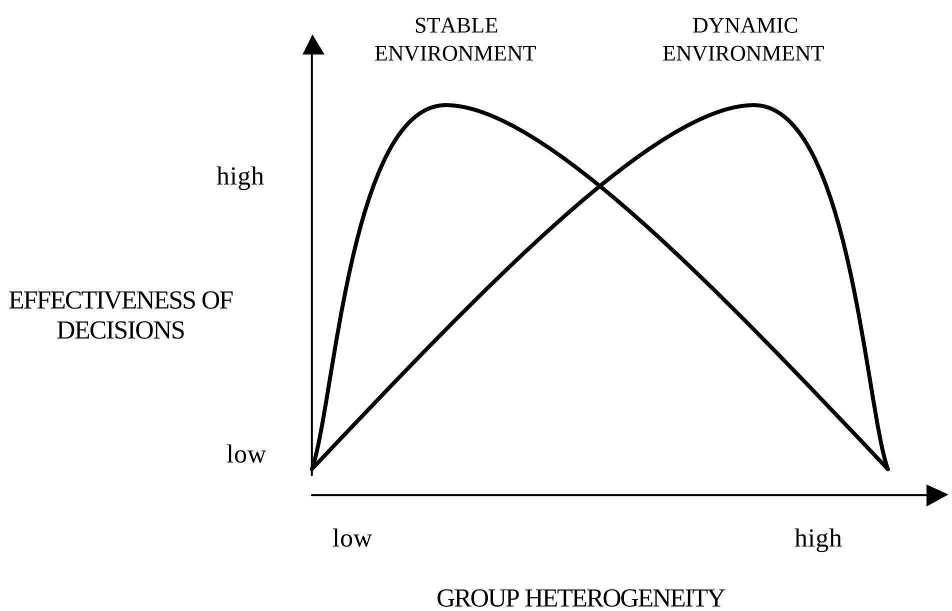

FIG 1 THE ROLE OF ENVIRONMENTAL DYNAMISM AS A MODERATOR OF THE GROUP HETEROGENEITY - DECISION EFFECTIVENESS RELATIONSHIP. SOURCE: ADAPTED FROM PRIEM (1990)

Sample and Methods

To test the hypotheses, we have analyzed data from a survey that we are carrying out on a sample of 300 Italian small and medium enterprises belonging to three different sectors: furniture, machine tools and electronics. The sample was extracted from the Mediocredito Centrale Database[iii]. The general aim of the survey, that has still to be completed, is to explore the evolutionary paths of Italian small and medium enterprises; data are collected through phone interviews, based on a structured questionnaire, with the president or the CEO of the firm. So far we have completed 152 interviews.

For the purposes of the present research we have analyzed only the data concerning the governance structure and to the internationalization processes, choosing family firms only. This has restricted the sample to 116 enterprises.

We have chosen three sectors that present clear differences in terms of competitive and technological characteristics. Following the Patel and Pavitt [1994] classification, wood-furniture, machine tools and electronics can be respectively defined as traditional, specialized and high tech sectors. We can assume that environmental turbulence increases as we move from traditional to high tech sectors.

We have studied the processes of internationalisation observing the various forms through which the firm operates in the foreign markets: indirect export, direct export, partnerships [technical-production related or commercial], joint ventures, foreign direct investments. These typologies are characterized by different levels of risk and financial-strategic involvement by the enterprise.

The corporate governance system has been analysed through the following variables:

1) ownership structure
2) board composition
3) actual distribution of the strategic decision making functions among board members and other top executives

To simplify, we have considered two types of ownership structure: 1) *complete family ownership*, where the ownership structure is composed only by family members; 2) *open family ownership*, when non family members [persons, firms, financial institutions] hold shares of the company.

To define the strategic decision making groups of the firms we have jointly analysed variables two and three, because the simple information about the structure of the formal bodies often tells us nothing on how the governance functions are actually allocated [Pettigrew, 1992]. Variable three was constructed by asking who were the responsible of the main strategic decisions within the firm. We have found three kinds of strategic decision making groups:

Closed family group*:* the board of directors is composed exclusively by family members, who are at the same time responsible for the main governance decisions. In some cases in the board we can find non-family members representing minority ownership stakes. These persons, however, don't exert any influence on the long-term strategy of the firm, as they play only a formal role.

Enlarged family group*:* the family members sitting in the Board are the ones that take the strategic decisions but the decisional process is supported by the key non-family managers, or by outside directors that are involved for information and/or consulting purposes.

Open group*:* the strategic decision making group is composed by family and non-family members, each with the same degree of power and responsibility. The outside directors sitting in the board have an active role in setting the future objectives of the firm.

We have studied the relationship between the governance system and the processes of internationalisation. We have then performed a cross-sectorial analysis to explore the moderating role of the environment.

Significance of the results has been tested through the chi-square method.

Results

Governance system

The empirical analysis has been carried out on a sample of 116 Italian family SMEs belonging to three sectors: wood-furniture [39 firms], machine tools [39 firms], and electronics [38 firms]. All the firms operate on the final market. With regard to the ownership structure, 65% of the firms have a complete family ownership. In the remaining cases we find other owners with minority shares. The higher proportion of open ownership structures has been observed in the electronics sector [46.5%]. On the contrary, in the wood-furniture sector, 85% of the firms have a complete family control. In the machine tools sector, 44% of the firms present an open ownership.

The typology of non family owners is almost the same in the three sectors: persons [50%], national companies [25%], foreign companies [15%], banks [10%] and institutional investors [4%]The majority of the companies has a board of directors [63%]; in the other cases we find the figure of the "sole administrator" ["amministratore unico"]. In the electronic sector the majority of firms has a Board of Directors that includes non-family members [61% of the firms]; again, we observe the opposite situation in the wood-furniture sector, where 58% of the firms has a board with family members only. In the machine tools sector 51% of the boards include non-family directors. We observe the presence of outside directors in 10% of the firms, with no relevant sectorial differences.

The strategic decision-making groups are in 42% of the cases closed family groups. Up to 26 % of firms have an enlarged family group, whereas in 32% of the firms, governance decisions are taken by open groups.

It is interesting to observe that firm size is not related to the adoption of specific governance structures. For example, closed family groups are equally distributed among all the size intervals.

Internationalisation processes

In our sample, on average, 44% of firm turnover comes from sales on international markets. In the machine tools sector this percentage is 50.3%, in the electronic sector is 41%, in the wood furniture sector is 40.2%.

As shown in table 1, the most widespread "structured form" of internationalisation is the technical-production partnership, relevant in all sectors. Joint Ventures and Foreign Direct Investments assume significant values particularly in the electronic and machine tools sectors

TABLE 1: FORMS OF INTERNATIONALISATION IN THE ENTERPRISES OF THE SAMPLE

.

Forms of internationalisation	Electronics	Wood-Furniture	Machine Tools	All sectors
% Export	46	54	38	45
% Technical-production Partnerships	41.8	38.2	35.9	38.7
% Franchising agreements	1.1	5.1	-	1.7
% Consortia	4.6	2.9	2.6	3.4
% Supply partnerships	16.3	8.8	12.8	13
%Joint Ventures	13.9	5.9	10.3	10.3
%Foreign Direct Investments	11.6	11	15.4	12.7

We have observed that direct investments, in the majority of cases, have market seeking and labour seeking purposes. Only in the electronic sector we can see source seeking direct investments, i.e. investments aimed to obtain from the international environment critical resources such as capital, technologies, know how.

The dimension of the firm seems not to have influence on the adoption of advanced forms of internationalisation, except for the foreign direct investments, usually made by the bigger firms [more than 150 employees].

Ownership structure and internationalisation processes

Using the univariate analysis, we have found no support to our first hypothesis. The opening of the ownership structure to non-family members seems not to be related to the adoption of structured forms of internationalisation.

TABLE 2 RELATIONSHIPS BETWEEN OWNERSHIP STRUCTURE AND ADOPTION OF ADVANCED FORMS OF INTERNATIONALISATION. CHI SQUARE TEST SIGNIFICANT AT THE 0.01 LEVEL.

Ownership structure	Indirect export	indirect export	Tec.-Prod.-Supply Partnerships	Joint Ventures	FDI
%Complete familyownership	59	65	57	67	0
%Open family ownership	41	35	43	33	0

The chi square test for independence of the data reported in table 2 supports the opposite statement, i.e., the exclusive presence of the family in the ownership does not increase the risk aversion of the firm leadership; it seems, on the contrary, to enhance the entrepreneurial posture of the enterprise. No significant differences have been observed between sectors. This finding is consistent with previous results, indicating that in smallest firms the concentration of ownership in the hands of family is not negatively related to the adoption of internationalisation strategies [Bechetti and Gonzales, 2001].

The presence of non family owners, especially as long as they are not directly involved in the management of the firm, could hinder the adoption of entrepreneurial behaviours. The exception, again, comes from the foreign direct investments, that seem to be associated to open family ownership, but it is probably only a dimension-related effect.

Strategic decision making groups and internationalisation strategies

The analysis of data concerning all sectors [Tab.3] indicates that the presence of the enlarged and open groups is significantly lower among the enterprises that adopt the less advanced form of internationalisation, i.e. the indirect export. Among the firms that pursue advanced international strategies the percentage of the enlarged and open groups is significantly higher. This finding seems to indicate that the cultural heterogeneity and the new strategic insights brought by the non family members can influence the adoption of entrepreneurial and proactive strategies on the international markets. This seems to be true in particular when the firm is directed by an open group.

TAB. 3 RELATIONSHIP BETWEEN STRATEGIC DECISION MAKING GROUPS AND ADOPTION OF ADVANCED FORMS OF INTERNATIONALIZATION
* SIGNIFICANCE AT THE 0.1 LEVEL; ** SIGNIFICANCE AT THE 0.05 LEVEL; *** SIGNIFICANCE AT THE 0.01 LEVEL

	Indirect Export	Direct Export	Supply Partnersh ips	Technical Partnerships	Joint Ventures	FDI
%Closed family group	44	30	37	27	30	15
%Enlarged family group	30	35	30	22	25	7
%Open group	26	35	33	50	45	78
p-values	0.030635**	0.363254	0.599865	0.001162***	0.037332**	0.000064***

Interesting suggestions come from the comparison between sectors [Tab. 4].In the electronic sector the percentage of open strategic decision making groups is significantly higher among the firms engaging in technical-production partnerships, joint ventures and foreign direct investments, whereas the firms with the enlarged groups seem to have the same strategic posture as the closed family firms. The same trend is observable in the furniture and machine tools sector with reference to joint ventures and foreign direct investments.

We could say that an effective cultural change in the firm leadership occurs only when non family members are actively involved in the decisional processes and their competences are actually applied. The presence of non-family actors [including outside directors] that provide technical-specialistic information and play a consulting role seems not to have significant impact on the evolution of the strategic insights of the small and medium firms.

TAB. 4 RELATIONSHIP BETWEEN STRATEGIC DECISION MAKING GROUPS AND ADOPTION OF ADVANCED FORMS OF INTERNATIONALISATION: COMPARISON BETWEEN SECTORS * SIGNIFICANCE AT THE 0,1 LEVEL; ** SIGNIFICANCE AT THE 0,05 LEVEL; *** SIGNIFICANCE AT THE 0,01 LEVEL

	Indirect Export	Direct Export	Supply Partnerships	ec.-Prod. Partnerships	Joint Ventures	FDI
WOOD-FURNITURE						
% Closed family group	67	40	60	54	35	30

Table 5 shows the direct comparison among sectors of the relationships between governance groups and advanced forms of internationalization. P values show that relationships are significantly different.

Hypothesis three seems to be supported observing the data, because the relationship between opening of the governance group and adoption of advanced forms of internationalization is stronger in the electronic sector, characterized by a major environmental dynamism. In fact, in the furniture and machine tools sector we observe the persistence of complete family groups even among the firms committed in joint ventures and foreign direct investments.

According to hypothesis three this could be an effect of the effectiveness of the homogeneous strategic decision making groups in stable environments, but we could argue that other external effects play a relevant role. In particular, the network position and the complementarities with the bigger firms is important for the internationalization of the SMEs in the wood furniture sector. In the majority of cases these firms are of cases belong to industrial districts and their internationalization processes are often "pulled" by the leading firms that play the role of a "learning catalyst" for the whole system; moreover for these firms is often easy to replicate in the international context the cooperative behavior that characterizes the interorganizational relationships within the district [Compagno and Pittino, 2001]. With regard to the machine tools sector we could partly refer this result to the action of very effective entrepreneurial associations.

Conclusion

In this work we have investigated the relationship between corporate governance and firm level entrepreneurship in the small and medium enterprises, assuming the internationalization processes as corporate entrepreneurship activities. In fact, an important determinant of the internationalization paths of the small and medium enterprises is the adoption of a proactive and risk taking behavior, fundamental to pursue advanced international strategies and not only marked pulled initiatives. The opening of the governance structure, in particular through the active presence of non-family members in the strategic decision making groups, seems to have a positive impact on the implementation of advanced international strategies, enhancing the entrepreneurial posture of the firm through a "cultural change" in the leadership. Results suggest that industrial sector could be a moderating variable of the relationships between governance groups and internationalization: in more dynamic environments the heterogeneity in the strategic decision making groups seems to be necessary to adopt effective strategies. This relationship is less pronounced in more stable environments. We have found no support to the hypothesis that the presence of non family owners promotes internationalization. According to previous studies this could depend on the small dimension of the firms and on the fact that external owners often are not directly involved in the governance of the firm.

The principal limitations of this study concern the variables used to define the heterogeneity in governance groups: the exclusive involvement of non family members is not sufficient to define the degree of cultural heterogeneity and dynamism of the leadership. We should add other demographic variables, not available for this study, such as age, specific competences, previous experiences, organizational tenure. In addition, it would be interesting to investigate the effective group dynamics during the decision making process.

[iii][iii] Mediocredito centrale is a merchant bank. Data are collected every four years by the "Osservatorio sulle PMI italiane," that depends on the Mediocredito. The database is based on a representative sample of around 5000 Italian firms with more than 10 employees. Its aim is to gather information of qualitative and quantitative type concerning the Italian industrial system and in particular the small and medium enterprises.

Corporate Governance Reforms in France

Abstract

Corporate governance has considerably changed since the early 1990s driven from a new legalistic, institutional and global environment. However, a new type of capitalist model did not emerge after the privatisation process and it did not really contribute to separate the public and private spheres. This paper addresses these issues by analysing the merits of the French corporate governance system and its degeneration.

Introduction

Since Berle and Means [1932] several authors tried to assess the competitive differences in the systems of corporate governance and the general hypothesis of convergence [Geoffron, 1997, 1999; O'Sullivan, 2000]. In general, authors consider the existence of two main systems: the Anglo-Saxon model and the Nippon-German model (see for e.g. Albert, 1991). Nevertheless, in the European context, several other authors consider the existence of other models like the French and other Southern European corporate governance models. Authors addressed the problems and specificities of corporate governance in the French corporate governance system [e.g. Bancel, 1997; Charreaux, 1997; Morin, 1996, 1998]

Corporate governance deals with the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment [Shleifer & Vishny, 1996]. Corporate governance deals with the agency problem: the separation of management and finance. It has been a matter of great interest in the last few years. Over the last two decades, the effectiveness of institutional arrangements (boards of directors, CEO, shareholders) has been widely discussed in the United States and in Britain. To the extent that the subject is now commanding, albeit as yet limited, attention in France, the issues are being framed in terms that are largely derived of the Anglo-American debates. These debates have been dominated by a shareholder theory of corporate governance.

Historically, French companies have taken full advantage of the legal structure of the *société anonyme*. This legal structure limited the risks for shareholders who were not inclined to take an interest in the day-to-day activities of the firm [Alcouffe & Alcouffe, 2000]. The upper echelons of large French companies are recruited from a small number of *Grandes Ecoles* (ENA, Polytechic) and benefit from peer-network effects in boards and committees. Also, from the end of World War II, French corporate governance system is characterised by the dominance of the entrepreneurial role of the State. It dominated the entire economy through the extend power of owning and managing many state-owned enterprises in almost all of the domestic industries. In the middle 1980s and the beginning of 1990s, the privatisation process did not entail a truly rupture with the former system [Morin, 2000]. The privatisation process did not liberate the French economy from State influence. In fact, privatisation established a certain number of cross-shareholdings among the top main firms in which the influence of the State was still present. Nevertheless, starting in the 80s the internationalisation process of many top MNEs changed the nature and the structure of the main shareholdings.

Concentration of direct ownership and voting power is very high in France, both for non-listed and listed firms, and even for CAC40 firms. The largest direct owner of non-listed firms owns 66 per cent of the capital. The degree of concentration is a little lower for listed firms but still very large: the share of largest identified stake is 52 percent, over half of the capital. The largest direct owner or the largest voting blockholder of the CAC40 firms holds around 20-30 per cent and has the control in facts of the company.

Families seem to play an important role in ownership and voting power, both in unlisted firms and in the CAC40 firms. Around 40 per cent of unlisted firms have, as first shareholder, individuals owning directly more than

50 per cent of the capital. For the CAC40 firms, individuals are not the largest blockholder, but when they effectively are present as blockholders, they hold around 30 per cent of the voting rights and have the control in facts. These results confirm and complete La Porta and al. [1998] main conclusions on the top 20 firms at the end of 1995, that firms with controlling shareholders rarely have other large shareholders, and that family control is rather common.

In the second half of the 1990s, the rise of institutional investors and the adoption of a new legal setting reoriented French capitalism towards more transparency and accountability. However, in certain areas like executive pay it is still characterized by little systematic disclosure [Alcouffe & Alcouffe, 2000].

A new type of capitalist model did not emerge after the privatisation process and it did not really contribute to separate the public and private spheres. This paper addresses these issues by analysing the merits of the French corporate governance system and its degeneration.

The paper is structured as follows. Part 1, presents a brief outline of the main characteristics of the French corporate governance system. Part 2 is focused in the dynamics of the evolution of the legalistic environment of corporate governance (French civil law and major legal reforms). The changes in the institutional environment are discussed in part 3 (shareholdings specificity and *elitisme*). Finally, part 4 deals with the pressures to change and its influence over the French corporate governance system. At the end, we discuss some key issues arising from the actual evolution of corporate governance in France.

An Outline of French Capitalism

From the end of World War II, French corporate governance system is characterised by the dominance of the entrepreneurial role of the State. It dominated the entire economy through the extend power of owning and managing many state-owned enterprises in almost all of the domestic industries. In the middle 1980s and the beginning of the 1990s, the privatisation process did not entail a truly rupture with the former system. The privatisation process did not liberate the French economy from State influence. In fact, privatisation established a certain number of cross-shareholdings among the top main firms in which the influence of the State was still present. However, more recently, France constitutes an excellent case study because the country has undergone from a major transformation in the last decade, shifting from an insider to an outsider model of corporate governance, and introducing various monitoring mechanisms borrowed from its Anglo-Saxon counterparts.

Bloch and Kremp [1999] by looking at listed firms and CAC 40 firms, and at a large dataset of unlisted firms, they show that concentration and direct ownership and voting power is very high in France, even for listed and CAC 40 firms. The second direct owner lags far behind the first one and the category «families» plays a major role in the detention of non-listed firms. The average ownership stakes of banks insurance companies and other financial institutions are relatively low, except for CAC 40 firms.

Concentration of direct ownership and voting power is very high in France, both for non-listed and listed firms, and even for CAC 40 firms. The largest direct owner of non-listed firms owns 66 per cent of the capital. The degree of concentration is a little lower for listed firms but still very large: the share of largest identified stake is 52 per cent, over half of the capital. The largest direct owner or the largest voting blockholder of the CAC 40 firms holds around 20-30 per cent and has the control in facts of the company.

Families seem to play an important role in ownership and voting power, both in unlisted firms and in the CAC40 firms. Around 40 per cent of unlisted firms have, as first shareholder, individuals owning directly more than 50 per cent of the capital. For the CAC 40 firms, individuals are not the largest blockholder, but when they effectively are present as blockholders, they hold around 30 per cent of the voting rights and have the control in facts. These results confirm and complete La Porta and alii [1998] main conclusions on the top 20 firms at the end of 1995, that firms with controlling shareholders rarely have other large shareholders, and that family control is rather common.

One of the main criticisms addressed to the French corporate system during the 90s was that due to its inefficiency it proved not to be able to transform into a new type of capitalist model after the privatisation process and it did not really contributed to separate the public and private spheres. It is argued that the French corporate governance system served to promote the interests and priorities of the main actor in the innovation system – the state until the mid-1980s or the large firm since then [Goyer, 2001].

The transformation of the French system of corporate governance is nothing short of impressive: in less than a decade, France shifted from an insider to an outsider model. As a result, the ability of the French system of corporate governance to support incremental innovation is severely limited. The new institutional arrangements of the French system of corporate governance are ill suited to encourage trust and commitment between the various stakeholders inside and outside the corporation. They are structured to better defend the interests of shareholders- which are increasingly Anglo-Saxon institutional investors.

The nature and process of the transformation of the French system of corporate governance is interesting at three levels:

a) first, the globalisation of financial markets and the rise of the Anglo-Saxon investors as shareholders have not led to a convergence across industrialised nations. Prior to the advent of financial liberalisation, Germany and Japan were insider systems of corporate governance whose main source of external finance was debt. Despite being subjected to the same types of stimu lus as France, the corporate governance systems of these two countries have exhibited remarkable resilience;
b) second, the pattern of foreign ownership concentration in France raises some serious doubts about the apparent omnipotence of the Anglo-Saxon institutional investors. For only six CAC 40 firms the percentage of combined ownership of the top three foreign institutional investors superior to 5 percent. The breakdown of the combined equity stake held by the largest three Anglo-Saxon institutional investors in the remaining 34 CAC 40 firms is the following: between 4 and 5 percent (2), between 3 and 4 percent (3), between 2 and 3 percent (1), between 1 and 2 percent (14) and less than 1 percent (11);
c) third, the pattern of economic specialisation of French enterprises reveals a potential timing inconsistency between the French system of corporate governance and the structure of innovation. Data on the innovation process reveal that, as early as 1983, French firms had a profile of economic specialisation similar to that of the USA and UK. Moreover, this pattern of economic specialisation amplified between 1983 and 1992. By contrast, the transformation of the French system of corporate governance toward an outsider model is a recent phenomenon.

To deal with the economics of innovation, a theory of corporate governance must come to terms with the reality of a resource allocation process that is developmental, organisational and strategic. Thus it must explain how, at any point in time, a system of corporate governance generates institutional conditions that support:
1) the commitment of resources to irreversible investments with uncertain returns ;
2) the integration of human and physical resources into an organisational process to develop and utilise technology ;
3) the vesting of strategic control within corporations in the hands of those with the incentives and abilities to allocate resources to innovative investments.

To date, research on the relationship between the process of innovation and corporate govern ance has been limited because the leading theories of corporate governance do not systematically integrate an analysis of the economics of innovation [O'Sullivan, 2000].

Estimations of 1997 stocks held by foreign investors in French companies are around 35% of the CAC 40 index. These figures had a strong increase in the last few years : from 11% in 1997 to 23% in 1993 of the capitalisation of the CAC 40 index [Baudru & Kechidi, 1998].

The previous discussion has raised two fundamental points that characterize the process of change in France. First, the transformation of corporate governance is recent and nationally specific. The globalisation of finance does not entail the transformation of every insider system of corporate governance. Second, the innovation and corporate governance systems had been divorced for many years. As late as 1992, the institutional features of corporate governance were supportive of the firms capabilities associated with incremental innovation while the pattern of economic specialis ation of large firms was similar to those of the USA and the UK.

The balance of this section will account for this apparent paradox by examining the development of innovative capabilities of French firms over two periods: the period of massive state intervention (from 1958 until the mid-1980s) and the process of adjustment following the retreat of the State.

From 1958 to mid-1980s the impact of state intervention on the innovative capabilities of firms made them ill equipped to succeed in areas of incremental innovation. This does not imply that French companies were necessarily well endowed to proceed in every area of radical innovation. Instead, this work emphasizes that organisational structures and management styles required for production and technologies in incremental innovation niches were absent in France. What characterized the French innovation system on the eve of the withdrawal of the State from its traditional highly interventionist role? In the mid-1980's, the French system of corporate governance shared several characteristics with the insider models. In this regard, the institutional features of the system if corporate governance were conducive to incremental innovation. However, other institutional features of the French innovation system did not encourage incremental innovation during the period of economic dirigisme. The educational formation and the role of knowledge-bearing elites promoted the development of large, «mission-oriented» efforts to develop specific technologies. The access to patient capital and the highly visible nature of the tasks at hand facilitated the undertaking and successful completion of radical innovation projects. By contrast to German firms, French corporations exhibit little ability to succeed at low visibility projects. The concentration of power at the top of French firms reduced their capability to monitor innovation carried out in numerous subdivisions. In addition, there was a sharp division of responsibilities between academia and the various state mission-oriented scientific agencies – the latter having the task of developing scientific and technological activities in numerous public policy fields. The role of the system of corporate governance in this specific innovation context was different from its traditional assigned task of either promoting risk taking and developing new competencies (radical) or encouraging the development of credibility and trust between the firm and its stakeholders (incremental).

Given the dominant role played by the State in France, its eventual withdrawal created a deep crisis in the national innovation system. Moreover, the legacy of State intervention had left domestic firms ill prepared for international competition. As a result, the French corporate sector was suffering from a competitiveness crisis in the mi-1980s. The innovative capabilities of French firms did not allow them to compete either on the basis of price or on the quality of products.

How did French firms restructure themselves?. A substantial redrawing of their relationships with banks, suppliers, fellow firms, and their workforce provides part of the answer. Large French firms took advantage of the failed government reforms of the 1980s – in labour relations, finance, and decentralization – to restructure their competitive environment. This economic adjustment process was made possible by the autonomy of management of large firms from both state and capital markets. The restructuring of the French industry was a process led by large firms. The process of economic restructuring in France hinged on the development of core competencies via mergers and acquisitions (M&A) in radical innovation markets. The process of economic restructuring in France was also accompanied by external growth: large firms develop radical innovation capabilities through M&A in the USA and in the UK. This pattern of external growth solved various problems associated with French institutional framework of incentives and constraints.

In France, a New Economic Law[i] tried to reform some of the devices of monitoring and control of managers and to improve corporate efficiency. One of its main goals was to improve transparency through the obligation of publishing the amount of managers' remunerations in listed companies.

In general, the change toward decentralisation in French firms, together with decreasing cross-shareholding, is considered to be a development in the direction of the Anglo-Saxon model, implying a reduction of *Président Directeur Général* - Pdg's power and an increase shareholder power. However, taking the specific position of Pdg's power and the relationship with stable shareholders into account seems that although decentralisation of managerial decision-making has occurred at lower levels of the hierarchy, major decisions still remain in the hands of the CEO, who, given the increasing size and internationalisation of French industry along with the restructuring of ownership and control, has now a great deal more power than in the past [Schmidt, 1996]. So, it is not the shareholder, but the Pdg who has more power. The persistence of the importance of the educational system and the value of individualism (*logique d'honneur*), combined with the inclination to centralisation have had a large impact on how recent changes in corporate governance are absorbed by the system. The domains are still controlled by the *Corps d'État*, which means that M&A, shareholder power, and the influence of politicians can only be understood in that specific context.

The Legalistic Approach

French Civil Law System

Corporate governance reform efforts have generated considerable attention in France in the past decade due: to the privatization of government-owned entities; a slow unravelling of cross-shareholdings among corporations, banks and insurance companies; and, increased activism by both institutional and individual shareholders. In addition, the private sector has undertaken voluntary reforms in an effort to avoid legislation. The governance code issued in 1995 by a committee chaired by Marc Viénot played a significant role in encouraging voluntary reform. Legislated reforms have also emerged, most notably in the *Loi relative aux Nouvelles Régulations Economiques* adopted on 15 May 2001 (NRE Act).

The principal business entities under French law are the *société anonyme* ("SA"), a form used primarily for large publicly-held companies, and the *société à responsabilité limitée* ("SARL"), a form used by more closely held limited liability companies having fifty or fewer shareholders. (The SA is similar to the Germany AG and the United Kingdom's plc). The SARL is similar to the GmbH in Germany and the Ltd. in the UK). Another company structure is the *société en commandie par actions* (limited partnership), which is used by large family-controlled companies to retain control while assessing the equity markets. A specialised corporate form, the *société par actions simplifiée* ("SAS") was created in 1994. The SAS is intended to provide more flexible structure for management and administration of large private commercial corporation than the SA regime.

Other forms of commercial business entities are available under French law, including the *société en nom collectif* (general partnership) and the *société civile* (civil company). They function in a manner different from SAs, SASs, and SARLs and are subject to different rules. According to French law, all these types of entities have their own legal entity separate from the shareholders and partners.

La Porta et al. [1997] provided the basis for analysing the strengths and weaknesses of the various corporate governance systems around the world. Based on their approach, the French system is characterized as follows (see Table 1):

TABLE 1 - LAW AND FINANCE IN FRANCE

Country	# of Domestic Firms / Population	IPOs / Population	Ownership Concentration	Anti-Director Rights	Creditor Rights	Efficiency of Judicial System	Rule of Law
France	**8.05**	**0.17**	**0.34**	**3.00**	**0.00**	**8.00**	**8.98**
Italy	3.91	0.31	0.58	1.00	2.00	6.75	8.33
Portugal	19.50	0.50	0.52	3.00	1.00	5.50	8.68
Spain	9.71	0.07	0.51	4.00	2.00	6.25	7.80
Germany	5.14	0.08	0.48	1.00	3.00	9.00	9.23
Japan	17.78	0.26	0.18	3.00	2.00	10.00	8.98
US	30.11	3.11	0.20	5.00	1.00	10.00	10.00
UK	35.68	2.01	0.19	4.00	4.00	10.00	8.57
Average	*16,235*	*0,81*	*0.375*	*3*	*1,875*	*8,19*	*8,82*

Average is for all 49 countries included in La Porta et al.(1997).

?? *Domestic Firms:Pop*. Is the ration of the domestic firms listed in a given country to its population in 1994.
?? *IPOs/Population* is the ratio of initial public offerings of equity in a given country to its population.
?? *Ownership Concentration* is the average percentage of common shares owned by the three largest shareholders in the ten largest, non-financial, privately owned domestic firms in a given country.
?? *Anti-Director Rights* is an index that indicates shareholder rights and ranges from 0 to 5 representing best protected shareholder rights.
?? *Creditor Rights* in an index that ranges from 0 to 4, with 4 representing the best protected creditor rights.
?? *Efficiency of the Judicial System* is the assessment of the efficiency and integrity of the legal environment as it affects business, particularly foreign firms produced by Business International Corporation (scale from 0 to 10, with lower scores indicating lower efficiency levels).
?? *Rule of Law* is the assessment of the law and order tradition in the country produced by the risk-rating agency International Country Risk (average between 1982 and 1995, scale from 0 to 10, with lower score for less tradition of law and order).

Source: *La Porta, Lopez-de-Silanes, Shleifer, and Vishny* [1997, 1998].

The data provided by the table above indicate that the French system of corporate governance is characterized by low ownership concentration and low pressure from market mechanisms. Creditor rights are unprotected.

Indeed, the successful corporate governance systems, such as those of the United States, Germany and Japan, rely on some combinations of concentrated ownership and legal protection of investors. In much of the rest of the world, legal protection of investors is less substantial, either because laws are bad or because courts do not enforce these laws. As a consequence, firms remain family-controlled and, even in some of the richest countries, have difficulty rising outside funds, and finance most of their investment internally [Mayer, 1990].

Although there is little systematic evidence available, most of the world appears to be more like France than like the United States, Germany or Japan. So we can assume that corporate governance systems of the United States, Germany and Japan have more in common than is typically thought namely a combination of large investors and a legal system that protects their rights. Corporate governance systems elsewhere are less effective because they lack the necessary legal protections.

The effects of any given mix of corporate governance devices can be evaluated on two different grounds: *static efficiency*, i.e. the ability to carry an allocation of control as close as possible, given the skills and technology of all agents, to efficiency (i.e. maximising innovation and human capital investments); and *dynamic efficiency*, i.e. the ability to guarantee a degree a of control mobility that creates enough of an incentive for people to improve their skills, given their endowment of talents. In the context of the French corporate governance systems two conditions seem essential to supplant the obsolete devices: the privatisation process – initiated in the 1990s – and the emergence of control-oriented activist financial institutions. These processes are under way and are far from being achieved.

French Corporate Governance Reforms

France has been moving in the direction of incorporation accepted principles of corporate governance into law for several years. Recently adopted recommendations and requirements in France were the following:

Viénot I Report

In July 1995, two of the leading French business authorities, the AFEP (*Association Française des Entreprises Privées*) and the MEDEF (*Mouvement des Entreprises de France*) requested a panel composed of CEOs of 14 major public companies to issue a report promoting non-binding corporate governance principles. The report focused on the composition, functioning and duties of the Board of Directors of French listed companies.

Viénot II Report

In July 1999, as advocated by the Viénot I Report and at the request of the AFEP and MEDEF, the same panel reviewed effective implementation of these principles in French listed companies. The report reiterated the Viénot I report's recommendations and emphasized on new non-binding principles regarding Director compensation, stock-options and Director independence.

Bouton Report

In reaction to the Enron and Vivendi Universal scandals, the AFEP and MEDEF requested the same panel to re-examine application in France of corporate governance principles. The report issued on 2002, contained stricter recommendations regarding Directors' independence, Committees' roles, Statutory Auditor's independency and financial information.

Corporate governance has certainly been improved in France by the two reports prepared by a commission headed by Marc Viénot, in 1995 and 1999, which are seen as the political and intellectual preparation for significant reform of French company law. As a result of these reports, substantial changes in French company law were enacted.

Although the recommendations advocated in these 3 reports are non-binding, French listed companies are strongly encouraged to comply with them by the end of 2003. Some of these recommendations were also given a binding effect due to their inclusion in Statute n°. 2001-420 on so-called "New Economic Regulations" or in the rulings issued by the *Commission des Opérations de Bourse* (which is the French equivalent to the SEC).

Nonetheless, some important points in French law will remain problematic for foreign investors and also French shareholders who more and more are demanding a higher level of professionalism, accountability and transparency in the companies in which they invest.

Among the areas in which work needs to be done is the staggering of boards of directors: shares with unequal voting rights; the lack of a formal requirement to have independent directors on the boards; and committees which should be further empowered.

Nonetheless, even within the existing framework, there is a multiplicity of mechanisms by which shareholders, other stakeholders (including suppliers, clients, employees and others) and officers and directors themselves can demand constantly improving disclosure, responsibility, and, when all else fails, sanctions for egregious behaviour.

Changes in the Institutional Environment

Blockholdings and Cross-Shareholdings in France

Concentration of shareholdings in Continental Europe is one of the main distinctive features of corporate governance compared with the U.S. and the U.K. Thus the relationship between large controlling shareholders and weak minority shareholders is an important research subject. While in the U.S. the main agency problem seem to stem from conflicts between managers and dispersed, insufficiently interventionist shareholders, in much of the continental Europe there are large blockholders present who can and do exercise of control over management. Instead, the main potential conflict of interest lies between controlling shareholders and powerless minority shareholders [Becht & Röell, 1999]. Within Europe, the level of concentration of voting power is by no means uniform; and these differences are rooted in differences in customs and the legal environment in different countries. For example, in Italy, France and Belgium, pyramidal holding company groups are a preferred method of amassing voting power without concentrating (cash flow).

Elite Coordination, Endogamy and Metamorphosis

The elite coordinating mechanism, which tied the large companies to the state, provided the conditions for management autonomy from both the state and the stock market. The set-up was one in which top management was sealed off from the rest of the company, but tightly linked to the administrative apparatus. The privatisations of the 1980s and of the 1990s, grafted themselves upon this system, but led to a profound change in the way it operated. Because of how the privatisations took place, they created a protective circle of core shareholders, giving the CEO more autonomy from the state while protecting the company against takeovers. If the state was able to directly influence decision-making in large companies before, the changes in ownership structure made that much harder in the future. The hard core of investors that grew out of the privatization process simultaneously became the central point of reference for management action, and offered protection against invasive initiatives by the state.

Pressures to Change: the Dynamics of Corporate Governance

The elements of change have already emerged in the process described above, and the effects of globalization were explicitly part of the mandate of the Viénot I & II, Bouton reports and the Law of NRE. The pressures to change can be divided into four main issues, whose main impact is the reduction of economic and cultural idiosyncrasies, the internationalization of competitions and the growing importance of the stock markets:

a) the growing role of foreign institutional investors;
b) the integration of capital markets;
c) shareholder activism;
d) privatizations underway

Institutional investors are increasing their shareholdings in most of the companies and France is not an exception. This issue provoked an intense debate due to developments in retirement financing and healthcare.

First of all, the introduction of the Euro currency and the globalization of the monetary and financial markets accelerated capital flows. The arrival of this new type of investors provoked a sharp increasing in the CAC 40 stockholdings. Morin [2000, p. 28] reports an increasing from 10% in 1985 to 35% in 1997. By 2001, a survey conducted by the American firm Georgeson Shareholder related to the presence of foreign investors in the shareholdings of 65 companies presents in the CAC 40 and EUROSTOXX 52 concluded that 45.57% of the ownership was owned by foreign investors.

This analysis led to two main conclusions:

- the presence of foreign investors is strong in the Euroland countries and mainly in France (44,9% of the stockholdings). It accounts for 1154,4 billion Euros and the participation of institutional Anglo-Saxon represents 22,95%, i.e. 598,17 billion Euros.

However, the shareholdings held by foreign investors in the CAC 40 index is more important (45, 57 percent) if one excludes the France Telecom and Orange shareholdings, whose majority is held by the state. This results are quite different from those obtained in the U.K. for the London Stock Exchange (29.3%) and in the U.S. for Wallstreet (less than 10 percent).

Secondly, the presence of foreign investors in France is increasing over the time. Since 1997, some of the companies like Vivendi, AGF or Elf Aquitaine opened their ownership to the Anglo-Saxon pension funds. For example, in three years, the part of the capital held by Vivendi increased from 42% to 61% and for AGF from 42% to 73.4% and for TotalfinaElf, from 51% to 65% of the overall shareholdings.

Conclusion

Corporate governance has become a topical issue in many European countries in recent years. Despite there was being much conventional wisdom about the different systems of corporate governance, many questions remains on how the French and, at a larger extent, how the European scene will evolve. This paper reviews the main reforms and institutional driving forces of corporate governance in France.

The role of national institutions, however, is particularly useful in explaining the directions of change. In France, the mixtures of constraining and enabling institutional features have shaped the choice of strategy by top management (*elites*).. From detailed institutional analysis based on knowledge of institutional specificities, the French case shows that changes are absorbed and molded by existing institutions, which make the consequences for the system as a whole specifically "French". In other words, the direction of change looks similar, but the consequences are diverse.

The French system of ownership and management of equity is confronted by three problems: the very marked presence of Anglo-Saxon institutional investors in the ownership structures of largest companies; an absence of national investors who are able to mobilize long-term savings; and a system of retirement which depends on the distribution of funds. These problems are exacerbated by the desire of French government to reform retirement pensions around a new social compromise, whereby state pensions to individuals are to be supplemented by private pensions.

The process of refocusing in the core business of the main companies in France also provides some support for the functional convergence perspective on corporate governance. Compared with Germany, the process of refocusing was not negotiated, but unilaterally determined [Goyer, 2002]. This led to the adoption of major restructurings in companies and to social conflicts (Danone and Michelin were two of the problematic cases).

The process of change does matter for the transformation of national systems of corporate governance as it sends companies and nations along a path dependent transition. The occurrence of functional convergence is more difficult to achieve than that of institutional convergence [Gilson, 2001].

Corporate Governance - Who Governs and How

Guillermo Cruz
Mexican Association of Public Accountants in Guadalajara, Mexico

Abstract

We must be clear about one thing: investors are the owners, while directors and managers work for the owners. Even though CEO's are fully aware of the importance of long term investor loyalty, we should perhaps ask how loyal management is to stockholders. Are the decisions made by directors and managers inspired by the desire to increase share value? If this is not the case, then company directors and managers have the wrong objective.

Good corporate governance adds value to short term company development, while also generating increased share price value elements. Consequently, good corporate governance identifies and reduces the possibility of risks arising from negative events that limit or reduce the achievement of business objectives.

Unfortunately, throughout the international business world, there are a large number of frequent business practices that effectively prevent the implementation of corrective measures by board members and stockholders.

Definition and Background of Corporate Governance

As a general point of departure, we will define Corporate Governance as a mechanism established by the stockholders' meeting to act as a management counterweight and guide to ensure proper efficiency levels, while guaranteeing the timely distribution of quality information on the company's financial and operating conditions.

Through good corporate governance, interests become aligned, responsibilities distributed, conflicts identified and made known, to enable their follow-up and resolution.

However, managing corporate governance does not imply a double management scheme, but rather a strengthened management with a development follow-up, advice and support process to enhance company results.

In May 1999, the Organization for Economic Cooperation and Development (OECD) issued its corporate governance principles which, in general terms, establish the following:

A company's corporate governance framework must:

?? Protect and ensure equal treatment for all stockholders, including minority or foreign stockholders
?? Recognize the rights of interested third parties
?? Precisely and timely disclose material issues with an influence on the achievement of business objectives
?? Act as a strategic, effective guide to monitor company management

The Code of Best Practices issued by different countries, including Mexico, is essentially based on the OECD provisions. The specific functions of the members of the Board of Directors differ according to the laws of each country and the corporate bylaws of each company. However, the following points must nonetheless be observed:

?? Review and management of the corporate strategy, main action plans, risk policy, annual budgets, business plans, the establishment of management team performance objectives, corporate performance monitoring, main expense supervision, investment and disinvestment.
?? The selection, compensation, monitoring, replacement of key executives and supervision of succession plans.
?? Review the remunerations of key executives and board members, ensuring that the latter are nominated in a formal and transparent manner.
?? Supervision and arbitration regarding conflicts of interest affecting top management, members of the board of directors and stockholders, including the misuse of company assets and abuse of transactions between related parties.
?? Assurance regarding the completeness of company accounting and financial information, including External Audit, systems.

?? Ensure the existence of an adequate internal control infrastructure to meet organizational needs and guarantee effective risk management and control.
?? Create an Audit Committee to ensure effective corporate governance practices and permit proper company management supervision.
?? Ascertain and supervise proper process documentation and the respective compliance levels.
?? Supervise regulatory compliance levels.
?? Ensure the existence of an adequate, appropriate process for disclosing information within and outside the company.

Reasons behind Corporate Governance

We must recognize that CEO's may have a different position regarding certain important organizational concepts, such as recognizing and distributing profits, managing liabilities or asset values. This situation necessarily leads us to a convergence of different positions, thus enabling us to reconcile interests by adopting the measures most favoring the organization's transparency, stability, profitability and development.

Corporate objectives naturally implying a certain degree of conflict between company management and stockholders include the following:
?? Who controls the company and how this control is exercised; which measurement framework is utilized to determine business efficiency or effectiveness.
?? What is the structure and nature of the company's capital, investments in assets, and liabilities.
?? This year's expected profitability vs. that of future years.
?? How Management should be compensated.
?? The appointment of directors
?? Stockholders' and board memb ers' business management rights.

Who Governs and How

We must be clear about one thing: investors are the owners, while directors and managers work for the owners. Even though CEO's are fully aware of the importance of long term investor loyalty, we should perhaps ask how loyal management is to stockholders. Are the decisions made by directors and managers inspired by the desire to increase share value? If this is not the case, then company directors and managers have the wrong objective.

In itself, good corporate governance adds value to short term company development, while also generating increased share price value elements. Consequently, good corporate governance identifies and reduces the possibility of risks arising from negative events that limit or reduce the achievement of business objectives.

Business Failures

Nowadays, it is a fact that many businessmen who accept positions as board members and members of corporate committees are exposed to the possibility of legal action filed by stockholders, the authorities or general investing public. Although these positions are normally accepted based on professional recognition or friendship, in most cases, this is really a formality as company information is neither obtained nor properly analyzed. Without such information, members of corporate committees are unable to make decisions, participate and act in such a way as to manage and direct the company towards secure, efficient evolution.

A stock market that has recently undergone different financial earthquakes, like the recent cases of Enron or World Comm, seriously threatens savers' confidence. However, it is unfortunately a fact that such crimes are not isolated cases; indeed, they constantly take place on a greater or lesser scale, with varying degre es of publicity. Their real effects are not only felt on the stock market, but also in the microeconomic stability of millions of families that depend on the corporate well-being of directly or indirectly related companies.

Although the implementation and operation of professional, independent corporate governance is a regulatory obligation for many companies in Mexico, the United States and other countries worldwide, this effort should nonetheless be made for essential business reasons. Intermediation committees like the Audit Committee must be implemented according to a formula that ensures access to the analysis of all critical company information and, accordingly, the secure, high-yield practice and exercise of corporate governance.

Common Conditions of Business Failure Experiences

We frequently hear of corporate business failures that lead us to focus on the weakness of certain beliefs and paradigms upon which management and leadership functions were based. In fact, we constantly hear of companies that have lost considerable amounts, have gone bankrupt or have been sanctioned. We must therefore identify the common symptoms or conditions that traditionally arise in such cases.

Highly Recurrent Identified Irregularities

Unfortunately, in the business world prevailing in Mexico and abroad, there are a large number of frequent business practices that effectively prevent the implementation of corrective measures by board members and stockholders, thus leading to significant business failures. These factors include:

?? Overestimating the cost of restructuring to satisfy future estimated profits.
?? Inappropriate penalties.
?? Accumulating excessive reserves or provisions in good times for application in less favorable ones.
?? Premature revenue recognition.
?? Inadequate expense deferment.
?? Misuse of the materiality concept for accounting manipulation purposes.
?? Hiding losses or falling profit margins.
?? Insecure and uncontrolled credit and treasury practices.
?? An inadequate collection process and a considerable degree of immobilization.
?? An incorrect and inconsistent business strategy and practice.
?? The implementation and/or operation of inefficient, duplicate, costly and obsolete processes.

Circumstances Favoring or Preceding Corporate Failure

The risk conditions or circumstances that generally facilitate, precede and/or favor corporate failure include:
Strategic conditions:

?? Lack of an independent opinion on businesses operating progress.
?? Insufficient information/disclosure in the company's financial statements.
?? Adaptation of figures by management to reflect the best possible performance level.
?? Overestimation of the external audit scope
?? Board members without real participation
?? Audit Committees without organizational influence or added value

Operating conditions:

?? Operating circumstances that primarily lead to figure alteration include the following:

Inadequate financial stability due to economic threats to the industry or operating conditions of the entity, such as:

?? Reduction of margins subject to a high level of competition and saturation
?? A high degree of vulnerability derived from rapid change
?? Production of customer demand and increasing business failures
?? Operating losses with the threat of bankruptcy
?? Frequent negative cash flow, while reporting profits

?? Unusual profit growth that is not comparable with that of similar companies

Excessive pressure on management to fulfill third party requirements or expectations, based on:

?? Aggressive or unrealistic profit expectations.
?? The need to obtain additional credit lines.
?? Low amortization and interest payment capacity.

Income of directors and managers either threatened or proportional to company development:

?? Higher income concentration depending on the company's performance.
?? Significant amounts paid in special profit bonuses and stock options.
?? Personal guarantees given for debts contracted by the entity.

Nature of Company Transactions Susceptible to Fraud:

?? Assignment of unlimited powers or limits in excess of those required.
?? Excessive control procedures (registration, custody, authorization, disposal - use)
?? Unaudited transactions with related parties.
?? Records based on estimates that are either subjective or hard to corroborate.
?? Complex or unusual transactions, especially at yearend.
?? Substantial bank accounts in tax havens without a business justification.

Inadequate management monitoring:

?? Management dominated by a single person or group of people without counterbalancing controls.
?? Ineffectiveness of the Board of Directors and/or Audit Committee when evaluating the financial statements and internal control infrastructure.
?? High management turnover.
?? Complex organizational structure without clear lines of responsibility.
?? Ineffective accounting and information systems with a substantial manual report preparation component.

Management Attitude:

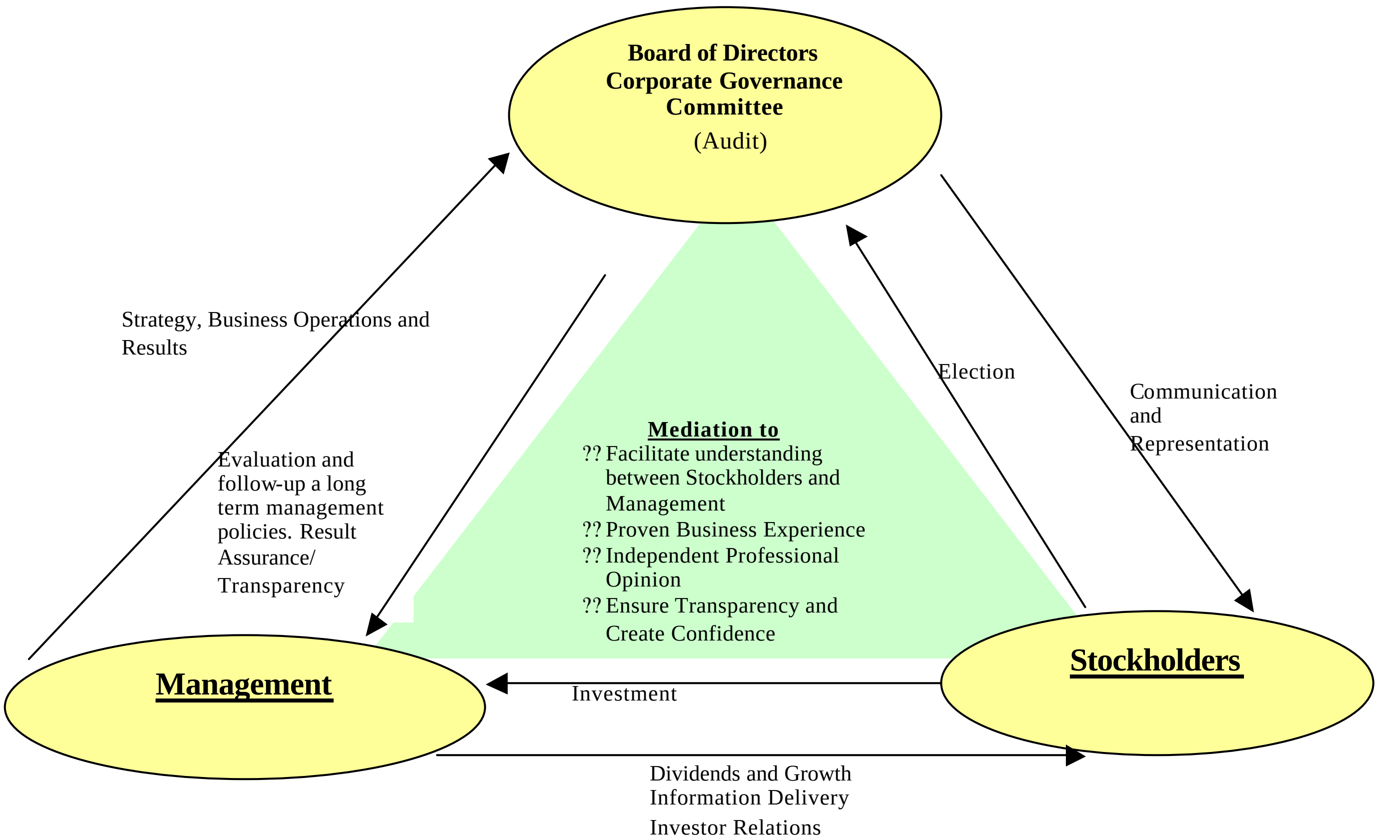
?? Inadequate business ethics practices and communications.
?? Excessive concern with the application of accounting principles.
?? A known history of management's nonfulfillment of regulations.
?? Excessive management interest in maintaining and increasing the share value.
?? Management interest in using inappropriate means to minimize the tax burden.
?? Insistence on applying inappropriate accounting practices, justifying this position based on materiality.
?? Constant management intervention with auditors to influence their scope, samples and opinions.
?? An inadequate segregation of functions, unlimited powers and the ability to appropriate assets.
?? Little value is given to the implementation and operation of corporate control mechanisms, while also maintaining an attitude of general dissatisfaction and criticism towards them.
?? Changes in standards of living that are incongruous with income earned.
?? Inadequate financial stability due to economic threats to the industry or operating conditions of the entity.
?? Excessive pressure on management to fulfill third party requirements or expectations.
?? The income of directors and managers is either threatened or directly proportional to company development.
?? The nature of company transactions is susceptible to fraud.
?? Inadequate management monitoring.
?? Management's high-risk attitude.

Corporate Governance Triangle

The Corporate Governance thesis means achieving a virtuous triangle which, in turn, permits the development of a highly-professional, stable relationship in which management has a clear guide and is properly listened to, the company's main critical conditions are known and studied, and the best possible response options proposed.

This does not mean establishing a double management scheme, but rather developing an effective, strengthened management with a clear notion of stockholders' expectations and the support needed to promote business actions required to achieve higher levels of efficiency, productivity and transparency.

The relationship between management, the Board of Directors (Corporate Governance) and stockholders is detailed below.



The corporate governance triangle allows us to clearly identify the different interrelations between stockholders, the Board of Directors and company management, while also constituting the main reason for Corporate Governance.

Corporate Governance Committee

For many years, board members and their Audit Committees have played an important role in management supervision responsibilities. In fact, Audit Committees have been necessary for long time; companies quoted on the New York Stock Exchange have been subject to this obligation since 1978, which was actually promoted by the Securities and Exchange Commission as of 1940.

The importance of the Audit Committee in achieving corporate governance has recently been highlighted by authorities worldwide, as well as by professional organizations like the Treadway Commission, General Accounting Office, American Law Institute, Public Oversight Board, AICPA and Congress in the United States, and the Securities Law and National Banking and Securities Commission in Mexico.

Furthermore, in September 1998, Arthur Levitt –SEC Committee Chairman– requested that the National Association of Securities Dealers of the New York Stock Exchange create the "Blue Ribbon Committee on Improving the Effectiveness of Corporate Audit Committees". The respective report was issued in February 1999; since this time, a large number of declarations and proposals have been issued to facilitate implementation of the best practices established in the report. As expectations regarding the effective participation of Audit Committees are extremely high, members of the board and Audit Committees must receive information on specific actions and best practices to be applied, to enable them to achieve a simple, yet efficient participation process that generates high added value.

Responding to high expectations undoubtedly requires a clear perspective of the business and type of responses required. In fact, this perspective must serve as a compass guiding Committee actions, enabling it to determine which issues must be reconsidered and those that can be discarded due to their minimal importance, risk or impact on the organization's interests. The type and scope of responsibilities undertaken by Audit Committees, their Chairman or members can vary from one company to the next depending on the particular circumstances of each.

The Code of Best Practices was published in Mexico in 1999; per article 33 of the Securities Law, the Code is mandatory for companies quoted on the Stock Market. According to the statistics of Mexico's National Banking and Securities Commission from August 2003, 76% of companies have responded to these recommendations. Similarly, an average 70% compliance rate with the Code's principles has been recorded; the average percentages reported have increased on a yearly basis.

The importance of the activities assigned to the Audit Committee and its need to ascertain the correct operation of other committees like the "Related Parties Committee", the "Planning and Finance Committee" or the "Compensations and Remunerations Committee", leads us to believe that the Audit Committee could actually be termed as the Corporate Governance Committee. Notwithstanding, this situation clearly depends on the specific configuration and requirements of each organization.

Supporting the Corporate Governance Committee

As it might seem that board members do not have enough time and, in many cases, the information and methodology needed to fulfill their responsibilities, it is vitally important that board members implement and support the operation of a Corporate Governance Committee. In turn, the Committee must receive support from a work group –specialists able to ensure and facilitate the proper performance of its duties by simplifying board members' knowledge of and follow-up on pending issues. Corporate governance means owners, directors and personnel working together to ensure the company's proper development.

Business Perspective with Control Methodologies and Best Practices

We must also understand that the essential transformation of the Audit Committee is based on the integration of a clear business perspective. It is not enough to simply implement international best practice methodologies, as in-depth knowledge and the experience of how to operate the business and where the real secrets of its success lie, are also crucial. Traditionally, this experience has been held by the figure of the Committee Chairman and/or Committee members, and is complemented by international best practices and a support group that permit the required identification and analysis of critical information.

Corporate Governance Committee Characteristics

The issue of Committee independence has traditionally been controversial. Committee members frequently include executives with operating duties or who have family ties with people responsible for company operations. Is not humanly possible for a person to evaluate and/or analyze an organization from an independent standpoint if involved in its operations.

Consequently, the most important quality of the Committee lies in its independence, due to the need for an additional opinion rather than the perspective of people who are directly involved in the operating process. This additional opinion is extremely valuable because Committee members are traditionally people with extensive business experience who, free from daily operating pressures, are able to assimilate the necessary information to enable them to jointly analyze business circumstances and make recommendations with effective added value for the company.

When we speak of Committee meetings, we are not simply referring to the narration of company circumstances, but rather a forum for in-depth analysis based on different business experiences, to generate opportunities for the company and processes embodying increased security and productivity levels.

As we can see, the possibility of generating valuable recommendations primarily lies in the following characteristics of Committee members and other participants:

- Business experience and creativity
- Business perspective
- Independence regarding the business issue under evaluation
- Free, unlimited expression of opinions
- Time to analyze issues and present recommendations
- Executive-level information and synthesis regarding business circumstances

Accordingly, the Committee must not be understood as a forum that simply criticizes management; indeed, any such tendencies must be quickly eliminated. The search for the common good, including profitability, security and quality service, must be clearly understood. It must also be clarified that management is responsible for immediate decisions affecting the going concern, a process that creates different tensions and operating challenges. However, the Committee is able to work without this ongoing business pressure, and also has the unique opportunity to jointly analyze circumstances based on proven best practices. Furthermore, derived from the successful experience of its members, the Committee is able to seek alternatives to provide additional options for management.

The responsibility of developing an ideal Committee not only lies with its members, but also with management, which must strive to ensure that the Committee is absolutely independent and possesses the high-level business capacity required to analyze recommendations, offer opinions and fulfill commitments undertaken.

Committee Purpose

The Corporate Governance Committee is primarily intended to assist the Board of Directors with the task of monitoring and evaluating the quality and integrity of accounting and business processes, while also identifying the level of compliance with the company's strategy, policies, practices and operating legal framework, together with the consistency of business objectives defined by stockholders. Furthermore, the Audit Committee must contribute business alternatives leading to successful strategies, policies and practices that, in turn, permit increased objective attainment.

As discussed in the article published by Spencer Stuart in March 2002, in Mexico, the management of board members is still at a primary-archaic phase, inasmuch as approximately 50% of companies quoted on the Stock Market pay their board members in *centenarios* (gold coins) based on meeting attendance. Although there is nothing wrong with this, the time invested by each board member must be properly remunerated, while also avoiding the development of significant economic dependencies. The following paragraphs detail some of the main personal skill requirements of the Committee Chairman and its members.

Committee Members' Personal Skills

Given the important contribution expected from Committee members, we should mention some of the elements that permit identification of people qualified to occupy this type of position. However, before reviewing the ideal profile of Committee members and the Chairman, we must first discuss two situations that help define such profiles:

First: The time required by the Chairman is very different from that of other Committee members. While the Chairman is traditionally required to make a constant effort, Committee members generally function as advisors who attend a monthly meeting lasting several hours.

Second: To enable the Committee to perform its duties, a support group reporting directly to it should be created, as this will allow members to invest a minimal amount of time while ensuring a high contribution level. Furthermore, access to and immediate application of best business practices regarding control and corporate governance, are also facilitated.

Considering the above, we can suggest that members of the Committee and, above all, its Chairman, should have the following qualities, among others:

?? Dynamism (high-level, proactive executives willing to contribute the necessary time and concentration, are necessary).
?? Openness to change and new ideas (an intelligent, knowledgeable person with a constant willingness to learn, is required)
?? The ability to listen attentively (to properly interpret stockholders' needs)
?? Fair judgment (common sense is needed to properly evaluate different situations in a timely, independent manner)
?? Communications (executive communications skills permitting the simple and efficient transmission of prevailing conditions, must be identified)
?? Discretion (the ability to diligently handle company information, while ensuring the required confidentiality)
?? Negotiations (the ability to obtain commitments and results is essential)
?? Visionary perspective (the ability to create business alternatives)
?? Knowing how to delegate and demand (leave company operation to management, while maintaining a firm attitude regarding the need to fulfill commitments)
?? A history of ethical behavior and successful experiences

Required Committee Dynamic

Formal Committee meetings are held on a monthly, bimonthly or quarterly basis, depending on company circumstances and needs. Aside from these formal meetings, the Audit Committee is expected to maintain ongoing activities; i.e., the Committee Chairman or members are expected to attend work meetings with the support team and with company directors to monitor real commitment progress.

Information Access Powers

Another vital characteristic involves full access to all business information. Without this power, Committee members are really unable to contribute to business objectives. Each company undoubtedly has information that must be handled with extreme care regarding its disclosure and the type of executives empowered to access it.

Furthermore, the company's Board of Directors must notify the entire organization that the Audit Committee and its representatives have unrestricted access to company information. This notification must also include the procedures to be followed when requesting and delivering information, as well as the related identification procedures. Extremely confidential information should only be handled through the Committee Chairman or a committee member appointed by the latter for such purpose. Furthermore, Committee representatives must incorporate different procedures into their normal practices to ensure the diligent, secure and confidential handling of all documentation and information received.

Specialist Advice and Support

Given the variety and dynamics of business circumstances and the knowledge of best business practices, the Corporate Governance – Audit Committee must seek information, consulting and activity performance alternatives that make an immediate contribution to the company, while also involving a relatively low time investment.

At times, this alternative is provided by contracting specialized support services for the Audit and Corporate Governance Committee, which permits the experience of internal personnel to be combined with the vision of external consultants who are independent of management and have immediate access to corporate governance methodologies proven in different companies worldwide.

A research report published by the "Institute of Internal Auditors" shows that the most important means of ensuring Audit Committee effectiveness is to provide their members with reference information on the real status of business processes, together with training in analysis and best practice methodologies.

Personal Courage and Energy

As discussed above, in conjunction, the underlying characteristics of the Audit Committee, such as independence, powers, technical capacity and professional experience, do not guarantee success if the final ingredient of personal energy is not present, as this implies an individual desire and commitment to make contributions to successful company performance.

Forming part of this Committee is not a simple task; on the contrary, it requires executives willing to make the utmost effort by taking advantage of all their experience and ability to find alternatives to effectively support company managemet.

Responsibilities of the Corporate Governance Committee

As a preliminary guide to duties that must be handled by the Corporate Governance Committee, below is a list of primary responsibilities:

?? Validate accounting principles, treatments and practices
?? Promote and evaluate the internal control infrastructure
?? Evaluate compliance with laws and regulations
?? Promote the sufficiency of policies and procedures
?? Ascertain, express opinions on and monitor the status of lawsuits and tax treatments applied
?? Ensure the sufficiency and high added value of the internal audit function
?? Contract and evaluate external audit services
?? Complaint and accusation reception and analysis mechanism
?? Resolution of disagreements with auditors, ensuring the effective implementation of corrective measures
?? Commitment follow-up system
?? Promote sound and efficient basic business cycle practices
?? Evaluate and promote efficient computer system operation
?? Promote self-control and generate a control and compliance culture
?? Promote penalties for noncompliance
?? Coordination and independence of audits and examiners
?? Issue a report to the Board of Directors on the business control infrastructure, compliance with accounting principles and other issues
?? Record and file the minutes of Audit Committee meetings
?? Ensure the correct application of the Code of Best Practices in the company

Corporate Governance Program

The implementation of a corporate governance program requires an ordered, clear and simple application methodology that facilitates an immediate, high-level contribution to the organization.

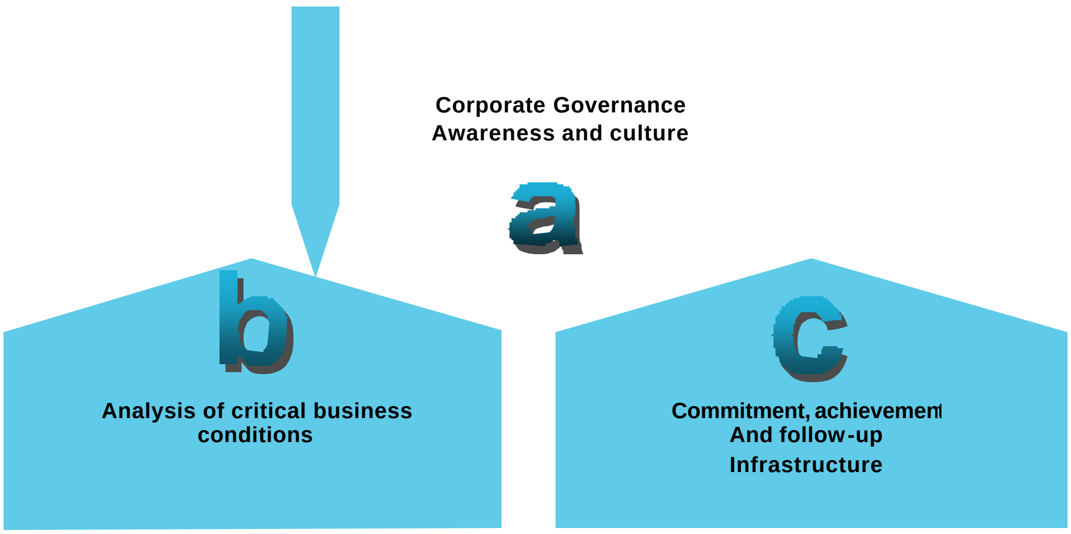
Key success factors of a Corporate Governance program include:

Key Success Factors

- ?? Independence of board members
- ?? Abilities of the Committee Chairman (the contact with the Board of Directors and its Chairman)
- ?? A working mechanism that combines members' business experience and knowledge with specialized methodologies –team of specialists– and support (analysis of critical information, modern control and management methodologies and specific best business practices approach)
- ?? Emphasis on priorities, commitments, follow-up and results

Corporate Governance Program Stages

The following graphs illustrate the three essential program stages:



Corporate Governance Awareness and Culture

This first stage means laying the foundations of a Corporate Governance culture that permits the implementation of basic premises by recognizing the organizational responsibility of each company employee and officer. This stage includes at least the following elements:

A-1
Committee integration, based on independence, business experience, a program and methodologies

A-2
Committee member awareness and updating programs. Committee creation

A-3
Preliminary diagnosis of business and control opportunities

A-4
Integration of corporate governance plan (Business and control)

A-5
Formalization of the corporate governance committee (audit) (Corporate bylaws)

A-6
Definition and implementation of management, control and audit policies

Analysis of Critical Business Conditions

The second stage of the program involves identifying, evaluating, expressing an opinion and giving follow-up to critical conditions, with particular reference to:

B-1
Business cycles (efficiencies– best practices – risks)

B-2
Main accounting treatments

B-3
Systems and contingency plans

B-4
Financial changes, trends (Covenant compliance) and high risk accounts

B-5
Complaints, fraud and client service

B-6
In tax and legal conditions

B-7
Corporate finance events (Acquisitions, sales and mergers) and clients

B-8
Regulatory compliance

Infrastructure of Commitment, Achievement and Follow-Up

The application of Corporate Governance efforts can lead to unnecessary expenses if the mechanisms required to ensure compliance with commitments involving highly effective results, an infrastructure of improvement, self-correction and permanent monitoring, are not created.

The presence of the following elements and essential Corporate Governance conditions is, of course, necessary; such elements are identified as the assurance and permanence components of the third and fourth program stages.

C-1
Follow-up system

C-2
Operating and financial indicators

C-3
Self-control agendas and alerts

C-4
Internal audit evaluation, integration and support

C-5
Integration of Controllership and Risk Management best practices

C-6
Coordination of internal control and audit entities

C-7
Report to the Board of Directors on opportunities, commitment programs, programs and achievements

Permanent Application and Program Benefits

The corporate governance program really implies a permanent activity in which the application of a three aforementioned phases is constantly repeated.

Although seeming otherwise, application of the activities established in the corporate governance program is in fact simple, provided the methodology and support of specialists with specific experience are available. Both the Committee Chairman and its members must primarily focus on contributing to the company through their business vision, while also requesting that specialists implement methodologies and best practices that are clearly applicable to the company's specific business needs.

Based on the certainty derived from personal experience, we can state that, although requiring considerable effort and commitment, the implementation of an effective Corporate Governance system does not imply an additional cost for the company. On the contrary, it represents an investment leading to savings, increased efficiency, the elimination of errors and fraud and, naturally, the possibility of maintaining a business with acceptable profit margins for a long time.

Conflict Management and Corporate Responsibility: Opportunities and Challenges in a Period of Economic and Political Transition

Basilio Verduzco
Universidad de Guadalajara, México

Abstract

This essay analyzes the conflict between TV-AZTECA, the second largest television network in Mexico and Televisora del Valle de Mexico (TVM) a small television company based in Mexico City, over the control of CNI Channel 40 owned by TVM. This is a long battle that has been the subject of confrontation and an arbitration process which has seen several episodes. In the last episode occurred between december 2002 and January 2003, lawyers from TV-AZTECA, commanded a hostile takeover of a transmission tower operated by CNI. During this episode, Channel 40 was off the air for one moth and was restated only after an order was issued by a federal judge. The essay explores lessons that can be learnt from this conflict. The evolution of the conflict and its connections to the political and economic transition observed in Mexico show the need to develop new corporate practices in conflict management.

Introduction

Corporate responsibility in conflictive situations is an important issue that needs to be considered to maintain a good business environment. The issue has been analized in the literature from several perspectives. For one branch of the literature the problem is how to mitigate the impacts of conflict on business operations.[1] Companies need to be aware of conflictive situations and plan accordingly. This literature however takes conflcit as given and regards business operations as "entering the conflict". But what happens when corporate practices are responsible for creating or maintaining a conflictive situation?. Corporations may be involved in such situations for different reasons and each society may produce different types of opportunities for conflicts to emerge. For a society in transition, the transformation of institutional arrangements may be one large window of opportunity for corporations to engage in conflictive situations.

The process of change observed in the political and economic realms foster changes in the expectations of economic agents involved in negotiation and conflict resolution. Some players in a conflict may wish to follow traditional approaches to conflict resolution based on previous experiences, while others may read more carefuly the uncertainty associated to the aplication of rules and procedures. Issues such as negotiation power, and the probability of forging winning coalitions may be interpreted in different, or even opposite directions by the players involved making it more difficult to reach agreement, and increasing the costs of negotiation. Often this path leads to solutions that are unsatisfactory for all the players involved. A lose-lose situation is not an imposible outcome during a period of transition. Some players may simply try to take advantage of the transition period. As shown by Dean, Bloom and Ratnikov (2003), in a society in transition, oligarchs may use hostility to consolidate their position in particular industry through the abuse of legal processes, the corruption of judges and other court officials and government officers, and the effective subversion of the legal regime.

The conflict between Tv Azteca, the second largest boadcaster in Mexico, and CNI Chennel 40, a small independent broadcaster based in Mexico City is one of the best examples of the type of controversies that may emerge in the corporate world during a period of economic and political transition. IN such environment, power, capacity and corporate practices that were useful even in recent years need to be reviewd in order to reach consensus. The battle has been conducted from a confrontational perspective focusing on winning at any costs and not looking for creating value and finding alternative options that still fulfill stakeholders´ interests (Raiffa, 1982) This is a particular case of what Dean et al. (2003) call the "Illegal conversion of minority interest to controlling interest".

The aim of this essay is to analyze the evolution of the conflict and to draw some lessons for conflict resolution in a society in transition. The argument posed here is that corporations need to take advantage of the transition and look for the right negotiation strategies that may best serve their long term goals. Corporations, is also argued, may set an example of civic mindedness that a society in transition desperately needs to maintain a good business environment and to foster social stability.

The Way to Disagreement

It took four years and six months to TV Azteca and CNI 40 to move from the announcement of the formation of a strategic alliance (Jul. 29/98) to step into violent hostility for the control of CNI 40. In the process the two companies have produced what can be seen as the best teaching case of how corporate executives may fail to serve the benefit of the shareholders and the public in general by involving their companies in controversial battles and ignoring other paths to consensus building. On October 9, the two broadcasters signed an agreement by which TV Azteca made a loan to CNI for 10 million dollars. On December 10 a new agreement gave TV Azteca programming, promoting and marketing rights over Chaneel 40. In return TV azteca paid 15 million dollars in lieu of profits for the next three years. This contract included a clause granting a buying option to TV Azteca if any of the parts cancelled the contract. This right could be exercised between november 30, 2002, and December 1 2008. On july 13, 2000, the Ministry of Transportation and Comunications (SCT) aproved the contract but established that any buying of CNI`s shares by TV Azteca should be aproved once this was about to happen. Four days later, CNI argued that SCT had not aproved the contract and removed Azteca´s signal from the screen of Channel 40.

From that day on, a battle started over who had the right interpretation of goverment and judicial rulings and, in consequence who had the right to control Channel 40. For two and a half years both companies maintained a phase of confrontation with "live" episodes of the conflict taking place from time to time in both screens. Table 1 presents a timeline of the conflict and shows how it passed trough several arbitration efforts. The problem was that each ruling was interpreted as favoring each company´s interest so the conflict escalated. In the process the conflict was took to the International Court of Arbitration (ICA), a branch of the International Chamber of Commerce. On December 20, 2002 the ICA ruled that the contracts were valid but its ruling was not clear about whether TV Azteca could excersice its buying rights, or, more precisely, if it could do that without the approval of Mexican Government. As usual, both corporations interpreted that the ICA ruling favored their interests. CNI released a news bulletin highlighting the following: a) that the contract of options – strategic alliance- is valid, b) the legal assumptions for the option to buy 51 % were not actualized and TV Azteca did not satisficed the conditions to use the option, c) TV Azteca is interpreting the ruling in a biased way to satisfy its interests.[2]

This conflictive situation reached a new level in the eraly hours of the 27 of December 2002. TV Azteca took over a transmission tower owned by CNI Channel 40. According to CNI, men in black uniforms stormed the station's transmission facilities located in Cerro del Chiquihuite before dawn. They holded channel employees for several hours and took over the channel's signal. The consequences of this episode and the way the conflict evolved for one long month is worth exploring in detail. This analysis should spread light on the failures and mistakes that need to be considered in an effort to improve conflict management and to enhance corporate responsibility.

This fast transtition from amicable negotiations searching for a common goal to violent hostility poses important questions regarding the expectations that some agents may have regarding the outcomes and evolution of negotiation processes during a particular period of time. This essay presents the argument that in this case both players, but in particular TV Azteca, made wrong assumptions about issues such as negotiation power and the economic and political environment, therefore they miscalculated the disposition of secondary players in the conflict to form a virtual coalition that favored a particular outcome.

Table 1 Timeline Of The Conflict 1998-2003	
DATE	EVENT
Jul. 29, 1998	TV Azteca and CNI Channel 40 (CNI 40) announces the formation of a "strategic alliance".
Sep. 01, 1998	Azteca 40 starts new programming
Oct. 09, 1998	Both companies sign a contract that includes programming, promotion and commercialization
Jan, 11, 1999	The agreement is announced. TV Azteca has an option to buy additional shares of Channel 40 until it has the control of the channel.
Jul. 14, 2000	The Minister of Communications and Transport (SCT) declares invalid the contract
Jul. 16, 2000	Javier Moreno Valle, (JMV) owner of CNI 40 declares on the channel´s sunday prime time news program the termination of the contract with TV Azteca
Jul. 17, 2000	TV Azteca announces that they have the intention to use the option to buy Channel 40.
Aug. 16, 2000	JMV steps down from TV Azteca´s board of directors. TV Azteca announces its intention to go to extremes in its intention to buy 51% of the shares of CNI 40.
Sep. 05, 2000	TV Azteca sues CNI 40 for 100 million dollars in damages
Mar. 14, 2001	A primary circuit judge (j-47) in Mexico city orders CH 40 to put 51 % of the shares in a trust fund so TV Azteca can have the option to buy them.
Jul. 13, 2001	CNI 40 should pay 34 million dollars to TV Azteca for damages
Dec. 20 2002	The International Court of Arbitration, (ICA) an entity of the International Chamber of Commerce releases its resolution on the case, both TV corporations argue that the resolution favors their interets.
Dec. 23, 2002	TV Azteca argues that ICC authorizes to buy 51% of CNI 40, but CNI 40, argues that ICC denies TV Azteca the right to buy its shares.
Dec. 27, 2002.	At about 2:00 AM, Tv Azteca security personnel makes a hostile takeover of CNI 40} transmisión tower in Cerro del Chiquihuite with the objective of replacing the regular programming with TV Azteca programs.
Dec. 28, 2002.	Ciro Gomez Leyva, Vicepresident of Information and co anchor of the channel´s most important news program announces his disposition to go to court and show the role of paramilitar (parapolicaco) group in the takeover of the tower. TV Azteca announces that that they will sue Ciro Gomex, for libeling
Dec, 29, 2002	CNI 40 demands the intervention of SCT to recover the intervened installations
Dec. 30, 2002	TV Azteca lawyers sue Ciro Gomez
Jan. 01, 2003	TV Azteca explores new programming for Channel 40
Jan. 02, 2003	TV Azteca publishes an add in major newspapers calling for CNI Workers to sign a contract
Jan. 03. 2003	CNI 40, workers reject to sign a contract with TV Azteca
Jan. 04, 2003	The Attorney General (PGR) issues a supoena to TV Azteca executives to clarify the intervention of Cerro del Chiquihuite CNI workers announce a public demonstration to recover the transmission tower.
Jan, 06. 2003	Several Newspapers publish an open letter to the President of Mexico signed by Ciro Gomez CNI workers march to Cerro Del ChiquihuiteInformativo 40, a news programa anchored by Sergio Sarmiento from TV Azteca begins its transmissions
Jan, 07, 2003.	Owners of both TV corporations end a meeting at dusk. A thrre days period is declared to reach agreement. Channel 40 starts transmiting color bars
Jan, 08, 2003	Mexico´s President announces that the federal governme will declare its position until after the three days period finishes.
Jan, 11, 2003	CNI workers organize a public demonstration in front the World Trade Center and distribute flyers asking citizens to support their demands
Jan, 13, 2003	TV Aztecas releases a news bulletin saying it asked Mexico City´s Attorney General (PGJDF) to invetigate JMV for fraud of 25 million dollars
Jan, 15, 2003.	The Senate calls the minister of Comunications and Transport (Pedro Cerisola) for a hearing to explin

	the situation
Jan, 19, 2003	Hundreds of persons express their support to CNI Workers in Downtown Coyoacan
Jan. 21, 2003	CNI presents a petition for protection against the government intervention of the transmission tower and the petition is received by a an administrative judge (VII)
Jan. 22, 2003	Congress votes a resolution to call the Minister of Communications for a hearing and to invite the president to restitute the signal to CNI
Jan. 24. 2003	A judge orders the government to restitute the signal to CNI 40, but SCT argues it will wait until 13:50 to take the right action.
Jan. 24. 2003	The minister of Comunication and Transportation says that the federla government will follow the ruling.
Jan. 26, 2003.	SCT ends the intervention of Channel 40 but does not give back the installations.
Jan. 27, 2003	SCT gives back the installations to CNI 40, but the company is forced to pay a bailout amount of 50 million pesos
Jan. 30, 2003	PGJDF exonarates Ciro Gomez
Feb. 01, 2003	Aprhension order aginst Moreno Valle is denied.
Feb. 05, 2003	CNI 40 announces its disposition to pay 25 million dollars to TV Azteca
Feb. 07, 2003	CNI, 40 pays the bailout ammount of 50 million pesos
Feb. 11, 2003	SCT, imposes a fine of 210 thousnad pesos for using a signal without a proper authorization.
Feb. 14, 2003	TV Azteca appeals the fine.
Feb. 20, 2003.	CNI demnds that the cancelation of the bailout for 50 million.

A Hostile Takeover

On December 26, 2002 TV Azteca decided to wait no more to take control of CNI 40. They took over by force a transmission tower owned by CNI, in Cerro del Chiquihuite in Mexico City. From that hour on and during a month the battle over channel 40 went "live" not only in the both brodcasters screens but almost in any newsoutlet –printed or electronic- that was availbale. While most news sources in Mexico and in other countries were busy reporting the case emphasizing the force and illegality of the takeover, TV Azteca launched a campaign arguing that the action was justified according to the ruling of the International Court of Arbitration. While both players lost in the process, the loses were bigger for TV Azteca.

TV Azteca Loses Public Opinion

In retrospect, it is fair to say that the hostile or violent takeover conducted by TV Azteca produced an unexpected outcome for this corporation. Their efforts to convince the public that this action was right, fair and legally grounded felt into a heated public arena that did not favored its cause.

Almost all observers regarded the takeover conducted by TV Azteca as the worst example of illegal use of force to take advantage of a week adversary. Several TV news sources including Azteca´s bigger rival Televisa, reported how armed guards in ski masks from TV Azteca took the station's studio and held staff for several hours. Ciro Gomez Leyva, CNI´s major news anchor claimed that this could have been the media world's most hostile takeover. In a small dispatch that he posted to the group Democracy Now, he quoted CNI´s news editor Manuel Feregrino saying that "They retained the IDs of our staff, their addresses were taken, and they were told that their families could be in danger," .[3]

On December 29, the BBC posted in its webpage a report of the takeover and a summary of the conflict (Fig. 1). In this report the BBC was clearly critical to TV Azteca. It echoed other voices and described the event as one that "could be the most hostile takeover ever" it gave space to the allegations that it used "armed men in ski masks". For the BBC reporters this was case of abusive force used by a giant against a small player. TV Azteca was reported as "the world´s second biggest spanish-language programme-maker".

Amerricas.Org, a branch of the Resource Center of the Americas, an international organization focused on the defense of human rights, reported the case on its webpage with the title "Guards take over TV station"[4]. In this report, drawn from Mexico City´s major newspaper *La Jornada*, CNI was portrayed as an independent TV station while TV Azteca was protrayed as one of Mexico´s two TV Monopolies.

By January 6, most important news media oulets in Mexico City had covered the conflict and the prevailing spirit of the coverage was one of criticism to TV Azteca and to the lack of action by the federal government. CNI workers and executives were clearly more succesful in gaining the battle for the public opinion. Javier Moreno Valle, his lawyers and the most popular faces on Chanel 40´s screen were at the front of a public demonstration conducted by CNI workers and executives. Protesters marched to Cerro del Chiquihuite to demand that instalations should be returned to its owner. As expected this action had a broad coverage. Even as they were in their way to Cerro del Chiquihuite Reforma, an influential newspaper ran an article in their business section under the title "Arrancan Marcha Empleados de CNI"[5]. Simultaneusly , the business section ran an article on the same topic that emphasized the relevance of the protest within the conflcit. "The conflcit wil take new dimensions", wrote Abel Barajas and Ernesto Nuñez, authors of the article[6].

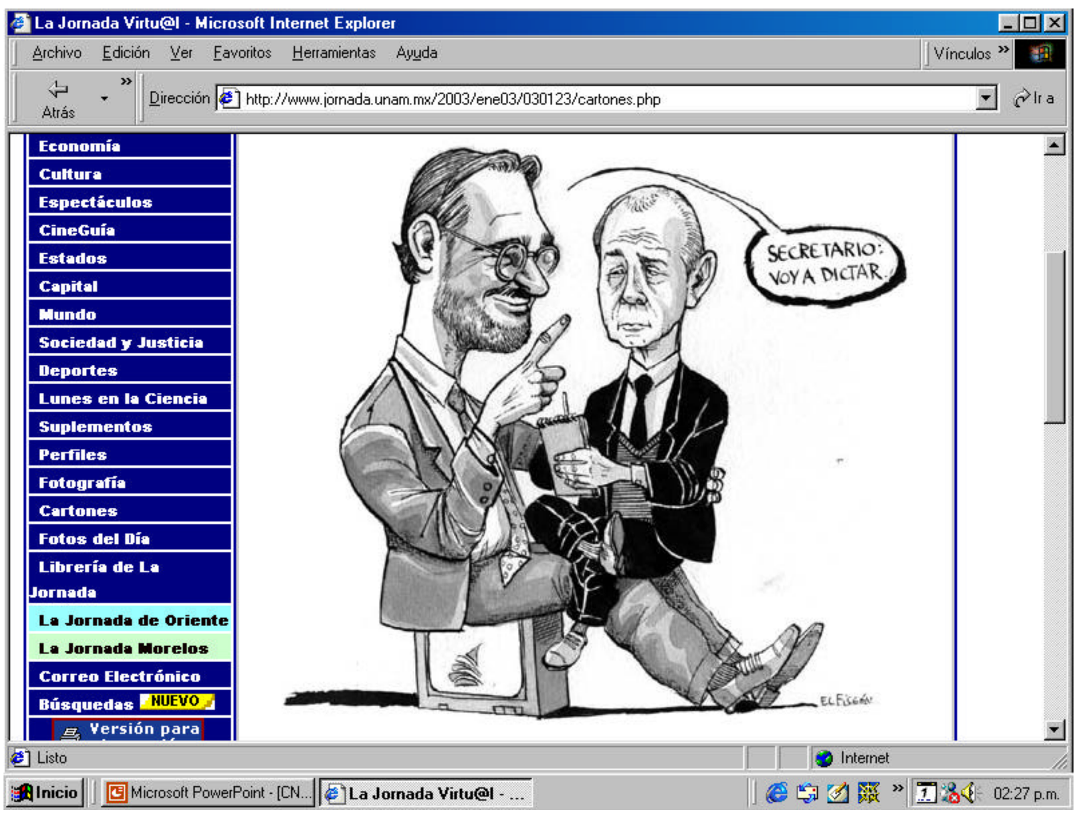
FIG. 1. MEDIA COVERAGE DID NOT FAVOR TV AZTECA

TV Azteca Loses Political Support

Along with the lost of public opinion, TV Azteca also lost political support. Little by little, key political players took distance from the takeover conducted by the television company. Some were seriously critical of the postion assumed by TV Azteca. Senator Javier Corral (PAN), Chief of the Communications and Transportation Committee, played an important role in criticizing the act and in creating a colition to put pressure in the executive to intervene and return the transmission tower to CNI. On Dec, 31, he wrote an op ed column in EL UNIVERSAL[7], one of Mexico City´s most influencial newspapers titled "TV AZTECA: Calculating Power". For Senator Corral, Azteca´s violent act had not comparison world wide, and it could only be compared to acts conducted by guerrilla movements in Central and South America. In his words this was "one of the most serious challenges launched against the democratic change in Mexico, and one of the most serious provocations to legality". Thus, he argued, one may assume that in conducting this act, TV Azteca is calculating how much power it has over the formal institutions of the state and over the government of Mexico. For Senator Corral this act was only one in a chain of abusive behavior that TV Azteca had developed in the past against the goverment which included having a black list of political actors to put pressure on them and the censorship that they have excerscsed even to the President of Mexico. Fig. 2, shows how newspapers were very critical in the way TV Azteca was trying to push a solution favoring its interests by lobbyng the presidency of Mexico.

On January 22, the Permanent Commission of Congress passed, by unanimity, an agreement to demand the executive branch the inmediate devolution of the transmission equipment to CNI and to call the minister of the interior (Secretaria de *Gobernacion*) for a hearing. In Mexico, this minister has the capacity to oversee TV concesions. In their agreement congresspeople argued that TV Azteca had acted illegally when it took control of Cerro del Chiquihuite[8]. Representatives from the three largest political parties, demanded both television

FIGURE 2. TV AZTECA MISCALCULATES POLITICAL SUPPORT



companies to take back their conflcit to court. Senator Diego Fernandez de Cevallos, leader of PAN senators (Partido de Accion Nacional) urged the federal government to find a solution to this conflict. After a judge ordered that the government should end the intervention, Senator Fernadez was quoted by several newsoulets saying that the first thing the government should do was to "take no delay in restituting the signal from Cerro del Chiquihuite to its legal concesionary, Channel 40"[9].

TV Azteca Loses in Court

On the 24th of January, the Judge for administrative affairs Luz Maria Diáz Barriga gave a provisional judicial provision (amparo) to CNI Channel 40 and ordered to cancel the intervention (aseguramiento) of Cerro del Chiquihuite and to restablish Channel 40´s signal. The federal government claimed that it did not have to return the instalalations to CNI since the ruling did not establish to whom they should be given back. In an example of the mood that prevailed in the federal government, Pedro Cerisola, minister of comunications declared during an interview while touring an industrial park that he ignored the terms of the provision and what aims it was trying to pursue but regardless of what was on it, the federal government will follow the ruling of judge Diaz Barriga[10].

For TV Azteca there was still hope. Even when it was clear from the events of the past two weeks that TV Azteca was losing the battle, their lawyers were still claiming the right to the signal. Meanwhile Reynaldo Reyes Rosas, a federal judge acused nine TV Azteca employees who were involved in the takeover of the instalations of CNI for the crime of stealing television space[11]. By January 7, the screen of Chaneel 40 was transmiting color bars.

On January 27, after a federal criminal judge refused to rule on which of the two tv companies was entitled to get back the instalations after they were intervened by the government, the Ministry of Comunications and Transportation returned the transmission tower to CNI. The judge ruling established that this was not a criminal issue but an administrative one[12].

Dealing with Conflict and Corporate Responsibility

An issue that needs to be analyzed on the light of the episodes of conflict between TV Azteca and Channel 40 is to what extent corporate managers should be held responsible for bad conflict management practices.

This includs hostility in takeover attempts such as the one conducted by TV Azteca over more than two years. In light of the public debate that emerged in the aftermath of the assault to Cerro del Chiquihuite, it is clear that there are at least four areas in which corporate responsibility is a major concern when dealing with conflicts in a society in transition: this areas are, a) the impact on the credibility of market rules, b) the impact of hostile tactics on peoples perception of the legal system, c) the impact of hostility on a company´s employees reputation and morale, and d) the impacts of hostility on the company´s financial situation.

Impacts on the Credibility of Market Rules

This episode of the conflict between TV Azteca and CNI had, and still has the potential of affecting Mexico´s credibility. If this type of behavior is tolerated, investors who could see their investments unprotected by the law and from hostile competition. Using this case as en example, *Business Edge,* a web based news report wrote in its edition of January 9, 2003. “If you thought competition was tough in Canada , you better think twice about expanding to Mexico . Federal prosecutors there are investigating claims a rival television station took over another channel using private armed guards wearing ski masks”[13].

Impacts on the Legal System

The assault conducted by TV Azteca was quickly framed by media analysts and intellectuals as a challenge to the rule of law in Mexico and as an example of the need to change the relationship between government and the media. As pointed out by Pou Gimenez, (2003). “The tardy, incorrect, and confused reaction of the government planted embarrassing suspicions of governmental complicity with the invading television station, but above all else reinforced the image of a government weighed-down by a simple incapacity to react and with a instinctual tendency, once again, to entrust dispute resolution to negotiation processes, even in cases that do not have anything to do with freedom of expression or demands of social justice”[14].

Impacts on Employees Reputation and Morale

By opting to pursue a confrontational strategy a corporation is not only putting in jeopardy its prestige, image and opportunities to grow, it is also endangering its employees´ reputation and morale. The hostile takeover conducted by TV Azteca demanded workers in both corporations to assume a position on an issue that was beyond their control but still had to be decided putting at risk their future and reputation. On CNI 40 side, employees were presented with the dilemma of choosing whether to sign a contract with TV Azteca or being loyal to their current employer. Under the conditions of the debate that petition could be regarded as pure harassment for which there is no easy way out or legal defense. Most employees decided to stay with TV Azteca, but the few that parted ranks with CNI, were quickly portrayed as defectors who had no value for CNI anyway. Azteca employees did not have an easier situation. Those involved in the assault had the worst part because they were indicted with criminal charges. But they were not the only ones who sought their careers facing a major hurdle. Sergio Sarmiento, an influential news director in Azteca gave its face to a short-lived news program at CNI 40. This act was regarded by other journalist as an immoral act that was tainting Sarmiento´s prestige. These are situations that could be avoided using a different negotiation strategy that seeks beyond the simple goal of winning.

Impacts on Corporate Finance

For TV Azteca and CNI the conflict has had huge costs and they may be even larger. These costs include not only those associated to the legal battle, but also the impacts on shareholders perceptions and advertizers. There are certainly big gains to be obtained by each company, should they get a favorable outcome. While such outcome can only be assessed in the long run, there are costs and risks to be faced in the short run. In the mist of the battle for the control of Cerro del Chiquihuite, IXE Bank analysts reported that in an escenario of an extended conflict Azteca´s image among shareholders would face serious damage[15] This hipothesis, not confirmed yet, seemd more likely two month later. On March 28, Standard & Poor"s, anounced that it was reducing the credit ratings for Azteca Holdings on the basis of its debt problems and the dificulties to face its obligations. 6 days later, Moodys anounced that it may follow S&P, and reduce its ratings for the corporation[16]. While S&P based its decision on the difficulties faced by Azteca Holdings to finish an exhange offer which was considered disstresed and not precisely because of the impacts of Aztecas legal battles, the conection between the two cannot be discarded since it also confirmed that TV azteca shares had also a negative perspective[17].

Beyond the costs associated to bad image, the conflict had costs for both corporations. Just the ICC arbitration process had a total cost of 370,000 USD, paid in half for each part (See Table 2). Other legal costs are not disclosed but both corporations have maintained a team of highly qualified lawyers for more than two years.

Table 2

ICC Arbitration Costs

ITEM	COST IN USD
Administrative costs	41,600
President of tribunal	102,640
2 Co-arbiters	153,960
Mision of tribunal	17,800
TOTAL COST	370,000
PAID BY EACH PART	185,000

NOTE: The final ICC Ruling asked the sued player to pay 70 % and the suer 30 %: see: http://www.cnienlinea.com.mx/boletines/resolutivo%20paris.html

Lessons for Conflict Resolution: An Opportunity for Changing Corporate Practices

What are the lessons of the conflict between TV Azteca and CNI 40 for conflict resolution and conflict management? Does this case show the need for better conflict management practices at the corporate level? Do conflicts between private corporations have any implications for the society at large? Does a transition represent an opportunity for changing corporate practices in conflict management? These are questions that need to be addressed by decision makers in both the private and the public realm. From the academic perspective the case shows how a transition represents a challenge for corporate executives involve in conflict management. For one thing, this case shows the disadvantages of miscalculating power and negotiation capacity and the importance of a careful analysis of new rules and patterns of relationships that emerge during a period of political and economic transition

Some of the key mistakes that took place during the process that clearly demand changes in strategy include the following:

- ?? CNI 40 signed a contract from a weak position and gave almost any power of decision making on key issues such as programming, without enough contingency clauses that could be renegotiated with the aim to have a better contract under certain conditions.
- ?? Both corporations sought the backing of the federal government, which was granted without a careful revision of the existing legislation. The result of this was a heated debate over whether or not the contracts were approved. As a result, it was possible to assume that the backing of the contract was sufficient as long as none of the parts decided to move towards confrontation. Thus when CNI 40 estimated that TV Azteca would not follow the contract as expected (programming or marketing), decided to interpret that the government had not approved the contract and cancelled the terms of the agreement that gave rights of programming to TV Azteca, and took control of he signal of channel 40.
- ?? That decision induced new rounds of confrontation and the case was taken to arbitration courts whose rulings were regarded by both corporations as favorable to their interests. When TV Azteca decided to takeover the installations of CNI based its decision in overestimation of its power and influence. As it was proven by subsequent judicial rulings, TV Azteca violated Mexican legislation , perhaps expecting the support of the executive branch of the federal government, which, in their plans, would put an end to the controversy.
- ?? By taking this path, TV Azteca ignored several changes that were taking place in the last years in the public and economic spheres. Among others, it ignored the new role that mass media and newspapers were playing in shaping public opinion, and more specifically how this was occurring in a context of a democratic society. In retrospect, it could be said that this was a huge mistake not only because most news outlets dedicated a lot of space to the case in question, but most important, because a large proportion of the coverage was very critical of TV Azteca´s arbitrary decision.
- ?? Tv Azteca decided to ignore that a more critical public opinion was already formed. Thus, it launched a campaign that in vain tried to convince the public opinion that the key issue was whether or not there is respect for legal contracts in Mexico. But public opinion interpreted the case in a broader sense and regarded Azteca´s action as a challenge to the most basic tenets of the legal system in general.
- ?? But most importantly, TV Azteca blatantly ignored the changes observed in the relationship of the judicial, the legislative and the executive branches of the federal government. This could be easily regarded as the worst calculation made by TV Azteca´s corportate executives and lawyers. The result was far from what they expected. Congress put a lot of pressure on the executive to intervene and restore the respect for Mexican law. In the same vein, judges ordered the executive to intervene and to return the situation where it was until the day before the assault. Thus the executive was virtually forced to return the installations to CNI 40. When it did so, TV Azteca argued that CNI 40 had incurred in unlawful behavior with the court system and decided to launch a campaign against specific political and judicial targets.
- ?? At the end, the executive returned the conflict to its situation of December 2002. This decision put both corporations back to the negotiation table. To take advantage of the new opportunity, CNI 40 offered some choices to Azteca but they all were rejected. Salinas Pliego, owner of TV Azteca declared to Expansion, that despite of the lessons he thought that Azteca was doing the right thing and defended the corporation´s controversial attitude.

In sum, corporate executives have missed the opportunities for consensus building created by the process of economic and political transition which has resulted in a failure to forge stronger corporations and to develop negotiation skills to cope with the new political and economic environment.

Conclusion

From the theoretical perspective, this case is clearly an example in which a lose-lose situation prevails over any other option that could be considered. Corporate executives involved in the negotiations between CNI 40 and TV Azteca clearly lost the opportunity of addressing the situation from value-creating approach and come up with solutions that could strengthen their position in the market. The case also shows that in a society in transition, corporate responsibility in conflict management has a broader impact on society. Hostile takeovers such as the one attempted by TV Azteca over CNI constitute bad corporate practices that may endanger the future of the Mexican economy. The public outcry for respect of the legal system is a logical outcome in a society that desperately needs to put in place a legal system that makes the country attractive to investors.

Drawing on the lessons of this case, it is possible to develop a long lists of recommendations for corporations and lawyers that may wish to change their approach to conflict resolution. For lack of space I want to stress that, to cope with the new challenges posed by the process of economic and political transition in Mexico, corporations seeking to address conflict resolution assuming full responsibility with their stakeholders and the public at large, may want to focus their work on the following elements: capacity building in both conflict assessment and negotiation, changing negotiation culture to focus in the creation of value, careful evaluation of negotiation capacity, power and the possibilities for coalition building with players that may no be directly involved in the conflict but may influence the outcome of a negotiation process by simply expressing their point of view on the situation; and last, but not least, a careful evaluation of the experience of negotiator and lawyers. In the face of a new conflict, corporations should seek to adopt an agency form with their negotiations that is appropriate for the situation since this has an influence the negotiators´ effectiveness (Salacuse, 1999) and in particular they should evaluate negotiators´ capacities to deal with uncertainty, which seems to be a central feature of the context for conflict resolution in a period of transition.

The fact that two important corporations have been able to escalate a controversy to the level observed in this case reveals the need to strengthen the legal system to institutionalize alternative options for conflict resolution. Beyond the legal debate, this case also shows that corporations, in particular those with a large capacity to shape public opinion such as TV Companies, need to assume their responsibility in the public domain to show entrepreneurial civic mindedness when facing a conflict situation. Bad civism is a path not worth pursuing for corporations, not only because is not a good strategy for conflict resolution under a period of transition, but also, and this is perhaps more important, because in such an environment it may poison the basic institutions of society which are key to achieve economic growth and social development.

Whither Corporate Social Responsibility?

Fred Robins
University of Adelaide, Australia

Abstract

There are growing demands that the corporate world act with greater social and environmental responsibility. This paper examines these demands and their likely impact on corporate behavior, beginning with a definition of the concept of 'corporate social responsibility' and briefly commenting on the equivocal status of the concept within the business community. An attempt is then made to highlight the core ideas of the concept while also indicating its broad scope. The author summarizes the publicly stated attitudes of a number of prominent corporations followed by a description of some of the mechanisms which have been developed in recent years to assess corporate performance in this regard. Brief description and discussion of these mechanisms reveals the still-fuzzy nature of the 'corporate social responsibility' concept and leads naturally into consideration of the ideas of those who criticize the concept. Finally, the paper seeks to reach a balanced judgement about what society may reasonably expect of business and, more particularly, how business might most sensibly respond to the growing community pressure to be 'socially responsible'.

Concept and Issues

A growing number of voices in contemporary society are calling on business, especially larger corporate enterprises, to contribute more to general public and social welfare. While these calls are varied and some are imprecise, the basic idea is that individuals as citizens, consumers and employees, want a commitment from business to a broad notion of *social responsibility*. This is a view which is increasingly heard. Proponents of the idea demand that business pay more attention to the needs of the environment, the community, the workplace, and much, much more. Such thinking stretches the established, legal responsibilities of business into new areas and proponents demand that business accept costs and responsibilities which may be remote from their commercial focus and from which there may not be any identifiable return in revenue. So, *corporate social responsibility*, hereafter *CSR,* is a big and complex issue. Not surprisingly, it is argued over and not all accept it as legitimate. Nonetheless, it is increasingly at the forefront of senior managers' minds; particularly those with direct responsibility for risk management.

The traditional, narrow, attitude towards the non-economic responsibilities of business is commonly represented by quoting Nobel prize-winning economist, Milton Friedman. In an article he once wrote for the New York Times' magazine section [6] he stated in crystal clear terms the view that:

> "The business of business is to maximise profits, to earn a good return on capital invested and to be a good corporate citizen obeying the law – no more and no less. To go further in a deliberate fashion is to exceed the mandate of business. It is to make what amounts to an ideological stand with someone else's money and possibly to engage in activities with which many stockholders would not agree."

There is however a wider, somewhat more contemporary, different view. This is that a company, which in law after all is a legal person, can legitimately be regarded as analogous to a real person, so that concepts of responsibility may be applied to both; in this way a company can be considered a *morally* responsible entity. In the words of another prominent economics professor, Kenneth Andrews [1], corporate social responsibility may then be defined as:

> "Sensibility to the social costs of economic activity and to the opportunity to focus corporate power on objectives that are possible but sometimes less economically attractive than socially desirable."

This latter statement makes explicit the core issue in the contemporary debate about corporate social responsibility and its legitimacy. The key question is whether, when there is *no* legal or financial reason, companies should nonetheless address social and environmental issues? This question can arise in the context of basic human rights as well as with regard to child labour, pollution standards, sustainable resource exploitation, and so on. In fact it is a very many-sided question. Research reported by staff of McKinsey's [4], has suggested that ethical and social responsibility issues may clash with emerging business opportunities in at least four growing categories of commercial activity. These are: the exploitation of some new technologies, such as GM foods; the movement of activities from the public to the private sector, like power and water supply; entry into third world markets, as with subsidised foodstuffs from the EU in Africa; and the exploitation of legally contestable markets, such as tobacco, alcohol, gambling and sex.

Business Perspectives

CSR poses a stark question for the business community: "When there is no clear financial reason, after all contractual and legal obligations are met, *should* companies still address wider social and environmental issues?" Big business is already familiar with the notion of the 'Triple Bottom Line', comprising a balance sheet of environmental and social consequences of business operations in addition to the necessary financial outcome [3].. However CSR seeks to extend this whole-of-business approach and to make it obligatory for all. In fact there have already been moves in some jurisdictions to *require* corporations to produce social and environmental reviews as part of their annual reports. France, for example, already has legislation requiring listed companies to make such information available to investors and a British company law review has similarly recommended that public corporations be required to produce social and environmental reviews as part of their annual reports [17]. Moreover, in 2001, 45% of the largest global companies published Triple Bottom Line reports voluntarily and 72% of top Japanese firms produced sustainability reports [11]. Similarly, since 2000, UK pension funds have been required to publish the percentage of their portfolios placed in 'socially responsible' investments.

Yet not all are convinced this is desirable. Some think it completely misguided, noting that many companies are ill-equipped to anticipate the less direct social consequences of their actions [19]. In any case, if society wishes to focus on social goals, rather than economic ones, it is legitimate to ask why this should become the responsibility of the private corporate sector, rather than the public and accountable political process.

Given the contested legitimacy of CSR and disparate approaches to the issue in different jurisdictions, it makes practical sense to take note of specific corporate responses. This is especially the case among larger, more globalised companies. One example is offered by Sweden's *'IKEA'*, the world's largest retailer of furniture and home furnishings, a company with an annual revenue in excess of US$5 billion [10]. This is a highly individualistic company which actively protects its entrepreneurial and innovative traditions. On its own initiative, it developed what it terms its 'Natural Step' framework to enable it to assess the ecological and social sustainability of its commercial activity. Sustainability is both commercially important and environmentally relevant in an industry based largely on timber. Another case is offered by the world's fourth largest oil group, '*TotalFinaElf*' [7]. In recent years this company has come in for a barrage of public criticism, from NGO's, safety regulators and some shareholders, for maintaining links with arguably unsavoury regimes in such countries as Burma, Iran, Iraq and Libya. Indeed, revelations at a trial involving former employees suggested that bribery was a core competence of the company [2]. In response, in 2003, the company commissed an independent review of its safety and ethical standards by 'GoodCorporation'. In due course it hopes to apply the findings of this review in a manner which will help it shed its controversial image. More generally, the Ashridge Centre for Business and Society surveyed Fortune 500 companies in 2000 [12]. Although only 52 of the 500 companies responded, 36% of those which did indicated that human rights issues had caused them to abandon a proposed investment project and 19% of them had actually withdrawn from existing operations in a country on account of human rights issues. One publicly documented case of such disinvestment is that of '*PepsiCo'*, which left Burma in 1997 following intense public pressure from human rights and student groups.

The latter example, among others, illustrates a growing corporate sensitivity to social and environmental issues. Of course, the response may well have as much to do with self-interest as it does with morality. One factor which is certainly present in the corporate mind is a recognition that social and environmental considerations *need* to be addressed when they are likely to impact on corporate reputation and profitability. A different factor, sometimes present, is recognition that CSR aids employee attraction and motivation. Another factor is the potential contribution of CSR activities in the management of risk.

For all of these reasons, many big companies are moving beyond minimal legal compliance with regulation and willingly embracing a deeper, more active, involvement in the wider community. To the extent that they do so, this implies acceptance of a much broader concept of who and what constitutes a stakeholder, plus at least some degree of corporate social responsibility to the broader citizenry.

In the aftermath of the demise of Arthur Andersen, no large corporation today is unaware of the frailty of corporate reputation. As the Andersen saga demonstrated with brutal clarity, it need take only one false step to destroy a hallowed reputation. More generally, a single negative story can strip billions of dollars from a company's share value in minutes, hurting shareholders and employees alike. So, as a recent Director-General of the World Trade Organisation has written [13]:

> "The challenge for companies is to leverage the power of their brands for socially positive outcomes without damaging their profitability, and in doing so overcome some of the prevailing distrust of global business."

One global company which ignored the risks was '*Bayer'* before 2001. Although their pharmaceutical product 'Baycol', 'Lipobay' in the USA, was first associated with unexpected deaths in 1998, it was only in 2001, after the Federal German Institute for Medication and Medicinal Products had determined that the product caused 'undesirable medication effects', that the company took the product off the market. When this was finally done, the company share value fell approximately €6 billion in just two days [20].

Indices and Measurement

Efforts have been made over recent years to measure *the level* of CSR displayed by corporations. Not surprisingly, this has proved difficult. There have also been efforts to identify the number of companies which have accepted *the principle* of CSR. Indeed, there are already at least four international Corporate Social Responsibility frameworks which are reasonably well known, from which companies can choose. These frameworks are all available in user-friendly form, online, free of charge:

?? UN's Global Compact
?? AccountAbility 1000
?? Social Accountability 8000
?? Global Reporting Initiative (GRI)

The last of these was launched in New York as recently as April 2002 but it already has a faster take-up rate than the others. There is a permanent GRI secretariat based in Amsterdam and about 150 companies have already published annual reports based on its *voluntary* guidelines [5]. In addition to the above frameworks, the UN Environment Programme has jointly launched publication of a 'SustainAbility' league table which attempts to show how effective companies are proving to be in meeting CSR objectives. Some believe this SustainAbility table illustrates emerging best practice in reporting on the Triple Bottom Line. However, at this stage, few companies are linking sustainability directly with governance or with brand management and few observers would claim that environmental reporting is yet firmly established in the corporate world.

The 'Global Compact' was launched by UN Secretary-General, Koffi Annan, in 1999. It promotes nine business principles, covering human rights, labour standards and environment, with considerable emphasis on labour practices. It is very broad in scope and does not lend itself to easy measurement of progress. 'AccountAbility 1000', in contrast, comes out of the non-government Institute of Social and Ethical Accountability in London. In another contrast, this does offer a standard for measuring and reporting 'ethical behaviour' in business. Its designers hope, thereby, both to improve ethical performance and to be able to judge the validity of company's ethical claims. The goal is to help business define targets, measure progress towards the targets, audit and report performance, and establish feedback mechanisms. The standard is designed for both internal and external audit procedures and to be applied by businesses of any size. The third framework, 'Social Accountability 8000', is a voluntary, universal, standard for companies interested in auditing and certifying their labour practices together with those of their suppliers and vendors. Like the UN 'Global Compact', it highlights nine key areas for assessment, but unlike the

Compact it seeks to measure performance in these areas. This is despite the inclusion of notoriously hard-to-measure dimensions like 'discipline' and 'discrimination'. 'The 'Global Reporting Initiative', which is already more popular than the others, is developing a corporate disclosure framework which businesses can use to *fully* report on their economic, environmental and social performance. The reporting guidelines are of course entirely voluntary. However the GRI is currently leading debate on issues such as the triple bottom line in accounting and is acknowledged by many CSR enthusiasts as the leading initiative of its kind.

Step Forward or Red Tape?

In most major jurisdictions attempts are already underway to measure CSR. In Australia, for example, there is the Good Reputation Guide, or RepuTex. This is compiled by a private organisation, with respected university support. It seeks to rank the CSR of Australia's top 100 companies on an annual basis. The detailed annual rating is then sold to companies for A$25,000. However this ranking mechanism is not without serious criticism. Companies that respond to the survey and complete it carefully, tend to score well, while companies which omit answers to some questions or do not respond at all, attract zeros. This, of course, risks a situation in which respondent companies score highly while those which do not complete the survey, do badly. This is seriously misleading. It is hardly the case that a company is 'bad' in terms of CSR just because it chooses not to participate in the survey! [8]. A more widely known and probably more soundly based corporate ranking of this kind is the 'Social and Environmental Ranking' of SustainAbility.

The issue of measurement is a complex one. In the first place, *no* universally agreed CSR standards have yet emerged. In any case, it is not yet known to what extent it makes practical sense to apply common standards across all sectors of business. At the same time, in principle, measurement seems the only reasonable way to monitor progress.

The next question which often arises, is whether moves towards corporate social responsibility should remain largely voluntary, as at present, or be strengthened by new legislative requirements. The question is raised here because we have already noted some piecemeal moves towards the regulation of CSR and there seems to be something of a trend in this direction, at least in Europe. However the consequences of CSR regulation are not necessarily obvious, nor is its desirability established.

The Proper Place of CSR?

To date, CSR thinking has only had real impact on larger companies, which is probably what we should expect. It is the larger companies which are most in the public eye and these are the ones responsible for most of the more prominent developments. Among these large companies, however, the impact of CSR thinking is often considerable. Many of them accept, albeit sometimes reluctantly, that the need for enhanced CSR is simply a fact of modern, corporate life. This view is particularly prevalent in those sectors of business, like mining and pharmaceuticals, where there have been some spectacular corporate misjudgments in recent years. The cost, in both money and reputation, of the former BHP's environmental degradation caused by its Ok Tedi mine in PNG, is but one well publicised example. The case of Bayer, mentioned above, is another. Some, more and more, bigger companies today are accepting responsibilities outside their sphere of direct commercial interest, in the non-business world; at least, in the communities in which they operate and are exposed to public view. Some evidence of this comes from a survey of 50 CEOs from 16 countries, undertaken for the World Economic Forum in 2002. This identified four frequently cited reasons used by big business to justify what they chose to call 'good corporate citizenship'. These were: to enhance their corporate and brand reputation; to attract good employees; to protect their license to operate; and to help compete for market position (Taylor, 2003). This survey also identified that the relevant decisions on such matters were nearly always taken in one of the following three ways: by a subcommittee of the board; by a committee of senior executives; or by following external advice. A comparable Australian study of CEOs [18], identified that:

> "Often CSR is manifested in partnerships and agreements with community organisations, in recognition that businesses have social, cultural and environmental responsibilities to communities – *alongside* (my italics) the firm's financial responsibilities to shareholders."

At first sight this may all seem too good to be true. On the other hand, it may be supporting evidence for the views of well-known Harvard economist, Michael Porter [14]. Porter believes CSR can increase rather than decrease corporate returns. Like both Porter and the World Economic Forum respondents, Richard Lambert, editor of the Financial Times from 1991 to 2001, suggests there may be three reasons for this:

The first is to enhance and avoid damage to reputation; especially with consumer products;
The second is to help recruit and retain the best employees;
The third is to enhance the surrounding business environment.

There is further evidence of the growing acceptance of CSR. In March 2003, some 120 companies voluntarily participated in the first index of 'Corporate Responsibility' of the 'Business in the Community' organisation. This is an index which defines responsible business practice and enables companies to assess and compare how they integrate responsible practices across their organisations in four key areas. These are: environment, marketplace, workplace, and community. The index was developed and tested with input from 80 companies.

