Family influences their household members' norms, attitudes and values because of the more time they spent together. Through the family unit the children can obtain skills, knowledge and attitudes towards life and consumption patterns. Wald (1974) classifies this learning process as consumer socialization. According to the author, it is not necessary to learn new knowledge to be a consumer because they can accept what has become a firmly accepted norm in the family. As such the preference to certain products can come easily for them through their family influence. Furthermore, parents can influence the behavior of teenagers through rewards. Besides parents, siblings have also been found to influence teenagers in the area of fashion, music and leisure activities that will lead to specific consumption patterns. In many instances, due to their close proximity, a child can grow up idolizing their parents or siblings.

In a study by Martin and Bush (2000), the influence of direct role models (parents) and vicarious role models (favorite athletes and celebrities) on teenagers' purchasing behavior was examined. Their results indicate

that both direct and vicarious models influenced teenagers' purchasing behavior. Further outcome also suggest that parents and entertainers have a greater impact on purchase intentions than athletes and that parents consistently exhibited stronger influence on adolescent purchase intentions and behaviors than vicarious role models did. Beatty & Talpade (1994) analyzed the influence of parental employment status on teens as well as gender-based differences in perceptions. According to the authors, motivational aspects including product importance and usage provided the strongest and most consistent explanations of teenagers' perceived relative attention across stages and purchase situations. Furthermore parental employment status positively influence teens' perceived influence of durable family purchases. Their study indicates that mothers and daughters generally did not differ in the ratings of the daughters' perceived influence in the durable purchase decision-making process, while fathers' and sons' ratings did differ.

Ross & Harradine (2004) conducted a study to investigate the relationship between school children and branding in England. The authors included pre-focus groups, focus groups, and census of all children and a survey of parents. Their findings prove that brand recognition commences at early age with older age groups having greater brand awareness. This study identified the differences in the perceptions of parents and their children's towards brand, with parents express their concerns over the effects of branding. It is found that older children saw the role of branding in enhancing self-esteem and acceptance in peer groups. Further, Kirchler (1993) suggested that peer groups have greater influence than family as children grow up to be adult. That is, adolescents will look for approval and acceptance in peer groups to get the opportunity for gaining new attitudes and social skills necessary for future interactions. In essence, these findings should support two dimensions of brand behaviour as noted by Gaedeke & Tootelian (1983) - prestige and differentiation.

In Malaysia, a study suggested that the influence of family and peer groups differ according to product category. Sim and Huei (1999), while examining the attitude and purchase behavior of teenagers towards Malaysian made products, found that the family was the major source of influence for the purchase of food, beverages, cosmetics, toiletries and clothes. On the other hand peers group have greater influence for the purchase of books and magazines. For electrical goods media influence was ranked as the most important source.

Without a doubt, there are many determinants to teenagers' brand behaviour. This paper, however, will focus on the five dimensions described by Gaedeke & Tootelian (1983) – familiarity, confidence, differentiation, identification, prestige and the influence of family. In fact a study using the above variables has been conducted on Malaysian female shoppers in 2000 (Abd. Rahman, 2000). The result has shown that identification is the most deciding factor in their brand choice. It would be very interesting to see whether the result of this study will generate the same outcome.

## **Research Methodology**

Essentially, two types of fieldwork were carried out in this study. First was an observational study to gain an exhaustive list of sporting footwear brand names in various retail outlets. Second was a survey to capture the teenagers' attitude towards brands, the level of awareness and acceptance, and descriptors of brand choice.

The observational study was carried out by visiting major shopping complexes in Klang Valley to record as many sporting footwear brands as possible and to observe teenagers behavior, while they were in the sporting footwear specialty stores and departmental stores. The shopping complexes visited were Midvalley Megamall, Damansara One Utama, Sunway Pyramid, Leisure Mall, Suria KLCC and Lot 10. Later, a set of questionnaire was designed to describe the awareness and acceptance of teenagers towards local and international brands. Teenagers, in this study, refer to those who are still schooling and in the age bracket of 13 to 17 years old. In Malaysia, this age range points out to secondary school students in form 1 to form 5. Several schools in Shah Alam, Petaling Jaya, Puchong and Bukit Nanas were selected and 300 respondents were intercepted.

Section A of the questionnaire contains statements that are reflective of the brand behaviour descriptors as noted earlier. Section B was designed to gauge teenagers' awareness and acceptance towards sporting footwear. The questions in this section were developed based on the information gathered during the observational study in the shopping complexes. Section C contained questions on the respondents' demographic. Demographic factors such as race, age, gender, monthly allowance and favorite shopping spots were used in this questionnaire.

To describe brand awareness and acceptance of the respondents, data was processed through frequency technique. Descriptive statistics, reliability tests, cross tabulations, annova, and factor analysis were later performed to identify the relevant brand descriptors. Factor analysis is "*a generic name given to a class of techniques whose purpose often consists of data reduction and summarisation*" (Hair, Anderson, Tatham, & Black, 1998). It attempts to draw out a number of factors underlying the input variables and it should be possible to label them in terms of the original variables. Factor analysis could also create an entirely new set of variables that is much smaller in numbers to partially or completely replace the original set of variables. Thus this analysis technique can be used to confirm or explore the proposed dimensions (Hair, Anderson, Tatham, & Black, 1998).

Fundamentally two basic decisions have to be made, prior to using this factor analysis (Green and Carmone, 1970). They are:

1. How many factors to extract?

The first few factors to be extracted are likely to have greater descriptive powers. On the other hand, later factors are more likely to be the result of unreliability of measuring instruments and other sources of error.

2. How to rotate the resulting axis?

The objective of the rotation is to attempt to make each variable has a substantial loading on as few factors as possible. The first issue is whether to rotate the resulting axes; and if so, what kind of rotation?

To address the first issue, items with communalities less than 0.4 were eliminated while all factors whose eigenvalues exceed 1.00 (this the default in SPSS 12.0) were extracted. As to the second decision, a varimax rotation was chosen (SPSS 12.0). Later, the variables were grouped together according to their factor loadings to describe the resulting brand descriptors.

## Findings and Analysis

### Profile of Respondents

Table 1 provides the respondents' demographic profile. As shown, respondents were almost equally spread out in term of age and gender. Likewise, the percentage of race reflects the current ethnic proportion in Malaysia. It is also worth noting that the majority of them get above RM100 of monthly allowance – the top most allowance bracket set by the researchers. This outcome shows that a large number of these teenagers received a much higher amount of pocket money than anticipated (by the researchers). The majority of them cited 'Midvalley Megamall' – one of the most upmarket shopping complexes in Malaysia as the place they bought their sports shoes. Suria KLCC, the most prestigious retail complex, came third.

Table 2 provides an overview of Malaysian teenagers' attitude towards local versus international brands. As demonstrated in the table, Malaysian teenagers were rather receptive towards local brands when they disagreed (mean 3.66) that '*Made in Malaysia brand is low quality*'. Likewise, they seemed to choose product suitability over brand names (2.61). Nonetheless, they agreed that '*the main problem with local brands is low image*' (3.22). Given the latter attitude towards local brands, it is not surprising the teenagers responded positively to '*international brands gave them more satisfaction than local brands*' (2.80) and it registered the smallest standard deviation. The highest variance in answers (1.560) belongs to '*I am not bothered with brand names*' registering mean responses of 3.44 – a neither 'agree' and 'disagree' response. In essence, this outcome points out that Malaysian teenagers associate local brands with low image and international brands with high image, the finding that parallels with many studies in this area mentioned in the literature review. Therefore, international exudes cooler personality. As image building is not something that can be created overnight, this outcome signals a choppy time ahead for local producers. It is critical to the long-term success of a product to build the right brand image by paying attention to understanding these teenagers better and meeting their needs as closely as possible.

TABLE 1: BACKGROUND OF RESPONDENTS (n=300)

Age	Percentage	Monthly allowance	Percentage	Shopping Complex	Percentage
13 years old	17.0	Below RM20	9.3	Sunway Pyramid	18.3
14 years old	22.0	RM21 - RM40	18.7	Leisure mall	3.0
15 years old	20.3	RM41- RM60	19.7	Lot 10	3.7
16 years old	21.0	RM61 - RM80	15.3	Midvalley Megamall	30.0
17 years old	19.7	RM81 - RM100	15.3	Suria KLCC	10.3
		Above RM100	21.7	Damansare One Utama	6.7
				Others	28.0
Race	Percentage	Gender	Percentage		
Malay	66.3	Male	48.0		
Chinese	18.7	Female	52.0		
Indian	12.0				
Others	3.0				

TABLE 2: TEENAGERS ATTITUDE TOWARDS BRANDS

	Mean	Std. Deviation
Made in Malaysia brand is low quality	3.66	1.545
I am not bothered with brand names	3.44	1.560
I do not care about brand. The important thing is, the products suits me	2.61	1.499
International brand names give me more satisfaction than local brands	2.80	1.393
The main problem with local brands is low image	3.22	1.448

Scale 1 (Strongly Agree) - 6 (Strongly Disagree)

#### Awareness and Acceptance Towards Sports Shoe Brands

To measure the level of awareness and acceptance towards sporting footwear by teenagers, respondents were first asked to name the brand of sports shoe they were most familiar with, the most recent purchased brand and sports shoe brand of their choice. The 300 respondents cited about 25 brands on these three dimensions. Nonetheless, only four brands registered high percentages (more than 5%) on brand awareness and acceptance (brand purchased and brand choice). Table 3 shows the top four familiar brands, top four currently used brands, and the top four preferred brands respectively. Replicating the outcome discussed earlier, it is beyond doubt that these teenagers were more familiar with international brands - a natural outcome, given its image, cool personality and wide circulation in all retail outlets in Klang Valley. Among these international names, Nike and Adidas came top in awareness and acceptance (both purchased and choice). The fact that Nike is the most popular sport-shoe brand as uncovered in this study concurs with the one carried by Wee (1999) discussed earlier. Nonetheless, it is also worth noting that one local brand 'Power' managed to muscle into the top four brands in both brand awareness and acceptance (bought) dimensions.

Interestingly or rather understandably, while Nike and Adidas were consistently placed as the top two most familiar and most accepted brands, the third and fourth placing in the awareness and acceptance grids were dynamic. Reebok was third in the familiarity and brand choice segments, Power topped Reebok in purchased brands, and Skechers replaced Power in brand choice dimension. Arguable, price is the pushing factor for Power's acceptance. However, as noted earlier, Nike and Adidas brands were widely accepted even though their prices were very much higher than the above local brand. Brand value of Nike and Adidas, therefore, is so much higher than Reebok that if the teenagers can afford it they will buy the former brands. This outcome shows that price does matter in deciding the total package of brand value but it is the weakest dimension in brand value. Thus differentiating one's brand though this attribute is a risky business. Besides, this outcome further confirms the positive relationship between brand awareness and acceptance. Finally, the data in Table 3 also revealed that locally branded sports shoes were not in teenagers' brand choice consideration set. Naturally these outcomes should be a cause of concern to local sports shoe producers as globalization brings with it intense competition.

TABLE 3: BRAND AWARENESS AND ACCEPTANCE – RECALL TEST

Brand Most Familiar		Brand Purchased (current)		Brand of Choice	
Brands	Percentage	Brands	Percentage	Brand	Percentage
Nike	47.0	Nike	25.0	Nike	46.0
Adidas	28.0	Adidas	21.7	Adidas	23.7
Reebok	5.7	Power	10.0	Reebok	5.0
Power	5.7	Reebok	9.0	Skechers	3.6
Percentage top four	84%		65.7%		78.3%
Others	16%		34.3%		21.7%
Total	100%		100%		100%

Table 4 on the next page demonstrates the result of aided recognized test, where the respondents were exposed to eighteen different brands collected through the observation at sports specialty shops and departmental stores. Replicating the recalled test results on brand awareness, Nike, Adidas, and Reebok captured the highest percentage. However, Puma came fourth, replacing Power, which occupied the fifth place. Nonetheless, in terms of acceptance Puma only obtained 39.7% of the purchased sports footwear. This could be because, even though Puma is a well-known brand, its usage for normal sports footwear is limited. It is also worth noting that the level of awareness of Umbro, Mizuno, Carlton, Fila and Diadora were more than 50% but these brands only experienced less than 30% of acceptance (buying) level. Naturally, this outcome reflects the specific usage of these brands, where Umbro is a brand mainly known for soccer, Carlton for badminton, Mizuno more into golf and Fila and Diadora are for casual rather than sports. Therefore, many teenagers may have heard of these brand names but did not have the need to buy these shoes.

It is important to note (Table 4) that, although Nike enjoyed the highest level of awareness (99.3%), the acceptance level (purchased) was not as high as Adidas (69.7% versus 66.0%). This outcome, in the beginning may seem to contradict with the one in the recall test (Table 3). One possible explanation could be that (since this a multiple response question) a number of teenagers who purchased Nike had also purchased Adidas. Power, the local brand came third, reflecting its unchanging position from the recall test. At the fourth place in purchased brand is another local brand ‘North Star’, which secured the same position with Reebok. Again, price might be the factor to this outcome.

Finally, Table 4, once more, confirmed that local brands were way below in the brand choice dimension. On the other hand, Nike was at the top of Malaysian teenagers mind as the brand to own. So dominant was Nike in this brand choice dimension, it commanded roughly two times the number of teenagers who aspire to own Nike as compared to Adidas, the second position of the brand choice segment. The conclusion then, brand awareness and brand acceptance is positively correlated and the majority of Malaysian teenagers included Nike in their consideration set and inspired to own Nike and would own Nike if they can afford. In the long run, this trend would spell danger to local producers who are reluctant to invest in brand building. This outcome does show that price matters in deciding the total package of brand value but it is the weakest dimension in brand value. Literature earlier has indicated the many interrelating factors that might lead to the fondness towards international brands. Among them are family and peer pressure. The next subsection will tackle these issues along with the framework suggested by Gaedeke and Tootelian (1983).

TABLE 4: BRAND AWARENESS AND BRAND ACCEPTANCE OF SPORTING FOOTWEAR

Brand Have Heard		Brand Have Purchased		Brand of Choice	
Multiple Choice		Multiple Choice		Single Choice	
Brand	Percentage	Brand	Percentage	Brand	Percentage
Nike	99.3	Nike	66.0	Nike	52.6
Skechers	34.7	Skechers	7.3	Skechers	4.1
Puma	96.3	Puma	39.7	Puma	2.9
Adidas	98.3	Adidas	69.7	Adidas	27.0
Saucony	2.7	Saucony	0	Saucony	0
Mizuno	58.3	Mizuno	13.7	Mizuno	0.3
Reebok	96.7	Reebok	56.0	Reebok	5.7
Aasics	34.7	Aasics	8.3	Aasics	0
Yonex	85.7	Yonex	34.3	Yonex	0.3
Umbro	79.3	Umbro	26.3	Umbro	0.3
Vans	24.7	Vans	9.0	Vans	1.5
Weinbranner	20.3	Weinbranner	7.3	Weinbranner	0
Power	90.7	Power	58.7	Power	3.1
North Star	87.3	North Star	56.0	North Star	1.8
Carlton	74	Carlton	28.0	Carlton	0
Fila	85	Fila	25.0	Fila	0
Brooks	18	Brooks	2.3	Brooks	0
Diadora	77.7	Diadora	23.3	Diadora	0.3

**Descriptors of Malaysian Teenagers’ Sporting Footwear Brands**

Teenagers’ attitude towards the six descriptors of brand acceptance - familiarity, confidence, differentiation, identification, prestige and family was measured through ordinal and interval scales. Respondents were first asked to rank the six variables according to its importance in buying a sport-shoe. Next, they were asked to respond to the six point Likert scale ranging from 1 - ‘totally agree’ and 6 - ‘totally disagree’. Table 5 below shows the ranking results. As displayed, the teenagers ranked internally driven factors as the most important dimensions starting with ‘confidence’ to be followed by ‘identification’ and ‘familiarity’. Factors associated with socialization such as ‘Prestige’ and ‘Differentiation’, however, were of less importance. It is also worth noting that ‘family’ became the least important factor. This is quite a surprise outcome given that Malaysians in general; and Asians in particular are noted as very family-oriented. On the other hand, outcome such as this may signal that Malaysians are fast embracing the modern world and thus, are more flexible in bringing up their children.

TABLE 5: THE MOST IMPORTANT FACTOR IN BRAND PURCHASED

Reason	Percentage
I trust the quality of the brand (confidence)	38.1
I know the brand well (Familiarity)	11.2
The brand is unique (Differentiation)	8.8
The brand is very prestigious (Prestige)	8.9
The brand is very suitable with my style (Identification)	22.4
The brand is recommended by my parents (Family)	9.7
Others (eg. Cheap, I like it, my choice)	0.9

The Likert scale questions with several statements representing each of the six dimensions were first subjected to reliability test (alpha) with readings ranging from 0.863 to 0.690 and thus accepted for further analysis. Mean for each dimension and an example of each statement was demonstrated in Table 6. The outcome shows that ‘confidence’ was the main determinant of brand acceptance to be followed by ‘familiarity’ and ‘identification’. In essence, the outcome of the ordinal and Likert data supports each other leading to a conclusion that Nike is the most familiar and accepted brand because it is able to best positioned its brand value as the brand that consumers can

depend on. Once more the data in Table 6 provides evidence that ‘family’ is the least influential factor in deciding the teenager’s brand behavior.

TABLE 6: DESCRIPTORS OF BRAND BEHAVIOUR

Descriptors	Example of statements	Mean
Confidence	I like to buy brands that I trust its performance	1.63
Familiarity	I like to buy brands that I am familiar with	2.20
Identification	My brand of choice must reflect my personality	2.20
Prestige	I feel proud if I use prestigious brands	2.59
Differentiation	I like brands that make me different from the others	2.83
Family	I buy brands that my parents suggest	3.86

To gain an insight on the association between race and the six attributes of brand behavior, Table 7 demonstrates Anova output. As noted, ethnicity has an impact on familiarity, identification, and prestige. Among these dimensions, prestige registered the highest association. On the other hand, family, differentiation, and confidence did not vary significantly across each race.

TABLE 7: ANOVA – RELATIONSHIP BETWEEN RACE AND DESCRIPTORS

		Sum of Squares	df	Mean Square	F	Sig.
Confidence	Between Groups	9.233	3	3.078	2.030	.110
Familiar	Between Groups	13.523	3	4.508	2.785	.041
Identification	Between Groups	9.351	3	3.117	2.693	.046
Prestige	Between Groups	19.170	3	6.390	5.437	.001
Differentiation	Between Groups	4.557	3	1.519	.956	.414
Family	Between Groups	9.760	3	3.253	2.203	.088

Cross tabulation (Table 8) shows that Indians were most prestige conscious to be followed by Malays. This outcome does reflect the work of Abd. Rahman (2002) and goes to confirm that the lower is the economic status of a race, the higher is the need to buy brands that symbolize prestige. Being the poorest among the three dominant races in Malaysia and with the history painted earlier by Snodgrass (1980), brand acts as social tools for them to communicate with the significant others (Leigh & Gabel (1995). On the same note, being most ‘superior’, the Chinese were the least bothered with this ‘prestige’ dimension.

Another cross tabulation was also performed to see the association between prestige and age. As evidenced in Table 9, younger children were very much influenced by prestige in brand choice. This is not a surprise outcome and goes to show that the younger a person is, the easier influence them through the right advertising message. On the other hand, as a person gets mature, it is much harder to influence them, a finding parallel to Ross and Harradine (2004). Cross tabulation between prestige and gender was also carried out to gain insight of their association. The resulting Chi-square at 0.55 indicates that neither male nor female teenagers behave differently enough in this dimension.

TABLE 8: MEAN PRESTIGE \* RACE

% Within race		Malay	Chinese	Indian	Other	
Mean Prestige	1.00	4.5%		19.4%	33.3%	6.3%
	1.33	9.5%	1.8%	19.4%		9.0%
	1.67	6.0%	16.1%	8.3%	22.2%	8.7%
	2.00	13.6%	5.4%		11.1%	10.3%
	2.33	17.6%	8.9%	13.9%		15.0%
	2.67	14.1%	14.3%	13.9%		13.7%
	3.00	8.5%	7.1%	2.8%		7.3%

	5.33	2.0%			3.2%		1.0%
	5.67			3.3%	1.6%	1.7%	1.3%
6.00			1.6%			.3%	
Total		100.0%	100.0%	100.0%	100.0%	100.0%	100.0%

To explore further the six dimensions, factor analysis was run on all the statements representing these descriptors. Table 10 and 11 provide the outputs. As evidenced in Table 10, four distinct dimensions of brand orientation emerged with variance explained ranging from 27.62% to 8.15%. The first factor (Table 11) was a collection of statements related to ‘differentiation’ and ‘prestige’, with the former became the core emphasis. Therefore this dimension was labeled as *self-esteem*. The second factor consisted of ‘identification’ statements, thus it was labeled as such. The third factor, on the other hand, reflects the dimensions of ‘confidence’ and ‘familiarity’. Since familiarity can lead to confidence, this factor was labeled as *confidence*. The last emerging factor as clearly illustrated in the table was *family*. In general the outcome shows that all the dimensions put forth earlier are relevant to the study Malaysian teenagers brand orientation. Nevertheless, the findings also indicated that Malaysian teenagers in general possess less complex brand behaviour since several dimensions merged together. Given time, however, this complexity will grow, making it more difficult to fulfill their distinct needs and wants.

TABLE 10: THE COMPONENTS

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %

TABLE 11: THE NEWDESCRIPTORS OF BRAND BEHAVIOUR

	Component			
	Self esteem	Identification	Confidence	Family
Differentiation and Prestige (alpha 0.769)				
I am extremely happy if I use brands that are different from my friends	.831			
I like brands that make me different from the others	.755			
I feel proud if I use prestigious brands	.725			
Prestigious brands enhance my personality	.571			
I like buying trendy brand names	.533			
Identification (alpha 0.721)				
I do not care about brand. The important thing is, the product suits my taste		.786		
My brand of choice must reflect my personality		.751		
Confidence and familiar (alpha 0.686)				
I like to buy a brand that I trust its performance			.806	
I like to buy brands that I am familiar with			.796	
I buy brands that I can depend on			.755	
I will always buy brands that I am used to			.750	
Family (alpha 0.560)				
I will buy the brands chosen by my siblings				.790
I buy brands that my parents suggest.				.785

## Discussion and Conclusion

This paper takes a look at two dimensions of brand behavior – brand awareness and brand acceptance in the context of the footwear industry with Malaysian teenagers as the samples. The aims are to describe and compare the awareness and acceptance levels towards international and local footwear brands as well as to establish the factors that significantly affect these two brands behavior. This study has uncovered and confirmed several issues found very much relevant in any brand study.

First, Malaysian teenagers, like many other their counterparts all around the world associate local brands with low image and international brands with high image. Nike got an overwhelming vote in brand awareness and acceptance. As image building is not something that can be created overnight, this outcome signals a choppy time ahead for local producers. Second, brand awareness and brand acceptance is positively correlated and the majority

of Malaysian teenagers included Nike in their consideration set and inspired to own Nike and would own Nike if they can afford. In the long run, this trend would spell danger to local producers who are reluctant to invest in brand building. This outcome does show that price matters in deciding the total package of brand value but it is the weakest dimension in brand value. Third, the teenagers ranked internally driven factors as the most important dimensions starting with 'confidence' to be followed by 'identification' and 'familiarity'. Factors associated with socialization such as 'Prestige' and 'Differentiation', however, were of less importance and 'family' became the least important factor. Finally, 'prestige' is very much associated with race and serves to confirm that brands act as social tools for consumers to communicate with the significant others (Leigh & Gabel (1995).

# **Development of Direct Marketing in Slovakia as an Incentive for Competitive Advantage**

*Peter Starchon*

*Comenius University in Bratislava, Slovak Republic*

## **Abstract**

The paper focuses on current trends in direct marketing (DM) and highlights selected aspects of direct marketing and its utilization in Slovak Republic. It describes the role and importance of direct marketing, discusses also the nature of DM and puts the stress on the emergence of the concept of integrated direct marketing, which involves the aim of a greater synergy. Any organization should be in touch with its customers and to find the best way of doing this and to be able to differentiate its products on issues other than price and quality. This approach can be considered as an incentive for a competitive advantage, especially under the stronger competition fight. Marketing communications and direct marketing has an important role to play in providing this advantage. The main objective of direct marketing on the beginning of this century is not only to “cultivate” customers and to “create” loyal customers. This objective should be enlarged by additional adjective “committed”. Development of direct marketing can be therefore considered as a stimulus for further growth; it is able to provide a competitive advantage to an organization.

## **Introduction**

Direct marketing itself is considered as a specific approach of a company to existing and/or potential customers, based on creation of long-term relationship. DM offers to organizations a lot of advantages, which should be exploited. From the marketing-oriented organizations point of view marketers have to improve their marketing strategies and find new approaches how to satisfy present and potential customers. In this way, direct marketing is a capable and valuable marketing tool. But, in contrary to this statement, it is also possible to see some weaknesses of DM. As Philip Kotler said on marketing seminar in Prague (Marketing in the New Economy, Prague: March 25, 2002), “not all customers want a close relationship with you. Actually it is not in the customer’s interest to be loyal. Then, not all customers are equally profitable. Sometimes 20% of the best customers account for 80% of the company’s profits. A company must therefore find a way to grade the customers by profitability and allocate more proactive and defensive attention to the more profitable customers. It is important to be a partner with your employees, customers, suppliers, and distributors for co-prosperity and to manage your customer relationships through integrated database marketing. Treat customers differently and appropriately and build your brands through performance, not promotion”. In this way the importance of DM, which is based on creation of long-term relationship and on “permission” is continuously enlarging.

## **Importance of Direct Marketing**

Thanks to the single market also Slovak companies can sell and/or buy goods and offer services in any country of the European Union just as easily as if they were trading on their domestic market. It seems to be very interesting how transitional countries are able to follow an on-going process of “europeanization” and how companies of the Middle and Eastern Europe will be efficient under stronger competition. An emerging economy, such as the Slovak Republic, faces considerable competition from the ever-growing European Union. During the last decade Slovakia was trying (and still is trying) to find its place in new market conditions. In an increasingly global economy, success of any organization will very much depend on understanding the needs of customers. Production has moved away from standard goods to individualized goods for individual customers. Companies are demanded to produce goods and services of a high quality. There is, in addition, very little price differentiation amongst modern day goods and services. Organizations need to be able to differentiate their goods and services on issues other than price and quality. Consequently means by which it can defend itself from the competition and facilitate growth must be

welcomed. In this way, marketing communications and its sub-set Direct Marketing have an important role to play in providing this advantage.

For a growing number of Slovak organizations direct marketing gradually is becoming a fully valuable marketing communication and distribution tool. Direct marketing is utilised by organizations, which are continuously planning and implementing DM campaigns; but also by organizations, which are using some of direct marketing tools occasionally and unconsciously. Direct marketing is a suitable marketing tool not only for profit-oriented companies. DM is utilised by non-profit organizations too (organizations of public sector and private organizations of the third sector, e.g. associations, communities, foundations, political parties, churches, public utility services, etc.). Non-profit organizations are using direct marketing for fundraising activities in particular.

The growth of importance of DM in Slovakia is visible also on activity of The Association of Direct Marketing (ADiMa). In June 2004 ADiMa increased the number of its members from 4 to 12 and constituted new authorities. New members of ADiMa established committees for educational activities, legal environment monitoring, multinational communication and promotion. ADiMa would like to make its activities more effective and dynamic through these committees. This year ADiMa is planning to organize a conference on customer relationship building through direct marketing activities. The Association of Direct Marketing in Slovakia (established in 1997, the key aim of ADiMa is to support the growth and using of direct marketing in practice and to support positive attitudes forward DM in public audience; ADiMa also has constituted The Code of Ethical Principles and has started to create “the Robinson’s List”) published the economic results of its members from the years 2000, 2001, 2002 2003 and 2004 and it recorded (compared to the previous year) nearly a 30% increase in DM. It is a significant signal that DM in Slovakia is growing and it has strong potential to grow further. But it is remarkable that potential of DM in Slovakia is still not exploited.

Development of DM in Slovak conditions is based on gradual and permanent evolution. It is evident that direct marketing in practice was used for a long time before developing of theoretical background and principles. Its development is in strong correspondence with development of new communication and distribution technologies and with evolving business environment. The main reason why to use DM in practise is cost management. Utilisation of DM is bringing for organization positive economic benefits. They can be demonstrated by reducing of acquisition costs for a new customer; increasing of trading volumes; increasing of a customer life time value; reducing of inventories costs; increasing of the sales management process efficiency.

Utilisations of marketing communications and its sub-set direct marketing vary from company to company. It depends mainly on its inner potential – managerial, financial, personnel and on practical skills and knowledge. It is necessary to evaluate the advantages and the disadvantages of DM and implement them into business. DM could be a competitive tool in an increasingly global economy, when the success of any organization will very much depend on understanding the needs of customers. DM offers to organizations also a wide range of innovations, in fact it is a tailor made marketing.

The importance of DM will be permanently increasing because of stronger competitive environment, new distribution and communication channels, identifying of specific, individual wants and needs of existing and potential customers. “Individuality” of DM relies on its main features – transparency, measurability, flexibility, and variability. DM can be considered as a powerful weapon both of defensive and offensive marketing especially on the market, which is continuously becoming more and more opened and is influenced by process of globalisation. A lot of organizations will gradually change marketing thoughts and recognise that customer is not only source of an immediate profit, but also the source of long-lasting stability on the market. Customers and needs of customers are crucial terms in marketing conception. Customers are deciding about an organization success. Also customers select the tools of marketing communication that have gained their attention. Relationships between a company and its customers rely mostly on customers’ own volition. Therefore here is a wide area for DM approach. This approach is supported by development of new distribution, communication and computer technology. Former interpretation of direct marketing was putting the stress on direct sales, DM was considered only as a distribution tool. But now, also in Slovakia, direct marketing is considered as relevant tool of marketing communication. The future of direct marketing is on its complete implementing into marketing programmes and strategies. Its further development is enhanced by integrated database and integrated direct marketing, and of course with integrated marketing. Managing the customer base means that the firm has at least some kind of direct knowledge of how satisfied its customers are.

Instead of thinking in anonymous numbers as Grönroos (1994, 12) said, or market share, management thinks in terms of people with personal reactions and opinions.

## **Current Position of Direct Marketing in Slovakia and Conditions for Further Development**

Further development of direct marketing in Slovakia will depend on various factors. One of the most important factors is legal environment. Permanent changes in legal environment cannot positively stimulate usage of DM in practice. But if the area for non-ethical and wasting utilisation of direct marketing will be opened, no one will accept any of DM tools and techniques. Customers will refuse this approach. Social responsibility of companies that are participating on DM business is enormous. Therefore ethical limits must be “welcomed”. Slovaks protect their privacy and organizations should plan and implement marketing strategies carefully with the stress on “permission” and on incorporation of potential or existing customers to the marketing planning process. Otherwise negative attitudes to direct marketing will be increasing.

Purpose of marketing communication is not in disturbing to the target audience. If proliferation of advertising is noticeable, organizations should find another possibilities how to communicate messages and to influence potential and/or existing customers. In this point is good to start with discussion about the nature of direct marketing and to focus on the emergence of the concept of integrated marketing communications. Integrated marketing communication involves the aim of achieving a greater synergy. There is much more than couple of good reasons, why to use direct marketing in practise. According to Kotler (2003, 621), although direct and online marketing are booming, a large number of companies still relegate them to minor roles in their communication/promotion mix. Advertising and sales promotion departments receive most of the communication dollars and jealously guard their budgets. It is very similar in Slovakia. Advertising is still winning.

Direct marketing has a strong potential of further development. But it depends only on organizations, if they will use it. It depends on their communication strategies, financial sources, and skills and will of employees and also on external factors. It is important to combine number of marketing tools to create and cultivate loyal and profitable customers. Direct marketing is one of them. Media explosion offers to enlarge number of organizations to sell products to customers directly, without intermediaries. New media refills traditional media, e.g. fax, e-mail, Internet, mobile phones. They are suitable for individual, direct and interactive communication between an organization and customers. They are suitable both to acquisition of new customers and retention of existing customers. Direct media allow specific targeting and improve offer specification.

In mass marketing the seller engages in the mass production, mass distribution, and mass promotion of one product for all buyers. But the proliferation of advertising media and distribution channels is making it difficult and increasingly expensive to reach a mass audience (Kotler 2003). How to be more productive? How acquire, keep and enlarge number of customers? One of possible answers is to adopt some key features of direct marketing into the practice of struggle companies. A new approach to customers is supplying a traditional marketing conception. This approach is based on individualization in relation organization – customer(s). DM has reached a new level of its development – the level of interactive marketing.

Occasional utilization of DM tools is being replaced by continuous utilization. DM is accepted by many companies and by customers, too. DM activities have not been utilized intuitively and in short-terms. Appropriate DM activities and exploitation of particular techniques of DM should always bring profit and satisfaction to the company and must respect needs of customers. On the other hand the vast usage of DM could negatively influence consumer attitudes. DM is particularly powerful when it is applied to integrate marketing programmes that incorporate multiple sales channels and a wide range of marketing communications. If direct marketing is carefully planned and implemented, it is extremely promising marketing component. According to Welford and Prescott (1996, 295) competing firms need to find innovative ways of promoting products to their customers. This may either be achieved through innovative advertising campaigns, which capture the imagination of the customer, or through innovative means of advertising, which give the firm a differential edge over other industry players. In general, direct marketing in Slovakia appears as an extremely promising segment of marketing communications.

## Conclusions

It is more than visible that new forms of marketing communication are replacing traditional advertising and communication media. In the case of DM there is a wide range of new mass-communication media. Interactive marketing and m-marketing (especially SMSmarketing and MMSmarketing) are representing current trends in direct marketing also in Slovakia. The Slovak DM market is still opened for specializing agencies although competition in this area is strong. Direct marketing could be used very effectively in Slovakia but it is difficult to predict its future use. The potential of direct marketing in Slovakia will be only fully exploited.

Most people living in developed countries come across DM daily – sometimes they become very annoyed. Some businesses in Slovakia utilising DM do not care about privacy and guidelines. Ethical business behaviour has still not been intensively developed or maintained. These organisations must be taught how to respect individual customer privacy and to be ethically responsible. It is important to realize that DM is a powerful “marketing weapon” only if it is applied to integrate marketing programmes. DM could be used very effectively in Slovakia but it is difficult to predict its future use. It is up to marketers to evaluate the advantages and the disadvantages of DM and implement them into business. DM has reached a new level of its development – the level of interactive marketing. In Slovakia both individual and business customers have observed a large number of companies involved in DM. Whether organisations take advantage of the rapidly expanding e-commerce, emerging new media and the possibility of global one-to-one marketing stimulus will be influenced by the economy of the country. According to the thoughts of father-founder of contemporary direct marketing Lester Wunderman (2004), it is also remarkable, that DM must be considered as a strategic marketing weapon. In this way direct marketing represents a real incentive for a competitive advantage for companies under stronger competition.

# Gender Differences in Locus of Control and Social Influence: A Comparison between East - West Purchasing Behavior

*Kritika Kongsompong  
Chulalongkorn University, Thailand*

## Abstract

This study focuses on the potential differences in consumer behavior in a multicultural setting. Of particular interest, the relationship between people's orientation toward locus of control and the amount of social influences that occurs in purchasing decisions. The locus of control construct has long been recognized as a factor capable of explaining important 'drives' of consumer decision making. The results show that overall, men are relatively more internally oriented than women; and as a consequence men are less socially influenced in buying decisions than their counterpart. Furthermore, regardless of gender, respondents from East Asian collectivist countries (namely Thailand and Singapore) exhibit more external locus of control than respondents from typical individualist countries (Australia and America). In addition, the author found that Asian men and women are more responsive to social influence in a hypothetical buying situation than that of their Western counterparts. Managerial implications are briefly discussed and direction of future research is recommended.

## Introduction

The sources that determine consumer purchasing decisions are numerous: personal, biological, or social setting. The relative impact of these sources will vary based on several factors, some highly intimate to the consumer, others related to the product/service and the nature of buying situation. Since marketing mix should be responsive to the nature and impact of these influences, international marketers should gain more insights on the similarities and differences that exist across their markets. Accordingly, their marketing strategy and tactics will have to be adapted and integrated to increase the feasibility of the marketing plan.

Respondents from four countries are examined to measure their orientation to locus of control. Two sets of respondents are citizens of Asian countries (Singapore and Thailand), while the other two are of Western countries (Australia and USA). The four main hypotheses developed are: (1) gender difference in orientation to locus of control; (2) gender difference in level of social influence in purchasing decision; (3) the nature of differences in the level of external/internal locus of control to characterize the four countries; and (4) differences that exist in the level of social influence in the buying decision of the people across these four countries.

### Background and Theoretical Framework

#### Sex Differences

Research on gender differences began to appear in 1960, with the work predominantly proposing that males and females differ in the extent to which they develop self-concepts that are separated from or connected with others (Markus and Kitayama 1991). These studies found that the male agentic role was characterized by concern for the self, while the female communal role typically embraced concern for both the self and others. In the same line of this research, Meyers-Levy (1988) determined that because of their attention to both self and others, females are expected to respond favorably to both agentic and communal advertising appeals. Men, on the other hand, due to their agentic role, do not incorporate communal concerns.

More recent social researchers, however, have recognized the importance that cultural traditions assigned to dominance and assertiveness by males, and submission and passivity by females, may significantly contribute to observed sex differences. As an example, self-concept research moved from investigation of gender schematicity toward a concept of self as either 'separate' from or 'connected' with others (e.g., Cross and Markus 1993; Josephs and Tafari 1992). The relationship between sex and self-concept also appears to vary with social class, religion and ethnicity (e.g., Collins 1997; Crawford 1997).

### **Locus of Control**

As early as 1954, Rotter had suggested that the probability of a behavior satisfying a need is dependent on two variables, namely the expectation of a specific reinforcement from this behavior and the value that the individual attributes to this reinforcement. Later, Rotter (1966) described the concept of “internal or external reinforcement control”, also called locus of control (LOC). An external control is when reinforcement is perceived by the subjects as following some action of his or her own but not being entirely contingent upon his/her action. It is typically perceived as the result of luck, chance, or fate; as under the control of powerful others. An internal control, however, reflects a person’s perception that the event is contingent upon his/her own behavior or his/her own relatively permanent characteristics. Therefore, those with an internal versus external LOC hold different beliefs about the extent to which their actions can have an affect on the outcomes in their lives. Years later, Burns (1984) suggested that LOC is associated with the general attitude that one has toward oneself, one’s behavior and one’s capacity to influence events. Social science research has also reinforced these general definitions of internals and externals across many domains (see, for instance, Spector 1986; Strickland 1989; Parker 1989; Lefcourt 1991; Kren 1992; and Marks 1998).

### **Locus of Control in Marketing Research**

LOC research in marketing context has primarily been concerned with predicting behavior differences between the externals and internals in purchasing related situations. The concept of locus of control has also been applied in the areas of environmental marketing and consumer use of credit. LOC studies have been conducted on the relationships between general psychological constructs and environmental (‘green’) behavior (Berger and Corbin 1992; Biswas et al. 2000; Dietz, Stern, and Guagnano 1998), pinpointing the antecedents of postpurchase/postconsumption behavior (Alwitt and Pitts 1996; Bagozzi and Dabholkar 1994; Shrum, Mccarty, and Lowrey 1995), and investigating the influence of individualism, collectivism, and LOC on environmental beliefs and behavior (McCarty and Shrum 2001). Consistent with general LOC findings, externals exhibit a reluctance to make sound decisions after exposure to environmental events. In the area of consumer credit, Tokunga (1993) found that internals are more likely to use consumer credit successfully than externals. Lunt and Livingston (1991, 1992) reported that internals are more regular savers and have fewer problems with personal debts. Both Dessart and Kuylen (1986), and Rundinick and Deni (1980) described internals as those who are less likely to experience financial difficulties and to act impulsively, were more likely to plan ahead, to act according to a plan and to be well informed. Attribution theory, which is integrally associated with LOC, has also received considerable attention in the marketing literature (see, for instance, Mizerski, Golden, and Kernon 1979; Weiner 2000).

### **Limitations of a Generalized LOC Construct**

Despite the widespread use of LOC as an explanatory tool, the construct and its measures have raised certain concerns among researchers. LOC has been found most useful when tailored to predict behavior in specific settings (Rotter 1990; Lefcourt 1982; Munro 1979; Furnham & Steele 1993; and Marshall 1991). Specific context measures of LOC have been used successfully to predict behaviors pertinent to health (Lau and Ware 1981; Wallston & Wallston 1981), work (Spector 1961, 1988), management (Hodgkinson 1992), and consumer behavior (Busseri, Lefcourt & Ketton 1998). These studies have supported the idea that the predictive powers of LOC measures are better enhanced when the assessments of expectancies are tailored to particular social arenas. The present study therefore employs a consumer behavior-focused measure of LOC developed by Busseri and Ketton (1997).

### **Cross-National Differences in LOC**

To date, no formal LOC cross-national research has been conducted to study the impact of LOC on consumer’s purchasing decisions. When Triandis (1984) examined cultural differences in causal reasoning, members of independent cultures judge the individual to be the responsible agent of action, while members of interdependent cultures judge situation or social groups to be the directors of action (Holland et. al 1986; Ross 1977). People with an independent self tend to recognize their surroundings in regard to their components (Peng & Nisbett 1999), focus on his/her dispositions to the exclusion of the other components in an environment (Morris & Peng 1994; Shweder & Bourne 1984), and attribute power to the collectives (Menon et. al 1999). In short, people in interdependent cultures (e.g., collectivist/interdependence East Asians) perceive group collectives as the determinants of their behavior, whereas people in independent cultures (i.e., individualist Australians or Americans) perceive individuals as causal agents of their behavior.

### **LOC and Social Influence**

Although social influence in the buying decision is widely recognized to vary across cultures (Redding 1982; Fisher and Ackerman 1998), the majority of LOC research has focused on behavioral attributions and predictions relating to individuals' perceptions of their control over the environment in which they operate. The relationship between LOC and susceptibility to social influence has received less attention, but has been addressed conceptually in the literature. Lefcourt (1982) stated that in regards to purchasing decisions, internals are more resistant to social influences while externals are more attentive and yielding to social cues. These observations are consistent with findings that indicate internals pay more attention to information pertinent to purchasing outcomes, exhibit more purposive decision-making, and have more confidence in their ability to succeed at important tasks (Lefcourt and Davidson-Katz 1991).

### **General Hypotheses**

Based on the above discussion, the present study is designed to test the following hypotheses: (1) overall, men are expected to be more internally oriented than women, thus (2) men are less subject to social influence than women; (3) men and women in collectivist countries are expected to be characterized by more external LOC traits than men and women in individualist countries; and (4) men and women in collectivist countries are expected to be more responsive to social influence in their buying decisions than are their counterparts in individualist nations.

### **Method**

#### **Selection of Countries**

Since there have not been prior studies that classify national cultures as being characterized by internal or external LOC, the current study employed a surrogate indicator derived from the literature. Hofstede (1980) classified countries according to the levels of individualism/collectivism exhibited by their people. As noted above, the concept of individualism/collectivism was attempted to be linked with locus of control. Specifically, individualists tend to have an internal LOC, while collectivists an external LOC. Based on Hofstede's (1980) findings, two individualist countries (Australia and USA) and two collectivist countries (Thailand and Singapore) were selected for this study. These countries were the extremes on Hofstede's individualist/collectivist scale, with Australia and USA being the two most individualist, and Thailand and Singapore among the most collectivist.

#### **Research Instrument and Sample**

The instrument comprised a 14 item (5-point Likert scale) LOC scale (Busseri and Kerton 1997), a buying scenario ("*You need to buy some new sneakers. You are considering two models, one that you like, and another that is liked by the person who is with you. How likely would you be to purchase the sneakers that the other person likes if that person is*": *mother/father, close friend, boy/girlfriend, salesperson*), and classification questions. The LOC measure fits the requirements of the research in two major respect. First, it focused specifically on consumer-related LOC issues. Secondly, the scale items addressed several dimensions of LOC, one of which was social influence, the focus of the present study. After reading the purchase situation scenario, respondents were asked the likelihood (5-point Likert scale from: 1 = very likely to 5 = very unlikely) that they would be influenced by the other person's opinion.

Questionnaires were pre-tested in each of the countries. English was employed in the Australian, USA, and Singaporean questionnaires, since that is the official language of those nations. The Thai questionnaire was translated and back-translated using two Thais proficient in English. To test the psychometric equivalence of these measures, the author compared the reliability statistics between the countries and checked the variances for floor or ceiling effects (Van de Vijver and Leung 1997). Questionnaires were administered in classroom settings. The study employed samples of university students from the four countries, thus controlling for age, occupational and social class factors. After elimination of respondents for whom there was missing data, the sample consisted of 770 respondents: 243 Thais, 124 Singaporeans, 205 Australians, and 198 Americans.

### Analysis

The data were first subjected to principal components factor analysis with varimax rotation to determine validity and to potentially isolate the social influence component of LOC. Relevant factors and total scale results were then subject to MANOVA and Scheffe tests across the four countries to determine whether: (1) Australian and USA respondents reported to be more ‘internal’ than Thai and Singaporean respondents; and (2) Australian and USA respondents reported less social influence in their buying decisions than Thai and Singaporean respondents.

### Findings

Three clean factors emerged from the analysis of the LOC scale accounting for 62.5% of the total variance. Cronbach’s alpha ranged from 0.59 to 0.70 meeting (or very close to) the reliability test for exploratory/human behavior research (Nunnally and Bernstein 1994; Robinson et al. 1991). Of particular interest to the present study is that one of the factors contained items that are related to the level of social influence to which the person is susceptible in the buying decision. This factor, labeled *Susceptibility*, also explained the greatest amount of variance. Given the study’s concentration on social influence and LOC, the focus of the subsequent analysis is on results associated with the LOC scale as a whole (LOC Total), and the results of the Susceptibility factor.

To test the hypothesis across nations, MANOVA was first employed to determine if differences exist across the four nations and the three LOC factors, plus the sum of all LOC items. Significant main effects were found (Wilk’s lambda,  $f = 15.7$ , sig. < .000), indicating the existence of pronounced differences across the four countries and between individual countries. Table 1 shows the means for the susceptibility to social influence and the level of the social influences between men and women in each country. The findings are consistent with hypotheses (1 and 2): Men in each country have means that are significantly lower than those of women for the LOC scale, furthermore, with an exception of the Thai men, men from each country are shown to have means that are significantly lower than women on the scope of social influence.

TABLE 1: LOCUS OF CONTROL & SOCIAL INFLUENCE: COMPARISON BETWEEN MEN & WOMEN

Country	Means of Locus of Control		Means of Social Influence	
	Men (std. dev.)	Women (std. dev.)	Men (std. dev.)	Women (std. dev.)
Thailand	2.71 <sup>a</sup> (0.40)	2.83 <sup>b</sup> (0.44)	4.74 <sup>a</sup> (1.12)	4.38 <sup>b</sup> (0.91)
Singapore	2.44 <sup>a</sup> (0.31)	2.70 <sup>b</sup> (0.51)	4.18 <sup>a</sup> (0.94)	4.27 <sup>b</sup> (1.28)
Australia	2.43 <sup>a</sup> (0.49)	2.51 <sup>b</sup> (0.48)	4.00 <sup>a</sup> (1.09)	4.15 <sup>b</sup> (1.06)
USA	2.57 <sup>a</sup> (0.68)	2.68 <sup>b</sup> (0.65)	3.37 <sup>a</sup> (1.21)	3.67 <sup>b</sup> (1.18)
All countries	2.53 <sup>a</sup> (0.43)	2.67 <sup>b</sup> (0.50)	4.74 <sup>a</sup> (1.12)	4.38 <sup>b</sup> (0.91)

Note: Using a Scheffe test, means for ‘a’ are significantly different from ‘b’, but letters that are the same (e.g., ‘a’ and ‘a’) are not statistically different from one another. Means of locus of control and means of social influence are two separate measurements.

Table 2 shows the results in the second hypotheses largely confirm that men and women in collectivist countries are expected to be characterized by more external LOC traits than men and women in individualist countries. According to this finding, regardless of genders, Thai and Singaporean respondents have means that are significantly higher than those of Australia and USA, indicating that the former are more externally oriented than the latter. Both men and women in Thailand and Singapore are not significantly different from each other on the Susceptibility dimension and marginally different on the LOC total dimension. USA is significantly more internal than Australia on both the susceptibility and LOC total.

TABLE 2: LOCUS OF CONTROL – COMPARISON OF MEANS ACROSS COUNTRIES

Country	Susceptibility		All LOC	
	Mean	St.Dev.	Mean	St.Dev.
Thailand	3.26 <sup>a</sup>	0.57	2.77 <sup>a</sup>	0.42
Singapore	3.12 <sup>a</sup>	0.57	2.63 <sup>a</sup>	0.44
Australia	2.86 <sup>b</sup>	0.67	2.49 <sup>b</sup>	0.48
USA	2.64 <sup>c</sup>	0.66	2.34 <sup>c</sup>	0.51

*Note: Using a Scheffe test, means for 'a' are significantly different from 'b' and 'c'; mean for 'b' are significantly different from 'c', but letters that are the same (e.g., 'a' and 'a') are not statistically different from one another.*

The third hypothesis related to differences in the impact of social influence reported by Thais and Singaporeans versus Australians and Americans. In this case, the dependent variables were the reported levels of social influence related to respondents: parents, friends, boy/girlfriends, and salespeople. The independent variables were the four countries being investigated. MANOVA main effects were significant ( $F = 13.4, p < .00$ ) again indicating significance across the countries and influence factors. The Scheffe results presented in Table 3 indicates a mixed pattern of results that indicate a qualified acceptance of the hypothesis. In all cases (except boy/girlfriend influence), Thai men and women report the highest level of influence and as hypothesized, higher than the Australians and Americans. Similarly, in all cases except boy/girlfriend influence, the American men and women participated in the survey had significantly lower mean influence than the men and women of the other three countries. The Singaporean men and women reported less parental and salesperson influence than the Thais.

TABLE 3: SOURCES OF SOCIAL INFLUENCE: COMPARISON ACROSS COUNTRIES

Country	Parents		Friends		B/Gfriend		Salesperson	
	Mean	St.Dev.	Mean	St.Dev.	Mean	St.Dev.	Mean	St.Dev.
Thailand	4.66 <sup>a</sup>	1.54	4.96 <sup>a</sup>	1.24	4.98	1.43	3.67 <sup>a</sup>	1.57
Singapore	3.70 <sup>b</sup>	1.75	4.64 <sup>c</sup>	1.37	5.11	1.52	3.26 <sup>c</sup>	1.41
Australia	3.50 <sup>c</sup>	1.71	4.57 <sup>c</sup>	1.29	5.01	1.39	3.12 <sup>c</sup>	1.53
USA	3.00 <sup>d</sup>	1.61	4.00 <sup>d</sup>	1.57	4.70	1.62	2.54 <sup>d</sup>	1.43

*Note1: Employing a Scheffe test, means for 'a' are significantly different from 'b', 'c', and 'd'; mean for 'b' are significantly different from 'c'; means for 'c' and 'e' significantly different from 'd'*  
*Note 2: Social influence was measured by 7 point scale with: 1= very likely to purchase & 7= very unlikely to purchase.*

## Discussion

The findings provide evidence that largely confirms the hypotheses, as well as raising questions that invite further research. In terms of LOC, the findings indicate that overall, men are more internally oriented than women; and men are less socially influenced in purchasing decisions than their counterpart. At a more micro-level of investigation, the findings clearly indicated that men and women from the individualist nations are more internally oriented than those from collectivist nation.

The findings are more nuanced, however, when the results of social influences are examined. Although, overall the results supports the hypothesis that Asians (means = 2.72, std. = 0.43) are relatively more externally oriented than Westerners (means 2.41, std. = 0.50); and that Asians (means = 4.44, std. = 1.08) are relatively more influenced by social pressures than their counterparts (means = 3.81, std. = 1.16). One variable, boy/girlfriend influence showed no differences across the nations. This finding could be explained by the likelihood that many

sample members do not have a “legitimate” boy/girlfriend, given their age of 19-23 years. Respondents were thus responded to a hypothetical situation with regards to a person with whom they probably had such a hypothetical relationship. With respect to the other sources of social influence, Thailand and USA follow the expected patterns, but Singapore and Australia clearly do not. No significant differences in social influence levels were found between the latter two countries, despite the fact that the findings associated with the second hypothesis clearly indicated that *Singaporean men and women are relatively more externally oriented and Australian men and women.*

The anomalies in social influence results indicate that LOC may have some limitations when applied in an international setting when trying to predict the levels of social influence to which consumers are subjected. Other factors may intervene to counter the effects that LOC orientation has on social influence in consumer decision making. One possibility may relate to level of economic development. Singapore and Australia are quite similar in terms of per capita GDP, suggesting that consumers in the two countries have similar purchasing power, which could impact their perceived ‘independence’ in the buying decision. This explanation, as presented here, is strictly correlational and cannot be taken as definitive. It appears, though, that the relationship between LOC and social influence is a complex one in a cross-national context, and should be the subject of further research.

### **Managerial Implications**

This research has provided marketing insights for both firms that engage in international marketing and for firms that operate domestically. Internationally, the findings show that significant differences exist between Asian and Western consumers in regard to locus of control orientation. Domestically, the findings also demonstrate varying levels of susceptibility to social influences and behavioral differences between men and women.

Knowing the significant differences of Asian and Western customers, marketers would have to formulate their strategies accordingly, particularly by integrating the differences between the purchasing behavior of men and women. Moreover, since this research has established empirical evidence that consumers across nations have different orientation to locus of control and social influence, marketers would also have to develop their strategies and tactics, keeping cultural variations in mind.

# **Implications from Social and Business Studies to Demand Analysis for Hi-Tech Products Used in Business Practice**

*Kamil Sveda*  
*Nagoya City University, Japan*

## **Abstract**

**This paper presents a link connecting the fields of social science and business studies in one common purpose: to refine the current approach to demand analysis. The focus is on hi-tech products, which can be used in business practices. Based on previous studies, a thesis about individuals belonging to a group of the early adopters of the products is developed. The paper is also an illustration of empirical research, using the thesis to investigate individuals from two different countries and to identify demand curves related to the hi-tech markets.**

## **Introduction**

Hi-tech products, which are new entrants in many product categories typically experience a short life cycle. A crucial period that often decides the success or failure of the product is its early sales stage. The product needs to be adopted by consumers who would pass on positive word-of-mouth to the rest of the market [7]. Such individuals are called early adopters and the examination of their preferences is important. However, the early adopters differ according to particular products and therefore the group definition that would allow for tractable econometric analysis is difficult. An elaboration on literature from the social science and business fields in the first part of this paper leads to a thesis about the individuals belonging to the early adopter group of hi-tech products which can be used in business practice.

In the second place, empirical part of this paper illustrates application of the thesis to analyze demand for hi-tech products used in managerial practice. Subjects are from two different countries, Japan and the Czech Republic. Mainstream of the comparative research on consumer behavior toward new products applies aggregate data and Bass model [1]. Notwithstanding revealing results of the studies the projects have limits when it comes to practical suggestions for marketing activities, such as pricing and market segmentation. That is also a lack of past studies that examined managerial hi-tech demand via disaggregate data analysis. The researchers did not provide conclusions in a form of price-demand figures, which are the convenient tool for hi-tech supplier's decisions. Applying the thesis about the individuals from the early adopter group, the issue is addressed in this paper.

## **Conceptual Part**

### **New Product and Its Early Adopters**

The pressure on the supply side of the market is becoming enormous, owing especially to the enhancement of technologies, less government regulations, and easier access to education and capital. For a firm to stay competitive it must deliver good value for consumers. In many cases that means firms must devote sufficient resources to innovation process and bring new products to the market. Despite the enormous efforts of companies and massive inflow of new products to market, Urban and Hauser in [12] report an 35% failure of new products entering the market. In some cases the companies' strategy is to bring many new products to the market and eventually some products are established there, with the help of marketing instruments. Nevertheless such an approach is not sustainable in the case of new products that incur large investments. In that case, careful market research is necessary, according to which the new product can be developed and appropriate marketing support aimed at particular consumer groups.

Kotler presents in [7] a historical view on the audience, a target of the support activities. In the past,

companies introducing a new product relied on the broadest-possible market appeal without recognition of the market structure and thus differences between consumer groups. The approach has not been very effective and suppliers introducing new product began to aim their marketing efforts toward a group of perceived heavy users. Kotler claims that recently suppliers recognized the importance of early adopters and target the initial distribution and promotion toward them.

The idea of early adopters evolved from research on the diffusion of social innovation [10]. Rogers, who studied the adoption of innovations in various fields, found that the adoption of innovations follow a bell-shaped curve, when plotted over time. On the basis of innovativeness, defined by Rogers as continuous dimension in that individuals adopt a new idea at different times, he categorized people into five distinctive groups: innovators, early adopters, early majority, late majority and laggards. The new product entering the market as well as a new idea in the case of social innovation must be first acquired by group of innovators and early adopters who through positive word-of-mouth help the idea or product to be accepted by majority of society or market respectively [10, 12]. In the following section the research on early adopters and its implication to an approach used in the present research is described.

#### **Early Adopters as the Research Subjects**

The idea of market division according early adopters and a later majority is generally accepted and there is large number of empirical projects (of descriptive character) that focus on the group of early adopters. Hereafter only some of them, related to the hi-tech field, are mentioned since they share the characteristic with the empirical part of this paper.

Chau and Hui describe in [2] adopters of Windows 95. They claim that early adopters tend to be younger males who are opinion leader and have a good technical knowledge (computer experience). In [8], Min and Galle focus on managers and their adoption of e-purchasing. They test the hypothesis that adopters who recognize the managerial benefits of the hi-tech innovations are more likely to adopt it. Their results support the hypothesis. Trodsen in [11] examines CEO's, financial managers and data processing managers from six countries to describe the characteristics of early adopters of open system for computers. In contrast with [10], he reports no difference between early adopters and nonadopters in terms of age or education.

Two notes are essential on the three examples. First, they are characteristic in the sense that the findings of descriptive research typically focus on demand side and ignore supply side factors. However, the supply side factors are key factors for producers as well; those are the factors a company can influence through R&D and marketing activities. Second, results of the projects generally confirm and extend Rogers's essential description of early adopters: early adopters are most probably individuals with the ability to understand and apply complex technical knowledge, they have the greatest degree of opinion leadership and possess substantial financial resources. In examined markets - Japan and Czech Republic, the consumers having relatively high income and possessing good technical knowledge as well as leadership character are naturally searched in managerial positions of industrial companies. The important role of technical knowledge and the use of hi-tech products for business practice give rise to the key requirement for subjects in the empirical part of this study: they must be working in senior managerial positions and their companies need to be part or have close links to the electronics industry since the investigated tangibles are electronic devices. Considering the researched objects (business assistants, car navigators and dictionaries) following quote and findings link to context of early adopters:

*"...first 50,000 users of Palm PDA were on average self-rated computer experts, earning more than \$100,000 a year, nearly all between the ages 15 and 45, and 95% male. Those 50,000 guys became our sales force. They went out and told their colleagues and their neighbors and their friends. They bought it for their friends and their colleagues for Christmas, and that was how the Pilot started taking off." (Yoffie and Kwak, 2001, p.57)*

Study of ITS-Michigan and Michigan State University [6] identifies early adopters and trends of in-car technologies. It claims that initially, buyers of high-end luxury cars were targeted; however these consumers are not typical innovators and early adopters, which resulted in poor market acceptance. The study accentuate that early adopters are business professionals.

Prior to this project, author searched shops offering electronic dictionaries (as a new gadget) in the Czech Republic. The shop assistants asked for characteristics of consumers, who purchase the electronic dictionary said that in 80% cases buyers are managers who need the device for their work.

In the literature we can find only few studies that examine managers' hi-tech choices and use an inferential (compared to descriptive) statistic approach. One study [4] investigated Dutch managers' choice of electronic banking. The study applies a choice probability model and authors claim to examine both supply and demand side factors influencing the use of such an electronic service. However, the supply side is represented by managers' perceptions of marketing variables which are generalized into three categories – intensity of market support, risk reduction of the supplier's activities and the supplier's market positioning. Therefore, the results do not extend to identification of price-demand relationship, the convenient tool for decision making of hi-tech suppliers.

In another research [5], Gatignon and Robertson focused on managers' choice of laptop computers and the estimated results applied both logit and probit models. Authors summarize the supply side variables into two predictors: first, incentives, which indicate marketing activities. Interestingly, a second supply side variable is a vertical coordination. The variable is associated with the higher propensity to consume output from the industry, the consumers belong to (though not only their own production). Gatignon and Robertson also found this variable significant on the 10% level. This finding further supports our idea to investigate companies with links to the electronics industry, of which the examined products are outputs.

There are two other studies [3, 9] that investigate managers' choice of electronic data interchange service and object-oriented programming languages respectively. Though the latter study tests several supply side variables, the overall approach to the researched problem is in both cases like the two studies described above: researchers do not approach the issues with purpose to provide the traditional tool of price-demand figures convenient for marketing decisions. Empirical part of this paper is positioned to fill this gap, where adoption of hi-tech products is investigated with results important for suppliers' marketing (mainly pricing) activities.

## **Empirical Part**

### **Respondents**

Each country sample contains 40 respondents. Regarding their socio-economic status, the major requirement is that the respondent is a CEO of company, related to the electronics industry. It follows that the respondent would have good knowledge of technology, have a character of leadership and possess sufficient financial resources to afford expensive product purchases. The size of the companies included in research is restricted to small and middle size since it would be difficult to get in contact with a CEO of large company and subsequently to pursue him to reply to our questionnaire.

In Japan, we obtained a list of small and middle sized companies from the Nagoya Centre for Small and Middle Sized Companies. Respondents are from Nagoya, the 4-th largest city in Japan known mainly for its industrial character, and city close to Nagoya, Gifu (population 500,000). The list contains the name of the company, its address, phone number and the name of its CEO. At the initial stage, companies were contacted by phone and asked whether they would participate in the international survey. They were also briefed about the purpose of the research and the examined products. If they agreed, the questionnaire was sent to them by e-mail. The respondents' companies fall into four groups according to the type of business they provide: software production, business consulting for IT companies, communication service and trading consumer electronics.

In the Czech Republic list of companies from Zlate Stranky was used; it lists firms according to the purpose of its business. Only companies belonging to the electronics industry or with a possible link to the industry were considered. A firm was randomly selected and then information about its suitability for present research (size, etc.) was checked via several internet websites (e.g. the homepage of the company; the website of the Ministry of Justice that provides information about all commercial subjects in the Czech Republic). If found suitable for this research, the company was contacted by phone. The CEO was briefed about the research purpose and asked if he would participate. If he agreed, the questionnaire was sent by mail or e-mail. All companies were from the capital Prague (population app. 1.1 million). Respondents' companies belong to the same four business groups like their Japanese counterparts.

### **Examined Product Categories**

Products from three categories were used for the study: business assistants, car navigators and dictionaries. A view

of supply in the three examined product categories is simplified so that the available choice alternatives become:

1) *Traditional Product*: a good, of which all consumers are well aware; it has been established in the market for a long time. Specifically, traditional products included set of devices (address book, calculator, etc.) in the business assistant category, map and atlas in the car navigator category and paper dictionary in the dictionary category.

2) *Standard Hi-Tech Product*: an electronic device that serves to satisfy the same needs as the traditional product, however thanks to digital technology it has significantly enhanced attributes. Researched products included personal digital assistant (PDA), GPS car navigator and electronic dictionary.

3) *Progressive Hi-Tech*: a high-end extension of a hi-tech product line.

These alternatives were described as a mix of attributes of various levels. The examined individuals were supposed to copy real purchase decisions and make a choice from a set consisting of two or three alternatives. The frame of the decision situation is as follows: the respondent is asked to consider a situation where he needs a product from the examined category. He has researched offers in various shops, ruled out most of the options and makes the final decision from the two or three best alternatives. The respondent is exposed to eight decision situations in each category. It is explicitly stated that the respondent should consider each decision situation separately. The outcome of the decision situation – the consumers' choice of the best alternative is in nature discrete and appropriate model is described in the next section.

#### **Applied Model**

The discrete model applied in this research is multinomial logit. Generally, the multinomial logit (MNL) is convenient, essential start for the utility calculations. A test of the adequacy of the MNL assumption, independent, identically distributed errors, is in this study carried out by McFadden test. Based on the test result, the appropriateness of multinomial logit has been confirmed. Probability of choosing particular alternative is described by following formulae:

$$P_C(i) = \frac{A_i \cdot \exp(V_i)}{\sum_j A_j \cdot \exp(V_j)}$$

where  $P_C(i)$  is the probability of choosing  $i$ -th alternative from choice set  $C$ ;  $j$  is number of all possible alternatives, some of which are available ( $A = 1$ ) in the choice set  $C$ , and some are not available ( $A = 0$ ).  $V_i$ ,  $V_j$  respectively, is systematic part of utility function.

Utility of the  $i$ -th alternative  $U_i$  is considered to be random function, including systematic part  $V_i$  and error  $\varepsilon_i$  (Gumbel distributed).

$$U_i = V_i + \varepsilon_i$$

Generally, systematic utility is modeled as a function of product attributes  $X_i$  and consumer characteristics  $Z$ .

$$V_i = \sum (\beta_i \cdot X_i + \gamma \cdot Z)$$

Greek letters are the estimated parameters. The product attributes used in the utility functions are various product functions and prices. Income category is used as the characteristic of respondent. Following chapter presents results of the demand analysis when all attributes but price are *ceteris paribus*.

#### **Empirical Results**

Fig. 1 bellow illustrates dependence of demand on price estimated for the Czech and Japanese respondents in the business assistant market. The variable price relates to examined prices of personal digital assistant. It is worth noting that simulation of the revenue trend (price times choice probability) in this category would imply maximizing price approximately two times as high in the Japanese market as in the Czech market.

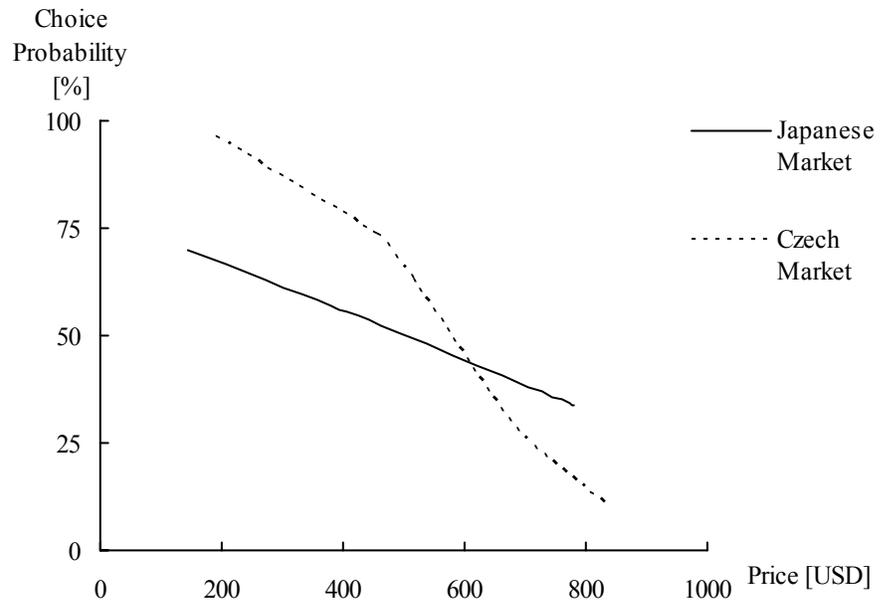

FIG.1: DEMAND CURVES FOR JAPANESE AND CZECH RESPONDENTS IN BUSINESS ASSISTANT CATEGORY

The contrast of demand curves in the examined markets for hi-tech products in the navigator category (Fig. 2) is even larger than in the business assistant category. The revenue maximizing price of GPS car navigator in Japan is approximately three times higher than in the Czech market. Last Fig 3 illustrates a demand curve in the Czech and Japanese market for the electronic dictionaries. The revenue maximizing price is calculated more than twice as high for the Japanese market compared to the Czech market.

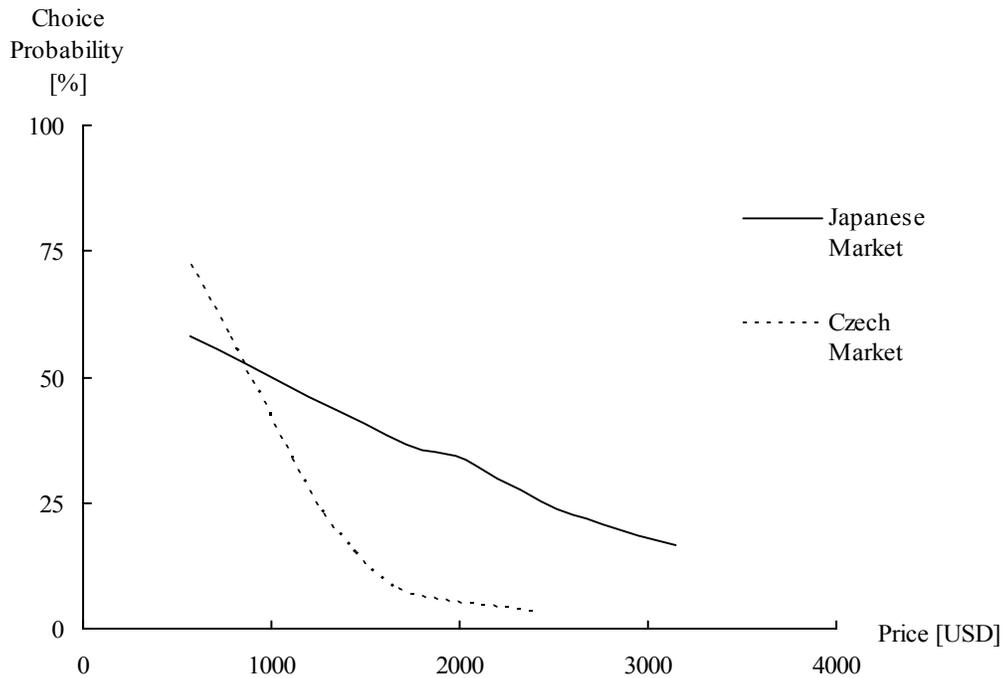

FIG 2. DEMAND CURVES FOR JAPANESE AND CZECH RESPONDENTS IN CAR NAVIGATOR CATEGORY

## Conclusion

For the examination of consumer behavior with implication to pricing and market segmentation, demand analysis with a low aggregated data is necessary. Elaboration on literature in first part of this paper yields a thesis about early adopters of hi-tech devices which can be used in the business practice. Applying the thesis, data on the individual's level concerning choice of the hi-tech products is collected and demand curves are identified via random utility framework. Clear, graphic illustrations show how powerful instrument such demand analysis may be for decision making of hi-tech producers.

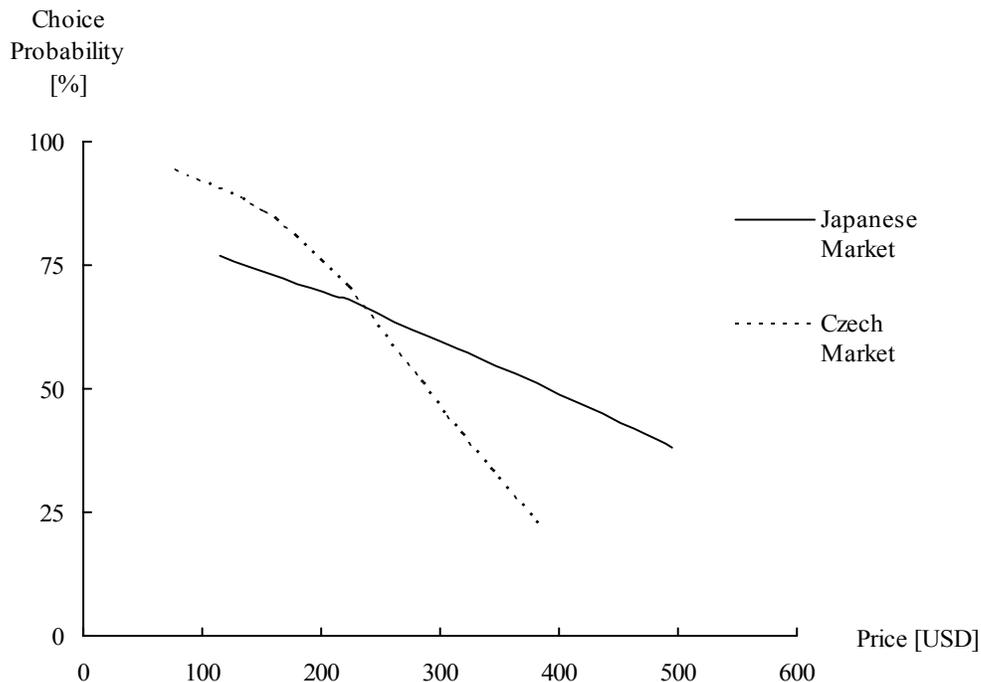

FIG 3. DEMAND CURVES FOR JAPANESE AND CZECH RESPONDENTS IN DICTIONARY CATEGORY

# Information Privacy and Online Participation: A Field Experiment

*Kai-Lung Hui*

*Hock-Hai Teo*

*National University of Singapore, Singapore*

*Sang-Yong Tom Lee*

*Hanyang University, Korea*

## Abstract

With the increase in information use and exchange for Internet commerce, consumer privacy is now an intense, focused media issue again. In response to pressures from multiple sources (e.g., consumers, privacy advocates and regulators), online firms have begun to make substantial investments in privacy protection mechanisms and changes in information collection practices. However, the extent to which they are effective in assuaging consumers' concerns and encouraging online participation have yet to be empirically validated. In addition, there are some limitations of existing laboratory experiments or surveys used to examine the relationships between online privacy and online participation in that they tend to directly prompt respondents on online privacy issues that may result in inaccurate or inflated responses. This study hence designed and employed a *novel field experiment* to evaluate and calibrate the relative effectiveness of privacy mechanisms (privacy statement and seal) and information collection practices (monetary reward offer and extent of information collection) on actual online participation behavior. Our findings show that privacy statement, monetary reward, and extent of information collection had significant influences on subjects' online participation behavior. Some managerial implications for practice are discussed.

## Introduction

The rapid growth of Internet commerce has spurred a remarkable increase in information use and exchange. Increasingly, firms are collecting and processing consumer information that they have acquired through a wide range of business-to-consumer e-commerce transactions. With the help of Internet tools such as cookies and activity tracking software, and the sharing of customer databases amongst online firms, consumers' personal information is sometimes acquired and used without their prior consent. This has sparked consumers' concern about their online privacy (Esrock and Ferre 1999; Smith et al. 1996). Landmark cases involving Amazon.com, Microsoft and Toysmart.com suffice to show that consumers are perturbed by the improper use and handling of their personal information.<sup>i</sup>

As an answer to consumers' increasing privacy concern, the U.S. Federal Trade Commission (FTC) released a set of fair information practices (FIP) which highlight several core principles for firms to safeguard consumers' information privacy (Federal Trade Commission 1998). Generally, the FTC recommends industry self-regulation as an approach to regulate online privacy. The Online Privacy Alliance (OPA) also recommends that any company that engages in e-commerce should adopt and implement a privacy policy that clearly states what information is being collected, how the information is used, whether third parties have access to the information, and others.

In line with the FTC recommendations, the majority of websites today publish privacy statements to illustrate their information handling practices, which often correspond to the FTC's guidelines. However, such statements are largely informational in nature, and it is very difficult for consumers to verify if the firms actually comply with the guidelines laid down by the FTC.

Consequently, third party enforcement and privacy "seal" programs began emerging to complement this weakness of privacy statements. Many websites acquire third-party privacy seals to certify that they follow the practices listed in their privacy statements to add further assurance.<sup>ii</sup> These third party endorsement programs were being supported by the FTC. For example, on May 23 of 2001, the FTC has granted the TRUSTe Children's Privacy Seal Program "Safe Harbor" status under the Children's Online Privacy Protection Act (COPPA).

Besides assuring consumers' online privacy, many websites offer monetary incentives, such as shopping vouchers, discount coupons, or chances to lucky draws, to consumers who are willing to disclose their personal information. Anecdotal evidence has shown that consumers respond to monetary incentives (Jupiter Media Metrix 2002; Russell 1989). However, exactly how effective these incentives are is a question that perplexes many firms and researchers (e.g., Hann et al. 2002; Milne and Gordon 1993). Are consumers sensitive to a slight change in monetary incentives, or perhaps they only care about the presence of such incentives?<sup>iii</sup> Answers to these questions can help firms perform accurate cost/benefit assessments, and devise appropriate information collection strategies.

Note that both protection and monetary incentive may only serve to encourage consumers to participate in online transactions. Because consumers are concerned about their online privacy, another fundamental factor that may affect their decision is the amount and sensitivity of personal information that is being requested (Hine and Eve 1998; Nowak and Phelps 1997). Previous work has shown that consumers' disclosure decision varies across information types (Phelps et al. 2000). That is, consumers may exhibit heterogeneous responses when a firm asks for different sets of information items (which could vary in length or intimacy). It is thus imperative for firms to find out the response function of consumers in real marketing contexts.

Hence, whether FIP can effectively address consumers' privacy concern and whether monetary incentive and the amount and nature of information collected plays a role in determining online participation are key research issues for many academic researchers and practitioners. While prior empirical research has found that FIP and the ability to control information use may help alleviate consumers' concerns on online privacy (Culnan and Armstrong 1999; Hoffman et al. 1999; Phelps et al. 2000), little has been done to assess the relative impact of FIP, monetary incentive, and the extent of information collection on actual participation decisions.

Moreover, many of these studies employed a survey approach, whereby the respondents were asked to indicate their preferences or behavioral intentions, by answering questions that were framed using hypothetical scenarios. Two weaknesses are inherent in such a methodology. First, as pointed out by Harper and Singleton (2001), directly prompting consumers with questions about online privacy may inadvertently lead to biased responses. When asked to express their opinions, people may tend to inflate their privacy concerns and put more emphasis on protective measures, such as FIP. This, however, may not reflect their true thinking when making disclosure decisions in real life contexts. Second, survey response is not equivalent to, or fully indicative of, actual behavior. When studying controversial issues such as the benefit of online privacy protection, it is useful for researchers to observe the actual behavior of consumers, which is reflective of the consumers' true inclinations. Therefore, the true behavioral effects on online participation when websites implement FIP either through privacy statements or through third party privacy seals have yet to be investigated.

In this study, we designed and conducted a novel field experiment to observe consumer response to online information solicitation. Specifically, we manipulated the experimental conditions of privacy protection, the provision of monetary incentive, and the extent of information collection, to generate multiple data collection scenarios (hereafter called "stimuli"). To present these stimuli to consumers, we collaborated with a local market research firm and hosted the experiment under its website. We (or, rather, the firm) then invited a group of subjects to browse the website and sign up as a member of the firm. Because the subjects were randomly assigned to different experimental stimuli, their decisions as to whether to sign up and provide information allowed us to directly assess the influences of the studied independent variables (privacy protection, monetary incentive, and information collection).

By estimating a binary logistic response function that incorporates the manipulated factors and a few control variables, we found that privacy protection, in the form of publishing a privacy statement, and monetary incentive increase consumers' predisposition to sign up as the firm's members. The amount and sensitivity of the requested information show a negative effect, while the display of a third-party privacy seal (a "stronger" form of privacy protection) does not seem to affect the subjects' decisions. Several control variables, including prior shopping and privacy invasion experience, and individual's propensity to trust other people also significantly influence the subjects' choices. The fitted logistic response function successfully predicts the behavior of more than 85 percent of our subjects.

One distinct advantage of our methodology is that the purpose of the study is completely disguised – the subjects interacted only with our partner firm, and the whole experimental task was framed as a membership sign up

exercise. Because of this empirical realism, our response function provides a clear-cut and unbiased assessment on the substantive value of the studied factors. Further, it also generates findings that triangulate previous survey or laboratory research on information privacy (e.g., Culnan 1993; Culnan and Armstrong 1999; Hann et al. 2002).

The rest of this article is organized as follows. Section 2 provides a sketch of our theory and formulates the research hypotheses. Section 3 outlines the details of our methodology and the experimental procedures. Section 4 presents the binary logistic response model and the estimation results. Finally, section 5 discusses the research findings, suggests a few managerial implications, and concludes the paper.

## Theory and Hypotheses

Any marketing transaction imposes risk on consumers, which includes the uncertainty and adverse consequences of taking part in the transaction (Cox and Rich 1964; Dowling and Staelin 1994; Sitkin and Pablo 1992). In an online environment, consumers not only need to worry about the products/services that they are acquiring, but also the risk pertaining to the collection and use of their personal information. This has aroused concerns about online privacy (Culnan 1993). Theories in consumer psychology and sociology suggest that people seek privacy to maintain self-identity, social divisions and status, and avoid unwanted disclosure or intrusion (Goodwin 1991, 1992; Schwartz 1968). Consumers may associate a high perceived risk of information misuse to potential privacy invasion, which in turn may lead to lower intention to participate in online activities or transactions (Culnan 1993; Stone et al. 1983).

To mitigate the perceived risk associated with information misuse, it is important for firms to bestow distributive and procedural justice when soliciting consumer information (Culnan and Bies 2003). That is, firms should take steps to ensure that consumers are provided with fair outcomes resulting from the disclosure, and they should implement proper procedures (such as FIP) to handle consumer data.

Two theoretical frameworks are pertinent to predicting consumers' willingness to partake in online disclosure. First, the resource exchange theory characterizes six broad categories of interpersonal resources: love, status, information, money, goods and services, which are repeatedly found to be exchangeable for one another by individuals (Foa 1971). Previous empirical research has shown that this theory can be applied to analyze interpersonal relationships (Donnenwerth and Foa 1974), and it also sheds light on marketing transactions and consumer behavior (Brinberg and Wood 1983; Hirschman 1987). If we consider an online transaction as an interpersonal exchange between a consumer and a firm, then we can directly extend and apply the theory to the online context, and predict that the consumer is more willing to forgo personal data when the firm provides her with proper resources.

Specifically, applying the resource exchange framework to online privacy, we can consider privacy protection as a service resource which firms could use to exchange for individuals' personal data, the latter being an obvious member of information resource. Similarly, monetary incentive, a direct manifestation of money resource, could potentially be used to trade for consumer information. A straightforward implication of this resource exchange hypothesis is that consumers may be more willing to disclose information to a firm if the firm provides a reasonable level of privacy protection, sufficient monetary incentive, and does not request for excessive personal information. As long as the consumers think the terms of exchange are "fair", then there is a higher chance for them to join the exchange (i.e., participate in the transaction).