A comparable development has occurred within the financial sector under the auspices of the World Bank's International Finance Corporation. Here, the Heads of 'project finance' and 'risk management' have collaborated with ABN Amro, Barclays, Citibank and WestLB, to adopt a sector-specific set of social and environmental rules known as the "Equator Principles" [16]. These aim for sustainable development and include guidelines on issues ranging from environmental assessment and natural habitats to indigenous peoples and child and forced labour.

Such developments reflects increasing sensitivity to the risk to reputation of participating in controversial transactions; in both the private sector and in international organisations, For example, both Citibank and JP Morgan Chase have recently been publicly challenged for providing services which helped *'Enron'* inflate its reported earnings. John Ruggie, the Director of the Harvard Center for Business and Government [15], argues that many companies fail to grasp the extent to which they are at the receiving end of a sharp increase in social expectations about the role of the corporation in society. He believes that this is not just about philanthropy or even ethics, but about many-sided social accountability to society at large. He adds that "we live in a world of proliferating problems without passports" and that, unlike national governments, large corporations have demonstrable global reach and can make decisions and act faster than governments or their agencies. In this view, we should recognise that large corporations are more than mere economic actors on the world stage and are powerful social actors in today's globalising world. Ruggie argues that these realities are fundamental to an understanding of the *emerging* nature of corporate responsibility.

Yet we cannot forget that CSR approval remains far from universal in the business community. Support, moreover, is largely confined to the big end of town. In addition, the drift towards increased acceptance of CSR remains without any generally agreed intellectual underpinning. As indicated at the start of this paper, *informed* opinion remains divided.

A MORI investigation of European public opinion on CSR, however, has yielded some very clear indications of 'majority' *popular* opinion. A clear majority in each of twelve European countries surveyed claimed to regard company commitment to social responsibility as 'important'. While this is not surprising, 70% of European consumers also claimed that such company attitudes influenced their purchase choices and some 20% of them claimed a willingness to pay more for products which are socially and environmentally responsible. Indeed, in Switzerland, Spain and the Netherlands, no less than 66% of respondents thought large companies should actively address social issues.

On the other side of the debate, the most telling argument is probably the philosophical one that social goals are more *properly* pursued through open and legitimate political process, rather than through private, commercial agents which, ultimately, may lie beyond popular control through the democratic process. This argument has been clearly expressed by one leading economic journalist in the following terms [9]:

"If we want to pursue social goals, the right way is openly, through the political process where the pros and cons can be argued out explicitly. CSR will either achieve little or do harm. Which one it will be, I do not know. But I do know the right response is one of profound scepticism."

In this view [21], if CSR deflects business from its primary goal of profit, it is unlikely to prove successful for long. In any case, other things being equal, less profit is likely to mean fewer jobs and lower tax revenues. So, effectively, the price of corporate social responsibility comes from *both* profit and tax paid. While it is true that business *can* add to social welfare by prompt and effective community action, it is not at all obvious *to what extent* business should be expected to do so. Further, there is unlikely to be easy agreement on this point.

Conclusion

There is obviously still plenty of room for debate about CSR. A spread of opinion is anyway evident on most aspects of the issue, including its desirable scope, how best to encourage it, how best to measure it, and whether to keep it entirely voluntary or introduce elements of compulsion. It is likely that all these questions will be the subject of increasing attention in the near future.

This observer's judgement is that if CSR risks deflecting business from its primary goal of profit, common sense suggests that it is unlikely to be very successful. Ultimately, profit has to come first; without it, there can be no company. At the same time, business *undoubtedly has the capacity to* add to social well-being, in a community sense which goes beyond economic activities. There are myriad examples of this, large and small, ranging from Quaker entrepreneur-philanthropists in eighteenth and nineteenth century England to the Tata family businesses in contemporary India. It is worth noting explicitly, however, that the cost of CSR activity must obviously come from company revenue. This means, in reality, that CSR expenditures must come at the expense of something else, presumably profit and tax. In addition, the acceptance of costly burdens by profit-seeking companies cannot easily be imposed on the ill-qualified or the unwilling. This is the risk if CSR is imposed by legislative compulsion. So this observer judges that a combination of moral suasion and market pressure is much more likely to prove effective. In this view, any attempt to spread social burdens on business through regulation is far more likely to be counterproductive than effective. In particular, it risks wholly negative social outcomes such as inefficiency and corruption.

Interestingly, the corporate social responsibility website [www.iblf.org/csr/] is itself mild and persuasive rather than assertive or moralistic in tone. The site draws attention to three levels in what it sees as an emerging governance framework: national regulations, international conventions, and voluntary standards. At the first level, national regulation, there is recognition that all companies, regardless of jurisdiction, are obliged to comply with the company law, labour, safety and environmental standards, of the countries in which they operate. Beyond this there is a second level of internationally agreed conventions on an increasing number of issues. Among the most important, of course, are conventions on labour, environmental and human rights issues. These are increasingly used by global corporations as a basis for judgement and decision making. Then, there is an emerging third level of voluntary standards. These are varied and are often established by specific industry groups for their own purposes, and to promote competition among companies within a sector on equal terms. Some involve accreditation systems; others offer guidelines.

So what is the overall, contemporary reality? To this observer there are three developments taking place. One is that as more and more big companies develop regional and global operations, we see more and more of them confronting differing local standards and accepting at least some measure of corporate responsibility for lifting standards in the poorest and least sophisticated environments in which they operate. They do so, if for no other reason, in order to avoid public criticism in their home country and in their markets. Second, in an information-rich and increasingly integrated world, with increasingly active shareholder groups, we see companies giving far more structured attention than in the past to factors which may potentially impact on their corporate and brand reputations. Third, as ever, it is more than just comforting for corporate kings and their professional managers to seek a place on the moral high ground. There are often direct benefits in terms of recruitment and retention of high quality staff in doing so. In short, there is indeed a trend towards enhanced CSR and we only need to examine corporate self-interest to explain it. It is important to note, however, that legislation and compulsion is unlikely to be a good way to foster this trend. It is also salutary to keep in mind that while big business, in its present phase of development, may well be able to take on some community responsibilities more effectively than some governments, they cannot and should not usurp the role of government. It is political processes, alone, not corporations, which have the legitimacy to make social choices for the community at large. This means that the entire, complex bundle of issues we think of as CSR is probably better approached with hard-nosed caution than with messianic enthusiasm.

The Impact of Relations between Mexico and the United States in the Face of Strengthening Sino-American Commercial Ties

Renato Balderrama
Instituto Tecnológico y de Estudios Superiores de Monterrey, México

Abstract

Since 1979, the People's Republic of China has initiated a series of economic reforms with the purpose of boosting and opening up its economy. Since then its foreign trade has been expanding and has now placed China as the world's seventh most important exporter. At the same time, due to a strategy in 1982 of opening up economic zones, China has managed to attract capital and technology helping her to expand and to diversify her manufacturing base. Since 1979 when the United States managed to open up relationships with China, commercial relations, overall, have grown in an exceptional way. From the beginning of this century, two events have marked the relationship of China with the United States impacting the geopolitics of the North America Free Trade Agreement (NAFTA). In November 2001, China was formally accepted into the World Trade Organization (WTO). Currently its commercial exchange has grown with the whole the world, but particularly with the United States and to such a degree that in 2003, China dislodged Mexico as the United States' second most important supplier after Canada.

Introduction

Relations between China and the United States were re-established on February 28th 1972 with the visit of U.S. President Nixon and the "Official Communiqué of Shanghai". In this meeting, a framework was set up, on December 16th 1978, so that finally, bilateral diplomatic relations could be reestablished and ambassadors could be exchanged on January 1st 1979. Subsequently, it was arranged for Chinese Premier Deng Xiaoping to visit Washington. As a result of this visit, each president who has reached the White House has visited China at least once during his administration, just like the most important personalities of the elite in Beijing, who always have corresponded in terms of attention to their counterparts. Nevertheless, this relation has had its highs and lows and has been a relation centred on the paradox of conciliating political interests with the economic interests. There have been moments reflecting closeness, but others reflecting open hostility.

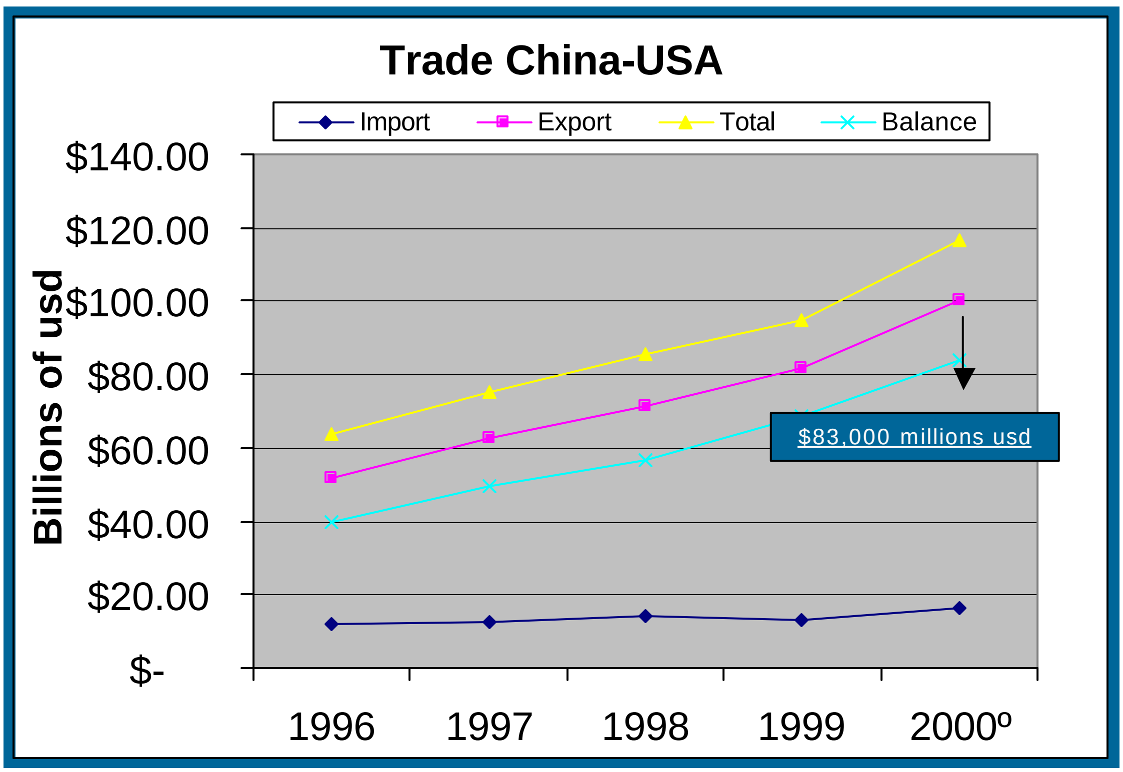
Perhaps the second half of the eighties was one of the best times for the relationship. Nevertheless, after the Tiananmen Square incident, relations entered a rut. The most conservative groups had ammunition with which to justify their hostile attitude towards China. It was not until the administration of William Clinton that the White House decided to give preference to commercial relations over political considerations despite ample and strong opposition from some members of congress and labour unions (1).

For its part, China initiated a series of reforms, which were economic in nature. She gave herself the task of, on one hand, attracting direct foreign investment and, on the other, opening up its markets beyond its borders. Regarding the first task, the results were outstanding, with the creation of four strategic economic zones in coastal areas, where the Chinese managed to attract capital as well technology. To achieve a successful conclusion, in the second part of its strategy, China needed to assure its entry into the U.S. market on favourable terms, that is to say by obtaining the most favoured nation status. As well as being lengthy, this process caused, year after year, tensions with the United States, because some congressional representatives and leaders of diverse organizations used these discussions to condemn the lack of human rights in China, among many other issues.

Therefore, from 1986, China made reaching an agreement in GATT one of its priorities. However, she ran into problems with an American congress and administration in Washington that was against the project and with a GATT that was on the verge of initiating the Uruguay Round. It would have meant having to negotiate new issues, with which China would have found impossible to comply. Therefore, the "long march" began in China's entry into GATT, which became the WTO in 1995, including bilateral negotiations with the United States. Discussions largely centred on linking China's membership to the WTO with commitments that went beyond the purely economic sphere, to specifically accelerate political and social reforms with a tendency, according to the West, on democratising the Chinese state, guaranteeing freedom and social rights. China gave a series of commitments to observe the overall economic and commerce plan, giving the hope that over the medium term they would be able to undertake other possible reforms (2).

Finally, China is accepted officially into the WTO, December 2001, and from that, moment China's foreign trade has boomed. In 1999, for example, 31% of China's total sales were exported to the United States. In 2003, this figure is expected to reach 40%, making the United States the principal destination of Chinese goods in overseas markets. As outlined in the Tab. 1, this situation has meant that the deficit of the United States with China has reached the $83,000 million dollars (according to the statistics from the United States Department of the Commerce). This figure not only reflects the biggest deficit that the United States has with any country in the world, almost 20% of its total world-wide deficit, but also its most imbalanced commercial relationship, since its trade with China only represents 5% of its total commerce. The United States exports to China only 2% of its total sales (3).

TABLE 1. FOREIGN TRADE BETWEEN CHINA AND THE USA



Tab. 2 highlights the imbalance in foreign trade, as well as the growing deficit. Until China's entry into the WTO, the country that had the greatest deficit with the United States was Japan. From 2002, the deficit shifted towards China (4).

In addition, Japan and the European Union (EU) have increased considerably their commercial dealings with China. Japan, as well as the EU, imports much less and exports much more to China than the United States does, but nevertheless they also have a deficit with China, as can be seen in table 3 (5).

TABLE 2. TOTAL USA –CHINA TRADE (THOUSANDS OF MILLIONS OF DOLLARS)

Total Trade China-USA (billions of dls.)

	1996	1997	1998	1999	2000°
Import	$ 12.00	$ 12.80	$ 14.30	$ 13.10	$ 16.30
Export	$ 51.50	$ 62.50	$ 71.20	$ 81.80	$ 100.10
Total	$ 63.50	$ 75.30	$ 85.40	$ 94.90	$ 116.40
Balance	$ 39.50	$ 49.70	$ 56.90	$ 68.70	$ 83.80

Source: The United States-China Business Council (2001)

TABLE 3. DEFICIT FROM THE MAIN TRADE PARTNERS WITH CHINA IN 2000

Deficit from the main trade partners with China in 2000
(millions usd)

	USA-China	Japan-China	EU-China
Export	$ 16,000	$ 30,400	$ 27,800
Import	$ 103,000	$ 55,100	$ 61,200
Balance	*- $ 87,000*	*- $ 24,700*	*$ 33,400*

The strengthening of China's exporting ability has directly affected, not only those countries that compete with the same products as the Chinese, but also on competition within the most important market in the world, which is the United States. In this respect, Mexico has been the country most affected, since more than of 90% of its commerce is concentrated on exports and imports within North America, mainly the United States(6).

Therefore, the competition from China within NAFTA has already displaced Mexico as the United States' second most important commercial partner. This situation has put foreign investors in a difficult situation when considering whether to continue investing capital in Mexico. The short-term result has been that the world's principal multinational companies have decided to invest in, or to move to their plants and facilities in Mexico to, China. It would seem that the benefits that Mexico had obtained from signing the agreement on NAFTA with the United States are now disappearing. Despite the factor of geographic proximity, companies with foreign capital are considering as a priority the market and the facilities that China offers against the benefits offered by Mexico (7).

Relations between the U.S. & China since China's Entry into the WTO

Since 2000, a report has been commissioned every year by the U.S. Congress on bilateral relation with China. This report is undertaken by a group of experts from several organizations, from the Secretariats of State, Defence and Commerce, and includes independent academics, experts in military and economic affairs, and business and labour union leaders.

The last report, July 2002, entitled U.S.-China Economic and Security Review Commission, had the objective of analysing the implications on national security, the United States' economic relations with China, so that the executive and the legislature act jointly and expeditiously through a coordinated national effort.

The most important findings of report were: a) the government of the United States is *poorly* organized to administer its growing relationship with China; b) the United States is not *adequately* informed about developments within China and dedicates few resources to understanding the country; c) the Congress must expand the capacity of the U.S. government to collect, translate and analyze materials in Chinese; d) Congress will have to provide federal funding and other incentives to strengthen Chinese studies and related areas in U.S. universities, very similar to the 1958 national defence education act regarding the USSR; e) Chinese leaders aim to maintain good and stable relations with the United States because it is an important market and source of technology, financial capital and investment; f) this lack of understanding has *provoked errors* (a lack of monitoring), from a dependency of the military industrial base on Chinese imports to the transfer of the latest technology, an unbalanced commercial trade deficit and lack of analysis of a correlation with unemployment in the United States; and finally, g) Chinese leaders think that the United States, although technologically superior in military aspects, can be defeated through tactics and the Chinese philosophy of "feeding off the weaknesses of your opponent", taking as an example the failure of the United States in Somalia.

Impact on the Mexican Economy Due to the Complexity of Commercial Relations between China and the United States

Although China does not have a Free Trade Agreement with the United States, its bilateral relations, and not just economic and commercial ties, but also its political ties, have pushed Mexico-American relations onto the back burner. The current bilateral agenda between China and the U.S.A. is so widespread and complex on one hand, and so strategic for both sides that the government of Washington has considered it as its most important relation. This relation at the moment is being reviewed in several areas, especially in: a) foreign trade between the United States and China, due especially to the enormous commercial deficit that has been created; b) American multinationals and their investment in China, helping to create the biggest exporting platform in the world; c) the entrance of China into the WTO; d) United States' foreign policy towards China in the struggle for the regional hegemony in the Asian Pacific; e) the increasing dependency of the American military industrial base, according to U.S. internal reports, on Chinese high technology products (8).

Therefore, Chinese competition in the North American market is becoming stronger and stronger. On one hand, more and more U.S. multinational companies are relocating to China using it as an exporting platform which is not only flooding the U.S. market with goods manufactured in China, but also developing markets, such as that of

Mexico. This is part of the problem of contraband goods, in that in spite of the product being made in China, the merchandise is labelled by U.S. companies and from there enters Mexico, taking advantage of NAFTA.

On the other hand, every day more and more of international companies are investing in Chinese high technology companies, putting an end to the myth that all Chinese products are of poor quality and labour intensive. At the same time, it is important to note that all this investment and technology transfer has been established not just by the United States, but also by Japan, South Korea and Europe in what are called Special Economic Zones, which have been created to maximise industrial capacity and according to the knowledge of each type of industry (10).

Therefore, we have ports like those of Shenzhen, which have managed to create productive chains and suppliers of excellent quality and delivery times in such industries as vehicle manufacture, textiles, machinery, etc. Starting with only five economic zones created at the beginning of the 1980s, today there are more than 100 such areas or regions, which promote the arrival of capital, technology and jobs in the same way as when the first zones were created (11).

These strategies have led to U.S. investment in high technology manufacturing goods companies being established in ever great numbers in Chinese coastal areas. It is interesting to note that even in this area the United States runs up a deficit with China. As we can see in Table 4, in just one decade, Chinese exports are higher than the imports of US capital goods. This situation led to a deficit of $6,120 million dollars in 2001. The figure of just $160 million dollars which China exported in high technology goods to the United States in 1990 has reached $13,360 million dollars in 2001, an 8,126 per cent variation (12).

TABLE 4. UNITED STATES -CHINES HIGH TECHNOLOGY TRADE IN MILLIONS OF DOLLARS

Trade USA-China Goods of High Technology (GHT) (millions usd)

	1990	2001	Variation
Export	$1,240	$ 7,240	*483%*
Import	$ 160	$13,360	*8,126%*
Balance	$1,080	- $ 6,120	

On the other hand, in undertaking a minute analysis of US-China bilateral trade within the area of high technology goods, we can see that of the 100 percent of trade in 2001, the United States had a 81-per-cent trade deficit in these goods. The total US trade deficit reached $5,400 million dollars, against a surplus of only $500 million dollars, concentrated in airplanes and space vehicles, photographic, optical and measuring equipment as can be seen in Table 5 (13).

TABLE 5. US- CHINA TRADE IN HIGH TECHNOLOGY IN 2001. MILLION OF DOLLARS

Total Trade USA-China Goods of High Technology in 2001

Areas	(100%)	Status	Accumulate (million usd)
Mechanical Equipment, including computers	46%	Deficit	“
Electric Machinery	35%	Deficit	$ 5,400
Aircrafts and Space aircraft.	12%	Surplus	“
Photography equipment, optic and measurement.	7%	Surplus	$ 500

In Tab. 6, we can appreciate, that apart from U.S. investment in high technology goods, U.S. investment has turned to the installation or creation of strategic alliances in other sectors, as for instance in the manufacture of electronic equipment. In this sector, the United States has invested more in terms of amounts and percentages than in all its investments in China. The United States also invest highly in petroleum extraction projects. At the same time, one can appreciate the growing amount of investment in financial and banking services. This, to a large extent, is due to China’s negotiations to enter the WTO (14).

TABLE 6. POSITION OF FDI OF THE UNITED STATES IN CHINA BY SECTORS. THOUSANDS OF MILLIONS OF DOLLARS

Position of FDI from USA to China per Sector

Sector	investment position in 2000 (Musd)	% from the total in 2000	% of increasing 1994-2000
Oil	1,846	19.3%	106%
Food manufacture	181	1.8%	38%
Chemical manufacture	245	2.6%	11%
Metalic manufacture	183	1.9%	76%
Machinery manufacture	931	9.7%	N/a
Electric Equipment manufacture	3,208	33.5%	1,787%
Transport Equipment manufacture	147	1.5%	N/a
Other manufactures	768	8%	252%
Wholesale Trade	362	3.8%	168%
Banks/Finances/ Services	1,113	11.6%	179%
Others	594	6.2%	357%
Total	9,577	100%	275%

Conclusion

Growing Sino-US trade and political relations have left Mexico off the radar screen, even with NAFTA, Mexico's geographical proximity and a government with favourable tendencies toward the U.S., at least up until 11th September. Even more than China's entry into the WTO, its presence in the U.S. market has grown to such a point that it has displaced Mexico in the first months of 2003 as shown in Tab. 7 and 8.

TABLE 7. VALUE OF TOTAL MEXICAN AND CHINESE EXPORTS TO THE USA IN 1990 -1992
THOUSANDS OF MILLIONS OF DOLLARS

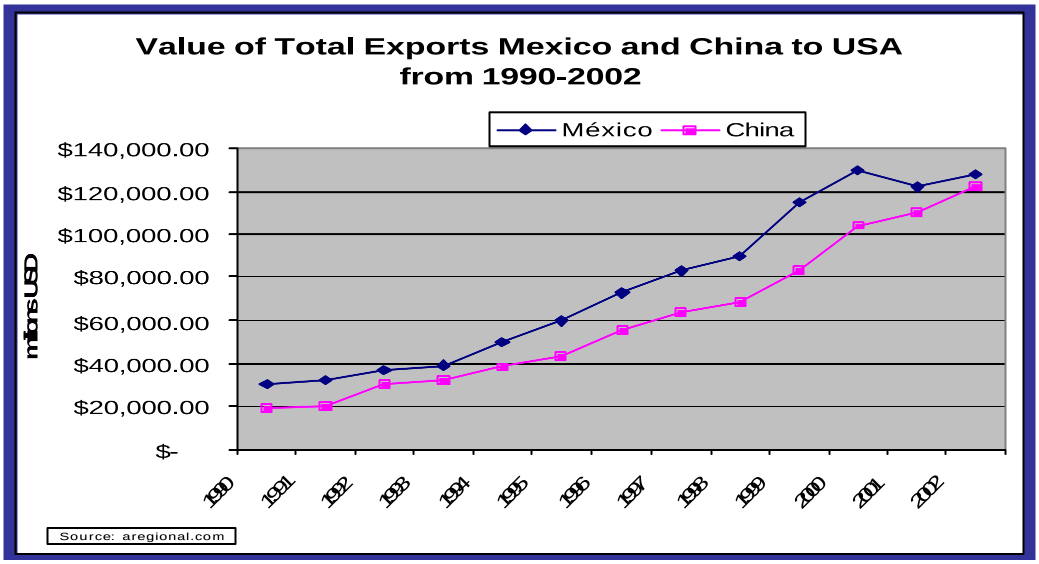


TABLE 8. VALUE OF MEXICAN AND CHINESE MANUFACTURING EXPORTS TO THE USA 1998-2002.

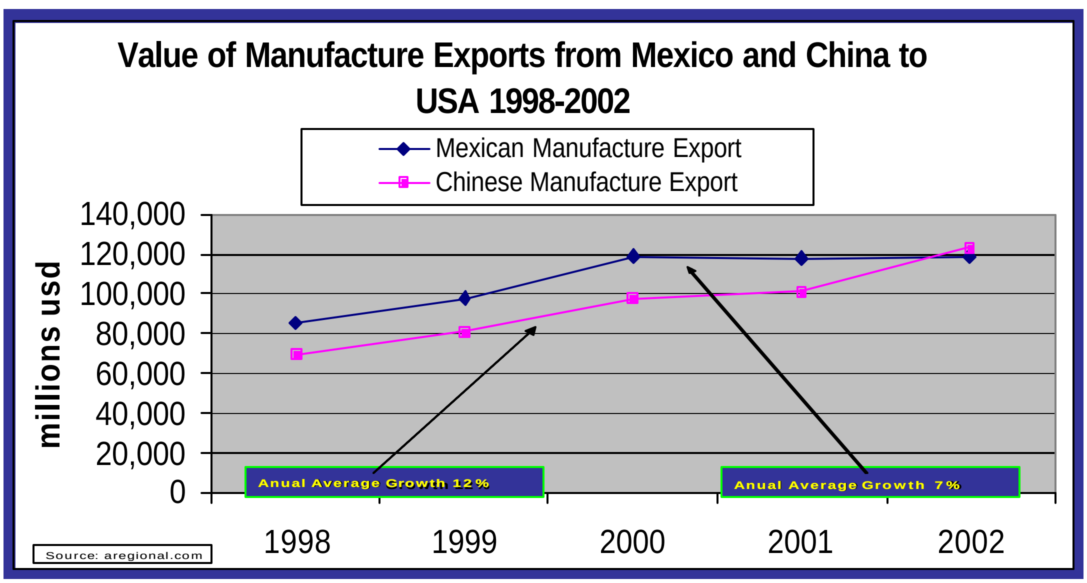

In the final analysis of the different sectors, we can see that there are sectors where Mexico cannot nor will not be able to compete with Chinese goods, such as in toys, furniture, computer accessories, and sound equipment, among others. Nevertheless, there are sectors dominated by Mexico and where China will not present a threat, at least over the medium term. Here we can mention especially the automobile and automobile parts industries. There are two other areas, which can be seen in table 8, where there is strong competition and where they are fighting to the last. It is here where Mexico will have to determine its strategies and the resources that can be put to the aid of the country's companies.

TABLE 9. CATEGORIES OF THE PRINCIPLE MANUFACTURING ACTIVITIES ACCORDING TO THE TYPE OF COMMERCIAL COMPETITION BETWEEN MEXICO AND CHINA

Categorization of Manufacture Branches according with the type of Trade competition between Mexico and China

Branches of Mexican Dominium (no threat short and medium run)	Chinese competitiveness in Branches of Mexican dominium (red warning)	Mexican competitiveness in Branches of Chinese dominium (China is growing)	Branches of Chinese Dominium (due in part for the EZZs and FDI)
(1)	(2)	(3)	(4)
Automobile	Industrial Machinery	Home Appliances	Toys and entertainment products
Automobile Accessories and its parts	Instruments of Mesurament and Control	General Equipment	Sintetics and cotton Cloth and Textiles
New and second hand Autobuses	Computers	Writing and drawing devices	Computer boards and Typewriting machines
Complete and assembly trucks	Telecommunications equipment	Sport Shoes	Computer appliances
Motors y its parts	TVs and VCRs	Kitchen tools and devices	Furniture and home devices
Process products of iron and steel	Electric Generators and accessories		Stereos and Audio equipment
	Electric Appliances		
	Textiles and cotton fabrics

Institutions of Economic Freedom, Political Competition, and Economic Growth

Antonio Saravia
American University of Sharjah, United Arab Emirates

Abstract

Institutions that promote economic freedom (i.e. personal choice, protection of private property, and freedom of exchange), are usually regarded as being fundamental for the process of economic growth. That these institutions affect the performance of economies is hardly controversial. Neither is the notion that the differential performance of economies over time is fundamentally influenced by the way they evolve. The question is: "*how* do these institutions evolve?" In a seminal paper, Acemoglu and Robinson (2002) argue that countries experience institutional evolution and economic growth at two extremes: when the incumbent ruler is highly entrenched and faces small political competition or when he is not entrenched and faces high political competition. This paper presents a cross-country analysis testing Acemoglu and Robinson's political theory of institutional evolution. We also test the positive correlation between institutions of economic freedom and economic growth. In both cases our results are consistent with the theoretical predictions.

1. Introduction

There is widespread agreement that institutions (the laws and informal conventions within societies that both permit and bound economic behavior) matter a great deal in the process of economic development. In particular, institutions that promote economic freedom (i.e. personal choice, protection of private property, and freedom of exchange) shape economic incentives, and via this channel have a first-order impact on economic growth.[1]

Formally, institutions determine the ``economic rules of the game'' - in particular, the definition of property rights, the set of contracts that can be written and enforced, and the rules and regulations that determine the freedom of exchange and personal choice. Common examples of institutions include, therefore, individual property rights, commercial and contract laws, price controls, discriminatory taxation, etc.

That institutions affect the performance of economies is hardly controversial. Neither is the notion that the differential performance of economies over time is fundamentally influenced by the way institutions evolve. The question is: "*how* do these institutions evolve?" Could a country in which "bad" institutions are employed improve them? And conversely, could a country with "good" institutions hope to sustain them? Why are many countries unable to change the institutional set for long periods of time, consequently suffering from institutional and economic ossification?

Following Acemoglu and Robinson (2000, 2002), we believe that an important part of the answer to the previous questions is found in the dynamics of the country's political power distribution. The argument is that an institutional change not only has a growth effect, but also a redistributive effect in the economy. In particular, the adoption of a new institutional set may change both the economic and the political power distribution among different groups of the population. Groups with political power (incumbent rulers) may, therefore, block institutional change when they are afraid that this change will destabilize the existing system and increase the probability of losing this power.

Acemoglu and Robinson call this phenomenon the 'political loser hypothesis' or 'political replacement effect.' Due to the economic and political turbulence generated by an institutional change, citizens may be more likely to replace an incumbent ruler who has adopted the change than one that has not. The incumbent ruler, therefore, has a trade-off between the positive effect of increasing rents conditional on maintaining power and the negative effect of increasing the likelihood of being replaced.

The political replacement effect suggests that a Coase Theorem type of logic, maintaining that institutional changes that increase the size of the social pie will always be carried out, does not apply. There is no credible way of ex post compensating the political rulers who lose their power.

The implication, in terms of economic development, is twofold. On one hand, countries might experience institutional change and growth if the incumbent ruler is not entrenched (faces high political competition) or if he is highly entrenched (faces small political competition). On the other hand, however, countries might not experience institutional change nor growth if the incumbent ruler's political position is just somewhat entrenched and fears replacement. If we were to graph it, this relation would take a U shape with institutional adoption on the vertical axis, and the degree of entrenchment or political competition on the horizontal axis.

The first growth path follows a competitive market type of logic: the incumbent ruler has incentives to adopt an institutional change because if he does not he is likely to be replaced by the citizens. The second growth path rests on the incumbent ruler's security of keeping his political power after adopting an institutional change. This security is the result of enjoying a high degree of political entrenchment. An important source of entrenchment, emphasized by Acemoglu and Robinson, are the strong political coalitions that elites are sometimes able to form. They show how groups with political power may be willing to concede some of this power and associate with other groups. In this way, they manage to keep their position, and rents, even after an institutional change. They argue that this were the cases of Britain, Germany, and Japan in the nineteenth-century.

Despite the appeal of the previously described theory we do not know of empirical research developed to tests its arguments. This paper attempts to do so. Using a sample of 59 countries, we run a cross-country regression analysis which results are consistent with the theoretical predictions of Acemoglu and Robinson. We also provide a robust support of the positive relation between institutions of economic freedom and economic growth. The data used is derived from the Index of Economic Freedom 1975-1995 constructed by Gwartney, Lawson, and Block (1996), and the Legislative Index of Political Competition (LIPC) constructed by Beck, Clarke, Groff, Keefer, and Walsh as part of their Database of Political Institutions (2001).

The next section presents a description of the data used for our analysis. Section 3 tests Acemoglu and Robinson's (2002) political model of institutional evolution. Section 4 presents an analysis of the relation between institutions of economic freedom and economic growth. Section 5 concludes.

2. Data Description

2.1 The Index of Economic Freedom

The first set of data we need is an index of institutional adoption. We need a measurement that combines the central institutional elements affecting property rights, freedom of exchange, and personal choice into one overall magnitude.

We were fortunate to find that this task was already accomplished in the Index of Economic Freedom 1975-1995, constructed by Gwartney, Lawson, and Block (1996). This index combines 17 components grouped in four major areas: I. Money and Inflation, II. Government Operations and Regulations, III. Takings and Discriminatory Taxation, and IV. Restrictions on International Exchange. Table 1 provides a description of each component of the index.

TABLE 1: COMPONENTS OF THE INDEX OF ECONOMIC FREEDOM

I. Money and Inflation (Protection of money as a store of value and medium of exchange)
A. Average Annual Growth Rate of the Money Supply During the Last Five Years Minus the Potential Growth Rate of Real GDP
B. Standard Deviation of the Annual Inflation Rate During the Last Five Years
C. Freedom of Citizens to Own a Foreign Currency Bank Account Domestically

D. Restrictions on the Freedom of Citizens to Engage in Capital Transactions with Foreigners

Source: Gwartney, et. al., (1996)

The authors of the index assembled the data and rated countries on a zero-to-ten scale for each of the components, with zero representing no economic freedom and ten representing high economic freedom. They propose three alternative ways to weight the components into an aggregate summary rating. For the *Equal Index (Ie)*, the simplest alternative, they assign each component a weight equal to the inverse of its standard deviation. For the *Survey Index (Is1)*, they ask knowledgeable people to provide their estimates for the importance of each component.[2] For the *Survey Index (Is2)*, they ask a large number of people who are familiar with specific countries to rate those countries' overall economic freedom on a common scale, and then regress the 17 components on these country ratings, deriving the implicit weights.

The authors present each of the three summary indices but strongly recommend the use of Is1 "because it reflects the views of a sample of people who have thought seriously about economic freedom and the importance of various ingredients of that freedom." We follow their suggestion.

To measure institutional adoption we use two different approaches. The first one consists of taking the *change* in Is1 from 1975 to 1990. This approach captures both, active institutional adoption (countries that show positive change) and active institutional blocking (countries that show null or negative change), during that period of time. The second one consists of taking the *level* of Is1 at specific points in time. This approach is less intuitive and requires some explanation. In a sense, one may argue that the level of these institutional measures reflect institutional adoption that occurs every period. For instance, the definition of property rights must occur each period or it reverts back to the situation in which they are absent. Thus, the level measure reflects the extent of innovation that occurs in a given time period - it is the change over a condition of no innovation. For this approach we use single components of Is1 chosen for their relevance as institutional variables.

2.2 The Degree of Entrenchment or Political Competition

The second set of data we need is a measure of the degree of entrenchment or political competition faced by the incumbent ruler. We use the Legislative Index of Political Competition (LIPC) constructed by Beck, Clarke, Groff, Keefer, and Walsh as part of their Database of Political Institutions (2001). The core of this index is the number of parties that could and did compete in the last election. Countries are rated on a seven-point scale, with one representing no political competition and seven representing high political competition. The categorization of the index is as follows:

1. No legislature
2. Unelected legislature
3. Elected, one candidate
4. One party, multiple candidates

5. Multiple parties are legal, but only one won seats (because other parties did not exist, compete, or win seats)
6. Multiple parties competed and won seats (but one party won 75% or more of the seats)
7. The largest party received less than 75% of the seats

Table 2 shows our data for a sample of 58 countries used by Gwartney, et. al. (1996). The authors divide the sample into three groups based on the countries' change in Is1 from 1975 to 1990: the 17 countries with the largest increase, the 16 countries with the largest decline, and 25 selected middle-rated countries. The second column of the table shows this variable. Table 8 in the Appendix presents Is1 for 1975, 1980, 1985, and 1990.

The third and fourth columns of the table show single components of Is1. The third column shows Ic (Freedom of Citizens to Own a Foreign Currency Bank Account Domestically) in 1985. This is a *dummy* variable that assigns a 10 to a country in which citizens possess this freedom, and a 0 to a country in which they do not. When residents are allowed to maintain bank accounts in foreign currencies, it is easier for them to avoid the uncertainties accompanying an unstable domestic monetary regime, and thus, protect their property rights. Ic is, therefore, an important institutional variable.

The fourth column shows IIc (Price Controls - the Extent that Businesses are Free to Set Their Own Prices) in 1989. The freedom of individuals to use their own property rights and engage in voluntary exchange can be substantially reduced by regulations that limit the scope of business activity and the use of privately-owned property. Price controls interfere with the freedom of buyers and sellers to undertake exchanges even though the terms of trade are mutually agreeable. Price controls also, in effect, take property from a private owner. For example, if price controls on rental housing cut the rate of return of a property in half, in essence, they take half of the property's value from the owner.

The fifth column of the table shows the average of the LIPC during the period 1975-1990. The sixth and seventh columns show this index in 1985 and 1989 respectively. Finally, the eighth column of the table shows the average growth of per capita GDP during the period 1985-1994.

3. Institutional Adoption and Political Competition

3.1 Change in Is1 from 1975 to 1990

To explore the relation between institutional adoption and the degree of political competition, we take two alternative approaches when using the change in Is1. First, we use the *level change* in Is1 (column 2 of Table 2), and second, we use the *percentage change* in Is1 (column 2 of Table 2 divided by Is1 1975).

In both cases, and following Acemoglu and Robinson's (2002) model, we expect to find a U shape when plotting Change in Is1 1975 -1990 vs. Av. LIPC 1975 - 1990. This shape is consistent with the hypothesis that countries in which the incumbent ruler is either highly entrenched (faces low political competition) or not entrenched (faces high political competition), evidence institutional adoption. Countries in which the incumbent ruler is just somewhat entrenched and fears replacement, on the other hand, do not evidence institutional adoption. To capture this hypothesis we run least-squares regressions for the two approaches. The regressions take the form:

$$\text{Change in Is1} \ ? \ ?_0 \ ? \ ?_1 \text{Av. LIPC} \ ? \ ?_2 (\text{Av. LIPC})^2 \quad (1)$$

$$\text{Percentage Change in Is1} \ ? \ ?_0 \ ? \ ?_1 \text{Av. LIPC} \ ? \ ?_2 (\text{Av. LIPC})^2 \quad (2)$$

We show the results of our regressions in Table 3. All coefficients have the expected sign and are statistically significant at 5% level. The results of the regression are, therefore, very consistent with the predictions of Acemoglu and Robinson's (2002) model, which lends strong support to their principal hypothesis.

Figure 1 shows the plot of data for the countries and the fitted values when we use the percentage change approach. Again, support for the hypothesis is clearly visible.

Finally, countries like Brazil (BRA), Greece (GRC), and Venezuela (VEN) suggest that high political competition may not be sufficient for institutional adoption. They could also suggest, however, some limitations with the LIPC, in that most of the countries with low Is1 values are developing countries that may truly have slighted lower levels of political competition than countries like Canada (CAN), despite having an identical rank.

TABLE 3: COEFFICIENTS FOR CHANGE IN Is1 1975 - 1990 VS. AV. LIPC 1975 - 1990

Dependent Variable:	Level Change	% Change in Is1
Constant	2.71	0.74

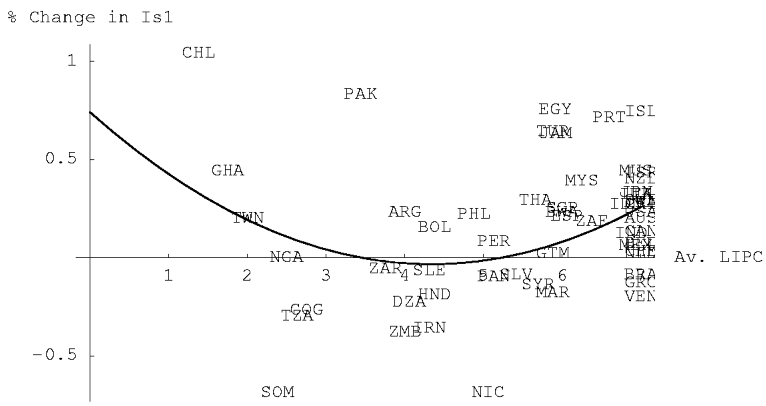

FIGURE 1: PERCENTAGE CHANGE IN IS1 1975 - 1990 VS. AV. LIPC 1975 - 1990

3.2 Level of Single Components of Is1

We now turn our attention to the *level* of single components of Is1 at specific points in time. We take the Freedom of Citizens to Own a Foreign Currency Bank Account Domestically (Ic) in 1985 (column 3 of Table 2), and Price Controls -the Extent that Businesses are Free to Set Their Own Prices (IIc) in 1989 (column 4 of Table 2). In the first case, since the dependent variable Ic 1985 is a dummy one (takes values of zero or ten), we run a probit regression of the form:

$$\text{Ic 1985} \ ? \ ?_0 \ ? \ ?_1 \text{LIPC 1985} \ ? \ ?_2 (\text{LIPC 1985})^2 \tag{3}$$

For IIc 1989, we run a least square regression of the form:

$$\text{IIc 1989} \ ? \ ?_0 \ ? \ ?_1 \text{LIPC 1989} \ ? \ ?_2 (\text{LIPC 1989})^2 \tag{4}$$

We show the results of our regressions in Table 4. All coefficients have the expected sign and most of them are statistically significant at 10% level. Figures 2 and 3 show the plot of data for the countries and the fitted values in both cases. Again, the results are consistent with the predictions of Acemoglu and Robinson's (2002) model.

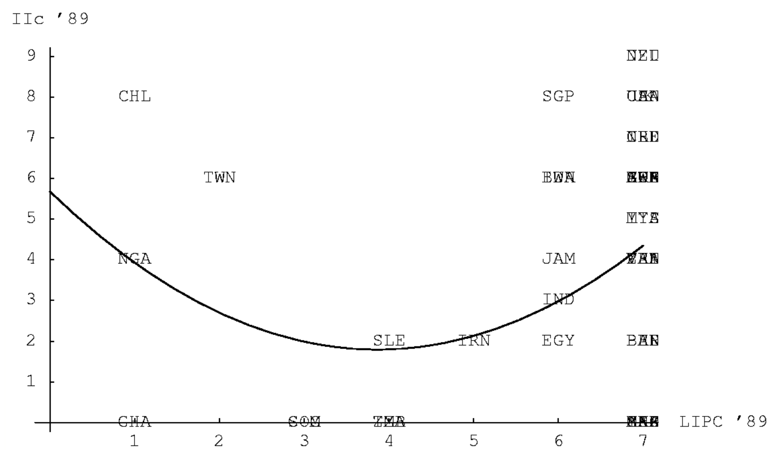

FIGURE 3: IIC 1989 VS. LIPC 1989

4. Economic Growth and Institutional Adoption

Institutional adoption (which we have shown to be related to the degree of political competition) matters in terms of economic growth. To explore this relation we take three alternative approaches. First, we simply regress the Average Growth of Per-Capita GDP 1985-1994 (column 8 of Table 2) on the two different definitions used in the previous section for the Change in Is1 1975-1990. Second, we estimate a traditional Cobb-Douglas production function on average percentage changes during 1975-1990 that includes, besides capital and labor force, the Percentage Change in Is1 1975-1990 as a third input. Third, we take Fischer's (1993) approach to construct the average *Solow Residual* from 1975 to 1990 and then regress it on the Percentage Change in Is1 1975-1990.

The data for the second and third approaches is presented in Table 9 in the Appendix. This table shows the averages of Percentage Change in GDP, Percentage Change in Capital, and Percentage Change in Labor Force for 1975-1990, compiled from The Penn World Data. Our sample was reduced to 53 countries due to the lack of data for some of them. As is conventional in these approaches labor force data, L, is proxied by population estimates. Capital stock data is less readily available and so we constructed it assuming that the growth rate of GDP is equal to the growth rate in capital: $\frac{\Delta \text{GDP}}{\text{GDP}_i} = \frac{\Delta \text{K}(\textit{Investment})}{\text{K}_i}$, therefore, $\text{K}_i = \left(\frac{\Delta \text{K}(\textit{Investment})}{\Delta \text{GDP}}\right)\text{GDP}_i$. For more details see Brada and Mendez (1988).

4.1 Average Growth of Per-Capita GDP 1985-1994 vs. Change in Is1 1975-1990

In this approach we simply regress the Average Growth of Per-Capita GDP 1985-1994 (column 8 of Table 2) on the two different definitions used in the previous section for the Change in Is1 1975-1990: the *level change* (column 2 of Table 2) and the *percentage change*. We have selected growth subsequent to change in Is1 since we expect institutional adoption to have an effect over time. Table 5 shows the results of least-squares regressions of the form:

$$\text{Av. Growth of Per-Cap GDP '85-'94} = \beta_0 + \beta_1 \text{Change in Is1 '75-'90} \quad (5)$$

$$\text{Av. Growth of Per-Cap GDP '85-'94} = \beta_0 + \beta_1 \text{\%Change in Is1 '75-'90} \quad (6)$$

TABLE 5: COEFFICIENTS FOR AV. GROWTH OF PER-CAPITA GDP 1985 – 1994 VS. CHANGE IN Is1 1975 - 1990

Dependent Variable: Av. Growth of Per-Cap GDP	Level Change Is1	% Change Is1
Constant	0.76 (0.00)	0.75 (0.00)
Is1	1.32 (0.00)	4.42 (0.00)
Observations	58	58
R^2	0.47	0.37

P-values in parenthesis

All coefficients have the expected sign and are statiscally significant at 1%. The least-squares results are, therefore, consistent with the intuition behind our model. Figure 4 shows the plot of data for the countries and the fitted values when we use the percentage change approach. A similar graph can be constructed for the other case.

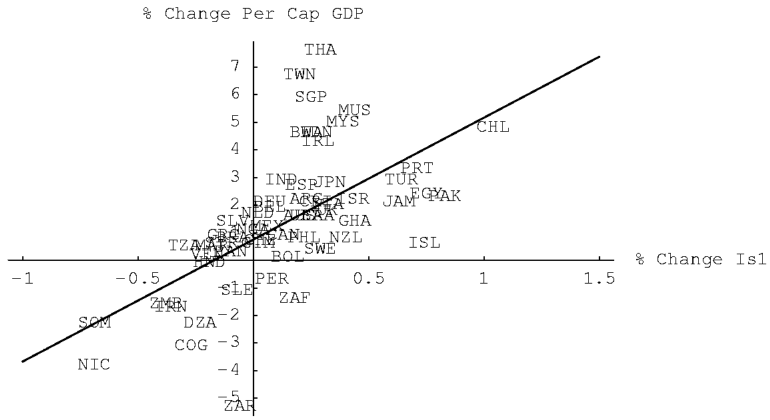

Figure 4: Av. Growth of Per-Capita GDP 1985 - 1994 vs. Percentage Change in Is1 1975 – 1990

4.2 The Cobb-Douglas Production Function Approach

This approach estimates the intensive form of the production function:

$$\left(\frac{\Delta GDP}{GDP} - \frac{\Delta L}{L}\right) = \beta_0 + \beta_1\left(\frac{\Delta K}{K} - \frac{\Delta L}{L}\right) + \beta_2 \frac{\Delta(Is1\ '75\text{-}'90)}{Is1\ '75} \tag{7}$$

The variables (except for ΔIs1) are yearly averages during the period 1975-1990. The estimated equation is:[3]

$$\left(\frac{\Delta GDP}{GDP} - \frac{\Delta L}{L}\right) = \underset{(0.01)}{0.01} + \underset{(0.00)}{0.56}\left(\frac{\Delta K}{K} - \frac{\Delta L}{L}\right) + \underset{(0.00)}{0.02}\frac{\Delta(Is1\ '75\text{-}'90)}{Is1\ '75} \tag{8}$$

All variables and the constant are statistically significant at 1%. Again, the least-squares results are consistent with the intuition behind our model.

4.3 Fischer's (1993) Approach

This approach follows Fischer (1993) to compute the average Solow Residual from 1975 to 1990 an then regress it on the Percentage Change in Is1 1975-1990. Adopting the original formulation, we compute:

$$Res1 = \left(\frac{\Delta GDP}{GDP} - \frac{\Delta L}{L}\right) - 0.4\left(\frac{\Delta K}{K} - \frac{\Delta L}{L}\right) \tag{9}$$

Fischer's approach is a modified growth accounting method. In his formulation the constant is forced to be zero and a value of 0.4 is imposed as a coefficient of the independent variable instead of measuring these parameters statistically. We found from our data, however, that allowing for a non-zero constant the equation becomes:[4]

$$Res2 = \left(\frac{\Delta GDP}{GDP} - \frac{\Delta L}{L}\right) - \underset{(0.02)}{0.01} - \underset{(0.00)}{0.6}\left(\frac{\Delta K}{K} - \frac{\Delta L}{L}\right) \tag{10}$$

We compute the average Solow Residual from 1975 to 1990 following both equations and then regress it on the Percentage Change in Is1 1975-1990 to discover how much of it is explained by institutional adoption. The results are shown in Table 6. The coefficients are statistically significant at 1%. Notice that in the case of Res2 the constant is very close to zero and not statistically significant. This is capturing the fact that Res2 already presents a constant in its construction. Figures 5 and 6 show the plot of data for the countries and the fitted values. Again, this third method confirms our previous results that the empirical evidence is consistent with the intuition that institutional adoption does matter in terms of economic growth.

TABLE 6: COEFFICIENTS FOR SOLOW RESIDUAL VS. PERCENTAGE CHANGE IN Is1 1975 - 1990

Dependent Variable:	Res1	Res2
Constant	0.02	0.0006
	(0.00)	(0.82)

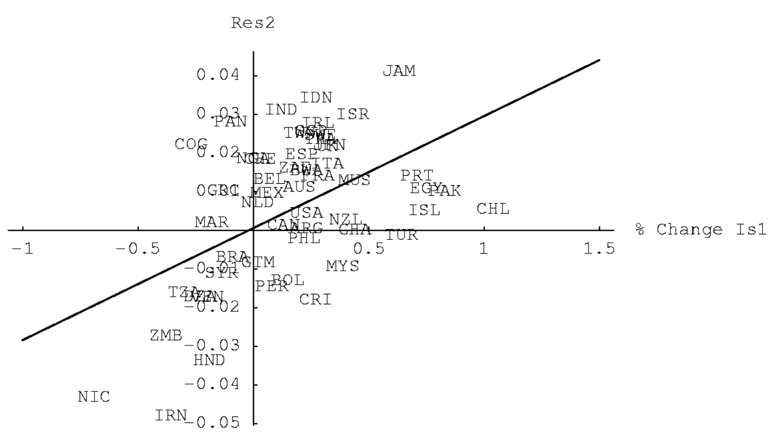

FIGURE 6: RES2 VS. PERCENTAGE CHANGE IN IS1 1975 – 1990

4.4 Forecasting Institutional Adoption and Growth

Our final exercise is to compute the growth consequences of the different degrees of political competition. We first take equation 2 and compute fitted values of the Percentage Change in Is1 for values of the Legislative Index of Political Competition (LIPC) from 0 to 7. Next we use equation 8 to forecast GDP per capita (where the change intensive capital is the mean value over the sample). These forecasts are listed in Table 7. Notice the pattern of per-capita growth rates associated with varying levels of political competition. The table clearly illustrates the relationship between political competition, institutional adoption, and economic growth predicted by our model. It also illustrates the costliness (in terms of economic growth rates) of one degree of political competition versus another.

TABLE 7: FORECASTED VALUES OF INSTITUTIONAL ADOPTION AND ECONOMIC GROWTH IN PERCENTAGES

LIPC (*)	Institutional Adoption (*1)	Economic Growth (*2)
0	74	5.84
1	43	5.22
2	20	4.76
3	5	4.46
4	-2	4.32
5	-1	4.34
6	8	4.52
7	25	4.86

* Average Legislative Index of Political Competition 1975 - 1990
Higher values represent greater political competition
*1 Percentage Change of the Index of Economic Freedom (Is1) 1975 - 1990
*2 Average Change of GDP Per Capita 1985 – 1994

5. Conclusion

Institutions that promote economic freedom (i.e. personal choice, protection of private property, and freedom of exchange), are usually regarded as being fundamental for the process of economic growth. It is crucial, therefore, to understand how these institutions evolve over time.

We contribute on this question by empirically testing a seminal theory of institutional evolution developed by Acemoglu and Robinson (2002). They argue that countries experience institutional evolution and economic growth at two extremes: when the incumbent ruler is highly entrenched and faces small political competition or when he is not entrenched and faces high political competition.

Using a sample of 59 countries, we run a cross-country regression analysis which results are consistent with the theoretical predictions of Acemoglu and Robinson. We also provide a robust support of the positive relation between institutions of economic freedom and economic growth. The data used is derived from the Index of Economic Freedom 1975-1995 constructed by Gwartney, Lawson, and Block (1996), and the Legislative Index of Political Competition (LIPC) constructed by Beck, Clarke, Groff, Keefer, and Walsh as part of their Database of Political Institutions (2001).

Are Patents Necessary in the Field of Software and Business Methods?

Margaret Liddle
Ka Leung Kwan
Hong Kong Polytechnic University, Hong Kong

Introduction

A patent is defined in Black's Law Dictionary as "a grant of right to exclude others from making, using or selling one's invention and includes right to license others to make, use or sell it[i]." Patents are (subject to some exceptions) "available for any inventions, whether products or processes, in all fields of technology, provided that they are new, involve an inventive step, and are capable of industrial application".[ii] There is a long history of doubt as to the desirability and even morality of patents:

> [Granting of patents] "…inflames cupidity, excites fraud…begets disputes and quarrels
> Betwixt inventors, provokes endless lawsuits, makes men ruin themselves for the sake of getting
> the privilege of a patent, which merely fosters a delusion of greediness.[iii]"

The quotation above is a reminder that there has never been any universal belief in the virtues of patents, and in respect of new innovative ones, such those for software and business methods, there are sharp divisions of opinion as to whether they can even be justified, let alone "necessary".

Software and business method patents ("S&B patents") are the latest incarnation of this doubtful breed and have only recently been recognised as being patentable in the United States ("US"). In 1998 after a landmark case, business method patents were ruled be patentable and much of the restrictions against software patents have now been removed. Such a major change in the law cannot be expected to be without consequences and as will be clear from the text below there are many on going issues of principle and practice which have arisen as a result of this move to recognise S&B patents. The controversy generated by this issue has now spread from the US to Europe where the European Union ("EU") is currently considering whether to follow the US in recognising S&B patents[iv]. There is strong opposition to any moves to introduce patents of this kind from respected members of the science community along with other commentators.[v]

Any examination of the necessity of S&B patents has to include a short account of how they came to be. Since much of the development of S&B patents happened in the US it is necessary to consider the US experience with S&B patents in some detail, as it provides a foretaste to the EU states as they consider whether patents should be harmonised.

At this point it is useful to remember that patents are essentially national in nature and the monopolistic powers attached to them are granted on a country by country basis. Although in recent years international conventions like the Patent Corporation Treaty and the Trade Related Intellectual Property agreement ("TRIPS") of the W.T.O. have made the international award of patent rights far easier than before, patents are still enforced on a country by country basis. Therefore, the legal position in the US is still not the same as that in the UK. However, moves to harmonise patent laws may well change this situation in the future.

The Oxford paperback dictionary partly defines the word "necessary" as an action or an object that is "essential in order to achieve something." The traditional arguments in favour of patents are that they are necessary because it is essential to safeguard the legitimate interests of inventors in their inventions in order to benefit society by encouraging innovation and by increasing its knowledge base. Thus the patent system guarantees a limited term of protection in return for the inventor agreeing to disclose details of his/her invention and ultimately to abandon his/her rights to it, when the patent expires. In other words it is a genre of contractual arrangement between inventors and society[vi].

The question remains are the traditional assumptions behind the necessity of patents true in the case of S&B patents? The answer to this question is found by answering the following questions:

How if at all, do S&B patents benefit society by encouraging innovation?
How if at all, do S&B patents increase the level of knowledge in society?

How if at all, do they help safeguard the legitimate interest of inventors?

Are S&B patents used for building control through the use of monopolies?

As will be clear from the account of how S&B patents came to be accepted as law in the US, there are protagonists who argue that there is no justification for such patents. Also that there are disadvantages to S&B patents which are harmful to both the internet and industry. This raises a further question: Are the protagonists correct, and if so, do the gains from S&B patents outweigh the disadvantages, making the exercise worthwhile?

Patents in General

Not everything can be patentable in the US or the EU. Historically, certain things were found under legislation and common law rulings to be unacceptable for patent. For example, in the US abstract ideas and objects, which occur naturally in nature, were outside the limits of patentability. In the US, courts interpreting section 101 of the Patents Act 1952 have developed over the years rules, which said that concepts like business methods[vii] and software mathematical algorithms[viii] were not patentable.

For a number of years, the position in the US and in the UK remained largely in tandem in that software and business methods were universally accepted as being non-patentable. The landmark judgement in *State Street Bank & Trust Co v Signature Financial Group Inc*. ("State Street")[ix] reversed such thinking and redefined the limits of patent law by opening up business methods for patenting and greatly curtailing restrictions against patenting computer programs.

The State Street Bank & Trust Co v Signature Financial Group Inc. Decision

State Street Bank & Trust Co v Signature Financial Group Inc. ("State Street") centred upon a patent for a computer based system that allowed a financial administrator to monitor and record the flow of financial information as well as to make calculations to maintain a financial services configuration called a "Hub and Spoke" system. The District Court on hearing the case held that the patent was invalid because the claim fell within the patent exceptions of mathematical algorithm and business method. On appeal[x] however, the Federal Circuit Court overturned the lower court's decision, redefining the limits of patent law by overturning the business method exception and significantly curtailing the mathematical algorithm exception. In emphatic language the court stated that business methods were now a legitimate subject matter for patent protection:

> "We take this opportunity to lay this ill conceived exception to rest…Since the 1952 Patent Act, business methods should have been subject to the same legal requirements for patentability as applied to any other process or method." [xi]

On page 1373 of its judgement, the court took the view that Congress, from the language of the Patent Act, did not intend to place restrictions on what could be patented, beyond those laid down in section 101 of the Act. The general processes or methods of conducting business were not caught by the wording of s 101; therefore, the business method exception was an improper expansion of this statue. On page 1375 the court went on to say that the business method exception was "error-prone, obsolete, and redundant".

As to the exception of mathematical algorithms, the court overruled the Freeman-Walter-Abele test[xii] and found that there was a practical application of a mathematical algorithm in this case, because it produced "a useful, concrete and tangible result", stating that:

> "The mere fact that a claimed invention involves in-putting numbers, calculating numbers, out-putting numbers, and storing numbers in and of itself, would not render it non-statutory subject matter."[xiii]

Implications of the State Street Bank & Trust Co v Signature Financial Group Inc. Decision (Aftermath of the Decision)

The major changes to patent law by the judiciary happened without prior consultation or debate. Few members of the public were even aware that it had happened. As the government's patent commissioner later admitted to Lessig during a debate, [xiv] the PTO did not at anytime conduct surveys or studies on what impact the State Street decision might have, and therefore, had not satisfied itself that implementation of the decision would not harm innovation in the development of software or the practice of business.

Fundamental change of this nature begets controversy and scepticism[xv]. The protagonists decried the lack of consultation with interested parties proclaiming that software and business method patents are wrong in principle.[xvi] Pragmatists expounded on the practical difficulties encountered when dealing with such patents.[xvii]

The Patent Flood

Perhaps predictably after the State Street decision there was a "patent flood". [xviii] The PTO received a large increase of applications for the registration of S&B patents. For example, applications to the PTO for patents rose from 920 in 1997, to 1,300 in 1998, and then to 2600 in 1999.[xix]

Periods of patent flooding cause a fall in quality of patents to unacceptable levels and is generally associated with patents on obvious inventions, overlapping claims, and inappropriately broad claims. The reason for the fall usually has to do with the pressure caused by large numbers of patents being processed in a short time. Other factors include a lack of skilled examiners, or a lack of material on "prior art" so that ineffective checks are carried out, and the sheer weight of work to be carried out on the limited resources of the PTO.

It is important to note that software patents do not always cover whole programs; they usually cover algorithms and techniques that form parts of programs. In any given program there can be many different algorithms and techniques because they combine to tell the computer what to do. So a program can have some algorithms which might have been patented by others and some which are not. Any search of the patent system may not uncover software programs in the process of being patented (due to a time lag of 2 to 5 years between the date of application and award). Furthermore, it is possible for different computer programmers to independently write (in different times and places, using different languages) the same algorithm as solutions to different problems. Therefore, the possibility of overlapping patents is a real one and may be impossible to uncover despite a detailed search. To compound matters, the patent system in the US is designed to encourage the award of patents regardless of the quality of applications presented to it. This is evident in the mission statement of the patent department:
"The primary mission of the Patent Business is to help customers get patents.[xx]"

Consequently the processes adopted for the examination of patents are slanted in favour of patent applicants;[xxi] hearings are held in private and opposition to applications are not encouraged. Therefore it is hardly surprising that an overwhelming majority of patents submitted to the PTO are approved. This is supported by Quillen & Webster (2001-2) who found that as many as 97% of patent applications surveyed were accepted by the PTO[xxii].

A System in Crisis

Commentators reviewing the patent law system in the U.S. agree that the continuing deterioration in the quality of patents issued and the declining quality of the system itself due to flooding is propelling it towards crisis point. Professor Robert Merges declared that:

> "The concerns about quality, especially in the light of the data on the overall volume, point to one conclusion: the present system is in crisis [xxiii]."

The continuing escalation of claims led to the head of the PTO, to publicly acknowledge in October 2002 that many business method patents had been wrongfully awarded.[xxiv]

As a direct consequence of the rise in the number of poor quality patents, people in the internet and software industries had to bear high licensing and litigation costs associated with the new patents. There also followed a slow-down in the spread and accumulation in innovation as well as an increase in cases where patents were misused[xxv]. The repercussions of which are still felt today. The question is has it all been necessary?

The Question of Necessity

Are S&B Patents Necessary to Encourage Innovation? One of the basic justifications for the existence of patents was that they were necessary to encourage innovation. In fact Article 1, Section 8 of the US Constitution states:

> "Congress Shall Have Power To […] promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries."

Implicit in the purpose of patents is the idea that it must be used to encourage innovation. Under British law[xxvi], innovation has been taken to mean activity which must have an appreciable degree of novelty. However, the process of innovation is not uniform in all fields of activity. In certain fields where there is discrete technology and one patent usually encompasses only one product, (i.e. Pharmaceutical industry), patents seem to benefit innovation[xxvii].

Innovation in the software industry on the other hand, tends to be cumulative or sequential[xxviii]. In other words, unlike industries such as the pharmaceutical industry, new developments in software are very often built on work that has gone on before. As a direct consequence of which innovators who worked earlier in this field would have a great advantage over people who entered the field later. While it is possible for later entrants to the field to try and design their programs around known patents, innovators who entered earlier can accumulate enough patents to make innovative competition very difficult. The barriers to new entrants (especially small companies) represented by S&B patents can be a formidable obstacle to new players.

The recent patent flood sparked by the ruling in the State Street decision has led to patents being awarded to individuals in generic material that is being used by many in the industry but have never been patented before, because it is material that has always been thought of as in the public domain[xxix]. In September 1997 Amazon.com started offering its one-click feature and received a patent for it in September 1999. In October 1999 the company sued Barneandnoble.com (New York) for patent infringement. In December 1999, Amazon obtained a preliminary court injunction that prevented its competitor from using the one-click system. It won its court case on the strength of a patent which many felt should never have been awarded. The patent was based on a concept that was so basic that many failed to see how it was novel. Patrizio was moved to say of this case, "the one click shopping for Amazon is absurd. What is the original idea there?[xxx]" The injunction was overruled in February 2001. The US District Court in Seattle officially ended the court case on 5th March 2002. Details of the settlement were not disclosed.

Any innovator hoping to develop new software has to ensure that his/her innovation does not fall foul of any patents already awarded or about to be awarded. Normally one would expect to be able to conduct a quick and simple search to discover patents already submitted to the PTO for approval. Unfortunately things are not as simple as that. In practice software developers have been known to slow down or stop development of new innovations if news is received that others have been engaged in the same field of development before themselves. This is for fear of wasted effort or legal action if it is later discovered that the in-house innovation in progress trespasses on another patent. Lessig describes this as the "hold-up" problem[xxxi], which is considered a critical problem for future innovation.[xxxii] It is doubtful that S&B patents encourage innovation as they should. Instead S&B patents appear to encourage the accumulation of patents by certain individuals or firms in the hope that they can benefit, not so much from the development of the patent themselves, but from making easy money by either licensing to others the right to use the patents or by taking them to court. As Kahin[xxxiii] puts it:

> "The licensing market, such as it is, seems to be defined characterised by patentees looking for infringers, rather than productive companies looking for technology."

The Economist magazine [xxxiv] sought to find objective evidence that patents encourage innovation. However, his results concurred with Kahin, in that firms taking out patents tended to do so not so much for exclusive rights, but for strategic purposes instead. The same magazine then conducted a broad range of research into the question: "Do firms become more innovative when they increase their patenting activity?" The findings showed that for the most patent conscious business of them all, the semiconductor industry, the answer was no[xxxv]. This finding is supported by Arundel[xxxvi] who found that a high proportion in the computer industry resort to patents for "tactical reasons", whereas a low percent (13%) of the same industry agreed to the proposition that patents were very "important" or "critical" for innovation.

The accumulation of patents by large firms for strategic purposes is something, which can have an effect not only on the rate of innovation, but also the future survival of small start up firms. As Richard Foster so aptly stated:

"Patents are the traditional way to get or protect a technology. Unfortunately, most corporations are skilled in getting around patents. In many cases patents become important only as tradable assets. They are the ante for getting in the game. If you have a large patent portfolio, as do companies like Bell Labs, IBM, Du Pont, or Hewlett Packard, it's possible to trade patents like baseball cards until you get the set that you want. It is better to have them than not, but patents are rarely strong enough by themselves to prevent leapfrogging." (p. 213)[xxxvii]

As large firms accumulate the lion share of patents they tend to use their portfolios not only as a source of income via the collection of licence fees, they also use their patents as assets in a barter system with other large patent rich firms. Under this informal system, large companies use software and processes covered by other company's patents, and in return for not being sued for patent infringement, the company will allow other companies (who allow them this liberty) to use their processes and software patents. This high stakes bartering favours patent rich companies. Small start up firms may not have enough patents to enter the game and therefore cannot compete. This does not bode well for the process of innovation when history has shown that many of the innovative products and processes have their genesis in small start up firms.

To conclude, it is perhaps useful to recall that the recent leaps of innovation, together with the massive expansion of the computer, software and internet industries all took place without the benefit of S&B patents. Therefore, if it is true that what the world saw happen in the eighties and nineties to those industries was a prime example of innovation at its best, then it seems reasonable to conclude that S&B patents are not necessary for innovation.

Are S&B Patents Necessary to Advance Knowledge in Society?

A second pillar of the traditional argument for patents is that in return for a period of patent protection, patent holders have to reveal enough information about his/her patent to enable others (reasonably skilled in the art) to make practical use of the invention. It is through this disclosure of information and knowledge that society derives its reward for allowing patent holders a period of monopolistic rights.

A preliminary point worth considering is the length of validity for patents. Normally a patent is a legal right, which exists for up to 20 years. Since the useful life of software tends to be for a much shorter period there has to be a question mark over what possible benefit society can gain from a piece of software that is twenty years old.

Secondly, disclosure is a prerequisite of patent protection aimed at ensuring that when the patent period expires others can gain the benefit of the advancement in knowledge represented by the patent. This is supported by the dicta from Grove J (at 31) in *Young v Rosenthal*[xxxviii],

> "He (the applicant) is bound to describe his specification as that any workman…would know how to make it; and the reason of that is this, that if he did not do so, when the patent expired he might have some trade mystery which people would not be actually to use…"

Although this position is a basic requirement of patents the situation with S&B patents is somewhat different. In practice the benefit that society gains from S&B patents do not work out as well as one would hope from the theory stated above. For example, an applicant for S&B patents in the US does not have to disclose his/her source codes, therefore no public record is made of a vital part of the patent.[xxxix]

So it is hard to see how society can benefit from S&B patents when the patent runs out, as only a partial recital of the information is on public record at the US PTO.

Patent quality has deteriorated and when the quality of patents is poor the public is not likely to benefit in terms of any advancement in knowledge. In fact there appears to be very little evidence that much can be learned from patents awarded lately by the PTO. The situation has become so bad that the PTO has decided that the cost of getting the necessary information to judge the patentability of an application has become so high that the exercise exceeds the cost of the benefit. The PTO would rather choose to remain uninformed or "rationally ignorant."[xl] In short, the quality of patents coming out of the PTO recently is unlikely to be of much value in advancing the level of knowledge in society.

In such a situation Kahin[xli] has observed that, "…it appears that patents are not a useful source of knowledge and if knowledge does not flow smoothly and transparently within the system, patents may encourage opportunistic, even parasitic, behaviour rather than meaningful innovation."

What then is the gain for society in allowing the existence of a monopolistic right under a patent? If the ideas behind the current crop of patents are not inventive, incomplete (with source codes missing) and of doubtful quality, it would seem reasonable to doubt that anything useful can be gained by way of new knowledge.

Are S&B Patents Necessary to Safeguard the Legitimate Interests of Inventor?

To ask if S&B patents safeguards the legitimate interests of inventors may at first sight appear to be an odd question. S&B patents are clearly beneficial for people who take them out but part of the reason why society puts up with the monopoly created by patents is that it is necessary for safeguarding the legitimate interests of the inventor. The idea is not for patent holders to have the right to control markets per se, it is to enable them to protect legitimate interests like the investment of time and resources they have invested in their invention. To this end many lawyers in the US claim the ability of small firms to take out patents is the main benefit of S&B patents because they enable small inventors to withstand any pressure exerted by their larger rivals. In essence, they claim that without patent protection, large companies will use their superior financial and marketing resources to force small out of business. Therefore in the absence of patents to safeguard the investment in time & effort of investors, no one could be sure of any reward for the whole process. Many who favour S&B patents often cite the case of Stac Electronics v Microsoft[xlii] as an example where the patent model worked well to protect a small player. This was a case where a large company negotiated with a small firm to use its compression technology. However, when negotiations broke down the large company developed a compression programme of its own as part of its operating system. The small firm then sued and won a jury award of $120 million. This case however should be contrasted with the case of BT v Prodigy[xliii] where BT discovered an old patent it had on hyperlinks that pre-dated the World Wide Web. BT then tried to assert its rights in relation to the patent and sued Prodigy, a company that pioneered an online service then became an internet service provider. If BT had not lost its case it could at a stroke, have gone on to exercise great power over much of the internet and profit from many firms engaged in e-commerce. All of which, would seem grossly unfair considering it was trying to lay claim to a public standard to which it did not contribute and upon which, other people had invested vast sums on the understanding that hyperlinks were things which were open and non-proprietary. This case goes to illustrate that patents are a double edged sword when it comes to safeguarding rights and can work against the interests of small firms just as easily as for them.

Patents have only recently been introduced as a method of regulating intellectual property law rights for software. Up until recently the use of copyright was the main protection for software. Copyright is of course totally unsuitable for protecting business methods because these are pure ideas for procedures and copyright does not operate to safeguard such things. In Europe and elsewhere, copyright has always been the recognised as the proper IP vehicle for protecting things like software. However, many people plainly prefer relying on patents as opposed to copyright because of the greater legal powers under patents. Nevertheless it is useful to recall that for many years the software industry grew at a rapid pace without the use of anything other than copyright law and the law of trade secrets. Companies such as Lotus, Novell, WordPerfect and Microsoft all grew into what they are today without the need for patents. As mentioned above, the size of the software industry today indicates that S&B patents are not essential for either innovation or for the growth of the software industry.

From the above it is clear that there are major problems with using the traditional model of patent law on things like software. Perhaps a new form of patent law could be developed to deal with some of the problems mentioned in this paper. For example, there are plans[xliv] in the EU to bring in a lesser form of patent called the "utility model", which gives only 10 years of protection instead of 20 years. However, at present this model has not been introduced into UK law and it is unclear when this will happen.

It is interesting to discover that computer software innovators themselves have seen the drawbacks of S&B patents and has voiced their reservations. For example, some software writers have been critical of the PTO mistakes in awarding patent software, which is not innovative.[xlv] Elsewhere scientist have joined together to call for a stop to S&B patents being adopted by the EU.[xlvi] And many diverse groups, some as obscure as the British Crystallographic Association, have published papers voicing their concerns about S&B patents and the dangers they represent.[xlvii] All of which seems unexpected in that software writers, scientists and diverse groups working on developing software models like the British Crystallographic Association should have been the very groups that stood to benefit if S&B patents were indeed 'necessary.' Instead the people who appear to be most in favour of S&B patents are either managers of large companies (who get to enforce monopolies through patents when it is otherwise illegal) and IP lawyer.

One other thing used to safeguard the interests of inventors is the law of breach of confidence. Many large corporations have grown into multi-national businesses using trade secrets. For example, Coca Cola and Kentucky Fried Chicken have both built substantial businesses with the use of confidential trade information. Consequently it is doubtful that S&B patents are essential in order to safeguard the legitimate interests of inventors.

Conclusions

"If people had understood how patents would be granted when most of today's ideas were invented, and had taken out patents, the industry would be at a complete standstill today." (Bill Gates in a 1991 memo)[xlviii]

As will be clear from the arguments above, there is little evidence that S&B patents are 'necessary' in the sense that they are essential for promoting innovation, advancing knowledge in society or protecting the legitimate interests of innovators. In fact there are indications that they do harm in the way they were brought about, used and in how they operate.

Perhaps part of the problem here is that there has been little to no discussion about the nature of S&B patents themselves. S&B patents are very different from other kinds of patents because they are patents on concepts and so the abstract nature of S&B patents should have had an influence on the whole idea behind how patents are used. However, this has not happened and everyone treats S&B patents as just another type of patent, much in the same way as a new type of engine or chemical. As Kahin[xlix] points out,

> "Conceptual patents refocus competition on securing broad business monopolies and away from competition at a technological level – the traditional domain of the patent system."

This illustrates that people use conceptual patents like S&B patents in a different way. Very often instead of using a patent to develop a product S&B patent holders will use portfolios of patents to operate in a market. This in turn leads to the question of how patent related restrictions on the operation of the market can be justified in the context of anti trust law in both Europe and the US.[l] Although the issues of S&B patents and anti-trust law will not be looked at here, it is nevertheless relevant when thinking about the 'necessity' of S&B patents to bear in mind the fact that anti- competition aspects of these patents in themselves raise grave issues of public interest.

In conclusion, the issues of S&B patents when looked at in detail appear straightforward. The new patents do not appear to encourage innovation, offer the chance of advancing the knowledge of society or provide the only means of protecting innovator's interest. The harm that they do looks out of proportion to the good they bring about i.e. the protection of legitimate interests of innovators. Yet the EU commission appears determined to introduce S&B patents in order to harmonise patent rights between the US and Europe[1].

Lessig asks an important question on page 217 of his book 'The Future of Ideas',

> "This then presses the fundamental question of this book: If the extreme of these constrains (IP systems) are not necessary, if there is no good showing that they do any good, if they limit the range of **creativity** by virtue of the system of control they erect, why do we have them?"

The question of 'necessity' here has to do with balancing the good that can come out of allowing software and business methods to be patented with the harm that will be caused by doing this. In this case the amo unt of good that can be obtained from S&B patents is at best uncertain whereas the harm that they represent is clear. In which case we should perhaps heed the words of Lucius Cary, Viscount Falkland[2] who once said, "When it is not necessary to change, it is necessary not to change."

Outsourcing of Justice: Applying the Legitimacy Test of Fairness to the Institutionalisation of International Commercial Arbitration

Noemi Gal-Or
Kwantlen University College, Canada

Abstract

This paper explores the instrumentality of legitimacy as a fairness indicator. I apply legitimacy to a short sample of NAFTA arbitral awards and juxtapose the NAFTA awards with the trend evolving in the WTO jurisprudence in order to assess to what extent the debate on the institutionalisation [building and regime building] of international commercial arbitration applies both to the WTO DRU and to the NAFTA dispute resolution mechanism.

An argumentative building block in my larger study on the Outsourcing of Justice: International Alternative Dispute Resolution, Free Trade, and Fair Trade, the process leading to legitimisation of, and compliance with legitimacy requirements by, international commercial arbitration, unravels the connection [or disconnect] between trade liberalisation, legal supremacy, and democracy as they converge concerning access to justice and the relationship between the presumed advantages of international law [public and private] harmonisation in dispute resolution and the theory of competitive legal markets.

Introduction[1]

This paper is part of an emerging yet small and kaleidoscopic literature applying a *transdisciplinary* approach to grapple with the elusive transformations generated by globalisation. In earlier studies, I addressed the theoretical frameworks and practical solutions to improve access to justice both in the Pacific Northwest as well as in larger free trade transborder regions [e.g. EU, NAFTA, and WTO]. This paper will take those studies one step further. It will introduce additional analytical detail and evaluate the role of alternative dispute resolution [ADR] in commercial and trade matters in the context of regional market integration and global trade liberalisation institutions. I will continue to elaborate on the underlying proposition advanced in my earlier research namely, that the contours of the "benefit" of regional and global market integration encompass vital questions of justice, and that lack of universal access to justice at these levels amounts both to a non-tariff barrier [NTB] to trade, and to a "trade barrier to justice" [TBJ]. As long as practices of private international law continue to permeate public international law and create privatised legal enclaves as provided by international commercial and trade ADR, justice will remain elusive.[2]

In this paper, I will focus on one particular aspect of access to justice pertaining to the institutionalisation of the dispute resolution law governing regional and international market liberalisation. Namely, I will apply the legitimacy test of fairness to international commercial arbitration as reflected in the adherence of arbitral tribunals to their sphere of jurisdiction in rulings under the NAFTA Ch. 11 and by the WTO Appellate Body [AB]. I will outline various aspects of legitimacy and explore the broader range of fairness and institutionalisation, however, defer the detailed analysis of case studies for a later version of this paper.

Indicators of Fairness: Legitimacy and Distributive Justice

While international relations - as realists maintain - exist in a state of anarchy, law, which consists of rule-based expectations for order, prevents them from slipping into chaos. Even if perceived as purely interest-oriented, international relations require for their maintenance the aid of legal instruments, namely principle-oriented guidance. However, without at least a veneer of fairness, the guidance function of reconciling international relations and law remains mute. Fairness, which has multiple interpretations and appearances, rests on two foundations - a procedural and a substantive.[3] Legitimacy represents the procedural aspect and a necessary condition of fairness "for it accommodates a deeply felt popular belief that for a system of rules to be fair" [Franck, 1995, p. 7] formal requirements of rule making, rule-interpretation, and rule-application must be satisfied. The tenuous relationship in international ADR between theoretical/principled rejection of stare decisis and the practical consideration of precedents serves as one example of procedural inconsistency. The substantive aspect of fairness focuses on distributive justice where burdens and entitlements are shared in a way that encourages voluntary compliance. [Franck, 1995, p. 8] In the contemporary world, the fairness discourse is delineated by two structural circumstances: "Moderate scarcity"[4] and "community". Moderate scarcity refers to the state of "polarities of plentitude and deprivation" [Franck, 1995, p. 11]. Community, which refers to a "social system of continuing interaction and transaction" [Franck, 1995, p. 10] facilitates the reconciliation of moderate scarcity by reciprocity and reasonableness. So far, international law, which attempts to reconcile the state of international relations with the notion of law, has mainly centred on fairness in the commu nity of states. While neither always, nor necessarily, does fairness to states often differ from fairness to persons. [Franck, 1995, p. 12]

To ascertain what is accepted as fairness, incidents of unfairness serve as the easiest available markers. I interpret Franck as suggesting a two-legged test of fairness addressing both procedural and substantive foundations of fairness. The first leg consists of four indicators of legitimacy:

- Determinacy, i.e. clarity and transparency through the language of the law, so as to communicate the law's essential meaning;
- symbolic validation, i.e. reinforcement of legitimacy by signalling that authority is institutionally recognised and confirmed;
- coherence, i.e. generality of the rule evidencing a principled approach [sometimes inconsistent but never capricious] and explaining why a rule compels; and
- Adherence, i.e. the connection between primary and secondary rules, the jus cogens of "peremptory norms" where rules are validated or invalidated by other rules. [Franck, 1995, 30-46]

The other leg of the test addresses the fundament of distributive justice by resorting to equity as representing the substantive source of fairness. There are:

- Corrective equity, i.e. to correct a rule which is too conservative or rigid to be applied without risking killing its spirit;
- broadly conceived equity, where equity itself is a rule of law pertaining to resource allocation; and
- Common heritage equity,, that unlike the two former variations that belong ab initio to states, assumes that "certain resources are the patrimony of all humanity". [Franck, 1995, pp. 76; 58-76]

To pass the fairness test, compliance with both legs is necessary. In other words, it suffices to show failure in one of the legs in order to establish a "defect" state of fairness. A vast literature by environmental and labour (and social justice) critics has already been challenging the fairness of international dispute resolution mechanisms on substantive grounds.[5] In this paper, I will address the legitimacy leg of the fairness test, and refer to distributive justice only where it is intertwined with the legitimacy argument.[6]

What does institutionalisation mean in the context of dispute resolution in liberalised trade regimes?

Through the process of institutionalisation formal institutions and democratic procedures acquire both value in the eyes of the population and stability to withstand pressure. [Huntington, 1968] Institutionalisation, which is a key to the maintenance of law and order, is indeed a form of conflict management, including conflict resolution, and possibly, conflict prevention. In the EU, "institutionalisation" is also understood in reference to "democratic governance", democratic consolidation, and institutional design; low degrees of institutionalisation are interpreted as symptoms of institutional decay or loss of political leadership. [Siedschlag, 2000, p. 3] In other words, institutionalisation pertains to process; the adequacy of the process instructs legitimacy. An example of the process of institutionalisation is institutionalised conflict regulation. Institutionalised conflict regulation prevails when actors have internalised common rules to govern the conflict. When challenged with change, and when rules are externalised [e.g. by the introduction of new NAFTA-made conflict resolution mechanisms for investors, or by establishing a final appeal instance such as the WTO AB], re-internalisation becomes indispensable.[7] Re-internalisation will emerge as a modified institutionalisation of the previous rules.

There are two main routes by which practises and structures are elevated to the level of principles and values, e.g. are being institutionalised: Organisation-building and regime-building. While the former represents the setting up of structures and their operating processes, the latter focuses on legislation. Both are necessarily complementary and intertwined. There are no rules without bodies to create and enforce them; there are no organisations that can survive lawlessness.

Historically, trade expansion had entailed the creation of political coalitions that established new types of institutions [e.g. France, the Hansa, and Italian city-states]. Although occurring sporadically, some of the directions such coalitions followed have become irreversible. [Spruyt, 1994, pp. 184, 186, 187] Irreversibility, which suggests that a state of institutionalism has been achieved, is also a necessary however insufficient condition of legitimacy.[8] Indeed, legitimacy is assured only through the intermediary of the state:

Although the abilities of the state vis-à-vis society might have changed [private actors resorting to self-help], the institutional principle of sovereign, territorial rule as the foundation of the international system has not. [...]From an international relations perspective, the question is how the emergence of the sovereign, territorial state has altered international conduct, not how the role of government has changed. [Spruyt, 1994, p. 189]

Seen from this theoretical realist perspective, the proliferation of international organisations and regimes, which are state-created and depend on state co-operation [whether voluntary or deliberate or other], represents an extension of the state. To what extent then, do an organisational body such as the [WTO AB] and practises established by the NAFTA, follow in the logic of the state-based international regimes?

In the context of this paper, it suffices to mention that the substance of lex mercatoria (i.e., merchant law) benefits from two worlds: Public and private international law on the one hand, and the commercial "code" created by such agencies as the International Chamber of Commerce [ICC], on the other hand.[9] My interest here is to ascertain the degree to which the international legislative process of developing the lex mercatoria nourishes the ADR regime of trade liberalisation with new international legal substance.[10]

Institutionalization of the WTO AB and the NAFTA Ch. 11 ADR mechanism: Do they satisfy the legitimacy requirements of fairness?

Organization-building

Institutionalization by way of organisation-building traces a rich history. The abundant literature on international organisations, e.g. the Bretton Woods and others [regional and international], serves to illustrate that such bodies have over time evolved to address, regulate, and harmonise international commercial activity, whether practised by states only or by non-state actors. In the area of private foreign investment, international organisations have played an important role in adopting, and consequently participating, in the legitimisation of extra-judicial practises [even if these practises were originally intended to facilitate negotiations rather than arbiter disputes]. [Jackson, 2000, p. 68] Indeed, "one of the interesting and certainly more controversial aspects of GATT as an institution was its dispute settlement mechanism. […] and some could argue that in fact they [procedures] worked better than those of the World Court and many other international dispute procedures." [Jackson, 2000, p. 68] The WTO followed suit with the Dispute Settlement Understanding [DSU] for intellectual property and service trade interests.[11] The NAFTA, which is an agreement establishing a free trade regime, devoid of any central institutional structure, carried the process an extra step further by inviting a distinct private legal person, namely the investor, to become a recognised and equal subject in the process.

Institutionalisation as organisation-building is [indirectly] addressed by Hertz [1997] who comments on the weakness of the International Court of Justice [ICJ] in matters intellectual property rights [IPRs] dispute settlement. I take Hertz' analysis as an example which can be applied to any other field of international public law. Although the main IPRs conventions provide for the filing of disputes with the ICJ, the statute of which is an integral part of the United Nations Charter; and although the United Nations is an inter-governmental state-based organisation par excellence, "the Court has never been used to litigate an IP case for reasons which are not entirely clear."[12] [p. 269]

However, if measured against the legitimacy requirements of the fairness test, the ICJ, which is tailored according to the raison d'État of state sovereignty, represents a model which is closest to the domestic judiciary state authority. It is reasonable to expect that determinacy, i.e. clarity and transparency in the language of the law, is satisfied thanks to the judges' professionalism in rendering adjudicative decisions. Symbolic validation, i.e. reinforcement of legitimacy by signalling that authority is institutionally recognised and confirmed, almost automatically emanates from the fact that the decisions are rendered by judges recognised as the highest judicial authority available, not only domestically but also internationally. It is the ICJ's

"[constitutional incapability] of laying down positively how a treaty is to be performed" [Rosenne in Hertz, 1997, p. 272, my emphasis]. This incapability derogates not of the ICJ's legitimacy, but of its competency and consequently, practicality.[13]

Recourse to the ICJ arises when domestic processes and/or remedies are unavailable or undesirable.[14] Consequently, commensurate to the rate of governments' avoidance of ICJ adjudicative services, has been the recourse to substitutes, e.g. GATT-style followed by WTO DSU, or NAFTA ADR mechanisms. These mechanisms appear strong in satisfying the substantive - distributive justice - leg of the fairness test.[15] Corrective equity, i.e. to correct a rule which is too conservative or rigid to be applied without risking killing its spirit, is made available by flexible compromise-seeking arbitral awards. Broadly conceived equity, where equity itself is a rule of law pertaining to resource allocation, is presumed to be warranted by the logic of the consensual underpinnings of alternative dispute resolution. Common heritage equity, which assumes that certain resources, for instance the right of authoritatively sanctioned retaliation for injustice, is shared equally by all humanity. Therefore, the GATT-style dispute settlement, followed by the WTO DSU, and by the NAFTA ADR, of ordering withdrawal of non-conforming domestic law or practise [Hertz, 1997, p. 273] is a more viable and effective law enforcement option than any ICJ judgement. It also has the appearance [contributing to a sense of legitimacy] of being a preferable solution to self-help. [Hertz, 1997, p. 274]

So, while the ICJ is seen as strong in legitimacy and weak in distributive justice, international ADR mechanisms, which appear to be strong in substance, are weak in legitimacy, i.e. procedural fairness. Faced with the inability to satisfy both aspects of fairness, the international community of states has opted for the latter. However, the practical and expedient preference of effectiveness[16] is intrinsically vitiated by the shaky foundation on which it rests. By placing the WTO AB as an authority of appeal from the DSU panels, and by declaring its decisions as final, the DSU created a legal androgynous of an ADR mechanism cum court of justice competence. Created by a process and guided by a logic unlike those leading to the establishment of a court of justice, the WTO AB has been empowered in certain aspects with competences that equal those of a court of justice. Such inconsistencies should not be considered a source of "law"; cannot be a source of justice. The NAFTA provisions do not even come close to the justice-appearance of the WTO AB.

Cognisant of the paradox, the government of Canada identified several WTO DSU key issues requiring improvement. In its communiqués, it does not neglect to mention the sources of its findings as "based on dispute settlement experience and the advice of Canadians" [Update, 1/3, my emphasis]. Among the issues identified, improvements designed to enhance efficiency in the dispute settlement process, panel professionalism, and transparencies are pertinent. The efficiency of the DSU, for instance, is compromised where the AB has refused to rule on certain issues due to absence on the record of sufficient findings by the panel. This may leave a complainant without a resolution of the dispute, and necessitate the commencing of an entirely new set of proceedings. "Canada therefore supports proposed amendments to the DSU that would provide the Appellate Body with the authority to refer factual or legal issues back to the original panel to address issues not covered earlier or to re-examine factual findings." [Update, Jan 3/3]. Presumably, borrowing more from the national court practise, here - the re-trial, is considered a means to overcome the legal conundrum arising from the finality of the arbitration award. For that purpose, and to insure the cohesion and teleology of the suggestions for improvements, enhanced professionalism - of the panellists, not the AB members - is vital.

"Canada agrees with many of the observations made by the European Communities […], including the […] insufficient number of qualified panellists. […] Panellists are to be selected with a view to ensuring the independence of those serving on a panel, a sufficiently diverse background and wide spectrum of experience. […]

[T]he qualifications for panellists should be no less stringent than those for Appellate Body Members." [Consultation, 3-4/16][17]

Finally, transparency is perceived as a requisite to "reinforce the legitimacy of WTO dispute settlement". [Consultation 5/16] Again, in a move that appears to bring the WTO DSU closer to an administrative tribunal, and furthermore, elevate the AB closer to the traditional court level, Canada argues that unlike other ADR mechanisms [e.g. consultation, good offices, conciliation, and mediation].

"[…] the rationale for keeping consultations confidential does not apply to panel or Appellate Body proceedings. Members do not engage in negotiations at panel and Appellate Body meetings. Likewise, Members do not negotiate with one another through their written submissions to panels and the Appellate Body". [Consultation, 6/16].

Although the NAFTA ADR mechanism shares similarities with the WTO DSU, a significant departure from international practise - the de facto recognition of the status of subject of international law for the non-state actor [investor; with precedents in bilateral investment treaties] - introduces a NAFTA specific ADR problematic. Here, the government of Canada is more reserved. While recognising the need to further develop Ch. 11, it does not yet make any organisation-building proposals. [Notes] For the time being, the NAFTA Ch. 11 "irregularities" have been addressed by

The NAFTA Free Trade Commission [which] took the unprecedented step of issuing a joint interpretive statement aimed at clarifying key aspects of the process for the purposes of future arbitrations. This statement effectively endorsed two key aspects of Justice Tysoe's [in Metalcald[18]] ruling with respect to the ambit of Article 1105. It also committed the NAFTA Parties to taking greater steps to share documents filed in connection with Chapter Eleven proceedings with members of the public and other levels of government, in the hope that, as the U.S. Trade Representative put it, 'sunshine [will] overcome some of [the] fears and concerns' created by the procedure." [Tollefson, 2002, p. 186].

In his work on systems of control in international adjudication and arbitration, Reisman [1992] points to a current factual departure of the previously maintained sharp distinction between inter-state public international tribunals on the one hand, and inter-non-state-entities international commercial tribunals on the other hand. "The great public international tribunals have often served as models for private developments and vice versa. Thus, there has been a certain amount of interstimulaton in which the experiences of one are shared and sometimes transferred to another." [p. 29] This observation applies to the organisation-building aspect of legitimacy, e.g. the WTO AB's emulation of an appeal court mechanism discussed above. It applies also to the regime building facet of legitimacy, namely the rule interpreting, and hence indirect rule making, role of judiciary bodies, discussed next.

Regime building

International courts as well as international commercial arbitration tribunals are not institutionally required to cite or to found their awards in their previous or other tribunals' holdings. Thus, their awards do not fall within the doctrine of stare decisis governing national judiciary bodies. In fact, however, to secure consistent interpretation of the law, the legal precedent by definition, "performs a special, if latent control function in international adjudication." [Riesman, 1992, p. 31, my emphasis].[19] Bjorklund [2001] [suggests that while not binding, decisions by the NAFTA tribunals "may be viewed as persuasive authority by subsequent tribunals."], [p. 186] Laird [2001] is more explicit in his reference to stare decisis in arbitration: "[I]nvestment treaties, such as Bilateral Investment Treaties […] include rather arcane substantive trade provisions developed over a hundred years of international arbitration." [p. 224, my emphasis]. In other words, the legitimacy of a justice system is rooted in the predictability of the court's or tribunal's behaviour. Such predictability is best served by two of the components of the legitimacy leg of the fairness test. Coherence represents the generality of the rule by evidencing a principled approach [sometimes inconsistent but never capricious], and explaining why a rule compels. Adherence assures the connection between primary and secondary rules, the jus cogens of "peremptory norms" where rules are validated or invalidated by other rules. "This problem appears to be bedevilling […] certain international commercial tribunals with regard to party-designated law, the latter through the device of the so-called lex mercatoria." [Riesman, 1992, p. 34].

I will explore later[20] the extent to which awards rendered by the WTO AB and the NAFTA tribunals operate as de facto, although not de jure, sources of international law - in part, because they are founded in lex mercatoria. Here, I am addressing only one aspect of the arbitral tribunal-generated stare decisis. I am focusing on arbitral jurisdiction and on the process of judicial oversight, i.e. the position taken by domestic courts to which arbitral awards are appealed for want of arbitration tribunal jurisdiction. Another aspect played by the national court deals with the court's interpretation of the award.[21] To be sure, these two aspects are not independent; in fact, they spill over one into the other.

An arbitrator's source of adjudication is derived from the contract between the private parties and limits the arbitrator to do only that which is authorised by the parties: arbiter nihil extra compromissum facere potest. [Riesman, 1992, p. 6] Whereas the GATT/WTO dispute resolution mechanisms have preserved this principle as governing their state-to-state disputes,[22] the NAFTA has introduced the "practice" of "arbitration without privity". In this arrangement, the state sets the terms governing the claimant, which is not party to the agreement. [Bjorklund, p. 1] This arbitral jurisdiction power has its source in the law governing international commercial disputes. According to one argument, Ch. 11 represents the latest development in an "international legislative" process beginning in the late 19th and early 20th centuries with the use of mixed claims commissions, and continuing in the 1980s with the protection of foreign investors through bilateral investment treaties [BITs]. [Bjorklund, 2001, p. 185]. Both practises vary in their characteristics from Ch. 11, and there is little to learn from BIT disputes which remain confidential. [Bjorklund, pp. 186-187]. The extent to which these practices can be considered as primary sources underpinning Ch. 11 is therefore unclear. Furthermore, in the hybrid case of Ch. 11, which provides for a state-to-private-party dispute resolution mechanism - should arbitration be governed by NAFTA law or by lex arbitri as is the case in the context of state-to-state trade disputes? [Tollefson, 2002, pp. 229-230]. Of vital importance - for to date most Ch. 11 cases have raised at least some sort of jurisdictional objection - a clarification of this dilemma will require addressing also the legal principles created by the jurisprudence of lex mercatoria.[23]

On the issue of judicial oversight, the output of NAFTA Ch. 11 arbitral awards, one of which had been adjudicated by a Canadian national court [Metalclad], suggests, largely but not exclusively, a pattern of court deference to tribunal's jurisdiction, i.e. of findings that the tribunal did not exceed its jurisdiction. In the benchmark Metalclad judgment, Justice Tysoe's sends a message to courts to keep out of the "other" justice system, namely the arbitral one founded in a separate teleology of justice. Although Tollefson [2002] marks the decision as characteristic of a pattern of very "cautious […decisions] that approach[es] the task of reviewing the award deferentially", an approach typical to arbitral-awards-reviewing-courts, [p. 221], this in itself would have been insufficient to evidence such pattern. However, where a court makes such decision, and the foundations for the judiciary's deferred position remain unknown, it may logically follow that, perhaps by default; the judiciary is granting allowance to arbitral tribunals to develop new international law. This constitutes yet another piece in the larger jigsaw puzzle of the perforation of public international law by private international law.

In Metalclad, Mexico, supported by the Intervenor Attorney General of Canada, urged the Court to review the traditional judicial deferential approach to private commercial arbitral awards because Ch. 11 represented a departure from that type of disputes. Linking arbitration without privity to judicial deference it maintained that, unlike GATT/WTO disputes, Ch. 11 involved non-parties to the contract [treaty], i.e. the investor in this case. Indeed, Ch. 11 transposes "arbitration rules [that] were created to remove investment disputes from the heated political arena of state-to-state controversy to the cooler […] tribunal," [Laird, 2001, p. 225], to investor/private-party-to-state disputes, however without neither legal nor political explanation hence without justification.[24] It also raised issues of public concern and the public good [Tollefson, 2002, p. 204]. In avoiding addressing the argument, the Court practically rejected it.

Another (partial) NAFTA award from 2000, is S.D. Myers. v. Government of Canada [S.D. Myers] also gave rise to a similar consideration of arbitral jurisdiction. In the absence of NAFTA guidelines on compensation, the tribunal turned to international law. However, since an arbitration tribunal is restricted to interpret the "contract", dito the NAFTA treaty only, and not decide on issues which are outside the realm of the "contract", Canada asked the Federal Court to set aside the award based on jurisdictional excess and conflict with Canada's public policy [Canada Seeks].

Conclusion

In this paper, I examined part of the role of institutionalisation in legitimising the legal status of international commercial arbitration. I used Thomas' [1995] characterization of legitimacy which embodies the procedural component of justice. I distinguished two main processes typical of institutionalisation: Organisation- building and regime-building. I used the four legs of the legitimacy test to explore whether organisation-building and regime-building as developing in international commercial arbitration in the WTO DSU and NAFTA Ch. 11 ADR provisions, pass that part of the fairness test.

My study shows that the WTO AB, with final jurisdiction, largely emulates the characteristics of a national court of appeal instance, although the legal foundations of the WTO AB do not support endowment with such competencies. The improvements suggested by the EU and the government of Canada lend further reinforcement to this observation. The WTO AB therefore fails to conform with the procedural component of fairness although, on its' face, it appears to satisfy the substantive one. This part of the legitimacy test of institutionalism does not apply to the NAFTA Ch. 11 ADR mechanism, which is still too remote from any stage of organisation-building.

An examination of the role played by the WTO AB and NAFTA Ch. 11 in international commercial arbitration regime-building also reveals an aberration from the presumed legitimatising authority imputed to this quasi-legislative process. As NAFTA arbitral procedures and awards show, much revolves around the question of the jurisdiction of the arbitration tribunal. The only judicial oversight exercised so far in Ch. 11 matters was clearly deferential of the tribunal [Metalcald]. As a final appeal instance, and given the limited jurisdiction of the ICJ, the WTO AB is free of such oversight. Future analysis of NAFTA arbitration tribunals and WTO AB awards, and where applicable, court's [and also academic] interpretations of such awards, will allow to establish whether the absence of judicial oversight does indeed facilitate, by default, the turning of such awards into de facto stare decisis. Law interpretation being the purview of courts of law - not of a private party consent based dispute settlement procedure - such examination will shed additional light on the legitimacy, and consequently fairness, of extant international commercial arbitration.

End Notes

[1] Several sections of this draft paper are adopted either directly and/or with some modification from my paper "Private vs. Public International Justice: The Role of ADR in Global and Regional Economic Treaties", 48pp, *NACS Text Series*, forthcoming end 2003, temporarily available on the Website of the Canadian Swedish Business Association [CSBA], www.csba.nu.

[2] See Harlow on access to justice and the rule of law and on the "relatively high place on the rights agenda for the procedural value of access to justice" [188].

[3] This paper explores the instrumentality of fairness indicators as developed by Thomas M. Franck in *Fairness in International Law and Institutions* [Oxford: Clarendon Press, 1995] to the issue of access to justice.

[4] A term that Franck borrows from Rawls [9].

[5] See Maduro addressing the "what is" vs. "what should be", but not the "how", questions of the constitutional analysis of fair vs. free trade.

[6] Since my data collection and processing are still incomplete and therefore do not yet permit an exhaustive analysis of all the indicators, any conclusion must be considered temporary and partial.

[7] Three components are necessary to re-institutionalise conflict management: Well-defined general procedures of conflict management, reliable expectations based on well-defined actors and reciprocity, and typifying of the conflict according to types of actors. [Siedschlag in Gal-Or]. These conditions [which correspond with parts of the fairness test] have only partly materialised in the GATT/WTO and the NAFTA.

[8] Of course, irreversibility of a certain institution lasts as long as the next revolutionary change.

[9] Mistelis refers to this as international legislation and international commercial custom, respectively. [13]. However, "international commercial custom" must not be confused with international customary law, which is a source of law of Westphalian statist foundations.

[10] I will discuss the meaning of constitutionalism in the context of dispute resolution in liberalised trade regimes in a later paper. For the time being, it suffices to note that constitutionalisation is the legal twin sibling of political institutionalisation. It reflects the establishment of a new meaning and substance to existing and/or newly formed values by the eternalisation of core values. Cass lists various meanings of constitutionalism evidenced, for instance, when some issues of international trade become firmly incorporated within national legal systems; when questions of legitimacy are involved; when a custom originating in a base is emerging; or, as Cass prefers to understand it - when there is "constitution-making by judicial interpretation." [3-5, note 3] For a most recent stage in the debate on constitutionalism see Petersmann; Howse; Alston, Maduro.

[11] In the EU as well, the law of commercial dispute resolution strikes out as an exception to the plurality and incongruity of authority [national, subnational, and supranational] in various other EU domains. For instance, the EU authorities do have exclusive competence, aided by the European Court of Justice [ECJ], in the area of competition policy. [Schmitter 239]

[12] I contend in mentioning here that the limited jurisdiction of the ICJ to order certain remedies also figures among these reasons. For lack of space, I will skip the discussion of these reasons, and will return to it in a more elaborate version of this paper.

[13] Which, of course, affects the distributive justice aspect of fairness.

[14] The latter, among other reasons, for suspicion of discriminatory practises against foreigners by national courts, among other reasons.
[15] Addressing the legislative process [hereafter] emerging from arbitral decisions, will unravel the fallacy of such expectation.
[16] "If the system of international arbitration is to continue to meet the needs of international business, it is necessary to reach a balance between the conflicting goals of justice and finality in commercial arbitration. […] The United Sates depends upon international markets to expand its economy. Accordingly, the possible unfairness inherent in a lack of judicial review is outweighed by the national interest in preserving the independence of international arbitration." [Gelander 627, 642].
[17] See, Contribution from the EC and Its Member States, raising the issues of panelists' expertise, rules of conflict, and particularly the remand procedure – all of which suggest a more litigious band less compromise oriented process hence a shift closer to a court-like situation. For a general legal reasoning of the WTO AB see Behboodi.
[18] Discussed in the next section.
[19] For *stare decisis* in WTO arbitral awards see *supra* note 10.
[20] In the comprehensive study of "Outsourcing Justice".
[21] I am deferring this discourse to the final draft of this paper.
[22] The question of judicial oversight is mute in the case of the WTO for this organization has its own final instance – the WTO AB.
[23] The expedient argument that "Ch. 11 is a new remedy for investors to make claims against governments in their own names, rather than through traditional diplomatic methods and politics" [Laird 224] cannot serve as panacea nor as legal argument to elevate the investor to the status of a subject of international law status.
[24] Again, the argument that Ch. 11 "is a relatively limited, although powerful […], legal remedy" [Laird 226] [limited as to the number of cases arbitrated] - doesn't make it any more or less legitimate. In fact, it lends support to my argument [in previous publications] about both the legal and social unfair nature of Ch. 11, which is discriminatory in its current form.

Legal Principles and Judicial Decisions on Environments in Malaysia: An Overview

Nuarrual Hilal Md. Dahlan
Universiti Utara Malaysia, Malaysia
Abdul Rani Kamaruddin
International Islamic University, Malaysia

Abstract

The awareness that healthy environment is a necessity to human life, is increasing today. Long time ago, people only tended to lay emphasize on the satisfaction of their basic and personal human rights, which would include foods, lodging, raiment as well as other simple constitutional rights such as freedom of speech etc. But now it evinces that, environmental safety and health right, though at the first glance and at the outset, seems only a peripheral right, it has become overwhelming and expedient to human life, that should be reckoned with. In respect of the law, it is manifestly clear that it could lend its aids protecting mankind against any adverse environmental wrongdoings. These would include providing legal remedies such as injunctions, damages, compensation or even imposition of criminal penalties against the defendants/perpetrators. Hence, this article will look into the law in Malaysia in regard to its ability to provide environmental protection based on the decided cases in courts.

Introduction

Environmental awareness has been quite overwhelmingly an important topic today. This is due to the increasing knowledge among people on the importance of preserving and maintaining healthy environments. Long time ago, in particular on the verge and uprising era of the industrial ages, particularly in the 16^{th}, 17^{th} and 18^{th} centuries, people tended and revolved to lay emphasize on the maximization of profits through the mass production of products and services in the course of industrial revolution, which were achieved to certain extent, flippantly nor callously, to the detriment of the environment. But nowadays, healthy and safe environment becomes indispensably and overridingly essential to ensure the survival of mankind, without which, our surroundings - the earth, air, waters and lands which we live on would be hazardous, dangerous to health and life itself. Examples of environmental catastrophes which are evident till today include - the poison gas incident at Bhopal, India (1983); the problems caused by contaminated land at Love Canal, USA (1978); the disaster at Chernobyl (1986); the UK Braser oil tanker disaster in 1993, the effects of which are still with us today. These catastrophes are also grim reminders that the exercise of enough care in protecting environments is vitally important.

Thus on this footing, there arose the awareness of the importance of its sustainability and longevity, thus ensuing the necessity of providing rules and regulations governing the conducts and policy with view to control and govern the environments. In this regard, it is found that, the law has since its birth and evolution recognized acts and conducts of man which could possibly affect environments and attempts to control and govern them. This law was formerly and still hitherto known as law of torts. This branch of law mainly concerns the identification of wrongful acts and provides remedies, penalties and judicial redresses to compensate and protect the aggrieved parties'/claimants'/plaintiffs' rights against adverse environmental acts by others. Instances of the category of this principles of law are, the law relating to nuisance and negligence and the rule under Rylands v. Flether, which emphasize on the importance of observing and respecting others' right and enjoyment against any interference, disturbance and wreaking havoc. These are amongst the principles adopted by law in the attempt to govern and control the effect of environmental hazards.

Further, to consolidate and improvise the existing law – the common law or the unwritten laws, some government had embarked into introducing statutory provisions in regard to maintaining, governing and controlling the standard practice of people who could affect the environments. For instance, in Malaysia, these provisions contained in the Environmental Quality Act 1974(EQA) and its regulations made there under. Apart from these statutory provisions, the English common law is also applicable in dealing with environmental issues and matters, via its law of torts or in certain extent the law of contract.

Definition of Environment

In so far as Malaysia is concerned, there is no judicial definition on the meaning of 'environment'. However, this word has been defined by statutes. Thus, pursuant to section 2 of the Environmental Quality Act 1974, 'environment' means:

> 'the physical factors of the surroundings of the human beings including land, water, atmosphere, climate, sound, odor, taste, the biological factors of animals and plants and the social factor of aesthetics'

Based on this statutory definition, environment would, it is submitted, to mean 'all physical matters that surround us (mankind)'. These would of course include water and air, land etc. What concerns environmental law is how could government or we as the general public exercise control over these matters (environments) to ensure its safety and health.[1] Other alternative definition, which we could refer, is the UK statutory definition. Accordingly, pursuant to section 1(2) of the UK Environmental Protection Act 1990 defines 'environment' as:

> '…consists of all, or any of the following media, namely, the air, water and land; and the medium of air includes the air within buildings and the air within other natural or man-made structures above or below ground.'

This is clearly a very wide definition which encompass environmental challenges ranging from ecological problems, such as damage to natural habitat and the conservation of flora and fauna, the 'working environment' with problems such as 'sick building syndrome' and more obvious problems such as noxious emissions into the atmosphere.[2]

Objectives

This paper is to elaborate the law in regard to environmental issues and protection, particularly on the decided cases in Malaysia which are based on several causes of action and legal principles as provided by law of torts and environmental statutory provisions. Via these disclosures, they would able to illuminate as well as to underscore us the legal positions and rights and remedies affordable and espoused by law as practice in Malaysia, in the course of its environmental protection.

Approach

This paper will only touch on the decided cases in Malaysia as far as its relate to environmental protection. Thus, the provisions as contained in the Environmental Quality Act 1974('EQA 1974') and its regulations made there under would not be touched except on some respects insofar as it has been dealt with by cases decided in courts. This paper will highlight such cases based on the below sub-headings.

1) The cause of action based on nuisance, negligence and under the rule under Rylands v. Fletcher;
2) The new thought on cause of action based on recent English and foreign cases; and,
3) Cases Emanate From EQA 1974.

1) The Cause of Action based on Nuisance, Negligence and the Rule under Rylands v. Fletcher[3]

The aggrieved party/plaintiff/claimant to these tortuous acts may commence action in court against the party who has committed these tortuous acts and thereby caused damages, sufferings and losses to him. Usually, the remedies that are available and imperative for him are damages, restitutions, abatement (a summary remedy which was only justified in clear and simple cases)[4] or an for an order of injunction restraining the defendants from further committing these actionable acts. The following elaborations will highlight in detail the operations of these causes of actions and supported by cases, hitherto been decided in Malaysia.

a) Nuisance

Nuisance is 'an act or omission which is an interference with, disturbance of or annoyance to, a person in the exercise or enjoyment of (a) a right belonging to him as a member of the public, when it is a public nuisance, or (b) his ownership or occupation of land or of some easement, profit, or other rights used or enjoyed in connection with land, when it is a private nuisance'[5]. In environmental law, this cause of action can be invoked to protect or preserve the status quo of the ownership or occupation or enjoyment of land or interest belonging to the aggrieved party/plaintiff/claimant. For example, floods, excess soils, fumes, leakages of poisonous, chemical and radioactive hazardous substances or smokes or others act or causes, created or caused by or due to one's unreasonable interferences and disturbances, either he done it advertent or inadvertently, detrimental to the other who might reasonably could have been affected or suffered by his acts. In this action, courts in Malaysia, would follow and apply the law of nuisance and principles as practices in England subject to the permission given by the Civil Law Act 1956.

The instance of the case that falls under this heading is Chan Jen Chiat v. Allied Granite Marble Industries Sdn. Bhd[6]. In this case, the plaintiff, a tenant occupying a piece of leased land whose activities' were subject to the express condition that the land used was for horticulture and fishery. On this, ponds were constructed and parts of them were used to breed worms as feed meals for his fishes. Adjacent to his land, was the defendant, carrying on business of earthworks which included leveling of land for the construction a factory to be built on it. The defendant's land also was a leased land. The plaintiff's ponds were filled by water supplied flown from drains running through and across the defendant's land. However later, the defendant altered the drains by constructing a culvert. He did this with the view to prevent any excess soils resulting from the earthworks' undertaken from flowing into the plaintiff's ponds. However, it was found that, due to heavy rainfalls, the drains were not suitable and insufficient to carry away the water and soils into the river. Thus, inadvertently, these excess soils eventually flew into the plaintiff's ponds, killing all the worms. The plaintiff suffered losses due to this interference. After several requests by the plaintiff to the defendant to restore and rectified this catastrophe proved futile, the plaintiff took an action against the defendant, the prayers *inter alia* included an order for mandatory injunction to compel the defendant to repair the drains so as make it good enough to flow and channel the excess soils resulted from the carrying out of the earthworks by the defendant and so they would not spill over and flow into the plaintiff's ponds.

In the judgment of this case, the issue of suitability of granting mandatory injunction was highlighted by the trial judge. According to the judge the plaintiff was entitled to mandatory injunction to compel the defendant to repair and provide suitable and sufficient culvert and drains so as to be capable of carrying and channeling these water and excess soils to proper place. Otherwise, the plaintiff would suffer irreparable damages and injury. On this the judge referred to the principles of law in Wah Loong (Jelapang) Tin Mine Sdn. Bhd v Chia Ngen Yiok[7] and Hubbard v. Vosper.[8]

Apart from the above contention by the plaintiff, the plaintiff also had successfully convinced the court that the acts of the defendant were nuisance in that the acts had created a dangerous situation and unnatural use of the land and finally it ensued that the defendant would have known and ought to have known that, by his very acts, they would likely to affect and block the natural flow of water and excess soils, which the drains and culverts could bare and due to this unbearable circumstances, excess waters and soils would have flown into the plaintiff's ponds thus resulting in actionable nuisance. Similar principles were adopted in Seong Fatt Sawmills Sdn. Bhd v. Dunlop Malaysia Industries Sdn. Bhd[9], Toyo Textiles Industries Sdn. Bhd & Anor v.Lian Foong Housing Development (M) Sdn. Bhd.[10] (the defendant blocked the natural stream causing waters flowing into the plaintiff's), Pacific Engineering Limited v. Haji Ahmad Rice Mill Ltd[11](spreaded smoke, ash, rice husks and dust caused by the defendant's business to the detriment of the plaintiff's comfort and convenience of life), Wu Siew Ying v. Gunung Tunggal Quarry & Construction Sdn. Bhd. & Ors[12] (where the defendant as a quarry operator was held liable for nuisance as he failed to take sufficient precaution during the course of extracting limestone of the hills which due to their failure, had caused the limestone rock debris fallen onto the plaintiff's land and destroyed the plaintiff's nursery) and Ng Chen Kee & Ors v. Loh Peng Kung & Anor[13](the defendant had caused nuisance against the plaintiff in that he had wantonly created a drain which resulted excess waters to have escaped into the plaintiff's paddy and destroyed them).