The second perspective that may help predict individuals' privacy preference is the social exchange theory, which is popularly used in social psychology to explain network relationships and human behavior (Cook and Whitmeyer 1992). The social exchange theory posits that individuals tend to perform actions that generate outcomes which, based on their past experience and personal preference, are rewarding to them (Blau 1964; Emerson 1972; Homans 1961; Thibaut and Kelley 1959). The more rewarding is a particular outcome, the more likely the individuals to perform the action associated with the outcome. Likewise, the more costly or undesirable is a particular outcome, the more likely the individuals to avoid the associated action.<sup>iv</sup> Previous research has applied this social exchange framework to analyze various economic and social phenomena, such as strategic information technology alliance, voluntary cooperation, and wage-effort equity (Akerlof and Yellen 1990; Hollander 1990; Young-Ybarra and Wiersema 1999).

In online exchanges, most consumers would prefer money and service resources (the resource exchange hypothesis; Foa 1971), which implies that monetary incentive and privacy protection are positive reward factors that consumers treasure. On the other hand, because consumers perceive a subjective risk of information misuse (Culnan and Armstrong 1999), the provision of personal data may represent a negative cost factor associated with a particular transaction. Applying the social exchange hypothesis, we deduce that it is more likely for consumers to cooperate with websites that provide more monetary resource, privacy protection, and solicit less personal data. Equivalently, websites which follow these practices tend to be more attractive to prospective consumers.

Based on the above theoretical perspectives,<sup>v</sup> and previous evidence generated in empirical privacy research (e.g., Culnan and Armstrong 1999; Hann et al. 2002; Phelps et al. 2000), we formulate and test the following three hypotheses in this study:

H1: A website that offers a higher information privacy protection can draw more consumers to sign up and provide personal information; the higher the level of protection, the more likely the consumers to join the website.

H2: A website that offers a higher monetary incentive can draw more consumers to sign up and provide personal information; the higher the monetary incentive, the more likely the consumers to join the website.

H3: A website that collects less consumer information can draw more consumers to sign up and provide personal information; the lesser the information collected, the more likely the consumers to join the website.

Figure 1 depicts the research model that we pursue in this study.

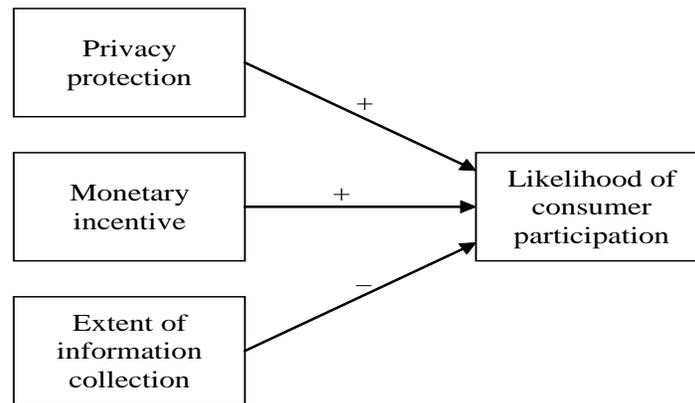

FIG. 1. RESEARCH MODEL

## Methodology<sup>vi</sup>

To observe the actual response and behavior of consumers, we conducted a field experiment and tested the proposed hypotheses using carefully constructed stimuli. The experimental website was hosted under the domain name of a local market research firm, which specializes in providing consulting and survey services to clients. To disguise the real purpose of the experiment from our pool of subjects, we framed the whole exercise as a membership sign-up request, and asked the subjects to answer questions pertaining to their personal records and their preferences toward mobile computing products. The latter questions were used to distract the attention of the subjects, and to provide an arbitrary purpose for initiating the requests. Essentially, we positioned ourselves as seeking the subjects' opinions on mobile devices, which would be used in the future to introduce customized product offerings.

The subjects were asked to visit the firm's website and fill in a survey form, which contains mandatory information items that they must submit to complete the registration, together with the optional mobile device

questions. After the subjects made their sign-up decisions, regardless of whether they decided to join as a member (and provide all the mandatory information), a follow-up survey would be posed to solicit some background questions (manipulation checks, past experience, privacy knowledge, etc.). To motivate the subjects to answer the follow-up survey, which is important for experimental control and statistical estimation, we provided a substantial monetary incentive to all the subjects.<sup>vii</sup> Most of the questions in the follow-up survey, except the experience-related questions, were seeking the subjects' personal opinions. Therefore, they were substantially less intimate than the main survey, which requested for personal data that could be rather sensitive to certain people. Because of this, even though 23 subjects did not fill in the main survey form, they nevertheless completed the follow-up survey.

#### **Manipulations**

We varied the three independent variables corresponding to H1, H2 and H3, to construct multiple experimental stimuli. First, for information privacy protection, we created three treatment conditions: (1) no protection; (2) protection by means of publishing a detailed privacy statement; and (3) protection by a privacy statement and a third-party privacy seal. Prior literature has recommended privacy seal as a comprehensive protection mechanism that ensures adherences to all the FIP (Benassi 1999). To assess the added benefit (if any) of a privacy seal over a privacy statement, we implement condition (3) by acquiring and displaying a commercial privacy seal from TRUSTe.<sup>viii</sup> Because condition (2) is basically a subset of (3), the magnitude of information privacy protection is, in ascending order, (1) < (2) < (3).

Second, for monetary incentive, once the subjects arrived at the website, we informed them that they would receive a check upon completing the main survey and signing up as a member of the firm (which requires them to fill in all the mandatory information).<sup>ix</sup> The value of the check varied from one to nine Singapore dollars (around 0.6 to 5.2 U.S. dollars). This manipulation allows us to assess the sign-up rate with respect to the different levels of monetary incentive, which corresponds to testing H2.

Finally, to manipulate the extent of information collection, we varied the length of the mandatory section in the main survey form by asking subjects to fill in different sets of personal information. The number of questions asked of subjects ranged from four to twenty three. The complete set of the solicited items are displayed in the Appendix. To avoid contaminating our results due to the subjects' idiosyncratic assessments of a particular piece of information, we arranged the treatment levels in such a way that the items requested in a shorter form was always a subset of the items requested in a longer form. For instance, the shortest treatment condition asked for name, email, address and citizenship; the next higher treatment condition asked for the same four items plus gender; the next one added ethnicity; and so on until the longest group, which requested for all the 23 pieces of information. A sufficient variation of this experimental treatment allows us to effectively test H3.

The specific stimuli presented to the subjects were constructed by randomly combining the different levels of the three treatment variables. A particular stimulus that a subject may see is, for example, a survey form that asks for name, email, address, citizenship, and gender, provides a monetary incentive of five dollars, and the website publishes a privacy statement. The stimuli were dynamically generated using a uniform probability density function, and presented to the subjects randomly when the subjects visited the website. To ensure that the manipulations were salient to the subjects, the explanation about the monetary incentive and privacy protection treatment (display nothing, privacy statement, or privacy statement and seal) were presented together with the main survey form that contained the mandatory items.

#### **Control Variables**

In the follow-up survey, we captured a few demographic variables and used them as controls to calibrate the logistic response model. First, we gauged the subjects' propensity to trust other people by including two 7-point Likert scale items: (a) I feel that people are generally trustworthy; (b) I feel that people are generally reliable. The basis for including trust propensity as a control variable is that it may reflect the predisposition of consumers to trust general others, which may directly affect their confidence on our partner firm in the experiment (Culnan and Bies 2003).

Second, we asked the subjects whether they had any experience of personal information misuse (yes/no binary response). One important proposition of the social exchange theory is that interpersonal reward/cost is individual specific, and its salience may depend on how often and recent the corresponding stimulus was presented (Emerson 1972; Homans 1961). People have lower tendency to perform actions that lead to reward/cost that they have received in the recent past.<sup>x</sup> If we treat information misuse as an online privacy cost, we would expect more

negative responses from subjects who have encountered such an experience.

Third, we asked the subjects if they have shopped on the Internet in the past 12 months (yes/no binary response). Past privacy research suggests that the sensitivity to privacy and the perception of invasion are situation specific, and they vary across individuals with different characteristics and personal preferences (Laufer and Wolfe 1977; Stone and Stone 1990). To capture such variations, we used Internet shopping experience as a proxy to probe whether the subjects are reactive to online privacy threats. In general, we posit that people who are used to shop online have higher likelihood to show positive responses.

Finally, consumers' concern about online privacy could be reflected in their knowledge and attitude toward browser cookies. As an attempt to control for the subjects' a priori concern, we asked the subjects to indicate their cookie settings, and used this question (a binary response – whether they have explicitly set their cookie preferences) as a behavioral indicator of their concerns about online privacy.

We also asked the subjects to rate separately the intimacy of each of the mandatory information items on a 7-point semantic-differential scale. We then used these ratings to construct an aggregate intimacy score from each subject's responses. Such a score could be used as an alternative to number of items to assess H3. Because information intimacy is subjective, the solicited intimacy score should represent a more accurate assessment of privacy cost as compared to number of items.

**Subjects**

We obtained mailings lists to 600 business undergraduate and postgraduate students in a large university. The sampling frame was constructed carefully such that all the listed members were not customers of, and had no transaction experience with, our partner firm. Invitation emails with individual-specific claim codes (refer to footnote 9) were then sent to all the listed members. Over a period of two weeks, 137 people responded and visited the firm's website, and 109 of them completed the experiment.<sup>xi</sup> This represents an overall response rate of 18.17 percent. As suggested by Pitkow and Kehoe (1997), most people delete unsolicited emails without reading the contents. Therefore, the somewhat low response rate is not surprising. The response rate is 79.56 percent if we consider only those people who responded to the email.

TABLE 1: DESCRIPTIVE STATISTICS OF THE SUBJECTS AND EXPERIMENTAL TREATMENTS

	Mean	St. Dev.	Max.	Min.
<u>Subject background:</u>				
Internet shopping experience	0.38	0.49	1	0
Information misuse experience	0.43	0.50	1	0
Cookie preference setting	0.44	0.50	1	0
Trust propensity	3.09	0.98	6	1
<u>Treatment variables:</u>				
Protection by privacy statement	0.39	0.49	1	0
Protection by privacy statement and privacy seal	0.27	0.44	1	0
Monetary incentive	4.76	2.46	9	1
Number of information items requested	13.41	5.66	23	4
Total intimacy of the requested information	52.68	27.49	115	6

Note: the two experience, cookie preference setting, and two privacy protection variables are binary. Hence, the means represent the proportion of subjects having the characteristics or treatments. Total intimacy is computed by adding up the intimacy score for each requested item.

Table 1 presents some descriptive statistics of the 109 subjects and the experimental treatments. The average age of the subjects was 24, and the range was 21-28. 53 and 47 percent of the subjects were females and males respectively.

## Results

### Manipulation Checks

In the follow-up survey, we asked the subjects to answer several questions to assess the effectiveness of the manipulations. First, we asked the subjects to indicate, using yes/no binary responses, whether they had seen a privacy statement and a privacy seal. All answers were consistent with the corresponding treatment conditions, indicating that the privacy protection manipulation was successful.

Second, we asked the subjects to rate two 7-point Likert scale items to verify the manipulation of monetary incentive.<sup>xii</sup> A regression of the response on the provided incentive levels gives a coefficient of 0.084, with a one-tailed p-value of 0.07. This indicates that the manipulation is satisfactory, albeit only marginally.

Finally, we used two questions to check the manipulation of information collection.<sup>xiii</sup> A regression of the response on the number of items requested gives a coefficient of 0.103, with a one-tailed p-value less than 0.01. Therefore, we conclude that the manipulation of information collection was successful.

### Hypotheses Testing

In the main survey, the subjects could choose either to sign up with our partner firm by filling in all the mandatory information or they could withdraw without answering anything. Because the response was discrete and contained only two states (participate or withdraw), we used a binary logistic response function to approximate the probability of participation by the subjects. In line with the model in Figure 1, our empirical equation assumes the following form:

$$\log\left(\frac{\pi}{1-\pi}\right) = \alpha + X\beta + Z\gamma + \varepsilon, \quad (1)$$

where  $\pi$  denotes the probability of participation by the subjects, and  $X$  is a matrix of the studied variables: privacy protection (H1), monetary incentive (H2), and the extent of information collection (H3). Note that we need two dummy variables to capture the three privacy protection treatments, and  $\alpha$  represents the base case with no protection imposed. Also, the intimacy score and number of items requested were used as two alternative measures for the extent of information collection.  $Z$  is a matrix of control variables: trust propensity, information misuse and Internet shopping experience, and cookie preference setting.  $\beta$  and  $\gamma$  are parameter vectors that were estimated by fitting equation (1) to the experimental data. Finally,  $\varepsilon$  catches any unexplained random errors.

Among the 109 subjects, 86 participated and answered all the requested mandatory information. The first column of Table 2 reports the maximum likelihood estimation results of equation (1), using the intimacy score as a measure of the extent of information collection.

To assess the joint significance of the explanatory variables, we compared the fit of the estimated model with a null model, which was constructed by restricting all model parameters (except the constant) to zero. The likelihood ratio test statistic was 37.18 ( $p < 0.01$ , with 8 degrees of freedom), indicating that the model variables helped predict the probability of the subjects' participation. The computed McFadden R-square was 0.331, which suggests moderate explanatory power.

The Wald statistics in Table 2 show that the effect of privacy statement was positive and marginally significant, but the coefficient of privacy seal was not significant. This provides weak support for H1. The effect of monetary incentive was positive, and that of information intimacy was negative. Both coefficients were statistically significant. Therefore, H2 and H3 are supported.

TABLE 2. ESTIMATION RESULTS

	(1)		(2)	
	Coefficient <sup>a</sup>	Wald	Coefficient <sup>a</sup>	Wald
Constant	-2.746* (1.507)	3.320	-2.532 (1.573)	2.591
Privacy statement	1.169* (0.688)	2.888	1.154* (0.683)	2.861
Privacy seal	1.058 (1.085)	0.950	1.234 (1.103)	1.251
Monetary incentive	0.398*** (0.142)	7.823	0.374*** (0.143)	6.883
Intimacy score	-0.027** (0.013)	4.328		
Number of items requested			-0.136** (0.065)	4.379
Trust propensity	1.126*** (0.366)	9.432	1.106*** (0.374)	8.751
Information misuse experience	-1.147* (0.639)	3.227	-1.266** (0.640)	3.912
Internet shopping experience	1.758** (0.748)	5.527	1.786** (0.750)	5.671
Cookie preference setting	-0.531 (0.656)	0.654	-0.494 (0.653)	0.572
Sample size	109		109	
Log likelihood	-37.574		-37.390	
McFadden R-square	0.331		0.334	

\*\*\* p < 0.01; \*\* p < 0.05; \* p < 0.10.

<sup>a</sup> Standard errors are presented in parentheses.

For the control variables, consistent with a priori expectations, the subjects who tended to trust other people, and who had previous Internet shopping experience, were more likely to sign up as members of the firm. On the other hand, those who encountered information misuse in the past had a lower likelihood to participate. The sign of the cookie setting parameter was negative and consistent with our prediction, but it was not statistically significant.

Finally, to assess the goodness of fit of the binary logistic response model, we conducted the Hosmer-Lemeshow (1989) test, using predicted probabilities from the estimation as grouping variable. The calculated Hosmer-Lemeshow statistic, with 6 degrees of freedom, is 8.995, which has a p-value of 0.17. Hence, there was no evidence for lack of fit of our model.

#### Robustness

As a further test of our hypotheses and the robustness of the model, we re-estimated the logistic function using the number of requested items in place of the intimacy score. The results are reported in the second column of Table 2. Generally, the variables were jointly significant (likelihood ratio test statistic = 37.55, p < 0.01), and the signs and significance of the parameters were consistent with those obtained above.

Specifically, H1 is weakly supported, with the parameter of privacy statement being positive and marginally significant, while the addition of a privacy seal was not significant. H2 and H3 are both supported. Providing more monetary incentive and requesting less information seemed to encourage people to participate. All the control variables had the same signs and significance levels as those in Table 2, column one. Finally, the Hosmer-Lemeshow test statistic is 7.729 (p-value = 0.26), indicating an adequate fit between our model and the data.

#### Prediction

The predictive power of our model can be observed by inspecting the classification results, which are summarized in Table 3, panels (a) and (b). Evidently, our model is quite powerful in predicting the “participate” cases, whereas it does not perform as well in identifying the “withdraw” cases. We can correctly classify only 57 percent of the

subjects who chose not to provide their personal information. In any case, the overall classification accuracy exceeds 85 percent, irrespective of which variable we used to measure the extent of information collection.

TABLE 3. CLASSIFICATION TABLES  
(a) With intimacy score

Observed frequency	Predicted frequency		
	Withdraw	Participate	Percentage correct
Withdraw	13	10	56.52
Participate	3	83	96.51
Overall percentage			88.07

(b) With number of information items

Observed frequency	Predicted frequency		
	Withdraw	Participate	Percentage correct
Withdraw	13	10	56.52
Participate	4	82	95.35
Overall percentage			87.16

The value of adding each of the three treatment variables can be individually examined using the fitted logit function. By substituting the fitted parameters into the logit model and removing the random error term, the “participate” probability,  $\pi$ , can be calculated as:

$$\pi = \frac{e^{\hat{\alpha} + X\hat{\beta} + Z\hat{\gamma}}}{1 + e^{\hat{\alpha} + X\hat{\beta} + Z\hat{\gamma}}} \quad (2)$$

Due to the non-linear specification, the marginal effect of the independent variables (X or Z) on the participate probability ( $\pi$ ) is not uniform. Therefore, the merit of increasing a particular treatment depends on the current levels of all the predictors.

Table 4 presents the results of several scenario analyses, by computing the “participate” probabilities using (only) the significant parameters in Table 2, and the mean values of the control variables as reported in Table 1. For an average subject, if we do not request for any personal information, do not provide monetary incentive, and offer no privacy protection, then the chance for her to participate is roughly 0.71-0.73. This probability drops substantially to 0.31-0.37, once we request for an average of 13 pieces of personal information (or total intimacy score of 53). These estimates present strong evidence that the extent of information solicitation does indeed deter consumers from joining a website.

TABLE 4: SCENARIO ANALYSIS OF PARTICIPATE PROBABILITIES

	Model (1)	Model (2)
<b>Base case 1 (B1):</b>		
Absence of all treatment variables (privacy protection, monetary incentive, information collection)	0.71	0.73
Add a privacy statement to B1	0.89	0.90
Add a \$5 incentive to B1	0.95	0.95
<b>Base case 2a (B2a):</b>		
Request for mean intimacy of information, as reported in Table 1, in addition to condition B1	0.37	
Add a privacy statement to B2a	0.66	
Add a \$5 incentive to B2a	0.81	
Add a privacy statement and a \$5 incentive to B2a	0.93	
<b>Base case 2b (B2b):</b>		
Request for mean number of items, as reported in Table 1, in addition to condition B1		0.31
Add a privacy statement to B2b		0.58
Add a \$5 incentive to B2b		0.74
Add a privacy statement and a \$5 incentive to B2b		0.90

Note: model (1) corresponds to the first column of Table 2 (with intimacy score), while model (2) corresponds to the second column (with number of items).

Such an undesirable consequence, however, could potentially be mitigated by some external instruments. Specifically, if the firm provides online privacy protection by means of publishing a privacy statement, then the “participate” probability rises to 0.58-0.66. If the firm further adds a \$5 monetary incentive to those who sign up, then the probability would go up to 0.90-0.93, a rather high chance of success. In fact, based on the fitted models, a \$5 monetary incentive is always superior to publishing a privacy statement. From the analyses in Table 4, the provision of a \$5 incentive outperforms publishing a privacy statement by a probability of around 0.15-0.16 in typical data collection scenarios.

## Discussion and Conclusions

### Limitations and Future Research

This study employed a novel field experiment to assess the influence of privacy protection instruments (privacy statement and third party privacy seals) and information solicitation practices (use of monetary reward and extent of information collection) on online participation behavior. Except for privacy seal, all other factors had significant impacts on online participation. To the extent that our field experiment represents a realistic encounter for the subjects on the Internet, our findings should provide a rather accurate indication of actual online participation behavior on the Internet.

Notwithstanding our contribution of providing a realistic assessment of the relative effectiveness of the privacy instruments and the information solicitation practices, our study has some limitations. First, the use of Singapore-based student subjects could potentially make our results less generalizable to working adults or to a population in a different economic, political, social, and cultural context. While it is possible that our subjects may be more sensitized to monetary reward and less concerned for privacy violations, we believe that this concern is somewhat mitigated in our study because our findings show that privacy statement did have a strong impact on the subjects’ participations. Second, there may be a concern that our prediction of the “withdraw” cases is somewhat marginal although we did manage to predict more than 95 percent of the “participate” cases correctly. This suggests that better variables may be needed to identify the people who withdrew. Hence, we believe much can be gained if future research can replicate our study using a similar methodology with subjects having different demographics and with other variables pertaining to website characteristics that might be more effective in predicting the “withdraw” cases. For example, the relevance and the reputation of the website might play an important role in determining

subjects' decisions to "withdraw" from the website. It is possible that only when the subjects have determined the relevance of the website, do they decide to consider the privacy instruments and the information solicitation practices used by the firm. Similarly, the reputation or its lack of may deter subjects from engaging with the website, regardless of the conditions provided by the firm.

#### **Explanations for Non-Supported Hypotheses**

The lack of usefulness of the privacy seal mechanism in encouraging online participation is rather surprising and perturbing. Seals of endorsement from trusted third parties (e.g., Truste, BBBonline, TrustSg<sup>xiv</sup> program from the National Trust Council of Singapore) purportedly should enhance consumers' trust in those firms that deploy them because they provide an authentication and certification of those firms' privacy practices. Indeed, much investment has gone into promoting the use of trusted third parties' privacy seals in the United States, Singapore and Europe in general. Given this huge investment in promoting the adoption of these privacy seals, our finding thus begs the question of "why" these seals are ineffective in encouraging online participation.

There are a few plausible reasons. First, consumers may have some doubts concerning the independence of these trusted third parties that derive their sustenance (revenue) from the very firms that they audit and certify. For instance, Microsoft "earned only an investigation" from these trusted third parties when it was discovered to have sent a specific hardware identifier to Microsoft during user registration of Windows 98 operating systems without the user consent and knowledge.<sup>xv</sup> Second, even if consumers were to believe in the independence of these trusted third parties, there are some nagging perceptions as to whether they have any legal bite at all when enforcing the compliance of privacy practices to established guidelines. To-date, reported cases of how these trusted third parties dealt with offenders appears to be lacking and there is also no blacklist of offenders on their websites. Because of these problems, our subjects may have found no significant value-added in privacy seals compared to the privacy statements that are in place. In essence, a consumer whose privacy has been violated, may complain to FTC based on the posted privacy statement with the same effect as compared to one who may complain to these trusted third parties based on the abused privacy seals.

#### **Managerial Implications**

Our finding has significant practical implications for both trusted third parties and online firms. It appears necessary for trusted third parties to embark on a more pro-active communication campaign to improve its credibility in the eyes of the consumers. They ought to exhibit greater transparency in the way investigations are being conducted for privacy violations of their clientele, and to communicate their investigation outcomes to the public at large (and not only to the complainants). Such a move could help enhance their relevancy to the public, which in turn ensures their sustainability in the long run. To remain passive would induce consumers' skepticism and distrust of them, and firms upon realizing their irrelevance to the public, would also forsake them and pursue other avenues (e.g., technological solutions like P3P) to assuage consumers' privacy concerns.

Based on our results, online firms should also carefully assess their own situational context (e.g., resources constraint and data mining abilities) when adopting appropriate strategies to address consumers' privacy concerns in order to solicit online participation. The binary response model (Table 2) suggests that providing privacy statement exerts a strong influence on online participation behavior. Firms should thus generally invest more resources into drafting an appropriate privacy statement and devising proper procedures and routines to meet its obligations espoused in that statement. As our control variables of trust propensity and previous information misuse experience are also significant, firms' adherence to the fair information practices in privacy statement carries a greater significance because any publicized malpractice is likely to deter consumer from registering with the website. Besides providing privacy statement, firms could also solicit online participation through providing a monetary reward or collecting less information from consumers. The latter should be practiced especially when it is critical to convey to the consumers that only the necessary information is collected to provide the service or effect the transaction, and when the firm does not possess any internal capabilities (data mining skills) to exploit the collected information.

## Concluding Remarks

Our study contributes to extant literature on how consumer privacy concerns can be effectively addressed by several interventions in an e-commerce arena, an area that is still in need of much research given the evolving technologies and practices of online firms (Milne 2000). A key strength of this study is the use of a novel field experiment to evaluate subjects' actual online participation behavior and to calibrate the effectiveness of different privacy protection mechanisms and information collection practices. In addition, we explored two variables, monetary reward and amount (sensitivity) of information collected, that are relatively less studied and less understood. Our findings show the primacy importance of monetary reward and privacy statement in determining potential consumers' information provision or participation behavior. To the extent that our study induces strong empirical realism, the lack of support for the effectiveness of privacy seals in determining online participation is a serious concern that warrants greater attention and investigation. We strongly believe that research along the direction of this study should contribute to an in-depth understanding of consumers' online participation and information provision behaviors.

## End Notes

---

<sup>i</sup> In 2000, *Amazon.com* was alleged practicing price discrimination using consumers’ demographic information when providing discounts to DVD purchases. Although the company denied the charge and stated that it was merely conducting a random price test, it nevertheless apologized and made refunds to 6,896 involved customers ([http://www.internetnews.com/ec-news/article.php/4\\_471541](http://www.internetnews.com/ec-news/article.php/4_471541)). At around the same time, the U.S. Federal Trade Commission (FTC) stopped a bankrupt website, *Toysmart.com*, from selling its customer database, which the company previously promised not to share with any third parties (<http://www.ftc.gov/opa/2000/07/toysmart2.htm>). Recently, the FTC confronted *Microsoft* for providing false promises regarding the security and privacy protection incorporated in *Microsoft’s Passport* technology (<http://www.ftc.gov/opa/2002/08/microsoft.htm>). It is instructive to note that most of these incidents were spearheaded by consumer groups and privacy advocates.

<sup>ii</sup> The leaders of these are TRUSTe and the Better Business Bureau’s BBBOnline.

<sup>iii</sup> Hann et al. (2002) use a conjoint experiment to estimate the utility that consumers attach to monetary incentives and privacy protection. Because the study is conducted in a laboratory with hypothetical websites and scenarios, the results are only indicative of individuals’ preferences across the set of manipulated stimuli. They may not necessarily translate into actual disclosure/participation behavior.

---

<sup>iv</sup> Homans (1961) calls this the *value proposition*. Note that these behavioral inclinations are all expressed in probabilistic terms; given a certain set of stimuli with different reward and cost structures, people *tend* to perform the action that generates the highest net value (i.e., more rewarding/less punishment to them).

<sup>v</sup> Other related privacy theories include the “privacy calculus” proposition developed by Laufer and Wolfe (1977), and the expectancy theory-based model proposed by Stone and Stone (1990). The general theme of these models is consistent with the social exchange theory: people assess interpersonal rewards and costs, and they gear toward an outcome that maximizes their net value.

<sup>vi</sup> The actual webpages and surveys that subjects saw are in the appendixes and available upon request.

<sup>vii</sup> Specifically, we offered the subjects 20 Singapore dollars (around 11.5 U.S. dollars) if they completed the follow-up survey, which took them only around 10 to 15 minutes.

<sup>viii</sup> Note that privacy statement and third-party privacy seal are apparatus to protect consumers’ online privacy, and they can both be employed to assess H1. The net value of having a privacy seal on top of a privacy statement is an empirical question.

<sup>ix</sup> To prevent a subject from registering twice to claim more money, we generated a unique claim code for every subject that we solicited through email. Each claim code could only be used once, and a valid claim code must be entered before a subject can see the survey. The checks were mailed individually to the subjects after the experiment.

<sup>x</sup> This corresponds to the *deprivation-satiation* proposition in Homans (1961), and Proposition 2 in Emerson (1972).

<sup>xi</sup> We were not able to use those 28 subjects who visited the ‘Welcome Page’ and did not participated in the survey. We don’t know the real reason of non-participation. Furthermore, they didn’t see the stimuli at all.

<sup>xii</sup> The two items are: (1) the amount of money I received is adequate to compensate for my effort and time spent in participating in the mobile device survey; (2) the reward I received from participating in the mobile device survey is worth the information I give. The reliability of the two items is 0.8611. The two items were averaged to produce an overall score (mean = 4.66 across all the subjects).

<sup>xiii</sup> The two 7-point Likert scale items are: (1) I feel that the mobile device survey is collecting too much personal information about me; (2) I am giving out a lot of information (reliability = 0.9120). The two items were averaged to produce an overall score (mean = 4.54 across all the subjects).

# Innovative Model for Product & Price Decisions in Marketing

Cezar Scarlat  
University "Politehnica" of Bucharest, Romania

## Abstract

Based on author's original method DISTEH (i.e. technical distance) – an innovative competitiveness model was developed. Following to previous author's research work, this paper presents the model, which is used for making the right product and price strategy in marketing, useful mostly when new product or technology spring. The decisions on product and price are intimately interlinked. Using statistical methods, as regression analysis, one might identify "technology family" curves, as well as technology breaks or "technology peaks". The trend of the technology innovation and progress could be identified. Given the "technology family", the marketing manager easily identifies the lower competition zones or marketing niches. A niche corresponds to the best price & product strategy. The managers of marketing and R&D departments can use this method to design marketing strategies with a higher probability to succeed, based on the price and product mix that targets the lowest competition market zone.

## Introduction: Is there an Extra-Reason for Competitiveness Concern?

Besides all well-known economic reasons that an economy must be competitive for, the strategy makers from Romanian companies are more and more concerned about the relatively low competitiveness of their products – in relation with the country's EU accession coming day. On one hand, the day of accession is a nice desired dream but, on the other hand, it could be a nightmare: on a lot larger market, the "Romanian quality" goods and services have questionable chances to succeed in a highly competitive market and lots of firms will probably fail.

For this reason, it is extremely important for the company decision makers to have practical and operational tools to assess and analyze the competitiveness of their products. Starting from this vital and burning need to be addressed, the author's research led to *the competitiveness model*.

It is important to mention that the proposed model is useful mostly when new technologies appear and are analyzed, by and large at the microeconomic decision level.

## The Competitiveness Model

The "Competitiveness Model" developed by the author [5, 7] is an innovative model, which can be used for marketing decisions on product and/or price.

As far as product competitiveness, there are two major goals:

- To identify and assess the main factors, which have a major impact on the product competitiveness;
- To decide how competitiveness and profitability interact.

Based on the *DISTEH* method for assessing the level of technical performance<sup>1</sup>, any product/service might be represented by a dot within the  $p(\bar{T})$  domain (Fig. 1).

The *competitiveness area* is defined (as depicted in the same figure) bi-dimensionally: the dimension of *the technical competitiveness (TC)* – assessed by the level of product's technical performance (this is *technical distance*, according to *DISTEH* method<sup>2</sup>) – and the dimension of *the economic competitiveness (EC)* – measured by the unit price level.

The squared domain can be even measured and evaluated geometrically (the shadowed area  $A_C$ ):

$$A_C = \bar{T}_L * (p_E - c) \quad (1)$$

Lower the technical distance (better the product – as we have seen), higher the technical competitiveness; lower the price, higher the economic competitiveness. A product is more and more competitive as it is – simultaneously – technically and economically competitive (closer to 0) – as the pointed arrows show below.

Unfortunately, this is almost impossible to achieve, because:

- Highly technically competitive products ( $\bar{T}_i$  closed to 0) are rather expensive (unit price goes to  $p_E$  or over);
- Highly economically competitive products (low priced ones) are usually of poor quality.

The solution is compromising – sometimes this is called “good price/quality ratio” or “good value for money”.

*The model allows doing more than that: to measure the competitiveness for each product.*

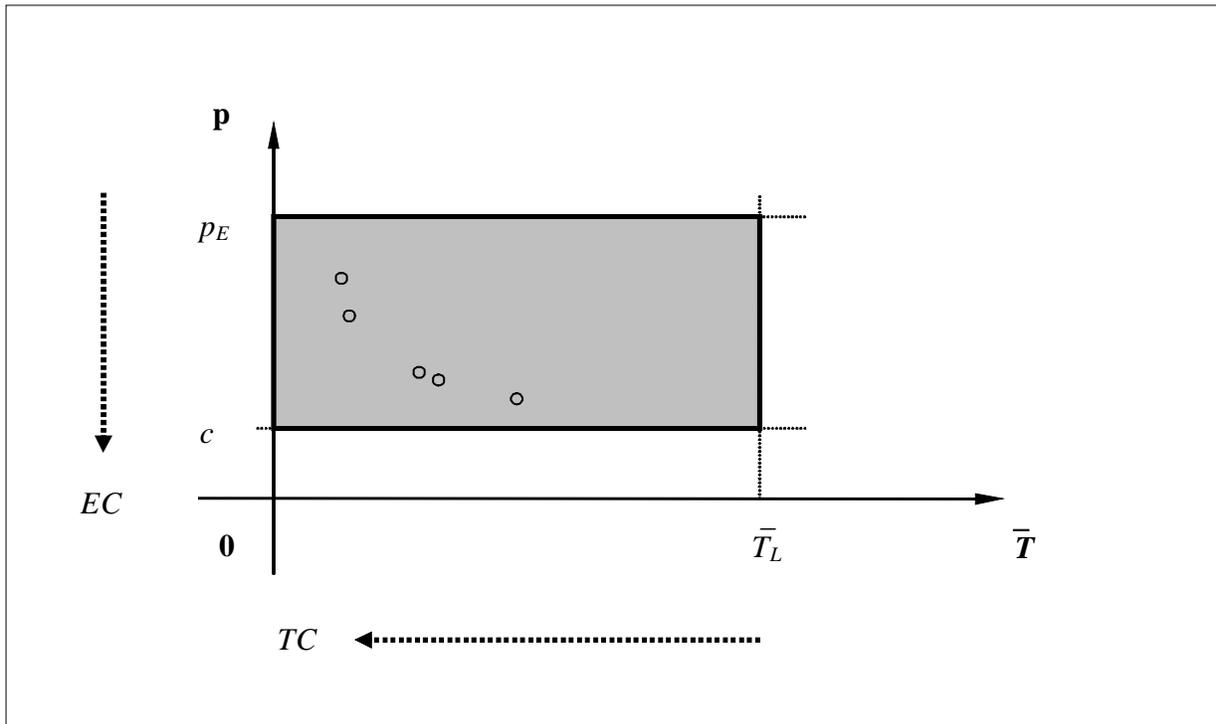

FIGURE 1: COMPETITIVENESS AREA

$\bar{T}$  = Technical distance

$\bar{T}_L$  = Technical distance – limit (over  $\bar{T}_L$  products are not competitive, technically, because of the poor quality)

$p$  = selling price per unit

$p_E$  = excessive price per unit (over  $p_E$ , products are not competitive, economically, as too expensive)

$c$  = production cost per unit (under  $c$ -level, products and production are not profitable)

For each product  $A_i$ , the Competitiveness Index ( $K_i$ ) is defined as (2):

$$K_i = \sqrt{\left(\frac{p_i - \min p_i}{\min p_i}\right)^2 + \left(\frac{\bar{T}_i - \min \bar{T}_i}{\min \bar{T}_i}\right)^2} \quad (2)$$

where:  $p_i$  is the unit price of the product  $A_i$

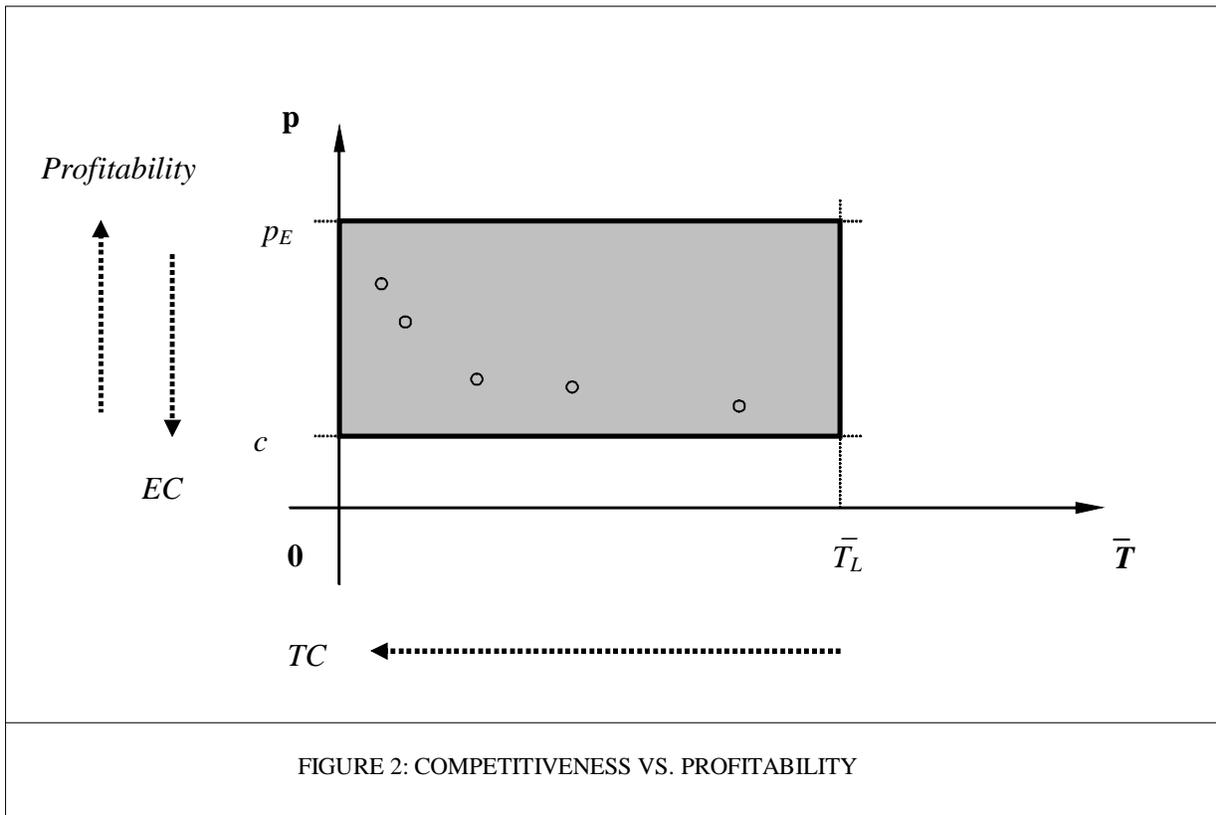

$\bar{T}_i$  is the technical distance for the product  $A_i$

The values  $\max p_i$  and  $\max T_i$  correspond, respectively, to the most competitive product – economically and the most competitive product – technically.

The competitiveness index is positive and un-dimensional, which is appropriate for comparative analysis. The products are ranked according to the  $K_i$  values: the hierarchy is topped by the most competitive product (with the lowest  $K_i$  value), which realizes the best compromise between price and technical performance<sup>3</sup>.

The *Competitiveness Model* also reveals the strong contradiction between competitiveness and profitability: as the unit price is decreasing, the economic competitiveness (EC) increases but the profitability per unit ( $p_E - c$ ) is smaller and smaller (Fig. 2). This “conflict” between (economic) competitiveness and profitability can be solved considering the total profit ( $G$ ) generated by the total amount sold ( $q$ ):

$$G = q(p - c) \quad (3)$$

Because of the sales elasticity,  $q$  depends on  $p$  and – finally –  $G$  depends only on  $p$ . The problem of profit maximization is solved by Scarlat [3, p. 108-112] using derivatives: there is an optimum price ( $p_{opt}$ ) for which the total profit is maximized:

$$G_{\max} = G(p_{opt}) \quad (4)$$

where:

$$p_{opt} \in (c, p_E) \quad (5)$$

and depends on  $c$  and elasticity curve parameters.

### Product Decisions based on the Competitiveness Model

The competitiveness model can be used for (new) technology analysis [7] as well as for product/price strategy design and decisions, which are intimately interlinked.

For a given type of product, there are “clouds” of dots within competitiveness area, each dot corresponding to a specific product of that type. Using statistical methods, as regression analysis, the curve  $p(\bar{T})$  can be easily identified and designed. Note that  $p(\bar{T})$  curve is non-linear (convex). Usually, the most performant product is the most expensive one (towards upper-left on the curve). It represents the so-called “*technology peak*”. In many cases, not only a regression curve can be obtained but several. *Fig. 3* shows the case of two such regression curves, A and B. They describe different “*technology family*” curves, which were identified.

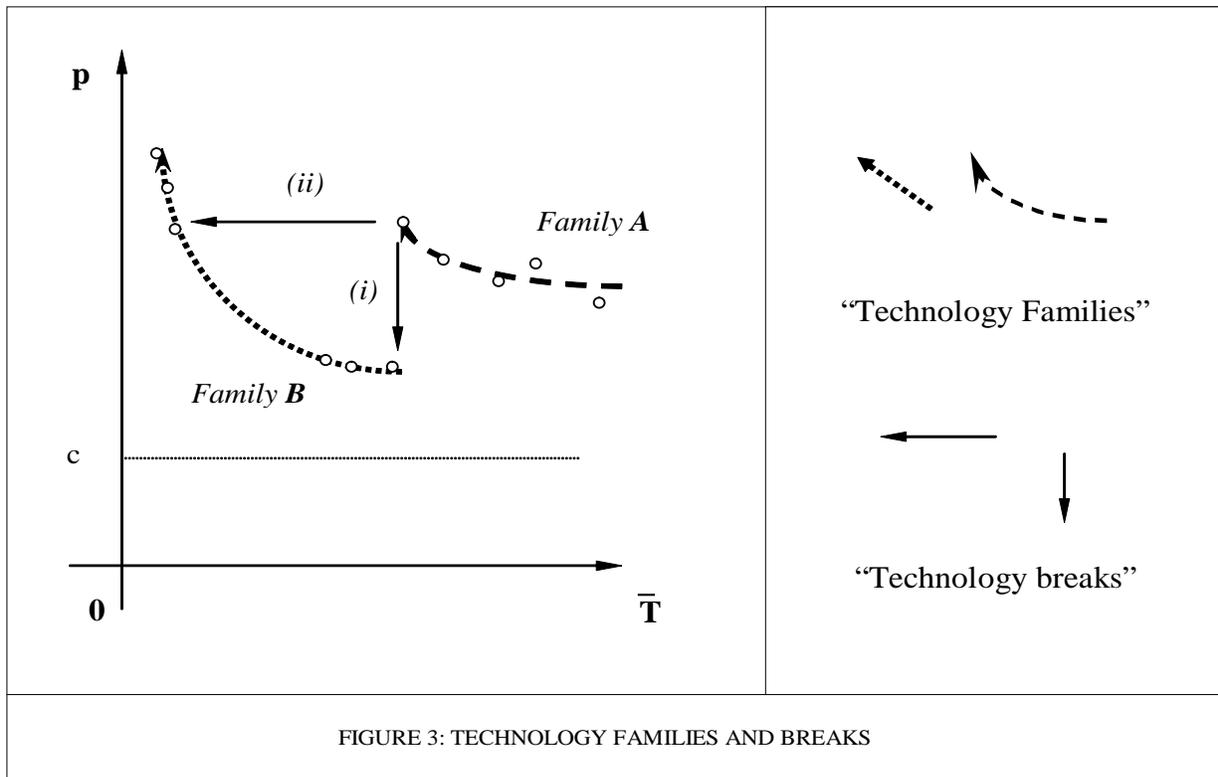

FIGURE 3: TECHNOLOGY FAMILIES AND BREAKS

The B family corresponds to *the innovative technology* as it includes either:

- (i) Chipper products with similar quality and technical performance (technical level  $\bar{T}$ );
- (ii) Products with improved quality and technical performance, at equal price (p).

The transitions of (i) or (ii) types are called “*technology breaks*” (or “*jumps*”). The technology progress always means new products with new and/or improved technical characteristics. The most innovative technology is always placed on the extreme-left of the diagram.

When launching new products, companies may use the bi-dimensional competitiveness model of the  $p(\bar{T})$  curve, as practical method to identify the market niches, as low-competition market zones.

The market niche corresponds to that portion of the regression curve (the most extended) where there are no dots (Fig. 4) – i.e. there is a considerable large demand for a well-defined range of specific technical performance of the given product, *which is not covered by products* and *there is no competition!* Exhibit 4 presents the niche on the curve of “new technology family”.

The niche indicates the range of technical performance of the new product to be designed and engineered, because of the variety of the clients’ needs, which are not covered by the current products, yet (“ $\bar{T}$  gap” on the  $\bar{T}$  axis). It is important to remember that “ $\bar{T}$  gap” corresponds to a set of different technical features of the product. This is extremely valuable market information for a company that will enter in a new market or intends to launch a new product on a given market.

The Marketing and Research & Development departments should be actively involved in making this strategic decision, providing the background information about market niches (the coordinates of the market niche on both axes: product and price). The two components of marketing-mix (“product” and “price”) are strongly interrelated. The decisions on “price” cannot avoid the “product” and vice versa. The top-level management should design the marketing strategy with a higher probability to succeed, based on the price & product mix that targets the lowest competition market zone.

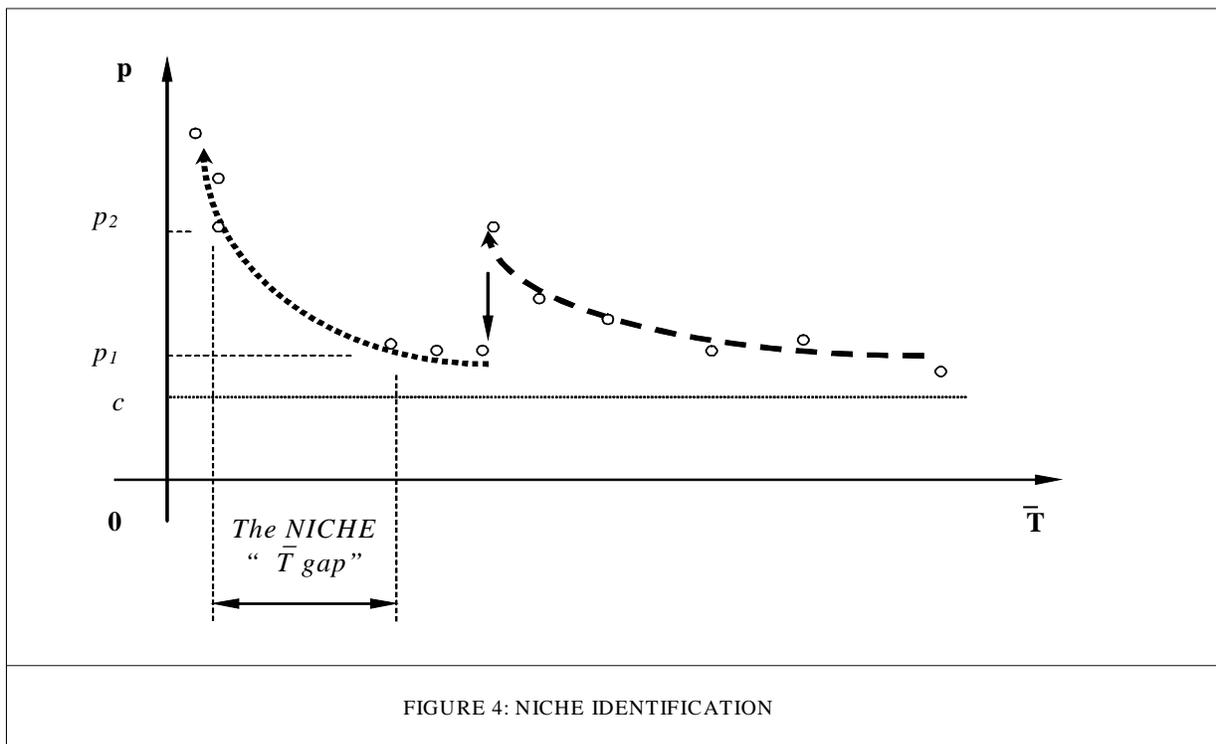

FIGURE 4: NICHE IDENTIFICATION

## Price Decisions based on the Competitiveness Model

The niche identification is only the “coarse tuning”; the “fine tuning” is *how to set the right price within the niche*.

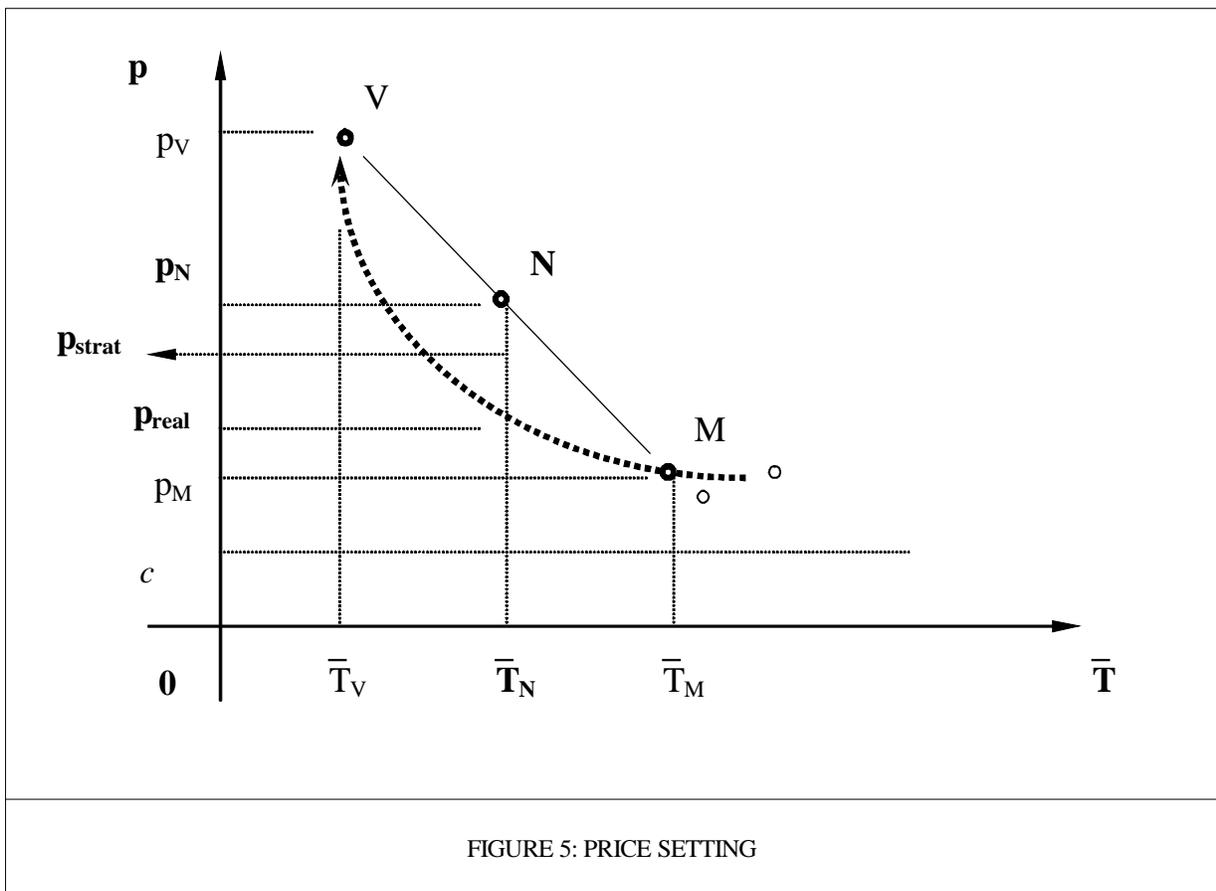

A common situation is presented in *Fig. 5*. The market niche is defined and limited by two existing products (V and M) and their corresponding product and price limits:

- The technical performance between  $\bar{T}_V$  and  $\bar{T}_M$ ;
- The unit price between  $p_V$  and  $p_M$ , respectively.

Assume that a new entrant intends to launch a new “N product” of same type; also, assume its technical performance ( $\bar{T}_N$ ) is roughly in the middle of the distance  $\bar{T}_V$   $\bar{T}_M$ . Most of the customers expect the unit price  $p_N$  to be in the middle of the distance  $p_V$   $p_M$ , as well. As we presented, fact is that the fair unit price ( $p_{\text{real}}$ ) should be on the  $p(\bar{T})$  curve, *which is considerably lower than  $p_N$* ! As Scarlat pointed out [5, p. 337-339], the wise price strategy would set the unit price under  $p_N$  (clients will have the feeling of a low price) but above  $p_{\text{real}}$  (company will report an extra-profit). *This is a very good example of win-win strategy!*

The assumption of mid-positioning of the new product does not influence the above conclusion; it just eases the understanding of the whole rationale.

It should be mentioned that the company management would set the price based not only on the optimum considerations presented but other strategic elements, as well<sup>4</sup>.

## Conclusions

The bi-dimensional competitiveness model – based on **DISTEH** method – is a practical analytical tool for competitiveness assessment. The profitability index allows products' ranking and selection of the most competitive products.

Competitiveness improvement is possible; more than that, the Competitiveness Model and Index indicate which competitiveness component (either technical or economical) that might be improved. The analysis can be refined using the DISTEH method [6].

The competitiveness and profitability are contradicting to each other only apparently. It makes full sense to calculate the optimum unit price, which maximizes the total profit.

Analysis of the competitiveness diagrams – constructed based on  $p(\bar{T})$  regression curves – reveals the innovative technology among different technology families, technology peaks and breaks, the sense of technology progress (prognosis) as well as market niches.

Within the market niches, the best product-price decisions would be based on  $p(\bar{T})$  regression curves. The model presented is a powerful tool to enhance the manager's "science" component. It is up to the company manager's science (but also experience and even ... art!) to make the best marketing decision – in terms of the optimum unit price mixed with the most suitable product strategy – for the most successful marketing-mix and, finally, marketing strategy.

## End Notes

---

<sup>1</sup> The products' technical performance might be measured by several methods; we do prefer to apply the **DISTEH** method, which is an original method, based on author's own research [4, 6]. The method was developed by the author as an original method to assess the level of technical performance of products (goods or services) and technologies [4], within laboratories of Industrial Management Department from University "Politehnica" of

---

Bucharest. The method was originally named DISTEH [1, p.18]. The influence of time factor is considered first time by Costake and Scarlat [2, p. 226, 233]. The method was tested in a number of practical training, consulting and research circumstances and continuously improved [6, 7].

<sup>2</sup> According to the *DISTEH* method, for any given product  $A_i$  ( $i = 1, \dots, m$ ), one might calculate a unique value associated to that product  $\bar{T}_i$ , value that allows the ranking of all the products considered (starting with the best on the top). The products are ranked starting from the best one (minimum  $\bar{T}_i$ ). The technical distance could be zero in an ideal case. Bigger the  $\bar{T}_i$  value, lower the quality of the product  $A_i$  and its technical performance. It should be mentioned that all the  $m$  products considered belong to the same category: they address to the same need (as mobile phones, for example). The method can also apply when the decision maker needs to select not the absolutely best product but the relatively best product [6, p. 372-373].

<sup>3</sup> Note that the product competitiveness is influenced by other factors, as well: the other components of the marketing mix (other than product and price); commercial policies in force in different economic unions or commercial zones; contractual provisions as the product delivery terms or payment conditions – even the currency used [5].

# The Holistic Perspective of Thailand Brand Meaning

*Krittinee Nuttavuthisit  
Chulalongkorn University, Thailand*

## Abstract

National image can significantly influence consumer perceptions of products and services in the global market. Previous research has mostly focused on the effect of country of origin on consumers' decisions and information processing, while overlooking consumers' holistic perspectives due to a lack of research exploring the abstract and contextual quality underlying the national image. Hence, this phenomenological inquiry was conducted with diverse participants in the United States in order to capture consumers' holistic perspectives of Thailand's image. An outcome of this research is the establishment of a typology that incorporates the two interrelated structures of people (living) and place, and reveals four dominant attributes of Thailand's image (Fun, Fulfilling, Friendly, Flexible). This development should enhance current understanding of Thailand brand positioning in a global market and ultimately contribute to the development of a more comprehensive national marketing strategy.

## Introduction

The global market has become more competitive with a variety of offerings from different places. Particularly in times of changes and uncertainty, many businesses are required to adjust their strategies to the diffusion of new demands and technologies. Though this attempt can greatly benefit consumers in having multiple alternatives, it also leads to complicated matters of criteria and priorities. Empirical evidences suggest that current consumers consider the factor of national image when making decisions about global products or services. Because an image of country-of-origin can have either positive or negative impact on consumers' perspectives, it is important to understand perceptions of country image in order to posit a coherent identity of products, services, or brands from the specific nation.

Brand meanings in the global market are generally driven by both the company's branding efforts and the images of country-of-origin. While the first factor rests upon the capability of individual firms, the second factor requires a synergistic effort at the national level to create a favorable image that can assist firms to leverage on the country's positioning (Maesincee, Nuttavuthisit, Ayawongs, and Phasukvanich 2003). As an example, Scotland assigned the advertising agency to create the meanings of "Scotland the Brand." They came up with the idea of associating the country brand with the images of integrity, inventiveness, tenacity and independence of spirit (Combes, Hibbert, Hogg, and Varey 2001). Unfortunately, many advertisers just take for granted that they already know about the national values and they can assume what relevant audiences believe about Scotland (ibid). To truly create the long-lasting relationship with customers, country branding effort should be developed based on a research of those residual attitudes and beliefs in people's minds about a nation.

Previous research has extensively examined the influences of country branding on consumer attitude formation and evaluation; or the importance of country of origin as an information cue for consumer decision making (Shimp, Samiee, and Madden 1993). Many studies have been conducted with an experimental, information-processing approach (Bikley and Nes 1982). Such approach aims to demonstrate the relationships between a national image and product evaluation in different conditions or situations. For instance, Han (1989) proposed the two cognitive models (i.e., the halo model and the summary construct model) which explain the ways in which country image influences product evaluation.

Some experimental research has focused on indicating the relationships between different factors (e.g., demographic variables, personality) and consumer preferences for foreign products. For example, Dornoff, Tankersley, and White (1974) claimed that females rated foreign products more highly than did males. Yet, this difference did not hold in the case of products made in more developed countries. Wang (1978) suggested that the more conservative people are, the less they prefer foreign products. The similar inverse relation occurs with level of

dogmatism and status concern (Anderson and Cunningham 1972).

Although it is pertinent that national image affects consumer perception toward products, such effect does vary in the different situations. Some experimental research conducted in the different settings produce contradictory results leading to questions about the methodological limitations. The country image is rather holistic and contextual since it depends on individual interactions with the social contexts. Thus, treating country image as an independent variable in either experimental research or traditional survey research can mislead the results of the research. Bilkey and Nes (1982) argued in their extensive review of the country brand effects that most of the studies were not quite realistic because they referred to national image as a solely separated cue for product evaluation. This methodological approach is bound to yield a significant cue effect that might or might not exist in reality.

Realizing this theoretical limitation, I proposed this research utilizing interpretive approach to examine consumers' holistic perspectives of the country images. Kotler, Jain, and Maesincee (2002) highlighted the holistic view as the key feature that represents broadening, dynamic, interactive, and integrative values of the current market. In this case of country image, consumers' holistic perspectives represent multi-layered meanings of the individuality, history, society, and culture. It is essential that both public and private sectors understand holistic meanings of the national image because current approaches in this time of change and uncertainty are based on interrelated influences of local, national, regional relations.

## **The Case of Thailand**

In the international market, "Thailand," as an umbrella brand, has been widely recognized in the food and tourism industries. Unlike other countries such as Japan, which is undoubtedly known for its high quality and reliability electronics, Thailand's positioning is rather unclear. The vague positioning is due to the fact that current areas of study and practice involving Thailand brand only place emphasis on production, sales, or market share, while discounting consumers' perceptions of Thailand as a national brand. This direction results in the multiple fragmented strategies created without a fundamental understanding of the market demand.

At the same time, it is possible that the ambiguity of Thailand brand meanings is due to the mixed holistic nature of the nation's characteristics. An image of Thailand appears in a form of "fusion" rather than rigid beliefs, opinions, or attitudes. Triandis and Gelfand (1998) emphasized contradictions and tensions of varieties emerging in Thai culture. This concept is demonstrated in consumer perceptions of Thailand ranging from excitement to tranquility and from the tangible to the intangible. One participant in this research stated:

"Thailand is an amazing place. Amazing in a sense that you have this juxtaposition of everything from an eclectic city to a remote beautiful resort. Umm... you see everything from 5 star cuisine to carts on the street. You see people running around and you see people who are more relaxed and laid-back. On the street, you see an elephant walking along the Mercedes. There is variety in the ways people live. I can't just pick one thing and have that be representative of Thailand because that's not. The notion of Thailand is diversity. For me, that's an amazing sensation."

While this mix can lead to the positive emotion such as amazing or wondrous, it is noted that without clear and concrete understanding, the "juxtaposition of everything" can also lead to negative responses like confusion, tension, or fear. In this research, one participant expressed her concern when experiencing the many differences in Thailand.

"I feel struggle in between like seeing diamond in the rough... It gets a dichotomy or tension.

Often I feel like "what just happened to me? who can I trust?"

From this case, we see that consumer perceptions can become the barriers that prevent the country from attaining a competitive positioning in the world market. One of the ways to deal with complex diversity is to better analyze different elements that integrate into a big picture of national image and inform consumers in advance about what country brand means. As for Thailand, I propose that the overwhelming experience can be overcome by providing clear information about the country features beforehand. One participant noted:

"I wish I could learn more about [Thai] cultures before I went there and I gotta learn it from Thai natives. I need level of preparedness."

Realizing the needs to compose and project the diversity of Thailand images in a clear and consistent way, I have initiated this research to systematically explore the different elements of Thailand from the consumer perspectives in an international market. As a part of the “Branding Thailand” project co-organized by the Sasin Graduate Institute of Business Administration and the Kellogg School of Management, this research aims to understand the demand of the international market so that the government of Thailand can develop a coherent branding strategy to enhance the global perceptions of Thai products and services and propose a more favorable image of the country branding. With global change and uncertainty, it is crucial that the country communicate a clear message about the national image positioning. In addition, with respect to the theoretical development, studying the various identities of Thailand provides a fertile ground for research on consumers’ holistic perspectives of the country images.

## **Methodology**

This qualitative research was conducted with thirty foreign consumers in the United States, one of the major markets that interact with Thailand through tourism, trade and investment. I used broad sampling criteria of consumers in order to capture as many different experiences and perceptions as possible. To represent the true nature of the market, these participants may and may not be users of Thai products or services. When interacting with the participants, I assured them that any identifying material in the research (i.e., their names) would be removed or disguised. In some cases, I asked for permission to make follow-up contacts in order for me to gain clarification on key issues, and also for any other pertinent feedback that the informants wished to provide.

Through thirty in-depth interviews, the studies yield a detailed qualitative account of consumers’ holistic perspectives. The results include intersubjective features underlying consumer perceptions rather than providing the scaling objective responses as derived from traditional research approach (Sherry 1983). The interviews ranged in length from thirty minutes to an hour. Sometimes I interviewed regular customers of the Thai restaurants and the owners of Thai restaurants so as to gain preliminary understandings of Thai food or Thai brand as presented to consumers via these outlets. Many times I visited the participants at home where they showed me pictures of the places in Thailand, souvenirs they bought, or cooking ingredients they got from the local Asian market. These in-depth interviews conducted in a natural setting, as opposed to laboratory experiments, yield a thick description of consumer experiences and present the context-dependent nature of the holistic perspectives. Following a phenomenological inquiry, I focused this study on understanding the differing holistic responses that emerge as patterns embedded within the situation. This approach helped me eliciting the meanings of Thailand’s image that connect people with the surrounding contexts.

Overall, the interview discussions began with a series of “grand tour” questions (McCracken 1988) concerning the participants’ backgrounds and the circumstances that brought them to their enactments with Thailand. I encouraged the participants to describe any situations or feelings that they typically thought of first. The purpose of this opening method was to set out a foundation for further dialogue about the specific perspectives. Subsequent interviews followed by asking the participants to describe their perspectives of Thailand, Thai products, or Thai services both in general and with specific details (e.g., specific stories, or even fantasies). Here, the descriptive questions flowed from the course of the dialogue, which was largely set by the participants and not from the predetermined path. Emic terms used by participants were further probed to elicit emergent meanings of the essential qualities of Thailand image that promote a particular character of consumer perceptions.

## **Interpretation of the Data**

I interpreted my verbatim transcripts from the interviews by means of a hermeneutical process, an iterative back-and-forth process of relating a part of a text to the whole (Thompson, Locander, and Pollio 1989). First, for each consumer I derived the case analysis and salient themes from an idiographic reading of a specific interview. Then I identified common patterns, referred to as “themes,” among interview transcripts (e.g., perceptions of eclectic vs. peaceful places in Thailand). This helped me to broaden the interpretive context. By tacking between personal

meanings expressed in the emic data (e.g., “I feel free”) and the etic constructs used to establish theoretical understandings of these themes in the consumer perspective (e.g., the theory of self-expression), the interpretation process unfolded in an organic way.

This interpretation has been continuously revised during the research process as additional information is collected. Data collection was enhanced and refined with ongoing analyses of themes and issues. Although texts are always open to multiple interpretations, it is imperative that the interpretations be consistent with the study’s underlying motivations and that they provide insight into the phenomena being investigated (Thompson 1990; Thompson, Locander, and Pollio 1989). The focus of my data interpretation is consistent with a fundamental aspect of phenomenological approach that aims to describe broad varieties of consumers’ holistic experiences and to illustrate complexes of pattern that outline the meanings of Thailand’s image.

### Consumers’ Holistic Perspective of Thailand Brand Meaning

From the data interpretation, I discovered the fusion of consumer perceptions of Thailand which is consistent with previous theories that associated Thailand with a land of diversity (Fieg 1976, Gannon 2001). Nevertheless, unlike many countries where diversities lead to a disintegration of people and culture, the diversity of Thailand is seen to be harmonious. The harmony is also witnessed in the balanced mix of consumer perspectives between the active and passive descriptions of Thailand (Maesincee, Nuttavuthisit, Ayawongs, and Phasukvanich 2003). One participant stated, “I think Thailand is like pop music ‘cause it’s like mellow but yet something you can dance too.”

When consumers think about the country image, they refer to the two interrelated concepts of place and people (or living status) (Kotler, Haider and Rein 1993; Kotler, Hamlin, Rein, and Haider 2002). In this research, consumers mentioned about the places in Thailand by demonstrating the eclectic (active) element (e.g., “a city of life”) and the peaceful (passive) dimension (e.g., “a soothing vacation destination”). Moreover, they illustrated the ways of life in Thailand by describing the dynamic (active) living (e.g., “an uptight business,” “a constant negotiation everywhere”) and the relaxed (passive) lifestyle (e.g., a “laid-back” people). By using a “structuralist approach” like that of Hirschman (1987) or Levy (1981), I have integrated these interrelated concepts of people (living) and place; and proposed a thematic typology that reveals four dominant perspectives of Thailand’s image: Fun, Fulfilling, Friendly, and Flexible [Figure 1]. An outcome of this systematic analysis not only illustrates the underlying structures of consumers’ holistic perspectives but also promotes a greater insight into Thailand brand image.

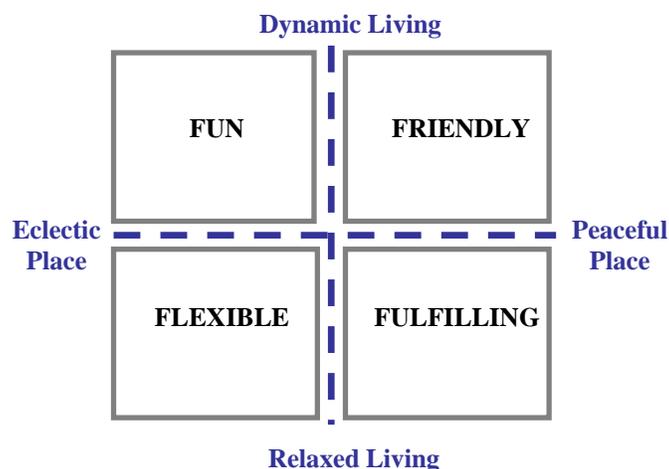

FIG. 1: A TYPOLOGY OF CONSUMERS’ HOLISTIC PERSPECTIVES OF THAILAND’S IMAGE

## **Fun**

Many participants particularly those who spent much time in Bangkok talked about the “fun” attribute of Thailand images. They regarded the *dynamic livings* in *eclectic places* which led them to feel the vibrant and entertaining experiences. The fun feeling more often occur when consumers engage with the circumstances through their attentions, interests, or excitements (Krugman 1965). One participant explained such involvement as “soaking it in” or “osmosis [the] feeling.”

“I think “Fun” is part of the culture. Thai people...they like to go out, celebrate, and have fun. It’s more open in Thailand. At the same time you have these fun places that cater to that. I think people [non-Thais] can almost ‘osmosis’ that feeling, you know. You just soak it in. They can sense that. They can realize that.”

This participant elaborated the ‘fun’ description by referring to the Thai people who enjoy the dynamic livings such as going out, celebrating, and having fun. This notion interrelates with the eclectic or “fun places” which cater to the fun experiences in Thailand. Like the concept of entertainment explained by Pine and Gilmore (1999), people absorb the experiences through their senses. The dynamic of people and place energizes consumers’ spirit as suggested by one participant:

“[Bangkok] is a city of life. There are many things going on which make me feel that I’m innocent (ha ha) and I want to just have fun.”

Feeling that [he’s] innocent, this participant was more open to absorb the new discovery and ready to simply “have fun.” Additionally, the nature of many places in Thailand facilitates the exploration as claimed by one participant; “Many places in Thailand have this adventurer’s spirit. It makes me feel like I want to discover or to explore...” Holbrook and Hirschman (1982) proposed that the entertainment feature stimulates the sense of explorations among consumers.

However, the eclectic place and dynamic people do not always present itself in a positive fun energy. Some participants saw these vibrant characteristics as the factors leading to the hectic conditions such as “problems with traffic in Bangkok and serious challenges with prostitution and AIDS.” In this research, I found that most of the people who expressed such concerns were the ones who have never been to Thailand. This might be explained by the stereotype concept and media influence which played a part in the overall image of the nation. Though the stereotypic features need have no carryover effect on a specific product of that particular nation, many times consumers use the national stereotypes to be a convenient heuristic to simplify their choices (Elliott and Cameron 1994).

In this case, I also found that participants who have been to Thailand or experienced Thai products were more likely to appreciate the variety that Thailand has to offer as well as the exotic attributes of the culture. This is consistent with the previously explained concept of consumer involvement which generates the positive fun feeling (Krugman 1965). Thus, it is important that the government find the way to overcome the negative images by presenting the positive aspect (i.e., fun) of the dynamic lifestyles in Thailand. To emphasize the “fun” element of Thailand brand meaning, experiential branding can be implemented by encouraging people to interact with the Thai product, people, and place. One participant mentioned about her fun experience gained from actually trying street food in Bangkok: “I couldn’t resist that smell of (umm) meatball on the street. So I tried it and I love it. Street food is so fun.”

## **Fulfilling**

In contrast to the ‘fun’ attribute of Thailand’s image, when consumers express awareness of the *relaxed living* and the *peaceful places* in Thailand, they acknowledge the ‘fulfilling’ element of Thailand brand meanings. This seems consistent with the concept of the desire to escape reality suggested by Holbrook and Hirschman in 1982. One participant claimed:

“When I was on that island, surrounded with nature...and very cordial people, I just forgot about time and my hectic life.”

The ability to escape from reality is evoked by the sense of nothingness illustrated through relaxed living and peaceful places of Thailand. Many of today’s marketers strive to achieve this serene feel that appeals to consumers who seek the peace of mind particularly in this world of turbulence. The fulfilling notion is exemplified in the comments of one participant’s remarks about the unique characteristic of Thai society and culture.

“Thailand is different from other countries in terms of social stability. Probably it’s due to the culture and personality because people are more relaxed. Umm... I think it’s part of Buddhism philosophy too. And in spite of many western influences, you still see serene scenes of temples and people living along the river. It’s very safe and stable. That’s the feeling that comes to my mind.”

Here, this participant appreciated the safe and stable feels induced by the rather passive personality of people (i.e., “more relaxed”) and similarly the peacefully “serene scenes” of temples and lives along the river. She saw this feature as relevant to the “Buddhism philosophy” which emphasizes the nothingness and harmonious living with/of the nature. In this research, many consumers referred to Thailand brand meaning by linking with the naturalness of people, products, or places. For example, one participant expressed: “Thai food in my mind is refreshing ...because it has a mix of fresh ingredients and herbs.”

#### **Friendly**

Consumer perception of the Thai friendliness emerges when they experience or associate with the attentive participation of people in a comfortable environment. This combination of *dynamic living* and *peaceful place* enhances the feelings of warmth, welcoming, and embracement. One participant described her view of the “friendly” element of Thailand’s image.

“When I think of Thailand, I think of friendly people and a warm, comfortable environment. I don’t know. I’ve never been to Thailand but I speak from my experience with Thai people and Thai restaurants (ha ha). You know, normally Thai restaurants are nicely decorated with those delicate souvenirs or something... the peaceful music. And I love their services. They are very nice, very attentive. I think this social aspect is an interesting part of Thailand”.

At the Thai restaurants, this participant noticed its relaxing atmosphere generated by the Thai traditional décor and music. Together with the active willingness to service customers, this consumer perceived the friendly feel from the relation of peaceful place and dynamic people.

As Thailand brand has been widely recognized in food industry, many consumers explained their holistic perspectives of Thailand’s image by elaborating on their views or experiences of the Thai foods. This approach is congruent with the technique in sociocultural research which utilizes one distinct metaphor to present its other bigger or overall phenomenon (Gannon 1994). Because metaphor is pervasive and fundamental in ordinary conceptual system, it represents the way in which people perceive, think, and act both within themselves and in relation to the other people or the world (Lakoff and Johnson 1980). An example is derived from Gannon (1994)’s study of French wine metaphor that illustrated on the five principle elements of wine (1. pureness 2. classification 3. composition 4. suitability and 5. maturation), which relatively identify the perspectives of French society and culture.

In this research, some participants identified their perceptions of Thailand brand meanings with a distinctive activity, phenomenon, or institution involving Thai food metaphor. One participant made observation of the way Thai foods are normally presented in the Thai restaurants;

“Thai foods certainly can represent the warmth of Thai family. Thai people always live in a big family which is comprised of many generations. They have a meal together with a lot of foods in the center.”

Through the food metaphor, this participant associated the shared combination of “a lot of foods in the center” with the unification of “many generation” of Thai family. Again, the notion of warmth and friendliness is illustrated by its relation to the dynamic living (i.e., “big family” “a lot of foods”) and the peaceful, harmonious setting (“a meal together”... “in the center”).

#### **Flexible**

Feelings of flexibility were expressed when consumers noticed the easygoing, *relaxed lifestyle* despite the complexly *eclectic environment*. Many participants were amazed with the flexible essence of the Thai-ness demonstrated through compromising relationships among the diversity of people, places, and situations. One participant made an illustrative comment on the free spirit of Thai people to live as they like by not having to identify with any specified social standards.

“I think Thailand is about freedom. Because I see a contrast of high-rising businesses and very poor circumstances there...food on the street. Traffic is terrible. It’s very exhausting, very hot, very humid. But people don’t seem to be that agitated. Day to day when you’re in the street people are very patient. You don’t hear the cars honking all the time. And you don’t see the poor there that are bitter because they are poor...unlike the other countries where you see the fights among people of different races or social classes. I was pretty amazed with this relaxed attitude in Thailand. It seems to me that they feel free to live as they like.”

This participant thought about the frenzied, eclectic places in Thailand by referring to terrible traffic, and “very exhausting, very hot, very humid weather”. Yet, he further described the surprisingly calm and cool lifestyles among people who simply continue on their ways of lives. Despite the obvious contrast between the rich and the poor circumstances, he did not feel the sense of bitterness. Such freedom and flexibility was perceived as the unique quality of Thailand image. The response is congruent with the theory by Fieg (1976) who proposed to depict the Thai values with the image of a rubber band because it represents a combination of loose and tight degrees of Thai behavioral freedom. With authority ranking, a subordinate adheres to an order from a superior and so the rubber band tightens. Yet, as the demand of the order has been met, one can return to their looser and more liberated behaviors. This metaphor of flexibility also illustrates the loose degree of relaxed living in the tight degree of eclectic place.

## Conclusion

National images exist for different consumers at different levels of meanings and they seem to appear in dissonance. However, in order to capture the best benefits of the country branding, it is important that we find the suitable mixes of the dominant values. Through a phenomenological inquiry and a systematic analysis, this research demonstrates a typology of consumers’ holistic perspectives of the country images (i.e., Thailand). The typology yields better understanding of underlying attributes (i.e., dynamic vs. relaxed living and eclectic vs. peaceful place) that influence the four dominant features of the Thailand’s image (i.e., Fun, Fulfilling, Friendly, and Flexible). Moreover, the study addresses the under-explored area of previous theories which mainly focus on consumer decision making and information processing while neglecting the holistic nature of consumer perspectives.

In practice, the typology assists the company in identifying and leveraging strong brand positioning in a global market. Knowing consumers’ holistic perspectives facilitates the company to establish experiential-driven strategies which helps sustaining long-lasting customer relationship. Synergizing the well-perceived meanings of Thailand brand images in the minds of consumers ultimately contribute to the development of a more comprehensive national marketing strategy.

# **The Use of Marketing Audits as an Instrument for Enterprise Controlling Activities: Results from Czech Enterprises**

*Jitka Kloudova  
Tomas Bata University, Czech Republic*

## **Abstract**

Marketing (as a tool) has always been traditionally under estimated by Czech enterprises, while its significance under contemporary economic conditions based on market-oriented principles is steadily growing. In 2003, research into 276 such enterprises was performed with the aim of investigating and verifying the exploitation of marketing control mechanisms in Czech enterprises. This research was oriented above all on discovering whether Czech enterprises make use of so-called Marketing Audits within the framework of their internal control mechanisms. The essence of the problem was to discover the frequency of the occurrence of the use of such enterprise controlling mechanisms, what their content was, and also, whether these were predominantly internal or external audits.

## **Introduction**

The Marketing Audit is a control mechanism of the marketing behaviour of an organisation and ranks among the most significant elements of control mechanisms of the management of an enterprise, since its aim is to identify the problem areas of an enterprise and thus to create the pre-conditions for the correction of the same. It is concerned with controlling the actual state-of-affairs within an enterprise from both the internal and external perspective with the aim of increasing its competitive ability.

The Czech Republic, after the fall of Communism, found itself in a completely new market environment, where Czech enterprises were (suddenly) face-to-face with tough international competition. It saw the change from a planned economy, where enterprises were oriented on production and not on sales, to an economy based on market principles.

Over the course of the last 14 years, the representatives of Czech enterprises have been forced to master new marketing skills that were a matter of course for managers of enterprises conducting business in a market environment.

Marketing Control is not an equal partner to Financial Control in Czech enterprises for the ascertaining of the state-of-affairs within an enterprise. For this reason, this begs the questions: “What is the (current) state-of-affairs of marketing controls in Czech enterprises?” and “Do Czech enterprises exploit marketing control systems in the form of marketing audits – and if so, what is the composition of such an audit?”

### **Research Aim**

The aim of this piece of research was to ascertain, whether or not Czech enterprises conduct controls of their marketing activities with the assistance of marketing audits, and what was the most frequent composition of such a marketing audit?

## **Research Methodology**

Marketing Controls rank among the most significant aspects influencing the successful standing of enterprises in today’s contemporary entrepreneurial environment, marked as it is by rapid and frequent change. A whole range of authors have drawn attention to the fact that enterprise frequently used an incorrect approach in that they have based their decision-making processes on financial indices only, whereas what is decisive for the health and future of an enterprise is financial controls, and they have further recommended that, apart from financial controls, marketing controls should also be used as equal-value mechanisms. (viz: Kotler, P. 2000, Ward, K., 2003).

From the study conducted by D.W. Vorhies, M. Harker, C.P. Rao, (1999, p.1180) it flows that enterprises which are “marketing managed” and which exploit marketing principles, are more successful on the market, are better able to adapt to new conditions, and even demonstrate greater customer satisfaction.

V. Govindarajan, A.K. Gupta (1985, p.65), in their research into the behaviour of enterprises pointed out that those enterprises in which a built-in commercial strategy control system exists, are more efficient and perform better, which is reflected in increases in market share and higher profits. Marketing controls – as one of the significant factors capable of improving marketing activities, and thereby the effective performance of an enterprise, is also highlighted in the work of Morgan, N.A., Clark, B.H., and Gooner, R., (2002).

A whole range of authors, c.f. Kotler, P. (1998, 2000), Wilson, A.(1993), Brownlie, D. (1996), Macdonald, Ch. R. (1982), Mcdonald, Malcom, H. B. (1991), Tomek, J. (1999), and Lyková, J. (2000), form a consensus that the regular conduct of marketing audits is a necessary pre-condition for a well-functioning and prosperous enterprise. The actual content of such marketing controls is considered in detail by Kotler, P. (2000, p.213), Tomek, J. (1999), Lyková, J.(2000, p.13), and break down the elements of a marketing audit into environment, strategy, organisation, marketing systems, productivity, and functions – and point out that a marketing control system should include the control of marketing outcomes, the control of marketing benefits, and the control of marketing expenditures.

Marketing control in an enterprise should be conducted either in an external form, i.e. the outsourcing of such an audit to an external, professional firm – or in the form of internal audit, and this by a pre-determined person within the enterprise. The advantages and disadvantages of external as against internally-conducted marketing audits have been covered by a whole range of authors, e.g. (Kotler, P.1998), Brownlie, D. (1996), Ewert, G.A.(1997), Mcdonald, M.H.B.(1991), Means D.W.A.(1998).

#### **Hypotheses**

The following hypotheses were established for this piece of research:

**H<sub>1</sub>:** Marketing Control in the form of Marketing Audits in Czech enterprises is neither a frequent phenomena nor sufficient.

**H<sub>2</sub>:** Marketing Audits used for the control of marketing activities in Czech enterprises is neither complex, nor do they include all of the requisite areas.

**H<sub>3</sub>:** An external marketing audit is more complex than an internal audit

### **Characteristics of the Enterprises under Investigation**

The subjects of this research study were wholly owned Czech enterprises, while at the same time; Czech management teams managed the enterprises under investigation.

For reasons of a more detailed and punctilious investigation, the results of the research study were subdivided into individual problems and issues on the basis of the size of the enterprises in such a way that the interpretation of these outcomes be as comprehensive as possible. The enterprises were sorted according to size, i.e. on the basis of the number of employees.

Very Small Enterprises (VSE) were categorized as being those with 0-19 employees, Small Enterprises (SE) as those with 20-49 employees, Medium-large Enterprises (MLE) as those with 50-249 employees, and Large Enterprises (LE) as those with 250 and more employees. In the categorisation of these enterprises according to number of employees, we based ourselves on the definition of enterprises as quantified by the European Commission with the deadline for its use set from 1. 1. 1998 (The European Observatory for SMEs, 1997).

TABLE 1: ENTERPRISE CATEGORISATION

Enterprise Category:	Number of Employees:	2003 percentage
Very Small	0 - 19	41
Small	20 - 49	18
Medium-large	50 - 249	25
Large-scale	250 and more	16
		n=256

## Data Collection and Collation

The research study conducted in 2003 addressed enterprise drawn from the Czech Republic on the basis of a random selection process. The effort was that the representation of these enterprises from the point-of-view of their size as determined by the number of employees correspond to a certain degree to the distribution of enterprises in the Czech Republic, while at the same time preserving a certain degree of declarative ability of the result obtained.

The individual enterprises were visited on a personal basis, in the course of which the questionnaire submitted to them was completed together by the administrator of the questionnaire and the top management of the enterprise in question.

Students of the Faculty of Management and Economics, Tomas Bata University in Zlín were used in the process of data-acquisition – especially those drawn from the ranks of auxiliary scientific research staff, who had a shared role in the given research study.

## Research Study Outcomes

Based on the conducted research study, it was discovered that the majority of the enterprises addressed did not conduct marketing audits. As can be seen from the following Table 2, only 74 enterprises indicated that they use some such form of management tool. This is only 27% of these enterprises. Of these, 36 enterprises indicated that the marketing audit was resolved on the basis of an internal form, and 38 indicated that they made use of external marketing audits. It can therefore be said that, in these enterprises, external audits are used approximately as frequently as internal audits, while at the same time; it is clear from Table 1, that the larger the enterprise, the more frequent the occurrence of the use of external audits is.

For the Large Enterprise, half of them elaborated some form of marketing audit, where in the majority of cases this had to do with external marketing audits.

TABLE 2: NUMBER OF ENTERPRISES PERFORMING MARKETING AUDITS

Enterprise size	Number of Enterprises Performing Marketing Audits (MA)						TOTAL
	YES				NO		
	TOTAL		Internal	External	Abs.	%	
	Abs.	%					
Very Small	15	13	14	1	98	87	113
Small	11	22	7	4	39	78	50
Medium	26	38	11	15	40	58	69
Large	22	50	4	18	22	50	44
All	74	27	36	38	202	73	276

A further subject of these investigations apart from the frequency of the occurrence of marketing audits in Czech enterprises as one of the mechanisms of the (management) control system in these enterprises was, in the case that they do regularly elaborate such an audit, what made up its content?

In the following table, Table 3 shows the elaborated outcomes with a view to the informational presumptions for the given audit.

The most frequent item elaborated within an enterprise was data relating to the domain of marketing expenditures – where these analyses cover the number of sales personnel to the number of done deals over a period of time, the costs per sales employee as a % of overall sales, and the cost of sales support. All of the enterprises, without regard to size, indicated that these presumptions formed the basis of their marketing audit.

It can be considered that a very frequent item of the presumptions for a marketing audit is the analysis of marketing outcomes, which covers for example, customer penetration, customer loyalty, and average purchase volume. 91% of these enterprises indicated that these analyses were regularly elaborated as material for the marketing audit.

The content of the analysis of the marketing benefits is the saleability and financial performance of the product range and the “rentability” (return-on-investment) of sales trips, these analyses form the basis of marketing audits in 80% of the enterprises questioned.

A problematic area for Czech enterprises that use marketing audits as a form of control mechanism was shown to be the areas of marketing strategy and the behaviour of the given enterprise. Only 41% indicated that, an informational resource of the marketing audit was the analysis of their strategy/ies and the behaviour of the enterprise itself – whose content is the analysis of the competition, market share, market attractiveness, and macro-environment.

Based on the research study we performed, an interesting discovery was that it is not possible to talk about significant differences between small and large enterprises.

TABLE 3: THE USE OF INFORMATION ANALYSES FOR MARKETING AUDITS

Enterprise size	<b>The Use of Information Analyses for Marketing Audits (MA)</b>				TOTAL
	Marketing. Outcomes <i>Percentage</i>	Marketing. Benefits <i>Percentage</i>	Marketing. Expenditures <i>Percentage</i>	Marketing Strategy/ies <i>Percentage</i>	
Very small	93	53	100	33	15
Small	91	64	100	55	11
Medium	88	85	100	27	26
Large	91	100	100	55	22
All	91	80	100	41	74
	n=67	n=59	n=74	n=30	

In the following table, Table 4, the summary of the outcomes of the content of marketing audit are shown for those enterprises which regularly elaborate marketing audits – whether in the form of external or internal audits. Our efforts were to discover just which were the areas most frequently controlled by these enterprises.

For all 74 enterprises that indicated that they did perform marketing audits, it was noticed that the content of such an audit was a SWOT analysis of the enterprise. For 97% of these enterprises, this was composed of a SWOT analysis of their products. However, the majority of these enterprises completely lack SWOT analyses of their competition, market segment, and sales organisation, while for only 28% of them was a component of the marketing audit a SWOT analysis of their geographical location and area.

The incomplete use of marketing audits performed by Czech enterprises is shown by the outcomes regarding the individual elements of marketing audits in the following table, Table 4. For the majority of the elements of a marketing audit, less than 50% of these enterprises indicated that they make use of them. The most frequently used, i.e. in 53% of these enterprises, elaborate an audit of their marketing strategy/ies. This result however, does not completely correspond to the finding that (Czech) enterprises perform analyses of their marketing strategy/ies and behaviour the least.

TABLE 4: COMPOSITION OF MARKETING AUDITS IN CZECH ENTERPRISES

Marketing Audits Composition	N <sup>o</sup> . of Enterprises	% of Overall Number of 74 Enterprises Using MA
SWOT Analysis of their own company	74	100
SWOT Analysis of their sales organisation	32	43
SWOT Analysis of the competition	36	49
SWOT Analysis of their products	72	97
SWOT Analysis of their geographical location and area	21	28
SWOT Analysis of market segments	35	47
Marketing Environment Audit	37	50
Marketing Strategy/ies Audit	39	53
Marketing Organisation Audit	27	36
Marketing System Audit	25	34
Marketing Productivity Audit	38	51
Marketing Functions Audit	29	39
<b>OVERALL N<sup>o</sup>. of Enterprises:</b>	74	X

Table 5 shows a summary of the outcomes regarding the content and composition of marketing audits established by the enterprises being tracked. It records the number of enterprises for which the marketing audit is composed of less than 50% of the suggested items, and the number of enterprises in which, on the basis of the research study, it was found that the given audit contained more than 51% of the said items.

The outcomes of the content and composition of these marketing audits were also investigated from the perspective of whether these involved external or internal marketing audits.

TABLE 5: NUMBERS AS A PERCENTAGE OF AREAS INCLUDED IN EXTERNAL AND INTERNAL MA

	N <sup>o</sup> . Of areas Included in MA in these Enterprises					OVERALL N <sup>o</sup> . of Enterprises:
	All areas of MA	Less than 50%		More than 51%		
		Abs.	%	Abs.	%	
External Marketing Audit	-	13	34	25	66	38
Internal Marketing Audit	-	27	75	9	25	36
<b>OVERALL N<sup>o</sup>. of Enterprises:</b>	-	40	54	34	46	74

For 54% of these enterprises, it was found that the audit as set up, contained less than 50% of the suggested items (entries). Should we look at whether these were for external or internal marketing audits, we are able to state that we can meet with less than complex marketing audits in enterprises which establish such an audit on the strength of their own efforts. For 75% of all enterprises that indicated that they use internal marketing audits, the given audit contained less than 50% of the suggested item entries.

On the other hand, for enterprises making use of external marketing audits, these audits contain 66% more than 51% of the suggested item entries.

### Summary of the Outcomes of this Research Study

There can be no doubt that marketing in the contemporary entrepreneurial environment belongs among the most significant factors influencing the success of an enterprise and its standing as against its competition (competitors). For any activity whatever to be of high quality, it is necessary that it be controlled.

The aim of this research study conducted into 276 Czech enterprises was to discover whether these enterprises perform controls of their marketing activities in the form of marketing audits, and if so, what the content and composition of such an audit was and also, whether Czech enterprises make more (or less) frequent use of internal as against external marketing audits. An interesting discovery was also the verification as to whether external marketing audits are more complex – and therefore more professionally elaborated than internal audits.

On the basis of the elaboration of the outcomes of this research study, which was oriented on the use of the principles of marketing audits as one of the mechanisms for controlling a Czech enterprise's activities, it is possible to respond to the hypotheses set out in the Introduction.

Hypothesis H<sub>1</sub> was accepted. Marketing Control in the form of marketing audits is neither frequent enough nor sufficiently elaborated in Czech enterprises. The research study outcomes also indicated the fact that, for more than 73% of these enterprises, marketing audits are not performed. The occurrence of marketing audits increases in correlation to the size of the enterprise. For 50% of the Large Enterprises, with more than 250 employees, marketing controls in the form of marketing audits are performed; however this number does not indicate an overall good-quality situation as regards the frequent incompleteness of the occurrence of marketing control systems in Czech enterprises.

Hypothesis H<sub>2</sub> was confirmed, marketing audit used for control of marketing activities in the enterprises investigated is neither complex nor does it cover all areas.

The research study outcomes indicated that the underpinning information for marketing controls in the form of individual analyses is often not available in Czech enterprises. In Small and Medium-large Enterprises the situation is even worse - which may be associated with the certain time and financial demands made by the processing of such analyses. From the outcomes of the use of the individual forms of analysis as information resources for marketing audits it also is clear that these enterprises make use of them predominantly for information for the analysis of marketing expenditure, while at the same time, the least used is that for establishing analyses of marketing strategy/ies and the behaviour of the enterprise.

Marketing audits in the majority of Czech enterprises do not contain even half of the suggested control areas.

Hypothesis H<sub>3</sub> – it is necessary to accept this on the basis of the outcomes of the research study. Externally performed marketing audits demonstrate characteristics of a greater degree of complexity; more frequently, these audits include more of the suggested areas of investigation, from which may be judged their greater degree of quality.

In conclusion, it is possible to state that for Czech enterprises, marketing controlling is an undervalued and underestimated tool, and evidently thus does not belong, as does financial controlling, to their basic information database – which would be of assistance to the management team representatives of the given enterprise in uncovering both the current and future situation of that enterprise.

Equally, it can be stated that even for those enterprises which have established marketing audits, the controlling function is infrequently based on a sufficiently high-quality base that is based on individual analyses (as set out above – viz Table 4), and the marketing audit often does not contain even half of the suggested areas.

External audits are shown to be of better quality; they are more complex and cover a greater range of the suggested areas. Large Enterprises make more frequent use of external forms of marketing audits than do smaller enterprises, which could be a consequence of the fact that the information-base of the marketing audit is more extensive and therefore, it can be assumed, of better quality.

# Transfer Pricing: A Cost of Resource Approach

*S. Thomas Rim  
National University, U.S.A.*

## Abstract

For a growing number of multinational companies the determination of appropriate prices to charge for interdivisional transfers of goods and services across national borders is becoming increasingly challenging as they attempt to balance the disparate objectives of minimizing overall tax liability while maintaining cost control and suitable measurement of divisional operating efficiency. Each of the more traditional approaches to the pricing of transfers -- market price, resale method, cost-plus -- has limitations, especially when applied to transfers across national borders. This paper suggests an approach designed to satisfy the taxing authorities in each of the countries involved, while serving the cost management objectives of the overall company as well as the individual profit centers. The approach blends elements of both the resale and cost-plus methods, and introduces the added factor of time-weighted capital investment.

## Introduction

There are special problems in evaluating the performance of business segments when goods and services are transferred from one division of a corporation to another. Since the selling and the buying divisions are related to one another as parts of the same company, transfer prices may not be subject to the same market forces that apply to parties who negotiate with each other at arm's length.

While interdivisional transfers have no direct effect on the overall company's profit, they have a substantial impact on the individual reported profit of each of the two profit centers involved, and thereby on performance measurement and motivation of division managers to control costs, maximize operating efficiency and achieve goal congruence. However, motivation and related benefits of autonomous decentralized management often become secondary where the divisions of a multinational corporation transfer goods and services across national borders.

In determining transfer prices, multinational companies tend to focus on maximizing overall corporate profit by dictating transfer prices that minimize taxes, import duty, tariffs, and risks associated with fluctuating foreign exchange rates. However, as the practice of "manipulating" (or what might more diplomatically be called "managing") taxable income has become more commonplace, so has the development of tax laws and regulations to impose constraints on otherwise arbitrary transfer price-setting policy.

For multinational companies, these two objectives -- cost control and operating efficiencies on the one hand, and the maximizing of overall corporate profit on the other -- are generally *not* compatible; it is unlikely that transfer prices designed to meet one objective will satisfy the other.

This paper examines an approach to transfer pricing which has been adopted by a large multinational company to meet the objective of goal congruence while, at the same time, satisfy tax authorities in both the seller's and the buyer's jurisdictions.

## Current Approaches to Transfer Pricing

Where the majority of a business unit's sales are made to unrelated parties at arm's length, the market price charged to external customers generally provides an appropriate basis for setting the price of goods and services transferred to a sister division. Even when the buying and selling divisions reside in different countries, market prices are usually accepted by taxing authorities in both jurisdictions. However, an alternative to market-based transfer pricing is needed when market prices are unavailable, or when their validity is impaired because the particular product sold to an affiliate differs from the one sold to external customers, or is sold under different payment terms, warranty conditions and the like.

In the U.S., Section 482 of the Internal Revenue Code establishes a hierarchy of valuation methods to be used if market prices are unavailable: The preferred alternative is the “resale price” approach in which a transfer price is determined by working back from the price charged by the buying division to its external customers. As an example, assume that the selling division (Division “S”) manufactures and transfers a product to a buying division (Division “B”), which further processes the product at a cost of \$20 per unit and then resells it to outside customers at a price of \$100 per unit. B’s normal gross profit on other products sold to external customers is 35%. Under the “resale approach”, the transfer price would be calculated by subtracting from the \$100 selling price the \$20 additional cost plus \$35 in gross profit, resulting in a transfer price of \$45. If the resale price method is not applicable, then the likely alternative is the cost-plus approach in which an “appropriate” markup is added to the seller’s product costs.

If market prices are not available and a cost-plus method is used as the alternative, most income tax authorities tend to use full absorption cost computed under conventional cost-accounting principles, and allow (or require) the addition of a reasonable profit margin. The general rule is that the mark-up percentage must be at least as great as that earned on other domestic business of the selling division. Where used, such margins are applied as a kind of secondary overhead charged at a uniform rate against all expenses. This process of applying a uniform profit margin against all recorded expenses is analogous to the commonly used approach for allocating overhead on the basis of direct material or direct labor.

Where the resale price method is used, the buyer’s profit margin on sales must be no greater on transferred goods than on comparable goods sold to external customers. Applying a common profit margin to two disparate operations which account for different proportions of the operating cycle makes the assumption that capital costs accumulate at the same rate as product costs such as direct labor, direct materials and traceable overhead. Typically, they do not. While direct material costs are incurred at the time of purchase, most labor and manufacturing overhead costs are incurred during the generally short period in which work is in process. In contrast, a significant portion of capital costs are incurred while the product is just “sitting” in the form of either raw material or finished goods inventory -- or after it has been sold but before receivables have been collected.

From an economics perspective, the operating cycle may be viewed as a process in which various sums are advanced from time to time to cover costs as they accrue, to be recovered from the proceeds of sale to the final consumer. The average period-of-production concept, defined as the average time a dollar advanced is outstanding before it is collected, has played a central role in the development of capital theory in economics, and as “duration” in modern financial economics. In determining transfer prices, segmented periods within the operating cycle provide an appropriate basis upon which to allocate costs of capital (University of Texas, 2000). But, accounting systems which make explicit provision for the cost of capital in computing product costs remain a rarity (University of Pennsylvania, 2000). While the practice has been endorsed by the Cost Accounting Standards Board in CASB Standard 414, it is not acceptable under generally accepted accounting principles (GAAP) required for financial reporting. And, since inventory valuation for financial reporting remains a major requirement for most cost accounting systems, the practice has not been widely adopted.

An analogous procedure is widely used by regulatory bodies in determining the “cost of service” for public utilities under their jurisdiction: Generally, the calculation involves the use of a rate base, which is a measure of the amount of capital employed, multiplied by a rate of return -- usually an approximation of the cost of capital -- to determine an allowed-return component which is added to operating expenses to arrive at an allowed cost of service (Halperin and Sprindi, 1996).

#### **A Blended Approach**

The approach described here is not a completely new and different one, but rather a blend of the resale method with the cost-plus approach, which takes into account the cost of capital in allocating the excess of revenues over traditionally-defined accounting costs. The process can be outlined as follows:

The transfer price is arrived at by adding to the seller’s product cost through the point of transfer (i.e., labor, materials, and manufacturing overhead) a portion of the profit realized when the end product is sold to external customers. The amount of that profit is determined by subtracting from the resale price (i.e., the price charged to external customers) the total of all manufacturing, selling and administrative costs incurred by both divisions – as if there was a single operating company without profit center subdivision. The portion of that profit

that is added to the seller's product cost in arriving at the transfer price is determined on the basis of time-weighted capital investment: the cost of capital employed through the point of transfer is divided by the total cost of capital employed through the point at which payment is received from the external customer.

By way of illustration, the example that follows is based on the procedure used by a real multinational company, but with dollar amounts that are hypothetical. For computational convenience, it is assumed that opening and closing inventory balances remain the same for both buyer and seller of the transferred goods. Monetary amounts for both countries are expressed in U.S. dollars.

The company, headquartered in the U.S., manufactures and sells a small consumer durable both in the U.S. and in an Asian subsidiary, which was originally established to qualify for the lower rate of customs duty applicable to parts as opposed to finished products. Manufacturing operations include the machining of parts, all of which occurs in the U.S. plant facilities. Some of the machined parts are exported to the Asian subsidiary, which assembles the parts into finished product, and sells 10,000 units per year to its domestic Asian customers at a price of \$140. The remaining parts are assembled and sold in the U.S.; annual U.S. sales of the finished product are 100,000 units at a price of \$100 per unit.

As mentioned earlier, the determination of transfer prices takes into consideration the cost of time-weighted capital investment which is comprised of two components. The first of these is the investment in working capital, which represents the amounts advanced at various stages of the operating cycle, including production, sales and collection of receivables. The second is the investment in the plant facilities that are used in the production and warehousing of raw materials and finished product.

With regard to the investment in working capital, raw materials are purchased and held in inventory an average 60 days. The machining of material into parts is completed in six days. Assembly of the product destined for the U.S. market follows immediately, and is completed in another two days. Parts destined for the Asian plant are shipped immediately after machining, but spend three days in transit and an additional 15 days in parts inventory prior to assembly. The assembly operation in the Asian plant takes two days, as it does in the U.S. Both plants keep approximately 24 days' sales in finished goods inventory, and carry receivables approximating 45 days' sales.

Denoting the date when machining is completed and the parts are transferred from the U.S. to the Asian plant as day "T", a calendar for the production/sale process as it is carried out in the two countries is shown in Table 1, below.

TABLE 1: OPERATING CYCLE

	<u>U.S. DIVISION</u>	<u>ASIAN DIVISION</u>
Raw material inventory received	T-65	-
Raw material inventory paid for	T-35	-
Production process started	T-5	-
Machining of parts completed	T	-
Parts shipped and duties paid (same day)	-	T
Parts inventory received		T+3
Assembly starts	T+1	T+19
Assembly completed	T+2	T+20
Goods sold	T+26	T+44
Payment received	T+71	T+89

Note that from the viewpoint of working capital consumption over time, an additional three days of shipping time plus 15 days of "waiting time" are incurred in the case of the Asian operation. The amounts representing the cost of investment in working capital are shown in the first part of Table 2, below.

The second investment component is the investment in fixed asset plant facilities. The cost of the U.S. and Asian plant facilities is \$2 million and \$150,000, respectively. In applying a cost of capital component to the product, a hypothetical annual rate in the U.S. of 12% is used. The second part of Table 2 illustrates the manner in which the time-weighted investment in capital facilities is calculated:

TABLE 2: TIME-WEIGHTED INVESTMENT CALCULATION

	NUMBER OF DAYS	WORKING CAPITAL INVESTED PER DAY	TIME WEIGHTED INVESTMENT
Investment in Working Capital Assets:			
T -35 to T -36	30	\$12.13	\$363.90
T -5 to T	6	65.06	130.12
Investment at point of transfer			
T+1 to T+2	2	65.06	130.12
T+3 to T+26	24	73.18	1,756.32
T+26 to T+71	45	100.00	4,500.00
Total Working Capital Investment			<u>\$6,958.42</u>
Investment in Long-term Capital Assets:			
Raw Material Storage Facility			\$829.55
Machinery and Plant			3,318.15
Investment at point of transfer			
Assembly Plant			1,825.00
Finished Goods Storage Facility			912.00
Total Fixed Asset Investment			<u>\$6,884.73</u>
Grand Total – Time-weighted Investment			<u><u>\$13,843.15</u></u>

The transfer price is computed in Table 3: Part A computes the time-weighted investment to the point of transfer, and continues through the point of sale. The ratio of the former to the latter is then calculated. Part B computes the unit profit on external sales by subtracting from the selling price the total traceable costs (including selling and traceable administrative expenses as well as manufacturing costs) together with an allocated amount of corporate administrative expense. The allocation of the latter is made on the basis of direct labor. The resulting profit figure is then prorated in Part C on the basis of the ratio determined in Part A, and added to the costs booked to the point of transfer (Part D) to arrive at the transfer price (Part E). In effect, this approach establishes a mark-up over accounting costs that takes into consideration the cost of the capital employed in production, inventory and receivables.

TABLE 3: TRANSFER PRICE COMPUTATION

A. Investment Related to Goods Transferred as a Percentage		
of Total Investment		
Working capital:	T-35 to T-6	\$363.90
	T-5 to T	208.08
Fixed Asset Investment:		
	Raw Material storage	829.50
	Machinery and plant	3,318.18
Total Investment on Goods Transferred		<u>\$4,719.71</u>
Total Investment on Goods Sold		\$13,843.65
[Ratio: $\$4,719.71 \div \$13,843.65 = .3409$ ]		
B. Profit per Unit on Transferor's Domestic Sales		
	Selling price	\$100.00
	Total of costs booked	<u>( 83.33)</u>
	Profit per unit	\$16.67
C. Pro-rata Portion of Profit to Point of Transfer		
	$(\$16.67 \times .3409)$	\$5.68
D. Product Costs Booked to Point of Transfer		
		57.09
E. Transfer Price		<u><u>\$62.77</u></u>

In this example, the rate used to calculate the cost of capital in both divisions was the domestic rate applicable to the selling division. Since returns on investment may differ between countries, a refinement might be the application of separate rates to the investments made in each of the two divisions. As a further refinement, the element of risk might be quantified and factored into the computation. Though variations of this type may be useful in specific instances, such complexity would seldom be called for where the purpose is the relatively simple one of allocating tax liability fairly (Shapiro and Mantegani, 1998).

An issue which this model does not address concerns the fair allocation of economic rent derived from access to resources which, because of proprietary control through patent protection and the like, are available at a cost that is well below market. Cost-based rules, such as those adopted here, will fail to take into account such unbooked but nevertheless real economic cost. Where this would cause income to be inappropriately allocated, a fair charge for the use of such resources will shift income back to the selling division (Halperin and Sprindi, 1996).

## Concluding Observations

This paper outlines a transfer pricing model which uses of the time-weighted investment measures to allocate income and provide a basis upon which to establish and support the amount of profit to be added to accounting costs in arriving at an economically and politically fair and defensible transfer price.

While such an approach may not appeal to some corporate taxpayers who prefer using arbitrary techniques to allocate large portions of income to low tax-rate jurisdictions, it is a credible approach that stands a good chance of being accepted globally, and indeed has already been tested both in the U.S. and in at least one non-U.S. country.

Moreover, it provides a basis of allocation which should minimize risks of double taxation, and be neutral in its effect on location: while firms may be attracted or repelled by tax rates, the attraction or repulsion is not accentuated by the income allocation method employed. As such, models of this kind should be considered in forming the basis for international agreements on income-allocation rules, which, in view of the rapidly increasing globalization of commercial enterprise, are likely to become a reality in the foreseeable future.

## Abstract

No single B2B (Business-to-Business) e-marketplace model can address all the requirements of a company, and different e-marketplace types will complement each other. It is therefore needed to clarify the differences and contentious issues in e-marketplace business models in order to better understand and make a right decision. Research into e-marketplaces has occupied a prominent position in managerial and technological studies resulting in a vast and diverse literature. However, no articles organizing and discussing the contradictory and contentious issues in the literature can be found. In an attempt to cut through the confusion and differences in the literature as well as to provide valuable insights into a taxonomic resolution to scholars and practitioners, this paper examines and categorizes the issues and then provides a topical discussion about them. In addition, the paper develops three revised taxonomies extending and augmenting prior taxonomies for e-marketplace business models.

## Introduction

One of the casualties of the great dot-com shakeout of 2000 has been the B2B e-marketplace. In early 2000, third-party independent e-marketplaces looked like the wave of the future. However, despite the significant venture capital invested in third-party e-marketplaces and the thousands of e-marketplaces formed, real success stories are hard to find [3,6]. Then, the investment money available for dot-com businesses was drastically reduced in 2001 [24]. The third-party e-marketplace valuations subsequently plummeted, pushed further down by the emergence of well-financed consortium players such as Covisint, which promised higher volumes and greater liquidity industries. At the same time, major firms like Cisco Systems, Wal-Mart and Eastman Chemical moved rapidly to implement private exchanges. But because no single e-marketplace model can address every one of a company's buy-and-sell requirements, it is increasingly clear that most organizations will need to work concurrently third-party, consortium, and private e-marketplaces, even though the answer differs from company to company. These e-marketplace types will complement each other rather than compete [3]. Therefore, it is necessary to clarify the differences and contentious issues in e-marketplace business models and transaction mechanisms in order to better understand and make a right decision.

Research on B2B e-marketplaces has occupied a prominent position in managerial and technological studies from the late 1990s to the early 2000s resulting in a vast and diverse literature. The starting point for this paper, though, is the contention that no articles organizing and discussing the contradictory and contentious issues in the literature can be found. This paper aims to cut through the confusion and differences in the literature as well as to provide valuable insights into a taxonomic resolution to scholars and practitioners. For that purpose, this paper investigates and categorizes the issues, and then provides a topical discussion of them through the literature review. In each main section of the paper, we begin our discussion by building revised taxonomies extending and augmenting prior taxonomies for e-marketplace business models. These revised taxonomies serve to provide a framework for our examination of the topics. Then, we examine and categorize the contentious issues within the framework, and then provide our findings and discussions about them.

## Contentious Issues in e-Marketplace Business Models

### A Unified Classification of the e-Marketplace Business Models

In the din and noise of B2B e-marketplaces, there is an amount of confusion about what the different e-marketplace business models are, where they add most value, and how profitable and defensible are they likely to be [19]. There are also wide variety of synonyms for e-marketplaces: electronic marketplace, electronic market, electronic intermediary, cybermediary, net market, net marketplace, digital marketplace, virtual marketplace, procurement marketplace, market maker, exchange, trading exchange, digital exchange, e-hub, trading hub, market site, market space, trading networks, fat butterflies, vortex, and market tone.

In addition, there exist many different categories, taxonomies, classifications, typologies, or types of the e-marketplace business models, based on different viewpoints, criteria, or dimensions. It is becoming increasingly difficult to force them into a single category. Furthermore, not only scholars and practitioners use different terms and taxonomies for the same concepts or business models, but they also give different definitions or meanings to even the same terms and models, which gives much confusion [3, 5, 7, 9, 12, 27, 28]. Despite earlier attempts to classify e-marketplaces as vertical (vortal) and horizontal (hotal or functional), recent findings showed that products and services in both types are often traded within the same e-marketplace [8, 11]. Instead, one of the most commonly accepted classifications for e-marketplaces is the one by the ownership (or governance) model or the participant model (i.e., the number of participating buyers and sellers). Drawing on both of them, in this paper, we consolidate the different categories into a unified classification that is presented in Table 1 and act as a framework for our discussion in this section.

TABLE 1: A CLASSIFICATION OF E-MARKETPLACE BUSINESS MODELS

Ownership	Participant	Publicity	Neutrality
Third-Party	Many-to-Many (M:M)	Public or Open	Neutral or Two-Sided (Independent)
Consortium	Some-to-Many (S:M)	either Public or Private	Biased or One-Sided (Buy-Side or Sell-Side)
Private	One-to-Many (1:M)	Private or Proprietary	Biased or One-Sided (Buy-Side or Sell-Side)

### Third-Party e-Marketplace vs. Portal

Third-party, neutral, open, or independent intermediaries in Table 1, typically hosted and operated by dot-com startups, bring multiple buyers and sellers together in one central Internet-based market space and use various transaction mechanisms to mediate any-to-any transactions among businesses [19, 26]. Each e-marketplace has its own specific business processes to run transactions and uses methods or tools to enable these processes [4]. An e-marketplace not only lets its members buy and sell goods and services, but also enables them to engage in building and participating in communities with others [14]. The widest variety of participants maximizes access but makes deep collaboration difficult [3].

Third-party e-marketplaces mobilize one of two strategies. The first is to enable online purchasing at predetermined fixed prices. These types largely make money on transaction fees or margin. These e-marketplaces are rarely anonymous, allowing a certain level of reciprocity between organizations. By allowing sellers to reveal their identity, reputable suppliers can still leverage their brand name while communication may occur before purchasing. In addition, an organized search engine makes finding products easy through a robust online catalog, automating the purchasing process from requisition to payment, and making purchasing possible. Finally, the e-marketplace directly addresses reciprocity concerns by monitoring every step of the fulfillment process, streamlining the business processes and supply chain, notifying organizations if any problems occur, and providing order fulfillment and status information [11].

The second strategy is to offer posted inventory or posted price (if available) and link buyers and sellers to conduct offline negotiations. This type of strategy often employs a subscription or posting fee [1]. However, some [23, 30] argue that if buy-and-sell orders after the search for catalogs should be transacted offline rather than online

or not through the transaction system of the e-marketplaces, then the site is not an e-marketplace. It is, instead, an infomediary, a directory service, a post-and-browse, a bulletin board or a community portal with contents such as product, price, and company information. This argument is based on the general definition of the market or marketplace; “A marketplace as a historically evolved institution allows customers and suppliers to meet at a certain place and at a certain time in order to communicate and to announce buying or selling intentions, which eventually match and may be settled” [16]. This definition is also corresponding to the four distinguished phases of market transactions: information, negotiation, settlement and after sales [13, 15, 16]. Portals support only the information phase. They bring together buyers and sellers in commerce-oriented settings, but do not enable negotiation transactions online.

On the contrary, others [15, 16, 26] classify the content and community portal where bring together buyers and sellers in commerce-oriented settings, but do not enable negotiation transactions, as one of the e-marketplace models. Content and community portal is primarily a structured bulletin board on the web where authorized members of the e-marketplace can post expressions of interest (instead of catalogs) or offers to buy and sell. Most portals provide a main screen that lists members’ postings by one or more categories. Since communications between users of the post-and-browse feature are critical, e-mail or instant messaging services is provided. In the portal, prices and terms are negotiated for each trading through a one-to-one, anonymous negotiation like over-the-counter market in the securities industry. This is the ideal mechanism for very fragmented markets with non-standardized products because each contract is quite different and requires one-to-one negotiation [26]. In addition, Schmid and Lindemann [25] state that an e-marketplace supports all the phases of market transaction or at least the information phase.

Drawing upon both arguments, we can conclude that portals are e-marketplaces if they facilitate the “online” negotiation and settlement through the transaction system of the portals. Otherwise, they are just contents and community portals.

#### **Public vs. Private Consortium e-Marketplaces**

Consortium-led, industry-sponsored, or affiliated e-marketplaces share their ownerships and common infrastructures between industry leaders, typically the big brick-and-mortar companies, and the technology platform providers. They are buyers-driven (buy-side, buyer-oriented, buyer-centric, buyer-focused, buyer-specific, buyer-biased, or buyer-managed), sellers-driven (sell-side, seller-oriented, seller-centric, seller-focused, seller-specific, seller-biased, or seller-managed) or pulled from both sides [5].

In most literature, the consortium e-marketplace is commonly classified into a public model lined up with the third-party e-marketplace. It might offer almost as much collaborative capability as private e-marketplaces, but at the expense of standardizing processes across members. Consortium e-marketplaces give individual members access to each other’s trading partners. They might be open to all and allow other companies to join the e-marketplace, which broadens access [3]. But some of them might be closed and proprietary for a specific network of suppliers. These are sometimes not discrete and they may overlap. For example, Covisint is a private, consortium e-marketplace where buyers may communicate directly with selected suppliers . Therefore, a consortium e-marketplace is public, private [24], or both sides [3].

#### **Private e-Marketplace vs. End-to-End Trade Exchange**

A private, dedicated, or proprietary e-marketplace (private trading network or private trading exchange) is owned and operated by a single large company that acts as either a single buyer or a single supplier. It creates values for participants by making existing processes more efficient - enhancing offline trading relationships between buyers and sellers through automation and integration. Businesses seeking to reduce trading costs through collaboration instead of competition use private marketplaces. A private marketplace likely acts as a technology partner offering buyers or sellers access to B2B applications and infrastructures that enable greater process and data coordination with their established trading partners.

Private e-marketplaces typically offer a customizable interface and can support deep collaboration between supply-chain partners. They provide access to the company’s qualified supplier base or known customers, but do not enable companies to look beyond the trading partners they already know [3]. Businesses have established relations with their suppliers, and the trust engendered by reliable performance and commitment over the long term may be more valuable to firms than any short-term price advantages offered by the supposedly neutral marketplaces.

Indeed a new trend in the B2B electronic trade arena is the rise of collaborative commerce where networks are used for far more than simple trading support. Joint product design, more tightly integrated inventory databases, and other forms of coordination between producers and suppliers occur over private e-marketplaces [29]. A private e-marketplace affords the enterprise the opportunity to streamline all interactions with customers and suppliers in a secure way, without worrying about what competitors might find out [18].

Some researchers and practitioners, however, do not encompass the private e-marketplace in their definitions of e-marketplaces [2, 19] or clearly exclude them from e-marketplaces [1, 16, 26] because of one of the following reasons:

- Private e-marketplaces do not bring “multiple” buyers and sellers together or many-to-many participants.
- They do not play the role of “intermediaries,” but act as a direct-trade model.
- “One-to-one” interaction (communication, trading, or connection) for an individual transaction does not meet the definition of e-marketplace.
- E-marketplace business models have been rapidly evolved and expanded to incorporating new models, e.g., private e-marketplaces, since the time when the literature published especially before and around 2000.

Scully and Woods [26] argue that one-to-many private e-marketplaces are not the market or e-marketplace; “The important point, which differentiates an exchange from other B2B e-commerce companies, is that an exchange involves multiple buyers and sellers (i.e., aggregation) and it matches buy and sell orders in accordance with the rules of the e-marketplace (i.e., matching), and provides post-trade information. One should compare this with the e-procurement process of one company, say General Motors, which sets up a web site with an auction process for suppliers to bid on contracts with General Motors. This is not an e-marketplace because there is only one buyer. Similarly, a business that offers goods or services for sale to other businesses, over the Internet, is not an e-marketplace even if it provides a price-setting mechanism (e.g., auction) that is normally associated with an e-marketplace because there is only one seller.”

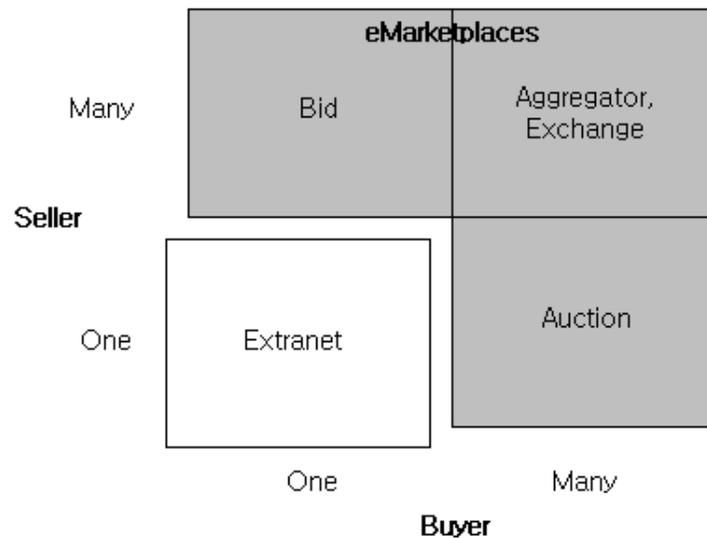

FIG. 1: TYPES OF E-MARKETPLACES PRESENTED BY FORRESTER RESEARCH

On the other hand, Steinfield [29] assert that private e-marketplaces are merely the latest manifestation of what Malone et al. [22] referred to as electronic hierarchies, where firms rely on networks to facilitate outsourcing, but only to a small number of firms with which they are tightly integrated. In addition, as Forrester Research illustrates in Figure 1 [20, 21], e-marketplaces act as intermediaries (or market makers) supporting any-to-any (or

multilateral) transaction mechanisms between multiple buyers and sellers. Note that one-to-one or end-to-end EDI (Electronic Data Interchange) and Extranet are excluded from the e-marketplace categories in Figure 1, which will be more discussed below. Intermediaries act as brokers or mediators between buyers and sellers. In the markets that lack price transparency and where it is difficult to find out who is buying or selling at any one point in time, the broker's role is to facilitate the ability of buyers to find sellers at the right time and at a mutually acceptable price. In such markets, the brokers restrict the free flow of information. For example, they ensure that the prices at which trades are made not widely disseminated and that the knowledge of who is buying and selling in the market is tightly controlled [26].

As shown above in Figure 1, the mediated any-to-any (or multilateral) transaction mechanisms hosted and controlled by e-marketplaces are generally differentiated from the end-to-end transaction mechanisms of EDI and Extranet. An extranet uses Internet protocols and is a security-enabled replica of the closed, proprietary EDI network. EDI messages may be translated into a standard format and routed via VAN (Value Added Network) with the hub-and-spoke model. However, VANs or EDI hubs supporting any-to-any document exchange are "communication intermediaries" or "message brokers". They do not act as market intermediaries, market makers, or transaction brokers at all. Since actual transactions take place at each end, the transaction mechanism through VANs is actually end-to-end or point-to-point. Note that the cardinality here does not mean that of network architecture (e.g., the many-to-many, hub-and-spoke model for EDI/VAN) or that of the participants (or members) to an e-marketplace. It means the relationship between trading partners participating in an individual transaction or deal in an e-marketplace.

Besides Forrester Research, A.T. Kearney [1] states that one-to-one web trading enablers do not meet the definition of e-marketplaces. Hemond-Wilson at IBM [17] also makes a clear distinction between e-marketplace models and one-to-one B2B trading partner agreements (TPAs) in EDI: She articulates four common B2B electronic commerce business models, that is, neutral, buy-side, sell-side e-marketplaces, and trading partner agreements. Trading partner agreements have the potential to automate the processes for negotiating and enforcing contracts between businesses using EDI and XML-based message exchange systems. That is, one-to-one interactions bypassing intermediaries do not meet the definition of e-marketplaces.

According to the arguments above, is it also acceptable to exclude the private e-marketplace, which is one of the direct-trade models without intermediation, from the e-marketplace models in spite of the fact that it is currently viewed as one of the e-marketplace models in most other literature? Deloitte Research [10] gives a clue for an answer to this debatable question: "A *One-to-Many Private Vertical* is an e-marketplace that links a large company to simultaneously and dynamically interact, trade and collaborate exclusively with its community of trading partners. A *One-to-Many (more accurately One-to-Some) Private Extranet* is an end-to-end B2B system or web site built by an individual buyer or seller company to attract their trading partners. It is often used to disseminate information and conduct one-way transactions. It usually lacks the capability for dynamic, simultaneous interaction and collaboration with multiple trading partners." Based on the statements quoted, we would make a distinction between the private e-marketplace and the private extranet (or end-to-end private exchange); "the dynamic, simultaneous interaction" in the private e-marketplace embodies one-to-many transaction as well as one-to-one transaction, but EDI or Extranet supports only one-to-one interaction. Thus, the private e-marketplace can be a type of the e-marketplace even though it is a direct-trade model without intermediation.

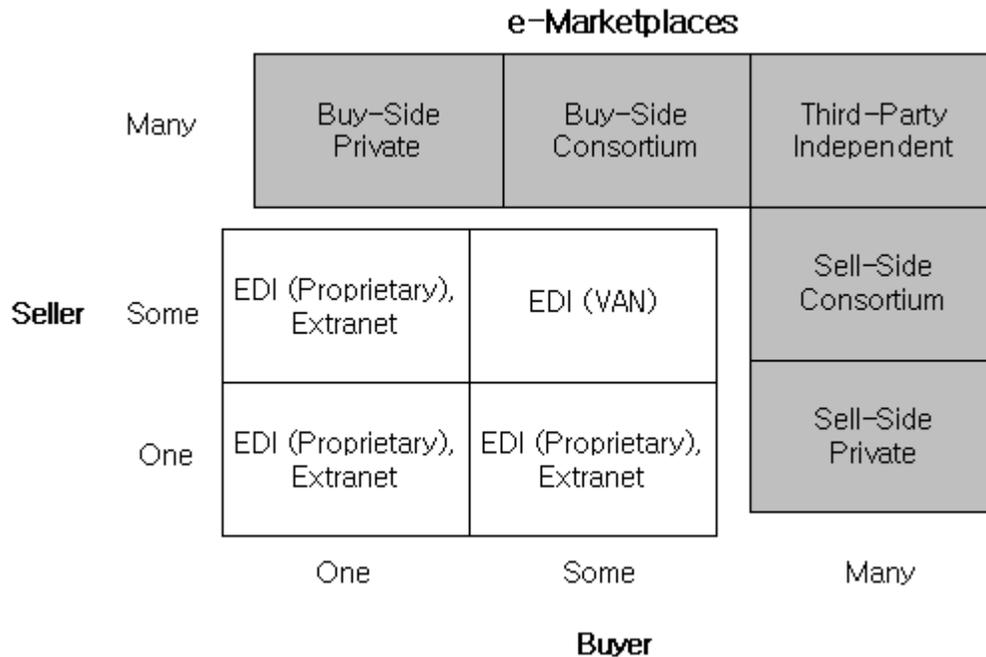

FIGURE 2. A REVISED TYPES OF E-MARKETPLACES BY THE PARTICIPANT AND NEUTRALITY MODELS

Drawing on the discussions above, we additionally develop a revised classification of e-marketplaces by both the number of participants in an e-marketplace (i.e., by the participant model) and the neutrality or bias (i.e., buy-side, sell-side, and neutral e-marketplaces) as shown in Figure 2, which also presents the differences from EDI and Extranet. In Figure 2, both buy-side and sell-side e-marketplaces are further divided into one-to-many private and some-to-many consortium e-marketplaces.

## Conclusions

Despite a wide variety of literature, no articles organizing and discussing the contradictory and contentious issues in B2B e-marketplaces can be found. In this paper, we set out to contribute to our understanding of the issues, as well as to provide valuable insights into a taxonomic resolution to scholars and practitioners. First of all, we begin our discussion by building three revised taxonomies extending and augmenting prior taxonomies for the business models in B2B e-marketplaces:

- A unified classification of the e-marketplace business models in Table 1,
- A revised types of e-marketplaces by the participant and neutrality models in Figure 2, which also representing the differences from EDI and Extranet.

All of these taxonomies serve to provide a framework for our examination of the topics. Then, we investigate and categorize the business models within the framework, and then provide our findings and topical discussions about them, which can be summarized as follows.

- Third-Party e-Marketplace vs. Portal: we can conclude that portals are e-marketplaces if they facilitate the “online” negotiation and settlement through the transaction system of the portals. Otherwise, they are just contents and community portals.
- Public vs. Private Consortium e-Marketplaces: Consortium e-marketplaces may be viewed as a public e-

marketplace, a private e-marketplace, or both sides. That is, although the consortium e-marketplace is commonly viewed as a public model in most literature, it can also become a private model or both sides.

- Private e-Marketplace vs. End-to-End Trade Exchange: This paper provides a clear distinction between private e-marketplace (one-to-many e-marketplace) and private extranet (or end-to-end private exchange).

# The Effects of Product Involvement on Consumer's Purchase Decision Process in Online Shopping

*Jonguk Kim  
San Cheol Park  
Sungkyunkwan Univeristy, Korea*

## Abstract

Despite the growing appeal of online shopping trends that indicated a remarkable potential, it will be not easy to attract new online customers and retain existing ones. And also, little previous studies employing consumers' needs to understand why Internet shoppers make purchase are found in the relevant literatures. This study assumed that customer's ability to select online shopping malls differs according to product involvement. In general, online consumers cannot depend on all senses to make purchase. Instead, they must rely on limited product representations such as photographs and text descriptions. Therefore, we consider that online consumers judge an online shopping mall by personal importance, interest or relevance about their products to purchase. According to marketing and consumer behavior literatures, involvement is defined as perceived personal importance, interest or perceived personal relevance. Based on this concept, the purpose of this study is to determine whether a customer's purchase intentions on the online shopping malls differ depending on product involvement. Therefore, this study examined how selected variables (i.e. trust, informativeness, entertainment, product variety) influenced the impact on customers' purchase intentions through product involvement for selecting online shopping malls. We collected 282 survey responses from online consumers who have prior experience with online shopping malls to purchase a product. The survey data are used to empirically test the proposed eight research hypotheses using LISREL. The LISREL results showed that product involvement indicated a statistically significant explanation of online consumers' purchase intentions. In a state of high product involvement, online consumers may be more willing to demand detailed information by selecting trustworthy online shopping malls. And also, more involved online customers might make purchase more hyperlinks to detailed product specifications, various products display provided through the online company. The findings suggest online companies should utilize our conclusions while understanding consumer purchase behaviors in online environments.

## Introduction

Internet shopping malls enable consumers to shop conveniently without limitations of time and space as placing orders in online. Due to these attributes, although consumer behavior in the online environments has been the subject of considerable B2C (business-to-consumer) research in the last few years (Brynjolfsson and Smith, 2000; Cho et al., 2003; Devaraj et al., 2002; Eighmey, 1997; Jarvenpaa & Todd, 1997; Koufaris, 2002; Loshe and Spiller, 1999; Novak et al., 2000; Szymanski and Hise, 2000), there have been lots of difficulties in understanding what consumers need and how they behave in online shopping malls (Devaraj et al., 2002). Also, there were little understanding for characteristics of network sales.

From the consumer's viewpoint, the way to purchase products/services in Internet shopping malls is quite similar to brick-and-mortar except for using network technologies. Therefore, the ultimate goal of consumer's usage in online shopping malls is to purchase products/services. If online consumers' final purpose is to purchase products/services, it will be quite similar to the characteristics of consumer behavior in offline shopping.

But, because of characteristics of online environments, consumers may go through different information search, attitude, and behavior compared with offline contexts. That is, online consumers think and act differently from offline counterparts. For instance, online consumers who want to purchase products/services should depend on information, well-designed display structures provided by Internet shopping malls. In general, online consumers are more powerful, demanding information related to products/services than offline consumers but they should rely on limited product presentations such as text descriptions and photos because they cannot make purchase using all five

senses. Therefore, online consumers to make purchase may have a different information search stages and also, take a cautious attitude to select Internet shopping malls.

From this point of view, consumer's criteria to select a certain Internet shopping mall depend upon consumers' interest, relevance, importance of products. For example, if online consumer's importance or interest on purchasing products/services is high, they will find a specific reliable Internet shopping malls that enable themselves to maximize their benefits, minimize perceived risks with the product purchase, and provide correct product information.

After all, consumer's specific situational factors must be considered because online consumer's decision process to buy a product on the web is already decided by the degree of interest on a certain product. Through these personal and situational factors, they will take actions from selecting an Internet shopping mall to purchasing behavior on products/services in that shopping mall.

Marketing and consumer behavior literature suggested involvement as one of the most important components in a decision process to enhance understanding of consumer behavior. Involvement is defined as perceived personal importance, interest, or perceived personal relevance evoked by a specific stimulus in specific surroundings and intensity of consumer's purchase needs. Especially, product involvement suggested by this study is consumer's continuous interest about a product. It was derived from perceived psychological and financial risks on product purchase. In general, consumers who want to purchase products select one of the shopping malls by their own several evaluation criteria because it differs from main purposes or benefits out of relevant products.

Therefore, we consider that online consumers judge online shopping malls by their own personal importance, interest or relevance about their products to purchase. Based on product involvement concept, the purpose of this study is to determine whether a customer's purchase intentions in online shopping differ depending on product involvement. And also, this study will examine how selected variables (i.e. trust, informativeness, entertainment, product variety) may influence the selection of online shopping malls.

## **Theoretical Backgrounds**

### **Involvement**

Involvement, one of the most important variables in consumer behavior research, played an important role in consumer's persuasive process (Celsi & Olson, 1988; Hoffman & Novak, 1996; Kruman, 1967; Petty & Cacioppo, 1983). Involvement was defined as perceived personal importance and interest evoked by a specific stimulus in specific surroundings or degrees of perceived personal relevance toward an object (Peter & Olson, 1996; Zaichkowsky, 1985). According to this concept, consumers are willing to pay more attention and interests under high involvement when purchasing a particular product. As a result, they will search for more product information and treat information more considerately. Extensive marketing literature have illustrated that the consumer's learning process relied on the degree of involvement. So, it could be suggested for each consumer to bring about the difference of information search and alternative evaluation process that could be generated by involvement (Cho et al., 2003; Koufaris et al., 2001; Kofaris, 2002; Kokoonaki, 1999; Kruman, 1967; Petty & Cacioppo, 1983; Robertson, 1976; Rothschild & Gaidis, 1981; Traylor, 1981).

We suggest that a consumer with high product involvement have high interests on an intrinsic attribute of products; thus, he or she will look for more information related to a specific product. On the other hand, a consumer with low product involvement has interests on peripheral components such as website design, sounds provided in the web shopping mall rather than critical information about products. Therefore, when a consumer feels relevance to the needs and values from searching for products, he or she has high product involvement and selects an Internet shopping mall that can meet needs. Conversely, in case of a consumer with low product involvement, he or she selects a specific Internet shopping mall that emphasizes entertaining factors.

### **Involvement in Online Environments**

Hoffman and Novak(1996) suggested that involvement was related to information search on the web. According to their study, web users' behaviors were divided into two types of behaviors: goal-directed behavior and experimental behavior. Those behaviors rely on distinct search motives combined with the target of involvement. Furthermore, consumer behaviors on the web were explained by involvement and search motives. Especially, goal-

directed behaviors are characterized for situational involvement and directed search. For instance, once web users navigate on web sites for purchasing products/services, their behaviors reflect goal-directed behavior.

Meanwhile, users may go through experimental behaviors when they search for interesting web sites. According to their study, it is suggested that consumers can evaluate products/services by remembering their own memories or using collected information from external sources. And then, to purchase their involved products/services, they should select a specific one of the online shopping malls which meet their own needs.

Koufaris et al.(2001), who especially investigated consumer behaviors in the web-based commerce, examined the impact of consumer experiences and attitudes on the intention to return and unplanned purchase online. According to his research, he found that new web customers tend to have return intention to the online shopping mall through perceived control and shopping enjoyment.

Novak et al.(2000) also mentioned that product involvement influenced consumers; experiences and behaviors. And they said that it could influence the flow construct as antecedents of flow. Therefore, using involvement, consumer's importance of web-based store or products/services would be simply measured. And also, Kokoonaki(1999) ascertained involvement played important roles from persuasion process to an attitude based on elaboration likelihood model of attitudes. A previous study which is applicable to this study indicates that consumers with low product involvement do not make a lot of efforts for information search and those who have high product involvement, conversely, aggressively search for more and specific information about products (McGaughey and Manson, 1998). Through the investigation of related research, we suggest that consumer behavior including forming of attitude, decision process, information-handling process, etc. will depend on involvement of a specific object. Therefore, we analogized that consumer's product involvement is considered as the key factor mediating consumer's decision process for purchasing products/services, and further evaluation and selection of a specific online shopping mall.

#### **Online shopping mall attributes**

##### **Informativeness**

Informativeness is the ability to provide necessary information efficiently to target customers (Ducoffe, 1996). And also, Andrew (1989) indicated that informativeness was associated with the consumer's beliefs that focused on economic benefits. Gupta(1995) mentioned that one of the biggest consideration for consumers is the collection of information related to purchasing products. Thus, consumers are willing to collect rich and useful information about specific information on the web. Namely, information collected from Internet functions to facilitate consumer's purchase decision process. Information provided in Internet shopping malls depends on how they provide accurate and sufficient information to consumers. That information must be clear and persuasive to consumers on the web. In the same context, it will be similar to DeLone and McLean (1992, 2003)'s information quality concept. Ranganathan and Ganapath (2002) also mentioned that high level of information quality could provide adequate information about products/services at B2C web sites, easily access to information via search engines, and provide consumers the help for evaluation processes.

From these perspectives, we can guess that a consumer will select an Internet shopping mall that can provide diverse, accurate and relevant information because of high level of needs on necessary and reliable information as consumer's interest on products increases.

##### **Entertainment**

Entertainment on the web can be very important in online shopping malls because it may have a significant impact on attitude and intention towards online shopping (Jarvenpaa and Todd, 1997; Eighmey, 1997; Rice, 1997). Barker and Gronne(1996) mentioned that a consumer was generally exposed to a specific product or message with entertainment within a certain period of time. And also, they said that entertainment ambiguously set boundaries between information and entertainment because of information irrelevant to a specific product. Maignan and Lukas(1997) said that entertainment could facilitate to generate consumption of product and services. And Ducoffe(1996) proved a significant causal relationships between entertainment and advertising value. Koufaris et al.(2001) found that shopping enjoyment was the main determinant of online consumer's intention to return through the empirical analysis.

Based on the results of previous studies, we conceptualize that entertainment is the degree of enjoyment from pleasant or likable advertising on Internet shopping malls. Thus, in case of consumers with low involvement,

we suppose that they select a specific Internet shopping mall which emphasize on entertainment because they do not seriously consider a purchase decision rather than consumers under high involvement.

### **Product Assortments**

In the previous literature of retailing management, those literatures suggested that product merchandises or assortment could be another important factor when a consumer selected a specific store. Craig et al.(1984) said that consumers could have a probability to choose a specific store that meets their own needs if a certain store has various product assortments. And, they also mentioned that product assortments had an important factor due to providing opportunities for consumers to choose a product. In online environment, product assortments have consisted of price, product quality, and product and brand variety and so on. Especially, Jarvenpaa and Todd(1997) classified the characteristics of internet shopping into four categories : product perception, shopping experience, customer service, and customer risk. And they examined a consumer's response to those characteristics on the Internet shopping mall. The results of product characteristics including product price, quality and variety have significant impacts on the consumer's response.

Internet shopping malls have various products for sales and also provide much product information to customers. If an Internet shopping mall gets ready for various product assortments, the customer will have more chances to find better satisfactory and qualified products. According to Szymanski and Hise(2000), product assortments can be related to the degree of product offerings and the degree of product information. And also, they mentioned that consumer satisfaction would be more positive when consumers perceive online shopping malls to provide superior product assortments because of those augmentations; First, superior assortments can increase probability of meeting consumer needs and satisfaction. Second, the wider product assortments can include items of better quality that may be more attractive to customers.

### **Trust**

The importance of trust has been already emphasized in many transactional and buyer-seller relationships focusing on long-term behaviors(Donney and Cannon, 1997; Morgan and Hunt, 1994). Trust has been conceptualized by previous research in several of ways, both theoretically and operationally. McKnight and Chervany (2001) defined trust as 'a willingness to believe' or 'beliefs regarding various attributes of the other party'. And further, they mentioned that trust was similar to fairness, goodness, strength, ability, benevolence and predictability. As mentioned above, trust in many previous studies has been regarded as a crucial key factor to intentions to purchase and satisfaction in online and offline commercial transactions (Jarvenpaa et al.,1999; Brynjolfsson and Smith, 2000; Reichheld and Scheffer, 2000; Ba and Pavlou, 2002; Gefen et al., 2000). Especially, Ba and Pavlou (2002) also pointed out that trust was an important factor in relationships between buyers and sellers. And they mentioned that consumers could pay more price premiums to reputable sellers by reducing transaction-specific risks when they purchase a product in online.

### **Purchase Intention on the web**

Purchase intention refers to the expected or planned individual behavior for foreseeable future and the degree of moving from beliefs to attitudes. Attitudes, a central position in the study of consumer behavior, are thought to motivate individual behavior and thus to contribute to prediction. The Theory of Reasoned Action(TRA) suggested by Ajzen and Fishbein(1980) is a dominant approach to modeling attitudinal influence on behaviors. TRA is based on the assumption that individuals make a rational use of available information when they make decisions for their behaviors. TRA views behavioral intentions as the intermediate determinants of behaviors. In turn, intentions are determined by attitudes toward the behavior and subject norms.

Meanwhile, in previous studies with application of TRA in the online context, Hoffman and Novak (1996) mentioned that purchase intention could increase by repeatedly visiting the same web sites when giving enjoyment during navigation to online customers. Jarvenpaa and Todd(1997) presented main attributes(product perception, shopping experience, customer service, and consumer risk) for consumers' purchase intentions in the online shopping context.

## Research Model

We propose the research model based on the results from diverse previous studies in the marketing, consumer behavior and information system area (see Figure 1).

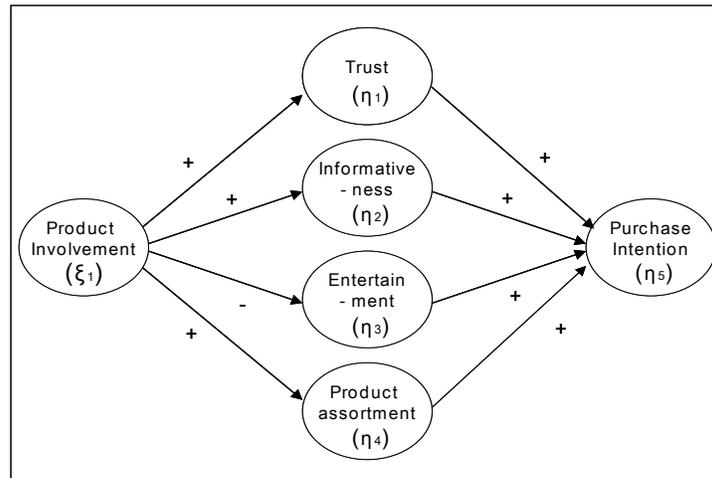

FIG. 1: RESEARCH MODEL

### Hypothesis

#### Product Involvement and Trust

Online consumers have to rely on the limited product information and presentations such as photographs or text descriptions in the purchase decision process. However, those product presentations have significant impacts on attitude and purchase intention of online shopping because those did not explain to consumers perfectly (Jarvenpaa and Todd, 1997; Novak et al., 2000).

And also, online consumers thought of risks such as delivery processes or use of credit cards for purchasing product appeared to web environments (Bhatnagar et al., 2000). Especially, online consumers with high product involvement tend to minimize their risks when they consider purchasing a specific product. Risks refer to the perceived risk of consumers. That is, consumers tend to consider selecting an Internet shopping mall, a product and way to purchase and so forth. Those perceived risks could be antecedents of trust in variety of previous literatures (Hoffman et al., 1999; Lee and Turban, 2001; Pavlou, 2003). After all, an online consumer makes informed decisions to purchase products depending on perceived risks with individual interest of a specific product in online contexts.

Therefore, we suggest that intention to purchase be different from relying on a consumer's perceived risk and individual involvement in online shopping. Trusting a specific Internet shopping mall means that online consumers expect to minimize their own perceived risks. Thus, consumers with high involvement tend to select more reliable shopping mall. We, therefore, hypothesize that:

**HYPOTHESIS 1:** Online consumers with high product involvement will choose a reliable online shopping mall.

#### Product Involvement and Informativeness

Involvement can be the intensity of a consumer's purchasing needs. Thus, highly involved consumers will search more information about a specific product and handle it cautiously. Under highly involved decision process, consumers tend to collect information and be deeply involved in the purchase processes. On the other hand, consumers with low involvement will go through simple and quick process on purchasing information because they have a relatively low risk of buying products.

In general, online consumers can choose better products through less effort and time rather than offline consumers because of low search costs (Bakos, 1997; Devaraj et al., 2002). Thus, online consumers are able to make right decisions through searched product information. In turn, those information collected from online can be a function to facilitate purchase decisions making. Therefore, information provided by Internet shopping malls must be clear, persuasive, accurate and sufficient. That is, informativeness in an Internet shopping mall can be a stimulus to facilitate a consumer's purchasing behavior. Therefore, the mall should present reliable, various, accurate and sufficient information. After all, consumers with high involvement will search information that is to meet their own goals, needs, and values. To do it, they tend to have probabilities to select an online shopping mall that can provide accurate, sufficient information to compare with each product. We, therefore, hypothesize that:

**HYPOTHESIS 2:** Online consumers with high product involvement will choose an online shopping mall with greater relevant product information.

#### **Product Involvement and Entertainment**

High product involvement can increase intention to purchase in online when consumers are conscious of their propounded relevance of goals and values from information search or investigation of products. On the other hand, if consumers have less relevance of products, they are influenced by color, size, and sounds of online shopping malls. Consumers with low involvement may change attitudes for purchasing with those trivial attributes of the mall. Thus, we can understand that low involved consumers tend to select the Internet shopping mall that can provide shopping enjoyment or pleasant rather than information relevant or critical to products.

Jarvenpaa and Todd (1997) mentioned that entertainment such as shopping enjoyment could have a significant impact on attitude and intention towards purchasing the products. In previous studies (Maignan & Lukas, 1997), entertainment refers to the degree of enjoyment provided in an Internet shopping mall and can attract consumer's attentions, in especially, online consumer with low involvement. Therefore, entertainment attributes of the shopping mall will be an important determinant to low involved consumer's intention to purchase.

**HYPOTHESIS 3:** Online consumers with low product involvement will choose an online shopping mall with highlighting entertainment parts.

#### **Product Involvement and Product Assortments**

According to the retailing management study, product assortment is an important determinant of selection of a certain store. Especially, Craig et al. (1984) mentioned that consumers could find a specific product that meets their own needs when a store has a variety of product assortments and have many opportunities to select products they need.

In previous studies, researchers also revealed that consumers considered product assortment as an important factor regardless of on/offline (Burke, 1997; McQuitt and Peterson, 2000; Loshe and Spiller, 1999). Jarvenpaa & Todd (1997) found that product assortment would positively influence the consumer's response. And Szymanski and Hise (2000) mentioned that consumer satisfaction in online would be more positive when consumers perceive that online shopping malls provide superior product assortments.

Therefore, if there are various products in the Internet shopping mall, consumers with high involvement can achieve many choices to choose and compare products that they need. In turn, it means that they can be deeply involved in purchase process due to various alternatives about products. We, therefore, hypothesize that:

**HYPOTHESIS 4:** Online consumers with high product involvement will choose an online shopping mall with highlighting product assortment.

#### **Trust and Purchase Intention**

A number of previous studies indicated that trust had a significant impact on behavioral intention in online environments (Jarvenpaa et al., 2000; Gefen et al., 2000, 2003; Lee and Turban, 2001; Bhattacharjee, 2002; Palvou, 2003). And also, Shrama & Patterson (1999) asserted that trust was a foundation to maintain a long-term relationship between customers and companies. Gefen et al. (2003) insisted that visiting online shopping mall was strongly based on trust, and found that trust influenced perceived usefulness and intention to use. Based on these results of such prior studies, we suggest the following hypothesis.

**HYPOTHESIS 5:** Trust in selected online shopping mall will be positively related to consumer's purchase intention.

#### **Informativeness and Purchase Intention**

According to Hawkins(1994)'s research, internet can be enable to access various information on products/services as a distribution channel. In turn, information would be an important function as values of web sites before purchasing products. Thus, if consumers can utilize much available information provided by an online shopping mall, they can make informed decisions. Also, Chakraborty et al.(2003) insisted that consumers recognized importance on information when purchasing products. We, therefore, hypothesize that:

**HYPOTHESIS 6:** Informativeness in the selected online shopping mall will be positively related to consumer's purchase intention.

#### **Entertainment and Purchase Intention**

Many prior studies empirically proved that entertainment, defined as fun, pleasure, exciting of users when visiting web sites, determined consumers' intention toward purchase or satisfaction (Chen and Wells, 1999; Eighmey, 1997). Jarvenpaa & Todd (1997) also mentioned that it had a significant impact on attitude and intention in online shopping. Koufaris et al.(2001) found that the more often customers return to an online store, the more their shopping enjoyment was determined.

Maignan and Lukas(1997), and Rice(1997) mentioned that entertainment provided by shopping malls could facilitate consumption of products and services. From these results, we suggest that intention to purchase be significantly influenced by entertainment in online shopping malls. Thus, we hypothesize that:

**HYPOTHESIS 7:** Entertainment in the selected online shopping mall will be positively related to consumer's purchase intention.

#### **Product Assortment and Intention to Purchase**

Online shopping malls can provide various product assortments without absence of stock. That means consumers are able to compare products and have opportunities to find the best suitable product for consumer's needs. Prior studies revealed that consumers could have greater chances to face high quality of product that they needed when there is a variety of product assortments(Burke, 1997; McQuitt and Peterson, 2000; Szymanski and Hise, 2000). Thus, product assortments in an online shopping mall will be related to intention to purchase.

**HYPOTHESIS 8:** Product assortment in the selected online shopping mall will be positively related to consumer's purchase intention.

#### **Instrument Development**

The questionnaire included the items to measure variables appeared from the previous studies for the followings. Product involvement was assessed by three measurement items from Petty and Cacioppo(1988) and Zaichkowsky(1985)'s scale. It refers to the perceived individual relevance, interest and value when a consumer makes a purchase. Trust items were composed to reflect specific beliefs of consumers in the online shopping mall (Bhattacharjee, 2002; Gefen, 2000; Gefen et al., 2003). And informativeness items represent the ability to provide accurate, abundant and relevant information regarding a specific product (Ducoffe1996; Ranganathan & Ganapathy, 2002). Entertainment items were adopted from Ducoffe(1996) and Koufaris et al.(2001)'s scales. These were previously applied to generate pleasures or enjoyment on the web. Product assortment items capture some of Burke(1997) and Jarvenpaa and Todd(1997)'s scales. Finally, examining purchase intentions is consistent with the way of and Jarvenpaa and Todd(1997), and Gefen et al.(2003)'s research.

## **Research Methods**

To examine the effects of product involvement and other factors such as trust, informativeness, entertainment and product assortment on purchase intention in the Internet shopping mall, a survey method was employed in this study. The sample for analysis in this study was drawn from those who were experienced users of online shopping malls.

#### **Study Design, Procedures and Descriptive Statistics**

A survey was conducted from online shoppers to collect data and empirically analyze the research model. All of the measurement items are consisted of seven Likert point scales ranging from strongly disagree (1) through neutral (4) to strongly agree (7) except for demographic characteristics. In total, the initial sample consisted of 373 responses and final responses were 283 through screening out missing values for analyzing the research model. We used the LISREL software 8.51 to analyze the data sets collected.

LISREL was used for data analysis because it has superior advantages over other methods (Gefen et al., 2003). It provides the appropriate and most efficient estimation technique for a series of separate multiple regression equations estimated simultaneously (Hair et al, 1998). The LISREL analysis includes two steps of the statistical result. The first step in the data analysis was to establish the convergent and discriminant validity of the constructs with a LISREL confirmatory factor analysis(CFA). The second step is the structural model, which includes hypotheses in addition to the paths between the items. The latent constructs were examined in the measurement model.

This resulted in a dataset of 282 responses. Of the respondents, 142(50.4%) were women and 140(49.6%) were men, without some missing values in the dataset. Most respondents were in almost in their early and late 20s(n=245). And they had purchased online an average of 1-3 times during the last one month. In addition, most respondents were in undergraduate students (n=190) and others (n=92) and they had used an average of 4-5 hours for a shopping during the one-week. The most frequent sites for last purchase were D&Shop(20.6%), CJ mall(17.1%), InterPark(14.5%), Auction(10.6%), and others(22.8%). Most purchased items are the followings: clothes (17.9%), books (11.7%), cosmetics (11.3%), others including electrics.

**Measurement Model and Reliability**

The CFA showed an acceptable model fit. The  $\chi^2$  of 254.67 with 120 degrees of freedom showed a  $\chi^2$  to degrees of freedom ratio of less than the recommended 1:3. The GFI at .91, AGFI at .87, NFI at .90, CFI at .94, RMR at .06, and RMSEA at .064 are all within the accepted thresholds for CFA.<sup>i</sup> That means the measurement model has convergent validity. And also, the composite construct reliabilities, shown in Table 1, are also within the commonly accepted range greater than 0.7 (Bagozzi & Yi, 1988). The reliabilities of all instruments had acceptable Cronbach's alpha values (from 0.7574 to 0.8590) as seen in Table 1.

In addition, discriminant validity of the resulting scales was examined employing the guidelines advanced by Furnell and Larcker(1981). It is a method whether AVE is more than a squared root of all correlation coefficients. If AVE is over them, there is an existence of discriminant validity. Thus, the measurement model also has discriminant validity shown in Table 2 (Furnell & Larcker, 1981)<sup>ii</sup>.

TABLE 1: CONFIRMATORY FACTOR ANALYSIS, COMPOSITE RELIABILITY AND CRONBACH'S ALPHA

Variables	Items	Factor Loadings	t -value	Cronbach's Alpha	Composite Reliability	AVE
Trust	Trust1	0.69	12.76	0.8590	0.8300	0.620
	Trust2	0.92	19.02			
	Trust3	0.85	16.95			
Product Assortment	Brand1	0.77	14.08	0.8290	0.8444	0.644
	Brand2	0.83	15.58			
	Brand3	0.76	13.91			
Entertainment	Ent1	0.82	14.96	0.8208	0.8239	0.610
	Ent2	0.81	14.70			
	Ent3	0.71	12.64			
Informative -ness	Inform1	0.79	14.95	0.8443	0.8655	0.685
	Inform2	0.79	14.80			
	Inform3	0.83	15.77			
Product Involvement	Invol1	0.56	9.23	0.7574	0.7775	0.545
	Invol2	0.82	14.45

Fit Indexes	$\chi^2=254.67$ , $df=120$ , $RMR=0.06$ , $RMSEA=0.064$ , $GFI=0.91$ , $AGFI=0.87$ , $CFI=0.94$ , $NFI=0.90$					

TABLE 2: CORRELATION MATRIX AND AVERAGE VARIANCE EXTRACTED (AVE)<sup>iii</sup>

	AVE	TRUST	INFORM	ENT	IP	BRAND	INVOL
TRUST	0.62	1.00					
INFORM	0.64	0.26	1.00				
ENT	0.61	0.19	0.20	1.00			
IP	0.69	<u>0.53**</u>	0.46	0.34	1.00		
BRAND	0.54	0.26	0.27	0.20	0.28	1.00	
INVOL	0.54	0.50	0.52	0.38	0.46	0.52	1.00

**Path Analysis**

To test hypotheses in the study, the structural model was examined on the measurement model. The fit indexes are within accepted thresholds, except for GFI= .88, which is slightly lower than the commonly cited threshold.  $\chi^2$  to degrees of freedom ratio of 358.71, 127, CFI = .91, RMR = 0.09, RMSEA = 0.081, AGFI = .83. Figure 2 shows the LIRSEL path coefficients and the overall fit indexes. Squared multiple correlations were: intention to purchase 43%. And all paths are found significant expect the path between product involvement and entertainment, which is for revered direction (p=.38, t=5.29), and the path between product assortments and intention to purchase which is insignificant (p=.06, t=0.85).

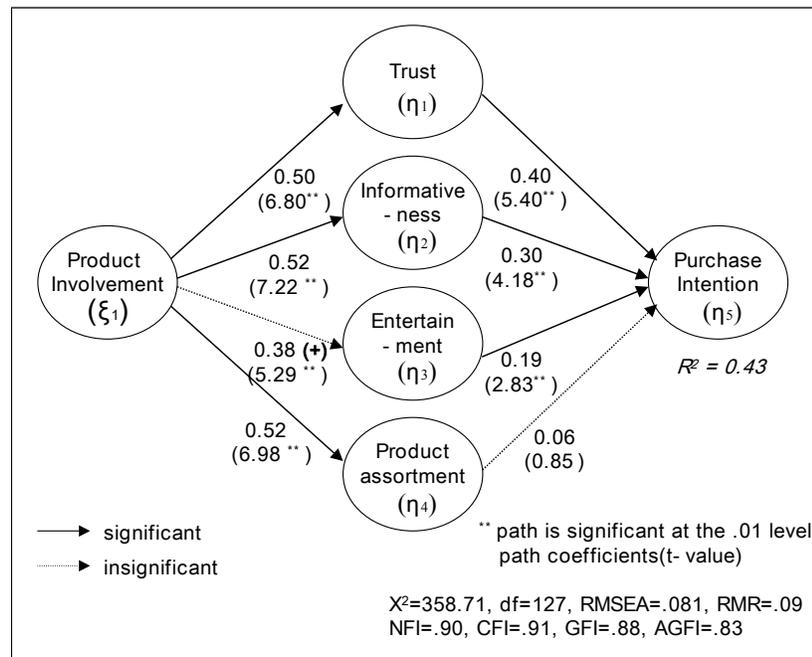

FIG. 2: PATHS IN RESEARCH MODEL

Table 3 shows the results of hypothesis using structural models. First, the relationship between product involvement and trust was statistically significant. Therefore, Hypothesis 1 is supported. In turn, consumers with high involvement tend to choose more reliable online shopping mall. Second, the relationship between product involvement and informativeness was also significant. Thus, Hypothesis 2 is supported. On the other hand,

Hypothesis 3 is not supported because consumers buying product with higher involvement tend to shop in a shopping mall with higher entertaining contents. It is contrary to our expectation. On the other side, Hypothesis 4 is also supported at the 0.01 significance level. And also, Hypothesis 5, 6 and 7 are supported except for Hypothesis 8. Figure 2 shows the final research model among the proposed casual relations. Based on the results of our evidences, we interpreted each hypothesis for the followings.

TABLE 3: SUMMARY OF HYPOTHESES TESTING RESULTS

Seq	Hypotheses	Direct effects		Direction	Results
		Path coefficients	t-value		
1	product involvement ( $\xi_1$ ) $\rightarrow$ trust ( $\eta_1$ )	0.50	6.80	+	<b>Supported</b>
2	product involvement ( $\xi_1$ ) $\rightarrow$ informativeness( $\eta_2$ )	0.52	7.22	+	<b>Supported</b>
3	product involvement ( $\xi_1$ ) $\rightarrow$ entertainment ( $\eta_3$ )	0.38	5.29	-	Rejected
4	product involvement ( $\xi_1$ ) $\rightarrow$ product assortment ( $\eta_4$ )	0.52	6.98	+	<b>Supported</b>
5	trust ( $\eta_1$ ) $\rightarrow$ purchase intention ( $\eta_5$ )	0.40	5.40	+	<b>Supported</b>
6	informativeness ( $\eta_2$ ) $\rightarrow$ purchase intention ( $\eta_5$ )	0.30	4.18	+	<b>Supported</b>
7	entertainment ( $\eta_3$ ) $\rightarrow$ purchase intention ( $\eta_5$ )	0.19	2.83	+	<b>Supported</b>
8	product assortment ( $\eta_4$ ) $\rightarrow$ purchase intention ( $\eta_5$ )	0.06	0.85	+	Rejected

First, Hypothesis 1, 2, 4 are significant but hypothesis 3 is not supported. In case of hypothesis 1, it explains that online consumers under high involvement tend to select more reliable online shopping mall to purchase a specific product because they are deeply involved in their decision-making processes such as collecting more information for a long time or minimizing their risks. And, from hypothesis 2, we find that consumers with high product involvement tend to prefer to an online shopping mall providing sufficient product information because they want to receive more, accurate and relevant product information from the selected online shopping mall. In case of hypothesis 4, it can be explained that high-involved consumers are willing to choose an online shopping mall that has a variety of product assortments for enabling them to compare products. In turn, the more various product assortments for sale are in an online shopping mall, the easier high-involved consumers compare products they consider to buy since they are deeply involved in purchase-decision processes.

Meanwhile, Hypothesis 3, which is not supported, shows that high-involved consumers prefer to choose an online shopping mall that underlines the entertainment. From this result, we can predict that consumers who have high product involvement also consider accurate product information as well as entertainment in an online shopping mall when they make a purchase. Thus, entertainment such as fun, pleasures and enjoyment can be one of the important factors in purchase-decision process on an online shopping mall when consumers search and explore much information about products. In turn, if the online shopping mall adds the entertainment such as enjoyment or pleasure to customers who take serious view of usefulness on product information, it can be more attractive to them. And also it is interpreted that some online shopping malls are providing friendly various web site design and animations to customers as entertainment promotion tools. Those shopping malls are several renowned, reliable ones that are currently providing lots of information on products and having various product assortments.

Thus, as stated in hypothesis 3 above, we insisted that high-involved consumers pay less attention to be interested in entertainment of an online shopping mall. But the result in this study are contrary to the our expectation because a reliable online shopping mall that has grater abilities to provide much product information can have also highlighted entertainment sides. Therefore, we consider that the relationship between product involvement and entertainment will be independently studied in the further studies.

In case of hypothesis 5 which was supported, trust in the online shopping mall has a strongly positive impact on intention to purchase. It supported the results of previous studies (Jarvenpaa et al., 2000; Gefen et al., 2003; Palvou, 2003). Trusting a specific shopping mall means that online consumers can always expect to minimize their perceived risks. So, online companies involved in facing consumers must make efforts to provide superior service and securities. In summary, from the customer's viewpoint, trust is still an important factor when making a purchase via Internet. And also from a standpoint of online companies, they have got to actively utilize trust in online surroundings.

Third, Hypothesis 6 and 7 are both also supported. Both of them are in accordance with the results of previous studies (Chen and Wells, 1999; Eighmey, 1997; Koufaris et al., 2001). After all, those results revealed that consumers could repeatedly visit and buy products in an online shopping mall when consumers are deeply conscious of product information and are in high emotional responses status from entertainment such as shopping enjoyment or pleasure to purchase a specific product.

Fourth, in general, because of limited presentations such as photographs, text descriptions or animation of products in the online shopping mall, online consumers must depend on those presentations unless having other ways to evaluate products. Hypothesis 8 is not supported. It is quite different from the results of other previous studies (McQuitt et al., 2000; Szymanski and Hise, 2000). In case of this study, most respondents made a purchase of standard products such as books, CDs. Thus, product assortments may not have a significant impact on intention to purchase because they already decided what they would buy.

## **Conclusions**

### **Summary of Results**

This study is to investigate the effects of product involvement on the selection of online shopping malls. Thus, this study formulated the research model based on theories from marketing, consumer behavior and information systems literatures. From the statistical analysis of 282 response data, it was found that consumers buying products with higher involvement tend to shop in a shopping mall with greater trust, which provide more information about their products and a wider variety of products. After all, selecting an online shopping mall can depend on consumer's involvement with a specific product. In addition, another purpose of this study was to investigate factors of shopping malls which influence the buyer's purchase intention. The results of data analysis indicate that consumers are more likely to buy in a shopping mall with greater trust, with detailed product information, and with higher entertaining contents. The results of the study indicate that the shopping malls which give more detailed product information to their customers and establish greater trust will finally lead to a higher sales revenue because more expensive products will be sold.

### **Discussions**

As we mentioned above, this study indicates that consumers are more likely to make a purchase in a shopping mall with greater trust (Gefen et al., 2000, 2003; Bhattacharjee, 2002; Palvou, 2003), with detailed product information (Hawkins, 1994; Chakraborty et al., 2003), and with higher entertaining contents (Chen and Wells, 1999; Eighmey, 1997; Koufaris et al., 2001) because testing hypothesis 5, 6 and 7 proves the significant evidences. Therefore, it is very important for online shopping malls to work out their strategies with greater trust, more detailed product information, and entertainment contents such as animations in order to attract new customers and maintain existing customers.

Although the role of involvement of offline shopping in the marketing literature has been widely conducted, few previous studies employing product involvement in online shopping contexts are found in the relevant literature. That is the reason why this study is valuable. The reason that establishes primarily focusing on product involvement in this study is that consumers' cognitive processes such as decision-making, information handling and cognitive dissonance are different in depending on product involvement when making a purchase (Robertson et al., 1984). Therefore, it does not uniformly prescribe the consequents of decision-process for a final purchase, but necessities to explain how purchase decision-process is different in depending on product involvement. Based on these findings, it can present business strategies that are suitable for each online shopping mall company.

The findings of this study revealed that consumers buying products with higher involvement tend to shop in a shopping mall with greater trust, which provide more information regarding their products and a wider variety of products. In turn, those findings can become successful conditions for online shopping mall firms to increase higher sales revenue. Meanwhile, in general, consumers with higher involvement tend to ignore things regardless of main product information because they pay more attentions to product quality, price and so forth when they make a purchase. But, our empirical result of hypothesis 3 shows the contrary to the proposed one. That is, an online shopping mall with greater trust, with detailed product information regarding a wider variety of products can be also one with higher entertainment. A possible explanation of this findings may be the followings: 1) when a consumer's involvement is high, entertainment and other factors proposed by this study have high correlation as we mentioned above. 2) As Gefen et al.(2003) stated, it can be inferred by correlation between high web site quality and high trust.

Therefore, when considering these findings independently, entertainment can be negatively related to or not related to product involvement but consumers with high involvement can be likely to find an online shopping mall with higher entertainment because an online shopping mall with higher entertaining contents may lead to be with higher trust (Koufaris, 2002). Thus, future research is needed to explore alternative operational definition of entertainment and also examined to focus on the relation between entertainment and product involvement.

In case of product assortment, it does not influence the purchase intention in this study because when consumers decide to make a purchase, they tend to search the online store with the lowest price of a specific product after considering what they buy. In addition, we mentioned above, one of the reasons is most purchasing items of respondents were non-sensory products or standard products such as books electronics and so on.

#### **Implications: Theoretical and Practical**

Our results of this study have important rhetorical and practical implications for the followings.

First, we present product involvement in consumer behavior area as the key construct in better understanding online consumer behaviors. Unless consumers in online shopping are familiar with a specific product, they have exposures to limited product presentations because they cannot make a purchase using all five senses (Eighmey & McCord, 1998). Thus, consumer-purchasing behavior in online shopping environment can be ultimately influenced by product involvement. And, in case of consumes visiting a specific online shopping mall, they visit it because of shopping mall structure, detailed information provided from web stores, product characteristics and so on. Because each consumer had different involvement regarding a product in his or her decision-process despite same product characteristics, online firms can guide right reactions of consumer behaviors to better understand consumer behavior with online shopping. To do this, IS managers and practitioners involved in an online shopping mall should develop information systems or better managing web tools that can strengthen user satisfaction and/or consumer satisfaction on the web. For examples, adequate communication tools can reach customer satisfaction and achieve systematically customer relationship management (CRM) for grasping a consumer's behavior. And also, by providing a chatting system in real-time, online firms can resolve the uncertainty about the products, so that online customers' satisfaction will be increased.

Moreover, this study academically illuminates that product involvement, which is less found in the online shopping literature, drawing from the consumer behavior literature, was examined by relationships among online shopping characteristics variables. Through these findings, it provides academic implications that are online consumers are more likely to depend on the degree of involvement regarding products as well as online shopping mall characteristics.