In this case too, apart from the wrongful conduct of the defendant in tort, the defendant also had failed to obtain necessary approval, required by section 70A(1) of the Street, Drainage and Building Act 1974, from the local authority before commencing the earthworks activities. In addition to the grant of injunction and further orders compelling the defendant to repair the drains, the court also allowed application for damages by the plaintiff.

b) Negligence

In an action on the ground of negligence, there are four requirements that need to be met by the aggrieved party/plaintiff/claimant to prove the liability of the defendant. These requirements are:

1) the existence in law of duty of care situation, on part of the defendant, ie one in which the law attaches liability to carelessness…;
2) breach of the duty of care by the defendant, ie that it failed to measure up to the standard set by law;
3) that the particular kind of damage to the particular claimant is not so unforeseeable as to be too remote.[14]

Under this sub heading, the claimant has to prove the existence of duty of care owed by the defendant who has, actually fails to exercise it and causes damages and losses to the claimant. The duty of care is determined by express or implied agreement that certain duty of care is required by the law, to have been reasonably exercised by the defendant. And because of this agreement, the claimant relies on such agreement and assured that the defendant would so exercise such duty of care. Further, the claimant must prove that the losses or damages he suffered must have been the outright result from the breach of such duty of care by the defendant.

The example of decided cases, in this respect, is Mc Gowan & Anor v. Wong Shee Fun & Anor[15]. In this case, the plaintiff was the occupier of a piece of land adjacent to a river. Up north of the river were lands occupied by the defendants. The first defendant had constructed a culvert to cope with the running rain water, whilst the second defendant was at all material times a developer carrying out their housing development projects beside the river. The plaintiff alleged that due to heavy rainfalls, soils were stripped off and excess waters were and could not properly channeled into the river as the culvert were not adequate enough to cope with the sudden spate caused. The matters were even worse when the culvert were blocked by fine earth, silt and partly by the branches of trees and other debris. These blocking materials were found to have carried away by the waters from the second defendant's land. This fine earth, silt, soils and excess water, which should have been flown throughout the river, but due to the blocking culvert, caused damage to the plaintiff's property. The court held that both defendants had caused nuisance and had negligently caused such trouble to the detriment of the plaintiff's property. The defendants were negligent in stripping off the top soil of their respective lands without taking all reasonable steps to prevent fine earth from being washed down the sides of the slopes into the stream and the second defendant was negligent in allowing debris and pieces of timber to be washed down into the stream. In the result, the court granted damages, to be equally apportioned between the two defendants, to the plaintiff.

Instances of other cases are:

1)Parimala a/p Muthusamay & Ors v Projek Lebuhraya Utara-Selatan[16]. In this case, the plaintiffs were passengers in a motorcar driven by the deceased which was traveling through the north bound lane towards Ayer Keroh, Melaka at the time of the accident. The deceased died on the spot after hitting a stray cow which had found its way, gained access through broken fences, to the highway. The defendant was the highway authority responsible for the construction, maintenance, management and safety of the North-South Highway, a line of highway constructed throughout the Peninsular Malaysia. The plaintiff's claim was for breach of duty of care on the part of the defendant as against the plaintiff who were users of the highway. The plaintiffs based their claim against the defendant, *inter alia*, on the common law negligence. The court found that the defendant had been negligence in failing to ensure that the cows did not entered into the highways, which resulted the accident and death to the highway's users; and,

2) Goh Chat Ngee & Ors v. Toh Yan & Anor[17], where the court found that apart from nuisance, the defendant also was in negligence in that the defendant – a mining operator, as the owner of the adjacent land to the plaintiff's failed to maintain support for his neighbor's land, but instead he had done such as in

this case which had caused the soil structure of the plaintiff's disturbed, flooded and collapsed, causing damages and sufferings to the plaintiff.

c) The Rule Under Rylands & Anor. v Fletcher[18]

The principles of the rule were established in the judgment delivered by Blackburn J in the case of Rylands v. Fletcher. According to the court, commenting on this rule of law, that:

> 'We think that the true rule of law is, that the person who for his own purposes brings on his lands and collects and keeps there anything likely to do mischief if it escapes, must keep it in at his peril, and, if he does not do so, is prima facie answerable for all the damages which is the natural consequences of its escape'

Based on this ratio, whosoever causes 'mischief', in so far the mischief is due to his failure to reasonably keep things that would likely to cause mischief if it escapes, against other people who is or would be likely become the victim or foreseeably would be effected by his very act of letting the things out causing the 'mischief', he must be held liable to damages suffered by claimant. It is submitted that that things would include for example, oils, explosions, noxious fumes, poisons, radioactive substances or even wild animals. Thus, such person in possession of such thing which may cause 'mischief', must exercise greater care so as to protect nor to preserve these things from causing 'trouble' to others.

The application of the above principle can be seen in several cases in Malaysia. One of them is Dato' Dr. Harnam Singh Practicing As Harnam Ent Hospital And/Or Dato' (Dr) Harnam's ears, Nose and Throat Specialist Clinic Sdn. Bhd v. Renal Link (KL) Sdn. Bhd.[19] In the case the plaintiff alleged that the defendant was guilty of nuisance in that they - the defendant had emitted over the plaintiff's premises noxious and offensive fumes, vapors, gases, chemicals, smells and toxic materials which have caused the plaintiff to suffer injuries. The plaintiff also proceeded on the Rylands v. Fletcher's principle alleging:

- ?? that the defendant is bringing and storing in their premises noxious and offensive materials;
- ?? that this amounted to a non-natural user of the land;
- ?? that these noxious and offensive substances escaped onto the plaintiff's premises; and,
- ?? that these substances caused annoyance, discomfort, sickness and injury to the plaintiff.

The court found that, on the balance of probabilities, the plaintiff has proved firstly that the defendant's clinic was/is emitting noxious and toxic fumes, gases and chemical smells; secondly, that the said contaminants were escaping from the defendant's premises and getting into the plaintiff's premises; and thirdly, that the said contaminants were causing harm to the plaintiff in that he was unable to use and enjoy the premises. As such the defendant is held liable in nuisance as well as for negligence under the rule of Rylands v. Fletcher. As to negligence under the rule under Rylands v. Fletcher, the court was satisfied from the evidence adduced by the plaintiff that he had proved all the ingredients required to be proven under the said rule, firstly that the defendant had brought, stored and used at first formalin(formaldehyde) and then renalin (acetic acid) in their premises; secondly, that noxious gases were produced; thirdly, that the said gases escaped into plaintiff's premises and lastly, the said gases caused injury to plaintiff's health. In the result, the court awarded damages to the plaintiff for the daily and long suffering the plaintiff has endured since the time he was affected by the act of the defendant. Further, injunction also was issued by the court to restrain the defendant, by their servants or agents or otherwise from continuing the nuisance.

Apart from the above case, amongst other cases that followed the principles adopted the rule under Rylands v. Fletcher are:

1) Ling Nam Rubber Works v. Leong Bee & Company[20] (the plaintiff alleged that the defendant had negligently failed to exercise sufficient and reasonable degree of duty of care in carrying out the substantial earthworks on piece of land, adjacent to the plaintiff's, which due to this negligent had created dangerous situation, where this had allowed rain water to overflow into the plaintiff's land causing extensive damages to the plaintiff's lands, roads, buildings and goods stored therein); and,
2) Dr Abdul Hamid Abdul Rashid & Anor v. Jurusan Malaysia Consultants (sued as a firm) & ors [21] (the plaintiff alleged that third defendant had breached its duty of care towards the plaintiffs in respect of negligence, causing nuisance and liable in part under the rule of Rylands v Fletcher. The third defendant was the contractor engaged in erecting a double storey bungalow on a neighboring land. The third

defendant was said to have unnecessarily allowed infiltration or seepage of water into the land owned by the plaintiff and/or allowing it to overflow onto the plaintiff's land causing saturation in the soil resulting in landslide which brought down the plaintiff's house. The third defendant had artificially accumulated the rainwater with the excavation which was an alteration to the nature of the land and had also interfered with the rainwater by constructing transverse drains ending three quarters down the slope of land adjacent to the plaintiff's land. All these had affected the natural flow of the water resulting in its concentrated and increased infiltration into the land thereby causing destructive effect to the plaintiff's land. The court agreed with the plaintiff's contention).

2) The New Thought on Cause of Action in Environmental Matters

According to one legal practitioner in Malaysia[22], environmental cases can also be brought to court based on, apart from the above traditional cause of actions, the following rules, *viz* 1) The rule in Cambridge Water Company and; 2) The Lender Liability.

a) The Rule in Cambridge Water Company23

This case lays principle that a person would be liable in tort in the event that he had done certain act, which although he considered it to be perfectly normal and effective yet he would have reasonably foreseen that his very act, such as in this case, by letting a solvent, advertently or inadvertently, to leach into the aquifer, would contaminate the water owned by the other party, which virtually found hazardous or detrimental to party consuming that water.

The facts of this case were that, in September 1976, the Cambridge Water Company bought a piece of land which was formerly used as a paper mill at Sawston, Cambridgeshire, attached to which was a license to abstract water from a borehole on the site. Cambridge Water Company began to abstract the water for public consumption in June 1979. Unknown to the water company was the fact that the water was contaminated by a solvent which had leached into the aquifer from a nearby tannery operated by Easter Counties Leather. The spillages of the solvent occurred regularly between 1950 and 1976, after which the tannery began to operate more efficiently. This contamination was not considered an issue until, in 1976, the EC issued Directive 80/778 relating to the standards of drinking water for human consumption and contained figures relating to the maximum levels of perchloroeghylene which could be present in the water. The water abstracted from the borehole from Eastern Counties Leather was found to exceed these limits and use of the borehole was discontinued. In was originally thought that the action would be brought under WRA 1991; however this proved to be impossible as the pollution pre-dated its enactment. Cambridge Water Company began proceedings against Eastern Counties Leather on the grounds of nuisance, negligence and the rule under Rylands v. Flether. The High Court dismissed the action of the plaintiff on the ground that the defendants (Eastern Counties Leather) could not have foreseen the damage caused to the acquifer arising from their tannery operations. However, this was reversed by the Court of Appeal. But, finally this was over ruled by the House of Lords on the ground that the defendant had not reasonably foresee that their solvent would leached into the aquifer. Thus if the element 'reasonably foreseeable to the possibility of the leaching of solvent could contaminate the water', the defendant would not be appropriate nor just to be held liable. In order to succeed, the plaintiff must prove this test, that the defendant having exercising their act, by which act they considered it to be perfectly normal and effective, would have reasonably foreseen that their very act, *viz* by letting the solvent, advertently or inadvertently, to leach into the aquifer, would contaminated the water. Thus the defendant was held not liable. The rule under Rylands v. Fletcher and action on nuisance is qualified by this new 'principle'.

b) The Lender Liability24

This case points out that if the lender/charger/mortgagor of the land or property under a mortgage or charge, knew at the outset, before the prospective buyer came to bid the property, that the said property would not fit for human habitation, yet persuaded the buyer to proceed on to so buying the property, the lender would be liable in tort, if later found that the property, occupied by the buyer to be so defective.

This was the finding in Karoutas v Homefed Bank – In this case, a court of appeal case from California held the knowledge of the lender that the house under bid was subject to progressive soil movement, exposing the house to forces and stresses, and this had not been made known or disclose to the prospective bidder and later became the successful buyer on the view that it would distracted the buyer interest on the house, would tantamount to breach of common law duties on part of the lender.

View on the Application of the Above Two New Authorities

However, it is opined that the above new causes of action or authorities, would be contrary to section 3(1)(a) of the Civil Law Act 1956**.** Pursuant to this section, in West Malaysia, the law that shall be applied are the written laws in force in Malaysia except where there is none, then the common law of England and the rules of equity as administered in England as at 7 April 1956. On the other hand, section 3 (1) (b) and (c) provide that in the case of Sabah and Sarawak, apart from common law and rules of equity, the civil courts shall apply, provided that there is no written law, the statutes of general application as administered or in force in England. The application of these sources of law is that, only those practised and applied in England as at 1st December 1951 for Sabah, and as at 12th December 1949 for Sarawak. However, the application of these sources of law is subject to the proviso 'so far only as the circumstances of the States of Malaysia and their respective inhabitants permit and subject to such qualifications as local circumstances render necessary'.

Thus based on the above provisions, the law that would be applicable in the states in the Peninsular Malaysia would be the common law of England and its rules of equity as administered in England at 7th April, 1956. Now, the above new propounded authorities clearly decided and became law after 7th April, 1956, 1st December, 1951 or 12th December, 1949. Hence, it is submitted that by virtue of this provision, they could not become the law in Malaysia.

3) Cases Emanate From EQA 1974

The first and foremost landmark case that has hitherto, in Malaysia, touched on EQA 1974 is Kajing Tubek & 2 Ors v. Ekran Berhad & Ors[25]. In this case, the plaintiffs being the residents in longhouses in the district of Belaga, Sarawak commenced an action against the defendants on the defendants plan to develop a hydroelectric project in their district. The project would involve the creation of a reservoir, construction of dam, the transmission of the generated electric power from Sarawak in East Malaysia by transmissions cables which will be submerged across the South China Sea. The plaintiffs alleged that by the very act, if allowed to proceed, of the defendants, would lead to the destruction of their long houses, ancestral burial sites as well as lands and forests from which they seek shelter, livelihood, food and medicine which have a strong cultural attachment. However, the defendants, alleged by the plaintiffs, had failed to submit a report to the Director General, of Environmental Department. A report required under section 34A of the EQA. This was because the activities which would be undertaken by the defendants fell within the meaning of 'prescribed activities', pursuant to rule 13(b)[26] of the Environmental Quality (Prescribed Activities) (Environmental Impact Assessment) Order 1987. This report should contain an assessment of the impact such activity which is proposed to be carried out will have or is likely to have, on the environment and a proposal of measures that shall be undertaken to prevent, reduce or control any adverse impact on the environment. A detailed EIA prepared by the proponent of the project must be made available to the public. The public are invited to comment on the proposed project to a review panel. This review panel will formulate its recommendation to the Director General for his considerations and decision on its approval.

At the first instance, the High Court judge allowed the application of the plaintiffs on the ground as prayed. However, upon further appeal to the Court of Appeal, the judgment was reserved[27]. The grounds of such reversal *inter alia* are:

1) the power to allow and regulate such a project lay on the State of Sarawak, pursuant to item 2(a) of List II(land) and item 13 of List IIIA(the production, distribution and supply of water power and of electricity generated by water power) of Schedule 9 to the Federal Constitution, not to the Federal Government. The EQA did not apply to the environment that was the subject matter of this case and the plaintiffs had no vested or other interest under the EQA upon the Amendment Order could have any effect; and,
2) The project was subject to the Sarawak Natural Resources Ordinance 1949 not under the EQA. According to this Ordinance, there was no requirement for the plaintiffs to be supplied with copies

of the environmental impact assessment report. As such the plaintiffs had no cause of action in the appeal. Even if section 34A of the EQA applied, the plaintiffs would only be given copies of the report if they had asked for it. There was no accrued right that the report must be distributed to the public without the public asking for it.

Conclusion

Based on the above elaboration, it is clear that, environmental problems can be brought to court of law *via* the remedies and avenues provided by the rules emanate from common law, in Malaysia. These causes of action include the action on nuisance, negligence and Ryland v. Fletcher. However, it is opined that action on trespass may also be invoked. However, there is yet environmental cases, in so far as Malaysia is concerned, that have touched on this respect of law. It is thought that action on trespass may as well be applied in environmental law, in that, commonly action on trespass concern interferences and disturbance on other's land so as to affect the owner's right and enjoyment over or on the land. Trespass on land is the unjustifiable physical interference with land, arising from intentional or negligent entry onto the land. A continuing trespass may be caused by continuing entry onto the land or by allowing physical matter to remain on land. For example, the emission or leakage of poisonous or radioactive substance into other lands, resulting in the damages or losses to the owners of that particular land or his interest on the land. Such owner apart from applying law of nuisance or negligence or rule under Rylands v. Fletcher, may as well, it is opined, could commence an action based on trespass.[28] Commonly, the remedies that normally be given by court, are damages subject to assessment or injunction or abatement.

In regard to the two new remaining foreign rules *viz* the application of Cambrige Water Company and lender liability as suggested by one author, in Malaysia, it is regretted that these principles may not be applicable in Malaysia on the ground that these rules or principles were made after the dateline allowing the importation of English law and principles unto Malaysia pursuant to the provision of the Civil Law Act 1956. In as much as these rules are concerned, it is thought they are persuasive in nature without having any 'binding' effect to the current and subsequent cases tried in Malaysia. Be that as it may, it is thought that the principles adopted in the law of nuisance, negligence and Ryland v.Fletcher can be expanded and developed by judges in Malaysia, without much reliance on 'Cambridge Water Company' and 'lender liability'. Besides, the principles of law of contract may also be invoked to show that the guilty party/defendant is in breach of a contractual duty to exercise certain duty of care as inherently or understandably to have or should have been exercised by him. This can be seen in the Paramila case, where the company of a highway was found to have been in breach of contractual duty, resulting in the death of passengers after hitting cows, in that they failed to ensure the highway was safe for users. This was evident when they failed to keep the highway free from stray cows, having entered into the highway through the broken fences. Further, it is submitted, among the area that the court could look into and expand the boundary of the existing law is on the liability of environmental or planning consultants, such as engineers, town planners, architects and quantity surveyors even as well, to include the Kuala Lumpur City Mayor, known as people who are responsible in planning the growth of the city, in the event, for example the city is flooded after heavy rain falls due to insufficient or defective street, drainage and planning systems or disasters due to other instances such as soil erosions, leakages of poisonous gas, radioactive substances, fumes, contaminated waters etc resulting in the sufferings of the city's citizens such as diseases, cancers, losses and other deformities.

Finally, with the promulgation of EQA 1974, environmental protection in Malaysia would be more guaranteed in that the EQA 1974 and its regulations made there under seem to have provided measures and rules to govern things or matters that would affect environment as a whole.

Marketing, Entrepreneurship and Small Enterprises

Current Trends in Direct Marketing in Slovak Conditions

Viera Cibakova,
Peter Starchon
Comenius University in Bratislava, Slovak Republic

Abstract

The paper highlights selected aspects of direct marketing and its utilization in Slovak republic. The stress is on identifying of a broad frame of direct marketing in Slovak conditions and also on factors with strong influence of further development of direct marketing.

Introduction

The importance of direct marketing (DM) and its roles in the Slovak Republic are increasing. For a growing number of Slovak organizations direct marketing gradually is becoming a fully valuable marketing communication and distribution tool. Direct marketing is utilised by organizations, which are continuously planning and implementing DM campaigns; but also by organizations, which are using some of direct marketing tools occasionally and unconsciously. Direct marketing is a suitable marketing tool not only for profit-oriented companies. DM is utilised by non-profit organizations too (organizations of public sector and private organizations of the third sector, e.g. associations, communities, foundations, political parties, churches, public utility services, etc.). Non-profit organizations are using direct marketing for fundraising activities in particular.

Development of DM in Slovak conditions is based on gradual evolution. It is evident that direct marketing in practice was used for long time before developing of theoretical background and principles. Its development is in strong correspondence with development of new communication and distribution technologies and with evolving business environment. Direct marketing has also its own position as a specific approach of a company to customers, based on creation of long-term relationship. The main reason why to use DM in practise is cost management.
Utilisation of DM is bringing for organization positive economic benefits. They can be demonstrated by:

a) Reducing of acquisition costs for a new customer;
b) Increasing of trading volumes;
c) Increasing of a customer life time value;
d) Reducing of inventories costs;
e) Increasing of the sales management process efficiency.

Utilisations of marketing communications and its sub-set direct marketing vary from company to company. It depends mainly on its inner potential – managerial, financial, personnel and on practical skills and knowledge. It is necessary to evaluate the advantages and the disadvantages of DM and implement them into business. DM could be a competitive tool in an increasingly global economy, when the success of any organization will very much depend on understanding the needs of customers. DM offers to organizations also a wide range of innovations, in fact it is a tailor made marketing.

The importance of DM will be permanently increasing because of stronger competitive environment, new distribution and communication channels, identifying of specific, individual wants and needs of existing and potential customers. “Individuality” of DM relies on its main features – transparency, measurability, flexibility, and variability. McCorkell states, there are four building blocks in DM; Targeting - to find out who will be interested; Interaction – information on how the consumer last responded to an offer; Control – was the interaction worthwhile and Continuity – understanding how to build relationships with customers. DM in its very nature is tailor-made marketing. Of course (according to McCorkell) you can’t devise a unique strategy for every customer or prospective customer. But neither does a tailor design a suit for each customer. The tailor merely ensures the basic design is adapted to match the shape, size and taste of the customer. The tailor's efforts are perfectly focused on the individual customer.

DM can be considered as a powerful weapon both of defensive and offensive marketing especially on the market, which is continuously becoming more and more opened and is influenced by process of globalisation. A lot of organizations will gradually change marketing thoughts and recognise that customer is not only source of an immediate profit, but also the source of long-lasting stability on the market. Customers and needs of customers are crucial terms in marketing conception. Customers are deciding on an organization success. Also customers are selecting tools of marketing communication that have their attention. Relationships between a company and its customers rely mostly on customers' own volition. Therefore here is a wide area for DM approach. This approach is supported by development of new distribution, communication and computer technology. Former interpretation of direct marketing was putting the stress on direct sales, DM was considered only as a distribution tool. But now, also in Slovakia, direct marketing is considered as relevant tool of marketing communication. The future of direct marketing is on its complete implementing into marketing programmes and strategies. Its further development is enhanced by integrated database and integrated direct marketing, and of course with integrated marketing. Managing the customer base means that the firm has at least some kind of direct knowledge of how satisfied its customers are. Instead of thinking in anonymous numbers, or market share, management thinks in terms of people with personal reactions and opinions.

Further development of direct marketing in Slovakia will depend on various factors. One of the most important factors is legal environment. Permanent changes in legal environment cannot positively stimulate usage of DM in practice. But if the area for non-ethical and wasting utilisation of direct marketing will be opened, no one will accept any of DM tools. Customers will refuse this approach. Social responsibility of companies that are participating on DM business is enormous. Therefore ethical limits must be "welcomed". Organizations need to be in touch with customers and to find the best way of doing this. Slovaks protect their privacy and organizations should plan and implement marketing strategies carefully. Otherwise negative attitudes to direct marketing will be increasing.

Purpose of marketing communication is not in disturbing of target audience. If proliferation of advertising is noticeable, organizations should find another possibilities how to communicate messages and to influence potential and/or existing customers. In this point is good to start with discussion about the nature of direct marketing and to focus on the emergence of the concept of integrated marketing communications. Integrated marketing communication involves the aim of achieving a greater synergy. The approach of DM to customers differs from mass marketing. It allows using large volumes of customer data to predict their future behaviour and estimate their lifetime value to a particular business. Other advantages of DM are that it allows stealth marketing and the opportunity to create a stable client base as a result of engendering positive perceptions of goods and services. One of the most important issues for a company using DM strategies is the eventual creation of a database of potential and existing customers. There is much more than couple of good reasons, why to use direct marketing in practise. As per researches, although direct and online marketing are booming, a large number of companies still relegate them to minor roles in their communication/promotion mix. Advertising and sales promotion departments receive most of the communication dollars and jealously guard their budgets. It is very similar in Slovakia. Advertising is still winning. Direct marketing has a strong potential of further development. But it depends only on organizations, if they will use it. It depends on their communication strategies, financial sources, and skills and will of employees and also on external factors. It is important to combine number of marketing tools to create and cultivate loyal and profitable customers. Direct marketing is one of them. Media explosion offers to enlarge number of organizations to sell products to customers directly, without intermediaries. New media refills traditional media, e.g. fax, e-mail, Internet, mobile phones. They are suitable for individual, direct and interactive communication between an organization and customers. They are suitable both to acquisition of new customers and retention of existing customers. Direct media allow specific targeting and improve offer specification.

In mass marketing the seller engages in the mass production, mass distribution, and mass promotion of one product for all buyers. But the proliferation of advertising media and distribution channels is making it difficult and increasingly expensive to reach a mass audience. How to be more productive? How to acquire, keep and enlarge number of customers? One of the possible answers is to adopt some key features of direct marketing into the practice of struggle companies. A new approach to customers is supplying a traditional marketing conception. This approach is based on individualization in relation organization – customer(s). DM has reached a new level of its development – the level of interactive marketing.

Utilization of direct marketing in Slovakia is neatly illustrated as follows:

1. DM used is used often or occasionally by one third of Slovak companies. This fact indicates positive trends of further growth.
2. The most utilized direct marketing tools are direct mail and telemarketing.
3. A lot of organizations have an interest on new information about direct marketing.
4. Direct marketing in Slovakia is evolving and enlarging.
5. Slovak advertising, DM and media market is profiling.

The Association of Direct Marketing in Slovakia (ADiMa)[i] published the economic results of its members from the years 2000, 2001 and 2002 and it recorded (compared to the previous year) nearly a 30 % increase in DM. This could be considered as a signal that DM in Slovakia is growing and it has strong potential to grow further. But it is remarkable that potential of DM in Slovakia is still not exploited. There is an assumption that DM in Slovakia, in contrary to the economically highly developed countries, is used only for 10%.

In Slovakia both individual and business customers have observed a large number of companies involved in DM. Whether organisations take advantage of the rapidly expanding e-commerce, emerging new media and the possibility of global one-to-one marketing stimulus will be influenced by the economy of the country. Occasional utilization of DM tools is replacing by continuous utilization. DM is accepted by many companies and by customers too. DM activities don't have been utilized intuitively and in short-terms. Appropriate DM activities and exploitation of particular techniques of DM should always bring profit and satisfaction to the company and must respect needs of customers. On the other hand the vast usage of DM could negatively influence consumer attitudes. DM is particularly powerful when it is applied to integrate marketing programmes that incorporate multiple sales channels and a wide range of marketing communications. If direct marketing is carefully planed and implemented, it is extremely promising marketing component. According to scholars in this field, competing firms need to find innovative ways of promoting products to their customers. This may either be achieved through innovative advertising campaigns, which capture the imagination of the customer, or through innovative means of advertising, which give the firm a differential edge over other industry players. In general, direct marketing in Slovakia appears as an extremely promising segment of marketing communications. But in contrary to this statement it is important to point out some of the latest information about attitudes of Slovaks to advertising. According to the press release of January 28, 2003 by TNS SK are Slovaks saturated by TV advertising (76%), and then by non-addressed mailing (49,9%), print advertising (44,6%). Respondents are not embarrassed by Internet advertising (11,6 %) and by transport-oriented advertising media (10,8%)[ii]. It is visible that new forms of marketing communication are replacing traditional advertising and communication media. In the case of DM there is a wide rage of new mass-communication media. Interactive marketing and m-marketing[iii] are representing current trends in direct marketing also in Slovakia. The Slovak DM market is still opened for specializing agencies although competition in this area is strong. Direct marketing could be used very effectively in Slovakia but it is difficult to predict its future use. The potential of direct marketing in Slovakia will be only fully exploited.

End Notes

[i] The Direct Marketing Association (ADiMa) was established in 1997. The key aim of ADiMa is to support the growth and using of direct marketing in practice and to support positive attitudes forward DM in public audience. The ADiMa also has constituted The Code of Ethical Principles and has started to create "the Robinson's List". Further information is available on: <http://www.adima.sk>.

Development of SMEs in APEC: A Comparison Between Mexico and Thailand

Ernesto Rangel
Universidad de Colima, Mexico
Antonina Ivanova
Universidad Autónoma de Baja California Sur, Mexico

Abstract

In the APEC region the SMEs are the backbone of regional economic growth. The 40 million SMEs throughout APEC economies account for over 90% of all enterprises. They also employ 32% to 84% of various economies´ work forces, contribute 30% to 60% of gross domestic product and account for 35% of exports in the region. That´s why the Small and Medium Enterprises Working Group was established as an *Ad Hoc* Policy Level Group on SMEs in February 1995. In 2000, as part of the decision of the Management Reform process, the Small and Medium-sized Enterprises Working Group (SMEWG) was granted permanent status.

After a brief presentation of the Working Group activities that facilitate an open discussion on matters affecting SMEs and enable the ministers and business people to find the common ground necessary to create a favorable policy environment for the development of SMEs, this paper presents a comparative analysis of the governmental support policies for the SMEs in two APEC members: Mexico and Thailand. We classify the policy measures provided by the governments for the promotion and support of SMEs into 3 key areas, namely (i) Investment Promotion, (ii) Financial Assistance and (iii) Technical Training and Consultancy through various administrative organizations dealing with SMEs promotion activities.

In the conclusions are compared the impacts of the policies and instruments applied in Mexico and Thailand and suggested the introduction in Mexico of some Thailand´s positive experiences. Further more, it is recommended to use the SMEWG as a permanent forum to exchange the positive experiences of the APEC members in the SMEs development instruments and policies.

Introduction

Nowadays, Thailand and Mexico are immersing in a fortifying process of their economies, due to the effects of the 90's economic crisis. Thailand recovery policy after the crisis is supported in the knowledge-based economy, which is constituted by the government, managers and international organisms such as World Bank and APEC. At the same time Mexico's government is trying to alleviate the poorest and unemployment problem with the supporting to SMEs. Mexico has to emphasize the KBE especially in Research and Development and human resources development. The purpose of this paper is to identify some government policies oriented to support the small and medium enterprises, taking the knowledge-based economy as a guide.

Importance of a Knowledge Economy

First of all, it is important to know how Knowledge Economy is defined by the World Bank: "The knowledge economy could be defined as one where 'comparative advantage [is] much less a function of natural resource endowments and capital-labour ratios and much more a function of technology and skills'. Its development is the product of two forces: a rise in the knowledge intensity of economic activities and an increasing globalization of economic affairs. It is driven by the revolution in information and communications technology, the increasing pace of technological change and by national and international deregulation.[1]

From a policy perspective the knowledge economy can be seen as consisting of four main inter-related spheres. These are: Innovation Systems: R&D, diffusion of technology, links between science and industry, firms focusing on new technology, industry clusters; Human Resource Development: basic education, scientific and engineering talent, lifelong learning, job training, organizational learning and innovation; Business Environment: regulatory environment, intellectual property rights, competition policy, tax rates, physical infrastructure;

Information and Communications Technology (ICT) Infrastructure: investment in ICT, digital networks, access to and use of ICT, growth of electronic commerce and enterprises.

The Thai knowledge system is composed of three parts: locally-owned Thai firms (especially SMEs), multinational or global corporations and other knowledge institutions such as schools/universities and government research institutes. Unfortunately the country is located in early stage in building innovation and knowledge infrastructures, related to other Asia Pacific Countries as Malaysia and Singapore.[2] “A central problem is that many government institutions and incentive schemes for industrial technology and skills upgrading are following old policy models which focus more on single entities (whether firms or institutions) than on knowledge networks, interactions and supply chains”.[3]

This country has decided to confront the international market; so the question here is what kind of policies the government of Thailand is taking into account in order to reduce the difference between old and new policies that are needed because of the globalization, and also how this decision is associated with capital talent[4] for the SMEs.

In turn Mexico tries to fortify its domestic Market through the improvement of business environment mainly with the strengthening and the establishment of SMEs, favoring in this manner the generation of jobs and the families income as a strategy of relief to the poverty, in this sense the president Fox affirmed recently that “…the poverty in Mexico has many doors of entrance, and …few doors at the outset. Because of it the generation of the self-employment, the start of micro and small business and the to undertake ‘is the door at the outset of the poverty for an extensive layer of the national population, for many families’“[5]

At the same time, Mexico seeks to favor the ICT use, the innovation systems and the human resources development as strengthening strategies of KBE in the SMEs.

Nevertheless Mexico require to emphasize the generation of high technology through R&D combined to the precision of the type of human resources that would require an economic structure based on the knowledge.

Small and Medium Enterprises

In Thailand SMEs have long been a pillar of the country's economy and they make up a large portion of national economy in terms of output, employment and effective utilization of regional resources. There are more than 850,000 SMEs and constitute over 90% of the total number of establishments. 19% are in the manufacturing sector, 26% en service, 3% in wholesaling, retailing 30% and other kind of SMEs 22%,[6] which are scattered both in Bangkok Metropolitan and regional areas. They employ about 65% of industrial workers and contribute about 47% of the total manufacturing value added.[7]

At present, there is no generally agreed definition of SMEs. Each organization has derived their own definition of SMEs for convenience in their work. The various administrative organizations which deal with the SMEs classify SMEs based on measures of fixed assets, registered capital, sales or number of employees:

a) Ministry of Industry has defined the SMEs as follows: By size of employment (small scale: less than 50 persons, medium scale: 50 - 200 persons, large scale: more than 200 persons); By fixed assets (small scale: less than Baht 20 million, medium scale: Baht 20-100 million, large scale: more than Baht 100 million)

b) The Industrial Finance Corporation of Thailand (IFCT), the Small Industry Finance Corporation (SIFC) and the Bank of Thailand define small industries as fixed asset investment less than 20 million Baht.

c) Office of the Board of Investment (BOI) has defined small scale industries with fixed assets less than Baht 10 million and medium scale industries with fixed assets more than Baht 10 million but less than Baht 100 million.

In Mexico’s case Ministry of Economy is considering into SMEs the micro their classification is by number of employees and annual sales. Micro: from 1 to 20 persons, and 900, 000 pesos; 16-100 persons, and 9 million pesos: medium scale, 101-250 persons, and 20 million pesos; and large scale more than 251 persons, and more than 20 million pesos.[8]

SMEs generate 6/10 of pesos and contribute to the economy with 42% of the national production. They are shared as follows: 13% -industry; 36%-services; and 51% commerce. Their value added which is near 50% is located in industry.[9]

SMEs in Mexico are faced with the following problems:

- Difficulty access to credit and high interest rates
- Lack of skills and management expertise
- High cost of access to information on market opportunities and technologies
- Lack of marketing skills especially for entering export markets
- Insufficient incentives
- Lack of knowledge about the procedures for entering foreign markets

Government and Some SMEs Promotion Activities[10]

Next we have some strategies and policies which the Thai and Mexican governments have implemented or are trying to develop it, in order to support the SMEs and human resources formation. It is important in other paper, to evaluate these strategies to find out their relationship with the detailed countries economic impact.

A relevant aspect is the interest of Thai government to adjust higher educational supply under minimum requirements standards according to the market activities and the emphasis of the practical experience during human resources development and the use of prices mechanism inside education and training costs, all this is supported by the long distance education.

On the other hand, E-education has been very important; was necessary to reform the basic educational level to develop curriculum and teaching procedure that support the scientific thinking, create incentive for researcher career, seed money from government budget to promote and induce R&D investment in ICT, set up R&D promotional strategy in Thai ICT, support the research work that can be applied to e-commerce industry, establish an Excellency Center. Without a doubt all these policies are supporting SMEs.

It has been considered the implementation of training programs to reduce the inequalities among small and medium-size companies. Accounts for this uneven distribution of training in Thailand is not known, but some studies reveal that while many firms do not train because the derived demand for skills from using old technology is low, many firms and SMEs, in particular, are also constrained by high labor turnover (and loss of training investments), poor knowledge about how to train or the benefits of training, and access to finance for training.

This implementation has been accompanied by a review of the legal and institutional framework, in order to make possible the SME Promotion Act thus, the Institute for SMEs Development (ISMED), and the agency called Office of Small and Medium-Sized Enterprise Promotion, the first to provide business management and technology services and training to SMEs, and the second would have the important task of disseminating information to SMEs on management, skills development and technology upgradation support services.

Also, tax incentives have been established, but there is not enough training among SMEs. Less than 2 percent of firms have been reported using the training tax exemption. The major beneficiaries of this incentive were larger firms and not SMEs, even though a high proportion of both groups of firms reported providing formal training to employees.

One of the most important strategies into SMEs is transferring and absorbing the advanced and appropriate technology, because the natures of small and medium enterprises are strongly beneficiary with this strategy. Also the use of the whole system of ICT in business management, promotes e-Business development, and use ICT for management in industrial sector, at he same time it makes the database for planning and service, and develops SMEs Portal. The purpose is to fortify the competition among this kind of enterprises.

Master Plan for development of SMEs has been established to organize this strategy in the manufacturing, trade and services sectors, which makes coherent the development of this sector, as it was said at the beginning, it represents 90% of the business in the country.

On the other hand, Mexico supports its policy for the SMEs in the Development Program for the Entrepreneur-ship (2001-2006). This program looks for the participation of local economic agents in order to elevate the enterprises competitiveness. So it is oriented to achieve a better business environment and facilitate the financial support; at the same time it is looking for ICT implementation in SMEs. As one of the most important aspects is the regional strengthening of domestic market trough creation of privet sectors value chains.[11]

SMEs policies are implemented with the following objectives: 1) To reduce the disadvantages between SMEs and large enterprises in areas such as: financing, human resource development, technology development, access to foreign markets, technology transfer and development for supporting industry, and 2) To ease the process towards increased quality and competitiveness. This is important because SMEs are facing new challenges as a result of tariff reduction and increasing competition in the domestic market. The modernization of facilities and the incorporation of more efficient technologies have become priorities for most enterprises

Especially in SMEs Human Resources Development support in Mexico the Ministry of Economy and Ministry of Work and Social Prevision promote one kind of programs oriented to competitive capacity of the enterprises. This program is focused in the creation of the National Network of Regional Centers for the Entrepreneurial Competitiveness for the advice and training trough seminars and specific courses, especially for new SMEs; Integral Quality and Modernization (CIMO); COMPITE which is oriented to the training of human resources inside the SMEs; Quality System Program in the SME. Mexican Council for Productivity and Competitiveness is responsable for enhancing productivity and competitiveness through industrial workers training program. Ministry of Finance and Public Credit grants the taxpayer a tax deduction for the contribution paid to the R&D funds.

In fact we can observe that all these programs in Mexico are focused in the capacity building of the workforce in order to increase the enterprises competitiveness, together with an enhanced business environment and incorporation of the information and communication technology.

However we can not find so clear the R&D innovation system for the SMEs. We think is necessary strengthen this factor in order to discover the high technology ways.

Some of the best programs in Mexico are the Technology Transfer Unit (UTT), the Compite Program and the CIMO Program.

The UTT is a non profit organization created by the Mexican Government trough the Ministry of Economics and the private sector through the National Chamber of Manufacturing Industry (CANACINTRA), with the participation of IBM of Mexico, S.A. UTT services are especially designed to satisfy information and technical assistance needs of SMEs, but UTT is also useful for other industries, associations and chambers, service companies, financial institutions, government and non-government institutions. It provides the enterprises with the information and technical assistance needed to solve technological and production problems, and to increase their competitiveness in the marketplace. This program includes: National and international databases, R&D institutions, libraries and information centers, consulting firms, government, international and private organizations, distance access via INTERNET.

The relevance and quality of the UTT services is ensured by an interdisciplinary group of experts. Some of the services provided are: information and advice on patents, trade marks and standards, access to specialized information through query services, technology assistance and training programs, legal advice on technology transfer contracts, development and upgrading of information systems, information and financing programs for technology development.

The objectives of the COMPITE Program are the human resource development, management support and intellectual property rights protection. Other goals of the program are to reinforce the competitiveness level of the enterprises, to increase productivity through the efficient use of production processes, to make optimal use of the enterprises resources, to establish immediate, viable and low cost solutions to the problems, to develop actions that grant added value and total consumer satisfaction.

The program provides the SMEs with a strategy to develop an efficient method of production. The operations that don{t add value to the final product, as well as the unnecessary costs are eliminated. The program consists in intensive workshops organized within the enterprises during 4 or 5 days. Authorized consultants work with an interdisciplinary group of the SME. The situation of the enterprise is analyzed based on four parameters: productivity, requested time, stocks and output. Short run problems and solutions are identified. Some measures are implemented immediately followed by a productivity increase evaluation.

The CIMO (Integral Quality and Modernization) program must foster the human resource development, the support for management and the access to information for the SMEs. The Human Resources Development Promotion Units (UPS) and the enterprises make a basic diagnosis and elaborate a strategic program for the development of SMEs. They also identify specific needs of each enterprise in order to develop common aspects and to promote the exchange of experiences. On this base the program propose specific measures, involving the different areas of enterprise. The program has financing mechanisms for human resources development, consulting services and industrial information. The Ministry of Labor and Social Welfare as well as SMEs contribute to these mecanisms with financial resources.

SME Working Group of APEC

Nowadays the interest of Thailand about Micro, Small and Medium Enterprises is related with the incorporation of Micro Enterprises Sub-Group in the APEC SMEs Working Group, starting in 2002, in Los Cabos, Mexico. In that time Mexico proposed the incorporation of the micro enterprises and micro banking sub group in APEC.

At the present time, Thailand is leader in Micro Enterprises Sub-Group which favors the link between government and APEC about the strengthening of initiatives taken for the support of SMEs in Thailand.

The principal theme of Thailand APEC 2003 “a world of differences: partnership for the future” is centered in the knowledge-based economy for all, promotion of human security, financial architecture for a world of differences, new growth enterprises, so SMEs and micro businesses , and Act on Development Pledge.

“Thailand’s fourth sub-theme is ‘new growth enterprises: SMEs and micro businesses’. Issues of concern include ‘growth? (but also ‘distribution’) and ‘entrepreneurship’ (but also ‘employment’). This seems clear enough; Thailand will maintain the emphasis on ‘shared prosperity’ established by the Shanghai Declaration of 2001, and on micro enterprise development (MED) as a means to sharing, established at Los Cabos”[12]

In 2002, in Mexico, started the discussion about the benefits of micro banking to micro enterprises for the alleviation the poorest in all APEC members. The Philippines, Taiwan, China and Indonesia are some of the economies with big experience in this field. Mexico also has some experience but unfortunately not so successful, the country is interested in exploring more about this opportunity.

In fact APEC “Accepts micro banking and/or microfinance as broadly supportive of APEC goals and objectives and to accept that significant differences exist between micro enterprises and SMEs sufficient to justify separate consideration of the needs of Micro Enterprises Development… for economic and technical cooperation.

APEC gave some recognition to micro banking for the reduction of financial exclusion in all economies and to agree on and extension of the Economic Committee’s micro banking study to consider specialized financial institutions during 2003.

Established mechanisms for further study of MED issues notably by endorsing the creation of a permanent subgroup of micro enterprises in 2003, reporting to the SME working group, and encourage cross-sectoral communication and cooperation in support of these goals”.[13]

This information allows us to know that Thailand focus on the new knowledge society and that filters this interest in dual manner. On the one side, it emphasizes the 8th and 9th Development Plans; on the other hand, it promotes the discussion in the core of the APEC. Furthermore, it favors the discussion about the SMEs unemployment This strategy impacts in the urban and rural areas.

For Mexico is relevant the incorporation of the systematic study of MED because the necessity of the country to encourage the domestic market with the APEC support. In fact in the country more than 90% of the economic activities is focused in Micro and SMEs.

So, it is possible to observe the both countries interest about favoring the SMEs as strategy of poverty alleviation and unemployment. The existence of a master plan in this issue, research innovation (especially in Thailand), the education and training such as the generation of the permanent studies of micro, small and medium enterprises are aspects that confirm this interest.

However, it is necessary to study the impacts of this interest, which has been expressed in government policies, for the generation and development of the SMEs, as detonator of employment and poverty lightening.

Conclusion

Most of the APEC economies confront development problems, just few of them are considered as developed economies. Small and Medium Enterprises are an option to the employment generation, however, they need commercialization channels of their products. People interested in new SMEs will be confronted to different problems, since their foundation, product processes and technologic improvement, until the products commercialization. The problem is bigger in sub development societies.

Competitiveness has a foundation at the micro-level, whether or not it is measured and benchmarked at the industry, sectoral or national level (Porter, Sachs and Mcarthur 2001: 21; and Meyer-Stamer 1995: 143-146). Regrettably, however, there is currently little, if any at all, data and information needed to monitor and compare the evolving capabilities and potential of the top layers of SMEs in priority sectors and industries over time. Such an exercise is indispensable for a more accurate identification of core competencies of the SMEs under consideration as well as of their shared areas of weakness for follow-up capacity building. Indeed, learning what a country and its enterprises are, or can be, good at producing is a key challenge of economic development (Rodrick 2002: 7a). But the same exercise is also essential for better SME performance management and policy impact assessment. In particular, useful benchmarks can be obtained as regards the on-going changes (whether progressive or regressive) in the capabilities and competitiveness of direct SME exporters and first-rank SME suppliers to large domestic enterprises or cross-border production networks. These benchmarks constitute a solid input for the consideration of policy framers as well as for emulation by those SMEs presently in the lower ranks or tiers of suppliers. It is very important the training and formation of people to confront the reality that implicate the SMEs establishment or strengthening. The specific abilities development and the capacity to confront the bureaucratic instances and financial take part in the human capital required to the small and medium enterprises competitively.

Thai government is looking for its knowledge-based strengthening economy trough several government initiatives. The SMEs constitution, its legislative actualization, and taxes exemption; innovation systems, training and people formation in different educational levels, but principally secondary school, represent support initiatives.

Other actions are focused on the linkage between university and industry supported by research and development, which is strengthening by Universities Autonomy process promoted by the government. However, this process is going on slowly, such as its link with the industry that directly affects the SMEs development.

Thailand ranks low in global rankings of technological and skills capability, but also the instruments used to deliver the services (e.g. taxes and subsidies) are ineffective, so the country needs to improve targeting, coordination between agencies; improve governance increase awareness and; integrate technological and skills development.

So the public policy and institutional framework for innovation must change[14]. Developing of knowledge required and the financial resources to acquire that knowledge are necessaries. So it required more State involvement for better information, human resource development and financial incentives for R&D and innovation.

The situation for Mexico is similar in the sense of the domestic market strengthening and more state involvement into the economy. The interest of the government to support SMEs is very clear in the last times because they generate a very important share of the national production in the export-import and taxes framework.

Unfortunately the support to Micro and SMEs in Human Resources Development is not enough especially in innovation systems and Research and Development for micro, small and medium enterprises. It seems is necessary for the country to find more connection points between the factors of the knowledge - based economy.

Consumer Change in Japan: A Longitudinal Study

David McHardy Reid
Rochester Institute of Technology, U.S.A.

Abstract

The research question pursued in this paper is how the process of market developments will impact on foreign affiliated companies in Japan. It is based on a study and observations of the pre and post-bubble changes in the Japanese market at key epochs: 1990, 1992, 1995, 1998, 2000 and 2003. Using an approach influenced by Grounded Theory, the research involved 75 personal interviews and meetings with executives of 67 successful foreign firms operating in Japan, as well as several other agencies in 2003. A framework distilled from an earlier article on the subject (Reid 1995) is used to compare and contrast the situations at key stages over the last decade.

A Moribund Japan

Many foreign observers seem to have lost interest in Japan largely because of its inability to inspire growth. Its poor economic performance since the bubble burst in 1992 and the efforts of several prime ministers to revive it have apparently met with little impact. Nevertheless, the world cannot afford to write it off. Japan still has the second-biggest economy, and with current worries over sluggish growth in the United States and recession in Germany, it becomes more urgent than ever that Japan exerts its potential in motivating the world economy. Moreover, The Economist (2003) points out that Japan's experience now looks disturbingly relevant to Europe and America, given the risk that deflation may spread.

Where once, its economic performance invited well-deserved admiration; now, Japan attracts ridicule as it has repeatedly failed to escape from economic slump and eliminate so-called non performing loans (NPLs) as well as falling short in its ability to reform its shaky politics and corrupt bureaucracy. Yet, to outsiders, the depth of the problem is not so immediately apparent. The continuation of the recession, Takahashi (1997) avers, along with a volatile yen and changes in world markets, are bringing about less visible changes, as in the structure of management and employers' diminishing obligations to employees. Lay-offs are ongoing, the result of which is unemployment reaching an all time high by the beginning of 2003 (Sanchanta 2003). While In the centers of major cities many people still appear affluent, townships of homeless people have begun to appear. And the screw continues to tighten: wage and salaries declined by over 5 percent during 1998-2003 as the number of employees declined by 2 million (Interview data). The Economist 2003a reveals that some are trying to draw links between these economic hardships and Japan's rising crime rates. (The most recent white paper showed that violent offences, including robbery and rape, more than doubled between 1997 and 2001.) If any link exists between crime and unemployment, the crucial aim will be to increase the number of jobs available to the young, who make up a disproportionate share of both criminals and the unemployed.

During the thirteen years over which this research has been conducted, the Japanese economy has, for a long interlude, been the envy of the world, and its financial markets the source of spectacular wealth. Other countries have scrambled for Japanese investment. And, much of it poured into North America to buy bonds, property and companies; also to build factories for Japanese manufacturers that were reinventing entire industries. Foreigners wanting to see how things were done homed in on Japan, where the firms were studied as models of efficiency and innovation, and their ideas of employee involvement, quality control and design were copied around the world (The Economist 1998b). Yet, the situation had changed so dramatically and Japan endured a resilient recession that on April 3 1998, Moody's, the leading international credit rating agency, challenged whether Japan deserved its top credit rating (The Economist 1998a). By October the new government decided to boost spending by issuing ¥30,000 shopping vouchers, valid for a limited time period, to each member of its population of 125 million. The government also introduced special holidays, Happy Mondays, to encourage people to go to the stores to spend the vouchers (Financial Times 1998). In the same month, the Japanese government's proposal to use 67 trillion yen of public money to purchase the banks' NPLs and reorganize the banking system was met with hope from around the world. This hope rapidly turned to despair in the face of subsequent inaction.

Critical commentary usually takes place at the macro level and is, almost by definition, highly abstract. What is missed, in the abstract, is that elimination of non performing loans may lubricate the banking system but at the cost of smaller companies that are depending on credit lines. This is a salient issue because, as Thornton (1998) explains, almost half of Japan's industrial output stems from small and mid-size manufacturers—some 800,000 small operations where much of the work is often done by hand in small workshops that line suburban back streets. In Thornton's Business Week article it is stressed that into the millennium many of these small suppliers were expected to be battling for survival: struggling for bank credit, trying to cope with stagnant domestic demand, and crumbling under pressure from big corporate customers to cut their prices.

The contrast with the glory days of the 1980s is indeed stark. Senior Japanese executive now joke self-deprecatingly with this author about their moribund economy. And nowadays few foreigners travel to Japan in search of answers. More likely they come from western capitals and other capitals to prod the Japanese government into reviving its failing economy. Foreigners cannot understand why paralysis is so widespread, and so entrenched.

Some, however, including Morgan Stanley's London-based currency team, believe there are three reasons to think that Japan has turned the corner. Its central bank is finally taking a more expansionary stance under Toshihiko Fukui, its new governor; while domestic investors are rediscovering an appetite for risk amid economic recovery; and, according to the Financial Times, Junichiro Koizumi, the 'reformist' prime minister, is reinforcing his political position (Financial Times 2003). Indeed, he succeeded in fighting off a leadership challenge in September 2003. None of these arguments, however, are persuasive. It is true that Mr. Fukui is less hawkish than his predecessor, but remains wary of truly radical action. Though, Japanese investors have started buying Japanese equities, this speculative interest could evaporate. Moreover, reformist Koizumi remains in power precisely because he has abandoned most of his initial structural reform promises.

The Bank of Japan's Tankan survey of business confidence is a respected metric. As reported in The Economist (Respite without reform 2003), the companies polled in the latest Tankan survey are still suffering. Among large manufacturers, the pessimists outnumbered the optimists by 38 percentage points in the quarter just ended (Figure 1). But, for the first time since September 2000, that metric has stopped worsening.

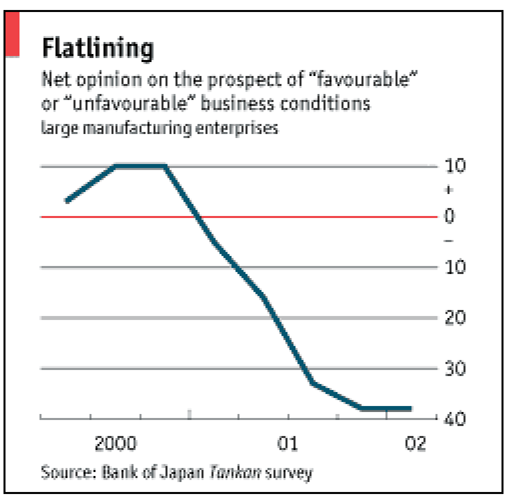

FIGURE 1: TANKAN SURVEY

Senior executives interviewed in 1995, in the course of this research, revealed that Japanese banks were adopting an aggressive approach and offering multi-million dollar loans on the strength of their published balance sheets. By 1998, however, it was a different story. The Economist (1998c) informs that strapped for capital, and carrying bad debts equivalent to, perhaps, 30 per cent of the country's Gross Domestic Product (GDP), Japan's beleaguered banks were reluctant to lend to any company with the slightest hint of risk. Unfortunately, the effects of this are felt mainly by smallish domestically oriented concerns. With exports slowing and domestic spending stagnant at best, this became a matter of disquiet. However, Japanese banks continued to have access to cheap funds but unfortunately, they continued to lend inappropriately. So, even though the equivalent of 20 percent of Japanese GDP in non-performing-loans (NPLs) were written off by early 2003, by mid year we learn that ten percent of Japanese GDP still remains in NPLs (Interview materials 2003). Japanese policy makers are at pains to point out that writing off these NPLs means prejudicing businesses and jobs. This would further exacerbate the general state of unhappiness: in the twelve months preceding June 2003, Japan, for the first time, witnessed more suicides than road traffic deaths.

Japanese Competitive Environment

While the Japanese market is traditionally considered to be obstructive and difficult to penetrate, experts on Japan have shown this view to be misleading. For example, Goodnow and Kosenko (1993) identified six strategies that have been particularly successful for North American companies. According to Yoshihara (1991), thriving foreign affiliated companies (FACs) exhibit several success factors: a management philosophy that holds true at the international level; high technological capabilities; and acceptance of the Japanese subsidiary as a strategic base. Other studies have pointed to US-based and European multinational corporations (MNEs) that possess these qualities (Gleckman 1996; Guild, Shill, and Yamaguchi 1996; Sweetman 1996).

Allen (1994) maintains that if a company can understand the Japanese market and play by the rules, then it will succeed in Japan. Reid (1995) presents evidence to show not only that foreign companies can succeed, but that they have developed leadership positions in the Japanese consumer products market. Hirsh (1991), on the other hand, claims that it is only companies competing in the non-strategic [for Japan] sectors that have been allowed to succeed.

A select number of foreign players have become established leaders in the Japanese market. Coca-Cola, for example, generates 30 per cent of its profits from Japan. IBM employs 20,000 people in what is the world's second largest information technology (IT) market. Ubiquitous MNEs such as Procter and Gamble and Unilever each command around 13 per cent of the highly competitive hair care market (Interview materials), and this achieved at the expense of formidable Japanese competitors such as Kao and Kanebo.

Prior to the bursting of the Japanese bubble, the prerequisites for success in the Japanese market were beginning to become clear. FACs thought they could interpret the big spending consumers. But, all that changed. As Johansson and Hirano (1996) illustrated, in post-bubble Japan the business environment changed and the rules for doing business altered radically. Notwithstanding, Johansson and Hirano (1996) contend that corrections of this ilk have a positive side, and argue that the changing situation in the Japanese market has opened up new opportunities for Western companies. In response this paper sets out to further examine the ongoing changes in the business environment arising from over a decade of economic stagnation, and identify the nature of new opportunities for FACs.

Method

The fieldwork carried out in Japan involved 75 personal interviews with executives of 52 successful FACs as well as a series of other informed individuals. These firms, primarily consumer-products oriented, and mainly recognized household brand names, are listed in Table 1. The research, focused on a representative sample of FACs, each of which had successfully developed a position in the Japanese consumer products market.

An approach influenced by Grounded Theory (GT) was adopted. GT is inductively derived from the study it represents; that is it is discovered, developed and provisionally verified through systematic data collection and analysis pertaining to the phenomenon. Thus, data collection, analysis and theory stand in reciprocal relationship with each other. One does not begin with a theory, then prove it; rather one begins with an area of study and allows what is relevant to that area to emerge (Strauss and Corbin 1990:24). As yet, the GT approach is underutilized though becoming increasingly popular in the management literature. For example, a search during September 2003 of ABI databases over the last decade unearthed 115 articles, whereas an earlier search conducted in 1999 unearthed only 34.

The initial sample for the present study was generated by using snowball sampling. This involves gathering a sample through chain referral (Burt and Ronchi 1994; Waldorf and Biernacki 1981). Using first the principle of open sampling to uncover as many potentially relevant categories as possible (Strauss and Corbin 1990: 181), the process of selection began with a list of foreign consumer goods companies that had successfully established a presence in Japan. The list was developed with the help of major consulting firms like McKinsey and the Boston Consulting Group; also major advertising agencies with offices in Tokyo, such as BBDO and McCann Erickson, were asked to name the most successful foreign players. At the outset major multinational enterprises with long-established positions in Japan, for example Unilever and Johnson & Johnson (J&J) were invited and their acceptance was leveraged to encourage others to participate. The companies identified (N=66) were then contacted by telephone, invited to participate in the study and, as mentioned above, the executives of 52 companies agreed. These were supplemented by meetings with 17 more in 2003.

Consideration was given to the assessment of the experience of companies that had failed or made dramatic mistakes. For obvious reasons, outright failures cease to exist and are difficult to track, although a record was made of some names of executives who had left Japan and might have had experience to share. However, none of the companies interviewed represented pure successes; most of them had experienced their share of errors over the years, and some of their learning is reflected here.

The individual interviews, on average lasting around two hours, were conducted across a range of executive groups: CEOs (45), vice-presidents (15) and other senior representatives (15). At the end of each interview, respondents were asked to suggest other FACs that, to their knowledge, were achieving success in Japan. As the interviewing program proceeded, it became clear from the extent of duplication of the suggestions received, which of the FACs were viewed as the major success stories.

The data was collected in three phases: initially, during the latter part of 1990, with follow-up by telephone and fax continuing through 1991-1992; then, to examine post-bubble issues, a second phase of 24 interviews was conducted in 1995. These second-phase interviewees were selected according to the principles of theoretical sampling, "sampling on the basis of concepts that have relevance to the evolving theory" (Strauss and Corbin 1990:176). To keep the research up-to-date, a telephone follow-up was made in 1996. During this second (1995–1996) phase, some of the original companies (1990 fieldwork) were re-interviewed, and some technologically intensive companies such as Compaq and Microsoft were added. In some instances, the same individuals were still occupying the same positions, whereas in others, their replacements were interviewed.

A follow up visit was made in 2000 and in 2003 an additional phase was added. The emerging constructs were found to be stable from throughout this time period. These were supplemented by sessions with a variety of other informed sources, accessed recently by way of the author participating in a study tour in 2003 hosted by AACSB and the respected think tank Keizai-Koho Center, to learn directly of the 'Japanese economy: its challenge for revival'. The itinerary took us to Tokyo, Naro, Hamamatsu, Nagoya and Kyoto. We received inputs from the Bank of Japan, Nomura, the Commissioner for Cultural Affairs, Politicians, Hakuhodo Institute of Life and Living (a consumer research house) and others. We also made visits to Ito Yokado (retail conglomerate) owner of the highly successful Seven-Eleven chain of convenience stores, Hamamatsu Photonics (high-tech venture business), Toyota Motor Corporation and Sharp Corporation to study its direction in LCD development. We also visited the Hitotsubashi University Graduate School of Commerce and Management. The program started and ended in Tokyo. It culminated with a symposium, attended by high-level members of the business community, at which an exchange of views was made on Japan's future economic development.

The fieldwork followed a list of topics and themes designed to explore the macroeconomic and business-environmental issues, market and competitive trends and their strategic responses to these stimuli, but were not confined to them so that "grounded theory wisdom" (Bailey 1987; Glaser and Strauss 1967) could surface. That is to say that the study was not limited by a priori hypotheses; rather the data were allowed to emerge according to the perceived importance by the interviewees.

The list of topics was committed to memory and each individual was asked the same questions in an identical fashion. However, the sequence was allowed to vary in order to facilitate what was constructed to be a conversational interaction. The interviewees were probed on the difficulties involved in marketing in Japan, thus enabling identification of specific differences in contrast to other markets. While respondents were allowed to range broadly, coverage of key topics was ensured. All interviews and meetings were recorded; in some cases company documents were provided for subsequent analysis. Some interviewees were agreeable to being quoted, others not. Those who refused to be quoted were given neutral attributions in the analysis of data.

The contents of the interviews were reviewed several times and were transcribed. In this way, not only was the author's memory refreshed but also an in-depth contextual understanding of the issues was achieved. The data was then analyzed qualitatively with NVivo (Richards 1999), a software product designed for this purpose. After reviewing the data, a framework was generated that was cross-referenced to the context of the interview

1990-1996-2003 Pre and Post Bubble: An Evolving Shift

Key themes that emerged from the data on the Japanese business environment, specifically on the collapse of prices and distribution, are now presented. These are supplemented by a framework, distilled from two earlier articles in the Journal of International Marketing (Reid 1995; Reid 1999), which is used to compare and contrast the pre- and post-bubble situations and the process of ongoing change. A number of quotations from senior executives, based on the 1995–1996 and 2003 fieldwork are offered in support. The framework, with an italicized summary of the key elements from the Reid (1995) article, is based on the following topics:

?? The Japanese business environment
?? Radical consumers
?? Heritage
?? Hedonism
?? Consumer interest criteria
?? Product churning behavior
?? Radical opportunities
?? Ferocious competitive standards
?? Need to sharpen marketing skills.

Given that the GT approach yields different amounts of insight, depending upon what emerges; the sections on the pre- and post-bubble situations are of varying length. Specifically, changes in the Japanese business environment are dealt with in more detail because of their underlying significance for changes in other areas. An analysis of consumer interest criteria is seen as generic to a discussion of market changes, and this topic is also tackled in greater depth than the other topics in the framework.

The Japanese Business Environment

Foreign companies in Japan have learned that the primary obstacles to success are not invisible trade barriers but rather the high costs of operating in Japan and the extreme competitiveness of the market (Reid 1995). Essentially the Post-Bubble environment is riddled with pessimism. Senior Japanese executives now make self-deprecatory remarks about the state of their country and their inability as Japanese to wrest themselves from their moribund state. Japanese seemed fatalistic and often not exhibiting the spirit that made Japan great and to become an example which many of us wished to study. Hence they are being exhorted, by billboard advertising, to be proud to be Japanese and feel pride to be part of a culture that, in 2002, delivered two Nobel prizewinners from different fields, together with a coterie of other world-class Japanese luminaries.

Government lacks, according to our 2003 briefings, the courage to initiate change. Japan's aging demographics demand that the social security system be overhauled. Yet, to court popularity, Prime Minister Koizumi has pledged not to change the consumption tax rate which limits fiscal flexibility significantly and the ability to engineer radical change. He is, we are told, not brave enough to be the radical reformer he claims to be: merely enjoying his interval of fame. But, little evidence emerged that the political machine has moved into gear to deal with the crisis in a manner appropriate to its magnitude and valence, or in the experience of this author even to give frank answers to sensitive questions.

This is unfortunate as the malaise infects the mood of the people and influences purchasing behavior. For example, the collapse of the property and stock markets has resulted in a sharp reduction of paper wealth. Corporate entertaining budgets have been cut, as a consequence Japanese men compensated for the loss of their drinking money by commanding larger allowances from the housekeeping budgets, which reinforces an endemic trend toward parsimony in buying behavior.

In the 1995-96 interviews, CEOs of FACs cited the new price consciousness among consumers, and the consequent price destruction in all business sectors, as the most significant changes arising from the bursting of the bubble. These changes have emerged as a result of both company and consumer responses to the new climate. Personal Care companies such as Bristol Myers, L'Oreal, Nippon Lever and Procter and Gamble typify the foreign companies that have experienced a collapse of prices their products command at retail levels. The impact of price-cutting on L'Oreal, for example, is typical of that experienced by companies that had developed a market position predicated on premium pricing. Supermarkets contained a series of products among which there would be sub-groups of more expensive products. Foreign manufacturers used to be able to achieve impact with their shelving positions while establishing price points higher than local suppliers maintained.

Senior executives of L'Oreal saw significant declines in the prices of L'Oreal products in a number of sectors during 1994–1996. For L'Oreal the post-bubble market delivered a shift to lower prices, larger packaging formats and smaller margins, coupled with a pressure to increase media advertising. The bursting of the price bubble saw accelerated retailer discounting leaving those companies with high-margin brands, such as L'Oreal, especially vulnerable as their brands became discounted increasingly. It is in this context of price collapse that L'Oreal, and others like it, must learn to survive in the market. From a consumer's perspective, the coupling of falling prices with the fear of lay-offs is causing them to postpone purchasing endlessly. The ramifications of this deflationary behavior are far-reaching, with some radical changes occurring in the wholesaler and retail sectors.

Environmental pressure groups abound. They make their views known and educate passing pedestrians about the issues of the day. In some important ways Japan is exercising a leadership role, for example, the introduction of anti-smoking initiatives in outdoor areas of the Tokyo Central Business District. Nowhere else in the world has this been attempted, it is akin to setting up a chain of girlie bars in Mecca. The streets and sidewalks are cleaner than ever and largely free of cigarette butts. It is impressive and appropriate that Japan should set this example. In Japan, where smoking is so endemic this action has import beyond the environment. This is as a very positive indication that Japan may be capable of grappling with and bringing about necessary change.

However, the economy and banking system is hobbled by non performing loans (NPLs). They are concentrated in certain sectors: construction, automobiles, for example. Banks can afford to maintain NPLs because interest costs are zero and continuing payments by borrowers constitute incremental income. Indeed, Japanese banks attracted the ire of many of the experts interviewed. Seemingly, many loans, made by banks, were advanced without sound business predicates. And Japanese banks have been pursuing their business by staking their loan capital in unsound investments against land as collateral. They often did not extend due diligence as the conventional wisdom held that land values on these over populated islands would always increase. Many of these NPLs are therefore pledged against declining land assets. Traditionally, vast amounts amount of land would be held by the wealthy as assets, but in response to the turn-down in values these assets are now pouring onto the market. Because of decreasing land values, the pattern, now endemic deters borrowing and fuels deflation. There are large amounts of un-rented office space in Tokyo which further exacerbates and reinforces the deflationary trend.

It was possible to glean that a major restructuring of the 'Japanese model' is underway. For instance, the attraction of foreign direct investment (FDI) is on the national agenda. Areas such as Hamamatsu, with long-standing reputations as innovative regions, having given birth to the likes of Honda and Yamaha, are actively promoting their areas. Another initiative involves the National University where, currently, members of faculty are classified as government servants, so there is no incentive to make extra contributions beyond the minimum and much sloth prevails. As from next year, however, universities in the national system will be given freer rein and faculty will no longer be government officers. Institutions will be subject to both inspections and evaluation of teaching and research in a manner similar to the British model.

Distribution:

Unlike the system in the West, where manufacturers tend to supply large retailers direct, deliveries in Japan are made to retailers via wholesalers. Aggressive wholesalers continue to acquire less resilient concerns to expand their coverage while, at the same time, increasing their concentration. Among the interviewees, some major consumer products manufacturers, working with distribution systems containing over 1,000 wholesalers, are attempting to reduce the numbers of tiers in their channels, as well as the absolute number of wholesalers through which they work. At the retail level changes are ongoing.

Daiei, until 1998 was Japan’s largest supermarket group has been replaced in the top slots of Income and after tax profits by Ito Yokado. Daiei is now accused by its competitors, Ito Yokado primarily, an interviewee, of losing focus by attempting to continue to apply a 1950s American model of supermarketing. Japan has strained the ability of many of the world’s major retail operations. Carrefour, for instance, the French owned hypermarket operation is struggling to replicate its China-like success in Japan. The British retailer, Marks and Spencer (M&S), has shown interest from time to time but according to Ito Yokado it discouraged M&S from pursuing this interest. Boots Ltd, the British pharmacy and personal care chain attempted to develop a position and even opened a store in Ginza. That venture was quietly disbanded. Wal-Mart has acquired over 60 percent of Seiyu and is using this as a bridgehead into the market. So far, according to interviewees, none of the major Japanese retail players are perturbed about this.

Discounting:

Discount operations that sell both private brands and parallel imports were, by the year 2000, interviewees from McKinsey estimate, to increase their share of the household products markets by 37 per cent to 60 per cent. Mom and Pop stores, once considered an extension of the social security system, are being replaced by convenience stores. Chains of outlets such as Lawson and Seven-Eleven proliferate, and gaining distribution in these outlets is essential for the success of consumer products.

A result of this movement has been to wrest many categories from department stores, in some cases entirely. It is hard to find any example of cameras and photographic equipment in department stores: this category is now dominated by discount chains. Men’s suits are another category which has found discounted distribution. Tokyo Suits, for example, offers a wide variety of style and size, sourced mainly from Italy at price points around the ¥20,000 mark. Indeed, mastery of a China-based supply chain is showing to be one of the planks in the strategy of Japanese companies, and this is highly apparent in the apparel business. Providers of men’s’ suits have learned to work with Chinese apparel producers to ensure that they can produce at the high levels of quality to satisfy Japanese purchasers.

Return on Investment:

Many retailers, interviewees maintain, are now focused on Return on Investment rather than being preoccupied, as in recent but earlier times, with market share by volume. So, they no longer disregard the cost of maintaining high inventories comprised of a multiplicity of brands: retailers now appraise commercial opportunities through a different lens, one that focuses on return per square foot. Inventory turnover is now a major issue, whereas once it was not. POS terminals and Electronic Data Interchange (EDI) are being speedily introduced. Many Japanese retailers these days are aware of what has been sold in the last hour or two. Major retailers are linking into manufacturers’ computer systems and are able to trigger automatic stock replenishment. One of the companies studied in 2003, Ito Yokado, the retailing group that owns, among others Seven-Eleven, is regarded as the most advanced in Japan with respect to the application of EDI to retailing. Ito Yokado claims that its subsidiary Seven-Eleven is ahead of the holding company in terms of EDI and is second only to Wal-Mart, which in turn was inspired by Ito Yokado.

Cheaper and Faster:

Given the consumers' new value-driven propensity, there is a reduction in shopping purely as a mode of entertainment, many consumers forego service providing they save money; hence the growth of large low-service outlets such as Toys 'R'Us. Japanese consumers, like consumers elsewhere, want things faster. This has implications for many companies and their brand strategies. For example, Levi-Strauss Japan used to typically offer its product in one leg length and expect the consumer to wait 30 minutes or so while the alteration was made in the shop. Levi's President now recognizes that its customers have more immediate expectations in that they expect to choose the right leg length and be able to complete the purchase in less than five minutes: So to speed up the difference between thirty minutes and five minutes…to some people probably still isn't much. But to you and me and to a lot of our consumers it's twenty-five minutes too long. Then look at what that does to retail space; they [retailers] are not set up for carrying two or three leg lengths because they are carrying too many brands. So, the decision that many retailers are wrestling with now is 'Do I keep several brands of jeans or do I figure which ones are providing the best return in terms of sales per square foot, dump the rest and maximize the sales of those few.

Vertical Restructuring:

Since retailers are attempting to improve ROI as well as stock-turn, yet maintain an increasing number of sizes and variations, this is inevitably leading to the exclusion of less popular brands and an increasing focus on so called 'power brands'. This, in turn, may provide additional thrust for the vertical integration of retail chains: both foreign and local. This we are seeing with respect to the coming together of Wal-Mart and Seiyu. Other Japanese retailing chains are beginning to forge closer ties.

International Sourcing:

Downward spiraling prices are impacting severely in the arena of distribution. In particular, it has encouraged international sourcing. What happens when all retailers can buy at the lowest available landed price? International sourcing by supermarket chains posed a competitive threat to those Japanese manufacturers dependent upon high-cost structures. Conversely, it presents opportunities for those that have international linkages. And these companies have worked with Chinese suppliers to overcome Japanese reservations on quality to such an extent that 34 percent of product in major Japanese supermarkets is now sourced from China. Indigenous suppliers, focused on the Japanese market, have been more threatened by these developments than FACs, which, by definition, have international connections.

Radical Consumers

Japanese consumers sample and adopt new, and sometimes eccentric, products more readily than Western counterparts (Reid 1995). Japanese society imposes very specific role definitions on male and females. Traditionally the male household head would leave for work early in the morning, commute to work, then spend time after work drinking and eating with his colleagues. However, interviewees assert that this has started to change. Corporate entertaining has been cut back drastically causing many men to return home to their families early in the evenings. Since 1990 one of the most acute changes in lifestyle is that families are spending more time together. However, this does not imply increase of closeness. They rarely find the time to sit down as a family and even when they do, they generalize from their eating out experience and seek individualized meal experiences: mother may eat something left over from a previous meal, the son pizza, father sushi, etc. Each family member may have his or her own favorite shampoo, and other toiletry products, and everyone has his or her own favorite items in their kitchen and in their refrigerator'. So a father might like this brand of beer; son might like something else; the wife may prefer a different brand still. We witness ad hoc cooking, ad hoc and individual shopping, individual cooking, even individual menus when they sit together.

This shift does not nurture radical consumption behavior. Indeed, the reverse is true (See Hedonism below). What has happened is that there has been some re-balancing between work and leisure. There is evidence of a new sense of chore sharing between males and females and a pronounced move from groupism to individuality. The higher incidence of females remaining in the workforce after marriage has liberated males as consumers. With working wives they can and do consume more and differently.

Heritage

Because of cramped living conditions in Japanese cities coupled with a heritage of concern for aesthetics, the Japanese consumer is a key target for luxury designer items (Reid 1995).
Japan has for a long time been a key market for foreign luxury brand producers. Interviewees maintain that is because Japanese use them as compensation for living in cramped and otherwise parsimonious conditions.

Given the consumers' newfound concern for value for money, one would expect that the post-bubble climate might mediate against designer products. However, this is not solely the case. Major labels such as Chanel continue to maintain strong distribution presences. In parallel with the proliferation of designer labels is the 100 yen ($1) store phenomenon. The Ferragamo consumer is, some of the time, the same consumer who shops in the 100 yen store. All night auctions are also very popular: equivalent to a car boot sale, consumers transport items they earlier paid a fortune for and auction them for cash so they can buy more fashionable items. To some extent, however, after a decade of economic melancholy, Japanese consumers' love affair with European luxury goods appears to be losing some of its spark. To rekindle enthusiasm, Sager (2003) maintains luxury retailers such as Ferragamo, Louis Vuitton, Coach and Prada are all opening big stores. Prada invested $85 million in its so-called mega store in Tokyo and which opened on June 7, 2003.

Unfortunately, these new shopping magnets are opening just as Japan's luxury goods market appears to be ebbing ? with sales expected to drop 4% during 2003. Apparently retailers calculate the new stores will help them get a bigger slice of a shrinking pie. It worked for Louis Vuitton: its sales jumped 15% during 2002, to $1.16 billion despite the economic downturn. Other international luxury brands are investing in further growth: Christian Dior, Lanvin and Mont Blanc have recently opened boutiques in Ginza. Seemingly the office ladies who once made shopping trips to Hong Kong are now forgoing these breaks and staying at home but buying their designer bags in Japan (The Economist 1999). Some designer labels have even begun to appear in discount outlets. It seems that during the high-yen era some of the discount chains, taking advantage of employees' tax free allowances, have sent their employees on buying sprees to European fashion houses such as Chanel, Louis Vuitton, and the like, in order to retail the designer wares through their outlets.

An interesting trend that combines parsimony with heritage is a trend exhibited by young females to return to wearing the kimono. These can be bought at huge discounts (up to 90 percent) of the new price. This has spurred several major businesses dealing in antique kimonos as well as the creation of service businesses that train wearers in the ritual obligations of kimono wearing.

Hedonism

Japanese consumers exhibit a great propensity for foreign travel and out-of-home experiences such as eating and drinking (Reid 1995). The average Japanese housewife, as Tajima (1989) put it, has had two wallets to pick from, her own and her husband's. She controls them both. On receiving her husband's net salary, she allocates "pocket money" to meet an agreed set of expenditures. So-called salarymen husbands previously were able to supplement their allowances by claiming for drinks, dinners, even taxis home, as a consequence of the "onerous" entertainment practices in which they engaged. According to research conducted by Coca-Cola Japan Co. Ltd., the increased tendency of males to dine at home has imposed an additional burden on the housekeeping budget. At the same time, husbands' need for more "pocket money" to offset the loss of expense account living, has, in turn, further increased housekeeping expenses. As the Vice President Coca Cola Japan put it: Cutbacks in corporate entertainment are driving different behavior inside the home. There was a trend to more eating out and more fast food restaurants but that is changing again. Now more people are eating at home.

Clearly hedonism is being diminished somewhat. Japanese consumers are more inward looking towards their homes. This is the trend that is driving the popularity of DIY stores such as Tokyo Hands, which now abound in Tokyo. Another key change is an awakening of interest in healthy life styles. Organic foods are increasingly popular.

Adult education, always popular, is now becoming more license-oriented. Hitherto Japanese management has been populated by generalists. This model appeared to work well enough insofar as outsiders could tell. On the other hand there was little opportunity to obtain an MBA in Japan. Those making an investment in MBA education abroad were unable to secure worthwhile premiums in the kaisha and many bled away into Foreign Affiliated Companies. Today there is an increasing uptake of adult education. Although adult education has typically been geared to pursuing and developing new interests, the focus is now more license-oriented. Furthermore more Japan-based MBA programs exist. The International University of Japan and Hitotsubashi University, for example, offer programs, some taught in English, including executive programs taught, in the evenings, in the Central Business districts. Hitotsubashi Graduate School of Corporate Strategy now occupies 4-9F of the National Center of Sciences Gakujutsu Sogo Center. Hitotsubashi has also recently made significant investment in world-class teaching facilities on its campus and is attempting to recruit foreign visiting scholars.

Consumer Interest Criteria

A preoccupation with travel and an obsession with quality translate into preference for foreign designer brands and opportunities for premium pricing (Reid 1995). Japanese consumers have, since the economy initially flourished been considered rich in comparison to their Western counterparts. However, these purported rich consumers, if living in the cities, normally experience very restricted living space and, interviewees maintain, enjoy a doubtful quality of life. There was general agreement among those senior executives interviewed that, to offset these disadvantages, Japanese consumers maintain an obsessive interest in newness by indulging themselves with the consumption of new products, especially designer brands.

The consumers' new concern is for value. They now regard quality as an unspoken entitlement and are unequivocal about the need for product performance that satisfies their new price/value equation. This has resulted in closer examination of functional claims and less reliance on buying brands merely for the sake of the brand name. The increasing popularity of private brands is partial testament to this. Many retailers are working closely with both foreign and local manufacturers to develop private brands that can be sold at lower prices but which retain consumer standing. As the CEO of Levi Strauss explained: People are looking at things in terms of utility and value more often. 'What do I need this for, what will it do for me, is it easy to look after, and is it flexible? They are looking less slavishly at designer brand names…The price/value equation is much more realistically applied.

Similarly, another interviewee, James Abegglen, Chairman of Gemini Consulting and author of Kaisha: The Japanese Corporation, had this to say: It has changed from where Japanese will pay any price for quality. Now price/value is the most important thing.

Senior executives interviewed for this study disclosed that not only have many people forgone salary increases, usually awarded twice each year, but their bonuses, an important remuneration component, have been cut back. Research houses that track consumer concerns, ASI Market Research (Japan) for example, observe that consumers' concern for quality has remained static whereas the ranking of value for money has increased. Another research house interviewed, Infoplan, performs an annual survey of social values, attitude shifts and consequent behavioral change. According to Infoplan's CEO: Japanese consumers increasingly want to make smart decisions and aren't going to pay premiums merely because they want the badge of success. But they don't necessarily want cheap, cheap. On the contrary by 2003, Hakuhodo informs, the concern with freshness and purity has become so robust that farmers are able to charge significant premiums for organically grown rice on the platform that it is safe and tastes better. This organic movement now transcends into the ready to eat meals market. Sandwiches, are labeled as containing organic lettuce and such.

Product Churning

Japanese companies churn out new products irrespective, seemingly, of market and financial rationale (Reid 1995). Interviewees in 1990 maintained that Japanese companies, obsessed by market share, tended to be highly committed to winning business wars. A common practice, detailed elsewhere by Jones and Ohbora (1990) was 'product churning', seemingly irrespective of the relationship between costs and gains.

It was also generally accepted among the 1990 interviewees that Japan's fast pace of change was a significant factor in the business environment. Many people argue that, in Japan, everything happens faster than in any other country. A one-day market leader can rapidly—within months—almost cease to exist. It is a market where successes soon become history. For example, in the late 1980s and early 1990s, Nippon Lever shocked its Japanese competitors, Kao in particular, by seizing over 10 per cent of the shampoo market with its Timotei brand. Yet, within four years that brand had all but disappeared from the shelves.

There is a tendency routinely to follow competition and emulate what competitors do, irrespective of economic rationale. The Managing Director of Nippon Lever highlighted this trait: In this market you can be sure if you have got a bright idea, it is copied within a year, and within two years everybody has done it and, therefore, you very quickly lose your novelty. Unless you keep improving it, you could find quickly that you are at the end of the road. So I would say those are the two main lessons out of the Timotei experience.

There is a slight reduction in product churning activity in the post-bubble era. Although, the interviewees maintain that, with a zero growth rate, the environment has become much less predictable. Consequently, the style of competition has changed. According to several of the executives interviewed, so-called one time growth industries are operating like mature industries. The Managing Director of Infoplan gave the following illustration: It may show maturity in a particular industry in that brands are becoming more important and there is more concentration on line extensions and product reformulation. I hypothesize that for economic considerations there are fewer new products launched. I also hypothesize there's less in reality because the market is more mature.

Radical Opportunities

Major foreign players have uncharacteristic Japanese product portfolios. Opportunities for radically different products abound (Reid 1995). Coca-Cola's product mix in Japan is quite unlike anything that exists elsewhere in the Coca-Cola international network. Its major seller in Japan is not cola; it is mainly focused on coffees and teas. These products are often dispensed in cans via vending machines, hot in winter and cold in summer. These vending machines proliferate even in relatively quiet suburban streets. Although not the first into the market, Coca Cola Japan was able to use its distribution clout to dominate the market for canned coffee. It has made a successful strategy out of being second. But in the post-bubble era, in an arena that still sees over one thousand new product introductions in any single year, it has, of necessity, become committed to a more aggressive stance in staking out its leadership position.

Functionality now plays a big part in the post-bubble consumers' evaluative process. According to Coca-Cola, its consumers are becoming smarter and are challenging imagery-based claims. Yet this drive for functionality can register in many ways. By way of illustration, Coca-Cola consumers that initially switched to cheaper imported colas eventually began to examine their construct of value and reverted to the major brand. Apparently, in this sector consumers weigh quality, dependability and reliability as well as price, and are inclined to balance these elements.

Ferocious Competitive Standards

A presence in Japan is necessary to maintain competitive advantage world-wide (Reid 1995). One of the keys to success for FACs has long been thought to become a Japanese insider. Several foreign companies, for example Kodak, when interviewed in 1990, claimed 'to become part of the Japanese scientific and technological community' was its primary objective for being in Japan. When re-interviewed in 1995, Kodak had 'let a number of people go', including newly hired graduates, and, as a result, had suffered a major credibility setback. Clearly, the implications of balancing return to shareholders with the costs of maintaining a competitive edge in Japan are difficult to weigh.

Japan, with its fast pace of business, should be a good training ground for company executives. Abegglen, the Chairman of Gemini described the changing trends: As a generalization through 1960-70, people sent to Japan were of no great distinction, for the most part. I don't think Japan was seen as a training ground in any sense. In the late 1970's as Japan moved up very sharply and rather suddenly on the agenda of international companies, there was quite an effort made to move potential top management into Japan as part of the training exercise.

The notion of establishing a Japan presence fails to win general appreciation because of the high operating costs. Several interviewees believe that the costs of doing business in post-bubble Japan are so great and the competitive environment so tough that they overpower the benefits that may be derived from using Japan as a training ground. Some made the point that the United States is also a highly competitive market and a much cheaper location for international executive postings. There is evidence that FACs in Japan are tending to hire younger single-status executives as a means of containing mushrooming costs. So, instead of adding to the expertise of senior executives the level of expertise among the gaijin contingent declined throughout the 1990s and into the new millenium.

Need to Sharpen Marketing Skills

The pace of movement in Japan provokes a sharpening of marketing skills (Reid 1995). Successful players in the Japanese market typically require the benefits of scale to contain costs. The absence of critical mass leaves companies vulnerable to their Japanese competitors, which are highly developed predators. For example, according to the President of Bristol Myers: In the consumer products' arena, a sales-force of less than 100 will suit only a niche player. Once they sense weakness, Japanese competitors prey mercilessly on the vulnerable party by investing in new products, boosting advertising and other combative marketing initiatives.

Many interviewees claimed that the major players in key business sectors are becoming stronger, generating greater cash flows while strengthening their research and development and product development efforts. Simultaneously, weaker players are being squeezed. Some key Japanese sectors are becoming more concentrated. For example, the top three Japanese manufacturers in the Personal Care sector, Shiseido, Kao and Kanebo now have a combined market share of 40 per cent of their domestic market, much more, according to Nippon Lever, than the top three international players would command on the world stage.

With respect to sharpening marketing skills, there are lessons to be learned from Japanese marketers, an issue brought into sharp relief by the President of Bristol Myers: My marketers here attend focus groups every night of the week. Every night of the week sitting watching the groups, that's how they get close to the consumer. When I was in the UK I would do it once or twice but usually I would await the report. To do that here you would be despised. Table 2 (below) provides a summary of the significant factors operating in the fiercely competitive business environment of post-bubble Japan.

TABLE 2 SUMMARY OF FACTORS, CHANGES AND IMPLICATIONS

Framework factor	**Post-Bubble Change**	**Implications**
Japanese business environment	Price destruction, distribution becoming more concentrated. Increasing expectations of fast retailer response. Seeming political complacency but evidence of change underway.	Power brands, vertical integration to encompass retail sector. Enhanced 'value added' will be a criterion for success.
Radical consumers	More balance between work and family. Some convergence to 'international values'. Individualized mass consumption.	More and different products consumed in the home. Single person packaging sizes of consumer products. Greater variety of product and brand choosing in family unit.
Heritage	Luxury designer products hold strong but consumers more price/value conscious. Luxury products sold through discount outlets. Rise in popularity of night auctions and 100 yen stores Some resurgence of traditionalism	Quality and image remain important but supplemented by functional and value claims. Expensive and inexpensive purchases made by same consumers. New array of service-based opportunities
Hedonism	Less hedonism, more interest in healthy living. Organic foods, adult education	More license orientation with respect to adult education
Consumer interest criteria	More value-for-money driven behavior. Parallel importing a major issue.	Justify positioning of brands and price levels. Value driven positionings. Mastery of a China-based supply chain a major competitive advantage
Product churning	Reduction in product emulation activity	Products must have genuine consumer justification.
Radical opportunities	Increased emphasis on functional performance. Less slavish brand devotion.	Stress on dependability and function.
Ferocious competitive standards	Japan remains a tough highly competitive environment. FACs attempting 'insider strategies' are struggling.	Adopt those aspects of 'insiderism' that are financially justified.
Need to sharpen marketing skills	Marketers in Japan maintain dedicated dialogue with consumer. New environment requires high interpretative efforts.	Gear up effort to track and interpret contemporary needs of consumer.

Conclusions

Having reviewed the temporal market changes, induced as a result of the collapse of the bubble, it is clear that several fundamental changes in the business environment have occurred. Prices are deflating in all sectors. Consumers are, as a result, delaying purchasing. They have become more balanced in their orientation and weigh value more heavily than previously. Consumers shop around more rationally, even in 100 yen stores, and consequently, are less likely to pay premium prices. Competition, responsive as ever, remains fierce. Despite the downturn, media expenditures remain high, imposing high cost burdens on all players. FACs that are attempting to develop market positions are specially challenged as they are squeezed by high costs and increasing price conscious consumer behavior (see Table 2 above).

The new climate has spurred changes in the distribution system. Less competitive wholesalers are being swallowed by more aggressive concerns. The demise of Mom and Pop Stores has been hastened by the ascendancy of price-competitive convenience chains. Retailers are more focused on profitability and are adopting newer technologies that will help depress retail prices further.

Some reduction in product chuming among Japanese companies has occurred. It is recognized that products in the post-bubble era must have a real consumer-based justification to survive. Evidence of this is the premium that put on speed of service. Also, keener pricing is stimulating international sourcing, which advantages those companies with international linkages, FACs in particular. This trend to international sourcing and parallel importing includes designer labels, which are now also discounted.

The tendency of consumers to buy cheaper products is a challenge for FACs. Wherever possible, they must find opportunities to re-engineer creatively the positioning of their brands in ways that justify price premiums. Brand propositions are required that are capable of working responsively in environments where discounting intrudes, fashions swing and consumer mores shift radically. There is a need for big brand ideas that capitalize on the consumers' drive for greater value but also meet the Japanese consumers' requirement for quality.

Japanese competitors were once regarded as unsophisticated marketers. What they lacked in terms of marketing sophistry, if ever true, is now compensated for by their dedication to gaining an in-depth understanding of their consumers. Japan's post-bubble experience is likely to result in a number of pervasive changes. Many elements of its previous success paradigm will be reappraised, if not discarded. New-found wisdom from the price destruction experience will permeate many aspects of business and trading behavior. Japanese companies will negotiate more stringent terms with international suppliers, making Japan an even tougher market in which to compete.

On the output side, Japanese products are likely to become even more competitive, as Japanese companies become leaner and meaner. This is especially true in the likely scenario of a weakening yen. For FACs, such an environment poses a formidable challenge, but one that will be ultimately to their benefit should they succeed in applying the resultant expertise to their operations elsewhere.

Suitable Market Entry Modes for International Franchisors in China

Zhu Mingxia
University of International Business and Economics, China

Abstract

This paper focuses on international franchising in china, mainly analyses the international franchising market entry modes and the impact of China's WTO accession on franchising. The research results show that as for the popularity of the entry modes, master franchising is the method used by 57 percent of responding members internationally, licensing is used by 19 percent of respondents to the new survey, joint venture by 12 percent and foreign subsidiary by 6 percent. Also, because of the huge difference between Chinese culture and Western culture, direct franchising is not the most suitable mode for an international franchisor to enter China. Indirect international franchising and joint venture appear to be more suitable for China.

Introduction

As the business environments in China are becoming more and more sound and China itself is becoming increasingly involved in international business, especially after joining the WTO, more and more foreign franchisors are eyeing this potential markets and try to tap this most promising market. Although there are some famous international franchisors operating in China now, such as Macdonald's, it still adopts the foreign direct investment entry modes and, equity joint venture. The famous franchisor applied this joint venture method due to the legal limitations that they are not permitted by the Chinese government to build wholly owned subsidiaries. Now the Chinese government release their regulations about foreign investment in China, international franchisors can pursue their most favorite modes comparatively free (Chou, 2002). Under this situation, the problems facing the international franchisors are what are the suitable entry modes and what factors should be taken into account when they want to do franchising in the Chinese market.

The research on 'how best to franchise in China?' is rare. That's why I choose this topic. I will analyze the entry modes of international franchising and find out the most suitable entry modes of international franchising in my research project. It is my greatest pleasure if my research can give some guidance for the foreign franchisors to choose the proper entry mode of franchising into the Chinese market.

Three Stages of Franchising in China

The embryo stage (1986-1992):

Franchising began to be adopted as a brand-new mode of operation with the entrance of McDonald and KFC in China in mid and late 1980's. In the light of the laws and regulation in that period, franchising was conducted in the form of joint venture rather than sale of chartered right, and franchising business characterized by the sale of chartered right didn't exist in a true sense in China. In the mean time, some Chinese restaurants with traditional prestige were expanding their business by means of alliance and transferring brand and technology. These firms, bearing some traits of franchising in their operations, became the first generation of Chinese franchising.

The growth stage (1993-1996):

In this stage, some world-famous franchisors entered Chinese market in great numbers. Brands of clothing, restaurants became well-known, such as Pierre Carden, Crocodile, Geodano, Apples, KFC, McDonald, Fiji, Kodak and so on.

With the initial experiences acquired and foreign modes for reference, Chinese enterprises started to take actions to develop its own franchising in a planned way. Relaxation of some restrictions made it possible for foreign franchisors to expand quickly in China. In this stage, Chinese franchising was focusing on three areas: restaurants, retailing business and clothing Business.

For shortage of regulations and laws in franchising, and for lack of knowledge of the importance of brands and standard operation and management, this stage remained probing stage for franchising in China.

The popularization and standardization stage (1997—present).

In this period, the departments concerned published a series of policies related to chain-store operations and more Chinese firms began to expand franchising business under the standard of "3 Unifications"—— unified procurement, unified delivery and unified management. In this period, Chinese franchising has been fundamentally framed.

The Current Situation of Franchising in China

Rapid Development

According to the statistical report from Chinese Chain-Store Association, by the end of June 2002, Chinese franchisors are up to 1000, more than half of them began their franchising operation after 2000. Out of the top 100 chain stores, are 61 franchising enterprises with the sales volume up to RMB 27 billion, accounting for 17 percent of the total sales of the top 100 chain stores. The number of franchised shops has increase to 5400, constituting 40 percent of the top 100 chain stores. Franchised shops developed more rapidly than chain stores both in terms of sales volume and the number of increased shops. For example, from October of 1995 to end July 2003, Shanghai Hualian supermarket cultivated 2006 franchisees; Malan Noodle, 436 from October 1997 to 2002. Since the beginning of 2003, Chinese franchising has swiftly developed in many other industries and franchising systems has increased nearly to 2000.

A broad range of trades with franchising

Franchising has been broadly applied to over 50 industries, between which franchising in service industry is the most vigorous and developing rapidly. Apart from traditional restaurants, retailing, and individual service, franchising in some new and developing industries, such as cultural and educational industry, commercial service, household service, auto-related service, IT industry are rapidly advancing. The latest news reports that government-authorized franchising system will be set up in municipal public sectors, that is to say, monopoly will be broken away in some traditional municipal public sectors which is directly related to social public benefits, such as city water supply, air feed, wastewater treatment, trash treatment and public transportation and implement franchising under government authorization.

Diversified and multileveled franchising

In the course of developing franchising, enterprises, based on their understanding of franchising and objective conditions, brought out varied forms of development. Firstly, some enterprises, depending on their business brands and managerial dominance, enlist potential franchisees by means of advertisements and exhibition. Secondly, some enterprises, through internal ownership transfer, transfer the ownership of chain stores to employees and meanwhile sign up join-up contracts. Thirdly, as for those chain stores, in which some part of ownership is non-transferable, or their employees are unable or unwilling to take over the ownership, employees are permitted to pay a percentage mortgage for the transfer of operation right and then sign up join-up contracts, and finally become a franchised store of the enterprise. Fourthly, some poor-operating-and-stand-at-the-bay enterprises will be brought into franchising system.

Laws to abide by in franchising

Franchising is not one or two behaviors of some enterprises alone. As a brand-new form of business, franchising plays a significant role in pushing forward the development of the service, stabilizing medium-sized and small enterprises, increasing employment opportunities, and satisfying consumer demands.

Government impetus and its supporting policies on franchising

Government supporting policies guarantee the sound development of franchising in China. In 2001, Vice Premier Li Lanqing inspected many chain-store enterprises and made comments and instructions on chain-store operation. The State Economy and Trade Committee, the former Ministry of Internal Trade and the State Commission for Structural Reforms have ever co-held a symposium on chain-store operation application. The former Ministry of Internal Trade placed chain-store operation as a primary task. China Industrial and Commercial Bank provided RMB 37.5 billion of preferential loan for franchising. All levels of local governments, various organizations concerned framed a series of policies and launched activities for the purpose of promoting franchising.

Literature on Methods of International Franchising Expansion

Freeman (1999) points out that franchising can be viewed as a licensing relationship within which an owner (the franchisor) of a trademark (including service trademark), product, patent, know-how or business method grants exclusive rights to affiliated dealers (the franchisees), and in return receives a payment or royalty and conformance to quality standards.

Franchising entry modes have provided many good opportunities for multinational firms to expand to overseas markets with comparatively less resources and risks, so the international franchising entry modes have long intrigued many researchers (Chan and Justis, 1990; Niu, 2001;Justis & Judd, 1998; Martin 1992). There are a number of different approaches to international expansion that are commonly in use. These include:

1 Company-owned only operations or indirect franchising
2 Direct franchising
3 The establishment of a subsidiary
4 The establishment of an area developer
5 The grant of master franchise rights
6 The entry into of a joint venture
7 Wholly-owned foreign enterprise

Let us examine each in turn.

Company-owned only operations or indirect franchising

In such a case the master franchisor would decide not to franchise in the target territory but only to establish its own operations. In order to do this the company would have to possess the manpower and financial resources to establish and sustain the operation. A successful company-owned network would, of course, provide the basis for the future use of the franchise marketing method for growth if a change of course were considered desirable. Usually the master franchisor will also have sufficient knowledge of local conditions of franchising concepts. Normally the master franchiser starts one or two stores to engage sub-franchisees or to open all stores themselves.

The major advantages of this system are:

1 It leverages the master franchiser's resources and knowing of local market conditions to get off the ground quickly.
2 The master franchisers can adopt and, if necessary, adapt policies to fit the market place successfully.
3 The master franchiser is able to establish a showcase (a successful franchise operation) to generate and promote sales of sub-franchises.

The major disadvantages of the system are:

1 The involvement of the master franchiser can reduce the profits of both the franchisor and the sub-franchisees.
2 The franchisor loses the direct control to the local market.
3 An unqualified master franchiser could impede the franchiser’s expansion plans and, in the worst case, damage the brand.

Direct franchising

This involves the franchisor in entering into a franchise agreement with each individual franchisee and providing the basic support directly. As a technique it is normally limited in scope since the further away the franchisor is from the target territory the more difficult it becomes to serve franchisees. Very often direct franchising, combined with the establishment of branches or subsidiaries, can provide tax advantages (Kahler and Kramer, 1997).

The use of the direct franchising method also makes the franchisor vulnerable to a failure to recognize the differences, which exist between the territory of origin of the system and the target territory. However, direct international franchising has some disadvantages that are either unique to China or, at the very least, magnified in China:

1 Cultural difference between the franchisor and the host country could cause problems in the absence of an

intermediary.

2 If the franchisor were not fully aware of the ground realities of the host country, it would not be able to modify or formulate policies to ensure that its franchisees succeed. For instance, when KFC opened in China, it realized that its "finger licking good" campaign was a flop in China, because the Chinese hated eating with our hands. Eventually, KFC began to give disposable, plastic gloves to its patrons in China so we could eat without having to lick their fingers. Though several years pasted, the practice of providing gloves has long been discontinued.

3 The average Chinese does not share the Westem view on dignity of labor. To the average, educated Chinese, to do menial work--even if well paying--is a "loss of face" (dignity). Thus, an average, educated Chinese would rather be doing a low paying, white-collar job than work as an owner-operator of a franchise because it involves menial work.

The establishment of a branch operation

This may be set up in the following circumstances:

1 The franchisor may be operating its own outlets.

2 The franchiser is franchising direct into the target territory and has established a branch operation to service franchisees.

3 The branch has been established as a regional base to provide services to franchisees within the region. Fiscal may well affect whether or not a branch is established or legal considerations rather than the business need to have a presence in the territory. These considerations may lead the franchisor to follow the next course available to it, the establishment of a subsidiary.

The establishment of a subsidiary

The establishment of a subsidiary may fulfill any of four functions:

1 The franchisor could be franchising directly from its territory into the target territory and will use the subsidiary to service franchisees.

2 The franchisee may grant master franchise rights to the subsidiary and the subsidiary will be either opening its own operations or sub-franchising or both.

3 The subsidiary may be involved with a joint venture partner.

4 The subsidiary may be used as a regional base either to provide services to franchisees in the region or to master franchisees in the region. The service which the branch or subsidiary would provide would be similar in nature and would cover the whole range of franchisor services, including, as the network develops, a training facility (Martin, 1992).

The grant of master franchise rights

This form of arrangement has many of the characteristics of the area development agreement. The area developer will undoubtedly have the right to a part of a country. The master franchisee will usually have the exclusive right within a country either to open its own outlets or to sub-franchise or to do both. The master franchisee in essence stands in the shoes of the franchisor in the country and is, to all intents and purposes, the franchisor of the system in that country (Pawan & Dant, 1994).

The franchisor has to consider a number of points:

1 The difficulties in identifying and selecting the right master franchisee.

2 The need to have a strong home base to sustain the demands.

3 The diversion of manpower and financial resources from the domestic operations. It should be noted that it will always take more people and cost more money than one would expect.

4 The time factor - it will always take much longer than one expects.

The problems, which arise when the franchisor feels it has no alternative but to terminate, are many and varied. It is likely that the franchisor will inherit problems since termination will result either from the master franchisee having done its job badly or because it is not doing very well.

The entry into of a joint venture

This involves the franchisor in establishing a joint company with another company or person within the territory, and the exploitation of the territory either by means of operations owned by the joint venture, as by sub-franchising, or a combination of both.

EJVs are limited liability corporations in which Chinese and foreign partners jointly invest cash and management resources through a directorate. Profits and losses are shared in proportion to the investment contributed by each partner. Noticeably, foreign investment cannot be less than 25 percent of the registered capital in this method. This is a popular form of cooperation, because it is ideal for companies that possess technology and access to a market but either do not have ample capitals or wish to mitigate their risks (Konigsberg, 1990).

Wholly owned foreign enterprise (WOFE)

WOFE is also limited liability enterprises, but the registered capital is entirely provided by the foreign investor. With the improvement of investment climate and increasing of investor's confidence, WOFE is becoming an increasingly popular vehicle for entry into China. This is probably the best mode for a franchisor that has knowledge of the local market and sufficient capital to manage operations until they become self-sustaining. The foreign investor has full control in WOFE, at the same time, it also requires that the foreign investor must have a good management team in place to ensure good harmony with the workers and good relationship with the various authorities such as Revenue, Industry and Commerce Bureau etc, with whom the WOFE would have to interact from time to time (Kahler and Kramer, 1997).

The Impacts of China's Entrance into WTO on Franchising

Many TNCs believe that any global enterprise that desires to survive in the 21st Century must enter the market of China. Based on this perspective, many TNCs alter "a strategic option" of the entrance into China into " a strategic necessity", so China will be the biggest, and the most potential-abundant franchising market. Since China's entrance into WTO, the circulation of goods and the field of service commerce have further broadened; its capacious markets have become the hot spot of foreign investment. Nowadays, Chinese franchising is confronted with double challenges. On one hand, Chinese franchising enterprises are not fully reinforced yet, and they have much room for perfection. On the other hand, in competition with foreign franchising tycoons, Chinese enterprises must adjust their operations in order to conform to the international franchising practices, laws and regulation as soon as possible. Meanwhile, Chinese enterprises should frame a new culture-empowered business mode, solve the bottleneck problem, which threatens the enterprise's survival and restricts its development, and thereafter inaugurate a new era of capital expansion.

WTO Agreements' influence on Chinese Franchising

In the process of negotiating on China's entrance into WTO, service industry is the hard core. Distribution service is the focus of negotiation. In addition to retailing and wholesales, distribution also includes direct selling, agency, franchising, inventory, delivery and after-sale service, etc. In respect of franchising, China promised that foreign enterprises is eligible for developing direct-selling in China in the form of franchising and all restrictions concerned will be removed in 3 years. China also allowed foreign-fund enterprises to sell their products manufactured in China and provide relevant services, including after-sale service. With China's entrance into WTO, some foreign franchising brands are taking quick actions to enter the market of China in the fields of fast food, education, retailing, commercial service, etc. The data from Chain-Store Operation Association show that franchisors from Hong Kong outshine others in clothing franchising, and franchisors from Taiwan do a better job in restaurants. European and American countries show prominence in retailing.

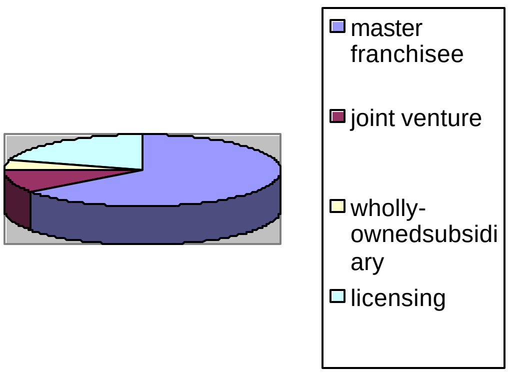
The impact of China's entrance into WTO may be analyzed from both sides. Firstly, after the entrance, Chinese franchising enterprises can acquire other countries' ripe experience, advanced technologies and managerial skills so that they can improve their operation in a short time. Secondly, the entrance of some large-scale chain-store groups will enable the Chinese enterprises to learn from them at home, reduce the grafting cost and learning cost and become more competitive. Thirdly, through franchising the medium and small-scale distribution systems will be better organized, so they will become more competitive. In a society, more franchising enterprises mean more replications of original technique, original services, original operations and successful economies. Franchising can improve the quality of products and services, raise the over-all level of products and services and thereafter promote the whole society's economic profits and commercial civilization.

However, more foreign enterprises with their well-known brands entering China to strengthen the penetration of their brands with advanced franchising technology will surely bring about huge pressure to the

Chinese franchising. In the coming several years, survival of the fittest in the reintegration of franchising enterprises in various trades will be an inevitable fact.

Results

\As for the popularity of these entry modes, Justis & Judd (1998) describe that master franchising is the method used by 57 percent of responding members internationally, licensing are used by 19 percent of respondents to the new survey, joint venture by 12 percent and foreign subsidiary by 6 percent. Of those respondents, 66 percent have an international division in their corporate structure to oversee foreign franchise development.



Source: Justis & Judd (1998), *Franchising, Chapter 22*, second edition, Prentice Hall

Because the huge difference between Chinese culture and Western culture, the difficulties of direct franchising far outweigh the advantages of it. In my view, direct franchising is not the most suitable mode for international franchisor to enter China. It is more suitable for countries that are culturally homogenous. It is not quite suitable when the franchisor seek to enter a country that is culturally different from the franchisor's home country.

Indirect international franchising may be more suitable for China, because the presence of a master franchisee that knows the territory and has the resources to develop the market is an essential bridge between the franchisor and the franchisee. In fact, a knowledgeable and resourceful master franchisee can make international brand localization better. The time for undertaking master franchisee is mature now.

Joint venture is also another more suitable entry mode for international franchisors to enter the Chinese market as China has a unique culture and the cultural difference will pose investment risk. In addition, with the help of local partners, a franchisor will enter Chinese market successfully and expand quickly with relatively less resources and risks. This form may be suitable for a franchisor with limited resources that is seeking to expand quickly with the help of a powerful local partner. However, a chicken-and-egg situation exists here. A relatively unknown franchisor is unlikely to command attention from a powerful local partner, while a well-known franchisor may not be willing to give up or share access to the Chinese market, which comprises of 22% of the world population.

Under the licensing form of cooperation, an international franchisor will license a franchise right to a Chinese vendor. This type of undertaking has limited relevance to franchising in fact. Currently, coca-cola has entered Chinese market by licensing bottlers (technically, franchising bottlers) and providing the syrup necessary to produce the soft drink.

Cooperative joint venture cannot be taken as a vehicle for franchising entry mode in China unless the franchisor is well experienced in China and the domestic partner is well known and trustworthy.

With the investment climate having improved and the investor confidence increasing, wholly owned subsidiary is becoming an increasingly popular mode for entry into China. This is perhaps the best mode for an international franchisor that has knowledge of the local market and the cash flow to manage operations until they become self-sustaining. The foreign franchisor has full control therefore he must have a good relationship with the local government such as Custom, tax, and so on. In the future, perhaps this is more appropriate for international franchisor to enter the potential market with a more deregulation of China's foreign currency control and more perfect legal climate.

Conclusion

On both theories and practice basis, my paper discussed a few ways of international franchising firms entering the Chinese market. Decision concerning the modes of international firms' entry to the Chinese markets is the most crucially important. All the factors, such as cost, possible loss of control, the risk involved etc, must be taken into account before making the decision of the entry modes. Finally, due to the complexity of the international franchising market entry modes, the one choice may be linked to another. For this reason, international franchisors may adopt a combination of entry modes when operating in China.

As China continues to experiment with a market economy and new method of doing business, franchising will become one of the most attractive methods of doing business there. It shows that franchising will be the fastest growing way of doing business in China. However, given the rapidly changing legal system, ever evolving laws and regulations and the different culture, a franchisor should carefully decide his entry strategy when entering China. Done correctly, franchising offers an opportunity for entry China's vast market with minimal capital investment and excellent profits.

New Trends in Marketing Management and Management of Customer Relations

Gabriela Bartakova
Viera Cibakova
Comenius University in Bratislava, Slovak Republic

Abstract

Today's marketing represents a business philosophy primarily oriented on the customer, satisfaction of his/her needs and wishes. Marketing has become a company function that identifies unsaturated needs and wishes, defines and measures their size, determines which target markets can be served best by the company, decides about particular goods, services, and programmes which are intended to serve the markets and address everyone in the company to "think of the customer and serve him/her". From the societal viewpoint marketing is the force that utilises the industrial capacity of the society in satisfying the society's material needs.

Introduction

The characteristics of the new market environment can be summarised as follows:

Ever growing power of the customer status and purchase power concentration can be characterised primarily by rational behaviour of the customer in his/her choice and preference of a brand, decreasing impact of advertising in terms of the decline of its efficiency and last, but not least, by mergers as an outcome of hard competition in which just the best wins. Most companies try to over satisfy the customers' expectations and thus enhance their loyalty. Many of them have started applying "life-long need satisfaction" marketing which means that they provide so-called life-long supply of regularly consumed goods (such as coffee, tea and the like), of course, for the lower unit price (HASPROVA 2002:43).

Scattered consumer markets allow for the so-called "micromarketing", the concept of which is focused on the strategy for ever-decreasing consumer markets with the aim to get as close to the customer as possible and produce in accord with his/her needs and wishes. The success here is conditioned by the existence of high-level flexibility in case of preference changes and the immediate producer's response. In this concept, for instance, the advertisements in mass media have not proved to be efficient communication tools with the "small markets". On the contrary, most decisions originate during the purchase itself. And thus, utilising database marketing with precisely specified target groups has proved very useful. Geodemographic databases include sets of demographic data (gender, age, address), socio-economic data (job, income) as well as data on purchasing behaviour, life style and the like. To acquire such a database has become a priority for many businesses while they represent an important competition tool that can be applied in serving new markets.

Necessity to identify competitive advantage resources is derived from the ever-growing saturation of the market. To be successful in competition, the company must enhance its relationships with individual parts of a distribution chain. Primarily, it has to establish or strengthen its relationship with customers via maximisation of the value it offers. Not only it covers the price to be paid for the product, but also the product reliability, safety, simplicity of operation or its familiarity. The relationship with dealers can also represent a competitive advantage when providing the total product value to the customer including the price. Finally, appropriate selection of a supplier and efficiency of the entire supply chain exercise their importance for the success of the company in serving a particular market. Integration of a supplier-customer chain has become an important factor for the success in a competitive environment. While total costs and service quality are dependent on the structure of the supplier-customer chain to a degree as well as on the communication within it, it is crucial to pay appropriate attention to its management.

At present, when serving the consumer markets most businesses frequently face the following problems:
The consumer is more and more experienced and sensitive to the price. The consumer exercises more and more complex life style and requires more comfort when buying. The consumer enlarges the requirements related to

services and becomes less and less loyal to the supplier. Businesses spend inefficiently a lot of means on communication with the market (advertising becomes more expensive and more inefficient at the same time, costs of sale support and salespersons management grow). The offered products are just slightly distinct from the products of competitors.

Thus, marketing managers have to answer the following questions:

1. How to define the right segment/segments on which to focus all business activities?
2. How to differentiate the offer from the offer of competition?
3. How to react to the sustainable customers' pressure on price cuts?
4. How far one can go in adjusting products to the individual customer's needs?
5. How to cut costs in order to gain customers?
6. How to build customers/consumers' loyalty?
7. How to identify the most efficient customer segments?
8. How to stand up to competition with never ending competitor's price cuts?
9. How to measure advertising, sale support and PR efficiency?
10. How to increase salespersons' productivity?
11. How to build more sale channels and secure their efficiency?
12. How to direct the other company units so that they would focus on customer needs?

The consumer/customer's position and his/her role in the modern concept of marketing management is indisputable, however, it is obvious, that in this coordinated effort of marketing management the marketing department is not the only unit whose locus of interest lies in the customer/consumer as it is presented in the following description of the ideal roster of the other units' activities oriented on the customer.

In the current marketing theory, customer relationship management has become one of the most preferred fields of experts' interest. The customer playing the "key" role in marketers' focus is more and more highlighted in the view of building long-term and prospective relationships projected to the future.

In addition to the others, the important source of information for gaining the first contacts with the customer is the Internet as an electronic medium. The Internet represents an extraordinary source of information of various types, forms, contents, relevance, reliability, price, and quality. As a public medium it enables the access of millions of users to the documents of diverse characters (ZAK 2002:74).