Second, the results of this study also show that trust and informativeness have the strongest impact on purchase intention. Those constructs are very important components on uncertain online environments in business to consumers (B2C) literatures. After all, online firms' trust and abilities to provide detailed product information are very important considerations from the online consumer's viewpoint. Controversy, online firms should also make an effort to build trust or brand reputation for increasing customer satisfaction and loyalty. To build trust of an online shopping mall, it should build its brand reputation. By establishing well-known brands or a strong brand image, the online shopping mall should be able to notify its best service activities and polices for customers to trigger customers to purchase products. Especially, since the results of the study indicate that consumers with high involvement tend to consider trust of an online store with higher information on products, it will finally lead to help increase higher sales revenue because more expensive products will be sold.

### Limitations and Suggestions for Future Research

It is important to evaluate the study's results and contributions in light of its limitations and also, need additional studies to overcome those limitations. First, the results of representative respondents may limit the generalization of our findings. It did not explain a large portion of the entire population of respondents because most respondents were in almost in their early and late 20s. Thus, future research needs to assess the generalization of the model by collecting from sample in various respondents.

A second limitation is that the study focused on relatively simple. Thus, our research model is needed to reorganize research model. For examples, it can be possible to analyze the difference between high involvement groups and low involvement group or to investigate the moderating effects of product involvement the relationships between attributes of online shopping mall and purchase intention

# Marketing in Emerging Economies of the East African Community

*Jokull Johannesson  
Ming Chuan University, Taiwan*

## Abstract

**There are many economic reasons for marketers to be interested in Africa, the Continent's growing population of 740 million, abundance of natural resources, relatively unsophisticated competitive market, and fast economic growth in the past 10 years. Africa's potential as an attractive emerging market and specifically the opportunities in the newly formed East African Community (EAC) are discussed in this article.**

## Introduction

Globalization takes companies on eternal search for market niches for their goods and services world wide. Much focus has been on emerging markets in China and South-East Asia. However emerging markets in Sub-Saharan Africa has received little attention in the academic literature; the news coverage is usually bad and, most pictures show images of war and famine. This image of Sub-Saharan Africa is deceiving and hides the fact that the region is experiencing rapid economic growth. In 2004, the region's economic growth was 4.5% and 17 of the 42 countries experienced growth above 5%, and the projections for 2005 are even better at 5.5% and 7.5% if South Africa and Nigeria are excluded. [23]

The corporate sector is taking notice of the fantastic growth opportunities in Africa as many sectors are recording phenomenal growth and profits. Retailers like Metro and ShopRite are investing heavily in the region; many international banks with operations in Southern Africa are experiencing record growth and return on investment. Capital investment is flourishing and, the number of stock exchanges has risen from seven in 1989 to 19 in 2000 and, one of them, Nigeria, was the best performing stock market in year 2000. [7] The telecommunication sector is booming and Celtel, Africa's largest mobile telephone provider is cashing in on a rise in customers from 1.4 million to 5 million in just two years.[19]

Governments are paying attention to the emerging markets in Africa and, according to the government of Thailand 2.5% of its exports worth USD2.41 billion are to Africa. More importantly, the exports grew 50% in 2004 and they are expected to grow 28% in 2005. [1]

There are more economic reasons for marketers to be interested in Africa. The continent's growing population of 740 million, abundance of natural resources, relatively unsophisticated competitive market, and fast economic growth in the past 10 years. Africa is truly a prosperous emerging market and with its resources and people Africa's potential is remarkable. [18]

The newly formed East African Community (EAC) presents an attractive market that can not be dismissed and presents attractive investment opportunities in a number of sectors such as trade, tourism, telecommunications, agriculture, fishing, mining, textiles, chemicals, electronic equipment and motor vehicles. [33] Although there are less than 10 cars per thousand in the majority of countries in Sub-Saharan Africa [8] and only 4 per thousand in Uganda, there were 30,000 new cars registered in Uganda annually from 1995 to 1999 [34] this is a market hard to ignore.

The rapid economic growth and the rise of the middle classes in the EAC particularly in Kenya and Uganda have transformed the business environment in these countries, and over the past decade dramatic structural changes in the retail sectors have taken place in the EAC. Previously, the retailing industry was primarily based on outdoor markets and over the counter stores but, now it has transformed to a large extent to self-select supermarkets, convenience stores, and large supermarkets. The fastest transformation is happening in Kenya and Uganda.

Hence, this paper seeks to shed some light on some of the issues and challenges in marketing in emerging economies in East African Community and will explore the EAC socio-economic environment, the

marketing environment, and the challenges for marketers.

The socio-economic environment is analyzed in terms of social and economic indicators and the emerging trends affecting them.

The marketing environment is analyzed in terms of: the retail environment, competition, pull vs. push marketing strategies, products, distribution and logistics, price sensitivity and elasticity of demand, and promotion. Furthermore firm strategy, structure, and rivalry are discussed as well as the role of chance.

The challenges for marketers are analyzed in terms of the socio-economic and marketing environments, and the challenges firms face in overcoming unique structural restraints in the EAC.

## **Current Socio-Economic Situation**

The EAC has a large and fast growing population of 92.8 million people and at a growth rate in excess of 3% the population of the EAC is projected to be 122 million by 2015. [37]

The Purchasing Power Parity GDP is estimated to be USD100 billion in 2004. [37, 23] However the actual GDP may be much higher because unreported income and fraud are widespread [17] and because, much of the economic activity in small agricultural economies goes unrecorded in economic statistics.

A further indication of this underestimation of the actual GDP in these countries can be observed by looking at the differential in the growth rate of the broad money supply and inflation. In the EAC, the broad money supply has been growing at average rate of 13.68% from 1997-2004 but, the inflation was at an average rate of only 5.6%. Whereas increased broad money supply over a sustained period of time should lead to inflation if the size of the economy remains constant, then the fact that inflation did not rise at par with the growth in the broad money supply indicates a growth in economic activity that has gone unrecorded. Consequently, the actual GDP of the EAC countries may be twice or as much as three times greater than has been recorded.

The real economic growth in the EAC has been 3.5-4.6% in the past 7 years at the same time the inflation rates have been modest at 4-6.6%. The domestic savings and investment rates were 11.2-13.9% and 16.5-19.6% of GDP respectively. [23]

### **Factor Investment**

The factor investment in Africa is unique as much of the capital comes from official foreign aid. In 2004, the world richer nations, mostly the United States, and EU countries, donated USD50 billion to Africa, and British Treasury chief, Mr. Brown calls on the richer nations to double their contributions. [31] In addition to this huge amount of public foreign contributions are the contributions made by foundations, relief agencies, and individuals. These contributions result in unprecedented inflow of capital and, it should be considered as a foreign direct investment as most of it goes for the development of factor conditions in the African countries. The factors being infrastructure, education, health care system, and such. In addition is the traditionally defined foreign direct investment (FDI) by corporations, which amounted to USD20 billion in 2004. [36] In comparison, the total FDI in China was USD60.6 billion in 2004. [26]

The factor investment in education and training has been significant in the nations of the EAC. The UN estimates that adult literacy rate will be 70-80% in 2005, and primary school enrollment is 100% in Uganda, somewhat less in Kenya 97% and 47% in Tanzania. Enrollment in secondary and tertiary schools is still very limited, [41, 35] which poses challenges for businesses entering the EAC because of shortage of skill workers and the resulting low productivity.

Repatriated salaries from workers working oversea, called "Keiyo," are a significant infusion of capital for the region and may exceed the regions largest export commodity.

When the development aid from governments, agencies, and private institutions, the FDI, and repatriated income are added up, then the total capital infusion into the EAC creates a fast growing emerging market for international marketers.

The following section discusses the socio-economic trends in each of the EAC countries.

Uganda has moved away from socialistic economy of absurd poverty and dependence on foreign exchange controls and inefficient state run enterprises to market driven free economy. Most of the former state own enterprises have been sold off and are now operated at a profit instead of being dependant on government subsidies and

protection. The Ugandan currency exchange rate floats although the Bank of Uganda maintains the exchange rate in certain range with direct market intervention.

In 2004, the GDP per capita was USD402 and it is expected to grow at 5.5% [15], the inflation is expected to remain at 3.5%. In 2002, official foreign aid was USD606 million, and FDI was USD274 million, the capital formation stood at 22% of GDP. The agriculture sector contributed 31% of the GDP, industry 21%, and services 46%. [35, 41]

Kenya has made similar transition to a free economy, it has progressed further and has achieved surprising success in cement, capital markets, banking, road transportation, as well as in some transport and machine manufacturing industries. The coffee, tea, and flower industries have achieved international quality standards. The Mombasa tea auction is the world's third largest in volume and the largest in terms of export. [25]

The Kenyan based Africa Online is one of Africa's premier internet service providers. The Nairobi Stock Exchange was established in 1954, and is the fourth largest in Sub-Saharan Africa. [22]

In 2003, the GDP per capita was USD437 and it is expected to grow at 1.2%, the inflation was 6.6%. In 2002, official foreign aid and grants were USD560 million, and the International Monetary Fund(IMF) resumed lending to Kenya after a three year freeze and lent the country USD252 million, [29] the gross domestic investment stood at 3% of GDP. Agriculture contributed 15% to the GDP, industry 19%, and services 64%. [41]

Tanzania begun its economic structural reforms in 1992; many state owned enterprises have been privatized, exchange controls have been eliminated, and competition increased in many sectors. Still, Tanzania is lacking behind in economic development because of stubborn attachment to obsolete communist economic policies which hamper the potential the country has in a host of economic sectors. Tanzania has large fertile land, an assortment of mineral deposits including gold, gemstones, iron ore and, natural gas and, opportunities to develop its tourism and fishing industries. Manufacturing is limited and has great potential. [38]

In 2004, the GDP per capita was USD235 and it is expected to grow at 4.3%, the inflation was 4.3% and is decreasing. In 2002, official foreign aid was USD1.2 billion, and FDI was USD240 million, the capital formation stood at 17% of GDP and agricultural sector contributed 45% of the GDP. [35]

## **History of the East African Community**

The co-operation among Kenya, Uganda, and Tanzania dates back to the time the two first countries were colonies of the United Kingdom (UK). Tanzania was German colony but, after the WWI Tanzania came under UK. Tanzania remained under UK administrated UN trusteeship until independence in 1964. Various co-operative agreements have been in force since and, include a Ugandan/Kenya Customs Union established in 1917, which was joined by Tanzania in 1927. The East African high Commission functioned from 1948 to 1961; the East African Common Services Organization was established in 1961 and it was in effect until it was succeeded by the establishment of the East African Community in 1967.

In 1977, interregional co-operation came to an end but it resumed with the signing of the East African Co-operation agreement in 1993. Since, various co-operative treaties and agreements have been initiated and lead to the formation of the East African Community, which was established July 7th, 2000 by a treaty among Kenya, Tanzania, and Uganda. The establishment of the EAC set into motion further collaborative protocols between the nations and included agreements on standards, crime prevention, establishment of free trade area, economic development strategy, scientific and technological collaboration, establishment of legislative assembly, courts, and East African customs union, which was formally established in November 2004 and with the objective of creating a customs free internal market and harmonized external tariff rates. [6, 10, 11]

## **Retail Environment in the EAC**

The emerging markets in EAC have their own particular characteristics. Therefore the success of the marketing strategy for EAC depends on the careful analysis of the traditional marketing mix elements and selecting the appropriate product, price, promotion, and distribution strategies for the EAC market.

The EAC is a relatively small market characterized by unsophisticated demand conditions. Most buyers' needs are basic but, the rising level of affluence in the EAC has increased buyers' sophistication and demands for greater selection and medium quality products.

The retail sector in the EAC has undergone a radical transformation in the last decade. The retail sector has become more formalized with significant portion of the market transformed from small shops, outdoor markets, and kiosks to supermarkets and large retail stores. Each of the EAC countries is different, so, the following section analyses the retail environment in Kenya, Uganda, and Tanzania separately.

**Kenya.** Kenya has the most advanced retail market in the EAC. Kenya has more than 200 supermarkets and Kenyan small shops number in the tens of thousands. For example, Nairobi alone has 119 independent supermarkets, and further 34 operated by supermarket chains. In addition, there are 10 hypermarkets, 5 shopping malls, and hundreds of specialty retail stores. The Kenyan supermarkets have up to 30% of the retail markets share in the country. [40, 39, 13]

The Kenyan based Uchumi is East Africa's largest supermarket chain; it has 27 supermarkets in Kenya and one in Uganda. Recently, an unknown strategic investor acquired 35% equity stake in Uchumi, the company plans to use the funds to strengthen its balance sheet and finance growth. [21] Other Kenyan supermarket chains are the Nakumatt, Tusker Mattresses, and Ukwala Group. Foreign retailers have taken notice of the emerging market in Kenya and the Metro Cash&Carry and Woolworth's have set up operations in the country. [40] In addition to the bloom in supermarket expansion other parts of the retail sector has boomed in the recent years. Franchised fast food outlets, furniture stores, petrol stations, and convenient stores have experienced an expansion bonanza.

**Uganda.** The Ugandan retail market has gone through a dramatic transformation in the past decade. In the early 1990s, most retailing was done in small shops, outdoor markets, and kiosks. Only a handful of medium size stores were in the country. Now, much of the retail operation has moved to independent small supermarkets, chains of convenience stores, and large supermarket chains.

Foreign retailers have noticed the emerging market in Uganda; the first large hypermarket was established by Metro Cash&Carry in 1998. Initially, Metro Cash&Carry operated as wholesale discount store, with a retail concept similar to the Wal-Mart's Sam's Club concept, but later changed the format and opened to the public. Additionally, Metro Cash&Carry has established a number of the smaller KwickSave supermarkets around the country. ShopRite followed suit in 2000 and has two stores; Woolworth's entered in 2002 and it has established two upscale department stores; Megasave and the Kenyan Uchumi supermarket chain are recent entries and have one supermarket each. [28]

In the mid 1990's, the petroleum import and distribution industry was liberalized, as a result the number of petrol stations has quadrupled. In 1996, Shell Uganda opened the first convenience store in the country at the Bugalobi Shell petrol station. Since then convenience stores have been set up at most petrol stations.

Additionally, foreign fast food chains and furniture stores have entered the emerging market in Uganda.

**Tanzania.** The Tanzanian retail environment is undeveloped as its development was hindered by archaic communist government policies, and the development of the Tanzanian retail market did not take off until the late 1990s when these communistic government policies were lifted. The pattern of the development of the retail sector was similar to that of the retail sector in Uganda. First, was the proliferation of small over the counter shops, then introduction of small self-select supermarkets, then establishment of larger domestic supermarkets chains- the Imalaseko and Shoppers' Plaza, and finally the entry of South African retail chains- ShopRite and PnP in 2000. In 2003, PnP pulled out of Tanzania by selling its 4 stores to ShopRite. [40] In 2004, Megasave and Usave established presence in Tanzania with one store each.

## **Marketing Mix Strategy for the EAC**

### **Product Strategy**

Prior to the recent transformation of the retail industries in the EAC, most products were sold in open markets and small over the counter stores. In this retail environment the merchants would often buy items in bulk and package the goods themselves. The recent transformation of the retailing industry to more formal retail environment such as

self-select small stores and supermarkets has led to the need for standardized products of fair or average quality but relatively few features, options, and styles to minimize cost. Trade marks and brands are important and, it is particularly important to emphasize the national origin of the product or design, as foreign designed or made products are perceived of higher quality and prestige. "Made in UK" and "Design in Japan" are particularly desirable in the EAC.

Global packaging for mass market consumer items needs not to be localized if brand names are in English. The packaging should be tailored to the needs of price conscious customer. Therefore extensive consumer oriented packaging in blister packs and in multiple sizes is a waste of money. In most cases, one or two sizes of consumer packaging and one wholesale size packaging will do. For an example, most of the cooking oil is sold 500ml or 1 liter bottles, and 3 or 20 liter jerry cans for restaurants and retailers who will sell the cooking oil in containers brought in by the customers or in ordinary plastic bags. Warranties are not provided for most products and most sales receipts carry a "No Returns" note at the bottom.

#### **Distribution Strategy**

Although the distribution channels selected depend on the goods sold, intensive distribution channels are most appropriate for most consumer goods as most customers don't have personal transportation and, therefore do most of their shopping in local stores and supermarkets.

In the EAC distribution channels were typically long and relied on multiple agents and distributors. Producers sold their production at the factory door to authorized distributors who transported the good at their own cost to wholesale markets such as the Nakivubo wholesale market in Kampala; then the retailers shopped in these wholesale markets and brought the goods to their retail outlets. In the last 10 years, the trend has been to shorten the distribution channels by direct delivery by producers to retail stores. At the same time, larger private supermarkets are purchasing goods directly from producers or importing goods and, the larger supermarkets chains have established their own distribution centers for sourcing and distributing goods.

A push channel policy is most appropriate for basic consumer goods because, most customers have limited exposure to mass promotional devices such as newspapers, radio, and TV. The emphasis on push channel strategy in East Africa concurs with the findings of researchers investigating distribution strategies in other emerging economies. [4, 30, 20] A combination of push and pull policies would be appropriate for goods targeting the growing middle class customers as they will have greater access to the mass media.

#### **Distribution Centers**

Only a few distribution centers exist in EAC. The domestic supermarket chains operate their own distribution centers; ShopRite purchased PnP's distribution center in Tanzania; and Metro Cash&Carry has a distribution center in Nairobi. In Uganda, there are no distribution centers as such and Metro Cash&Carry uses its main store at the Showgrounds as a distribution center for its KwickSave network of stores.

Warehouses. Warehouses and storage yard space are sufficient in Kenya and Tanzania. However warehouse space is limited in Uganda, particularly around the capital, Kampala, where hills make the construction of warehouses difficult. Refrigerated warehouse space is limited in all three countries. Material handling equipment is in short supply and most loading is done manually.

Location. Retail outlets need to be located close to major public transit areas such as bus and taxi parks in order to attract customers and facilitate the customer's transportation of goods to their homes as most customers do not have private transportation.

#### **Inventory**

Inventory requirements are higher in the EAC than in more developed countries because, of the long transport distances, poor infrastructure, and bureaucratic delays which all contribute to longer delivery times and frequent interruptions in supply.

#### **Road Transport**

Most road trucks are general purpose flatbed or stake-bed trucks, container carriers, and tankers. Gross vehicle weight is harmonized at 56 tons for a seven axle truck-trailer combination with maximum axle loading of 8 tons on steering axle and 10 tons on other axles. Specialized trucks are limited in number.

Demand for trucks is seasonal and related to the harvest seasons: February to end of May and September to end of December. Trucks are in short supply during the second harvest season which coincides with the surge in

demand for transportation of imports for the Christmas shopping season. Road transport rates are approximately ten US cents per ton per kilometer. Lower charges apply to exports because of a lack of freight going back to the ports of Mombasa and Dar es Salaam.

#### **Railways**

The railway system in EAC is debilitated due to government mismanagement. Only a fraction of the network actually works and when it does the system is plagued with delays and corruption. For example, Uganda has 1241 km of railways but, only 220 km of it from Tororo to Kampala is functional. [6]

There are two main railway lines in the EAC. The northern corridor is from Mombasa, Kenya, to Kampala, Uganda, with a branch to Kisumu in Kenya. The southern corridor starts in Dar es Salaam, Tanzania and goes to Mwanza on the shores of Lake Victoria where there is an onward rail ferry to Kampala. The Tanzanian railway system is important for Zambia. The cost of rail transport is slightly lower than compatible road transport.

#### **Air Cargo**

Exports by air are mainly fresh fish, fruit, vegetables, and flowers; exporters complain of periodic shortage of air cargo space and high transport charges. Exports exceed imports on most destinations except Dubai and Johannesburg. Hence import air cargo rates are one half of the export rate which was USD0.65 per kg from Kampala to London in 2003.

**Tariff Barriers.** As of July 1, 2005, external tariffs for the EAC countries will be harmonized and set at three levels according to how much the imports have been processed. Raw materials have zero tariff; semi-processed goods have 10% rate; and manufactured goods 25% tariff. [24] Internal tariffs will be eliminated with the exception of Kenyan goods which will be charged 2-25% import duty in Uganda and Tanzania according to a list of 762 items published by the EAC on January 16, 2005. The import duties will be phased out by 2010. [16]

#### **Import Quotas and Licenses**

In the past there have been various restrictions of specific imports in the EAC countries, the obvious one being on the importation of arms and ammunitions of any type. Others vary by country and the restrictions are often meant to protect an industry or a specific company. For an example, Uganda has prohibited the importation of lead acid batteries for vehicles to protect the Uganda Battery Ltd, the country's only battery manufacturer.

#### **Spare Parts and Supplies**

In the EAC most tools, parts, and production machinery need to be imported. The local sourcing of spare parts is hampered by underdeveloped spare part distribution system. Most companies of any size get their spare parts delivered directly from abroad via express courier or by have their own imported stocks.

Furthermore, there is a critical shortage of trained technicians and maintenance personnel; as a result firms initiate in-house training and apprenticeship programs. For these reasons, maintenance costs are increased and productivity of existing facilities and equipment is decreased due to extended downtimes caused by lack of spare parts and poor quality repairs and maintenance.

#### **Price Elasticity of Demand**

The customers in EAC tend to be highly sensitive to price. Hence the elasticity of demand is high and steep increases or declines in sales occur when the price is adjusted up or down.

#### **High-Midrange-Low and Discount Pricing**

Pricing strategies are the prime questions merchants face when deciding on positioning their businesses in the emerging market in EAC. Should it be the upper class luxury market, the middle class, or the mass consumer markets, the trend in EAC is lead by the international retailers(Metro, ShopRite, and PnP) which have targeted the mass market, and the low/and middle class consumers. [40]

Special discount pricing or promotional pricing is not common the EAC but, merchants who have experimented with discount pricing have achieved significant success in some instances.

#### **Negotiated Pricing**

Prices on most consumer goods are fixed. However, price negotiation is the norm on large ticket items such as electronics and home appliances, and it is considered rude if the merchant is not willing to negotiate the price and/or terms. The expected negotiation range is approximately 10% percent. Consequently, merchants adjust their pricing accordingly.

### **Seasonality in Pricing**

The price of most goods and services rises during the Christmas shopping season, which is from end of November to the end of the Christmas holiday season in the second week of January. Prices of all produce and food staples are seasonal. Transport prices are seasonal as mentioned above.

### **Export Pricing**

Merchants need to give special concerns to export pricing as the value added tax (VAT) and exercise/import duties are refundable on goods that are re-exported. Businesses are well advised to set up programs to facilitate the collection of refunds on the behalf of foreign merchants who purchase smaller quantities of goods. The firms in the EAC have re-export opportunities to: Democratic Republic of Congo, Sudan, Burundi, Rwanda, Zambia, Malawi, Zimbabwe, and Mozambique. The African Growth and Opportunity Act may facilitate export opportunities to the United States of America. [32]

### **Promotion**

#### **Advertising**

The product and the target market determine the media, timing, reach, frequency, and continuity of advertising in EAC.

The media of choice is radio as it is the most accessible medium for the general public for several reasons. First, radio listening is a low cost, most accessible, and popular mass medium for the general public. Second, in comparison to reach of other mediums the radio advertising is the cheapest alternative for marketers. Third, most people have radios on all day at home and at work. Fourth, public transport such as buses and minibuses (taxis) pipe the radio to loud speakers in the back of the vehicles for the entertainment of passengers. On the other hand billboards are common and appear to be effective in promoting brand names. News paper and TV advertising are expensive by contrast to the reach they have. The burgeoning use of mobile phone SMS messages and the opportunity to use SMS messages as an advertising medium is an unexplored opportunity in the EAC

The best timing of radio advertising depends on the product but, for mass consumer products the morning and evening rush hours are the best times because of the captive audience in the public transport system. The morning rush hours are between 7-10 in Uganda and Tanzania and 6-9 in Kenya; evening rush hours are 5-10 and 5-9 respectively.

Frequency is important and continuity is typically much longer than in developed countries.

The messages need to be localized to the languages most commonly used. In Kenya and Tanzania, Kiswahili is the lingua franca but, in Uganda most messages are in Luganda or the regional tribal languages. Messages contained in musical lyrics and sing-a-longs appear to be particularly effective.

Most of the advertising budget should be allocated to radio advertising in Uganda and Tanzania with a small portion to billboards as oppose to, radio and TV in Kenya.

### **Sales Promotion**

Contests/Sweepstakes have been used successfully by soft drink bottlers and breweries. Still, few others have adapted this method. Samplings and demonstration are rarely used. Yet, they have promising prospects as a low cost personalized medium. The issuing of warranties or guarantees is rare.

Personal selling has great potential in the EAC because, of the low cost of the local labor. Sales personnel should be recruited and trained locally and, commissions encourage performance. Though salary and commissions are most often paid monthly, employees have difficulty with budgeting that long and, weekly or biweekly payments increase moral and reduce fraud. Effective controls of stock and money are paramount because, of high levels of corruption and fraud.

Publicity and public relations. The recent trade liberation and privatizing of state owned enterprises in the region still has its skeptics and is in no form securely institutionalized. Hence, publicity and public relations as well as corporate social responsibility need to be given careful consideration and appropriate funding. Corporate sponsorship of socio-cultural events and public appearances of corporate officials are the norm.

## **Firm Strategy, Structure and, Rivalry**

Competitive strategy is mostly based on price because of the price elasticity of demand and rather unsophisticated

marketing culture.

The structure of most business is highly hieratical with multiple layers of management who exercise little decision power; most decision making is centralized in the owner or the managing director. The titles of company officers follow the British convention.

A wave of privatization has significantly reduced the government ownership of businesses. However government officials fully or partially own many businesses; the ownership is either overt or covert through agents or family members. The Asian community, who are people originating from the Indian Sub-Continent, control significant portion of economic activity in the EAC. Nairobi has the only stock exchange with active public ownership of companies and many of the companies listed are local subsidiaries of multinational companies. Still most companies in the EAC are family owned.

Competitive rivalry is low and responses to competitive behavior are slow and usually they do not materialize until sales and profits have dropped to unaccepted levels. Price collusions and cartels are common.

## **Role of Chance**

Chance events are independent of a nation and firms have limited ability to influence them. [27] Nowhere is that more clearer than in the EAC countries where chance events play significantly more role in the economies than in more developed countries. The most important chance events affecting EAC are: fluctuations in world commodity prices, policies of foreign governments and international organizations towards aid, the El-Nio in the Pacific Ocean, and war.

The EAC countries are very dependent on fluctuations in the world's commodity prices and they can create recessions or economic booms. For instance, the 11.5 percent growth in Uganda's GDP in 1995 coincided with sharp rise in world coffee prices to USD1.52 per pound which is nearly three times the average market price in 2004. Whereas coffee constitutes more than one half of Uganda's total exports any change in coffee prices is going to have major impact on the economy in the country. [34, 14]

The policies of foreign governments and international organizations towards aid and loans significantly impact the economies of the EAC. For example, the International Monetary Fund (IMF), most governments, and international institutions suspended aid and lending to Kenya in 2000. Accordingly, Kenya plunged into recession and remained there until aid and lending resumed in 2004. [29, 35]

An El-Nio in the Pacific Ocean impacts the rainfall in East Africa hence the economy. El-Nio (sometimes spelled Nino or Ninyo) occurs every 3-4 years when the ocean currents of the Pacific cost of South America change the direction of their usual flow. The El Nio normally begins at Christmas time and lasts 8-9 months [3, 12]. The El Nio changes the weather pattern in East Africa; usually, the El-Nio results in a year of drought; consequently agriculture suffers so the economies are negatively affected. After the El-Nio disappears, a year of heavy rainfall usually follows resulting in bumper crop and economic prosperity. After an El Nio occurred in 2001 many areas of the EAC were severely affected . Apparently, another El Nio has started a new drought in late 2004 causing crop failures and reduction in hydro electricity generation. [5, 2]

War and conflict have a negative impact on the economies in the EAC and the level of impact is related to the intensity of the conflict. Outright wars wreck the economies like happened in the civil war in Uganda between 1972 and 1986. An involvement in the internal conflict in other countries has significant consequences too; like happened in 1998 when Uganda got involved in the revolution in Zaire. Though the official GDP rose by 5.6% it was boosted by another sharp rise in world coffee prices to USD1.30 per pound. Meanwhile, many sectors of the economy suffered sharp decreases in economic activity and deflation. [34, 14]

Low intensity conflicts carried out by the many rebel movements operating inside the countries appear to have little effect on the economies as the conflicts are usually limited in scope and are located in remote areas where little economic activity takes place.

## East African Community in Perspective

East African Community is a sparkling example of rapidly emerging economy. Its attractiveness has thus far rested on export opportunities of basic low quality goods, vehicles and, equipment; the procurement of government contracts, fulfillment of development assistance, and sourcing of basic commodities. EAC's uniqueness as a market comes from its rapid economic growth, unsaturated market, low competitive intensity, large population, emerging middle class, trade and investment liberation, harmonized internal market, and a tariff protection of 25% on imported finished goods.

The main restraints on marketing in the EAC are: insufficient management, marketing, and technical knowledge; undeveloped financial markets, insufficient supporting industries, and corruption.

# Effects of Culture, Product Type and Price on Consumer Intention to Purchase Mass Customized Products Online

*Junyeon Moon*

*Hanyang University, Korea*

*Doren Chadee*

*University of Auckland, New Zealand*

## Abstract

Do culture, product type and price have an impact on consumer intention to buy mass customized products online? The initial hypotheses are that consumers' intentions to purchase mass customized goods online will be affected by individualism, uncertainty avoidance, power distance, and masculinity dimensions of a national culture. Also, it is hypothesized that consumers are more likely to buy mass customized search goods than experience goods, and their purchase intentions for a mass customized product will not be influenced by price premium up to some level.

Results indicate that individualism has a significant effect on the purchase intention for mass customized products. As expected price premium does not have a significant effect on the purchase intention for mass customized products, and product type has a significant effect. Also, individualism x price interaction has a significant effect. Major findings and implications are discussed.

## Introduction

Mass customization strategies have become increasingly popular in various types of businesses [13]. Mass customization involves "offering products individually customized to customers' needs" [15]. Technological developments in flexible manufacturing as well as information technologies have enabled firms to implement mass customization.

Internet and related technologies have emerged as an essential vehicle for implementing mass customization in an economical way [14, 50]. Obtaining accurate, timely, and relevant individual customer information is a key problem facing many companies trying to customize. By providing a direct connection between manufacturers and final customers, companies now have an efficient method of collecting the data they need to implement mass customization. Firms have adopted web-based mass customization to successfully market a wide range of products from personal computers, eyeglasses, bicycles, and coffee to greeting cards. For example, computer manufacturer Dell has met the diverse needs of different customers by producing thousands of different computer configurations [50].

Online mass customization may provide a new direction in the long lasting, however, not resolved debate in international marketing, which is standardization versus customization debate [21, 55]. One primary advantage argued for standardized marketing strategy over customization is a low cost, which is realized from its economies of scale in production and marketing [57]. However, a standardization approach has an inherent weakness in that it is a product orientation, rather than a customer orientation. The marketing literature has suggested that a market orientation, in which customers and competitors are the focus of a company's strategy, can lead to enhanced business performance [22, 29]. A company that emphasizes product costs can ignore differences in customer needs and preferences across countries, and become vulnerable to competitive attacks in individual foreign markets [5].

It seems that mass customization can take advantages of both standardized and customized strategies because it offers individually customized products at costs that are almost the same as that of standardized production and mass marketing. While the concept of the global, online mass customization sounds unique and exciting, it has not been validated with consumers [13].

Our understanding is very limited on consumer responses to and factors affecting consumer responses to mass customization. Therefore, we would like to examine consumer responses to online mass customization across

different cultures. More specifically, we would like to empirically examine issues that are vitally important for firms considering mass customization strategy. These issues include: How strongly do consumers intend to purchase a mass customized product? Do consumers of different cultural orientations show differential responses? Do consumer responses vary across product types? How much does a price premium of mass customized products affect consumer responses?

In the following sections we develop the research hypotheses, describe the experimental study used to test the hypotheses, report the results, and discuss the implications of the findings.

## **Conceptual Background and Hypotheses**

### **Mass Customization and Customer Perceived Value**

The essence of mass customization is to provide what a particular customer wants by transforming a standard product into a specialized solution for an individual [35]. Von Hippel [49] highlights the importance of customer involvement in designing products, as the customer has the best understanding of his or her needs. Customization of product features increases the value of the bundle of benefits that the customer receives from a product or service. Mass customization can thus enhance customer perceived value.

Customer perceived value is the difference between the prospective customer's evaluation of all the benefits and costs of an offering, and the perceived alternatives [25]. Mass customization will increase value if the increase in the value of the bundle of benefits provided by the mass customized product is greater than any incremental cost associated with it. Being value-maximizers, consumers will be more likely to purchase customized products if these products provide greater value.

Different aspects of the marketing mix elements are likely to affect customers' perceptions of the value of the incremental benefits and costs associated with mass customized products. The price premium, the type of product, the degree of personalization, and the distribution medium, for example, will affect the consumer's perceived value of the customized product. The aspects we examine include the impact of product type and price on consumer response to mass customized products across different cultures.

### **Mass Customization and Culture**

Since Levitt [26] some scholars posit that globalization has created a progressively more homogenized world market, with an increasing number of consumers from diverse geographic locations and cultural backgrounds sharing the same preferences. The view that people around the world live in a more uniform pattern has facilitated the emergence of global brands with relatively standardized marketing strategies employed across cultural boundaries [56].

Yet, other researchers report an evidence of increased divergence, especially among industrialized countries [45]. For example, in Europe, with economic union and a progression toward the standardization of the political and social infrastructure, national cultural values are strongly rooted in history, and appear to be stable over time [9]. It has been reported that consumers from different cultures have different attitudes, preferences, and values, and remain reluctant to purchase foreign products even after much exposure to globalization [42]. Cultural differences impact consumer behaviours such as attitudes and persuasion [1], diffusion of new products [43, 41], and product and service usage [53].

Accordingly, we posit that consumers respond differentially to mass customized products across different cultures. For example, New Zealand is a more individualistic, less uncertainty avoiding, less power distant, and more masculine society compared to Korea [See 18] and the difference may affect consumer responses to mass customized products differentially between the two countries.

The four cultural dimensions suggested in Hofstede are likely to be relevant in explaining cross-cultural differences in consumers' purchase intention, which is a multi-faceted concept. Individualism implies a loosely knit social framework in which "I" consciousness and individual initiative are emphasized, whereas collectivism indicates a tight social framework in which "We" consciousness and belonging to organizations and membership are emphasized [18]. People of high individualism society value a private life, individual decisions, autonomy, and variety. In contrast, people of high collectivism society value group decisions, order, and security. For example,

Chinese society has historically focused on harmony and conformity in governing all interpersonal relations, and de-emphasized personal goals [30]. On the other hand, in Europe and North America, individualism is a desirable trait worth striving for, thus seeking a mass customized product will be stronger.

Uncertainty avoidance indicates the extent to which a society feels threatened by uncertain and ambiguous situations and tries to avoid these situations [18]. Individuals of a strong uncertainty avoidance society tend to establish more formal rules and not tolerate deviant ideas and behaviours. Being different from others is not desirable, thus seeking a mass customized product will be weaker in a society of high uncertainty avoidance.

Power distance is the extent to which a society accepts the fact that power is distributed unequally [18]. In societies with a high degree of power distance, status and age are very important and generally people tend to be less innovative. It was found that the coefficient of innovation was significantly lower in countries with high power distance [51]. Consumers are less likely to seek a mass customized product in countries with high power distance.

Masculinity indicates the degree to which a society values assertiveness, achievement, and the acquisition of wealth [18]. In masculine cultures, achievement and success are more important than caring for others, and improving the overall quality of life [18]. A largely symbolic means of demonstrating achievement is by having the latest and most novel possessions [52]. The implication is that consumers are more likely to seek a mass customized product in masculine countries.

On the basis of the arguments we can posit that consumers' intentions to purchase mass customized goods online will be affected by individualism, uncertainty avoidance, power distance, and masculinity dimensions of a national culture. Therefore, Hypothesis 1 is offered as:

**Hypothesis 1a:** Consumer intentions to purchase mass customized goods online will be stronger for consumers of more individualistic country than for those of less individualistic country.

**Hypothesis 1b:** Consumer intentions to purchase mass customized goods online will be stronger for consumers of less uncertainty avoiding country than for those of more uncertainty avoiding country.

**Hypothesis 1c:** Consumer intentions to purchase mass customized goods online will be stronger for consumers of less power distant country than for those of more power distant country.

**Hypothesis 1d:** Consumer intentions to purchase mass customized goods online will be stronger for consumers of more masculine country than for those of less masculine country.

#### **Mass Customization and Product Type**

As a retail channel, the Internet provides both marketers and consumers many benefits over alternative channel formats. Most notably, it eliminates time and space barriers, and facilitates efficient consumer information search [17, 33]. Its major limitation is that Internet shoppers cannot physically experience a product at the time of purchase. Indeed, the best-selling products on the Internet are products that can be digitized or that are dominated by search attributes [37]. This Internet sales pattern is consistent with the link between product characteristics and retail store patronage that has been noted in conceptual and empirical research [2, 39, 48].

The Internet significantly facilitates consumer search but does not enable consumers to directly experience a product before purchase, so it is more appropriate for selling search goods than experience goods [6, 24]. A consumer can obtain full information on the dominant attributes of a search good without direct experience. The qualities of an experience good cannot be determined by the consumer prior to purchase or use [31, 32]. For experience goods, information search for dominant attributes is more costly or difficult than direct product experience [24, 31, 32].

Girard, Silverblatt, and Korgaonkar [12] found that consumers are more willing to shop from Internet retailers for search products than experience products. We posit that this finding will be similarly applied to other classifications of product types. That is, consumers are more willing to shop from Internet retailers for cognitive products than affective products [47], for utilitarian products than value-expressive products [36], and for instrumental products than hedonic products [16].

Would mass customization make a difference in consumer willingness to purchase search versus experience goods in online settings? We would expect mass customization to make it more likely that search products would be purchased online; besides providing consumers specific information about important attributes, mass customization ensures that the attribute specifications match consumer preferences. The potential impact of mass customization on purchase intention for experience goods is less clear. Mass customization does not let the

customer try or use a product before purchase, except for products that can be digitized. The costs associated with buying customized experience products online are also likely to be higher than the costs associated with buying customized search products. Buying customized products generally involves non-monetary costs such as additional time, effort, and uncertainty as well as monetary costs like price premium [4]. Consumers are likely to spend more time and effort in evaluating experience goods than search goods.

Participation in the process of mass customization may however, contribute toward making the consumer more comfortable with buying experience goods online. The evaluation of experience goods can be highly subjective and personal taste plays an important role in their purchase. Participation in the mass customization process may produce psychological benefits that might make consumers more comfortable in buying an experience product online than they would be otherwise. For example, consumers are more satisfied when they are allowed to specify their attribute preferences in selecting products than when they are not [20]. Participation in the mass customization process can also provide consumers some sense of control over the exchange process. Van Raaij and Pruyn [46] suggest that an increase in the sense of control should make customers more willing to buy a product.

The potential beneficial consequences of mass customization for experience products, however, appear to be limited as compared to the potential beneficial consequences of mass customization for search products. Accordingly, Hypothesis 2 is offered as:

**Hypothesis 2:** Consumers' intentions to purchase online mass customized search goods will be stronger than their intentions to purchase online mass customized experience goods.

#### **Mass Customization and Price**

It has been suggested that customers are often willing to pay a premium for customized products because their needs are better met [4]. If a company facilitates the creation of a co-production process to produce a product tailored to the customer's need and the product adds great value, the price becomes a less important factor [50]. There is less incentive for customers to comparison shop based on price.

Similarity across competing products or brands is reduced with the mass customization, and making a direct price comparison will be more difficult for consumers. Consumer search cost for price is generally low in online [3], however, the cost increases in this case. Consumer search cost for price and that for product attributes, such as product quality is a key concept in online price research. Lynch and Ariely [27] found that price competition is reduced when the cost of searching for prices is high relative to the cost of searching for product attributes. Similarly, Zettelmeyer [54] explores a scenario where firms compete with two distribution channels and control the amount of product information provided to consumers who are uncertain about their preferences. The author shows that firms can achieve finer consumer segmentation by strategically influencing search costs.

However, if the price goes up beyond a certain range, customers may begin to substitute less customised products. Consumers search for information until the marginal cost of obtaining a unit of information is equal to the marginal benefit of possessing a unit of information [44]. Thus price search will increase as the benefits of search increase. The benefits of consumer search should increase as the price of a seller's customised product goes up.

Also, the conventional wisdom is that the Internet lowers the cost of distribution and the cost of consumer search, thereby lowering barriers to entry and intensifying price competition [2, 3]. The convenience, time-saving aspects, and product matching features of online markets can increase the consumers' motivation to search price information, indicating that consumers are becoming more sensitive to price [23].

We should consider the generally negative implication of higher price as well as the positive implication of consumer willingness to pay premium price for and the reduced price comparison by mass customization. Therefore, Hypothesis 3 is offered as follows:

**Hypothesis 3:** A price premium up to some level will not affect customers' purchase intentions for mass customized products.

## Research Methods

### Experimental Stimuli

A pre-test was conducted to identify both product stimuli for search and experience goods and important product attributes to be customized. Forty seven undergraduate students at a large New Zealand university participated in the pretest.

Subjects were provided with four products including computer desks, desk lamp, sunglasses, and blue jeans. These products were selected because they are used extensively by college students and have been subjects of study in other research. The subjects were asked to rate the products on three items intended to capture the difference between search and experience goods: 1) The quality of [name of product] can be judged by web-based information; 2) the quality of [name of product] can be judged without physical examination; and 3) the quality of [name of product] can be judged without trial use. The responses used a seven-point Likert scale (1 = Do not agree at all, 7 = Agree completely).

The mean rating on the three items to identify search and experience goods was highest for the computer desks and lowest for sunglasses. We thus selected the computer desks as the experimental stimulus for the search good and sunglasses for the experience good. Computer desks (CD) and sunglasses (SG) were significantly different from each other in terms of each item's score and average score of the three items (CD = 5.93, SG = 4.67,  $t=5.16$ ,  $p<.001$ ).

For each product in the set of products, subjects were provided with eight product attributes and asked to rate the importance of these attributes for purchase. The product attributes were identified using *Consumer Reports* and student input.

To become a meaningful customization the product or service should provide attributes that customers truly care about [34]. Thus, product attributes of the two products should be important and the two sets of product attributes should not be different from each other in terms of perceived importance. Construction, height, width, and CPU storage were selected for CD and lens material, lens diameter, nose bridge length, and frame material were selected for SG. Respondents were asked to evaluate the importance of the attributes in purchasing the products. The average score of the four attributes was 5.29 for CD and 5.31 for SG, and there was no significant difference between them ( $F=0.004$ ,  $p=.94$ ).

### Experimental Design and Procedure

In this study culture is coded by the subject's nationality and hence is a within-subjects factor. Product type factor has two levels, that is, computer desks as a search product and sunglasses as an experience product. Price has three levels: same as, 15% higher and 30% higher than a standard price. The price levels were set keeping in mind customer perceptions of value. Assuming customized products better match customers' needs, customers should be willing to pay a premium price for them. They can obtain maximum value from mass customized products if they are available at a price similar to the standardized mass produced product. Thus, the same price level and two price levels at intervals of a 15 percent increase beyond the standardized price were selected.

Subjects were assigned randomly to one of the six between-subjects, experimental conditions. Subjects were told an Internet shopping mall that had developed a plan to customize products was evaluating its plan on a small scale. They were asked to assume that they happened to find an information window while surfing this Internet shopping mall. They were shown an announcement offering customers customized computer desks (sunglasses). Then, subjects were shown an ad manipulation of product type and price where they could choose from different specifications for four important product attributes. Appendix 1 shows the ad for the sunglasses.

Subjects assigned to the computer desks conditions could make choices regarding construction, height, width, and CPU storage. Subjects assigned to the sunglasses conditions could make choices regarding lens material, lens diameter, nose bridge length, and frame material. The delivery information was the same for all experimental conditions, free delivery in five working days.

### Measures and Subjects

The dependent variable, purchase intention, was measured by adapting items used in previous research [10]. The four items of the scale were: 1) I will purchase the computer desks (or sunglasses), 2) Given a choice, my friends will choose the computer desks (or sunglasses), 3) There is a strong likelihood that I will buy the computer desks (or

sunglasses), and 4) I would like to recommend the computer desks (or sunglasses) to my friends. All four items were ranked on a seven-point Likert scale (1: Do not agree at all, 7: Agree completely).

To assign scores for each of the four cultural dimensions the subject was asked to name the country that she/he was born. The cultural dimension scores for the named countries were taken from [18]. The foreigner respondents residing in New Zealand for five or more than five years were classified as New Zealand residents. Some studies report that immigrants are acculturated as they reside in a host country for more than 3 years [e.g., 40]. We adopted a more conservative rule because many studies have found little or no relationship between time of residence and acculturation [e.g., 11].

A total of 116 undergraduate and graduate students of a large New Zealand university participated in this research. In terms of nationality of origin 35 students were Chinese (30.2%), 33 were New Zealanders and no other nationality took more than 5 percent of the sample. The total number of nationality of origin was 30 in this study.

## Results

### Reliability

Cronbach alpha value was .86 for the four-item purchase intention scale and the value indicates that the scale has satisfactory reliability. The average score of the scale was computed and used in statistical analysis.

### Manipulation Checks

We compare the importance ratings of the four product attributes for the computer desks (CD) and for the sunglasses (SG) to check the manipulation for product attribute importance. There is no difference on the perceived average importance of the attributes for the two products (CD=5.27, SG=5.10, F=1.31, p=.25). Nor do the two products differ from each other on any pair of individual attributes. Therefore, we can conclude that any effect on the dependent variable is not attributable to differences in the importance of the product attributes for the two products.

The computer desks and the sunglasses were rated differently from each other on each of the three items of product type manipulation: 1) can be judged by web-based information (CD = 5.17, SG = 4.50, F = 7.45, p < .001); 2) can be judged without physical examination (CD = 4.88, SG = 4.30, F = 7.56, p < .001); and 3) can be judged without trial use (CD = 4.80, SG = 4.29, F = 6.28, p < .01). The two products were also different from each other on the average score of the three items (CD = 4.95, SG = 4.36, F = 8.98, p < .001). These results indicate that the product type manipulation was successful.

### Preliminary Analysis on Culture Effects

The dependent variable, purchase intention was regressed on the four cultural dimensions to assess the relative importance of and decide analysis procedure for the cultural dimensions. Only individualism dimension had a significant regression coefficient among the four dimensions ( $\beta=.42$ ,  $t=1.96$ ). Almost the same result was obtained when each observation was coded as either high or low on each of the dimensions as in [18] and ANOVA was conducted.

Two factors emerged with having over 1 eigenvalue when the four dimensions were factor analyzed using principal component analysis. As shown in Table 1 the first factor consists of individualism, power distance, and masculinity and explains about 55 percent of total variance. The second factor contains only uncertainty avoidance dimension and explains about 26 percent of total variance.

TABLE 1: FACTOR ANALYSIS RESULTS: STANDARDIZED FACTOR LOADINGS AND EIGENVALUE

Variables	Factor	
	1	2
Individualism	<u>.93</u>	.14
Power distance	<u>-.88</u>	-.30
Masculinity	<u>.68</u>	-.36
Uncertainty avoidance	.10	<u>.91</u>
Eigenvalue (% of variance)	2.18(54.61)	1.02(25.72)

The first factor had a significant regression coefficient at  $p < .05$ , whereas the second factor did not have a significant coefficient when purchase intention was regressed on the two factors. It seems that individualism dimension represents the effect of the four cultural dimensions on purchase intention. We may conclude that the other three dimensions do not significantly affect consumers' purchase intention or at least their direct effect on purchase intention is not as large as that of individualism.

**Tests of Hypotheses**

Table 2 shows the results of an analysis of variance model where individualism dimension, product type and price level are the factors and purchase intention is a dependent variable. For each observation's country of origin individualism dimension score was taken from and coded as either high or low as in [18].

The overall model is statistically significant ( $F = 2.76, p < .005$ ). As main factors the individualism dimension of culture is significant ( $F = 3.89, p < .05$ ) and the product type is significant ( $F = 5.08, p < .05$ ). However, the price factor is not significant at  $p < .05$ . As an interaction effect the individualism dimension by price term is significant ( $F = 3.04, p < .05$ ) and individualism dimension by product type and price is significant ( $F = 3.12, p < .05$ ).

TABLE 2: ANOVA RESULTS

Source	Sum of Squares	F	P
Model	40.00	2.76	<.005
Individualism	5.12	3.89	<.05
Product Type	6.68	5.08	<.05
Price	3.66	1.39	.25
Individualism x Product Type	1.21	0.92	.33
Individualism x Price	7.99	3.04	<.05
Product Type x Price	1.43	0.54	.58
Individualism x Product Type x Price	8.21	3.12	<.05

Table 3 shows cell means and standard deviations and Table 4 shows marginal means. Combined with the preliminary analysis ANOVA results indicate that individualism dimension of culture significantly affect consumers' purchase intention for online customized products. As predicted by Hypothesis 1a consumers' purchase intention is greater in high (3.89) than low individualism condition (3.43). Therefore Hypothesis 1a is supported, whereas Hypotheses 1b, 1c, and 1d are not supported.

Hypothesis 2 regarding product type effect is supported. As predicted purchase intention is greater in search product (computer desks: 3.92) than experience product (sunglasses: 3.40).

As shown in Table 2 price factor is not significant and a multiple comparison test does not indicate difference in any pair of the three price levels. Thus, Hypothesis 3 suggesting no price effect up to some level is supported. We can note a recognizable pattern in marginal means in Table 4, although the means are not significantly different from each other. Consumers' purchase intention goes up as the price charges 15 percent premium and then goes down as the price charges 30 percent premium.

The interaction terms show an interesting pattern. It seems that the three-term interaction effect is significant mostly due to the significant individualism x price effect. In Table 3 (See also Fig. 1) we can note that for sunglasses individualistic consumers' purchase intention is greater than that of collectivistic consumers in the same price condition (3.22 vs 3.08) and 15 % higher condition (5.00 vs 2.69). However, the magnitude of the purchase intention is reversed in 30% condition (3.00 vs 3.40). The same pattern is observed for computer desks.

TABLE 3: MEANS AND STANDARD DEVIATIONS

Individualism	Product Type	Price	Mean	Standard Deviations
High	Computer Desks	Same	4.33	.97
		15% Higher	4.12	.64
		30% Higher	3.67	1.32
		Total	4.09	1.02
	Sunglasses	Same	3.22	.83
		15% Higher	5.00	.81
		30% Higher	3.00	1.00
		Total	3.36	1.12
Low	Computer Desks	Same	3.60	.84
		15% Higher	4.00	1.00
		30% Higher	3.81	1.07
		Total	3.77	.95
	Sunglasses	Same	3.08	1.83
		15% Higher	2.69	1.31
		30% Higher	3.40	1.14
		Total	2.96	1.49

TABLE 4: MARGINAL MEANS

Individualism	Mean	Product Type	Mean	Price	Mean

Low	3.43	SG	3.40	15% Higher	3.95
				30% Higher	3.47

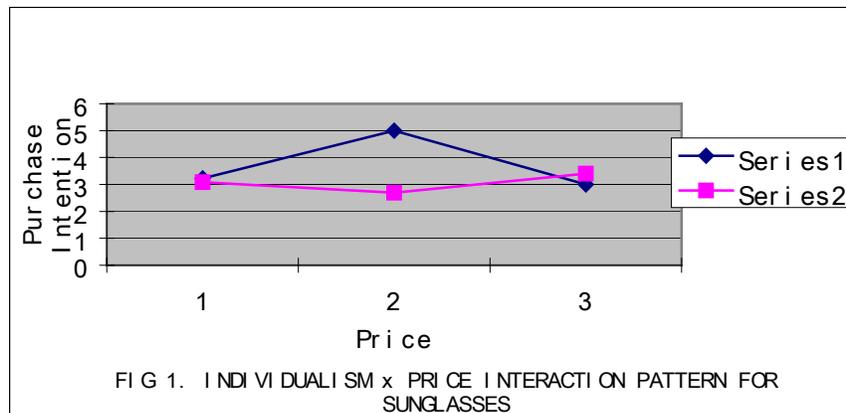

FIG 1. INDIVIDUALISM x PRICE INTERACTION PATTERN FOR SUNGLASSES

■: Low Individualism Condition ◆: High Individualism Condition

### Discussion and Conclusion

There are three primary findings of this research. First, individualism dimension significantly affected consumer purchase intentions for both the customized computer desks and sunglasses. It was found that consumers of individualistic countries are more likely to purchase customized products online than those of collectivistic countries. Also, individualism dimension is the most important factor among the four cultural dimensions in explaining consumer purchase intentions for online customized products.

This result is not surprising since extant research has reported cultural impacts in various consumer behaviours such as consumer attitudes and preferences, product and service usage, and diffusion of new products [e.g., 1, 11, 42, 43]. This research expands existing knowledge in that it empirically examines cross-cultural effects on consumers' response to mass customized products. The result implies that firms may attempt to reach consumers in more individualistic countries as a primary target when marketing customized products online. For example, New Zealand, Australia and U.S. should be better than China, Japan and Korea as initial targets.

However, the significant individualism x price interaction indicates that firms should consider varying price sensitivities to mass customized products across different cultures. Individualistic consumers tend to respond to the products more favourably than collectivistic consumers when the customized products charge the same price as or a moderate price premium up to 15% of a standard product. However, their response deteriorates considerably and their purchase intention is lower than that of collectivistic consumers when firms charge up to 30% price premium. Interestingly, collectivistic consumers' purchase intention does not decrease even at this price level. They tend to more tolerate a higher price to obtain customized benefits.

The second primary finding is that product type effect was significant. This result is consistent with extant research indicating that internet retailing is more appropriate for selling search goods than experience goods [6, 12, 24]. This result implies that the potential beneficial consequences of mass customization for experience products are limited as compared to those of mass customization for search products.

To exploit the marketing potential of the Internet, the challenge for marketers of experience goods is to make the buyers of experience goods comfortable with buying such products online. It seems that providing choice options is not attractive enough to make customers more willing to buy experience products online. Extra efforts may need to be exercised to help consumers evaluate the qualities of an experience good prior to purchase or use.

Third, price did not significantly impact consumer purchase intentions for both the customized computer desks and sunglasses. Purchase intentions were not significantly different across the three price levels. In fact, as shown in Table 4 purchase intentions increased with a 15 percent price premium, although declined in response to the 30 percent premium.

This result has two implications for the pricing of mass customized products. First, firms need to determine the increase in customer value that their customization creates and the price premium consumers would be willing to pay for the incremental value. Second, that consumers are likely to pay more for the better match provided by a customized product (although there is a limit on the price premium they are willing to pay) has important ramifications for the bargaining power between a firm and its customers. A firm loses some pricing power when it is marketing online because the Internet reduces information asymmetry between the customer and the firm; the buyer gains power [28]. The insignificant price effect we find indicates that mass customization might be an effective way to counter a firm's loss of pricing power in online settings.

It is especially beneficial to a firm when it can charge a price premium for mass customized products, but not incur disproportionate costs for the service. Technological advances have made it possible to produce personalized products at costs similar to standardized products [15]. Therefore this issue should be considered even before deciding standardization versus customization in approaching customers around the world through internet.

There are some limitations to our research, mainly that it is based on a laboratory experiment involving student subjects. It suffers from the limitations associated with laboratory experiments using student subjects, and the findings may not be generalizable to situations beyond those specified in its design.

Only two products that are familiar to students were examined and due to this limitation we cannot exclude product category-specific, idiosyncratic effects in this research. Also, only two levels of price premium, that is, 15 percent and 30 percent were examined and we might miss certain response patterns in other price ranges. Future research can examine the impact of mass customization using different product stimuli and more varying price levels.

## “ Get the Sunglasses Right for You”

Developed by Top Manufacturer!

Priced Only 15%  
Higher than a  
Standard Product!

Free Delivery  
In Five Working Days

Select freely from the following options

- ◆ Lens Material (Tempered Glass-Polycarbonated Plastic)
- ◆ **Frame Material (Metal- Plastic)**
- ◆ Lens Diameter (10 choices from 48mm to 62mm)
- ◆ Nose Bridge Length (5 choices from 13mm to 17mm)

Universiti Utara Malaysia, Malaysia*

## **Abstract**

This paper is based on a research study to assess the ICT adoption in IMT-GT region in the industrial sector, specifically the small-medium enterprises in Malaysia. The study was conducted in a form of survey research using a cross-sectional approach where a sample of SMEs representing the production and manufacturing firms listed in the Federation of Malaysian Manufacturers (FMM, 2003) were sought. Sampling technique in the form of proportionate random sampling was used by taking into account the different sample of frame sizes according to the industries (Kerlinger, 1986). A total of 200 firms were selected in which questionnaires were sent and 84 usable returns were received representing a 42% response. Results of the study showed a small number of K-Workers present in the SME firms was only 33%. There was also a low degree of technology and ICT adoption among the SMI firms with only half of the firms invested in technology and/or ICT. However, there was a positive indication towards increasing the number of K-Workers among SMEs in the study as all respondents have access to e-mails. This can be seen as a motivating factor towards encouraging more SMEs to adopt ICT and changing the way employees perform their business activities moving towards achieving the long-term competitiveness in the knowledge economy. The study indicated that the level of ICT adoption among SMEs is currently still low and in its infancy in IMT-GT region especially the four states in Northern Region of Malaysia. The survey results showed a significant contribution of ICT adoption in SMEs growth. This study found that Malaysia has comprehensive ICT support programs which include: ICT policy from the government/agency to SMEs ; access to digital infrastructure and technologies; access to network ; and access to knowledge creation.

## **Introduction**

Malaysia is fast moving towards the knowledge economy underpinned by innovation and enterprise. This can be further expedited by the small and medium industries (SMIs) known to encourage innovation, promote competitiveness, create employment and wealth across society (DTI, 1997). The SMIs can play an important role in leveraging the nation's economy by having a workforce that is highly skilled, trainable in new technology, and knowledgeable. They have the capability to be more innovative and can provide greater flexibility to the economy and encourage the creation of new jobs. They also encourage healthy competition both within the domestic market and internationally. Recent findings have shown that the small and medium industries are now going international with the help of ICT, especially the Internet, to enable e-commerce (Westhead et al., 2002).

A knowledge-based economy would require a workforce that is highly skillful, learned, possess a positive motivation and attitude, innovative and possess entrepreneurial skill to grab the many opportunities that are widely available as a result of globalization and the proliferation of advanced technology. To achieve this, greater emphasis should be given in enhancing the workforce equipped with academic credentials, technical requirements and the right skill set that can increase the work efficiency with positive attitude and creativity. These knowledge workers (K-Workers) are vital ingredients for the nation to transform itself into a knowledge-based economy.

Reports on the current scenario of human resource development of SMIs in Malaysia have not been encouraging. SMIs in Malaysia are still operating in the traditional way with mostly family-based (Hodge, 2001), using traditional and obsolete technology to produce cheap and low quality products with limited market penetration. Among the problems faced by SMIs include lacks of able personnel to negotiate fundings (Chee,

1979), lacks of expertise in using and managing technology (Raymond, 1990 and Anderson, 1987), lacks of skilled workers (Moha Asri et al., 2000), and poor user attitude towards technology (Lees and Lees, 1987).

Previous studies have shown a close relationship between the individuals and the organizations they belong. This is linked to the characteristics of human resource as contributing to the organizational development, which include: flexibility and adaptability (Waterman et al., 1994; Atkinson, 1984; Blyton and Morris, 1991); increase in individual competency (Cappbeli and Crocker-Hetter, 1996; Gorsline, 1996; Holms, 1995; Lei and Hitt, 1996); Individual workability (Arthur and Rousseau, 1996; Bates and Bloch, 1995; Ellig, 1998; DeFillippi and Arthur, 1996); and High Achievement (Sandberg, 2000). In today's era of k-economy, human resource development is focusing on the capability of individuals and the organizations adapt themselves with the latest information and communication technology (ICT). This is to ensure that the organizations are able to compete globally in accordance with the current demands. This paper attempts to make an assessment of the presence of k-workers in SMEs by examining their usage of ICT and other related technology.

#### **IMT-GT Region in Malaysia**

The concept of the Indonesia-Malaysia-Thailand Growth Triangle (IMT-GT), first mooted in 1990, has spurred regional cooperation in economic activities and boosted development by exploiting the complementary functions and comparative advantages of the participating nations. The three IMT-GT areas combined offer a wealth of resources and a consumer base of 21 million people, both a source of labour and a ready market for goods and services.

The four Northern States of Malaysia, the five provinces of South Thailand and the two northern provinces of Sumatra, Indonesia, form one sub-regional growth area of the ASEAN region. This study focused on Malaysia's four Northern states which include Perlis, Penang, Kedah and Perak. These states provide potential domestic market access around 4.9 million population. The states profile is exhibited in Table 1

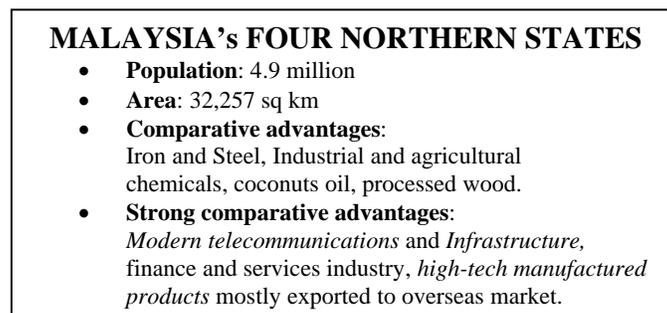

FIGURE 1: STATE PROFILE IN NORTHERN REGION

The growth of Small & Medium Enterprises (SMEs) in the four states has a very encouraging economic growth in northern regions in Malaysia.

#### **Government Plans and Focus in ICT Policy**

Malaysia intensified its commitment towards the Information and Communication Technology (ICT) in the early 1990s with the setting up of the National Information Technology Council (NITC). The NITC is an advisory group chaired by the Prime Minister to drive the use of ICT as a strategic technology for national development.

The government is backing its ICT vision with a serious financial commitment. In the Eighth Malaysia Plan (2001 – 2005), RM5.2 billion (US\$ 1.37 billion) or 5% of the government budget has been allocated for ICT development. This budget includes government computerization, flagship ICT applications and projects to reduce the digital divide.

Malaysia's ICT strategy took on a more focused, balanced and structured approach in 1996 with 2 main programs: The National IT Agenda (NITA) and the Multimedia Super Corridor (MSC).

NITA provides a framework to utilise ICT to transform the entire Malaysian society into an information society, then to a knowledge society and finally to a values-based knowledge society. NITA views ICT development

from three angles – people, infostructure and applications – with the concept that with the relevant skills, infrastructure and tools, people are able to use ICT to develop society.

NITA's socio-economic approach includes the provision of grants to communities and the Small and Medium Enterprises (SME's) that want to implement pilot ICT projects such as E-community. Recognizing the need to involve all Malaysians in the NITA process, NITC launched the Demonstrator Application Grant Scheme (DAGS) in 1998 to fund and develop e-communities by encouraging Malaysians to participate in and utilise the opportunities made available by ICT.

The MSC on the other hand, predominantly focuses on the economic and industry development. It envisions the creation of an oasis for ICT companies to make Malaysia a multimedia hub. The MSC is primarily a top-down, centrally coordinated project designed to act as a catalyst for ICT industries and products by attracting and nurturing hi-tech companies. Besides enacting the first set of Cyber and convergence laws, and establishing the institutional market framework such as the Ministry and Commissions for Energy, Communications and Multimedia and the venture capital industry, MSC also tenders out Flagship projects such as the Smart School, E-Government, Multi-purpose Smart card and Telemedicine.

Under the Multimedia Super Corridor (MSC) plan, seven major flagship applications were identified to create awareness and to spearhead the ICT development within the nation. These flagship applications include; E-Government, E-Procurement, Project Monitoring System, Generic Office Environment, Human Resource Management System  
E-Services, Multi Purpose Smart Card, Smart School, Tele-health, R & D Clusters, E-Business and Technopreneur Development.

Both NITA and MSC are part of a bigger national vision to become an industrialized nation by 2020, with ICT and knowledge as the main drivers of growth. It's comprehensiveness include aggressive HR development, boosting public spending in R&D, and incentives to attract the right FDI's, in an attempt to move from the manufacturing-base to knowledge-base economy.

In Malaysia, the national ICT strategy is very crucial to enhance SMEs growth and Malaysia government has given clear direction in ICT policy to support SMEs development. Generally, all IMT-GT group countries have ICT strategy such us promotion to ICT content and human capacity building in order to create knowledge society and ICT environment (See Table 1).

TABLE 1: MAJOR ITEMS OF ICT STRATEGY OF IMT-GT COUNTRIES TO PROMOTE SMES GROWTH

ICT Strategy	Malaysia	Thailand	Indonesia
1. Private Sector Initiatives	X	X	X
Promotion of software industries	n.a	X	X
Promotion of ICT venture companies	X	n.a	X

### ICT Adoption in the SMEs

In the developed countries, an increasing number of SMEs are adopting ICT in their effort to develop a competitive advantage and maintain their position in the marketplace. A study in the UK found that all small firms with less than 100 employees adopt ICT using at least one PC to support their business (Dahalin and Golder, 1998). Lees and Lees (1987) found that the reasons small firms adopt ICT are to improve operational procedures, to produce information at a lower cost, to make available new management tools for decision making, to facilitate billing and invoicing, to facilitate business growth, to facilitate inventory control, and to be innovative. The benefits derived include better record keeping, timely, accurate, and expanded information, improved customer service, increased productivity, and enhanced management control and decision making. This many benefits may have prompted many SMEs to adopt ICT.

However, studies have also shown that SMEs generally have end-users with low level of computer literacy and received elementary formal education. In addition, SMIs also lacked qualified ICT personnel, no specific policy and planning on ICT adoption, lack of formal IS methodology, lack of end-user participation and minimal technology diffusion throughout the firm (Montazemi, 1987). It is also the intention of this paper to assess the level of ICT adoption of the Malaysian SMEs in terms of the end-users, ICT personnel, education and training, and the types of technology and ICT products used.

### Methodology

The study was based on a field study in the form of a survey research using a cross-sectional approach where a sample of SMIs representing the production and manufacturing firms listed in the Federation of Malaysian Manufacturers (FMM, 2003) were sought. The size of the firms chosen was based on the definition of small and medium industries as suggested by Abdul Aziz Latif et al. (2000) that specify a firm with full-time employees of not exceeding 150. Sampling technique in the form of proportionate random sampling was used taking into account the different sample frame sizes according to the industries (Kerlinger, 1986). A total of 200 firms were selected in which questionnaires were sent and 108 returns were received. Out of this 24 firms have more than 150 employees hence they were discarded from the sample and the remaining 84 firms were deemed usable representing a 42% response.

Questionnaires with self-address stamped envelopes were sent to the selected firms based on the FMM list together with a cover letter describing the aims of the study and instructions on filling the questionnaire. A supporting letter from the Ministry of Science Technology and Environment (MOSTE) was also included to support the study and to encourage better response. The 42% rate of return was considered good as it far exceeded the typical response reported by other studies involving SMIs which was between 10% to 20% (Palvia et al., 1994; Lai, 1994; Raymond and Bergeron, 1992).

Data entry was carried out using SPSS within which a database of the returns was created. Data analysis was then carried out using descriptive statistics on the firms' demography, manpower requirements, Advance Technology and ICT adoption, and training.

## Findings

Table 2 presents the distribution of the firm's demography and background information. Part I of the table shows that almost three-quarter of the sample firms are Malaysian owned with 50% fully Malaysian and 21.4% owned majority by Malaysian. The remaining 28.6% of the sample is foreign owned with less than 50% local equity. In terms of location, half of the sample is located in Penang, and the remaining 28.6% in Kedah and 21.4% in Perak. Penang is an industrial state with high concentration of industries particularly in Prai whereas in Kedah a new industrial area has been developed in Kulim. Together, both these areas formed the majority of the sample firms in this study with 71.5% respondents. In terms of the firms' size, more than 90% of the sample firms employ between 50 to 150 employees. All small firms with less than 50 employees are located in Perak.

TABLE 2: DISTRIBUTION OF THE FIRMS' DEMOGRAPHY AND BACKGROUND INFORMATION

	Frequency	%	Cum. %
I. Ownership			
Fully Malaysian	42	50.0	50.0
Malaysian owned (> 51% local)	18	21.4	71.4
Foreign owned (< 50% local)	24	28.6	100.0
II. Location			
Kedah	30	28.6	28.6
Pulau Pinang	54	50.0	78.6
Perak	24	21.4	100.0
III. Number of Employees			
Less than 50	6	7.1	7.1
50 to 150	78	92.9	100.0

Table 3 shows the background information of the respondents. The instruction has specifically requested the employer or his/her representative to respond to the questionnaire. It is assumed that the respondents of this study are the key people in the firm. Managerial level personnel made up the majority of the respondents with 57.1%. However, in terms of job category, operational level personnel made up the largest group with 42.9%. This was followed by the top level management with 35.7% and middle level management with 21.4%. Overall the distribution of respondents was divided almost equally among the three levels of job category. It was interesting to observe that all the top level management executives owned a university degree with a significant majority (60%) have post graduate degrees. A majority of the middle level management also has a tertiary education and two-third of the low level management have diplomas and first degrees. Only one-third in each of the middle and low level management categories were school leavers. Chinese made up the largest respondents with 64.3%. This is followed by Indians with 21.4% and Malays with 14.3%. A closer look at the data also revealed that all the top management respondents were Chinese.

TABLE 3: BACKGROUND INFORMATION OF THE RESPONDENTS

	Frequency	%	Cum. %
I. Job Category			
CEO/Top Management	30	35.7	35.7
Managerial/Professional	18	21.4	57.1
Clerical/Operational	36	42.9	100.0
II. CEO/Top Management Qualification			
Post Graduate	18	60.0	60.0
First Degree	12	40.0	100.0
Diploma	0	0	100.0
High School (STPM/SPM)	0	0	100.0
III. Middle Level Management Qualification			
Post Graduate	0	0	0
First Degree	12	66.7	66.7
Diploma	0	0	66.7
High School (STPM/SPM)	6	33.3	100.0
IV. Lower Level Management Qualification			
Post Graduate	0	0	0
First Degree	6	16.7	16.7
Diploma	18	50.0	66.7
High School (STPM/SPM)	12	33.3	100.0
V. Race			
Malay	12	14.3	14.3
Chinese	54	64.3	78.6
Indian	18	21.4	100.0

Table 4 shows the manpower requirements of the sample firms categorized according to managerial level, technological skill and IT skill. Manpower requirement at the managerial level showed high percentages of current fulfillment of manpower across the three levels with the lowest level scored the most at 94.5%. This may suggest that the SMEs in the sample currently have almost fulfilled their manpower requirements in terms of filling the job vacancies across all levels of the firm. There is a higher demand for manpower at the higher managerial level both currently and five years down the line. However, greater job demands are expected in the future in all three categories, perhaps due to anticipation of high staff turnover and company expansion due to the recent economic recovery.

TABLE 4: MANPOWER REQUIREMENTS

	% Fulfill Current	% Fulfill Future
I. Managerial Level		
Top Level Management	88.9	72.2
Middle Level Management	88.9	72.2
Lower Level Management	94.5	77.8
II. Technological Skill		
Skilled Worker	88.9	55.6
Semi-skilled Worker	83.3	55.6
Unskilled Worker	88.9	61.2
III. ICT Skill		
Computer Engineer	22.2	33.3
Computer Support Specialist	16.7	33.3
Systems Analyst	27.8	16.7
Database Administrator	27.8	33.3
Desktop Publishing Specialist	11.1	16.7

Data on technological skill suggests requirements for all categories of skilled and unskilled workers are currently almost being fulfilled. However, the future may see an increase in the demand for skilled and unskilled workers as the percentage of manpower requirements for technological skills decreases. This is even worse in the skilled and semi skilled categories which may suggest higher staff turnover among these categories as anticipated by the respondents.

In terms of ICT skill there is an overall shortage of ICT manpower requirements across all categories of IT professionals as shown in Table 4 above. The worse is Desktop Publishing Specialist with

only 11.1% meeting the current manpower requirement. Computer Support Specialist is next with only 16.7% fulfilling the current demand. This is followed by Computer Engineer at 22.2%, Systems Analyst and Database Administration both at 27.8%. Similarly the shortage of IT manpower in the future is anticipated to remain with only slight increase in the percentage. However, the demand for Systems Analyst is expected to increase in the future as the percentage of fulfilling the manpower requirement for this category decreases as suggested by the 16.7% drop from 27.8% as shown in Table 4.

Data on technology adoption also shows an overall low level of automated technology used by the SME firms in the sample (see Table 5) The use of fully automated high-technology products ranges from 5.6% to as high as 22.2% of the respondents. The use of high-technology products at 22.2% includes Computer Aided Design (CAD), Automated Inspection and Testing Equipment (AITE) and Material Requirements Planning (MRP I). This is followed by the use of Numerical Control/ Computer Numerical Control/ Digital Numerical Control (NC/CNC/DNC) machines at 17.6%, Automated Storage and Retrieval System (AS/RS) and Computer Integrated Manufacturing (CIM), both at 16.7%, and robot technology, Automated Material Handling System (AMHS), Just-in-time (JIT) and Manufacturing Resources Planning (MRP II) at 11.1%. Among the lowest usage of fully automated high technology products were Flexible Manufacturing Cells/ Systems (FMC/FMS) at 5.9% and Material working laser at 5.6%.

TABLE 5: USAGE OF ADVANCES TECHNOLOGY PRODUCTS

High-Tech Products	Usage (%)			
	Manual & Semi-Automated	Fully-Automated	Not Used	Plan to Acquire
<b>Stand Alone Technology</b>				
• Engineering & Design Technology				
- CAD				
- CAPP	33.4	22.2	44.4	
• Machine, Fabric & Installation	18.8	6.3	68.8	6.3
- NC/CNC/DNC				
- Robots	5.9	17.6	58.8	
- Material working laser	16.7	11.1	72.2	
	16.7	5.6	77.8	
<b>Intermediate Technology</b>				
• Material Control				
- AS/RS	33.3	16.7	50.0	
- AMHS	38.9	11.1	50.0	
• Inspection & Testing Equipment				
- AITE	38.9	22.2	38.9	
<b>Integrated Technology</b>				
• FMC/FMS				
• CIM	35.2	5.9	58.8	
• MRP I	33.4	16.7	50.0	
• JIT	33.4	22.2	33.3	11.1
• MRP II	55.5	11.1	27.8	5.6
	38.9	11.1	22.2	27.8

Most of the respondents also did not indicate any plan to acquire these high-tech products in the future, with the exception of MRP II, MRP I, Computer Aided Process Planning (CAPP) and Just-in-time. This clearly indicates the use of high technology products among the SMEs is still in its infancy stage. Table 4 shows the usage rate of the high technology products of the participating firms in the sample. It is also interesting to observe that the percentage of high technology products not used was also high across all categories, especially in the Machine, Fabric and Installation category such as Material Working Laser, Robots and NC/CNC/DNC machines; Engineering and Design Technology category such as CAPP; Integrated and Flexible Manufacturing category such as FMC/FMS, CIM, MRP I and MRP 2, and Materials Control category such as AS/RS and AMHS. Even for JIT, the most used high-tech product

according to the survey indicates quite a significant proportion of respondents not using the product with 33.4% of the respondents. Even so, those who use JIT are largely not using a fully automated product with more than half of the respondents indicated having a manual or semi-automated JIT product. This clearly indicates that the use of fully automated high technology products in the SMIs is still very low.

Table 6 shows data on ICT adoption among the sample firms. Based on 100% usage of e-mail it can be deduced that all the SME firms in the sample owned at least one PC. This may suggest that ICT is now pervasive among the SMEs in Malaysia. However the adoption of the other ICT products is still low with varying degree of usage. The most popular is Word Processing with 66.7% of the respondents indicated using the software fully. This is followed by Spreadsheet at 61.1%, Database at 44.4%, and to a lesser extent Accounting at 27.8%, Finance at 22.2%, Scheduling at 16.7%, Sales at 12.5%, Human Resource Management and Material Control at 11.1%, and Project Management at 5.6%. None of the firms however indicated computerizing the Purchasing system fully. Despite having PCs connected to the Internet by virtues of the 100% usage of e-mails, only 27.8% of the firms in the sample have their own websites. The data clearly indicates the current level of ICT adoption among the SME firms is currently still very low despite the many opportunities for increased ICT sophistication.

TABLE 6: ICT ADOPTION

IT Products/ Application	Usage (%)			
	Manual & Semi-Automated	Fully-Automated	Not Used	Plan to Acquire
E-Mail		100.0		
Word Processing	33.3	66.7		
Spreadsheet	38.9	61.1		
Database	56.6	44.4		
Accounting	72.3	27.8		
WWW (website)		27.8		72.2
Finance	77.8	22.2		
Scheduling	83.3	16.7		
Sales	87.6	12.5		
HR Management	61.1	11.1	27.8	
Material Control	89.9	11.1		
Project Management	61.1	5.6	33.3	
Purchasing	100.0	0.0		

An important characteristic of a K-Worker is the capability of the employees in adopting ICT to perform their duties and responsibilities. Firms are also obligated to provide the necessary training in order to increase their employees' ICT competency. Table 7 shows the distribution of the K-Worker ICT skill, ICT Training needs and ICT Budget allocation on the sample SMEs.

TABLE 7: ACQUISITION OF ICT SKILL, ICT TRAINING NEEDS AND ICT BUDGET ALLOCATION

	% Acquired	% Not Acquired	% Plan to Acquire
Employees with ICT skill (K-Worker)	33.3	66.7	
ICT Training needs	50.0	27.8	22.2
ICT Budget Allocation	77.8	22.2	

Table 7 above shows that only one-third (33.3%) of the sample SMEs have k-workers, that is employees with the necessary ICT skills and using the IT products in carrying out their job functions. Despite the low percentage, half of the sample have acquired ICT training. This suggests that not all who went for ICT training would eventually end up acquiring the ICT skill. In terms of budget allocation for ICT, majority of the firms (77.8%) did set aside budgets for ICT expenditure. Though this was encouraging, the data suggests the actual impact of IT to the employees was not fully realized even though firms were supportive in terms of providing the financial and training support in order to promote ICT.

## Discussion and Conclusion

The development of human resource is to ensure contribution to sustainable productivity for continued economic growth. In line with that, this study provides an assessment of the development of human resource based on the application of information technology in the industrial sector, specifically the small-

medium enterprises in Malaysia. Awareness by the industrial sector in adopting ICT and other advanced technology is important in order to generate higher value-added economy.

This study has shown a large vacuum exists for well-educated skilled manpower in the areas of IT and other high technology in the industrial sector particularly the SMEs. This may not be favorable in today's era of k-economy where the need for progress in high technology development and IT is in high demand in order to facilitate globalization. The findings reveal a low level of IT manpower and a low technology adoption among the SMEs. The requirements for skilled human resource in ICT and other technologies are still not adequate to meet the demands of the industry. One distinguishing feature that can be highlighted based on the facts presented in this study is the accessibility of e-mails by all the respondents in the sample. This seems to be the likely trend that is currently prevailing all over the world. These findings also indicate that workers are familiar with computers and can use computers to access their e-mails. Motivating them further to use other tools and technology within similar computing environment should not be a difficult task compared to other past employees who had developed computer phobia.

In addition, it is suggested that the relevant training programs should be given to the relevant employees and firms should also be encouraged to support re-training to address the issues of trainees not being adequately trained. In addition, firms should consider introducing incentives to encourage more ICT literate employees and likewise, the government may consider giving subsidy in terms of tax incentives, etc. on training programs to encourage SMEs to invest in training.

With the current capability of ICT, further research and development works should be carried out to determine the best usage of the technology to help facilitate training, either through computer-assisted learning and instruction, e-learning and/or using virtual reality and other modeling and prototype development. An easy to use and user friendly software as a training aid will allow in getting more people into ICT, hence producing more knowledge workers capable of utilizing the right tools and technology to carry out their work.

# Strategies for Effective Management of Supply Relationship by Ancillary Industries in SME Sector

*Vishnuprasad Nagadevara  
Indian Institute of Management, India*

## Abstract

Developing a healthy relationship between the suppliers and their client companies is critical to effective functioning of the firms. An interesting relationship emerges when the supplier is a SME firm but, a single supplier and the client is a large corporation, but a single buyer. Nevertheless, the SME supplier needs to manage the relationship with the client company and adopt appropriate strategies for maintaining such relationship. The usual irritants in maintaining the relationship are the modalities of price determination, frequency of orders, quality, payment terms and exchange of information. This paper analyzes the strategies adopted by the SME suppliers with respect to these factors in light of prior commitment of the client company.

## Introduction

Developing healthy relationship with the suppliers is critical to the effective functioning of the firms. Over the past few years, many large firms substantially reduced the number of their suppliers. This trend obviously means that there are certain suppliers who are exclusive to the client company. Under such circumstances, an interesting relationship emerges, when the supplier happens to be a small or medium enterprise, and the client company is a large corporation. The SME supplier, being the only supplier or one among two or three suppliers, operates from a monopoly position. At the same time, the client company is the only buyer or one among two or three clients of the SME. Hence it is in a position of monopoly buyer. In such a situation, neither the supplier, nor the buyer is able to take advantage of their monopoly position. Even though the supplier operates as a monopoly, it remains at the mercy of the client company because the client company is the only buyer. At the same time, the client company is averse to leverage its monopoly buying position because of the fact that the supplier is the only supplier and it is not easy, if not impossible, to switch over or develop a new supplier in the short run. The relationship becomes more interesting when the supplier happens to be a small or medium company and the client happens to be a large corporation. In such a situation, the SME supplier needs to manage the relationship with the client company and at the same time derive the maximum from the relationship. There are certain principles enunciated to maintain the relationships between the suppliers and the client companies. They should attempt to integrate their activities in their attempts to improve quality [4]. It was also suggested that the suppliers and the client companies should be motivated to initiate opportunities for product and process innovations. Both the SME supplier and the client company need to maintain a symbiotic relationship, even though there are a number of points where the interests of the two conflict with each other. "While customers are seeking more collaborative relations through supply chain management, the supplier behavior may only be instrumental compliance rather than cultural change premised on deep-seated values. The SME supplier may only be responding to a relationship of unequal power and the reality of supply chain management may be very different from the theoretical concepts of integration and collaboration" [1]. Developing a healthy relationship with the suppliers is critical to the effective functioning of the firms [3]. Over the past few years, many large firms substantially reduced the number of their suppliers. This trend obviously means that there are certain suppliers who are exclusive to the client company. The primary reason is that the corporations are becoming leaner, and the procurement function is becoming more centralized. As outsourcing of operations is becoming more and more common, more opportunities to partner with suppliers are arising. Maintaining this partnership and managing the relationship is becoming increasingly important for several reasons [3].

Various strategies are adapted by the SMEs to manage the supply relationship. This study identifies the factors influencing the relationship and the strategies adapted by the SMEs in managing the relationship. Initially,

in-depth interviews on various aspects of relationship management were carried out with a limited number of SME suppliers. The information gained out of the interviews is used to identify various parameters that govern the relationship between the SME supplier and the client company. Based on the results of this exploratory study, a detailed questionnaire was prepared. Data was collected from a larger sample of SME suppliers using the questionnaire. Data was collected from the SME firms spread over three states namely, Tamilnadu, Karnataka and Pondicherry. Only the firms, which supply to one or at most two client companies, were included in the sample. The exploratory study has identified the following as important factors in managing the relationship between the supplier and the client [2]:

- Initiative to start the SME
- Modality of price determination
- Regularity of orders
- Quality
- Payment terms and
- Business intelligence

The data obtained from the larger sample in the second phase of this study is analyzed to highlight the impact of the above factors in the supply relationship.

### **Profile of the Sample Firms**

As mentioned earlier, data was collected from a total of 110 firms spread over 3 states. These sample firms were distributed as follows: 59 from Hosur in Tamilnadu, 40 from Pondicherry and 11 from Bangalore in Karnataka. The average age of the firms was about 14 years. Forty percent of the sample firms were less than 10 years old and about 20 percent were between 10 and 15 years old, where as another 28 percent were more than 20 years old. In other words, the sample firms are well established and had been doing business for considerable period of time.

Of the 110 firms in the sample, 42 are partnership firms, 27 are privately owned and 39 have personal ownership in an individual capacity. One firm is incorporated as a private limited company and the other is registered as an association involving physically challenged persons. About 70 percent of the firms operate a single unit and another 21 percent operate two units where as the remaining 9 percent operate 3 to 6 units for production. Similarly, 30 percent of the sample firms work a single shift where as another 44 percent work double shift with the remaining working 3 shifts. The average number of employees is about 31 and more than 60 percent of the production is supplied to a single client. In that sense, these firms could be clearly classified as ancillary units.

### **Analysis**

Many of the entrepreneurs have started the firms on their own Initiative and there are 80 such firms. Few entrepreneurs have been encouraged by the client company to start the unit and 18 fall in this category. Another 11 entrepreneurs had been working in some other company as an employee and later became an entrepreneur by starting the unit. Among the 110 entrepreneurs in the sample, 38 had managed to secure a commitment from the client company before starting the unit. These firms are classified as Category I. Another 68 firms started without any prior commitment, but managed to secure the relationship with the client after starting the unit. These firms are classified as Category II firms. The remaining 4 firms had started with a commitment from a particular client, but shifted to the present client. These firms are classified as Category II firms. Since there are very few firms from Category III in the sample, most of the analysis in this paper is with respect to the Category I and Category II firms.

#### **Technology for Production**

Only 35 percent of the firms had a commitment from the client before starting the unit where as the remaining 65 percent had received the commitment after starting the unit. The commitment from the client company plays a major role in the technology used for production. Table 1 presents the distribution of the sample firms, in percentage terms, with respect to various aspects of technology used. It can be seen from Table 1 that majority of those who have started on their own initiative had obtained the commitment of the client where as almost 95 percent

of those who were encouraged by the client had the commitment before starting the unit. In other words, the client's commitment is completely associated with the encouragement. Similarly, prior commitment of the client led to obtaining the technology from the client as demonstrated by a majority of the firms falling in this category. On the other hand, those who had obtained the commitment later had obtained the technology either on their own or from a common source. Similar linkages are observed with respect to up-gradation of technology as well as any specific technology required by the client. When the firm shifted its supply from some other client to the present client, the technology is predominantly obtained from a source recommended by the client. This behavior is not very uncommon in the sense that the client company's prior commitment is usually tied to the technology to be used by the supplier. Similar is the situation with respect to up-gradation of technology.

TABLE 1: DISTRIBUTION OF THE SAMPLE FIRMS BASED ON TECHNOLOGY RELATED ISSUES

Characteristic	Detail	Commitment of client			Total
		Before starting	After starting	Shifted to present client	
How did you start?	Own Initiative	21.25	75.00	3.75	100.00
	Encouraged by Client	94.44	5.56		100.00
	Working for some other Company	36.36	54.55	9.09	100.00
Technology for manufacture	Provided by the client	58.82	41.18		100.00
	Obtained by the firm	25.37	70.15	4.48	100.00
	Common source of technology	31.82	63.64	4.55	100.00
Up gradation of Technology	Provided by the client	63.64	31.82	4.55	100.00
	By the firm	27.06	69.41	3.53	100.00
	By one recommended by client	50.00	50.00		100.00
When Client needed specific technology	Provided by the client	46.94	51.02	2.04	100.00
	By the firm	25.00	71.67	3.33	100.00
	By one recommended by client			100.00	100.00

### Order Placement and Pricing

The prior commitment from the client plays a major role in the distribution of orders to a particular ancillary or across many ancillaries. As shown in Table 2, 35 percent of the Category I firms had the entire order placed on them only. Even when it is distributed across different firms, it is mainly to provide enough capacity utilization to all the ancillary firms and the distribution is generally based on the capacities. On the other hand, the clients seem to place the orders based on their whims with respect to the Category II firms. There are equal number of Category II firms where the entire order is placed on them. This could possibly be because these are the only firms supplying the components to the client. On the other hand, the pricing strategies of the client companies seem to be very similar across the two categories of firms. About 35 to 40 percent of the sample firms reported that client companies resort to collaborative pricing where the client company and the ancillary supplier together decide on the price. Less than 20 percent of the sample firms indicated that the client companies resort to tendering process through competitive bidding and then decide on the supplier based on the lowest quotation. The practice of forcing the lowest bid (quotation) on other suppliers do not appear to be very common. The practice that appears to be more common is to invite quotations through competitive bidding and then negotiate the appropriate price with individual firms.

TABLE 2: ORDER PLACEMENT AND PRICING PRACTICES

Characteristic	Detail	Commitment of client			Total
		Before starting	After starting	Shifted to present client	
How are orders given?	Entire order to us	35.14	29.41	25.00	31.19
	Split between us and others to provide work for all	27.03	13.24	25.00	18.35
	Distributed based on capacities	21.62	26.47	50.00	25.69
	Based on clients whims	16.22	30.88		24.77
Total		100.00	100.00	100.00	100.00
Price is based on	Competitive bidding	18.42	17.91		17.43
	Bidding followed by negotiation	39.47	40.30	25.00	39.45
	Lowest bid forced on us		7.46	25.00	5.50
	Collaborative pricing	42.11	34.33	50.00	37.61
Total		100.00	100.00	100.00	100.00

Costing exercise plays an important role in determining the price. If the costing information is shared between the supplier firm and the client company, the processes of negotiation as well as the collaborative pricing strategies become easier. Interestingly, little more than two thirds of the sample firms carry out a costing exercise. But, only one-third of such firms share the costing information with the client. On the other hand, the remaining two-thirds of such firms use the costing exercise for their own information. In about 10 percent of the cases, the client gets involved in the costing exercise. More than 75 percent of the firms use the costing information for determining the prices or bid levels as well as for negotiations with the client company.

As shown in Table 3, many of the clients do not share their costing information with the supplier firms. This percentage is much higher with respect to the Category II firms. Also, the clients provide indirect indication of the upper and lower limits in terms of their costing so that the supplier firms can take it into account while determining their own price levels. In other words, there appear to be more exchange of information between the client and supplier firms with respect to the Category I firms. There does not appear to be any difference between the Category I and Category II firms with respect to the payment. Almost 75 percent of these firms appear to receive the payment within the specified period. Only about 8 percent of the firms had to wait for payment until the client company itself sells its products. On the whole, the receipt of payments does not appear to be a major irritant between the supplier firms and their clients.

TABLE 3: COSTING INFORMATION AND PAYMENTS

Characteristic	Detail	Commitment of client			Total
		Before starting	After starting	Shifted to present client	
In your relationship with the client	Client does not share costing information with us	38.71	66.04	75.00	56.82
	They are open about their costing and margins	38.71	30.19	25.00	32.95
	Client tells us the upper and lower limits	22.58	3.77		10.23
Total		100.00	100.00	100.00	100.00
When do you receive payment	Within the period specified	71.05	76.12	75.00	74.31
	After prolonged follow-up	18.42	16.42	25.00	17.43
	After the client sells his product	10.53	7.46		8.26
Total		100.00	100.00	100.00	100.00

### Diversification and Expansion

Expansion and diversification of operations is an indicator of the success of the supplier firms. More than 75 percent of the sample firms have expanded or diversified their operations. There is a slight variation in the percentage of firms that have either expanded or diversified in the two categories. About 82 percent of Category I firms have expanded or diversified where as the corresponding percentage is about 72 percent in the case of Category II firms. Table 4 presents the details with respect to expansion of the sample firms.

The prior commitment of the client has played a major role in the expansion decisions of the firms. Majority (76 percent) of the Category II firms have expanded to supply to other clients where as almost 50 percent of the Category I clients expanded to supply to the same client. The increased level of operations of the client company provided the thrust for expansion for 67 percent of the Category I firms where as the corresponding percentage for Category II firms is 53 percent. One of the differentiating factors between the Category I and II firms is the expansion initiative owing to other clients. Almost one third of the Category II firms expanded because of other clients where as only one-fourth of Category I firms fall in this segment. Interestingly, two thirds of both categories of the firms are able to supply to other clients after expansion. In other words, even though the expansion initiatives are due to the original client to start with, the firms that have expanded have started supplying to other clients, there by reducing their dependency on a single client. This is true even with the firms, which had prior commitment from the client. Needless to say, these firms are supplying more to the original client.

TABLE 4: DETAILS WITH RESPECT TO EXPANSION

Characteristic	Detail	Commitment of client			Total
		Before starting	After starting	Shifted to present client	
Reasons for expansion	to supply to the same client	48.39	20.00	50.00	30.59
	to supply to other clients	45.16	76.00	50.00	64.71
	to get economies of scale	3.23	4.00		3.53
	to enter the market directly	3.23			1.18
Total		100.00	100.00	100.00	100.00
Initiative for expansion is	client has increased his level of operations	67.74	53.06	50.00	58.33
	because supply from others have come down	6.45	10.20		8.33
	other clients are interested	25.81	36.73	50.00	33.33
Total		100.00	100.00	100.00	100.00
Because of expansion	our costs have come down	12.90	8.16	25.00	10.71
	we are able to supply to other clients	64.52	69.39	50.00	66.67
	we are able to supply more to the client	19.35	10.20		13.10
	Our quality has improved	3.23	12.24	25.00	9.52
Total		100.00	100.00	100.00	100.00

Almost all the firms that have diversified had done so within related products. Less than five percent have diversified into un-related products. The details of the diversification are presented in Table 5.

A large majority of the sample firms have diversified to provide forward linkages. 82 percent of Category II firms had gone in for diversification with forward linkages where as this percentage is only 62.5 percent for the Category I firms. One of the interesting aspects that arise among the sample firms is that a larger percentage of Category I firms had gone into diversification to supply to some other client as compared to the Category II firms. In other words, even though these firms have prior commitment from the clients, the diversification and expansion strategies had been to reduce the dependence on a single client. Similarly, the percentage of Category II firms that had gone into diversification in order to enter the market directly, i.e., without depending on any single client is higher as compared to that of the Category I firms. It should be remembered that these firms were started without

any prior commitment from the client and consequently, the tendency to increase the client base and there by reducing the dependence is much higher. Diversification does not appear to have a major impact on costs in both the categories of the firms. On the other hand, both categories felt that their quality had improved because of diversification. A higher percentage of Category I firms felt that they are able to negotiate better because of diversification, as compared to the Category II firms.

TABLE 5: DETAILS OF DIVERSIFICATION

Characteristic	Detail	Commitment of client			Total
		Before starting	After starting	Shifted to present client	
Diversification provided	Forward linkages	62.50	82.14	50.00	73.91
	Backward linkages	12.50		50.00	6.52
	Both	25.00	7.14		13.04
	Neither		10.71		6.52
Total		100.00	100.00	100.00	100.00
Diversification is mainly to	Supply to the same client	25.00	20.69	50.00	21.28
	Supply to some other client	68.75	58.63	50.00	63.83
	To market directly	6.25	20.68		14.89
Total		100.00	100.00	100.00	100.00
Diversification has actually	Reduced the average cost of production	31.25	30.77	50.00	31.82
	Increase the average cost of production	25.00	15.38		18.18
	no impact on the cost	43.75	53.85	50.00	50.00
Total		100.00	100.00	100.00	100.00
Because of diversification	More competitive on pricing	25.00	7.14		13.04
	Quality has improved	43.75	57.14	50.00	52.17
	Negotiate better with the client	31.25	35.71	50.00	34.78
Total		100.00	100.00	100.00	100.00

### Quality Initiatives

Very often, the quality initiatives of the supplier firms are dictated by the client companies. More than 50 percent of the Category I firms have ISO 9000 or similar quality initiatives. The corresponding percentage for the Category II firms is only 40 percent. The higher percentage of Category I firms could be because of the insistence by the client companies. Similarly, the supply of raw material is one factor in determining the quality of the final product. Most of the sample firms obtain the raw material from their own supplier. One-fourth of the Category I firms obtain their raw material from a supplier identified by the client and the corresponding figure for the Category II firms is less than 10 percent. About half of the sample firms have their own in-house testing facilities for the raw material. On the other hand, almost 25 percent of the Category II firms do not bother to get the raw material tested. There appears to be a significant difference between the two categories of the firms when it comes to testing the final product. While large number of Category I firms (62 percent) test the final product before dispatching, only 44 percent of Category II firms do such testing. On the other hand, about 40 percent of the Category II firms reported that the client tests the entire product before accepting, where as only 25 percent of Category I firms reported such testing.

Providing required training to the employees is an important aspect in ensuring quality. Large number of the Category I firms in the sample provide training at their own premises. Only 13 percent of the Category I firms do not provide any training at all to their employees where as 21 percent of Category II firms fall in this group. Even though many firms in the sample do provide training, there is no specific schedule for such training.

Sharing of information is an important aspect the relationship between the supplier firms and the client companies. Table 6 provides the details of sharing of information on various aspects. Almost two-thirds of the firms, which have prior commitment from the client, routinely share their production plans with the client companies. On the other hand, only 43 percent of the Category II firms share their production plans with the client companies. Similar is the situation with the client sharing their market information with the supplier firms. Only a few clients share their costing information with the supplier firms. Even within those few, the proportion of Category II firms reporting such information is much lower than that of the Category I firms. Similarly, very few clients of Category I firms change the requirements after placing the order as compared to those of the Category II firms. There is not much difference between the two categories of firms when it comes to sharing of future plans as well as giving the annual requirements in advance to the supplier firms.

TABLE 6: DETAILS OF INFORMATION SHARING BETWEEN THE SUPPLIER FIRMS AND CLIENT COMPANIES

Characteristic	Detail	Commitment of client			Total

## Conclusion

The data collected from 110 SME supplier firms indicates that those firms, which started with a prior commitment of the client companies, manage to maintain a better and positive relationship with the client companies. At the same time, those which started on their own but received the commitment after starting the unit have to resort to different set of strategies to maintain the relationship. In addition, these firms tend to expand or diversify their activities in order to supply to other clients and thereby reducing their dependence on a single client. These companies use their costing information for obtaining better prices from the client companies. Even though costing is done by majority of the supplier firms, the sharing of costing information is not very common. Also many firms without prior commitments from the clients make sure that the product supplied by them is of high quality by testing the entire production before dispatch. Ultimately the prior commitment or lack of it by the client companies appear to have an impact on the strategies adopted the supplier firms in managing their relationships with the client companies.

# **The Impact of Venture Capital on the Italian SMEs Development In the Search for a Comprehensive Model**

*Mariantonietta Intonti  
Luca Petruzzellis  
University of Bari, Italy*

## **Abstract**

**Despite the strong concentration process in the Italian banking system in the last decade, new areas of support for local SMEs can be explored beginning with two Italian features: the presence of small and medium banks and of new investors in venture capital. An efficient network of local banks, closer to SMEs needs, requires new medium-long range financial forms for innovative firms, especially in high-tech, such as venture capital and private equity. In this paper the financial needs of the Italian SMEs are analysed and, in the end, a theoretical model is proposed in order to measure the impact of venture capital.**

## **Introduction**

Market globalisation and the creation of the EU present new challenges that need to be faced successfully in order not to be excluded from the competition. In this context Italian SMEs are dynamic in terms of exports and management approach but show some problems from the financial point of view. Despite the strong concentration process in the Italian banking system in the last decade, new areas of support for local SMEs can be explored beginning with two Italian features: the presence of small and medium banks and of new investors in venture capital.

Local banks must act on the weaknesses, such as small size, deep territorial rooting and the focus on local industries, turning them into strengths, such as higher flexibility, new technologies and outsourcing, in order to cover niche areas, not covered by the big banks.

Italian SMEs have always faced a poorly distributed financial system, with strong informational asymmetries and lack of intermediaries able to bring them closer to the new funding channels. An efficient network of local banks, closer to SMEs needs, requires new medium-long range financial forms for innovative firms, especially in high-tech, such as venture capital and private equity.

In this paper the financial needs of the Italian SMEs are analysed (par. 2) in terms of capital debt and capital risk, especially regarding the innovative finance forms of venture capital and private equity (par. 3, 4 and 5). Moreover, the role of small banks is observed in relation to their link to the local territory and its economic development. Finally, this paper also investigates the opportunity to develop an organisational venture capital model that better fits the situation in Italy, in the way it can foster the local economy and act as a means of place marketing in attracting further investments (par. 6).

## **Financing SMEs growth strategies**

Globalisation has challenged the competitiveness formula of firms and, sometimes, the surviving of small firms, especially when economies of scale and technology are considered the main competitive factors. The internationalisation process pushes SMEs to extend their strategic approach towards foreign markets, shifting from simple exportation (namely the commercial dimension of internationalisation) to foreign expansion through agreements and partnerships without risk capital contribution, or FDI in joint ventures or subsidiaries.

This process is influenced by external factors, such as global communication and transport infrastructures, enlargement of financial markets, information & communication technologies to reduce transaction costs, space and time limits, and market liberalisation, which have forced SMEs to change perspective and seek new growth tools.

As globalisation enlarges the markets, new banking systems empowered by IT, are lowering the global market entry barriers. This allows SMEs not only not to be excluded from global competition but also to play a new proactive role in it. In conclusion, technology, together with finance, switches the management approach from local to global (Audretsch, 2003).

Finance proves to be the potential constraint for SMEs expansion (Ang, 1992; Avery, Bostic & Samolyk, 1998). In fact in lacking transparent disclosure, SMEs are less able to send credible signals to venture capitalists, banks, or trade creditors; that is to say limited access to external funds due to informational asymmetries. Consequently, the difficulty in gaining external capital hampers SMEs' accumulation of revenue-generating assets and potential growth (Storey, 1994; Deakins, 1996). The financial source typologies follow the SMEs lifecycle, since most SMEs rely on internal sources of funds in their early years of operation (Ou & Haynes, 2003); as they grow in size and age, they ought to have better access to external sources of funds. The financial growth cycle that results is influenced by firm size, industry type, owner age, and organisational form.

Given that most of Italian production is carried out by SMEs which represent the biggest share of national export, their role in the whole economy is obvious. However, it should be noted, that Italian SMEs are basic exporters, in the sense that to serve foreign markets they depend on buyers, export companies and foreign importers, thus the commercial and the international marketing organisation is one of the main weaknesses of the Italian system. Since globalisation involves production qualification throughout the whole process and customised relation with the segment to be served, a fully structured, international-oriented organisation is necessary, that allows easy access to markets and, most of all, to the information necessary to innovate (Lanzara & Gatti, 1997; Gurrieri et al., forthcoming).

Therefore, Italian SMEs choose to position their unique outputs in a very definite segment, being rule maker/breaker more than rule taker in the international arena (Hamel & Prahalad, 1996). Competition is played on competences, avoiding the dimension factor in the competitiveness formula. The SMEs niche growth model requires the creation of networks among firms, banks and institutions at a local, national and global level.

In the international competition Italy has to face the European competitors and NICs, whose dynamism underlines lagging behind of Italy in taking the opportunities derived from new international markets. In fact, Italy shows a strong performance as an exporter rather than as a foreign investor. Above all, SMEs have a strong orientation to export and competitive assets based on industrial districts and family capitalism, but the industry-based competitiveness, inherited from the past, is a limit to the economy's globalisation negatively impacting the whole country-system.

The high information costs, the high risk of sunk costs in installing foreign settlement, the lack of human and financial resources to manage complex situations and transnational organisations, are factors that contrast a firm's international behaviour and cause vicious circles, hampering global entrepreneurship and collection of information on international markets.

The point to stress is that (Mariotti & Piscitello, 1999, p. 17):

- SMEs can gain growth opportunities only by developing their distinctive resources and competences (Prahalad & Hamel, 1996), activating a complementary process to the growth of at home activities;
- SMEs are forced to delocalise their activities abroad because of different comparative advantage (e.g. labour costs, commodities, raw materials), insufficient infrastructures and other externalities.

Research (Mutinelli & Piscitello, 1997; Mariotti & Piscitello, 1995; Cominotti, Mariotti & Mutinelli, 1999) has shown that the capacity to bear high information costs is a function of firm dimension; moreover, they can be reduced by territorial externalities through partnerships with domestic operators. It has also been proven that industry characteristics and geographical destination play a significant role on SMEs concentration process.

The Italian model of "investing" abroad results from a poor tendency and capacity to set up abroad, either through partnerships and agreements or through FDIs. Contrary to the classic internationalisation model (Caves, 1982; Penrose, 1959), international integration and new competitive advantages are the key concepts on which Italian success is based. However, the firms approach tries to balance the efficiency and costs of resources with the growth strategies in new markets, such as the enlarged European Union and the NICs. In this scenario SMEs

succeed in boosting the national system, developing an international culture in managers and entrepreneurs (Gurrieri et al., forthcoming), and stressing the importance of investing abroad to gain competitive advantages.

The complex exchange process of firms— which also involves FDI, commercial & trade agreements, licensing, know-how transfers – [1], requires an integrated supporting strategy that coordinates all the players involved and all the different financial tools (i.e. export credit, innovative finance, project finance, corporate finance, local bank financing, equity finance, and venture capital).

As for the data on Italy's international performance (ICE, 2004), almost all the SMEs are seeking new markets, mostly to spread the costs of R&D, design and production on many markets in order to survive; they try to combine new market opportunities with low production costs. Unfortunately, this is an occasional activity: it is not based on an accurate analysis of the opportunities and of the best production combinations.

So far the traditional model for entering the international markets, namely export, grants SMEs such flexibility to take the various opportunities, replacing them with others once exhausted. On the other hand the process of structuring the internationalisation model is obvious. It is important to have more stable structures, to invest in new competences and new international paths; that is why the whole value chain is involved and the banking system plays a significant role in fostering the natural flow of value.

To confront the strategic deficit, it is necessary to reduce the gap between a firm's needs and the offer of services supporting internationalisation, requiring information collection and supply, product and corporate promotion on foreign markets, assistance and consultancy, and training. Therefore an integrated business system should be created in which all the players collaborate to gain and distribute value.

In Italy the banking system is involved in a re-engineering process in organisation and management oriented towards a network of multinational alliances. However it is far from such standards of expertise, culture and organisation to strategically support its customers in the global competition. In fact, Italian SMEs face great difficulties in finding financial resources and very often have been cut off from the new financial circuits because, on one hand, of their weak structure and, on the other, of the complex national banking system.

However, the competitive international environment draws an unfavourable scenario for SMEs, due to their constant undercapitalisation, the lack of venture capital and the high level of borrowing.

Even though the concentration process that occurred in the Italian financial system in the last years, the availability of banking services increased due to a substantial rise in the number of branches which has risen from 16.500 to 29.200 (+76%) [2]. Acquisitions, rather than mergers, do not cause the disappearance of the acquired bank; so even though the number of banks does not decrease, the acquired local bank has in fact disappeared having become part of the distribution network of the bigger group.

Despite this local banks can develop strong relation with local firms due to their territorial rooting and long-running business relations, that boost the capacity to build personalised relationships with the customers through a generally motivated staff, a fast decision-making process, and a good knowledge of production and of individual operators.

Nevertheless these strengths are not sufficient to ensure, by themselves, the long-term success of local banks' support to SMEs. However local banks, acting on the opportunities represented by technology, globalisation and outsourcing, can turn the traditional weaknesses, such as small size, territorial rooting and focus on local industries, into new success factors, namely the ability to manage environmental complexity together with SMEs higher flexibility.

In particular investments in venture capital also help the industrial system development by selecting companies with a high growth rate, giving them the necessary tools for development. This can help in strategically managing the life cycle, especially in the most delicate phases (start up and development), in order to develop new products and new technologies, to expand liquid assets, to fund acquisitions or to strengthen the financial structure.

The SMEs can benefit from these new types of financing not only for the higher availability of financial sources, but also in terms of executive support to management and of reduction in informational asymmetries. However, since the main dimensional advantages for SMEs are given by independence and control, given that utility for an SME includes issues concerned with personal autonomy, lifestyle, family and the style of business, for a large proportion of SMEs the loss of managerial control and the consequent threat to personal autonomy leads to an aversion for equity finance, while very few SMEs satisfy requirements for entry into the venture capital market

(Mason and Harrison, 1999). Unfortunately, bank supplied finance is the main form of external provision within the small business sector.

## **Innovative Forms of Financing: Venture Capital Investment**

SMEs financial needs can be satisfied by new forms of financing, different from loan finance, such as venture capital investment from financial intermediaries or specialised players (European Communities, 2001). Venture capital investment is a branch of private equity activity and consists in financial resources provided by professionals who invest, alongside management, in young, non quoted, rapidly growing and innovative enterprises, with risk capital or near-equity instruments, such as mezzanine finance or subordinated loan finance. These companies have the potential to develop into significant economic contributors (Zara, 2003a). [3]

Therefore, since it is possible to segment the venture capital market on the basis of different stages of target enterprise life cycle, or on the basis of its specific needs, there can be different types such as “seed financing” and “start-up financing”, “early stage financing”, “expansion financing” or “development capital”, “replacement capital”, “buy-out operations” (“management buy-out and buy-in”, “leverage buy-out”), “turnaround financing” and “bridge financing” (AIFI & PricewaterhouseCoopers, 2000; Bottazzi & Da Rin, 2002).

Common factors to all these segments are the acquisition of temporary participations in enterprises with a medium-long term perspective and the aim to support their development, obtaining a capital gain when the participation is sold. Another typical characteristic is that in venture capital financing the backer gives not only financial support, but also an intangible contribution such as know-how in management and strategy development.

Far from being simply passive financiers, venture capital investors foster growth in companies through their involvement in the management, strategic marketing and planning. They are often entrepreneurs first, and financiers second. So venture capitalists have a proactive role in guiding, leading and growing the companies they have invested in. In addition, they can create synergies among the various companies they invest in, by attracting mergers or acquisitions providing liquidity and exit for the company’s founders.

The venture capitalist shows his particular characteristics depending on the kind of operation, on enterprise needs and in the stage of the enterprise’s life cycle. Specialised players operate in the cases of high tech firms, or strongly R&D ones, developing SMEs, and property restructuring. Instead banks are involved either directly, by buying a participation in a specialised closed-end fund, or indirectly, informing specialised players, receiving a fee for the service. In the case of official listing, i.e. temporary buying of low risk equity participation, the bank can give support for the organization of the emission and placement phases (Zara, 2003b).

Therefore, in the Italian financial system, either Italian or foreign financial or non financial intermediary firms can be considered venture capital operators. In majority stakes acquisition, the most frequent backers are industrial companies and foreign closed-end funds that have management skills and technological know-how. As regards minority stakes acquisitions, the backers are generally financial intermediaries and Italian closed-end funds that are aimed at financial return of the investment, not directly interested in management and oriented to drive the firm towards direct financing forms (e.g. official listing).

The Italian law on banking has imposed precise and different limits for banks on the acquisition of equity participations in non-financial enterprises [4]. Because of these, it is simpler for banks to operate in the venture capital sector, through the promotion of closed-end funds or through business relationships with them, rather than to proceed to an organizational restructuring for direct operation in it.

In addition, also specialised players can operate in this sector: closed-end funds, business angels and “enterprise incubators” [5]. Closed-end funds are nowadays considered the most important venture capital player and are the second channel for the banks to participate in this sector, after the direct shares acquisition in enterprises. In fact, the majority of legal Italian closed-end funds are managed by a firm belonging to a banking group. Since the main characteristic of the closed-end fund is the right to be refunded only at predetermined expiry dates, the fund manager can rely on a defined and stable liability, which fits well with venture capital investment. Business angels are wealthy individuals who invest in start-ups. Sometimes groups of business angels provide legal and organizational support to the target firm. Lastly, the “enterprise incubators” are private or public operators who

contribute to the support of the early stages of the enterprise, offering management assistance, rooms, offices and various services. In Italy they are mainly Polytechnics.

In many operations, venture capital financing is subdivided in several stages which are linked to the firm achievement of defined targets or “milestones” (Szego, 2002). This technique, known as stage financing, is one of the most effective means that venture capitalists can use to reduce the uncertainty of business success. Stage financing repartition reduces exposure of the venture capitalist to the total risk of the operation, as the backer can obtain the option of renouncing the project at every defined step and also as every new step of financing is conditional on the production of specific information about the business trend. In conclusion, stage financing is, for venture capitalists, a monitoring means on venture-backed enterprise: each stage represents an opportunity for checking suitability between reached and planned results. In addition, the implicit threat that venture capitalists exercise on the firm through the right to renounce the project at every defined stage is an incentive to correct and efficient behaviour and to reduce the risk of financing.

Professional venture capitalists also mitigate the risk of venture investing by developing a portfolio of young companies in a single venture fund, or co-investing with other professional venture capital firms.

The process of seeking investment commitments from investors is typically called “fund raising”. The fund will seek commitments of capital from institutional investors, foundations and individuals who seek to invest part of their portfolio in opportunities with a higher risk factor and commensurate opportunity for higher returns. Because of the risk, length of investment and illiquidity involved, this type of investment is generally out of reach for the average individual, since the minimum commitment requirements are so high. The venture fund invests in selected companies also by co-investment or syndication, and is called “disbursement”. It will provide capital and management expertise and will usually also have a seat on the company board to ensure investment success.

The venture capitalist, depending on the investment focus and strategy of the venture firm, will seek to exit the investment in the portfolio company within three to five years of the initial investment. Types of exit may be:

- initial public offer: this is the preferable way of cashing in their investment. It consists in the offer of corporate stocks to the public on the stock exchange.
- merger or acquisition of the company by either the original founders or another company;
- trade sale: sale of the firm to another company, typically a large competitor;
- write-off: consists in writing-off a non-performing company.

As regards the first procedure, the creation of a (the) New Market was particularly important in spreading venture capital activity in Italy. Recent regulations stated that for enterprises who have carried out the activity for less than three years, each shareholder venture capitalist, at the listing moment, has to hold at least 10% of equity capital for at least the previous 12 months. The existence of markets with these characteristics contributes to endowing the sector with good exit opportunities from investment and, in this way, support its development possibilities.

## **Venture Capital to Support SMEs Development: Some Italian Experiences**

The resistance of firms, especially family businesses, in finding financial resources through selling equity participation to external investors is well known. Families that have control of the business, very rarely accept new shareholders and prefer to find new resources by loan financing (Ferri & Inzerillo, 2002). However, from the economic point of view, only risk capital can absorb any shock affecting the enterprise, reducing the risk of insolvency.

The conviction that venture capital operations could be a growth opportunity for Italian SMEs, otherwise remaining under-sized, has induced the Italian market (i.e. private operators and public authorities) to take measures to promote and diffuse risk capital investment.

In addition to Aifi, the National Association of Venture Capitalists, which aims to develop, co-ordinate and represent Italian venture capital firms in institutional bodies, the following have to be considered: 1) the Ministry of Productive Activities that created the Simest (Italian Society for enterprises abroad) to manage 5 venture capital funds operating in the Mediterranean area, the Middle East, the Balkans, Russia and China and support the

internationalisation of SMEs; 2) Sviluppo Italia, the national agency for enterprises and inward investment development, which has the mission to promote, accelerate and diffuse industrial and productive development.

The Simest was created in 1991 as a joint stock company controlled by the former Ministry of Foreign Trade, that has 76% of equity participation. Its shareholders include banks, firms and businesses and trade associations. It was created to support entrepreneurs, specially SMEs, in all aspects of business internationalisation, by two main activities: the support to investments abroad, in non-EU countries, and commercial trade promotion.

As regards investments abroad, the Simest, as a member of the European Development Finance Institutions (EDFI) and on the basis of the law 100/90, underwrites up to 25% of the capital of foreign companies in which Italian enterprises have shareholdings, helps Italian enterprises to buy shareholdings in foreign companies and manages venture capital funds.

A direct equity participation of Simest in a foreign company, in which an Italian enterprise already has a shareholding, is the condition for the Italian firm to obtain contributions for interests accrued on financial intermediate loans. The Simest incentive takes the form of buying minority shares in joint ventures set up abroad (outside the European Union) by Italian companies, and of an interest subsidy on contracted loans.

In order to promote investment in particular geographic areas, Simest manages public funds of venture capital that can also buy a share in joint venture abroad. Venture capital participation cannot exceed twice the amount of Simest participation, and together they cannot exceed 49% of the firm capital. The Simest venture capital funds develop investments in many non-EU countries and have often specific conditions reserved for SMEs.

Sviluppo Italia has the mission to promote the country's productive development in three ways: the FDI's attraction in Italy; the support to corporate creation and development; the support to Public Administration for local development programs. The agency supports firm creation and development by the acquisition of temporary minority stakes, by lending at market conditions and by managing a network of enterprise "incubators", that help in creating new SMEs. The acquisition of share participation in firms happens at the moment of capital increase, in minority form (that means up to 30% in grown-up enterprises and up to 49% in SMEs) and is temporary (for about 5 years). Medium-long term loan financing at interest rate and collateral market conditions, can be granted as well as the venture capital financing.

The capital risk intervention is usually preceded by a corporate valuation process, based on a business plan and on the medium term economic and financial forecast. Having passed the evaluation step, Sviluppo Italia requires its members to be on the company board of directors and boards of auditors, and be involved in the balance sheet certification and the drawing up of periodical reports on business trend. Exit terms and timing are defined with the majority shareholder and generally involve the equity participation repurchase from the company. Alternatively, but less frequently, it is possible to sell the participation to outside parties or on the stock market.

In addition to temporary minority equity participation, it is possible to seek other kinds of business support, so-called near-equity, such as the underwriting of convertible or cum-warrant bonds. The possibility of having various kinds of intervention improves the impact with SMEs, that are not often available to open their equity capital to external operators, at least in a first phase.

In conclusion, the presence of company incubators linked to Sviluppo Italia helps the creation of SMEs by supplying them with complete support in the start-up period, consisting in availability of equipped space, in real and financial services and location.

## **Italian Venture Capital Market Dimension: Recent Facts and Figures**

The recent evolution of the Italian venture capital market (AIFI, 2003; AIFI, 2004; Benincampi & Salvini, 2003; Di Giorgio, 2001; Di Giorgio & Di Odoardo, 2002) shows a discontinuous trend: the two-year period from 1999-2000 registered an exceptional boom of venture capital investment, followed by a decrease during 2001, because international economic situation was affected by September 11 and by subsequent stock market weakness. The year 2002, on the contrary, showed a slight resumption of the sector, a signal of the renewed market trust. 2003 was an important year for the development of the Italian venture capital market, since the total amount invested was higher than three billions euros [6]. (see Fig. 1)

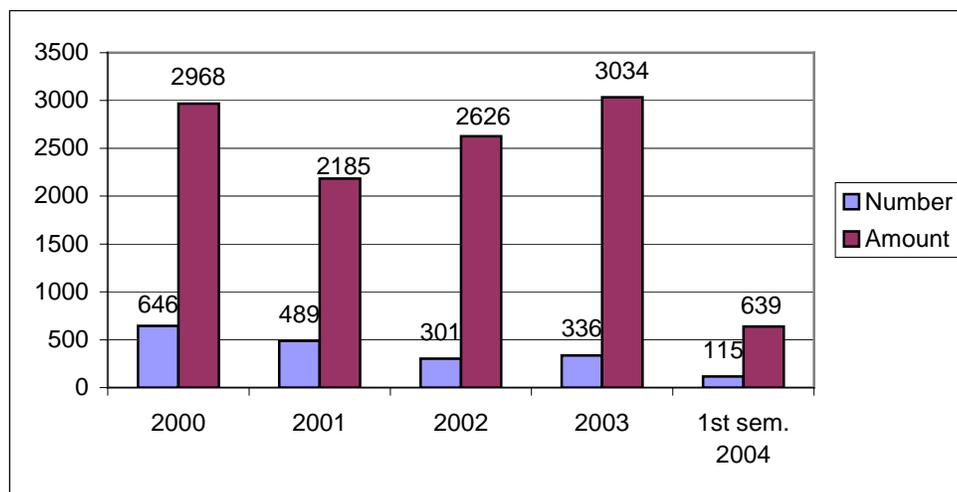

FIG. 1: EVOLUTION OF THE INVESTMENT ACTIVITY  
Source: AIFI (2004)

The data are influenced not only by big buy-out operations, which occurred in the second half of the year as unique in the European scenario, but also by financing operations finalised both at the development of already existing firms (expansion financing), and, for the first time since 2000, at supporting the start-up of new businesses. Considering the target firms' location, an increase in investment in foreign firms was registered, symptom of a growing internationalisation of national venture capital players, but also of a shortage of internal enterprises worthy of support.

In 2003 the venture backed Italian firms were mainly concentrated in the North of the country (84% in number, 97% in financing amount) while in the Centre (11% in number, 2% in financing amount) and in the South (5% in number, 1% in financing amount) they decreased, although the number of regions involved by venture capital players increased (see Fig. 2).

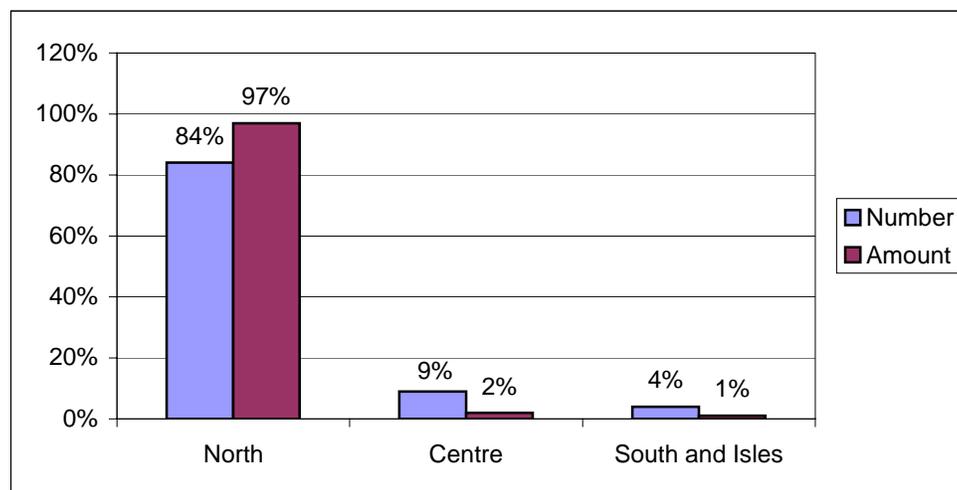

FIG. 2: GEOGRAPHICAL DISTRIBUTION OF THE INVESTMENTS IN 2003  
Source: AIFI (2004)

Considering the economic sectors, the venture capitalists were directed to consumer goods, manufacturing and industrial products and services, while operations in the high-tech sector decreased, both in terms of number of operations and financial resources (see Fig. 3) [7].

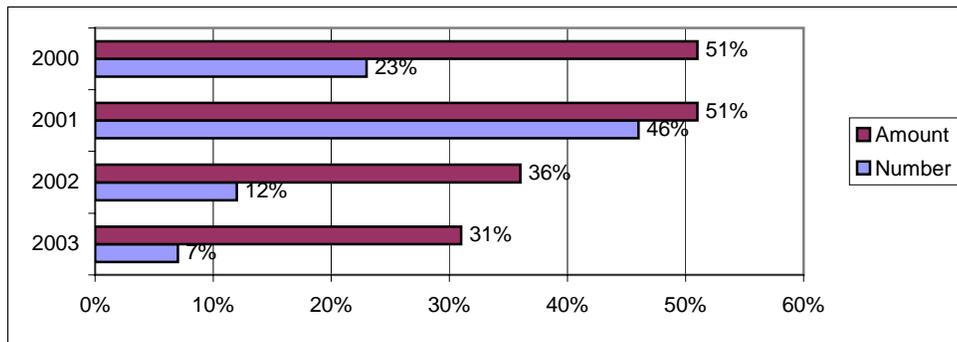

FIG. 3: EVOLUTION OF THE PERCENTAGE WEIGHT OF THE INVESTMENTS IN HIGH-TECH ENTERPRISES  
Source: AIFI (2004)

During 2003, the number of operations ending in venture capitalist exit was 222 with an increase of 55% compared to 2002; the exit systems were mainly a trade sale (221) while only one was the listing on equity market (see Fig. 4).

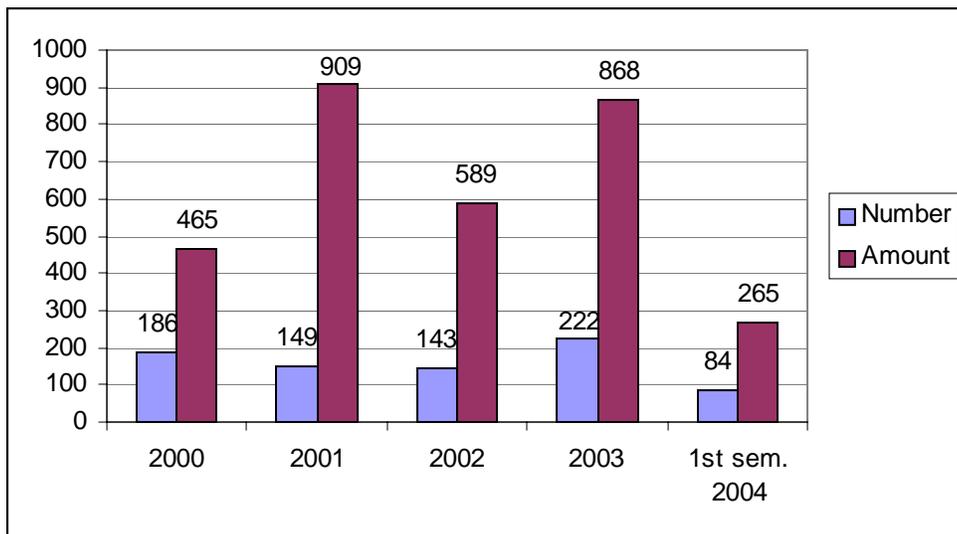

FIG. 4: EVOLUTION OF THE DISINVESTMENT ACTIVITY  
Source: AIFI (2004)

The financial resources mainly came (1478 millions over 1937) from closed-end funds specialised in Italy, which in 50% of cases were foreign. These data underline the international origin of sector financial resources. As regards internal sources, banks were predominant, followed by investment and pension funds. Until 31 December 2003 the portfolio of venture capitalists working in Italy was about 1300 firms.

In the first semester of 2004 115 investment operations were ended, for an equivalent value of 639 million euros, 54% of which was destined to buy-out operations. In addition, there was a relevant increase in start-up

financing (up to 31 operations) to the value of 86 million euros. Most of the total number of operations (53) were undertaken to finance the development of existing enterprises (expansion financing), for an equivalent value of 122 million euros. There were no medium size operations, since 60% was performed on companies with less than 100 employees.

As far as the geographical distribution of the financed enterprises is concerned, an important increase of resources invested in Italian companies was registered. Among these the amount of resources destined to enterprises located in the North of the country remained stable, that destined to the central region showed a slight increase and in the South was low (see fig. 5). Among the sectors affected by investment, the three most financed were consumer goods, telecommunications and chemicals.

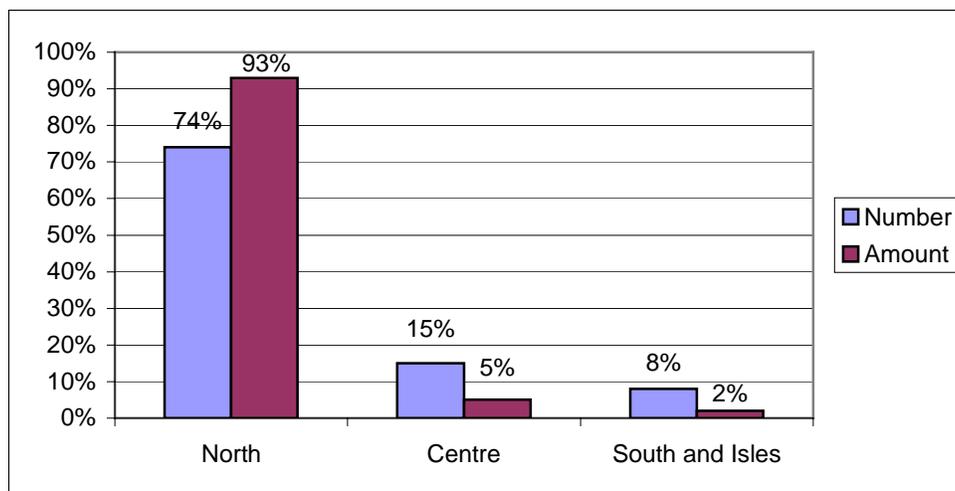

FIG. 5: GEOGRAPHICAL DISTRIBUTION OF THE INVESTMENTS IN 1<sup>st</sup> SEMESTER 2004  
Source: AIFI (2004)

In the first semester of 2004, 59 operations were ended. On 30 June 2004 the portfolio of venture capital investors working in Italy consisted in about 1100 companies, for an equivalent value (at purchase cost) of 8.5 billion euros.

## Developing the Theoretical Model and the Research Hypotheses

In a scenario, formed by international-oriented SMEs, a fragmented banking system but directly connected to local SMEs, and new financial operators in risk capital, shows how the growth of SMEs can be supported both by the traditional bank supplied finance and by venture capital. In particular, the latter proves to be the Italian case in the early stages.

This paper began by investigating the link between SMEs growth and venture capital, proposing a comprehensive theoretical model to be tested that summarises the relation among all the variables involved, from the firm point of view, from the bank and the territorial ones (see Fig. 6).

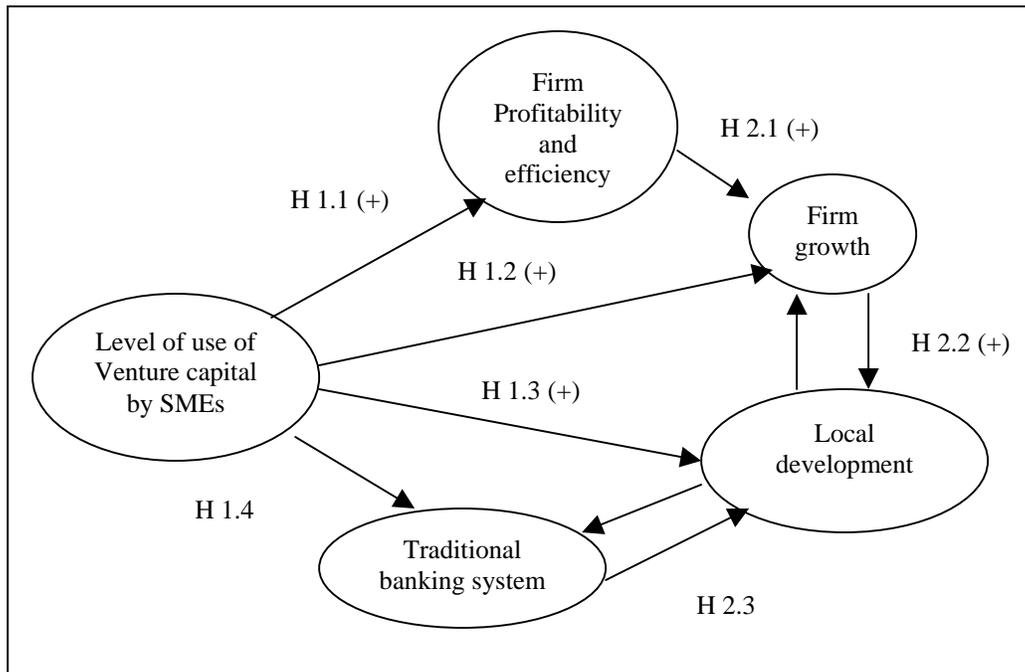

FIG. 6: THEORETICAL MODEL AND HYPOTHESES FOR THE IMPACT OF VENTURE CAPITAL ON THE ECONOMIC SYSTEM

Existing literature (Ferri & Inzerillo, 2002; Vesin & Gianfrate, 2002; Gervasoni & Sattin, 2000) has stated that venture capital financing plays a very important role and produces greater advantages in the present financial system. The role of specialised operators gives SMEs the possibility to increase and find “patient capital” to be used in any stage and activity of the company’s life-cycle.

In such circumstances, the availability of management know-how that the venture capital investor supplies to the firm to reach its development objectives, is fundamental. This know-how comes from management practice, experienced in operations in various contexts. In addition, familiarity with official listing operations can be considered an advantageous factor in defining corporate internal procedures to quotation and to set up the timing and pricing of the operation.

Moreover, venture capitalist contribution in terms of improvement of the corporate balance is considerable, since the venture backed enterprises show higher economic performances, a greater market power than other firms, and also a company image improvement on the market, as experience proves (Gervasoni & Sattin, 2000; Aifi, 2003; Evca 2002; Evca 2004).

In conclusion, the backer carries out an extremely profitable action, aimed at making the firm management and organization more professional, raising communication transparency and quality and introducing or strengthening control of results and planning systems. This situation also involves important repercussions on the local economy, as it identifies and supports the industrial vocation of various geographic areas. This is extremely important for the Italian market, since it can effectively allow the development of industrial districts.

Other research (Evca, 2004) showed that venture capital has a very important role in the development and growth processes of financed enterprises. In fact venture backed companies proved to have higher growth rates in sales, earnings before tax, assets, net capital, occupation, investments, and exports, than the 500 top firms in the same countries. Therefore, it is hypothesised that: H 1.1: the level of use of venture capital is positively correlated to SME profitability and efficiency; H 1.2: the level of use of venture capital is positively associated to SME growth.

The venture capital may also empower the competitiveness of the national system, providing all the tools necessary to enhance local development, through indexes such as the level of employment, the income, induced

activities, and GDP. Thus it is hypothesised that: H 1.3: the level of use of venture capital is positively associated to local development.

As regards the impact of this new financial tool on the traditional banking system, it will certainly force the existing one to reorganise, undertaking more risks but diversifying its activities. Indeed, banks that resort to these tools will better profit from investment opportunities at a positive net present value. The new financial products enable banking institutions to manage their portfolios with greater flexibility and aggressiveness. It is hypothesised that: H 1.4: the level of use of venture capital is correlated to the traditional banking system.

Three further relations derive from the interaction of the relational bonds among the systems. The firm's profitability and efficiency is treated as an antecedent of its growth, especially in the globalisation era; while the latter is doubly linked to the territorial development, it also forces the banking system to reorganise in order to respond quickly to the various markets needs. The three final hypotheses regarding interrelations amongst the relation links are as following: H 2.1: firm profitability and efficiency is positively associated to its growth. H 2.2: firm development is correlated to local development. H 2.3: local development is correlated to the banking system and its support.

The tools to investigate the above mentioned hypotheses are:

- for hypotheses H 1.1 and H 1.2, to compare the performances of listed non venture backed SMEs and of listed venture backed ones on the new market, using the trend of stock exchange price as an index of the venture capitalist intervention;
- for the hypothesis H 1.3, a multiparameter linear regression that relates the dependent variable with three explanatory variables such as the territorial one (GDP and employment rate), economic growth (FDI or exports), and financial variable (ROE of the venture backed ones);
- for the hypothesis H 1.4, a scenario analysis is carried out to evaluate the Italian listed banks organisation in order to analyse the venture capital related structures, their performance and the existence of closed funds.

The complexity of the model needs a systemic approach (Golinelli, 2000), in order to process the data and connect them to better understand the effects of venture capital. In particular, even though they represent weaknesses for the efficient and fast development of venture capital, Italian peculiarities are factors, that, if adequately exploited, will become strengths.

Furthermore, the opportunities of use these can support and foster the competitiveness level of the national system, for incoming or outgoing investments, helping the Italian economic systems (banking and industrial) to grow and cooperate, dealing with macro phenomena, such as internationalisation, FDI (global) absorbing them at a micro level (local), through consortium and more direct connection between SMEs and local banks, in order to reach competitive advantage, through the use of venture capital (glocal).

This model is a first attempt at exploring and generalising the effects of venture capital on the local economic structures. Although the model is still in the early stages and at the first stages of testing, future research will explore the validity of both the model itself and its reference to the various territorial entities, given the existing diversity among the various national systems and within them as in Italy's case, with its different regional situations.

## Conclusions

To date the global economy requires financial capital to finance trade and investments, or rather growth. This demand has caused the introduction of new tools and the system's deregulation.

On one hand, globalisation necessitates a financial system that is not linked with places, but on the other such a decontextualisation needs specific spaces where resources are concentrated and where transactions gain more value. This is generated by trust and reciprocity. Therefore the relationships between local banks and SMEs create and distribute more value especially if the former participate in the latter's risk and entrepreneurship.

### End Notes

M. Intonti contributed specifically to section 3, 4 and 5, L. Petruzzellis to section 2 and 6.

[1] According to UN (2003) almost one third of international trade takes place between firms connected through investment relations or production agreements. Moreover, a direct presence on the target markets shows benefits not only in cases of favourable conditions, but also in cases of unfavourable ones minimising the effects of international crisis.

[2] In the period 1990-2001 there have been 386 mergers or incorporations among banks and 166 acquisitions of the stock-holding majority, which reduced the number of banks in Italy from 1061 to 769.

[3] Venture capitalists have nurtured the growth of America's high technology and entrepreneurial communities. Companies such as Apple, Federal Express, Compaq, Sun Microsystems, Intel, Microsoft are famous examples of companies that received venture capital early in their development.

[4] Therefore, banks are classified in three groups: "ordinary", "qualified" (i.e. important banks with a capital of a billion euros, fully respecting capital adequacy requirements), "specialised" (i.e. the same as qualified, plus having a mainly medium-long term liability structure). The individual limit (3%, 6%, 15%) concerns the amount of a single participation in non-financial enterprises compared to bank capital, the global limit (15%, 50%, 60%) concerns the total amount of the same participations compared to bank capital and the separation limit (15%) concerns the amount of participation compared to non-financial enterprise capital.

[5] Even individuals may be venture capitalists. In the early days of venture capital investment, in the 1950s and 1960s, individual investors were the main venture investors. Actually, venture firms are the dominant venture investment vehicle, while the individual investment did not totally disappear. Indeed, in the last few years, individuals again became a potent and increasingly larger part of the early stage financing. They are known as business angels or angel investors and can mentor a company and provide needed capital and expertise to help to develop companies. They either be wealthy people with management expertise or retired business people seeking the opportunity for business development.

[6] During 2003, 3034 million of euros were invested, with an increase of 16% compared to the previous one, on a total amount of 336 different operations. 2258 millions of 3034 were destined to buy-out operations and 583 to expansion ones. These were 175, while the start-up operations were 65. In 2000, 11 venture backed companies were quoted in the New Market. After some years of inertia, at the end of 2003 new venture backed company quotations were registered: they were Travisa, Isagro, Azimut, Procomac and DTM.

[7] The financial resources directed to these companies were only 7%.

# The Study of ERP Implementation for SMEs in Thailand

*Duangpun Kritchanhai*  
*Mahidol University Salaya, Thailand*

## Abstract

During the last 3-4 years, supply chain management approach has been widely implemented in Thailand. It is expected to be one of the solutions that can increase competitive advantage for Thailand SMEs. Resource Planning is one of the key activities in supply chain. To link all information in the chain, ERP (Enterprise Resource Planning) has emerged. Despite its useful applications for supply chain management, it is found that there are still constraints and difficulties for implementation especially in SMEs. In this research, we have put an effort to identify the critical success factors for implementing ERP in Thailand. After the literature survey and the interviews with a number of ERP software providers, it is discovered that there are seven critical factors for the success of the ERP implementation. After that, a postal questionnaire survey was conducted in order to investigate readiness of Thailand SMEs in implementing ERP. The results reflect the status of IT infrastructure in the SMEs firms. Steps for implementing ERP for SMEs in Thailand are proposed.

## Introduction

Information technology (IT) is recognized as a primary tool in creating and strengthening the development of supply chain. Resource Planning is one of the key activities in supply chain. Nowadays, those philosophy and techniques such as MRP (Material Requirement Planning), MRPII (Manufacturing Resource Planning) and CRP (Capacity Resource Planning) require the use of IT for linking and sharing resource and planning information in the supply chain. Ultimately, to link all information in the chain, ERP (Enterprise Resource Planning) has emerged. ERP is an approach that enables the integration of transaction-oriented data and business process throughout an organization or an entire supply chain[1].

Small and Medium Enterprises (SMEs) is a group of business that significantly influence the entire economies of Thailand. Resulting from economic crisis in 1997, several problems in SMEs emerged in the areas of administration and management. ERP is one of the principles that has been applied successfully and solved these problems in a number of big enterprises. However it is suspected that there might be some limitations and difficulties for implementing this concept, especially with information technology, in SMEs. Thus, the purpose of this research is to identify the critical success factors for ERP implementation in SMEs in Thailand. Readiness and limitations for ERP implementation should be identified. There is also a need to show that if SMEs in Thailand would like to use ERP in their organization, what they should provide and how their ERP implementation steps should look like.

## Methodology

In this research, we begin with literature survey in order to gather a background about important criteria for implementing ERP in SMEs. Critical success factors (CSFs) are found. Then the interview is conducted. We have interviewed 10 ERP providers in Thailand in order to investigate the requirements they may have in implementing ERP according to those CSFs found in the literature. After that, a postal survey is used. The 800 sets of questionnaires are sent to the owners of SMEs in Thailand particularly in industrial sectors namely: headgear such as hat, cap (84 factories), plastic products (102 factories), food (111 factories), spare parts (112 factories), diary products (111 factories), clothing (91 factories), electronic equipment (102 factories) and leather (80 factories). This enables us to find the limitations of SMEs in using ERP in accordance with those requirements identified from the

interviews. The final step is to analyse and summarize the overall results and propose the ERP implementation steps for SMEs in Thailand.

## **Findings**

### **Findings from Literature**

Mashari and Zairi [2] said that the organizations implementing an ERP software should be prepared for organizational changes across various key areas related to strategy, technology, culture, management systems, human resources, and structure. The exclusive focus on technical aspects, at the cost of change management elements, has proved to be a major source of failure. It was also said that to implement an ERP, high cost of investment and effective human resource are required. A survey of SAP implementation experience shows that 63 percent of the responding companies used change management tools in various stages of implementation[3]. Curran and Ladd [4] stated that we need to understand how corporate and national cultures impact an ERP implementation and how this understanding delivers better methods for implementation. Bancroft, Seip and Sprengel [5] show example of an effective SAP R/3 project implementation which needs a wide participation from people in different business units and from different managerial levels, as well as the involvement of external parties such as consultants and customers. This critical demand falls most heavily upon a strong project management infrastructure.

From those above literature, it can be listed that the critical success factors for ERP implementation are: cost (the amount of money in ERP implementation), technology (IT infrastructure), technical installation process, strategy, business process re engineering, change management, project management infrastructure, human resource, and culture change.

### **Findings from the Interviews**

Ten ERP providers were interviewed according to the CSFs found from the literature. The outcomes show their perspectives on each CSF and the present status of ERP software in Thailand.

According to the interview, the providers view that there are two types of cost occurred - primary and secondary cost. The primary cost includes all cost that are paid at the beginning of the implementation which are hardware cost, software cost, implementation cost, consultant cost and add-on cost (cost of adjustment and adaptation to fit in each business). The secondary cost includes all cost that occur upon system running e.g. maintenance cost. We also found that the costs of ERP software are different. These range from 20,000 bath for small system to millions baht. Cost of server is 100,000-200,000 bath per server. Cost of client is 20,000 bath per client.

Technology needed can be viewed in terms of hardware, software and LAN. The hardware is typically PC for server and client. The software is composed of operating system, database and ERP application. For technical development, it should begin with basic computer skills such as MS-Office. Then more advanced skills should be trained such as LAN network and database. Some companies may have their own IT department but some choose to outsource their IT maintenance and development operations.

The providers suggested that each organization must have certain goals and investigate their real needs. They should know their own business process clearly and be able to prioritize the ERP modules needed.

Business Process Reengineering is one of the most important factor. Each organization should adjust their business process to be suitable for the ERP implementation. The new business process should be designed prior to the implementation. Importantly, it needs to be very careful if the old process is still activated at the same time.

It is also suggested that top management must take part in this big change. They should assign a project manager with a team to be responsible for this implementation. Each ERP module should be responsible by a representative from each department and report directly to the project manager.

Training and knowledge transfer is also essential. All ERP operations should be made clear to all level of operators in order to let them be familiar with this new system.

Furthermore, the outcomes from the interview also show examples of the status of ERP software providers in Thailand as seen in Table 1.

### Findings from the Survey

The survey response rate is 12.48% from various sectors. Forty six percent of the respondents are medium size with the revenue more than 100M baht. More than half of the respondents (53%) state that they have not heard about ERP before. Only 17% of the respondents are using ERP in their current system and 4% has just begun to implement. Among the ERP users, 6% of the respondents said that cost of investment is more than 10M baht, 4% of them said that it falls between 5-10M baht, 7% of them said that it falls between 1-5M baht, another 7% of them show the cost is less than 5M baht and the rest of them did not answer the question.

Sixty nine percent of the respondents use Window98 as their operating system and 18% is still using Window95. Thirty three percent uses MS-access for their database and 21% of them use MS-SQL. Only 6% of them use oracle. Not surprisingly, 53% of them do not have an IT department

About the CSFs investigation, 41% of them are aware of the importance of strategic planning but only 26% in the group put much effort on following the plan. Surprisingly, 68.69% are enthusiastic about BPR and are willing to make any changes in their organization. Forty five percent of the respondents pretty much understand the reason for changes.

TABLE 1: THE STATUS OF ERP SOFTWARE IN THAILAND

Company	Software	Operating System	Database	Cost of software		Total Cost Implementation
				Min Cost (Bath)	Full Package (Bath)	
A	Oracle	NT, Unix	Oracle	400,000	-	-
B	SAP	Windows Base	Oracle, SQL	2.4 M	-	8-10 M
C	JDE	AS 400	DB2, SQL	1.5 M	4.5 M	6-10 M
D	SAP, Oracle etc	-	-	**It depends on the revenue of customer	-	-
E	Macola	Windows Base	SQL	500,000	2 M	2-3 M
F	Macola	Windows Base	SQL	500,000	-	1.5 M
G	EFACT	Windows Base	SQL	-	1.2 M	1.5-2.5 M
H	-	-	-	-	-	2 M
I	Forma	Windows Base	-	20,000	2.5 M	5 M
J	-	-	-	100,000 +	-	3 M

About training program, 44.44% of them always have the training program run across the year while 6% of them never support staff training program. Around fifty nine percent of the respondents show top management involvement in every meeting when changes occur while 33.33% shows their seldom involvement from their top management.

## Discussion

### SMEs Readiness

From the survey results, it is found that SMEs are not ready to invest in full package of ERP. While the budget for implementing ERP is estimated around 600,000 to 2 million baht, the majority of SMEs in Thailand can only prepare the maximum budget of 500,000 bath per year. Most operating systems used in SMEs are based on Windows 95 and Windows 98. This must be problematic if SMEs plan to handle a number of transactions in the

future particularly for ERP implementation. The survey results also show that most SMEs still have inadequate human resource in IT. Moreover essential technical knowledge such as database and operating system are still insufficient.

About the critical success factors, although they may have their strategic plan and are aware of its importance, they hardly operate their works in conformity to their objectives and strategies. However it is found that they mostly are aware of business process re engineering and tend to have good attitude for changes. Some of them show their interest in training program although not high percentage of the respondents pay much attention on this. There is still a good sign for potential improvement. Top management involvement is quite high in any changes in organization. However more communications and coordination between levels of management are needed.

#### **ERP Implementation Steps**

From the overall results, we propose the steps for ERP implementations for SMEs in Thailand. The first step is the internal audit which relates to three parts: objectives, requirements, and strategies. SMEs should determine the objectives and requirements for using ERP in the organization before they purchase any ERP software.

The second step is to investigate their readiness on budget, technology, technique and human resource. Adequate budget, how to obtain technical knowledge and how much skill and knowledge their staffs should have, must be evaluated and provided. The third step is to choose ERP providers by considering the factors of cost, technology, technique and human resource assessed in the previous steps. The fourth step is the planning for ERP implementation which relates to two parties. The ERP provider and the company should meet up. Every details, constraints and conditions from each party must be declared. The fifth step is the ERP implementation. The ERP provider should provide staffs, project leaders and consultants while the top management, project leaders and users in the company must involve. The company should also provide a training and ensure that they understand each step in the application and are able to operate them correctly. The best way are that the ERP provider and the company must jointly run the project and that they should also meet and coordinate with each other all through the implementation process. The sixth step is monitoring and controlling the project. This step needs to take into account the four factors: project management, business process reengineering, change management and change in culture. The company must be aware of and manage each factor closely. It can be seen that the critical success factors identified earlier are mentioned in this implementation steps. This can be summarized in fig.1.

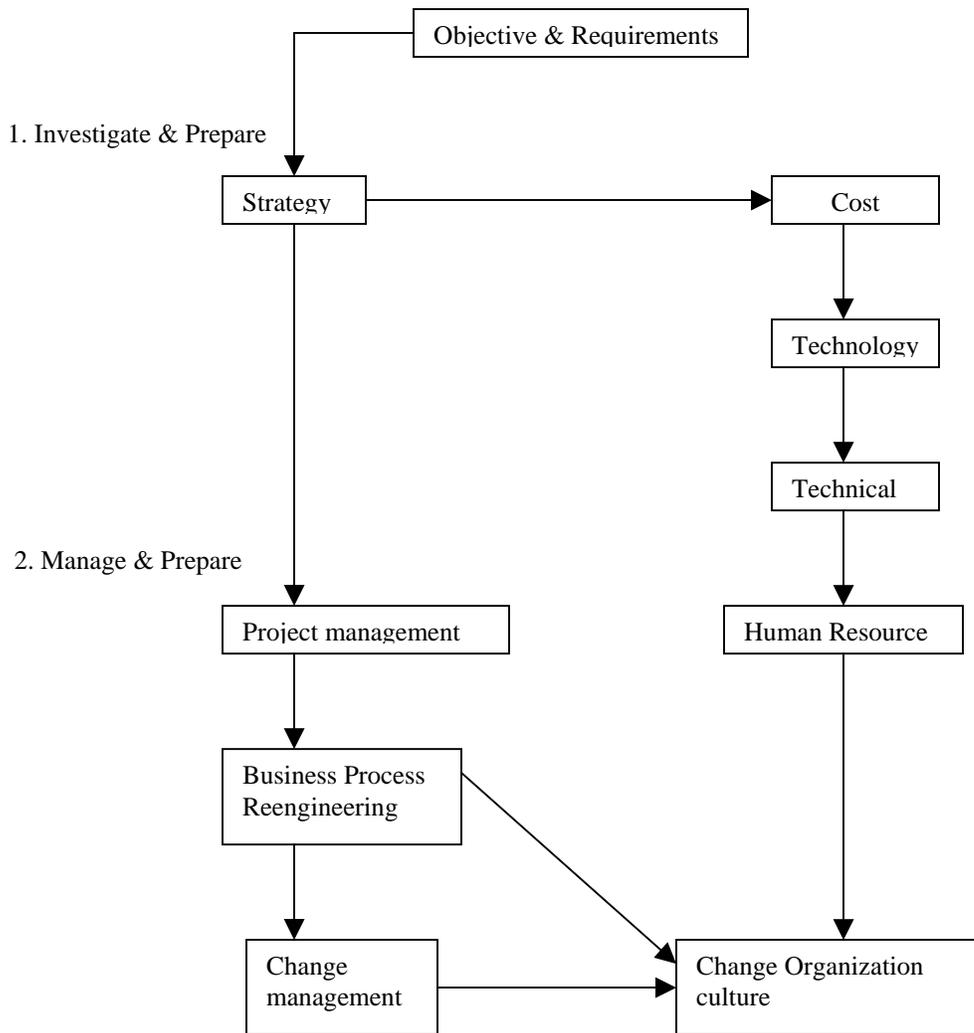

FIG.1 CRITICAL SUCCESS FACTORS IN IMPLEMENTING AN ERP

## Conclusions

The study has shown the status of SMEs in Thailand regarding the ERP implementation. We have investigated the issue by literature survey, interview and postal survey. The outcomes from our study show that although a number of big firms have experienced successful ERP applications, it might be too advanced for SMEs in Thailand. By considering those critical success factors identified, obviously, cost and technology might be the major obstacles for the SMEs. In other word, SMEs is not yet ready for implementing the application. The first reason must be those inadequate infrastructure including information technology together with investment budget. The second reason are those relate to management system in SMEs organization. This refers to change management, organization cultures and willingness to do the business process reengineering. Apart from that, it might be necessary to consider whether this ERP software is suitable for small to medium scale of operations as SMEs or not. The implementation steps

presented in the paper has highlighted the importance of organization objectives and strategic plan. This should be the first question to ask themselves if the answer should be the ERP, otherwise at what stage of resource planning they should go for.

However there is still a good sign in SMEs development status in Thailand. They tend to recognize the importance of information technology and are enthusiastic in learning and business process changing for improving their organization. Thus, to go for an ERP software might be a long way but at least it is realized that we are making a progress preparing for the concept.

# Entrepreneurship without Economic Development: The African Case

*Edward D. Bewayo*  
*Montclair State University, USA*

## Abstract

**In sub-Saharan Africa entrepreneurship is expected to lift countries out of poverty, improve income distribution, and increase political stability. The privatization of state owned enterprises (SOEs) is one approach African governments have pursued in order to promote entrepreneurship. Many African governments have privatized SOEs by selling them to the highest bidders. This has not promoted entrepreneurship among indigenous Africans. On the other hand many indigenous Africans are starting businesses, some because they have been laid off due to privatization, and others because of government small business promotion programs. However, most of the business start-ups never expand. Moreover, business expansion and profit maximization are rarely objectives of African small business owners. Consequently, because start-ups do not expand, the number of entrepreneurs is rapidly increasing while the overall economic conditions in African countries are not improving.**

## Introduction

“Entrepreneurship is in,” declared Albert Shapero (1984) in an article published in the *Journal of Small Business Management* entitled “Why Entrepreneurship? A Worldwide Perspective.” Shapero is only one of a growing list of observers who have commented on the upsurge in the interest in entrepreneurship worldwide. Other observers have included Carland and Carland (1993), Rein Peterson (1988), and Malcolm Harper (1991).

Although definitions of entrepreneurship are generally controversial, in this paper entrepreneurship is defined as “any attempt at new business or new venture creation, such as self employment, a new business organization, or the expansion of an existing business, by an individual, teams of individuals, or established businesses.” This is a very broad definition but it is used here because it is the one used by the *Global Entrepreneurial Monitor (GEM)* to measure entrepreneurship in different countries. (Zacharakis et al, 1999)

Many forces have combined to bring about the international groundswell for entrepreneurship. In the United States the forces that have rekindled interest in entrepreneurship that are frequently mentioned include the explosion of new technologies, especially in electronics, creating many new business niches; deregulation, especially in telecommunications, banking, and air/road transportation, allowing many newcomers in these industries which were previously open only to investors who met strict conditions; demographic shifts, especially in the participation of more women and minorities (including recent arrivals such as Koreans and Indians) in the workforce, including self-employment; an increase in masculine values such as materialism and independence (it is alright to be a millionaire, and most millionaires made it on their own) (Zimmerer et al, 1998); and, especially in the 90s, the emergency of “lean and mean management” as the corporate strategy of choice, which has resulted in massive layoffs, pushing many persons to venture out on their own.

Although not directly a factor considered by an individual for starting a business, entrepreneurship contributes to the improvement of the economy. Entrepreneurs increase total national output and employment. Through entrepreneurship, there is less economic concentration. Since economic power is a conduit for political power, entrepreneurship also contributes to a reduction in political concentration, and consequently an increase in democratic government. Entrepreneurship also enables otherwise marginalized peoples to enter the economy. These macro considerations associated with entrepreneurship are important for any country, including the U.S. For example, there is always a need for new jobs, and there, historically, always have been peoples who are left out by mainstream institutions, who have to start businesses in order to survive.

These macro factors are much more important for most third world countries, still characterized by low output, high unemployment, low but skewed income distribution and shaky democratic institutions. Many of these countries also have many marginalized populations, for religious and ethnic reasons (e.g., the Kurds of

Iraq and the Christians of the Sudan). It is these macro factors that figure most prominently in the push for entrepreneurship in the developing countries, especially those in Africa. In Kenya entrepreneurship is seen as an instrument for national development – “economic growth, improved quality of life, the equitable distribution of resources, and the capacity of the economy to deal with its socio-economic and environmental problems.”(Republic of Kenya, 1994). The question is whether entrepreneurship is up to the job. In the paragraphs below an attempt is made to address this question. First we look at privatization/liberalization as one of the leading approaches for promoting African entrepreneurship. We then examine the major reasons why the results of entrepreneurship in Africa are falling short of expectations. These reasons are political, economical and socio-cultural. However, before proceeding with these topics we need to make one cautionary note. It has to do with the vastness of the continent, even when restricted to Africa south of the Sahara. There are over twenty-five completely independent nations and over three hundred million people with somewhat different cultures. A major cause of the diversity among African peoples is colonial heritage. The French had different attitudes toward their colonial territories from those of the British. And so did the Spaniards, Portuguese, and Belgians. In this paper we hold the belief, as many others have, that there are enough similarities in the experiences African peoples have gone through, in their cultures (highly communalistic), and in the problems they face, to justify writing about them as if they were one people. Nevertheless, known differences between African countries will be noted at appropriate places.

## **Promoting Entrepreneurship Through Economic Liberalization and Privatization**

A popular approach to promoting entrepreneurship in Africa, since the late 1980s has been turning over state-owned enterprises (SOEs) to the private sector. This approach is often pushed by the international finance community (donor countries, the IMF and the World Bank) under what is commonly known as “structural adjustment programs” (SAP). The approach is assumed to be fundamentally sound because it attacks one of the major reasons that explains low levels of entrepreneurship in most African countries. Entrepreneurship is low because African governments dominate too many economic activities, via SOEs. Private/individual entrepreneurship is low because state entrepreneurship (state capitalism) is too high (Elkan, 1988).

There is a long list of reasons that are frequently given for state capitalism in Africa and elsewhere. They are mentioned here only in summary form. First, there is the natural monopoly/economies of scale argument. Government should produce electricity because there is only room for one producer and no private company to undertake the heavy investments needed. Probably most SOEs established during colonial times were justified on this basis.

After independence, beginning with the late 1950s, the reasons for setting up SOEs became heavily political. State ownership of means of production was offered as an anti-dote to capitalistic exploitation. State ownership of means of production was also seen to be more compatible with the communalistic culture known to be prevalent in black Africa (Friedland and Roseberg, 1976). State ownership of the “commanding heights” of the economy was also needed to protect “economic sovereignty”, and eventually political sovereignty. Fiscal expedience was also a factor in some SOEs, especially those in the marketing field. A government-owned crop marketing corporation could price crops in such a way that there was no need to impose income taxes on farmers. This was politically expedient before and after independence. Before independence, there was also a concern to protect unsophisticated African farmers against the fluctuations of international commodity markets. Crop marketing SOEs maintained price stabilization “Funds”. Drawings were made out of these funds to supplement incomes to farmers whenever international commodity markets dipped too low (Livingstone and Ord, 1994). Although never stated directly as a reason for setting up SOEs, many SOEs were set up to serve political patronage functions. Government ministers’ supporters had to be rewarded, and SOEs provided a convenient way for returning favors – jobs, factories, and loans. Also, used prudently, SOEs could be an instrument for political and economic balancing, still essential in most African countries.

Whatever their justifications, SOEs can readily be seen as a threat to private/individual entrepreneurship. So, private entrepreneurship development necessitated an onslaught on SOEs. To help the

process along, SOEs were badly failing to deliver the goods, the economies were stagnating and often declining. SOEs were destroying their countries' economies due to rampant inefficiency. Their survival depended on financial support, often squeezed from donor countries and organizations. At the same time donor/foreign aid from socialist countries was drying up. But probably the biggest blow to SOEs was the dissipation of ideological support. State capitalism lost out to private/western capitalism, with the demise of the Soviet Union. SOEs were out, or should have been. In most cases the IMF was going to see to that. Privatization was going to give a boost to entrepreneurship.

Privatization has taken many forms in the different African countries, sometimes even within the same country. In general the most profitable SOEs (especially in telecommunications) have gone to the highest bidder, often a foreign company. This form of privatization has been very good to national treasuries. In Ghana, for example, Ghana Telecom brought in \$38 million (Euromoney, 1997). It is highly doubtful that this approach to privatization contributes to entrepreneurship in the country at all. This is particularly the case if we concentrate our attention (as is commonly done when discussing entrepreneurship in black Africa) on indigenous entrepreneurship. After all, in many African circles, privatization should "boost black economic empowerment (The Wall Street Journal, 1995). While often the privatized organization's efficiency and profits go up after privatization, many employees lose their jobs.

On the other end of the spectrum, hopelessly money-losing SOEs have merely been abandoned, and have had their assets, if any, sold off. This has been the approach most frequently used for bankrupt/run down marketing/trading and transportation SOEs. Ironically, this approach has offered the greatest promise for entrepreneurship. Almost everywhere a government-operated transportation company has folded up, there has been a rush of African entrepreneurs to fill up the slack, by providing taxi, bus and truck service.

Where there are stock exchanges, such as in Ghana, Nigeria, and Kenya, the approach used to privatize some SOEs has been by selling government shares to the private sector via the stock exchange. It appears that this is the approach African governments have hoped to use in order to make the greatest impact on African entrepreneurship. Countries such as Nigeria placed some stipulations on these SOEs' stock sales. One such stipulation has been the percentage of the shares to be sold to "small investors". There has been even an effort to incorporate regional and ethnic balance (Drum, 1993). Unfortunately, this approach has proved impracticable in places where there are no stock markets, or where "small investors" have not been forthcoming because they have no access to loans to buy the shares reserved for them. On occasion governments have attempted to extend loan money for that purpose. Without minimizing the noble motives that drive governments' efforts in this area, there are a couple of issues to be addressed. First, should African governments be extending loans for financing stock purchases? What guarantees are offered for loan repayment? Why are commercial banks so reluctant to extend such loans? A second issue that needs to be raised relates to the "content" of entrepreneurship in the activity of owning corporate stocks. Granted there is risk-taking in owning stocks, and risk-taking is inherent in entrepreneurship. But entrepreneurship is managing risk through one's own effort. Does one take personal credit when his/her stock goes up? Probably not. A wide ownership of corporate stocks is good for economies, but it is not because it is an entrepreneurial activity on the part of individual stockholders.

Although African governments have either liquidated or sold off many SOEs or are in the process of doing so, they almost always stop short of turning over every SOE to the private sector. Most African governments still retain full or majority control in some public utility SOEs, especially electricity and water corporations. Also frequently retained are airlines, and specialized banks. And probably Nigeria will never privatize the oil refining SOEs completely.

We pointed out earlier that many SOEs were used for political patronage, and that sometimes this was the main (but unstated) reason some SOEs were created. Many SOEs suffered from inefficiencies due to having too many people on the payroll. Privatization has, therefore, resulted in massive layoffs. This has been especially the case with respect to selling SOEs to foreign interests. In Ghana, for example, privatization resulted in over 45,000 layoffs (Euromoney, 1997). Although privatization has caused many layoffs, African governments have, under IMF structural adjustment programs, been required to carry out additional layoffs in government departments. The massive layoffs have forced some people to become entrepreneurs. As we stated

in the introduction, the recent massive layoffs in the U.S. have been responsible, in a significant measure, for the recent rapid increase in the interest in entrepreneurship. Nearly 15% of the laid off employees have used their severance packages (including incentives to quit voluntarily) to launch businesses (Entrepreneur, 1994). It is conceivable that a large percentage of Africans (probably larger than in the US) of those laid off go into businesses for themselves, although few of them, in Kenya, for example (Republic of Kenya, 1994), have had severance packages to cushion the transition from employee to entrepreneur. Consequently, the businesses they have been able to start must be very small indeed, and they are not likely to grow.

Many observers of entrepreneurship in sub-Saharan Africa have noted the rapid growth in the numbers of business start ups. In fact a Global Entrepreneurial Monitor (GEM) survey in 2003 found Uganda, an African country, to be the most entrepreneurial nation of the 31 countries which have conducted GEM surveys. The survey found that a third of Uganda's population was "engaged in some kind of entrepreneurial activity" (Walter, 2003). Uganda was more entrepreneurial than the U.S., where only about 12 percent of the population is engaged in some form of entrepreneurial activity. However, Uganda, the only African country which has conducted a GEM survey, is also the poorest of the 31 countries which conduct GEM surveys. It appears that in Uganda and the vast majority of the countries in sub-Saharan Africa the huge numbers of entrepreneurs does not lead to high economic growth, and other aspects of national development. In the following two sections the reasons for this seemingly puzzling situation are explored.

## **Cultural-Social Values and Business Growth**

It was stated in the introduction that in the US a growing number of entrepreneurs are lured into entrepreneurship out of their desire to be independent. And a large body of research has discovered a deep-seated concern for independence among those who go into business for themselves. In their surveys, the National Federation of Independent Businesses (NFIB) concluded, "the primary reason people go into business for themselves is personal achievement and independence" (Dennis, 1993). And in the article cited earlier, Albert Shapero claimed that his involvement in entrepreneurship programs in many parts of the world has led him to believe that "...independence is the primary, driving motivation of the entrepreneur" (Shapero, 1985). Morris, Davis and Allen (1994) have also pointed out that "of all the elements necessary for successful entrepreneurship, the independent entrepreneur is the most critical." In the U.S. the high level of entrepreneurship is commonly attributed "to the cultural values of freedom, independence, self sufficiency, individualism, achievement, and materialism" (Morris et al, 1994). Studies on African entrepreneurship have found attitudes towards independence to be one of the major predictors of entrepreneurial success, success defined as business growth (Frese et al, 2002 and Koop et al, 2000). Independence is a major component of the entrepreneurial orientation personality, which Frese et al found to be critically important for entrepreneurial success in the difficult environment in Namibia. They defined entrepreneurial orientation to embrace autonomy, innovativeness, competitive aggressiveness, and risk taking. Independence or autonomy, is the "ability and will to be self-directed in the pursuit of opportunities" (Lumpkin and Dess, 1996). Frese et al (2000) point out that "an autonomous owner is motivated to act and make decisions independently. It [autonomy] helps a business owner to be successful because self direction allows quick and self-reliant decisions."