When considering the customer relations marketing, the main concept is value creation. The development of the relationship requires thorough knowledge of the process in which the customer creates the value. If the entire process is taken into consideration, the importance of a single purchase decreases. Thus, the management of relationship with the customer is not aimed at the increase of single purchase revenue, but at the establishment of a sustainable relationship with the customer.

The concept of customer relationship management is deeply embedded in understanding of the customer's value creation process, i.e. the process in which the customer creates for his/her own value for him/herself. The business oriented on the customer relations tries to learn more about the ways in which the customers create their own values. Then, assessing how the business can help the customer becomes much easier.

Without the principal understanding of value creation, it is difficult to develop the relationship with the customer either from the customer's perspective or the business's one.

P. Drucker claims that it is the role of marketing "to create customers". In the endeavour to satisfy the customer needs, in the process of exchange the seller tries to provide the maximum added value to the customer. The consumer added value is set as a difference between the total consumer value and the total consumer price. The total consumer value is given as a set of benefits the customer expects to gain from the product. The total consumer price is given as a set of "prices" that must be paid by the customer trying to get the product (financial costs, psychical effort and the like) (KOTLER 2000:50).

Focus on the relationship with the customer requires the shift to the search for and pursuit of general gain. The aim is no more to be close to the customer, but to "live" with one.

Traditionally, the relationships with the customer represent a triangle, the peaks of which can be named a customer, company and product (Fig. 1). As a rule, one of the peaks is emphasised. For instance, abilities and knowledge of the company oriented on the product culminate directly in the product itself and thus, the company model is developed around the product. Such a company is often identified as a company oriented on the product.

The company oriented on the customer looks at its activities from the viewpoint of the customer him/herself. In such a company, every customer has his/her own contact person who looks after the mutual relationship between the customer and the company. The company oriented on the product stresses the development of production processes and enhancement of their efficiency.

In relationship with the customer, the company utilises its own abilities and knowledge to support the value creation by the customer. Thus, the identification of such abilities and knowledge necessary to secure a competitive advantage is more important here than the product itself. The company must consider how to transfer its own abilities and knowledge to the customer so that the value can be created. In traditional marketing thinking, companies distribute values in the form of products. In the management of relationship with the customer, the company and the customer create the value together. Focus on the relationship with the customer thus elevates value distribution to value creation.

Value creation requires wide range emotion and information exchanges as well as negotiations that contribute to the value creation. Any exchange enhancing value creation process of the customer should be taken for part of the offer.

Such thinking emphasises the need to look at the knowledge and abilities in a different way – a new one. In business, product sales do not stand for the entire activity. On the contrary, it primarily stands for the exploitation of abilities and knowledge with regard to the support of the relationship with the customer for the time of its duration.

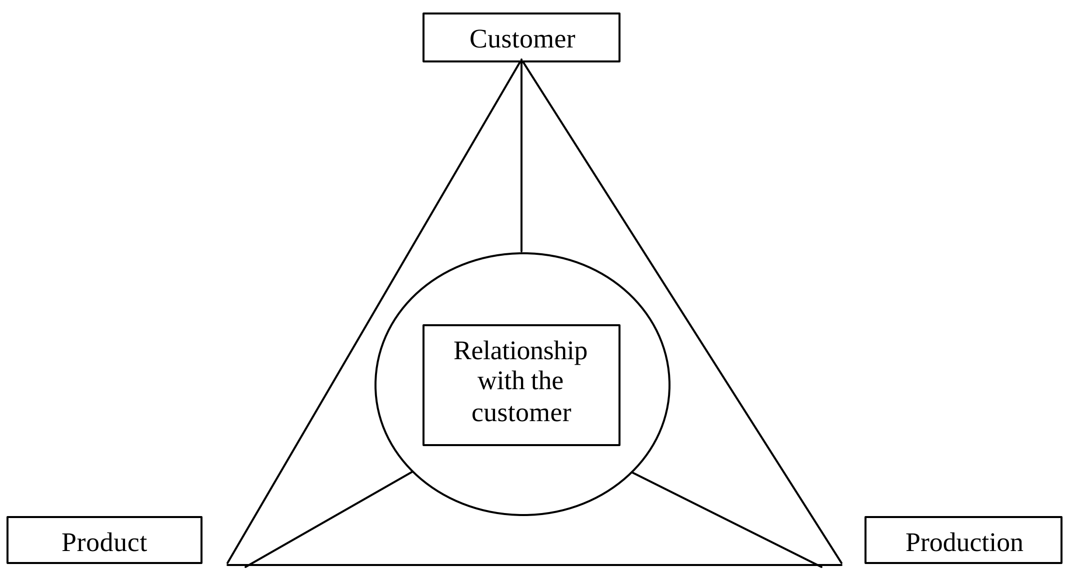

FIGURE 1 CUSTOMER RELATIONSHIP (STORBACKA – LEHTINEN 2002: 20)

The concept of customer relationship management can be described as a dual approach: on the one hand, it is the shift from the traditional business thinking towards the customer relations management, on the other hand, it is the shift in thinking with the product in its locus towards ability-oriented thinking.

Summary

A lot of top managers report that marketing is becoming less efficient. Increasing marketing costs generate lower economic results. Change in market environment brings a new approach to management of marketing activities in companies. Current marketing defines itself as an art of reaching and maintaining profitable customers. Under increased market saturation the focus is on customer loyalty and customer relationship marketing which has become part of management. A company incorporates customer relationship marketing into the strategy of increasing customers' value creation.

How and What Has Been Done on Country-of-Origin: A Classification and Foreground Studies

Jorge A. Wise
ITESM – Campus Monterrey, Mexico
Elisa Cobas-Flores
ITESM – EGADE, Mexico

Abstract

Country-of-origin represents one of the most studied topics in international marketing. Many researchers have worked on it trying to understand the effects on consumer behavior. Globalization has not make easy this task and generalizations are more needed than ever. Therefore, it is critically important for businesses to understand the consumer attitudes and the effect they may have on product success or failure. This paper presents an extensive literature review of country-of-origin and its classification of foreground studies. The major groups considered in that classification are research in marketing, construct decomposition, cross-cultural/national generalizability, and research in related areas. This classification integrates and contrasts most of the studies employing the country-of-origin construct.

Introduction

Since the mid-1960s, numerous studies have been conducted on Country-of-Origin. The focus of those studies was on the 'Made-in' images of products. In general, they have found that consumers have significantly different general perceptions of products made in different countries. Since those days, that stream of research has produced a substantial amount of publications and presentations in congresses. Probably, country-of-origin has been one of the most prolific and researched area in marketing.

It is convenient for any firm deciding to access a new market to evaluate possible country-of-origin effects. Next, it is worthwhile to consider whether a global or local approach will be follow. Whether the firm decides to originate the product locally or overseas, the decision may imply important market and marketing consequences. Among others are the awareness of products of foreign origin, the market size, language used on the label, customers culture, status of other brands found in the market, and the brand positioning of its country-of-origin [Klein, 2002]. The country-of-origin effects seem to have a direct impact on the consumer's overall perceived quality of the products [Bilkey & Nes, 1982; Peterson & Jolibert, 1995; Verlegh & Steenkamp, 1999]. In consequence, the selected approach seems to be paramount for the firm's success particularly considering the customers' perception regarding the country-of-origin of the products. Steadily, consumers can choose for a great variety of similar domestic and foreign products. Understanding the effects of country-of-origin on consumers' evaluation of products may signify the success or fail of any marketing program. To do that, research on the topic needs to be done considering what the literature offers and what has been done in the past. The classification here purposed will advance the knowledge in the area exposing in a snapshot different elements of the phenomena and offering a better perspective on possible ways to research country-of-origin.

The amount of studies scrutinized throughout of this paper is extensive. Tables presented help to synthesize the concepts. What follows introduces a classification of country-of-origin studies, next explains what is termed foreground studies of the areas along with each of its major groups, and ends with some related comments.

Country of Origin

In general, the country-of-origin affects consumer's product evaluation [Bilkey & Nes, 1982] since consumers evaluate a product considering information cues available [Kaynak & Kara, 2002]. As consumers in general tend to be less familiar with products of foreign origin [Huber & McCann, 1982] the country-of-origin is also found to be one of those cues. Country-of-origin is an extrinsic product cue, a class of intangible traits including product's brand, price, and warranty [Cordell, 1992]. Country of origin refers to "buyer's opinions regarding the relative qualities of goods and services produced in various countries" [Bilkey, 1993, p. xix].

Classification of the Studies

Probably the seminal work by Schooler [1965] can be considered as the first-ever published research of country-of-origin [Papadopoulos, 1993]. His study, made in the Central American Common Market (Costa Rica, Guatemala, El Salvador, and Mexico), analyzed the preconceived images of products on the bias of national origin. As Mexico was not then member of the Common Market, Schooler used it as a control group. In his investigation, he considered the regional jealousies, fears, and animosities as aspects with a specific weight in consumers' product evaluation. Even though the analyses are simple, the conclusion is that there are significant differences in the evaluation of identical products using labels with different country names.

The "Made in" label seems to have a significant impact on the consumers' product evaluation. Morello [1993] mentions the "Made in" concept is used since XIX Century as protectionist measures identifying products from foreign origin. The use of labels as origin identifiers is a common practice employed by companies of various nationalities in domestic and international marketing along with many governments whose regulations establish the obligation of declare the product's country of origin. Indeed, the World Trade Organization (WTO), pursuant to the principles decreed in the Uruguay Round's "Agreement on Rules of Origin," considers the country-of-origin marking as essential for global markets. Thus, we can think that the claim made by Dichter [1962] "The little phrase 'Made in . . .' can have a tremendous influence on the acceptance and success of products . . ." [pp. 116] is noteworthy. The "Made in" indication is one of the substitute or surrogate indicators (Cattin, Jolibert, and Lohnes, 1982) consumers have learned to use when there are missing cues; it has also been called by several authors as "stereotype" or "stereotyping" [c.f. Bannister & Saunders, 1978; Chasin, Holzmueller, & Jaffe, 1989; Khanna, 1986; Maheswaran, 1994; White & Cundiff, 1978; White, 1979] which exists and can influence people's behavior [Papadopoulos, 1993]. As a multifaceted construct with facets clearly interpretable [Parameswaran & Pisharodi, 1994], country-of-origin is potentially a powerful variable that can be used as a competitive business tool [Kaynak & Kara, 2002].

The country-of-origin's stream of research is classified in two categories introduced in this paper, foreground studies and background studies, subdivided into several major groups (see Table 1). Both of the categories contribute to the advancement of consumer behavior knowledge in its own right. This paper details the foreground studies, while the background studies and holistic and other relevant studies are developed in Wise and Cobas-Flores (Forthcoming). Table 1 includes the foreground studies with four major groups which approach country-of-origin effects, while the three major groups of background studies use country-of-origin as a basis for the research. For this classification, at least 99 studies were categorized representing a substantial part of the total research in the area.

The different approaches used to study the effects due to the country-of-origin examine product considering several areas of research. These areas of research are the four major groups here found (see Table 1): (I) Research in Marketing, (II) Construct Decomposition, (III) Cross-Cultural/National generalizability, and (IV) Research in Related Areas. Next, a description of each of them follows.

TABLE 1
CLASSIFICATION OF COUNTRY OF ORIGIN STUDIES

Foreground Studies	Background Studies
I. Research in Marketing 1. Source/Origin countries 2. Consuming countries 3. Test products 4. Test products brand	I. Literature Reviews 1. Product-country of origin 2. Product-country image
II. Construct Decomposition III. Cross-cultural/national Generalizability Assessment of reliability	II. Consumer behavior using country-of-origin as a research frame 1. Cue utilization 2. Perceived risk 3. Attitude theory 4. First-mover advantage 5. Cultural orientation influences 6. Market entry 7. Belief-attitude model 8. Likelihood model 9. Brand effects/image 10. Event analysis
IV. Research in Related Areas 1. Stereotyping 2. Ethnocentrism 3. Animosity 4. Brand	III. Methodology and Theory Construction 1. Sampling 2. Surveyed method 3. Type of research 4. Model definition 5. Test of approach
Holistic and Other Relevant Studies	
Combined foreground studies with background studies	

Note. This classification in an expansion and extensive modification of Kaynak and Kara (2002) map of product country images literature (pp. 932).

Foreground Studies

I. Research in Marketing

This is probably the largest major group of the whole classification due to several marketing variables are well embedded in the country-of-origin. One of such marketing variables has to due with the source or origin countries of the products, i.e. countries from which products are originated. The second variable has to do with the consumers' nationality of the products, i.e. nationality of the interviewee. The third and forth marketing variables refer to the products and their brands respectively.

1. Source/origin countries.

The country of origin research has been done considering diverse regions of the world (see Table 3). Diverse interviewees expressed their opinions about products originated from different regions of the world located in almost all the continents. Only six out of the 99 scrutinized studies consider products originated from single countries. In all the cases, the "made in . . ." label was addressed. The selection of a single country seems to be rooted in the nature of the studies. Other three studies examined the perceptions of domestic products by nationals of the same countries.

The largest direct mention in the 99 studies scrutinized is first for Japan and then for the USA with 51 and 46 respectively. Of them, 64 studies mention directly either Japan or the USA, or both together as the sourced countries researched. Both countries are evaluated in 33 studies while 27 discuss products originated either form Japan or the USA. The main selection for the two countries as source of products is the classification of them as industrialized [Darling & Kraft, 1977]; developed [Okechuku, 1994] or major trade powers [Papadopoulos & Heslop, 1989]. Further factors have been pondered such as been major trading partners of another country [Agbonifoh & Elimimian, 1999; Chang & Kim, 1995; Jaffe & Martínez, 1995], between them [Chao, 1989; Han & Terpstra, 1988; Han, 1990] or have recognized their products and brands as similar or comparable [Ettenson, 1993; Goldberg & Baumgartner, 2002; Johansson, Douglas, & Nonaka, 1985; Nebenzahl & Jaffe, 1996]. While other studies do not mention any clear or specific reasons for their selection of sourced or originated countries [cf. Chinen, Jun, & Hampton, 2000; Gürhan-Canli & Maheswaran, 2000a; Insch & McBride, 1998, 2002; White & Cundiff, 1978], several are based on the selection made by previous studies [Agrawal & Kamakura, 1999; Cattin et al., 1982; Han, 1988; Maheswaran, 1994; Nes & Bilkey, 1993; Shimp, Samiee, & Madden, 1993; Zhang, 1997]. It is plausible to mention that Japan and the USA are both sourced and originated countries employed by many researches due to their importance in the world market, presence of brands and products in almost every marketplace. Maybe due to their perceived preponderance, products from many countries are compared to products from Japan and USA.

Selection of the sourced countries by researches considers diverse factors deemed in Table 2. Although in some cases the factors pondered to choose a sourced country lack of a clear specification, in others it is quite explicit. Many of these countries were chosen as sourced countries because the level of recognition of their products and brands presumably is low or because their products are among the least desirable [Ahmed, d'Astous, & Zouiten, 1993]. Conversely, Olsen & Olsson [2002] chose Denmark, Iceland and Norway because they were "... the three most important suppliers ..." [pp. 155] to Sweden over the last few years. The factor used to select a sourced country may be relevant to the perception of the consumers or due to the performance or geographical location of the country. Thus, the diversity of factors used, or the use of more than one, seems to be common in the selection of the sourced countries.

TABLE 2

MAIN FACTORS FOR THE SELECTION OF SOURCED COUNTRIES

1. Classification of the level of development: a. Industrializing or industrialized b. Developing or developed	2. Geographical location: a. East or West/Eastern or Western b. A continent or part of a continent
3. Trade Partners: a. Between two countries b. With a third country	4. Presence in the domestic market
5. Level of recognition of products and brands	6. Previous studies
7. Products from foreign countries	8. Selection by consumers in a pretest
9. Products from the home country	10. No clear reason
11. Classification of the level of development: a. Industrializing or industrialized b. Developing or developed	12. Geographical location: a. East or West/Eastern or Western b. A continent or part of a continent
13. Trade Partners: a. Between two countries b. With a third country	14. Presence in the domestic market
15. Level of recognition of products and brands	16. Previous studies
17. Products from foreign countries	18. Selection by consumers in a pretest
19. Products from the home country	20. No clear reason
21. Classification of the level of development: a. Industrializing or industrialized b. Developing or developed	22. Geographical location: a. East or West/Eastern or Western b. A continent or part of a continent
23. Trade Partners: a. Between two countries b. With a third country	24. Presence in the domestic market
25. Level of recognition of products and brands	26. Previous studies
27. Products from foreign countries	28. Selection by consumers in a pretest
29. Products from the home country	30. No clear reason

2. Consuming countries.

Researchers have used subjects from diverse countries while studying country-of-origin effects (see Table 3). Such a study requires individuals who express their opinion regarding products from one or several source/origin countries. Those individuals reside in what can be named consuming country. In general, researches explicitly name the nationality of the consuming countries' subjects though in some cases assumed the reader would realize it. For instance, Cattin et al. [1982] assert that the responders selected for the study were Directors of Purchasing of Industrial Firms included in the Fortune 500 and in the Europe's Largest Companies. Moreover, they claim "The English questionnaire was mailed in the U.S. with an American return envelope, while the French questionnaire was mailed in France with a French return envelope" (pp. 132) but failed to assert whether only responders from the U.S. and French were used. On the other hand, Han & Terpstra [1988] are more obvious specifying that "Non-US residents were excluded from the population . . ." (pp. 240). In this case, although the reader might deduce that the target population was U.S. residents, such conclusion is not directly specified. In a similar vein, Mort and Duncan, 2000 used a similar practice explaining "respondents who had lived in Australia for less than two years were excluded from the analysis" (pp. 843) letting the reader deduce that the sample were Australians indeed. However, some authors failed giving enough clues to identify properly the respondents' nationality [cf. Hong & Wyer, 1990; Gürhan-Canli & Maheswaran, 2000b; Maheswaran, 1994]. It is always convenient to mention explicitly the nationality of the sample used because its identification helps to understand properly the research results and their applicability.

The bases for selecting subjects from a particular consuming country seem to be situational for the specific research. Although the consuming country most researched is the USA, the presence of other developed countries is substantial as well as some developing countries. The selection of the consuming countries is driven yet by the sole characteristics of the study. Contrasting, the selection of eight consuming countries (six developed and two developing ones) done by Papadopoulos and Heslop [1989] lacks of an explicitly explanation for the bases of such choices. However, Roth and Romeo [1992] collected data from three consuming countries (two developed and one developing) explaining the cross-nationality different effects country-of-origin may have on consumers from various countries as the basis for such selection. The two developed countries selected by Johansson et al. [1985] as comparable samples may have a similar consequence. Interestingly enough, the choice made by Khanna [1986] included five consuming countries (one developed and four developing ones) of a judgment sample of firms substantially involved in import/export operations of the specific products researched (see a partial list in Table 4) in the Indian market. Khanna asserts to explain an apparent sound basis for his selection. Nevertheless, in general, the selection of the consuming country seems to lack of other arguments than to be propelled by the characteristics of the analysis attempting to accomplish.

TABLE 3

AMOUNT OF SOURCE/ORIGIN COUNTRIES STUDIED USING THE CONSUMING COUNTRY

Consuming Country	Source/Origin Countries	Consuming Country	Source/Origin Countries	Consuming Country	Source/Origin Countries
USA	72	Russia	7	Philippines	4
Australia	18	Poland	7	Korea	4
Canada	16	Finland	7	India	4
Netherlands	13	Japan	6	Hong Kong	4
Mexico	9	Nigeria	5	Guatemala	4
Ireland	9	Greece	5	Austria	3
Hungary	9	Great Britain	5	Turkey	3
Germany	8	Thailand	5	Israel	3
France	7	Singapore	4	China	3

3. Test products.

Researchers have employed a plethora of products while studying country-of-origin. Those products range from general to specific goods covering services and concepts (see Table 4). Moreover, one research even used a fictional product [cf. Chen & Pereira, 1999]. Many studies analyzed several products; often, only one product was used. For instance, Lim and O'Cass, 2001 sought to understand the role of origin information on consumer perception of brands utilizing fashion clothing as the test product. They allege the use of that particular sector due to its large number of successful global brands. Similarly, Crawford and Lumpkin [1993] focused on the specific apparel sector for two reasons. First, apparel appears to be a major category involving developed and developing countries. Second, apparel seems to have been the subject of major advertising campaign showing either the superiority of products made in the USA or the patriotism of buying such products. Furthermore, Hester and Yuen [1987] questioned the actual apparel consumer behavior due to the apparel import statistics showed an accelerated trend to growth and different surveys concluded that most people preferred clothing made in their country. The use of other products is also found in the studies of country-of-origin.

Some other products seem recurrent by researchers while studying country-of-origin. Automobiles (some authors use the term cars instead), TVs, VCRs and other appliances and products for personal use are among them. Johansson et al. [1985] examined the interaction of nationality and other demographic variables of respondents with familiarity and experience with specific products and brands. To accomplish that, they needed a product class as comparable as possible in terms of product variants in the two countries surveyed. Their “natural choice” (pp. 390) were compact automobile models because they could found similar foreign makers with very similar models in both countries, the USA and Japan. Han and Terpstra [1988] decomposition of the country-of-origin construct examined automobiles and TV because these products are frequently bi-national and are relatively well known to the average consumer. They sought those characteristics to research the decomposition of the country-of-origin construct into more simple concepts since the item’s brand name was one of them. In a similar vein, Ahmed and d'Astous [1996] selected automobile and two other products (shoes and TV) to “allow the generalization of results” (pp. 100) and based on “their financial risk, technological complexity, complexity of purchase task and personal involvement” (pp. 100).

The selection of the test products researching country-of-origin seems to comply with particular factors of the research objectives. While the analyses of products range from goods to services, few studies used concepts as test products. In general, researchers have solid bases for the examinations of particular products despite few others mention their reasons. The variety of products used is substantial. Products diversity is ample, from personal (as discussed above) to industrial use. The presence of the country-of-origin effects on the subjects’ evaluation appears to be involved with a wide range of products.

4. Test products brand.

One extrinsic characteristic regularly attached to the test products researching country-of-origin is their brand (see Table 5). However, not every study uses brands in their analysis. Many of them test the products without considering any brand. For instance, the focus in many cases is on the evaluation of the origin of the products regardless of their brand [cf. Bailey & Gutierrez de Pineres, 1997; Insch & McBride, 1998; Olsen & Olsson, 2002; and Schooler, 1965 among others]. Many other times, the brand is linked to a country-of-origin and researches examine the products using a particular brand. From the initial list of 99 studies investigated, 20 use brands for the test products. Interestingly, the large amount of brands is from automobiles followed by TVs and VCRs. As mentioned earlier, researchers have employed such products given the consumers familiarity with them.

TABLE 5

DETAILS OF THE CLASSIFICATION OF PRODUCT-COUNTRY OF ORIGIN STUDIES: TEST PRODUCTS BRAND

Automobiles	
Audi 400, BMW 320i, Chevrolet Citation, Datsun 200SX, Ford Mustang, Honda Accord, Mazda 626, Plymouth Reliant, Toyota Celica, Volkswagen Rabbit	Erickson et al., 1984

Audi 4000 or Audi 80, BMW 320i or BMW 318i, Chevrolet Citation, Datsun 200SX or Nissan Sylvia, Ford Mustang, Honda Accord, Mazda 626 or Mazda Capella, Plymouth K-Car, Toyota Celica, Volkswagen Rabbit or Golf	Johansson et al., 1985
Chrysler Colt, Honda Civic, & Volkswagen Rabbit	Han and Terpstra, 1988
Fiat 28, Honda Civic, Volkswagen Rabbit	Parameswaran and Yaprak, 1987; Yaprak and Parameswaran, 1986
Volkswagen Jetta & Hyundai Stellar	Parameswaran and Pisharodi, 1994
Buses: Nissan, Mitsubishi, & Mercedes-Benz	Stewart and Chan, 1993
Calculators: Canon, Olivetti, Royal	Parameswaran and Yaprak, 1987; Yaprak and Parameswaran, 1986
Cameras: Canon, Leica, Ferraria	Parameswaran and Yaprak, 1987; Yaprak and Parameswaran, 1986
Canned Food: Del Monte, Green Giant, Libby's, & Swift	Gaedeke, 1973
Car Tires: Elkem & Goodyear	Nes and Bilkey, 1993
Cigarettes: Marlboro	Goldberg and Baumgartner, 2002

GE, Samsung, & Sony	Ahmed and d'Astous, 1996
Gold Star	Chao, 1989
Grundig & Sony	Nebenzahl and Jaffe, 1993
Watches: Seiko, Tempomax, Timex	Cordell, 1992

Note: a. Stores names were used as surrogate for shoes.

II. Construct Decomposition

The importance of this major group in the classification of Country-of-origin (COO) studies (see Table 1) is meaningful to the advance in the understanding of the country-of-origin effects. As the research in the area matured, the country-of-origin construct began to be decomposed into more specific elements. The studies here included represent that stream of research. The decomposition of the country-of-origin construct has one of its examples in a product branded in one country while actually is manufactured or designed in another. Although Parameswaran and Yaprak [1987] mention some facets of the country-of-origin construct later taken by Parameswaran and Pisharodi [1994], their research purpose was not to decompose the country-of-origin construct Probably, Han and Terpstra, 1988 are the first to explicitly scrutinize the decomposition of the construct. They concluded that both source country and brand name affect consumer perceptions of product quality. Later, Chao [1993] used the term "hybrid products" refereeing to products made in one country, designed in another and sold in a third one. His study analyzed country of assemble (COA) and country of design (COD) addressing the multidimensionality nature of the construct. The results showed that COA had not significant impact on design quality perception while the COD influenced the perception of quality. Chao's study demonstrated the value of dimensionalizing the country-of-origin construct.

Country-of-origin seems to have several dimensions, but some of them appear to be on the image of the origin country. Attempting to develop and refine a scale for measuring country-of-origin image, Parameswaran and Pisharodi [1994] identify several facets of country-of-origin image. Two of those facets, general country attribute (GCA) and general product attribute (GPA); the third facet was specific product attributes (SPA). The three facets were previously identified as two by Yaprak and Parameswaran [1986] while introducing a deductive, paradigm-integrative approach to study country-of-origin.

It is plausible to delineate the domain of country-of-origin construct in a different fashion as Samiee [1994] attempted. Examining the customer evaluation of products, Samiee [1994] conceptualized three constructs: country-of-origin, country-of-manufacture (COM), and country stereotyping effects (CSE). The introduction of the CSE is done by Samiee due to the then scant research of country-of-origin to form inferential beliefs. He asserts that subjects exposed to country-of-origin cues modify their attitudes toward products. Despite the deconstruction of the country-of-origin is never mentioned by Samiee, al least two of the dimensions examined (country-of-origin and COM) correspond to what others researchers have considered as part of the country-of-origin construct.

The growing literature findings on the decomposition of the country-of-origin construct have kept suggesting the multi-dimensionality of the concept. Ahmed and d'Astous [1996] undertook the division of it into at least two cues: country of design (COD) and country of assemble (COA), following Chao [1993], adding brand name as one of the additional information cues. Brand name was added because seemed often been associated with the brand's corporate headquarters country location. Thus, brand name, COD and COA were argued to be extrinsic cues used by consumers to evaluate products. The study concluded that apparently consumers make a distinction between the COD and COA cues which seem to perform strongly than brand cues; also, it was suggested to include country of parts (COP, researched later by Insch and McBride, 1998). In the meantime, Iyer and Kalita [1997] studied "bi-national products" (pp. 8) bearing a brand name associated with one specific country while its manufacture was done in a third country. They deemed that the country-of-origin construct has two parts, the "Made in" image (country-of-manufacture or COM) and the "country-of-brand origin" (COB) image. Apparently, COM is used in the same fashion as the COA introduced earlier by Chao [1993]. The study tested the impact of both cues on consumer's perceptions of quality, value and wiliness to buy bi-national products. Again, it was found that COM and COB are factors considered by consumer's evaluations of quality and value. Moreover, such factors appear to have a particular effect absenting brand names.

Following the trend of the literature, additional research was further added to the deconstruction of the country-of-origin construct. Both studies by Insch and McBride [1998, 2002] include the same three components of the construct, country of design, country of assembly and country of parts. Country of design (COD) is defined as the country where the product was conceived and engineered. Country of assembly (COA) is the country where most of the product's final assembly was done. Moreover, country of parts (COP) represents the country where the majority of the materials used in the product come from and/or the components parts are made. As expected, the results evidenced that the three components have an effect on consumers' perception of the product overall quality. Finally, Li et al. [2000] examined the effects of global sourcing location and some related factors on consumer's evaluations of product quality decomposing the country-of-origin construct into COD, COA and country-of-corporation (COC).

The decomposition of the country-of-origin construct contributes to the study of consumer behavior presumably simplifying its multidimensionality. However, some of the dimensions proposed seem to have more than a single unidimensionality (for a full list of the components discussed before see Table 6). GCA, GPA, SPA and CSE can be included in that class. In a similar vein, while at least one component (USA branded) specify one country, the rest of them might related to more than one country, i.e. can be used for most of the origin or source countries. Although some authors have used different tags to designate equivalent dimensions, probably COA, COB, COD, COC and COP will prevail for future research. It general, it can be said that there are more advantages in the use of multi-items compared with a single-item to measure a single construct [Churchill, 1979]. Despite the aforementioned, the proliferation of research using country-of-origin continues and seems endless as more studies include diverse aspects of relevance in countries sparse researched.

TABLE 6
DETAILS OF THE CLASSIFICATION OF PRODUCT-COUNTRY OF ORIGIN STUDIES:
CONSTRUCT DECOMPOSITION

Country stereotyping effects (CSE)	Samiee, 1994
Country-of-assemble (COA)	Ahmed and d'Astous, 1996; Chao, 1993; Insch and McBride, 1998, 2002
Country-of-brand (COB)	Iyer and Kalita, 1997
Country-of-corporation (COC)	Li et al., 2000
Country-of-design (COD)	Ahmed and d'Astous, 1996; Chao, 1993; Insch and McBride, 1998, 2002
Country-of-manufacture (COM)	Iyer and Kalita, 1997; Samiee, 1994
Country-of-origin (CO)	Samiee, 1994
Country-of-parts (COP)	Insch and McBride, 1998, 2002
Foreign branded	Han and Terpstra, 1988
General country attribute (GCA)	Parameswaran and Pisharodi, 1994
General product attribute (GPA)	Parameswaran and Pisharodi, 1994
Specific product attribute (SPA)	Parameswaran and Pisharodi, 1994
USA branded	Han and Terpstra, 1988

III. Cross-Cultural/National Generalizability

Relevant to the study of COO is the cross-cultural/national generalizability of the findings included in this major group. It can be said, that by definition, all studies considering COO have a cross-cultural/national elements since at least two countries are analyzed, the source and the consuming countries. However, studies here considered attempted to compare results from different cultures and/or nations crucial to make meaningful comparisons across them [Malhotra, Agarwal, & Peterson, 1996]. Such research has used culture or a nation as its main independent or dependent variable but not as an extraneous and/or residual variable [Nasif, Al-Daeagj, Ebrahimi, & Thibodeaux, 1991]. Generalizability refers to the degree to which a study based on a sample applies to the population as a whole [Malhotra, 1999]. In general, the term reefers to the classical theory of generalizability where there is an emphasis on parallel tests assuming that measurement conditions are equivalent [Rentz, 1987]. The CETSCALE was initially developed with the intention “to measure consumers’ ethnocentric tendencies related to purchasing foreign- versus American-made products” [Shimp & Sharma, 1987, pp. 281]. However, the limitation of the generalizations beyond the samples and countries have been noted by Netemeyer et al. [1991].

IV. Research in Related Areas

Studies using COO as a base to undertake related studies are found in this major group of foreground studies. From the studies investigated, four related areas have been detected (see Table 1). Stereotyping refers to consumers common notions about people in other countries [Khanna, 1986]. Furthermore, stereotypes can be schemas formed on less objective bases such as attributes that are inferred, context dependent, and vary across the consumers’ classification of products [Maheswaran, 1994]. Also, product country images have been considered as product country stereotypes [Almonte et al., 1995]. Ethnocentrism can be defined as the beliefs to view purchasing foreign products as wrong because it hurts the domestic economy, causes job loss, and is unpatriotic [Durvasula et al., 1997;

Shimp & Sharma, 1987]. Animosity is defined by Klein, Ettenson, and Morris [1998] "as the remnants of antipathy related to previous or ongoing military, political, or economic events" (pp. 90) affecting consumers' purchasing behavior of products originated from a country with that resentments. Although brand is a very well known concept in marketing, its use with COO is commonly seen. Under that conception, brand is envisaged as an identification of a product to differentiate it from competitor offerings. However, recent studies use country of origin of brands as part of the research question. All the research areas encompassed in this group have particular contributions to the advancement of COO knowledge and help to understand better their effects in the international marketplace. In general, the studies included in this major group use country-of-origin as a basis to understand other phenomenon.

The related areas of research using COO as a framework help to explain several lacunas observed in international marketing. In many regards, it is possible to elucidate that the related areas here considered are not unique whereas the field is fertile. Similarly, these related areas of study are not exclusive and can be seen in other marketing studies (i.e. brand studies). It can be expected the inclusion of more related areas to the study of the COO effects as the field progresses.

Conclusion

The purpose of this paper was to introduce a classification of the country-of-origin research. The classification includes areas that cover aspects used by researchers while studying country-of-origin directly or as a base or support for other studies. As one of the classes, foreground studies have been scrutinized resulting in four major groups. Despite the generalized finding that country-of-origin is an effect present in almost every consuming country, there is still research needed to understand many of its effects on different consumers. Studying country-of-origin needs products originated in either the domestic market or international. The sourced countries studied represent a good amount of the countries. On the other hand, the consuming countries researched are only a small part having the opportunity to continue using them or adding other countries as the globalization reaches them. Many countries form Central and South America, Africa, and Asia are in that case.

As the globalization continues, the persistent presence of products designed, manufactured, produced, branded, and or with parts from different countries opens a good opportunity to research hybrid products. Additionally, the brands and store nationality could be added to the process. Although most of the researchers recognize the effects of country-of-origin on consumers' behavior, their generalization and specific effects are still controversial. Despite the large number of studies done, the country-of-origin effect is somehow generalizable, but much is still needed regarding the direction or intensity. Similarly, country-of-origin can be used to research related areas where much is yet needed. Understanding stereotyping, ethnocentrism, animosity and brands opens a vast door. Notwithstanding some of these have been studied extensively such as brand and stereotyping, the other two are relatively new.

Managers and marketers are each day more aware of the needs and perceptions of the consumers. Firms are investing and producing overseas. Then, they need to discover the best way to satisfy customers knowing their attitudes, perceptions and behavior. It seems that such tendency will draw the difference between survival and failure.

Exploiting Managing Relationships with One's Customers (CRM) for Improving the Competitive Ability of Manufacturers in Stagnating Markets

Vratislav Kozák
Tomas Bata University in Zlin, Czech Republic

Abstract

On the basis of a description of the essence and functions of Call Centres and Marketing Communications as applied in Z ELEKTRO, the intention was to carry out some research that would enable the extrapolation of conclusions as to the role these factors play in the attainment of competitive advantage and competitive capabilities. The research study was oriented on tracking changes in the management of Pre-Sales, Sales, and Post-Sale activities – and furthermore, on determining whether CRM is understood as an entrepreneurial philosophy by the enterprise as a whole, or only by the Commercial Sales Department. The author eliminated all other external and internal influences in order to be able to precisely determine the actual contribution made by marketing activities towards increasing the competitive ability of this enterprise.

Introduction

Competition on global markets today is an ever increasing phenomenon. The sale of products or services is evermore difficult, and enterprises are therefore forced into seeking new ways of persuading potential customers that their product is the best. Successful managers, including Mr. Jan Mühlfeit – the Managing Director of the Czech branch of Microsoft, point out that the basis of successful sales is grounded in constant cooperation with previously acquired customers. Our research endeavours at this stage were therefore oriented towards discovering the actual level of the relationship between Sales and customs in Czech enterprises and its influence on increasing Sales figures.

In periods when there is a surfeit if customers, and when it is not difficult for an enterprise to gain additional ones, mean that the pressure to take good care of one's customers is low. The significance of CRM grows in direct proportion to increases in competition and the correlated difficulty in gaining new customers and maintaining existing ones. The perception of the term CRM (Customer Relationship Management) has stabilised its meaning in the sense of an entrepreneurial strategy for the selection and management of the most "valuable" relationships with one's pro customers. CRM is therefore, an entrepreneurial philosophy and company culture oriented towards its customers, and which supports effective marketing, commercial and service processes. CRM is the means in which an enterprise behaves to its customers, how they maintain their relationship with those customers, and how they exploit these relationships to the mutual benefit of both themselves and their customers.

This case-study is concerned with the implementation of CRM in purely Czech commercial enterprises, and serves to demonstrate certain positive and even negative aspects regarding their approach and attitude towards their customers.

1. This analysis of the contemporary approach to customers investigated the following aspects:

a) Directly within the Z ELEKTRO Company: In the course of Departmental meetings held within the Commercial Sales Department; tracking the work of the telephone operators working within the Call Centre; in the course of operator selection procedures – drawn from the ranks of students of the Faculty of Management and Economics, UTB in Zlín; and the evaluation of printed materials prepared for distribution as well as the selected means of distribution.

b) External to Z ELEKTRO: It verified the quality of the work of the telephone operators by means of mock calling-in as well as verifying reactions to e-mail messages; it tracked the reliability of the distribution of special offer/discount catalogues to personal mailboxes; and verified the quality of ordering and collecting goods directly from the enterprise's stockrooms as well as the ordering and delivery of goods from outside the environs of Slain itself, within a radius of cca 50 km from the town.

c) It also analysed discussions of the outcomes of the investigations with the management of this enterprise, as well as tracking interviews held with the company's personnel employed in the Call Centre. Further, it considered both wholesale and retail outlets in the course of purchasing goods to meet personal needs and purchases at a distance.

2. The setting-up of the Call Centre

Z ELEKTRO reacted to increasing competition seen after 1995 among purveyors of electrical consumer goods on the Czech markets by establishing its PROTON customer care centre (Call Centre). As soon as customers receive the Monster (special, extended), PROTON Catalogue, they should discover upon reading the basic information it contains that they have at their disposal a Customer Call Centre, in which professionally trained Sales staff are able to advise them and to respond to any potential questions pertaining to the goods included in the catalogue, and that this service is provided on a "toll-free" telephone number. Furthermore, the Sales staff organises the deliveries of the selected goods to the nearest (to the customer) retailer's Salesroom, or eventually, they will organise its delivery C.O.D. (Cash on Delivery), or alternatively, will arrange appropriate hire-purchase contract details.

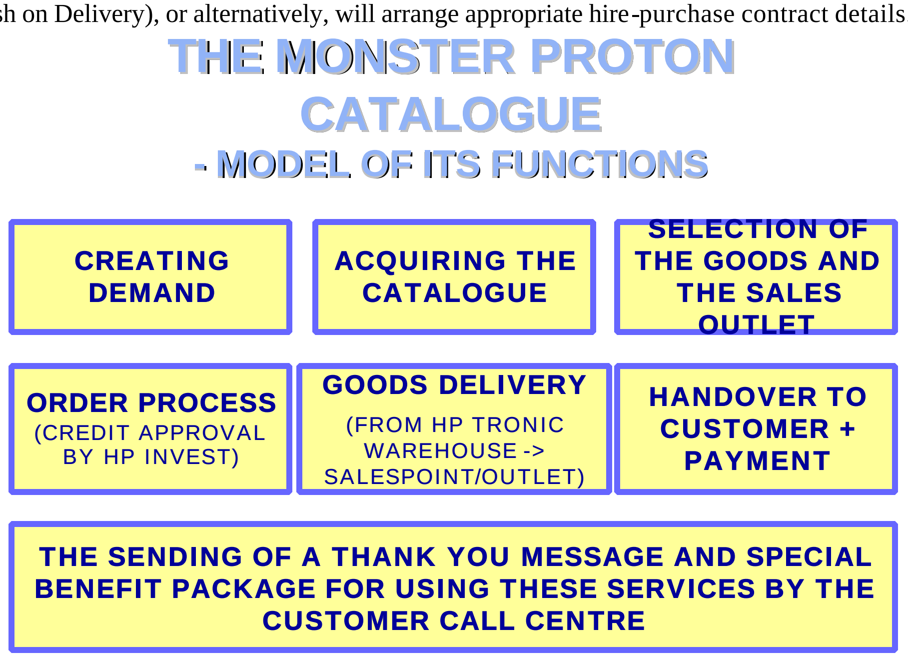

FIG. 1: THE APPEARANCE OF THE **M**ONSTER **P**ROTON **C**ATALOGUE (**MPC**)

Full coloured print on high-quality paper.

- 260 pages.
- 1,500 products.
- Product range – electronic and electrical goods, telecommunications products, photographic products, large and small-scale household electrical goods.
- Arranged according to product type and parameters.
- Advisory service and description of the system.
- List of contact details and addresses of retail outlets.

A further task of the employees of the Call Centre is to elicit the maximum information possible from customers and to register the customers´ product interests, whether or not they have already purchased anything from the company, their domicile, their educational background, type of employment, and eventually – what their social standing is, or how many children they have. It goes without saying, that all of this data is recorded only with the consent of the customer. The whole of the working collective of the Call Centre are supported by a specialised software package and computer network, which not only enables on-line searches, but also allows the checking of the current availability of products in stock in Z ELEKTRO´s warehouses, as well as the stock positions of the associated retail outlet network.

The decisive key to the quality of the services provided by the Call Centre is, of course, the people employed there. In the course of the selection procedure for appropriate candidates to work as telephone operators in this Tele-Marketing field, a basic principle held is that the first contact must take place over the telephone. This is because the fundamental attributes requisite for working as a telephone operator are their voice, its modulation and tone, level of courtesy, clarity of comprehension, delivery speed, and pronunciation. Other specific requirements for this field are, for example, previous experience with Tele-Sales, the ability to carry out so-called "Cold-Calling" (i.e. calling up a person who is not anticipating such a call), detailed product knowledge, or even such a prosaic skill as the ability to fluently communicate with someone over the telephone while simultaneously taking notes. It goes without saying that PC skills are essential, as are an eventual knowledge of the specialised SW packages used.

The basic aim of the PROTON project: Is to attract to its retail salesrooms those customers who would otherwise have ended up going to other market segments (i.e. Hypermarket chains like Makro, Triangl, Elekrocity, etc.)

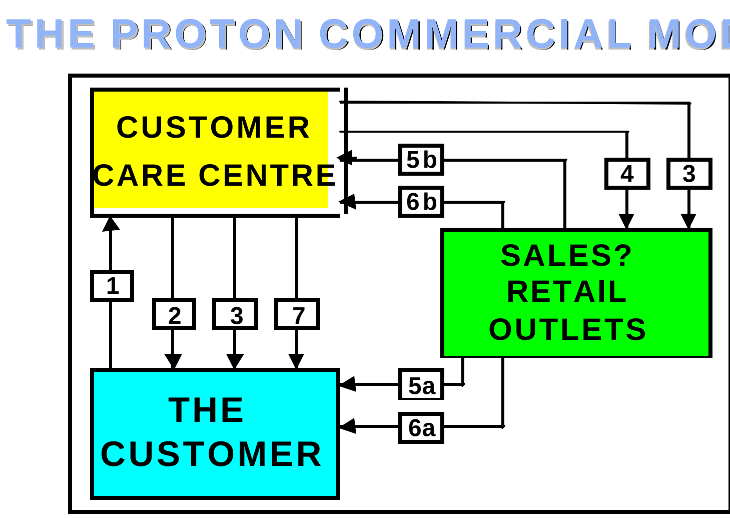

FIG. 2: THE PROTON COMMERCIAL MODEL

0. Demand Creation.
1. The customer contacts the PROTON **C**ustomer **C**all **C**entre (**CCC** => **3C**). Contact is via e-mail or toll-free call lines on the basis of a reaction to the stimuli – i.e. the catalogue, other advertising).
2. The **3C** collects data from the customer, enters this into the database, and accepts/creates actual orders.
3. The **3C** allocates the customer a concrete person who will be in contact with them from the „bricks and mortar“ sales outlet (i.e. **C**oncrete **C**ontact **P**erson => **CCP**)
4. The **3C** informs the **CCP** about the customer (and in parallel, checks on the availability of the goods).

5a The **CCP** contacts the given customer and agrees an appropriate solution to the customer's requirements.

5b A copy of the "contact" (news about such a contact) is sent by the **CCP** to the **3C.**

6a The **CCP** resolves the customer's requirements.

6b The **CCP** passes on a report to the **3C** about the way in which and deadline for the resolution of the customer's requirements.

7. The **3C** contacts the customer again, and asks them whether they were satisfied with the service provided, or whether they have any comments or suggestions to make, and offer them the Benefit Package, or eventually, the PROTON Guarantee.

Their Motto is: "There's no need to come to us, we will bring the goods to you, plug them in, demonstrate their functions, and we even take away the old product(s), or offer you a "Trade-in/Buy Back" scheme."

Evaluation of the functioning of the Call Centre

In the course of tracking the working practices of the operators directly within the Call Centre, they demonstrated their ability to react rapidly and promptly to enquiries as well as to complaints from potential customers. Customer dissatisfaction was mainly due to the delivery deadlines of the **M**onster **P**ROTON **C**atalogue (**MPC**). The customers had ordered one, but delivery (**C.O.D**. = **C**ash **O**n **D**elivery) depended on a sufficient number of orders being received beforehand. The fault lay in the delay caused by waiting for a greater number of orders in order to take advantage of discounts for bulk postage offered by the Czech Postal Services. In 2002, the catalogues were sent out by Recommended Letter accompanied by a pre-printed Postal Order for its payment. Approximately 50% of the customers paid. It is recommended that the **MPC** (catalogue) be sent out free-of-charge, in order to reduce administrative complications.

On conclusion of the telephonic verification of the working practices of the Call Centre, I can state that the practices of the operators were up to the anticipated level. My comments and recommendations were directed to the loudness of the music on the call-waiting function, as well as to its (inappropriate) orientation (it was clearly "Techno"). My suggestions that this music be more main-stream were accepted, since the clients of the Call Centre do not in the main belong to the adolescent generation. Responses to e-mail messages took circa one hour.

The free Z ELEKTRO flyers were delivered to my classic mailbox in good order. I was not however, contacted by letter (Direct Mail), even though I am a Z ELEKTRO cardholder.

3. Ordering and picking up goods from the company's warehouses

I expressed my interest in an electrical appliance to meet the needs of my family in the Call Centre itself. The employees were very willing and capably advised me as to the appropriate selection and assured the reservation of the goods directly from the Warehouse. At the warehouse, they processed my order and gave me the goods despite this taking place at the same time when they had to organise large deliveries for some of their larger customers. The invoicing and filling out of the Guarantee was performed in due order.

A disadvantage though, is the location of this warehouse within the environs of the (former) SVIT site. The customer is forced to prove their identity to the Security personnel several times, and to detour round private lots. Getting to the building, which is easily visible from outside the perimeter is complicated. Z ELEKTRO have leased two floors of this building, the others are not exploited by the building's proprietors. I do not consider it to be particularly felicitous that, on a building that is clearly visible from the main thoroughfare of Zlín, (i.e. Tr. T. Bata; Tr = Avenue), and directly below the Z ELEKTRO logo and billboard, hangs an advertising panel saying "Rooms To Rent". To the uninitiated, this advertising panel could cause the impression that Z ELEKTRO have got into financial difficulties, and have had to rent out floor space that they might have been using themselves at some time in the past.

4. Ordering and picking up goods from outside Zlín

After my positive experience with the practices of Z ELEKTRO, I ordered an automatic washing machine for my parents, who live in a village some 50 km outside Zlín. This was delivered by an employee of a transport company the day after they had received my order. However, he refused to carry it to the requisite place in the house where it should have stood, and equally resolutely refused to plug it in and connect it up, on the grounds that his job was simply to deliver the goods. I had to got here myself a day later, and with the assistance of a schoolmate, carry the washing machine to its proper location, and take away the old one. Then, I had to spend a lot of time studying the connectors of the washing machine, since this was the first time in my life that I had done such an activity.

5. Verification of the validity of the scientific method and outcomes

The chosen methods were shown to have been valid. The opportunity to be able to be engaged in the actual setting up of f the Call Centre, and at the inauguration and inception of its activities proved to be exceptionally advantageous to the research investigations. I had the opportunity of being acquainted with the conceptions and notions of the General Manager, and the fulfilment of the same directly within the enterprise as well as outside grounds of the enterprise. I consider the verification of the activities of the Call Centre by means of my own telephonic exchanges with them and their reactions to my email stimuli as being highly important. The practical verification of the introduction and implementation of the new CRM system within this enterprise was by means of the actual purchases from the company warehouse and the ordering of the automatic washing machine for a location outside Zlín.

6. Establishment of the hypothesis governing the level of approach and attitude to Z ELEKTRO`s customers and its verification in practice

In the course of formulating this hypothesis, I based myself on the preceding research conducted into the enterprise Z ELEKTRO in which it was determined that this company is situated on the borderline/interface between a transactional and a relational conception of entrepreneurial activity with a predomination of the elements of a relational approach.

The individual elements of both approaches are shown below as follows, and they are numbered as sub-hypotheses (1-7). In the course of the verification of the outcomes with the hypotheses, it will either be confirmed or else refuted whether the enterprise is noted for its predominantly relational approach.

TRANSACTIONAL APPROACH:	RELATIONAL APPROACH:
1. An orientation on “One-off” Sales.	An orientation on customers and maintaining them.

This hypothesis was confirmed in the case of large-scale customers. Customers who order goods from the Monster Catalogue are simply not contacted again. This error also holds true for owners of the Z ELEKTRO loyalty card.

2. A discontinuity in contacts with customers.	Continual contact or dialogue with one’s customers.

Continual dialogues are less likely to be led. There is an effort to communicate and to maintain key customer through the intermediary of the Commercial (Sales) Department. The reduced number of operators in the Call Centre does not enable the holding of continual dialogues with all of the customers.

3. An emphasis on the characteristics of the product.	An emphasis on the customer’s perceived values.

This research was carried out in a commercial enterprise which has the possibility of influencing its product range, and thereby the characteristics of the products. Special offer leaflets are however oriented predominantly on price-led competition (price-cutting) rather than on the values perceived by the customer. This hypothesis was therefore refuted.

4. A short-term approach.	A long-term approach.

This hypothesis was only partially confirmed. For small-scale customers, a short-term approach holds true; a long-term approach only holds true for significant, large-scale customers.

5. Little emphasis on Customer Service.	Large emphasis on Customer Service.

This research study showed that the After-Sales Service is a great weakness for this enterprise. Everyday matters like connecting up the product, demonstrating its functions, and the carrying away of old, obsolete appliances is not included in contractual arrangements with the transporters. This hypothesis was therefore refuted.

6. Little effort to fully satisfy the customer’s expectations.	Great efforts to fully satisfy the customer’s expectations.

This hypothesis was not confirmed predominantly due to the incorrect approach applied by the employees of the contractual transport company or companies.

7. Quality issues are the domains of production department employees.	Quality issues are the domains of each and every employee.

This hypothesis was only confirmed in full for employees of the Call Centre and the warehouse in Zlín itself. As regards salespersons in the Z ELEKTRO chain, this is more-or-less true; for the contractual transporters, this does not hold true.

In aggregate, it is possible to state after evaluating the outcomes of the sub-hypotheses that Z ELEKTRO is situated on the borderline/interface between a transactional and a relational conception of entrepreneurial activity with a predomination of the elements of a transactional approach.

Therefore, the original hypothesis that a relational approach predominates was not confirmed, and that this was predominantly "by rights" due to the "services" of the contractual transport companies.

Conclusion

The establishment of a contact centre in the enterprise Z ELEKTRO is one of the first steps towards increasing the competitive abilities of this enterprise. It is necessary that this project be continuously evaluated and subsequently correspondingly corrected. An essential condition is a sustained endeavour to attain a "zero tolerance" level towards errors. The seeking out of errors should not however become a hammer dangling over the employees of the Call Centre; otherwise the employees will not identify themselves with the goals of this activity. The goal must be the complete satisfaction of the customer, who will make full use of the offered "Club" benefits and thereby will become a long-term customer of this enterprise.

The enterprise must realise that the relationship with its customers is not simply built by the employees of this enterprise who are already at the requisite level. Their best endeavours can simply be turned to dust by the employees of the contractual transport companies, who SIMPLY ONLY deliver the goods, and all the rest simply does not interest them.

The creation of a CRM system in this enterprise is not simply a momentary fashion issue, but the necessity to survive in a (highly) competitive environment. The customer's requirements over the last five years in the Czech Republic have escalated to a significant extent, and this trend will only continue.

Local enterprises are already feeling the pinch of an insufficiency of capable employees able to work in the Customer Services Department and are beginning to realise that they must orient their strategies more towards better recruitment practices, better training, and better reward systems for their (good) employees.

In the future, successful organisations will those that:

- Readily understand that customers have differing requirements for services.
- Segment their customer-base to a greater degree than is now the case.
- Establish the correct investment strategy for developing their human resources and technology-base.
- Ensure the provision of Top Quality services.
- Enforce Customer service as a component of the overall evaluation of their enterprise.

From the above-mentioned conclusions, it is clear that the employees of Z ELEKTRO know and observe the principles of courtesy, and approach the fulfilment of customers' requirements in a responsible manner. However, other employees in the frontline escape such controls, and these are those working for the contractual partners as transporters. The delivery and unloading of washing machines, freezers and fridges and getting them up and running is nothing unusual. Equally, the taking away of obsolete appliance is becoming an evermore-commonplace occurrence.

Z ELEKTRO are fully aware of the competition on the market with electrical appliances and goods, and are endeavouring to accommodate customers` requirements, and to enable the benefits of ordering from the comfort of one's own home with the assistance of catalogues and leaflets. In comparison with the best (in this field), it has been shown that their weakness is in their After-Sales Service.

Entrepreneurial Identity and Personality Types

Vesa Routamaa
Anna-Leena Rissanen
University of Vaasa, Finland

Abstract

In promoting entrepreneurship, the importance of the personality of the potential entrepreneur is usually ignored. This study focuses on the question "What kind of entrepreneurship is appealing to business students?" Especially the students' personality as a predictor of entrepreneurial identity is concerned. Jungian-based Myers-Briggs Type Indicator was used to measure the personality types. The sample consisted of 283 students, who were rating those entrepreneurial identities that they found attractive or less attractive. Nineteen different types of entrepreneurial identities, e.g. businessman-, inventor-, co-operative- and team-entrepreneur, were possible to rate by the observations. The results indicated that business students in Finland would favor team-entrepreneur, trainer/consultant, manager, and businessman identities. By personality, each of the identities is favored or disfavored by quite different personality types. That is, when trying to focus on different educational systems, the results can be useful.

Introduction

There are a number of assumptions, beliefs and even cases of 'confident knowledge' about entrepreneurial attitudes, intentions and prerequisites, but in reality, knowledge about these matters is based more on suppositions than on real knowledge. At macro level, research should be used to examine the structural aspects of entrepreneurship to direct the development efforts in a proper way. At micro level, it would be appropriate to combine a survey on entrepreneurship potential of students, which partly explains the background and favors positive attitudes towards entrepreneurship or a wage-earner work culture. That is, on the one hand, contributing the development of entrepreneurship requires surveying existing entrepreneurial attitudes and entrepreneurship potential to know the starting points. On the other hand, developing entrepreneurship requires creating a positive cultural climate and structural prerequisites for entrepreneurship. It is possible, of course, to implement development programs separately especially at macro level, but development means are often 'a shot in the dark' if the starting point and the essential effect and cause relations are not known. At its best, a survey of entrepreneurship potential, and in this case the entrepreneurial identity of university business students, clarifies the components of entrepreneurship potential to understand the attitudinal climate and entrepreneurial readiness. Especially, the number of academic entrepreneurs has been alarmingly small in many countries, not least in Finland. Therefore, this study focuses on the entrepreneurial identity of university business students. [11]

There are several systems, projects and training courses to enhance new venture creation. There are results, too, but not very accurate knowledge about them. An entrepreneurship profile, based on survey of potential, serves for better planning and focusing of these activities. It is possible to identify special characteristics and target groups through this survey and thus direct development activities towards 'right' targets. Through considering entrepreneurial identities (e.g. in subcontracting, franchising, agribusiness), it is possible to focus research, training and other development activities for example on woman entrepreneurship, academic entrepreneurship, on so-called marginal entrepreneurship and rural entrepreneurship and more generally on micro and service entrepreneurship taking special characteristics into account. Entrepreneurship profiles can be exploited with their information about attitudes and facts for entrepreneurship education and for information, coaching and training focusing on special groups. [11]

Entrepreneurial Identity

When trying to explain entrepreneurship there have usually been two different aspects. The role of environment has been one of the key words to explain entrepreneurship. Other studies, instead, have focused on finding the differences between entrepreneurs and non-entrepreneurs. Previous studies have indicated some results of this subject but they have mostly ignored the personality aspect. In this study, the role of the environment has not been forgotten but we focus on the association between entrepreneurial identity and personality. The main aspect is to study the appearing of entrepreneurship among business students and the influence of the personality on the entrepreneurial identity.

The definition of entrepreneurship often includes the idea of new venture or enterprise creation. It is also well established that an entrepreneur as an individual differs from other people somehow. For instance, Gartner [2] describes the creation of new ventures as an interaction of several factors: personal characteristics of the entrepreneur (individual), competitive entry strategies (organization), push and pull factors (environment) and the action the entrepreneur takes (process). Schumpeter [16] also indicated that becoming an entrepreneur requires tendencies that are unique. McClelland [7] suggested that, for example, a high need of achievement, risk-taking ability, preferences for challenge, acceptance of personal responsibility and innovativeness are the characteristics of an entrepreneur. Other traits that are found to describe entrepreneurs are for instance tolerance of ambiguity and internal focus of control [1]. One of the attempts to create an entrepreneur typology was Smith's [17] theory in which he separated entrepreneurs from each other based on differences in job descriptions and characters. Smith's categories were craftsmen and opportunistic entrepreneurs. Stanworth and Curran [18] further developed the rough typology of Smith and started to call their types identities. Types of entrepreneur differ also in strategic-level goal setting [14].

The majority of the studies dealing with entrepreneurship and personality have focused on finding one description of entrepreneurs, or characteristics, which are typical of entrepreneurs. However, these studies have mainly ignored the fact that the entrepreneurs of different fields, or the different forms of entrepreneurship, might be connected with different characteristics or traits. In other words, there might be, not only one ”true” personality of entrepreneur, but also many personalities, which might favor different forms of entrepreneurship. Also the entrepreneurs' for example, orientation, to networking [15] or internalization [13] differ from each other depending on personality type. An enterprise can actually take multiple forms requiring more or less of training and various skills, like those of an expert entrepreneur, farmer entrepreneur, entrepreneur in a co-operative movement, scientist entrepreneur, venture capitalist, franchising entrepreneur, partner entrepreneur, businessman, shopkeeper, intrapreneur etc. – there is a good number of alternatives. It is not necessary for an entrepreneur or the founder of an enterprise to have all skills, since it is possible to outsource sub-functions, to purchase from a network or from a joint venture, subcontract etc. 'In a very basic form all you need is a mobile phone and good organizing skills.' It is very important to correct misunderstandings particularly in the case of youngsters. Practical training and apprenticeship training could be used with other general education to correct views. [11] It can be concluded that the personality structure of entrepreneurs differs from general population [13,15] but also entrepreneurs differ from each other and different personality types favor different entrepreneurial identities.

People who gained an academic degree can naturally work as entrepreneurs in different sectors just like other citizens. It is appropriate, however, to activate the entrepreneurial intentions of those with higher education through special actions. It is reasonable to identify those industrial sectors, entrepreneurship identities and enterprise forms (e.g. network and virtual enterprises and joint ventures), where the threshold is lowest for academic people to start up a business. Developing academic entrepreneurship is naturally a complex problem relating for example to selection, curriculum, practical training and general cultural values (e.g., many parents generally guide their children to make a choice of a secure career in the public sector). Integration of intrapreneurship, creativity, innovativeness and new business development into studies to a larger extent provides a stronger basis for entrepreneurial know-how. Furthermore, it may be mentioned, also by combining the implementation of national and regional development projects more concretely with the research and teaching activities of universities, it is possible to lower the threshold of university graduates to become entrepreneurs. Arrangements like science parks with their incubation centers and research assignments (traditional as well as action-research type of projects) serve well this purpose of objectifying needed business know-how. [11]

Personality Types

There are several ways to conceptualize and assess personality. In this study, the Myers-Briggs Type Indicator (MBTI) was used. It is based on Carl Jung's theory of psychological types and it reports personality preferences on four scales: Jungian Extraversion – Introversion, Sensing – iNtuition, Thinking – Feeling, and the Judging – Perceiving preference added by Briggs and Myers. According to Myers [10] *'the MBTI is primarily concerned with the valuable differences in people that result from where they like to focus their attention, the way they like to take information, the way they like to decide, and the way they like to adopt'.* Usually one pole dominates over another. The eight preferences are identified in sixteen types, each representing a certain preference order [9]. Briefly illustrated the preferences or dimensions are [10]:

Extraversion (E)	Interested in people and things in the world around them.
Introversion (I)	Interested in the ideas in their minds that explain the world.
Sensing (S)	Interested in what is real and can be seen, heard and touched.
Intuition (N)	Interested in what can be imagined and seen with 'the mind's eye'.
Thinking (T)	Interested in what is logical and works by cause and effect.
Feeling (F)	Interested in knowing what is important and valuable.
Judging (J)	Interested in acting by organizing, planning, deciding.
Perceiving (P)	Interested in acting by watching, trying out, adapting.

As stated by Myers & McCaulley [9], *"according to theory, each of the 16 types results from a preference for one pole of each of the four preferences over the opposite pole. A preference of any dimension is designed to be psychometrically independent of the preferences of the other three dichotomies, so that the preferences on the four dichotomies yield sixteen possible combinations called types, denoted by the four letters identifying the poles preferred (e.g., ESTJ, INFP). The theory postulates specific dynamic relationships between the preferences. For each type, one process is the leading or dominant process and a second process serves as an auxiliary. Each type has its own pattern of dominant and auxiliary processes and the attitudes (E or I) in which these are habitually used. Determining these dynamic relationships is enabled by the J-P dichotomy of the MBTI. The characteristics of each type follow from the dynamic interplay of these processes and attitudes"*.

In order to interpret the association between type and entrepreneurial identities, the types are next briefly illustrated |9].

ISTJ	Quiet and serious. Succeed through concentration and thoroughness. Practical, orderly, matter-of-fact, logical, realistic, and dependable. See to it that everything is well organized. Take responsibility. Make up their own minds as to what should be accomplished and work toward it steadily, regardless of protests or distractions.
ISFJ	Quiet, friendly, responsible, and conscientious. Work devotedly to meet their obligations. Lend stability to any project or group. Thorough, painstaking, accurate. Their interests are usually not technical. Can be patient with necessary details. Loyal, considerate, perceptive, concerned with how other people feel.
INFJ	Succeed by perseverance, originality, and desire to do whatever is needed or wanted. Put their best efforts into their work. Quietly forceful, conscientious, concerned for others. Respected for their firm principles. Likely to be honored and followed for their clear visions as to how best to serve the common good.
INTJ	Have original minds and great drive for their own ideas and purposes. Have long-range vision and quickly find meaningful patterns in external events. In fields that appeal to them, they have a fine power to organize a job and carry it through. Skeptical, critical, independent, determined. Have high standards of competence and performance.

ISTP Cool onlookers, quiet, reserved, observing and analyzing life with detached curiosity and unexpected flashes of original humor. Usually interested in cause and effect, how and why mechanical things work, and in organizing facts using logical principles. Excel at getting to the core of a practical problem and finding the solution.

ISFP Retiring, quietly friendly, sensitive, kind, modest about their abilities. Shun disagreements, do not force their opinions or values on others. Usually do not care to lead but are often loyal followers. Often relaxed about getting things done because they enjoy the present moment and do not want to spoil it by undue haste or exertion.

INFP Quiet observers, idealistic, loyal. Important that outer life be congruent with inner values. Curious, quick to see possibilities, often serve as catalysts to implement ideas. Adaptable, flexible and accepting unless a value is threatened. Want to understand people and ways of fulfilling human potential. Little concern with possessions or surroundings.

INTP Quiet and reserved. Especially enjoy theoretical or scientific pursuits. Like solving problems with logic and analysis. Interested mainly in ideas, with little liking for parties or small talk. Tend to have sharply defined interests. Need careers where some strong interest can be used and useful.

ESTP Good at on-the-spot problem solving. Like action, enjoy whatever comes along. Tend to like mechanical things and sports, with friends on the side. Adaptable, tolerant, pragmatic; focused on getting results. Dislike long explanations. Are best with real things that can be worked, handled, taken apart, or put together.

ESFP Outgoing, accepting, friendly, enjoy everything and make things more fun for others by their enjoyment. Like action and making things happen. Know what's going on and join in eagerly. Find remembering facts easier than mastering theories. Are best in situations that need sound common sense and practical ability with people.

ENFP Warmly enthusiastic, high-spirited, ingenious, imaginative. Able to do almost anything that interests them. Quick with a solution to any difficulty and ready to help anyone with a problem. Often rely on their ability to improvise instead of preparing in advance. Can usually find compelling reasons for whatever they want.

ENTP Quick, ingenious, good at many things. Stimulating company, alert and outspoken. May argue for fun on either side of a question. Resourceful in solving new and challenging problems, but may neglect routine assignments. Apt to turn to one new interest after another. Skillful in finding logical reasons for what they want.

ESTJ Practical, realistic, matter-of-fact, with a natural head for business or mechanics. Not interested in abstract theories, want learning to have direct and immediate application. Like to organize and run activities. Often make good administrators; are decisive, quickly move to implement decisions; take care of routine details.

ESFJ Warm-hearted, talkative, popular, conscientious, born co-operators, active committee members. Need harmony and may be good at creating it. Always doing something nice for someone. Work best with encouragement and praise. Main interest is in things that directly and visibly affect people's lives.

ENFJ Responsive and responsible. Feel real concern for what others think or want, and try to handle things with due regard for the other's feelings. Can present a proposal or lead a group discussion with ease and tact. Sociable, popular, sympathetic. Responsive to praise and criticism. Like to facilitate others and enable people to achieve their potential.

ENTJ Frank, decisive, leaders in activities. Develop and implement comprehensive systems to solve organizational problems. Good at anything that requires reasoning and intelligent talk, such as public speaking. Are usually well informed and enjoy adding to their fund of knowledge.

In addition to the types, the dimensions (E, I, S, N, T, F, J, P) illustrated above as well as the pairs (EN, NT, ST, etc.) of the personality in relation to entrepreneurial identities will be analyzed.

Method

The sample consisted of 283 business students, 144 males (50,9 %) and 139 females (49,1 %). Most of the respondents were ESTJs (20,9 %), ENTJs (13,1 %), ISTJs (9,9 %) or ESFJs (9,9 %) by their personality types. The most rare types in the sample were INTJs (1,4 %), ISTPs (1,4 %) and INFJs (1,8 %). Respondents preferred more Extraversion (74,9 %) than Introversion (25,1 %), more Sensing (55,1 %) than Intuition (44,9 %), more Thinking (61,5 %) than Feeling (38,5 %) and more Judging (68,6 %) than Perceiving (31,5 %). The distribution of personality types and preferences in the sample is illustrated in Table 1.

Procedure

A Finnish research version of Myers-Briggs Type Indicator (Form F) was used to assess personality type, and completing it was voluntary. The Selection Ratio Type Table (SRTT) was used to compare the distribution of types in certain entrepreneurial identity groups. SRTT was devised by Isabel Myers as a way of displaying the distribution of types within a sample and for comparing different samples. It makes either chi-square or Fisher's test depending on the number in each cell. If the Index (I) is greater than 1 the proportion in the sample is smaller than the proportion in the base. [8]

To clarify the entrepreneurial identity of business students, they were asked to respond to the questionnaire of entrepreneurial potential. They were supposed to think of themselves as entrepreneurs and answer how they saw themselves as potential entrepreneurs. Answers were given on the Likert scale (strongly disagree, slightly disagree, not disagree/agree, slightly agree, strongly agree). Respondents evaluated themselves as 19 different kinds of entrepreneur types or identities as listed below. Respondents who evaluated themselves as being most (over the mean) of each type of entrepreneur were transferred to the SRTT-table. The 19 different kinds of entrepreneur types or identities to be chosen are:

?? Agent/representative (Represent and sell products to customers against a sales commission),
?? Businessman (A work based business and scenting different transactions),
?? Businessman in team (Works in a team of 1 to 3 other entrepreneurs in a shared enterprise),
?? Co-operative entrepreneur (Sharing co-operative),
?? Franchising entrepreneur (Enterprising based on a franchising contract),
?? Farmer/forest entrepreneur (An enterprise based on running one's own farm or forestry),
?? Handicraft entrepreneur (A business based on the production or selling using one's own handicraft skills),
?? Innovator (An enterprising based on different new technical innovation produced by the entrepreneur),
?? Manager (Managing one's own company employing several people),
?? Net marketer (Sells products via or through acquaintance),
?? Part-time entrepreneur (Carrying on business in addition to paid work),
?? Restaurant entrepreneur (Running food, dancing or other restaurant),
?? Scientist (Commercializing one's learning and one's own developed research knowledge),
?? Shopkeeper (Keeping a relatively small shop (specialist shop, retail store, grill etc.)),
?? Social services provider (Taking care of old people, the sick, handicaps, households),
?? Sole proprietor (A person practicing a profession, e.g., bookkeeper, physician, masseur),
?? Subcontractor (Subcontracting know-how or production capacity for bigger companies),
?? Trainer/consultant (Selling expertise acquired by education and experience), and
?? Transport/machine contractor (Running business using one's own transport, excavator equipment).

Results

In Table 2, the 19 possible entrepreneurial types indicating the entrepreneurial identities are listed in the order ranked by the observations.

Table 2: ENTREPRENEUR TYPES AND MEANS OF EACH (ranging from 1 to 5; 1= not interested, 5= very interested)

1. Businessman in team	3,83	11. Shopkeeper	2,36
2. Trainer/consultant	3,81	12. Scientist	2,35
3. Manager	3,56	13. Co-operative	2,13
4. Businessman	3,48	14. Handicraft	2,05
5. Part-time	3,16	15. Franchising	1,99
6. Subcontractor	3,05	16. Social services provider	1,88
7. Sole proprietor	2,99	17. Net marketer	1,57
8. Innovator	2,43	18. Farmer/forest	1,52
9. Agent/representative	2,41	19. Transport/machine	1,40
10. Restaurant	2,39		

The top four consist of team entrepreneur, trainer/consultant entrepreneur, manager entrepreneur and businessman entrepreneur. The four top ranked by population in general, in Finland, were team entrepreneur, handicraft entrepreneur, sole proprietor, part-time entrepreneur [5,6]. That is, the business students naturally favor more business-minded identities but it must be kept in mind that, as can be seen, there is a clear association between personality type and entrepreneurial identity favored. Students' personality distribution is more 'managerial' emphasized than the personality distribution of the population in general.

Next, the statistically significant or else strong relationships between personality and entrepreneurial identities will be briefly reported in the order presented in in Appendix 1,2 and 3. More specific results and the level of significances can be seen in the Appendixes. It may be considered that a clear deviation of Index (I) from 1 refers to a tendency of favor or disfavor in spite of the missing statistical significance.

Of all the sixteen personality types, ESTJs (Extravert-Sensing-Thinking-Judging), one of the most common types, evaluated themselves as having most **businessman identity** whereas ISTJs (Introvert-Sensing-Thinking-Judging), another of the most common types, felt themselves having least of this identity. Also ISTPs (Introvert-Sensing-Thinking-Perceiving) and ENTJs (Extravert-iNtuitive-Thinking-Judging) tended to identify themselves with businessman entrepreneurs. Those who felt being most inclined to businessman identity were rather Extraverts than Introverts. The preference combination EJ and T-dominance (types which have Thinking as their dominant preference) were also over-represented, while combinations IJ, SJ and IS as well as S-dominance were under-represented.

ENFPs (Extravert-iNtuitive-Feeling-Perceiving) were the most willing to evaluate themselves as innovator entrepreneurs and INTJs (Introvert-iNtuitive-Thinking-Judging), ISTPs (Introvert-Sensing-Thinking-Perceiving) and ENTPs (Extravert-iNtuitive-Thinking-Perceiving) seemed also to favor this identity slightly. ISFJs (Introvert-Sensing-Feeling-judging) tend to have the least of **innovator entrepreneur identity**. On the preference level, innovator entrepreneurs seem to be more likely iNtuitive, especially NP and EN, than Sensing, and especially SJ-types. They also tend to prefer Perceiving style rather than Judging style. N-dominance was over-represented while S-dominance was under-represented.

ESTJs were the most willing types to describe themselves as **manager entrepreneurs**, whereas ISTJs and ISFJs of all sixteen types saw themselves being least prone to this entrepreneur identity. ISTPs, INTPs (Introvert-iNtuitive-Thinking-Perceiving), ESTPs (Extravert-Sensing-Thinking-Perceiving) and ENTJs tended also favor this kind of entrepreneurship. Manager entrepreneurs tend to be more Extraverts than Introverts, and more Thinking than Feeling types. The preference pair EJ as well as T-dominance was over-represented while IJs, SFs and ISs as well as S-dominance were under-represented.

When considering **scientist entrepreneur identity**, ENTPs were over-represented. ENFPs and INTJs tended also to favor this kind of entrepreneurship. INFJs (Introvert-iNtuitive-Feeling-Judging) and ISTPs tended to be the types who were the least prone to this identity. Scientist entrepreneurs seem to be more Intuitive than Sensing, and more Perceiving than Judging types, and there were especially many EPs and NPs as well as types which have iNtuition as their dominant preference. STs were under-represented.

ESTPs were the types who evaluated themselves as being least prone to **sole proprietor** entrepreneur identity while INTJs tended to have most of this identity. Sole proprietors are more likely Introverts than Extraverts and especially the EP-preference pair was rare among them.

ENTJs saw themselves as most likely to be **businessman in the team** while ISTJs and ENTPs were under-represented in this category. Potential team entrepreneurs prefer more Extraversion than Introversion. And especially EJs and T-dominated types were most interested in this kind of entrepreneurship. IJs, NPs, TPs and N-dominated types did not favor team entrepreneurship.

Types, which favored most **part-time entrepreneurship,** were ESTPs while INFPs (Introvert-iNtuitive-Feeling-Perceiving) and INFJs showed the least tendency towards this kind of solution. Part-time entrepreneurs were more likely Thinking- than Feeling-types and the number of NFs and FJs was particularly small. T-dominance was over-represented while F-dominance was underrepresented.

There were no statistically significant results when investigating the personality of potential **subcontractor entrepreneurs**, but most tendency towards this kind of entrepreneurship had INFJs and INTJs, while ENFPs were least interested in subcontractor entrepreneurship.

Franchising entrepreneurship seems to interest most ESFJs (Extravert-Sensing-Feeling-Judging) and least INTJs and ISFPs (Introvert-Sensing-Feeling-Perceiving). Particularly Feeling-types favor this style while Thinking-types do not. The preference pairs SF and FJ as well as F-dominance were over-represented while combinations NT and TJ were under-represented.

INFJs and ISFPs of all types, and especially FJs and F-dominated types tended to favor most **co-operative entrepreneurship**, while this kind of entrepreneurship did not appeal to ENTPs or ESTPs, or generally EPs.

Any significant results among potential **handicraft entrepreneurs** was not found but it seems that INTJs, ISTPs, ISFPs and INTPs, and Introverts in their entirety, tended to regard themselves as being handicraft entrepreneurs. EPs, NPs, TPs and N-dominated types do not seem to be very suitable as handicraft entrepreneurs.

The career of **trainer or consultant entrepreneur** seems to appeal most to INTPs, ENFPs, ENTPs and ENTJs, whereas ISTJs and ESFPs did not see themselves as potential trainer or consultant entrepreneurs. Altogether, this kind of entrepreneurship was more favored by Extraverts than Introverts and Intuitive-types more than Sensing-types. Especially NTs and T-dominated types showed interest in this kind of entrepreneurship, while IJs, ISs or S-dominated types did not seem to be very potential trainer or consultant entrepreneurs.

Shopkeeper entrepreneurship did not interest particularly any specific type, but INFJs showed most, and ISTJs as well as INFPs showed least tendency towards this kind of entrepreneurship. Feeling types might be a little more inclined to be shopkeepers than Thinking types.

ESFJs and ENFJs (Extravert-iNtuitive-Feeling-Judging) were the types, which showed most interest in the career of **agent or representative entrepreneur**. In the preference level, Feeling-types, EJs, NJs, FJs and F-dominance were over-represented. This kind of entrepreneurship did not appeal to ISTJs or Thinking-types, and Introverts did neither see themselves as potential agents or representatives.

Most potential **restaurant entrepreneurs** seem to be ISTPs, and to some extent INFJs, too, whereas ISTJs do not favor this kind of entrepreneurship. Feeling-types and especially NFs could consider themselves as restaurant entrepreneurs while Thinking-types and TJs were under-represented.

Conclusions

The purpose of this study was to find out if there are connections between personality and entrepreneur identities of business students. Furthermore we were interested in what kind of personalities tend to have potential to certain entrepreneur careers. The results indicate that certain personalities have a tendency to favor some entrepreneurial identities more often than others.

The personalities who were potential entrepreneurs in different fields according to the entrepreneurial identities matched well with the theory and descriptions of the personality types and preferences. For example, ESTJs are known as manager types, due to their logic, analytic thinking, objectivity and abilities to organize. They are practical, realistic and matter-of-fact personalities who act systematically and pragmatically. Therefore, it was not surprising that ESTJs favored businessman identity and manager entrepreneur identity. ISTJs, on the other hand, did see themselves neither as potential businessman or manager entrepreneurs nor as team entrepreneurs, trainer/consultant, shopkeepers or restaurant entrepreneurs. ISTJs were not favoring any of the entrepreneur identities studied but they were the least favoring several identities. Therefore it could be interpreted that ISTJs are not very potential entrepreneurs in any fields. It may be noted that also other 'typical' manager types, ESTJs and ENTJs, were not very strongly associated with any of the entrepreneurial identities, in spite of some significant results.

ENFPs described as *"curious, creative, imaginative innovators, initiating projects and directing great energy into getting them under way*" [9:79] as well as ENTPs, NPs, and Ns seem to favor identities demanding intuition, creativity and flexibility as innovators, inventors and trainers/consultants. Feeling types (Fs) tend to favor identities minimizing risk, e.g. franchising, agent or representative, co-operative entrepreneurship, offering small-scale enterprising in good company, e.g. restaurants, shop keeping. Introverts (Is) favor, according to a definition, identities that allow working alone or in small circle, e.g. handicraft entrepreneurs, sole proprietors.

In general, there are types who are not especially interested in any entrepreneurial identity, e.g. ISTJ, ISFJ, INFJ, and INFP. Further, there are types who can imagine themselves in one certain specific role, e.g. ISFP as co-operative entrepreneurs. Some types, e.g. ENFP, ENTP, favored several identities in investigative, innovative or creative working environments. All in all, any of the personality types favored any or very many entrepreneurial identities. That is, different entrepreneurial identities are very much associated with personality dimensions and types. Thus, as career orientation in general [3,4,12], personality is an important predictor of a proper entrepreneurial identity. It must be noted, however, that the associations between personality types and entrepreneurial identities reported here do not mean that some types could not act or succeed as entrepreneurs. In spite of that, this knowledge should be used in vocational guidance and entrepreneurial training. Additionally, this knowledge could be used to lessen those fears and obstacles [5,6] found by potential entrepreneurs. Referring to the many negative associations between types and entrepreneurial identities, the assumption that also business students are not very entrepreneurial-minded was supported. That is why it is very important to obtain knowledge of the possibly favored identities as well as fears of and obstacles to entrepreneurship.

The Impact of Institutional and Environmental Conditions on Entrepreneurial Activity

Sanjay Peters
ESADE Business School, Spain

Abstract

Adverse environmental factors generally have a negative impact on entrepreneurial activity in a given country or a large region within a country. Environmental conditions in this paper refer not only to the physical or infra-structural attributes of a territory such as roads, ports, rail services, airports and access to broad band connection, but it also includes human capital, political and economic institutions, such as government bureaucracies that issue business licenses and private and public banks that offer capital for investment purposes. Through a case study of small and mediums sized firms in Kerala state, a region within South India, which historically has shown an unusually strong record on social development, this study identifies the most important barriers to entrepreneurship and economic growth in Kerala. In doing so, this research also reveals what other would-be entrepreneurs could learn from successful Kerala firms to survive in this otherwise hostile business environment.

Introduction

How are new entrepreneurial opportunities to be recognized by would be entrepreneurs? Is there a standard generic checklist or an off-the-shelf product available on the market to advice nascent entrepreneurs of things to avoid prior to setting up a business? Is a stable business environment imperative in order for a new venture creation to be successful? A straightforward answer to the latter two questions would be "no". Carter, Gartner (1996) and Reynolds (1997) maintain that nascent entrepreneurs are not homogenous, and that usually those who eventually end up starting up a business, as opposed to those who give up after weighing out the risks, take up a lot of initiatives, such as gathering the necessary resources and information to ensure that their business plan turns out to be feasible in practice. One of the principle aims of this case study based research work on the South Indian State of Kerala is to highlight that new innovation and business opportunities may often arise from the most adverse environmental conditions. If one were to point to recent technological innovations, the introduction into the market of fuel efficiency cars, for example, may be seen as creativity driven largely by environmental adversity. The described market demand was motivated by the petroleum crisis of 1973. During the oil shocks, the sudden shortage of supply and high cost of fuel meant that viable revenue generating alternatives had to be sought by the automobile industry in order to avoid bankruptcy. In the same light, it is proposed in this study that truly innovative entrepreneurs are able to identify strong business opportunities sometimes in unusually hostile environments. Carrying out a business venture under unfavourable environmental conditions generally mean that the markets are unlikely to be fully competitive, and therefore the opportunities to expand profit margins are likely to be greater to compensate for the proportionately high risk. Hence, instead of being faced with the problem of "crowding out", new venture creation in a hostile business environment (characterised by varying obstacles such poor infrastructure, high cost of land, labour volatility and energy shortages), allows entrepreneurs to identify new business opportunities and to develop effective strategies to extract higher returns on their investment. Though there is no commonly accepted definition of entrepreneurship, most scholars on entrepreneurship concur that entrepreneurs tend to be risk un-averse. However, it would not only be reckless, but it would also be unequivocally erroneous to infer from this research that all hostile business settings invariably provide positive opportunities for entrepreneurs. The main aim of the study is instead to draw attention to entrepreneurial processes and strategies required in order to succeed in otherwise difficult environmental conditions.

Through evaluating the economic development and constrained entrepreneurial initiatives in Kerala, India, this study focuses on some of the adaptive strategies that successful entrepreneurs have relied upon in a specific hostile business setting. The implication of the research is that certain generalizations can be made about how adaptation by entrepreneurs to a hostile business environment is positively related to entrepreneurial outcomes.

The Relevance of Kerala as Case Study of Entrepreneurship

Throughout the past three decades, the development efforts pursued by subsequent governments in the South Indian State of Kerala, have been closely followed with a great deal of interest by experts in the field of economics, international development and social policy from within as well as outside of India. Curiously, similar interest has not been shown on the region by specialists in business policy or strategy. Intrigue with the development experience in Kerala has been sparked largely as a result of the relatively high standard of living that has been achieved in this industrially under-developed region (approximately the size of Spain in population terms) with a low per capita income level of $182 in 1986. If one were for example, to rely on proxy indicators such as the Sen Index or Morris' physical quality of life index (PQLI) to measure standard of living, Kerala's performance level would not only be seen as better than many developing countries, including China. Morris' PQLI include arguably the four most important characteristics of social development, life expectancy, infant mortality, birth rates and adult literacy rates. What is astonishing about Kerala's accomplishment is that if it were to be seen as a separate nation state, it would rank as the ninth poorest in the world. Nevertheless, Kerala's social achievements could be compared with most developed countries with income levels that are ten to twenty times higher. The prospects for survival for both men and women in Kerala are greater than for Blacks in the United States. The female literacy rates in Kerala are also higher than those in every province in China. Kerala has a population of 29 million (1991), a total area of 38,863 sq kilometres and it accounts for 3.43 per cent of the population of India. What is particularly noteworthy is that the social benefits in Kerala are distributed on a fairly equal basis, irrespective of gender, caste and across rural and urban areas. However, in terms of conventional performance indicators such as GDP per capita, State domestic Product (SDP) and growth rates within various productive sectors of the economy, Kerala falls far below the national average. Thus, the development approach pursued in Kerala is viewed as a paradox by many observers because a relatively high social standard of living has been achieved (at low per capita SDP), which is often associated with high income regions. Another reason that many observers perceive the development process in Kerala as a paradox stems from the presence of a high saving ratio (which could potentially serve as invertible resources), rich human capital resource endowment and high ranking per capita consumption expenditure. All of these ingredients generally tend to translate into strong possibilities for the establishment of a vibrant entrepreneurial class and the required market as well as for the promotion of advanced industrial activities. However, the performance of productive sectors, both within agriculture as well as in manufacturing remain relatively poor.

In recent years, there have been a number of plausible theories put forward to explain the causal factors to low entrepreneurial activity and to poor performance within the productive sectors. These range from such issues as, centre/state conflict and unequal federal financial allocation, which is believed to have forced the state government of Kerala to spread its planned expenditures over many unplanned areas in order to sustain, let alone improve human development initiatives (e.g. the level of public services in health, education and food rationing policies) that it had already put into place. The end result is that state finance for productive sectors has been severely curtailed and public services have deteriorated considerably. This explanation has not gained much ground amongst experts on the region, though it remains an issue of serious concern. Energy deficiency within the state has also been identified as a highly significant reason for the poor performance within the productive sectors. Kerala relies almost entirely on hydro-electric power for its energy requirements. A recent study has shown that the years of particularly poor growth rates have coincided with years of bad monsoons. Nonetheless, this explanation begs the question of whether all other energy deficient states in India have performed equally as bad as Kerala during years of bad monsoons. If the answer is no, then it would raise doubts about this explanation as one of the main causes for low growth. Another competing explanation to the poor performance of the economy is high price of land and the theory of labour unrest. According to the labour unrest argument, labour is seen as much more volatile and expensive in Kerala than in any other state in India. It is this last point which will be the focal point of this paper. All these mentioned factors may have had or continue to have an impact on Kerala's economy, but what is unclear is the direct causal relationship between these variables and the near obsolescence of entrepreneurship and poor performance of the productive sectors. Thus far, there have been no successful attempts to quantify the impact of these factors on the state's poor performance.

There are a number of key historical processes that have enabled Kerala to achieve positive outcomes within the social sphere. Apart from a strong tradition in social policies which dates back to the late 19th century, mass mobilization and direct public action have been the two most significant factors to influence human development outcomes since the creation of the state in 1957. Some critics have argued that the mentioned social achievements are unsustainable over the long term, given the heavy indebtedness of the state and the general poor performance of the economy.

One of the instrumental objectives of this research study is therefore to empirically investigate the underlying causes to low growth in Kerala. More specifically, it sets out to draw attention to key factors within the region which deter entrepreneurial activity amongst a highly educated, skilled and able working population. A second related goal of the research is to reveal what successful firms and entrepreneurs have done (strategies) in order to succeed in a considerably hostile business environment.

Proposition

The main hypothesis put forward in this study suggests that irrespective of a strong record on human capital formation, the business environment in Kerala is considerably more hostile than other regions within as well as outside the Indian sub-continent. The most salient environmental conditions which restrict productivity growth and entrepreneurial activity in the state are thought be, labour volatility (strikes and restrictive labour practices), high wages, political party intervention, poor industrial development policy at a state level (i.e. issuing of licenses, lack of government incentives such as tax subsidies, access to investment credit), high energy tariffs, poor infrastructure and high cost of land. How can these assumptions be tested empirically?

Research Methodology

Entrepreneurial activity will be measured in this study by examining the pattern, and motives behind new investments made in neighbouring regions by leading Kerala industrialists. Organizational behaviour (i.e. the firm, in accordance with Herbert Simon) Institutional, transactions costs (in the Coasian tradition) and evolutionary economics offer theoretical insights for examining the question of why some firms and entrepreneurs have failed disastrously in Kerala whilst others have been highly successful, inspite of undertaking entrepreneurial initiatives within the same commercial environment.

Data on the industrial sector in other Indian States and on human development indicators have been gathered and analyzed in this study in order to make inter-state comparisons of wages, growth rates in manufacturing and on living standards. The main sources of secondary data relied upon in this study, which include, wage rates and labour productivity in the factory sector and small scale industries (SSI) are published in the Annual Survey of Industries (ASI). Estimates of State Domestic Product 1960-61 to 1982-83 (SDP) are published in the Central Statistical Organization (CSO). The key approach, however, to identify a possible causal link between the points mentioned above and the near obsolescence of dynamic entrepreneurial activity in the state has been through carrying out interviews with 50 of the state's leading entrepreneurs. The interviews were carried out personally during October 2000 to March 2001, and in most cases involved visiting production facilities in Kerala as well as in Tamil Nadu State and meeting with owners of firms, members of senior level management, labour union representatives and workers. Basic statistical data and relevant information (i.e. names and contact details of CEO´s owners,) regarding the leading entrepreneurs and enterprises in Kerala were obtained from Dhanam Magazine and Business Deepika, the two leading business magazines in Kerala state. Starting in 1998, Dhanam magazine has published feature stories about the top 100 and 50 leading enterprises in the state. The main criterion used by Dhanam for selecting leading firms is on the basis of public perception and by other industrialist both from within and outside a given industrial sector.

Limitations and Strengths to the Industry Survey Method.

There are a number of restrictions associated with the questionnaire-interview approach employed in this industry survey study of Kerala firms. For example, (1) The interviewed managers may exaggerate claims about firm performance and in some cases under report labour management disputes to avoid being perceived or represented as incompetent (2); Owner/managers may conceal information about the enterprise to avoid being presented in the local media or in any formal scientific journal as a problematic firm (3); Patriotic sentiments on the part of interviewees may also get in the way of an outside researcher possibly making unfavourable reports (in the foreign press) about how companies, labour unions and governments function in the state of Kerala (4); the interviewer may be perceived as a government agent trying to extract incriminating information about dubious company accounts and therefore balance sheets and reported earnings and losses could be exaggerated or under-reported (5);. If a senior manager is being interviewed, s/he may be reluctant to disclose factual information regarding the functioning of the enterprise, out of fear that the interviewer could have been hired by the owner to test management loyalty (6). Lastly, and most importantly, the criteria relied upon by Dhanam Business Magazine to select the top 100 firms in Kerala are somewhat weak in purely empirical terms. The companies on their list for example, have not been selected on the basis of number of employees, annual turnover rate, sustained high profits over fixed costs during a period of 5 years, or company growth in terms of establishment of new subsidiaries or joint partnership with foreign multinationals. Public perception and the opinion of industry experts according sector have been the main sources used by Dhanam to select the 100 and top 50 leading firms in Kerala.

The upside to the industry survey approach employed in this study is that it enables one to gain first account information from entrepreneurs, managers, labour and syndicates themselves about actual obstacles they face on a day to day to basis. Primary level data of this type can augment and, in some cases be much more reliable than estimations of causes to low growth that could be derived from computing and analysing secondary level macro and micro data. The type of industry survey carried out this study is also much more effective than a mail-in questionnaire or telephone interview, in that it allows for physical observations to be made of firms (visits of production facilities) by the investigator.

Each personal interview lasted between 2-4 hours and involved meetings with owners, senior managers, labour union representative and workers. Though Dhanam Magazine´s selection of leading firms is not based on an empirically rigorous and testable criteria which most economists would deem necessary for a study of this type, the data they provide are nonetheless valuable given that no better alternative source of information regarding firm behaviour in the region is readily available. Therefore, the data made available by Dhanam provided a useful starting point to procure more information about the top industrialists in the state. The conclusion reached by Dhanam Magazine about leading firms and industrialists in the region, coincide for the most part with the conclusions reached in this study.

Results of the Industry Survey

Out of the 50 top enterprises in Kerala state, where interviews where carried out, 19 have relocated production facilities to neighbouring states and to other regions of the country. Out of this group of 19 firms, 14 have listed high wage costs as the main influencing factor for shifting production facilities outside of Kerala. Ten out of the mentioned 19 firms have also indicated that political party intervention through collaboration with labour syndicates as the second most important reason for relocating some of the production plants to neighbouring states. Political parties (offshoots from both the main conservative and socialist parties) are reported to intervene and often times to instigate conflicts within firms with the sole purpose of extracting rents in the form of periodic bribes and annual payment requirements. The strategy goes as follows: Competing labour unions that are formally represented at a given firm, through pressure from different political parties make demands for wage increases or for an annual bonus of 30 percent. If representatives of labour syndicates do not comply with the request of the party/ies, then mafia style revenge is sought by the political party. In other words, often times syndicates are forced into creating conflict between labour and management by competing political parties. In such scenarios, when management decline to comply to labour's request, the political party (to which each main labour union is attached to) that is able to achieve the best deal with management, by negotiating on labour's behalf and to reach a satisfactory settlement are ensured party loyalty and labour votes. In exchange for the favour, the firm owners are also then required to pay the respective political party/ies for striking an acceptable deal. Nine out of the 50 firms also list poor government incentives and poor infrastructure as the third most important reason for relocating to production facilities to other regions. For one firm, Popy Umbrella, lack of government incentives was the main reason given for shifting production facilities to Rajasthan. The distribution of employment creation in other Indian states by Kerala firms and entrepreneurs is as follows in order of significance: Tamil Nadu (5130), Karnataka (1495), Andhra Pradesh (840)

Rajasthan (550) and Mumbai (120). All in all, a total of 8,135 jobs have been exported out of Kerala during the 1990's due to the problematic business environment conditions mentioned above. Also, an estimated 40,000 ancillary jobs alone have been created in Rajasthan by Popy Umbrella. Given that Kerala state has one of the highest rates of unemployment in the country when compared to other regions, particularly educated unemployment, labor loss due to hostile environmental factors should be of serious concern to policy makers.

A perhaps equally if not more alarming finding of the survey is that 23 of those firms out of the list of top 50 firms in Kerala that did not relocate production facilities to other states, indicate that labour volatility, high wages, political party intervention through collusion with labour unions, lack of an integrated industrial policy by the state and outdated labour laws (in order of significance) are the main barriers to productivity growth.

Lessons in Strategy to be Learned

The CEO of Almagam Enterprises, for example found a way to keep out labor unions altogether in the firm's Kerala operations. This is a laudable achievement, given that Amalgam has 2000 employees. How was this strategy achieved? The tactic within this firm was to provide loans to employees during periods of critical importance. Most banks were unwilling to provide loans to such a high risk group. According to the CEO of Amalgam, there are three important periods when loans are required by his workers. They are, during birth, death and during marriage. Through providing loans to his workers during this these critical periods, Amalgam's CEO is able to achieve company loyalty and in some sense a form of debt peonage. Mr. Ramesh, the owner/manager of SD pharmacy on the other hand employs a somewhat different strategy to keep troublesome labour unions out of his firm. SD pharmacy has 200 employees. Firstly, Mr. Ramesh divides his staff into units of 50 workers for the specialization of oriental medicine production. Decentralization of the workforce is carried out as a safety measure against strikes. Secondly, Mr. Ramesh only employs married men. According to him, married men are perceived as behaving more responsibly in India than single males. Thirdly, Mr. Ramesh does not employ relatives of employees, as laying them off would potentially create greater problems. Lastly and most importantly, Mr. Ramesh of SD Pharmacy provides 40 percent of his wages in kind (i.e. food and medicines). He asserts that "this way even if 60 percent of the wages are wasted by the worker on drink or other vices, the basic needs of the family are met". Though these strategies may seem rigid and draconian to some extent, they nonetheless demonstrate the necessary skills that a successful entrepreneur must possess in order to adapt to a unique and complicated business environment. An another innovative strategy that has been employed by Mr. Chitilapilly, owner/manager of Vigod electrical goods industries, perhaps the most successful entrepreneur in Kerala state, in order to avoid labour unrest and to increase productivity was to sub-contract work out to various charitable organizations. This method also meant that the size of each production unit would be significantly smaller than the large scale factory unit which was previously responsible for all production. Fortunately for Vigod, the kind of manufacturing that they specialize in does not require assembly line production. Vigod's technicians and engineers provide the necessary training to small production units. Key positions (supervisory and quality control) are occupied by Vigod staff. The remaining workers are contract labour. Vigod have 2500 employees, but only 600 are officially listed in their books. A similar decentralization strategy of outsourcing work to religious charities is employed Mr. Jacob, owner/manager of Kitex Garments, which specializes in the production of umbrellas and hand bags. Mr. Jacob's team of technicians provide the outsourced group with training and materials (sewing machines and fittings for umbrella parts) in exchange for wages. This strategy is employed to avoid labour unrest and to also increase profit margins by getting access to lower cost labour. Both Vigod and Kitex Garments have experienced severe labour unrest problems in their firms and therefore have learned to adapt and find strategies to overcome such obstacles. Both firm owners have also set up production facilities in the neighboring state of Karnataka as an insurance mechanism in case of disruption in the Kerala production plants. Other successful family run firms such as Synthite Limited provide employee incentives such as access to low interest loans for home purchasing, where such loans would not be made available to blue collar workers by public or private banks. All of these strategies may be seen as survival and adaptive strategies undertaken by entrepreneurs to survive and prosper in a hostile business environment.

Implication of Research Findings

Disentangling fact from fiction in rhetorical debates and unresolved disputes within and between various groups, as competing political parties and governmental organizations at a regional, national and international level can be formidable even under the most favourable of conditions, characterised by the prevalence of democratic political institutions and easy access for the majority of the population to uncensored information through the media (newspapers, television and radio). The truth in most such cases usually lies somewhere in between the two extreme poles and often tends to be possessed by individuals and groups from both sides of the political divide. A similar parallelism could be made when providing a causal explanation to the ongoing debate surrounding low productivity growth and limited opportunities for entrepreneurship in Kerala, an otherwise highly favourable region for economic development with a strong record on human development, political freedom, high savings rate and a highly skilled labour force. No all encompassing explanation or single entity can be isolated out as the sole cause behind low productivity growth and for the general lack of entrepreneurship spirit in the state. The complex relationship at an institutional level in Kerala's business environment between firms (entrepreneur-owner-manager), organized labour unions/workers and competing political parties at a state level have been identified in this fieldwork oriented research as one of the main undermining forces to entrepreneurial activity and productivity growth. If a general term were to be required to explain this trend, institutional failure would be the one that fits best. Through employing analogies from evolutionary biology, each of the mentioned groups in this tri-alliance can be seen as playing an integral part in putting up barriers to productivity growth and to subsequently reducing their own chance of survival and reproduction (to succeed) by not having learned to adapt to the environment in which the co-exist and operate. A brief account of the perceptions and the real existing tensions between management, labour/labour unions and political parties will serve to shed more lightly on this problem.

The Firm

The relationship between labour and management in most manufacturing (small medium and large sized) firms within Kerala is excessively hierarchical and often feudalistic in form. There is virtually no opportunity for labour to have any input about productivity decisions. Orders are generally handed down by management and they are to be unquestionably carried out by labour. The bureaucratic structure of a family run firm, private-public joint venture or fully public enterprise tends to be overly centralized and "top down" in nature. Even senior level managers or heads of different divisions within a firm are seen to be treated like glorified clerks by the owner/manager or by a CEO of a firm controlled by shareholders. The relationship between labour and the entrepreneur owner/managers of a firm can be summed up as one of "us against them" mentality.

Organized Labour

Labour unions, on their part tend to consistently be non-cooperative and non-compliant in labour management disputes, and to regard owner/managers or CEO's of shareholder firms as the enemy or exploiters. Moreover, there is a sense of disunity even amongst different labour unions within the same firm. Often times (depending on the size of the enterprise in terms of number of employees) there are up to 10 different labour unions competing for legitimacy within a firm. Only four unions are legally permitted within a firm. Labour unions can be legally kept out of production units comprised of 20 employees. The main labour unions often tend to be linked to the main political parties. This lack of coordination and cooperation between different labour syndicates impedes effective dialogue between labour and management within a firm. Workers on the other hand, tend to regard management as indifferent to their needs and therefore adopt an attitude of doing as little as possible (through restrictive labour practices) unless otherwise forced to do so through monitoring and enforcement mechanisms imposed upon them by their superiors. Ironically, workers appear oblivious to the fact that doing as little work as possible can result in their own demise (species extinction) if the company were to close down due to sustained losses over an indefinite period.

Political Parities

In the case of Kerala, the level of political party corruption is reported by leading entrepreneurs in the state to be notably higher than other regions of India. The behaviour of politicians in their relationship with firms in Kerala can be seen as misguided in terms of long-term survival. Their main goal is to extract as much rent in the form of bribes for themselves and to pass the remaining amount to the political party to which they belong. The perception of management/owners of firms by politicians is one of distrust on the one hand, and supplier of funds on the other. There is general belief amongst politicians and labour unions that firm managers or owners, if left to their own devices, would exploit labour (expose them to harsh unfair working conditions and offer very low wages). Ironically the system of checks and balances that politicians have put in place to avoid the exploitation of labour appears to achieve the exact opposite effect both for them, as well for labour. The continued abuse of management by political parties through collusion with labour unions has resulted in companies decentralizing production to avoid the presence of unions and to also relocate production facilities to neighbouring states.

As a consequence of these developments (the theoretical construct offered in evolutionary economics would suggest that), competing political parties in Kerala run the risk of not being elected or re-elected as a result of their unscrupulous conduct within firms through collaboration with organized labour. Likewise, the firm can also be seen as sacrificing its chances of increasing its market competitiveness by not adequately taking into account the significant impact which fair labour practices and the implementation of adequate rewards and incentive mechanisms in management/labour relationships can have on company profits and sustained growth. Labour unions also appear to bypass the opportunity to be represented in new and existing firms as a consequence of their opportunistic behaviour and collusion with political parties. Lastly, employees can be seen as overlooking the acute need to hold on to their jobs or for achieving promotion within the firm by demanding higher wages and bonuses without achieving corresponding results in productivity (i.e. through carrying out restrictive labour practices). In order to survive and to succeed in a such a hostile business and highly politicised climate, each of the mentioned groups would need to make appropriate compromises, coordinate better with each other, recognize the need for a collective aim and to learn to adapt and to adopt strategies that are best suited to the prevailing environmental conditions. Clearly, transforming the business environment through carrying out broad institutional reforms at a governmental (legal, bureaucratic, financial), infrastructure, firm (owner/management) and labour syndicate level would greatly contribute towards fomenting entrepreneurship and productivity growth in the region, but often times these lofty objectives remain just that and are extremely difficult to implement at a policy making level. This is not to suggest that these goals cannot be achieved, but in the meantime or interim period, alternative strategies have to be employed by Kerala's entrepreneurs to remain competitive and to achieve productivity growth and profits. In the case of many of the successful Kerala firms, the best strategy has been to relocate partly or entirely to a new environment that allows greater prospects for survival and success through increased market competitiveness and better incentives. Ten out of the top 50 firms identified by Dhanam Magazine, the leading Business Weekly in Kerala, and where interviews have been conducted as part of this research study have done precisely that. They have subsidiaries in neighbouring states and other regions in India. If a new breed of potential young entrepreneurs were to follow suit and to imitate such strategies in order set up business, then the prospect of endogenous industrial development in Kerala would not look particularly bright for the proximate future.

Conclusion

Through carrying out fieldwork based study of the causes of poor productivity growth and entrepreneurial activity in Kerala, India, this research has shown that hostile environmental conditions and institutional barriers can have a detrimental impact on macroeconomic growth. On the other hand, this research has shown that difficult environmental conditions can sometimes provide wealth generating opportunities for innovative entrepreneurs whom posses adaptive traits and are able to develop strategies to cope against harsh institutional settings. The study also shows that entrepreneurship must not be studied or assessed in isolation, in purely in an economic sense, but that the process of entrepreneurship has to be examined within the social context which determines the various types and forms of entrepreneurial outcomes.

The results of this study provide several useful insights to would be entrepreneurs in any part of the world to the importance of adaptation to the business environment, to gather the necessary information and to develop strategies not only to survive but to excel in a complex environmental setting characterised by various forms of institutional hardships (bureaucratic constraints, access to finance for investments, poor infrastructure etc..) A deep knowledge and thorough understanding by the entrepreneur of the rules of the social context in which a new business is undertaken is critical for success, particularly if the venture is to be carried out in hostile environment. This knowledge can be acquired, according to Jack and Anderson (2002) through social embeddedness, whereby the entrepreneur becomes part of the local social structure, or through entering into a partnership with an existing firm from within the chosen environment (joint venture). Resource dependence theorists such as (Pfeffer and Sanacik (1978) suggest that differentiation and diversification encourage organizational survival and growth. Adherents of this school maintain that the newly created organization or firm has to play an active role to adapt to the environment.

The strategies adopted by the successful firms in Kerala show that shifting some of the production facilities to neighbouring states has served as insurance mechanism against bribery payments by the state government of Kerala (through agitation via labour syndicates within firms). If firms are threatened with closure, then the option of shifting all of the production activities to an existing plant outside the state has served and continues to serve as a deterrent to bureaucratic interference. Moreover, it is worth noting that the nearly all of the 19 firms that have shifted some of their production facilities outside Kerala, have either opened up several new business ventures or sustained their existing enterprises in Kerala. This business practice demonstrates that Kerala is a desirable state for new venture creation and for sustaining existing ones. The relevant points to bear in mind are that if one is operating in an earthquake zone, it would be unwise to build a brick office building. It would be strategically more effective to construct a wooden edifice that can sway without crumbling down or can withstand the movements of the ground below. Likewise, if land prices are too high, the optimum business strategy would be to build upwards rather than outwards, or to set up the new venture in an area where land prices are not so prohibitive. Lastly, if labour costs are higher than market standards, to set up a new venture that is non labour intensive, to move production facilities to a low cost area, or to provide appropriate incentives to increase productivity output which correspond to higher than average wages would be the most appropriate choice. Whether a new venture creation is undertaken in a hostile climate by a nascent, novice, habitual, serial or portfolio entrepreneurs, adaptation to the environment and the adoption of strategies that coincide with the social and physical context are fundamental for survival and for entrepreneurial success. If this message has been clearly articulated through the fieldwork research on Kerala, then the modest goal of investigating entrepreneurship behaviour and processes in a specific developing country social context will have served to broaden our knowledge and understanding of the impact of environmental conditions on entrepreneurial activity.

Mexico State's Economic and Political Transition: From Entrepreneurial State to State of Entrepreneurs

José G. Vargas-Hernández
Universidad de Guadalajara, México

Abstract

This paper has the purpose to analyze most recent economic and political changes in the Mexican States, which show a clear transitional tendency from an entrepreneurial state toward a state of entrepreneurs through the following stages: The PRI-presidential Mexican Entrepreneurial State with an emphasis in the welfare state model, followed by a period marked by the transition of the Mexican State focused on a neoliberal PRI-presidential reinventing of the state, as the result of the economic and political impact of globalization and its pervasive effects on an unequal income distribution, weak governance, political instability and lack of property security, besides a new relation's interface between government and enterprises. Finally, the regime's transition under the change of party in power opens the stage of a Mexican State of Entrepreneurs in the new period PAN-presidentialist.

Introduction

Mexico is a highly centralized country with a powerful government, no reelection or, until recently, strong, open political competition. Since independence and for the last two centuries the dominant political system in Mexico has been authoritarian and presidential. Starting with the governments emerging from the Mexican Revolution (1910-17), it settled on a system of dictatorship in which the dominant party monopolized political representation and a deformed presidency. Krauze denominated the Imperial Presidency, weakening the legislature's ability to carry out its functions and duties, and diminishing judicial power. Various forms of patriarchal power represent yet another feature of the Mexican government before and after the Mexican Revolution.

The Mexican Entrepreneurial, Pre-Presidential State

Mexican economic nationalism emerged as a result of promoting public and private Mexican capital to avoid foreign investment, mainly by the United States. The Mexican State was characterized by an historical distrust of capitalism and a belief in the ability of the government to intervene and regulate economic affairs through its explicit constitutional mandate ?11?. However, from the 1930s and until the 1970s a model of import substitution industrialization (ISI) favored private Mexican investments and was also believed to benefit the people. The Mexican public sector enlarged the number of publicly owned corporations. In 1982 state owned enterprises produced 14 percent of gross national product (GNP), received net transfers and equal subsidies of 12.7 percent of GNP and represented 38 percent of investment in fixed capital.

In the name of the great conquests of the Mexican Revolution, during the time of the Mexican welfare state, organizations were constituted that corporately grouped militias, peasants, working class and popular sectors which exerted political control over the state's party bureaucracy in power and the "charro" (Mexican horsemen) leaders. The "charrismo" (a scornful term for union leaders) forced workers to conform to the rules of the official party, the Institutional Revolutionary Party or Partido Revolucionario Institucional (PRI). The workers were pressured and threatened with wage reduction, loss of employment, benefits, agricultural credit, increase in urban and rural poverty, etc., to guarantee their loyalty and a reserve of votes.

Although since 1929 all the Mexican presidents came from the Institutional Revolutionary Party (PRI), economic policy did not follow a regular and coherent pattern of policy making. Nevertheless, during the period of the hegemonic PRI, the government cultivated a degree of social consent that avoided extreme levels of repression in what has been called the "perfect dictatorship". In line with the so-called meta-constitutional powers, the President of Mexico was also the true head of the PRI and had, as his duty, designed national leaders and candidates for popular election. The Mexican president had both extensive constitutional and unwritten supra-constitutional powers and was committed to the retention of his political power during his mandate. The continuation of his power required him to follow the "ritual" of choosing his successor.

As the ruling political party, in the sense that it dominated the country's political life, the PRI held power in the federal executive branch of the Mexican government for 71 years. It was the center of the Mexican political system and used political mechanisms to control workers, peasants, the popular sector and organizations, such as "cuadillismo" (leadership), corporatism, etc. Also, the PRI enforced institutional control mechanisms over the electoral process. The PRI's corporatism focused on workers and peasants whom it promoted but did not liberate, guarantying them patrimonial rights and, with the pretext of institutionalizing the Mexican Revolution, identifying the causes of democracy and social justice with trickery. Its success in both areas was very poor, although they did maintain social stability. Each president in turn appointed his successor through a phenomenon known as "tapadismo" (overcoat candidate) and "dedazo" (finger pointing) to signal who was chosen.

Such analysts as Abascal and Macías ?2? identified three stages in the PRI's evolution: Hegemonic, bipartisan, pluripartisan. During the hegemonic stage, from 1929 to 1979, the infinitely superior PRI dominated over the other political parties and maintained total control of political power. During the bipartisan stage, from 1979 to 1985, the PRI maintained dominance over political parties of the opposition but lost seats in municipal and state governments to the National Action Party or Partido Acción Nacional (PAN). During the pluripartisan stage, from 1988 through to the end of 2000, it opened up political competition between the PRI, PAN and the PRD (Partido de la Revolución Democrática or Democratic Revolution Party) which shared power in municipal and state governments.

The effectiveness of the "perfect dictatorship", according to Vargas Llosa, or to the presidential monarchy (Ortiz Pincheti, 2000), was best demonstrated during an era of prosperity which coincided with a period of stabilized development, from 1940 to 1970, and a period of shared development, from 1970 to 1982. During both periods there were great advances in social policy, although poverty and social inequality were never eradicated, and a strong middle class emerged and claimed its place in political participation. The "perfect dictatorship" was underpinned by the shedding of the blood of the marginalized Mexicans. The State model, which distributed power and had emerged out of the Mexican Revolution, culminated in a crisis that degenerated into institutionalized violence.

At the end of Echeverría's period (1970-76), after 22 years of monetary stability and sustained growth, the peso (Mexican monetary unit) was devalued, an economic crisis began, and the constant tensions between entrepreneurs and government officials became crucial elements in initiating change. The entrepreneurs founded the Consejo Coordinador Empresarial (Entrepreneurial Coordinating Council)(ECC) to defend their interests from State intervention. In 1982 in the middle of a general economic crisis caused by a fall in oil prices, President López Portillo nationalized the banking system, devalued the peso, and increased interest rates. The country defaulted on practically all payments causing a fracture in the pact between the State and the ECC.

Transition of the Mexican State: Pre -Presidentialist Neoliberal Restructuring

Much of Latin America experienced financial crisis in the 1980s and the mid-1990s. In Mexico, intense economic crises occurred in 1976, 1982, 1987 and 1994-95, with intervening periods of mild economic recovery. Mexicans suffered periods of dramatically high inflation, external imbalances, devaluation, currency flight, increasing unemployment and declining purchasing power.

Since the beginning of the eighties the pressures on Mexican creditors to guarantee payment of external debt resulted in the creation of an instrument, the so-called "Washington Consensus", which imposed infallible neoliberal rule over a free market and a democratic system with free elections. Thus the "neoliberal agenda", which proposed structural adjustment programs and economic stability, was imposed by international financial organizations, such as the World Bank, the International Monetary Fund and the Inter American Development Bank, as a condition for negotiating the Mexican "debt crises" of 1982, 1987 and 1994-95.

Therefore, after the 1982 crisis, Mexico entered into a painful, distressful, and controversial period of state restructuring. The changes included: economic reorganization; national market openness; elimination of commercial barriers; elimination of price controls and subsidies; privatization of public enterprises and state property; reduction of social policy expenses; free money exchange, and also wide political reforms and administrative modernization. It abandoned the import substitution model and called economic intervention in the state into question.