It is very doubtful, and there appears to be no evidence to suggest, that independence is the primary motivation of the vast majority of African entrepreneurs. Studies that have investigated this question (Bewayo, 1995, and Gray et al, 1997) tend to point to more basic motivations, a la Maslow's hierarchy of needs. African entrepreneurs tend to emphasize "economic survival", "making a living," and "providing for family" as reasons for going into business. It appears that entrepreneurs in Africa look at business ownership as a way out of poverty or a way to survive for themselves and their families. They are not even concerned about maximizing profits, they just want to make a living. The African entrepreneur tends to be much more of a "necessity" entrepreneur than an "opportunity" entrepreneur (Reynolds et al., 2001). The African entrepreneur is motivated by necessity and has no other ways to survive. That African entrepreneurs may not be too concerned about independence and profit maximization has implications for what entrepreneurship will and will not do for

African countries, for the near term at least. It may also have implications for government programs to assist entrepreneurs.

When the entrepreneur's objective is merely to make a living or merely to provide for family, we should not expect businesses to expand and become big businesses, as entrepreneurial firms do. This is probably one of the explanations of the frequently found phenomenon in African countries: the number of businesses is rising rapidly, but not their average size. "Evidence indicates that the number of MEs [micro enterprises] has grown steadily over the last two decades in sub-saharan Africa and continues to grow while the size of MEs themselves does not change much" (Fafchamps, 1994). Unfortunately, it is now clear that economies do not grow on the basis of small businesses alone (Dana, 1988). Economists doing research in this area point out that "Jobs arising from expansions are likely to reflect demand-pull forces, while start up jobs are more likely on balance to reflect supply-push forces as individuals search for activities to sustain themselves" (Liedholm et al, 1994). Consequently, a country can experience an entrepreneurial boom, and still remain poor. Entrepreneurship may, thus, fail to lift a country out of poverty. A study covering Kenya, Swaziland, Zimbabwe, Botswana, and Malawi found that only 0.9% of the surveyed firms grew to 10 employees or more over a five year period (Liedholm, et al., 1994). Most start-ups stagnated at start up size (1 to 4 persons). Nearly 30% of the start-ups failed in five years. Those, which survived without expanding, did so due to their access to cheap labor and capital (family labor and savings), and probably deep commitment, as is common in family businesses. They also survived by remaining below the radar of government bureaucrats, thus not paying for licenses and avoiding taxes (Fafchamps, 1994).

It should be pointed out, however, that most models for promoting entrepreneurship are predicated on the assumption that entrepreneurs start businesses and grow them over time. For example, in the U.S., the section 8a program for promoting minority entrepreneurship is aimed at getting a minority entrepreneur through the tough initial years of existence. Once established the minority entrepreneur is expected to fend for him/herself, locating customers and funding.

Businesses which stagnate at small size, even though they might have certain advantages tied to their size (Fox, 1988) (21), face certain disadvantages, one of which relates to financing. Surveys of African entrepreneurs cite lack of capital to be the most serious constraint they encounter (Satta, 2004, and Morewagae et al., 1995). In a survey of 13 African countries (Cameroon, Cote d'Ivoire, Ethiopia, Gabon, Kenya, Mauritius, Morocco, Namibia, Nigeria, Senegal, South Africa, Tunisia, and Uganda) only South Africa and Tunisia had reasonable availability of loan financing from commercial and development banks (Nyiira et al., 2001). Commercial banks do not want to lend to very small businesses, because of the high transaction costs relative to loan size. Further, an overwhelming number of African entrepreneurs are devoted to speculative trade (Fafchamps, 1994), always an activity banks are reluctant to finance. Additionally, banks face difficulties in assessing the credit worthiness of potential borrowers due to lack of proper accounting and difficulties in minimizing bad debt due to the poor legal system in most African countries. Most government small business loan programs are expected to be stop gap measures. Borrowers are expected to establish more long-term relationships with the banking community. Failure to do so eventually cripples the business.

We stated earlier that African entrepreneurs are not particularly concerned about maximizing profits, and that this may explain why many of their businesses stagnate at small size. Their lack of concern for independence may also have the same consequences, although not necessarily. An accentuated concern for independence has both positive and negative implications for entrepreneurial success. And so does a low emphasis on independence. That African entrepreneurs tend not to emphasize independence, at the present time any way, has both positive and negative consequences. On the positive side, issues of control do not arise, and accordingly, do not demand solutions. Loss of control is a major issue in raising funds for businesses (Longenecker et al. 2003). This issue is at center stage in the debate between equity and debt financing. This debate is not likely to be a serious one for African entrepreneurs. Relatives, friends, and others are readily invited to help out. Moreover, a low emphasis on independence (and an emphasis on cooperation and teamwork) is probably essential for growing a business, if growth is an objective. Entrepreneurship in a growing business requires a reduction in the emphasis on independence and individualism (Morris, et al., 1994).

On the negative side, a total lack of concern for independence may invite excessive interference from outsiders. The presence of extended families in most African countries already makes excessive interference from outsiders, and excessive concern for others, real possibilities. Lack of concern for independence is not likely to make the entrepreneur protective about his business. Consequently business assets may be squandered satisfying non-business ends, a constant concern (Republic of Kenya, 1994). Under these circumstances, it is even debatable whether profit maximization could be a viable objective. This lack of concern for independence leads to lack of concern for profit maximization. Independence and a little bit of selfishness are required to grow a business. They give the ability and self-direction to pursue new opportunities.

Independence has long been a phenomenon of great interest in discussions of national cultures. G. Hofstede (1984) contrasted it with collectivism. We already noted that many people attribute the high level of entrepreneurship in the U.S. to the deeply-seated cultural values of independence and freedom (Morris, 1994). Sub-Saharan African communities have been commonly considered to be communalistic with strong tendencies for altruism towards family, clan, tribe, and in rare cases, country. Fafchamps has observed that “in most of sub-Saharan Africa mutual assistance is a way of life” (1994). He believes that this is one of the major reasons why an African businessman may choose to “transmit valuable information to relatives and friends instead of trying to use it” himself. In this case and similar others a businessman misses on an opportunity to expand his business.

Social networks, a derivative of communalistic life, have been found to enhance entrepreneurship among many communities. Reynolds (1991) has stated that social networks are “an important prerequisite to starting a successful new firm”. In the U.S. much of the success of Asian entrepreneurs has been attributed to the existence of well-maintained social networks. A popular manifestation of social networks has been the Rotating Credit and Savings Associations, called “kye” in Korean and “hui” in Chinese, which are communal business funds from which members of the community borrow for business and non-business purposes. The strength of the social networks makes the borrowers pay back the loans without legal pressure. Schemes like this have been attempted in Nigeria (called “esusu”), in Ghana (called “susu”), in Senegal (called “tontines”) and in Kenya (Achua et al, 1999, and Harper, 1984). These schemes are for starting businesses, not growing them. Moreover, they probably don’t work as well in African communities as they do in Asian communities. For example, Achua et al (1999) found that in Cameroon these mutual assistance schemes, called “nyangi” locally, suffered from loan delinquency problems, which traditionally were supposed to be prevented by feelings of “solemn duty” towards these schemes.

## **Political and Economic Factors and Business Growth**

It was stated in an earlier section that a popular approach to promoting entrepreneurship in sub-Saharan Africa has been turning over state-owned enterprises (SOEs) to the private sector. This privatization policy was to be the thrust of economic liberalization that the international finance community (foreign aid donor countries, the World bank, and the IMF) was urging Africa and other developing regions to adopt. Economic liberalization policies, collectively known as Structural Adjustment Program (SAP), were supposed to give a boost to economic growth and economic development by increasing competition and, therefore, improving the efficiency of resource allocation. SAP included privatization, reduction or elimination of subsidies, elimination of price controls, elimination of restrictions on imports and foreign exchange. In many ways SAP has not worked out well for entrepreneurship. First, many state-owned enterprises (SOEs) were sold to foreigners, often in cahoots with government officials. Those not sold to foreigners went to the few already well-to-do local businessmen, often based upon less than transparent procedures. It is not unusual to find a chain of hotels, formerly owned by an SOE, now owned by a well-known family with good political connections. New

competition against businesses formerly under SOEs is often not encouraged. Under these circumstances some African governments have not even enunciated any small business/entrepreneurship policy, such as is the case in Namibia (Frese et al., 2002). Even where governments have proclaimed small

business/entrepreneurship policies, such policies have not been implemented aggressively. This has often led to accusations of empty government rhetoric towards small business and entrepreneurship.

Economic liberalization, always followed by currency devaluation, has resulted in a flood of cheap imports into many African countries. One can even find crafts representing African themes, e.g., a Kenyan tribal dance, made in Taiwan. The budding African entrepreneur has no chance to compete with imports of this kind. Economic liberalization aimed at encouraging African producers to sell abroad in the developed countries. Potential exports to developed countries include products of light industries such as textiles and leather products. African countries would have to enter stiff competition with Asian and Latin American countries which currently dominate export markets in the U.S. and other developed countries. This domination has been facilitated by the establishment of strategic alliances with large retailers, such as Wal-Mart. A nascent African entrepreneur is not likely to aggressively go after export markets because of his or her lack of knowledge of what sells well overseas. "While [African business owners] have some idea of African ...tastes, they are largely ignorant of what consumers like in developed countries" (Fafchamps, 1994). In addition, export markets in developed countries are probably inaccessible to imports of low quality, produced with very traditional methods. Some developed countries, especially the EU, and the U.S., have shown interest to increase imports from sub-Saharan Africa. The Clinton administration, with the urging from the increasingly vocal African-American economic and political community, engineered the African Growth and Opportunity Act (AGOA) through congress. The legislation exempts certain African imports from import tariffs. The challenge for African leaders is to exploit this opportunity to further the growth needs of small entrepreneurs. Also, African leaders should investigate the methods used by Asian governments to develop export markets for small businesses in their countries.

SAP eliminated controls on bank interest rates and commodity prices and subsidies on bank loans and manufactured products (e.g., corn flour). As a result, small businesses, including those started by people laid off due to SAP, faced new hardships including stiffer bank interest rates and soaring prices for raw materials, especially as a consequence of devaluation. Combined, these two situations created a working capital crunch. It is this situation that has resulted in the growing interest in micro finance, following the successful experience of the Grameen bank in Bangladesh. Many African countries have seen a rapid growth of microfinance activities in recent years. In most cases there has been foreign donor (mostly non government organization' such as Catholic Charities) involvement and often with active donor supervision. Despite the growth of the microfinance activities in African countries, there is still a serious shortage of working capital for small entrepreneurs. Several African countries are still investigating ways of promoting further expansion of microfinance institutions. A balance must be found between maintaining the independence and informality of these institutions and imposing enough government oversight so that the small depositors of these institutions are protected from fraud. Traditional banking requirements such as collateralization of loans do not work for microfinance situations (Satta 2004). A major challenge that faces efforts to regulate microfinance activities in any country is the many forms in which microfinance activities occur. For example, now the term microfinance covers even revolving savings and credit societies, traditionally free from governmental regulation.

SAP eliminated government control in many sectors of the economy. However, it didn't do away with government regulation on economic activities altogether. Because government no longer has control over state-owned enterprises, whose operations often generated revenues to support public expenditures (e.g., education, roads, and the military), government must now impose more taxes on the private business sector. Moreover, licensing avenues need not only to be increased, but licensing fees must rise. These consequences of SAP have major implications for business survival and growth. High licensing fees and taxes on business, income or sales, never do any good for an individual business entity (i.e., not as a member of society). High taxes always encourage tax avoidance (which is legal) and tax evasion (which is illegal). It is common to exempt very small businesses from certain taxes and legal requirements. In the U.S many laws do not apply to businesses with less than 10 employees, for example the Americans With Disabilities Act. In many states in the U.S. business sales under \$100 do not attract sales tax. It is conceivable for a shrewd businessman can keep his business below the legal threshold in order to avoid paying taxes or buying licenses. This is all legal. However, the bigger problem for legal enforcement is the business man who evades compliance with laws and gets away with it

because he knows that he is too small to be caught. Many entrepreneurs in sub-Saharan Africa take this advantage of being small. In a survey of 87 Namibian entrepreneurs who were interviewed by Frese et al (1994) an entire 29 of them were not “registered.” Small business size confers cost advantages, legal or illegal, to business owners. As such business growth, by size and sales, can be seen as involving certain opportunity costs. So, an African business owner can rationally choose and they often choose to stay small, and in the so-called “informal sector.”

Businesses which are strategically kept small or in the informal sector, pose difficult problems for those entrusted with small business and entrepreneurship development responsibilities. There is the practical matter of reaching businesses of this nature in order to help them grow past the informal sector. At the present time almost all government-backed programs aimed at promoting entrepreneurship require registration, requiring information such as address, ownership, and products of the business. Among the many problems cited for the low or total lack of effectiveness of entrepreneurship training programs is that those programs do not reach enough of those engaged in entrepreneurial activities. Most sub-Saharan countries have had entrepreneurship training programs, some for over thirty years. Kenya’s Industrial Estates program and Uganda’s Management Training and Advisory Center have existed since the late 1960s. In both of these cases as well as most of the cases of training in other African countries, there has been active involvement of foreign donors, including United States Aid for International Development (USAID), International Labor Organization (ILO) and United Nations Development Program (UNDP). Entrepreneurship training has long been seen as one of the major non-controversial tools for African governments that wanted to be seen as taking a “strategic interventionist approach” (O’Neal and Viljoen, 2001) to promoting entrepreneurial development. But according to most observers entrepreneurial training has not yet created a truly broad-based entrepreneurial class, capable of abating the influx of people into urban centers or reducing the growing gap between rich and poor.

Most researchers on African entrepreneurship believe that the training programs in African countries been both less in quantity and different in content than what is needed (Wallace, 1999). The training has overwhelmingly been urban center-based. The training is often given by people not familiar with the actual needs of African entrepreneurs. The technology involved in the training, such as that provided in industrial estates has tended to be beyond what graduates of industrial estates can afford to buy and use. In most cases, there hasn’t been after-training follow up services. Consequently, there is no effort made to assess the effectiveness of the training, beyond asking attendees to fill out “happy sheets” (where the attendee is asked questions such as “Did you enjoy the training?”). And following SAP, attendees of most government-backed training had to pay fees, creating new recruitment problems. In earlier times most training was not only free, but attendees received stipends for attendance or were promised financial assistance upon completion of training.

## **Summary and Conclusions**

There is a growing worldwide interest in entrepreneurship and small business. Even in already highly entrepreneurial countries such as the United States, new economic and social forces are leading onto entrepreneurial careers. Many people are choosing business ownership instead of corporate life because corporations are restructuring and eliminating jobs at an unprecedented scale. There is no more job security in corporations. Additionally, for an increasingly independent-minded young generation, corporate life is too stifling.

In Africa, and many other areas of the third world, entrepreneurship is expected to do much more for people, especially the indigenous Africans. Entrepreneurship is expected to contribute to national development, by helping to expand the economy, to improve income distribution, and to strengthen national unity. These are monumental tasks.

Until the late 1980s, most African governments, sometimes due to colonial heritage, but oftentimes due to ideological inclination, tended to own and operate all important means of production, thus stifling private entrepreneurship. Therefore, programs to promote private entrepreneurship had to begin with economic

liberalization and the privatization of SOEs. In countries such as Tanzania, Uganda, Nigeria, Zambia, Senegal, and Ghana, governments have already privatized more than 80% of SOEs. In many privatizations, governments have taken the most pragmatic approach – selling the SOEs to the highest bidders, who often turn out to be foreign companies. In spite of all its merits, this approach does not appear to increase the involvement of the indigenous entrepreneurs in the economy. It cannot, therefore, be considered a serious effort to promote African entrepreneurship.

Nigeria, Togo, Ghana, South Africa, and several other African countries have actively sought out “small investors” in the privatizations of those SOEs that are not sold to the highest bidders. In many places, small investors have encountered problems coming up with the money to buy shares in the privatized SOEs. Encouraging or even enabling Africans to own shares in privatized SOEs helps in reducing economic concentration. But it is doubtful whether it also helps in building entrepreneurial skills.

Many Africans become entrepreneurs, sometimes backed by government programs, but oftentimes armed only with their instinct to survive. Unfortunately, only a very tiny percentage of the start-ups expand. The reasons why most start-ups do not expand are still subject to debate. Lack of capital is almost always mentioned. Additionally, several studies on micro-enterprises in Africa have indicated that maximizing profits is rarely a major motivation for their owners. “Providing for family” or merely “making a living” are mentioned much more frequently. In the context of extended families these are major obligations. A business may not be able to do more than “providing for family.” Consequently, the business may not be able to expand, since often expansion requires ploughing resources back into the business. Now, business start-ups which do not expand do not lead to economic growth, more so because some start-ups always fail. In this sense, entrepreneurship comes up a little short. African governments, and governments in other third world countries, may have to supplement the basic entrepreneurship model in order to bring about real, long term improvements in their countries.

# Small Claims Court's Procedure for Small Claims Business Dispute

*Abdul Rani Bin Kamarudin  
International Islamic University, Malaysia*

## Abstract

Often than not, a person with a cause of action involving a small amount probably finds it even costly to pursue his or her cause of action than abandoning such cause of action. The cost involving in bringing the case to court, the involving court's papers which to a layman are difficult to draft and prepare, and further, the need to have an advocate and solicitor would accumulatively mean that it is not worth the trouble to pursue the matter since it has become 'too costly'. It is best and cheaper to simply rely on diplomacy, patient and luck in getting the money due and owing from the scrupulous guy. Though, justice that is delayed is as good as justice is being denied, but in this case, justice is not simply delayed, instead, is not seen to be done. The purpose of procedural law has always been to serve the ends of justice rather than to defeat a person's substantive rights based on technicalities unless the omission in the procedures are those that are so fundamental as to cause a miscarriage of justice. Thus, this paper attempts to look at how a plaintiff can pursue his cause of action in court where the amount is small at nominal costs, making it worth the trouble to take the matter to court against the defendant. Accordingly, it will discuss the procedures involve when making such a claim in the light of the Malaysian Subordinate Court Rules 1980.

## Introduction

There has been of late the realization that the cost of litigation in court has been unreasonable high with the result that even a plaintiff with a good cause of action finds it unaffordable, very hesitant to be drawn in, in a long drawn out battle with the defendant. The situation is made worse if the amount one intends to claim is very nominal so much so that it is no longer worth to pursue the trivial amount, and no lawyers may even want to take the case as it is no longer feasible for them considering their legal fees. There must, therefore, be a more simple and quick procedures without much fuss where one can pursue his claim or grievance, and considering the trivial sum, at nominal or negligible cost. In this regard, there are for examples, tribunals such as the Consumer Claim Tribunal established in 1999 for a claim of an amount of up to Malaysian Ringgit RM 10,000<sup>i</sup>, and the Homebuyer Claim Tribunal established in 2002 for a claim of up to RM 25,000 per cause of action<sup>ii</sup>. These tribunals can cut down formalities, and where trial is conciliatory in nature rather than adversarial. This is also evident under Industrial Relations Act 1967 in cases where a workman who feels that he has been dismissed without just cause or excuse, may make a representation under section 20 of the Act. At the conciliation stage (not the trial stage) before the Industrial Relations Officer, no lawyer is permitted to represent the workman and the employer. Similarly is the case under the tribunal for homebuyer claim under the new section 16B of the Housing Development (Control and Licensing) Act 1966 is a panacea to aggrieved buyers wishing for a cheap, speedy or easy-peasy claim proceeding, and lawyers are not allowed except where there is dire necessity or expedient to do so.<sup>iii</sup> Both the Homebuyers Claim Tribunal and the Consumers Claim Tribunals stipulate that the tribunal should give an award within sixty days from the commencement of the trial. The purpose of existence of tribunals is obvious, to cut down the crap in terms of procedures and evidence. This paper, however, focus on the Small Claims Court Procedures as provided by Order 54 (Small Claims Procedure)<sup>iv</sup> of the Subordinate Court Rules 1980 made by the Subordinate Court Rules Committee<sup>v</sup> in the exercise of its power under section 4 of the Subordinate Courts Rules Act 1955.

## Subordinate Courts

The Subordinate Courts which comprise of the Session Courts, the 1<sup>st</sup> and 2<sup>nd</sup> Class Magistrates', and not the least the Penghulu court are established under section 3 of the Subordinate Courts Act 1948. The Courts relevant with

regard to small amount of claim is the 1<sup>st</sup> and 2<sup>nd</sup> Class Magistrates whose respective civil jurisdictions are where the amount in dispute or value of the subject matter do not exceed Malaysian Ringgit 25,000<sup>vi</sup> and 3,000<sup>vii</sup>. The Penghulu (Village Chief) Court too is in a way a small claim court since it may hear and determine original proceedings of a civil nature in which the plaintiff seeks to recover a debt or liquidated demand in money, with or without interest, not exceeding Malaysian Ringgit RM 50. However, in the case of the Penghulu Courts, the parties to the dispute have to be persons of an Asian race speaking and understanding the Malay Language<sup>viii</sup>. These Courts are relevant as Order 54 rule 2 of the Subordinate Court Rules 1980 (hereinafter referred simply as `SCR 1980') provides that the amount in dispute or the value of the subject matter of the claim must not exceed Malaysian Ringgit RM 5,000<sup>ix</sup>, a sum very much lower compared to the Homebuyers Claim Tribunal and the Consumers Claim Tribunal. Off course, the amount of up to Ringgit RM 5000<sup>x</sup> is by now, it is submitted, archaic and should be increased, if I may suggest, to up to Ringgit Malaysia RM 15, 000.

## **Procedure for Commencing Proceeding**

As in all cause actions arising under any contract, the limitation period to bring an action has to be done within six years<sup>xi</sup> or the cause of action is time-barred. This must, however, be pleaded in the pleadings. The plaintiff (must be an individual person<sup>xii</sup>) when he takes up his cause of action against the defendant (is not defined, and thus not limited to an individual person, and can be any legal entity such as a Company) must state in Form 164 the amount and particulars of his claim<sup>xiii</sup>, signed or thumbprinted by the plaintiff personally<sup>xiv</sup>. 4 copies of Form 164 must be filed in the Registry, and paying the prescribed fees (Malaysian Ringgit RM 10.00<sup>xv</sup>): One copy is to be kept by the court with the three remaining returned to the plaintiff with the Court's seal so that the disputants will have their respective copy. If there are more than two defendants, then 5 copies of Form 164 should be filed in the registry, though; this is not stated in the Order. In other words, 4 copies is the requisite minimum. The Form 164 is not valid unless it has been duly perfected with the seal of the Court.<sup>xvi</sup> Form 164 is essentially an originating summons against the defendant. Service of the Form 164 with the Court's seal to the defendant can then be done by way of personal service or by prepaid registered post addressed to the defendant's last known address.<sup>xvii</sup> If it is done by personal service, it is prudent of the plaintiff to get an acknowledgement from the defendant, or the defendant's immediate family members. An affidavit of service need not be filed as that will be against the very purpose of small claims procedure to make the procedures simple and practical, more so when the litigants are mere laymen, and often than not, without lawyers to assist. This is fortified by the fact that service of the Summons by way of prepaid registered post to the defendant's last known address would be adequate – why then the need for affidavit of service when there is receipt from the postal service that the summons is posted by prepaid registered post? It should not, therefore, prevent the plaintiff from getting from the Court, a judgment in default of appearance against the defendant.

The defendant who has been duly served with Form 164 may dispute the claim by filing<sup>xviii</sup> in the court registry his defence in Form 165 in four copies within 14 days after service of the claim. The defence in Form 165 must contain particulars as to why he disputes the claim, and may also counterclaim. If the defendant counterclaims, he must state the amount and the counterclaim in the same Form. Like Form 165, Form 166 must be personally signed or thumbprinted by the Defendant, and is then to be served to the Plaintiff either by way of personal service or by prepaid registered post addressed of the Plaintiff's at the address mentioned in Form 164. The Plaintiff in turn may file a defence to the Defendant's counterclaim in Form 166, and then served the same to the Defendant.<sup>xix</sup> Order 54 rule 7 stipulates that no party in the dispute shall be represented by an advocate and solicitor except where the defendant is required by laws to be represented by an advocate and solicitor or such other authorized person. In the case of a Company, it is submitted that the authorized officer rather than an advocate should represent a Company as to have a lawyer is against the conciliation process the Court is required to adopt under this small claims procedure. Order 54 rule 7 should not, however, it is submitted, be construed to mean that an advocate and solicitor is precluded from preparing the originating papers and the pleadings for the parties. Form 164, the instructions to both the Plaintiff and the Defendant clearly allows them to consult a lawyer but at the hearing, they cannot be represented by a lawyer.

## **Pleadings**

Judgment in default of defence may be given against the defendant in Form 168 if he fails to file his defence in Form 167 by the day of the hearing date, though the Court may in its discretion adjourn the hearing to enable the defendant to file his defence. Judgment may also be given against the absent Plaintiff in Form 169 such as striking out the claim, or judgment if there is a counterclaim, and costs.<sup>xx</sup> Where the defendant in his statement of defence admits the claim, the judgment to be entered shall be in Form 170.<sup>xxi</sup> A judgment obtained in default of appearance or defence, as the case may be, may be set aside by the aggrieved party in Form 171 on such terms as the Court thinks just. The application should be made within 21 days after the service via personal service or prepaid registered post of the judgment or order, not from the day judgment was made. Service of the judgment whether via personal service or prepaid registered post has to be done by the Court,<sup>xxii</sup> not the litigants in this instance.

## **Mode of Trial: Adversarial or Conciliatory**

The mode of trial tends to be conciliatory rather than adversarial as the Court shall where possible assist the parties to effect the settlement of a case by consent.<sup>xxiii</sup> Consent Judgment shall be in Form 172.<sup>xxiv</sup> Where the parties will not settle their matters by consent, the Court may proceed to hear the case and give a decision thereon, or may adjourn the hearing to another date for final disposal.<sup>xxv</sup> The Court (not the litigants as in the adversarial trial) when it hears the case, may ask the parties for further information (further and better particulars), and in particular for a short description of the claim and the defence, as the situations warrant, if such descriptions has not been adequately supplied already earlier.<sup>xxvi</sup> This is important since the parties are layman with no legal training or expertise when drafting their pleadings. In other words, it is submitted, in small claims court, parties are not so much bound by their pleadings. The Court shall consider the documentary or other evidence, including affidavit evidence, tendered by the parties and in their presence, shall hear such oral evidence and argument, including written argument, as the parties may submit.<sup>xxvii</sup> Form 164 (the Originating Summons) instructs the defendant to bring all witnesses, books and other papers to support his defence or counterclaim. Section 2 of the Evidence Act 1950 states that the Act `shall apply to all judicial proceedings in or before any Court' and thus the Evidence Act 1950 is without doubt applicable to Small Claims Courts as these Courts are either the 2<sup>nd</sup> or 1<sup>st</sup> Class Magistrates' Courts. The Court role, it is submitted, is proactive than reactive.

Judgment obtained after a hearing shall be in Form 173.<sup>xxviii</sup> The Court may in its discretion award costs to the winner (costs shall follow the event) not exceeding Malaysian Ringgit RM 100. No costs for advocacy shall be allowed in proceedings under the Small Claims Court.<sup>xxix</sup>

## **Enforcement of Judgments and Orders**

The judgment creditor may file in Court a notice to show cause in Form 174 against the judgment debtor if there is non-compliance on the part of the judgment debtor. Service of the judgment is via personal service or prepaid registered post addressed to the defendant's last known address as required by Order 54 rule 5 (2). Within ten 10 days of its receipt the judgment debtor must comply by depositing cash or money order in the name of the judgment creditor, and in such a case, he need not appear in Court on the date stated in the notice. Otherwise, the judgment debtor must appear or faces arrest. This is akin to the procedure on Judgment Debtor Summons to examine how best the judgment can be enforced against him. Usually, a Judgment Debtor Summons procedure should be resorted before choosing the modes of enforcing the judgments. However, the purpose of Form 174 is to some extent the same. After examination, a judgment debtor who fails to comply after receipt of the judgment of the Court faces an order for writ of seizure and sale (Form 78). The Court may also allow the judgment debtor more to pay the judgment debt amount or to pay by instalments, or order the judgment debtor to be committed to prison.<sup>xxx</sup>

## Conclusion

The fill in the blank format of the Forms (Form 164, 165 & 166) and given free of charge make things easy for the Plaintiff and the Defendant to simply put in writing (most probably handwriting) what they have to say. The Court through further and better particulars can also overcome any inadequacy in the pleadings unwittingly committed by the litigants with no extra costs imposed upon the defendants if that were to result in the amendments to their pleadings. Moreover, the process is conciliatory than adversarial and the Court is required where possible to assist the parties to effect the settlement of a case by consent. `Assist' is to mean not only assisting the parties in getting their pleadings right, but should also mean that parties are constantly guided by the Magistrate all to the way to judgment, enforcement and also in terms of what evidence is or is not admissible. Surely, one should not sue another person if one is not able to bring relevant evidence to proof his claim. To allow otherwise would be an injustice. Further, the nominal filing fees of only RM 10 is undisputedly very cheap by Malaysian Courts' standard. A right that is too costly to pursue is useless. The costs and procedures have to be feasible. The Small Claims Court Procedures ensure that justice is expedited and not delayed, and equally important is, costly and fussy procedures cannot be allowed to defeat a substantive right.

# **Consumer Protection in China: An Examination of the Toshiba Notebook Case from an Australian Perspective**

*Mary Ip*

*The University of New South Wales, Australia*

## **Abstract**

This paper is inspired by a growing concern of Chinese consumers' complaint against foreign goods since the opening up of China's market. This paper first provides a brief account of the selected incident – Toshiba Notebook case. Then the paper examines the legal issues entailed in the dispute in China. Those legal issues are then also addressed from an Australian perspective with particular reference to the major source of consumer legislation, the Trade Practices Act 1974 (TPA). Comments are also made about other implications that relate to the case in question. The last part of this paper concludes that even if Toshiba were found liable under the Australian laws, Australian consumers would be unlikely to receive a quantum of compensation that matched that of their American counterparts.

## **Introduction**

With the further opening of China's market since the country's accession to the World Trade Organization, Chinese consumers now enjoy more goods and services from foreign operators. However, the influx of foreign investment has simultaneously increased the chance of conflict between Chinese consumers and foreign enterprises. In the past few years, there has been an increasing perception amongst consumers in China that their rights have been trampled by foreign manufacturers. For example, Pioneer Pty Ltd, a Japanese-based company renowned for sound equipment, was the subject of complaints that it was not providing the same type of repair service to Chinese purchasers as it was for customers in other countries. Consumers were also angry at a Finnish mobile phone enterprise, Nokia Pty Ltd, for failing to carry out its 'three guarantee'<sup>1</sup> obligations under Chinese law. Kodak, a photonegative production company based in America, was criticized for the poor quality of its films sold in China. Vigorous protests were made against Toshiba Electronic Corporation (Toshiba), Mitsubishi Motors Corporation (Mitsubishi), and Mercedes-Benz Motors Corporation (Mercedes-Benz). Toshiba was accused of discriminating against Chinese consumers in terms of paying compensation. Mitsubishi was being criticized for its failure in disclosing certain defects of their Pajero model V31 and V33. The grievance against Mercedes-Benz turned to fury. A disgruntled consumer smashed up his car when repair service was given instead of replacement as demanded.<sup>2</sup> All these incidents reveal the tension between Chinese consumers' rights and the obligations of foreign business operators.

It is not the purpose of this paper to adjudicate these consumer disputes. Rather, this paper aims to explore the legal issues that arise from these consumer gripes. Given that most of the commentaries on these incidents were written in the Chinese language, it is also the aim of this paper to bring those commentaries to the attention of manufacturers in the western world. Another goal of this paper is to increase foreign manufacturers' awareness of the business impacts resulting from such conflicts with Chinese consumers. Since it is not within the scope of this paper to investigate all the above mentioned incidents, it has selectively focused on the Toshiba case for the purpose of discussion. The paper first provides a brief account of the incident. Then the paper examines the legal issues entailed in the dispute in China. Those legal issues are then also addressed from an Australian perspective with particular reference to the major source of consumer legislation, the Trade Practices Act 1974 (TPA). Comments are also made about other implications that relate to the case in question. The last part of the paper concludes that even if Toshiba were found liable under the Australian laws, Australian consumers would be unlikely to receive a quantum of compensation that matched that of their American counterparts.

## Toshiba Laptop Computer Dispute – A Brief Outline

In mid-2000, several consumers in China filed a lawsuit against Toshiba Electronic Corporation for a glitch found in the laptop computer they had bought. The allegation was that the notebook computers had a faulty disk drive which could cause potential loss of data. The legal action was inspired by a similar case pursued in the United States court where Toshiba paid out USD 2.1 billions to 500,000 American users as out-of court settlement. When Toshiba only offered Chinese customers free patch-up software and technical assistance to correct the potential disk drive problem instead of paying monetary compensation, the latter were very upset by the disparity in treatment. Chinese media and internet chat-rooms were immediately flooded with coverage of, and hot debate about, Toshiba's strategy toward Chinese consumer claims. Toshiba's non financial compensation policy in China was generally condemned as a form of racial discrimination and a violation of Chinese consumers' rights.

Toshiba has vigorously rejected the accusations and has claimed that their product had no major quality problem. Toshiba explained that the potential disk drive error could cause data loss only when the computer ran multiple programs simultaneously. They claimed that, hitherto there had been no report of data loss experienced by its customers. Toshiba further denied that the amicable settlement in America was an admission of a major defect in the disk controller. As for the allegation of racial discrimination Toshiba defended its action by pointing out the enormous legal risk it faced in the United States. The stringent America laws, which cover potential loss and punitive damage, might subsequently oblige the company to pay a huge compensation as much as USD 9 billions.<sup>3</sup> Toshiba further declared that, apart from America, the company had not made any similar settlement with purchasers in any other part of the world, including China and Japan.<sup>4</sup> Not surprisingly, Toshiba's explanation failed to convince the laptop buyers in China. Most of them still believed that the settlement reached by Toshiba with the American users was an admission of guilt and the company should recompense consumers in China in the same way as they compensated the Americans buyers.

### Sources of Liability

The disparity between the two countries' laws was Toshiba's major argument for the differential compensation policy it applied to users in America and China. In order to verify the validity of this argument, it is necessary to find out in what way product liability could be established upon Toshiba towards Chinese consumers. Chinese commentators allege that there are relevant provisions under contract law, product liability law, and consumer law, which would provide Chinese consumers with a solid cause of action for finding Toshiba liable. These areas of law will be scrutinized in turn.

### Contract Law – Privity

Leung<sup>5</sup> argues that Toshiba has violated Article 155 of *the Contract Law of the People's Republic of China*<sup>6</sup> (the Contract Law) which provides that the goods delivered by the seller fail to conform to the quality requirement, and the buyer may claim from the seller liabilities for breach of contract in accordance with Article 111. He further argues that, by virtue of Article 111, the quality requirement could be ascertained by Article 62(1)<sup>7</sup> in the absence of express contractual terms. Regardless of the computer glitch in question, while this provision seems plausible, it is unclear from the newspaper reports or legal commentaries whether the relationship between Toshiba and the Chinese consumers is seller and buyer within the scope of the contract law. It is not customary practice that buyers contract directly with a manufacturer instead of with the downstream wholesalers or retailers. Furthermore, buyers in China require authority to import goods into the country<sup>8</sup> so it is unlikely for an individual consumer to hold such a licence. The situation is further blurred by the fact that Toshiba had a business partner in China called Legend Corporation, which provided the main contact for buyers in the country. If Legend Corporation were not an agent for Toshiba, but a wholesaler instead, a lack of privity of contract between Toshiba and the Chinese buyers may render the purport provision under the contract law not applicable. However, Article 121 states that 'one party that violates the contract because of a third party shall be liable for the breach of contract to the other party. The disputes between the said party and the third party shall be settled according to law or their agreement'. To circumvent the privity requirement and make Toshiba ultimately liable, the Chinese consumers can sue the retailer/wholesaler for its contractual breach under Article 155, and let the retailer/wholesaler to settle its dispute with Toshiba by virtue of Article 121.

In Australia, the legal technicality of privity under contract theory can be overcome by Division 2A of Part V of the TPA. The said Division is designed to allow consumers to sue manufacturers for damages even when there is no contract between them, provided the manufacturers have supplied the goods to an intermediary who re-supplies them to the consumers. Thus, in Australia, consumers can resort to Section 74D in Division 2A for seeking compensation from Toshiba by reason of its failure to provide goods of merchantable quality. Furthermore, Division 2A has explicitly held manufacturer accountable for its product in the end even though consumers opt to sue seller for breaching the implied terms of their contract. It is because under S74H manufacturer is obliged to indemnify the seller for the compensation recovered by consumers.

#### **Product Liability Law**

It is alleged that product liability law is another avenue whereby Chinese consumers may seek legal redress. The principal product quality legislation, namely *the Product Quality Law of the People's Republic of China*<sup>9</sup> (the Product Quality Law), provides compensation for a consumer who incurs loss because the goods supplied fail to correspond to the described quality or are defective. In addition to the principal statute, provisions that confer on consumers a remedial right in the case of defective or substandard product can be found in the Law of *the People's Republic of China on the Protection of Consumer's Rights and Interests*<sup>10</sup> (the Consumer Law) and *the General Principles of Civil Law of the People's Republic of China*<sup>11</sup> (the Civil Law). Article 35 of *the Consumer Law* states that if defective product caused physical injury or property loss to consumers or users, they can claim against seller or manufacturer for compensation. Furthermore, Article 122 of *the Civil Law* imposes liability on manufacturer and seller if substandard goods have caused property damage or physical injury to others.

Under the Chinese laws, there are two key aspects of product attribute which allow redress, that is, product with a defect or product non-conforming to specified requirements or standards. Article 46 of *the Product Quality Law* defines the term 'defect' as 'an unreasonable danger in a product, which danger threatens personal safety or another's property';<sup>12</sup> and also provides that 'where a product is governed by the State or industry standards for safeguarding health and safety of persons or the safety of property, the term 'defect' shall also mean noncompliance of such standards'.<sup>13</sup> The technical problem of the disk drive may not fall into the first limb of the definition given that the probability of the disk error was low as Toshiba claimed.<sup>14</sup> Whether the disk drive flaw would be regarded as noncompliance with the specify standard, if any, and therefore caught by the second limb of the definition, is by no means clear as the computers in question had never been sent to the relevant authority in China for examination of their standard compliance. Furthermore, it has not been indicated from the various reported materials that there is a mandatory standard applicable to this case.

The Australian law also describes 'defective goods'. Section 75AC of Part VA of the TPA defines the term 'defective goods' as 'goods having a defect if their safety is not such as persons generally are entitled to expect'. Apparently, Part VA of the Act is more concerned with goods which are unsafe or dangerous rather than goods with unsatisfactory quality.<sup>15</sup> Though Section 75AC broadly defines the phrase 'having a defect' by including failure to comply with the government mandatory standard, the related standards refer only to the safety aspects of the products. Furthermore, *the Explanatory Memorandum to the Trade Practices Amendment Bill 1992* (the Explanatory Memorandum) has stated that a 'small statistical chance of injury associated with them does not of itself mean that they are defective'.<sup>16</sup> *The Explanatory Memorandum* would be in Toshiba's favor, assuming as the company has claimed, that the chance of disk error was low and there had been no report of damage.

#### **Misleading and Deceptive Conduct**

Article 49<sup>17</sup> of *the Consumer Law* suggests that deception is an alternative ground of action. Does Toshiba's failure to disclose the computer glitch constitute a deceiving act within the scope of relevant Chinese laws? Provisions governing deceptive conduct can be found in *the Civil Law*,<sup>18</sup> *the Contract Law*<sup>19</sup> and *the Consumer Law*<sup>20</sup> legislations. However, each statute is silent as to the definition of the crucial term 'deceptive'. Tung states that 'deceptive' means when one party 'intentionally fabricates or distorts the facts, or intentionally conceals the truth, which consequently led others to act upon it erroneously'.<sup>21</sup> Tung's explanation coincides with Article 67 of *the People's Supreme Court's Opinions for Issues relating to the Implementation of the Civil Law*,<sup>22</sup> which specifies that misleading conduct occurs when a party deliberately conveys untrue information, or conceals the truth on purpose, and as a result causes others to make a wrong decision. According to academic and judicial interpretation, the element of 'intention' is the crucial ingredient for establishing misleading and deceptive conduct. Besides, the

relevant provisions would only be breached if someone has actually been misled. Therefore, in order to win the lawsuit, Chinese consumers would need to prove that Toshiba has distorted the facts about the computer glitch, or concealed the defect with intent.

It should be noted Toshiba has always denied that the technical problem of the computer drive was a defect giving rise to a legal obligation to warn its customers. Despite its knowledge of the potential disk problem for more than 10 years, Toshiba alleges that at all times it believed that was not an issue as severance problem was unlikely to arise and there was no report of damage.<sup>23</sup> Whether this decade-long knowledge of the potential flaw in these circumstances would be sufficient to constitute a deliberate and fraudulent concealment needs to await a Chinese judicial decision.

Section 52<sup>24</sup> of the TPA prohibits 'misleading and deceptive' conduct 'in trade or commerce' in broad and general term. It is aimed at ascertaining whether the conduct is misleading or deceptive rather than whether the conduct has actually misled anyone unless damages is the remedy sought. In other words, if injunction or corrective advertisement is the preferable remedy, consumers only have to prove the conduct complained of is likely to mislead and deceive. Accordingly, Section 52 covers a wider ambit of conducts than its Chinese counterpart. Furthermore, Section 52 generally does not require intent on the part of the representator. Thus, Toshiba's intentional non-disclosure of the computer glitch becomes irrelevant. What is relevant is whether Toshiba's conduct of non-disclosure is actually misleading or capable of misleading the public at large with respect to the type of remedy sought.

Nevertheless, for the purpose of Section 52, 'conduct' is defined by Section 4(2) of TPA to include doing or refraining from doing an act. Despite the broad statutory definition, court interpretation<sup>25</sup> has narrowed down the meaning of 'conduct' to 'an act that abstained from doing something deliberately'. Hence, failure to disclose information due to carelessness or unawareness of its importance does not satisfy the meaning of conduct under Section 4(2) for the breach of Section 52.<sup>26</sup> Chinese scholars also do not consider 'mistake'<sup>27</sup> or 'omission'<sup>28</sup> in disseminating information as deceptive conduct because it lacks the required intent for concealing the truth. Thus, Toshiba's silence about the computer disk information due to its belief of trivial to alert consumers of the potential problem may save it from the contravention of Section 52.

#### **Silence Amounts to Misleading Conduct**

Yet failure to speak is not totally immune from being a possible case of misleading and deceptive conduct in both Australian and Chinese laws. Chinese law takes the viewpoint that an act of silence is considered misleading or deceptive where there is a duty of disclosure<sup>29</sup> and the duty could arise from a contractual relationship or from trade custom.<sup>30</sup> The narrow scope which gives rise to such a duty would impose difficulty on the Chinese consumers due to their lack of privity with Toshiba and lack of established trade custom by reason of the short history of market economy in the country. If there is a duty to reveal relevant facts,<sup>31</sup> silence could be treated differently in Australia too. However, recent Australian case law has focused on the effect and purpose of the impugned conduct rather than the duty of disclosure. Subsequently a flexible approach of 'reasonable expectation of disclosure'<sup>32</sup> is adopted. Thus, whether Toshiba withholding information about the computer glitch can be regarded as conduct of the proscribed character would depend on Australian consumers' success in passing the 'reasonable expectation of disclosure' test.

#### **Right to Information**

The Chinese Consumers Association argues that the consumers' right to information was infringed because Toshiba did not adequately notify users in China of the possible computer glitch in the Chinese language; and only posted a warning notice in Toshiba's website after the Chinese media had extensively reported the matter.<sup>33</sup> Decrees that require product labeling in the Chinese language can be found in *the Product Liability Law*<sup>34</sup> and *the Product Label Marking Provisions*<sup>35</sup> with respect to specifications, ingredients, grades, names and quantities of its major constituents and so forth of the product. *The Consumer Law*<sup>36</sup> has stipulated business operators' obligations to present true product information. Though the provision does not specify Chinese language should be used in the presentation, it is implied.

*The Product Liability Law* further imposes on producers an obligation to clearly indicate flaws found in their products. 'Flaw' is defined as product which 'does not possess good quality, or fails to comply with the stipulated standard, or fails to correspond to the product specification or product quality by sample; but it has no

unreasonable danger which threatens personal safety or property damage'.<sup>37</sup> *The Consumer Law* has gone further in conferring on consumers the right to be informed of the true nature of the product bought or used, or the service acquired.<sup>38</sup> Parallel to this right is the obligation<sup>39</sup> of business operators to notify the relevant authority or consumers when the product or service is found to have a serious flaw which may inflict harm to person or property despite the product or service being used in a correct way. When consumers suffer from such a breach, they can either sue the seller or the producer.<sup>40</sup> Although the obligation under *the Consumer Law* is narrowly restricted to serious flaws rather than to a general notion of faulty in *the Product Liability Law*, no actual harm is required for the violation. Therefore, Chinese consumers might have a case for infringement of their rights to information if the elements of those pertinent stipulations from *the Consumer law*, *the Product Liability Law* and *the Product Label Marking Provisions* were able to be satisfied.

Furnishing product information is also a statutory obligation for producers in Australia. Section 65D(2) of the TPA calls for disclosure of product particulars relating to performance, composition, contents, design, construction, finish and packaging and so on but only if the regulations so required. However this product information standard disclosure usually applies to hazardous products which may expose consumers to risk of physical injury, and that is not the case in Toshiba. Apart from Section 65D(2), product information is generally overseen by Section 52 and Section 53, and there is no specific provision within the Act governing product labeling. Since Section 52 has already been discussed, the following examination is for the applicability of Section 53 to the case in question. Section 53 includes eleven specific prohibitory subsections against false representation in the supply of goods and services. Section 53(a) specifically prohibits certain attributes of goods or services to be falsely represented. Such attributes include standard, value, quality, grade, composition, style and mode, and the good's history. As the term 'representation' or 'represent' has been given a wide meaning, it encompasses a variety of actions and behaviors. Thus, if Toshiba's concealment of the computer glitch is regarded as a false representation of the quality of the goods, the company might have to face a fine of up to \$1.1 million and monetary claim from consumers as Section 53 attracts both criminal and civil liability.

## Compensation

### Onus of Proof

Establishing a cause of action for compensation raises the subject of evidential proving. According to the general rule of evidence in civil proceedings in China, the burden of proof rests on the party who brings up the issues.<sup>41</sup> However, under *the Stipulations relating to the law of evidence in civil procedures* (the Stipulation)<sup>42</sup> emanated by the People's Supreme Court, when a defective product has caused physical injury to a person, the onus of proof is reversed. The manufacturer bears the burden of proving goods are not defective instead of the consumers having to prove they are. Leung, a researcher at the Chinese Academy of Social Sciences, also states that Article 41 of *the Consumer Law* has deemed a manufacturer liable until it can prove the contrary, thus the onus of proving liability moves from claimant to manufacturer.<sup>43</sup> However, *the Stipulation* is silent on the situation when the consumer opts to sue the seller instead of the manufacturer in accordance with *the Product Liability Law*.<sup>44</sup> Furthermore, *the Stipulation* fails to clarify who has the onus of adducing evidence in the case of substandard goods<sup>45</sup> rather than defective ones. Finally, *the Stipulation* seems to confine its application to the case where injury is inflicted on a person rather than on property. Thus, if this proposition is correct, the obligation of attesting liability still remains<sup>46</sup> with the consumers in the Toshiba case.

Similar to its Chinese counterpart, in Australia the common law principle of burden of proof for civil proceedings is that the person who asserts the matter, has to bear the onus of proving each essential element of that matter. This is particularly pertinent for the case regarding rights of action against manufacturer by virtue of Part V, Division 2A of the TPA. Division 2A imposes obligations on a manufacturer in respect of unsuitability, description, merchantable quality, sample, repair, and warranty of its goods. Though Division 2A provides compensation<sup>47</sup> if there is a breach of these statutory obligations, it has no mention of whom owe the onus of proving. Thus, the common law principle of proving the dispute would apply to Australian consumers if Div 2A is the appropriate cause of action against Toshiba.

Certain provisions of the TPA have reversed the onus of proof for allegation of defective goods. In accordance with S75AD to S75AG, once the plaintiff can show a prima facie case for defective product, the defendant must disprove them to escape liability. Nevertheless, as previously discussed, the Toshiba case does not seem to fall within the scope of defective goods under Part VA of the TPA.

#### **Actual Loss versus Potential Loss**

Although Toshiba defends the case by alleging zero damage reports, the damages claimed by the American users were potential loss of data. The American remedial system does allow money compensation for potential loss that is the possibility of harm caused by defective product. However, potential loss is not recognized in China.<sup>48</sup> Nevertheless, Hong<sup>49</sup> cites Article 49 of *the Consumer Law* in an attempt to circumvent the requirement of actual loss usually required for seeking compensation under the Chinese remedial regime. Article 49 states that if a business operator that practises fraud in providing a commodity or a service at the consumer's request, the business operator is obliged to increase the amount of compensation *for loss* incurred by the consumer; and the increment shall be double the price of the commodity or service. He argues that actual loss is not the prerequisite for contravention of Article 49 as the objective of awarding punitive damage Article 49 is to punish deceitful acts. He further argues that had actual loss been the prerequisite for the section and consumers required proving it, the principle purpose of the provision would be defeated. Thus, Hong considers 'loss' is deemed to exist if there is commission of a fraudulent act. With respect, if Hong's argument is correct, it is perplexing why the phrase 'loss incurred' is used in the provision. Furthermore, from the obtainable sources of information, it is indecisive whether Toshiba has practised fraud or not.

A literal interpretation of Articles 35 and 122 of *the Consumer Law* and *the Civil Law* respectively seems to suggest that only actual and proven loss is recoverable. Kwok,<sup>50</sup> an official from the China Consumer Association, supports this proposition. He states that the potential defect of a product that has not yet caused actual harm is insufficient to bring about the application of *the Product Quality Law* for seeking remedy. Professor Dong from Beijing's China People's University is of the same view. He asserts that the manufacturer is liable to pay compensation to consumers only if the latter can show damage caused by the product.<sup>51</sup> Wu, professor at the Remin University of China, concurs with this assertion. He believes that there is no legal ground for an action in respect of potential damage in China because the country has inherited the continental legal system under which compensation is based on tangible loss.<sup>52</sup> However, Wang, who also comes from the Remin University, disagrees with his peers. Wang argues that suing for compensation for substandard product does not require loss actually suffered. He argues that a substandard product does not always cause harm. As long as there is evidence that the product fails to meet the necessary standard, liability will arise under *the Contract Law*. Professor Wang's argument could be right if Toshiba's computer glitch is considered as inferior rendering the goods 'substandard' rather than 'defective'; and also if there is a contract to which the Chinese consumers are privy thus activating *the Contract Law*.

In Australia, Section 82 is the major compensation provision for the contravention of Part IVA and Part V of the TPA. If the present case falls into the scope of unconscionable conduct,<sup>53</sup> misleading conduct<sup>54</sup> or false representation,<sup>55</sup> compensation could be sought under Section 82. However, the section would only confer rights on a person to recover damages for the breach of the Act if the person has suffered 'loss or damage' by reason of the contravention. Courts'<sup>56</sup> interpretation of the phrase 'loss or damage' refer to actual loss or damages that has occurred and not potential or likely damage. Nevertheless, potential or likely damage is recoverable under Section 87. But the word 'likely' renders the section only applicable to cases where there is 'real chance or possibility' of loss and damage suffered by the plaintiff.<sup>57</sup> Although Toshiba claims that the company has received no complaints of data corruption or loss from customers,<sup>58</sup> a computer designer indicates that the disk problem is most likely to occur when a computer is running many tasks simultaneously and Toshiba admits this.<sup>59</sup> Thus, the prerequisite for Section 87 could be found in the Toshiba case. Consequently, the Australian court could be empowered to make compensatory relief for consumers under Section 87 by reason that Toshiba had contravened a provision in Part V of the Act. Section 87(2) sets out a non-exhaustive list of court orders including order directing the repair of goods. Nonetheless, it is worth noting that the relief granted under Section 87 is what the court considers appropriate to compensate the applicant's damage and does not need to redress the whole of the applicant's loss. Thus, the Australian court may, 'as it thinks fit', make order directing repair of goods rather than ordering refund which in effect is what Toshiba has offered to the Chinese consumers.

### **Exemplary Damages**

Assuming consumers are able to establish a right of recovery against Toshiba, another question would be what quantum of damages they would be able to obtain. The remedial system in China is based on the theory of recompensing for actual loss suffered.<sup>60</sup> Hence the Chinese remedial regime does not generally recognize exemplary damage.<sup>61</sup> However, it is submitted<sup>62</sup> that Article 49 of *the Consumer Law* does produce an effect comparable to exemplary damages. Article 49 states that a business operator who practises fraud in providing a commodity or a service at the consumer's request, is obliged to increase the amount of compensation for loss incurred by the consumer; and the increment shall be the price of the commodity or service. However, Article 49 might not carry out the predominant purpose of exemplary damages, which is deterrence. The penalty is statutory limited to twice the amount of the original price, instead of being decided by the court in accordance with the background of the defendant, may fall short of producing the deterring effect. Article 49 has set two limitations for Chinese consumers. Firstly, the section restricts its application to deceptive cases.<sup>63</sup> Secondly, as stated above, compensation is capped at twice the amount of the purchase price. Thus, even though Chinese consumers may be able to satisfy the requirement of deception, the quantum of exemplary damage they receive from Toshiba would be far below the amount received by American standards.

It is generally conceded that exemplary damages as punishing persons who commit socially undesirable acts and deterring the commission of those acts in the future instead of compensating the innocent party.<sup>64</sup> The major criterion for awarding exemplary damages is 'contumelious disregard' in the conduct of the wrongdoer.<sup>65</sup> Though exemplary damages are awardable in Australia, it is limited by Section 82 and Section 87 of the TPA. Given the concepts of Section 82 and Section 87 are compensatory, the nature of exemplary damages is beyond the reach of the concepts. Furthermore, Australian courts have taken a conventional view of not awarding exemplary damages for breach of contract.<sup>66</sup> It is partly because the object of damages in contract is to place the plaintiff in the position in which he would have been had the contract been performed rather than to punish the wrongdoer. Therefore, it is unlikely that consumers would get exemplary damage from an Australian court.

## **Other Implications**

### **Economic Rationale**

It has been alleged that there is an economic rationale behind Toshiba's decision in offering a different set of remedies to Chinese users. At the time of the dispute, Toshiba had sold to China only 200,000 sets of notebook computers out of its total sales volume of 15 millions.<sup>67</sup> Since exemplary damage are not generally available under the Chinese remedial regime, if Toshiba lost the legal battle, the quantum of compensation that it might have to pay would not be as much as in the United States. Because Toshiba would be able to meet the consumers' claim in China, it is more prepared to confront Chinese consumers in court.

### **Court Administrative Rationale**

An administrative factor has strengthened Toshiba's affordability of litigation in China. There is no precedent for successful group litigation in Chinese courts at the time of the incident.<sup>68</sup> Chinese courts are still at an early stage in handling claims brought by large numbers of claimants. In 1991, Articles 54 and 55 of *the Civil Procedure Code*<sup>69</sup> introduced a representative action for collaborative litigants in China. Similar to American's class action procedures, representative action in China requires certification.<sup>70</sup> This is a vital procedure for Chinese consumers as the viability of their claim is dependant on whether the court accepts to hear them as class action. However, the lack of infrastructure in handling the insurmountable managerial matters could be an explanation why Chinese Courts reject such applications.<sup>71</sup> Indeed, denial of class certification on the ground of administrative difficulties is not uncommon in other jurisdictions, like America and Australia.<sup>72</sup> So, breaking the 'never victorious' record of a class action in Chinese courts is another legal obstacle consumers have to overcome.

### **Who is the Final Winner?**

Though Toshiba seems to be holding the upper hand position in this legal dispute and was able to avoid paying monetary compensation in China, it did pay a price for the incident. Toshiba offered Chinese consumers technical assistance in installing remedial software for free and suffered from a number of adverse market impacts. After the incident hit the airwaves with speed and volume, consumers' confidence in the trustworthiness of the Toshiba

computer laptop, as well as the company's other products, was undermined. It has also been reported that some shops in China intended to take Toshiba products off their shelves as a form of protest.<sup>73</sup> Considerable damage was caused to the goodwill that Toshiba had cultivated in the country.<sup>74</sup> Consequently, there was a fall in its sale volume in the China market<sup>75</sup> and a drop of its share price on the stock exchange.<sup>76</sup> In addition, a substantial portion of senior managerial time had been lost in handling the case.<sup>77</sup> In the end only Toshiba know whether its company is better off financially by offering two different compensation schemes for users in different countries. In assessing legal risk, Toshiba and other business operators should be aware that a penalty for repeat violators of the relevant Chinese law is cancellation of import licence.

#### **Should the Chinese Remedial Regime Fully Recognize Exemplary Damages?**

Most Chinese commentators assert that if China had comprehensive remedial system, consumers' rights and interests would have been better safeguarded. Therefore, it has been suggested that opening up the availability of exemplary damages has become necessary for consumer protection in China. However, the suggestion of using exemplary damages as a mechanism has been objected to as counter-productive to product liability victims for the following reasons. Firstly, China's financial system is not yet a full-fledged market economy. Extending the scope of product liability and imposing heavier penalties would minimize the chance of survival and competition for new manufacturers.<sup>78</sup> As a consequence, consumers would possibly find less choice in the market. Besides, exemplary damages should be applied without discrimination to both local and foreigner manufacturers in case of violation. It is doubtful whether local manufacturers could afford to pay the same huge amount of penalty as their foreigner counterparts when convicted.<sup>79</sup> Nevertheless, this uncertainty could be resolved by the court in considering penalty taking into account the defendant's wealth and deciding on an amount sufficient to bring about a deterrence effect.

Secondly, during the country's transition to a market economy, product quality is still a serious issue in China. Protecting consumers from shoddy goods by means of exemplary damages could send many local producers into bankruptcy.<sup>80</sup> In the end consumers would suffer from having lesser quality but affordable goods. Furthermore, some consumers might participate in the local production as employees and would be doubly jeopardized if heavy damages awarded which led to the close down of local business.

Thirdly, with the ever increasing manufacturers' liability under tort and statute, such as *the Trade Practices Act* in Australia, there is a universal use of insurance by potential defendants to cover themselves against losses arising out of their defective products. As the insurance industry has started to develop in China, manufacturers are able to cover the risk of heavy quantum of compensation by way of insurance if exemplary damages are going to be awarded by the Chinese remedial system. However, shifting the penalty liability to their insurer<sup>81</sup> would possibly moderate or defeat the punishing and deterring effect of exemplary damage for the violators in question. Furthermore, insurance premiums increase production costs and undermine the competitiveness of those manufacturers. Worse than that, if the market situation allowed, the premium fee would translate into higher retail prices, which consumers ultimately have to pay. Thus, awarding exemplary damages might not be the penicillin for the product liability plague in China.

Finally, exemplary damages, which are non-compensatory, have been criticized as providing a 'windfall' for claimants. While the correctness of this argument is yet to be tested in the Chinese remedial system, the exemplary damages imposed by Article 49 of *the Consumer Law* have already aroused a controversial incident called the 'Wang Hai phenomenon' in China. Wang Hai, a contentious fake goods fighter, relies on the remedial provision that provides a double refund for fake commodities, and employs a buy-and-sue technique to make a profit. Wang Hei's techniques of money making have been followed and have spurred a tidal wave of fake goods fighting across the country.

The debatable legal issues in the Wang Hai case aside,<sup>82</sup> the phenomenon supports the argument that exemplary damages do incite people to sue. Indeed, Toshiba's settlement is a good example. Apart from motivating Chinese consumers, Toshiba's settlement has also led to four copycat lawsuits filed against various computer companies<sup>83</sup> in America. Apparently, litigants are excited by the thought of the compensation that they could get out of the desirable settlement or favorable judgment. However, litigants may not be aware of the fact that winning the case on legal grounds and getting the actual compensation are separate issues. This is because American lawyers are allowed to charge their legal fees on a contingent basis. Thus, in most consumer class actions only the lawyers gain much financially.<sup>84</sup> This phenomenon is well illustrated by Toshiba's case. Out of the USD 2.1 billions

settlement fund, various law firms, which filed the suit pocketed USD 145.7 millions. The owners of Toshiba computers received only discounted coupons (USD 100) for buying other Toshiba's products, or cash payment of few hundred dollars and free software patches to repair the alleged defect.<sup>85</sup> In fact, not all American users were excited by the amount of compensation and there was USD 350 millions left over in the settlement funds.<sup>86</sup> In Australia, contingent fee contracts between lawyer and client are basically illegal. But a conditional costs arrangement allows an Australian lawyer to collect a normal fee plus an extra charge of up to 25 percent of that fee if the case is successful. Nevertheless, an Australian losing party can be required to pay the legal costs of his opponent, unlike American litigants who usually pay their own costs. Whether a contingent fee is allowed in China is unclear. But the dual questions of who is going to foot the legal bill and the legal fee of other party if the claim fails would make Chinese consumers carefully consider their action before filing the lawsuit. Apart from using insurance to manage legal risk and provided other market factors allow, the financial bill resulting from litigation or from settlement might sooner or later be met by other innocent consumers who pay a higher price for the product but are not a beneficiary of the exemplary damages. Thus litigation is not a panacea for the product quality problem in China nor does it advance the Chinese consumer's wellbeing as a whole.

## Conclusion

It is evident that the laws of a jurisdiction determine the outcome of a legal issue in a particular case. However, rules and regulations are just one of the contributing factors. Other features in a legal environment, for example, the judicial background, the due process of law, and policy issues in a court decision have to be taken into account.<sup>87</sup> Furthermore, the non-legal aspects of a country, such as the availability of a national health care system, which provides collateral sources for seeking compensation, also play an important role in litigation outcome. Above all, economic rationale often outweighs legal consideration in shaping a company's decision about a commercial dispute.

Under Australian laws, Toshiba may have breached the manufacturer's obligation of merchantability. There could also be a possible claim against Toshiba for contravening Sections 52 and 53 of *the Trade Practices Act*. With respect to Toshiba's liability for defective goods under Part VA of the Act, it does not seem to be the appropriate base. Leaving aside the issue of the evidential burden, even if Australian consumers could successfully prove Toshiba breached a statutory obligation, exemplary damages are not available for such contravention. Furthermore exemplary damages are not awardable for violating Sections 52 or 53 though aggravated damages might be granted to consumers. In addition, exemplary damages are inconsistent with the compensatory theory of *the Trade Practices Act*. Thus Australian consumers would be unlikely to experience the same kind of dispute outcome, which was shaped by some specific aspects of the United States legal system, as their American counterparts.

It is hoped that this analysis of the Toshiba case through the perspective of Australian laws will provide Chinese consumers an objective viewpoint of the matter. The Toshiba case shows an immediate need for upgrading the present Chinese consumer protection system, which could be achieved by drawing experience from its counterparts. The Trade Practices Act in Australia provides a special experience that would be a good reference point for China. Only a constant review of the safeguard mechanisms would be able to protect adequately consumers' rights and interests in China in the multifaceted market situation after the country's entry to the World Trade Organization.

# The Tests to Determine ‘Constructive Dismissal’: The Malaysian Legal Perspectives

*Dahlan, Nuarrual Hilal  
Universiti Utara Malaysia, Malaysia  
Kamaruddin, Abdul Rani  
International Islamic University, Malaysia*

## Abstract

In so far as Malaysia is concerned, there are certain tests adopted by the courts to determine whether the acts of the employer tantamount to constructive dismissal or not. These tests are, - the ‘Contract Test’ and the ‘Just and Equitable Test or Unreasonable Test’. However, courts in Malaysia have yet to resolve which one of these tests is the most prevailing and practical one? There are cases that apply the former test whilst in others the latter test is applied. This paper attempts to define what are these tests, their origins, rationale and applications in cases involving constructive dismissal and to forward suggestions to improve and suggest the best test in determining ‘constructive dismissal’ in Malaysia.

## Introduction

The termination and dismissal of workers has always been a matter of great anxiety and inevitably poses a common equitable and legal problem to the employer on the one part and the employees on the other. To minimize and prevent any inequality and injustice in industrial relations and to secure industrial harmony, certain law and regulation have been established. It is trite law that legal rules not only enumerate rights and duties of the employer/employee before and during the course of employment, but it also seeks to provide provisions governing the process of its termination and dismissal. This transparency between employer and employee ensure that disputes arising will be dealt with objectively and in accordance with equity and justice. There are various ‘ever kept recurring’ issues in employment law which deserve special attention. But one of the most important issues to reckon with is ‘indirect dismissal’ or what is commonly known as the ‘constructive dismissal’. This is because the law relating to this type of dismissal, as far as the legal position in Malaysia is concerned, is to a certain extent still shrouded in uncertainty. In this type of dismissal, normally, it does not require any express words or manifest act on part of the employer which could understandably denote dismissal. In fact, the occurrence of such dismissal may not be realized by the employee concerned for it rarely involve any clear and unequivocal sign that shows there was in fact ‘a dismissal’, unless guided by the principles of law.

The only statutory provision in Malaysia which deals with the right of the employee where there is a dismissal is the notorious section 20(1) of the Industrial Relations Act 1967 (‘IRA 1967’). This section provides that a workman who believes that his employer has dismissed him without just cause or excuse may make representations in writing to the Director General of the Industrial Relation for reinstatement or other relief. However, the provision does not mention and define ‘constructive dismissal’ and its applicable test.

## Objectives

The purpose of this paper is as follows:

- 1) To identify the applicable tests applied by the courts in Malaysia in determining ‘constructive dismissal’; and,
- 2) To examine the tests, their origins, rationale and applicability, and to then propose the best test that the court should apply.

## Importance of Research

It is understood that in the era of globalization, cross border transactions and trades play an indispensable phenomenon. The purpose of international trades today, apart from seeking new potential markets and customers, it is argued, eventually they would maximize the shareholders' profits. When involving trades, apart from funds, good management and incentives given, legal rules and regulations too play a fundamental part. For otherwise, investors would not dare to venture into any business undertaking unless the law available, in a given country, is clear and would guarantee and protect their rights. Any failure and incompetence of the law to tackle and govern certain issues, could cause substantial pecuniary and financial chaos. This would, of course, mar, in the future years, the confidence of the investors on that country. One of the areas of the law which have a direct connection to this respect is the 'labour or employment law'. It contains rules and regulations governing the relationship between employer and employees. On part of the employees, they would expect that they would get the payment as promised and other legal and equitable rights, in return to the efforts they rendered in compliance with the will of the employers during the course of their employment. Thus, if the law and rules concerning labour or employment law in any given country is insufficient nor alien to the recognized international practice or so handicapped to be a set of law which could attract the confidence of the investors, the investors, who would normally be the prospective employers, would hesitate and reluctant to invest or channel any funds into that country. Thus, the law of constructive dismissal, which this paper seeks to address and expound, would be a relevant knowledge to the prospective investors who are interested to invest in Malaysia. This is because, deficiency on this branch of labour law, would to a certain extent, affect their plans and corporate strategy in the later period of their operation in Malaysia.

## Approach

This paper will be divided into several parts. First, the author will explain the meaning of constructive dismissal as proposed and formed by the learned judges and jurists. This would be followed by probing into the tests that have been adopted and applied by the courts in Malaysia in relation to constructive dismissal through decided cases. The final part would be the commentaries on the principles adopted, and thereafter, the authors' conclusion.

## The Meaning of Constructive Dismissal

The relevant laws in Malaysia dealing with employment do not provide any statutory definition as to what 'constructive dismissal' actually is. The IRA 1967, the Act which specifically deals with industrial relations and employment<sup>i</sup>, for example, has no such definition. According to certain quarters, the labelling of 'constructive dismissal' is rather confusing and should not be used at all.<sup>ii</sup> It is thought that 'constructive dismissal' is also a type of 'dismissal'. The IRA 1967 merely provides that pursuant to its section 20(1), a workman or employee is entitled for reinstatement of his former job if he has been dismissed 'without just cause or excuse' by his employer. It does not specifically states 'constructive dismissal'. The full provision of this section worth reproducing reads as follows:

*'Where a workman, irrespective of whether he is a member of a trade union of workmen or otherwise, considers that he has been dismissed without just cause or excuse by his employer, he may make representations in writing to the Director General to be reinstated in his former employment; the representation may be filed at the office of the Director General nearest to the place of employment from which the workman was dismissed'* (the emphasize is added by the author)

According to Oxford Dictionary of Law (2000), 'constructive dismissal', literally, means 'termination of a contract of employment by an employee because his employer has shown that he does not intend to be bound by some essential terms of the contract, and although the employee has resigned, he has the same right to apply to an employment tribunal as one who has been unfairly dismissed by his employer'.

On the other hand according to Maimunah (2003), constructive dismissal is:

*where the behaviour of the management causes the employee to resign...management takes certain actions to make continued employment intolerable...the employee can consider himself as has been 'constructively dismissed'. The employer's conduct must amount to a breach of contract in order for constructive dismissal to take place.*<sup>iii</sup>

From the above suggested definitions, we can deduce that constructive dismissal is when an employee terminates his service (with or without notice) with the employer due to the employer's behaviour, action or non-action, treatment or non-treatment that expressly or impliedly shown that the employer does not intend to be bound by the contract entered into or has repudiated their contract of employment.

Section 20(1) of the IRA which states 'where a workman,...considers that he has been dismissed without just cause or excuse...', must connote the following situations:

- 1) Where the employer, manifestly, has dismissed him without any reasonable ground; or
- 2) Where the employee involuntarily or voluntarily, terminates his employment because of the conduct of the employer which caused him to be driven out of the employment. In other word, the act or conduct of the employer towards him in the course of his employment could not be accepted or borne by him any longer and the conduct of the employer has forced him to leave his employment.

The first situation, it is submitted, is a 'direct dismissal' whilst the second is an 'indirect dismissal' or 'constructive dismissal'. What it means is that the employer has at the very outset evinced an intention to dismiss the employee, subtle or otherwise, that finally would cause such employee realizes that he could no longer carry out his duty reasonably. The question then is what are the elements or guidelines that could indicate to us if there is in fact a constructive dismissal?

## **The Test To Determine Constructive Dismissal**

Based on the decided cases, there exist at present, two types of test that are being applied by courts in Malaysia to determine constructive dismissal. The tests are:

- 1) The Contract Test; and,
- 2) The Just and Equitable Test or The Unreasonable Test.

## **The General Provision Provided in IRA 1967 In Respect of The Test**

There is no statutory provision that states the above tests. However, section 20(1) of the IRA 1967 states that if an employee 'considers that he has been dismissed without just cause or excuse by his employer', he could make an application or representation to the Director General of Industrial Relations office for reinstatement of his position. This provision does not provide the meaning of 'dismissed' and 'without just cause or excuse'. The meaning of these words and sentences depend on the interpretation of the court. According to Quah Swee Khoon v Sime Darby Bhd<sup>iv</sup>, 'dismissal' means 'the employee had been driven out of employment'. The question follows that whether the reasons that had caused 'the employee being driven out of the employment' were made with 'just cause or excuse or not'? If not then, that employee is entitled under section 20(1) of the IRA 1967 to apply for his reinstatement.

There are several types of dismissal.<sup>v</sup> These include - direct dismissal, termination of contract of employment, forced resignation and constructive dismissal. However, these dismissal as required by section 20(1) of the IRA 1967 above, shall only be exercised with 'just cause or excuse' by the employer, failing which the court would nullify the termination.

## **The Contract Test**

The proponent jurists of this test advocate that there should exist a contractual relationship between the employer and employee. What is meant by contract of employment is that, the employee is entitled to be rewarded and to receive appropriate consideration or treatment from the employer in return to the exercise of his consideration or treatment for the benefits of his employer under the contract of employment. In other words, each party has duty and

obligation to one another as prescribed in the terms and conditions of that contract. In employment law, once the terms and conditions of the contract of employment have been breached, this may lead to the determination of the contract, and as usually the case is, the termination or dismissal of the employee or the worker. This termination is either at the request of the employer or the employee himself opts to terminate it due to the failure of the employer to comply with the said terms and conditions of the contract.

Further, could constructive dismissal occur when there is a breach of an implied terms? What is the 'implied terms' then in the contract of employment?. The answer lies in the ratio of Lord Browne-Wilkinson J in Woods v WM Car Services (Petersborough) Ltd<sup>vi</sup> case. He said 'the implied term or the contract of employment requires the employer:

*'...not to conduct himself in a manner calculated or likely to destroy or seriously damage the relationship of confidence and trust between the employer and employee.*

*It is to be emphasized that this implied term of contract is an overriding obligation independent of, and in addition to, the literal terms of contract. Furthermore, the breach of this implied obligation of trust and confidence may consist of a series of acts and incidents, some them quite trivial which cumulatively amount to a repudiatory conduct by the employer'*

To illustrate this, take for example, if the express term of the contract of employment states that the employee is entitled to get certain payment from the employer on the completion of certain works and it happens that the employer fails to pay that certain payment, and this finally lead to the termination of the employee concerned. Well, this would certainly lead to a 'constructive dismissal' because the employer had breached the contract to make the certain payment as promised. On the other hand, if in case there is an implied term that the employee is guaranteed to receive certain rate of bonus when the profits of the business reaches certain amount, yet the employer only gave the bonus to certain employees, neglecting others out of spite, could it be said that there was a constructive dismissal against the employee who did not received it, if at the end of the day, because of this ill treatment and unfair practice, the employee concerned believed himself to have been driven out of the employment? In this case, it is humbly opined that under this circumstance it would amount to constructive dismissal. Cases relevant on this point are Palmanor Ltd v Cedron<sup>vii</sup> and Syarikat Sports Toto (M) Sdn Bhd v Akmal a/l V A Lazarus, Negeri Sembilan<sup>viii</sup>.

Based on this definition, the test to be applied in determining the 'constructive dismissal' is the contract test. The judge in Wong Chee Hong's case applying the contract test held that the appellant had been constructively dismissed by the employer when instead of obtaining reward for the good work he had done, he was demoted from being the Head of one of the employer company's department to a mere cinema manager, a position which he had held some fifteen years ago as a junior executive, albeit on the same terms and conditions of service. Such relegation of responsibility with its consequence humiliation and frustration and loss of estimation amongst his fellow employees made it impossible for the appellant to carry on being employed under the employer company's organization. In other words, he had been driven out of his employment and been dismissed.

Some judges have laid down specific guidelines to further explain the test. This guideline states that in order to ensure that a claim of constructive dismissal succeeds under the contract test, two limbs of the contract test must be present:<sup>ix</sup>

*Firstly, did the employer's conduct amount to a breach of the contract of employment going to the root of the contract or had he evinced an intention no longer to be bound by the contract, thereby entitling the workman to resign?*

*Secondly, did the workman make up his mind and act at the appropriate point in time soon after the conduct of which he had complained had taken place?*

Other example of cases that followed the principle in Wong Chee Hong that apply the 'contract test' are Southern Bank Bhd v Ng Keng Lian & Anor<sup>x</sup>, Anwar bin Abdul Rahim v Bayer (M) Sdn Bhd<sup>xi</sup>, Christoph Hoelzl v Langkawi Island Resort Sdn Bhd<sup>xii</sup>, Rudy Darius Ogous v Ming Court Hotel<sup>xiii</sup>, Michael Brian Davis v Microsoft (M) Sdn. Bhd<sup>xiv</sup>, Tan Cheng Hing v Federal Metal Printing Sdn Bhd<sup>xv</sup>, Kumpulan Jerai Sdn Bhd, Rengam v National Union of Plantation Workers<sup>xvi</sup>, Holiday Inn, Kuching v Lee Chai Siok Elizabeth<sup>xvii</sup>, Campbell Cheong Chan (M) Sdn Bhd v Ayyawoo a/l Nadeson<sup>xviii</sup>.

## The Just and Equitable Test (or Unreasonable Test)

### Origin of the Test

This test was based on the statutory provision contained in section 20(1) of the IRA 1967. This section requires that every dismissal or termination employment shall only be exercised by the employer on just cause or excuse. Failure to comply with this requirement will mean that the act of dismissing and terminating the employee to be null and void. The employee in question may lodge a complaint and make representation to the Director General of the Industrial Relation for reinstatement. This test has been applied in several cases.

In Goon Kwee Phoy v J & P Coats (M) Bhd.<sup>xxix</sup>, the appellant's employment had been terminated by the respondent Company on the ground of redundancy. However, this ground had not been proven and it was evident that it was merely a fallacy. So, the appellant applied to the Director General of Industrial Relation that the act of the respondent amounting to dismissal without just cause and excuse. Pursuant to section 20(1) of the IRA, if the dismissal was made without just cause and excuse, the appellant was entitled to reinstatement. The DG later referred to the Minister and then the Minister referred to Industrial Court for determination. The Industrial Court found that the ground given by the respondent Company was fallacious and held that this had amounted to dismissal without just cause and excuse. The respondent company appealed to the High Court. The High Court agreed that there was no redundancy. However, the High Court allowed the appeal of the respondent on the ground that the respondent Company was merely exercising its right under the contract of employment in terminating the appellant by giving one month's notice and an ex-gratia payment of six months' notice by way of retrenchment benefit in recognition of the appellant's past services. The respondent company's act was justified as being derived from the terms of the contract, however fallacious the ground of termination on the appellant would be. Dissatisfied with this finding, the appellant appealed to the Federal Court. The Federal Court held that irrespective whether there was a termination of employment in the exercise of their right under the contract or an outright dismissal, such act of the respondent must and ought to have been carried out only with just cause and excuse. This is required under section 20(1) of the IRA 1967. By terminating the appellant's employment based not on just cause and excuse, ie by giving reason that there was a redundancy which in fact there was none in order to convince the appellant to accept the termination of employment would certainly tantamount to dismissal without just cause and excuse, which warrant the court to grant compensation in lieu of reinstatement to the appellant.

Other cases that followed the principle of unreasonable test (just and equitable test) are Supercomal Wire & Cable Sdn Bhd v Anjana Devi A/P Satiavelu and Ors<sup>xxx</sup> (even though it is doubtful whether this case would fall under 'unreasonable test' as the judge in this case had applied 'the rule against natural justice'), in upholding that the appellant employer had exercised discrimination in dismissing the respondents employee, thereby had breached the rule against natural justice when it only chose the respondents to face the allegation of misconduct and even though there were also others too involved in such misconduct), Dr A Dutt v Assunta Hospital<sup>xxxi</sup>, and Ang Beng Teik v Pan Global Textile Bhd, Penang (except when the case was brought to the Federal Court, where the Federal Court had applied contract test).<sup>xxii</sup>

### Conclusion: Which Test Is The Most Appropriate and Should Be Adopted by Courts?

It is apparent that the prevailing test applied and preferred by the apex court on constructive dismissal in Malaysia is the contract test. This is because, apart from Wong Chee Hong and the like, there is a recent Federal Court decision of Ang Beng Teik that reversed the decision of Gopal Sri Ram JCA who had applied the 'just and equitable test' in the Court of Appeal. However, Gopal Sri Ram JCA<sup>xxiii</sup>, B Lobo<sup>xxiv</sup> and Farid Sufian Shuaib<sup>xxv</sup> argued that the 'just and equitable test' should be preferred on the grounds that:<sup>xxvi</sup>

- 1) Before Wong Chee Hong there was Goon Kwee Phoy, a case decided by the Supreme Court which applied the statutory 'just cause and excuse' test. Thus, in Wong Chee Hong, the Federal Court should not have applied the 'the contract test' as applied in England in Western Excavating. In Goon Kwee Phoy, the Supreme Court had examined in a considerable length about 'termination' and 'dismissal' and eventually accepted the 'just and equitable' statutory test as the test to determine constructive dismissal;

- 2) It follows that, according to the principle of 'just cause and excuse', the court should look into the alleged act of 'constructive dismissal' on part of the employer and then determine whether the dismissal (which could include 'constructive dismissal') is with just cause or excuse or not;
- 3) In addition, section 30(5) IRA 1967 imposes certain principle to the court to settle industrial dispute 'in accordance with equity, good conscience and the substantial merits of the case without regard to technicalities and legal form'. Thus, it means that the court should apply the principle of equity and not restricting itself to the common law principle such as the contract test as propounded by Lord Denning in Western Excavating; and,
- 4) The test 'just and equitable' should be preferred because it is in congruent with section 17(A) of the Interpretation Act of 1948 and 1967: in the interpretation of a provision of the Act, a construction that would promote the purpose or object of the underlying Act shall be preferred to a construction that would not promote that purpose or object. It is submitted that the purpose of the IRA 1967 and employment law as practised in Malaysia is to preserve industrial harmony based on equity and good conscience as heralded by section 30(5) of the IRA 1967.

It is also in the authors' view that, 'just and equitable test' would be the best test in determining 'constructive dismissal'. Apart from the above grounds, the author would like to emphasize the limitation imposed by section 3 (1) of the Civil Law Act 1956. Pursuant to this section 3(1)(a), in West Malaysia, the law that shall be applied are the written laws in force in Malaysia except where there is none, then the common law of England and the rules of equity as administered in England as at 7 April 1956. On the other hand, section 3 (1) (a) and (b) provide that in the case of Sabah and Sarawak, apart from common law and rules of equity, the civil courts shall apply, provided that there is no written law, the statutes of general application as administered or in force in England. The application of these sources of law is that only those that are practised and applied in England as at 1st December 1951 for Sabah, and as at 12th December 1949 for Sarawak. However, the application of these sources of law is subject to the proviso 'so far only as the circumstances of the States of Malaysia and their respective inhabitants permit and subject to such qualifications as local circumstances render necessary'.

Thus, if we see the grounds of judgment made under Wong Chee Hong, it is clear that these grounds were based on the law decided in Western Excavating, a case that had been decided after 7<sup>th</sup> April, 1956. It follows that the principle of law on the contract test applicable to determine constructive dismissal should not have been applicable in Malaysia because of this statutory prohibition. However, it can be argued that what has been laid down by the IRA 1967 in particular section 20(1) does not specifically mention the test to be applied, and this lacuna warrant the Courts to refer to the law as applied in England. However, as Western Excavating was decided after 7<sup>th</sup> April 1956, whatever principles of law adopted in that case including the contract test propounded by Lord Denning MR would not be applicable here in Malaysia. It should be remembered that before Western Excavating, particularly as at 7<sup>th</sup> April 1956, neither in England was there any definite applicable test to determine 'constructive dismissal'. Thus, Malaysian Courts, it is submitted, have erred when they regard the 'contract test' as the conclusive law as at 7<sup>th</sup> April 1956 applicable in England.