The main thrust of the reforms encouraged in Mexico was the development of a competitive, broad-based export sector of nontraditional goods. Mexico joined the General Agreement on Trade and Tariffs (GATT) in 1986 and became an exporter of manufactured goods. The strategies adopted for the design of the Mexican State, as it was for other states, was reduction of state structures and facilities, privatization of state owned enterprises, and economic deregulation.

With the introduction of these reforms the Mexican State began to loose its capacity to function as a nation, although the State maintained that there are high indicators showing that the reforms benefited the owners of capital. These reforms to the structure of the Mexican State's apparatus make sense out of its transition and change from the welfare state model toward a neoliberal state model. This transition and change are understood, in Roitman's terms, as forms of behavior, loss of centrality in politics, loss in the ability to build a sense citizenship, transformation of politics into one electoral technique, and an increase in market problems. Also, a loss of ethics and principles in the work of politicians and political institutions evidently appeared in Mexico during the government of Miguel de la Madrid (1982-88), continued with Salinas de Gortari (1988-94), and also with Zedillo (1994-2000), and now with Fox (2000-2006), ?3?.

But the crisis of 1982 was also meaningful as the "crisis of hegemony" which was present in the old alliance between the State and ECC who represented national capital and were the direct beneficiaries of economic policies based on the import substitution model. Nationalization of the banking system was the main event that provoked the rupture between the political and entrepreneurial hegemonic blocks and their representatives, the politicians and government officials from the party of the State and the factions that controlled capital. As it is said by Fazio ?9?, they were living in one tortuous lover relationship of subterranean blurred tides, intense shady deals, and complicity networking.

With nationalization of the banking system Mexican capitalists, who felt betrayed, broke their alliance with the political bureaucracy and designed a strategy for their own re-constitution. The reinvention of the new Mexican State was initiated under the impulse of an intervening state with a strong neoliberal technocrat orientation, to the benefit the owners of capital. The process was based on neocorporatist negotiation between entrepreneurs and government, and built on mutual interests and compromise.

Economic and Political Impact of Globalization on the Mexican State

Under the influence of the PRI, the Mexican State initiated economic modernization and participation in the globalization processes, as a response to the trends of the economic globalization of markets, and the technological revolution that began during the last two decades of the past century. Under the pretext of cleaning up the economy, the Mexican State privatized strategic enterprises of the public sector, most of which were acquired by foreign investors, who had already penetrated all economic sectors. The high concentration of capital in a few corporations through the privatization process of public enterprises unleashed the phenomena of political privatization.

In 1987 inflation reached 159 per cent and a drop in the stock exchange devoured savings. Inside the PRI, a dissident group formed called the Democratic Current (Corriente Democrática) that later split to form a new party, the Frente Democrático Nacional (National Democratic Front) (NDF). President Miguel de la Madrid Hurtado (1982-88) was the first to stand questioning in his sixth and last term in government. On the sixth of July 1988 Salinas achieved power by controlling the election, i.e., where electoral irregularities and fraud were reported, resulting in a general crisis and the collapse of the political system.

Salinas deepened neoliberal reform and public enterprises were liquidated, economic openness was accelerated, and free commerce agreements were signed with Chile, the United Sates and Canada (NAFTA), Venezuela and Colombia (Group of Three), Costa Rica, Nicaragua and Bolivia. Amendments to Constitutional Article 27 allowed investments in the Mexican countryside. The activism of the Mexican State during Salinas' mandate allowed the transfer of public enterprise to financial groups which were determined to maintain links of political complicity.

Vast programs for the privatization of public enterprise in Mexico had been successful, to a certain point, in ameliorating the economic intervention of the State. Mexico ranked second in privatization in Latin America during the decade of the nineties when the government transferred to private corporations assets that amounted to 31,458 million dollars, which represented 20.4 percent of the total sales of state owned enterprises in Latin America. Privatization reached 3,160 million dollars in 1990, increased to 11,289 million in 1991, and totaled 6,924 million dollars in 1992.

By June of 1992, the Mexican government had privatized 361 out of approximately 1,200 enterprises owned by the state. Privatization during 1993 represented 2,131 million dollars. In 1996 it increased to 1,526 million dollars, in 1997 to 4, 496 million, and in 1998 decreased to 999 million dollars. A report from the World Bank states that between 1990 and 1998 privatization of public enterprises reached a total amount of 154,225 million dollars, an amount only less than the balance of the total external debt of Mexico which in 1998 was of 159,959 million dollars.

The year in which the state recorded most privatization was 1991 with a total of 11,289 million dollars, while in 1998 Mexico the lowest was 999 million dollars. The new government of Mexico plans to privatize airports, railways, and the energy sector, oil and electrical industries.

The benefits of privatization have not yet been evident to the Mexican people even though defenders try to demonstrate the opposite. According to data provided by Salinas de Gortari (1988-94), privatization reduced budget expenditures to finance social programs thus preventing a fiscal deficit. However, the effects have not been satisfactory over all. Programs of privatization in Mexico have reduced employment by half, while production has increased 54.3 percent with a significant reduction in investment. A study by Galal et al (1992) analyzed the after-privatization performance of twelve companies in different countries, including Mexico, and documented an increase of 26 percent in profits in eleven cases but an increase of benefits to workers in only three of the cases.

On the 17th of December of 1993, the United States Congress approved the North America Free Trade Agreement (NAFTA). Reactions were not long in coming. On January 1st, 1994, the date on which the Agreement came into force, the indigenous people of the State of Chiapaz created the National Liberation Zapatista Army (Ejército Zapatista de Liberación Nacional). Quarrels, resentment and bitterness between political groups inside the PRI resulted in the assassination of the official candidate to the Presidency of the Republic and the assassination of the General Secretary of the PRI. Even with these conflicts and serious problems the economy remained stable and Salinas was elected to his sixth and last term in 1994 with victorious animosity. Zedillo became President with 17 million votes, the greatest democratic legitimacy given in the history of Mexico. But, after twenty-one days in power, Zedillo faced the worst economic crises in the history of Mexico, the so-called December's Mistake.

Two years after the privatization of its banking system, in December 1994, Mexico was forced to devalue its peso which set off a macroeconomic crisis characterized by increased exchange rate volatility, further devaluation of the peso and was followed by a financial sector crisis and bailout. The meltdown of the Mexican stock exchanges resulted in the loss of half of the stocks value and share prices, for major Mexican companies quoted on Wall Street, dropped 75 percent within a few months. However, after this situation was resolved a deeper crisis in financial markets came in the form of the devaluation of the peso and the sovereign-default crises. The majority of the governmental crises, without a degree of investment (as is the case of Mexico), were caused by characteristic weakness in governance. If local people and foreign investors fear the Mexican peso will be devalued, they may convert pesos into dollars.

The new structure of State debt, during the Mexican crisis of 1994-95, has been studied widely in order to understand the way in which financial markets, governments, and multilateral institutions respond to the new questions of governance. The Mexican crisis raised the problem of sustaining fixed exchange rates in an environment of high mobility of international capital. Mexico did not recover because its weak financial system was strengthened through the intervention of the International Monetary Fund (IMF). It recovered because it had benefited from increased exports to the United States as a result of NAFTA and the accelerated growth of the neighboring U.S. economy.

The economic crises through which the Mexican economy has passed, aside from the inability of its institutions to limit the range in social problems, have caused repercussions on the application of neoliberal economic policy and are the key factors in the deterioration of social governance. One of the most pervasive and disturbing aspects of economic crisis is its effect on the most vulnerable population groups. In general terms the economic policies implemented by the majority of Latin American countries present similar features, although there are some differences in the design of the packs.

Although the causes and consequences of the different economic crises, through which Mexico passed from 1976 to 1994-95, have differed the crises were preceded by periods of high economic growth that could not be sustained because of the imbalance the crises caused. The crisis of 1976 showed the limitations of the economic model that was based on the principle that economic growth depends on major state intervention. The crisis of 1982 began with the idea that oil could be used as a lever for economic development and resulted from an active policy that the State should administer abundance. This resulted in high degrees of external indebtedness and an irrational expansion of the state.

Both the international debt crisis of the eighties and the Mexican crisis of 1994-95, also called the "Tequila effect", are considered to have their roots in the financial imbalance in the public sector. But in comparison, the later crisis (Asia, Russia, South Africa, Brazil, etc.) had its roots in the financial imbalance in the private sector and is considered the first global financial crisis to impact the economies of emerging countries. The Asian crisis exploded just after the crisis that lowered the Mexican peso. It therefore seems that financial crises occur more frequently in the later years of emerging economies, such as was the case in Mexico.

If the democratic social development and the economic growth of emerging countries is controlled, they are not significantly more corrupt than more developed countries. The pack of credits given to Mexico in 1995 by the IMF was a reward for banking with more risk. While more governments of other countries lend to Mexico, their banks have more security to cover their loans. In reality, the privatization of the banking system into financial groups emerged from the "steam" and complicity among investors and politicians who took advantage of international organizational finances channeled to rescue Mexico from the debt crisis. However, their differences in crisis management took them into highly indebted economies, which had the opportunity of transferring charges to society.

In 1995, as a result of these events, a program to modernize public management and eliminate corruption, decentralize public functions, and reorganize intergovernmental relationships within the federal system, was initiated in Mexico. The monopoly of power and its discretionary use, retained by some members in the structures of government, were still the main source of corruption with impunity, therefore deep institutional reform was required.

The program pretended to develop mechanisms of major responsibility and accountability for governmental agencies, in the matter of management of public services, and also to ensure the major disposition of established associations with non-governmental organizations. It is necessary to consider that these non-governmental organizations were the base of credibility and impartiality before the citizens whom they represented in human, political, labor, and citizen rights to governments that sustain poor relations, emanated from the PRI which always tried to incorporate them when they were more independent.

In 1996, public and private investments in Mexico were kept under the levels of the seventies and eighties. The results of the globalization processes confirmed that it had gone in only one direction: the entrance of transnational and multinational enterprises, now called global enterprises or contemporary business, which in essence are foreign, have taken legal ownership of the natural resources, land, etc., and returned few benefits. For example, the market value of General Electric calculated at 520,250 million dollars, is equivalent to the GNP of Mexico. In fact, 23 of the greatest transnational and multinational corporations have sales that are higher than the GNP of Mexico. Neoliberal governments have shown their inability to reduce the pain of the integration processes through more favorable negotiations that would allow comparative and competitive advantages for Mexico.

Damned Inheritance

At the end of the period between the years 1982 and 2000, which marked the development and implementation of the Neoliberal State model in Mexico, the results were disastrous. Although there were achievements in economic growth during the last four years, 1994-2000, the Mexican economy showed several structural imbalances as expressed in a corresponding fiscal deficit. As Lomas ?17? affirmed, President Zedillo's inheritance also included the great pressure of debt service from the financial rescue that will exercise influence over public finances in the medium term. Lamentable as it is foreseeable the present administration will leave an inheritance to the next government of a greatly compromised public finance and an even greater inability to respond to the reasonable demands of the people. Zedillo´s inheritance amounts to more that two billion dollars (million, million dollars) in public debt, including the wasted debt of the Institute for the Protection of Bank Savings or Instituto para la Protección del Ahorro Bancario (IPAB).

Interface Government – Companies

In Mexico, the main obstacles for managers are continued crime and robbery, because of an inadequate infrastructure, inflation, corruption and lack of financing. Many companies still do not pay taxes.

Unjust Distribution of Income

According to Cepal's estimates President Zedillo left a country with an increase in the difference in income distribution, i.e. high wealth concentrated in a minority and poverty in the majority, from 40.5 to 45.5 million Mexicans. Of these, 26 million are mostly indigenous, rural, and live in misery. The contradictions were caused by polarized growth, according to Boltvinik an expert on poverty and income distribution in Mexico. He stated that, "When the economic pattern that has been followed up to this point in Mexico is able to generate growth it will be accompanied by a growing concentration of income and an increase in poverty among the poorest strata. …the crisis of 1994 produced a brutal impoverishment of the population…until 1996, when the economy began to recover, and income again began to concentrate….". In a period like the current one, in which the Mexican economy reached a peak over 18 consecutive trimesters of growth, the benefits went to a very reduced group of people: "only the crumbs fall down" states ?12?.

Poverty increased from the 36 to 38 percent of the total of Mexican homes in 1994 from 45 to 47 percent in 1998. Data from the National Survey of Income-Expense in the Homes (ENIGH) of the National Institute of Statistics, Geography and Informatics (INEGI) indicates that between 1994 and 1998 the number of Mexican homes subsisting under the poverty line with a monthly income no larger than 560 pesos at a constant value of April 1994 increased from 69 to 76 percent of the total population. In general terms, the investigators agreed that poverty increased by more than 5 percent during Zedillo's term in office. This resulted in a society with big contrasts in income distribution, where 20 million Mexicans (20 percent of the total population) live under conditions of extreme poverty, and more than 40 millions (40 percent of the total population) live below the line of poverty.

In the last three six-year terms the rate of inflation has risen above the increases to the contractual minimum wages and, therefore, above the level of the workers' income. World Bank figures show that 42 million Mexicans have salary levels below twenty pesos daily, the equivalent of less than 2 dollars a day. Between 1974 and 2000, the real wage of the workers had an accumulated deterioration of 72 percent. During Zedillo's government an accumulated loss of 50 percent in real wages was recorded, registering the lowest purchasing power in the last 18 years. With data from the United Nations organization, 64.5 percent of the population received insufficient wages to sustain minimum nutritional requirements; 40 percent of Mexican women live in homes with low income compared to 20 percent of Mexican men ?15?. More than half of Mexicans old enough to work were employed in the informal sector of the economy.

During the period 1964-1981, the gross internal product per inhabitant rose to 7,776 dollars a year, with an average annual growth of 3.4 percent. However, after l982 with the implementation of the Neoliberal State model in Mexico, the growth of the gross internal product fell. For the period of the Neoliberal State, which lasted from 1982 to 2000, the gross internal product per inhabitant only grew on the average of 0.3 percent yearly. The National Survey of Income-Expense in the Homes, carried out by the National Institute of Statistic, Geography and Informatics (INEGI) in the year 2000, reports that the generation of wealth increased in the last six years, but the distribution of the wealth became more inequitable, with alarming levels of deterioration.

In Mexico 38.11 percent of national income is concentrated in 10 percent of the homes. At the other end, 10 percent of the poorest hardly receive 1.50 percent of the total, when in 1996 it was 1.79 percent. The income available monthly to 10 percent of the poorest homes was 26 percent less than in 1994, while for ten percent of the homes the reduction was 20 percent ?12?. The coefficient of GINI for the monetary income in 1992 was 0.5086, in 1994 it was 0.5137, and in 2000 it was 0.4889, which indicates a tendency in the concentration of the national wealth to decrease, though those with more however continues being high.

Quick economic growth has not resulted in an improvement in the levels of the population's standard of living, due to the inequitable distribution of income that impedes the transfer of macroeconomic benefits. The higher rates of growth that reached four percent, on the average, of the gross internal product between 1996 and 2000 has not contributed to improvements in the well-being and standard of living of the family, because they contribute 2.4 real percent of the product per layer. According to an analysis of The Financier (2000), for each peso (Mexican currency) that was generated in the economy in the first trimester of the year, 0.07 cents corresponded the population with scarce resources (38.11 percent), while the population with high levels of revenue (10 percent) obtained 50 cents.

Since 1994 when NAFTA was signed regional development has also been inequitable and unbalanced, subject to processes of economic separation that were the result of integration with markets of the North. Mexicans with lower revenues per layer are concentrated in seven States in the Southeast of the country. They represent less than 10 percent of the national gross internal product, while with a similar population, six States in the North generate 23 percent of the national wealth. The pattern of export growth based on cheap manpower allows only that small group of companies to benefit from the commercial treaties between Mexico and other countries.

Weakness of Governance

Weak governance in Mexico, for example, had its beginning in the weaknesses in the spheres of economics, society, culture, education policies, etc. and in the weaknesses of government institutions, although in the past the Mexican State was strong in creating institutions and public policy. The characteristic weaknesses of governance, were official and private corruption, influence peddling, corruption and inefficiency in the judicial institutions, and the influence of drug cartels. Moreover, deficiencies existed in internal security in the form of guerilla groups operating in rural areas and violence in the big cities.

The governance deficiencies were related to the uniqueness of the political system, which had its origin in erroneous economic policies implemented by the wealthy, who then created the organizational design for the transition of the Mexican State. Mexico has lived with the people focused more on the ideas of its rulers than on concrete proposals for national development through institutional development. The Mexican State has been able to maintain its uniqueness by making political promises that offer social protection on the one hand and more benefits that would favor the diverse social groups on the other.

Political Uncertainty and Security of Property

In Mexico's specific case, a consistently high factor of political risk (qualified as " BB ", non-investment degree) is the quality of governance that embraces the quality of the public sector's institutions; the efficiency of government services and the government's capacity to establish macro-economic stability. In an analysis of the dynamic factors, the estimate of the monthly national risk index is the decisive criteria for calculating the ratios of imports to reserves and debt to exports. Socio-political uncertainty is an important component of national risk.

Another important aspect to determine is the uncertainty involved in the regular transfer of government in order to evaluate the possible uncertainties caused by elaboration of the laws. The government's constitutional position (as a result of elections) is usually accompanied by big changes in the rules and regulations that impact on business.

With regard to the uncertainty in equitable application of the law, it is important to determine if companies trust the ability of the authority of the State to protect their property rights and to guarantee a dependable judicial process. Robbery and crime are serious problems that can substantially increase the costs of doing business and there is no trust in the authority of the State to protect people and their property from criminal acts. The unpredictability of the judiciary presents an even bigger problem for business operations. Public insecurity in Mexico has put the country into a situation of near chaos, surpassing other institutions that are pillars of an already decomposing system, as in the case of the PRI.

The governments' years in power leave behind "open wounds in the national conscience" from the indigenous conflicts of Chiapaz. The result being: increasing levels of poverty, the growth of the informal economy, increase in violence and public insecurity, corruption with impunity, the precarious conditions of micro, small and large enterprises and the deterioration of the countryside and farming sector.

In sum, the current problem in Mexico is good macroeconomics but bad microeconomics.

The Transition of the Régime of the Mexican State: From State Manager to a State of Managers

The pattern of the State party, and more concretely of the Mexican PRI-State, has ended. The failure of the PRI to form the federal government and their loss of an absolute majority in the Union Congress in the last elections was an event that constituted a new stage in the life of Mexico by placing the alternative National Action Party (PAN) in political power. Unlike other changes in power that have taken place in Mexico this one has been a peaceful road taken in an atmosphere of political stability, culminating in the arrival of a party contrary to the one that had held power.

During the last four administrations the transfer of power under conditions of economic and political stability was not evident. First it was necessary for the PRI State to disappear. During the last sixty years change occurred more within the party than in the political régime centered in a State party, characterized as a hegemonic political party. The PRI was a hegemonic party that held power for a period of seventy-one years, from 1929 to 2000. It served to sustain a presidential system with meta-constitutional powers, omnipotent above other powers (legislative and judicial) and over the spheres of economic life, politics, society and culture.

For the government to change required agreed upon and sometimes not agreed upon accommodations between the political and economic interests. First, the President relinquished constitutional powers and the system of patronage, established by the PRI and given to all the presidents who had emerged from within its ranks. However, the changed governing party retained the same presidential structures derived from the political culture of the Huei Tlatoani, or supreme lord, who ruled over the military, civil and religious life of our Aztec ancestors. For the political culture and government régime to truly change, structural transformation of the laws of public administration would be necessary, as well as strengthening legislative power, freeing judicial power and delimiting executive power, especially presidential control over the government and the State.

In the last two decades, since the eighties, amid major financial crises and a neoliberal agenda to change economic policy, growth stopped and its decline accelerated during the last four years of the nineties. This resulted in big imbalances in the economic processes and the dismantling of the defense mechanisms of the Mexican State. During the decadent stage of the PRI-presidential system, corruption increased, social cohesion was destroyed and the levels of poverty increased alarmingly. Income became increasingly concentrated "in favor of a minority coinciding in its composition and voracity with the elite of Creole inheritors and beneficiaries of the colonial caste system and of the porfirista system." So, in part, the defeat of the hegemonic PRI party was due to the collective rejection of economic policies that increased the levels of poverty, corruption and social violence. The PRI lost its capacity to respond when faced with a more active civil society.

Zedillo, the last PRI president, "cut his finger" to indicate that his successor inherited the power to allow the tri-colored candidate's election. He was not able to stop the buying of votes or coercion of the voters. But he did discipline the most reactionary to impede their stealing the election again and then, when losing in the war with the other parties, to open the way to a democratic transition that would reinvent the system. In a few hours it was transformed from a hegemonic party and authoritarian government régime, to a more democratic system, concluding the process of democratic transition, and handed over power in conditions of political normality, without any uncertainty about the change of the government or regime.

The transition occurred from a single party system to a democracy. However, this democratic transition was questioned to a certain extent, because what really happened was a change of the party in power. In any transition, it is evident that the total abdication of those powers that have to do with the control of the political process would leave a power vacuum resulting in adverse consequences. Still more, it remains to be seen if the democratic system improved the living conditions of Mexicans. Certainly, there was not a change of political régime, but a deepening of the neoliberal economic policy that had already been applied in Mexico since the middle of the eighties. The 71-year era of the hegemonic PRI party ended and it is expected that it also ended the Mexican presidential era.

The change to democracy after sixty years under the same political régime and the same access to political-power, has modified expectations and the operation of national public life. These changes have partly been the result of filling the vacuum created by the political party that had been in power. However, the form of the election was highly questionable in that it appealed to the "useful vote", and not to the "ethical vote based on principles and projects." PAN built its own place in the electoral market by conditioning voters to accept the falsehood that it was time for a change. They explained that "it didn't mean that they were in contention with neoliberalism but their only goal was to shoot the PRI out of The Pines" ?26?.

For some skeptics what happened was simply a change in the way of doing things, rather than in the content of what is being done. By all means possible during its last three years it was the satanic PRI that sold the depoliticized youth on the idea of the necessity and possibility of altering political power to create scenarios which would multiply opportunities for social mobility, education and employment for them.

The change of political party within the same régime represented a rupture in the old Mexican political system and continuity of the processes of development according to the neoliberal pattern imposed by the interests of transnational capital. This way, the change became significant because it represented a final balance between a presidential régime and its neoliberal economic model.

With the change of party in power came the end of the PRI era that covered a period of seventy-one years, already well known as the era of the dinosaurs with 22 presidents from the same party. Members of the "revolutionary family", had a patrimonial governing style with investiture and where public goods attributed to the public position were considered personal property. As well as paternalism the chains of corruption and complicity facilitated political control through corporate practices, clientelism, and the corruption of those who had less resources. The corporate interests that conditioned the votes of citizens also oppressed their political and human rights. It is interesting to analyze the different presidents' careers, the first from the military, who gave way to lawyers, then to economists and finally a manager.

When considering the change of the Presidency of the Republic, the end of the first sixty years was different from the last four years that left an inheritance of economic crisis and political deterioration, although political decomposition, violence and corruption still persist. In the last two six-year terms, that of the technocratic presidents who privatized politics, Salinas (1988-94) and Zedillo (1994-2000) truly represented the two big local groups of officials and managers politically. The two technocratic presidents had as a common governing characteristics a personal focus on social and power relationships. Both fostered the emergence of complicity between the technocrats and managers enlarging the capital-politics relationship to the men that held economic power, without respecting the rules of the system or the correlation between social forces and politics.

The Mexican technocracy has been insensitive and indifferent to social problems. Both, Salinas and Zedillo can be identified more as administrators or managers of economic politics than as rulers. The strategy they used to implement the neoliberal model consisted of maintaining a reduced group of technocrat economists in a network of alliances in collusion with capitalist groups. These capitalist groups, those whom Ortíz Pinchetti ?21? named the nomenklatura, had insatiable financial interests and were the main beneficiaries of the model. In Salinas' strategy, through the support of PAN, political leverage was given to the group of managers and financiers. It was their mega-negotiations with Zedillo's group (Grove, 2000) which killed the PRI. The decentralization of power began with Salinas and was deepened by Zedillo. Together they consolidated the neoliberal economic model.

Salinas first and later Zedillo, governed with authoritarianism to implant the economic policy imposed by supra national institutions. They were flexible in politics where they enlarged political freedoms for pragmatic purposes, provided they didn't contravene economic policies. The principle was stated this way; all economic reforms without political reforms are insufficient and result in dangerous contradictions. The modernization project of the technocratic presidents, neoliberalization and globalization, were promoted by the PRI governments. The government paid dearly because it gave up power and was not able to give benefits to most of the population because the modernization project was sustained by a substantially different economic order and guided by the governments that emanated from the Mexican Revolution.

In Zedillo's the sixth term in office the Deputy of the opposition, Batres, accused him of seeking to be a "Robin Hood the other way around, robbing from the poor to give to the rich…." The neoliberal governments confirmed that they acted in way which was "wicked, nothing moved them and their biggest works were the businesses that in some years allowed some to be enriched" ?27?. But the unusual thing was that the same PRI parliamentarian factions abandoned the old habit of defending their president to criticize the mistakes and inefficiencies of their administration. Social dissent could only cause loss of the neoliberal modernization project, which supposed a 25 year period of adjustment, during which time they sought conserve power, based on the control of the incomes of the working people and not of capital.

In the 2000 elections, for the first time in 71 years, the PRI lost the presidency of the Republic. This was a transcendental event for the political life of the country because it radically changed the political perspective and national expectations. The defeat of the hegemonic PRI party, which "progressively destroyed social cohesion: normally expressed and implicit, that held us together as Mexicans was due to the government's inclination to favor the Creole oligarchy and the concentration of monopolized capital" ?22?.

On the other hand, Touraine ?29? argues that the result of the elections put an end to the long reign of the PRI. It had reinforced the political action and intervention of the State in a country whose growth had not reduced social inequality. The economy grew but the benefits of that growth were not distributed, that is to say, it generated wealth but it also generated poverty. The opposite, the reduction of the weight of the State, was announced, although the public sector was traditionally weak in Mexico. Mexico's entry into the global economy increased the State's options for institutional change.

It opened up the Mexican political system for movement guided by the changes they had made, beginning with protest and public debate, more than a new political project. However, this democratic project could only be understood when viewed from the standpoint of political depolitization.

In fact, Fox's political and economic project gave continuity to the technocrats' project which was not more than a transition, because the only thing that happened was not a change of political régime but an alternate party in power. Given the conditions of the system the ideal thing would have been an alternate party with an alternative, a necessary alternative to government. In any event, political transition has been possible thanks to that same neoliberal model as disarticulated to civil society and citizens. What has happened in Mexico, according to several analysts, is that "a type of caudillista democracy has triumphed over a weakened left, marked by weak, unstructured political parties that reflect the decadent, centralist elite" ?20?. However, it is highly questionable whether the change has lead to a democratic régime and the death of a dictatorial presidential régime.

More than continuity, the pattern of neoliberalism increased with the Fox's rise to the presidency of Mexico. He represents a third movement of the neoliberal economy begun by Saline. Nevertheless, the technocrats were hit politically by the managers. The new political class, which mainly emerged from the local organizations of small and medium managers in the North, wanted to liberate the country from the corruption and clientelism of the State party. The Manager State was dismantled in the rise to power of the technocratic economists. Now with a manager-like President in Mexico, the Mexican State has become a State of Managers that treat democracy like good business, called the Coca-colaification of Mexico in reference to the managerial antecedents of Fox's transnational government.

According to a Canadian managerial leader, for Fox the governing of Mexico won't be the same thing as managing Coca Cola, but his managerial experience will help him to make decisions ?14?. The analyst Rubio ?16? describes Fox as "evidently a practical, pragmatic person who clearly adapts to circumstances. He has his priorities very clear and he has a clear sense of who to use and for what reason; he wants to use each one of the people. And in that sense what we see is a person not very ideological, not very dogmatic, but very adaptable to circumstances as they arise, moment by moment."

It is paradoxical that in a country where more than 60 percent of the population is poor, the elections were won by a party of the right that proposes to deepen the neoliberal model responsible for the increase in poverty. Fox's rise to power, coincides with the consolidation of a concentration process, an economic oligopolitation, and political centralization of decision-making ?9?.

With Fox the Mexican presidency is transformed from autism to democratic caudillism. Fox's ascendancy to the Presidency of Mexico, according to Krauze (mentioned by Fazio, ?10? resulted in "a direct, immediate switch to managerial power. Wines of new marketing in old wineskins of caudillism…a caudillism plebiscitary with messianic edges, very dangerous in a country like ours that finds the separation between the church and the State difficult". Nevertheless, the ghost of presidentialism has not gone away with Fox in the presidency. He has assumed an attitude of "commander of the town" because behavior patterns still exist that encourage it, reinforced by the existing Constitution. A true change in the régime implies a deep reformation of the State with a new Constitution, and in which diverse political forces delimit presidential activity.

Fox is the first manger president to arise out of the local elite from the center of the country. He represents the "electoralist stream" of the managerial elite in PAN and especially the stream dominated by the faction from the northern states or "Monterey Group". It has loose connections and is supported by the ideology of the new, Mexican right, as expressed in current pragmatism or neopanism, and is opposed to traditional orthodoxy. According to the ex-leader and twice Panista candidate, Pablo Emilio Madero, nephew of the democratic anti-re-electionist Francisco I. Madero, "Vicente Fox Quezada's eventual victory in the presidential election crowned the agreement of a group of managers. In 1982, these managers decided, in a meeting in Cd.

Juárez, Chihuachua, to infiltrate and control the National Action Party (PAN) to gain particular interests. The virtual ascent of neopanism to power constitutes a serious risk for Mexico because the pragmatic principle of personal interest would take precedence over common interests. And once in power they would be overcome by the temptation of authoritarianism to eliminate opponents, which would discourage the nation" [28].

Fox's proposed changes are considered imprecise as they relate to the panista proposal. According to Loaeza [25] "The lower and middle classes are described as not reactionary. On the contrary they want political change, would like a modern society, and are outward looking, though on the other hand, would be interested in a reduction of social inequality but not absolute equality, because that doesn't interest them. They have a vision of an anti-egalitarian society, they are not interested in equality but freedom. Freedom with order yes…social justice is not a panista topic…"

Contrary to the current doctrine, the ideology of neopanism, with certain flashes of fascism, defends the "changarro" from the attacks of official populism. With the focus on a distant political social democracy, the view is that the "useful vote" doesn't recognize the difference in ideologies but operates on the simple desire to reduce the power of the State Party. And under the representation of "virtual party unity", the political class is recomposed with the rise of the managers to formal power. The managers, mainly fom managerial unions in the North of the country, rose to political power using their managerial unions as launching platforms.

Nevertheless neopanism fought official populism and the decomposition of the Mexican political system was the main reason that a new, anti-party populism arose. According to Touraine [29], this political decomposition goes hand in hand with the advance of worldwide economic conglomerates. In the Mexican case it is also expressed as an alternative "to the Mexican" that, though difficult can be considered "like a real road for the creation of a true democracy." But in the aftermath of these political remarks, it is as dangerous to give priority to the fall of the whole substance of their régime, as it is to encourage the union that is already way too strong between a vague populism and economic liberalism. The resistance to this populist tendency attacks the political system at the same time that the capacity of the State to intervene has to be organized for popular movements. These popular movements have the capacity to manifest and to express the popular demands of the less favored sectors, in such a way that they really contribute to the restoration of public life.

The transition to the new régime has not been so smooth and soft. The caciques that held political and economic power weren't resigned to their loss. The death of the wounded PRI has ended in internal disputes over the little power that remains and the political groups defend their interests to their share of the power, resulting in violent confrontations. The smoothness of the political transition leads us to suppose a pact was made with those with real power.

Change of the Party in Power: The Mexican State of Managers in the New Pan–Presidencialist Period

The arrival of the managers to the Mexican State meant the displacement of politicians with formal power. In other words, what changed was formal power, because the real power remains unalterable. The Mexican Council of Businessmen stopped being a pressure group in the face of the power of the State and became instead the representatives of the managers in the federal government who determine national economic and political decisions. That is to say, the political power taken by the conservative groups that held hegemonic, economic power and the national neo-oligarchy was subordinated to the interests of transnational capitalism exercising a new governance strategy. This strategy allowed them to dominate and directly control the means for achieving their maximum benefit (efficiency), without necessarily appealing to the mediation of a political class that was highly paid for the mediation of the arrangements for production factors. This is the case between capital and work, for example. However, in humanity's history, the achievement of efficiency has not brought social justice.

The new State of managers administers the existing order efficiently to guarantee transnational global capital that the best conditions for investments exist in Mexico. Already the general coordinator of economic affairs in the transition team guaranteed "zero discrimination" for Mexican entrepreneurs. On the other hand, the leader of one of the most powerful organizations of managers warned that Fox's government would be friendlier to the production sector. Fox has a clear vision of the needs of a company, so he can create wealth and more work sources [5].

Fox represents the alteration of government and has stated that the purpose of his public administration is to increase efficiency in the government's work to a large degree and to eliminate all that has to do with error and corruption. “I will delimit the functions that reduce the effectiveness of government administration and damage of the whole society… …we have to put an end to political and administrative centralism and promote the invigoration of federalism to drive the development of the regions and the viability of municipalities, starting with their vocation and resources and the expectations of their communities.” ?19?.

His project of reengineering the federal public administration followed the advice of the World Bank. Based more on the pragmatism of changing the administration without changes to the law, it is sustained more by horizontal and flexible structures than by approaches to efficiency, effectiveness, opportunity, pragmatism and quality ?1?. The horizontal and flexible structure was articulated in a strategic plan reaching as far into the future as 2025. It combines managerial approaches with experience in the public sector. It was formed by super advisers and super managers who coordinate the work with regard to human development, security and justice, equal opportunity, and restoration of the government's institutions, general coordination, Czars (anticorruption and borders). It also formed Secretaries of State in government, social development, labor, companies and industrial development, agriculture, and country property.

On the other hand, the managers have declared ?5? they are convinced that the new government will be “friendlier”. They request options for participation in the investment deprived energy sector (electricity and secondary petrochemical). They reject that it seeks to recapture populist politics and they trust that the relationship is close enough that they will be critical when Fox makes a mistake. It is clear that Fox will govern the Mexican State with a focus on the New Public Management, as if Mexico was a corporation: Mexico, CORP. which gives the petrochemical and electric sectors to transnational global capital.

Fox's approach is frank and pragmatic. Madero qualifies Fox as “pragmatic, a man willing to throw ropes, say big words, buy votes, anything to win the election… in the name of pragmatism, and I worry that for him the pragmatic principle is more important than the democratic principle… (we) shall have to wait and see whether a panista government under Fox ‘will respect the people of Mexico for criticizing those who are… already in the government in power or he will do the same thing, which is to eliminate those that are opposed…” ?28?. Fox´s discourse was characterized by its open style and it broke with rigid protocol. His frankness, businesslike style and democratic genuineness are points in his favor. Fox has the intention of making his government a dynamic promoter of development, vigilant of human rights and pragmatic in administering domestic policy ?13?.

As a good manager, his pragmatism in solving problems is his main asset in achieving an “agreement” of the aspirations among the various sectors of society. But also his weak point is in negotiation. He tries to create “minimum points of outburst” where all the political actors simultaneously put on an air of agreement in economic and political matters. The proposals will be open to questioning by civil society and legislative power, where a majority doesn't exist for some of the political parties. It will be easier then to achieve cohabitation that won’t be unconditional to build the consent necessitated by lack of absolute control of the Congress. Fox has said in this respect, “my government won't make overall decisions in economic matters that will be against the interests of the majority. Nothing will be done without consent or behind backs or against the will of Mexicans” ?19?. In this sense, there is consent among the diverse political forces to delimit presidential power by suppressing his meta-constitutional power and creating an independent civil service free of the executive’s will.

But Fox’s pragmatism doesn't have an ideological base. It is be postulated on liberal values but the necessity of escaping the priísta cage, as stated in Reyes Heroles ?24?. Fox declared that his government won't be bitter and it has demonstrated that it is moving away from the demands interposed against him by those who accused him of receiving the foreigner’s money. Thus he confirmed certain rumors that came, in part, from former president, Salinas de Gortari ?18?.

The State’s managerial focus considers citizens as clients whom it must satisfy with services of absolute quality. The president exchanged the word client for that of citizen, with a vision on the one hand, for example, that it is inappropriate to promote the policy of indigenous community development. Disrespectfully, Fox has called the indigenous people “vocho, changarro and tele” in response to their centuries of rebellions against the capitalist system for the injustices perpetrated against them. To neoliberalism centered in the forces of the market, the indigenous peoples are not consumers. Therefore, they are disposable and, in the best case scenario, a population to be integrated or assimilated into the lowest ranks of the work force without rights and subordinate to capital, as exemplified by the proposal made during Fox’s campaign to train them to be “the foreigners' gardeners". Political analysts agree that "his proposals have been contradictory, sometimes retrograde, sometimes hopeful, but always lacking a coherence that would make the program complete. We have to be critical of a possible, new liberal version with some attenuation" ?22?.

In this way, the factions integrated into the directing elite were recomposed of managers to guarantee the continuity of the economic model, the dimensioning of a functional democracy that matches the discipline of the market, and the structural reinvention of the system. This allows a bigger reproduction of capital and deepening of the dominant instruments to markedly increase differences and social injustices. But this democracy favored by a authoritarian free market system is a hegemonic ideology of the elite of transnational globalized capitalism that imposes decisions to its own benefit. However the real power remains under the control of transnational capitalists.

On the other hand, the PAN in government will have to confront the issue of waste during the President's rule. There is evidence that Fox's governing style will be less flexible in politics and more authoritarian in economic politics than previous presidents, although he affirms that his priorities are to attend to the poor. Under this new correlation of forces, and with the same rules of separation of powers that established their autonomy, public matters are managed with more transparency. The frauds of the public sector and violence of the conflicts are now treated by the rule of the State and citizens can demand the right to the rendition of bills and transparency. Establishing the material conditions for law and order will be one of the government's challenges.

The organization of the new political system will be conditioned by economic politics. According to Bendesky's analysis ?6? the country reached a macroeconomic peak that lasted for more than four years because it "was sustained by factors hidden in the macroeconomic bills such as the high price of petroleum, the entrance of foreign currencies that reduced the dollar, and the dynamics of the economy of United States (which)… can change its tendency and pay the costs of the whole Mexican society when it is, of course, Fox's government. Among the changes necessary would be an adjustment of the exchange rate, increase in inflation, a bigger external imbalance and an inability to solve the problem of poverty." So the challenge is to maintain economic stability, to increase economic growth, support competitiveness and increase the productivity of the economic agents.

The political transition will come harnessed to economic reform but there won't be social advance. Structural economic reforms are needed to modernize the regulatory framework of general economic activity and strengthen the functional structure of the financial system. Cutting social expenditure in education and public health would reduce the weight of bureaucracy gradually by transferring these functions from the State to the private sector. Fox has said that they will reduce the cost of government in the next six years by subjecting it to a rigorous but gradual diet of federal public administration. Changes are needed to eliminate the lock on 51 percent of national investment to give a bigger opening to private and foreign investment and to invigorate the financial system.

Fox´s government committed to an integral fiscal reform and to tightening fiscal discipline. However, the IMF recommended maintaining "wise fiscal policies to assure the continuity of favorable growth and to avoid the risk of overheating their economy", ?23?. National development was sustained by fiscal reformation, based on the federal pact to assist in removing the inequalities of regional development, but this eroded the principle of solidarity.

Privatization and opening the energy sector to competition, especially the electric and petrochemical industries, won't work according to the same managers. "The country functions well… entrepreneurs don't want to buy Pemex or CFE. As a private sector what we want is to be allowed to compete, to participate in certain areas of production, to make them competitive at the international level… it is not necessary to put padlocks on foreign investment so that it intrudes in the electricity and hydrocarbon industries. The only rules for national capital and foreigners should be a free market economy, open commercial prices set by international competition" ?5?.

Under the focus of the New Public Management, Fox's government intends to deepen decentralization of decision-making by means of invigorating federalism, a post-PRI federalism to transfer to State government resources, abilities and responsibilities. In economic matters, this accumulation of resources, abilities and decisions gives place to what Zaid called "the Presidential Economy." The restructuring project and the federal government's reengineering are guided by an efficiency approach to the gradual reduction of the bureaucracy in order to optimize resources and to reduce the costs of operation.

The agenda of Fox's government is focused on eight strategic areas. These are restructuring of the Secretary of Government, modifications in the procurement of justice and public security, redefinition of functions in controlling public expense. Also, modernization and reformation of the energy industry (petroleum and electricity), redefinition of social development objectives, continuity of the economic project and reactivation of foreign policy ?7?. In general terms, the prevailing neoliberal economic policy has not been changed in the last 18 years, but rather it has been deepened. However, the project of restructuring the federal public administration assures that "none of the current public servants will be left in the street without employment opportunities" ?8?.

The Reformation of the State, the decentralization of functions and reorganization of government bureaucracy, are required to improve democratization, governance, public administration, and to impose the rule of law for legality and justice. The challenge to organize the government lies in building a system of multi-sector, matrix management of public administration ?4?. This can be done with a dual purpose: to coordinate the sector's actions and to redistribute the structures of local governments, attributes and abilities. Both have as their purpose the reestablishment of solidarity and social cohesion and the inclusion of the excluded social sectors in the benefits of development.

The new government's main challenge will be to build new institutional structures to solve the problems of the new reality that faces the managerial group in power. For example, those institutions that impede the practice of monopoly and that sustain governance of the Mexican society. This governance should be considered a democratic mechanism that facilitates relationships in the decision-making processes formulating and implementing public relationships, and establishing a harmonious relationship among the three powers. In political matters, it highlights the maturity of the electoral democratic processes, to achieve political reconciliation among the diverse political forces, to foment political and ideological plurality in the organs of the State, to drive the processes of decentralization, federalism, and regional and municipal development.

The new institutions that emerge from the government's decentralized reorganization should be guided to satisfy the demands of the citizens thereby opening channels for social participation. Also, to enlarge democracy by means of the recognition of its territorial environment and structures characteristic of public organization, the direct election of representatives, the assignment of abilities to the municipal government, the coercion capacity, the existence of untapped resources, and the direct administration of local services.

With a weak fiscal structure, financing of the basic functions of the State won't be possible. Other functions of the State will be transferred to civil society and to the market. Social expense will have a limited margin to maneuver to support such social policies as education, health, public security, and infrastructure. A public, lay, gratuitous education, based on values and quality, will be the axis of social politics. Fox will have programs and mechanisms that reduce poverty, achieve a fair distribution of income, recover real income, and translate into benefits for families by means of the generation of employment opportunities, financial resources, training, etc., for all. Philanthropic societies and the Catholic church will take charge of developing some of the functions given to the welfare State, when there existed a separation between the Church and the State, such as social attention to excluded groups.

The proposed democratic capitalist model for market economies in Latin American countries needs to be revised so that the function of the results is expressed in increments of poverty. Some of the main challenges for the rest of Fox's administration are to recover the government's credibility and genuineness in such a way as to reduce the high index of poverty by creating one million two hundred thousand new jobs per year, and to maintain economic growth and development. Correction of social inequalities is required starting with the reorientation of economic policies. One inevitable topic is how to draft public policies that will combat inequality in education, health, infrastructure, and housing.

It was necessary that the State should govern and act to rectify inequality, create a social economy that is a humane economy, and humanistic policies in the economic sense with a high emphasis on combating inequality. Economic policies should be drafted to generate good conditions of human life and not only change the bias that gives the market an indisputable hegemony and to guide certain production bases, but to make the State responsible for combating inequality. Economic policies have to become unified to reduce poverty through such measures as the establishment of Social Banking to support families and associated companies, as well as to create a government salary pact between employer and worker, that allows workers to recover their purchasing power.

A political system is required that will produce a public administration that is accountable to the people in such a way that rulers are brought closer to those they govern and which will permit social participation in the design and implementation of public policy. However, the conservative panista speech manages only to recognize the social participation of private philanthropic non-governmental organizations. Nevertheless this joint alteration of party power, the civil society that had always maintained a relationship in conflict with a government that sought corporate control, now has the opportunity to participate in the design of the country in a new relationship with government.

A strong concern still exists, however, because of the presence of certain signs threatening danger in state governments of panista extraction, such as in the cases of Jalisco, Chihuahua and New León. The panista governments in these States left a history of repression of those civil organizations that sought commitments and that criticized the government in the defense of human rights, labor: political and civic, and sought institutional answers to situations of violence. This paper supports the lowering of the profile of the Fox government.

New Venture Creation: Assessing Regional Entrepreneurship Potential

Vesa Routamaa
Anna-Leena Rissanen
Tiina Hautala
University of Vaasa, Finland

Abstract

To create a positive cultural climate and structural prerequisites for entrepreneurship development, special regional characteristics should be known. A survey of entrepreneurship potential clarifies the components of entrepreneurship potential to understand the attitudinal climate and entrepreneurial readiness and a view of regional specific attributes. An untestified assumption is that there is a suitable age, something between 36-45 years, to start up a business. However, it is proposed here that there are large regional variations between certain background variables. Accordingly, it is assumed that the local entrepreneurship culture and history make it impossible to draw country-wide generalizations except with regard to, for example, family background. In this paper, entrepreneurship potential and intentions in regard to age, especially, will be analyzed. Results from three regions will be reported. The supposition of an 'entrepreneurial age', that is, a favourable age to start a business, is not valid due to local cultures and history.

Introduction

The importance of entrepreneurship in terms of regional development and even to ensure the viability of scattered settlement is nowadays more and more recognized in various countries. However, the measures promoting entrepreneurship are often random, uncoordinated, and short-sighted, that is, a central problem seems to be the incoherency, poor co-ordination, and lack of synergy of the development projects. In practice, there is a shortage of appropriation and allocation on the one hand, and a shortage of good, long-term projects on the other. In Europe, the European Social Fund tempts diverse players to apply for money for diverse and impulsive projects carried out many times, frankly said, mainly to employ the organizer and his workers. There are multiple actors contracting out development projects, due to disconnectedness of regional government, among other things, and most diverse actors are competing for development funds. Free competition as such helps to improve the quality of development activities to a certain extent, although the development activities may be less goal-oriented and less objective in their evaluation of results. There is no single right way to develop entrepreneurship. Experience and results indicate that with disconnected inputs no sustainable results can be achieved. [8] Largely, as a result of lacking entrepreneurial policy, in Finland, the proportional number of SMEs and family firms is small [9]. As economic history and statistics indicate, micro-entrepreneurship and owner-driven SME activities constitute a central balancing state of employment when volume-based production, as such certainly important, varies and causes sharp fluctuations in terms of employment. That is why more consideration of new entrepreneurship, micro-entrepreneurship, and SME activities is important.

In Finland, after the serious recession and increased unemployment in the early 1990s, the Decade of Entrepreneurship 1995 – 2005 project, a coordinated national effort to advance entrepreneurship in Finland, was established. The objective of the project was to promote entrepreneurship in a holistic and persistent way together with key interest groups. A considerably increasing proportion of entrepreneurs in the labour force, increasing new start-up activity, an increasing number of enterprises in new areas of entrepreneurship and the net increase of enterprises were some of the main objectives of the program of the project. The realisation of these objectives called for promotion of entrepreneurship in the form of new entrepreneurship, new businesses and intrapreneurship. [8]

In order to pursue a certain goal in developing society, organisations, and individuals, the prerequisite is that the starting point is known. Orientation towards goals also calls for a more accurate identification of the current situation in order to know from which starting point and in which direction to go. There are a number of assumptions, beliefs, and even 'confident knowledge' about *entrepreneurial attitudes, intentions, and prerequisites*, but in reality knowledge about these matters as well as about factual structural factors in entrepreneurship is based more on assumptions than on real knowledge. That is why a development plan for entrepreneurship, 'A new, more entrepreneurial generation', based on a starting point research on entrepreneurial potential was established. In this paper, the basic question is: Do the prerequisites of entrepreneurial development activities regionally vary? In answer to that, entrepreneurship potential and intentions in regard to age, especially, will be analyzed as an example of potential regional differences. As background information, the framework of the development pogram will be presented.

A Framework for Developing Entrepreneurship

Identification of existing entrepreneurial attitudes and entrepreneurship potential in general requires research on entrepreneurship potential. A comprehensive survey is useful in order to know the starting-points and to be able to direct and allow the measures demanded to develop entrepreneurship.

Fig. 1 summarises the logical and temporal relationship between the central elements of development of entrepreneurship as a process[i]. At its best, a survey of entrepreneurship potential clarifies the components of entrepreneurship potential (see Fig. 2 and Table 1) to understand the attitudinal climate and entrepreneurial readiness and a view of specific regional attributes. Research at macro-level should be used to examine the structural aspects of entrepreneurship so as to direct the development efforts in a proper way.

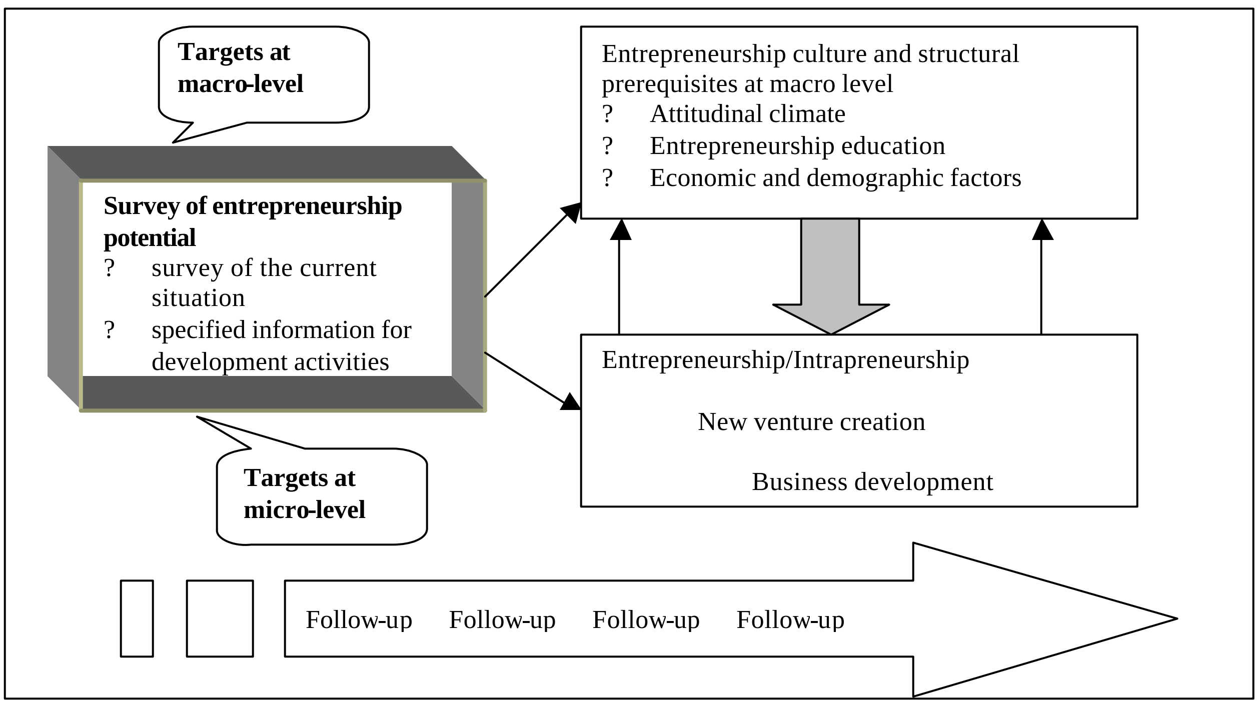

Fig. 1: THE FRAMEWORK FOR DEVELOPING A MORE ENTREPRENEURIAL GENERATION.

At micro-level, it would be appropriate to combine a survey of entrepreneurship potential with an exploration of local entrepreneurial culture, which would partly explain the background and attitudes to entrepreneurship or a wage-earner work culture.

According to the Development Plan for Entrepreneurship, *firstly*, through a survey of entrepreneurship potential, a comprehensive regional comparison base should be created to follow up the outcomes of development efforts over the next few years. *Secondly*, as an intervention this survey works as a catalyst for positive attitudes towards entrepreneurship by drawing attention to entrepreneurship as a phenomenon. *Thirdly*, informing about the results regionally provides pressure on municipal and regional government to promote entrepreneurship and its prerequisites. At its best, surveying entrepreneurship potential serves as a 'positive pressure' on development tasks. For example, if the most and least positive regions in terms of entrepreneurship can be seen on the map of a country in www, the awareness of this certainly encourages municipalities and regions to take action in various ways. *Fourthly*, it is the primary task of the survey to create knowledge about the dimensions of entrepreneurship potential as presented in Fig. 1.

Based on the dimensions of entrepreneurship potential presented in Fig. 1, regional entrepreneurship profiles, a picture of local entrepreneurship types will be gained (for example, what kind of interest, for what type of industry), to direct the development efforts to promote entrepreneurship and to make it possible to carry out better planned ‘specified development activities and training’.

Based on research results, it is possible to forecast cautiously the regional development of entrepreneurship. Positive attitudes to entrepreneurship, entrepreneurship qualities, and certain entrepreneurship identities correlate positively with entrepreneurial intentions. Entrepreneurial intentions correlate with starting up a business, although this relationship is not strong. According to pilot surveys, entrepreneurial motivation correlates quite strongly with entrepreneurial intentions.

In *regional comparisons,* research data can be examined in sub-samples according to the background variables. The different background factors can be studied in addition to general observations in terms of gender, age, education, current professional status, the industry sector, and family background. This is a way to provide focused information about entrepreneurship potential for developing attitudes, training, supporting activities, and so on.

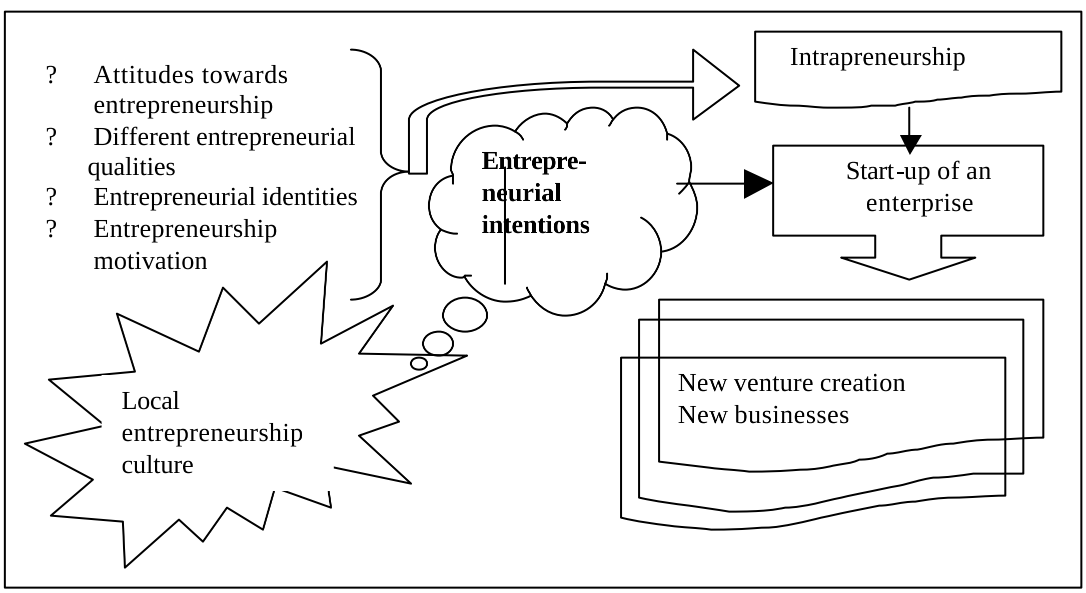

Fig. 2: THE ROLE OF ENTREPRENEURSHIP POTENTIAL IN PROMOTING INTRAPRENEURSHIP AND ENTREPRENEURSHIP.

Surveying entrepreneurship potential thus provides a broad *basic data base to understand how one becomes an entrepreneur* and how to *create preconditions* for and *reduce obstacles* to becoming an entrepreneur. Fig. 2 tries to clarify the relationship between the components of entrepreneurship potential and becoming an entrepreneur.

The local entrepreneurial culture either supports or hinders the realisation of intentions. For example, wage-earner culture and peasants' culture have a quite different effect on entrepreneurial activity in the region [1]; the former making passive, the latter stimulating.

From Potential to Intentions

It is quite a common belief that positive attitudes towards entrepreneurship should also predict the activity of new start-ups. However, for example in Finland the attitudes are very positive in general, but the number of people starting on their own in relation to the number of people of working age is lowest compared with other developed countries. Also the proportion of family firms in Finland is together with Portugal the lowest in Europe [6]. It is, however, to be noted that the phenomenon of entrepreneurial activity cannot be generalized either on a national level. The Global Entrepreneurship Monitor reports mainly country level results based on small samples giving generalizations, which have proved to be incorrect [5]. The research has discovered large regional variations and differences according to different background variables; between age groups, between male and female respondents, between family backgrounds, between groups of current professional status, etc. [3, 4, 5, 10].

Positive attitudes form the basis and favourable climate for entrepreneurship but are rarely the basic reason or motive for it. Entrepreneurship qualities may be the decisive factor when an individual is faced with the choice of an entrepreneurial career. A clear-cut entrepreneurial identity makes it easier to choose an entrepreneurial career if one is in two minds about starting up a business. However, there is a gap between 'identity' and action if the other entrepreneurial factors are not favourable. Entrepreneurial motivation is quite decisive in the case of a free choice between entrepreneur or wage earner. All these factors form a chain, which can lead to an entrepreneurial career in the context of push-and-pull factors as well as barriers to entrepreneurship. The more positive the dimensions of potential in the chain, the more probable will be the entrepreneurial career. Concerning Finland, the weakest link in the chain is entrepreneurial motivation. In Finland, the security factor is the most important motive in general [3, 4, 5]. This generally explains the weak position of entrepreneurship in Finland. This is largely due to the excessive social security in Finland and in the Nordic countries in general. Maybe also the strong uncertainty avoidance culture, typical of Finland [2] is partly behind the dominating security factor. As mentioned, there are large regional and background variations.

An untestified assumption is that there is a suitable age, something between 36-45 years, to start up a business. It is proposed here that there are large regional variations and differences between certain background variables. Accordingly, it is assumed that the local entrepreneurship culture and history make it impossible to draw country-wide generalisations except with regard to some background variables such as, for example, family background. Family background in entrepreneurial terms predicts statistically significantly entrepreneurial intentions regardless of general local cultures [3, 4, 5] It is proposed that based on the local culture, entrepreneurial potential varies in different age groups in general and between different regions. Actually, the variation is apparent also inside the regions for the same reason.

Method

To strengthen the positive attitudes towards entrepreneurship it is necessary to know the entrepreneurial attitudes of the general public. For this purpose as well as to produce knowledge for the other aims of the project, the author was authorized to construct the measure required. Accordingly, the entrepreneurship potential measure was constructed in the Department of Management at the University of Vaasa[ii]. The dimensions of entrepreneurial potential and their contents are presented in Table 1. A scale of five alternatives ranging from 'strongly disagree' to 'strongly agree' was applied when suitable. In addition to the dimensions above, offering 26 alternatives, the barriers to entrepreneurship were asked about. The potential barriers concern economic risk, entrepreneurial role, the lack of business ideas or knowledge, social risk, resources, social support, and personal traits. Further, push-and-pull factors, i.e., dissatisfaction and opportunity factors were also asked about. The question of entrepreneurial intentions consists of three dimensions, which are: the intention of starting up a firm, the intention of preparing to start one up, and the intention of being educated for an entrepreneurial career. These dimensions include several alternatives, for example starting up alone, starting up with a partner, buying a firm alone, buying a firm with a partner, etc. In this connection, starting up a firm with a company will be concerned. Of course, several background variables were asked about, too, for example, age, gender, education, work experience, current professional status, and family background in terms of the parents' occupation.

In this article, results from regions of three Employment and Economic Development Centres (EEDC) will be reported[iii]. The whole population of the North-Karelia, Häme, and Satakunta EEDC regions is 798 500, of which the target group, the relevant population representing a working age between 18 and 55 years, is less than 479 000. The final sample consists of 3 138 respondents (North-Karelia 697, Häme 1 136, and Satakunta 1 305). The response rate is irrelevant, because the sample was measured to cover at least 100 people from every rural district, which can be very small.

Table 1: THE DIMENSIONS OF ENTREPRENEURSHIP POTENTIAL.

1. Attitudes towards entrepreneurship;
Attitudes towards entrepreneurship, intrapreneurship, entrepreneurs and SMEs
2. Different entrepreneurship qualities;
Mastering one's life, tolerance of uncertainty, need for achievement, creativity, proactivity;
3. Entrepreneurial identities;
A personal interpretation about how one sees oneself as an entrepreneur; 19 response alternatives offered.
4. Entrepreneurship motivation
Challenge, self-efficacy, incentives, instrumental value;
5. Entrepreneurial intentions
A direct path to actual entrepreneurship

Results

Next, the entrepreneurial potential will be compared in the three regions, North-Karelia, Häme, and Satakunta, from the point of view of age. The aim is to find out the possible variation between the regions. Attitudes, qualities, motivation, and intentions as well as barriers are considered here. Entrepreneurial identities are not equally important from the point of view of this analysis when the probability of start-up is focused on.

As illustrated in Fig. 3, entrepreneurial attitudes follow quite similar lines in the different regions. However, the rate of attitudes somewhat varies. It can be seen that the attitudes in Satakunta are almost consistently weaker. The age group from 46 to 50 represents the most positive attitudes as well as the older people in general. The age between 26 and 30 seems also to be favourable for entrepreneurship, especially in North Karelia. In the 'start-up age' the attitudes are not particularly positive.

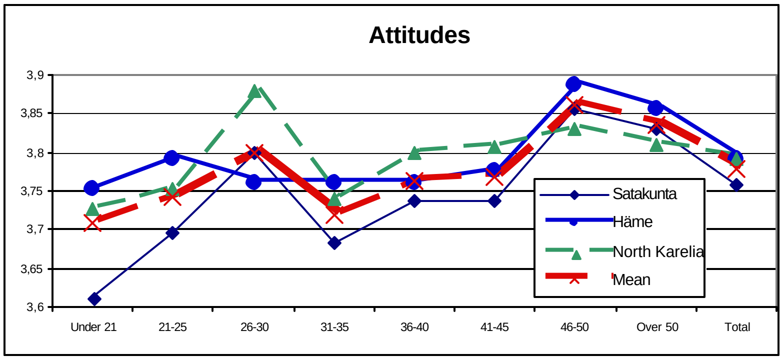

Fig. 3: ENTREPRENEURIAL ATTITUDES IN DIFFERENT AGE GROUPS.

Somewhat surprisingly, the entrepreneurial qualities seem to be at their best among the youngest people (see Fig. 4). An exception to this is Häme, where the age groups from 21 to 40 years are at quite the same level, at their highest. Compared with that, in Satakunta the level of qualities goes down with increasing age, having a small but not remarkable rise in the ages between 41 and 45 years. Correspondingly, in North-Karelia, there is a drop in ages 31 to 35. Thus the assumption of an 'entrepreneurial age' in terms of qualities is most nearly valid in Häme. To try find explanations for these regional differences, the history of the industries in these regions should be considered. In one area of North-Karelia, in Outokumpu, with an earlier active and highly profitable mine, which originated from the discovery of a deposit of copper in 1910, was closed down in 1989. It may be assumed that this setback depressed a certain generation, especially the age group of between 31 and 35. They experienced a too long period of local unemployment and pessimism. On the other hand, Pori, and Rauma, the main towns in the Satakunta region, have a quite thriving industrial history in terms of heavy industry and as ports. From father to son, the inhabitants of those areas were employed in that industry. The last twenty years have, however, shown a decline. It may be mentioned that the empty apartment houses of earlier industry workers owned by the employing industry in the harbour of Pori are a terrifying reminder of bygone times of industrial wage-earner culture. The region and its towns have built their future on the pillars of heavy industry, neglecting the importance of entrepreneurship and entrepreneurship education. Now the industrial towns are taken by surprise, trying to build a new culture.

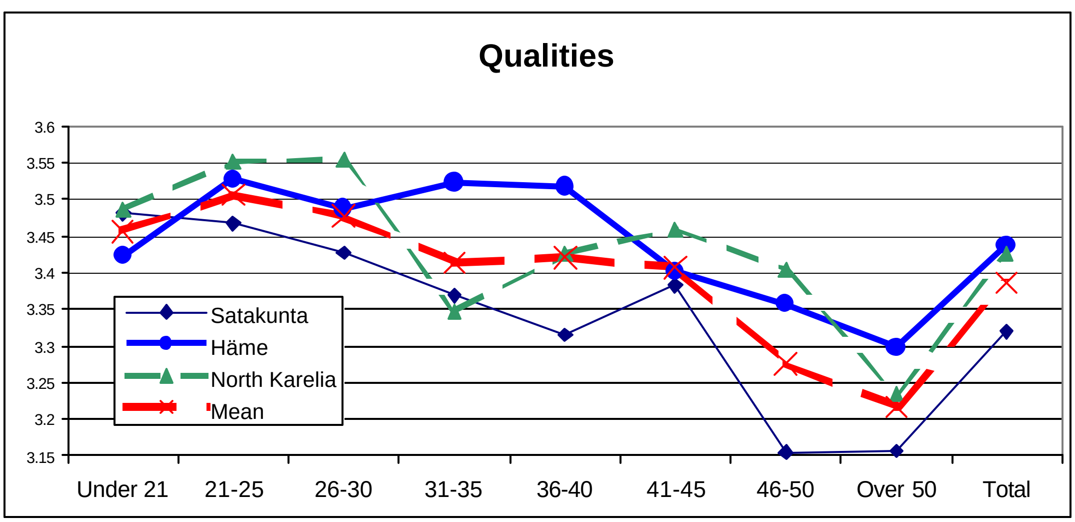

Fig. 4: ENTREPRENEURIAL QUALITIES IN DIFFERENT AGE GROUPS.

Just the other way round, entrepreneurship motivation increases with the age, except for those between 26 and 35 in North-Karelia (see Fig. 4). In Häme, the age group of 31 to 35 shows the highest motivation, and the older groups are also quite motivated. In North-Karelia also those of 36 and upwards are most motivated as regards entrepreneurship. In Satakunta, the peak is at the ages of 46 to 50. In North-Karelia, the motivation goes along the same line as attitudes and qualities, i.e., the frustration of that generation is pervading all the elements of entrepreneurship potential. In Satakunta, the trend is also in accordance with the other dimensions of entrepreneurship potential.

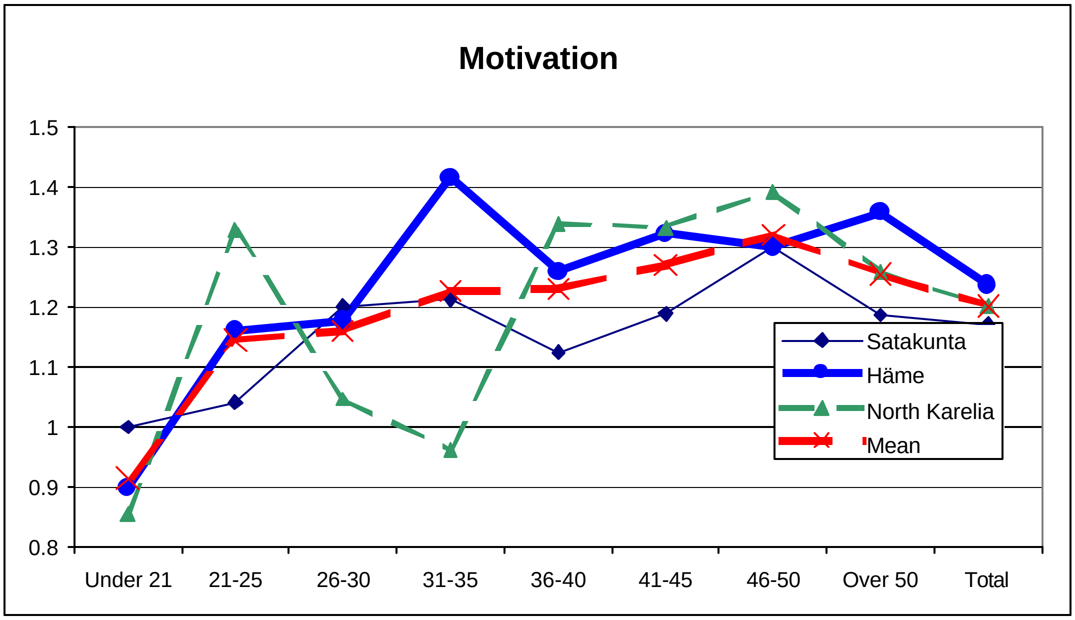

Fig. 5: ENTREPRENEURIAL MOTIVATION IN DIFFERENT AGE GROUPS.

Taking a look at the barriers to entrepreneurship, one will find that in North-Karelia those with the lowest entrepreneurship potential meet the highest barriers to entrepreneurship. In Satakunta, correspondingly, those in the entrepreneurial age of 31 to 45 meet higher barriers than respondents on the average. Consistently, respondents in Häme who have the greatest entrepreneurship potential also find the lowest level of barriers.

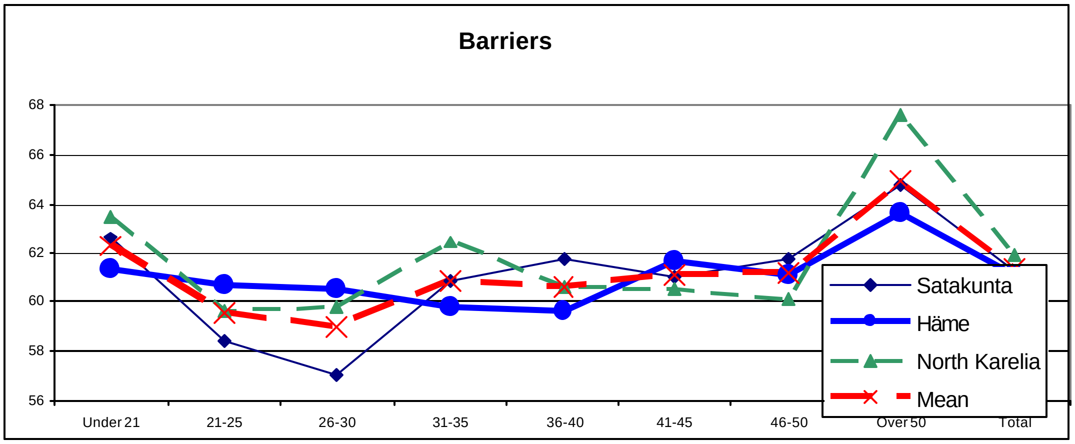

Fig. 6: BARRIERS TO ENTREPRENEURSHIP MOTIVATION IN DIFFERENT AGE GROUPS.

From the point of view of new venture creation, intention is the most important step before start-up. Who are those starting up? As mentioned, those coming from entrepreneurial families are most probably starting up [3, 4, 5] but what is the role of entrepreneurship potential as regards age? As could be supposed, in Häme those between 31 and 45 are the most probable starters (see Fig. 7). However, at the age of 36 to 40 there seems to be a drop in all of the regions. It may be a phase in the human life cycle where career and family are clashing in a way that forms a barrier to entrepreneurship to some extent. Concerning North-Karelia, it could be expected that those of the ages of 26 to 30 have not a very high rate of intention, in spite of the most positive rate of attitudes in the region. That is, the level of attitudes is not a reliable predictor of start-ups. In accordance with the entrepreneurial potential reported, the rate of intention decreases in Satakunta after the age of 26 to 30. Those in the 'entrepreneurial age' are not most active as regards intentions. In Häme, again according to the coherent entrepreneurial potential, a favourable age to start up is between 31 and 50, excluding the small drop at the age of 36-40. Additionally, in Häme, the youngest group seems to have a relative abundance of intentions, too.

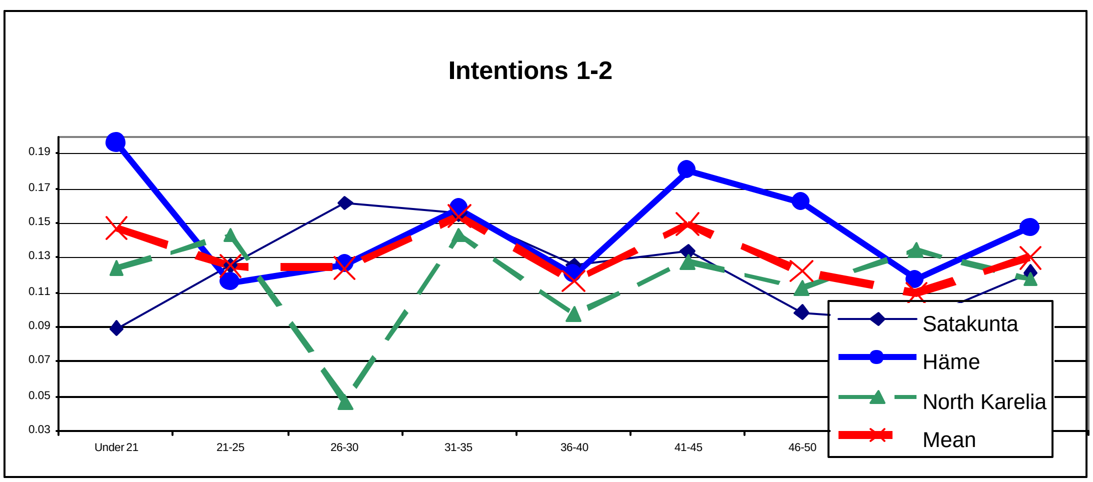

Fig. 7: ENTREPRENEURIAL INTENTIONS IN DIFFERENT AGE GROUPS.

Conclusion

Based on the results obtained above, it can be concluded that entrepreneurship potential and intentions walk hand in hand. Further, it can be stated that they cannot be generalized on a national level, not even on a regional level due to the large regional variations and differences between certain background variables. As regards age, the supposition of an ‘entrepreneurial age’, that is, a favourable age to start a business, is not valid due to local cultures and history. As reported above, in one region, the age cycle behaved as expected; the most favourable period of starting up was found to lie between 35 to 45, or even 50, years. However, in another region a temporary setback seems to have ruined a certain age phase, especially the ages between 31 to 35. Further, a third of the regions concerned had experienced a long period of decline which, as assumed here, caused damage to the entrepreneurship potential of several generations. In this region, only the youngest generation, grown up after the period of decline, during the new orientation phase of the region, showed some entrepreneurship potential.

Accordingly, there are few explanatory factors which can be generalized above regional or local cultural and structural circumstances. A careful analysis and comparison of several potential and background variables inside and between regions should be performed in order to get more exact knowledge for promoting entrepreneurship and new venture creation. In order to promote regional and local entrepreneurship, a careful survey of entrepreneurship potential, preferably accompanied by an exploration of local culture, should be made. Entrepreneurship development requires, first of all, intrapreneurship of the actors, and understanding of entrepreneurship in terms of theoretical as well as of practical points of view. That is why public bureaucracy is not capable of managing entrepreneurial development [9]. For example, the number of SMEs has turned to decrease.

Family Firms in Western Mexico: Regional Profiles Facing Global Challenges

Ricardo Arechavala Vargas
Eva Raquel Ponce Aguilar
Noemí González Méndez
Universidad del Valle de Atemajac, México

Abstract

Based on previously reported instruments, an instrument has been developed to assess family firm profiles, in terms of family dynamics and resources, and in terms of managerial skills and competitiveness in open markets. This instrument has been applied to a sample of family firms in several cities in Western Mexico.

Results show the complexity with which family and business issues are intertwined in these firms. However, clear patterns emerge when specific interactions between system components are mapped with the aid of this instrument. Specifically, as identified by several authors in the field, three subsystems are closely scrutinized: family, business and property. Implications for both management and policy issues are discussed. Most of all, specific attention is given to the identification of sources of stress for both business and family structures. Criteria for their evaluation and management are also set forth.

Introduction

Even though few reliable statistics are available, family firms in Latin America seem to have a stronger relative importance in their economies [Poza, Danco and Nader 1998, De la Cerda 1995] than in industrialized countries. It was only as late as the middle fifties that Mexico started its industrialization process. Many firms were first created in the following two decades, mostly by entrepreneurs with little formal education, and without a strong industrial culture to back them. In a significant proportion of those firms that survive, founders are currently at their final stage of their entrepreneurial careers. Their firms are therefore facing the crises and challenges that come with succession issues.

On the other hand, the opening process for the nation's economy started in the middle eighties, and acquired a much significant momentum in 1994, with NAFTA. Having developed within an export substitution industrial policy, which secured closed markets for them, firms developed an entrepreneurial and managerial culture that is not well prepared to face the challenges of international competition. On top of this, for historical and geographical reasons, entrepreneurs in Western Mexico are wary of problems that come with growth and size in their firms. Their survival strategies in recurrent economic crises in the last decades have depended on the agility of their firms to adapt to small market niches [Nunez y De la Cerda 1993]. To a large extent, survival strategies in Western Mexico meant keeping firms' size small, and relying to a large extent in informal networks to provide alternative income sources and to manage human resources as through flexible structures [Calleja 1994]. Among those networks, as is usually recognized for Latin American countries because of their culture, the family is of prime importance [Young and Welsch 1993].

All of these factors, which are present to varying degrees in different industrial sectors [Arechavala 1998, 1996]; currently lead family firms to face significant challenges. In a significant proportion of firms, succession is an open issue, while international competition places previously unknown challenges to them. To the extent that succession planning is not yet a common practice in the region, the associated risks and crises are becoming common for these firms. Which are the most salient characteristics of typical family firms in Western Mexico? How do they affect their capacity to face those challenges that come with international competition? How do family dynamics and resources affect their competitiveness? What influence do business factors have in family interaction patterns?

The family system, the business system, and the interaction between them.

Research on family firms has explored different processes and has focused in different aspects of a family firm. Family businesses are closely related to entrepreneurial behavior, they give rise to gender, governance, and succession issues; the firm's performance profoundly shapes family dynamics, and it is determined itself by the ability to tap on the family's emotional and professional resources and skills. It is therefore inherently difficult to develop a model of all those factors and processes that can cut across disciplines.

Models developed so far concentrate mostly on one or a few of these aspects of family firms. A few of them focus on the interface between family and business, and the way in which it shapes their interaction. It should be clear, however that these two domains interact in ways that either facilitate or hinder important capacities for both the family and the firm.

Starting from the view that the family's profile is shaped by factors that are common to other groups, Danes, Rueter, Kwon and Doherty [2002] adapted a model of how interactions among family members and business decisions and goals are integrated. Their model is based on the Family FIRO model developed by Doherty and Colangelo [1984] which itself is an application of a model developed for groups. Based on the explicit recognition that "family and business goals are forces that steer each family business through predictable patterns of growth and change", they explore the processes that determine the family's ability to integrate those factors that influence "the well-being of the whole system and the achievement of goals" [Danes, Rueter, Kwon and Doherthy 2002, p. 33].

As discussed by Riordan and Riordan [1993], it is not correct to conceive family and business systems as systems that should operate independently of each other. As owners/managers painfully know, "(…) owner-managers are expected to direct behaviors simultaneously to achieve both family and business goals. It is impossible for the majority of individuals to excise the business 'system' from the context of the family and business" [Riordan and Riordan 1993, p. 67]. Actually, our group's experience and field research direct us to concur with their view that: "Control approaches that focus on the business as a separate system ignore the ability of the owner-manager to allocate resources in non economic ways to fulfill personal family goals. Advice to excise business decisions from family interference ignores reality." [Riordan and Riordan 1993, p. 76].

Advocating a field theory model of family and business interactions, Miller, Fitzgerald, winter, Paul and Kaye [1999] state that "The system requirement to establish consistent, clear boundaries between family and business systems is not always possible. Sometimes the problem at hand cannot be cleanly placed in the appropriate system. Business conflicts arise that spill over to affect the family and vice versa." [Miller, Fitzgerald, Winter, Paul and Kaye 1999, p. 254] Field theory has the ability to overcome this limitation while holding that "The central tenet of field theory is that individuals hold positions within a field or life space and attempt to maintain a dynamic equilibrium in relation to their environments (Deutsch,1954)" [Miller, Fitzgerald, Winter, Paul and Kaye,1999, p.254]. In their view, this fact has implications for both the family and the business's health:

"Because conflict occurs frequently within a family business, it is important to identify the source of conflict. Given the limitations of the overlapping family and business fields, it is also important to try to manage each component effectively for the adaptation and survival of both the family and the business" [Miller, Fitzgerald, Winter, Paul and Kaye 1999, p.255].

According to Riordan and Riordan's perspective, "(…) family business managers attempt to reach business and family goals simultaneously, thus, attempting equilibrium in both the business and the family fields" [Miller, Fitzgerald, Winter, Paul and Kaye 1999, p.254].

Individuals make decisions that simultaneously include influences from all of the groups to which they belong. They are subjected simultaneously to several influences. "Individuals make decisions in a life space that includes **simultaneously all of the groups with which they are interdependent**" [Riordan and Riordan 1993, p. 76] (emphasis added).

The potential for conflict to spill over from one domain to the other is unavoidable. "In family firms, work-related roles affect family roles and vice versa (…) Consequently, behavior-based internal conflict is regarded as being particularly ubiquitous and unavoidable among members of family firms (…) Behavior-based interrole conflict involves discord associated with behavioral expectations across roles (e. g. owner vs. parent). Differences between family and business cultures also contribute to interrole conflict." [Smyrnios, Romano, Tanewski, Karofsky, Millen and Yilmaz 2003, p. 38]

Looking at the same issue positively, one of the models that look closely at this interface has been developed by Habbershon and his group, within their resource-based view (RBV) of the firm. Tenets of this framework for assessing strategic advantages of family firms are based on the recognition that family firms can have important advantages, the origin of which lies within the owner families and their relationship with the enterprise. "The RBV of competitive advantage, because it examines the links between a firm's internal characteristics and performance, provides the opportunity to more fully delineate the competitive capabilities of family companies (…) In contrast to the generic approach, specific family firm resources are identified and matched to the firm's capabilities. (…) 'Familiness' is defined as the unique bundle of resources a particular firm has because of the systems interaction between the family, its individual members, and the business." [Habbershon, Williams and Kaye, 1999, p.6-7]

But, should the family be considered only as potential resources to be applied to the business, or does it have developmental goals of its own, that should be at least well taken care of? At least in the Mexican culture, this is not only the case, but it is also the case that individuals are expected to find in the family a nurturing context, conducive to their own development and growth as individuals.

Is this context, and its implicit goals, affected by patterns of interaction in the business? Again, as owner/managers painfully know, and as is consistently reported by consultants, it is. Even though systematic research has not addressed this phenomenon directly or consistently, business problems are usually carried into the family context, and they either create or feedback into interpersonal conflicts in the family.

Thus, the model for this study is built under the assumption that not only family interaction patterns influence the business system performance, **but that personal interaction patterns in the business system affect family capabilities and performance.** Underlying this assumption is also the tenet that a family is a system that has growth and performance capabilities. Just as the business system is expected to generate wealth and perform successfully in several dimensions, **the family should foster the growth and well-being of its members and of the family as such.** Family capabilities are affected by business interaction patterns and performance, and these capabilities can also be assessed.

This view of the family/business system is consistent with the Sustainable Family Systems Model proposed by Stafford, Duncan, Dane, Winter, and Kaye [1999], which states that "(…) sustainability of the family business (is a) function of family achievements and business achievements and transactions between the family and the business (…) families must be as efficient in the pursuit of satisfaction as a firm must be in the pursuit of profit", [p. 202]. Their model "(…) includes analogous processes in the family and the business systems (but) separates them to call attention to the difference in purpose and specific content of the processes within the two systems." [p. 202]. Furthermore, it proposes that the study of interaction patterns should acknowledge that business and family interactions may change during times of environmental change, structural change, or both. "Sustainability results from the confluence of family success, business success, and appropriate response to disruptions (…) Sustainability also requires consideration of the ability of the family and business to cooperate in responding to disruptions in a way that does not impede the success of each." [p. 203].

The Instrument

To this date, there is little empirical research on family firms in Mexico, reported in the scientific literature. Our study, therefore, is to a large extent exploratory. Even though it is likely that many phenomena studied elsewhere would also occur in our context, we do not know yet to what extent cultural characteristics in Mexico would imply significant changes in the applicable models.

Based on the models mentioned in the previous section, and on a review of both the academic and the consulting practitioner's literature, we developed a conceptual model of those areas of family firm member interaction that have a significant potential to influence both the family and the business systems. This instrument is designed to both in terms of family dynamics and resources, and in terms of managerial skills and competitiveness in open markets.

The underlying rationale is that, just as the "Family FIRO Model" [Danes, Rueter, Kwon and Doherthy, 2002] implies, patterns of member interaction determine the family's ability to achieve its goals. Identity and control issues determine the way and the degree in which they can integrate both family and business resources to achieve common goals. From the practitioner consultant literature, we have identified the following fields of interaction that reflect control structures that can significantly affect performance in both the family and the business systems. The instrument includes several items for the assessment of patterns of interaction in each one of several areas. As proposed by Stafford, Duncan, Dane, Winter, and Kaye [1999], it also includes items that attempt to measure the ability of the family and the business to adapt their interaction patterns to respond to change in environmental conditions, as well as in structural conditions, both in the family and in the business system. The following are the areas in which the instrument attempts to measure interaction patterns, as reported by the owner/manager:

Commitment:	The family and its members' commitment to the sustainability of the firm beyond the generation of the founder.
Training:	The norms that govern the ways in which family members are trained for jobs in the firm.
Succession planning:	Family member knowledge of, and eventually participation in, succession plans.
Interpersonal dynamics:	Openness, communication, and conflict management, as is reflected both in the business and in the family system.
Gender issues:	Family attitudes and values around equality and opportunities for both genders in the firm
Property management:	Rules and values in assigning property of the firm to family members.
Management skills:	Reported behavior in the development of management skills in family members, and the assignment of jobs and responsibilities in the firm to them.
Fairness:	Rules and values in evaluating performance and assigning compensation, promotion, and incentives to family members and non-family members in the firm.
Patrimony management:	Reported behavior in managing family financial resources, business resources, and the flow between them.
Performance evaluation:	Definition and communication of performance evaluation criteria for family vs. non family members.

Items in the questionnaire describe desirable interaction patterns in each of these areas. Responses, on a Likert-type scale, indicated the degree to which those descriptions are applicable to the family firm.

Patterns of interaction in the domains outlined above affect performance of both the family system and the firm system. Interaction patterns described in each of the questionnaire items will affect one or more of the family and the business capabilities. Based on research literature, on practitioner consultants' literature, and on previous fieldwork, these interaction patterns' effect on several systems' capacities were assessed:

Business System	Family System
Growth: The capacity of the firm to constantly increase its patrimonial value and its return on investment.	**Family harmony**: Patterns of interaction among family members that foster inclusion, trust, individual and collective well-being and growth.
Institutionalization: Its capacity to endure as an organization, regardless of whether the persons in charge are members of the family or not, and regardless of who controls ownership of the firm.	**Communication**: the presence and consistent use of communication channels and mechanisms in the family.
Sustainability: The capacity of the firm to mobilize and capture resources in favor of its development and competitiveness.	**Conflict resolution**: Ability to face and solve conflicts within the family, when they appear.
Results: the capacity of the firm for consistently generating positive business outcomes.	**Growth/nurture**: ability of the family to prevail as an environment that is conducive for members' well being and personal growth.
Managerial capacity: the ability to consistently develop higher managerial talent in the firm.	**Involvement**: Degree of commitment in family members to maintain the viability of the firm as a family enterprise.
Innovation: The capacity of the firm to adapt to changing conditions, and to keep abreast of the competition.	**Foresight**: Ability of the family to foresee contingencies that may endanger the family-business system, and to plan for them.

A score for each participating family firm was derived for each one of these capabilities. Scores are computed as the percentage of the desirable interaction patterns that are present, and the degree to which they are present in each case.

Methodology

The instrument is administered in an interview with the owner/manager of the firm. Interviews were 60 to 90 minutes in duration, on average. The first part of the interview deals with the history of the firm and of participation of the family in it. This part of the interview helps in assessing the validity and reliability of the instrument. A second part was dedicated to gathering data about the business's organizational structure, participation of family members in that structure, and in its ownership. The third part consisted of administration of the 74-item questionnaire by the interviewer.

A report is presented to owner/managers, with an assessment of what the instrument indicated about their businesses' and about their families' capabilities, as affected by the interaction patterns reported by them. The validity of those assessments and their implications were discussed with them in every case. Although its foundations are built on theoretical models reported in the literature, this phase of the study has not been directed towards hypothesis testing. The aim of the study has been mainly to validate the instrument, and to begin to draw the typical profiles of family businesses in the central and western part of the country.

The issue of sampling has several aspects to consider. One of them is the theoretical interest of the study, but the other is the availability of access to the firms, in order to obtain their consent to participate in the study. Rather than assuming a strict definition of family firm, from which a decision rule of whether a firm was a family firm or not would follow, we assumed Astrachan's approach [Astrachan J.H., Klein S.B., and Smyrnios K.X. , 2002] in which the question is rather the degree to which a family holds control of the firm.

However, given the objectives of the study, it was important to identify family firms that could be expected to at least attempt to maintain the integration of both the family and the business systems. Therefore, an important criterion for sampling was that they would show a clear determination to maintain the viability and control of the firm for future generations in the family.

Because of cultural values, firms are reluctant to provide information to strangers. In most cases, however, it is enough that the researcher be introduced to the owner/manager by a trusted third party. Random sampling is therefore out of the question. Researchers from our group initiated network cascading techniques in order to obtain access to, and participation of, firms in the study. At this time, the sample consists of 39 cases.

Contrary to the general expectation that family firms are mostly small businesses, firms participating in the study were not selected for size. Even though in Mexico it is customary to differentiate four levels, according to size (in number of workers and sales), this differentiation is not essential to the objectives of the study. Moreover, since the main goal of the study implies that interaction and viability of the family and the business be considered in the long range, it is to be expected that successful family firms would grow as successive generations are in charge, and should therefore be included.

Results

One out of 40 cases had to be eliminated from the sample, because related items in the questionnaire indicated that the family was not interested in continuing with the firm, even though it had interesting characteristics and performance indicators. Furthermore, the accompanying history, revealed that they were about to sell it. Final size of the sample was 39, with the following characteristics:

TABLE 1. BUSINESS CHARACTERISTICS

	n	**Percentage**		**n**	**Percentage**
Size of firms			**Longevity of firms**		
Small and medium	37	95%	1 - 10 years	3	8%
Large (>200 employees)	2	5%	11 - 20 years	12	31%
Sector			21 - 30 years	11	28%
Industry	23	58%	31 - 40 years	5	13%
Commerce	8	21%	41 – 50 years	2	5%
Service	8	21%	51 – 65 years	6	15%
Line of business			Mean of longevity	27.64	
Leather and shoe industry	6	15%	**Generation managing**		
Metal-mechanic	6	15.%	First generation	28	76%
Confection and textile	4	10.%	Second generation	10	22%
Food industry	6	15%	Third generation	1	2%
Graphic Arts	3	8%	**Exportation**		
Commerce	8	21%	Yes	8	20%
Others	6	16%	No	31	80%

TABLE 2. FOUNDER'S AND MANAGERS' CHARACTERISTICS

	n	Percentage		n	Percentage
Average age of founders			**Average of managers**		
30 – 40 years	4	14%	30 – 40 years	10	26%
41 – 50 years	5	18%	41 – 50 years	11	28%
51 – 60 years	10	36%	51 – 60 years	13	33%
61 – 76 years	9	32%	61 – 70 years	5	13%
Mean age of founders	55.82		Mean of age managers	48.72	
Gender of founder			**Gender of managers**		
Male	34	87%	Male	33	85%
Female	5	13%	Female	6	15%
Education founders			**Education managers**		
No formal studies	3	8%	No formal studies	0	0%
Basic studies	8	21%	Basic studies	3	8%
Medium studies	15	38%	Medium studies	15	38%
University studies	9	23%	University studies	16	41%
Master degree	4	10%	Master degree	5	13%

Tests for inter-item correlation showed absolute values between 0 and .75. Only one of them reached the value of .798.

Average scores for family and business capabilities, as described above, are shown in table 3.

TABLE 3. BUSINESS CAPABILITIES AND FAMILY CAPABILITIES.

BUSINESS CAPABILITIES	MEAN	SD		FAMILY CAPABILITIES	MEAN	SD
Growth	0.56	0.11		Family harmony	0.67	0.11
Institutionalization	0.60	0.13		Communication	0.65	0.13
Sustainability	0.61	0.12		Conflict resolution	0.65	0.11
Results	0.62	0.13		Growth/nurture	0.58	0.10
Managerial capacity	0.63	0.14		Involvement	0.72	0.12
Innovation	0.56	0.14		Foresight	0.61	0.19
Overall business score	**0.60**	**0.11**		**Overall family score**	**0.65**	**0.11**

It may be noticed that average scores in business capacities are generally lower than family capacity scores. This is reflected in the overall mean score for both domains. A rather interesting finding is that family firms that score well in business capabilities also tend to score high on family capabilities (Pearson r=.904)

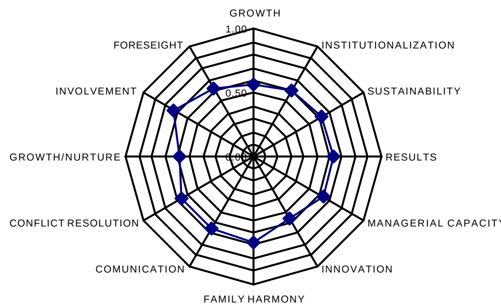

FIG. 1: GRAPHIC REPRESENTATION OF AVERAGE BUSINESS AND FAMILY CAPACITIES IN SAMPLE.

Preliminary results show the complexity with which family and business issues are intertwined in these firms. However, clear patterns emerge when specific interactions between system components are mapped with the aid of this instrument. Specifically, as identified by several authors in the field, three subsystems are closely scrutinized: family, business and property [Gersick, K., Lansberg, I., Desjardins, M., and Dunn, B., 1999].

In the regional context, common pattems begin to emerge with regards to the ways in which family firms are coping with current challenges, and with regards to those competencies that they must address directly, if they intend to survive in the currently turbulent environments they face.

Self-reported assessment of interaction patterns relating to various family and business issues show strong associations among them. These associations develop into a complex network of relationships among patterns of interaction which could initially be considered to have little to do with one another. While it is not surprising that association in responses to items from the same area or field of interaction (as detailed above) show strong correlations[i] among them, it is interesting to find that patterns of association between responses to different items consistently cross among areas. Pending the development of a more sophisticated model, as more cases become available, we have found the following major correlations among items pertaining to different areas in the instrument[ii]: A few examples are the following:

TABLE 4: SELECTED ITEM INTERCORRELATIONS.

Item	**Pearson r**	**Item**
The way in which the succession process should take place when the moment arrives is clear for me.	.70	We have clear rules for the participation of family members in the business, and they are well known by them.
Family conflicts do not affect business performance.	.55	Family patrimony is handled separately from the business's capital.
(It is not the case that) Some family members do not live up to expectations in their performance.	.55	Those family members with a greater motivation and capacity have a greater share of property in the business.
Each member's contribution to family harmony is clear and valued by the others.	.55	Only family members who wish to work in the business.

Association among responses to different items tends to group them in distinct sets, mostly according to interaction patterns that belong to the same area. More interesting is the fact that responses to items dealing with the succession process have a strong association with multiple interaction patterns and capabilities in both family and business arenas. Of particular notice is the fact that succession process items are strongly associated to items pertaining to performance evaluation, commitment of family to business, interpersonal dynamics, and management capacity.

Discussion

Relatively high scores for family system capabilities, although not surprising in the Mexican cultural context, have been paid relatively little attention in the family business literature. Even though our sample is still small, it may be assumed that the instrument captures important aspects of the family business system in this regard. Whether this result may hold in different cultural contexts is still to be seen. Cross-cultural research, with all its logistic and methodological problems (see Birley 2001) will provide a much better frame of reference to assess its real value.

Strong association among interaction patterns that would seemingly pertain to different domains (like patrimony management and interpersonal dynamics, or property and performance evaluation, for example) point in the direction of very close connections among interaction patterns and capabilities both in the family and in the business system. As field theory applied to the family business context implies, the behavior of individuals in the system do not only respond to values and interests in one group or the other. Over and above that, however, some of the interaction patterns developed in the family and in the business tend to be strongly associated with others pertaining to different functions in them. Assessing the relative integrity and performance of each subsystem, therefore, cannot easily be done disregarding the other.

This point stands out when considering the degree of association between items related to succession process and items related to interaction patterns in performance evaluation, interpersonal dynamics or management capacity, for example. Analyzing individually and collectively those items that show a strong association with succession issues, we interpret the observed patterns to mean that the succession process is a complex one, which demands that the family and the business bring their resources and capabilities fully into play. Family's commitment to the business, interpersonal dynamics, performance evaluation and management capacities are among the ones whose support is demanded most by requirements of the succession process.

The fact that there is a strong correlation between overall scores in family and business capabilities further strengthens one of our main arguments: that effects of interaction patterns in both accounts cross over into each other. Validation of these interpretations is provided by accounts of the business and the family histories that are documented during the interviews. We are perfectly aware, however, that this strong correlation is not entirely (and maybe not even principally) due to empirical correlations among independent variables. A significant portion of it is likely due to the way in which interaction patterns are considered to affect different family and business capacities. Interesting conceptual and structural features of the implicit model need to be sorted out.

To the degree that our instrument is based, to a large degree, on the application that Danes, Rueter, Kwon and Doherthy [2002] develop of the Family FIRO model to family businesses, the mentioned high correlations in both family and business interaction patterns implies that this model can in fact be applied to predict performance in both arenas. This conclusion also reinforces the resource view of the family firm that Habbershon and his group advocate.

What this implies, in a more general vein, is that families who can be considered as groups with greater resources and better patterns of interaction will be more successful in family and business arenas at the same time. The degree to which this may be the result of better integration patterns and skills (as in the Family FIRO model), the result of better education, or of other variables, will be an interesting matter to explore in future research.

Implications for both management and policy issues

Recognition of the strong interdependence between the family and the business system should help both owner/managers and policy makers in understanding that sources of stress in one of them will necessarily impact the other. As policy makers realize that when family businesses are unable to follow through into successive generations a valuable business know-how and social capital are lost, measures directed to the training and support of family business members could be devised. Small businesses, which usually are family businesses, can be better helped as the strong interactions between the two subsystems are understood.

As Mexico's current policy is the promotion of the establishment of small firms, it is important to realize the ways in which informal and family networks enable young entrepreneurs to initiate and carry on their projects. Even though reliable figures are not available, however, it is estimated that 50% of small firms existing at any one time will not survive beyond two years. As they grow into more mature businesses and approach succession stages, another set of perils await them. Knowing more about how to identify enabling (rather than disabling) interaction patterns is important. Knowing more about how family and business interaction patterns feedback into each other may help devise programs that can help more in their successive developmental stages.

End Notes

i Even though our data do not strictly represent continuous normally-distributed variables, and therefore the use of Pearson correlation should be questioned, non-parametric tests have proven also to show the same strong associations among them. We have chosen anyway to use this index in this presentation in order to emphasize the fact that association among the variables is strong enough to warrant further exploration.

ii Due to space limitations, only those correlations that are most meaningful in the regional entrepreneurial culture are reported.

Issues and Research Agenda for Malaysian SMEs Revisited

Mohd Khairuddin Hashim
Sa'ari Ahmad
Universiti Utara Malaysia, Malaysia

Abstract

Small and medium-sized enterprises (SMEs) represent an important part of the Malaysian business system. Notwithstanding their economic importance, research on SMEs is still limited and neglected. The literature review indicates SMEs in Malaysia have attracted minimal theoretical as well as empirical research attention from researchers as a field of study. Based on the review of the small business literature, this paper initiates an attempt to provide a research agenda for studying SMEs in Malaysia - stressing the shortcomings of past studies as well as highlighting the major issues and research areas that have yet to be explored and benefited by future researchers.

Introduction

In Malaysia, despite their significant role in the national economy, research on SMEs appears limited and neglected. The literature indicates that SMEs have received minimal theoretical and empirical research attention as a serious field of study. Recent reviews have revealed this important issue as well as indicated the gaps in our knowledge concerning SMEs in Malaysia.

A basic conclusion of the reviews has been that previous studies are exposed to several limitations and as such do not seem to have been able to provide a framework for better understanding of the sector. Given the various shortcomings of past studies, the major issues and research areas pertaining to SMEs, it is high time for us to develop a new research agenda for SMEs in the Malaysian context. Attempting to meet this need, this paper aims at spearheading the development of serious research tradition for SMEs in Malaysia.

The present paper is divided into five sections. Sections Two and Three focus on the basic issues which needed to be addressed before proper research on SMEs could be conducted. Following this, Section Four highlights the limitations of the previous works on SMEs in Malaysia. Based on the findings in these sections, a research agenda is proposed in Section Five. Finally, Section Six presents the concluding remarks for the paper.

Research Issues Concerning SMEs in Malaysia

Issues concerning the concept of SMEs

As far as the concept of SMEs is concerned in Malaysia, the author identified two major issues that need to be clarified not only by researchers but also policy makers. The two conceptual issues are discussed briefly below:

SMEs or SMIs?

In Malaysia, the terms small and medium-sized enterprises (**SMEs**) and small and medium scale industries (**SMIs**) are often used interchangeably to mean the same thing. However, it is important to note that the two terms does not mean the same thing. In economics, an industry means a group of firms producing the same type of products. Whereas, an enterpris*e* refers to a firm (which can be small, medium or large) in an industry. This means that enterprises of various sizes are found in an industry. Hence, it is the enterprise that is small-sized or medium-sized, and not the industry. As such, "enterprises" (and not "industries") is the accurate and appropriate term to be used. Accordingly, the acronym SMEs (and not SMIs) is used throughout the present paper. By doing so, the authors hope to avoid confusion because SMEs can be found in almost all industries.

Inappropriate definitions of SMEs

There are not less than 18 ministries and more than 60 government agencies involved in assisting the development of the SMEs sector in Malaysia (Hashim, 2000). However, these agencies used different criteria to classify SMEs. In other words, the term SMEs still appears to have been differently defined by the various supporting agencies.

On behalf of the Division of Small Enterprise in the Ministry of Trade and Industry, the Coordinating Council for Development of Small-scale Industries (CCDSI) offered one of the earliest formal definition of SMEs in Malaysia. Initially, the CCDSI defined SMEs as enterprises with fixed assets of less than RM250,000 or; in the case of companies, the shareholders' funds not exceeding RM250,000.

Subsequently, in the Industrial Coordination Act 1975 (Amendment 1986), the Promotion of Investments Act 1986, and as noted in the Bank Negara's lending guidelines, SMEs are defined as enterprises with net assets or shareholders' funds of not more than RM2.5 million (see Malaysia, 1998). Under this definition, a firm with shareholders' funds of less than RM500,000 is considered as small, whereas a firm with shareholders' funds of between RM500,000 to RM2.5 million is labeled as medium-sized.

Another of the earlier definition of SMEs in the country was also provided by the former Small-scale Industry Division of the Ministry of International Trade and Industry. According to this definition, an enterprise with assets or shareholders' funds between RM500,000 to RM2.5 million and employs full time employees of between 5 to 10, is an SME.

In 1995, the Small and Medium-sized Industry Development Corporation (SMIDEC), which replaced the former Small-scale Industry Division in the Ministry of International Trade and Industry defined SMEs as:

a. Small-sized business enterprise is "an enterprise with a paid-up capital of less than RM500,000 and employs full time employees not exceeding 50 persons";
b. Medium-sized business is "an enterprise with a paid-up capital of RM500,001 to RM2.5 million and employs full time employees of between 51 to 75 persons".

More recently (as reported in the New Straits Times of January 19, 1998), realising the inappropriateness of its old definitions, the Ministry of International Trade and Industry reclassified SMEs in the manufacturing sector as:

a. A small-scale firm is a company "with less than 50 full time employees, and with an annual turnover of not more than RM10 million".
b. A medium-scale enterprise is a company "with between 51 and 150 employees, and with an annual turnover of between RM10 million and RM25 million".

In short, definitions of SMEs in Malaysia are not uniform and that they are too general in nature. Moreover, these definitions are based on fixed quantitative criteria only, making their operational value questionable (Hashim and Abdullah, 2000).

Data sources for research on SMEs

The used of various definitions of SMEs in Malaysia could be attributed to the difficulties in obtaining the accurate data or even the unavailability of data sources on SMEs, limited experience as well as the lack of research and knowledge in the area.

Presently, up-to-date and comprehensive data on SMEs in Malaysia have been lacking. Most of the available sources of data on SMEs are inadequate and inaccurate. The primary concerns about the available data are:

1) not current;
2) variation in definitions,
3) different units of measurement used;
4) uncertain of their actual numbers;
5) difficult to access; and
6) difficult to verify their accuracy.

The problem of obtaining reliable and accurate data has often been a major constraint for researchers striving to investigate empirically SMEs in Malaysia. The unavailability of reliable, accurate data and the lack of research on SMEs may have also resulted in the limited information on the sector.

Boocock and Wahad (1997) Ling (1990) and Chee (1986) have also indicated in their studies that information on SMEs in Malaysia are still lacking, unreliable and difficult to obtain. This may be due to the limited effort made by the relevant agencies to collect quality information on SMEs on a continuous basis.

Issues from past studies

Over the years years, although SMEs in Malaysia appear to have been able to attract increasing research attention, empirical studies on SMEs iare still relatively limited in scope and fragmented in nature. At the general level, the research focus has been primarily on reporting, and describing their general profile such as personal characteristics of the owners, problems and constraints faced by them and the assistance programs provided by the government. The common characteristics and shortcomings of past research on SMEs are presented below.

Narrow focus

The review of the literature reveals that, in terms of focus, previous studies on SMEs in Malaysia in general, can be grouped as follows:

Focus on demographic characteristics.

Previous researchers focused on observing and reporting the demographic characteristics of SMEs owners. In particular, their major interest was on examining the obvious characteristics of the owners of small businesses such as their education level, marital status, race, sex, age, and experience level (Chee, 1986; Ling, 1990; and Lisa, 1990).

On the other hand, there has been limited research emphasis on SMEs management styles, their organisational structures, culture, stage of development, and their external environment (such as the structure of the industries they are in).

Moreover, few studies have been conducted to investigate the relevant theory of entrepreneurial achievements such as the personality traits of successful entrepreneurs and the competencies required for becoming successful entrepreneurs. Further, the literature suggests that studies conducted to investigate the relationship between the demographic characteristics and the performance of SMEs have also been limited (Chee, 1986; and Ling, 1990) .

Focus on problems faced by SMEs

Majority of the past studies examined and described the problems and constraints faced by SMEs. Most of these studies agreed about the common problems and constraints encountered by SMEs (see Hashim, 1999; and Lisa, 1990; and Chee, 1986). Most of these studies suggest that SMEs faced problems that range from the use of out-dated technology to lack of resources and capabilities to achieve their objectives (Chee, 1986; Hassan, 1992; and Hashim, 1999).

However, the literature suggests there are some common problems and constraints that appear to have resulted from their size. That is, organisational size has some bearing on the problems and constraints faced by SMEs. Welsh and Jerry (1981) stressed that their small size operations and limited resources may leave SMEs susceptible to even minor changes in the efficiency of their operations or to changes in the external environment.

Focus on SMEs assistance programs

Known for their economic contributions as well as their important role in the economy, the SMEs sector has been heavily supported by the Malaysian Government. Most of past studies on the supporting programs reported the agencies and the types of assistance that they have provided (Chee, 1986; Hassan, 1992; and Hashim, 2000). However, little attention has been given to study on the impact and the effectiveness of these assistance programs on SMEs.

Surprisingly, the Government has conducted and published very few studies on the impact of the assistance programs on the operations of the SMEs. Of the few studies conducted, two studies revealed that majority of SMEs owners in Malaysia are still unaware of the various assistance programs (New Straits Times, February 25, 1995 and New Straits Times, October 12, 2000). Another study indicated that the assistance programs were not well utilised by the SMEs sector (New Straits Times, October 30, 1995).

The other studies on the assistance programs are also limited in focus (Chee, 1986; and Hassan, 1992). These studies only reported the various SMEs supporting agencies and the different types of assistance they provided such as training, information, advisory, consultancy, financial and vendor programs.

Limited focus on management practices and relevant theories

Despite the tremendous increase in knowledge in the areas of management such as purchasing, quality, finance, marketing, human resource, operation/production, and strategic management, not much of these management disciplines have been utilised by researchers in investigating SMEs. For example, although strategic management is applicable and relevant to SMEs, there has not been limited attempt to study SMEs from this perspective in the Malaysian context.

Lack of enterpreneurial orientation

As pointed out by Jeninngs (1994), the success of an individual firm depends on factors that can only be observed at different levels of analysis. However, the literature indicates the lack of entrepreneur's perspective as well as multi-level research design in the study of SMEs in Malaysia.

Many of the research on SMEs has been at a single level of analysis (either individual level or organisational level). This single level of analysis may result in a researcher overlooking other key factors that can affect the success of SMEs at different levels of analysis.

Examining SMEs from the entrepreneurial perspective is important in maintaining the notion of the three basic elements of the strategic management - defining an organisation's business and strategic mission; establishing strategic objectives; and formulating and implementing strategy – which are entrepreneurial responsibilities and tasks that requires entrepreneurial skills (Mintzberg, 1973; Miles and Snow, 1978; Drucker, 1987; and Thompson and Strickland, 1987).. Similarly, Greenly (1989) posited that entrepreneurial fair is one of the important feature of strategic management which is concerned with the opportunities as well as risks associated with doing business.

Entrepreneurial approach in the study of SMEs is also in line with the observations of previous researchers who have discovered that SMEs differ from each other in terms of their management styles and sophistication (Carson, 1991; Khan and Manopichetwattana, 1989; Bracker and Pearson, 1986) development (Churchill and Lewis, 1983) and performance (Birley and Westhead, 1990). Further, Lafuente and Salas (1989) asserted that entrepreneurial characteristics can have some influence on the type of firm to be created and how it will be managed.

In line with this view, it is suggested that future research on SMEs should also examine key variables from different levels of analysis. For example, a two-level analysis would involve examining entrepreneurial (characteristics of owners/managers) and organisational characteristics of the firms.

This multi-level approach in studying SMEs will assist in distinguishing between entrepreneurs, non-entrepreneurial managers and small business owners who may lack the knowledge and experience in strategic management, as well as whose businesses may have limited impact on the national economy.

Revisiting the Research Agenda for SMEs in Malaysia

Based on the shortcomings and limitations of past research on SMEs as documented in the small business literature, the following research agenda is proposed.

"New" data sources for research on SMEs

As discussed earlier, up-to-date and comprehensive data on SMEs have been lacking. Whilst some data have been available in fragmented form, data at the micro level have generally been unavailable to the public. Previously, data for research on SMEs in Malaysia were obtained mainly from the following sources:

i) Department of Statistics;
ii) Ministry of International Trade and Industry (MITI) and;
iii) Federation of Malaysian Manufacturers (FMM).

However, the data available from the above sources are not comprehensive and, in most cases, out of date. For example, the FMM keeps data on its member firms only. While, MITI has data on firms that registered with them only. Given such a reality, if we are to witness a more efficient and comprehensive research on SMEs in the future, initiatives must be taken by those concerned to:

a) update the available data; and
b) identify other data sources.

As for identifying the other data sources, the authors were abled to identify several alternative sources. The following Table 1 lists some of these sources.

TABLE 1: ALTERNATIVE SOURCES OF DATA ON SMES IN MALAYSIA

Source:
? 1. The Social Security Organisation (SOCSO)
2. Employees Provident Fund (EPF)
? 3. Local/Town/City Councils
? 4. Tenaga Nasional Berhad
? 5. The Water Supply Department
? 6. The Chambers of Commerce
? 7. The Labour Department
? 8. The State Economic Development Corporations (SEDC)
? 9. The SMEs Supporting Agencies (such as MITI, MARA)
? 10. Small and Medium Industries Association of Malaysia
? 11. Registrar of Companies
? 12. Registrar of Businesses.

More appropriate definitions of SMEs

As noted earlier, currently there is no one overall acceptable standard definition of an SME in this country. In practice, the definitions of SMEs found in Malaysia are based on fixed quantitative criteria such as the number of employees, the amount of capital, the amount of assets and more recently, sales turnover.

However, given the uniqueness of SMEs (in terms of their resources and management styles for instance), any definition based on quantitative criteria is believed to be inappropriate to describe and measure satisfactorily the size of firms in different industries.

Defining SMEs appropriately is important because it has serious implications on the directions of research to be conducted and the formulation and implementation of the related policies. Put another way, a precise and more appropriate definition that reflects the size, the nature and the needs of SMEs is essential and advantageous not only for a particular SME, but also for policy makers and supporting agencies in planning and nurturing the proper growth and development of the SMEs sector as a whole.

Given the importance of a precise and more appropriate definition of SMEs, this paper advocates that more empirical studies should be carried out in this area. As indicated earlier, in attempting to define SMEs, the definition(s) should not be developed based on quantitative criteria alone, but qualitative criteria should also be taken into consideration (Hashim and Abdullah, 2000). Such a practice is common in developed countries such as in the United States of America and the United Kingdom. It is believed that an SME definition that is 'quantitative-qualitative' in nature would be more 'appropriate' to capture the true nature of SMEs in the Malaysian context.

Developing SMEs taxonomies in Malaysia

SMEs consist of different firms and encompasse a wide range of industries. It is generally believed that the presence of a wide variety of SMEs is the manisfestation of imperfections in the economies in which SMEs exist.