Finally, in the event the above contention and grounds is still not enough to settle such a problem on the appropriate test applicable, it is suggested that certain amendments be made on the IRA 1967. These amendments must necessarily give a definition of 'constructive dismissal' as well the statutory test to determine it.<sup>xxvii</sup>

### **Comments on Recent Case – Ang Beng Teik**

It needs no reiteration that a definite test applicable in relation to constructive dismissal is very essential or there would be 'chaos'. For example, in Ang Beng Teik, the Industrial Court decided that the test is the 'just and equitable'. However, when this case went to the High Court, the judge reversed and applied the contract test instead. Aggrieved with the decision, the appellant later appealed to the Court of Appeal and the Court of Appeal applied the 'just and equitable' test which resulted in his appeal being allowed. Then, at the Supreme Court, it was reversed again, and restored the 'contract' test adopted by the High Court. The Supreme Court held that the refusal of the appellant to take up the demoted position offered by the respondent employer tantamount to breach of his contract of

employment, which warrant the employer to dismiss him. However, the court did not consider the chain of events leading to his refusal to accept the offer ie the facts or events that had caused him to be driven out of the employment. The dissatisfaction of the appellant was that the domestic inquiry held, had not called all witnesses and evidence before convicting him. This inquiry certainly, contended by the appellant, was formed by the respondent company as a means to victimize him in order to get rid of him. Accordingly this 'chain of event' had influenced him not to take up the offered demoted position. Now, let us examine certain issues below, in order to see the problem faced by the judicial minds in Ang Beng Teik clearer.

- 1) Can we say that at the time of holding the first domestic inquiry, the respondent employer/company had breached the contract, in that the appellant employee alleged that the inquiry did not conduct itself properly? We could say so as there was proof that showed that there was indeed acts of victimization on part of the respondent employer/company towards the appellant employee during the course of domestic inquiry conducted by the respondent employer/company;
- 2) Can we say that the domestic inquiry undertaken by the respondent employer/company was made without just cause and excuse? Similarly, we would agree as there was proof of unjustified acts of the respondent employer/company during the domestic inquiry; and,
- 3) Can we say that when the appellant employee refused to accept the demoted position because of his frustration with the finding of the domestic inquiry which finally found that there were several 'baseless' and 'unfounded' charges which finally had been unduly proven, made against him, there was a breach of contract on his part or had he by so acting shown unreasonable attitude warranting his dismissal? In this respect, it is difficult to say that he had breached the contract. This is because he considered that he had been victimized in the domestic inquiry held earlier and that by so refusing to accept the offer, he indicated his protest against the offer. However, this very non-complying act of the appellant employee had persuaded the Supreme Court to hold that he was the one who had breached the contract and that the dismissal by the respondent employer/company was justified. This is because, at the time of his objection and refusal to report for duty to the demoted position offered, he was still an employee, and that during the course of employment he is under a contractual obligation to comply with the instruction of the respondent employer/company. Thus, by not complying with the instruction of the respondent employer/company, he had breached the contract of employment and that the dismissal by the respondent employer/company was justified. On the other hand, before the case came to the Supreme Court, the Court of Appeal had a contrary view on this point. According to the Court of Appeal, the act of the appellant employee by not complying with the instruction of the respondent employer/company was justified. The refusal by the appellant to take up the demoted position offered indicated his objection against the victimization done by the respondent employer/company during the domestic inquiry. Accordingly, the Court of Appeal held that 'the chain of events' occurred, prior to the objection by the employee to take up the demoted post, should be looked at and be taken into consideration, *viz* - the act of victimization (committed by the domestic inquiry held earlier) done by the respondent employer/company was made without just cause and excuse and this had finally caused the appellant employee to be driven out of his employment. In the result, the Court of Appeal held that the constructive dismissal committed (the domestic inquiry process was conducted without hearing all evidence and witnesses, which was detrimental to the appellant's case) by the respondent employer/company was done without just cause or excuse. And that because of this victimization the appellant employee refused to accept the demoted position offered by the respondent employer/company.

Thus, it is important for Court in Malaysia to put a stop to this state of uncertainty and tussle. Again, as reasoned out above, the preferred test would be the just and equitable test. If this test is applied, then Ang Beng Teik (the appellant) would win the case.

# Does the Global Transition Imply Some New Accounting Techniques?

*Tamara Simunaci Boskin*  
*University of Primorska – Universita' del Litorale, Slovenia*

## Abstract

One of the primary goals the management has to reach is the constant growth of a firm. The other important goal the management is interested in is reaching such a firm's business performance that guaranties the stability of their employment. In times of global change when things tend to change unexpectedly, many managers have found out some semilegal or even illegal ways of how to preserve their jobs, by altering the financial statements. When we talk about aggressive accounting, earnings management, window dressing, income smoothing, fraudulent financial reporting, we are talking about those techniques which enable management to make the firm's business performance look better than it is in reality. In this article I try to describe some techniques of the creative accounting and I will also try to answer the question if the (new) Slovene accounting standards allow or not the use of »creativity« in the accounting.

## Definitions

The term creative accounting can be adequately described by several definitions. They are all very similar, although quite some differences can be noticed. Four authors from Great Britain gave four definitions of creative accounting. Regarding the fact that all four of them come from different backgrounds, all the definitions are very interesting, since they focus on the same topic from different perspectives (based on Amat, Blake and Dowds: *The Ethics of Creative Accounting*; Economics Working Paper; December 1999)

Ian Griffiths, a business journalist says, that companies in their reports include financial results, which do not give a true and fair picture of a company's business performance but are rather adapted in the light of the pursued goals. The business performance data, which is published by companies is based on adequately adapted, modified, readjusted information. The published information is a variation of variations and can be even far from the initially entered information shown in the books of a company. Such method of disclosing information on a company's business performance is called creative accounting.

The accountant Michael Janson claims that accounting actually means the harmonization of different methods of assessing and solving conflicts between different approaches in publishing results of financial and other business transactions. Since the generally accepted accounting principles (GAAP) are flexible and provide a great deal of freedom regarding valuation, this gives a rather large window of opportunity for manipulations, frauds and bias in disclosing business performance. According to Janson these »subjective-based« accounting methods are nothing else than creative accounting.

Based on years of experience Terry Smith, a financial analyst, came to the conclusion that the growth which was shown by companies in the eighties was a mere consequence of the flexible application of accounting rules and adhering to its principles not actual economic growth.

Kaman Naser defines creative accounting as a process of changing financial statements from what they actually should be into such which show what is intended to be disclosed. This is achieved by bending some existing rules or by dropping others. Naser also emphasises that the accounting systems in Anglo-Saxon countries is explicitly prone to manipulations through applying techniques of creative accounting, since they are governed by general principles and guidelines (GAAP) rather than strict rules, as this is the case under the conservative European approach. This way companies, which find themselves in similar economic environments, show different business results, which is exclusively due to a different application of accounting rules and principles, governed by GAAP.

This way, three areas can be defined, since due to the flexibility of GAAP there is quite some room for creative accounting approaches. This refers in particular to the following:

1. Inventory cost determination,

2. Software revenue recognition,
3. Defining the goodwill amortization period

### Inventory Cost Determination

Inventory cost determination provides quite some room for selecting the valuation method. Accounting principles offer quite a number of methods, while the selection of a particular method affects the results shown in the balance sheet as well as the profit and loss account. The most commonly used methods are FIFO, LIFO and average price method. In times of changing purchase prices of inventory items, each method has a different effect on the business result (through cost) as well as the balance sheet, through the total inventory value.

If the LIFO and FIFO methods are compared against each other it can be established that under unchangeable conditions the FIFO method has a more favourable impact on the business result, since the cost of goods used in working process is valued according to the first incurred cost (which is usually lower), while the inventory itself is valued at higher, more recent prices.

Let's illustrate this with a short example:

1. Purchase 100 units of material at 90 MU
2. Purchase 150 units at 100 MU
3. Expenditure (cost of goods used in working process) 110 units
4. Purchase 50 units at 110 MU
5. Expenditure 60 units

### FIFO Method

(1) Transaction	(2) Pcs.	(3) Price (MU)	(4) Purchase value (MU)	(5) Expenditure (MU)	(5) Stock value (MU)
1. Purchase	100	90	9.000,00		9.000,00
2. Purchase	150	100	15.000,00		24.000,00
3. Expenditure	100	90		9.000,00	15.000,00
	10	100		1.000,00	14.000,00
4. Purchase	50	110	5.500,00		19.500,00
5. Expenditure	40	100		4.000,00	4.000,00
<b>TOTAL</b>			<b>29.500,00</b>	<b>14.000,00</b>	<b>14.500,00</b>

According to the FIFO method, the expenditure is calculated as 14.000,00 MU, while the final stock is valued at 14.500,00 MU.

### LIFO Method

(1) Transaction	(2) Pcs.	(3) Price (MU)	(4) Purchase value (MU)	(5) Expenditure (MU)	(5) Stock value (MU)
1. Purchase	100	90	9.000,00		9.000,00
2. Purchase	150	100	15.000,00		24.000,00
3. Expenditure	110	100		11.000,00	13.000,00
4. Purchase	50	110	5.500,00		18.500,00
5. Expenditure	40	110		4.400,00	14.100,00
<b>TOTAL</b>			<b>29.500,00</b>	<b>15.400,00</b>	<b>14.100,00</b>

According to the LIFO method, the cost of goods used in working process is calculated as 15.400,00 MU, while the final stock is valued at 14.100,00 MU.

With all other data remaining unchanged, the cost of goods used in working process according to the FIFO method is lower (by 1.400 MU), which means that while all other circumstances remain unchanged the business result will be better by 1.400 MU under the FIFO method.

Should other data remain unchanged it is also true that the stock value according to the FIFO method is higher by 400 MU (valuated according to the most recent prices).

This highly simplified example shows that by selecting a certain valuation method, the company can have a significant impact on the business result, the asset value as well as the value of capital.

GAAP provides a high level of flexibility regarding inventory cost determination. The selection depends on several factors, among them also on the fact whether the purchasing prices are stable or not, as well as the tax burdens and into which direction the business result of a company needs to be »shifted«.

#### **Software Revenue Recognition**

In the past, companies had far more freedom in recognizing software revenues, while today this field is somehow more explicitly defined. It used to happen that companies recognized such revenues at the time when this suited them best. This led for example to cases when companies recognized such revenues already in the moment when the software manual was sent out to the customer, although this may have happened even before the software was actually delivered to the customer. At the same time, it also used to happen that companies recognized their revenues even before their client has sent them a statement by which he has confirmed the receipt and acceptance of the ordered software. This way companies inflated their revenue figures, because the probability that such revenues would never materialize was quite high since the customer may not have been satisfied with the product or may have had certain additional requirements regarding the product. This would mean that the actual revenue would be lower. This field has been recently more precisely defined, since GAAP requires that the minimum condition for a company to recognize revenue is that the software has to be at least delivered to the customer. In any case, the company can act even far more conservative: it can recognize revenues even after the customer has confirmed the receipt of the software.

#### **Depreciation Period and the Useful Life of Goodwill**

In Slovenia, the subject of goodwill is dealt with by the Slovene Accounting Principle (SAS) 2. Goodwill is the surplus of the purchasing price of the acquired company over a fair value of the acquired assets, less its debts, if such a company ceases to exist as an independent legal person. The same principle also says: the »amortisable value of the intangible long-term asset is prudentially allocated across the useful life determined according to the best of knowledge. The intangible asset is amortised throughout its useful life. As a rule, goodwill is amortised over a period of 5 years, while the useful life can be, if well grounded, extended to (a maximum) period not exceeding 20 years«. As it can be seen, there is some window of opportunity for applying creative accounting methods, since the selection of the useful life of an asset is left to the assessment of the appraiser, which means that selecting an adequate useful life may have an effect on the business results of the upcoming years. If such a period is long, the amortisation cost in the individual years will be lower compared to the one if the useful life were shorter. The SAS define that goodwill is amortised over a maximum period of five years, but allow that under adequate argumentation this useful life can be extended to a maximum of twenty years. Of course, the SAS further require that every year it is necessary to verify the period and method of amortisation. If the anticipated useful life of the intangible long-term asset is different from the one based on the aforementioned principle, it is necessary to adjust the amortisation period accordingly. If the anticipated pattern of commercial benefits based on such an asset changes considerably, it is necessary to adjust the amortisation method. Such changes need to be regarded as modifications of accounting principles, which affect the calculated amortisation for the period in question and periods to come.

### **Estimated Values (Estimates)**

It is obvious that the business world is constantly undergoing change and it would be unrealistic to expect that all things could be exactly predefined and anticipated. Due to the inevitable fact that the value of certain assets, liabilities cannot be known to the last detail or at least known in advance, this calls for the use of so-called estimated values. A well-known example from practice is the valuating of long-term provisions for the warranty linked to products sold. It can be estimated what a percentage of products will be returned for repair but an exact figure cannot be known in advance. In this case it is necessary to estimate the value. Of course, when estimating value it is necessary to base such an estimate on statistical studies, data from the past and to consider all factors, which affect

the quality of the products (for example if it is known that a new machine or modern technology has been purchased, which ensures a lower percentage of imperfect products, this has to be considered when estimating such a value). When preparing such an estimate it is at the same time necessary to consider future events, which could affect the amount, required to meet the incurred liabilities. Since this involves a large amount of uncertainty, risk and incapacity of exact anticipation, there is actually a lot of room for creative approaches.

## **Why Regulations are not More Stringent?**

The aforementioned are just a few examples how it is possible by applying creative accounting techniques to shift the business result in the direction, which best suits the management. By considering the fact that the most interested for a true and fair disclosure of the business performance of a company are its stakeholders, the question arises why accounting principles allow such looseness and provide so much of a window of opportunity for creative approaches? Why the valuation methods, methods of disclosing and discussing all economic categories are not harmonized, predefined? Maybe this way the »creativity in accounting« would be eliminated making us sure that the financial statements are a true and fair picture of the business performance of the company in question.

Such a solution is impossible. In times of constant and quick changes it is impossible to expect that universal rules could be adopted, which would be beneficial to all players in the field of economy. It is impossible to require that two companies, which operate in completely different economic environments, book and disclose their business transactions in the same way. It is inevitably necessary, actually fair that it is possible that companies from different economic environments represent business transactions differently. But even if companies operate in the same economic environment this still does not mean that they will both book business transactions the same way, since there are already differences between individual companies, which call for the application of different approaches and methods.

Let's focus only on inventory cost determination. If a company applies the LIFO method, the cost of goods working process is valued according to the most recent prices, which means that they reflect a slightly more realistic picture (regarding current market prices) and so the generated financial statement reflects the current market prices. At the same time it is also true that stock is valued at lower, initial cost, which means that the values in the balance sheet are already »slightly outdated« or too low. In periods when prices increase, the LIFO method leads to positive tax effects from the aspect that the disclosed business result is lower than it would be by applying the FIFO method. Therefore, it is well understood that in periods of growing prices companies prefer the LIFO method rather than for example the FIFO one.

If it would be required that all companies use the same methodology for valuating cost this would mean that this way the existence of different economic environments, where companies operate in, would be neglected. At the same time the existence of different historical backgrounds, which caused the development of different cost valuation would also be neglected.

In the case of goodwill it can be established that the SAS are slightly more conservative in determining the useful life, since the Slovene principles anticipate that goodwill has to be amortised over a period of five years after coming into being or based on special argumentation this period may be prolonged, but may not exceed 20 years. In this respect the GAAP are far more liberal. They do not define the exact number of years, over which this intangible asset should be amortised. The argumentation to support such a liberal approach is that it is impossible to expect that all companies are likely to provide economic benefits, which arise from the acquisition of a company over the same period of time. Defining a cap on the useful life will not contribute to any more realistic financial results.

The elasticity in financial reporting will and has to exist as long as different economic environments exist where the different companies operate in. (Mulford, Comiskey, 2002, p. 26).

Of course, the possibility of a free, objective assessment not only regarding the valuation method but also selecting the accounting method may not be misemployed to attain goals by one group at the expense of the other. This elasticity has to exist in order to allow all companies to disclose the results of operations in different environments as realistic and fair as possible.

If certain accounting principles are defined only vaguely and if companies are allowed by their own assessment to apply different methods, rules... (considering specific economic conditions, where such companies operate in and considering special internal features of their own company) why is creative accounting regarded as negative? When does accounting go beyond the limitations of the framework of general rules and not staying within them? Where is the line, which separates true and fair from unfair, misleading?

## **Aggressive Application of Accounting Standards, Rules**

We can talk about aggressive accounting when this loose accounting framework is not applied for the purpose of getting a fair statement on business performance but remains a tool for tailoring/adapting accounting information with the purpose of giving a different picture from the actual one. When companies abuse their freedom given by the accounting rules and principles for the purpose of showing their business performance in a better light than otherwise, when they try to mislead a certain group or even several groups of users of accounting information (stakeholders, creditors, bank, state, employees,...), then we can definitely speak about aggressive accounting.

Examples of aggressive accounting

- Including restructuring cost (example from American practice): according to GAAP a company which restructures itself has to include the restructuring cost in the year when this restructuring took effect along with all cost which the restructuring already required and will still require (in the years to come). If the company deliberately “inflates” the restructuring cost, it shows a rather downgraded financial result compared to the one that it normally would. The consequence of such an approach is that the company in the years following the restructuring shows better business results. The aim of such approach is that the management in the years following the restructuring shows better financial results than during the years before it and thus justifies the correctness of the implemented restructuring. This measure requires that all restructuring cost in the coming years are carried over to the year when the restructuring was carried out.)
- Premature recognition of sales revenues: the company enters an agreement with a customer, which stipulates that the delivery will be made at a later date regarding the one the agreement was signed. If the company among sales revenues also recognizes those which will materialize based on the concluded agreement and considering the fact that the delivery has not been made yet, the company shows unrealistically high revenues. Hence, the shown financial result is better than it should be.
- Example of tangible assets and equipment: The management defines the useful life of an individual tangible asset. The useful life of any tangible asset depends on a) the expected physical wear; b) the expected technical obsolescence; c) the expected economic ageing and d) the expected legal and other limitation regarding its use. As the useful life of an asset the shortest among all of the specified conditions is considered. Although SAS (SAS 13.8) stipulates that among the various useful life periods it is necessary to select the shortest one there is still room for discretionary decisions by the management. The management can adjust this shortest period in such a way that it meets the required goals. If it wants to reduce the amortisation cost in an individual year thus improving the financial result, the selected useful life will be relatively long, by all means too long would the accounting rules from the standards not be violated.
- Even some expenses could be included unrightfully: if management wants to show the best financial result it will take care that the cost or expenses within a given period will be as low as possible. The financial result can be manipulated also by not recognizing cost within the period when they actually accrued, but are carried forward to the next period. Most often this happens at the end of the business year when certain cost and expenses are not booked in the year when they accrue but are carried forward to the next year. This way the financial result is improved in an incorrect way.

## Special Cases of Creative Accounting

As much as the fact that life is a cyclical process applies to the individual, where years of growth and prosperity are followed by periods of recession and slow growth, the same applies to economic growth. If this process would be illustrated by a diagram, it would be a winding curve featuring local minimums and maximums. Just the same way we could illustrate the growth of a company over a longer period of time. Steep growth at first, then slower growth towards the local peak, then a turnaround to recession, until it reaches the local minimum, where new growth is starting. The management of a company is not prone to such a sequence of events, since its task is making business and growing the company, showing a steady growth of revenues over different periods of time. Such a flow is actually welcome, since investors prefer a steady, constant flow of revenues, which reflects stability, strength and growth of a company as well as competent management. Such growth also has a psychological impact, since in the eyes of investors such a company is less risky, which is in the end reflected by a premium in the stock market price. Of course, it is also the management, which benefits from a uniform flow of earnings, particularly in cases, when their compensation depends on the business development of the company.

And in particular the strive for achieving constant growth without major oscillations is quite often the driving force for applying aggressive accounting methods. Usually the management defines a certain long-term growth rate as one of its goals and focuses its activities on achieving this rate. In years, when business is very good it can »save« a part of the revenues and carry them over to future years, when business performance will be less successful or the achieved results would be lower than anticipated. This is the so-called technique of income smoothing, by which the management tries to show a more or less stable growth of revenues.

There are several methods of how to smoothen revenues and hide profits. To confine ourselves just to a few examples, we could take the field of receivables. When it is necessary to smoothen revenues or to reduce the profit of the current year for the benefit of business results in future years, the management will take a more conservative – pessimistic approach in determining the amount of dubious or disputed receivables. The Slovene Accounting Principle 5.25 defines that receivables, which are believed not to be settled in due time or in the full amount, should be considered dubious, while if a legal proceeding has been started, they should be considered as disputed. Based on experience from previous years and expectations within a statement period, companies identify a certain percentage of their sales, a percentage of credit-based sales and then calculate an average adjustment of the amount of receivables, which are debited against adjustment expenses in connection with receivables and defines a corresponding adjustment of receivables. The amount of the dubious and disputed receivables affects the profit of the current year. If in future it should be established that the company was too pessimistic in determining the amount of such receivables, the adjustment of receivables will be reduced thus again showing corresponding revenues, which will have a positive impact on the business result.

Long-term warranty provisions for products sold, determining the useful life of tangible assets, conservative recognition of revenues – these are shown later, although in the given moment all conditions for their recognition are met - are very »suitable« for applying the technique of smoothing earnings.

In less successful years just the opposite approaches are applied: the management becomes more optimistic regarding dubious receivables, which are far fewer in such years, the management is even much more optimistic regarding the fault-rate of products sold and therefore generates less long-term provisions for the warranty for products sold, provides a new estimate about the useful life of tangible assets, which are suddenly considered to last longer, etc. The effect of such an approach on the business result is positive, which in the long run results in a more steady growth rate.

## Errors in Accounting, Discrepancy from Standards

It would be wrong if every error or discrepancy from standards would be immediately considered as a creative approach in order to conceal the truth. Drawing the line between an error and deliberate different disclosure of information lies in the intent. If the error or different approach has not been applied with the intent to play with data, non-disclosure of certain information, then we cannot and may not speak about creative accounting. To err is

human, therefore we can not expect that no errors will ever happen. If we find some, they need to be corrected and disclosed.

## **Creativity in Preparing Financial Statements**

At this place it is necessary to mention the so-called window dressing technique. This is a process of adapting financial statements with the aim of achieving the optimum financial situation on a certain date (Mathews, Perera, 1991, p. 235). Such a date is the date of drawing the balance sheet or date of taking out a loan. The balance sheet and the profit and loss account can be manipulated with instruments and measures, which are applied immediately the day before preparing the balance sheet. Due to the close link between the balance sheet and the profit and loss account, these instruments provide adverse effects. Measures which improve the financial structure of the balance sheet, make the profit and loss account look worse and vice versa.

The financial structure of the balance sheet (this is the relation between long-term assets and capital on one side and short-term assets and liabilities on the other) can be improved in several ways (Cokelc, 1993, p. 36).

Long-term liabilities can be reprogrammed, while at the same time the short-term liabilities can be converted into long-term ones. It is possible to accelerate the collection of receivables and short-term financial assets and at the same time settle due liabilities. Even the reduction of the scope of purchasing raw-materials and goods for sale or postponing the purchase of tangible assets have a favourable effect on the financial structure.

As we can see, creative accounting is not limited to merely keeping record of business transactions. Fact is that by incorrect bookkeeping of business transactions completely different, even false information may be produced, but we have to be aware that the financial statements may be set-up by pursuing the required goals despite a completely correct keeping record of business transactions. This may not be regarded as incorrect bookkeeping but rather incorrect classification of certain economic categories not only in the balance sheet but also in the profit and loss account as well as the cash-flow statement with the aim of giving incorrect information.

Profit and loss account: If the management in a certain year failed to meet the profit target from ordinary business operations it can by applying creative accounting show exactly the opposite. Among ordinary revenues it can include those which by nature are not such revenues or it can exclude certain expenses and can show them in another group of expenses. The net profit and loss of a certain period will be no different, although individual business results (from business activity, ordinary activity, out of ordinary activity) will differ.

Cash-flow statement: is also prone to a creative approach, since by deliberate incorrect classification of financial flows incorrect, even misleading information is given. Incorrect classification of financial flows between the three main groups (financial flows from ordinary business activity, investing and financing) can make the overall image of the business conduct in a certain field look a required way.

## **Reasons for Negative Application of Creative Accounting**

The most common reasons for applying creative accounting are driven by the desire for taking personal advantage and enforcing special interests.

Agent relationship between participants is established every time when one or more individuals, called principals authorise another individual or organisation, called agent, to perform for him and on his account a certain business or service. In an agent relationship it is important that the agent has the right to decide autonomously, with consequences borne directly by the principal. The problem of agency fees arises among different interest groups, most often among stakeholders and managers, stakeholders and creditors as well as stakeholders, managers and creditors.

Since the principal directly carries all the consequences of the agent's deeds it is in his interest to have his agent perform his tasks as well as possible. Among different methods how to provide incentives for the agent (in our case the manager) to perform well, thus most effectively protecting the interests of the principal (stakeholders) are also:

- Form of compensation which attracts and keeps managers, having matching interests with the ones of the stakeholders within the company,
- Manager compensation tied to performance,
- Intimidation by threatening to terminate the employment contract should the interest of the stakeholders not be protected and
- More intensive control of the performance of managers, although the cost of such control is not negligible.

Among other relations between the parties involved the relation between the accounting or auditing company as well as client of the accounting or auditing services can also be considered. Among these parties involved, no interference on their integrity, objectivity and independence should be permitted. However, in the business world we can also witness examples when despite legal autonomy between the parties there is an interaction between them (Dodge, 1993, p. 514-525):

1. Excessive dependence of the client or associated group of clients: if the amount of revenues generated by the individual party represents a considerable share of the total revenues of the accounting company, it can be asserted that there is a certain interaction between them. This is quite often the case with start-up accounting companies, which are eager to win recognition and are faced with the problem of the client's importance. If they give in to his requests, which are against the principles of fair business conduct, then we can already speak about creative accounting,
2. If the possibility of a legal case exists: if the accounting company and its client due to various reasons find themselves on opposite sides, their mutual confidence can weaken or even disappear,
3. Even after a long-year relationship the accounting company may not cross the line of consulting service. The managerial decisions are always reserved to the company management and not the accounting company. The accounting company can not and may not accept responsibility for business decisions.

Among other reasons which have an impact on applying creative accounting are also financial motives. The most widespread is the request for lowering the tax base and thus the tax burden. Within the valid legislation, the company can find the most suitable accounting solutions regarding tax base, tax rates and paying contributions. The company strives to use tax incentives, reducing the tax burdens or even postponing them for future years.

Naser (1993, p. 64-66), Mathews and Perera (1991, p. 230-231) give other reasons for applying creative accounting.

**Unsuccessful management** will try to conceal its inability or mistakes committed by it through creative accounting and to postpone the process of finding solutions to problems. With a growing distinction between managerial and ownership function there are pressures on the management to provide and maintain good business results.

The company can **economise for truth** by reporting correctly but incomplete. Certain information is disclosed only if it is advantageous, otherwise it remains undisclosed.

**Fast development of technology and business methods**, which are progressing ahead of legislation or accounting principles and regulations cause that without modern regulations the accounting profession lags behind the requirements of the business world and has no other alternative than to apply alternative methods to meet new challenges.

Pressures by large institutional investors can lead companies to manipulate their business data in order to meet the expectations of financial markets, which seek stable growth of profits and are reacting negatively as soon as the results fall behind expectations.

The lack of clarity regarding accounting regulations, legislation and principles, which use very vague and flexible terms in defining how accounting reports should be prepared and presented. Although at first sight, they may give the impression of congruence, they in fact permit a wide spectre of accounting solutions for any individual accounting problem.

## **Professional Ethics**

Professional ethics and ethical conduct are quite important aspects of civilised society. Ethics deals with good and bad types of conduct, which drive the individual, group or profession. It represents a kind of a set of basic rules by which the people act and behave, particularly regarding fellow people. The ethical professional code of a profession is important particularly because the members of a profession are increasingly aware of the moral aspects of their work, they act in a more uniform way and are able to better appreciate their work. If members consequently follow the obligatory code, they can justify their deeds if being criticized. At the same time it keeps them away from non-ethical conduct, since it is easier to identify. Of course, adopting an ethical code for a certain profession does not mean that those who are governed by the code will act ethically. As a matter of fact, it is the accountant who will decide how to act in a certain moment.

Even in Slovenia there is a professional ethical code for accountants. It is represented by a set of rules, which the accountant has to follow when performing his work. The professional ethics of accountants requires that they completely focus on their work and that they take great care for its quality, not only to follow professional achievements but also to expand their own knowledge base and maintain a high professional level of work ability.

The principles of conduct for accountants refer to expertise, responsibility, confidentiality, fairness, authenticity and ambitiousness. The basic feature of all principles requires that an accountant may not be deliberately involved in any wrongdoing or illegal activity as well activities which shed negative light on the accountant's profession. At the same time the accountant has to protect confidential information, which he has access to, except when he is explicitly authorised to do so or is bound by regulations to disclose them. In no other case he may not use confidential information for his own benefit or allow others to take advantage of them.

The use of creative accounting considerably increases the professional risk of auditors and accountants, while at the same time it considerably increases the scope of the required knowledge for preparing and auditing accounting rules.

## **Is Slovenia Safe Against the Application of Creative Accounting?**

Even Slovenia makes a lot of efforts to implement the west European capitalist system not only in the field of changing the social system but also from the economic aspect. There are of course similar problems just like in any other east European country under transition.

It was as late as 1993 that Slovenia for the first time ever introduced modern accounting approaches, particularly through introducing Slovene Accounting Principles. In the earlier system when Slovenia was still part of Yugoslavia, the accountant followed the given procedures and regulations. There was hardly any room for creativity. Today there are constant changes and the accountants have to continuously follow these changes and expand their knowledge base. In 2002, the new Slovene Accounting Principles were introduced which are to a large extent based on international accounting principles and are slowly approaching the Anglo-American guidelines of accounting principles. Despite the fact that among the basic accounting assumptions the principle of prudence is not explicitly underlined like in earlier 1993 SAS, the Slovene Accounting Principles still maintain their rather conservative approach. To name an example are the increase and decrease of asset value: the increase of asset value is admissible, while the decrease of asset value is obligatory.

## **Conclusion**

In this paper I tried to briefly present some creative accounting methods. I mentioned only few of them, just to get an idea how the financial numbers game can be played. There are many other techniques, many other fields prone to the use of creativity in recording and representing the business performance of a firm. I also tried to show very few examples from Slovenian practice and I found out that with the liberalization of accounting rules, due also to the global change in social, economic and political environment, there is much room for use of creativity in accounting,

obviously in negative manner. My research continues: the next goal I'll try to reach is to determine which are the mostly used creative approaches in preparing financial statements in Slovenia.

# The Ability of Accounting Information to Express the Evaluation of Financial Positions and an Enterprise's Performance

*Eva Hýblová*

*Masaryk University in Brno, Czech Republic*

*Marie Paseková*

*Tomas Bata University in Zlín, Czech Republic*

## Abstract

The objective of financial statements is to provide information about the financial position, performance and changes in financial position of an enterprise useful to a wide range of users in economic decision-making processes. The information's qualitative characteristics are ease of understanding, and their relevance, reliability and comparability. This contribution includes for example, the "writing off" (depreciation) of long-term tangible assets accompanied by the comparison of financial indicators at the international level.

## Introduction

As long as a manager has to make responsible and well-founded decisions as to the management of their enterprise, they must indubitably know the actual situation in the enterprise, and the tools that will provide them with the requisite information about the financial state of affairs and the performance of that enterprise. One of the most significant tools for this purpose is accounting, which provides information on:

- The enterprise's assets (types of asset, their valuation, wear-and-tear, composition, etc.).
- Asset acquisition sources (own resources - equity, external resources – other equity, short-term resources, long-term resources, etc.).
- The enterprise's financial situation (what profit levels were achieved by the enterprise in the given period and how these were divided, whether it is able to pay its debts in time, etc.).

This information is necessary for management decision-making processes, and at the same time, provides a form of feed-back – by informing management as to their success in the past. Kovanicová (2002) states that, "Accounting is the means by which the activities of an enterprise are converted into a range of numbers, which provide information as to the standing of the enterprise, its problems, outlooks and chances. With the help of the correct interpretation of these numbers, it is possible to analyse developments to-date, to plan the enterprise's future activities, and to estimate developments in its financial situation. Information as to the financial strength of the enterprise is required by top management of that enterprise as well as by a wide circle of external, interested parties (e.g. investors, creditors, etc.)".

Primary information is gained from the accounting statements, and is further developed in the financial analyses of an enterprise, in so-called "extensive"<sup>1</sup> and "intensive"<sup>2</sup> indicators. In order to be able to exploit the information gained from the accounting procedures, it is necessary that they be easily understood, reliable, relevant, and comparable, such that they enable the taking of the appropriate correct decisions – not only by the owners of that enterprise, but also by other users (stakeholders), whom might have an interest in so doing.

Czech accounting practice is subject to significant levels of regulation – both as to its content, as well as its formal aspects, and the content of each individual item entry is more-or-less set. Despite this fact, certain differences might well exist, which arise from the various ways of performing valuations, write-offs (depreciation entries), and such like. For instance, should an enterprise choose between a uniform and an accelerated method of calculating accounting write-offs (depreciation), then this would result in the following (differing) outcomes. Let us say for example's sake that one owns long-term assets with a value of 580 thousand CZK whose life-cycle has been set at 5 years. Then the depreciation, (which has an influence on the levels of Net Profit) calculated using the SYD (Sum of the Years Digits) uniform depreciation method – a method based on a decreasing depreciation rate and a constant

depreciation amount, and using the DDB (Double Declining Balance) method – a method based on a constant depreciation rate and a decreasing depreciation figure), would appear as follows (N.B.: Data in thousands of CZK).

TABLE 1: DEPRECIATION USING THE LINEAR DEPRECIATION, DDB, AND SYD CALCULATION METHODS – OWN SOURCE

Depreciation period	Depreciation using the Linear Depreciation calculation method	Depreciation using the SYD Depreciation calculation method	Depreciation using the DDB Depreciation calculation method
1.	116	186.67	224.000
2.	116	149.33	134.400
3.	116	112.00	80.640
4.	116	74.67	48.384
5.	116	37.33	29.040

The level of clear profit will also have an influence on the associated financial analysis indicator, for example, let us consider the “rentability” of one’s own equity or capital, (i.e. Return On Equity – ROE). In order to simplify issues, if we anticipate that for returns on an equity value of 500 thousand CZK, whose only costs will be those of depreciation, then the value of one’s own capital excluding the operational outcome is 260 thousand CZK. In our example, we will not consider taxation influences. Thus, the data (in thousands CZK) calculated below – is shown for the first year of depreciation write-offs.

TABLE 2: CALCULATION OF ROE USING VARIOUS CALCULATION METHODS – OWN SOURCE

Depreciation Method	ROE = Profit/Own Capital
Linear	0.63
SYD	0.55
DDB	0.51

Similarly, the indicators for Net Profit and Own Capital would be altered in the course of ascribing correctional entries for inventory and outstanding debts, or reserves.

Should we orient ourselves on comparability at an international level, further differences would arise. The accounting practice of individual states varies as a result of differing economic environments, taxation systems, legislative systems, and so forth. Each state also has its own means of regulating accounting practices, and it is precisely for these reasons that the varying forms of accounting statements from individual states are non-comparable.

From an international comparison perspective for instance, national adaptations regarding the arrangements for issues involving the activation of interest rates on the acquisition costs of assets, the consequences of changes to methods used in accounting practices, as regards Own Capital - the possibility of adjusting long-term asset values in an upward direction, etc., all of these may project themselves onto the level of Net Profit.

The following example deals with adjustments to asset value, from that shown in the account books to (real) market value, this has to do with increases in the value, carried out in line with International Accounting Standards<sup>3</sup>, or, to be more precise, using the alternative method shown in International Accounting Standard No 16<sup>4</sup>.

An enterprise owns long-term assets to a value of 400 thousand CZK. It writes down the asset value linearly, where the life-cycle has been set at 10 years. The following Table shows a comparison of two variants, given that the enterprise performs a revaluation at the end of the fifth year from “book value” to a “market value” of 260 thousand CZK. Let us then compare this with the variant in which revaluation did not take place. (N.B.: Data in thousands of CZK).

TABLE 3: REVALUATION OF ASSETS IN ACCORD WITH THE ALTERNATIVE SOLUTION CONTAINED IN IAS 16 – OWN SOURCES

Values AFTER Revaluation		Values W/OUT Revaluation
Asset Acquisition Cost	400	400
Write-offs over 5 years	-200	-200
Balance	200	200
Accounting value in 5th year	260	200
Annual depreciation write-offs in subsequent years	52	40

The differences in revaluation are expressed as a component of Own Capital (Equity) in the item entry “Increases from revaluations”, which are calculated in the course of writing off those assets, to which they are related, into Retained Earnings, i.e. against the operational outcomes of the past accounting period(s). In this case, enterprises that have re-evaluated assets in the course of their use will show lower profits than those that have not re-evaluated these assets. A second possibility exists for the calculation of increases from revaluations into the profits of individual accounting periods at the level of the difference between the original write-offs of the assets and their new values after re-evaluation. In such a case, the enterprise would show the same profits as if re-evaluation had not taken place at all. Should an enterprise account for “Increases from revaluations” only upon the absolute writing-off of that asset then the ROE values would be the following. (In this example, we will work with a profit value of 500 thousand CZK, costs will only be depreciation write-offs, and where the value of Own Capital without the operational outcome and the Revaluation Reserve Fund is 200). In this example we will not take into consideration taxation’s influences.

TABLE 4: CALCULATION OF ROE IN THE COURSE OF RE-EVALUATING LONG-TERM ASSETS (LTA)– OWN SOURCES

Depreciation write-offs		ROE = Profit/Own Capital
Value without revaluation of LTA*	40	0.70
Value after revaluation of LTA*	52	0.61

The above-mentioned example is a clear example of one of many (potential) differences that might occur in the course of performing international comparisons.

Indicators based on the value of Profit and Own Capital (e.g. ROE) or the asset value (e.g. Returns On Assets), or liquidity indices and so on, will develop in accordance with the various ways of re-valuing and accounting for differences in such revaluations.

### **End Notes**

- <sup>1</sup> Extensive Indicators – contained directly within Accounting Statements, the Balance Sheet, and Profit and Loss Statements.
- <sup>2</sup> Intensive Indicators – ratio-based indicators.
- <sup>3</sup> International Accounting Standards – IAS: These are standards proclaimed by the International Accounting Standards Board – IASB, and serve for the harmonisation of accounting statements.
- <sup>4</sup> IAS – 16, Property (land), buildings, and facilities – The aim of this standard is to describe the approach to accounting for property (land), buildings and other facilities. The fundamental problem lies in the “time-related recognition” of assets, the determination of their accounting values, and the accounting methods for depreciation write-offs.

# The Relation between Accounting Frauds and Corporate Governance Systems: An Analysis of Recent Scandals

*Riccardo Tiscini  
Francesca di Donato<sup>i</sup>  
Luiss Guido Carli University, Italy*

## Abstract

Recent international financial scandals have shown how actual corporate governance systems are far from preventing the risk of misleading financial information. This paper focuses on the main features of some well-known Italian and international accounting frauds, to find some relations between corporate governance rules, control systems, accounting regulation and the frauds themselves. Deeply, each case of accounting fraud will be analysed through the following grid of main features - Origin, Causes and Incentives, Development Process, Implementation Tools, and Internal and External Controls. The final purpose is to identify the relation between frauds characteristics, economic and legal systems and corporate governance practices in different countries and to highlight the effects of contest variables, regulation and control systems on the genesis and development of accounting fraud.

## Introduction

In the past few years, public attention has been directed to the continuing revelations by major corporations of accounting misreporting and frauds, mismanagement, bankruptcy and excessive executives compensation.

Most of these cases have been revealed in United States, whose capital markets, corporate governance rules and accounting systems have always been considered as an efficiency and effectiveness exempla.

The wave of scandals began with the demise of Enron and Arthur Andersen. Later, the list of corporate irregularities and failures has grown every day: WorldCom, Kmart, Tyco, Global Crossing, Adelphia and many others. Some of these companies (such as Enron, WorldCom, Tyco..) have destroyed billions and billions of dollars in shareholder value while moving toward bankruptcy.

The number and the importance of American corporate scandals have raised questions about the quality of corporate governance in the United States. In fact, even if some of these scandals can be considered as a result of the market bubble burst in 2000, the broadness of corporate misconduct and misreporting suggests also a failure of the American corporate governance system.<sup>ii</sup>

Furthermore, many scandals have also characterised the European scenario, showing that probably every corporate governance system in modern economies is far from preventing the risk and the damages of misleading financial information.

The structural differences between the American and the European system are basically linked to how much influence outsiders wield over a company's operations<sup>iii</sup>.

In the United States there is a strong shareholder oriented norm; anyone could gain influence over a company by purchasing shares in it. Moreover, because hedge funds invest a large part of their money in stock and bond markets, even who does not own stocks directly has a vested interest in the country's corporate health.

European situation has been different. European companies have traditionally raised capital through the typical continental banking systems or through retained earnings rather than from the securities markets. The state protects citizens from the rise and fall of the stock and bond markets but also removes most incentives to care about what is going on in the corporate world.

A common aspect characterising the main scandals is the relevance of corporate reporting failure, as shown by the willingness of corporate managers to inflate financial results, either by overstating revenues or by understating costs, or to divert company funds to private uses.

Fraudulent "earning management" or "misreporting" are indeed a leit-motif of recent corporate scandals.

Investors' confidence in the quality of corporate financial reporting has been seriously damaged. The ever-increasing process of overstated earnings, inflated asset values and understated liabilities, suggests the possible existence of deficiencies in the accounting standards and in corporate governance rules. Both issues play a primary role in financial information by public companies<sup>iv</sup>.

Accounting frauds and financial shenanigans are an increasing phenomenon in the current competitive scenario, even if nature and consequences of frauds are far from being completely understood. It is then important to investigate the nature of the fraud, what factors can motivate and provide incentives to it, what factors influence the probability of fraud detection and what corporate governance mechanisms can be effective in discovering corporate fraudulent activities.

## **Objective, Scope, and Hypotheses**

The purpose of this paper is to analyse the relation between financial frauds typologies and corporate governance systems.

We will empirically investigate, on a qualitative perspective, twenty of the recent international scandals, chosen from different countries, trying to get evidence about the relation between the corporate governance system of each firm and the characteristics of accounting frauds, defined by specific parameters.

The empirical analysis is also a base to highlight, even in future implementation of the research, the effects of contest variables, regulation and control systems on the genesis and development of accounting frauds.

In this paper we aim to demonstrate the empirical relevance of the following two hypotheses:

- Hypothesis A: accounting frauds follow two main generation processes and can be tentatively distinguished in two categories: "excessive power" and "performance stress" accounting frauds;
- Hypothesis B: corporate governance system has a significant influence in determining the typology of accounting fraud.

This paper provides a first empirical evidence for these hypotheses and represents a first partial step in the investigations on the relation between accounting fraud nature and incentives, corporate governance systems, with particular attention to control mechanisms, and environmental variables.

The following paragraphs, after a brief review of the literature on accounting frauds and their relation with corporate governance, will go through the definition of the two categories of accounting frauds, the methodology of the analysis and the empirical results.

## **Literature Review**

The worst aspect of the recent corporate misconduct has been the collective failure of corporate governance mechanisms to detect financial misreporting and to prevent sudden and surprising corporate debacles.

In fact, one of the most important issues of corporate governance systems is related to the mechanisms that provide shareholders with information about the corporate business, and the legal rules establishing responsibilities for managers and boards of directors<sup>v</sup>.

First of all, it is necessary to define accounting frauds, misreporting and manipulated earnings, in such a way as to understand what are the incentives to realise those performance and the possibility to detect them. Furthermore, it is important to focus on relevance and role of corporate governance.

### **Accounting and Financial Fraud and Manipulated Earnings**

Accounting and financial fraud is defined as deliberate misstatement or omission of amounts or disclosures in financial statements to deceive financial statement users, particularly investors and creditors<sup>vi</sup>.

The concept of accounting fraud can also be expressed like manipulated earnings or accounting irregularities.

Young divides financial misstatements into two categories: errors and irregularities<sup>vii</sup>.

The difference is related to the intent of people providing the incorrect numbers. Errors are defined to be accidental inaccuracies, irregularities are defined to be inaccuracies that are deliberate. When a firm finds an

accounting accidental error, it does its best to fix it and it does not have generally negative consequences. On the contrary, an accounting irregularity is not an accidental mistake that implies that someone is lying.

The concept of fraudulent earnings makes sense just if it is related to “true” earnings. What are true earnings? A true statement, for business people, is something corresponding to reality or facts<sup>viii</sup>.

Usually, earnings reported by corporations and used by investors and managers are imprecise numbers based on multiple assumptions and subjective estimates. This does not mean that financial reports are useless, but just that it is important to set a standard for useful and high-quality earnings.

External financial information is the principal tool to manage the complex relations between firms and a large group of stakeholders with different characteristics, interests and cognitive objectives<sup>ix</sup>.

But financial information depends also on external variables, related to its environment (laws, national and international accounting principles,..)<sup>x</sup>.

As matter of fact, frauds victims’ groups are broad. The victims can be insiders (like employees, audit committees, internal auditors, managers suffering a reputation loss) and/or outsiders (like investors, creditors, customers, suppliers, external auditors).

Financial fraud can be committed through the following tools:

- Falsification, alteration or manipulation of material financial records, supporting documents, or business transactions;
- Material intentional omissions or misrepresentations of events, transactions, accounts, or other significant information from which financial statements are prepared;
- Deliberate misapplication of accounting principles, policies, and procedures used to measure, recognize, report, and disclose economic events and business transactions;
- Intentional omission of disclosures or presentation of inadequate disclosures regarding accounting principles and policies and related financial amounts.

Frauds can be divided in two categories: management frauds and employee frauds.

Management frauds are maybe more difficult to detect due to collusion; if a small mistake is not rectified when it is discovered, it can become a fraud. Some of the causes that enable fraud to occur include failure to allocate responsibility for its prevention.<sup>xi</sup> The best deterrent for fraud is an effective functioning system of internal controls, so that where fraud is perpetrated by eluding security arrangements, companies are reluctant to admit accounts falsification.

#### **Origin, Causes, Incentives**

According to Rezaee, three variables can explain frauds accomplishment:

- Conditions
- Corporate structure
- Choice.

This model (3Cs model)<sup>xii</sup> can help to explain motivations and opportunities of financial frauds.

#### **Conditions**

Economic pressures, such as pressure to meet analysts’ earning estimates, are one of the most relevant elements in the process of fraud committing.

Costs/benefits evaluation is fundamental in this process. Managers will compare the benefit in terms of positive effects on company’s stock price or the cost saving of preventing the negative impact on share price, with the possible cost consequences of fraud accomplishment in terms of probability of detection, prosecution and sanction.

Financial pressures, such as inability to meet analysts’ earning estimates or declines in quality and quantity of earnings, are often motivations for management commitment in financial frauds.

It is obvious that very often financial frauds are linked to conditions enabling them, such as:

- Ineffective corporate boards;
- Existence of management with no accountability and insufficient market’s accountability;
- Lack of responsible corporate governance;
- So on.

### **Corporate Structure**

The existence of an effective corporate governance mechanism (such as internal control structure and audit committees) would discourage managers from committing frauds thanks to a larger probability of detection.

The role of corporate governance devices can also be discussed in relation to other social and economic characteristics of different countries where frauds can be accomplished.

It is also important to explain to what extent an effective corporate governance system can help to prevent and detect frauds.

### **Choice**

Independently of the external contest and corporate structure, managers have their own characteristics in terms of aggressiveness and lack of moral principles so that fraud is also a matter of choice regardless of environmental pressure or corporate structure. Some people could be even interested in committing fraud without any consideration for the consequences of their action and of the sanctions (they are crazy nonetheless!).

The increasing incentives to misreporting and the large alleged accounting frauds of recent years have left legislators, regulators and academics searching for answers about the causes of irregularities. Many have suggested that the explanation lies in the incentives and opportunities for personal gain faced by executives.

Recent analyses have demonstrated that there is a strong relationship between stock-based compensation and frauds incentives<sup>xiii</sup>. The use of stock-options for executives compensation rose during the 1990s, when the compensation structure of American executives shifted towards equity-based compensation. The average compensation of CEOs of large U.S. companies tripled in real terms during the 15-years period from 1980 to 1994<sup>xiv</sup>.

### **Fraud Prevention and Detection**

Financial and accounting fraud prevention is not always possible. Anyway, the prevention is linked to some mechanisms whose main elements are:

- Vigilant corporate governance;
- A corporate code conduct;
- An adequate and effective internal control structure;
- An internal audit function;
- External audit services.

These tools refer to a firm culture based on financial and economic disclosure for an effective stakeholders relations management, independently of normative rules<sup>xv</sup>.

Nevertheless, lack of responsible corporate governance and other control mechanisms does not necessarily mean that the company will commit a fraud. A company needs specific reason and incentives to engage a fraud. In fact, it finds a set of acceptable accounting alternatives to justify its actions and opportunity to commit illegal action<sup>xvi</sup>.

Moreover, firm's cost deriving from account falsification consists of reputation damages and big investors' loss of confidence, besides legal procedures cost, functioning in case of accounting and financial frauds<sup>xvii</sup>.

Corporate governance is characterised by organisational structure, which defines the standard operating procedures for the legal behaviours. When frameworks of corporate governance become established, they begin to define the corporate culture. Corporate governance that is consistent with the structure and decision-making routine of a company may be different and inconsistent with the structure of another company.

Due to the difficulty to prevent accounting fraud, the mechanisms of internal/external control, which are strictly linked to corporate governance systems, must be very effective and play anyway a primary role to detect any kind of possible fraud.

### **Corporate Governance**

Corporate governance consists of a various set of legal and institutional mechanisms aimed of safeguarding the interests of corporate shareholders and of reducing agency costs deriving from the separation of ownership (shareholders) from control (managers and/or controlling shareholders)<sup>xviii</sup>. The most important elements in a corporate governance system are the mechanisms that provide shareholders with information about the activities and

the operations of the corporation, and legal rules that establish management's and board of directors' responsibilities as well as the penalties for irresponsible behaviours.

A narrow definition of corporate governance, principally based on the accountability and responsibility more than on the concept of who has the power, is the one referring to the relationship between the company's capital providers (investors and creditors) and the top management<sup>xxix</sup>. Corporate governance, according to another definition, simply means the way a corporation is governed through a fair accountability for managerial and financial performance.

In the past few years we can notice an increasing awareness of the role of corporate governance in financial frauds prevention and detection, thanks to its impact on earnings stability and the quality of financial reporting.

A good corporate governance system can help the recovery of investors' trust<sup>xx</sup>. In fact, the relation between accounting frauds and corporate governance is really strict, independently of the specific governance system, corporate bodies structure and control mechanisms<sup>xxi</sup>.

Misreporting has been considered as whatever action that allows low-value companies to report the same earnings, or revenues, or other dimensions of corporate performance, as high-value ones<sup>xxii</sup>.

There are mainly two kind of actions enabling this process:

- Violation actions, that is actions in open contrast with accounting standards and accounting principles in general, false representation and, eventually, false documentation;
- Elusion actions, that is actions not openly in contrast with accounting standards, generally referring to forced interpretations of them, but aimed of misleading investors about the prospects of the company.

Financial information represents a way to communicate with stakeholders, but the real relationship with them depends on corporate governance model<sup>xxiii</sup>.

In Anglo-Saxon countries, financial information is the main instrument for firms communications to stakeholders. It is a consequence of a "market-oriented" corporate governance model, characterised by public companies, with high split up ownership and the absence of a controlling shareholder. In these case, management is usually not subjected to effective control and has a great leadership in making actions.

In continental Europe (Germany, France, Italy) instead, stakeholders get often financial information through indirect channels.

In these countries corporate governance systems are usually defined as bank-oriented, characterised by controlling shareholders with a strong leadership, consisting of few people, such as families or banks, with a high concentration of ownership<sup>xxiv</sup>. In these cases managers are subjected to the influence of ownership interests<sup>xxv</sup>. In this contest financial information can more easily loose its role of primary and neutral information channel because the interests of some groups of stakeholders (for instance controlling shareholders) could be privileged and they can get information through informal and private sources.

The distinction between market-oriented and bank-oriented systems has been often criticised. Rajan and Zingales show for example that financial information, in developed financial systems, plays an important role for firms with a few tangible assets<sup>xxvi</sup>. These ones can be used like a guarantee to get bank funds, so that firms with low proportion of tangible assets depend much more on the market for financing and markets require higher standards of information disclosure.

The relation between typologies of accounting frauds and characteristics of corporate governance systems is thus explained also by the corporate governance role in guaranteeing quality of financial reporting.

## **Two Models of Accounting Fraud Development Process**

According to the hypotheses of our work, corporate governance systems have a significant influence on the characteristics of accounting irregularities.

We identify three typologies of corporate governance systems, based on differences in shareholders and board composition.

As regards shareholders and ownership structure, we distinguish three cases:

1. The “privately controlled” company, in which there is one shareholder, or one group of shareholders who strictly owns the absolute or relative majority of voting rights;
2. The “open ownership” company, in which there are some shareholders with significant influence, but none of them has got the stable control of the company;
3. The “public” company, in which no single shareholder has a significant influence.

In our model, and only for the aims of this paper, board composition is supposed to be strictly related to ownership structure. Consequently, we distinguish three cases:

1. In the “privately controlled” company, the board is strongly influenced by the controlling shareholders and the Ceo clashes to the controlling shareholder or is a person who strongly depends on him; the executive members of the board are therefore, when not coincident, strictly linked to the controlling shareholder; they have a great decisional power and controlling bodies (i.e. independent directors, supervisory board, collegio sindacale, ...) are not effective in limiting it;
2. In the “open ownership” company, the board is representative of shareholders with significant influence, but it is not dominated by a controlling shareholder (this case also refers to voting agreements and voting trust as a device for co-ordination between significant shareholders); the executive members and the Ceo are quite independent in formulating strategies and in managing the company to implement them, but they are effectively controlled (through controlling bodies or through other informal mechanisms, such as moral suasion) by the shareholders with significant influence;
3. In the “public” company, the board is elected by the shareholders’ meeting, but it is completely independent of shareholders; the executive members have a strong decisional power and they are substantially independent in formulating strategies and in managing the company to implement them; furthermore, neither shareholders nor controlling bodies effectively control the actions of top managers.

Our hypothesis is that it is possible to identify two main typologies and development processes of accounting fraud<sup>xxvii</sup> and that the typology and development process of accounting fraud (from here on, for simplicity, the “accounting fraud models”) depends on the corporate governance system of the company.

The two main models we are going to define, based on the different causes, incentives and environmental circumstances that generate or help the birth of a fraud, are:

- The “excessive power” accounting fraud;
- The “performance stress” accounting fraud.

In the “excessive power” case, the fraud arises from the action of powerful, but also unscrupulous, entrepreneurs or managers. They actually are not subject to only effective controls, and thus deliberately act to deceive other parties in order to gain a private benefit (different from result-based compensation, such as cash distraction). In this case, the accounting irregularity is generally well identifiable, often referred to specific deals or operations and generally it reaches very soon a large extent in value.

In the “performance stress” case, the fraud is generated by the pressure on results that competitive and business environment exercise on top and middle management. We refer, in particular, to the pressure exercised by the financial markets through analyst’s expectations or bank’s requirements, but also to the pressure exercised by the internal budgeting procedures. In this case, the irregularity does not generally arise from an intent to gain private benefit (in the narrow sense, described above) nor with a full awareness of the fraudulent behaviour. That is the result of the intent to meet expected interim results (even on a monthly or quarterly base) and with the hope to compensate very soon the irregularity in the following periods. Accounting frauds of this kind are at the beginning very little in value, but they grow progressively over time (the more the competitive environment is complex the faster they grow) up to become of relevant dimensions.

Obviously, this is a not clear-cut distinction, as in each case of fraud there could be features of both models, but we will try to demonstrate that, depending on some environmental and context variables, and in particular on the corporate governance systems, it is possible to find a significant congruence between each case of fraud and one of the presented models.

The “performance stress” case of fraud is typical of companies with a strong results-oriented culture, characterised by very challenging budgets and high-growth expectations from external analysts.

In the growth phases of a business life-cycle, the market itself helps to improve results and targets are fixed in a more and more challenging way. But when the business comes to maturity, budgeted or expected growth becomes unbearable; nevertheless, company's culture still asks for high-demanding performance. In this situation, missing the expectation becomes very likely, but also very costly for top and middle management in terms of compensation and career.

Often, even for a scrupulous and honest manager, earnings management is too easy to give up. He will find a way to meet monthly or quarterly targets, conscious he is postponing a problem to the future, but also with the sincere hope that, as it has been in the past, the recovery of better market conditions and the implementation of new strategic or tactical measures will help to reabsorb results overestimate. If the case would not be, the manager will find himself to choose between declaring an even bigger targets missing or to implement somewhat bigger artifice for earnings management. If market or strategies would not, as it is indeed very likely, help to reabsorb past overestimate and to reach satisfying current results, the process becomes self-feeding and dangerously irreversible. It becomes, in other words, a hard to defuse mine.

It is not surprising that many frauds of this kind have emerged in recent years in a slump, when not recession, situation, when the concealment of financial shenanigans becomes quite impossible. When it emerges, the dimension of the fraud is much bigger than expected at its beginning.

Financial chronicles in recent years have also known many accounting frauds of a different kind: intentional, generated by lucid dishonesty or avidity. These accounting frauds are more likely to be big since their origin.

According to our hypotheses, these are favoured by corporate governance systems in which one or very few key people have a very big decisional power and in which control bodies are very weak.

Ambition, avidity, unscrupulousness, sensation of almightiness and lack of sensibility for business ethics could be a dangerous recipe, which pushes powerful entrepreneurs or managers to act in a border-line or illegal way, covering their actions with false financial representations.

In the worst cases the accounting fraud is aimed to hide losses or risks related to specific operations generating private benefits (in the narrow sense) for the powerful key figure. In other cases, it only covers intrinsic weaknesses of the company and it is perpetrated to prosecute the dominion of the key decisional figure over the company (continuing to grant, in this way, the consequent private benefits).

In any case and in any kind of process, when the fraud emerges, it suddenly shows problems generated for a (more or less) long period of time; damages for stakeholders, who took decisions based on wrong information, are consequently always relevant.

Before going analytically through our methodology of analysis, we now summarize the most important features of each accounting fraud model.

The principal characteristics of "performance stress" accounting fraud can be summarized below:

- It generally doesn't origin from conscious dishonesty;
- It origins from pressure on results, in companies with a strong culture on performance and challenging targets;
- The fraud starts with little alterations of results; people don't deliberately meet to start a fraud, but they often begin it without a full consciousness to be violating law;
- irregularities often regard the more discretionary items of financial information (revenues recognition in presence of particular selling clauses, reserves and provisions, depreciation and impairment, ...), where it is possible to maintain that accounting standards have been respected also with very different estimates;
- The dimension of irregularity grows over time, as new alterations sum to the old ones, not reabsorbed;
- There quite never exists a way out different from disclosing the fraud; the authors hope the future will help them, but the passing of time only makes the fraud bigger.

The main features of "excessive power" fraud, on the other side, can be highlighted like that:

- The origin is attributable to a well-defined unscrupulous action, known to be dishonest and unethical, aimed to hide the real conditions of the company or, worse, the effects of specific operations which

caused damages to the company and, often, private benefits for the powerful key figure (in a narrow sense);

- The fraud is favoured by personified and authoritative governance style, in which the entrepreneur or the top manager have absolute and undisputed decisional power and in which, consequently, control bodies are not effective because, in fact, “controlled” by the leader;
- The fraud can have big dimensions from the beginning; anyway it tends to grow for the cumulative effect of loss deferment;
- It is likely that, as in the “performance stress” model, the irregularity regards most discretionary items, but it can be as well a clear violation of accounting laws and standards;
- Also in this case there is a hardly way out different from disclosing the fraud; the disclosure time being now dependent on how long is the dominion position of the leader.

### **Models Variables Definition and Methodology of Analysis**

This paragraph will:

1. Define the variables of the two models of accounting fraud here presented;
2. State the expected relation between corporate governance systems and accounting fraud models;
3. Illustrate the methodology of the analysis.

#### **Variables of Accounting Fraud Models Definition**

We define and distinguish each of the two models of accounting fraud according to four variables, that we are here going to discuss:

1. Incentives and causes;
2. Development process;
3. People involved;
4. Accounting standards.

#### **Incentives and Causes**

Incentives and causes regard the motivations to perpetrate a fraud and the interests pursued with it.

In the “excessive power” model, the interests pursued with the fraud are both to present a better situation of the company to investors (shareholders, bondholders, banks, other creditors, ...) and to obtain specific private/personal benefits, different from what represented by bonuses related to results or stock options (or other similar compensation instruments).

On the other side, in the “performance stress” model, the interests pursued are exclusively results improvements to present a better situation to investors, while no specific private/personal benefits (different from compensation instruments) are pursued.

We define these two incentives as:

- Private benefits;
- Performance improvements.

In the “excessive power” model both incentives are present. In the “performance stress” model only the “performance improvements” incentive is present.

“Performance improvements” incentive regards presenting a better company situation either to investors, through external financial information, or to top management, in the internal information flows for budgeting process. In our analysis, which only includes listed companies, we have focused on external information, but in many of the observed cases the improvement of performance for internal management accounting is supposed to be a fraud incentive as well.

#### **Development Process**

Development process regards the way in which the fraud evolves. We refer, in particular to the duration of the fraud and to the way it grows over time.

The duration of the fraud is the number of years for which the company has restated its earnings or anyway the number of years for which a misreporting has been ascertained by authorities, gatekeepers or controlling bodies.

The way the fraud has grown over time is only observed from a qualitative point of view, distinguishing, when possible, irregularities that have grown over time from irregularities born, more or less, with the same dimension they had at the time of the disclosure.

In the “excessive power” model we assume the duration is longer than in the “performance stress” model. This is because in the second case control systems are more effective and should discover the fraud sooner.

For the aim of our analysis we distinguish:

- Frauds lasting up to 2 years;
- Frauds lasting more than two years.

We expect that frauds of the “excessive power” model are more likely to last more than two years while frauds of the “performance stress” model are more likely to last up to two years.

### **People Involved**

The variable “people involved” refers to the persons involved in the fraud, that is the persons that, from the ascertainment of authorities, gatekeepers or controlling bodies result to be the authors or the inspirers of the fraud.

In the “excessive power” model we assume that the fraud stems from the top management or from the entrepreneur (in the entrepreneurial companies).

In the “performance stress” model we assume that, besides that in the top, the fraud could also be generated in the periphery of the company.

We distinguish then:

- The cases in which middle or peripheral management is involved in the fraud, that, according to our hypotheses, should pertain to “performance stress” model;
- The cases in which only the entrepreneur or top management is involved in the fraud, that, according to our hypotheses, could indifferently pertain to both models.

Top management is defined as the Ceo and the executives reporting directly to him. Entrepreneur, when identifiable, is the person who has the controlling ownership of the company.

### **Accounting Standards**

The variable “accounting standards” regards the way in which the fraud is implemented from a technical point of view and, consequently, the way it is contrary to accounting regulation.

We distinguish:

- The “violation” of accounting standards;
- The “elusion” of accounting standards.

We define “violation” of accounting standards an accounting behaviour which is clearly contrary to accounting regulation, because it gives a representation not coherent with facts, operations or contractual relations and with the documentation which proves and disciplines these facts, operations or contractual relations. In this sense, there is a violation of accounting standards when the accounting behaviour openly and clearly doesn’t follow accounting standards in representing the facts, operations or contractual relations.

We can have two typologies of “violation”:

- Accounting doesn’t fairly represent the facts and the documentation;
- Accounting corresponds to the formal documentation, but it doesn’t fairly represent the facts.

We define “elusion” of accounting standards an accounting behaviour which is not contrary to accounting regulation in a clear and straightforward way, but which forces it in order to give an altered representation of the economic and financial situation of the company.

We can have two main typologies of “elusion”:

- Irregularity resides in the most discretionary items of a financial statement, so that the presentation of the company situation could be altered through unfair estimates (for instance about provisions) or interpretations matters (for instance about the revenue recognition criteria), without openly violating accounting standards, but in facts not respecting them<sup>xxviii</sup>;

- Irregularity resides in doing actions without economic convenience (and often with negative consequences on earnings of following years) and whose only justification is the improvement of current results (for instance anticipating deliveries or producing for the warehouse).

Our hypothesis is that the “excessive power” accounting frauds are more likely perpetrated with “violation” of accounting standards, while the “performance stress” accounting frauds are more likely perpetrated with “elusion” of accounting standards.

Obviously, many frauds are perpetrated with more than one implementation tool (i.e. accounting principles manipulation) so that “elusion” and “violation” can be both present.

#### **Summarizing**

For the aim of this paper and necessarily simplifying a more complex reality, the two kind of accounting frauds can be briefly defined in the following way:

- The “excessive power” accounting fraud is committed with the purpose to improve reported performance, but also to get private benefits different from performance compensation, involves directly the top management, lasts more than two years and is perpetrated also through open violation of accounting standards;
- The “performance stress” accounting fraud is committed only with the purpose to improve reported performance, can start from the periphery of the organization, lasts two years or less and is perpetrated through the elusion of accounting principles.

It is important to underline that the distinction of the two models is never, in reality, clear-cut. These definitions are then useful only for the purpose of this paper, as showed hereinafter.

#### **Expected Relation between Corporate Governance System and Accounting Fraud Model**

According to the proposition stated in the first paragraph, we expect that companies with corporate governance systems in which a single or very few executives have an absolute decisional power and in which controlling bodies are less effective, are more likely to develop an “excessive power” fraud, while companies with corporate governance systems in which executives are significantly controlled by influent shareholders and in which controlling bodies are more effective, are more likely to develop a “performance stress” fraud.

For the sole purpose of this paper, the definition of corporate governance systems is the following:

- “Public” company, if there aren’t shareholders holding more than 10% of voting rights;
- “Open ownership” company, if there are shareholders holding more than 10% of voting rights, but nobody holds more than 30% of voting rights;
- “Privately controlled” company if there is at least one shareholder who holds more than 30% of voting rights.

Referring to our simplifying classification of corporate governance systems, our proposition is that:

- The “privately controlled” and the “public” companies are more likely to develop an “excessive power” accounting fraud;
- The “open ownership” companies are more likely to develop a “performance stress” accounting fraud.

#### **Methodology of the Analysis**

The methodology of the analysis presents the following steps:

1. Classification of the 20 case-studies according to the corporate governance model;
2. Analysis of the relevant variables for each case of accounting fraud or irregularity;
3. Analysis of coherence of the logic actual values of variables with the expected values of variables according to our hypotheses;

The case-studies analyzed in this paper are listed in the following schedule:

TABLE 1: CLASSIFICATION OF THE 20 CASE-STUDIES ACCORDING TO THE CORPORATE GOVERNANCE MODEL

<b>Company</b>	<b>Country</b>	<b>Sector</b>
Adecco	Switzerland	Employment Agency
Adelphia	USA	Cable company
Ahold	Netherlands	Food service - supermarket group
AOL	USA	Mass media
Bipop	Italia	Financial services
Bristol Myers	USA	Pharmaceutical industries
Cirio	Italia	Food industries
Enron	USA	Energy Trading
Finmatica	Italia	Software development
Freedomland	Italia	Internet- Tv
Giacomelli	Italia	Sportwear trade
Global Crossing	USA	Broad band wire telecom services
Kmart	USA	Distribution
Nortel	Canada	Telecom equipment
Parmalat	Italia	Food industries
Royal Dutch Shell's	Netherlands	Oil - Natural Gas
Tyco	USA	Industrial and financial conglomerate
Vivendi	Francia	Multimedia
Worldcom	USA	Telecom services
Xerox	USA	Photocopier

Companies are classified, according to their corporate governance systems, in this way:

TABLE 2: ANALYSIS OF THE RELEVANT VARIABLES FOR EACH CASE OF ACCOUNTING FRAUD OR IRREGULARITY

<b>Company</b>	<b>Country</b>	<b>Sector</b>	<b>Corporate Governance</b>
Adecco	Switzerland	Employment Agency	Open ownership
Adelphia	USA	Cable company	Privately controlled
AHOLD	Netherlands	Food service - supermarket group	Open ownership
AOL	USA	Mass media	Public
Bipop	Italy	Financial services	Open ownership
Bristol Myers	USA	Pharmaceutical industries	Public
Cirio	Italy	Food industries	Privately controlled
Enron	USA	Energy Trading	Public
Finmatica	Italy	Software development	Privately controlled
Freedomland	Italy	Internet- Tv	Privately controlled
Giacomelli	Italy	Sportwear trade	Privately controlled
Global Crossing	USA	Broad band wire telecom services	Open ownership
Kmart	USA	Distribution	Public
Nortel	Canada	Telecom equipment	Public
Parmalat	Italy	Food industries	Privately controlled
Royal Dutch Shell's	Netherlands	Oil - Natural Gas	Open ownership
Tyco	USA	Industrial financial conglomerate	Public
Vivendi	France	Multimedia	Public
Worldcom	USA	Telecom services	Public
Xerox	USA	Photocopier	Open ownership

This analysis was conducted through public information contained in sources like annual reports, information and filings to authorities and gatekeepers (when public), information from newspapers, journals, magazines, internet website and other public sources.

For each case of accounting fraud it has been determined:

- If the incentives and interests pursued included also private benefits or not;
- If the development process of the fraud, as understandable from public sources, lasted more than two financial years or not;
- If the fraud started from the top or the periphery of the company;
- If the fraud consisted of an open violation of accounting standard or not.

#### **Analysis of Coherence between Actual Values and Expected Values of Variables**

The analysis of coherence between actual values of variables and expected, according to our hypotheses, values of variables has been conducted on two levels:

- Coherence with the hypothesis of relevance of the distinction of two models of accounting fraud;
- Coherence with the hypothesis of the relation between corporate governance systems and accounting fraud model.

On the first level, we have calculated, for each case-study, the number of observations which are coherent with the model of “excessive power” and the ones coherent with the model of “performance stress”.

We define “maximum” coherence the case in which all four variables are coherent with the same model of accounting fraud, “good” coherence if three variables are coherent with the same model of accounting fraud, “absent” coherence if two variables are coherent with one model and the others two with the other model.

In some cases in which we hadn’t enough information to classify the variable, we have classified it in order to diminish total coherence.

As regards the variable “people involved”, a fraud which starts from the top could be coherent with both models of “accounting frauds”.

On the second level, we have calculated the number of observations which are coherent with the model of corporate governance and the ones which are not, according to our hypothesis that “privately controlled companies” and “public companies” are more likely to put in place an “excessive power” accounting fraud, where “open ownership” companies are more likely to put in place “performance stress” one.

We then have calculated the total number of coherent observations and the total number of non coherent ones.

In some cases in which we hadn’t enough information to classify the variable, we have classified it in order to diminish total coherence.

## **Results and Conclusions**

The above mentioned analysis has conducted to the following results:

- Hypothesis A: the distinction of the two models of accounting fraud (“excessive power” and “performance stress”) seems to be quite relevant because in the 60% of cases (12 on 20) coherence has been “maximum”, in the 25% (5 on 20) “good” and in the 15% (3 on 20) “absent”.
- Hypothesis B: the relation of accounting fraud model with corporate governance system seems to be quite relevant because in the 70% of total observations (56 on 80) coherence has been “existent”, in the 30% (24 on 80) “absent”.

Detailed observations and results are shown in the annex A.

This analysis has given us a first confirmation on empirical relevance of the distinction between a model of “excessive power” accounting fraud and a model of “performance stress” accounting fraud, which was intuitively hypothesized.

This analysis has also given us a first confirmation on empirical relevance of the hypothesis that corporate governance systems influence the way in which accounting frauds are perpetrated.

The principal limits of the analysis are the number of the cases, which could be increased, the time horizon of the analysis, which could be extended, and the number of relevant variables which define each model of accounting fraud, which surely could be sophisticated. In particular, the fraud should be also studied with reference to the behaviour of controlling bodies (independent directors, audit committees, external auditors, gatekeepers and

so on) to infer the relationship between accounting fraud models, corporate governance systems and the prevention and detection of accounting frauds.

Further implementations of our analysis could then related:

- To the extension of the analysis to more cases in an extended time horizon;
- To a more detailed definition of the characteristics of the accounting fraud models;
- To the use of a more sophisticated quantitative methodology of treating the available data;
- To a deep analysis of the role of controlling bodies, regulation and context variables.

# Have Ethical Perceptions of Managers Changed? A Follow-up Study of Two Decades

*Asko Miettinen  
Tampere University of Technology, Finland*

## Abstract

Ethical perceptions of executives and managers were explored in this explorative study in 1981, 1993 and 2003 using the same questionnaire. The results showed that attitudes changed very little over the period of 22 years: there were more similarities than differences in this survey. A vast majority of the respondents (about 90 %) were in the opinion that there are unethical practices in business. On the other hand, a majority considered the ethical level of business to be better than a decade earlier and this positive development was also estimated to continue in the future. The managers defined ethics typically in a subjective or individualistic way rather than using more objective criteria. Contrary to expectations, perceptions were also rather homogeneous: there were no significant differences in ethical perceptions between respondents of different age groups nor respondents from various industries and different company size. The study challenges this homogeneity based in the first place by Kantian law ethics rather than virtue-based ethics in front of rapidly globalizing world economy calling for ethical pluralism rather than ethical minimalism.

## Introduction

Concerns with ethical problems have intensified in the early new millennium due to several recent corporate scandals such as Enron and Parmalat. At the same time, a great deal has been written about ethics in business life. A quick search on the Internet, using the Altavista search engine, has identified more than 20,000 web pages and some 1,200 books on business ethics. Thus, business ethics has grown in response to the apparent decline in ethical behavior in business and as a recognition that economic relations seem to have their own morality.

Aside of business ethicists, there have been attempts to theorize ethics and morality from a wide range of other perspectives, inter alia, sociology, law, economics, theology, philosophy, social psychology and cultural psychology (i.e. Bowie, 1999; Wilber, 1998). A further challenge is how to cope with the contemporary confluence of globalization and ethical pluralism, which seems to be at the origin of many ethical tensions that confront business today, both in practice and in theory (Gonzaléz, 2003; Sethi, 2003).

Emerson and Conroy (2004) state in their recent article that due to the data availability issues, only a few studies have taken a true longitudinal approach, sampling the same respondents over a number of years. The authors are also constrained by data issues and do not attempt such an analysis, but try to measure changes in societal views on business ethics that are more common in this field. Another notion is that college and university students usually without or with very limited work experience have been a typical target group for surveys. (i.e. Farling & Winston, 2001; Harich & Curren; 1995; Lewis, 1989; Zinkhan, Bisesi & Saxton; 1989)

One of the early writers in the field, Raymond J. Baumhart conducted a large empirical survey of American managers in 1968. In this survey, Baumhart highlighted some points mostly still relevant after almost four decades:

- Most managers and business believe that they are more ethical than the average manager, and extension of himself (his department, company, industry, and country) is more ethical than their counterparts.
- The ethical dilemmas of deepest concern to managers are personnel problems; more frequent, however, are unfair competitive practices such as price discrimination or collusion, bribery, and dishonesty in advertising or contracts.
- Managers believe that good ethics is good business in the long run, especially in employee and customer relations.
- Managers typically become more ethical as they grow older, partly because of financial security.

- It is easier to be ethical in jobs involving fiduciary relationships, such as the accountants' or engineers', than in those jobs involving competitive relationship, such as salesman's or purchasing agent's.
- Competition is the factor of greatest influence on ethical behaviour in business. Unethical practices tend to result from both too little or too much competition in an industry.
- Managers of multinational companies, as their handling of culture-related reveals, disagree about what constitutes ethical behavior abroad.

Maybe one of the most well-known and cited study on business ethics was published a decade later (1977) in the Harvard Business Review under the title "Is ethics of business changing". This article by Brenner and Molander has served as a model in certain aspects for the Finnish survey presented in this paper, too.

Brenner and Molander basically compare what some 1,200 HBR readers thought of business ethics in relation to what their counterparts perceived fifteen years earlier. The most emergent results of their study can be summarized briefly as follows:

- There was a substantial disagreement among respondents as to whether ethical standards in business had changed from what they were earlier.
- Respondents were somewhat more cynical about the ethical conduct of their peers about their own.
- Most respondents favoured ethical codes, although they strongly preferred general precept codes to specific practice codes.
- The dilemmas respondents had experienced and the factors they had felt to have the greatest impact on business ethics suggested that ethical codes alone will not substantially improve business conduct.
- Most respondents had overcome the traditional ideological barriers to the concept of social responsibility of business and had embraced its practice as a legitimate and achievable goal or business.
- Most respondents ranked their customers well ahead of shareholders and employees as the client group to whom they feel the greatest responsibility.

(Brenner & Molander, 1977)

## Research Question and Methodology

There are a number of follow-up studies on changes in ethical attitudes of business managers since the classical article by Brenner and Molander in the Harvard Business Review in 1977 (Ford & Richardson, 1994; Emerson & Conroy, 2004). In this study, a similar survey instrument was presented to Finnish managers and executives in 1981, 1992 and in 2003, respectively. The mailed questionnaire covered a wide range of questions and background data such as rankings of the relevant stakeholders, issues in social responsibility of business, existence of unethical business practices, unethical practices executives want to eliminate, conflicts between the advantages of one's corporate and own moral beliefs, role of code of ethics, how the ethical level of business could be improved etc.

## Sample

The number of respondents in the three surveys was as follows: 442 in 1981 (response rate 81.3 %), 412 in 1992 (70.1 %) and 324 in 2003 (45,4 %). The respondents were mainly males (the proportion of female respondents was about 10 % in all three samples), represented top executives and upper middle management (with some senior specialists) both industry and service industry and mostly medium sized and large enterprises (about 80 %) in Finland. About one third of the respondents were participants in executive education and management programs and two thirds were reached through a mail survey with the same target group consisting of executives and professional managers.

About a half of the respondents were 40-50 years old with a smaller amount of respondents aged under 40 or above 50. There is some variation in the age distributions of the three samples (Table 1) particularly in the 2003 sample, where the proportion of respondents above 50 is higher than in the other two earlier samples. This does not cause any major bias, because it appeared that age is not a discriminating factor among the respondents (Chi square tests were employed for each sample with no significant differences between various age groups).

TABLE 1. AGE DISTRIBUTION OF RESPONDENTS

Age	1981	1993	2003
- 39	42 %	28 %	20 %
40 – 50	40 %	55 %	48 %
51 -	18 %	17 %	32 %
	100 %	100 %	100 %

In terms of the size of companies the respondents came from there were also some variation between the three samples as follows:

TABLE 2. THE SIZE OF RESPONDENTS' FIRM

	1981	1993	2003
Small	15 %	21 %	18 %
Medium-sized	24 %	21 %	38 %
Large	58 %	61 %	44 %

These data with the increasing proportion of medium-sized enterprises in the 2003 sample may reflect the changing size structure of economy, but also the fact that medium-sized firms have become more interested in management education (a major proportion of the respondents come from managers who attended management training programs and courses). However, Chi square tests indicated again that there are no statistically significant differences between the respondents from various company size.

## Results

### What Managers Mean by 'Ethical'?

Many business people are somewhat puzzled about the meaning of ethics. They may prefer other concepts such as 'values' instead of ethics. Well-known management writer Peter Drucker has alleged that there is no such thing as 'business ethics', but ethics is ethics at home or at work. Any attempt to define special set for corporation is at best 'ethical chic' and at worst a stick with which to beat big business according to Drucker.

Ethics is basically a product of human reason: it derives its principles from reason, unassisted by divine revelation, but aided throughout by reflection on human experience. As a philosophical enterprise, ethics is concerned not only with the relationship of means to ends, but also with the discovery and choice of most reasonable ends. Ethics can be considered both art and science and it can be said to involve both knowledge and practice.

The respondents in each sample were given a forced-choice question about what they consider ethical, particularly ethical behavior. The nine alternatives or descriptions of ethical called from those proposed by philosophers, theologians and businessmen. The most preferred choices are seen in Table 3:

TABLE 3. WHAT MANAGERS MEAN BY ETHICAL?

	1981	1993	2003
What my feelings tell me is right	56 %	57 %	61 %
Whatever does the most good for most of people	14 %	13 %	14 %
Conforms to "the golden rule"*	15 %	17 %	9 %
Customary behaviour in our society	10 %	6 %	7 %
In accord with my religious beliefs	4 %	1 %	1 %
About the same as what is legal	1 %	6 %	8 %
Corresponds to my self-interests	-	-	-
Contributes most to my personal liberty	-	-	-
What I want in that particular situation	-	-	-
Total	100 %	100 %	100 %

\* "Always treat others as you would like them to treat you" or in most commonly stated form:  
 "Do unto others as you would have them do unto you"

Replies can be categorized into three kinds: objective, subjective or objective-subjective answer. Objective means answers referring to something that is personal or internal to the respondent. Subjective means something that is personal or internal to the respondents. This rough division shows that more than a half of the respondents in each sample defined ethical as "what my feelings tell me is right". This finding indicates of the dominance of an *individualist* or *emotive ethics*.

This way to define ethics is not without some serious problems: based on emotive (or subjective) theory of ethics it is not possible to derive general or universal ethical principles or norms guiding behavior. Subjective feelings can't give a constant base for ethical evaluation and reasoning. Its consequence at the individual level can be as well a rough egoism as altruism to give the extremes of the continuum. Individual feelings as a main criterion for right or wrong leads to contradictions between the rules of business life in most cases. The final criterion then in fact would be the moral sensitivity of an individual manager. If the individual frame of reference were the final criterion for ethical evaluation, the manager would be very alone with his moral problems. It can be also asked if the subjective feeling would be enough in dealing with multiple stakeholders as well as with competitor in the market place.

The Golden Rule (GR), representing more objective interaction-based interpretation about ethics, came up as second in the 1981 and 1993 sample and third in 2003. It is endorsed in one form or another by most cultures and major religions (versions of GR can be found in the Bible, the teaching of Confucius, Islamic and Indian writers, and in numerous other ancient sources) and is still espoused by philosophers, contemporary business ethicists and popular business authors. Extended with Kant's second formulation of the Categorical Imperative, the Formula of Humanity as an End in Itself (equaling closely to principle of universability), it corrects some of GR's defects and continues to appeal to GR as a fundamental moral principle (Bruton, 2004). Another notion is, however, that its ranking in the 2003 sample was considerably lower than in the two earlier gathered samples. Together with the finding that equaling 'ethical' more frequently to 'legal' in the 2003 sample may indicate the development of Finnish society towards a more post-Christian stage. However, the overall results seem to tell something of the homogeneity of the Finnish culture.

**Are there Unethical Practices in Business Life?**

The question in the subtitle was presented as such to the respondents. The results are seen in Table 4 with a very clear picture: some 90 % of the respondents in each sample were in the opinion that there are unethical practices (some or several) in business life. Only 4-6 % said that there are no unethical practices in use. Compared these figures for example with the Brenner & Molander 1977 study conducted in the US study covering 1,200 respondents from their business life, where 27 % answered that there are none unethical practices in business, the responses indicated much more critical standing in Finland than in the U.S.A. One conclusion may be that unethical practices in business have become more invisible and control by i.e. mass media tighter than what it used to be. The interest of general public in business has also grown even before the recent scandals.