Developing taxonomies of SMEs is a prerequisite for explaining how Malaysian SMEs differ. This move can facilitate studies on them. As documented in the literature, in the developed countries several attempts have been made to develop taxonomies of SMEs. The Economic and Social Commision for Asia and Pacific (United Nations, 1992), Rozzoni (1990) and Hosmer, Cooper and Ve sper (1977) have successfully develop three SMEs taxonomies. These three SMEs taxonomies are presented in Table 2 below.

TABLE 2: SMES TAXONOMIES

Taxonomy by ESCAP	Taxonomy By Rozzoni	Taxonomy by Hosmer, Cooper and Vesper.
1. The modern SMEs 2. The traditional SMEs 3. The agro-based SMEs	1. The static small firms 2. The traditional small firms 3. The dominated small firms 4. The imitative small firms 5. The technology -based small firms 6. The new technology -based small firms	1. The mom and pop company 2. The stable high-payoff company 3. The rapid growth company.

Purpose of research

The review of the literature suggests that in the past, much of the research on SMEs has either lacked clarity of purpose or the specified purpose was of little consequence. It is believed that the failure to clearly specify the purpose of the research combined with the lack of common ground for synthesizing research findings has in a way, hindered the advancement of the field in Malaysia.

In this area, it is advocated that future research projects should include a clearer statement of purpose. Furthermore, it is suggested that researchers attempt to link the specific purpose of their study to the fundamental purpose such as to explain factors that can influence their performances and the role of new SME in furthering economic progress, particularly in the Malaysian context.

Theoretical orientation

Theory should necessarily underpin a meaningful and rigorously empirical research. However, as previously highlighted, much of the research on SMEs to date has neglected to examine SMEs from the perspective of modern management theory. Despite the tremendous increase in knowledge in the areas of management theories, little research has been conducted to investigate the relevant and applicability of these theories to SMEs.

Although some researchers claimed that currently not a single theory is available to explain small business operations and growth, it is high time for us to start borrowing theories from the other areas (such as management and economics theories) to help explain SMEs behaviour. For instance, since SMEs are concerned with units of economic activity, attempts to borrow the theory of monopolistic competition can help us explain why certain SMEs adopt product differentiation strategy.

Based either on induction or deduction reasoning, we could attempt to construct theories of SMEs. Likewise, the various theories of strategic management (such as contigency theory, resource-based view theory, socio-cultural theory, and the uncertainty-based theory) could be benefited and exploited to understand, explain and predict SMEs behaviours.

Focus of research and methodological issues

SMEs in Malaysia are heterogeneous in nature: They differ in types of founders, in management styles and sophistication, in stages of development, and in performance. Meanwhile, the research focus on SMEs in this country is very limited and tend to confine to areas such as demographic studies, weaknesses of SMEs, SMEs profile and the types of assistance programs available.

Of the research on SMEs that observed demographic characteristics of SMEs, many suffer from methodological problems such as small sample sizes, non-comparability of samples, and static term of reference. As a result of these shortcomings, any attempt to develop a standard demographic profile would be futile.

Having raised these focus issues and problems, more contextual and process-orientated studies of the Malaysian SMEs are awaited.

Level/unit of analysis

As a field of research, SMEs can be studied at five different levels of analysis. Researchers may choose among the five levels of analysis: individual , group, organisational, industry, and societal. The problem with research on SMEs in

Malaysia to date – as can be found in the literature - has been the tendency of researchers to confine their analysis to single level only.

The relationships between the phenomena that can be observed at different levels or units of analysis are important not just for academics, but for both practioners and public policy makers as well. From the enterpreneur's perspective, the success of the individual enterprise will be affected by factors that can only be observed at different levels of analysis. To miss any one of these perspectives increases the probability that key factors will be overlooked, and that unanticipated events will take the enterpreneur by surprise. From the public policy maker's perspective, the insights generated by multi-level studies have the potential to improve targeting of government efforts to encourage successful SMEs.

In view of this, it is suggested that: future researchers need to examine more than one of the individual, group, organisation, industry, and society levels of analysis. Such multi-level studies provide a much richer understanding of the SMEs phenomena and should therefore be encouraged in future research projects.

Time frame

The literature on SMEs suggests that the concern for wide time frame among researchers on SMEs in Malaysia is almost nil. Of course, in general, short time frame studies are simpler to design and easier to execute but clearly lack the richness of insights as compared to results from studying a phenomenon over a longer time period. For SMEs research, this is important since new firms are extremely fragile and experience many changes and challenges within a short period of time. Often the seeds of future problems are sown in the early stages. Only wide time frame studies will allow us to examine the development problems faced by new firms and to pursue the objective of causal inference.

Having raised the above issue, it is recommended here that more future research should move towards longer time frame (at least three to five years) since different strategic issues become important as firm and industry evolve.

Methodology to be used

There has been slow progress in research that addresses issues of causality in SMEs. Previous studies were mainly in the forms of exploratory case studies or cross sectional statistical studies of the sample survey type. The survey of the literature leads to suggest that there is a need to pursue causality and longitudinal studies more aggressively. As a field of study, SMEs must move to the stage where exploratory case analyses or cross sectional sample surveys that are not theory-driven and do not test hypotheses, are no longer suitable for investigating SMEs since such approaches are very superficial in providing the necessary information to understand, explain, and predict their behaviour.

Conclusion

The present paper highlights important issues as well as attempts to provide a new research agenda for SMEs in Malaysia. Based on the authors' own experience, the information from previous discussions, and the literature on SMEs, this paper identified and proposed nine key areas that are important for better understanding as well as improving our knowledge in SMEs, especially the SMEs in the Malaysian context. The paper begins by identifying and discussing the basic issues which needed to be addressed before proper research on SME could be conducted. The proposed new research agenda is developed based on the various problems and shortcomings of the previous works on SMEs in Malaysia. It is proposed among others, that SMEs as a serious field of study need to be appropriately redefined; that any meaningful study on SMEs should be based on modern management or economic theory; that SMEs need to be investigated from multi-level and wide time frame perspectives. Finally, since the proposed research agenda appears to have never been addressed seriously elsewhere, it is hoped that this paper would provide some contributions towards the development of a healthy and rigourous research on SMEs in Malaysia.

Strategy of Small Manufacturing Firms in A Changing Environment

Jozef Papula
Comenius University in Bratislava, Slovak Republic
Emilia Papulova
University of Economics in Bratislava, Slovak Republic

Abstract

Strategic management is a highly important element of organizational success. Strategic success requires a clear understanding of the needs of the market, and the satisfaction of targeted customers more effectively and more profitably than by competitors. Real competitive advantage implies companies are able to satisfy customer needs more effectively than their competitors. It is achieved if and when real value is added for customers. Small organizations which understand their customers can create competitive advantage and so benefit from higher prices and loyalty of customers. Higher capacity utilization can then help to reduce costs.

Management of Small Manufacturing Firms

Entrepreneurship, the spirit of enterprise and the development of small enterprises are leading themes of development transition economics at the present time. They are regarded as essential factors of economic recovery, growth, employment generation and social progress. Entrepreneurs are viewed as individuals who can achieve more then other people in mobilising productive resources and starting businesses that will survive and grow. Small enterprises are a most important parts of the economic fabric of any country because they are flexible and easily adoptable to changing market opportunities, require limited capital, can combine simple and advanced technology as appropriate, while being generally labour intensive and able to create considerable employment opportunities.

Thinking Strategically

In order to be successful, organizations must be strategically aware. They must understand how changes in their competitive environment are unfolding. Organizations have to deal with dynamic and uncertain environments. They should actively look for opportunities to exploit their strategic abilities, adapt and seek improvements in every area of the business, building on an awareness and understanding of current strategies and successes. Organizations must be able to act quickly in response to opportunities and barriers.

Managers perform a number of activities in an organization, including planning and organizing the work of their subordinates, motivating them, controlling what happens and evaluating results. Decisions by managers have a strategic impact and contribute to strategic change.

The organization is shown as one of a number of competitors in an industry; and to a greater or lesser degree these competitors will be affected by the decisions, competitive strategies and innovation of the others. These inter-dependencies are crucial and consequently strategic decisions should always involve some assessment of their impact on other companies, and their likely reaction. [13]

To succeed long term, organizations must compete effectively and out-perform their rivals in a dynamic environment. To accomplish this they must find suitable ways for creating and adding value for their customers.

Strategic management is a highly important element of organizational success. The need to know what the business is about, what it is trying to achieve and which way it is headed, is a very basic requirement determining the effectiveness of every member's contribution. Every successful entrepreneur has this business self-awareness and every successful business seems to have this clarity of vision, even though it does not arise from a formal planning process. [9]

Managers who made long-range plans generally assumed that better times lay ahead. Future plans were merely extensions of where the organization had been in the past. But a number of environmental shocks undermined this approach to strategic planning: rapid technological developments, the maturing or stagnation of certain markets, increased international competition. These changes forced managers to develop a systematic means of analyzing the environment, assessing their organization's strengths and weaknesses, and identifying opportunities for competitive advantage. [10]

In the case of some small businesses external forces can dictate whether the business stays solvent or not. A major problem for many small businesses concerns the management of cash flow. To succeed, a business must have clearly defined objectives and fully developed strategy for achieving them. In short, what is needed is a business plan. A business plan shows the purpose of the business and what it intends to accomplish. A good business plan helps to give form and substance to an entrepreneurial vision, providing a mechanism that enables owners, managers and workers alike to function effectively.

The Competitive Environment

Whilst it is essential for all managers to have some insight into how their organization is affected by the environment, it is also desirable for them to consider how some of the environmental forces might be influenced and managed to gain benefits for the organization. This is less possible generally in the case of small businesses as they are relatively less powerful. However, small companies should examine their environment for opportunities and threats in order to establish where they can gain competitive advantage and where their resources might most usefully be concentrated. [13]

Thinking strategically requires an awareness of alternative strategic purposes and objectives and the ability to recognize critically different environments. In addition it requires the ability to diagnose an organization in terms of various critical characteristics and to be able to shape those characteristics so that the organization is best fitted to its environment in order to achieve its strategic purposes and objectives.

A complex and dynamic modern environment is inevitably difficult to forecast, the inherent uncertainties can make it highly unpredictable and potentially chaotic. Individual managers would develop their environmental and strategic awareness through experience and perception, and by thinking about their observations and experiences. It is particularly important to assess the significance of what happens and what can be observed to be happening. However, in considering future strategic changes there will be an additional need to supplies, customers, competitors, demand, technology, government legislation and so on. Managers who are encouraged to think about future changes, to ask questions and to query assumptions will increase their insight and awareness and this should help decision making. [13]

Effective strategic management involves more than just a few easy steps. It requires managers to thing strategically, to develop the ability to see things in motion, and to make sense out of a cloudy and uncertain future by seeing the interdependency of key factors. This ability requires more than a passing awareness of significant social, political, legal, economic and technological trends.

Managers who think strategically are able to envision their organizations in the context of world trends and events and to spot important interdependencies. They focus on how their organization should act and react to emerging opportunities and barriers.

For any organization certain environmental influences will constitute powerful forces which affect decision making significantly. For some manufacturing and service businesses the most powerful force will be customers; for others it may be competition. [13]

According to Ansoff, the extent to which the environment is changeable or turbulent depends on six factors: changeability of the market environment, speed of change, intensity of competition, fertility of technology, discrimination by customers, and pressures from governments and influence groups. [13] He suggests that the more turbulent the environment is, the more aggressive the firm must be in terms of competitive strategies and entrepreneurialism or change orientation if it is to succeed.

The competitive environment is affected by market structure and profitability; the intensity of competitive rivalry and the degree of differentiation; market growth; the stage in the life of the products or services in question and the frequency of new product launches; capital intensity; and economies of scale. It is important for managers to appreciate where the greatest opportunities and threats lie at any time and focus attention on those areas which are currently affecting the organization and which require strategic attention.

Strategy is about Thinking and Doing

Strategy is not about planning, but about thinking and doing. It is not a technique, but a way of managing the business according to a strategic understanding and perspective. [9]

Strategic management is concerned with understanding, choosing and implementing the strategy that an organization follows. Managers should be aware of the issues, which must be addressed if changes in strategy are to be formulated and implemented effectively. In addition, they should be aware of the managerial and behavioral processes, which take place within organizations in order that they can understand how changes actually come about.

Strategic management is the ongoing process of ensuring a competitively superior fit between the organization and its ever-changing environment. Strategic management is the process that defines the organization's mission, scans the environment to ascertain opportunities, then merges this assessment with an evaluation of the organization's strengths and weaknesses to identify an exploitable niche in which the organization will have a competitive advantage. [5] This process also includes implementation. The best strategy can go awry if management fails to translate that strategy into operational plans, structural designs, systems of motivation and communication, control systems, and other necessary means of implementation.

Strategic management involves awareness of how successful and strong the organization and its strategies are, how the effectiveness of these strategies might be improved, and of how circumstances are changing.

The important issues are: [13]

?? the ability of the organization to add value in meaningful ways, which

?? exploit organizational resources to achieve synergy and at the same time

?? satisfy the needs of the organization's major stakeholders, particularly customers and owners.

The selection of new strategy must take account of these criteria.

The studies of small manufacturing firms competing in a wide variety of industries suggest that obtaining information on several aspects of specific environmental sectors (for example, customers, competitors, suppliers) facilitates alignment between some competitive strategies and environments (that is, industry life cycle stages) whereas the frequency of scanning has no effect on such alignments. [2]

Environmental scanning is generally viewed as a prerequisite for formulating effective strategies. Moreover, effective scanning of the environment is seen as necessary to the successful alignment of competitive strategies with environmental requirements and the achievement of outstanding performance.

Environmental scanning is viewed as the important step in the process linking strategy. Scanning the task and general environment allows a firm to learn about opportunities that it may be positioned to take advantage of and conditions or events that threaten its performance or survival, thus enabling the firm to formulate a competitive strategy congruent with critical environmental conditions. [2]

Organizations must be able to understand the complexity and trends of the changing environment. Some of the changes will be the result of external forces. Others will be the outcomes of actions taken by organization itself. From this learning, organizations must be able to manage change successfully, changing technologies, processes and architecture to maintain a successful match with the environment. In turn this should create positive and beneficial competitive outcomes.

Therefore strategic management in small organizations should involve the following: [13]

?? a clear awareness of environmental forces and the ways in which they are changing

?? an appreciation of potential and future threats and opportunities

?? decisions on appropriate products and services for clearly defined markets

?? the effective management of resources to develop and produce these products for the market – achieving the right quality for the right price at the right time.

Strategic management is effective when resources match stakeholder needs and expectations and change to maintain a fit in a turbulent environment. The external environment consists of suppliers, distributors, customers and customers as well as bankers and owners. If organizations are to be successful – and in many cases, profitable – they have to meet the needs and expectations of their stakeholders. Their relative demands determine what it is that a business must do well.

Therefore, if organizations are to satisfy their stakeholders, especially their customers, whilst outperforming their rivals, their competitive offering should comprise: [13]

?? the ability to meet the recognized key success factors for the relevant industry or market

?? distinctive competencies and capabilities which yield some form of competitive advantage, and

?? the ability and willingness to deploy these competencies and capabilities to satisfy the special requirements of individual customers, for which a premium price can often be charged.

Strategic success requires a clear understanding of the needs of the market, and the satisfaction of targeted customers more effectively and more profitably than by competitors.

Competitive Advantage

Real competitive advantage implies companies are able to satisfy customer needs more effectively than their competitors. It is achieved if and when real value is added for customers.

A business must add value if it is to be successful. The important elements in adding value are:[13]

?? understanding and being close to customers, in particular understanding their perception of value

?? a commitment to quality

?? a high level of all-round service

?? speedy reaction to competitive opportunities and threats

?? innovation.

Small organization which understand their customers can create competitive advantage and so benefit from higher prices and loyalty of customers. Higher capacity utilization can then help to reduce costs.

While it is important to use all resources efficiently and properly; it is also critical to ensure that the potential value of the outputs is maximized by ensuring they fully meet the needs of the customers for whom they are intended. An organization achieves this when it sees its customers´ objectives as its own objectives and enables its customers to easily add more value or, in the case of final consumers, feel they are gaining true value for money.

Business Strategy in an Organization

Business strategy is all about competitive advantage. In general, strategy is to do with long-term prosperity. It is concerned with long-term asset growth, not short-term profit. Thus businesses need strategy in order to ensure that resources are allocated in the most effective way. This is particularly important when it comes to major resource allocation decisions. [7]

The purpose of strategy is therefore not best conceived in terms of its impact on “the bottom line”. Instead it can be identified in more operational terms as setting the direction of a business and achieving a concentration and consistency of effort. In this way inconsistent flitting from short-term opportunity to short term opportunity is avoided and business expertise and leadership can be built up. Finally, the purpose of strategy must also be to ensure an awareness of when change is necessary and thus the ability to be flexible. [9]

Business strategy is concerned with how to make an individual business survive and grow and be profitable in the long term.

The main considerations are as follows:[9]

?? the creation of customers

?? the identification of appropriate market niches where no competition exists

?? the identification of customer needs and how best they can be satisfied

?? the application of technology and its future development or substitution

?? the understanding of competitors and how direct competition may be avoided

?? the motivation of people to put their efforts and enthusiasm behind the strategic aims of the business.

According to Henry Mintzberg, business strategy could follow one of three modes: planning, entrepreneurial, and adaptive. He argues that the right choice depends on contingency variables such as the size and age of the organization and the power of key decision makers. [10]

The planning mode is a strategy approach that includes aclear statement of objectives, asystematic analysis of the organization and the environment, and a plan of action to reach those objectives. Managers should follow the planning mode when the organization is mature and well established, resources are adequate to engage in opportunity analysis, senior management is in agreement as to the organization's objectives, and environmental uncertainty is at a low level. Different conditions may favor one of the other modes.

The adaptive mode is a strategy approach characterized by both the organization's objectives and the means to achieve these are continually adjusted. The organization moves ahead timidly in a series of small disjointed steps. The adaptive mode of strategy making will be most effective when environmental uncertainty is at a very high level, thus focusing management's attention on the short term, and when internal power struggles make it impossible for senior management to agree on where the organization should be going.

The entrepreneurial mode presents a strategy approach in which, a strong leader, usually the organization's founder, draws on personal judgment and experience to form an intuitive image of the organization's direction. This strategy is characterized by bold decision making in which periods of pause are followed by periods of sprinting. The entrepreneurial mode is more likely to be effective when the organization is young and small, when a single, powerful leader has an intimate knowledge of the business, or when crises occur.

Small businesses produce relatively few products or services. Their resources and capabilities are limited. Their strategic options are comparatively simple and narrowly focused. These conditions do not require the sophistication inherent in the planning mode. Strategic planning practices in small firms have been found to be unstructured, irregular, and incomprehensive. They are best described as informal; they are almost never written down and are rarely communicated beyond the chief executive's closest associates. Moreover, the strategic focus in small businesses takes on a more limited time horizon than in large organizations, usually covering periods of two years or less.

Based on Mintzberg´s analysis, we might expect the strategic planning process in small business firms to resemble the entrepreneurial mode more than the planning mode. This is what surveys indicate.

Entrepreneurship and Strategic Management

There are numerous examples of entrepreneurs, who, by reason of considerable success early on, thought they could rely on their intuition only, and failed. In other words, good ideas and visions are necessary but not sufficient; they must be complemented by rational analysis. Strategic management provides for a method, and an attitude to filter the visions of entrepreneurs through rational analysis and decision-making. [14]

The main objective of strategic management is, therefore, to guide the flow of ideas and visions, and convert them into business decisions.

The Strategic Entrepreneurship Concept of Strategic Management in Small Organizations

The concept of strategic management in small organization should be the strategic entrepreneurship concept. This concept incorporates both the intuitive-creative and the rational elements. The strategic process is kicked off by the entrepreneur in the firm, presenting his view on how the organization should develop and what quantitative targets he has in mind. This leads to a vision statement, which outlines how the company should develop and which targets should be met in time. The vision statement is the expression, in business terms, of the entrepreneur's intuitive views. [14]

Following this, a rational process starts with the well-known internal and external analyses, because business decisions require and internal as well as an external situations, as well as the vision of the entrepreneur. In this way the internal and the external analyses provide the criteria by which the final decision can be chosen from a range of options and implemented including controlling.

The process of finding options for the issues is, once more, intuitive. Selection is a rational process, using criteria derived from the vision statement, especially its quantitative targets. The option, which best satisfies the criteria will be selected as the decision concerning the issue. This is the way in which entrepreneurs make their major decisions.

Strategic Approach and Small Firms

Small business managers´ experiences with strategic approach and strategic management point to the need for possible modifications in this process.

First, the process need not be as detailed or lengthy as practiced by large organizations. It could involve simply responding to the questions: [11]

- Where are we?
- Where do we want to go?
- Can we get there?
- How can we get there?
- What decisions must be made to get there? How do we monitor performance?

Second, because of an organization's small size, most if not all key employees can make inputs into the process. This allows the company to use important expertise and contribute to the development of employee commitment and communication. In essence, it becomes a valuable learning experience for all involved.

Finally, top management, or the top manager must be willing to give strategic management a chance. The manager must recognize that his or her company has become a growing enterprise. There is a need for taking the planning out of the mind of a single person and spreading the responsibility around. The benefit of this is that the process of transforming a company into a formal organization is enhanced.

Strategic approach in small firms offers some unique advantages and disadvantages. [11] On the positive side, an organization's small size may not present the complexity and detail faced by strategic planners in larger firms. In fact, the small business may be considered simply a strategic business unit. Other advantages include limited products, services, and markets served, the relatively small resource base, and a limited number of options.

On the disadvantage side, some equally significant issues exist. First and foremost, the executive team is usually small, sometimes only one person. This executive, or entrepreneur, may have always operated the firm from his or her own instincts and sees little use in a ore formalized procedure. Second, information and data to prepare an external and internal analysis may be limited, if they exist. Third, key employees usually have gained their skills through experience rather than with the use of systematic procedures, and resistance to change may develop. Other problems may include the constraint of limited resources and the issue of company ownership.

Planning for Competitive Advantage

If the organization gains an advantage, the business will survive. If that advantage is significant, the organization will thrive.

According to M. Porter, there are three approaches to building competitive advantage: a differentiation strategy, a low-cost strategy, and a third approach frequently used by entrepreneurs is a niche strategy.

A firm that uses a differentiation strategy competes on the basis of its ability to do things differently than its major competitors do. Afirm must truly be unique at something or be perceived as unique if it is to expect a premium price.

A firm that uses a low-cost strategy builds competitive advantage by producing goods or services at the lowest possible cost. And if entrepreneurs persist in their ability to keep costs lower than others, their organizations thrive.

Competitors using niche strategies are specialists. They serve a narrow market segment that can be local or national. Niche strategists build special skills that are uniquely matched to a specific market; they are rewarded with high profit margins. Effective entrepreneurs are aware that establishing and maintaining a competitive advantage is a great challenge. Without careful attention, competitive advantage can be easily lost. [Bate]

The Competitive Specialism

Though an understanding of the business mission is the key to survival, it is not in itself sufficient for high performance. That is achieved by exploiting the competitive specialism.

There are three ways in which the competitive specialism can be exploited. [9]

Firstly, it can be strengthened or intensified so that it is more readily perceived by customers or so that customers accord it a higher value and are therefore prepared to pay a higher premium. Thus, for example, a specialism related to product quality could be intensified by increasing the quality of the product further and/or promoting the quality of the product more effectively. The result will be to increase the actual and perceived level of quality and reduce the price sensitivity of the product.

Secondly, the specialism can be broadened so that it satisfies the needs of more customers. The most obvious way that this can be done is by geographic broadening, but any product which is focused on a arrow segment of the market can potentially have its focus broadened to appeal to other segments.

Finally, the specialism can be prolonged, so that it survives through developing technology and changing consumer tastes.

Intensifying the specialism must only be done with care and on the basis of hard information about customer perceptions. Broadening the specialism also has its dangers. Widening that focus to encompass more market segments risks losing its perceived value to the existing customers. Similarly with prolonging the life of a specialism. Some specialisms are related to single products, or to single clearly defined markets, which have finite lives.

Critical Resources in Small Firms

In a small firm, the key resources are financial resources, the entrepreneur's time and people who work for the firm. [1]

Financial resources are essential. Many unsuccessful entrepreneurs blame their failures on the lack of adequate financial resources. Yet, failure attributed to a lack of financial resources indicates either an actual lack of money or the failure to adequately use the resources available. Those entrepreneurs who fail to use their resources wisely usually make one of two mistakes: they apply financial resources to the wrong uses, or they fail to maintain adequate control over their resources.

Non-financial resources are also crucial to the success of the new business. Well-planned management of time and employees allows the new small firm to counteract the advantages of large firms. The entrepreneur can realize efficiencies by using a network composed of suppliers and customers.

With regard to critical resources, the entrepreneur must demonstrate sensitivity, control, delegation, and creativity. The successful entrepreneur is sufficiently sensitive to the needs of the business to identify the proper allocation of resources, has the good sense to control the use of those resources, delegates work to others, and uses creativity to expand the resource base. The entrepreneur then plans developmental benchmarks for the new business.

The Information Base

Pursuit of an effective entrepreneurial strategy is mainly through information. Identifying the competitive advantages has to be mapped through the collection and analysis of information from existing and potential customers. [1] Developing needed information base is, in practice, aprocess of selection and concentration on pertinent issues. The extent to which information should be maintained depends on circumstances. [6]

Sources of published information are under-utilized because firms, especially small firms, are reluctant to involve themselves in what at first sights appears to be an information jungle which it might be felt is more properly the field of specialist marketing researchers. But published research on existing and potential technology, on markets and on individual competitors and customers is easily identified and accessed through an increasing number of indexing and abstracting services.

In addition to published information strategic management also requires new information about the perceptions of existing and potential customers. This includes very specific and limited items relating to how customers perceive the products available to them and why they buy what they buy. This information too is available to even the smallest firms and the techniques involved in its collection are not unduly sophisticated.

Constructing a Conducive Environment for the Growth of Knowledge-Based SMEs Through the Establishment of a Science Park

Yuehua Zhang
The University of Waikato, New Zealand

Abstract

Through the late 20th century, establishing science parks to assist technological entrepreneurs and knowledge-based SMEs has been one of the features of national and/or regional strategies for stimulating innovation. The current paper presents a study probing the elements composing a conductive environment for the growth of knowledge-based SMEs, understanding of which is necessary for effective science park management. Through interviewing 20 executives of tenant firms of Technology Park Malaysia, the third most popular park in the Asia Pacific, the study found that infrastructure, incentive, publicity and service characterize those elements. Both good basic infrastructure and advanced technological infrastructure are their most common needs. Incentives concerning tax advantage, venture capital, grants, and rental subsidies are the second. Increasing publicity and providing technological, secretarial and administrative support/service are also beneficial. These findings provide insights for not only the operation of Technology Park Malaysia but also other parks, particularly those in developing economies.

Introduction

Small and medium enterprises (SMEs) can be found defined differently based on various indicators such as the number of employees, total assets, annual turnover, annual sales etc. In terms of the number of employees, numbers between 100 and 500 are imposed as the upper limits across national statistical systems (see OECD, 2000; Statistics New Zealand, 2002; European Commission, 2003). Although smaller in size, SMEs represent a significant section of both national economies and the world economy. In OECD (Organization for Economic Co-operation and Development) countries, they account for over 95% firms and 60 to 70% employment (OECD, 2000), and contribute up to 25-30% of global manufactured exports (OECD, 1997). In countries such as Italy, South Korea and China, SMEs contribute as much as 60% of total export (OECD 1997).

Entrepreneurs – people who sense opportunities, innovate, take risks and develop new goods and services – are essential to SMEs' development. About 30-60% of SMEs in OECD countries are innovative in such ways as re-engineering products and services to meet new market demands, introducing new organizational approaches to enhance productivity, or developing new techniques to expand sales. Top 5-10% of growing SMEs are exceptional innovators. They tend to be knowledge-based and conduct research and development (R&D). They play a pioneering role in developing new products and markets in sectors such as information and communications technology and biotechnology. In most countries, their job creation rates exceed those of larger companies (OECD, 2000).

Most SMEs have some similar weaknesses. These include insufficient capacity to achieve cost advantage due to lack of scale economies; inadequate financial resources and limitations in managerial and marketing skills which restrict them to compete with larger firms (Ozcan, 1995); a limited range of products and limited links to other firms or groups; and a low tolerance of risk (Dhingra, 1991). In order to assist technological entrepreneurs and knowledge-based SMEs to overcome their weaknesses for successful and quick growth, many governments have applied the strategy of establishing science parks. Science parks are property-based initiatives generally characterized with three features. These are (1) having operational links with universities, research centers and other institutions of higher education; (2) being designed to encourage the formation and growth of knowledge-based industries or high value-added tertiary firms, normally resident on site; and (3) having a steady management team actively engaged in fostering the transfer of technology and business to tenant organizations (IASP, 2001).

Science park schemes of this nature can be found in park/campus-style and center/incubator-style[1]. The park/campus-style is what original science park schemes look like. They are often in a park-like environment, usually adjacent to a higher education institution. They have a low density and a well-designed landscape suitable for knowledge-based firms of different sizes and stages of development. Science parks in this style are actually quite different in size ranging from less than 50 acres to over 200 acres. Center/incubator-style schemes often appear under the name of "innovation center" or "technology incubator"[2]. This type of scheme has restricted space and is usually located in an inner city, close to a university department, where land is tightly constrained. They have a higher building density. Landscaped areas for communal use scarcely exist. They work as prominent mechanisms for promoting the growth of technology intensive businesses by offering accommodation and business support for newly formed firms. In recent years, center/incubator-style schemes have been found often, but not necessarily, associated with park/campus-type developments (see Zhang, 2003). This indicates that a significant proportion of science park tenant firms can be small start-ups.

The establishment of science parks has been one of the features of national and/or regional strategies through the late twentieth century particularly in the Asia Pacific region. The major objective has been to stimulate innovation and generate economic benefits via assisting small knowledge-based firms and knowledge-intensive activities. An increasing number of science parks have bees established to serve this effort. Policy makers in developing countries began to adopt the idea around the early 1980s. This has led to an increasing number of science parks being established in this type of economy (see IASP, 1998; AURRP, 1998; McQueen & Haxton, 1998).

What motivated the current study is the high failure rates of earlier science park schemes as reflected by the literature (see Browne, 1966; Danilov, 1967; Minshall, 1983; Schamp, 1987; Miller & Cote, 1987; Joseph, 1989; Van Dierdonck & Debackere, 1990; Van Dierdonck, Debackere & Rappa, 1991; Luger & Goldstein, 1991), the lack of literature on science park management, and no clue about the perceptions of the demand side of science parks in the Asia Pacific region, namely those technological entrepreneurs and knowledge-based firms, particularly concerning their needs and expectations from a science park. The author perceived it necessary for a science park to know the needs and expectations of its potential tenants so as to assist their growth. Targeting at probing what may be the elements composing a conductive environment for knowledge-based firms in the perceptions of knowledge-based firms, the author conducted a primary study, for which the author interviewed twenty executives of tenant firms in Technology Park Malaysia at the end of 1999. Technology Park Malaysia is one of the earliest science parks established in developing economies. It has been ranked the third most popular science park in the Asia Pacific region (Corporate Location, 1997)[3]. Findings concerned are expected to benefit not only the operation of Technology Park Malaysia, but also other parks, particularly those in developing economies.

Profile for the Park, Interviewees and Firms Concerned

Technology Park Malaysia was established by the Malaysian government to assistant the transition from an agriculture-based economy into a full-fledged industrial economy, which was targeted by Malaysia's Industrial Master Plan (1986-1995) (see Abdul Rahman, 1988, Business Times, 1986; Straits Times, 1988a & 1988b). The park was expected to provide a national focus for action for new business formation and commercialization of R&D; be an active vehicle for technology transfer from the laboratories; provide support for industry and technology and will target specific areas for intervention and assistance; create a community of interest amongst companies and research workers; act as a source of venture capital finance for tenants; be a national exhibition center for new local and foreign technology; be a national information center for technology, including technical, market, management and financial information; be the home of new government R&D institutions and of collaborative regional R&D projects with commercial potential; and be the symbol of technology development in Malaysia (Abdul Rahman, 1988). In 1988, Technology Park Malaysia started as a government unit for park preparation and establishment. It was located in a 2-story commercial building in Kuala Lumpur. An incubation program was offered there with office spaces being rented at competitive rates and assistance of management expertise being provided to tenant firms. The construction of the present park site started in 1993. Phase I was completed in early 1996, when the park team moved in.

The present site of the park covers an area of 750 acres located in the south of Kuala Lumpur (TPM, 2003). It is at the heart of the Multimedia Super Corridor (MSC), the Silicon Valley of the country constructed since the mid 1990s (McGray, 1999; Einhorn & Prasso, 1999). The development of the park is divided into three phases. Phase I, completed in 1996, comprises 12 state-of-the-art buildings including the Resource Center, Innovation House, Incubator Center and Enterprise House. They provide facilities and ready-built units of various sizes for knowledge-based firms. Phase II, which is under construction, includes a Multimedia Center and Biotec City. The Multimedia Center houses a cluster of intelligent buildings serving the physical needs of multimedia companies and enabling them to be service providers to the MSC, the rest of Malaysia and the world. Biotec City will provide facilities assisting companies in the field of biotechnology. Phase III involves the leasing of land lots for individual companies to establish their own buildings for their head offices, research facilities, test sites, and expansion (TPM, 2001). The park leans heavily towards encouraging high-tech companies focusing on such fields as information technology and multimedia, biotechnology and biomedical technology, manufacturing processes, and advanced materials (TPM, 1997). It has 97 tenant firms in the mid 2003.

The author interviewed 20 tenant executives at the end of 1999, when the park had over 80 tenant firms. Convenience sampling method was applied for sample selection. These 20 tenant executives were those who were available at that time and were willing to accept the interview. Three quarters of them were at the top management level; one quarter, at the mid management level. 90 percent had being working with their firms for over one year, and 80 percent had been working in the park for over one year. This reflects that most of these interviewees were quite familiar with the park. In terms of educational background, 90 percent were bachelor degree holders. 70 percent were postgraduates. Among them, 14 percent were Ph.D. holders. Nearly two thirds graduated from a major in science or technology; the others, from commerce. 70 percent had studied abroad. 50 percent had worked abroad. 90 percent were over 30 years old. Most of them were men. Only two were women. Two interviewees were foreigners. The others were local (see Appendix 1).

Among the 20 tenant firms from which these interviewees came, 19 firms were private. Three quarters were purely local, the others had foreign share. 25 percent were very young, established less than two years before. Thirty-five percent had been in operation for two to four years; 40 percent, for over four years. Eighty percent of them had been in the park for over one year. In terms of activities, 90 percent were involved in R&D; half, in providing technological services; 30 percent, in providing business services; one fifth, in specialised production; and one firm, in trade (see Appendix 2).

Needs of Knowledge-Based SMEs

One major open-ended question was used for the interview: "What in your opinion are the needs and/or expectations of knowledge-based firms from a technology park?" Thirteen items were deduced from their answers. These are good basic infrastructure, advanced technological infrastructure, government support, prestige/credibility, internal co-operation, financial support, competitive rental, promotion, technological support, secretarial service, quick response to tenants' needs, co-operation with universities/research institutes, and linkage with tenant firms of other parks (Table 1). Details concerned are as follows.

Good basic infrastructure was proposed by 90 percent of the interviewees. It included a well-managed campus-like environment and facilities concerning dinning, car parking, air-conditioning, lighting, security, mapping, shopping, mailing, recreation, and transportation. A green and peaceful environment was envisaged important for the physical and mental relaxation of knowledge workers, and was also helpful to stimulate their creativity. Night operations of some facilities such as those concerning dinning.

TABLE 1 – NEEDS OF KNOWLEDGE-BASED SMES

N=20

	Needs		F requency	
	Rank 1			
	Good basic infrastructure		1	
	9 referrals to campus-like environment -	8		0
45%				
	Advanced technological infrastructure		1	
	12 referrals to IT facilities/Internet - 60%	6		0
	4 referrals to R&D equipment - 20%			
	Government support		1	
		1		5
	Rank 2			
	Prestige/credibility		8	
				0

				5
	Quick response to tenants' needs		3	
				5
	Co-operation with universities/research		2	
institutes				0
	Linkage with tenant firms of other parks		1	

Air-conditioning and recreation were suggested necessary as R&D people tend to work far into the night.

Advanced technological infrastructure was suggested by 80 percent of the interviewees. It includes two aspects: advanced information technology (IT) facilities and technological equipment for R&D activities. The former is within the concern of more interviewees, 60 percent; the latter, 20 percent. Advanced IT facilities were regarded necessary not only for firms of IT industry, but for all tenant firms' communications and research. Continuous upgrading was expected.

Government support was mentioned by 55 percent of the interviewees. It included incentives concerning tax, grants, and special status for tenant firms. Tenant firms in Technology Park Malaysia could enjoy MSC-status, which granted them a series of financial and non-financial incentives[4]. These incentives benefited their operations.

Prestige/credibility was put forward by 40 percent of the interviewees. It could be from the name of "science park" or "technology park". They envisaged that firms located in a place named with "science" or "technology" were usually regarded as engaging in high-tech activities, therefore, would won more respect and be regarded as reliable.

Internal co-operation was raised by over one third of the interviewees. In their opinion, people with similar talents and traits tended to group together. They could communicate, co-operate, and share equipment and expertise. This might complement or add value to their own work. Park management should arrange joint activities among tenant firms so as to provide more opportunities for their potential cooperation.

Financial support such as venture capital or funds for R&D and/or operation was suggested by one fourth of the interviewees. They agreed that technological entrepreneurs usually had brilliant ideas, but not enough money to start up their own ventures. A scheme of financial support would be necessary in order to assist them. Governmental funds should be channelled to tenant firms for their innovative projects. This would benefit the society in the long run.

Competitive rental was mentioned by one fourth of the interviewees. The major reason was that entrepreneurs and small knowledge-based firms had limited financial resources particularly at their early stage of development.

Promotion was proposed by one fifth of the interviewees. It would make a park and its tenant firms known to the public, which would benefit their development. Exhibitions, shows, and conferences were some of the activities that a park could organize, through which tenant firms could be exposed to the public.

Technological support was suggested by 15 percent of the interviewees. A science park was expected to play a leading role in R&D. It should provide technological support, organize seminars and workshops, and create projects that could assist tenant firms to explore their technological fields.

Secretarial service was proposed by 15 percent of the interviewees. It referred to those services concerning copying, scanning, telephoning and faxing. It would benefit tenant firms, mostly small ones, by reducing their investments and costs if a park could provide them.

Quick response to tenants' needs was also put forward by 15 percent of the interviewees. The reason was some needs could not be anticipated, and various incidents could occur at any time. The willingness and ability to provide quick responses to tenant firms' requirements would be a great support for them. A science park should take an active role to cater for tenants' needs and help them whenever problems occur.

Co-operation with universities/research institutes has two referrals, composing 10 percent of the interviewees. Such co-operation could help to upgrade the profile of a science park. Proximity to a university or research institute could facilitate the co-operation. Co-operative activities with leading international universities or research institutions should also be taken into the consideration.

Linkage with tenant firms of other parks was suggested by one interviewee.

To facilitate comparison, the above needs are divided into three ranks according to their frequencies of referrals. Rank one includes those suggested by more than half of the interviewees; rank two, by 25 to 50 percent of the interviewees; and rank three, by less than 25 percent. Those that fall into rank one are good basic infrastructure, advanced technological infrastructure, and government support. Prestige/credibility, internal co-operation, financial support, and competitive rental are in rank two. Rank three include promotion, technological support, secretarial service, quick response to tenants' needs, co-operation with universities/research institutes, and linkage with tenant firms of other parks (Table 1).

Further analysis shows that these needs fall into four feature groups. These are termed "infrastructure", "incentive", "publicity" and "service", which are listed roughly according to their frequencies of referrals (Table 2). "Infrastructure" refers to both good basic infrastructure and advanced technological infrastructure. "Incentive" includes government support, financial support, and competitive rental. "Publicity" has four elements: internal co-operation, promotion, co-operation with universities and/or research institutes and linkage with tenant firms of other parks. "Service" concerns technological support, secretarial service, and quick response to tenants' needs. Prestige/credibility, is excluded from this classification. The reason is it is derived from the word "science" or "technology" in the name of science parks as suggested by those interviewees, and most parks have either word as part of their names.

Implications and Conclusion

The above findings provide some insights for science park management in their effort in assisting the development of technological entrepreneurs and knowledge-based SMEs. While it has been realized necessary to construct a conducive environment for them to grow well, the above findings suggest the concrete elements, both tangible and intangible, that such an environment is expected to be equipped with. The significance of these findings is that they are from the perceptions of the demand side of a science park, those knowledge-based firms, rather than the supply side. Therefore, they reflect better what a conductive environment for knowledge-based SMEs should be in science park context. Those frequencies of referrals reflect what tend to be the most commonly or less commonly needed elements. Those needs that were nominated by more interviewees apparently are those needed by more firms. Therefore, needs in rank one (Table 1) appear to be those most commonly needed. Those in rank two and three are comparatively less common. While all of them are helpful for the growth of knowledge-based SMEs, these ranks indicate what should be the primary work to be carried out, should a park not be able to achieve all of them at a time.

Both good basic infrastructure and advanced technological infrastructure are what most commonly needed by knowledge-based SMEs. Good basic infrastructure composes the type of working environment that knowledge workers desire. It is human nature to look for the highest possible standard of working and living environment. Whether it is achievable or not depends on personal capability. Knowledge-based SMEs normally house a significant proportion of knowledge workers who are involved in knowledge-intensive activities. This segment of people is sought after worldwide. Due to the significant contribution they may make to the economic development, knowledge workers are crowned as the brain of a society. Virtually every country tried to enlarge its brain of knowledge workers through either "brain drain" (to get foreign knowledge workers) or "reverse brain drain" (to get back its own knowledge workers living abroad). Knowledge workers tend to locate themselves in the type of working and living environment that they refer. There should be no doubt that a science park should first of all meet such a need of knowledge workers in order to have them locate their ventures in the park.

TABLE 2 - CLASSIFICATION OF NEEDS OF KNOWLEDGE-BASED SMES

N=20

Needs	Frequency	%
A. Infrastructure		
1. Good basic infrastructure	18	90
?? 9 referrals to campus-like environment - 45%		
2. Advanced technological infrastructure	16	80
?? 12 referrals to IT facilities/Internet - 60%		
?? 4 referrals to R&D equipment - 20%		
B. Incentive		
3. Government support	11	55
4. Financial support	5	25
5. Competitive rental	5	25
C. Publicity		
6. Internal co-operation	7	35
7. Promotion	4	20
8. Co-operation with universities/research institutes	2	10
9. Linkage with tenants of other parks	1	5
D. Service		
10. Technological support	3	15
11. Secretarial service	3	15
12. Quick response to tenants' needs	3	15

As for advanced technological infrastructure, its importance is decided by the key function of a science park, that is, assisting the growth of knowledge-based firms and knowledge-intensive activities. The technological infrastructure is the tool facilitating the knowledge work being carried out. Small knowledge-based firms or entrepreneurs normally have limited capital at their early stage of operation, let alone purchasing the state-of-the-art IT or R&D facilities, which tend to be capital intensive in most cases. Knowledge-based firms need a location with the facilities concerned in order to keep their knowledge-intensive activities in motion. Getting access to such facilities appears to be obligatory for their further development if they don't have them. A science park that can meet this need will naturally benefit knowledge-based firms. Proximity to a university with research facilities concerned is helpful for a science park to achieve this objective at a lower cost. Good cooperation with such a university will enable park tenant firms to get access to the facilities that they need without or with limited investment from the park. If a science park has already had a university or research institution as its neighbour, the immediate question deserves to ask is whether the tenant firms can actually get access to their facilities, particularly if the park doesn't have the equivalent. Actions concerned will materialize the effect of the strategy of being approximate to a university or research institution, which features the locations of many science parks.

Incentives such as government support, financial support, and competitive rental in most cases relate to monetary support such as tax advantage, venture capital, grants, and rental subsidies. Their frequencies of referrals reflect that monetary support in various aspects appear to be the second common need of knowledge-based firms. Although innovative and ambitious, knowledge based firms lack sufficient financial recourses to achieve their objectives. A science park that can lead them to venture capital assisting their establishment and growth, to grants supporting their work, and to tax advantage to reduce their cost, and provide rental subsidies to share their financial difficulty will certainly benefit their development.

A science park should try every means to increase its publicity. Promotion and marketing are necessary, which will benefit both the park and its tenant firms. They can help a park to recruit more tenant firms and win more support from the society due to increased awareness they can help to build up. Meanwhile, they can help firms in their business development and expansion for the same reason. Cooperation should be established not only mong tenant firms within the park, but also with outsiders in various related sectors. This, on one hand, can help to increase the awareness of tenant firms and provide the opportunities of creating potential values. On the other hand, it will benefit them by opening more channels to various types of know-how. This is particularly necessary in the present age when knowledge has become increasingly integrated, and companies are increasing relaying on outsiders for know-how so that they can concentrate themselves more on their core competences (OECD, 1999).

Knowledge-based small firms do need some technological, secretarial and administrative support or service. However, their low frequencies of referrals indicate that they are not the primary needs of most firms. This could because most technological entrepreneurs are technologists themselves, and most knowledge-based firms have their technologists. They can serve their immediate technological know-how need for their knowledge work. As for secretarial service concerning telephoning, faxing and coping etc., some firms may be able to manage it themselves, therefore this type of service is not the immediate need for most firms either. Nevertheless, the need for external technological and secretarial support or service does exist among some knowledge-based SMEs. A science park providing the support or service concerned will benefit their operation.

End Notes

[1] Some literature also classifies city/region-style schemes such as Asian technopolises and European technopoles as science parks. This type of scheme can be either a city or a region in terms of geographic scale. They are associated with governments' regional development plans (Zhang, 2003). This type of scheme is not the focus of the current study.

[2] Science park schemes can be found named differently. "Science park", "technology park", and "research park" tend to be more popular. The present study uses the term "science park" for general discussion. However, where the literature refers respectively for "research park", "technology park" or other names, these terms are used interchangeably.

[3] Evaluation was conducted based on the factors employed by companies looking to set up typical R&D facilities such as quality of research carried out at the nearest university or institute, availability and cost of highly skilled staff, amount of foreign companies attracted, proper costs and the size of the local marketplace (Corporate Location, 1997).

[4] In Malaysia, the government has adopted a range of policies to stimulate the growth of technology and knowledge-based industries and encourage related investments. Incentives have been designed to ensure the long-term viability of companies planning to locate in the Multimedia Super Corridor (MSC). MSC-status has been created for this purpose, which grants companies located inside the MSC with a series of incentives, both financial and non-financial. Tenant firms of Technology Park Malaysia are also granted with the MSC-status as the park is part of the MSC. Financial incentives for MSC-status include a five-year exemption from Malaysian income tax (renewable to 10 years) or a 100 percent Investment Tax Allowance on new investments, duty-free importation of multimedia equipment, and R&D grants for local SMEs. Non-financial incentives include unrestricted employment of foreign knowledge workers, freedom of ownership, freedom to source capital globally for MSC infrastructure and the right to borrow funds globally, globally competitive telecommunication tariffs and service guarantees as well as high class physical infrastructure concerning IT, planned urban developments, educational facilities including the region's first Multimedia University, and a green environment protected by strict zoning (TPM, 1997).

Benefits and Risks of User-Developed Application in Small Business

Zulkhairi Dahalin
Universiti Utara Malaysia, Malaysia

Abstract

This paper discusses the benefits and risks of developing computerized business applications by end-users, particularly in the small business environment. As today's end-users are becoming more and more sophisticated coupled with the proliferation of IT that has brought the computerization of business activities within reach of many small firms, understanding the benefits and risks of user-developed applications would contribute towards the small firm's effectiveness in adoption IT. This is particularly relevant in today's managing business in a volatile environment where businesses, including the small firms, will have to compete not only locally but also globally. Therefore, IT is seen as an enabler that can help small firms to increase their competitiveness. Relevant literature on the benefits and risks of user-developed applications was sought and summarized in this paper. Findings were also based on a case study investigation of small firms with no formal IT function. Observations in these firms were made on the end-user developers who were given the responsibility to develop the firm's computerized applications. While the benefits have been enormously highlighted and at times overshadowed the risks, due attention is also given to examining the risks so as to provide a more balanced report, and as the precautionary measures for end-user developers. Risks were categorized according to organizational and individual risks following the application development stages of planning, analysis, design, and implementation.

Introduction

The benefits and risks of user-developed applications to small businesses have been well-documented [Amoroso and Cheney, 1992; Guimaraes and Igbaria, 1996; Alavi and Weiss, 1986; Frank, 1988; Cale, 1994; Edberg and Bowman, 1996; Floyd et al., 1995; Panko, 1998]. Many of these studies contend that the risks of user-developed applications could be potentially lethal to a small firm. However, the fact, that user-developed applications have been pervasive, and continue to grow in small businesses, tells much about their benefits rather than their risks. This phenomenon could be attributed to several reasons. First of all, the risks could be unrealistic and over-zealously reported involving isolated cases. Secondly, firms have taken the necessary precautionary steps to avoid the risks in light of these studies. Third, these risks could act as a 'time-bomb' waiting to explode and even if they do explode, they may go unnoticed in firms that are ignorant of IT. Lastly but not least, firms may realized that many benefits of user-developed applications may outweigh their risks and therefore companies are willing to take the chance. This is particularly true given that hiring of IT professionals could be difficult for small firms due to economic reasons as well as limited supply of IT human resource. No matter what the reasons are, recognizing the benefits and risks of user-developed applications is necessary as today's small businesses readily accept the challenges of globalization by using IT to increase their competitiveness. Recent findings have shown that small firms are now going international with the help of IT, especially the Internet, to enable e-commerce [Westhead et al., 2002].

Benefits of User-Developed Applications

As reported by Amoroso and Cheney [1992] the benefits of user-developed applications are not only specific to the end-users but also to the management and the IS staff as well as to the IS department. Many of these benefits are similar and cited in other studies as well [example see Guimareas and Igbaria, 1996; Alavi and Weiss, 1986]. Even though these studies were based on user-developed applications that appear in large organizations, lessons could be learnt for small businesses as well. While benefits to IS organization such as minimized application development backlog, decreased in IS spending, improved programmer productivity, and improved IS and end-user relations [Amoroso and Cheney, 1992; Guimaraes and Igbaria, 1996] are typical to the traditional large firm set-up, other benefits may also be applicable to small businesses. These include better decision-making, improved in end-user computer literacy, more satisfied end-users, faster response to information requests, direct end-user control of data and information, and increased in end-user productivity. Additional benefits include overcoming the shortage of IT professionals [Alavi and Weiss, 1986], and encourage innovation with less IS bureaucracy.

Within the specificity of small business Raymond [1987] described several benefits of user-developed applications which in addition to some of the above include lower IT investment, less dependent on vendors for application development, lessen the need for hiring IT personnel, and as an alternative to buying packages. Furthermore, as the development's efforts do not require additional financial and human resources, and the fact that today's software is becoming user-friendlier, user-developed applications seem to be more appropriate for small businesses [Raymond and Bergeron, 1992]. In addition, due to the assimilation of IT in most tertiary and training institutions, firms are more likely to hire graduates with higher computer literacy than they were in the past, making user-developed applications in small businesses more practical.

User-developed applications can be seen to be a "natural" solution to the limitation faced by small businesses in respect of effective utilization of their IT resources. It is the nature of small business to be 'poorly' resourced, and since user-developed application do not require the presence of internal IT expertise, users with the necessary development skills would be capable of developing applications appropriate to their needs with no support from the IT professionals. Furthermore, due to the specificity of small business with lack of IT expertise, the gulf between IT specialists and user-developers that may be present in large organizations is no longer an issue in small business. With end-user developer there is no need to hire dedicated programmers and analysts to develop applications and make effective use of IT resources. As user-developed applications evolved within the firms, users become less dependent on third parties and they will be in a better position to evaluate alternatives to IT adoption such as outsourcing, acquiring ready-made packages, or develop their own application. User-developed applications could give added flexibility to small firms to adopt IT as they allow more choices for IT adoption resulting in more flexible approach to effective use of IT.

Risks of User-Developed Applications

Alavi and Weiss [1986] made a comprehensive and widely cited study of user-developed applications' risks. The authors identify potential organizational risks associated with user-developed applications in different stages of the end-user development life cycle and suggest suitable control mechanisms to manage these risks. In the analysis stage, the risks identified include no proper analysis on acquisition of end-user tools and lack of analysis on application requirement. This result in ineffective investment in end-user tools, incompatible software, risks of security and integrity of data, not enough time spent on problem diagnosis and identifying systems requirements, and solving the wrong problem. This finding is also supported by Bronchia and Brown [1993] who found user-developed applications tend to promote incompatible end-user applications, threats to data security, integrity and privacy due to lack of development methods and knowledge of data management, and ineffective use of financial resources when investing in end-user tools, hardware and software. Janvrin and Morrison [1996] agree that user-developed applications will encourage applications developed without regards to any requirements analysis and design and do not follow any structured methods resulting in more errors and less user confidence. The authors also found that end-user developers tend to spend very little time on planning, problem definitions, and diagnosis.

Amoroso and Cheney [1992] found "solving the wrong problem" to be one of the risks associated with user-developed applications. Panko [1998] supports their finding suggesting that omission of errors caused by misdiagnosis of problems has the highest rate of being undetected and "is the most dangerous" of errors. The author further suggests that only few organizations have policies on end-user development that caused end-user (spreadsheet) developers to disregard the use of rigorous development disciplines. This lack of development methods and techniques seems to pose consistent risks in user-developed application what was also echoed in other studies [Amoroso and Cheney, 1992; Edberg and Bowman, 1996; Floyd et al., 1995; and Guimaraes and Igbaria, 1996].

In the design stage, the organizational risks identified by Alavi and Weiss [1986] include lack of documentation, lack of user tests, lack of quality in applications, and redundant efforts on similar development tasks. Moreover, development time has not been spent wisely. Other studies also found unreliable systems due to lack of QA procedures [Brancheau and Brown, 1993; Floyd et al., 1995], no reviews and validation on developed applications [Janvrin and Morrison, 1996], and lack of documentation and testing [Cale, 1994; Edberg and Bowman, 1996]. One other risk in the design stage may include frequent changes in the application design due to lack of development standards and procedures [Floyd et al., 1995].

Alavi and Weiss [1986] categorized risks identified in the implementation stage in terms of the operational and maintenance of end-user applications. In the operations of end-user applications among the risks are threats to the security and integrity of data, and putting additional burden to the corporate computing resources. Frank [1988] found that user department lacked control of file backup, off-site storage, and physical access to sensitive files with lack of control against fire hazards to PC files as the most serious risks. Other related findings include tendency of application development to create pockets of isolated personalized information systems across departments as opposed to an organizational information systems [Brancheau and Brown, 1993]. In addition, end-user developed applications tend to be in conflict with the overall organizational objectives, and tend to withheld valuable information to the knowledge of the organization at the same time retain data which if of little value [Floyd et al., 1995].

For maintenance of end-user applications, failure to document and test changes, and failure to upgrade applications are the two risks identified in the Alavi and Weiss study. In addition, organizations could also incur loss of investment in “personal” applications when the individual end-user that develops the applications leaves the organization [Floyd et al., 1995]. Other implementation risks identified include poorly maintained applications, corruptible corporate data, strained IS-user relationships, information overloading, and lack of integration between end-user and corporate applications [Guimaraes and Igbaria, 1996].

In studying individual end-user developer risks Panko and Sprague [1998] found that not all studies of spreadsheet errors that they encountered are error-free with the number of errors not acceptable in practice. The authors report that about 20% to 40% of all spreadsheet models contain errors and that the most common are omission errors. Logic errors were also numerous when mechanical errors were significantly less. The authors suggest that only systematic code inspections in groups/teams are able to reduce development errors, and minimized individual risks at an acceptable level. However, this study has only examined spreadsheet development when it is very important to examine risks in other end-user developed applications using non-spreadsheet development tools such as word processing, databases, application generators, web- development, and other fourth-generation languages.

Though none of these studies examined the risks of user-developed applications within the specificity of small business, it can still be assumed that most of the risks mentioned are also applicable to the small business environment. Nevertheless, it would be in the interest of IS management in small businesses for separate studies done on end-user development risks and outcomes within the specificity of small business. This paper attempts to present the outcome of a case study of two small firms involved in such user-developed applications.

The Case Study Approach

Information systems have been recognized as multi-disciplinary [Brancheau and Brown, 1993] and the multi-faceted nature of IS research has made case study research an appropriate research strategy [Cavaye, 1996; Remenyi and Williams, 1996]. Furthermore, studying contemporary events in their natural settings is more appropriate in a qualitative research method where case study research has emerged as a suitable candidate [Yin, 1994; Mason, 1996]. Since IS is multi-faceted, therefore it is appropriate to employ the case study approach as a research strategy for this study.

Two firms were used as respondents from a list of prior survey [Dahalin and Golder, 1998] consisting of respondents representing different levels of sophistication in terms of IT adoption. Both firms were chosen with no formal IT function and no IT professional. Both were categorized as small manufacturing firms involved in the steel-making industry, where one firm is involved in making steel tubes for the heat transfer industry and the other is in the business of making cold drawn seamless steel tube product. Data collection and analysis were done on these firms and findings from the cases are presented in the next section.

The primary data gathering technique used is through semi-structured interviews whilst other sources of evidence used, include company documents and observations. 15 interviews were carried out in both firms involving the end-user developers, the firms' senior management team, and other end-users. Each interview lasted between 1 to 3 hours for duration of 3 months. A further three months were spent for data transcription and reviews of the interview scripts, and another 2 months for analysis and preparation of reports.

Analysis of Findings

A pattern-matching strategy proposed by Yin [1994, p. 106] was used to compare the data as an empirically based pattern of evidence. This is to ensure the findings are based on strong internal validity of the cases. A cross-case analysis is presented to compare data from both firms where patterns could be established. This would enable similar or contrasting results to be obtained, consistent with Yin's suggestion on literal replication and theoretical replication [Yin, 1994 p. 64]. A cross-case summary of the firms' characteristics is presented in Tab.1 to reiterate some of the main findings already discussed previously. Obvious similarities and differences can be seen in the three categories of the firms' basic profile, IT adoption and end-user developed applications.

TABLE 1.
SUMMARY OF FIRMS' CHARACTERISTICS

Characteristics	Firm A	Firm B
1. Basic Profile		
?? Ownership	?? Family	?? Family
?? Industry	?? Manufacturing	?? Manufacturing
?? Age	?? 10 years	?? 70 years
?? Size (staff)	?? 45	?? 49
?? Sales (million)	?? 6.0	?? 4.5
2. IT Adoption		
?? Years using IT	?? 3	?? 15
?? No. of PCs	?? 18	?? 6
?? No. of Users	?? 18	?? 9
?? IT Support	?? Nil	?? Nil
?? No. of systems/IT products	?? 10	?? 3
?? No. of applications	?? 13	?? 13
?? CEO Support	?? Strong	?? Weak
3. End-User Development		
?? End-User Typology	?? 1 – End-user developer	?? 1 – End-user developer
?? Applications developed	?? 3 – Command level EU	?? 1 – Command level EU
?? Source of end-user support	?? 12	?? 9
?? Experience in development	?? Self-supported	?? vendor/training
?? Planning for development	?? 4 years	?? 7 years
?? Development Policy	?? Not documented	?? Nil
?? Development methods	?? Informal	?? Nil
?? Development responsibility	?? Not standardized	?? Not standardized
?? Documentation	?? Part time	?? Part time
?? User tests	?? Minimal (scratch)	?? Nil
?? Security/backup procedure	?? Nil	?? Nil
	?? Yes, informal	?? Nil

Some of the data presented above provide support for previous studies on IT adoption in small business, whilst other evidence may suggest the contrary. The capability of small firms to develop their own applications confirms earlier studies [Raymond, 1985; Lees, 1987]. The lack of IT support is typical of many small businesses [Doukidis et al., 1996; Raymond, 1990]. A strong CEO support implies an increase in IT adoption [Thong et al., 1996]. This is supported by the pattern of evidence on the number of PCs, and the number of users as well as the number of systems, and IT products on one firm in relation to the other. In addition, data on end-user developed application shows that in the absence of experience in application development, training can be an alternative to encourage end-users to develop applications as suggested by Raymond [1988]. Conversely, this also implies that in the absence of training in application development, on-the-job experience can also become an alternative to encourage end-user application development as demonstrated by Firm A.

Contrasting results can also be seen based on the data presented. There is no evidence to suggest that the firms are experiencing difficulty on developing applications due to having users with low level of computer literacy as suggested by Montazemi [1987, 1988]. However, difficulties have been experienced in other areas such as time constraint in the development, limited human resources, and firm's profitability in relation to application development. Both firms have never suggested the lack of technical knowledge as a form of difficulty or obstacle to application development.

Among the organizational risks associated with user-developed applications identified in the planning stage of the case study, firms include lack of formal planning in application development and lack of strategy for implementation as presented in Tab.1 above. Though, there was evidence of an informal policy on user-developed application in one of the firms, decision to develop an application is usually short term and depends on the availability of the end-user developer. In the other firm, applications were developed as and when the developer moved to different departments. This resulted in contention among the departments trying to win over the only expertise available. Individual risks appear to be the lack of planning knowledge and lack of formal management training.

In the analysis stage, the organizational risks identified include lack of analysis on user requirements, lack of development methods and techniques, and threats to security and integrity of data. However, there is evidence of proper analysis on acquisition of development tools and ensuring compatibility of all hardware and software used. On user requirements, there was evidence suggested that application development was done without consulting other users as the user-developer thought it unnecessary to seek users' input due to the developer's own knowledge and experience in the business itself far surpassed the other users. However, this resulted in less user satisfaction with the applications. Lack of formal training in development methodology has also contributed to this as well as the problem of discovering errors too late in the development stage. On individual risks, as well as the lack of formal training by the end-user developer in one of the case study firm, substantial amount of time was spent on performing diagnosis and trial and error during application development. The part-time nature of the development work has also made the whole development task more challenging and difficult.

A consistent risk found in the design stage is the lack of documentation on the applications developed. A common excuse was the lack of time as the developer has to either catch up with the backlog on his formal work or had to move on to developing other urgent applications. Another organizational risk in the design stage is the development of similar applications used by different departments within the same firm. In the case study, an example is the existence of three separate stock control applications, two keeping track of the same parts used by the Sales and Productions departments, and one for material control application used by the Production department. There was evidence of user tests being done before implementation but that was used more as a platform for user training than for validation and QA procedures. One individual risk identified in the design stage is the frequent changes in the design due to the lack of standard design method. This is exemplified in one of the firms' cases where the Order Processing system went through three major revisions in three years. The third revision was an oversight on the cascading problem in the design of the database due to failure to perform appropriate relational normalization. This could be seen as an "omission error" suggested by Panko and Sprague [1998] discussed earlier.

In the implementation stage, the organizational risks identified include, lack of control over security of the development tools and backup of files. Though these are also risks associated with the general IS issues, they are also user development risks as it involves operations of user-developed applications. One of the case study firms relates an incident where its PCs located in one of the department were stolen and because there were no backups; applications used by the department had to be developed from scratch. The situation got even worst when users from another department were affected when their PCs were needed to re-develop the stolen application! There was also individual risk in the implementation stage where an application developed by an end-user was not formally recognized but continued to be used by several other end-users in the department. Ignoring such talent would not benefit the firm and there could even be potential loss of investment in such "personal" applications when the end-user that develops the application leaves the organization.

Conclusion

Whilst there are many benefits associated with user-developed applications, understanding the risks is a first step towards developing the successful user-developed applications. This paper highlights the many possible risks a small firm may encounter in its endeavor to develop its own application with the aim to avoid such occurrence so as the development risks could be minimized. Only through carefully management of these risks, can small firms reap the full benefits of user-developed applications and be in a position to utilize IT for their competitive advantage. From the case study investigation, it seems reasonable to suggest that end-user application development in the small firms should be properly planned and not left to individual initiative. Top management should be aware of their internal talents and be more receptive and supportive of the development efforts. Instead of putting constraints on user-developed application, management should allow this trend to pervade across the firm and provide the necessary tools, training, policy, and incentives that would encourage the innovative and development culture.

Developments in the Level of Marketing in Czech Firms between 1999 and 2003

Jitka Kloudová
Tomas Bata University in Zlín, Czech Republic

Abstract

At the current time, when, as a result of the rapid developments in Information Technologies, frequent changes occur in the surrounding environment and in customer preferences, and where it is often necessary to implement changes to approaches in practice in firms, Marketing and its philosophies are becoming ever more important.
Marketing activities do not only concentrate on discovering the best methods for persuading customers to buy products, but also include the seeking of further opportunities for creating new values for customers, which it is then necessary to set in context with the current and future marketing environment of a firm and concurrently, to respect the real abilities of these firms.

Marketing is one of the key pillars of the successful management of an enterprise, since the primary role of marketing is the creation of value for customers. "New Millennial" Marketing is a philosophy, a method raised to the way of thinking, where the marketing management of a firm must always think about and deal with a regard to the current and future customer. In this philosophy, the most important is the ability to understand one's customer and market, to have the right product in the right place at the right time, and to be certain that the customer is sufficiently informed about the product. Marketing is an indivisible component of those processes that link the abilities of an enterprise to the requirements of its customers. To what degree Czech firms devote their attentions to marketing activities and are aware of its contributions and benefits for the prosperity of the firm formed the framework and was the subject of two research studies we conducted in 1999 and 2003.

Introduction

Marketing is one of the basic pillars of the management and directional-orientation of business. It is oriented on the customers, and represents not only a source of information about them but also about competitors and the overall entrepreneurial environment. It covers the domains of the long-term relationships of enterprises and their customers, as it does for the short-term Sales activities.
The primary role of Marketing is value-creation for an enterprise's customers. Successful value-creation for its customers in turn leads to value-creation for other materially-interested entities, i.e. including owners, shareholders, and employees.

Sales - as compared to Marketing, involves the direct persuasion of the customer, to buy the product, while Marketing is a philosophical issue, which assists in the maintenance of a balance between the aims and objectives and the possibilities facing an enterprise.

A whole range of Czech enterprises still mix up these two terms and are unable to comprehend that a Sales Department, oriented as it is on increasing sales and the saleability of existing products cannot, at the same time, afford to think about and speculate over new trends and changes in the surrounding environment, or even – about new consumer preferences.

Marketing activities concentrate not only on discovering the most effective means of convincing one's customers to buy the product, but also include searching out further possibilities (opportunities) for the creation of new value-added properties for one's customers. Searching is subsequently necessary to put into context with current as well as future marketing environments, while respecting the actual abilities of the enterprise at the same time.

In mid-2004, when the Czech Republic will finally become a fully paid up member of the European Union, Czech enterprises will be faced, more than ever before, with the enormous European marketplace. These Czech enterprises will have to reconsider their entrepreneurial strategies – in order to take into account this pan-European dimension with its great quantity of competitors, and to know just how permeable these markets are, as well as their (potential) customer and competitor behaviours. Even those producers operating on a purely local level in local markets will be unable to avoid the requirements imposed by a unified pan-European market – as regards prices, quality, the technical and Health & Safety parameters of the products, the ways and means of its propagation and promotion, its distribution, and of its After-Sales Service.

A new marketplace is already taking shape, filled with an enormous number of world-class competitors. The ability to be flexible and to react quickly to a new impetus or impulse from the market will bring these enterprises profits. However, the satisfaction of special requirements (demands) requires the commensurate knowledge and agile exploitation of marketing tools. The questions remain - Do in fact Czech enterprises exploit such marketing tools?, Are they aware of the advantages and benefits flowing from well-performed Marketing activities?

Problems, Issues and Hypotheses

Beginning in 1989, and over the course of the last 14 years, the Czech Republic has undergone enormous transformation from state-held enterprises and a centrally-planned economy to a private, market-led economy, in which each must ensure the take-up of their products themselves, through their own powers. Marketing – the promotion of an enterprise's products, and Advertising were completely unknown terms to Czech enterprises until shortly after 1989. What endured was the statement that the product was the most important/key, and by no means has this been replaced by the customer's needs, since Czech enterprises underestimate the powers of Marketing and very often, freely interchange this term with that of Sales [Rehor, V., 1995; Mozga, J., 2000].

The employees of Marketing Departments of enterprises hailing from EU countries often have a more detailed understanding of a Czech customer's needs and so often know them better than domestic manufacturer's do, since sophisticated marketing and customer care are, in the great majority of Western European enterprises, a simple matter-of-course [Šmejkal, V. and Coll., 2000].

Indeed, this is precisely why, with a view to the situation prevailing in Czech enterprises regarding developments in Marketing, this area has become the subject of investigation. It has proved, highly interesting to follow, how Czech enterprises have accepted marketing-related activities, and whether or not they see them as offering a contribution or benefit for their enterprise and for their future success in maintaining their position on the markets.

At the present time, as a consequence of the rapid expansion of new information and communications technologies and the acceptance afforded by their built-in advantages to both enterprises and customers, the Internet would appear to be essential to marketing practices above all. Czech customers have still to fully exploit the opportunities to purchase goods through the Internet, and to catch up with the Most-Developed Countries (MDCs), and, as OECD statistics show, Internet visitor numbers ("hits") per 1,000 inhabitants for the Czech Republic does not yet rank them among these MDCs [OECD. Information Technology Outlook, 2002].

The aim of the research undertaken was to gain information as to the state of Marketing in Czech enterprises, as well as whether changes in the perception of the importance of Marketing practices in the course of the period covering 1999 to 2003 took place. At the present time, marketing activities are indivisibly linked to the development of the Internet – which has become a highly-prized information and communication channel for these enterprises.

The following hypotheses were postulated:

H1: Czech enterprises underestimate (the value of) Marketing activities.

H2: In the course of 1999 to 2003, a shift towards strengthening the significance of these Marketing strategies occurred in Czech enterprises.

H3: The introduction of the Internet into Czech enterprises has grown over the course of the period: 1999 to 2003.

The answers to the above-mentioned hypotheses were sought through intensive investigations into the following areas:

-The Existence of an Independent Marketing Department.

Marketing is one of the basic pillars of the management and directional-orientation of business. [Kotler, P., 2000]. As it is agreed by a number of authors [Kotler, P., 1998; Murphy, 1996; Bendaly, L., Cates, L., 1999; et al.], an independent Marketing department is – above for larger enterprises, a very important aspect for the performance of high-quality marketing activities. These authors all draw one's attention to the difference in aims and objectives that are tracked from a Marketing and Sales point of view.

-The Standing of the Marketing Department within the Overall Organisational Structure.

The functionality of an existing Marketing Department can be judged in perspective of its situation within the overall framework of the organisational structure of an enterprise. What is the key in the development and functionality of the marketing activities in an enterprise, which are oriented on the customer themselves above all. For this reason, in order for an enterprise to be able to fully exploit the advantages and benefits that are the fruit of well-conducted marketing activities, it is essential that the Marketing Department's employees not be dependent upon the Sales Department. [Kotler, P., 1998; Capon, N.; Hulbert, J. M., 2000].

-The Education-base of the Marketing Department's Employees.

The qualities of the actual employees employed in a Marketing Department form an important aspect of well-performed marketing activities. Their knowledge, skills, and qualifications become an essential component of all of an enterprise's activities. What above all decides the competitive ability of an enterprise is its intellectual capital - since the qualified employee is, intrinsically, the greatest capital an enterprise possesses [Kelly, K.1999]. Siegel, D. [1999], sees the opportunity for an enterprise as not residing in their financial capital, but in the intellectual capital of its employees.

-The Marketing Strategy in Enterprises.

It is very important that an enterprise sets out its marketing strategy in order to be able to achieve the marketing aims and objectives set out in it. [Tomek, J.,1998].

Purchasing power is growing accompanied by a differentiation in customer preferences, which plays into the hands of operative (pro-active) enterprises. The transformation of a marketing orientation on the masses to an orientation on targeted groups, and indeed, in the future to one targeted on the individual needs of a single customer, which should prove feasible thanks to new communications technologies.[Kotler, P.,2000]. This is precisely the (detailed) knowledge of one's customers that will play a decisive role in the future in the course of strategic decision taking and subsequently, upon acquiring a strong position on the market [Strauss, J., 2000]. The customer is becoming the cornerstone in the value-creation process, and will become an essential component of the newly originated product [Terpstra, V., 2000]. The enterprise must target itself on its customers and require from its Marketing Department a detailed knowledge of the problems and issues facing these consumers. Moore, G. A., [1999], points up the rapidity of changes in both the entrepreneurial environment and consumer preference, while at the same time pointing out the unwillingness of managements to transform run-of-the-mill (tried and tested) ways of doing things.

The need for change in this new, digital age, and above all a change in strategies, is emphasised by Wurster Thomas and S. Evans Philip [1999], who emphasise that no enterprise, however dominant it may be in its branch, is immune from the drastic transformations currently under way in today's Information economies.

Christopher, M.[2000], talks about the fragmentation of consumer markets and proposes a conception of "Micro-marketing", in an attempt to precisely target marketing strategies on ever-diminishing customer segments.

-The Implementation of the Internet in Enterprises as an Ineluctable Component of Marketing Activities.

Working with information is an ineluctable (indivisible) component of marketing activities in general. The ability to gain a jump on one's competitors is closely connected to the introduction and exploitation of the Internet into enterprises in acquiring information about markets, customers, and even one's competitors. These electronic tools have been in use for some time now in marketing practice. Despite this, the enormous expansion of the Internet and other new technologies has had, as its consequence, the origin of completely new aspects of marketing practice.

Hartman, A. and Kador, J. [2000]; Christopher, M. [2000]; Strauss, J.[2000]; Tvede, L., Ohnemus, P. [2000]; Siegel, D.[1999], all of these afore-mentioned are in complete agreement on the necessity for a customer-oriented marketing strategy. Siegel, D.[1999], sees the future of enterprises in their preparations for the new world of "e-customers", in which they assist enterprises in taking the correct strategic decisions – as long as the enterprise grants them the chance to do so. Stan Rapp and Chuck Martin [2001], state that the link between e-shops and their e-customers will be ever more radically different that it was in the past. There will be an ever-clearer shift away from mass-marketing towards a more segmented market and the seeking of market niches, i.e. towards so-called individualised marketing. A whole number of works contain the statement that, thanks to the Internet, the customer will gain an upper hand and have the advantage - since not only the employees of an enterprise, but in the same manner its customers, are able to be very well-informed. [Stan Rapp and Chuck Martin, 2001], [Siegel,D.,1999].

Research Methodology

The main area on which our research study was oriented was the marketing activities of Czech enterprises. An effort was made to comprehend and give a clear picture of the approach of these enterprises to marketing activities, and as to whether a change in their perception of the significance of Marketing had taken place in the course of 1999 to 2003.
The research was mainly oriented on the following areas:
a) The existence of a Marketing Department in the enterprise; its standing within the overall framework of the organisational structure; who actually was working in these departments; and whether these enterprises had established a marketing strategy.
b) To what extent the enterprise was equipped with the Internet, and just how the Internet was exploited.

Research into these enterprises took place within differing two time-frames in order to be able to gain sufficient information about any changes, and developments in the approaches of these enterprises to Marketing. The first investigation into the behaviour of Czech enterprises in the Marketing domain took place in 1999; the second took place at the beginning of 2003.

The enterprises were supplied with questionnaires, which began with general questions as to the ownership structure of the enterprise, the management of the enterprise, the number of employees, and the branches in which the enterprise operates.

The second part of the questionnaire was devoted to the existence of a Marketing Department in the enterprise, what standing this eventual Marketing Department had within the overall framework of the organisational structure, what education the Marketing Department's employees had, and whether the enterprise had established a Marketing Strategy for itself.

The third part of the questionnaire was devoted to questions regarding the Internet, its introduction, and its exploitation within the enterprise. The 2003 research study was expanded by questions regarding the enterprise's web pages, whether they had their own, and whether these were used exclusively to promote the enterprise as a whole or whether they included a Product Ordering system.

Characteristics of Respondent Enterprises

The subject of this research study were enterprises in Czech proprietorship, since the enterprises so investigated were managed by Czech managements.

In order to be able to gain a more detailed and consistent elaboration of the outcomes of the research study, the individual problems and issues were investigated separately and based on the size of the enterprise such that this interpretation would be as complete and clear as possible. The enterprises were categorised according to their size – based on the number of employees.
Very Small Enterprises were designated as having 0-19 employees; Small Enterprises as 20-49 employees; Medium-large Enterprises as 50-249 employees; and Large-scale Enterprises as 250 and more employees.
Tab. 1 shows the categorization of the enterprises studied in 1999 and 2003 by size.

TABLE 1. ENTERPRISE CATEGORIZATION - 1999 AND 2003, BY SIZE.

		? of Enterprises.			
		1999		2003	
Enterprise Category:	? of Employees:	Absolute:	%	Absolute:	%
Very Small	0 - 19	168	52	113	41
Small	20 - 49	56	17	50	18
Medium-large	50 - 249	63	20	69	25
Large-scale	250 and more	37	11	44	16
	TOTAL:	324	100	276	100

Data Collection

In both investigations, we approached enterprises in the Czech Republic on a random basis. Our efforts were guided by the desire that the representative nature of these enterprises according to their size (employee numbers) reflects to a certain extent the actual distribution of such enterprises in the Czech Republic, in order to be able to gain a certain degree of certainty as to the ability of the outcomes discovered to faithfully reflect as a true picture as is possible.

The individual enterprises were approached on a personal basis (visits), since the questionnaires were completed on the spot by a research team member working in conjunction with the management of that enterprise.

In the course of acquiring this data, a number of students of the Faculty of Management and Economics at Tomas Bata University in Zlín assisted - most of these were drawn from the ranks of junior academic staff (Doctoral students and research workers).

Results

The subject of this research study was, above all, to gain a picture of the state and standing of Marketing in Czech enterprises, and whether their representatives were aware of the importance of Marketing for the future standing of that enterprise in its market. One of the fundamental assumptions was that, for an enterprise to be able to fully exploit and reap the benefits and advantages that a well-conducted marketing activity can bring, is the need for the employees of the Marketing Department to be independent and not to be dependent upon the Sales Department. At first glance, based on the outcomes of this research study, viz. Tab. 2., it can be stated that the majority of the enterprises consulted did not have their own independent Marketing Department. Whereas, in the course of the period between 1999 and 2003 a shift towards a greater number of Marketing Departments had occurred in these enterprises; i.e. from a total of 25% of the enterprises consulted in 1999 who indicated the existence of an independent Marketing Department, by 2003 this number had increased to 33%. What seems highly important however, is the view of the size of individual enterprises. As can be seen from Tab. 2., the majority of these enterprises do not have an independent Marketing Department; this number is however predominantly made up of Very Small Enterprises and Small Enterprises, where the independence of such a department must be considered within the context of the overall cost involved and also the benefits that might arise. Small Enterprises have to weigh in the balance whether such an institution would bring them, apart from increased costs, increased additional profits. It can be seen that for Small Enterprises, the period 1999 to 2003 does not show any marked shift, the given state regarding the question of an independent Marketing Department is constant.

The situation is different however, if we consider the Medium-large and especially, the Large-scale enterprises. An increased perception of the need for an independently operating Marketing Department is especially clear with the Large-scale enterprises, where from a level of 57% in 1999 it grew to 70% in 2003. It therefore flows that it is especially with these Large-scale enterprises which most clearly see a benefit in the marketing function, since it is possible to track a growth of 23% in this segment in the number of such departments. From this, it is possible to state that Large-scale enterprises in the Czech Republic see a clear benefit for themselves in the marketing function, and that ever more frequently, independent Marketing Departments are being created.

TABLE 2. THE EXISTENCE OF AN INDEPENDENT MARKETING DEPARTMENT
COMPARISION BETWEEN 1999 AND 2003.

	The Existence of an Independent Marketing Department.

	YES:		NO:		TOTAL:		YES:		NO:		TOTAL:	
	Abs.	%	Abs.	%	Abs.	%	Abs.	%	Abs.	%	Abs.	%
0 - 19	20	12	148	88	168	100	16	14	97	86	113	100
20 - 49	12	21	44	79	56	100	12	24	38	76	50	100
50 - 249	28	44	35	56	63	100	32	46	37	54	69	100
250 and more	21	57	16	43	37	100	31	70	13	30	44	100
Sub-Total:	81	25	243	75	324	100	91	33	185	67	276	100

The functionality of existing Marketing Departments can be judged from the perspective of their positioning within the overall framework of the organisational structure of the enterprise. Since in cases where the given department forms a part of the Sales Department, or even, is subordinated to the same, it proves that is very difficult to achieve the set of marketing aims and objectives, which are frequently markedly different to those of the Sales Department.

The outcomes of this research study shown in Tab. 3, demonstrate the actual functionality of an independent Marketing Department.2

Of 81 enterprises, which indicated in 1999 that they had an independent Marketing Department, 18% were directly subordinated to the enterprise's management, 61% were on the same level as the Sales Department, and in 21% of all cases, the Marketing Department was subordinated to the Sales Department. In 2003, of 91 enterprises which had an independent Marketing Department, in 37% of all cases this department was directly subordinated to the enterprise's management, 53% were on the same level as the Sales Department, and only 10% of all enterprises indicated that their Marketing Department was subordinated to their Sales Department. Overall, it can be stated that, for Czech enterprises, the Marketing Department is now most frequently ranked on the same level as the Sales Department.

However, in the course of 1999 to 2003, it has been shown that there has been a shift towards a perception of the right to direct itself and accept responsibility of Marketing Departments, and that there has been a significant decrease in the number of enterprises in which the Marketing Department is subordinated to the Sales Department and an increase in the number of enterprises where the Marketing Department is subordinated directly to the enterprise's management or else, is ranked on the same level as the Sales Department. If we consider this issue from the perspective of the categorisation of the enterprises by their size, this change can be noted for all size categories. It can be stated that, should an enterprise today decide to create an independent Marketing Department, they are now much more aware of the importance of its organisational ranking and the level of responsibility allocated to it than they were 4 years earlier.

Sub-Total:	15	18	49	61	17	21	81	100	34	37	48	53	9	10	91	100

The educational level of the enterprise's employees, levels of education attained so far, qualifications- these are all further assumptions for the correct functioning of an enterprise.

The educational levels, knowledge of the given problems and issues, and the overall view these give of a Marketing Department employee's effect on their work can influence an enterprise´ s (commercial) outcomes to a great extent. It can be assumed that a university-level educated employee working in a marketing function should be better prepared to meet the demands made of them by the enterprise's management.

In enterprises with an independent Marketing Department, we were interested in the level of education attained by the employees of that Marketing Department; since, as a consequence of the long-term period in which neither the market nor the market-driven environment simply did not exist in the Czech Republic, a feeling that the lack of importance of the Marketing function prevailed and predominated in a number of Czech enterprises for a long time afterwards. The Marketing Department was often created simply because it was "modern - and (any self-respecting) enterprise should have one" - but the staffing and job-content/role of such a department, were no longer considered to be important issues.

After studying Tab. 4., overall it can now be stated that the majority of Marketing Department employees are holders of a university degree, whereas Marketing Department employees with a basic education are now the exception rather than the rule.

If we look at the enterprises from a size perspective, we can see that especially for Small Enterprises, the shares of Secondary School-educated Marketing Department and University-educated employees are now equal, and that little has changed over the last 4 years. For Medium-sized and Large-scale Enterprises, the turn away from a Secondary School education is noticeable. With the latter, there is a markedly visible preponderance of University-educated Marketing Department employees. Over the course of the period being followed, the share of the number of University-educated employees in these posts has grown significantly, which is a very positive trend.

Sub-Total:	1	1	30	37	50	62	81	100	1	1	27	30	63	69	91	100

It is critically important that an enterprise establish the priorities for its marketing strategies in order to be able to achieve the set marketing aims and objectives. These strategies must be in a written form, in order to make it clear to all interested parties (employees), just what the final outcome of their endeavours is supposed to be. For this very reason, we asked each enterprise whether it had established a set of priorities for its marketing strategies and whether these priorities were in a written form. In cases where these priorities had been already established, we asked whether they had to do with traditional strategies that had been continuous for that enterprise for years, or whether they were newly thought-out, innovative due to new conditions facing that enterprise.

From both research studies viz. Tab. 5. it was clear that, for a majority of these enterprises, no clearly defined marketing strategies in a written form had been established. In the course of the four-year period in question though, we can see a certain growth in the numbers of enterprises in which such marketing strategies have been established and set out in a written form for all and sundry – but that this growth is only from the level of 23% of those questioned in 1999 to 37% in 2003, which would still seem to be insufficient (to us). Above all, it is in the Small Enterprises where such marketing strategies are not established – and which are most probably the consequence of the workload on the enterprise's proprietor(s), since these tend to assume all of the management roles, and in which the financial (payment) solvency question (i.e. debt-chasing/recovery) still means a not inconsiderable time burden on these small Czech enterprises.

For Medium-sized enterprise, no significant improvement was noted over the course of the two research studies. I n 1999, 57% of these enterprises had no marketing strategies; and by 2003, this was somewhat less – with 51%, but one cannot talk of a convincing change for the better!

For Large-scale Enterprise, there is a certain need to improve the quality of the performance of the marketing functions. However, it is still true to say that a majority of these enterprises still do not have clearly established marketing strategies. In 1999, 43% of such enterprises did not have their marketing strategies set out in a written form; by 2003, this had decreased to 32%. Despite the above, it is necessary to state that such a quantity of Large-scale Enterprises, still lacking clearly elaborated marketing strategies does not reflect well on the prevailingly (relatively) good situation for many of these Czech enterprises – and it would be worth considering their (chances of) success in the competitive conditions prevailing in the European and world marketplaces.

It is also interesting to look at the outcomes of this research study regarding the approach by these enterprises to marketing strategies in general. When comparing the two research studies over the course of the four years, it is possible to track a shift by these enterprises towards new marketing strategies, which react to the currently rapidly changing competitive environment (viz. Tab. 5.).

This change in marketing strategies from continuing (continuous or stable) traditional ones to strategies designed to react to changes in the marketing environment can be observed not only in small-scale enterprises, but also in the large-scale ones. It is only in the medium-large category that this trend cannot be observed. This can be associated to the fact that, as regards the low price-level of labour in the Czech Republic in comparison to other European countries, a great quantity of medium-large enterprises in the Czech Republic operate in the mechanical engineering and other production spheres and produce for foreign-based customers, whereas this is most often working for a daily wage. In truth, in connection to the ascension of the Czech Republic into the European Union in the middle of next year (2004), and where an increase in the price-level and a growth in the cost of labour is anticipated, this discovery does not bode well for, nor offer a positive perspective for these enterprises.

An important precondition for maintaining one's position in this newly forming economic environment is the introduction and implementation of, as well as the degree of intensity of the exploitation of, the Internet as one of the main informational, but also communications channels. The Internet is becoming an indivisible component of marketing practice as a source of information about the entrepreneurial environment, customers, competitors, and is used above all for the promotion of enterprises.

The research study outcomes summarised in Tab. 6 demonstrate the exceptionally high number of Czech enterprises that have implemented the Internet into their working practices. Above all, it is interesting to note the significant growth in the number of enterprises connecting to the Internet over the course of 1999 to 2003. This growth is clear for all size categories. In 1999, 62% of the Czech enterprises questioned had a connection to the Internet, whereas now this figure has risen to 94%. The Internet has become an indivisible and essential component of everyday working practices (in the Czech Republic). One can talk about an unusually rapid acceptance of this new information and communication channel for Czech enterprises.

All of the medium-sized and large-scale enterprises tracked in the course of this study had introduced the exploitation of the possibilities offered by the Internet to their enterprises practices by 2003. Only 6% of small-scale enterprises with up to 49 employees did not have it available as an everyday tool. This is a very optimistic finding, which shows the very high level of informational and communicational level of Czech enterprises.

Overall, it is possible to say that, within the framework of the enterprises being tracked, it was discovered that 94% of all these enterprises use the Internet. If we compare these outcomes to the research study conducted by the OECD in 2001 in selected countries [c.f. OECD. Business-to-Consumer e-commerce Statistics, 2002], Czech enterprises rank themselves - in comparison to the rest of the world, among the most-developed countries. The

OECD Report indicates that the best-placed countries in which the Internet is exploited in enterprises with more than 10 employees are Finland and Sweden, where more than 90% of these enterprises use the Internet. In Canada and Great Britain, the statistics are only more than 60%, and in Austria the figure is over 80%.

The Internet is one of the most rapidly expanding and developing information and advertising media. Customers are ever-more-frequently using the Internet to acquire information about products as well as about those enterprises that offer them. The research study on these Czech enterprises was expanded in 2003 (as against 1999) by questions regarding their own company web pages. This differentiated question was missing in the 1999 research study, but the passage of four years has led us to believe that this question is a highly appropriate one, in view of a contemporary evaluation of the marketing activities of Czech enterprises.

An indivisible component of the findings in 2003 was whether or not Czech enterprises are prepared to deal with e-customers, whether they provide them with information about their enterprise, and just how capable they are in exploiting the Internet to sell their products. Tab. 7 captures how many of the Czech enterprises tracked in this study had their own web pages used to promote the enterprise in 2003, and investigated how many of these provided not only information about the enterprise, but also if it was possible to order the goods being promoted immediately, directly from these web pages.

Based on investigations conducted in 2003, it is possible to state that the majority of Czech enterprises have their own webpage(s), i.e. this holds true for 83% of these enterprises. Among those who do not have their own web page(s) are mainly the Very Small Enterprises with up to 20 employees, i.e. 31%. This obviously has to do with enterprises that operate on a local basis, and rely on their word-of-mouth reputation and advertising in the local print and radio media for their promotional efforts.

With medium-sized enterprises, it was discovered that 93% of these had created their own web page(s), and for large-scale enterprises the figure was 95%. As became clear from the research study, Czech enterprises for the time being still use their web pages largely for promotional purposes to present their businesses, in order to provide information about their activities – but that, to a lesser extent, they also have implemented direct e-ordering systems. 83% of these enterprises indicated that they have their own presentation on their own web pages, while only 23% indicated that they had actualised an electronic ordering system on their web pages.

These enterprises therefore still insufficiently exploit the full possibilities represented by the Internet, which is - of course, the direct and immediate possibility of realising the sale of an item being promoted on their web page(s).
However, if we compare the results obtained from our study with those of the OECD statistics, (i.e. the OECD Business-to-Consumer e-commerce Statistics, 2002), we discover that our enterprises rank among the quickest in implementing these new sales technologies. The OECD statistics show that 30% of enterprises with more than 10 employees in Holland, but only 7 % of those in Canada or 10 % in Austria are capable of taking orders over the Internet.

If we consider the results for Japanese enterprises in 2001 made public in the OECD statistics (i.e. OECD. The Latest Official Statistics on Electronic Commerce: A Focus on Consumers´ Internet Transactions. 2002), the number of Japanese enterprise capable of accepting order via the intermediary of the Internet is not quite 30 %.
It can therefore be said, that for the given comparison is very optimistic for Czech enterprises.

TABLE 7. PRESENTATION OF CZECH ENTERPRISE ON THEIR OWN WEB PAGES.

Conclusion

The aim of this research study over the period of 1999 to 2003 was to provide an overview of the marketing activities in Czech enterprises. With a view to the past, in which a planned economy existed in the Czech Republic up until the end of 1989, and where Marketing, Product Promotion, and Consumer Demand, were neglected and in the given situation unneeded concepts, it has proved interesting to track the development of marketing activities in Czech enterprises.

Basing on both of the research studies, it is possible to provide answers and to respond to our hypotheses as set out at the beginning of this paper, as follows:

H1: Czech enterprises underestimate (the value of) Marketing activities.

This hypothesis has been confirmed, Czech enterprises continue to insufficiently assign a value to the benefits and advantages flowing from well-conceived and conducted marketing activities. The majority of these enterprises still lack an independently functioning Marketing Department. Where an independently functioning Marketing Department exists, this department is not directly subordinated to the management of the enterprise. These departments are often still predominantly staffed with employees with a Secondary School education level. A not particularly encouraging phenomenon is still not to be found in the domain of elaborating marketing strategies, where marketing strategies in a majority of the enterprises followed are clearly established nor are they in a written form.

H2: In the course of 1999 to 2003, a shift towards strengthening the significance of these marketing strategies in Czech enterprises occurred.

From the research conducted by us, it follows that a certain positive shift in the perception of the necessity for marketing activities in these enterprises has taken place in the course of 1999 to 2003. This hypothesis has therefore been partially confirmed. However, the question still remains, just how the given positive evolution will be sufficient to enable Czech enterprises in the future to stand up to the competition in a unified European or the world's marketplaces. It can be said that the given evolution is sufficiently apparent that it is possible to anticipate or presuppose the future continuation in this tendency in the direction of an increased significance being afforded to marketing practices in Czech enterprises.

H3: The introduction of the Internet into Czech enterprises has grown over the course of the period: 1999 to 2003.

Based on this research study, it is possible to accept unambiguously the given hypothesis. In the course of these two research studies, conducted in 1999 and 2003, a clearly apparent growth in the number of enterprises which are connected to the Internet and which exploit it in an everyday context in their daily activities. The Internet has thus become an integral and indivisible component of everyday working practices. All of the medium-sized and large-scale enterprises which took part in the research study in 2003 had implemented and integrated the Internet into their enterprise.

In a market-oriented, entrepreneurial environment, in which private ownership is given greater preference than state-ownership, and where neither production nor consumer demand are planned, Marketing-related activities have demonstrated their worth as highly useful, or even essential to an enterprise, simply in order for it to be able to maintain, or even improve its position on the market in comparison to its competitors.

Based on these two research studies conducted into Czech enterprises in the years between 1999 and 2003, it is possible to state that Czech enterprises still lack a sufficient awareness of the importance of the marketing function and those marketing activities associated with this function. A significant number of the enterprises underestimate the importance of Marketing, and often erroneously attribute a predominantly commercial role to it.

The Marketing function is still – traditionally undervalued. In a majority of the enterprises there is still no independent Marketing Department, and the employees of these Marketing Department are rarely directly subordinated to the Top Management of a Czech enterprise, since in the majority of cases they are still a part of the Sales Department. The educational level of employees in the Marketing Department is often at a Secondary School level. The majority of these enterprises still have not elaborated marketing strategies, nor do they have them set out in written form such that the corresponding employees would be able to identify themselves with these aims and objectives.

Despite the above, it is possible to track a certain positive shift over the course of the period covered by 1999 to 2003. An increase and improvement in the level of Marketing in these enterprises has occurred, and a tendency towards a shift in the perception of the importance of such departments (i.e. Marketing Department s) can be noted within the overall organisational structure – where, ever-more frequently, and this holds true predominantly for the large-scale enterprises, these are directly subordinated to the enterprise's Top Management. As regards the educational structures of Marketing Department employees, an increase in the share of university-educated employees has been noted in these Marketing Departments. From the perspective of the existence (or otherwise) of marketing strategies – it can be stated that it is possible to observe a positive growth trend in the number of enterprises that have seen the necessity for establishing a marketing strategy for themselves, and growth has also been noted in the number of new, innovative and well-thought out marketing strategies, reflecting the changes in the surrounding marketing environment.

As has been shown and on the basis of this research study, it fair to anticipate further improvements in the approach by Czech enterprises to the problems and issues associated with the Marketing function.

A pleasant surprise was the discovery that Czech enterprises are well placed as regards the domain of the existence and implementation and exploitation of the opportunities afforded by the Internet. The great majority of all enterprises tracked are already connected to the Internet, and conduct their own promotion by means of their own web pages.

Over the course of the years being tracked, i.e. from 1999 to 2003, a significant growth in the number of enterprises making use of the Internet in their everyday activities was noted. There was a significant increase in the number of Internet connections owned by Czech enterprises, while at the current time, all of the medium-sized and large-scale enterprises tracked, made use of the opportunities afforded by these communication and information-provision channels in their business activities.

The majority of the enterprises contacted in this study do not make use of electronic transaction systems in their business dealings. Overall, it can however be said, that Czech enterprises are on a comparable level with other economically-developed states in the world as regards the opportunities afforded by electronic commerce.

Czech enterprises continue to underestimate and value Marketing practices. The Czech Republic will become a member state of the European Union in mid-2004, and, as long as Czech enterprises want to maintain their share of the market and eventually, even to address customers hailing from all over the future unified European market, they should devote a lot more time and money to improving the quality of their Marketing activities, in order to better understand and know their potential future target customers.

Czech enterprises will have to place a greater emphasis on taking into account the European and even world dimensions given the enormous number of competitors, as well as to better know and understand the permeability of the market, the behaviour of customers and competitors and to factor all of these into their entrepreneurial strategies.

The Rabbit and the Wallaby: Why the Quality of North American OEM – Supplier Relationships in the Automotive Industry Lags behind those of the Japanese Transplants

Bernard M. Wolf
David R. Adamse
York University, Canada

Abstract

The North American automotive supplier industry is at a critical point in its evolutionary process as a do-or-die scenario presents itself, particularly with respect to smaller suppliers. For these manufacturers, the overall picture is bleak; prices remain under pressure due to excess global supply that is likely to worsen as production in China ramps up. With domestic automakers forced to cut prices in order to remain competitive in this increasingly price-sensitive market, North American suppliers must absorb much of the resulting profit squeeze. Hence, the failure or consolidation of a large number of North American suppliers is likely in the coming decade.

This paper explores the significance of the North American OEM-supplier relationship structure to this survival question. Despite efforts to eliminate the gap between the US OEMs and the Japanese transplants in terms of the quality of supplier relationship management, a significant deficiency remains. The pervading nature of this gap is explained through relating the evolution of the American and Japanese systems to that of a biological system.

The Automotive Industry as a Biological System

It will be shown that on some levels, the rapid integration of the Japanese OEM – supplier structural framework into North America mirrors the introduction of the feral European Rabbit oryctolagus cuniculus into the Australian continent by 19th century European settlers. An evolutionary biological framework when applied to the relationship structures present both in the North American traditional and the Japanese introduced systems, may aid our understanding as to why each system remains largely distinct. Considering the widely accepted notion that the Japanese system holds several key competitive advantages, the question turns to why the Japanese system has yet to be implemented in its totality by any one of the traditional Big Three automakers?

Through ascribing an organic nature to the industry, we may be better equipped to answer this question. The most generally accepted measurement of success in the natural world is reproduction and propagation of the species. In industry, the greatest measure of success might be somewhat more difficult to define, but if we take maximization of firm value as a starting point, we can move ahead with the analogy. Resources may be defined as those building blocks upon which the attainment of an end goal is founded. In nature, resources come down at the most basic level to energy, practically all of which was originally derived from the sun. In business, information is the most basic resource, the processing, transformation and translation of which creates value. The flow and associated riskiness of these information resources in the business world parallel the flow of energy resources in the natural world, providing an alternative means of competitive assessment to the strategic planning approach.

Relationship Efficiency

In nature, relationships may be crucial determinants of the ability not only to survive, but also to thrive, as efficiencies may be gained or lost depending on the methods of resource accumulation and processing employed. This is not only true within species (cooperation/competition), but also between different species as a form of symbiosis (mutualism/parasitism). Sharks with remoras, flowers with bees, and trees with squirrels, all involve a symbiotic pattern that results in mutual energy (resource) conservation, thus facilitating the diversion of more resources toward the furthering of the propagation end-goal. Relating symbiotic norms in the natural world to those of industry, we see that the same concepts may also apply. The Japanese have been lauded for their cooperative relationships with a different 'species,' namely their suppliers. What determines and affects symbiosis in nature may provide insight as to the nature of such relationships in the automotive sector.

Evolutionary Competition

With the Japanese transplant phenomenon introducing a fundamentally different type of organism into North America, the domestic manufacturers have been unable to effectively perform a most crucial function for survival, adaptation, at a fast enough pace. It will be demonstrated that even as the US manufacturers have implemented internal measures in an effort to match the dominant "species" (Toyota) in manufacturing, making the changes necessary for an adoption of the entire system, particularly supplier relations, has proven to be far more difficult. This can be tied to the complexity involved in replicating both a new external relational system, while concurrently adjusting the internal processes required to accommodate the information flows inherent to the new system. Even more critically, in all symbioses there are resource gains and losses, and it is often not immediately determinable where those gains and losses are located within the system. If we accept that in many cases the complexity of the system that is to be duplicated has emerged due to an evolutionary process, capturing and accounting for all the subtleties of these resource flows, external and internalized, in the laboratory-like setting of strategic planning is understandably difficult.

The current environment; pricing pressures and the incentive war

To understand any self-contained system or biotope in nature, it is first necessary to understand the state of the environment in which that system exists. It must be kept in mind however, as will be discussed further in later sections, an environment is constantly not only acting as a constraint to the evolutionary process and affecting it, but is also being affected by that which is contained within [Sapp, 1994, 197]. This is a crucial point as it helps us to realize the folly in assuming a simple or direct causal relationship between an environment and its inhabitants, when in all likelihood a far less linear and infinitely more complex one exists.

The overarching concern for the automotive industry as it stands today, at least from the sellers' perspective, is the glut of cars available for sale in the traditional markets. OEM global productive capacity, when defined as the designed-for output of all operable factories and support systems in the automotive sector, is currently estimated to be in excess of 90 million units, both cars and light trucks for 2003 [Truett and Crain, June 9, 2003, 40]. This figure is expected to grow significantly in 2004 and beyond as OEMs in China begin to ramp up domestic production. According to a recent KPMG study, China will produce 2.7 million vehicles in 2003, 900,000 more than domestic sales forecast. The bulk of this production stems from US, Japanese and European manufacturers partnering with Chinese producers in attempts to gain a foothold in what is anticipated to become a major automobile market in the coming decades. In the short-run however, excess domestic production is expected to climb to 2.3 million in only two years time, pointing to a net export of vehicles out of China and into more saturated markets [Brent, September 17, 2003, FP1]. Meanwhile, global sales totaled only 59,587,416 units in 2002, representing an approximate 66% average utilization rate of assembly assets in place across the major car manufacturers [Automotive News, 2003 Market Data Book]. In North America alone, excess capacity is expected to top three million in 2003 [Wilson, January 20, 2003, 14]. With stagnating demand growth in the traditional markets, this excess capacity can be dealt with in one of two ways. The automakers may reduce productive output to meet demand at previous price levels through reducing their asset utilization further, or reduce prices in order to maintain or increase sales.

This choice between two basic supply and demand alternatives has driven much of the current market's strategic focus over the past few years. With an abundance of competing automakers vying for customers through largely undifferentiated offerings, the price elasticity of demand is high for most mass-market model segments, and increasingly so even for niche market vehicles. The result of this price sensitivity and the selection by OEMs of the latter alternative of boosting volume at the expense of margins is that price incentives have driven a significant portion of sales growth over the recent down cycle. The mispricing of a model relative to current demand during such intense price competition can have disastrous consequences, and was likely the cause for the failing of Ford's Thunderbird revival. Intended to sell in excess of 25,000 vehicles per year but selling only 19,085 in 2002, the $35,495 sticker price appears to have been a significant factor in its lackluster sales and subsequent cancellation after the 2005 model year [Wilson, March 31, 2003]. Competing against other new models such as Nissan's 350Z, priced thousands less, Ford was unable to convince customers to fork out the extra funds necessary without turning once more to incentives on what was to be a "flag ship" product that initially sold at a premium to sticker.

General Motors has led the aptly coined "incentive war" through leveraging its current status as low cost producer in the US [Guilford, August 18, 2003, 1]. For General Motors, this may be less a war than a trouncing, as Chrysler and Ford have had their strategic hands forced. GM as the lowest cost producer of the traditional big three, largely due to its effective implementation of Japanese manufacturing principles, may be able to price Chrysler and Ford right out of profitability. "GM's going to be the only one of the Big Three who makes any decent money," with Chrysler and Ford now forced to compete on GM's pricing terms due to their recognition that because of manufacturing and union cost structures present, greater losses may be incurred through the idling of productive resources and losing market share than through accepting losses at volume [Content, December 29, 2002]. Unfortunately for GM, it is still not performing up to par with Toyota, Honda and Nissan, and with legacy costs from pension and health care liabilities looming large on the horizon, it may not be performing up to par for its own long-term viability.

Supplier Impact

Profit squeeze

As competition intensifies, suppliers are increasingly being called upon by their OEM customers to reduce prices on components and module systems. On average, approximately 50% of vehicle costs are outsourced to suppliers [Snyder, April 7, 2003, 22 and Fitzgerald August 1, 2003, 46], making them a prime target for North American OEMs that are otherwise constrained in their cost cutting options by UAW agreements [Kurylko, August 11, 2003, 1]. What's more, OEM – supplier contracts stipulate annual price reductions. In January 2001, Chrysler requested 5% price reductions from all its suppliers. More recently the struggling OEM has looked for a further 10% reduction across its supplier base, asking many suppliers to match prices in low-wage nations such as China [Sherefkin, June 16, 2003, 1].

Large tier one suppliers such as Magna International, component parts and module manufacturers that sell the bulk of their product directly to the OEMs, are in more enviable positions than most. Those that provide complete module solutions are better situated to negotiate and even refuse to commit to many cost cutting demands, particularly when diversified across a wide customer base. Magna has substantial negotiating power furthered by its growing stake in terms of content per vehicle in North America, contributing on average $441 in 2002 to the OEM cost of production for a new vehicle, and expecting that to grow to $520 for 2003 [Brent, August 7, 2003, FP6].

Tier one suppliers often look to tier two suppliers to carry a large part of the cost cutting burden that is dictated at the OEM level. These first tier suppliers are searching for ways to satisfy cost cutting imposed by their Big Three customers, and are finding that a consolidation of their own tier two and tier three supplier base is a necessary first step. Both Visteon and Delphi have indicated this year that they are looking to dramatically reduce their supplier base [Zachary, April 1, 2003, 4]. It is therefore the small and medium sized suppliers that will continue to suffer most from price competition and overcapacity. In spite of these poor conditions there are suppliers, both large tier 1's and specialized niche players, who have succeeded in the past decade. A study of 43 publicly traded North American suppliers found that while the median supplier has seen their profitability fall by 50 percent, top suppliers have increased their margins by 75 percent over the period 1992 to 2001 [Autoparts Report, July 3, 2002], reflecting a polarization in profitability and competitiveness. Some predict it is likely that half of the current tier 1 and tier 2 suppliers will be out of business in 10 years, and that 47 % of North American suppliers are currently in "fiscal danger" compared to 36% of Asian suppliers [Truett and Crain, June 9, 2003, 40]. Whether these figures include supplier consolidation is not clear, but the ominous tone of such a study, representative of many similar ones that call for massive failures within the industry, should be a cause for alarm in itself, as it is likely symptomatic of the North American domestic manufacturing industry. In fact, one of the greatest concerns to the Japanese may be the impact of US OEM's price pressure on shared suppliers. According to a supplier executive, Toyota had called in AlixPartners a financial troubleshooting firm, to look into some suppliers that it shares with Ford and GM to ensure that they were not in financial trouble [Sherefkin and Wilson, February 10, 2003, 6].

The Japanese: thriving in a harsh environment

Of particular interest to our analysis is how the Japanese OEMs have managed to cope with a weakened North American market demand. Thus far in 2003, the Japanese producers have employed average incentives of $1,062 per vehicle, the Korean manufacturers $1,371 and the Europeans $1,945, all while continuing to capture North American market share away from the Big Three whose own incentives average $3,389 per unit. These incentives have cost US automakers dearly in terms of profitability per vehicle vis-à-vis their Japanese counterparts, with Nissan and Toyota earning $2,069 and $1,214 respectively while GM earns $701 and Chrysler a paltry $226 on each vehicle sold [Priddle and Zoia, August 1, 2003, 8].

The future environment does not appear to be any rosier in terms of competitive pressures and overcapacity issues in either North America or globally. Renault is moving ahead with planned factory expansions that will see an additional capacity of 600,000 vehicles per annum in Europe [Johnson, November 18, 2002, 20]. China has been cited as another problem area as the potential exists for substantial export capacity into a global arena that is already flooded. According to a survey conducted by AlixPartners, global excess capacity may top 42 million by 2010 [Truett and Crain, June 9, 2003, 40]. The potential saving grace would be an expansion of the developing markets of China, India, Eastern Europe and South America. Goldman Sachs has recently come out with economic projections for Brazil, Russia, India and China (BRIC) predicting that by 2040, all of the 'BRIC' countries individually will overtake Germany in GDP, with China's GDP exceeding that of the United States by 2045 [Thorpe, October 3, 2003, IN1-FP4]. Such a scenario would certainly improve automotive sales growth prospects, as consumption would increase commensurate with income. However, the question then becomes how many North American suppliers, and indeed some of the OEMs themselves will still be viable companies in even the shorter-term of 10 to 20 years.

Relationship Structures

Given this hyper competitive environment, what is the prevailing sentiment between suppliers and their OEM customers? A survey by Planning Perspectives released earlier this year highlighted the growing divide in terms of satisfaction, between the North American suppliers and their OEM counterparts. The Japanese OEMs once more received praise while US OEMs were blasted for their pricing pressures and short-term business loyalties. In the survey, approximately one third of respondents said that their companies no longer provide Big Three OEMs their best technologies, and when asked if they could foresee a time when their company no longer did business with the Big Three, 17.6% responded in the affirmative [Murphy, August 1, 2003, 8]. Our own supplier survey, which is ongoing and not yet of sufficient scope to warrant quantitative inclusion, shows preliminary indications that supports this conclusion, with suppliers indicating that there are significant elements of trust lacking in their relationships with US based OEMs. One owner of a small Canadian supplier with annual sales in the $50m+ range completed the general portion of our survey but indicated that he was unable to complete a series of customer-specific questions. He did however convey the following thoughts:

> "I have not filled out the Customer Option section. My reason for not doing so is that our top customers in the OE area are Japanese and they believe in building relationships with their suppliers on the basis of mutual trust and respect. It is unfortunate, but the same cannot be said of the North American manufacturers."

The above statement appears to be indicative of the current state of affairs in the relations between the majority of suppliers, and the American OEMs. The following is a brief overview of the two distinct systems of supplier relationship structures, Japanese and American. Between the two systems there are a number of substantive issues that underlie the overall relationship linkages and norms in place.

Adversarial & Cooperative Systems Compared

US OEM-supplier relationships have often been described us being set in an "us versus them" framework. The fundamental principles of free market price competition would likely be cited as the philosophical basis of the system as a whole, with a liquid and rather homogenous pool of suppliers as viewed from the perspective of big three purchasing managers, making substitution from one contract to another the norm rather than the exception.

The Japanese on the other hand are touted as being far more cooperative and accommodating to supplier needs. Following below is a summary exploration of these tendencies.

Price pressure versus assistance

The Japanese and American OEMs differ in the means by which they attain their respective cost targets. Both apply some level of pressure to their suppliers in order to meet these targets, and both groups expect high levels of conformity to projected costs. The American OEMs are viewed by suppliers as being more rigid, demanding and less helpful in meeting targets, with the final price being the end determinant of the relationship's quality. "The Big 3 are quick to beat down prices with methods such as electronic auctions or rebidding work to a competitor." The Japanese on the other hand, are portrayed by most suppliers as being more flexible in situations where price targets are not met, and will act to assist suppliers in meeting goals. "The Japanese are equally tough on prices but are committed to maintaining supplier continuity" and when price targets are not met "both sides look for savings" [Sherefkin and Wilson, February 10, 2003, 6].

Quality demands versus solutions

Similar in concept to the price pressure versus cost assistance framework, is the quality demands versus solutions framework. The Japanese appear to be far more willing to accept the short-term investment of sending engineers in to assist a supplier in meeting quality goals and targets, looking for a solution with the supplier rather than merely imposing demands. The Big Three continue to press with price cut and productivity demands, often in a confrontational manner, increasing the possibility that quality will be impacted, particularly as less competitive suppliers try to hang on to survival through cutting corners in materials and component quality [Henke, March 2002].

Competitive bidding versus long-term relationships

With the free market process being the underpinning of the US OEM supplier relationship philosophy, it is therefore not surprising that the bidding process is similarly free market based. The bidding process looks to determine the absolute low cost provider of a solution, given the constraints of quality and function as determined by the manufacturer. Unfortunately, a potential error in such apparently quantitative (and misleadingly "hard") methods of best-provider determination is that the entire cost is likely not reflected. The result is a market failure due to lack of inclusion of all indirect costs, resulting in a decision that is based on too narrow a scope of factors. This may explain why the Japanese may value an incumbent bidder more highly due to what may have traditionally been deemed as subjective criteria by US managers.

These subjective considerations however, particularly regarding trust, may have merit as significant sources of cost advantage and savings if assessed in a holistic context [Dyer and Chu, Summer 2000, 259]. The result is that the US OEMs may undervalue incumbents or those companies that offer "soft" advantages, too eagerly pursuing a short-term cost advantage that even when assessed in present value terms and weightings, is not sufficient to account for the lost "soft" values attributable to lower transaction costs, increased investment expenditures, and greater learning that long term relationships may foster. Honda's facilitation of strong long-term relationships and supplier assistance is not a selfless act. Robert Schuld, senior staff administrator for supplier support, explains that Honda's assistance is intended to "strengthen supplier business operations to a level of competitiveness consistent with their needs as well as our own" [Zachary, July 1, 2003, 7]. It may be gathered then from Honda's historically strong margins and profitability, along with consistently high rankings in supplier relations surveys, that such assistance has been mutually advantageous.

Results, Reactions & Implications

The result of these very different approaches toward supplier management by the US and Japanese OEMs is that there are several key areas in which suppliers have reacted or are beginning to react. This reaction may be due to the recognition of the dire consequences of failing to change, or may be to exploit the Japanese' continued market share gains in North America.

Diversification of customer base

The first step that many suppliers are taking as a reaction to both the reality of declining US OEM market share and the continued adversarial posturing of the Big Three is to attempt to diversify their customer base. Most small and medium size suppliers in North America are over weighted in sales to the Big Three and under-weighted in transplant manufacturers. An argument can be made that in order to be effectively diversified, a supplier should have customers sales that reflect market share. With US OEM North American market share falling below 60% for the first time in history this year, it is an indicator that suppliers should not have more than 60% of their domestic business reliant on Big Three customers [Brent, October 1, 2003, FP1-FP9]. The urgency of diversification is compounded by projections that have foreign-based manufacturers continuing to capture market share away from the Big Three in what is now a slow growth market. For suppliers to grow themselves then, they must either look to capturing a percentage of the growing transplant market, or will otherwise need to pursue their growth opportunities through acquiring market share directly from competitors [Fitzgerald, April 2002, 34-36]. As industry consultant Kim Korth put it at a management briefing seminar to supplier executives, "you have the fiduciary responsibility to your organization to aggressively try to diversify your customer base" [Kisiel, August 11, 2003, 21].

Unfortunately, the advice of diversifying one's customer base is not easy to heed in practice, as the majority of small to medium suppliers (85%) currently have domestic (US OEM) customer concentration of 90% or greater [Fitzgerald, April 2002, 34-36]. Due to the long-term nature of Japanese OEM – supplier relationships, it is not easy for a small supplier to break into a Japanese supplier circle, particularly after having been weakened through price pressures from domestic OEMs. For those companies that are specialized enough, however, or offer a significant advantage that may be marketed to the Japanese OEMs, this route is very appealing. It not only diversifies away much of the price and transaction risk associated with being concentrated in domestic OEMs, but it also allows suppliers to grow sales by targeting companies that are experiencing growth themselves, thereby obtaining a piece of a growing rather than shrinking pie.

It is also interesting to note that from a resource cost point of view, changing over a customer base, particularly when that customer accounts for a substantial portion of revenue, is highly risky and therefore holds substantial costs. That so many top suppliers are attempting the switch indicates that there must be some sort of benefit beyond the initial dollars and cents that are dictated by a solely quantitative approach. Perhaps it is the cost of not making the switch and being over concentrated that is helping push this trend, as reliance on a single customer in decline is the nightmare scenario. Visteon knows this scenario all to well as it attempts to reduce its dependence on Ford, a company on which 81% of Visteon's business was based in 2002, and a company that is losing market share in North America to the Japanese [Phelan, November 6, 2002]. Magna on the other hand "is getting more business from offshore-based auto makers operating in North America" as they recognize the growth of these foreign auto makers' market share at the expense of the Big Three [Alphen, August 7, 2003, D01].

Reduction of capital investment

Unfortunately, the route that most suppliers have taken and are likely to take into the future is the path of least resistance; reducing capital investment. When OEMs continue to place price pressures on small suppliers without providing adequate assistance or assurances of continued business, innovation is a secondary concern to survival. When faced with two "hard" constraints, one being price, the other being a defined level of quality, in combination with the necessity of securing a contract for short-term liquidity, most suppliers are opting to reduce long-term investments. As this quick fix becomes a commonly used technique to bolster anemic margins across the industry, a weakening of innovative capacity would be the logical conclusion. This will negatively affect not only suppliers, but in turn, also the OEM manufacturers that rely on innovative supplier offerings to remain competitive against foreign competition. Foreign manufacturers such as Toyota and Honda on the other hand "understand that tomorrow's differentiation and component quality are their tickets to maintaining strong margins and bolstering their marketplace image," and therefore make it a priority to ensure that their suppliers are in a position to make the capital investments necessary to innovate [Robinet, September 1, 2002, 40]. This, compared with supplier sentiment towards North American OEMs that blames reduced capital expenditures on the fact that "the carmakers are unwilling to share in suppliers' significant research and development costs" according to John Plant, President and CEO of TRW Automotive [Content, August 7, 2003].

Withholding technologies and refusing low margin contracts

These scenarios of reduced capital investment and heightened price pressures are indeed prevailing realities for many small and medium sized suppliers, who in order to survive, must accept the status quo alternatives however painful they may be financially. If they are unable to find new customers in the Japanese or European "new domestics," options are limited to making do as suppliers to The Big Three or falling into bankruptcy through the loss of contracts. For those companies that are more financially stable, however, there are a couple of additional options with which they can attempt to fight back. The first (as previously mentioned) is the withholding of top technological innovations from North American customers. That is, as price pressures become unrealistic, or adequate assistance and commitment is not forthcoming, some suppliers may choose not to offer their top technologies to Big Three customers, reserving those technologies for their Japanese clients instead. This has unfortunately become a trend that appears to be catching on, with suppliers indicating in recent surveys their greater willingness to share innovation with the Japanese transplants over the Big Three [Murphy, July 1, 2003, 7]. Lack of trust is considered to be a key determinant to this issue, as is the greater business risk in engaging in R&D expenditures with a Big Three client that may or may not continue business over a long enough time frame for the supplier to amortize the often considerable investments required for their most innovative products.

A most extreme example of withholding technology is the outright refusal to bid on contract work with American OEMs due to their supplier treatment and pricing demands, even as an incumbent bidder. The justification being that the expected returns of dealing with a North American OEM is not high enough to support investment, citing basic net present value financial principles. An example of such a situation recently occurred where Tower Automotive Inc., a supplier of frames, withdrew from negotiations with Ford for the Ford Explorer despite their strong position as an incumbent supplier of the current model. CEO Dug Campbell cited the fact that "expected returns at targeted pricing levels did not meet our requirements" as the source of the move, and indicated on top of this that had Tower developed any great ideas for the Explorer frame, it would not be sharing those ideas with Ford. Tony Brown, Ford VP global purchasing "admits his company is a long way from its goal of becoming the 'customer of choice' for its suppliers" [Murphy, July 1, 2003, 7]. Unfortunately for the Big Three, it is not only a matter of being customer of choice, it is also a question for some suppliers as to whether the Big Three should remain customers at all.

One of the main considerations and indeed restraints on the ability for suppliers to withhold technology or refuse contracts on the basis of poor margins is the need to amortize high levels of capital investment across a large income pool. If at the margin the investment does not appear all that attractive, the decision must then be driven as to the total average effect against ongoing capital expenditures. If the additional profit stream helps bring productive resources closer to their capacity, then the average cost of production will be reduced as assets are depreciated across a higher income figure. There are limits to such an approach, as the marginal output produced must remain profitable on a per unit basis to justify this absorption of fixed costs, but so long as this remains true, the auto parts suppliers may benefit from even low margin contracts.

Increasing market power

Another possibility, and one that has indeed become a reality of late in the automotive supply sector, is to improve margins through increasing market power. The focus of this in relation to the current situation between North American suppliers and their OEMs, is the strengthening of a company's position in negotiation. Through consolidating into larger and larger companies that contribute to a greater proportion of an automobile's value, the ability of the supplier to extract a fair value for their product is improved substantially. Michael Burwell of PricewaterhouseCoopers' estimates that the number of tier 1 suppliers will fall from about 600 in 2002 to less than 35 in 2010, while tier 2 suppliers fall in number from about 9,500 in 2002 to 800 in 2010, largely due to sector consolidation [Harrison, June 2002, 18-19]. With the strengthening of tier 1 suppliers' ability to control the supply chain and reduction of unit costs through increased scale, the ability of automakers to use price competition against such a supplier is reduced.

Application of an Organic Framework of Analysis

Having explained some of the environmental and situational constraints present within the automotive sector and how they relate to the competitiveness of North American suppliers, we may return to the question of why this gap in the quality of relationship management persists. The significant advantages that the Japanese displayed in manufacturing prowess in the 1980s through both their Japanese and transplant operations are well known today.

The traditional Big Three realizing this have taken great strides in bringing manufacturing efficiency and product quality up to levels that now approach those of the Japanese. So why then are effective supplier relations apparently so elusive? The key may come down to the evolutionary process responsible for the Japanese versus the American supplier system, and the entirely different symbiotic structures that they have spawned.

The Rabbit and the Wallaby: an analogy of evolutionary system convergence

An analogy that may shed some light on the difficulty of playing evolutionary "catch up" is that of the introduction of the feral rabbit oryctolagus cuniculus into Australia in 1858. Prior to 1858, the herbivore population of Australia consisted primarily of the marsupial class (kangaroos, wallabies, wombats) and a variety of lower organisms. The introduction of oryctolagus cuniculus into wild Australia placed a herbivore with different grazing habits and reproductive capacity into an environment with few natural predators or limitations on resource accumulation, and therefore few constraints on its population growth. The introduction had disastrous consequences for indigenous species. Most obvious on the surface and immediately recognizable, was the direct competition that the rabbit posed for resources such as food. Somewhat less direct consequences included the destruction of habitat through excessive grazing on certain plant species that resulted in the erosion of land areas, and therefore the subsequent destruction of other plant species, many of which were essential for the survival of other herbivore species.

Indirect consequences however, are what highlight the complex nature of relationship structures, and their ability to have enormous impacts on the totality of a biological or even industrial system. The introduction of the rabbit, which coincided generally with the introduction of cat and dog populations, produced a new symbiotic structure for these introduced animals as well as the indigenous species. Although mutually beneficial effects did not take place on the individual relationship level between these species, which was one of phagotrophic predation, mutual benefit did take place in their interaction as part of the newly altered system. The dogs and cats controlled and maintained a healthy rabbit population through the culling of the sick, while growing their own population through utilizing these rabbits as convenient sources of food. When disease did grip the rabbit population, these carnivore populations, otherwise sustained by the rabbits, would then turn to indigenous species. The sum result is that feral rabbits now cover 4.5 million square kilometers of Australia, as do their imported predators, while indigenous species have fared far worse, with many such as the wallaby, on the endangered list if not wiped out entirely [Data from Australia's Parks and National Wildlife Services].

What is apparent from the introduction of Japanese manufacturing transplants into North America is that while a similar version of symbiotic restructuring took place involving resource gainers, losers and the alteration of the environment, the resulting consequences were distinctly positive. Prior to the entrance of Japanese transplants, which themselves were stimulated toward entry by the Voluntary Export Restraints of the early 1980s, there was a general complacency amongst the Big Three. Acting in relational manner that may best be described as parasitic in nature, the Big Three formed an oligopoly that extracted resource gains through reduced investment, innovation and quality, with the resource losers being consumers. Post transplant introduction, the new symbiotic structure introduced was largely mutualistic in form, with resource gainers being end customers as well as those suppliers that were able to internalize themselves as part of the new system as suppliers to the Japanese. Although the end result was that of a fundamental alteration of both the players and environment, the economic benefits to North America most certainly outweighed the costs.

Impact of new industry paradigm on domestic OEM-supplier relations

More specifically, how does this tie into OEM-supplier relationships in North America? It introduces two primary themes. First, the notion that evolutionary biology displays cases where if two distinct systems are isolated, and then introduced, the natural process of selection is largely bypassed, and this new competition will result in an unbalanced scenario where coincidental previous adaptations on the part of the introduced species can wreak havoc on the indigenous species. Second, evolutionary traits that encompass a unique system of relations within an environment may not be passive in their effect on the environment, but are in fact likely to have a significant impact. The rabbits introduced to Australia were not only direct competitors for food within the environment, but also altered the environment in such a way that was detrimental to the survival of indigenous species. Further, their predator-prey relationship with dogs and cats created a situation that adversely affected the previous balance within the system. The intricacies and unexpected impacts of such small changes to a large and diverse biotope as that of Australia, underline the difficulty in accurately assessing relationship structures of very complex systems that experience the introduction of complex elements, as has been the case in the automotive industry in North America over the past two decades.

The Japanese transplant operations when they took root in North America not only setup their own structures, but also had a significant impact on existing relationship structures within the USA. Their unique symbiotic nature vis-à-vis suppliers not only benefits them directly through more efficient and effective total production quality, but also negatively impacts on US OEMs and their ability to compete for supplier business. At the same time, the OEM-consumer dynamic is altered as consumers have the additional choice of Japanese-made products that were soon to offer superior quality at comparable price levels. As suppliers gain the option of dealing with the Japanese, the US OEMs, having previously held a monopoly on supplier relationship ideals, must now contend with an introduced ethos that better equips suppliers to effectively cope, if not thrive, in the current environment. It is no great wonder then that the US manufacturers have had such a difficult time adapting to such concurrent changes. With the loss of oligopoly gains from passing costs down to end consumers, the burden of making up the efficiency gap with the Japanese and maintaining profits was placed squarely on the backs of suppliers unable or unwilling to make the switch to supplying Japanese customers. The way in which this gap is being partially bridged is through the increased price pressures placed on suppliers, as well as the reduced levels of profit being experienced by the US OEMs themselves.

Attempting to emulate an evolutionary process through strategic implementations

Unfortunately for US OEMs, the nature of the structure of the entire relationship structure is not as simplistic as that of the basic manufacturing system that they have to a great extent successfully duplicated over the past two decades. Rather, it is the sum of the processes incorporated in Japanese OEM business practices due to what Takahiro Fujimoto describes as evolutionary learning. This learning has for the most part occurred in a foreign company environment, and is nearly impossible to relate to in the context of a North American company. This is not to say that the concepts inherent in the Japanese system are superior independent of environmental context. Rather, the evolutionary traits that these companies have acquired in Japan have produced a system that functions more effectively in the current competitive environment.

The complexity of the structure stems from the complexity of a total relational system, which must include both internalized and externalized interactive routines. While the US manufacturers may have attempted to apply some of the internalized routines of the Japanese in terms of kaizen, kanban etc, they have either failed to recognize the extent of the internalization of processes that they currently view as external to their own system, or have failed to adopt externalized measures that may effectively produce the same results through their own implementation version.

One example of a relational structure that was implemented by the US with great apparent success is JIT (Just-in time) or kanban. Reducing inventory-holding costs for the manufacturers, the eventual successful adoption of JIT has been used not only in the automotive industry, but also telecommunications and many other sectors. While the rewards are apparent in terms of explicit holding and store costs to the manufacturers, there does appear to be a rather frightening limitation. That is, the imposition of JIT requirements on suppliers was done on the basis of demands rather than cooperative assistance. Suppliers therefore had to bear a large portion of the costs, and indeed in many instances held excess inventory levels in order to satisfy the demand requirements of their OEM customers. As the US OEMs were virtual monopolies with respect to their customers at the time of initial implementation, there was little in the way of effective protesting of such arrangements. However, it could be considered to be a sure bet that these customers were not delighted with JIT, leading to the potential for a zero sum gain in total economic efficiency in at least the initial implementation of the system.

The Evolution of Japan's Competitive Framework: Impact on Symbiotic Patterns of Development

With the US automakers effectively removed from the Japanese automotive market in 1936 by the Automobile Enterprise Manufacturing Law, the Japanese began to setup a more independent domestic automotive industry. With most suppliers lacking expertise in parts engineering, the level of engineering assistance provided had to be significant if the Japanese were to avoid the usage of only imported supplier parts or full in-house manufactured systems. This, perhaps in combination with cultural norms in Japan, aided the development of a system that included a great deal of interaction between OEM and supplier. This was in contrast to the US system, where the slower, more evenly paced buildup of the industry allowed suppliers to progress technologically at about the same rate as manufacturers, leading to the far more independent structure of relationships present up until this day.

We may also learn more about the evolutionary process of competitive practices through specific cases of system development. Takahiro Fujimoto uses the development of the black box parts system by Toyota and Nissan suppliers as a test for his general hypothesis of system emergence and learning capabilities. Within this study, he concludes that the black box parts system emerged "not because of rational calculation by the automobile companies, but because of a set of constraints or historical imperatives imposed on the automakers" [Fujimoto, 1999, 167]. The emergence of such a system through an evolutionary process is a key indicator as to how Japan's symbiotic relationship practices have developed. The black box parts system according to Fujimoto, was the result of an evolutionary process that was not based primarily on strategic implementation by Toyota, but rather evolved as a species would, through trial and error. In the case of the black box parts system, this random evolutionary process began with the separation of Nippondenso from Toyota in 1949, due to a loss at the electric parts factory and a restoration plan submitted by Toyota to the Japanese government. With the separation of the electric parts factory also came the movement of the electric component engineers from Toyota to Nippondenso, providing the setting for a black box parts system to come into being. Shortly thereafter, as Nippondenso began to supply Honda, Mitsubishi and Mazda, the system became diffused throughout Japan. These divergent evolutionary frameworks and histories are what led to two very distinct systems of relational structures, both internal and external. We will now turn our attention to the symbiotic structures that reflect these historical developments and their impact on competitive advantage.

Symbioses: An Overview

The term symbiosis has a rather clouded meaning in modern language, and it is often misinterpreted as "a beneficial relationship." Symbiosis more accurately defines any form of relationship in which two different species correlate or co-inhabit in some manner or form. The three general forms of symbiosis are:

Commensalism: The symbiote gains while the host is unaffected. (+/0)

Mutualism: Both symbiote and host gain. (+/+)

Parasitism: The symbiote gains while the host is negatively impacted.(+/-)

For the purpose of this paper and the economic analogy used, the host-symbiote relationship will be defined based on market power, with the designated host holding less power. This is reflective of the logic that the symbiote selects a host, and not vice versa. OEMs will be regarded as having greater market power than suppliers as a general rule, due to the greater number of suppliers from which OEMs may source their parts.

More importantly, it is critical to recognize that in all symbiotic relationships, there are resource costs that must go along with any benefits enjoyed. As indicated earlier, the difficulty in assessing the location of both direct and indirect costs and benefits may be key to explaining why it is that the US manufacturers have had such a difficult time in replicating the system.

Mutualism and the Japanese way

The Japanese OEM's history has fostered a symbiotic relationship between manufacturers and suppliers that resembles that of mutualism. Information flows both ways, not only from supplier to manufacturer, but also from manufacturer to supplier. The entire system process is heavily internalized with a great deal of reliance and trust between the OEMs and tier one suppliers.

Mutualism in nature calls for an increase in potential fitness on both sides of a relationship structure [Boucher, 1985, 30]. Fitness is seen as the productive usage of resources toward the end goal of procreation, or in the case of our industry analogy, firm value. Firm value is a measure of the summation of all future expected cash flows discounted at an appropriate rate of return that depends on the expected riskiness of those cash flows. If a mutualism-based relationship can act to increase the rate of expected cash flows at a greater relative rate than any increase in the riskiness of those cash flows, or alternatively decrease the risk without a correspondingly equivalent decrease in expected flows, it can be seen as increasing the fitness of the participant. If both participants increase their fitness through the engagement of such a relationship system, we can describe this symbiosis as mutualistic in nature. One such example of cooperation in an area that is traditionally viewed as adversarial or competitive is logistics transportation. Steve Sturm, VP and general manager of Toyota Logistics Services explains:

> "We treat our transportation companies as partners so that we work as a team. A lot of companies treat their transportation companies or whoever their source is as vendors and it's all about cost and every year you have to cut your cost more. The rolls are adversarial at best. We took a different approach. We work with them and when the good times are there, we both reap the rewards. When the challenges are there, they step-up and protect our business plan and also come to our aide when we need it and vice versa. When they struggle, we protect their business plan." [Haight, August 2003, 24-28]

The components of the Japanese system are discussed when combined as a whole act to reduce the uncertainty of cash flows to the supplier base through the engagement of longer-term relationships. Suppliers in turn are able to increase their investments in productive assets, benefiting their OEM customers through higher quality parts, innovation, and supply stability. This reduction in the risk profiles of both suppliers and OEMs is expected to reduce required rates of return on investment for shareholders, thus increasing firm value. Additionally, higher future growth may be anticipated from this cooperation, as consumers recognize and value the increased quality of product that such an arrangement produces. On the OEM side it is readily apparent where shareholder value has been created and where it has been destroyed, as Toyota, Honda and Nissan have seen their market values increase, while Ford and General Motors have witnessed a drastic fall in market capitalization. A possible area of future study would be to determine the correlation between customer diversification amongst suppliers and their market capitalization.

Parasitism and the American OEM – supplier relationship structure

The US evolutionary path has not required there to be the level of interaction between supplier and manufacturer that is present in the Japanese model. This theoretically makes for excellent flexibility and diversification, as investments can be moved amongst a wide number of potential suppliers or hosts from which value and information may be extracted. The short-term nature of the relationships also acts to reduce the risk of mispricing resources. This is particularly true when the relationship is relatively monopsonistic and the OEM has the ability to select the most cost efficient suppliers from which to source its components.

Unfortunately, this setup increases the risk to suppliers of making long-term, strategic investments, as contractual uncertainty prevails and undermines future cash flow expectations. Effectively, the situation has OEMs selling their assembled products to a relatively low risk pool of customers, while further reducing their own business risk in terms of supplier sourcing commitments. Suppliers, particularly those with business concentrated in the Big Three, have a very risky and price sensitive customer (the OEM), and yet in order to innovate must make large, long-term capital investments. The result is a lopsided risk/return profile for suppliers in comparison to OEMs; there is little guarantee in being able to amortize capital expenditures across time if contracts are short and continued business uncertain. When faced with only US OEM customers, as was the case prior to the early 1980s, this lack of choice clearly reflects a parasite-host symbiotic system where the Big Three OEMs successfully leveraged their oligopolistic position to extract value.

This parasitic relationship structure worked well for the OEMs prior to foreign competition shaking up the domestic market and permanently altering the environmental landscape. Ford's famous Pinto calculation that weighed law suits against recall costs demonstrated the type of extreme parasitic structure that existed for years in the ranks of The Big Three. The introduction of transplant operations in the 1980s from the likes of Honda and Toyota was the catalyst toward competition on the basis of product quality, making supplier innovation a key component to success. However, the previous parasitic structure that was so effective for the domestic OEMs during their oligopolistic heyday persists in basic form right up until today. The resulting emphasis on price has meant that "supply chain members are earning substantially lower returns than required to retain risk capital in their business over the long-term," which is at the root of many of the credit failures of North American suppliers today [Fitzgerald, November 2002, 40-42].

Genetic Traits of Mutualism

Slow evolution:
In order to maintain the most efficient exchange of resources, evolution in a mutualistic environment is expected to be relatively slow in order to retain compatibility between host and symbiote [Boucher, 1985, 151]. Toyota has demonstrated this tendency in practice, only implementing procedures and materials after they are certain to be easily adopted into the Toyota system without great interruption or sacrifice in quality. The most recent test of a new system came about when Toyota opened up their system to the testing of module component systems, something that they had previously avoided doing [Treece, February 18, 2002, 3].

Adaptability:
Organisms that employ mutualistic tendencies spread more readily into new environments, as the host – symbiote relationship increases adaptability to resources and reduces total risk [Ahmadjian and Paracer, 2000, 225]. The advantage of mutualistic relationships in the Japanese OEM – supplier system is evidenced by the increased willingness of Japanese suppliers to follow their OEM partners. An investment banking analyst that covers the auto parts sector describes these suppliers as going in on "razor thin margins on impossibly low scale runs." They are willing to do so only because of the long-term security that such moves entail, hoping to first supply their transplant partner, and then move on to Big Three customers and finally the U.S. parts aftermarket [Kellogg, July 1988, 16].

Functional conclusion
When faced with the option of initiating a longer-term relationship with a Japanese OEM, the US supplier will see its total risk level fall, not only from diversification, but also through the reduced discounting of future cash flows. In a long-term relationship, these cash flows become less risky, and so capital investments may be employed that would otherwise not be possible with a US based customer. The Japanese OEM meanwhile benefits through innovative and high quality products that it may leverage with the consumer through higher prices and reduced needs for cash incentives. Furthermore, in penetrating new markets, long-term trust present within Japanese-supplier relationships has provided a huge boost in supplier dedication and investment abroad, as Japanese component suppliers follow their OEM customers into emerging markets such as China [Peart, August 5, 2003].

Attempts for System Replication: Deterministic Difficulties

In an evolutionary process, as parts of a system evolve, it is not always true that only the strong survive. Rather, so long as spontaneous genetic mutations (the organic equivalent of spontaneous combinations of old ideas allowing the synthesis of new ones) do nothing to significantly weaken the system vis-à-vis competitors, it is very possible for benign mutations to survive and be carried forward. These 'appendages' may add zero value to the system, and may in fact divert a minute amount of resources away from productive processing tasks. In assessing a system as it stands then, it becomes very difficult to determine what parts of the system represent true evolutionary progress, and which parts merely came along for the ride. As one example, replicating the basic functionality of the Japanese keiretsu system may not work if emphasis is placed on appendage parts rather than where true efficiencies lie.

Further, in assessing the use of evolutionary traits, determining internalized and externalized interactions and resource-processing tasks is a daunting task when it is done without the benefit of the context of its development. It is very likely then, that even as studies on the Japanese system improve in their ability to describe the current system in its totality, understanding the components in the context of the working system will still be lost to those on the outside. Attempting to duplicate such a system, particularly when both the externalized nature of the relationships as well as the internalized support systems are largely derived from foreign environmental constraints, can be very risky indeed.

Any attempt at replication is likely to be costly if done in piecemeal fashion where it is possible that severe losses of resource efficiency may be incurred when significant parts are lacking, or if done to the fullest extent, a misunderstanding on how to direct resource flows could result in failure of even an outwardly identical system. Even modern physicians for the longest time were under the impression that the tonsils were appendages with relatively little use. Now the protection offered by those components of the lymphatic system are better appreciated.

Our understanding of the evolution of the Japanese automotive system is still wrought with guesses, and so determining essential organs from mere appendages is a likewise difficult task.

Progress has been made in the case of the Big Three. GM's Oshawa truck plant is one example that displays the effective duplication of substantial parts of this very complex process. One of the results of increased efficiency and quality, as previously mentioned, is a more streamlined cost structure. GM has benefited from this in the short-run through its ability to profitably execute steep incentive programs that are putting pressure on the higher cost Ford and Chrysler, pressure that is being translated directly to lower competitor profit margins. The progress has not been holistic in nature just yet, perhaps due to the aforementioned difficulties of replicating an evolutionary process through strategic implementations.

Managing Business in A Volatile Environment: A Tight Rope Walk on Business Ethics, Values and Trust

Rajeshwari Narendran
M L Sukhadia University Udaipur, India
V Narendran
Hindustan Zinc Ltd., India

Abstract

With increasing thrust upon globalization and liberalization, the market has shrunk to be a global village. The tremendous pressure for prime efficiency, supreme profitability and ever best quality with the lowest of price and ultimate customer delight is paving way to a very big corporate dilemma of maintaining and harnessing these pressures with equal stress upon business ethics and values. For staying ahead in the competitive edge with quest for excellence, many organizations are compromising on the very basic issues of practicing ethics and values. The focus of the paper is on illuminating the mind-set through integration of different perspectives of businessmen, managers, customers and government about business ethics. The paper deals with ethical dilemma and different perceptions of various interest groups on values, ethics and trust in business, throwing light on harmonizing the core issues and integrated trust building amongst various interest groups and provides hallmarks of good strategy.

Introduction:

India is fast emerging as Asian super power in the world market today. At the threshold of changing world, all the industries, trade and services have to reassess their roles and embrace any innovation that would make it more effective and efficient and should grab the vast opportunities offered by the global business scenario. For forging ahead in the global mission, all the business practices have to bear the brunt of the volatility, uncertainty and tremendous competition. The pressure on the organization is rising further due to desirable standards, quality consciousness, commitment towards various segments of society and supreme, of course, the cost-volume-benefit ratio. Many organizations succumb to these pressures and sacrifice on trust in business. The basis of trust in business is frequently sought in the branch of philosophy called ethics and the topic is frequently discussed in the context of social, moral, and democratic processes. But, it is also the source of energy for any economic activity.

Ethics:

Ethics are the code of conduct and some commonly accepted standards and quality, which are bound to tell the difference between the right and wrong. To discriminate between right and wrong comes only from a deeper level. Mere intellectual development is not enough. The capacity to feel must come.

Values:

Values are a frame, which holds us together and gives shape to what we are. They come from the depth of human spirit, which has clear bearing on thinking, doing, and the direction of growth. Values brighten up human life both individually and collectively.

Trust:

The generation of trust means the level of confidence, the sense of feeling responsible, and the belief of being truthful and honest. The Webster's Dictionary defines "trust" as "assured reliance on the character, ability, strength and truth of someone or something."

Ethical Dilemmas:

For centuries together it has been a very popular saying " EVERYTHING IS FAIR IN LOVE AND WAR" This saying with the time has changed into" EVERYTHING IS FAIR IN BUSINESS, LOVE AND WAR".

This quote may raise many eyebrows as doing business and being ethical sometimes sounds to be so contradictory that it seems to be impossible to be both effective and ethical simultaneously. It leads to lot of confusions, chaos, and dilemmas in the action orientation of the business.

Choices in life are rarely simple. Situations do not always develop to one's liking. We are often under the control of others whose values may not be consistent with ours. We then have a dilemma as to what to do, no option being free from a value conflict.

A dilemma exists only when there is a choice or option. If it is not possible to resolve the dilemma fully, one must at least be aware that a compromise is being made. In making that decision to choose or to compromise, it is important to recognize the ethical issues and think through the consequences of alternative resolutions. This requires confidence to seek out different points of view and also tough mindedness.

Most of the dilemmas arise because each option favors one and harms another. The concern for the other has to take precedence over concern for self. The interests involved in any issue, may be of more than one "other", like community, family, society, country and so on. The simple rule recommended is that the bigger unit must get precedence over the smaller unit. Further, long term interests should get precedence over short term interests.

Self, other individuals, family, community, society, nation, world, and the universe are in that order, considered to be bigger and bigger functional units. The concern for every bigger unit takes precedence over all the smaller ones.

Can we Speak of Business Ethics?

Yes. Ethics or Values are what makes it possible to choose between alternatives, and the values held by an individual or an organization are revealed in those choices. Business values are those, which a business needs to pursue in order to survive and prosper as a business. The issue of business ethics covers the entire gamut of business operations which includes ethics in advertising, promotion, compensation, purchases and outsourcing, hiring and firing, accounting and reporting, consumer satisfaction…… and so on. The basic standards, norms, quality, credibility, utility, reliability, etc. all are the important dimensions and a primary concern for business ethics. Money can't buy reputation or integrity, both have to be earned. Organizations based on strongly held shared values amongst its customers, employees, and social segments have been able to professionalize and develop their market potential through strong brand loyalty and relationship building with their constituent. Ultimately, it leads to long-term successes and building and converting corporations into institutions of inspiration for many.

Different Perceptions…?

Trust, Ethics, and Values are perceived differently by different people. There is a famous story about 4-5 blind men who met an elephant and then started describing it as per their own perception one said that it is a big pillar another said that it is a big pot and so on….as they could feel only one part of the big animal. The same is the fate of these Inter-related, interdependent yet separate corporate jargons. The dilemma on the subject is so much that all the important segments of society and business have a different meaning, different perception, different understanding, and different perspective. We all know that in the juggling of these words one can be easily lost in the pool of these words.

Findings:

To examine, assess, and understand the relevance and perception of Trust, Ethics, and Values, as they are interpreted by different interest groups, we have conducted informal telephonic and electronic interviews with some of the businessmen, managers, Govt. officials and of course most importantly some consumers as representatives of the society. The quest included certain basic questions such as:

- o What do you understand by "Ethics"?
- o Is it possible to make reasonable profit by being ethical?
- o How do you balance both the factors?
- o How trust amongst the various interest groups can be created?
- o How much do you feel responsible for establishing ethics, trust, and values in your profession?

Businessmen's Views:

"Trust means faith and loyalty to customer and following some standard ethics including fulfilling some social responsibilities." To quote Shri. Subir Raha, Chairman-Managing Director, Oil & Natural Gas Corporation, India. "….The answer to corruption really lies in the ethics and value system of an organization. If somebody is intent on manipulation and is reasonably smart he will always find ways to get around any procedure." *("Cost of Competition", The Times of India, New Delhi, 2003 August, 6th*)

Certain points emerged from cross section of views during the interview are-

- ?? Being more practical is more important today.
- ?? Whatever is logically right is legally right…. Or you can make it happen
- ?? For success corruption is inevitable- *Sab chalta hai* (anything OK)
- ?? Quality and standards differ from customer to customer and place to place.
  This point is validated by the evidence that the quality and standard of Cokes such as Pepsi and Coca-Cola available in India contains residues of four extremely toxic pesticides and insecticides many folds high more than desired level whereas the test samples for US were found not to contain any such harmful content at all (*Centre for Science & Environment, New Delhi, The Times of India, New Delhi 2003 August 6th*). Still the multi-national corporations claim the charges as baseless.

Managers' Views:

On parameters of trust and ethics, the followings are some of the views expressed by the managers based on their expectations from their employers

- ?? Openness and transparency in the system
- ?? Importance to quality and merit
- ?? Fair policies and practices
- ?? Equality of opportunity

But…Boss is always right.

Government Officials' Views:

If business is following all the norms and prescribed standards, it is always a trustworthy and ethical business. Responsible government officials feel that legal aspect of the business is the most important. The general notions about the fair and ethical business are:

- ?? Fair and transparent accounting
- ?? Proper taxation
- ?? Legal compliance
- ?? Fulfillment of social responsibility.

But… it is difficult to check the corrupt and malpractice

Customers' Views:

In today's consumer oriented market, no one wants to compromise on anything less than the best. Some of the views captured from the consumers during the interview regarding their perception on business ethics, values, and trust are:

- ?? Best quality, lowest price, fair and favorable trade practices
- ?? Correctness of information and reliability of claims in advertisements and promotional efforts

- ?? Best benefits and schemes for customers
- ?? Social contribution
- ?? Long established name and fame matters.

But…Big brands means better trust

Harmonizing Different Perceptions:

All the issues raised above as a result of interviews conducted on the perception of various interest groups on ethics, values, and trust open up a messy world of mixed up meanings and motives. Everyone wants to have ones' own meaning and wants to be happy by closing eye towards the harsh reality of feeling RESPONSIBLE TO SELF, TO OTHERS, AND TO THE MANKIND**,** by manipulating and interpreting the meaning of Ethics, Values, and Trust totally differently.

Thus, the churning of the above points puts a lot of emphasis on harmonizing the different perceptions of various interest groups in a practical and dynamic way so as to stress and establish credibility and perfection both. The important criteria for business so emerged as regard to successful business and balancing progress and prosperity with ethics are:

- ? ? Accountability and transparency in all actions, objectives, and achievements
- ? ? Outstanding customer services by establis hing relationship of utmost good faith and ultimate consumer satisfaction.
- ? ? No compromise on legal, ethical, moral, and social values
- ? ? Vitality of role as an active corporate citizen rather than just a business for profit.
- ? ? Compliance of fairness, equity, law and justice not only for self but also to stakeholders, employees, customers, government, society, suppliers, competitors, environment as a whole
- ? ? Building of corporate image through good will and contributions
- ? ? Belief in harnessing the human values
- ? ? Quality consciousness and global benchmarking
- ? ? Best bargains for best productivity
- ? ? Professional commitment, credibility, pro-action, integrity and honesty, as top virtues

The points mentioned above can be easily dealt with the help of establishing trust between:

- ? ? Promoter and top management
- ? ? Corporate vision and top management's philosophy
- ? ? Business and society
- ? ? Business and environment
- ? ? Management and employees
- ? ? Business and customer
- ? ? Business and network of suppliers
- ? ? Business and government, and so on

All these are to be reinforced by an open and transparent communication system trust building exercises, agreement on norms, standards and ethics and adhering to various values as multi way integration (Fig.1). The dimensions exhibited in the fig.1 are not exhaustive but illustrative and self explanatory.

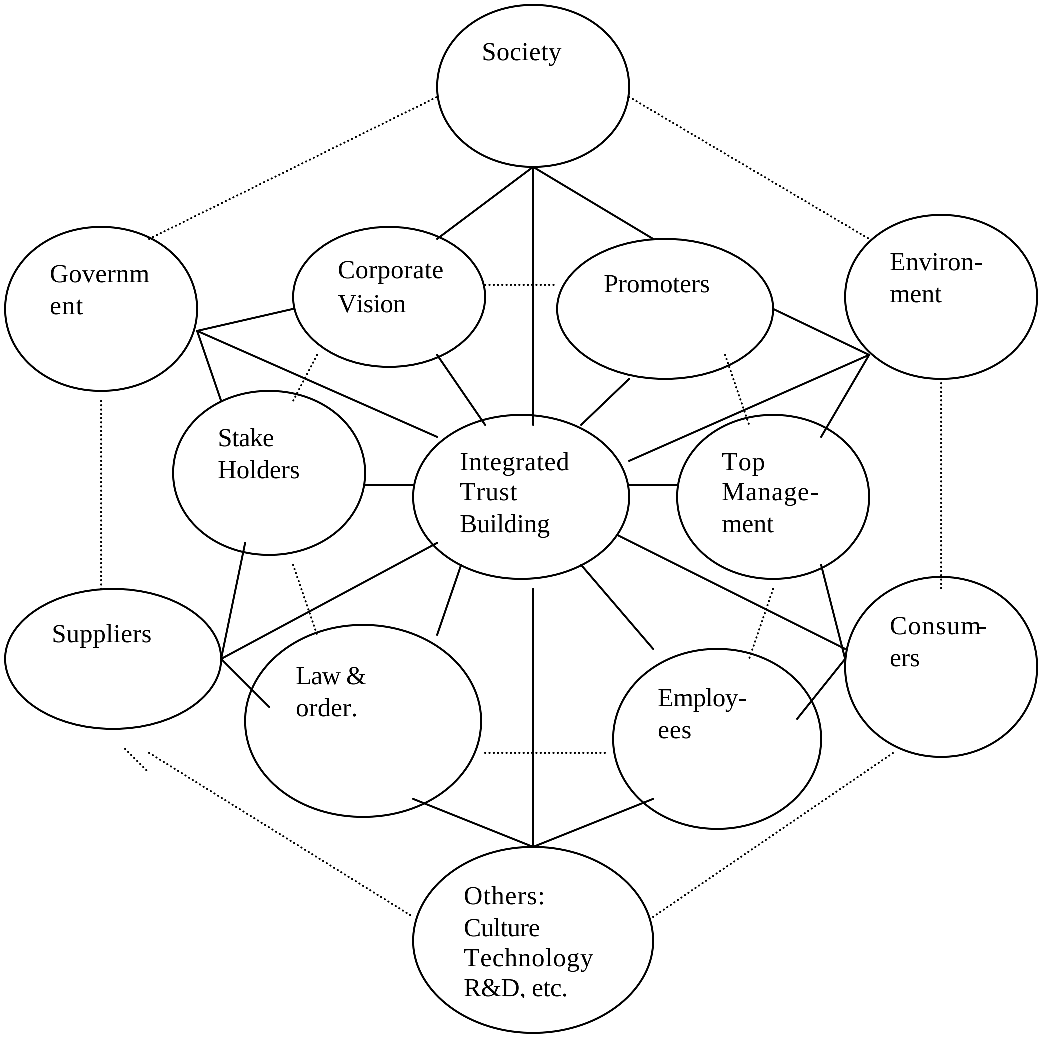

Fig. 1 INTEGRATED TRUST BUILDING AMONGST VARIOUS INTEREST GROUPS

The Emerging Corporate Social Responsibility (CSR)

The concept of CSR is now gaining a very important momentum in the business philosophy for generating and reflecting the impact on society in the context of sustainable development globally. It focuses on a white paper on issues related with contribution to sustainable development including environmental and social issues, human rights, local impacts, care for stakeholders, transparency, corporate governance and issues taken up for strengthening the trust. It also includes social reporting on human resources, community at large, labor standards and environmental issues. For many old business tycoons in India like the Tatas and Birlas, the corporate giving has been a tradition. Whereas the relatively new info-tech companies like Infosys and Wipro are headed by ethical professionals and have a corporate conscience. When global companies came to India, they made CSR as important a stamp as ISO-9000. The CSR strategy is now more like a fashion or brand statement. Rajat Gupta, MD, McKinsey and Co has this to say: “Enlightened corporate see it in their best interest, and that is what is driving it. We give back not merely by writing cheques, but by offering time, space, and skills". Pradip Kashyap, who runs American Indian Foundation from office space in New York's Madison Avenue, given by McKinsey, says:" The corporate culture in the US makes it impossible to do business unless corporations reach out to their stakeholders through philanthropy".

Hallmarks of Good Strategy for Ethics, Values, and Trust Building:

- Guiding ethics and values should be reflected in the commitment of each and every step taken by the Corporate, which should make sense, and clearly be communicated.
- The Corporate leaders, manager, and workers should be personally committed, credible and willing to take action on the values and ethics they espouse.
- The trust building exercise between various interest groups should be based on OCTAPACE values.
- The interpretation of ethics, values, and trust should flow and reflect in the decision making, empowerment and all the critical activities of the organization.
- The systems, procedures, structures, and policies should support and reinforce the ethics, values, and trust.
- The human power within the organization must generate the competence and inner strength to work on the aforesaid ethics and values and for this, competency building and empowerment must be initiated.
- To permeate these virtues in the manpower frequent and regular motivational exercises, workshops, Seminars, meditation, etc. for everyone from top to bottom must be conducted.
- The source of fresh water in the nature flows from top to bottom in its natural course. The same is equally true in the business that honesty, integrity, hard work, punctuality, loyalty, commitment, and practice of moral and ethical values should flow from top to bottom.

Here it is apt to quote Mahatma Gandhi, according to whom, the seven sins are:

- Politics without principle
- Wealth without work
- Pleasure without conscience
- Knowledge without character
- Commerce without morality
- Science without humanity
- Worship without sacrifice

Let us keep away from these sins and enlighten the world to forge ahead on the path of ethics, values, and trust. Though, it is very difficult but not impossible. Let us make the world a better place to live.

Searching for the Way Ahead for Cypriot Companies in a Changing Environment: An Exploratory Analysis from the Local Business Leaders Perspective

Elmos Konis
Cyprus College, Cyprus

Abstract

Cyprus is one of ten countries that have been granted entry into the European Union. Despite the fact that Cyprus is attracting renewed attention because of this fact, little has been done to understand how Cypriot business leaders, the architects of the country's economic success, view the volatile, rapidly changing internal and external environment. The orientation of this study was originally an exploratory one, covering a holistic perspective in search of key emerging concerns. From early on the issue of change pervaded discussions most subjects raised. Cypriot leaders realize that dealing successfully with current challenges, such as global competition, is instrumental to their companies' survival. They are responding, if hesitantly. They are reluctant catalysts of change. Being part of an old culture that is seeped in tradition, they are tempted to resist. But they are well aware that they will be left behind if they do not keep up, so they are instigating change.

Introduction

The Republic of Cyprus is one of ten countries that have been granted entry into the European Union (EU) as a full member. On the 14th of July 2003, the country's parliament voted 'yes' to accession, thus opening the way for formal membership in May 2004. In a practical sense, the impact of this development will not be overly dramatic. In fact, this has been intentionally so. Cyprus has been harmonizing its regulations, policies and legislation to fit the corresponding ways of the European Union for more than a decade. For example, the Value Added Tax (VAT) has gradually risen from non-existence to the mid teens, thus now essentially matching the European standard[1].

Even if this change toward EU harmonization has been relatively smooth, the fact remains that the local business environment waters are being stirred. Globalization is now directly affecting every corner of the world. Competition has intensified at company and labor level. The pace of life has quickened. The average life expectancy of businesses in Europe and Japan is just 12.5 years, according to a recent Dutch survey. Even the average life expectancy of a Multinational ranges between just 40 to 50 years. So why do some firms continue to survive? One explanation is that they learn - and change - effectively (Pollitt, 2003). Can Cypriot firms effectively survive transition?

Cyprus, a small independent island state in the Eastern corner of the Mediterranean Sea, is now attracting renewed international attention because of its new status as EU member. Thus far, focus has mainly centered on macroeconomic factors and the country's ability to stay within the indicators set by the Maastricht Treaty. However, little has been done in the investigation of business at a more personal, detailed and culture-oriented level. The voice of the architects of what used to be referred to as the 'Cyprus Economic Miracle', the local business leaders, has rarely been heard, at least from an academic, analytical and explanatory perspective. The purpose of this study was to examine the way these people view the volatile work and cultural environment they themselves are part of.

The importance of Studying Business Leaders

The importance of studying business leaders and what they have to say is continually being emphasized (Caudron, 2002). Leadership has been heralded as an important ingredient for the revitalization of organizations (Peters, 1987). It is known as one of the essential components of a successful operation (Dare and Boissezon, 2000). The field is also important from a sociological-psychological perspective, because it directly contributes to the improvement of people's lives (Kilduff and Day, 1994).

It is important that business leaders understand themselves. But it is probably even more important that others understand them. Dunn (1979) points to the necessity that western businessmen understand both the emotive and cognitive aspects of its (*the Middle East's*) managers, if they are going to be able to deal with their counterparts in that region.

Also, studying this particular group within a society is significant because leaders help shape society as much as they are shaped by it. Leaders have a significant role in creating a state of mind that is 'society' (Gardiner, 1985).

Moreover, there is profit to be gained by seeking information from experienced people in this area of study, tapping into their collective memories and experiences (Cooper and Shindler, 1998), because it is 'inside' information.

Learning about Cypriot business leaders is also of value for the purpose of completing a global management 'puzzle', for academic purposes. But there is a significant practical benefit as well. The individuals themselves can stand back and see how the system (*context-specific*) works and thus be better able to modify it (Lawrence, 1992).

Given these facts and the obvious gap created by the relative unavailability and triviality of local information[2], coupled with a continuing frustration over the abundance of mainly American management-leadership studies (Adler, 1997), led this researcher to look into the perspectives of Cypriot business leaders further. This information can be a key for understanding local management practices, both for observers from within and outside.

Challenging Times

There can be little doubt that difficulties lie ahead for Cypriot businesses. Staying on the easy, slow lane is no longer a viable option. Apart from the EU entry, organizations, and the people who run them, are being forced to move faster than ever before (Stalk and Hout, 1990). How do Cypriot business leaders see these changes? Are they feeling threatened? By and large, small cultures in general (*like Cyprus*) are susceptible to changes due to acculturation, thus rendering studies such as this one relevant for other similar environments.

For various reasons (e.g. the follower now demands more influence, he is better educated), the leader-subordinate relationship is also in a state of change (Block, 1993, Hollander, 1990). For example, there is a noted decline in member commitment and loyalty (Hirschhorn, 1998). Partly due to the increasing importance of the employee, there is currently also an increased concentration in leaders' people skills. In fact, research interest in leaders' social skills has been put on centre stage. Gone are the traditional key words like 'control' and 'command'. The new words are 'communicate', 'collaborate' and so on (Abramson, 1999).

The issue of change has been exacerbated by external forces as well as internal. In the past, people stayed closer to home, rendering behavior more predictable. Now, we interact across cultures, widening our range of human contact and 'shrinking' the world in the process (Hall, 1976). As a result, business today is increasingly being impacted by international considerations (Darling and Fogliasco, 1999). First, it was through bilateral and multilateral agreements, then by means of regional pacts such as those of the EU and NAFTA and, increasingly, by way of globalization in a sense few could have envisioned a few years back.

It must be reemphasized that small cultures, as is that of Cyprus, are often subjected to acculturation, that is, that they are heavily influenced by dominant cultures (Segal, 1981). Thus, it can be assumed that Cypriot managers are also affected in this way. Then, it could be argued, Cyprus is also moving out of its 3rd World setting, from a 'traditional' to a 'modernistic' mentality. Modernism has been associated with achievement (McClelland, 1961) and it includes such elements as are (a) independence from traditional authority figures (Inkeles and Smith, 1974), (b) abandonment of passivity and fatalism (Kiray, 1968), (c) ambition for one's self and children (Kiray, 1968), (d) individualism (Kahl, 1968) and (e) trust in one's fellow humans (Kahl, 1968). This modernism, if it is occurring, involves change.

Challenges, such as these cited above, are rising in importance. It can be safely asserted that the issue of change has now increased in significance, on a local as well as an international level. As La Barre (2000) concludes, change is the biggest challenge businesses face today. Hence, it is an increasingly important focus of attention in today's organizations (McLagan, 2002) and in management research. In fact, change is a key concern in the impact of management performance (Harris, 1985). In truth, this is no revelation.

The Impact of Culture

Also, it has long been recognized that diverse cultures are receptive to change in varying degrees, sometimes dramatically so. This relationship between culture and acceptance (or initiation) of change was identified as far back as half a century ago (Barnett, 1953).

It must be stressed: Change has always been with us, in management practice and otherwise. The difference today is that change takes place in a generally much more rapid manner than in the past. The pace is such that, literally, were one to blink he may find himself lagging behind. Of course, this pace has varied in different developing and emerging economies, some necessarily adopting emergency 'shock therapies' (e.g. Russia, Poland) and others attempting a more gradual shift (e.g. China, Vietnam) (Peng, 2003).

Still, generally, productive cultures have some common traits, as are those of rationality in decisions on actions, *handling of change*, alertness to new opportunities and energetic enterprise (Herbig and Dunphy, 1998). Hence, it has been concluded that 95% of business approaches are the same (Freeman, 1989). In fact, Farkas and Wetflauer (1996) interviewed 160 CEO's from around the world and found surprising consistency in their leadership approaches. These individuals are essentially motivated by achievement, power, status, income and advancement (Campbell, 1970) and these specific motivational needs are similar across many countries (Haire, Ghiselli, Porter, 1966)[3]. Moreover, Massie and Luytjes (1972) reviewed management practices literature in all continents and concluded that there is a trend toward similarity in management practices despite differences in managerial emphasis. And, according to John Adair (Powell, 2000), a leadership guru, the three main leadership 'circles' (the task, the team and the individual) are universal in all cultures.

Nonetheless, Hofstede (1983) states that the assumption that 'management is the same or becoming the same around the world' is a 'naïve' one. To Hofstede the influence of culture on management behavior is so important that he refers to it as software of the mind (1994). In addition, many researchers contend that management styles are culturally determined (e.g. Wright, 1981, Aram and Piriano, 1978). Also importantly, Trompenaars (1996), who investigated 15,000 employees in 50 countries, found that there is a unique management solution in each culture.

Kets de Vries (1999) used the case study format to look into the lives of global leaders, such as that of Richard Branson. He found that the new leader must behave differently because the environment is changing. For instance, due to rapid change, knowledge is now even more a critical factor. Do the Cypriot leaders understand its importance?

Thus, the cultural context is significant. Top management strategies are above all cultural (Drucker, 1985).

Negandhi (1983) investigated the future directions of management research. He concluded that such studies are shifting from management practices analysis to the psychological terrain, probing the motivations and personalities of top managers, and especially those from Third and Fourth World countries. The focus of this study was in line with this continuing trend.

Methodology

Leadership shares some characteristics with the Complexity (Chaos) Theory (Thitart and Forgues, 1995). That is, causal analysis is 'virtually impossible', because the number of variables jeopardise one's ability to understand causal roots. This is one of the reasons why leadership studies produce such mixed results. Out of literally thousands of studies, there are few, if any, authoritative studies that are universally accepted (Yukl, 1989), probably because of the diversity of the subject matter, rather than due to flaws in the studies themselves.

Leadership, culture and environment stubbornly defy measurement, and it is within this context that Cypriot business leaders needed to be examined. A quantitative data analysis approach would necessarily have had to omit factors that may have been important in the lives of individual leaders. Even multivariate analysis would have had its limitations, in terms of data amount, in producing a manageable and comprehensive document of the findings. Qualitative research, on the other hand, would recognize the complexity and diversity apparent in the leadership field.

Such issues are best understood when viewed from a *holistic perspective* (Hollander, 1978). This sort of an outlook effectively does not dismiss any of the previous diverse work (or schools) of leadership research. Kelly (1998)[4] addresses a 'whole person' approach to leadership that far too many other theorists ignore. It includes research on personality, leader-follower relations, and the work and cultural environment. This broad-based perspective is especially useful in exploratory research, when little is known about the phenomenon. Due to the fact that leaders in Cyprus had not been adequately studied, such a point of view seemed particularly appealing.

This study was initiated using the above outlook. That is, leaders were free to talk, to express themselves, thus 'allowing' the important issues to emerge by themselves, rather than being forced out. This is not to say that the research study began with a blank sheet. It would be 'foolish' to imply this (Wolcott (1982:157). The main instrumentation tool, the interview[5], was a semi-structured one, providing both direction and flexibility (Miles and Huberman, 1994). Perhaps surprisingly, it has been shown that non-directive interviews where both sides talk freely only serve to confine both parties (Easterby-Smith, Thorpe and Lowe, 1995). Researchers can be more successful if they are clear at the outset about the general areas of interest. In effect, this study was conducted in a philosophical sphere which lies between phenomenology and post-positivism. Particularly, the study began at an exploratory and descriptive level, yet later, as patterns emerged, explanation was attempted.

Using such an approach limits the number of interviewees. This does allow enough space for generalizations which, however, cannot show how often (probabilistic generalization) any patterns may occur. Rather, this approach contributes toward analytic generalisation, checking the findings for fit with previous research and theory, or with similar cases. If linkages and patterns can be found within these parameters, then analytic generalisation can be assumed (Gilgun, 1994).

Another common concern in qualitative research is that of reliability. A useful way to claim reliability is for the investigator to document his procedure well (Kirk and Miller, 1986:52-72). Hence, the entire contents of the interviews, which typically lasted about 2 hours, were transcribed word for word, including syntax and other errors on the part of the interviewee and interviewer.

Triangulation was achieved by cross-referencing issues with leaders' acquaintances and by observation. Also, by asking about the same phenomena across cases (Gilgun, 7:1994).

Selection was largely purpose driven. The number of leaders to be interviewed was not absolutely predetermined. Rather, the followed process was opportunistic and structured. Following the pilot study, thirty-six local business leaders were ultimately included in the data analysis. Anonymity was guaranteed to ensure that the leaders would openly express their feelings.

Despite the fact that probabilistic generalisation was not a direct goal, it is worth nothing that some characteristics of the studied Cypriot business leaders did emulate certain attributes of the broader population. For example, in the overall population 76% of firms are owned by the General Manager and/or his family. This proportion was also attained in the selected sample (77%). Also, 93.6% of the population are men, thus, overwhelmingly (bar one person), the interviewed leaders were men. Most Cypriot business managers are relatively young [70% of Cypriot General Managers are below 50 years old (Keravnos, 1998)], so a changing of the guard is happening right now. This proportion was adhered to. People over 45 years old was also represented, constituting 31%, in a manner befitting today's local business reality.

Some diversions from the population suited the purposes of this study better, and reflect an intentionally selective focus. For example, the selected companies tended to be larger, in terms of personnel, than the average Cypriot firm. Most Cypriot companies (94.8%) are 'microenterprises', employing fewer than 10 employees. In this study's sample, the aim was to select more successful firms. A higher number of employees were utilised as a success criterion, as financial figures were scarcely available. Thus, the average number of employees in the selected sample is 28.6. When one considers that only about 5% of Cypriot companies employ 10 or more employees, it is easy to see that the selected companies are 'loaded' in this area. There are but a few hundred companies belonging in this 'elite' category. As a result, reliable assertions can be made about leaders within this area.

In terms of the nature of business the selected firms were engaged in, an effort was made to choose companies from a diverse spectrum, to increase the chances of covering varying factors and issues which may have emerged in different areas. So, despite the fact that most economic activity is derived from services, a better 'balance' was sought here. There were 22 companies involved in services and 17 engaged in manufacturing and production[6].

Several techniques were utilised for data analysis. The interviews and observations were transcribed verbatim and then transferred to a specialist qualitative research software package (Nud*ist). Then, the data was manipulated by coding (pre- and post-), inserting marginal remarks, creating 'contact summaries', memoing, and by constructing checklist matrices and coping charts.

Findings

It is important to note that many leaders were found to share the 'experience' of the Turkish military invasion of 1974. For some, this directly affected business. A few had to start all over again, or open a new business (e.g. leaders 2, 6, 10, 12, 13, 19, 31). Many mention the traumatic effects of the war, either on a personal or a business level (Leaders 1, 3, 4, 6, 7, 9, 11, 12, 13, 15, 17, 19, 21, 22, 24, 28, 30, 31, and 32). It is also probable that the war had 'positive' side effects on business, in terms of improved personal resilience, emphasis on education and a focus on building the future rather than concentrating on the past. In other words, it may have provided an impetus, a feeling of forcefully starting afresh. Also, it is possible that some fear of risk and reluctance to change may be tied to the above distressing event. Future research would do well to directly research the impact of the invasion on the local leaders. Below is an excellent summary of the Cypriot spirit:

"… the Cypriot does not stop somewhere … of course a lot depends on the factors you are 'given' … because you can see difficulties in Europe (*our entry*?) but the Cypriot I believe is the person who pushes forward. After the invasion we became stronger. There were people who were 'high up' and ended up with zero. And they re-created themselves. And this is one of those factors that make Cypriots not stop, rest on their laurels… after the Turkish invasion there was a rapid growth in Cyprus. The invasion stagnated everything, yet the Cypriot still survived. He went abroad, to the Arabic countries, brought money back in. I believe the Cypriot marches on." (Leader 30)

The issue of 'change' sparked a lot of lively conversation and responses from several business leaders. No matter what was being discussed, (e.g. the country's development, employees, and current practices) change emerged as a key topic. Table 1 is part of a Checklist Matrix depicting relevant remarks made by some of the leaders. It provided a useful summarized presentation because of its immediate proximity to actual leader comments. Also it constituted a useful springboard upon which issues could be correlated, further investigated, and explanations attempted.

TABLE 1: CHECKLIST MATRIX ON 'CHANGE'

Leader	***Adequacy Judgment****	***Remarks*****
1	4	Pessimistic when asked about change: "You have to be naïve to think the human race will change overnight, people (employees) will always want power". "At work, you can see the struggle for power everywhere".
2	2	Associates change with employees negatively: "Trend is for staff to work less hours, not be so productive, to get more money". (employees) "We have rapid change but we are saying that our staff can't follow, and we expect them to catch up with us." (employees) Associates change with travel: "We go abroad and we see these changes… we have a problem investing in new technology… because we don't have any help from the government. They're useless they don't care about our work. Why risk 1 million pounds in new technology when the minister says that this business is dead. They are trying to kill you. It's dangerous.
3	2	"If there is a need to change something you have a contingency plan, you can adjust. Professionalism is VERY important." On rapid change in Cyprus: "Tourism ... happened very suddenly… a sudden change and they didn't have the correct structure. Regarding himself: "I am trendy. Changes happen every day, I adjust all the time."
4	2	Says Cyprus is changing from 'Middle Eastern culture' to 'European. "Family orientation, more conservative regarding changes (and) technological advancements". (family) (modernism) Is he a trendsetter? "No… changes should be done in a linear kind of way, not very dramatically (i.e. Slow change). Because there are a lot of risks. I don't like to do something without knowing the risk I am taking."(Security)
33	1	Some cultures, like Greece, live in the past. Others, like UK and France, live in the future. Cyprus lives in the present. Cypriots don't adapt, change easily. (culture) Says his adaptability is his strength.
34	2	Must Cypriots change? "The Cypriot manager wants everything to pass through his own hands. (management) I think very few Cypriots have managed to get away from this tendency." "I have changed my mind compared to my father. He had it for certain that I was to follow his footsteps. I was the continuation. If I had not followed through he could've died. I say, if there's somebody better than my son who will continue the business let him continue. I can sell. To someone who likes it, who loves the job. Why should I force my kids to come here..." (family) "The mistake is that they don't continue to educate themselves (the older managers) (Old and new) Now, the new ones after us will contribute to change. Because more decentralization will happen in companies (management). Prefers "change. New technology, new ideas, man cannot be static. When waters are stagnant, things go bad"
35	3	Cypriots have no desire to change things. (culture) "The way of thinking (should change)….let people be... then we would achieve more."
36	2	"But times have changed, it's not easy to be a manufacturer in Cyprus, because of a lack of labor… we are a small country." (small)

**Adequacy judgment key: Strong = 1, Adequate = 2, Weak = 3, Don't know/can't tell = 4. This grading is based on a number of criteria, including leader remarks, observation and personal judgment.*

*** The identified recurring key concepts were placed in parentheses.*

The following patterns emerged from the analysis of 'change' for the studied Cypriot leaders.

a) The issue of change is crucial to them.

b) Change and culture are inevitably linked. The 'culture factor' repeatedly featured in leader responses. At least 22 out of the 36 leaders associated or related Cypriot culture with change.

c) The Cypriot leaders, being immersed in Cypriot culture, are certainly affected by the norms. Because Cyprus is generally a conservative society, many leaders are careful with change. Still, most profess an inclination toward change. Eighteen of them clearly state this, and only five leaders openly do not support much change (Leaders 7, 13, 14, 28, 29). In this latter group, Leaders 7, 13, 14 and 28 have taken over successful family businesses. Although none of these leaders have had 'very good' development, three of them have had 'good' development, an indication that their reluctance for change may have worked for them, to a degree. This is possibly because of the comparative uniqueness of their industries and relative lack of competitive pressure (a tannery, marble producer and bedding manufacturer). Still, it is useful to see an assessment of a typical Cyprus business by one of the latter leaders:

"In Cyprus, most are small businesses, like families right? And the son comes up in the business, but nothing much changes, because he has been trained by the old man to do things a certain way (family tradition prevails). The children finish their education, become directors, have a nice car, get married, have children and their life is settled for the next 40 years…" (Leader 29)

This same individual stated that he prefers stability because "it calms things down". In fact, many leaders prefer slow, steady changes. Leaders 4, 6, 8, 17, 20 and 26 expressly stated their desire for such step-by-step change.

Another leader (4) offered a good typical explanation, which he associated with culture. He said that Cyprus is changing from a 'Middle Eastern culture' to a 'European'. He explained Middle Eastern culture as representing family orientation, and more conservativeness regarding changes and technological advancements.

Another explanation to a seeming reluctance to change was attributed to the small size of the Cyprus market:

"I don't like very rapid change. I want us to grow fast but I realize the limitations of this market". (Leader 8)

This smallness is an oft-mentioned concern (Leaders 7, 8, 24, and 36 expressly mention this in association with 'change barriers'), as a reason why growth is stifled. According to several leaders (seven of them directly mention this), the fact that Cyprus is dominated by small businesses will negatively affect future prospects, unless something is done to change this trend. Some believe (e.g. leaders 3, 8, and 19) that many small businesses will close down; they won't be able to live up to competition, especially imported competition. This is an even bigger concern when the studied leaders consider our entry into the EU. A relevant search revealed a lot of concern. 83% (30 of 36) of the studied leaders refer to this matter in one way or another. Certainly there is more concern, than the opposite. Only three leaders (9, 30 and 33) see the European Union entry positively. Nine others are clearly concerned about this prospect. For example, Leader 12 fears that Europe will reveal our 'business weaknesses'. Below is a typical response:

"There are very few Cypriots who are *professionals* (my emphasis), that's another criticism. Our structure, if we are not very well *organized* (my emphasis), will suffer. Especially when we get into Europe. I am not sure about that, the EU… In Cyprus we don't have the background, or the knowledge or the infrastructure to really grow. The only thing that might work is services. Which foreign companies will come here? The raw materials must be imported, *productivity* (my emphasis) is not here (*i.e. high*), technology is not here (*i.e. high*), electricity is very expensive." (Leader 13)

The above shows that there is concern, that Europe will somehow expose this country's apparent lack of professionalism and productivity problems.

There is a tendency to shift blame for an apparent change for the worse to other external factors as well. *Government* takes much of the blame. Government is mentioned in 26 out of 36 documents (72%). Incredibly, twenty-three of those mentioning government gave negative remarks, some even directly blaming government for business decline.

Despite the aforementioned concerns, the studied Cypriot leaders are confident that they can cope with changes and crises. Perhaps this confidence can be attributed to knowledge. There is an understanding that change requires one to know where he is going. A blind plunge is not the way to go about it. A couple of examples:

"…If I don't know something it's hard for me to try it. I won't risk doing something I don't know just because someone told me to", says Leader 26.

"I wasn't scared, despite the big risk, because I had good knowledge, I was confident in what I was doing." (Leader 7)

Most respondents support the necessity of knowledge about a venture before one initiates it, thus taking a calculated risk (24/36 or 66.6%)[7]. This is in line with the individuals' guarded response to the necessity for change. One manager clearly states the relationship between caution, change and risk:

"… my personal opinion is that changes should be done in a linear kind of way, not very fast, or very dramatically. Because there are a lot of risks there. I don't like to do something without knowing the risk I am taking." (Leader 4)

The need for learning and knowledge is also reflected in the General Managers' behavior, especially regarding their travel habits. Twenty-seven of them clearly state that they travel on business or to exhibitions, and in most cases extensively. They go abroad to see how their international counterparts are progressing. There can be no doubt that there is influence from abroad at a practical and, also, academic level: The selected sample typically included a large number of graduates from overseas (10 from the UK and 10 from the USA).

Many leaders associated 'change' with another Cypriot cultural characteristic (perhaps a tying element or 'key concept'): Family and family orientation. A typical remark:

"…as things are today, it's very difficult to escape the family orientation of businesses. In some industries, the family basis in business will remain in the future as well. It is difficult… because of the amount of business in Cyprus (*not much*)." (Leader 34)

The central role of the family within the local social and business fabric is essentially taken for granted by the participants. They inevitably, somehow, associate family with their business, their values, and the necessity for change, their behavior and even their motivation and goals. Importantly, there is a persistent conviction, when the subject arises, that a consequence of this orientation is stifled growth (e.g. s: Leaders 2, 3, 4, 11, 17, 29) because it promotes a lack of professionalism. This professionalism, or rather its absence, is interpreted in several ways:

[I] A prolongation of family-based mismanagement. A typical quote:

"We are family operations, this must change. I don't see it continuing this way, because this stifles growth." (Leader 11)

[II] The employment and promotion of family members and friends who may not be as capable, thus holding down productivity. Nepotism and cronyism is reportedly rampant. A typical response:

"I think management in Cyprus is not professional. The manufacturing units of any business, footwear, clothing have been based on the 'family business' concept, which is very unproductive, in my opinion. That's one reason. The second reason is that workers aren't very professional themselves, they don't…" (Leader 3)

[III] The use of networking, rather than a good product or sound business practices in order to advance.

"We are also a family oriented society, helping relatives. Whatever you do here depends on contacts." (Leader 24)

Many leaders (for example, leaders 1, 2, 3, 12, 13, 17, 22 and 33) talk of two types of employees. They refer to the new employee who is not as loyal and also to an inner more trustworthy circle and another less trustworthy one. Often, the inner circle consists of family members.

"(The) trend is for staff to work less hours, not be so productive, to get more money". (Leader 2)

It is also seen as a gradual degradation of values, such as the old work ethic. Leader 13 says,

"Then (mid sixties) Cypriots were willing to work from early till late at night. Of course things have changed somewhat now. With the new generation the old Cypriot pride (is gone)".

Leader 32 reinforces this:

"I see changes in the youth, some principles have been sacrificed… respect…"

The aforementioned family orientation may extend to a paternalistic management style (e.g. leaders 8, 9, 21, 24, 26, 29, 31 and 32), where there are mutual expectations of long term employment and interpersonal involvement. However, a more rational management style is increasingly being favored. All are experienced decision-makers, there can be no doubt. But, only a very few exceptions (e.g. Leaders 28 and 30) may still be steadfastly adhering to old-fashioned arm-twisting methods. Again, there is a sense of change here:

"They *(managers)* are getting better because more of them are getting educated. The past ones were too tough on employees, they did not know much about psychology." (Leader 10)

Conclusions

Change and adaptability are key ingredients in the 'transformational' model of leadership, which is widely considered a more effective leadership style in most contexts (Lowe and Kroeck, 1996). As Kilduff and Day put it, 'chameleons' do get ahead, according to research (1994). Accepting change and dealing with it requires a lot of self-confidence, and leaders are ideally equipped, in terms of personality, to deal with it (Bowman, 1999). Leaders are 'reducers', who can handle complex, novel situations without impaired task performance, or cognitive disorganization, or health problems (Kets de Vries, 1989).

However, it must be said, even leaders within similar cultures can vary. This difference is much more emphatic when one crosses international borders. For example, Jim Durcan (1994) takes a 'cluster' approach to leadership. He describes Mediterranean leaders as 'insulating' employees from market fluctuations. Regarding change, it is the leader's job to make sense of it.

Nonetheless, primarily, one must keep in mind the pragmatic fact that leadership can be different in every situation (Saal and Knight, 1988). Also, that measures of effectiveness are very difficult to identify and isolate (Hogan, Curphy and Hogan, 1994).

Having clarified the above, some common factors did emerge in this study. Cypriot leaders do share some of the concerns and problems that their international counterparts are currently facing. For example, the issue of change, and dealing with it, is of global concern, not only of Cypriots.

The 'people' element has risen in importance in many countries, Cyprus included. The relevance between leadership and social skills has taken a central role (Abramson, 1999). Cypriot managers are coping well with the social-capital challenge. For instance, they can adapt well to varying social situations. Cyprus may be a small country, rendering contacts a crucial aspect of good business, but networking has attracted increasing global attention in recent years (e.g. Low and Macmillan, 1988; Sjarka J., 1990).

The studied leaders are able to deal with uncertainty and change [key leadership attributes] (Smith, 2000), even if they do so reluctantly. They give the impression that they understand that today's leader needs a new approach to that of 15 or 20 years ago (Horner, 1997). Cypriots recognize the necessity for change, and they are not standing still. Although they are careful, they do try to learn about future possibilities (Eisenbach, Watson., Pillai, 1999). They understand that now knowledge is a critical competitive factor (Kets de Vries, 1999), so they keep learning from abroad. They travel extensively; they know how foreign companies are being managed. They seem to want to make the necessary changes, while recognizing their own, and their country's, limitations.

Here, there is a group of individuals who are inevitably affected (and even afflicted in certain circumstances) by what is the Cypriot culture: A less than fully organized society, rather Middle Eastern-style, one could assert, which is intensely family oriented. Being as such implies that family and friends can take precedence before what may be called professional business behavior. As a result, these leaders are not beyond nepotism and cronyism, even if they recognize the need for change. Also, they often display some paternalistic leadership elements, sometimes being tough and sometimes soft, while all the time displaying real emotions about the business and its employees. Being somewhat casually organized, these people are not champion team builders.

But this culture is in a state of change, moving toward a more European model. A large number of individuals are formally learning their trade abroad, mainly in the USA and the UK. Moreover, through extensive travel, these businesspersons can be said to be receiving a continuing education from overseas. These leaders are standing at a vantage position: They can see what needs to be done, they are not ignorant; they know what they must do. Now they are changing, even if they are doing so cautiously. They, along with their culture, are resisting, yet they are changing.

The studied Cypriot business leaders are reluctant change catalysts, because they perceive stifled growth due to several factors: First, the 'new' Cypriot employee is not as productive or loyal as he used to be. Second, environmental factors, such as government and the smallness of the market, are real barriers to growth. And third, the imminent entry into the European Union, with the added competition, may entail negative repercussions, especially in the small business sector, which is the dominant one in Cyprus.

[5] The interview was supported by observation, mainly for triangulation purposes.

[6] Three companies are involved in both manufacturing and services.

[7] The other managers were not against the necessity for risk. They just did not expressly state the opposite. Only one respondent indirectly does so, saying he is conservative.

Constructing Communities: Advantage, Innovation and the Management of Local Economic Growth

John de la Mothe
University of Ottawa, Canada
Geoff Mallory
Open University, United Kingdom

Abstract

This paper discusses, in a preliminary way, the new dialogues that successful knowledge-intensive communities have adopted in order to achieve global business growth. Using empirical data on innovation from cities in Canada and the United States; innovation governance models from small and medium sized countries including Scotland, Denmark, Finland, Sweden; and using differences in technology sectors – particularly telecom and photonics – this paper will present some modest insights into the path dependencies of small firms, small nations and globally competitive innovations.

Introduction

Governance is about handling complexity. It is fundamentally about interdependences, linkages, networks, partnerships, co-evolution and mutual adjustment [1]. In international business studies, this set of facts is well known.

For Robert Putman, governance is about building a strong and active civil society[1] [8]. In his excellent study of the political economy of Italy, Making Democracy Work, [9] he details how bakers or priests can have more political and business decision-making power than mayors. Yet a stable civil society is sustained. He also documents how macro-fiscal and monetary policies can actively hinder the growth of firms, ensuring an economy of small firms – thus, they think, protecting Italy's rich culture - and inadvertently promoting the shifting of Italian multinational industrial investment and activity over the borders, to France and Switzerland and further afield.

For Richard Florida, the importance of place in a knowledge-driven economy is key [4]. Constructing communities involves developing an organizational ethos that now signifies successful firms, cities and regions. Florida refers to this clutch of ideas as 'the rise of the creative class'. On the surface of course, this basic presentation may seem facile and non-operational from an urban planning, mayoral and managerial perspective. However, if one were to look, even at the most elemental of ingredients, involved in creative knowledge-intensive communities, then we could boil it down to the availability of infrastructure (both physical and smart – i.e. connectivity), leadership, capital, and people. Urban planners, in Florida's world, might observe that quality of life, as represented by bike paths, a clean and recreational environment, safety, orchestras and other cultural venues – including blues and jazz clubs, good school, cinemas, a vibrant downtown, and so on all are attractive to highly educated workers.

Florida and Putman both understand that communities are based on adaptive relationships,[2] [2] networks and mutual interests.

In a networked economy, private ownership gives way to social space. Jeremy Rifkin refers to this as "the age of access". [10]. In a broad sense, one could differentiate between differing types of networks.

Rifkin likes to point to supplier networks in which organizations sub-contract for a range of inputs; to producer networks in which organizations pool their production facilities, financial resources, and human resources; to customer networks in which manufacturers, distributors, marketing channels, value-added re-sellers and end users work together; standard coalitions in which as many organizations as possible establish standards of practice around the industry leaders; and technology cooperation networks in which valuable knowledge and technical expertise is shared [11].

Using these ideas, this paper will sketch out some recent work on cities, the interactions between cities, and the governance of innovation in some smaller nations as they try to create communities in their quest to construct advantage around science, technology and knowledge.

The Case of Some Canadian Cities

Cities of course are at the heart of economic growth in any country. In 2001, the Canadian Advanced Technology Alliance (CATA) launched a series of TechAction Town Hall meetings. This was in partnership with KPMG and other industry sponsors and under the research design of John de la Mothe.

The TechAction Town Hall meetings, held across Canada, involved executive community stakeholders who gathered to voice their concerns and pool their ideas about how to stimulate innovation and knowledge-based industrial growth. The goal of this series was to create a community based consensual for specific actions to grow the community's use of high technology in the near future. The TechAction Town Hall meetings had two components:

1. An extensive survey of city executives and leaders, and
2. The business and community leadership surveys which were used to create an 'Action Blueprint' to advance community growth:

Here is a summary of some outcomes at the local level.

Calgary, Alberta

Having established an advanced technology centre, Calgary is confident in its capacity to innovate and that it will play a vital role in a national effort to improve innovation. Access to capital remains an issue. Calgary, however, possesses well-educated human resources, an adequate technical infrastructure and highly skilled leadership. Calgary's challenge is to put in place the financial measures to sustain its momentum in the coming decade.

Action Blueprint: Calgary's leaders decided to take the following steps to overcome their challenges in the five areas measured in the Survey:

- ?? People: improve management skill training
- ?? Infrastructure: Market Calgary's infrastructure advantages
- ?? Capital: Have government encourage venture capitalists to treat high tech in the same way as oil and gas
- ?? Leadership: Support and adjust taxes for early-stage business growth
- ?? Innovation: Provide more streamlined access to innovation programs

Halifax, Nova Scotia

Overall, technology business leaders are positive about the quality of life, social infrastructure and the education system in Halifax. Access to venture capital and interest from venture capital firms are seen as barriers to growth. The outlook, however, remains positive regarding regional innovation potential. Local leaders expect that a mix of government and public/private sector partnerships will help ensure that the required infrastructure is in place to support this anticipated success.

Action Blueprint:

- ?? People: Tie education more closely to employment needs
- ?? Infrastructure: Create a clear vision of our technology future
- ?? Capital: Create an angel investment community
- ?? Leadership: Move from silo mentality to a common branding for the community

Ottawa, Ontario – The Nation's Capital

Ottawa scores high in all growth components needed for the advanced technology sector. Access to capital, skilled human resources, technical infrastructure and leadership are ready at hand. Ottawa is also rated positively for quality of life and social infrastructure. Local firms, however, tend to raid fellow companies rather than rely on colleges and universities for new recruits. Ottawa's challenge today is to put in place the measures to sustain its momentum in the coming decade.

Action Blueprint:

- ?? People: Increase collaboration between industry and universities
- ?? Infrastructure: Re-instate support for broadband
- ?? Capital: Encourage investment related to the New Economy
- ?? Leadership: Create a benchmarking system to give foresight against the global best

Vancouver, British Columbia

Almost 90% of the Vancouver executives reported that they live and work in a vibrant and sustainable community, albeit due principally to neo-Ricardian comparative advantage, based on tourism, a deep harbor and natural resources. Although access to capital is an issue, more than half of Vancouver's business leaders are confident that the city is a global innovation leader, but based on what? Respondents advised the government to adopt an internationally competitive tax regime as its priority to ensure future innovation strength. Vancouver's greatest challenge today is to obtain capital for its continuing expansion.

Action Blueprint:

- ?? People: Identify Vancouver's priorities, and develop cross-disciplinary studies at universities
- ?? Infrastructure: Create physical and specialized infrastructure to energize specific clusters
- ?? Capital: Establish a method to allow individuals to share company risk, and reflect it in tax exemptions
- ?? Leadership: Create industry forums to encourage leadership and vision

In conclusion, understanding the strengths and challenges facing these cities -- and creating an Action Plan to resolve them -- is the most important single task facing communities today. Cities drive economic growth, in every advanced economy. While we often speak of growth in terms of national statistics, growth is in fact a local phenomenon.

Canadian cities contain 95% of all the businesses in the country. In today's global "smart" economy, it is more important than ever that our cities be given the best possible foundation to invent, grow, and generate the tax base on which all our social programs and our structure as a nation depend.

Let's move to another level, that of smaller region or nation states.

The Case of Scotland[3]

Scotland is a small regional economy which is cultural, historically and economically very community based. It is deeply enmeshed, as are many other advanced small and medium sized economies, in an important transformation as they develop and enter the global knowledge economy. Just since 1997 (1997=100), Scotland's Gross Domestic Product has grown to 113.3. However, agriculture, forestry and fishing has rested at 99.3. Production is down to 96. Construction has grown, throughout various business and investment cycles, to 106.1 while services – largely in such knowledge-intensive activities as ICT - have impressively outpaced other sectors by an indexed growth of 122.1 (Q4, 2002).[4] GDP per head is currently $US22,000 as compared with Canada which stands at $US26,000.

With a population of 5.5 million people, 30% are engaged in managerial or professional occupations. Yet it has a long term unemployment rate of 18.5%. The distribution of population is highly variable, with as many as 3300 people per square km. in Glasgow and only 8 in the Highland Council Area. And Scotland is losing an estimate of 250,000 persons to employment related emigration annually. Scotland has an international reputation for excellence in higher education[5] and since 1998 enrolments in ICT fields has increased by 45%. Scotland is home to 20% of UK biotech start-ups, and is the 6th largest equity market in Europe (managing about £350 billion in funds). But between biotech, optoelectronics, telecommunications and semiconductor fabrication, Scotland employs only 37,000 people (out of a labour force of 2.5 million).[6] Sixty-five per cent of Scotland's exports flow into the European Union, but the top service exports arise from non-knowledge intensive activities, such as tourism, (27%), oil and gas (23%), followed by banks, insurance, assurance, and higher education (32%). Computer and software services account for 18%. Thirty eight percent of manufactured exports come from Scottish office machinery.[7] However non-Scottish firms – such as Cisco, Motorola Lucent, IBM, Hewlett Packard and Compaq – dominate the Scottish tech sectors and manufacturing. They tend to be at the lower scale of production and towards the lesser value-added end of the R&D spectrum. Official Scottish documentation notes positively an ability to attract over 200 call centres, even though these have been shown to be highly mobile, low value-added, low paying and lacking in regional staying power[8][7]. Scottish productivity trails Finland, the Netherlands, Belgium, Germany, France and the United States. Its entrepreneurship index shows lower levels than the UK as a whole, and digital connections are two thirds those of London.[9]

Thus it can be succinctly stated that Scotland faces a number of issues as it transforms into a knowledge economy. The central challenges are related to how Scotland can:

(1) attract and retain talented labour,
(2) optimize knowledge spill-overs and value creation, and
(3) attract high value-added foreign direct investment.

All of these issues ask the question 'how can they construct community, and advantage.

In order to achieve this, Scottish Executive (regional government) and Scottish Enterprise have designed a number of policies and programs. It has a series of complementary activities, such as Scotland: A Global Connections Strategy (2001), A Smart, Successful Scotland (2001) and A Science Strategy for Scotland (2002). These documents illustrate the progress that has been made since devolution.

However, all the news is not good news. For example, the science strategy bears a remarkable and undifferentiated resemblance to the science strategies of a number of countries, including Canada, South Africa, Finland, Denmark, the Netherlands, and Australia. It lacks specificity to Scotland's unique capabilities, opportunities and challenges. It emphasizes schools and public awareness, but does not locate itself within the economic context of the entrepreneurial, innovative, knowledge-intensive future of Scotland. Direct comparisons are problematic in that independent data for example GERD/GDP, HQP/capita for Scotland are not yet available. Moreover, there seem to be major disconnects in the production and flow of value-added knowledge. For example Scottish universities, which are world renowned, also show disinclination towards collaboration with local players, especially other Scottish universities. International bi-lateral relations seem to be greatly preferred over multi-lateral research with local industry. The data displayed in Figure One illustrate this tendency.

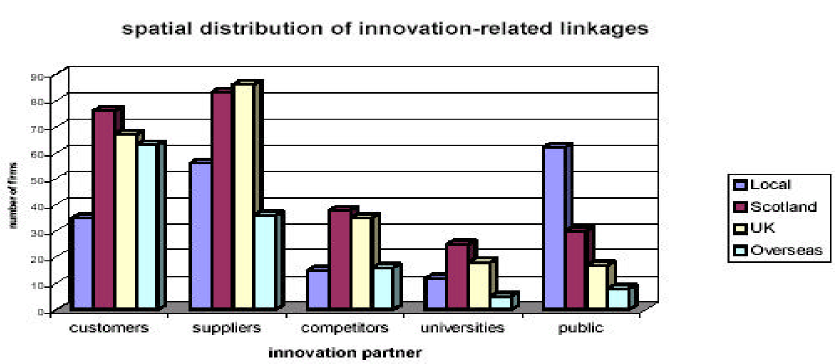

FIGURE 1

Scottish innovators rely more on distributed supply chains – notably distant final customers and on local suppliers for innovation, but not on local competitors, collaborators or universities. This eats away at efforts to construct community.

Put another way, the potential for building scale effects which are often required for competitive, world-playing (never mind world leading), research is largely missing. A similar tendency can be seen in the private sector, where pharmaceutical firms (for example) tend to situate themselves in stand-alone sites (not in science parks or knowledge communities) and deliberately separate research, development and design functions, only to distribute the value-added components abroad.

These types of examples, all gleaned from interviews with university officials, private sector executives and public servants in Scotland with the OECD Expert Panel, suggest that regions facing similar circumstances must adjust their longstanding commitment to a view of trade and production that is based on comparative advantage in which 'value-added' is defined in terms of 'what we have'. Nor can they, given a small domestic market base and population size, follow a strategy which centrally assumes scale and scope of either domestic consumer market or industrial capacity. Instead, they might well consider following a strategy of constructing advantage to maximize the impact of what they do as opposed to what they have.

A key factor we have identified as missing from the Scottish example is the notion of interactions.

Communities Interacting

Much of the popular literature on the global economy has emphasized the growing importance of interdependencies between regions and the speed of interaction because of information and communication technologies. Indeed, many of the citizens of OECD countries are now 'on-line' both at work and at home.[10] They're connected. Scotland and Canada are both nations that claim policy and government program success in connecting their citizens to the internet. But connectivity in and of itself does not lead to regional economic development. National initiatives need careful integration with local networks adding another layer of complexity to our argument.

Some influential contributions to this debate have in fact suggested that the nation state is dead.[11][5] This is clearly a non-sense. We should acknowledge that governance is more complex, involving the play between local institutions (firms, colleges, universities, city halls, local councils), regional governments, national governance bodies (including NGOs) and multinational agencies such as the EU and the WTO. But governance now is also more important.[12][3] Traditional arguments about industrial policy and top-down government intervention in the market place are now moot. But new arguments about innovation policy through which local ingenuity, entrepreneurial vigour and appetites, reach up and are met by regional and national government policies and programs which are adaptive enough to in essence become customized to local needs is now the way forward. Why is this?

Growth

Economic growth is local. National aggregate statistics notwithstanding, the causes – and benefits – of sustainable economic development are embedded in local institutions and people. In other words, if the OECD estimates that a country will experience growth of, say, 4% next year, no one expects this growth to be evenly distributed across every region. Growth is therefore 'lumpy'. Foreign investments, industrial concentration and talent agglomerate in areas that have prepared and culturally conducive institutions. We have seen this repeatedly in empirical studies, from comparisons of Route 128, Silicon Valley and science parks to numerous assessments of clusters and cities such as Dresden, Ottawa, Singapore and Austin.[13][12]

Location

In all of these studies, the readiness of local and regional economies has proven to be decisive. The role of robust and active governance – a matching of 'top-down' policy making and program design with 'bottom up' leadership and action – is key. Governance is no longer about picking winners but is one of backing leaders! Of course, on one level, this simple observation is not surprising given Marshall's work, a century ago, on industrial districts. In this important and well known work, the decision to locate a firm, to start a firm, the demand and supply of skilled labour, the draw on local and foreign investment capital, the inculcation of entrepreneurial drive, and so on… all relating to traditional factors of production….. were seen as key. This is still true. Manufacturing and primary services still matter. Indeed, these combinations of factors of production allowed trade patterns, based on local advantages such as natural resources, to be well understood. 'Value-added' was based on what was 'at hand' (an abundance of wood, marine life, coal, climate, and so on). Much of this, which can be noted here for its emphasis in terms of improvements of manufacture, improvements of technical skills, the development of local value chains, market access and trade profiles, can be linked with the work of the great Scottish political economist, Adam Smith.

Factors of Production

But what has dramatically changed since the time of Smith and his 'invisible hand,' has been a global and critical shift in the factors of production. No longer do we rely, either analytically or in terms of strategy, decision and policy, on simple capital and labour ($Q=f(KL)$ equilibria. Instead, knowledge is now added to the equation. Growth accounting has, since Solow, made knowledge and technology endogenous, not only in the eyes of economists but in the minds of policy makers.[14] Why is this so?

Knowledge

Knowledge is largely a public good. Unlike physical resources, it can be used and re-used over time without losing value. Intellectual property can be transferred locally and internationally without ownership being lost. Uncertainty is high in its production (i.e. research), but this drops rapidly as it is imitated and diffused. Of course, firms' pursue strategies of being world leaders, close followers, or imitators; each carries with it a variety of risk and investment requirements, particularly across industries. This in itself has significant implications for firms and regions. Traditional views of comparative advantage can be overturned by the governance of knowledge and innovation as can sources of advantage based on scale and size of domestic market.

Today, customization, niche production, knowledge and networks deliver increasing returns. The factors of production have changed and the contexts of smaller economies differ. In the cases of the Nordics, Scotland and Canada for example, proximity to the former Soviet Union, the United States, the United Kingdom or the European Union most assuredly have had an important impact on industrial performance and structure. The cases of Australia, South Africa, Singapore and Taiwan, for example, differ again, but not because of their immediate proximity to large markets but more because of colonial histories. All are small or medium-sized economies, lacking scale or scope in the traditional sense. But all are competitive in the global economy based on innovation and knowledge-intensive activities. Thus the question remains on the front burner of decision makers: 'given an uneven playing field in comparative terms and a deficiency of scale and scope, how can we build advantage in the new economy?'

Constructing Community and Advantage

Evidence shows that successful cities and regions understand that multiple levels of policy makers need to ask a series of ongoing questions. These could be stylized in the most simple of ways.

Q1: Why are people 'here' and why would people come and stay?

In Canada's eastern maritimes, the social demographic shows the highest number of universities per capita, the highest educated population and the highest aggregate level of unemployment in the country. This is because, while people are born in Nova Scotia, New Brunswick and Prince Edward Island, they move to Toronto or New York for graduate school and only return to the maritimes for retirement after a successful career elsewhere. From an economic development and innovation perspective, cultural charm and familial ties are therefore not enough. They will come however if there is opportunity for business development, risk capital and market access. Quality of life of course does matter, but for many people this means: is a place safe, can I run (ski, bike, walk), can I get to work easily and inexpensively (this is an issue for Londoners), etc. But from a talent/investment/growth point of view, this is a subsidiary issue.

Q2: Why is investment drawn into a region?

Responses to this question would include: access to smart people; access to infrastructure; access to leveraged funds; access to new and adaptive technologies, footholds into new and potential markets, and; a complementary regulatory regime. Moreover, branding efforts often ring hollow for investors. Where is 'silicon glen' in Scotland or why say 'the tartan tiger'? Incidentally, Canada, Wales and Ireland have also used the 'Tiger' metaphor despite the fact that no one has ever seen a tiger in any of these locales and even Dylan Thomas lamented about a ‘Wales without wolves.’[15] No one is looking for a tiger. They’re looking to invest in entrepreneurial opportunity, in locations that can grow smart firms, employ smart people, and to penetrate world markets. Regional and small national governments often fall into hyperbole. This actually deflects investment, perhaps attracting ‘vulture capital’ instead of venture capital. Gerhard Mencsh clearly understood this when he wrote his book on Stalemate in Technology in 1978.[16]

Q3: What should public decision makers do?

- ?? Recognize, deeply, the nature of innovation. Many do not. Underneath the obvious factors of production, innovation is based on risk, uncertainty, expertise, and networks. Sustainable communities are built on local networks and a spirit of collaboration. Public decision makers can play a critical role in this.
- ?? Engage local industries, university instructors, higher education leaders, not-for-profit organizations, youth groups.

How can these two basic proposals be conceptualized and achieved? One of course could easily fall into the thoughtful area of Schumpeter or Hayek. But practically we can say, ‘let’s look at our city, our region, our future, and our potential as a community.’ OK. We may wish to draw a diagram such as Figure 2.

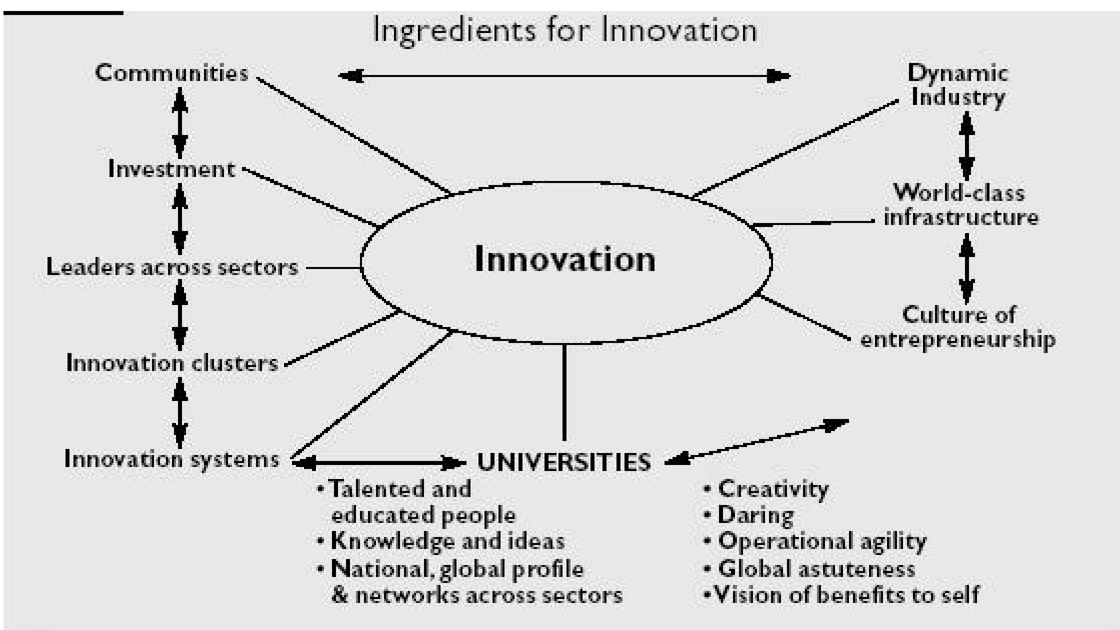

FIGURE 2

Source: Heather Munroe-Bloom, University of Toronto

What does this show? Not much maybe, but it does make us alive to the fact that creating communities and economic advantage is a ‘full contact sport’ and not an dry policy making exercise. For innovation and growth to occur, a region or a city needs collaborative relationships. Otherwise why stay, why commit, why invest? This simple figure actually challenges leaders and decision makers at every level.

One can see how this has been recently adopted, albeit not perfectly, by the City of Ottawa (Figure 3).

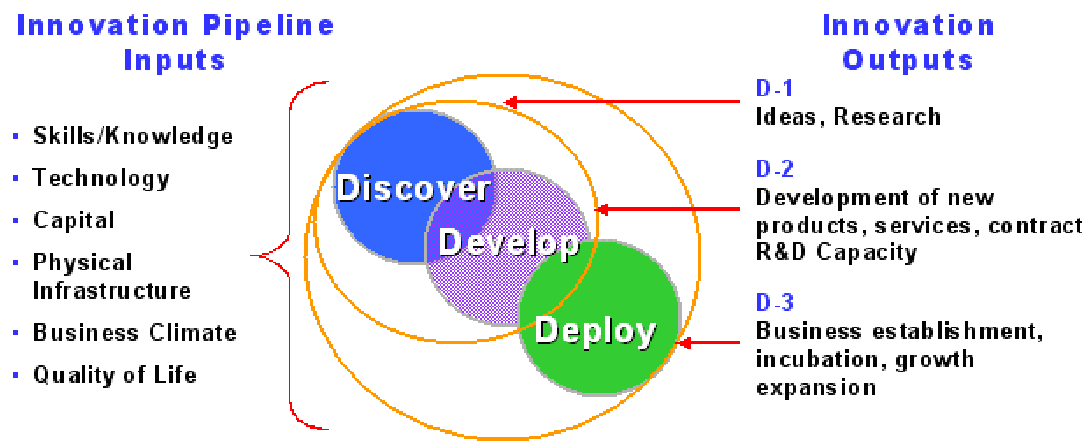

FIGURE 3.

Source: City of Ottawa, 2002

Thus we can draw some issues for regions and smaller states and point to some lessons from Canadian cities that are trying to develop.

A 'smart' region needs leadership from all local actors, firms, universities, government, and non-governmental organizations. This requires engagement, vision and debate in order to see your community as viable and vibrant in the global economy.

The innovative community also needs physical infrastructure, including airports, good roads, local amenities and institutions that offer support for investors and skilled people. Investment today is <u>not</u> going into New Haven even though it has Yale University and it is close to New York City. This is because the city has not dealt with the crime rate, has not dealt with re-vitalizing the downtown core through renovation, and only one airline goes into Tweed International Airport so it is hard to get to. Instead, Newark is getting tremendous investment and inflow of talent because of it's ease of access, proximity to New York (20 minutes), good schools (Rutgers and Princeton are near), and so on.

Coordination Between National and Regional Actors

An important element on constructing communities is one we alluded to earlier; linking regional actors with national policy institutions and frameworks which are becoming a increasingly strong force in research and innovation. However regions and smaller nations differ enormously. This can be seen in the next exhibit.

This indicates that there only two countries with a strong interaction between the national and regional level: Sweden and the UK. In Sweden the entry of the county as a regional actor is quite new, and at the same time these counties have little powers and funding. The picture in the UK is more complicated with some regions having had a strong independent position (Scotland and Wales) in innovation, whereas the English regional policies such as the recent Yorkshire Forward initiative are newcomers to this field.

In 1998, the Swedish Government introduced a new regional industrial policy. Based on the prevailing conditions of each individual region, the aim of the policy is to stimulate sustainable economic development that will spawn more companies and help existing enterprises expand. At the same time, regional 'growth agreements' were also introduced to facilitate implementation of the new policy.

	Co-ordination national regional
Canada	?? Strong State involvement in knowledge production, but concentrated in Ontario, B.C. and Quebec ?? Little co-ordination between federal and regional policies
Denmark	?? Activities of regional actors dispersed over counties and local communities and often sub-critical (small budgets) ?? National level attempts to help co-ordinate within and between counties
Finland	?? R&D heavily concentrated in few areas (Helsinki, Tampere, Olou) ?? Activities of regional actors dispersed over counties and local communities and often sub-critical (small budgets) ?? ST&I responsibilities very centralised at national level
Ireland	?? ST&I responsibilities very centralised at national level and implemented by regionally allocated agencies
Sweden	?? Strong co-ordination national regional Research and innovation strategies ?? Regional Performance contracts
United Kingdom	?? The Regional Development Agencies are a relatively new actor with increasing innovation budgets ?? Aimed to deliver research and innovation services from DTI ?? Strong interaction with DTI ?? In Wales and Scotland strong Development Agencies who work quite independently

A growth agreement must be primarily based on a fundamental analysis of the business development prerequisites in the region. Based on the analysis, a development program is formulated aimed at utilizing the identified opportunities and satisfying the need for measures to promote business sector growth.

According to the Swedish Ministry of Industry the encouragement of a cross-sectoral approach to regional growth and development means that multi-sectoral collaboration should also be intensified between the various Swedish ministries. For this reason a special committee consisting primarily of the state secretaries from various ministries has been set up. Most of the ministries are represented on this committee, which has the overall responsibility for co-ordinating issues relating to growth and employment policies within the Government Offices.

When the new UK government came into office in 1997, it was committed to create a new level of regional administration across England. This was both an attempt to emulate the economic success achieved in Wales and Scotland and provide some psychological balance to offset the creation of the regional assemblies in NI, Scotland and Wales. The new regional development agencies (RDAs) were given an economic development brief by London. Over time, the RDAs have seen their 'innovation' budget grow. A series of national innovation funds (Competitiveness Development Fund, Innovation Clusters Fund, Regional Innovation Fund) has been launched, each one larger than the last, and each one more open in terms of the conditions set by the Treasury and DTI (the source of the funding).

As the RDA innovation budgets have increased, so the central DTI budget has been squeezed to the point that its enterprise budget (£330 million) is almost entirely expended through regional delivery channels. In practice, central government expects a growing share of innovation support activities to be determined and delivered locally (most RDAs now have a Science Council).

The Innovation Liaison group (meets quarterly), which is coordinated by the DTI and involves officials from London and the regional Government Offices in discussing policy needs and instruments (to minimize overlaps and underlaps) has been opened up to the RDAs. This has proved popular and there is talk of strengthening the mechanism through the creation of a high-level steering group with its own budget.

Some Observations for Strategy and Global Business

Rather than develop a formal conclusion to this paper it is perhaps more appropriate to briefly summarize the argument and make some observations on the implications of our analysis for strategy makers in firms.

At a very basic level we suggest that economic growth is lumpy and occurs within countries and regions but is actually centered on cities. We argue that 'smart' cities i.e. those with good infrastructure, smart people and capital are capable of generating significant economic growth as traditional sources of competitive advantage, based on national sources of comparative advantage or on scale benefits disappear as the global economy shifts.

Instead we suggest that policy makers turn their attention towards constructing sources of competitive advantage. The process we envisage, and the basis of our questions is focused not only on a policy debate between regional city and national governance systems, itself quite a distinctive idea, but also with other interested stakeholders; most notably with sources of inward direct investment i.e. firms and their managers.

Culture and Business

Alessio Lokar
University of Udine, Italy

Abstract

There is a revival of interest in the role of culture in many areas of scholarly endeavour, from history to business. But the meanings of the words are often generic and not very accurate. In this paper we try to deepen this understanding on the subject by reassessing the definition of culture in different context. Starting with the definitions, we wide to similar and related concepts and meanings, which are used nowadays in many areas of interest including business. A substantial part of the paper is devoted to considerations regarding the time impact of culture. Finally, we look into the theoretical instruments developed in order to explain some recent cases from the fields of historical and business studies.

I. Introduction

The role of culture as a motivation factor for human activity is nowadays very much reappraised, with the economic area of interest not excluded. But the reciprocal influence between cultural background and human activities may be complex. Therefore, it is not without importance to try to reassess the subject as a whole. The present paper will try to carry out some steps in this direction, considering the following aspects of the problematic: [a] culture defining; [b] building stones of culture; [c] consequences for business and other areas of application; [d] discussion of cases from the business world and from other areas of human endeavour.

2. What is Culture?

In order to define culture we can start with semantics. This is useful, because it gives us a point of view on the evolution of the concept by means of the evolution of the word. The word derives from the Latin term "colere" , bearing past participles "cultum" and "cultus", meaning "to cultivate", "cultivated".

2.1. Agriculture

Hence, the first insight goes to agriculture, farming. Agriculture means the transformation of earth's surface or soil, from one kept "wild", like a forest, prairie or desert, into a worked out area, generating crops.

2.2. Education

If we use the term without the farming context, singled out by the prefix "agri", then we have in mind not a physical soil, but a human one, i.e., what classical thinkers called soul, and modern ones prefer to call brain and/or body of a person. The term "personal culture"[i], for instance, is a widely diffused concept. Personal culture is obtained through the process normally called education. Education means not leaving a person in a primitive or wild condition like a desert or a forest, but transforming him or her by means of a behavioural discipline and informing by knowledge. Similarly as a cultivated soil, also a cultivated person is expected to bring some kind of crops, as a result of the cultivation. Of course, cultural crops have a wider diapason than agricultural ones. They can stay in any area of human endeavour, from art, to science, political results and other kinds of spiritual achievements. Personal culture includes also physical culture, where "crops" refer to body achievements, like body form, sporting activities, strength, health.

2.3. Colonization

From the Latin "incolere", a derivation of "colere", comes "incola" which means colonizer, settler. Also here the meaning is easily understood: given an area in wild uncultivated conditions, people move in, settling and becoming colonizers. Originally, it has a benign meaning, considering that colonizers are doing something positive to the area, improving its conditions. But cultivating often cannot be done without exploiting, therefore, especially today, colonizers and colonizing got also a negative popularity.

Wild area colonizers settle down and some of the settlements grow to the size of cities. In Latin the city inhabitant was called "cives", which has approximately the modern meaning of citizen and generalizing becomes civilization, a term with a meaning not far from culture. There is a difference between the two terms, civilization refers more to the instrumental part of the meaning and culture is connected more with the informational part of it. As a matter of fact, the two terms overlap very often

3. The anthropological point of view

Between sciences, Anthropology is considered as the "science of man", but, as a matter of fact, it is the science of culture. Man indeed, may be divided in two parts, one merely biological, by which it is part of the so called biosphere, or biological world. In that sense man is similar to his biological relatives, plants and animals. But, as a difference to the biological part, man is also part of another realm, the realm of thought and spirit, the noosphere, as it was called by the French philosopher Teilhard de Chardin[ii] [iii].

The great modern discoveries of the DNA and of the genetic code, connected with the biological aspect of man, make it possible to reach a systemic generalization, regarding the meaning of man and culture[iv]. Modern discoveries have revealed that the genetic code is nothing else than a "script" or "information", we can also say, a "data base", or a "program", of the given biological item. The same is true for all living beings. We can generalize this by saying that the whole biosphere is constituted of information codified in the particular biological code. The evolution of this code in long epochs brought to the formation of all living subjects on earth's surface comprised also man. In this sense man is a part of the biological realm or biosphere. The biological kind of writing information has many advantages: we can see it by the development and existence of billions of living species and individuals on earth. But it bears also a remarkable disadvantage, which can be very easily envisaged: if a transformation is asked for by evolution, it can be obtained only by creating new species in a physical sense. For instance, if there are defects on a species, it can be changed only physically, taking a long effort to get it.

On the other hand, man has the possibility to gather and transform information in a way which is much more easily achieved without the mentioned physical disadvantage: he does it by the help of organs where information can be stored and transformed with less effort than by the genetic code. They are the brain and the memory as part of the brain. As at the birth of the individuals, memory is empty [or almost empty]; it must be afterwards filled with information of any kind. We can call the information accumulated in a man's memory, using the term culture. Namely it is not only a random gathering of information, but it is structured in many different ways. In order to obtain the ordered accumulation of information we need the process of cultivation – education. Consequently, we can call culture the ordered information present in man's memory, used as a program for activities. Culture is therefore the part of the information regarding man, which is present in man's memory, but not the one present in his genetic set. This is true for each individual. Anthropologists use a similar categorization of culture, as we followed above. They start with the biological base of mankind; speak about language learning, enculturation process, social, technological and ideological systems. This last part is particularly important. Inside this part we find also the religious relevance of culture. A most general term to signify religion is "cult", which is derived from the same root as culture.

3.1 Culture as a collective memory

Culture also has a very strong collective impact. This comes from the fact that individual memory has limited capability, and single persons specialize in different activities: therefore the one gathers more knowledge in one sector and the other one in the other. Not a single man but all together have the total memory of things. Culture is therefore both individual and collective. Between the whole and the individuals, subcultures can be envisaged: cultures owned by smaller groups of people than the whole, like for instance, single nations or a business. In such cases we speak of group culture. Culture is a pattern of beliefs and expectations shared by people[v].

3.2 Culture in Business and Management Sciences

Management sciences take its knowledge of culture from Anthropology. For instance, one of the branches of Management, International Marketing, offers normally to students a full chapter regarding culture[vi] subdividing it in the following building blocks: Technology and Material Culture, Language, Aesthetics, Education, Religion, Attitudes and Values, Social Organization, Political – Legal Aspects. This categorization is again similar to the one which we already saw above.In the business area culture is mentioned at several points of the subject. A very important part of the business system is the Marketing System. Hyperbolically, but effectively, we can say that it is the weaponry used by business to conquer customers and markets[vii]. Therefore, it is undoubtedly, a central part of the business system, even if it is not the whole of it. The elements of the marketing system are shown in Fig. 1 As elements of the system we can enucleate the active variables, or Marketing Mix, called also the 4 Ps:

1. Product and/or Service
2. Price
3. Place or Distribution
4. Promotion

And the passive or environmental variables, categorized as follows:

1. Macro:
1.1. Demo – Geography
1.2. Income and its distribution
1.3. Policy and laws
1.4. Culture
1.5. Technology
1.6. Natural Environment
2. Micro:
2.1. Suppliers
2.2. Middlemen
2.3. Corporate Culture
2.4. Competitors
2.5. Clients.

Considering in detail the above system, we can see that culture is a variable, mentioned two times in the listing. It is mentioned at point 1.4. as a macro variable and at point 2.3. as a micro variable of the environment. Point 1.4. references to an individual impact of culture: customer behaviour and his buying decisions. The business actor must know the cultural impact, if he wants the customer to take into account his offers. Point 2.3. refers to culture as a collective impact inside the company, influencing business decision making, regarding active variables of marketing, i.e.: the mix: product, price, distribution and promotion. Some companies prefer to do business with people they know[viii].This is at a first level of influence. But culture influences also the other Marketing variables, even if not in so direct a way. For instance, the geographic and demographic characteristics of the customer depend in part also on the cultural characteristics of the population.

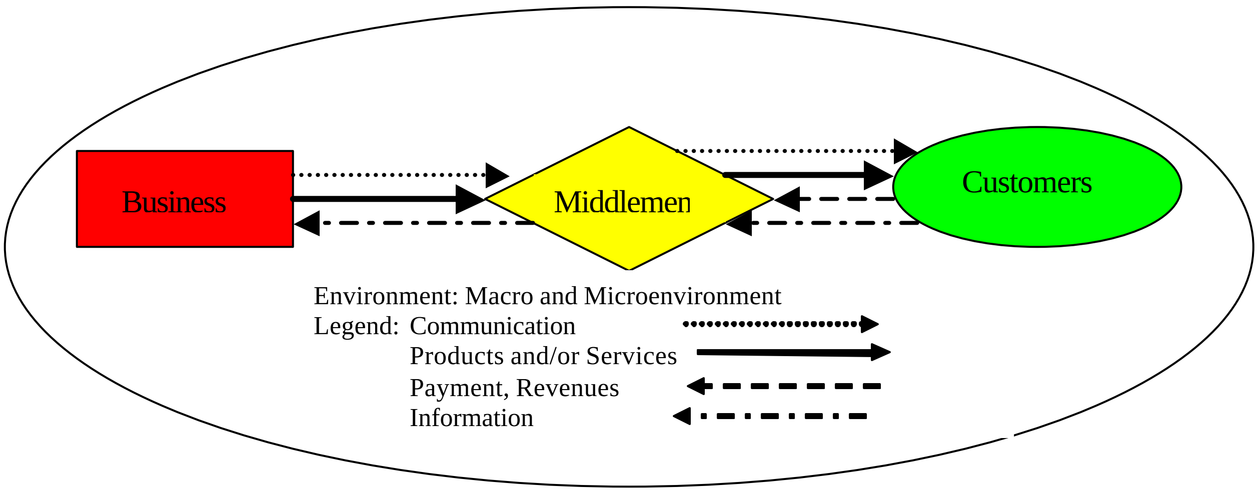

FIG. 1 THE BUSINESS MARKETING SYSTE

Let's consider only a trend, typical for Mediterranean areas, where most people live clustered in localities, whereas populations with cultural characteristics typical for Northern areas, either in Europe or in America, often prefer isolated home dwellings. The two types of culture have different consequences on customer demand. For instance, people living in isolated homes need different furniture, than people living in flats. Also income depends on culture: there is a positive correlation between income and education level, which is connected with culture. Here, again, culture has an individual impact.

The policy of a country and her laws depend on the kind of the prevalent local culture. Similar considerations could be thought also of other variables taken into account by the marketing system, like natural environment, suppliers, middlemen, competitors and others.

Hence, it is possible to state that culture stays in the forefront of some business variables but to a stronger or lesser extent it stays in the background of almost all of them: the business decisions, both from the point of view of offer and demand, are to some degree connected with player culture. It is relevant therefore, to understand with more detail the role of culture in the system.

3.3. Language

In order to create the collective culture, and when it is created to participate to it, language is needed for the sharing of information between individuals. A language is an ensemble of sounds with conventional meaning. The conventional aspect of language can be deduced by the fact that we don't know a foreign language, as we don't know the conventions at the root of it, but with some effort we can learn them. Language has not only a semantic impact but also a structural one: it is a collection of sounds united in words by using semantic and syntactic rules. Language is often defined as mirror of a given culture[ix], as it contains meanings and structures unique to the culture or subculture. There is a trend between scholars therefore, to study cultures mostly by studying languages. Language is very important an expression of culture, but it is questionable if it represents and exhausts all the building blocks of a culture. Similarly to subcultures there exist also sublanguages, for instance, dialects.

Hall[x] for example, divides cultures in two groups: low and high context. This idea has to do more with the use of language in a given culture, than with the semantic and syntactic aspects of it. By Hall's view low context cultures are those in which speakers express everything they like to tell with words and phrases of the language. So the receiver of the communication has just to listen to the words to know what was communicated to him. In high context languages to the opposite, words and phrases don't suffice. It is important also to observe the context in which things are told, stresses, accents, posture of the body, gestures. The receiver of the message has to evaluate all this aspects together in order to get the full meaning. Of course, in every communication process the context has a role, but in certain cases it may be paramount. These are the cases pointed out by Hall.

3.4. Artificial memories

One of the most important achieves of mankind is the creation and development of artificial memories. This was possible with script invention. Historically we can list in sequence the following means: wood, clay tables, stone, papyrus, parchments, books, magnetic tapes and disks, CD ROMs, DVDs and the related script systems: pictograms, ideograms, hieroglyphs, alphabets. Artificial memories have had an enormous impact on the widening of individual and collective culture, as they can store more information than the single brain memory; all of them they are storing the whole of culture, indeed.

3.5. Time dimension of culture

The justification of the time dimension of culture comes from the following consideration: cultivation is not possible in one instant, but it takes time. Only in a year period a wild soil can be brought to crops, many years are needed to colonize an area, even longer periods could be asked for, in order to educate persons and/or groups. The total culture of mankind has been accumulated during tens of thousands of years. In order to show this aspect, we will treat culture in its collective aspect. Hence, we will not speak of the culture of one person, but of group culture, or even mankind as a whole, treating it from a historical point of view.

History of culture could be carried out through a complex and detailed description, which would take not an article, but many books. But, I believe, it is also possible to make a simplified synthesis, which is lacking on details, but offers some basic patterns, in order to get useful comprehension of the basics of the phenomenon. In order to treat this aspect, let's start with some technological considerations. Already Karl Marx[xi] stated that civilizations are induced by what he called "production means", meaning, as a matter of fact, that every particular form of culture or

civilization, depend on the measures and instruments people use for their survival. With other words, we could say, that technology in the wide sense of the word, is compelling a given culture to develop within some limits given by the technological methods and instruments used by the given community.
The technological consideration is at the base, explaining the material forms and aspects of a culture. But men living in given conditions develop the ideological super structure, which is also something typical for every kind of culture and between them an important role is played by the form of religion, which is particular to a given culture or civilization. Therefore, I believe that a culture can be determined by its material means, from one side, and by the description of its basic ideology or religion, from the other. Technology is needed for survival, but why is religion developed by every culture, as it seems not to be needed for survival? An explanation could be the following one: by means of its material instruments men of every culture are trying to survive in the environment where they are dipped in. The technological means, representing the material part of the particular culture represent the survival means from one part, but the limit to the feasible from the other. The limit is a border to the still possible and to the impossible. Reaching this border by a man or a collective the maximum success is obtained, but also failure and death are close: it is a border between living and not living, which can be fully bridged only by ideological projections. Religion is the part of culture dealing with what happens on this border and on the other side of it, where it is not possible to go in the earthly form. To describe it we use again a Latin term: "transcend ere", meaning, the things existing on the other side of the culture border.
The border exists for every culture experienced until now; therefore every culture builds up its form of religion. The imaginative forms of it depend on what factually every culture experiences on this border. From the technological and ideological point of view, human history, as a whole, can be subdivided, by a first approximation, in three large periods: the period of nomadic tribes, the period of agriculture and that of modernity[xii].

3.6. Nomadic period

In this first epoch of history, people were compelled to move through the territory for the simple technological reason, that after a time they exhausted the crops offered by nature alone in a given area. When products were exhausted, they had to move from the old area into a new one, where crops were abundant or still present. This is due to the fact that in this period, men were able to use only the crops offered by nature alone, the so called natural resources. They were therefore bound in a given place to the existence of them. To survive and to be a winner in such an environment they had to organize themselves in small tribes under unitary command, as quick decisions were winning over slow moving. The positive aspect of such kind of life was given by logistic freedom either for the tribe as a whole, as also, to a lesser degree, for the individuals. But the freedom had to be paid off by risk. Risk came at the border, which we mentioned before, and was mostly provoked by environmental forces. The environment was to a large extent inimical due to natural forces: wild animals, catastrophes, battles with competing tribes for the few resources. Religion was a projection cross this border related to the dangerous forces lurking there, that couldn't be tamed: animals, woods, rivers, mountains and similar. At the beginning of human history, all people lived in nomadic conditions. Afterwards the number of nomadic tribes dwindled, but even nowadays we can find some population examples of this kind of culture.
Another important point not to forget is the following one: there was an evolution in time of the nomadic kind of culture. At the beginning we have very primitive forms; at the end we find more complex and sophisticated ones. I think that this evolution had to do with the improvement and risk reduction of nomadic life, using the technological survival means at disposal to mankind at this evolution step.

3.7. Agricultural period

Agriculture was initially possible only on particular places. This is due to the technological fact that soil needs to be fertilized, if crops should be obtained again in time. Agricultural crops exhaust soil very quickly, and we cannot continue to plant in the same area, but have to move further, giving again place to a kind of nomadic behaviour, even if to a lesser extent than the original one, bound to gathering and/or stock rising. This kind of agriculture is an intermediate form between the nomadic and the agricultural way of life. But there are certain particular areas, especially along large rivers, like Nile, Mesopotamia, Hindus and others, where soil fertilization happens naturally, mostly by flooding periodically. These were the first places on earth where it was possible to plant crops on the same area over and over in time. Here, for the same reason, people could settle in a steady fashion. They didn't have to move again and again, but just stay and work on the same place. This technological situation created a new cultural phase, which removed the risk of the nomadic life, but it had to be paid off by another undesirable effect: work compulsion for the vast majority of the population and hence the loosing of individual and/or collective freedom. This is due to the fact that through simple soil cultivation one person can produce only a little more of what he needs for survival: only a surplus which is relatively small. Seen from the point of view of the collective, hence we have the following condition: the large majority of the population must be applied on doing the agricultural work in order to guarantee subsistence of the group as a whole and in order to create the surplus. If we want more exceed, more people must be engaged in work. This is the reason why rural societies organized themselves mostly in large sizes, differently than nomadic ones.

The other aspects of this kind of civilization comes out from the use of the surplus: namely, it makes possible to free a small share of the population from subsistence work, feeding also some trade flows, exchanging crops for products not produced by the given population. Agricultural civilization develops a basic injustice between its members, as most of them are compelled to carry out the basic work and a small number is exonerated of it. But there is little choice to this situation. This is again a border situation, which people tried to cross by transcendence. From a practical point of view it worked very logically: the elite started to justify its being spared of the worst labour, by involving patron deities. Gradually a civilization evolved where priests were dwelling at the centre of the elite group and on wider circles there were to be found other kind of specialists not directly involved in the hardest activities: scribes, accountants, military, teachers, and merchants, all of them needed by the given community for special reasons. The social structure of such societies can be illustrated as a hierarchic pyramid[xiii] with a few people on the top and many at the bottom. Such a society needed religion in first place in order to give a sense to the existence of the pyramidal structure and in order to transcend it.

I understand that this kind of analysis is very similar to the one developed by Marxists in 1800. The difference is maybe only in the fact that Marxists thought that the ideology permeating the agricultural societies was mostly a lie, used by the elites to quiet down the bulk of the population. But I think that it was something more than a lie, it was a need of the society, as a consequence of the basic technological conditions. It was an ideological superstructure needed by the agricultural civilization to maintain its overall equilibrium.

Again, like we saw it for the nomadic tribes, we must say here that also agricultural societies evolved in time: the first ones were primitive if compared to the late ones. For example mankind learned how to extend farming also to areas without natural fertilization of the soil. With time people learned how to produce more and more surplus, liberating more and more persons from farm compulsion. Some two, three centuries ago the majority of mankind lived in the conditions typical for the agricultural society, nowadays this kind of culture is still present in vast areas of the globe, but it is minority and it is loosing ground to modern society.

3.8. Modernity

The contrast between the agricultural civilization and the modern one is what we normally describe as third versus first world, developing versus industrialized countries, South versus North of the equator. In all these areas, as such third world, developing countries, south of the equator, we observe one common indicator: a higher percentage of population involved in farm activities.

Modern culture started to emerge in Europe in 1500. It is not easy to explain what exactly modernity is in contrast to the older forms. The reason is that stages 3.1. and 3.2. of development stay in a historical perspective and we see not only the single trees, but also the wood as a whole. We are not in such a fortunate position with reference to the modern epoch. As far as material culture is concerned, we can say that there was a tremendous evolution of science and technology, making it possible to create survival surplus in unlimited size. In a first world country, for instance, some 1 to 2 percent of the population may create agricultural surplus in such quantity that it is enough for the rest 98 percent of the population, and there is also enough for export. Machines substitute almost the whole heavy work needed, once performed by hands. If you need a trench around your house, you just call a company with machines and in few hours it will be dug out. Mesopotamian farmers 4.000 years ago had to do it by human force and simple instruments. The consequence of it is that almost the majority of the population of a modern country is living in circumstances once typical for elites. It is interesting also what happened to religion: it lost its social importance and it acquired a new one, very individual and intimate. The forces unbound by modernity are so vast and strong that we don't see very clearly a border imposing a limit to its development and hence the need of religion in its original form seems to be lower than once. The impression is that everything can be solved without the intervention of some transcendental entities. But we must not forget that modernity started with a religious revolution: the demand of freeing Christianity of the forms acquired during the agricultural epoch, benchmarked to the pure evangelical standard. Religion didn't disappear, because also modern culture didn't solve all human problems. Also modern culture has borders, even if we don't see them so clearly as those of the older cultures.

What we can observe is that modern culture is winning ground to the older ones. It is conquering heads and hearts of people still living in old kind of circumstances. The phenomenon is apparent from several indicators: mobility patterns of emigrants abandoning areas where modern way of life doesn't advance quickly enough, sudden take-offs to modernity in countries with traditional ways of life[xiv], wars which can be more and more explained as clashes of modern and older civilizations[xv].

3.9. Modern culture and business

Development, or better, explosion of international business is tightly related to two conditions: fast advancement in field of communications and in field of transportation. Development of communication and transportation permitted quick transfer of information and people. Physical proximity did not matter any more. Companies went outsourcing in order to obtain cost savings, while technology permitted them to maintain tight control of subsidiaries.

On the other hand, enhanced flow of information created another effect. It made possible that people from very distant part of world have access to the same information, what led to convergence in general trends in politics, sociology and economy. On the first spot, it seemed that culture started to lose importance as an issue in international business. But, it is not so. In the field of business, for example, it could be said that every culture has developed through its own history some specific and unique insight into the managing of organisations. At the same time, any single cultural model may become pathological when pushed to its extreme. There lies undiscovered opportunities and threats of international management[xvi].Comparative research shows that managers from different national cultures hold different assumptions as to management and organisation. These assumptions shape different value systems and get translated into different management and organisational practice. The assumptions and values of the local designers could be highly meaningful and effective for the home country, but possibly meaningless, confusing, and ineffective for another country. In order to build, maintain, and develop their corporate identity, multinational companies need to strive for consistency in their ways of managing on the world-wide basis. Yet, and in order to be effective locally, they also need to adopt those ways to the specific local cultural requirements. In other words, while global nature of the business could call for increased consistency, the variety of cultural environment may be calling for differentiation.

3.10. The Hofstedian model applied to the historical approach to culture

An interesting contribution to the differences between cultures was given by Geert Hofstede[xvii]. He pointed out some variables which distinguish different cultures: [a] hierarchic distance, [b] uncertainty control, [c] individualism, [d] masculinity and [e] orientation to the long or term in achieving goals. It is easy to see that they differ a lot between the three cultural models hitherto proposed. Table N.1. is showing these differences.

TABLE 1. CROSS SECTION BETWEEN THREE HISTORICAL, CULTURAL AND HOFSTEDIAN VARIABLES.

Cultural models	[a]	[b]	[c]	[d]	[e]
Nomadic	low	low	Middle	high	low
Agriculture	high	high	Low	middle	high
Modern	low	middle	high	middle	low

If we are not sure what the characteristics of a given culture are, which we are studying, we can use the Hofstedian model in order to characterize it.

Case discussion

Readers of this paper will probably say that the evolutionary process of culture development described here is to sketchy, lacking of a full wealth of details, which are very important to have a true picture of what happened, and I would mostly agree with such an opinion. The proposed model offers only some basic considerations, which would need to be developed in many more detail[xviii], in order to explain the relationship between old and modern culture and all the happenings in between and in particular places. But even in such a wide painting the basic ideas, coming out of the picture can help to explain present facts either in history as a whole, or in Business Management, as special discipline. I would like to make some examples:

Some Authors sustain the thesis that modernity is also the end of history[xix]. In my opinion this thesis can have an explanation by means of the historical cultural models proposed above. The perspective of traditional history was mostly that of nomadic and agricultural worlds. It described the situations and the changes of these worlds. These changes happened mostly through wars between nomadic and agricultural realms and between agricultural realms themselves. In these species of wars there is mostly the telling of how one king won against another one, conquering his realm. Historical changes had very much a physical character. In modern times changes remain, but their character is becoming step-wise different, less and less physical. In this sense, for instance, I believe that World War Second was fought with modern means, but with old ideology. Hitler, for instance wanted to conquer physically the so called "Lebensraum"[xx]. The idea is a typical old time culture baby. Modern conquests are different.

As I mentioned above, it is not easy to show the characteristics of modernity, because we lack of historical perspective. Our time is still a blend of old and new, and these elements are mixing before of our eyes. But an example of the new may be the creating and the developing of the EU. Hitler wanted to conquer Europe but couldn't realize it with physical means, whereas it is nowadays happening under our eyes, by new means. The conquest is not based on armies but on bureaucracy and economy. Compulsion didn't disappear, but changed in character. If the old kind of wars were considered as quintessential to history, history nowadays would change so much, that it is possible to state that it disappeared. Modern conquest is a war without casualties, but with much paperwork. The point is that it is probably hard to write a historically interesting book of this kind of happening, as we are used to Napoleonic style of wars.

One of the main problems of International Marketing and of the so called problem of Globalisation is the following one: should we create standard products for the whole world, or is better to adapt them to local conditions? In the first case, we globalise strictly, in the second we accept the presence of local cultures to some degree diverse. The question has an economic payoff: if we go standard, we get economies of scale, reducing costs per item, but we may lack in depth of market conquer, addressing only small market segments in a given country, in the second case, we may reach more in the deep and hence sell more, but the product must be transformed opportunely with more costs. The right decision depends on many factors, but the final answer to the question depends also on the evolution of the market segments in a given country. Also in the most traditional areas we have some islands where modern culture tends to emerge, mostly in the cities, gradually catching out the old ones, which are mostly bound to the countryside. If the advancement of modern culture in a given country is dynamic, for instance, it may be better to plan the introduction of standard products. If it is less dynamic, the decision maker must consider the choice between the alternatives of skipping the particular market, or maintaining it in the international portfolio, but adapting the products to local culture and hence bearing higher costs to that regard.

The difference between old and modern culture may be used also to explain Hall's difference between high and low contest languages. In the agricultural stage there was a trend toward pyramidal hierarchy, as we saw, and in parallel with it also to crystallization of social behaviour. It is possible to advance the hypothesis that high contest languages depend mostly on this kind of background. Modernity brings a lot of innovation, asking for a language used as a mere technical communication mean, mirroring also in culture.

An interesting application of the culture explanatory model is reported recently from the area of Production Management. VW, one of the large world car corporations, adopted recently in its German factories an advanced method[xxi] of job organization in order to contrast the trend of job emigration to CEE[xxii] countries. The internal corporation bench-marking was given by a factory in Bratislava, Slovakia, where wages were much lower than in

Germany and work done of comparably good level. Without changes in flexibility of work application, factories would stepwise emigrate from higher to lower wage areas, creating unemployment and other negative economic consequences at home. In order to save work places in Germany, even with the high local wages, a new, complex method of work implementation was devised. It enhances very much productivity, making it possible to invest at home. It is one of the secrets of the economic recovery, now on the horizon of German economy. The VW general manager was asked if it would be possible to shift also this more complex production method to CEE[xxiii] countries. His answer was negative: the method is so communication rich that it is almost impossible, in his opinion, to carry it out with work force not understanding and using German language. It is an appraisal of the role of culture for successful management.

The Management of the Corporate Culture

Peter Gal
Comenius University in Bratislava, Slovak Republic

Abstract

The change of the corporate culture is one of the key elements in transformation of companies in Slovakia. In this article are compared the theoretical basis of the corporate culture management with the practical experiences of companies. The most important issues are outlined in the corporate culture management model. The aim of the corporate culture management is strategically appropriate corporate culture, which enhances the company's performance. Corporate culture is a very important success factor of the company, influencing both "soft" as well as "hard" areas of the company. Company should deal with its corporate culture when there is a difference between strategically appropriate and current corporate culture. The primarily responsibility for the corporate culture management has CEO and secondary senior management. The process of corporate culture management has four phases: assessment and diagnosis, development, implementation, and evaluation. It should hit the whole organization and be relevant to all employees.

Introduction

There were privatized almost all enterprises in the last twelve years in Slovakia. New owners want to improve the overall performance of these enterprises as well as their business results. This is especially important, because the competition increases and is expected to increase even more after Slovakia will join the European Union in May 2004. The companies hire new management teams, define new strategies and are heavily transformed. To be able to implement successfully new strategies and to transform these enterprises, it is necessary to change their corporate culture from a „socialistic-bureaucratic" type to a different one, business oriented. The corporate culture determines relations and climate in the corporation for implementation and execution of the company's strategy. The corporate culture is determined by previous development and could cause persistence and resistance to change *(Papula, 1993)*.

Bajzikova and Sajgalikova define the corporate culture as: „a set of credos, values, and norms, which are shared inside a society /company and which substantially affects the behavior of its members. This set has been built by collective experience of successful problem solving by the society during alonger time period. This set is transferred as relevant to new society members (Bajzikova, Sajgalikova, 2000)." Luptakova and Vargic define the corporate culture as: "categorizing principle of employee opinions and understanding of their work, their approach to it and the way in which they anticipate to be treated (Luptakova, Vargic, 2001)." We can say that the corporate culture is a very important dimension of the company. It affects how employees and managers access each other, problems, customers, and deal with suppliers, react to competition and how they perform various activities. The corporate culture is not completely clear and is difficult to interpret in a company. It is stable, persistent, but dynamic at the same time. It is transferred to new organizational members. The leaders of the company have very significant impact on its corporate culture.

A number of researchers, e.g. Peters and Waterman, Deal and Kennedy, who studied companies, which achieved above average results over a long period of time, showed that the most successful companies have built and managed their corporate culture. Kotter and Heskett found a strong correlation between the type of corporate culture and business results *(Kotter, Heskett, 1992)*. Corporations with performance enhancing corporate cultures grew in comparison with corporations without performance enhancing corporate cultures much faster in revenues (682% vs. 166%), employment (282% vs. 36%), stock price (901% vs. 74%), and net income (756% vs. 1%).

The process of the corporate culture management

Due to its importance, many companies are attempting to manage or change their corporate culture in recent years, but only few of them are successful. Sarkanyova did a research about organizational change in 34 companies in Slovakia. Five of the researched companies tried to change their corporate culture, but none of these changes of the corporate culture was evaluated as successful *(Sarkanyova, 2000)*. Gal and Muckova found that only 26% of 57 researched companies in Slovakia actively manage their corporate culture and they evaluate this process to be successful *(Gal, Muckova, 2003)*. The management and change of the corporate culture is quite a difficult process. It demands also changes of individuals – their personality, abilities, or skills, as well as a change in understanding of a role and position of managers within the organization *(Sulikova, 2003)*. However, it must be done, because in some cases the change of the corporate culture is a question of the company's survival. The major corporate culture change is time-consuming and very expensive. To achieve even half of the change a company attempts, it must spend an amount equivalent to between 5 and 10 percent of its annual budget for the personnel whose behavior is supposed to be changed *(Deal, Kennedy, 1988)*. The major corporate culture changes last about four to ten years; their most intensive part takes about two years.

The primary responsibility for the corporate culture management has the CEO of the company. In case, when company only starts to manage its corporate culture or needs an important change in it, the cultural manager and a steering committee focused and responsible for the corporate culture management could be established. Members of this committee should be high-level managers, key decision-makers as well as the CEO. The process of corporate culture management has four main phases: assessment and diagnosis, development of corporate culture, implementation, evaluation and control.

Assessment and diagnosis of the existing corporate culture

The first step in corporate culture management is to determine, what the current corporate culture is. This phase could be done internally by organizational members or externally by consultants or combined. The cultural assessment has several objectives:

?? To explore all aspects of organizational functioning in order to identify the values, beliefs, and assumptions currently held by organization's employees
?? To identify the personality and beliefs of the strategic leader (CEO)
?? To identify the strength and history of the existing culture
?? To identify how well the culture is understood
?? To identify major opportunities for cultural improvement
?? To identify possible barriers to cultural implementation program
?? To promote cultural awareness

The corporate culture could be analyzed by a variety of techniques, e.g. personal and confidential interviews with a cross selection of employees, group interviews, and written surveys. It is recommended to use more or all of these techniques.

Development of the new corporate culture

The next step in corporate culture management is the development of the new corporate culture. In this phase the vision, core values, and guiding principles of the organization should be prepared. A necessary input to development of these documents is the mission statement from the strategic planning effort. The mission and vision should definitely be consistent and supportive, but they will not be exactly alike, since they serve two different purposes.

A mission states what a company intends to do, to achieve, in the external environment on a one-time basis. A vision states what a company intends that its internal (cultural) environment should be or should become on a continuing basis. Because the mission is directly linked to the customers and external environment, it makes sense for the vision to be based on the mission and be developed second. The corporate culture is defined in following documents:

Vision - states, what a company intends that its internal (cultural) environment should be or should become on a continuing basis. A vision is a picture of a preferred future state, a description of what the organization would be like some years from now. The four most persuasive reasons for having a vision are: inspiration, unobtrusive control, focus, and integration.

Core Values - are the organization's essential and enduring tenets – a small set of general values, not to be compromised for financial gain or short-term expedience and not to be confused with specific practices, which are included in the guiding principles. Only a few values can be truly core – values so fundamental and deeply held that they will never change and will never be compromised.

Guiding Principles - describe how the vision and core values will be achieved. They establish the professional standards for the work done inside the organization. They specify the relationship between people in the organization – on all levels.

Before implementation, the results of cultural planning must be tested. There are more ways, how to test them, one of them are in-depth discussions in focus groups, consisting of valid cross section of the company's employees.

Implementation and shaping the corporate culture

To put the developed corporate culture into the organizational life, the implementation is needed. The behavior of CEO and senior management and the way, how they enforce the cultural values into corporate praxis is very important for the success of the implementation. The successful implementations of corporate culture have usually four common characteristics. First of all, they should be trustworthy. They should come from a credible source, like the CEO. The implementation of culture, which seems to be insincere, or which contradicts the basic organizational values would be probably rejected as company's propaganda. Second, the successful implementations of corporate culture should be dramatic. They should naturally be interesting, not boring. Third, the successful implementations should hit the whole organization and be relevant to all levels of employees. The middle-level management, supervisors and all other employees should be involved in the process of implementation. Last, the successful implementations must be easy to remember and to believe. The corporate culture should have clear relevance to the performance of all employees, e.g. it should indicate, which behavior is expected in specific situations.

The implementation of corporate culture is conducted through managerial areas. We outline few examples, how to use managerial areas to shape the corporate culture.

Shaping of subcultures might support different parts of the organization. Different subculture is suitable for research and development, which is long-term oriented, innovative, and producing ideas and in production, which is more costs and efficiency focused. The subcultures should not be too strong and act against each other, because then the individual departments do not sufficiently identify themselves with the company as whole.

The human resource management is a very important corporate culture-shaping tool. In the human resource area the important tools are: selection of new employees, socialization, development and evaluation of employees, and rewarding. In the selection process, the technical skills as well as fit of the individual with corporate culture should be taken into account on all positions, not only managerial. The corporate culture could be also shaped by development and socialization of workers. It is reasonable to invest into training activities, which learn not only the needed skills, but also imprint on employees the organizational values. Evaluation and rewarding of employees should also enforce the developed corporate culture. The evaluation criteria should be settled to identify people, who support dominant organizational values and are identified with them. This people should be rewarded and promoted.

Other often-used forms to communicate cultural values are organizational stories, myths or legends. The main actors in these stories are usually leaders, founders or key-executives of the company. These stories describe important moments from the company's history, which have implication to the current set of corporate values. Usually they are interesting and catching. Activities are also often used for shaping of the corporate culture. Activities might be annual conferences or Christmas parties, which communicate, that all employees are important for the company. Similar forms are rituals, which often imply equalization activities, like team-sport competitions.

Evaluation and control

The last phase of corporate culture management process is evaluation and control. The control should look backward, to the history; it should provide feedback to previous phases, evaluate the current situation and identify differences from expected state. This control should be also forward oriented, it should monitor the development of external and internal environment and provide signals and information for potential corrections of existing corporate culture.

The research findings

The main research objective about the corporate culture management was to outline the most important points, which successful companies in corporate culture management have in common. This research had both quantitative (sample 57 companies, structured interviews based on a questionnaire) and qualitative parts (sample 15 companies, case studies). We concentrated in this research on profit-making companies over 50 employees. The researched companies were from 15 industries. The target person in researched companies was competent employee who deals with or is eligible for qualified answers concerning the corporate culture management, mostly human resources manager or general director. The research was conducted by Peter Gal from Faculty of Management, Comenius University, Bratislava in years 2002 and 2003. Waste majority of the researched companies, which responded on the questionnaire, were interested in the research results. These are the points, which successful companies in the corporate culture management have in common:

- ?? These companies have defined their vision. This vision is positive and well communicated across the whole company.
- ?? The core values of the corporate culture have been set, e.g. good relations among employees, healthy competitiveness, mutual appreciation, cooperation, and support. Mechanisms were created so that employees would accept them. These mechanisms served for changing the attitudes and behaviors of the employees and their value orientation.
- ?? The top management was heavily involved in the management of the corporate culture. The general director and the top management dedicated a lot of time as well as needed financial resources. At the same time their own behavior affirmed the desired corporate culture.
- ?? The corporate culture was seen as a very important success factor of the company. Its influence is felt in many areas of the company, including its financial results.
- ?? The top management gained the trust of the employees, which is always difficult to obtain and is very easy to lose. Many unsuccessful managers had problems gaining that trust, but very often they were the very cause. E.g. they promised not to lay-off employees and in few months they made mass-lay offs.
- ?? The management effort was aimed at the whole company, not only on the top-level management, but also on the blue-collar level. Informal leaders were involved in this process on all levels of the organization.
- ?? Some companies changed their culture from a „socialistic-bureaucratic" type of approach to an active, creative, less centralized approach.
- ?? The attitude to change in the company was well balanced; the attention was put on the change process itself as well as the achievement of the business results.
- ?? The corporate culture management was seen as a long-term process, which entails several phases. The most intensive part would take from 2-3 years and continues though less intensively.
- ?? The companies used the results of their corporate culture evaluation as a starting point for practical implementation.
- ?? The companies paid special attention to employees. They concentrated mainly on the area of selection of employees, their socialization and continuous development. They invested alot of money on education and professional growth of employees. They tried to awaken the hidden potential in employees, energize them, and make them active.
- ?? The corporate culture management did not start with a radical change in the pay scale, however the change in pay seemed to be necessary later in the process.
- ?? The companies intensively used symbols and celebrations in the corporate culture management.
- ?? It seemed that some companies had a very healthy corporate culture despite the fact that they paid very little attention to it. This was due to the fact that the company founders established a healthy corporate culture at the beginning and it was maintained by company policies, e.g. selection process and socialization.

Conclusion

Many enterprises in Slovakia are in a process of transformation. It seems that the change of their corporate culture is one of the key elements in their transformation. In this article about the management of the corporate culture are compared the theoretical basis from the foreign literature with the practical experiences of companies in Slovakia. The research results deepen the theoretical basis and make them applicable for more efficient corporate culture management. The most important issues from this article are outlined in the corporate culture management model (Fig.1).

Why to manage the corporate culture?

To solve problems or difficulties in the company.

Corporate culture is a very important success factor of the company.

Corporate culture influences „soft“ - atmosphere, relations, ethics as well as „hard“ areas - innovations productivity, financial performance, and costs.

Who should manage the corporate culture?

The general manager.

Top and senior level managers.

Informal leaders on all levels of the organization.

The corporate culture management should hit the whole organization and be relevant to all employees.

Healthy corporate culture

Strategically appropriate corporate culture which enhances the company’s performance.

When to deal with the corporate culture?

When there is a difference between strategically appropriate and current corporate culture.

The business environment changes significantly.

The company is in the process of strategic change or wants to solve important organizational problem.

In case of merger, acquisition, creation of joint-venture or any other form of partnership.

How to manage the corporate culture?

Asses and diagnose the existing corporate culture.

Develop the new corporate culture based on strategy – vision, core values and guiding principles.

Implement the corporate culture. Use management tools – shape the subcultures, use human resource management, communicate, ... and be persistent.

Evaluate, control, and celebrate.

Managers in Culturally Diverse Environment

Rozalia Sulikova
Zuzana Kovacicova
Comenius University in Bratislava, Slovak Republic

Abstract

Formation of Multinational Corporations bring a formation of an international working environment, requiring quality changes not only for top managers, but also for all employees of the organization. This situation requires new abilities in many previously neglected areas. Success of organizations will be determined by managerial qualities such as cultural sensitivity, flexibility, justice, alertness, ability to cope with stress situations, ability to solve interpersonal problems and conflicts, strive for continual self-development and life-long learning. Ability to understand a multicultural environment is a condition of benefit from this situation, and can lead to higher performance, greater creativity and synergy effects among the employees. Success of organizations will also depend on the managerial ability to lead multicultural teams - people from different cultural background, and on the ability to see that culturally diverse environment brings not only advantages and opportunities but also certain problems. If the organization is to effective manage the impact of cultural diversity, it must not ignore it, but use and understand it and learn that people may have different perceptions of reality, different thinking and problem solving, different values, attitudes or styles of communication. Low level of knowledge about cultural determination of human behavior may lead to interpersonal conflicts, negative relations and a working atmosphere that negatively influences individual and team productivity and inhibits an effective style of leadership.

Introduction

At present, with globalization eliminating differences between national and international corporations, the significance of international trade is growing and multinational companies are being established in Slovakia. Their structure and strategy, but also philosophy, culture and management are acquiring new qualities. With the establishment of international companies comes the formation of an international work environment requiring changes in quality not only of top managers, but all other employees as well. Skills of available human resources determine whether organizations succeed; indeed, skilled employees become their employer's competitive advantage. Knowledge, skills, abilities and personal qualities of managers will differentiate organizations form one another and will become the key and the condition of their excellence. Managerial qualities such as emotional ability, cultural sensitivity, flexibility, justness, readiness, ability to control stress situations, interpersonal ability as well as the ability to continually learn and develop will become an integral part of the success of organizations, and managers themselves. Acceptance and effective use of the potential and heterogeneousness of their employees condition the success of organizations with multicultural environment. The ability to understand the asset of a diversified environment is the condition for profiting form diversification, which can lead to better performance in areas of creativity and knowledge and to synergic effects in the workplace, where people will respect each other and their differences. Differing point of view or opinion will be appreciated; skills and abilities of others will not only be shared, but also supported. Success of organizations will depend on the ability to maximize the potential and capabilities not only of individuals, but foremost of teams consisting of these individuals. Success will depend on the ability to find managers with new abilities, capable of effectively leading multicultural teams and people with different cultural background, with different standards of behavior, values and ways of communicating.

The important attributes for interaction of people in multicultural environment will therefore become:

??Recognition of the others' competencies (areas of expertise)
??Mutual acceptance - respect for standards, opinions and approaches of others
??Respect for the autonomy of others
??Development of creativity
??Support of positive interpersonal relationships

??Acceptance of diversity

??Use and development of personal potential equally in all

??Desire for self-development, self-improvement and life-long learning

??Ability to find, use and develop strengths of individuals and teams etc.

The leading philosophy for multicultural environment organizations will be the one that appreciates diversity, respects varying needs and requirements, and demands creativity and new ideas. Under this philosophy managers understand that leading people means leading the teams and individuals at the same time, self-management is emphasized and it is evident that there is no one and only correct and efficient style of leading for all and in all circumstances. The task for managers of successful international organizations will be to join people from different cultures to attain the aims of the organization.

Although the process of globalization brings varying cultures closer and closer, increases the contact of people of differing backgrounds and opens new possibilities, it does not mean that the cultural differences will disappear. It means that the need for understanding cultural differences (approaches, standards, behavior, problem solving) increases. Likewise, higher flexibility, open-mindedness for new ideas, opinions, demands and higher sensitivity for others, as well as a differentiated approach to and leadership of other people are needed more than ever before.

A successful manager in a multicultural environment should have knowledge about cultural differences and similarities of various cultures, and should have special abilities for effective interpersonal interactions. Knowledge of cultural differences is important primarily in regard to the approach to human resources. Managers should be able to work with human resources effectively irrespective of their origins, and should be able to choose the right "custom-tailored" approach. The ability to manage the intercultural interactions of individuals or multicultural teams is become essential.

It is important to emphasize that not only top managers participate in the interactions, but also lower level managers and common employees are included in the multicultural environment. Therefore it is necessary to develop and require the desired abilities in all employees of the organization. Development of these abilities in such multicultural spirit should become the challenge and the philosophy of the organization.

Influence of Culture on Management

The notion of culture may be understood as a set of opinion and attitudes about what is adequate and what not a given environment is. It is a set of values that is formally or informally endorsed; it is a way of thinking that differentiates one group of people from another. Cultural differences lead to differences in the perception of things and events, their interpretation, differing ideas on how to handle them, differences in value systems, in approaches to problem evaluation and solving, and in the way of communicating one's feelings, opinions and ideas in relation to superiors, subordinates or to the external environment.

Differing as well are standards of behavior, preferences and the aspirations of people with different cultural background - people who are part of the multicultural environment of the international organizations. Knowledge and understanding of cultural differences is becoming an essential requirement for effective multicultural manager competency, and a requirement for creating new development programs for managers (Sajgalikova & Bajzikova, 2000).

On the other hand, lack of understanding and knowledge of the influence of culture on the behavior not only leads to conflicts, to a deterioration of interpersonal relations, to a bad work environment and to a decrease of the productivity of individuals as well as teams, but it also hinders the managers in their effective leadership and motivation and their problem and conflict solving. Such conditions lead to a decrease the competitiveness of the organization.

The necessary condition for managers to become effective intercultural managers is a change of their thinking, changes of certain aspects of their personality-changes in their approach to people, changes in the forms of behavior, a need for a higher level of cultural sensitivity, greater openness to others and so on. In accordance with previous research the factors which most strongly determine an individual's behavior and which managers should respect are:

??Attitude towards uncertainty - the extent to which people from different culture prefer more or less structured tasks and situations, the extent to which they prefer rules of problem solving, the extent to which people try to avoid ambiguous situations

??Acceptance of an unequal distribution of power - people from different cultures differ in the extent they accept power, authority, status, and in their effort to participate in the decision-making process

??Collectivism vs. individualism - the extent of an individual's integration into the group and social environment, identification with their goals and interests, the level of support of the principle of equality, the emphasis on future or present. Individuals from collectivistic cultures prefer common goals and objectives, cooperation, collective decision-making and reward. On the other hand, people from individualistic cultures follow individual goals and interests, they emphasize skills and knowledge heterogeneity, independence, individual responsibility and reward; they prefer short-term goals and immediate effect and satisfaction of their needs.

??Gender Differentiation - cultures differ in the emphasis they place on different roles of men and women. Some cultures (Germany, Denmark) offer equal possibilities for both genders in education and professional careers. Conversely, there are cultures where no such possibilities exist.

??Time orientation - it is reflected in behavior and problem solving in the present. Time orientation can be focused on the past, present or future. This orientation influences all managerial activities, ways of planning, decision making, profit reinvesting, remunerating. Other examples of different perceptions of time are creating a strong barrier between private and office time, understanding of the notion of punctuality, or devoting time to business and managerial activities.

??Perception of the human nature - the extent to which there is a tendency, caused by various cultural influences, to see a human being as substantially good or bad. These cultural influences determine the behavior of individuals, including such managerial activities as the leadership style, the systems of control, remuneration etc.

??Performance focus – reflects in the way of compensation, in the professional development, acceptation and support of the excellence of individual

??Humanity – level of social support and award for individuals who are fair, true, friendly and tolerant. On the other side are cultures support power, materialism, and problem solving by individuals themselves

??Usage of space – strong feeling of the private space ownership, differences in the positioning of the barriers to the space between managers and subordinates, differences in the rooms equipment.

Effective manager in multicultural environment should know and understand the above-mentioned differences and the others as well. This knowledge is the condition of the correct people approach, choosing the adequate leading style, motivation, decision-making and evaluation and also the selection developing programs for personal development of manger and his subordinates as well.

Interpersonal communication is the part of the interpersonal interactions. Managers in multicultural organizations should have high quality communication skills in all fields, especially in the leadership. Effective interpersonal communication requires the knowledge about partner’s cultural individuality. Ability to provide the feedback, to work with information, solving conflicts is necessary to adjust to different cultural customs, opinions and values.

Effective communication in Slovak business environment is possible to characterize as open, direct, supporting the feedback (Luptáková – Vargic, 2001). On the other hand communication style in many Arab countries should take in to consideration the status, gender and age of partners in communication. Free-spokenness and directness is not acceptable.

In some cultures the preferred communication style with subordinates is one-way. Elsewhere this communication style is considered to be ineffective and discussion is preferred and emphasized.

Approaches to leadership are different depending on the cultural uniqueness. Manager should perform authority when he could not expect subordinates to participate in responsibility or decision making or otherwise, he should apply participative leadership style or combination of these styles in accordance with the situation and personalities in team. It is important, when working with people, to take in to consideration the cultural differences. IT cannot be expected the same style and approach to be effective in every situation, every culture or conditions.

Multicultural Teams

Success of organizations depends on individuals, as well as teams and effectiveness of team work. To be an effective manager of a team requires specific features of the manger's character and his interpersonal skills. It is even more difficult to work with a multicultural team. There is not only heterogeneity of gender, age and education but also the influence of each individual's culture. Cultural diversity often causes conflicts, tensions in interpersonal relationships, misunderstanding of received information, ineffective problem solving. Only manager willing to acquire intercultural competencies and skills and to apply them can become a successful intercultural manager.

Intercultural teams, like many researches have proved, are in general benefit for the organization for the very existence of different believes, attitudes and ways of thinking.

TAB 1: .SOME POSITIVE AND NEGATIVE FEATURES OF MULTICULTURAL TEAMS

Positive features	Negative features
New ideas, opinions, points of view	Increasing of uncertainty
Space for learning	Increasing of conflicts
Productivity support	Troubles in interpersonal communication
Creativity support	Ethnocentrism
Instigation to staring ambition	Increasing of tension and stress
Instigation to flexibility	Initial decreasing of productivity
Increasing of employees sensitivity	Initial problems in leading people
Increasing of relative understanding	Initial problems with motivation of employees
Increasing of toleration	Bilateral misunderstanding

Personal Qualities of Mangers in Multicultural Environment

In the research of top managers in 180 successful international organizations managers indicate as significant personal characteristics most needed for their job as follows (Abbas – Camp, 1996, p. 4):

?? Ability to get on well with people from different culture with different hierarchy of values
?? Flexibility of attitudes
?? Accepting changes and adaptability
?? Ability of global perspective
?? Cultural, political, economic knowledge of different culture
?? Communication skills
?? Cultural empathy and sensitivity

Managers in multicultural environment should have competencies that could be divided into three categories: (Black, J. S. & Mendenhall, M., 1990)

1. Self maintenance – ability to control stress and barriers and on the other hand willingness acquire the cultural knowledge about strange courtiers, that help to understand people's behavior and thinking,
2. Interpersonal competencies – ability to create and maintain positive interpersonal relationships among people from different cultures
3. Perception competencies – ability to apperceive and to interpret behavior, to tolerate ambivalence

There is higher possibility of existence of the different assumptions and expectations, different perception of phenomenon and things and their meanings in the frame of intercultural interactions. Nonverbal exhibition, which accompanies the interpersonal communication, could be also interpreted differently and inadequate.

Comparison of the manager features in traditional organizations and in successful organization with multicultural environment is in the Tab. 2.

TAB. 2: COMPARISON OF THE MANAGER FEATURES IN TRADITIONAL ORGANIZATIONS AND IN SUCCESSFUL ORGANIZATION WITH MULTICULTURAL ENVIRONMENT:

Traditional manager features	Required manager features in multicultural environment
Hard skills preferring	Soft skills and hard skills preferring
Self vision	Support for the vision of the others
Individualism, egocentrism	Orientation to the others
Personal development of individuals	Personal development of subordinates
Higher status position	Team unity
Usage of power and control	Participative leading
Individual concern	Team and organization concern
Focus on present and past	Focus on present and future
Fixed value order	Differences and paradoxes acceptation
Monoculture communication	Intercultural communication skills
One-way communication	Multi-ways communication
Frequent emphasizing of individual weaknesses	Focus on individual strengths and their development
Close confidence understanding	Complex approach to the confidence

Change manager to effective manager in multicultural environment requires changes in his personality in the level of his knowledge, skills and abilities.

It is difficult, long-term process and change could not be reached within a day. Required changes are reachable trough adequate chosen training programs and effort of managers themselves. The imaginations that the opinions from the visit of strange culture are sufficient for understanding and leading strange culture people, the idea that one training is guarantee of manager's ability is wrong as well as the imagination, that only one problem solution is correct and the only opinion is correct. Developed countries of Western Europe and USA pay attention to development and the quality of human resources. Human resources are key factor of organization achievement and become their competitive advantage. It is very important for Slovak organization to pay attention to these significant aspects. The subject of other research is the investigation what abilities of managers are supported in Slovak organizations, what abilities do managers really have, in what extent, what competencies do managers develop to meet the difficult requirements for international managers.

Safety Culture and OSH Performance: An Exploratory Study on SMEs in Malaysia

Mohamad Khan Jamal Khan
Juhary bin Ali
Universiti Utara Malaysia, Malaysia

Abstract

This study sought to explore the relationship between occupational safety and health (OSH) performance and safety culture in small and medium sized enterprise (SMEs) in Malaysia. A total of 118 manufacturing SMEs representing electrical machinery, apparatus, appliance and supplies; furniture and fixtures (wood-base); and food and drinks industries attended the postal survey. Regression analysis reveals that the model was significant and it explained 70.7% of variance in OSH performance.

Introduction

Industries worldwide are showing increased interest in the concept of "safety culture" as a means of reducing the potential of large-scale disasters, as well as the inherent risks associated with routine tasks [5]. Its growing importance can be seen from its application, for instance, offshore [14], nuclear [21] and shipping [12]. However, the wave of interest has over sighted the plights of small and medium sized enterprises in managing occupational safety and health issues at workplace. Studies have found that the working conditions were unattended, long working hours, higher work-related accidents and higher health injuries due to chemical, ergonomics and mineral dusts are among the known common characteristics of small and medium enterprises [8]; [13]; [19]. It was also revealed that workers in SMEs are generally unaware of hazards they are exposed to, legal requirements on OSH are often not complied with, and preventive measures are seldom taken by SMEs [12].

Even though safety culture has received much attention, yet literature offers no consensus on the operational definition of safety culture. Nonetheless, studies of the literature reveal two sets of definition: safety culture as a "product" and as a "purpose" [5]. As a product, safety culture is viewed as an emergent property of social grouping such as, set of values, beliefs and attitudes reflecting an "interpretative view". On the other hand, safety culture as a purpose reflects that culture has a predetermined function such as, implementing controls and policies to improve safety performance. Examples of the former definition may be viewed in Tumer, et al. [24], The International Atomic Energy Authority (INSAG) [9], and The Confederation of British Industry (CBI) [4]. The later definition may be seen in the U. K. Health and Safety Commission (HSC) [7].

Safety Culture and OSH Performance

The term "safety culture" was first introduced in 1987 in Organisation of Economic Cooperation and Development (OECD) Nuclear Agency report on the Chernobyl disaster in 1986 [10]. The concept of safety culture was loosely used during that initial stage to describe the corporate atmosphere or culture in which safety is understood to be, and is accepted as, top priority [6]. Such understanding was partly due to fact that safety was not treated as the dominant characteristic of an organisation's culture. As such, safety culture is treated as a subcomponent of corporate culture, which alludes to individual, job and organisational features that effect and influence safety and health. Nonetheless, the organisational dominant component of corporate culture, such as downsizing or restructuring will influence the development of subcomponent for instance, safety culture [18]. Consequently, safety culture also affects other operational processes or organisational systems [5]. Thus, safety culture does not operate in a vacuum, it interrelate with other processes and systems and reinforce each other within the organisation.

In practice, safety culture is developed through deliberate manipulation of various organisational characteristics that is perceived to increase safety performance, for example, conducting risk assessments [5]. Such an act of manipulating is intentional to achieve the desired goal or a specific purpose such as: to increase people's commitment to safety; to determine the style and proficiency of a safety programme [7]; to ensure that safety issues receive appropriate attention [9]; to ensure that organisational members share the same idea and beliefs about risk, accidents, and ill health [4]; and to reduce accidents and injuries [24]. Each of these purposes, as argued by Cooper [5] has two complementary roles: it may served as a sub goal that helps an organisation to attain its super ordinate goal, such as developing a safety culture; and it may also served as a goal that is, the consequence achievement that arises from the action of safety culture. Therefore, developing a safety culture may be achieved through sub goals such as, providing safety training, conducting risk assessment or auditing safety systems that will direct people's thought and behaviour to the management of safety, and through safety performance.

The confusion that surrounds safety culture in relation to safety and health performance lies in the lack of clarity about the "product" [5]. This is because safety culture "product" is viewed as a consequence that provides measurement of an outcome. This approach to safety performance is based on recorded statistics such as, accidents rates or lost-time index for incidents that has already happened. These performance indicators are frequently termed as reactive indicators [3]; [22] due to their post-effect nature. As such, many are sceptical about its effectiveness as safety performance indicator. For instance, O'Brien [16] argues that they do not accurately reflect a company's safety performance and therefore misleading. In this respect, the reduction in accident and injury rates, although an important indicator, are not sufficient in themselves to indicate the presence or quality of a safety culture [5]. However, this limitation on safety culture may be offset from the perspective of "purpose", that is safety culture as predetermined functions with regards to safety performance for instance, to determine people's commitment to safety, and the style and proficiency of safety programmes. This approach to safety performance is based on proactive indicators that are associated with organisational processes, systems and individual behaviours [23]; [11].

Employing multiattribute analyses, Molenaar et al. [15] classify safety culture into three main dimensions: people, process and values. The first dimension – people, is integral to define the cultural characteristics of an organisation. It is the people who determine the beliefs, values and behaviours that create an organisation's culture. The second dimension – process, is the manner in which an organization incorporates safety and health into practices. The third dimension – values, is concerns with organisation's philosophies regarding OSH. It determines the extent to which employees' belief that safety is a high priority of the organisation. The characteristics of the above dimensions are discussed as follows.

Methodology

The definitions of "small" and "medium" sized enterprises differ from one country to another. SMEs have been defined against various criteria such as the number of workers employed, the volume of output or sales, the value of asserts employed, and the use of energy [25]. For example, Rinefort [20] categorised small and medium firm by the number of employees. A firm is categorised as small if it has fewer than 50 employees, and a medium firm if it has between 50 to 199 employees. Aziz et al. [1] categorised a company with an annual sales turnover of not exceeding RM25 million and full-time employees of not exceeding 150 as SME. While OECD defines establishment with up to 19 employees as "very small"; with up to 99 as "small"; and from 100 to 499 as "medium"; and over 500 as "large" [25]. For this research purpose, a firm employing between 40 to 499 full-time employees is defined as a SME. The minimum number of 40 full-time employees is taken because the Act 514 mandates a workplace with minimum 40 employees to form a safety and health committee. This decision is in line with this study since a firm with 40 employees and more is legally required to manage safety and health at workplace. Therefore, an enterprise with 40 to 99 full-time employees is categorised as a small sized firm, while an enterprise having between 100 to 499 full-time employees is categorised as a medium sized firm.

It was a postal survey using a set of 60-items questionnaire to collect cross sectional research data on small and medium enterprises in three areas of manufacturing: manufacture of electrical machinery, apparatus, appliance and supplies; manufacture of furniture and fixtures (wood base); and food manufacturing and soft drinks and carbonated water industries in Peninsular Malaysia.

The population of this study covered all SMEs manufacturing electrical machinery, apparatus, appliance and supplies; furniture and fixt ures (wood base); and food and soft drinks and carbonated water registered with the Social Security Organisation (SOCSO).

The respondent was a full-time employee of the enterprise who is responsible for the occupational safety and health with at least one-year involvement in safety and health.

A total of 452 samples from a population 1129 were selected for data collection. The distribution of samples is shown in Table 3.1. A total of 198 questionnaires were returned; 118 questionnaires were attended and 80 were unattended. The response rate was 31.72%.

TABLE 3.1 DISTRIBUTIONS OF SAMPLES AND INDUSTRIES

Industries	Small (%)	Medium (%)	Total (%)
Electrical machinery, apparatus, appliance and supplies	131 (49.0)	120 (64.9)	251 (55.5)
Furniture and fixtures	95 (35.6)	40 (21.6)	135 (29.9)
Food and drinks	41 (15.4)	25 (13.5)	66 (14.6)
Total	267 (100)	185 (100)	452 (100)

The research instrument was adopted with modification from Molenaar et al. [15] who studied safety culture in construction industry and from Burke et al. [2] who studied safety performance. However, in order to suite with the Malaysian environment, legislation and the purpose of the research study, the instrument underwent minor modification. Since it has undergone minor modifications, pre-test of the instrument were done to ensure its validity and reliability.

The pre-test results showed that the Cronbach's alpha reliability coefficient scores were in the range of 0.7581 to 0.9154.

Findings and Discussion

Regression analysis indicated that 70.7% of variance in OSH performance was explained by the independent variables – people, process, and value (F = 91.704: Sig. = .000).

Correlation results show significant association between OSH performance and each of the independent variables (Table 4.1). The results provide evidence that OSH performance is significantly related to safety culture.

TABLE 4.1 PEARSON CORRELATION MATRICES

	OSH Performance	People	Process	Value
OSH Performance	1.000	.723*	.714*	.805*
People		1.000	.735*	.772*
Process			1.000	.670*
Value				1.000

*P< 01.

The standardized coefficients of each independent variable indicate that the relationship of variables - value and process on OSH performance were significant but the relationship of variable - people was not significant (Table 4.2).

TABLE 4.2 STANDARDIZED COEFFICIENTS

Model	Standardized Coefficients	t	Sig.
	Beta		
(Constant)		3.175	.002
People	.103	1.142	.256
Process	.276	3.583	.001
Value	.541	6.589	.000

The study highlights some insights with regards to the relationship between OSH performance in SMEs and safety culture. Nevertheless, the finding has to be treated with care since the response rate was rather low. Further investigation is highly recommended.

Conclusion

The study reveals that safety culture structure is a relevant approach to manage OSH performance in SMEs in manufacturing sector. The study focuses on three major components of safety culture. Two components i.e. value and process were significant. However, the people component was rather weak. This finding supports the general feeling that commitments from the management of SMEs were lacking and poor involvement of the managers in OSH activities at workplace.

Sustainable People

Gertrude Anne MacIntyre
University College of Cape Breton, Canada

Abstract

This paper suggests that the concept of sustainable development has considerable limitations because it has become abstract and too often ignores that many forms of development (oil and gas exploitation, mining) are not sustainable. Development, as the well-worn cliché puts it, is about people. Our approach at the Community Development Institute focuses on how individuals can become sustainable and motivated to develop their own potential while at the same time working towards the development of their organizations and communities. Discussions about development thus move from abstractions to ways in which specific individuals can live good lives (as they define them) while contributing to their communities. The concept of sustainable people is linked to that of community development, which offers a middle way for the creation of employment and wealth between the efforts of the state and those of the private sector, especially in poor and marginalized areas.

Sustainable People

Each year, statesmen, politicians, financiers, business corporations, executives and other rich and powerful people meet at the World Economic Summit in Davos, Switzerland to discuss the state of the world. In recent years, the World Social Forum in Porto Alegre, Brazil, has brought together activists, grassroots leaders, clergy, radical young people, anarchists and others united by a dislike for capitalism. They lament its ills and discuss alternatives to the market economy. The two very different gatherings reflect ongoing tensions in local, national and international development. Capitalism, rooted in competitive individualism, concerns the creation of wealth and the production of goods and services. Proponents of the Social Economy promote the redistribution of wealth and focus on quality of life issues such as pollution, sweatshop conditions, etc. They tend to favour collective action through community consensus, and many protest at international business gatherings.

Most of the protesters come from the middle class; poor people do not have the time or the resources to travel abroad to confront people. A major challenge to governments and leaders in the private sector lies in determining ways in which the genuine idealism, enthusiasm and energy of discontented western youth can be channeled into socially useful outlets. An even bigger challenge involves determining ways to create jobs for millions of young people in the developing world who live in idleness or join fundamentalist groups.

Some young people in the industrialized and developing world are attracted by the concept of sustainable development. Many forms of development such as oil and gas exploitation and mining of ores are not sustainable. The communities based in them vanish or decline once the resource is depleted. Canada, like other primary producing nations with boom and bust economies, has scores of ghost towns that once were the scene of frantic activity. Sustainability remains a sensible notion that can direct the conservation of renewable resources and avoid the "clean up and clear out" ethic that has damaged so many parts of the world.

The concept of "sustainable people" focuses on real people living in communities, rather than on abstract ideas about protecting the common good [1]. Sustainable people, human, fallible, contradictory, are much more difficult to create and encourage than vague academic and intellectual concepts that tend to be endlessly defined and redefined. Increasingly, people want to have some control over their destinies, but find it difficult to do so in a world dominated by large corporations and state bureaucracies. Through establishing their own business ventures, poor people and others can put their feet on ladders leading to better lives for themselves, their families and their communities.

As the last century ended, communism collapsed and scandal engulfed large business corporations. A healthy mistrust of state control of the economy and capitalism became pervasive, as interest rose in ethics and the moral basis of society. Václac Havel, a dissident writer who became president of the Czech Republic in 1989, noted:

"A modern state cannot consist merely of civil service, political parties, and private enterprise. It must offer citizens a colorful array of ways to become involved, both privately and publicly, and must develop very different types of civic coexistence, solidarity and participation" [2].

As the gap between governments and their citizens has widened, the concept of civil society has become increasingly popular. An American scholar defined it as; " [T]he realm of organized social life that is voluntary, self-generating, (largely) self-supporting, autonomous from the state, and bound by a legal order or a set of shared rules[3] ."

Social change creates new kinds of organizations and roles as the existing ones prove unable to cope with new demands. With the real and perceived failure of states and the private sector to generate jobs and wealth among poor and marginalized peoples, new forms of business organizations have emerged through which these people become participants in their own personal development and that of their communities.

In the 1920s, the British government made vast plans to improve the lives of their colonial peoples. When the Great Depression hit in the 1930s, it ran out of money to implement them. District officers combined government resources with those of the local people, including labour and land on community self-help schemes [4]. Thus began the community development movement. In Canada, Father Moses Michael Coady launched the Antigonish Movement during the darkest days of the depression. Based at St. Francis Xavier University in Antigonish, Nova Scotia, the priest gathered around him a group of dedicated clergy and lay people who went into small communities to encourage people to: "Listen. Study. Discuss. Act." Poor fishermen and farmers pooled their nickels and dimes to establish credit unions and co-operatives. In 1939, Coady published a book whose title summarized his goal of making poor people Masters of Their Own Destiny [5]. From humble beginnings, the credit union and co-operative movements have become big business in Canada. In 2000, credit unions had $122 billion in assets. Co-ops had 4.8 billion members, $30.2 billion in revenues and $17.4 billion in assets.

In the 1960s, the American and Canadian governments declared war on poverty. Prime Minister Lester Pearson of Canada announced:

"As a philosophy and a method, community development offers a way of involving people more fully in the life of their communities. It generates scope and initiative which enables people to participate creatively in the economic, social and cultural life of the nation" [6].

Community development soon became the flavour of the time.

Welfare and charitable agencies described their traditional activities as a form of it. Young people, including members of the Company of Young Canadians, a government funded agency, saw community development as a way of confronting – and perhaps overturning – the establishment [7]. The study of poor people and marginalized communities became an academic growth industry. Increasingly those outside the mainstream of society tired of outside experts coming in to their communities, telling them that they had problems, and launching government-funded interventions without an understanding of the dynamics of local life. In 1967, leaders in the Bedford-Stuyvesant area of New York invited Senator Booby Kennedy to visit their community. Concluding that official, top down, anti-poverty programmes were not working, he and Senator Jacob Javitz sponsored the Special Impact Program to tap federal funds for bottom up efforts in local development. They also brought together black leaders from the area with white business people from outside its boundaries to set up the Bed-Stuy Restoration Corporation [8].

Thus began the modern era of community economic development.

The principles underlying it – self-help, mutual aid and collective action – are as old as homo sapiens. By the late 1960s, CED as it became known, was firmly established in the United States. Poor communities set up their own business organizations to meet local needs, create employment, train people, generate and distribute wealth. With federal government funding, block associations, church, unions and ethnic groups became leaders in this new field of local economic development. In 1982, The Regan administration cut back federal funds for CED. The Bed-Stuy Restoration Corporation laid off half of its staff and sold some of its land. CED ventures had to deal with internal community tensions as well as external forces. When riots exploded in Los Angeles after the Rodney King decision in April 1992, the Watts supermarket, owned by a CED corporation, went up in flames. Other community business ventures collapsed through mismanagement and corruption.

But much has been learned about the most effective way to set up and run CED ventures and about the kinds of people who emerge as leaders in this complex field.

In 1976, a group of Cape Bretoners incorporated New Dawn, the first community development corporation in Canada. This venture originated with the passion and vision of Father Greg MacLeod, a charismatic priest inspired by the Mondragon enterprise in Spain. This arose under the direction of a priest who encouraged a small group of engineers in a Basque country to launch a locally-controlled enterprise. Mondragon has become a major player in Europe and the labour force no longer has same input into the decision-making processes as once they did [9].

New Dawn arose from the frustrations of local residents. The federal and provincial governments nationalized the coal and steel industries and poured millions of dollars into them in a vain effort to make them profitable. They also launched megaprojects, including two heavy water plants that closed after they failed to find a market for their product. The governments also tried to lure entrepreneurs to the island to start businesses. Some took the grants, opened factories, then closed them and decamped to places with lower labour costs.

Einstein defined insanity as doing the same thing again and again and expecting different results.

New Dawn struggled with little money and lots of volunteer help, raising capital locally and tapping into any government programme that met the needs of those they set out to service. The venture offered a new model for regional development, rooted in concern for creating new businesses that met social needs and reinforced the sense of local identity.

The corporation almost went bankrupt several times. It built much needed affordable houses and community services, and took over an abandoned radar base, turning it into senior residences with a built-in system of care givers. New Dawn assisted two laid-off welding instructors to set up a school which became immediately successful.

New Dawn did not avoid problems common to other businesses. Misreading the market, it launched a reusable diaper venture that lost $150,000. And it devoted resources to Telidon, a government sponsored videotext system for which no market existed.

In 1990, the Economic Council of Canada issued a report, <u>From the Bottom Up: The Community-Economic Development Approach</u>. It concluded that "Top down bureaucracy-driven plans for regional development have fallen into disrepute and policy makers know they need to consider new approaches [10]." A series of studies commissioned by the council described some of the successful CED ventures, ranging from a credit union launched by a community in Labrador when a bank left town to the Kitsaki Development Corporation in Saskatchewan, an Indian enterprise, that flourished with the help of an American visitor who set up joint ventures with non-Indians.

The 1990s saw wild enthusiasm in Canada for CED while the problems of setting up and running them were worked out in practice. The New Democratic Party that took power in Ontario at the beginning of the decade set up an agency to encourage CED. Officials from it descended on West End Community Ventures in Ottawa, a small, struggling enabling agency in the multi-ethnic area and offered the members a large grant. It came with targets for the number of jobs to be created by the venture. Despite their best efforts, the management could not meet the targets in the time laid down by the government agency and lost the funding.

While recognizing the value of CED as a way of meeting economic and social needs, governments in Canada and elsewhere still remain suspicious of this approach to local development. And too much government money can be the kiss of death for CED enterprises if it does not come at the right time and in the right amounts. The experiences of local business initiatives on Prince Edward Island offer ways of understanding how community ventures and economic democracy can succeed or fail. The Island grows huge quantities of potatoes, so a chip plant appeared to be a logical economic opportunity. The Acadians in this province, like the Basques in Spain, have a strong sense of collective identity. In 1986, a potato chip factory was launched as a worker's co-operative. Thirteen members invested $5,400 each, the local credit union put in $101,000 and federal and provincial grants contributed $374,000. The plant proved too small to compete with major producers and went into receivership in 1992. The workers and other investors lost their equity, but the new owner, a private businessman, retained the work force and upgraded the plant.

Other collective ventures, especially funeral co-operatives, have proved successful. Whatever the rhetoric about the free market, business people do not believe in competition – except among the suppliers. The funeral co-op movement on the Island began when Father Eliot Aresenault returned home in the mid 1980s. He discovered that poor parishioners spent up to $5,000 on funerals. He found a carpenter to make coffins, a licensed embalmer (as required by provincial law) and a group of volunteers to run the co-op. The funeral business on the Island is dominated by large corporations. Funeral directors pressured the bishop to transfer the priest from the Island, and refused to let the co-op join the association. They demanded that a Québec cabinet-maker stop supplying caskets to the co-op. This boycott ended when sympathetic co-ops in the province threatened a boycott of their own against the casket maker. The funeral directors filed criminal charges against the first graduate of the co-op's embalming course for not being properly licensed. A judge dismissed the charges.

Funeral co-ops have spread on the Island and in Atlantic Canada. They have a vital social component – they return the ceremonies associated with death to the local community instead of having them removed to larger centers where corporate funeral homes are located. One key factor in the success of CED in Prince Edward Island is the presence of a champion in the provincial government who keeps his fellow civil servants and politicians informed of what this method of generating employment and income involves [11].

CED ventures come in diverse forms. They include enterprises and venture centers, CED corporations, small business development agencies, regional development agencies, worker-co-ops, worker-owner businesses, community supported agriculture, community gardens, etc. They are countervailing forces of globalization, seeking to blend social and economic aims in ways that give communities and their residents more control over their destinies.

The new forms of business come in two basic forms: community ventures owned by community residents (CD Corporations, worker co-ops, etc.) and facilitating, enabling, non-government agencies that seek to help people, individually and collectively, to help themselves. They seek to do the following:

Provide ways whereby people can make better decisions. This involves more than simply handing out pamphlets. It requires an understanding of the choices and options available to individuals in communities and how they see them. All communities have a wide range of resources that can be tapped for personal and community development. Enabling agencies know where they are in terms and conditions of access to them.

Show people how to be more resourceful. HRDC in Halifax, Nova Scotia, has moved a thousand people from the welfare rolls into employment in small businesses. One of these complained that his wages were too small. It was pointed out that he was earning the same as many others in the enterprise and should tailor his lifestyle to his income. People seeking affordable housing through a community corporation in Winnipeg are told that they cannot have a house unless they have an income. This shifts their attention from house seeking to job seeking. In Cape Breton, a labourers' co-operative venture developed a scheme through which unemployed members could buy their houses. Working union members paid part of their hourly wage into a fund, and lowered the cost of their labour when building houses for fellow members.

Indicate how people can organize and motivate themselves. The emphasis in community-based development is on putting the onus on individuals and groups for taking control of their destinies. This is the key to creating sustainable people, individuals who can see themselves as actors in their own lives, not victims of the actions of others or bystanders in the great drama of life. While messianic visionaries are vital at the beginning of community development ventures, they are seldom good managers. Over reliance on one individual and his or her ideology has proved fatal to many collective ventures.

The successful CDCs resemble virtual corporations [12]. Such ventures are set up to undertake specific tasks within specific periods of time. They have a flat organizational structure. In the early days of community development, new initiatives sometimes collapsed in anarchy as everyone tried to do his or her thing for the benefit of the collective good. Or they became highly structured, rigid, inflexible, routinizing their operations, becoming remote and inaccessible to those they set out to serve.

Collective ventures resemble wheels, not pyramids. They are knowledge and information driven. In pyramids of power, information moves up and down the layers, being interpreted and reinterpreted at every level in ways that meet the needs there. Those at the tops of the pyramids seldom know what is happening at the lowest levels – and outside the organization. In the wheel model, information circulates all the time. The hub, the spokes and the rim are equally vital to the running of the operation and are interdependent. Everyone is in contact with the road – the real world over which the wheel travels.

The way in which successful small businesses operate offers guidance to community ventures. Like them, they require someone who scans and screens inside and outside the community for new opportunities. Small businesses need to find new products and new services to sustain themselves – and new markets. This requires the capacity to scan and screen society to find out where these are. In the same way, community ventures have to find market niches for their products and services. New Dawn initially focused on providing housing, later moving into other fields. HRDA, a government-funded agency set out to create small businesses for welfare recipients that did not compete with those operating in the city. Window cleaning created opportunities for people with few skills to earn a living. The corporation also acquired the local Rent-a-Wreck franchise. It proved profitable but did not generate jobs for unemployed people and was sold. Community development ventures have to be aware of the tensions and pressures in communities so as to tackle problems before they become crises.

George Foster identified one of the factors that makes community development difficult in some peasant societies. He coined the phrase "Limited Good" to describe how poor people see their local economies. If someone appears to be receiving more than their "fair share" of resources, they are judged to be stealing from others [13]. Edward Banfield lived in rural Italy in the 1950s and noted the presence of "amoral familism" which led to the inability of residents to work together. The dominant ethos in the village was: "Maximize the material short-run advantage of the nuclear family; assume that others will do the same" [14].

Community is a simple word for a complex reality. A study carried out almost fifty years ago examined 94 definitions of community and concluded that, "beyond the concept that people are involved in community, there is no complete agreement as to the nature of community" [15]. Entrepreneurs who start new ventures are accountable to their investors and shareholders. Community entrepreneurs are accountable to the people in the places in which they operate. Management of their enterprises must be efficient and transparent. Initially, because of the focus on the social aspects of development many of those involved in community-based ventures saw sophisticated management as a threat and preferred to fumble through their days in the belief that amateur enthusiasm would make up for any deficiencies in running their organizations. They also believed that someone – usually the government – would protect them from the consequences of their folly and lack of management skills.

Small businesses do not survive unless they have marketable products or services. The same holds for community development corporations that require skilled salespeople. But enabling, facilitating, animating community ventures are not in the business of selling things. They seek to move people into action rather than spending time lamenting their problems or pointing out the deficiencies and ills of the world. Those who take up the victim stance in society place their fate in the hands of others, blaming them for their shortcomings. Through the process of social animation, which seeks to determine why people are behaving and doing what they are doing in an open and non-judgmental manner, it is possible to move individuals, groups and communities from dependency to self reliance [16].

Successful community ventures thus require people capable of identifying opportunities and barriers inside and outside communities, good managers, and animators who can encourage people to start solving their own problems with their own resources and those in the community.

None of this is easy.

Much depends on the leadership of community development ventures. All depend on individuals who see themselves as <u>prima inter pares</u> – first among equals. As in a business venture, someone has to take responsibility for making decisions. But the person on whose desk the buck stops has to see himself or herself as sitting at the hub of the wheel, not the apex of the pyramid. They have to work with boards of directors from the community – and individuals still finding their feet in ventures that are unique. These new entrepreneurs face conflicting goals, balancing social needs against economic demands. They must maintain good relations with governments – and with members of the business community who tend to view their activities as charity. Charity meets immediate needs. Justice, which is what community development is all about, seeks to change society so that charity is no longer needed. Community economic development initiatives strive to generate wealth and redistribute it, giving poor people a chance to find better lives through gainful employment, and to bring new life, new enthusiasm, new visions to communities sunk in poverty and apathy.

Teaching and doing community development becomes a transformative task. Participants are not treated like "hands," "factors of production" or "clients." They are encouraged to become active in all aspects of the operation, offering their ideas and suggestions on how to improve it. They are offered a mirror on their own beings in which they can see themselves anew and come to understand and accept their limitations while exploring their potential. In HRDA, some welfare recipients became managers of small enterprises. Community development ventures also offer windows on their wider worlds for those who work in them, taking them out of isolation and alienation into which poor and marginalized people often sink. They learn about new opportunities for personal development beyond the confines of their small communities – and how to gain access to them. Acting like seed pods, CED ventures send participants to new pastures to establish new lives based on what they have learned about themselves and the world while working for their own good and that of others.

They become sustainable people, able to earn a living and to have a quality of life acceptable to themselves as they continue learning about themselves and their communities.

In 1910, the American philosopher William James wrote an essay entitled "The Moral Equivalent to War" [17]. Its theme resonates through our time with particular urgency. Describing war as "the strong life…*in extremis*," James identified a central issue of his time – and ours. He asked how "the individual and collective heroism and sacrifice demanded by war [can be turned into] more constructive channels." Militarism demands many values that can be used for creative rather than destructive purposes: courage, comradeship, loyalty, hardihood, discipline, surrender of narrow interests, cohesiveness and willing to sacrifice oneself for others. These are the characteristics of community development at its best.

Underlying all efforts in this field is a strong moral basis, a belief that the world can be made a better place through the actions of human beings working together.

There is no mystery about the doors through which individuals, organizations and communities have to pass to achieve more control over their lives and operations. They lay in the liminal territory, the land between the thresholds of old ways of doing things and new approaches to solving the problems of personal and community development.

The changes include moves from:

Responding to crisis to Anticipating crisis

Reacting to change to Being proactive

Taking specific measures to Taking comprehensive measures

Requiring consent to Requiring participation

Dampening conflict to Confronting conflict

Detailed central control to Generalized central control

Standardized administration to Innovative administration .

Separate services to Co-ordinated services

Short planning horizon to Long planning horizons.

Again this is not easy. For example, everyone wants co-ordination in human efforts – but noone wants to be co-ordinated.

Community development in its various forms involves people working together and intervening in each others' lives. Alex Sim, a pioneering Canadian adult educator, articulated the ethical basis of attempts to help others:

"Intervention that is defensible on ethical grounds must always be paradoxical. One acts for others only to the point of initiating a symbolic gesture of genuine respect and concern. This is the first overture. There is further action if, and only if, the other responds positively. The response is much more than consent as we usually think of consent. After this accepting response, a spiral of action, reaction and interaction can result between the two. In the final act of love, who is to say who is the helper and who the helped. Then the notion of help is finally relevant [18]."

This sense of respect and mutuality, this feeling of moving up the spiral rather than following a linear path, infuses all worthwhile community ventures – and all successful business operations. These two very different ways of generating wealth and creating employment are not as far apart as might at first seem.

European Union
Free Trade Agreement Chile - European Union

Luz Varela
Univesidad De Los Lagos, Chile

Abstract

The European Union is a set of organizations created between the countries of western Europe with the purpose of articulating mechanisms of economic, political and social cooperation that take to a progressive integration of these countries.The Agreement of Fourth Generation Extra signed in 2002 with Chile consecrates an asymmetry privileged for Chile. It is favorable for the agricultural, industrial development, the generation of use and the improvement in science and technology. The most important benefit of the Association of Chile with the European Union is the "Creación of Commerce".

The Agreement with the European Union represents a very important opportunity for the productive sectors of the X region of Chile. The regional activities that will participate in this commercial interchange are: Agricultural Sector - Cattle, Sivícolas and Pesquero.

Capital Markets: Globalization, Models and Tendencies in Latin America

Daniel Ayala
Universidad Del Valle de Atemejac, Mexico

Abstract

In recent years, the globalization of financial markets has grown in an astonishing manner. The economies have allowed the deregulation of domestic markets for free circulation of capital flows and also of participants of the worlds' main financial centers. Also, technological improvements have enabled in a considerable manner monitoring of markets all over the world - their operation, financial opportunities, etc.

We have the foundations and models used by investors to form their investment portfolio. Whereas, the Arbitration of Prices Theory (APT) states that profit of an asset is a function of several, an interesting feature of the APT model is that it supposes very little about investors and market structure.

Now, in the event of Latin America, privatization of asset values has recently grown, as well as the placement of sovereign, governmental and municipal debt within capital markets. This makes global capital flows in these economies much more competitive.

Managing International Joint Ventures in Emerging Markets: Thailand Experience

Marlar Thein Han
Royal Melbourne Institute of Technology, Australia

Abstract

International Joint ventures (IJVs) are critical concern for international business because of their growing strategic business environment, especially so in Thailand where IJVs have become very common. There are various reasons for the increasing use and importance of IJVs. This being the case, a study has been conducted with the objective of promoting a better understanding of how firms proceed in managing IJVs. The emphasis is on identification of strategies which firms employ when seeking the competitive advantage of IJVs. The study aimed to gain insight into the strategies adopted and the managerial perspective of IJVs in emerging market of Thailand. This paper presents the findings of a research on fourteen randomly selected IJVs in the manufacturing sector of Thailand, based on focused interviews with foreign and local managers.

Financial Characteristics of Companies Using the Fair Value and Intrinsic Methods in Accounting for Stock-based Compensation

Ramesh Narasimhan
Montclair State University, USA
Shifei Chung
Rowan University, USA

Abstract

A lot of attention is being focused these days on the accounting choices made by public companies in U.S. primarily due to the scandals related to fraudulent reporting in the last few years. Many changes have been precipitated due to these scandals, not the least of which is the formation of a new governmental oversight body to regulate auditors under the Sarbanes-Oxley Act of 2003. One of the many reasons given for the pressures on U.S. companies to fraudulently report high earnings is the use of stock-based compensation packages to reward top executives. Since most of the companies use the older intrinsic value method to account for these stock options, as opposed to the FASB recommended fair value method, some argue that the "real" cost of the compensation package is understated in the intrinsic method, giving executives an incentive to overstate the earnings in the short-term that the options vest to maximize their own returns at the expense of the stockholders. After the accounting scandals the FASB has been under pressure to re-examine this issue and not surprising the board has recently announced that it will study this issue and release a new standard. In addition some companies have voluntarily chosen in the last two years to expense the options using the fair value method. The Intemational Accounting Standards Board (IASB) has also proposed a new standard for this area in the international reporting arena. The purpose of this paper is to examine the accounting method utilized by U.S public companies in reporting stock-based compensation packages in their most recent annual reports. A comparative analysis will be done of the companies choosing the recommended fair value method of accounting for stock-based compensation packages versus the intrinsic value method. The results of the study will be useful for the regulators and the market place in examining the motivations of companies in using the two methods of accounting for stock-based compensation packages.

The PPP Theory of Inflation Transmission: The Experience of Costa Rica

Glenville Rawlins
Montclair State University, USA

Abstract

From all indications a Free Trade Area of the Americas will be a reality by 2010. Many of the smaller territories of the Central America and the Caribbean will join even though somewhat reluctantly. This paper examines one of the sources of that reluctance: currency instability. Using the absolute version of the purchasing power parity theory, the paper models the nominal exchange rate and the price level as integrated processes to ensure that trade between two countries will render the real exchange rate as a stationary process. Employing the Johanssen Cointegration technique, the paper investigates whether the current inflation differential accounts for the difference between the present and previous exchange rate levels for Costa Rica and the US. Given the tight trading relationship between the two countries, the PPP theory is expected to yield robust results. Finally, within this context we investigate the persistence patterns of exogenous shocks such as the episodes of devaluation of the Costa Rican currency.

Purchasing Power Parity and Inflation Variability, the Influence of Central Bank Independence

Hermann Sintim – Aboagye
Montclair State University, USA

Abstract

Under the Purchasing Power Parity (PPP), changes in relative prices account for exchange rate fluctuations between economies over time. Specifically, PPP postulates that exchange rates adjust to the differences in relative inflation at home and abroad. In essence the behavior of inflation affects the stability of the price of currencies and therefore the exchange rates. Empirical studies provide some evidence in support of the PPP; results have been stronger in the mid to long run time frames but relatively weaker in the short run. Empirical and theoretical expositions establish an inverse relationship between the degree of central bank independence (CBI) of an economy and the level and stability of inflation rates. A verifiable implication of the latter relationship is that, the higher the CBI the lower and less variable the inflation rate. Given the influence of CBI measures on the behavior of inflation, and the relationship between the relative inflation and the movement of exchange rates between two economies, a testable proposition would be to investigate the influence of CBI measures on the efficacy of PPP across sets of countries.

Arguments have been presented to the effect that PPP would likely hold stronger in high inflation situations because currencies of these economies will be more sensitive to price changes (Leith, C. J. (1991)). On the other hand, intuition will suggest that economies with relatively stable inflation rates will be less 'noisy' in terms of inflation variance and will more clearly impound any small changes in the pricing of currency. Either way, given the CBI-Inflation relationship, CBI measures may influence and explain the tenancy of PPP theory. The objective of this study is to investigate to what extent CBI measures explain the PPP argument.This paper extends existing CBI and PPP literature by developing a functional form that relates CBI to the first and second moments of inflation rates. This approach entails the use of a maximum likelihood framework that facilitates the direct inclusion of CBI parameters in the residual covariance matrix. This method allows for a more intensive use of information contained in the CBI indexes and the estimates obtained are perhaps more better reflective of CBI influences on the behavior of inflation. This paper demonstrates that there are significant differences in the residual variance of inflation that can be attributed to the measured degree of central bank independence. The next step will be to examine the latter relationship within the context of the PPP theory.

Foreign Direct Investment, Financial Markets, and Entrepreneurial Activity
The Micro Companies and Their Financial Access

Rosamaria Westrup
Ramon Espinoza
Centro de Estudios Universitarios, Mexico

Abstract

In analyzing the economic structure of a country, we have found that its productive chain is governed by the coexistence of companies from different span. Upon analyzing the sectors determined in the different countries we found the same phenomenon. We are postulating that the dimensions of a company are not related with a certain sector of activity. Neither exist countries nor economies that demand a certain level of activity so that someone can create a company. MIPYMES should play an important role in the globalization of trades, and the exchange between big economic regional blocks. Micro enterprises are made up of the most diverse range of products and services. They have been begun for people who need to increase their revenue, or by those who have lost jobs or by those who are venturesome.

Promoting Equity through Organisational Commitment: Progressing The Operationalisation of The Concept

Gordon Brooks
Macquarie University, Australia

Abstract

One tool for the provision of equity in the workplace is organisational commitment, which can deliver equity by providing benefits to both employers and employees. Despite a rich literature there has been a failure to operationalise the concept.

This paper examines causes of this failure. The literature is examined in three areas, each relating to part of the notional antecedent/organisational commitment/consequence relationship underpinning research in the area. Six factors restraining the operationalisation of organisational commitment are identified: lack of a general model explicitly linking organisational commitment to strategy; lack of a comprehensive theory-based categorisation of antecedents; lack of agreement as to the correct level of analysis or consideration of inherent assumptions; lack of agreement regarding what the concept properly embraces; the relative lack of empirical research into the consequences of commitment; a method of evaluating the usefulness of antecedent and consequence research.

A two dimensional framework for assessing the usefulness of antecedent and consequence relationships with organisational commitment having regard for corporate risk is proposed and successfully tested, offering a solution to one of the above limitations. Further research is foreshadowed.

An Analysis on the Competitive Trend of Foreign Entry into Chinese Banking

Xin Ye
Zongxian Feng
Yanling Ma
Xi'an Jiaotong University, P. R.China

Abstract

With the acceleration of foreign entry into Chinese banking sector after China's joining the WTO, the competitive trend between foreign and domestic banks in China has become intense in China. This paper presents a quantitative analysis of the current situation of foreign banks in China. And further, the competitive advantages or disadvantages between foreign banks and domestic ones have been described. We discuss the concept of "cherry picking" that foreign banks commonly apply in emerging markets such as China. These competitive tactics has been classified into four aspects (region/client/business/talent). There are expected to be the most fierce competition area for foreign and domestic banks in China in the considerable future.

Mexico in the Back Room of the International Trade

Jaime Ramírez Ramírez
Universidad del Valle de Atemajac, Mexico

Abstract

This document presents/displays analysis from two different perspectives. First of these is the position of Mexican economy from foreign trade and the second is the disadvantage which it represents to commerce that turns it into a quite vulnerable country before the attacks of foreign economies, mainly those of the Asian block.

Rio vs. Marrakech: The Stalemate at Cancun

Suresh Desai
Montclair State University, USA

Abstract

The stalemate at the fifth ministerial summit of the World Trade organization (WTO) at Cancun, Mexico has opened the season for the blame game. The developed as well as the developing countries, the global business communities and the non-governmental organizations are finger pointing at each other. The paper argues that the stalemate is the necessary outcome of a conflict between the two policy regimes that have evolved in the last 30 years and are attempting to govern economic interaction in the global arena. These two regimes are inconsistent and sometimes are in open conflict with each other. The one regime, guided by free market ideology, aims at ushering in a borderless economy, polity and homogenized (Americanized) human world. It strives to establish an even playing field for free mobility of global finance with a promise of higher economic growth for all participants. This regime culminated in the establishment of the WTO at Marrakech in1994 as a judicial arbiter to resolve all disputes and is backed by the structural adjustment policies of International Monetary Fund (IMF) and the World Bank. The other policy regime, crystallizing in the Rio agreement, seeks to establish a regulatory framework to promote ecological stewardship, equity and cultural integrity. This framework is the product of international agreements on climate, bio-diversity, forests, endangered species and various codes of conduct. These agreements are not guided by a single ideology but are compromises about actual needs of diverse interests. In the last decade, Marrakech seems to be winning and marginalizing the Rio regime. The Doha Declaration established a work program that would solidify this outcome. The Cancun statement indicates that this onward march of Marrakech over Rio has been halted. The paper offers some comments about the possible scenarios and outcomes.

The Trade and Investment Effects of Official Dollarization in Latin America

Anastasia Xenias
Columbia University, USA

Abstract

Globalization is bringing the countries of North and South America closer together. One trend which has gone virtually unnoticed is full dollarization in small countries of Latin America, such as Ecuador and El Salvador with Guatemeala a possible third candidate. Distinct from Argentina, these countries decided to go a step further than fixed exchange rates and currency boards—they have abandoned monetary policy altogether in favor of using US dollars for transactions. For many years few central banks in Latin America have been able to deliver on their mandate to maintain price stability. This has hindered economic stability and growth. Dollarization holds new promise for elusive economic stability. Economics analysis would predict that a single currency facilitates trade and investment between the countries using it because it eliminates transactions costs, improves efficiency and business confidence. Thus, using the US dollar should expand international business between those Latin American countries and the United States. This paper looks at trade and investment between officially dollarized Latin American countries and the United States to determine the extent that dollarization has contributed to international business among these countries and make some predictions for the future.

The Concept and the Type of Assembly in México

Marco Antonio Merchand Rojas
Universidad de Colima, Mexico

Abstract

With the prevailing trend of globalization and relaxation in economy world-wide and the políticis of opening and liberalizatión implemented by Mèxico, everything seems to aim at fortifying the pattern of accumulation or “development of style” supported in a process assembler. The investments of the trans-national capitals accelerate exportable products scattered in the national territory.

In order to integrally explain the meaning that has the maquilador process in country peripheral, like México, the paper is divided in these parts:

1.Dimensions and concepts of assemble
2.Internal and external factors that determine the location of assemb le
3.International and national customs regulations that favor American capital to settle in Mexico through the promotion of the IME in this sector.

Economic-Territorial Analysis of the Assembly Industry, in Nezahualcóyotl Country and Surroundings

Alejandra Ballesteros Aureoles
University Technological of Nezahualcóyotl, México

Abstract

For more than twenty years, and because the lack of industrialization, some economies have been hidden in the manufacturing companies, as this is a way of generating jobs and a way to activate the economy. In the short term, these kind of enterprises have grown and become a production option in the world. In Nezahualcóyotl County, there has been an important development in clothing manufacturing. This has become a core economic activity and is now considered as the main work and income source for the people in this area and nearby communities. This service is widely offered to a variety of enterprises in Mexico City, its surrounding area, and, even, to foreign markets. This paper analyzes the featuring characteristics in the development of the manufacturing industry in Nezahualcóyotl County and surroundings. It revise the historical development of manufacturing enterprises, and analyzes the current situation of manufacturing enterprises and its future for production automation.

ALCA: An Indecent Proposal?

Juan Carlos Robledo Fernandez
Technological University, *Colombia*

Abstract

This paper reports part of a study of different elements of the ALCA that are currently being developed by the Group of Investigations in Regional Development and International Competitiveness of the Faculty of Economics and Administrative Sciences of the Universidad Tecnologica de Bolivar. The historical and conceptual approaches of the theories of international trade try to establish elements of critical thinking about the relevancy of ALCA for Latin America. The paper attempts to establish if this is profiled more as an indecent proposal or in fact, as a unique opportunity for the hemisphere and the developing countries.

Internal and International Rural Day Laborers in Rural Markets of Work

María Barrón
Universidad Nacional Autónoma de México, México

Abstract

The objective of this work is to analyze the changes in the migratory currents of rural day laborers. In addition, the study measures the impact of migration from the following considerations. How the expansion of the harvested area of vegetables in California, USA, combined with the deterioration in the conditions of life of the rural population in Mexico, have caused an increase in the internal migrations and an expansion to international markets of work. This work is developed from a study of migrations from the countryside in the state of Baja California of the Mexican Republic and its link to Imperial Valley in California, USA.

To Decipher the Singing of the Mermaids: Social Imaginary and Migration

Myrna Huerta
Universidad del Valle de Atemajac, México

Abstract

This article is part of an investigation that was carried out on the migrant lives of Tala, Jalisco. After reviewing a series of previous studies on the migration, it was observed that they lacked certain perspectives namely, the vision that the migrant one has of himself, and the explanation that the migrant gives to the situation., before The object of project to study the relation of one's own collective imagination with the migration of their (inhabitants of Tala, Jalisco) to United States. Even though the main causes of migration are the poverty and the unemployment; nevertheless, it was observed that other reasons of subjective kind coexist. These are the desire of adventure, the need to participate in an initiation rite of virility, the illusion to maintain a united family or to flee from a social repressive situation.

Income Distribution and Inequality: Wage Rigidity and Conflict in Mexico

Omar Jiménez
Center for European Union Studies-UPAEP, Mexico

Abstract

According to neoclassical literature about labor market, wages are the opportunity cost among leisure and consumption, however, we need more arguments in order to understand the recent evolution of wages in Mexico. Education, age, gender and geographic location are very important arguments that explain the frame of wages in all regions of this country. Again, following the neoclassical theory of economic integration, wages will approach wages in the partners countries,. If 90% of Mexican trade is with United States, we will expect an approximation of wages and salaries with the U.S, but this is not true.

The polarization of the income process in Mexico is reflecting the diminishing weight of the "middle class". The bimodality of income distributions in some countries increases the probability of conflicts. Mexico is already part of a commercial block looking for free trade; however, convergence in wages and salaries is far away. Polarization process is coming with particular force due to the NAFTA and the lack of labor reform. We want to explore the recent evolution of wages and salaries, and use our results in order to understand the global challenges in labor market mobility.

Entrepreneurship Strategy and Enterprise Development

María Correa
Universidad Autónoma Metropolitana – Iztapalapa, Mexico

Abstract

This paper analyzes the entrepreneurship strategy to establish the factors that affect the enterprise' financial performance, the enterprise' performance in general and the enterprise's success or failure. There are very diverse strategy types for entering in new business. The performance of the company depend so much on the strategy that is implemented, the abilities of the entrepreneur or the abilities of the entrepreneur team and the type of the industry. The firm should choose appropriate strategies and to implement them to achieve excellent results and to achieve a sustainable competitive advantage on their rivals.

We consider three basic strategies– be a low cost producer, be the producer with the best quality and be a producer based on the time that can lead a company to be successful in the achievement of the high growth in their results.

Enterprise Resources Planning (E.R.P.): Development and Application at the Enterprise

Francisco Navarrete Báez
Universidad del Valle de Atemajac, Mexico

Abstract

The focus of this research is to understand the ERP - its applications, its usefulness in improving the processes and reducing the decision making time. AN ERP system can be applied to enterprises of all sizes - small to medium to large. With the help of an ERP system, finance reports could be ready in hours instead of days. The accuracy and the reliability of the inventories could be more than 99% if we want to apply a Just In Time system. Also, developing an application to manage some specific area if we do not have resources to use all ERP modules, will bring good outcomes.

Financial Reporting of Small (Sized) Enterprises

Marie Paseková
Lenka Drábková
Tomas Bata University in Zlin, Czech Republic
Eva Hýblová
Masaryk University in Brno, Czech Republic

Abstract

Small and Medium (Sized) Enterprises (SMEs) have an irreplaceable role in the economies of all countries. Each country endeavours to support its SME sector through a variety of programmes. The aim of this contribution is to provide information about the financial reporting practices of SMEs in the Czech Republic in comparison to the requirements ensuing from implementation and conformance with international standardisation efforts for Accounting practices. The Intergovernmental Working Group of Experts on International Standards of Accounting and Reporting (ISAR) has identified a number of problems experienced by such SMEs in the course of their accounting practices. The accounting practices of SMEs is based on the double-entry bookkeeping system but with certain granted reliefs, which are as follows: a simplified approach to the applications of the Accruals Principle, a simplified accounting structure, and a standardised format for Accounting Statements.

Conceptual Model for the Development of Strategies of Electronic Commerce for the Small and Medium Companies

Celestino Robles Estrada
Rommel E. Cedano Ansures
Universidad de Guadalajara, México

Abstract

The future is bright for electronic commerce. It has been forecasted to increase in from $109 billion in 1999 to $1.2 trillion in 2003 (Forrester Research, 1999) to as high as $7.3 trillion by 2004 just in the U.S. (Gartner Group, 2000). Global transactions are predicted to be $105 trillion by 2004 (Gartner Group, 2000). In spite of this, many small and medium sized enterprises (SME'S) that owe their current success to their entrepreneurial spirit, have shied away from electronic commerce technology and most of them are ill-equipped to capitalize on the Web's full potential for enhancing their marketing efforts, perhaps because their executives do not fully understand the potential of Internet marketing. The same is true for the Mexican SME's. Given this facts it is obviously critical for the SME's to develop strategies that link them to the online marketing world. To address this issue, this paper makes a review of the authors who studied the planning behavior of successful e-commerce companies and/or proposed alternative planning models, and offers framework for developing a e-commerce strategy. The model proposed integrates the main proposals from these authors and was adapted to the Mexican companies' environment and characteristics.

The Dark Side of Strategy

Jorge Luis Narváez
Universidad Nacional de La Matanza, Argentina

Abstract

The essence of the final decision is always missed by the beholder and it is often missed by the one who takes the decision. In the process of taking decisions there will always be a dark and mysterious hole. Those words belongs to John F. Kennedy, and describe a reality: each decision has to be based in principles or techniques to be effective.

In organizations, as well as in public life, people have given priority to values. The current key to success of modern organizations is in the building of a system of values adapted to people's necessities. Such key to success has not been clearly identifiable for managers, shareholders and clients. Nowadays, it constitutes the invisible support to implement any organizational attempt that intends to be successful. This is what is called the dark side of strategy.

Strategic Analysis for the Small and Medium Enterprises (PYMES) Development in the State of Veracruz

Clara Celina Medina
Universidad Veracruzana, Mexico
Francisco Ballina
Universidad Veracruzana and Universidad Autónoma de México, Mexico

Abstract

The main objective of this paper is to analyze the Pyme's situation in Veracruz, taking into account these factors - their strategy and main competitive factors; their organizational and human resources structure; technology indicators, quality and innovation; level of information and communication technology use; and different accounting and financial aspects. We will determine the competitive strengths of the Pyme and define the main difficulties for their development. Also, we will propose actions for the Pyme competitive improvement and success.

An Initial Investigation into Differences in Managerial Styles for Handling Change in the Organization: A Comparison of Chinese and U.S. Managers

Stephen J. Silver
Thomas I. Kindel
Ronald M. Zigli
The Citadel Charleston, USA

Abstract

A survey MBA students in China and Charleston, USA, was used to find differences in management styles between Chinese and U.S. managers. Fifteen vignettes – delicate situations requiring managers to handle problems – were given to these managers and their responses were analyzed to determine cultural differences. There were three categories of vignettes: seven involving values, five dealing with conflict resolution, and three in which managers had to deal with change in the organization. This paper will outline the results of the first two and talk in some detail about the results from the three situations dealing with change.

On Operational vs. Accountancy Approaches to Earnings Management

Jeffrey Kantor
University of Windsor, Canada
Liran Edelist
Bar-Ilan University, Israel

Abstract

Enron, WorldCom, Tyco, Qwest, Xerox, and 3Com are just a few of the prominent companies that been implicated in Earnings Management scandals. During the last year, two of these well-respected companies (Enron and WorldCom) went bankrupt following investigations and indictments by the U.S. Securities and Exchange Committee (SEC). Growing concerns about this phenomenon led to a demand in August 2002 that managers of the top 1,000 American companies (with company values of over $1.2 billion) submit their financial statements under oath. Managers have the ability to influence financial statements by 1) allocating and re-directing company resources (operational approaches) and 2) by choosing/changing to different accountancy methods (accountancy approaches).

The chairman of the SEC, Arthur Levitt, has expressed his deep concern over the growing phenomenon of earnings management. He argued that earnings management should be eliminated "For the sake of our markets; for the sake of our globalized economy which depends so much on the reliability of America's financial system; for the sake of investors; and for the sake of a larger commitment not only to each other, but to ourselves " (Levitt, 1998).

Should revising depreciation methods or inventory figures be considered less ethical than postponing expenditures or planned maintenance? Can we justify a manager who uses earning management to increase a company's profit? How does this compare to a manager who uses earning management to show a decrease in profits? Is there a difference because of gender? Do managers have different views to non-managers? The sample group in the research comprised 132 MBA students. Each questionnaire included 13 questions designed to measure the sample group's views on earnings management. Two situations are presented in which there are managerial dilemmas that provide a basis (pressure) to engage in earnings management. In situation A, the manager learns that the company's profits are far above the projected level. This achievement is considered a one-time phenomenon, so the manager is interested in understating its profits in order to avoid creating expectations for similar results in the future.

Marketing by Internet as Development of Business Strategy: Model to Implement Strategies Business to Consumer (B2C)

José Sánchez Gutiérrez
Elsa Georgina González Uribe
Felipe Toledo Gutiérrez
Universidad de Guadalajara, México

Abstract

This work presents the basic concepts of the e-commerce as they are pointed out in the contributions of Whiteley (2000), Gordon (2000) and Plant (2001). It continues the study with the work on marketing by Internet, referring to the topic that Janal (2000) denominates the differences between on-line marketing and traditional marketing. The study presents the diverse stages to establish marketing strategies in web, which is the basis for the proposal of a marketing model for internet. Finally we conclude with a model to implement marketing strategies of business to consumer (B2C) that can be adapted for the small and medium companies.

The Application of Quality Function Deployment Method to the Auction System of Taichung Wholesale Fish Market in Taiwan

Lee Tzong-Ru
Lin Ya-Chuan
Yan Shu-Hui
National Chung-Cheng University, Taiwan

Abstract

As an important channel of marketing fish and the medium between fishermen and consumers, a wholesale fish market not only controls the supply and demand of fish but also functions as the center of fair-trading. Therefore, the Council of Agriculture in Taiwan makes best effort to improve the fish-trading environment, to construct and promote open fish trading system, to increase marketing efficiency, and to carry out the computer auction system. However, unlike countries in which there are few kinds and large quantities of fish, Taiwan's fish are various and each kind is in a small quantity, which are hard to manage so as to cause slow development in automated auction of wholesale fish markets in Taiwan. Presently, 21 computer auction lines are set up only in the four wholesale fish markets of Pu-Shin, Chiayi, Taichung, and Hsin-Chu. (Council of Agriculture, 2003)

The computer auction system, in place of the traditional auction way, allows the buyer to see and touch goods. The buyer bids and trades with the bidding machine, which not only makes the whole trading process totally open and fair, but prevents man-caused mistakes as well. In this way, both the seller and the buyer trust each other and recognize this system. Because the open bidding process encourages more buyers to bid, the fish price is raised 0.1 American dollars per kilogram and thus increases the income of fishermen. Besides, manpower can be saved through the computer auction system, which can instantly prints out the detailed list of trading and provides it for the seller to receive money on the spot and for the buyer to check the quantity of fish goods. As for the wholesale fish market itself, the suppler trusts the trading system so is willing to entrust all kinds of fish products to the market for auction, and this boosts the business of the market.

The focus of this study is to study the operational quality in the process of Taichung wholesale fish market in Taiwan. There are numerous trading products in Taichung wholesale fish market, and about 7500 fish products are sold out; the trading process is still in order in spite of high trading demand just due to the implementation of the computer auction system which brings about systematic arrangement of fish goods from all over the country. Both of the seller and the buyer are able to check current prices of any fish at any single time in the whole market, and the inquiry into the wholesale market.

In the application of the automated auction, a sound auction system is the pivotal mechanism to maintain good quality of trading. To the wholesale fish market, the buyer is the customer. Nowadays, the customer's requirement is tougher and tougher, so quality management can't stick to prevention; on the contrary, what the wholesale market should put emphasis on in quality management is to positively and rapidly reply to the demand of the market, and to gradually become customer-oriented management.

To precisely understand the Voice of Customer, the company can use the Quality Function Deployment Method, QFD, regarding the customer demand as the important index of company improvement, and finding out the most effective strategy for quality improvement. Thus, through the application of QFD, our research will discuss the pivotal factors that have an influence on the efficiency of the operational process of the wholesale fish market, and analyze the main demand and concerns the buyer has about the automated auction and its system so as to provide information about improving the auction operation quality; further, the whole auction efficiency will be increased to better the computer auction system. In this way, the auction market will be able to function perfectly.

The Market Orientation and Its Influence on Relations Between Members of the Channel of Pharmaceutica Chemical Agent Distribution in Jalisco

Ernesto Raúl González Ramírez
José de Jesús Urzúa López
University of Guadalajara, Mexico

Abstract

The present work explores the degree of adoption of the market orientation approach that the product distributors of chemistry-phamacists in Jalisco perceive in their suppliers.The study begins with a perspective from the market approach and an empirical description of the management approach. This is based on a sample of 54 pharmaceutical chemical agent distributors in the Metropolitan Zone of Guadalajara. The results reveal that the companies of the sector are not highly oriented to the market. We discuss three comp onents of the market orientation. These are the generation of market information, the dissemination of the information by the organization, and the component of organizational response.

What the Executives and the Businessmen Comment about The Valuation of Businesses and the Creation of Value in Mexico

Juan Adam
Universidad Nacional Autonoma de Mexico, Mexico

Abstract

We interviewed 13 businessmen and executive of high level in relation to:

?? Their personal experience in processes of valuation of businesses with purpose of fusions, splits, alliances, acquisitions or sales.
?? The methods that they recommend to value a business.
?? The importance of the intangible in a process of valuation and negotiation.
?? The obstacles that are presented in these processes.
?? The recommendations that they give us for future processes of this type.

We present the results of a survey applied to 371 postgraduate course level executives.
The fundamental purpose of the survey was to know the following aspects:

?? Which methods the businesses use to measure the generation of value?
?? Which financial indicators the businesses use to measure this generation of value?
?? Any relation of value creation with the different programs of incentives for the businesses?
?? What advantages have been achieved when applying some of these methods?

Learning, Continuing Education and Training: Entrepreneurs' Development

Mario Mena,
Horacio Irigoyen
Universidad de Morón, Argentina

Abstract

The impact of globalization in Latin America has created a significant fall in the generation of business opportunities and on the contrary a strong trend, in fairly- trained young people, to migrate to some of the central countries. Due to a demographic policy developed in these countries, where segregation and the policies tending to admit immigrants "qualitatively interesting", a very outstanding characteristic is to absorb individuals with some basic skills and with a particular emotional disposition turning them into operating elements of the society.

Taking into account that at every moment and in every society, the paper postulates that there exist individuals who have at least a positive emotional disposition for the development of innovative activities. This paper aims to the possibility of implementing proper policies for the different countries of the region to promote a wide variety of activities in their own country.

When the Governments and social institutions of all kind are devoted to the task of individually, collectively and regionally promoting innate skills and others to be easily acquired with the purpose of making up potential enterprising individuals, that phenomena may not only change but complement with a series of structural rules tending to create a different "culture" capable to show a unique social view to the whole society.

Conditions That Favor Clusters Formation in the Provision Chain

Gabriel Fregoso
Ernesto González
Juan Flores
Universidad de Guadalajara, Mexico

Abstract

The international buyers insist on obtaining better quality, shorter response times and lots. In the words of a manufacturer from India, as commented by Hubert Schmitz comments (2000), "…is demanded to us that we produce to prices of the Third World, but with quality of the First World." This summarizes the challenge that companies of the developing countries face in competing for the export markets. The conditions that favor the formation of clusters in a particular geographic area are not understood completely. Nevertheless, the present work shows evidences of some determining factors in the internationalization of the supply chain. It discusses that a set of companies with the necessity to face the international competition must work together to establish a common strategy, thus forming clusters that help them to compete. On the other hand, the export represents a viable strategic option so that the companies are internationalized. This caused the interest in the last two decades to investigate the determinants of success in the exporting companies (Zou and Stan 1998).

An Educative–Institutional Model for International Competitiveness Development: Application to Primary Sector Business Units

Oscar Valenzuela Sahagún
Jorge Franco López
Monterrey Institute of Technology and Higher Education – Guadalajara Campus, Mexico
Guillermo Orozco de Rosas
Foundation Produce Jalisco, Mexico

Abstract

The globalization process is stronger and more evident than ever before. It is characterized by the enormous importance given by customers to quality, price and competitiveness of products. This situation creates opportunities and challenges for small and medium size business units included in the primary sector. In Mexico, the agricultural sector has been disarticulated from the rest of the domestic economy and has lost international competitiveness in the last thirty years. Nevertheless, the comparative advantages of production and the recent openness of the country to foreign markets–through commercial liberalization and free trade agreements–underpin the possibility for firms and growers to participate in markets all over the world. Using a model that combines the profile of international business students, rural development programs of non-for-profit organizations and public resources of government agencies, we provide the essential guidelines and organizational knowledge to generate international competitiveness that allow primary sector business units to compete successfully overseas in the short term.

Knowledge Administration: Learning, Improvement and Training

Mario Mena
Horacio Irigoyen
Universidad de Morón, Argentina

Abstract

According to the Darwinian view in economy and business, the closures of enterprises are balanced with the appearing and emerging of new ones. Enterprises do not appear spontaneously. They are the result of a succession of social and individual phenomena which determine the existence or absence of initiatives and the beginning of a special "spirit". Considering the Argentinean case, we find that in the 90s the closures were more than the openings.

One of the basic conclusions is that the university has a crucial role. The society needs to rethink the university's mission, the teaching-learning structure and the improvement of the learners' skills that .could be different from general skills. The prevailing academic structure shapes suitable individuals to work in organisations, to understand and to use technologies. It does not teach how to investigate, create, adapt and develop new technologies, which generate new enterprises.

The social importance of the university degree in Latin America goes beyond that of the executive and, at the same time, this factor withdraws the professionals and researchers from the practical field of the transfer of the scientific approach to the applied technology. Once the causes are known, it is possible to try to modify and anticipate its effects. For that reason, it is essential to redesign the universities' vision and mission in Latin America. The direct involvement of these in the process of encouragement and development of the students' ever-growing capacity will support, help and develop business initiatives.

Linking Business- University, from the Perspective of the Scientific Research: Limitations and Challenges of the Globalization

Salvador Gómez Nieves
Guillermo Vázquez Ávila
José Sánchez Gutiérrez
Universidad de Guadalajara, México

Abstract

This work presents the topic of the linking universities with business sector. However, in spite of recognizing the importance that this process represents for the sustainable growth in Mexico, this has had a slow development for the lack commitment among both sectors. Such linking was recommended by the United Nations for Education, Science and Culture Organization (UNESCO) as a strategic point in the Conference of the Americas (1998. Also, the Education National Plan of 2001-2206 (2000) integrated the vision and the strategic lines for higher education in Mexico.

Universidad de Guadalajara's general policies, detailed in the titled document: "Setting about to the University Plan of Institutional Development 2002-2010 (Universidad de Guadalajara, 2003)", state that research stays as a strategic element of development. Where it reinforces the links among university, society and government; self-critical evaluation of the program is promoted. The present study starts from the premise that the Higher Education Institutions (HEI) that are interested in the relationship with the productive sector would learn from the successful experiences of other universities This paper incorporates the experience of case studies of the Administrative Economics Science University Camp us (CUCEA), where the students carry out activities to develop administrative and managerial abilities (diagnostic, taking of decisions, observation, to know how to listen and to convince) while they are granted to the company consultantship services. Als o, the students are sensitized about the responsibility of taking real decisions in a practical environmental context.

Finally, a proposal of Long Term Development Plan is presented for the linking of the CUCEA with the diverse sectors.

Core Competences in Higher Education: Case of the Faculty of the University Center for Economic and Business Administration Sciences (CUCEA) of the Universidad de Guadalajara.

Verónica Baños
José Sánchez
Edgar R. Ramírez
E. Georgina González
Universidad de Guadalajara, México

Abstract

In accordance with the analysis carried out by Hamel and Prahalad (1994, 1995, 1998, 1999, 2002), a core competition consists of an element or a group of elements that are unique and very difficult to imitate by its competitors Other authors like Levy and Leboyer (1997), Van der Heijden (1998), Hoskisson, Ireland and Hitt (1999), Rastogi (2003), Goldberg (2003) have analyzed and directed their studies to the difference among the resources of the company (tangible or intangible) and whether these resources are really critical competencies.

Given the relevance to know and to identify the core competences in an organization, a field study is made at the Center for Economic and Business Administration Sciences (CUCEA) of the Universidad de Guadalajara, where the main critical competitions of the faculty of this center are detected.

The present work has as objective, to present the advances in the pursuit to the strategic plan of the CUCEA, to develop the critical competences detected in the faculty which will serve like one of the tools to improve the position of campus competitiveness.

Competencies of Outstanding Faculty Members of Business for Schools 21st Century

Liliana Manrique
Lourdes Francke
Instituto Tencológico y de Estudios Superiores de Monterrey, Mexico

Abstract

Based on future changes in faculty evaluation practices, this paper examines the key competencies of outstanding business faculty members in a Mexican university. The survey is based on the nominal group technique, personal interviews and students teaching evaluations. Our sample of the survey is 19 staff directors of different areas of Business School, 13 full time professors and 2500 students. The purpose of the survey is to determine the key competencies of high performance faculty members, identifying the weight given to competencies related to personal attributes and the weight given to competencies related to work. This survey will contribute to faculty personnel decisions such as merit pay, promotion and rewards. Our assumption is that competencies related to personal attributes will be higher in outstanding performance faculty members than competencies related to work. This approach is applicable not only to faculty member but also to any kind of employees within organization.

Higher Education and Income in Mexico

David Montaño Román
Universidad Tecnológica de México, Mexico

Abstract

The aim of this research paper is to demonstrate, for the case of Mexico City, the positive relationship between educational level and individual income. This paper also analyses other income determinant factors, such as gender, organizational job level and worked hours, to determine the exact impact of education level on individual earnings. For this we have used the micro data of the National Survey of Urban Employment (NSUE) for the third quarter of 2002.

The central emphasis of our research is in higher education, taking into account the differences in personal earnings of those individuals who advanced through different professional career stages and hold different academic degrees. We also focus on the way the educational level is concentrated amongst the different income earners deciles. The result of this research has lead us to a set of conclusions and considerations that could be useful for the design of a national educational policy.

Facilitators and Constraints in The Global Transfer Of Knowledge: Examining The Role of International Assignments

Eileen Kaplan
Montclair State University, USA

Abstract

International business practices are increasingly requiring cross-cultural transfer of knowledge, values, and experience as companies recognize the need to operate both locally and globally in a challenging and volatile environment. Managers are urged to adapt management practices to suit local contexts, to coordinate the work activities of multicultural groups and to integrate their operations into a global knowledge economy. Yet there are differences about the importance of international assignments as a vehicle for transferring global knowledge. Some companies consider international assignments as critical in transferring global knowledge, with global employees acting as a kind of organizational "glue" to facilitate the process. Others believe that moving people around and putting people in foreign settings doesn't necessarily result in the global transfer of knowledge or in the "right" attitudes that make a company global.

The purpose of this paper is to examine first, the extent to which companies use international assignments to facilitate cross-cultural transfer of knowledge, values and experience. Second, to what extent are these goals reflected in criteria for the selection of managers for international assignments, as well as in practical training for assignments. Third, what are the implications for using international assignments to facilitate the global transfer of knowledge in a volatile environment? We conducted a series of interviews with a senior Human Resource executive in 28 global companies. Of the companies, 21 were headquartered in the U.S. and 7 were headquartered in Europe. At the time of the interviews, the annual global sales of the companies ranged from $3.5 billion to $52 billion dollars and the worldwide number of employees ranged from 7000 to 13,200.Overall, international assignments appear to serve as constraints rather than facilitators in the global transfer of knowledge. The pattern of results indicated that companies overwhelmingly use international assignments on a limited basis to transfer technical skills rather than rather than management knowledge, values or experiences. For only three of the companies was there strong emphasis on transferring global knowledge and developing global talent, but selection in these companies was focused at the executive level as part of a broader development program. There was limited pre-departure training for international assignees in general and very little that dealt with transfer of knowledge either explicitly or implicitly. We discuss the implications of these findings and suggest ways for using both international assignments, and networks to facilitate the global transfer of knowledge. Directions for future research are discussed as well.

Coaching-Processes in the Future

Harald Kupfer
Harald Kupfer Consulting & Human Resources, Germany

Abstract

During the last few years the significance of the so-called "soft skills" in the entrepreneurial activities has considerably increased. Very often the personal development does not keep abreast with the continued changes requiring a success promising adaptation. Hereby it is worthy to bear in mind that the personal aspect of the management personnel or that of employees plays an important role, and the orientation towards employees becomes still more and more important success promising factor of management behaviour. The adequate coaching measures represent a possibility of achieving fast, global and entrepreneurial development. Nevertheless, it is already evident that based on the various demands imposed on the coaching, being an instrument of personal development, various interpretations of this term have already been developed both in the literature and praxis. At present, the term "coaching" is taken as a common term for a number of various interpretations. Coaching cannot be taken for some new fad anymore as it has arisen on the basis of market demands. Coaching proves to be useful instrument within the scope of personal development for the purposes of a constructive response on competitions and challenges. However, the success of the coaching measures depends in a decisive manner on the readiness to integrate the coaching into the scope of business activities and to take it as an instrument worthy to be considered seriously. The coaching being already more or less established as an instrument of personal development, now there are less questions about the understanding of the term of coaching than about its effective use for the internal personnel work. Hence the new approaches thereof are considered and analysed in this paper.

Quality of Labor Life on Institutions of Superior Education
Case of University of Guadalajara

Bertha Madrigal
José Sánchez
Jorge Barba
Fernando Fuentes
Universidad de Guadalajara, Mexico

Abstract

The paper is the result of a research project called "The human's talent management on Institutions of Superior Education". Topics included in the project were the impact on the quality of life of the employees – both current and retired, the acceptance of the new pension and retirement system at the University of Guadalajara, and the management of the human resources.

An exploratory, descriptive, case-based methodology was applied. The research results discuss the management of intellectual capital in the organization, the level of teacher's satisfaction against their life conditions, and the goals´ and needs of their educators.

The Institutions of Superior Education have the purpose to develop professionals in the different areas of scientific knowledge. They form part of a community where authorities, professors and administrative employees interact in social, economical, political and normative environments. On this organizational context of the Institutions of Superior Education, quality of life represents a very important issue to generate a high quality level and an academic excellence.

Some discoveries: to investigate these issues has allowed to awaken the interest of the Educative Institutions´ authorities, so that they can promote a management culture and administrate their human talent with the aim to generate equal opportunities in their quality of life, to encourage productivity to higher levels, to excel their human resources and to preserve their intellectual resources with a better quality of employment life.

Business Intelligence & OLAP Tools:
Business Data Analysis

Salvador Barrera
Universidad de Guadalajara, México

Abstract

This paper describes the technological basis of Business Intelligence, a taxonomy of solutions, OLAP tools evolutions, and technology architecture. It discusses the business use, concepts, benefits and risks, standards, selection guidelines of OLAP tools. Finally, it explains the features of OLAP tools, the benefits for the enterprises, an introduction to multidimensional databases, and the terms ROLAP, MOLAP, HOLAP, desktop OLAP.

The Best Practices for a Good Corporate Government

Maria Saavedra
Independent National University of Mexico/Independent University of the State of Hidalgo, Mexico

Abstract

The objective of this work consists of making an analysis of the best practices in the corporative government that are being adopted by the Mexican companies. It presents of the reaction of the companies in adopting the code of better practices along with the effect of this adoption. This work presents in the first place the normatividad established by the OECD for the determination of a good Corporative Government. It then shows the result of investigations that have found that the market of values awards a good Corporative Government.Finally, the paper presents the state of the Best Corporative Practices in Mexico. The main conclusion of this investigation is that the Mexican companies in their great majority (82%) have adopted the Code of Better Practices.

Environmental Education as a Process of Change in the Work Culture of Small and Médium Companies

Humberto Palos Delgadillo
José Sánchez Gutiérrez
Universidad de Guadalajara, México

Abstract

The first World wide meeting about the environment convened by Union Nations (ONU) in 1972 in Sweden Stockholm was an important event. The companies and governments worldwide considered environmental problems and the damage to the ecosystems of our planet. Solutions were discussed to preserve our habitat. Most recently, these issues were discussed in a meeting held in Johannesburg, Africa in 2002. One element of strategy is environmental education.

Companies can approach environmental education at three levels - informal. non-formal and formal. This research incorporates several elements of philosophical, pedagogical and didactic types in the intervention of the formation and awareness of those who work in the Small and Medium companies. (PyMES) located in the Metropolitan Zone of Guadalajara (ZMG), with the enthusiasm to improve its environmental performance situation that is reflected in an Environmental Conscience Basic (CAB), without doubt will be important part of the present and future existence of these organizations.

Finally, a model of learning supported in the environmental education has been proposed that involves all the internal parties interested in the environmental problems. The model provides answers that can be used to create a new ecological culture in the organization.

A Tool for Elections: Political Marketing

L. Rodrigo Díaz-Thome Yaniz
Universidad del Valle de Atemajac, México

Abstract

Throughout the last 30 years, the electorate in Mexico has become much more conscience of the power of its vote. The participation percentage of the citizenship in the elections has increased remarkably since 1991 in Mexico. For this reason the political parties must take into account the demographic, psychological, geographic and the behavior characteristics of the citizens that will eventually vote. They must join the globalization process. The modernization methods of a complex world must be integrated to electoral process in developing countries. The application of techniques and their principles to communicate a political ideology and the candidate proposals, as well as the handling of the campaigns that are carried out in the electoral processes, is called political marketing.

Historic Evolution of Brazilian's Politics of Foreign Commerce

Adilson Luiz Bulla
Universidade do Oeste de Santa Catarina, Brazil

Abstract

The Politics of Foreign Commerce in Brazil went through very special moments in the last 50 years mainly because of the prevailing conditions (in Brazil), which were characterized by little availability of high technology and non-existing industrial parks. The energy crisis of the 70's caused damage without precedents in all countries' economies, specially in Brazil. The country faced the "black decade", the 80's, and passed through some economic plans and changes of currencies but without much success.

Finally, after the commercial opening unchained by the Collor government in the 90's, the country initiated a fast paced process of industrialization. The change agent was the fall of the import taxes that compelled the industrial sector to leave its "comfort area" and to face the tough international competition. This caused the destruction of many companies, but the great majority of the ones that survived today enjoys a managerial and technological competence at the international level.

Sustainable Development and Economic Growth

Gabriela Correa
UAM Iztapalapa, Mexico

Abstract

The discussion on the effects of the liberalization in the international trade on the environment is one of the areas in which the ideas and social values are over borders. It is not rare that international networks of ecologists participate intensely in local conflicts and be the forum that offer the networks of information.

On the other hand, the discussion on the relation among sustainable development and international trade has entered a notorious phase. International institutions such as the WTO, affirmed 10 years ago that the analysis of the consequences that the international trade had on the environment was not one of its responsibilities..