TABLE 4. ARE THERE UNETHICAL PRACTICES IN BUSINESS LIFE?

	1981	1993	2003
No	5 %	4 %	6 %
Yes, some	83 %	80 %	79 %
Difficult to say	5 %	5 %	8 %
Several	7 %	12 %	7 %
Total	100 %	100 %	100 %

**Has the Ethical Level of Business Changed?**

The time period in this item was the last decade. The overall picture is encouraging: more than a half of the respondents considered the ethical level of business somewhat or considerably higher than 10 years earlier. Proportion of those respondents who evaluated it to have maintained the same varied from 14 to 27 % and those who assessed it to be lower (somewhat or considerably lower) varied from 17 % to about one third of the respondents. The differences were not significant as to various age groups, industry types or company size according to Chi square analyses.

TABLE 5. THE ETHICAL LEVEL OF BUSINESS TODAY COMPARED TO THE SITUATION TEN YEARS AGO

	1981	1993	2003
Much lower	1 %	7 %	2 %
Somewhat lower	22 %	27 %	15 %
The same	23 %	14 %	20 %
Somewhat higher	49 %	46 %	53 %
Considerably higher	6 %	6 %	10 %
Total	100 %	100 %	100 %

The same mostly positive development was expected to continue from 2003 on (Table 6). Unfortunately this item was not presented in the 1981 and 1993 surveys.

TABLE 6. THE DEVELOPMENT OF THE ETHICAL LEVEL DURING THE NEXT 5 – 10 YEARS.

	2003
Will be much lower than now	2 %
Somewhat lower	5 %
The same	28 %
Somewhat higher	61 %
Considerably higher	4 %
Total	100 %

**What are the Unethical Practices and what are the Main Reasons for them?**

The respondents were asked to rate what kind of conducts they would like to eliminate in the first place. This item was based on the list of ten alternatives and open-ended answers (“others, what?”). Each respondent was able to mark all practices he/she wanted to eliminate. Table 7 gives the frequencies in percentages for 1981, 1993 and 2003, respectively. The changes in rankings are given in Table 7, too.

TABLE 7. WAYS OF CONDUCT TO BE ELIMINATED.

	1981	1993	2003	Change in ranking 1981-93	Change in ranking 1993-03
Misleading advertising	74 %	60 %	51 %	-2	-3
Tax dodging	67 %	63 %	75 %	-	+1
Inaccurate fulfillment of contracts	52 %	42 %	35 %	-1	-3
Neglecting environmental protection	47 %	66 %	65 %	+3	+2
Making use of political connections	37 %	39 %	21 %	-	-5
Industrial spying	34 %	38 %	52 %	-	+3
Giving and receiving personal benefits (such as gifts, entertainment, travels etc.)	33 %	37 %	33 %	-	-
Buying an employee in order to get information	30 %	28 %	28 %	-	-1
Bribing in countries where it is customary	10 %	15 %	29 %	-	+1
Means of limited competition (e.g. by fixing prices, Regulating products or markets)	8 %	35 %	39 %	+2	-
Something else	7 %	9 %	10 %	-	-

The results show that the awareness of environmental problems grew considerably from 1981 to 1993 and has also maintained its position in the 2003 sample ranking already second tax dodging. Other visible changes can be seen in the cases of 'inaccurate fulfillment of contracts' and 'misleading advertising', both being less frequently mentioned than in the previous survey. 'Industrial spying' and 'bribing in countries where it is customary' are more often mentioned in the more recent surveys presumably indicating the globalization trend of economy meaning more international business operations than before.

On the other hand, 'giving and receiving personal benefits' was not mentioned more frequently in the 2003 survey than 22 years earlier. Another big change has taken place in 'making use of political connections'. This change may indicate the professionalisation of management practice. It is much more demanding and full-time effort compared the situation two decades earlier. This differentiation trend has also made politics more or less a full-time job. Finland has also earned the title of a least corrupted country in the latest global corruption reports from the late 1990's on ([www.globalcorruptionreport.org/](http://www.globalcorruptionreport.org/)).

It is clear that the new institutions established after the early 1980's and exercising public control i.e. in advertising, consumer protection. An increasing public interest in the operations of business enterprises and large companies in particular may play an important role. In terms of open-ended answers, a variety of observations occurred. Some 10-15 % of the respondents in each sample mentioned some other practices they would have liked to eliminate such as 'unfair rewarding and golden handshakes' and 'black payments' to children as labor force. Several respondents put their finger on illegal terminations especially as a means to improve the performance of the firm. 'Wild cat strikes', 'wrong information about one's competitors' and 'manipulation of financial data was also referred to several times.

There has been a widely discussed tension for managers in situations, where a conflict between the interest of one's company and one's own personal conviction exists. In the three samples, competitors were mentioned most often as a target group for this kind of contradiction. Still majority of the respondents had experienced this situation seldom or never, but almost one fifth of the respondents said this to have taken place often in the 1981 and 1993 samples and fewer (13 %) in the most recent 2003 sample (Table 8).

This finding is not consistent with some earlier studies. For example, in the Brenner & Molander survey cited earlier the most frequent conflicts had been in relation with superiors and customers, competitors coming as fifth in this HBR list. Once again, there were generally speaking no relationships between the frequency of experienced conflicts and the most background variables (type of industry, age of respondents, size of company) in the Finnish surveys. Those having positive religious attitudes fall into conflicts more frequently between company demands and own personal convictions in the 1981 sample, but the item concerning respondents' religious attitudes was not presented in the 1993 and 2003 surveys any more. A possible simple conclusion from the 1981 survey could be that those with very positive religious attitudes (Lutheran in this case) have taken a different stand toward the

conflicts. They had evidently more demanding personal moral standards than their counterparts and have based on taking a more moral standing in business life and in life in general.

**TABLE 8. CONFLICTS BETWEEN INTERESTS OF ONE'S COMPANY AND ONE'S PERSONAL MORAL CONVICTIONS.**

	often (%)			seldom (%)			never (%)		
	1981	1993	2003	1981	1993	2003	1981	1993	2003
Competitors	19	19	13	54	57	63	27	24	24
Employees (peers, subordinates)	6	7	6	64	59	56	30	34	39
Customers	7	8	4	59	61	58	34	31	38
Suppliers of material and services	7	8	8	56	58	59	37	34	32
Agents and representatives of the company	8	8	5	51	55	55	41	37	40
Superiors	4	5	2	49	55	53	47	39	45
The authorities	5	7	5	26	43	28	69	50	67
Owners	5	4	3	26	25	38	69	71	59
National interests	2	3	1	22	23	26	76	74	74

Table 9 gives an overview about the most influential experienced factors behind unethical decision-making and unethical practices at the company level. For simplicity reasons, a five alternative scale has been reduced by combining 'very much', 'rather much'.

**TABLE 9. THE MOST INFLUENTIAL FACTORS IN UNETHICAL DECISION MAKING AND UNETHICAL PRACTICES IN COMPANIES.**

	much (%)			to some extent(%)			little (%)		
	1981	1993	2003	1981	1993	2003	1981	1993	2003
Behaviour of superiors	60	65	72	20	15	14	20	20	14
The current 'moral climate' of society	46	53	51	44	27	37	10	20	12
The prevailing 'ethical climate' of the industry ('general notions')	46	51	53	39	26	33	15	33	14
Company policy	42	52	58	31	16	25	27	32	27
Behaviour of peers at the same organisational level	30	33	41	48	30	38	22	37	21
Individual financial situation	23	29	29	49	31	43	28	40	28

The most influential perceived factor in all three samples was the behavior of the superior. The role of the superior as a role model for the rest of the organization was highlighted increasingly and systematically from 1981 on. All other factors were considered less important. The difference was statistically significant in relation to all other alternatives (by using answers from the full answer scale) in all three samples. Thus, morality seems to be based more on examples than orders enforcing the old saying "if you want to be ethical, find an ethical boss". This finding is mentioned in several other studies as well (Brytting, 1998; Ford & Richardson, 1994; Lewis, 1989; Lindegren, 2004; Sims, 2003; Soule, 2002).

**How to Improve the Ethical Level of Business Life?**

A mainstream approach to try to improve the ethical level of corporations has been to draw codes of ethics. Their primary task is to communicate that the company and its management consider high moral standards as an essential component in business operations. These codes of conduct have become so common over the past decade that if there is none the general interpretation tends to see it as a signal about these issues not being important for the company.

On the other hand, numerous recent ethical breeches by corporate governors at the highest levels have called into question whether "egoism, cynicism and rampant materialism have given way to another set of values" (Emerson & Conroy, 2004). Emerson and Conroy further claim that each decade seems to have its own set of

scandals with a optimistic notion that cycle of reform and altruism would occur in the near future in the business world.

TABLE 10. WHAT KIND OF MEASURES WOULD YOU IN YOUR OPINION HAVE AN IMPROVING EFFECT ON THE ETHICAL CONDUCT OF THE ECONOMY?

	Having a strong impact (%)			Having some impact (%)			Hardly any impact at all (%)		
	1981	1993	2003	1981	1993	2003	1981	1993	2003
Company-wise ethical principles of operation	49	58	60	40	38	36	11	4	4
Under-graduate management education (universities and colleges)	43	41	42	48	52	52	9	7	6
Post-graduate management education	41	35	39	50	55	53	9	10	8
Bringing matter up for public debate	36	49	52	54	43	42	10	8	5
Industry-wise ethical principles of operation	32	27	33	55	58	58	13	15	8
Legislation	21	21	26	56	60	65	23	19	9
Profession-wise 'code of honor' (e.g. engineers, accountants)	16	17	12	42	46	51	42	37	37
A national 'code of honor' for the management level	11	13	17	48	46	47	41	41	36
Creating popular movements or action groups	9	13	9	36	43	32	55	44	59

Table 10 gives a message that there is more trust in the positive impact of company-wise ethical principles than 22 years earlier. This may also indicate that there was very few examples about company-wise codes of ethics in the early 1980's compared with the situation now. There is a strong evidence about company-based codes of ethics being "more hopeful than helpful". However, this means was perceived stronger than all other ones given in Table 10. This finding may also relate to opportunities to control operations. It can be noted for example that the majority of the respondents in all three samples found legislation having only some impact. As indicated in Table 3, only a few respondents equaled ethical to legal. This figure has a growing trend, however, because the proportion has grown from 1 % to 8 % in 22 years time.

## Discussion and Conclusions

In all, data gathered from three different decades showed more similarities than differences. Changes appeared to be slow, but a clear tendency was a believe that business ethics has become and will become higher over time. A vast majority agreed with the perception that there are unethical practices in business life.

For a majority of respondents "ethical" meant something subjective. This means that moral reasoning and action get their primary content through feeling rather than through knowledge or reasoning. Managers thus nominate themselves to be in control of ethical level in their companies and lives. This can lead in practice to many interpretations about what is wrong or right in each situation. Another outcome is that emotive-subjective standing inevitably brings in relativistic and situational characteristics. Thus, managers tended to be to a certain extent ethical relativists if not representing ethical pluralism.

On the other hand, the homogeneity of the Finnish society has evidently narrowed down the diversity of the various interpretations so far. This emerged in this study also in terms of the relationship between ethical views and used background variables: there were no statistically significant differences between the respondents from various age groups, industry types nor size of the company unlike in some other studies (e.g. Longenecker et al., 1989).

Northern Europe has a long tradition of Kantian duty ethics focusing on "external principles rather than 'internal' principles' (virtues) by emphasizing timeless and universal principles instead of special, concrete and separate issues, which were cut out of philosophy" (Elenius, 2003). A purely rational basis for ethical judgment may invite and encourage minimalistic ethical principles instead of tolerance and respect of other cultures by highlighting applying its imperative regardless of circumstance, personal inclination, desire or purpose. "Duty is the necessity of

acting from respect for the law". In this 'geography of moral', Elenius divides Europe into two blocks, areas of law and areas of virtue with northern protestant states belonging to the previous block.

The rapid globalization of economy will certainly challenge this traditional maintaining of moral ideas. Business ethics has been strongly a national cultural phenomenon, but this will necessarily not last any more in the near future. However, another notion of interest in these surveys was that ethics was considered to be something higher than just legal. The proportion of those respondents who equaled ethical to legal grew considerably from the 1981 sample to the 2003 one.

It is highly evident, however, that the contemporary confluence of escalating economic globalization and ethical pluralism necessarily included in this development will be at the origin of new types of ethical challenges that will confront business world, both in practice and in theory. One of the challenges arising from this megatrend has to do with cultural diversity (González, 2003). It has been said that the success of economic globalization tends towards increasing social and cultural homogeneity. To the extent that cultural diversity is seen as an asset this global trend may contradict the efforts to respect cultural pluralism. Multicultural, pluralistic society could mean society, where ethical consensus may apparently be reduced to a minimum. This may badly threat or even exclude good life.

González (2003) has indicated, however, the ambiguity and the double meaning of the expression "ethical pluralism". She calls it "existential" in the sense that the expression refers to plurality of lifestyles and "epistemological" in the sense that it refers to the variety of moral theories or moral philosophies. She further argues that ethical minimalism, despite its emphasis on tolerance and justice, does not take pluralism seriously into account in present-day society. Ethical norms are necessary, but not sufficient in themselves to encourage either justice or tolerance nor are they sufficient to inspire and encourage good practices and sound regulations. By projecting the idea of globalization for today's pluralistic society means rather bringing together diverse lifestyles within a common political framework. Thus, the question remains if it is possible to expand business while respecting cultural diversity and to what extent is ethical pluralism compatible with the globalization of business?

Business is a practice exerted by moral agents and inserted in moral contexts. Therefore, it is subject not only to economic criteria, but moral criteria as well. As to ethical pluralism, virtue ethics is supposed to offer much more than minimalism, which has the tendency to see the social risks of ethical pluralism and tries to overcome them by speaking of a moral minimum. According to González, this view actually assumes a static view of ethics, forgetting that human beings can also learn and change their views over time, and they often do when they find something better. Furthermore, from epistemological perspective, minimalist ethics has the tendency to present itself as a technical knowledge, forgetting that ethics is primarily not a matter of experts but a human matter allowing and welcoming a serious dialogue about ethical issues instead of a rigid 'politically correct' language.

The new economy is said to be in itself neither good nor bad, but laden with opportunities. These include "improving the standard of living, creating an environment in which sharing, trusting and serving others is easier, furthering transparency and increasing empowerment, with individual dignity as the ultimate beneficiary" (Argandona, 2003). However, there are also possible risks and dangers very visible in business operations such as unnecessary destruction of opportunities, encouraging disloyalty and opportunistic behavior, violating copyright or privacy rights, increased insecurity and uncertainty.

Thus, a continuous dialogue is necessary at various levels to ensure the creation of the moral fundaments in which the authenticity of daily practice is continually debated and tested. Management and employees that dare this responsibility literally are working towards a better company. They are developing the ability to resist the pressure of one-sided managerial decisions. That way, long-term thinking becomes realistic and the continuity of company activities is protected. In this way, a company is able to integrate the common human interest into the expression and implementation of high ethical conduct.

# Why Do People Believe IT- Enabled Privacy Intrusion as Ethical or Unethical

*Nivedita Debnath*

*Indian Institute of Technology Delhi, India.*

*Kanika T Bhal*

*Indian Institute of Technology Delhi, India.*

## Abstract

The benefits of speed, increased availability of data have thrown some practical challenges, to issues of piracy, privacy intrusion, accuracy and security [8]. How the individuals deal with these issues is a function of their ethical logic or framework that is used to address these issues. Violation of privacy in the workplace is one such major ethical issue that has arisen in the context of IT usage. Since the personal norms and cognitive maps are important, we explore the mental frameworks that people use for their perception of ethicality for privacy intrusion by the use of IT. Hence the paper also explores the cognitive logics that people use for their perception. Thus, the paper reports the findings of 12 in depth interviews of executive working in different IT firms was conducted to find out whether people perceive intrusion of privacy as ethical or not, and the logic or personal norms that people use for their perceptions.

## Introduction

Change in material culture like technology is driven by the needs of efficiency, however along with the technological change the social and normative culture too needs to change to make the technology truly effective. The theory of cultural lag postulates that material culture like technology changes very fast however the non-material culture like social norms and values take much longer to change. Information technology too has given us the advantages of speed, time and accessibility at a level which was inconceivable till very recently, however the concomitant social and ethical issues of piracy, intrusion of privacy and accuracy too have become increasingly significant, which need to be addressed both at the level of laws and social norms. With the introduction and use of technology are sought to be resolved through old paradigms, which applied to the older social order.

Kohlberg's model [7] of cognitive development tested over the last 30 years emphasizes the cognitive development or reasoning aspect of moral decision -making. It addresses how the cognitive processes of moral decision-making become more complex with development. The emphasis here is on the cognitive decision-making processes, the reasons an individual uses to justify a moral choice, rather than the decision itself (e.g., the outcome). Kohlberg proposed that people go through stages of moral development, and naturally the stage of moral development will influence his decision-making process. His framework provides three broad *levels* of cognitive moral development; each composed of two *stages*. Moral development involves the individual's passage from stage to stage in an invariant irreversible sequence. The profile of an individual represent a dominant stage the person is in, a stage the person is leaving, and a stage he or she is moving into. Though this process the individual develops a personal philosophy.

Thus, an individual philosophy is likely to influence the decision he/she takes in everyday course of action particularly when faced with a situation of ethical dilemma. Based on the various prevailing theories in the field of ethical decision-making, different researches have identified and used various frameworks (e.g. Utilitarianism, Justice, Kant Imperative, Duty etc.), which can be used to explain and guide individual's ethical decision-making process.

Privacy intrusion is one of the major ethical issues that have arisen in the context of IT usage. As some economists point out, soon we will be required to pay for our privacy. Let us just briefly examine this issue.

## Privacy

Alan Westin [2], defined privacy “as the desire of people to choose freely under what circumstances and to what extent they will expose themselves, their attitude and their behavior to other”, what things can people keep to themselves and not be forced to reveal to others [8]. Privacy is one fundamental need that comes in conflict with the value of transparency and openness. Privacy may be understood as that where others do not have access to oneself or to information about oneself. These are our own private thoughts that are never disclosed to anyone, or at best are shared with loved ones [10]. Privacy is a special kind of independence, which provides autonomy in few personal and spiritual concerns, it provides a reserve against the outside world. Privacy is an inherent point of freedom, it provides the opportunity to freely keep one’s thoughts, feelings and behavior. It is necessary for autonomy of an individual; a person cannot exercise it unless he/she has privacy. Kant would argue that autonomy is one among many other values, but fundamental to what it means to be human, to our value as human beings, autonomy is inconceivable without privacy [5]. Viewed in this light, privacy is fundamental right that needs to be protected.

Two forces threaten our privacy. One is the growth of information technology, with its enhanced capacity for surveillance, communication, computation, storage and retrieval. A second and more insidious threat is the increased value of information in decision-making. Information is increasingly valuable to policy makers; they convert it even if acquiring it invades another’s privacy [8]. Computing and communication technologies enable the collection and exchange of personal information on a scale unprecedented in the history of civilization. Thus there is increased potential for violating the privacy of individuals and groups [9].

IT has changed the public’s perception of privacy. Organizations are faced with completely new policy decisions about which actions can be deemed damaging to individual’s privacy and which are merely inconvenient [1]. Currently, many organizations use the information gathered as a basis for criticism. Companies will begin to realize that it is more motivating for employees to be coached rather than reproached [4].

Monitoring employees by checking their electronic mail messages has been a particularly sensitive issue. Studies have shown that employees have sued employers, claiming that supervisor have invaded their privacy by monitoring their email [13]. Employee reactions to computer aided monitoring suggest a potential for negative employee perceptions of the monitoring activities and use of the data by management. For example, the titles of many articles published on electronic employee monitoring contain negative terms such as “Big Brother” and “Electronic Sweat shops” [3]. One study concludes: ‘ Electronic monitoring may create adverse working conditions such as paced work, lack of involvement, reduced supervisory support, fear of job loss, reutilized work activity and lack of control over tasks” [11].

In many ways, privacy is an elusive concept that is, until a person’s privacy is threatened. Privacy can be identified as an instrumental good (a means to some end) from privacy as an intrinsic good. In 1968, Charles Fried argued that to have relationships based upon love and friendship, privacy must be valued without this necessary right, no solid relationship in society can exist or flourish. Privacy protects us from the prying eyes and ears of governments, corporations and neighbors. Within the walls of privacy, we may experiment with new ways of living that may not be accepted by the majority. Privacy, autonomy and sovereignty it would seem come bundled together [10]. Since technology has provided many opportunities for invading privacy of the workers in the workplace, it is important to assess the breadth and depth of privacy intrusion that can be considered ethical or vice versa.

Though the concepts of privacy intrusion have been issues in the past, they have gained a special significance in the context of use of information technology. The traditional notion of the two cannot fully explain the modern day manifestation of these issues. Till now studies of cognitive frameworks have identified certain frameworks and asked respondents to choose from whose frame works only. Imposing preconceived frameworks on respondents however gave us some mismatched results. Thus the previous work has tried to impose traditional frameworks on new issues in the context of IT. However, what is required is to explore the cognitive processes that go on in the minds of people for making decisions on privacy intrusion related issues. In this paper we first explore whether people perceived privacy intrusion as ethical or not. Since the personal norms and cognitive maps are important, we next explore the personal norms (mental frameworks) that people use for their perception of ethicality. Thus, the paper reports the findings of in depth interviews conducted to find out whether people perceive these various situations as ethical or not, and the logic or personal norms that they use for their perceptions.

## Methodology

For the present work respondents were presented with one situation of privacy intrusion issues. In this situation individual is asked to consider himself/herself as an 'actor' who intrude in the privacy of its employees. After testing the perceived ethicality, respondent were asked for the reasons of their perception of ethicality and the responses were analyzed using grounded theory. Grounded theory is a form of content analysis to find and conceptualize the underlying issues in the data [6]. Grounded theory "is a qualitative method that inductively discovered by careful collection and analysis of qualitative empirical data. This methods does not being with theory, and then seek proof. Instead, it begins with an area of study and allows theory to emerge from that area of study" [14] (p. 23). In grounded theory, analysis involves searching out the concepts behind the actualities by looking for codes, then concepts and finally categories [14]. The data has been collected from 12 executives, through interview from six IT organizations based in North, South and West region of India. Out of 12, 9 respondents were male, and only 3 respondents were female. Mostly the respondents were from the age group of 25-30.

The situation described was coded as follows:

Privacy Intrusion perceived ethicality: **A, 1,2,3...**are the respondents codes, **N** for No and **Y** is for Yes and finally small **a, b, c...** is number of reasons given by particular respondent. Thus A3Ya, means that perceived ethicality for situation of privacy intrusion, for respondent 3 who perceived it as ethical, the first reason.

The codes are then analyzed and those that related to a common theme are grouped together, this higher order commonality is called a *concept*. Concepts are then grouped and regrouped to find yet higher order commonalities called *categories*. It is these concepts and categories that lead to the emergence of a *theory* [14].

In the subsequent sections we report the analysis and results of our study.

## Results

The responses are reported in Table 1

TABLE 1: PERCEIVED ETHICALITY FOR INTRUSION OF PRIVACY

Yes			No		
Id	Codes	Categories	Id	Codes	Categories
A3Ya	Its necessary to keep eye on employees	Keeping eye on employees	A1Na	It will generate a feeling of insecurity	Insecurity feeling
A4Ya	Creates transparency in the system.	Transparent culture	A1Nb	It will create inflexibility	Inflexibility
A4Yb	Will help management in better decision-making.	Decision making	A2Na	It will affect creativity of employees.	Hamper creativity
A4Yc	Helpful in controlling no value added activities.	Controls information	A2Nb	It makes them feel treated badly.	Feel bad
A5Ya	Will reduce time.	Reduce time	A7Na	Trust is in doubt	Trust is needed
A5Yb	Help in checking that employees are not sharing sensitive and confidential matters.	No misuse of information	A8Na	Monitoring employee will hamper their freedom.	Hamper freedom
A6Ya	Transparency increases.	Transparent culture	A8Nb	It will be big bossing on employees.	Big bossing
A6Yb	Monitoring by computers reduces the chances of biases.	Reduce biases	A12Na	Trust and understanding is required	Trust and understanding needed
A6Yc	It is more accurate and consistent	Reduce biases			
A9Ya	Employees are not sharing sensitive information	No misuse of data			
A9Yb	Is helpful to check that is every thing is going ok	No misuse of data			
A10Ya	Reduce biases	Reduce biases			
A10Yb	Employees need to be monitored	Necessary to monitor			
A11Yb	Necessary for organizational security purpose.	Security purpose			
A11Ya	Required by the company to monitor its employees.	Rights of company			

Out of 12 respondents, 7 considered this activity of privacy as an ethical activity, where as 5 considered it as unethical activity. Respondents, who consider this activity as ethical, believe in transparent culture and according to them monitoring employees in work place create that kind of culture. By monitoring management can also keep an eye on its employees and can check whether they are using company resources properly or not. Respondents also believe that it's the "rights" of the organization to monitor its employees, where as on the other hand respondents who don't support this activity say monitoring will bring a feeling of insecurity among the employees and hamper their creativity. They also believe that there should be trust between organization and its employees, and by monitoring the activity of its employees organization is breaking that trust. Thus the dominant frameworks used in this context are transparency, organization rights and organizational efficiency.

## Conclusion

In this paper we tried to look at logics individual uses for considering intrusion of privacy as ethical/ unethical activity. It seems that in the intrusion of privacy situation where the individual is acting as an 'actor' and he him self is intruding the privacy of others in the workplace, in this kind of situation where self-interest is the guiding principle in deciding the ethicality of an issue and not a set of independent standards or values. This could be explained on the basis of changing situation and no clear social norms of right or wrong in the context of IT. The material worlds (IT) changes fast and the non-material world (values and beliefs) take a while to fall in place. In this time of flux, self-interest might govern ethical decision-making. At the individual level it looks like the psychological defense mechanism of neutralization is at work. Individuals, to lessen the impact of norm-violating behaviors upon their self-concept often use the neutralization framework as a technique. This is a rationalization process. The most common perceptual components of neutralization are (1) Denial of responsibility: where individuals might argue that they are not personally accountable for their actions because of circumstances beyond their control. (2) Denial of Injury: where the individuals contend that their action is not important and is an acceptable violation of normative behavior as probably no one suffers. (3) Denial of victim: where individuals condone their action by arguing that the violated party deserved whatever happened, i.e, a form of retributive justices is provoked. (4) Condensing the condemner: where individual points out that that they are not alone in the unethical action and that other are involved in similar disapproved behavior. Individual seems to justify themselves by saying that intrusion of privacy is necessary for organization efficiency, security and safety. No doubt to maintain the safety within the organization its become necessary to monitor the individual working in the organization, but does it gives the right to the management to monitor its employee while they are working. More over the management should not over look the side effect that can be caused due to monitoring. Ottensmoyer and Heroux (p 523) [12] have stated "computer surveillance and related forms of testing and controlling workers raises serious ethical dilemmas for thoughtful managers". One study concluded: "Electronic monitoring may create adverse working conditions such as paced work, lack of involvement reduce support, reduced supervisory support, fear of job loss, reutilized work activity and lack of control over tasks" [11].

Thus it seem in the case of a situation where ones own self acts as a violator of ethical norms the impact is significantly diminished.

# A New Challenge For the Corporate Leaders, Managers, Accountants and Auditors In the Times of “Enron’s Ghosts”

Darina Saxunova

Alexandra Bartkova

Comenius University in Bratislava, Slovak Republic

## Abstract

The objective of this paper is to highlight the recent trends in financial reporting mitigation. It covers the current development in the regulatory environment, speeded up by the recent fraud scandals and focuses on how these changes nowadays affect executives, accountants and auditors on a worldwide level. By reading this paper a reader should be provided with an overview of how economic crime is being addressed in today’s business world. In order to penetrate into this issue, the paper firstly introduces the changes in approaches to fraud that have been evoked during the last decade in the minds of managers, investors, auditors and regulators. The paper stresses the importance of paying attention to fraudulent activities reflected in financial reports of a company.. To foster the appealing currentness of this issue certain statistics of economical crime are included in the appendices.

## Introduction

As defined by International Accounting Standard 1 (IAS 1), “*financial statements are a structured representation of the financial position and financial performance of an entity.*” [16] The objective of financial statements is to provide information about the financial position, financial performance and cash flows of an entity that is useful to a wide range of users in making economic decisions. Financial statements also show the results of management’s stewardship of the resources entrusted to it. This information, along with other information in the notes, assists users of financial statements in predicting the entity’s future cash flows and, in particular, their timing and certainty. If financial statements are audited, the auditor’s opinion enhances the credibility of the financial statements. While the auditor is responsible for forming and expressing an opinion on the financial statements, the responsibility for preparing and presenting the financial statements is that of the entity’s management. The audit of the financial statements does not relieve management of its responsibilities according to the ISA 200. The responsible should be aware of these facts under any circumstances.

In the past, senior executives, shareholders, auditors and regulators alike tended to view fraud and misconduct as anomalies – infrequent failures of internal controls. Companies have not viewed fraud prevention as a primary objective of internal control activities. As a result of the large number of corporate scandals reported in the early 21st century, in spite of it fraud and misconduct have evolved into mainstream risks linked closely to market, credit and legal risks as well as risks to reputation. [23, p.5]

Economic crime, or fraud, is sometimes—and mistakenly—seen as a “victimless” crime, especially in larger companies. However, in the light of the Enron and WorldCom scandals it has become clear that economic crime is like any other crime: it has its perpetrators, and it has its victims. It is not rare at all, that fraud might be committed by managers, supervisors or senior employees with knowledge, access, and responsibility.[30].

Recent cases of corporate failure such as Enron, HIH, Tyco, Vivendi, Royal Ahold and Parmalat have led to the loss of credibility in financial reporting. Financial reporting had been believed to disclose the financial statements of an entity including any other information that the managements decides to disclose along (such as annual report, specific group reporting package or environmental reports and value added statements in compliance with the accepted standards. As a consequence, as the recent International Federation of Accountants (IFAC) publication *Rebuilding Public Confidence in Financial Reporting: An International Perspective* pointed out, the reduced confidence in financial information and corporate disclosure has produced an investor retreat and resulted in an increased cost of capital, which in turn has led into reduction of the economy’s productivity [17] (p.5) Another,

even more recent IFAC study focusing on enterprise governance explored the reasons of strategic failure such as corporate governance failure and fraud (for results of this study see Appendix 1).[18]

Almost all failures are the result of the combined effect of failures in business, failures in governance and failures in reporting.

However, there appears to be a close linkage between business and reporting failure such that many examples of misreporting, particularly when large sums are involved, appear to be part of the management policies that produced the business problem [17] (p. 5).

In today's business environment, fraud is a troublesome matter for all companies, public and private. Therefore the control factors are now rapidly replacing insufficient compliance concerns as the primary drivers of antifraud programs. A number of significant legal, regulatory and standards-setting actions are combining to pressure all players in the financial-reporting process – from directors and senior management to internal and independent auditors – to step up their efforts to combat corporate fraud and misconduct. To a growing extent, regulators and investors are now demanding proactive antifraud programs characterized by a strong focus on the prevention and timely detection of fraud. Today's antifraud environment is characterized by a shift from compliance-driven identification and investigation of incidents to proactive prevention and detection embedded into an organization's internal controls. [23] (p. 4)

#### **What is Fraud, Misconduct or Misstatement?**

For purposes of the Statements on Auditing Standards No. 99 (SAS 99), fraud is defined as an *“intentional act that results in a material misstatement in financial statements that are the subject of an audit”*. Also ISA 240 states that fraud refers to an *“intentional act by one or more individuals among management, those charged with governance, employees, or third parties, involving the use of deception to obtain an unjust or illegal advantage.”* Although fraud is a broad legal concept, for the purposes of ISA 240, the auditor is concerned only with fraud that causes a material misstatement in the financial statements.

Two types of misstatements are relevant to the auditor's consideration of fraud:

1. Misstatements arising from fraudulent financial reporting, and
2. Misstatements arising from misappropriation of assets.

Materiality refers to the extent of a misstatement. Information is material if in the case of not being disclosed could influence the economic decisions of users taken on the information provided by financial statements.

The Auditing Standard 306 (AUS 306) issued by the Australian Accounting Research Foundation states that: *“materiality means, in relation to information, that information which if omitted, misstated or not disclosed has the potential to adversely affect decisions about the allocation of scarce resources made by users of the financial report or the discharge of accountability by the management or governing body of the entity.”* [3] Further, IAS 1 considers material omissions or misstatements of items to be material *“if they could, individually or collectively; influence the economic decisions of users taken on the basis of the financial statements.”* [16]

When the item could be considered material for reporting depends on comparison of a misstated item (which is thought to be material) with such factors as the entity's earnings, total revenue, total assets and equity.

The material misstatement can be originated in two ways: first, by unintentional error; second, by an act of fraud.

The term "error" as defined in International Standard on Auditing No. 240 (ISA 240) refers to an *“unintentional misstatement in financial statements, including the omission of an amount or a disclosure”*, such as the following:

- A mistake in gathering or processing data from which financial statements are prepared.
- An incorrect accounting estimate arising from oversight or misinterpretation of facts.
- A mistake in the application of accounting principles relating to measurement, recognition, classification, presentation or disclosure.

#### **Fraudulent Financial Reporting**

Misstatements arising from fraudulent financial reporting are intentional misstatements or omissions of amounts or disclosures in financial statements designed to deceive financial statement users. Fraudulent financial reporting may be accomplished by the following:

- Manipulation, falsification, or alteration of accounting records or supporting documents from which financial statements are prepared.
- Misrepresentation in or intentional omission from the financial statements of events, transactions, or other significant information.
- Intentional misapplication of accounting principles relating to amounts, classification, manner of presentation, or disclosure. (SAS no. 99)

Fraudulent financial reporting need not be the result of a grand plan or conspiracy. It may be that management representatives rationalize the appropriateness of a material misstatement, for example, as an aggressive rather than indefensible interpretation of complex accounting rules, or as a temporary misstatement of financial statements, including interim statements, expected to be corrected later when operational results improve.

Fraudulent financial reporting often involves management override of controls that otherwise may appear to be operating effectively.

According to ISA 240 fraud can be committed by management overriding controls using such techniques as:

- “Recording fictitious journal entries, particularly close to the end of an accounting period, to manipulate operating results or achieve other objectives;
- Inappropriately adjusting assumptions and changing judgments used to estimate account balances;
- Omitting, advancing or delaying recognition in the financial statements of events and transactions that have occurred during the reporting period;
- Concealing, or not disclosing, facts that could affect the amounts recorded in the financial statements;
- Engaging in complex transactions that are structured to misrepresent the financial position or financial performance of the entity; and
- Altering records and terms related to significant and unusual transactions.”

#### **Misappropriation of Assets**

Misstatements arising from misappropriation of assets (sometimes referred to as theft or defalcation) involve the theft of an entity's assets where the effect of the theft causes the financial statements not to be presented, in all material respects, in conformity with generally accepted accounting principles (GAAP) according to SAS no. 99. Employees in relatively small and immaterial amounts often perpetrate misappropriation of assets. However, it can also involve management who are usually more able to disguise or conceal misappropriations in ways that are difficult to detect (ISA 240).

Misappropriation of assets can be accomplished in various ways, including embezzling receipts, stealing assets, causing an entity to pay for goods or services that have not been received or using an entity's assets for personal use (for example, using the entity's assets as collateral for a personal loan or a loan to a related party). Misappropriation of assets may be accompanied by false or misleading records or documents, possibly created by circumventing controls.

#### **Generic Fraud Schemes**

As the *PricewaterhouseCoopers Global Economic Crime Survey 2003* proved, by far the most common fraud is asset misappropriation, accounting for well over half of all cases [25] (p.7). But fraud is a very general term and in practice, economic crime can take an almost dazzling variety of forms, ranging from corruption and bribery to product piracy, industrial espionage, and financial misrepresentation. In recent years, PricewaterhouseCoopers has identified more than 150 generic fraud schemes, which fall into six basic categories:

1. Fraudulent financial reporting
2. Misappropriation of assets
3. Expenditures and liabilities for an improper purpose
4. Revenue and assets obtained by fraud
5. Costs and expenses avoided by fraud
6. Financial misconduct by senior management [23] (p.20)

Professional auditing standards (SAS 99 or ISA 240) require independent auditors to examine only two of these six areas – fraudulent financial reporting and misappropriation of assets. Senior management and the audit committee, in contrast, are in charge of all six categories.

PricewaterhouseCoopers's list of 150 generic fraud schemes and scenarios that differ drastically by product and service sector and geography. For example, sales and marketing schemes are quite common in the Asian market, whereas procurement fraud is more widespread in Central and South America. On the other hand, the types of schemes affecting a bank will differ from those affecting a manufacturer. While both companies may be obtaining assets in a fraudulent manner, the bank might do so by failing to credit interest or by charging improper fees, whereas the manufacturer may be short-shipping a distributor to obtain assets fraudulently. The typical large multinational company, as a result, faces hundreds of fraud and reputation risks. To develop scheme descriptions for your organization requires a deep knowledge of fraud, the industry or industries in which your organization operates, and the geographies where you conduct business. [23] (p.22)

#### **Environmental Conditions Typical to Fraud**

According to both ISA 204 and SAS 99, three conditions generally are present when fraud occurs. First, management or other employees have an incentive or are under pressure, which provides a reason to commit fraud. Second, circumstances exist - for example the lack of controls, not effective controls, or the ability of management to override controls - that provide an opportunity for a fraud to be perpetrated. Third, those participated are able to rationalize committing a fraudulent act. Some individuals possess an attitude, character, or set of ethical values that do not defend them knowingly and deliberately commit a dishonest act. Under regular conditions otherwise honest individuals can commit fraud in an environment that imposes sufficient pressure on them. The greater the incentive or pressure, the more probably an individual will be able to rationalize thinking over and finally starting committing fraud.

Three factors mentioned form famous fraud triangle of three conditions that indicate incentives/pressures to perpetrate fraud, opportunities to carry out the fraud, or attitudes/rationalizations to justify a fraudulent action. Such events or conditions are referred to in the auditing standards no.99 as "**fraud risk factors**." Fraud risk factors do not necessarily indicate the existence of fraud; however, they often are present in circumstances where fraud exists.

**The 3Cs Model** is another way – very similar to the one defined in ISA 204 and SAS 99 -of how to analyze causes of fraud. Fraudulent financial reporting occurs according to Zabihollah Rezaee\* for many reasons, which he groups into three broad categories - conditions, corporate structure, and choice, or the "3Cs." [27] The 3Cs model helps to explain motivations, opportunities, and rationalizations for the commission of financial reporting fraud.

Conditions are motivations and pressure to get involved in financial statement fraud. Pressures on corporations to meet analysts' earnings forecasts play an important role in the commission of this type of fraud. In several corporate cases, executives deliberately committed illegal actions to mislead users of financial statements - investors and creditors - about their poor or less-than-favorable financial performance.

Corporate Structure of an organization can create an environment that increases the likelihood that fraudulent financial reporting will occur. Given that management usually is the perpetrator of this type of fraud, it is not surprising that most incidences occur in an environment characterized by irresponsible and ineffective corporate governance. Attributes of the corporate governance structure most likely to be associated with financial statement fraud are aggressiveness, arrogance, cohesiveness, loyalty, blind trust, control ineffectiveness, and gamesmanship. Aggressiveness and arrogance can play a part in the organization's attitude and motivations toward being a leader in the field or exceeding analysts' earnings expectations. Cohesiveness, gamesmanship, and loyalty attributes increase the likelihood of cooking the books and subsequent cover-up attempts and decrease the probability of whistleblowing. Blind trust and ineffective controls can cause monitoring mechanisms - such as audit functions and the internal control structure - to be less effective in preventing and detecting fraud.

A Choice of the management is between using ethical business strategies to achieve continuous improvements in both quality and quantity of earnings and engaging in illegitimate earnings management schemes to show earnings stability or growth. Management may choose to engage in financial statement fraud when:

1. its personal wealth is closely associated with the company's performance through profit sharing, stock-based compensation plans, and other bonuses;

2. management is willing to take personal risk - such as risking indictment or civil or criminal penalties - for corporate benefit;
3. opportunities for the commission of financial statement fraud are present;
4. there is a substantial internal and external pressure to either create or maximize shareholder value; and
5. the probability of the fraud being detected is perceived to be very low.

The presence of any one of the 3Cs can signal the possibility of fraud, whereas the combination of two or more factors at any one time increases the likelihood that fraud has occurred. [27].

**Red Flags of Fraud** of Eric Krell in his article “7 Corporate Red Flags”[20] published in August 2002 issue of *Business Finance* magazine, presents seven red flags – hints that can indicate that the company has been a victim of financial fraud or may eventually lead to future fraudulent activity:

1. lax accounting (e.g. using inappropriate way to recognize revenue due to short-term performance pressures that have resulted in more aggressive accounting practices)
2. failure to anticipate cash needs (declining credit quality up to liquidity problems when focus is on P&L forecast while the balance sheet implications are overlooked)
3. supply chain blindness (financial managers should remove the IT blinders by understanding the information technology such as enterprise resource planning (ERP) systems used by their enterprise in order to be able to leverage the value of company’s actual assets and strengthen their forecasting capabilities)
4. perils of dirty data (neglecting data quality in key ERP, customer relationship management (CRM) or supply chain management (SCM) applications, while the IT systems are only as reliable as the data flowing through them)
5. draining the talent pool (human resource management and relating recruitment, staffing, training, compensation programs, benefits packages and retirement plans, which may result in poor allocation of resources or undermine employee moral and loyalty)
6. hazards of weak governance (poor corporate governance creates environment that provides opportunities for fraudulent activities)
7. ignoring the importance of crisis management (crisis can be defined as any event or series of events that negatively impacts financial results; reputation or brand; or key relationships with stakeholders; crisis management must be comprehensive, integrated throughout the organization, and flexible as it is the unexpected crisis that levels the company)

#### **Responsibility for Fraud Prevention and Detection**

The primary responsibility for the prevention and detection of fraud rests according to the professional auditing standards (SAS 99 or ISA 240) with both those charged with governance of the entity and with management. According to ISA 240, it is important that management places a strong emphasis on fraud prevention, which may reduce opportunities for fraud to take place, and fraud deterrence, which could persuade individuals not to commit fraud because of the likelihood of detection and punishment. This involves establishment of a culture of honesty and ethical behavior, based on a strong set of core values, which provides the foundation for employees as to how the entity conducts its business. Creating a culture of honesty and ethical behavior includes setting the proper tone; creating a positive workplace environment; hiring, training and promoting appropriate employees; requiring periodic confirmation by employees of their responsibilities and taking appropriate action in response to actual, suspected or alleged fraud.

Further, it is the responsibility of management to establish a control environment and maintain policies and procedures pertaining to the entity's objective of preparing financial statements that give a true and fair view (or are presented fairly in all material respects) in accordance with the applicable financial reporting framework and managing risks that may give rise to material misstatements in those financial statements.

Last but not least, it is the responsibility of those charged with governance of the entity to ensure, through oversight of management, that the entity establishes and maintains internal control to provide reasonable assurance with regard to reliability of financial reporting, effectiveness and efficiency of operations and compliance with applicable laws and regulations. Active oversight by those charged with governance can help reinforce management's commitment to create a culture of honesty and ethical behavior.

### Cost of Fraud

Collateral cost of fraud as the impact on reputation, business relationships, brand image, and staff morale can be more important than the direct financial loss. These can all be undermined by the occurrence or even the perception of fraud. The reported impact varies depending on the nature of the crime committed.

TABLE 3: THE COLLATERAL COST OF FRAUD

Type of loss resulting from fraud	Type of fraud that affects it the most
Reputation	Financial misinterpretation Corruption and bribery Product piracy
Brand image	Product piracy Industrial espionage
Share price	Financial misinterpretation Money laundering Corruption and bribery
Staff morale	Asset misappropriation Cybercrime Financial misinterpretation Corruption and bribery
Business relations	Financial misinterpretation Corruption and bribery Product piracy Industrial espionage

Economic crime has quickly become a major risk for today's corporations; with costs stretching far beyond the balance sheet and income statement. In fact, *PricewaterhouseCoopers Global Economic Crime Survey 2003* discovered that over one-third of the responding companies had been the victim of economic crime. What's more, almost three quarters of victims recovered less than 20% of their losses. More disturbing, perhaps, a significant number of organizations that suffered could not even provide an accurate estimate of their losses [30] (for results of this survey see Appendix 2).

A 2004 CEO survey conducted by PricewaterhouseCoopers in association with the World Economic Forum reflects just how seriously fraud and reputation risk is perceived by executive management. Of the 1,400 CEOs taking part in that study, 35% identified reputation risk as either "one of the biggest threats" (10%) or "a significant threat" (25%) to their business growth prospects. And as indicated by the spate of major frauds in recent years, a single fraud-related failure can result in a multibillion-dollar loss. In fact, a 2002 study of 663 fraud cases by the Association of Certified Fraud Examiners (ACFE) suggests that fraud can cost roughly 6% of a company's annual revenues. That figure, when applied to the U.S. Gross Domestic Product, translates into a fraud-related loss in the neighborhood of \$600 billion for U.S. - based companies in 2002 – about \$4,500 per employee.[23] (p.5)

Even though asset misappropriation is the most widely reported crime in the *PricewaterhouseCoopers Global Economic Crime Survey 2003*, the KPMG LLP survey (also performed in year 2003) clearly identifies the financial reporting swindles as being far most costly. Although only 7% of KPMG respondents said their organization had uncovered financial reporting fraud in the prior twelve months to the survey, the estimated cost of this type of fraud averaged more than \$250 million [8].

The damage inflicted by fraud goes far beyond direct monetary loss, however. Intangible costs of fraud tend to be even more severe than the direct financial loss. Collateral losses from fraud include intangible assets including business relationships, staff morale, reputation and branding, which are critical to any business. These can all be undermined by the occurrence or even the perception of fraud. Incidence of fraud in an organization invariably raises questions in employee's minds about its leadership and governance, its ethics, or as a secure environment to work. Repeated exposure to such issues can undermine years of carefully built up staff loyalty. A failure to tackle – or at least manage the risk of – fraud effectively can store up long-term operational problems for any enterprise [25] (p.10).

### **Current Global Fraud Mitigation Initiatives**

Over the past two and a half years the stream of news about Enron, Global Crossing, WorldCom, Adelphia and other high-visibility fraud cases has resulted in a tremendous loss of market capitalization.[2] (p.57). Recent corporate collapses have seriously undermined confidence in the capital markets as well as the public's trust in corporations, investment analysts, bankers, lawyers and accountants - both as preparers and as auditors of financial statements. There is now a clear need to restore confidence in capital markets and elsewhere by enhancing corporate governance in order to provide financial information of the highest quality. [10] (p.7).

Efforts to improve standards of corporate governance have been underway for many years at both national and international level. However, there has been a notable upsurge in activity since the collapse of Enron. What is of particular note is increasing international convergence. Many countries are adopting the "comply or explain" approach. This requires companies to comply with an evolving set of best practice principles rather than rule-based, inflexible legislation - or explain with reasons why they have not complied. There are, however, variations in how these provisions are implemented in different countries. The one notable exception to this principles-based approach is according to the IFAC the U.S. with the Sarbanes-Oxley Act [18] (p. 49).

A key challenge is the achievement of high minimum standards of corporate governance worldwide. The IFAC considers in its synopsis of international corporate governance developments (published as an appendix to the report on enterprise governance) the *OECD Principles of Corporate Governance* to be a welcome statement of intent in this regard. However, the authors of the IFAC report conclude that there is some way to go before these are implemented with equal rigor globally [18] (p.49).

### **The Sarbanes-Oxley Act**

To stem the tide of fraud scandals and restore confidence in the capital markets, the U.S. Congress passed the Sarbanes-Oxley Act of 2002, which clearly delineates the roles of senior management, boards of directors, audit committees and outside auditors. [2] (p.57) The act significantly focuses on the role of external auditors and their independence and relationship with members of the audit committee. It aims to strengthen the relationship between external auditors and the non-executive directors on the audit committee and to improve the integrity of company management and financial reporting [10] (p.17) Although it's not possible to detect every instance of fraud, now all parties responsible for financial reporting and internal control must exercise greater vigilance [2] (p.57).

The Public Company Accounting Reform and Investor Protection Act (Sarbanes-Oxley Act) is the most significant piece of legislation for the U.S. accounting profession since 1934 when Securities Exchange Act was adopted [1].

However, due to the globalization effects, this act concerns not only U.S. resident companies but affects the subsidiaries of companies listed in the U.S. Stock Exchange all over the world. In addition, the act also applies to foreign companies listed in the U.S. [18] (p.51). The main area of current or immediate conflict arises from this extraterritorial impact of the Sarbanes-Oxley Act. Issues arising from the need for a company to comply with the new U.S. governance regime, in addition to that in their home country, are a potential source of conflict and it is too early to know whether this will be serious or just aggravating and costly [17] (p.22). This continues to be the subject of much controversy although the Securities and Exchange Commission (SEC) has now relaxed some of the rules such as the audit committee requirements for foreign companies [18] (p.51).

Section 404 *Management Assessment of Internal Controls* of the Sarbanes-Oxley Act requires most public companies (i.e., accelerated filers that meet certain market capitalization requirements) to report annually on the company's internal control over financial reporting for fiscal years ended on or after November 15, 2004. The majority of the remaining public companies, including foreign private issuers, will be required to comply with these requirements for fiscal years ended on or after July 15, 2005 [24]. Section 404 also requires management to obtain a report from its external auditor attesting to management's assertion about the effectiveness of the company's internal control [26]. Both management's and auditors' assessment must make it into the annual report for 2004 [28].

#### **Public Company Accounting Oversight Board (PCAOB)**

The Sarbanes-Oxley Act created the Public Company Accounting Oversight Board (PCAOB), to be appointed and

overseen by the SEC. This five-member board will:

- a. Register auditors of public companies.
- b. Inspect and discipline auditors.
- c. Enforce compliance with the Securities Exchange Act of 1934.
- d. Establish standards relating to audits. [1]

In short, the PCAOB will oversee and investigate the audits and auditors of public companies, and sanction both firms and individuals for violations of laws, regulations and rules .

The PCAOB will issue standards or adopt standards set by other groups or organizations, for audit firm quality controls for the audits of public companies. These standards include: auditing and related attestation, quality control, ethics, independence and "*other standards necessary to protect the public interest.*" The PCAOB has the authority to set and enforce audit and quality control standards for public company audits. [17] (p.22)

Accounting firms that audit public companies must register with the PCAOB. The PCAOB is empowered to regularly inspect registered accounting firms' operations and will investigate potential violations of securities laws, standards, competency and conduct. Sanctions may be imposed for non-cooperation, violations, or failure to supervise a partner or employee in a registered accounting firm.

Foreign accounting firms that "*prepare or furnish*" an audit report involving U.S. registrants will be subject to the authority of the PCAOB. Additionally, if a registered U.S. accounting firm relies on the opinion of a foreign accounting firm, the foreign firm's audit workpapers must be supplied upon request [12]. Therefore, each national practice of an accounting firm, that either audits a company which is an SEC registrant or audits a significant subsidiary of an SEC registrant, is subject to the PCAOB's authority, including its monitoring process [17] (p.22).

The situation regarding the registration and oversight of foreign accounting firms by the U.S. PCAOB may get more serious in a close future. The central issue for the foreign firms is that they do not believe it appropriate or necessary that they should be subject to two monitoring regimes if the regime in their home country is one that complies with international benchmarks [17] (p.22).

This view is supported by the European Commission, which has suggested that there should be a moratorium to discuss and resolve registration issues. The European Commission also agrees with the firms' view that the U.S. approach involves major conflicts of law relating to data protection and professional client confidentiality. The Commission considers that the EU regulatory approach to the protection of investors and other stakeholders is equivalent to the U.S. rules and therefore should provide the basis for mutual recognition and European exemption from the U.S. rules. [17] (p. 22).

The U.S. has not accepted this approach and, as a result, the European Commission has indicated that the EU will have to consider parallel solutions involving the registration of U.S. audit firms in the EU [17] (p.22).

In the conclusion to its discussion on international perspective related to rebuilding of public confidence in financial reporting the IFAC stresses that neither the U.S. approach nor the European Commission's response will contribute to creating an efficient, cost-effective global capital market. Further, the IFAC concludes that whatever the outcome of the discussions on the international reach of the PCAOB will be, the fact remains that its existence provides support for those who argue that there needs to be a system of mutual recognition of regulatory regimes based on compliance with the agreed international benchmarks. And this should, according to IFAC, provide the necessary level of confidence in financial reporting required internationally, without the burden of duplication of regulation and monitoring [17] (p.22).

## **The EU Action Plan**

The creation of the single market and the breaking down of barriers not only aids legitimate business, but may also provide increased opportunities for money laundering and financial crime. European legislation has been adopted to protect the financial system and other vulnerable professions and activities from being misused for fraudulent purposes [14]. The European Corporate Governance Institute (ECGI) states that the European regulatory framework for company law and corporate governance needs to be modernized for the following reasons: the growing trend for European companies to operate cross-border in the internal market, the continuing integration of European capital

markets, the rapid development of new information and communication technologies, the recent enlargement of the EU to 10 new member states, and the damaging impact of recent financial scandals [9]. The collapse of Enron in the US and European corporate scandals (Dutch retailer Ahold and Italian agri-food giant Parmalat) have forced issues of corporate governance and financial reporting onto the EU policy agenda.

Rules and norms of corporate governance are important elements of the regulatory framework for successful market economies. Although corporate governance can be defined in a variety of ways, the European Commission communications generally refer to the mechanisms by which a business enterprise, organized in a limited liability corporate form, is directed and controlled. It usually concerns mechanisms by which corporate managers are held accountable for corporate conduct and performance [13].

Over the past decade, interest in the role corporate governance plays in economies has increased in the EU and member states, driven by factors such as the introduction of the euro, the freer flow of capital, the growth and diffusion of shareholding, the increased merger activity among large corporations and the competitive pressures of globalization. In the past, the EU policy action has been mainly to coordinate the safeguards required by member states of companies and firms with a view to making such safeguards equivalent throughout the Community. Several Company Law Directives have resulted [13].

According to the FEE discussion paper, Europe is continuing to enhance corporate governance practice through the development of corporate governance codes and “soft law” linked to the “comply or explain” principle. This approach uses disclosure, rather than legislation, as a regulatory tool [10].

In September 2001, the European Commission appointed a High Level Group of Company Law Experts, chaired by Jaap Winter (the Winter Group) [18] (p.51). At the Barcelona European Council of March 2002, it was declared that responsible corporate governance is the precondition for economic efficiency, and measures have been asked for in order to guarantee the transparency of corporate governance and corporate accounts and to better protect the shareholders and others concerned. The Commission and the ECOFIN Council in Oviedo in April 2002 agreed to extend the mandate of the Winter Group to review a number of specific issues related to corporate governance and auditing: the role of non-executive and supervisory directors, management remuneration, the responsibility of management for financial statements, and auditing practices [13]. The Winter Group presented its Final Report “A Modern Regulatory Framework for Company Law in Europe” (referred to as the Winter Group Report) in November 2002. The Winter Group Report focuses on corporate governance in the EU and the modernization of European Company Law [18].

In response to this report, the European Commission issued an Action Plan in May 2003 (“Modernising Company Law and Enhancing Corporate Governance in the European Union – A Plan to Move Forward”). Simultaneously, the Commission’s Communication “Reinforcing the Statutory Audit in the EU” was also issued in May 2003. It addresses corporate governance in relation to statutory audit, audit committees and internal control, [10] (p.7) including ten priorities for improving and harmonizing the quality of statutory audit throughout the EU, to ensure that investors and other interested parties can rely fully on the accuracy of audited accounts and to prevent conflicts of interest [9].

In its Action Plan the European Commission has concluded that there was no need for a European Corporate Governance Code as this would simply be an additional layer between international principles and national codes [18] (p.51). The Commission, however, added that “*a self-regulatory market approach, based solely on non-binding recommendations, is not sufficient to guarantee sound corporate governance...*” and that “*... the European Union should adopt a common approach covering a few essential rules and should ensure adequate coordination of national corporate governance codes.*” [9].

The main objectives of the Action Plan are:

- to strengthen shareholders' rights and protection for employees, creditors and the other parties with which companies deal, while adapting company law and corporate governance rules appropriately for different categories of company;
- to foster the efficiency and competitiveness of business, with special attention to some specific cross-border issues. [9]

The following initiatives have been identified in the Action Plan as the most urgent:

- Recommendation aimed at promoting the role of non-executive or supervisory directors.
- Recommendation on directors' remuneration, giving shareholders more information and influence [18] (p.51).

In its Action Plan the European Commission proposes a common approach covering a few essential rules, including:

- the requirement for listed companies to publish an Annual Corporate Governance Statement in their Annual Reports;
- the establishment of minimum standards on the creation, composition and role of the nomination, remuneration, and audit committees;
- the requirement for greater transparency and shareholder influence in relation to executive remuneration;
- the creation of a European Corporate Governance Forum (ECGF) to foster co-ordination and convergence of the development and enforcement of national corporate governance codes [18] (p.51).

Other corporate governance initiatives proposed in the Action Plan cover: achieving better information on the role played by institutional investors in corporate governance; giving further effect to the principle of proportionality between capital and control; offering to listed companies the choice between the one-tier and two-tier board structures; and enhancing directors' responsibilities for financial and key non-financial statements [9].

The report on the comments to the Commission Action Plan ("Synthesis of the responses to the Communication of the Commission to the Council and the European Parliament") dated November 2003 resulted among other findings in that: *"Widespread support was expressed in favor of the Commission initiative to modernize company law and enhance corporate governance. The vast majority of respondents considered this as an essential step to restore confidence in capital markets and the EU economy. Some respondents highlighted the difficulty to comment on individual measures proposed in the Action Plan given the general wording of the Communication. Some also highlighted the need for further clarification of a significant amount of detail and terminology used in the Plan."* [29].

Since the publication of the Action Plan in May 2003, a number of initiatives have been undertaken. In October 2004, the Commission adopted two Recommendations on independent directors (IP/04/1182 and IP/04/1183) as well as a proposal for the simplification of the formation, maintenance and alteration of companies' capital (IP/04/1334). A political agreement was reached in the Council on the 10th Company Law Directive on cross-border mergers in November 2004 (IP/04/1405) [7].

Other important initiatives are on their way, such as a proposal for a 14th Company Law Directive on the cross-border transfer of the registered office and a proposal for a Directive on shareholders' rights, for which a preparatory consultation was published in September 2004 (IP/04/1107). The Commission also published on January 7, 2005 a call for applications from suitably qualified individuals wishing to participate in an Advisory Committee which will provide detailed technical expertise to the Commission for the preparation of legislative and implementing measures on corporate governance and company law [7].

In conclusion, developments in the EU are intended to introduce IFRSs and ISAs, the international benchmarks for accounting and auditing standards, at least for listed companies in 2005. The success of this - and therefore the extent to which this move will meet international needs - is dependent upon how effectively and how quickly the associated regulatory and compliance regimes can be put in place. According to the IFAC, this will be a major challenge, as there are currently important differences between countries and most have significant gaps as compared with the benchmark requirements [17] (p.21).

## **The Revised OECD Principles of Corporate Governance**

The *OECD Principles of Corporate Governance* were published in 1999 and are a widely-recognized reference point on the various aspects of corporate governance. These include the rights and treatment of shareholders, the role of stakeholders, disclosure and transparency and the role and responsibilities of the board [18] (p.52). The OECD Financial Stability Forum in its "Principles of Corporate Governance" has designated the principles as one of the 12 key standards for sound financial systems.

In its Preamble the 2004 revised OECD Principles of Corporate Governance state that they are “intended to assist OECD and non-OECD governments in their efforts to evaluate and improve the legal, institutional and regulatory framework for corporate governance in their countries, and to provide guidance and suggestions for stock exchanges, investors, corporations, and other parties that have a role in the process of developing good corporate governance. The Principles focus on publicly traded companies, both financial and non-financial. However, to the extent they are deemed applicable, they might also be a useful tool to improve corporate governance in non-traded companies, for example, privately held and state-owned enterprises.”

According to the FEE discussion paper, the key additions to the OECD principles revised in 2004 include the following:

- the importance of ensuring an effective corporate governance framework;
- an increased role for shareholders;
- protection for minority shareholders;
- protection for whistleblowers [18] (p.52).

The OECD principles are non-binding and do not aim at detailed prescriptions for national legislation. Their purpose is to serve as a reference point to policy makers in examination and development the legal and regulatory frameworks for corporate governance that reflect their own economic, social, legal and cultural circumstances, and by market participants as they develop their own practices.

## **Slovakia in the Light of the Global Convergence for Fraud Elimination**

Slovakia faces global challenge of fraud mitigation and corporate governance initiatives the same way as any other market-based economy in the world. The international antifraud trends such as the European “comply or explain” principle and the EU Action Plan, the OECD Principles of Corporate Governance or the U.S. Sarbanes-Oxley Act are as appealing to and affecting the Slovak business environment as are to the rest of the world.

The Slovak Act on Auditors No. 466/2002 Coll. states that “Auditor is obliged to adhere to audit standards, orders issued by the Slovak Chamber of Auditors (SKAu) and the code of ethics for professional accountants.” Further on, the act rules that the Slovak Chamber of Auditors (SKAu) “issues national audit standards that are in compliance with the international audit standards.” The general assembly of SKAu decided on October 30, 2003 that the national audit standards would be International Standards on Auditing (ISA). The SKAu Directive No. 5/2004/audit rules that all audits of financial statements for the period ending on December 31, 2004, and later on, will be for the first time performed in accordance with ISA. According to this SKAu directive, the application of ISA in audit relates to all financial statements regardless of the accounting standards and legislation, based on which they were prepared [15].

The Sarbanes-Oxley Act affects all executives, boards and internal auditors of the Slovak subsidiaries or associated companies of SEC registrants (such as is US Steel or IBM), while the financial statements of these companies are subject to consolidation with their mother company resident in the U.S.

The Slovak accounting firms that prepare an audit report involving U.S. registrants will be subject to the authority of the PCAOB. Additionally, if a registered U.S. accounting firm relies on the opinion of a Slovak accounting firm, the Slovak firm's audit workpapers must be supplied upon request to the PCAOB [12].

The EU Company Law Directives, the European Commission Recommendations and other initiatives including the Action Plan affect Slovakia as any other member of the European Union responsible for harmonization of its national legislation with the EU standards.

The ISA 240 on The Auditor's Responsibility to Consider Fraud in an Audit of Financial Statements and other ISAs have begun to affect all Slovak auditors as they took over the engagements for the audits of financial statements for the period ending on December 31, 2004, and later on.

## **Implications of the Current Fraud Mitigation Developments**

Although the accounting scandals that gave rise to the Sarbanes-Oxley Act and the particular remedies and

punishments it prescribes are in many ways uniquely American, foreign issuers are subject to many of the legislation's provisions apart from their nation's norms for governance and disclosure have to be followed as well.. Protests from governments and companies around the world don't want to be heard in Washington. An estimated 1,350 foreign firms now fall under the new law, including the 468 non-U.S. companies listed on the New York Stock Exchange and valued at \$5 trillion [11].

Even though – as mentioned above - the legislative impact is direct only for the companies (and their auditors) that fall under the power of the Sarbanes-Oxley Act, the rest of the world has learnt its lesson from the recent fraud scandals as well. Although other countries besides the U.S. have not adopted any of such strong binding measures, an overall tendency leading to precise monitoring of internal controls, management's active involvement in fraud prevention and establishment of effective control environment can be noted in all public or globally operating and also in many larger, nationally operating companies. There is no doubt that this tendency is a result of the control and prevention-oriented atmosphere that has overwhelmed today's business world.

The overall changing perspective towards fraud prevention resulted from the ruined confidence in financial reporting and was emphasized by the introduction of the Sarbanes-Oxley Act and the launch of the Winter Group Report, thanks to which the effective internal controls are nowadays by many (if not all) viewed as the best-practice benchmark. In this light, also the organizations that are not under the direct effect of the U.S. legislation and the PCAOB have decided to implement mechanisms inspired by and/or similar to those defined and prescribed in the Sarbanes-Oxley Act. Meanwhile, there is still some road to go before the common benchmarks for national codes (soft law) of corporate governance are set at European level. Therefore when analyzing the implications of the current fraud mitigation developments, it is reasonable to concentrate on those that have resulted more or less directly from the adoption of the Sarbanes-Oxley Act.

Segregation of Duties under the Sarbanes-Oxley Act. As part of the post-Enron fallout, a series of legislative and regulatory actions have combined to clarify the antifraud roles and responsibilities of principal corporate players [23] (p.9). As a result, both the complex task of fraud mitigation and the U.S. law require segmentation of duties to take place in this fight.

Confusion surrounding the roles of management, the board of directors and the independent auditor in combating fraud relate according to PricewaterhouseCoopers directly to the diverse nature of fraud, which can be segmented into six distinct categories:

1. Fraudulent financial reporting, e.g., fraud arising from improper revenue recognition, overstatement of assets or understatement of liabilities.
2. Misappropriation of assets, e.g., embezzlement, payroll fraud, external theft, procurement fraud, counterfeiting or product diversion.
3. Improper expenditures or liabilities, e.g., commercial and public bribery.
4. Fraudulent acquisition of revenues or assets, e.g., overbilling or product substitution against third parties, employer fraud against employees.
5. Fraudulent avoidance of expenses, e.g., tax fraud, booking revenue offshore to avoid taxes.

Financial misconduct by senior management – includes misconduct of any magnitude as required by PCAOB Auditing Standard No. 2.

Professional auditing standards require independent auditors to examine only two of these six areas – fraudulent financial reporting and misappropriation of assets – and to do so only to the extent that the occurrence could lead to a material misstatement. Senior management and the audit committee, in contrast, are responsible for all six categories [23] (p.20).

#### **Management Implications**

In the past most financial managers did not concern themselves with fraud. In some company cultures, fraud was and is still such a taboo subject that controllers fear that if they even mentioned the word fraud to their employees it might create the perception that the company already has been victimized [21] (p.28).

Nowadays top management responsibly plays an antifraud role, members of the audit committee supervise actively antifraud attempts, and internal audit is in charge of defending the company against the threat of fraud by risk-monitoring as well as by preventing and detecting fraud [23] (p.7).

Management is responsible for projecting, implementing and executing organization's antifraud programs and controls. Management must assess fraud risk at the company-wide, business-unit and significant-account levels as well as attest to the quality of the company's antifraud controls [23] (p.10).

The board of directors and, in particular, the audit committee, should actively oversee the internal controls over financial reporting conducted by management as well as the process by which management satisfies itself that these controls are effective [23] (p.9).

Internal audit is uniquely juxtaposed between the audit committee and senior management, having either a direct or dotted-line relationship to both groups. Fraud in many circles is the proverbial hot potato – too blistering to handle. Senior management and the audit committee are likely to toss much of the operational responsibility for fraud monitoring to internal audit. High priority is being placed on the need for internal audit risk assessments and fraud audits, demands that will pressure internal audit to adjust its skill sets accordingly [23] (p.7).

Independent auditors have two interrelated roles. In their traditional role as auditors of financial statements, independent auditors must plan and perform audits to obtain reasonable assurance that financial statements are free of material misstatements due to fraud or error. And, in their new role as auditors of internal controls over financial reporting, independent auditors must evaluate antifraud programs and controls, a process that includes an annual examination of the effectiveness of their clients' internal audit functions [23] (p.10).

#### **Internal Control and Management Responsibility**

Internal control is a "process" established, operated and monitored by the board and management of a company to provide reasonable assurance regarding the achievement of the company's objectives [10] (p.23).

Management is responsible for the effectiveness of the company's internal control over financial reporting. This responsibility encompasses assessing the effectiveness of internal control as of the end of the fiscal year, using suitable criteria such as the COSO framework, and documenting and reporting on the assessment [26] (p.1).

Critical points relating to management's assessment under Section 404 include the following:

- documenting the design of controls related to all relevant assertions for all significant financial statement accounts and disclosures,
- testing controls related to relevant assertions for all significant financial statement accounts and disclosures and should include all components of internal control (e.g., under the COSO framework: control environment, risk assessment, control activities, information and communication, and monitoring).
- performing procedures to develop sufficient evidence and maintain documentation to support its assessment of the effectiveness of the company's internal control [26] (p.1).

Management cannot delegate its responsibility to assess the company's internal control to the external auditor or any other third party. Management may use internal auditors, other company personnel and third parties to assist in its assessment. The results of tests of controls that the external auditor performs may not be used as a basis for management's assertion about the effectiveness of internal control. The assessment of internal control is itself part of the company's internal control. It represents an important part of the company's monitoring of controls. Management is precluded from determining that the company's internal control is effective if one or more material weaknesses are identified. Management's Section 404 report must disclose any material weaknesses [26] (p.1). In conclusion, companies under the Sarbanes-Oxley Act are required to file, as part of the company's annual report, the attestation report from the external auditors [10] (p.39).

Whilst accepting that COSO is a recognized framework, the SEC has also recognized that other frameworks exist outside the U.S. that satisfy the intent of Sarbanes-Oxley without diminishing the benefits to investors. The SEC states that the Turnbull Report and CoCo are examples of suitable frameworks that satisfy their criteria. However, the SEC says that the board of a foreign registrant company that relies on such a framework used in its home country is nevertheless under an obligation to state affirmatively whether the company's internal controls (presumably internal control for financial reporting) are, or are not, effective [10] (p.39).

The Sarbanes-Oxley Act also introduces in Section 302 a new concept of "disclosure controls and procedures". These, which are to be evaluated for effectiveness and signed off by the CEO and CFO on a quarterly basis, cover the disclosure of information required under the Exchange Act reports (i.e. information filed with the SEC). SEC registered companies are thus introducing "disclosure committees" that are supported within the company by the necessary resources for reporting mechanisms [10] (p.40).

**Winter Group Report .**On the other hand, the Winter Group Report does not specifically refer to systems of internal control or disclosure controls but refers to the risk management system. According to the Winter Group Report, the proposed annual corporate governance statement should include information on “*the system of risk management applied by the company, describing the core strategy and activities of the company and the particular risks thereto. Where such a system does not exist, this must be disclosed.*” This recommendation is taken over by the Commission in that it requires disclosure by listed companies in the annual corporate governance statement of “the existence and nature of a risk management system” [10] (p.40).

Whilst the Winter Group refers to the risk management system, Sarbanes-Oxley only considers internal control in relation to external financial reporting and the controls over information filed with the SEC. As illustrated in figure 2 on the next page, the Sarbanes-Oxley definition of internal control essentially represents a component of disclosure control and that disclosure control is a (relatively) small component of internal control as previously understood in COSO, CoCo and Turnbull [10] (p.41).

Note: SOA is abbreviation of the Sarbanes-Oxley Act in the Fig.2:Internal Control [10] (p.41).

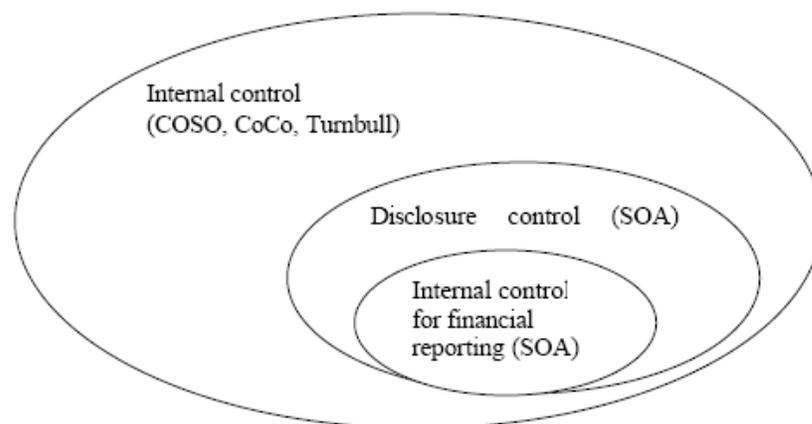

FIG. 2: INTERNAL CONTROL

The Sarbanes-Oxley definition is not linked to obtaining benefits to the business from a review of the wider aspects of internal control and the related processes for risk management. However, some EU member states have gone beyond reporting on internal control for financial reporting purposes as required by Section 404 of Sarbanes-Oxley. For example, boards of UK listed companies are required to disclose in their annual reports information on the wider aspects of internal control, including their risk assessment procedures, disclose the processes that they have adopted to review the effectiveness of internal control, and state that the work that the board has undertaken is in accordance with the guidance in the Turnbull Report.

## Auditors' Implications

### Internal Auditors' Implications

At first blush, the actions of the PCAOB would seem irrelevant to the internal audit function, as it is beyond the jurisdiction of the PCAOB. However, this is not the case. The PCAOB's Auditing Standard No. 2 requires independent auditors to evaluate and test the design and operating effectiveness of programs and controls intended to mitigate the risks of fraud. This evaluation must assess the “*adequacy of the internal audit activity and whether the internal audit function reports directly to the audit committee, as well as the extent of the audit committee's involvement and interaction with internal audit...*” [23] (p4). Therefore, of all the players in the financial-reporting

supply chain, internal audit is quite possibly the group most affected by the new emphasis on fraud prevention and detection.

Internal auditors are viewed as a first line of defense against fraud because of their knowledge and understanding of internal control structure, the business environment, and corporate governance. An example of how expectations of internal audit are shifting in response to the new environment is in prevention and detection of fraudulent financial reporting.

In the past, many internal audit groups have focused their resources and efforts primarily on the detection of frauds involving the misappropriation of assets. Assessment of risks associated with fraudulent financial reporting and the detection of financial statement fraud have often been left to be addressed by the independent auditor.

In the new environment, management can no longer rely on the work of the independent auditor as a basis for certifying the effectiveness of internal controls over financial reporting. As a result, many internal audit groups will need to strengthen skills necessary to assess the risks of financial statement fraud. The skills necessary will include an understanding of financial reporting standards, skill sets that may have atrophied given the historical focus on the misappropriation of assets. Moreover, the internal audit must be aware of potential schemes and scenarios affecting the industries and markets in which the organization does business, and it must be conversant with and able to identify the indicia of these schemes. What's more, internal audit must have a solid understanding of measures intended to prevent and detect fraud and be able to evaluate and test antifraud control effectiveness. In addition, internal audit must be knowledgeable about fraud auditing and forensic investigation techniques.

For internal audit, this environment poses both opportunities and challenges. Corporate auditors who move quickly to develop antifraud action plans will find ample ways to provide added value to their organizations. Conversely, internal audit directors who fail to address rising stakeholder expectations jeopardize their relevance and imperil their job security [23] (p.8).

Internal auditors can use the 3Cs model to predict and uncover financial statement fraud by:

1. identifying symptoms - conditions - that indicate a fraud may have been perpetrated;
2. searching for opportunities - corporate structure - that may allow fraud to occur; and
3. evaluating the need for further investigation, notifying the appropriate individuals within the company about the possibility of financial statement fraud, and taking the actions necessary to reduce or minimize its likelihood of occurrence - choice.

Because financial statement fraud is typically perpetrated by management - or at least with the knowledge and participation of top executives - internal auditors should pay close attention to identifying "business red flags," or those conditions and circumstances that arise from the perceived need to overcome financial difficulties, such as the inability to meet analysts' forecasts, increased competition, and cash flow shortages. Once financial statement fraud occurs, corrective actions include eliminating the fraud and its adverse impact on the quality, integrity, and reliability of financial statements and preventing further occurrences by eliminating related motives and opportunities to engage in fraud [27].

The role of internal audit will vary – depending on organizational needs, internal audit structure and available competencies. However, this role will likely include:

- Supporting management to construct an auditable antifraud process and program.
- Facilitating fraud and reputation-risk assessments at the corporate, management-unit and business-process levels.
- Linking (and documenting) antifraud control activities to identified fraud risks.
- Evaluating and testing the design and operating effectiveness of antifraud programs and controls.
- Fraud auditing.
- Leading or supporting investigations into alleged or suspected fraud or other misconduct.
- Leading or supporting remediation efforts.
- Reporting to the audit committee about the organization's efforts to prevent, detect, investigate and remediate fraud [23]

When incidents of fraud do occur, the audit committee, the CEO and CFO all stand in the direct line of fire from both prosecutors and regulators seeking to determine why a given fraud was neither prevented nor detected

earlier. While internal audit may not stand directly in the line of fire, it will share directly in the consequences of failed antifraud programs. Furthermore, internal audit is likely to take the lead in investigation of reported incidents [23] (p.10).

For internal audit groups, the fight against fraud has a silver lining. By reducing fraud, a company can cut costs and improve profitability, and to the extent that internal audit can strengthen an antifraud effort, it will create significant organizational value. According to industry research, antifraud programs can more than pay for themselves. A major study of the insurance industry, for example, demonstrated that for every dollar invested in antifraud programs, the return on investment was nearly \$7 [19]. Likewise, a separate benchmarking analysis and research by the General Counsel Roundtable [6] found that each additional dollar of compliance spending saves organizations, on average, \$5.21 in heightened avoidance of legal liabilities, harm to the organization's reputation and lost productivity. That's more than a five-to-one payback per dollar of compliance investment [23] (p.9).

#### **External Auditor's Implications**

Auditors are required to conduct a "brainstorming" session in every audit by SAS no.99. In any case this process comprises engagement of the all-key audit team members in a dialogue. This dialogue may be interfered or become ineffective if one or two participants are too dominant, then the creative work of the team might not lead to dialogue that will assist to identify any fraud risks. Those who dominate the dialogue will stop other's presenting ideas (Group domination). Leaders should encourage the team to address the issue without any hesitation. It is essential to set zero tolerance for criticism. Another potential pitfall of brainstorming is where certain members of the team will rely on the others to tackle the issue. Fear of losing credibility may be also possible threat, that prevents individuals from active participation. (social loafing) . Time pressure or unexperience should not speed up addressing all alternatives or forcing to make a quick conclusion about fraud by not evaluating all ideas. (Groupthink). They should not overreact; a wrong person can be accused of wrongdoing without any reason. Their attitude should be balanced between conservative and risk taker's one.. If the team members are assigned the homework in advance they have extra time to think over and dialogue should be more productive then. These are prerequisites that the possible fraud risk is revealed.

## **Future Challenges**

As any other newly adopted change, the recently introduced approach to fraud mitigation is not exempt from further challenges that arise parallel or subsequent to its first implementation. In its discussion paper the FEE suggests possible issues that relate to the recently adopted anti-fraud regulations and that will require further attention of companies, accounting profession and probably also the standard setters.

*The troublesome may be the question how to define effectiveness.* According to the FEE, there is not yet clarity or consensus as to what constitutes "effectiveness". It is an often-used word that cannot easily be defined. For example, to some users of financial statements, "effectiveness" could imply that controls can offer absolute assurance against misstatement or loss. Suitable criteria for evaluating effectiveness, which are applicable to different companies, have not yet been developed. Effectiveness is a relative concept and scoring mechanisms do not yet exist which allow one company, or even one process or team in a company, to be benchmarked against another.

While assessment of the effectiveness of internal control in enterprises for internal purposes should be encouraged, external reporting on the effectiveness of internal control presents considerable challenges and should be subject for further discussion and exploration. Public reporting of weaknesses in internal controls may present reputational risks to a company and may undermine the viability of the company, particularly companies in the financial services industry. There are few companies that are not capable of improvement in some parts of their internal control systems. Therefore the FEE concludes that there should be realism on what internal control can and cannot do and how it can be assessed and reported upon. For this reason, the FEE expects the future discussion to provide clarity on what is meant by internal control [10] (p.42).

*Different Levels of Internal Control can be distinguished.* The highest level of control is the governance function of the board. The next level is senior management, which is responsible for controlling the organization.

The third level is the management systems that assist management in controlling its activities, including financial reporting systems. The components of management systems such as documentation practices are the lowest level of internal controls.

According to the FEE, the challenges that may arise from such categorization include:

1. The bigger picture could be missed by focusing on the lowest level of internal controls,.
2. Difficulties of reporting and assessing of internal controls may differ in relation to the level of internal control. [10] (p.43).

*The Informal Aspects of Internal Control* are important and essentially mean the control environment and include such matters as culture, commitment, ethics and communication. COSO states that the effectiveness of internal controls cannot rise above the ethical values of the people who create, administer and monitor them. It has been suggested that most, if not all, major corporate governance failures are a result of weaknesses in the control environment. Obviously it is therefore harder, if not impossible, for management to assess and report meaningfully on the “operation” or effectiveness of other components of control, in particular the control environment, and harder still for auditors to attest [10] (p.43).

*Possible Forms of Reporting on Internal Control.* Boards in some jurisdictions are at present requested to make a statement on their review of internal control and auditors have to report upon this statement. FEE emphasizes that the main benefit in reviewing internal control is not to report upon an arbitrary assessment of effectiveness but to assess, reflect and respond to risks to achieving objectives so as to improve a business’s ability to meet its objectives. What is “effective” for one company may be insufficient for another, or totally excessive and unnecessary for a third company. Therefore will the information provided to investors regarding effectiveness be of any meaningful use? Benchmarking of systems of internal control against forms of pre-determined standards presents considerable difficulty [10] (p.44). Discussion in professional circles, further research and exploration are required with regard to the criteria for assessing the effectiveness of internal controls and the related matters that are just to emerge, as the above-mentioned challenges are just the top of an iceberg and many other issues are sure to arise as the new practice of fraud mitigation is put into life.

## Conclusion

No system of control is ideally working to protect the company against the possible human error or error deliberately made.

A sound system of internal control provides reasonable assurance that a company should be successful in achieving its business objectives, including reliable financial reporting. No system of control can provide protection with certainty.

Implementing already accepted rules and also introduction of all additional, formalized requirements in the U.S. or in Europe will take time, much effort and additional costs. “The transfer to these new requirements, most of which will require much formal paperwork for evaluations on a quarterly basis is an all pervasive change. It is not like a change in accounting policy” in words used in Discussion Paper on the Financial Reporting and Auditing Aspects of Corporate Governance of July 2003.

## Appendix 1: Recent Cases of Fraud Scandals

The IFAC team undertook a series of 27 case studies, which were drawn from ten countries and covered ten industries. Based on this sample, the IFAC study provided summaries of the causes of corporate failures (the most famous cases are presented in the table below).

TABLE 1: WHAT WENT WRONG? [18]

Company	Country	Sector	Brief Background
Ahold	Netherlands	Supermarket retailing	Large scale accounting irregularities
Enron	United States	Energy	Serious accounting irregularities
WorldCom	United States	Telecommunications	Major accounting fraud
Xerox	United States	Optical imaging	Serious accounting irregularities

The IFAC study ruled that key corporate governance issues underlying company failures were:

- Culture and tone at the top
- The chief executive
- The board of directors
- Internal controls
- Aggressive earnings management

The following table illustrates some of the outcomes of an analysis of the corporate failures in terms of specific corporate governance issues. Table 2: What went wrong? - corporate governance issues [18]

Company	Ethics / Culture Tone at the top	CEO	Board of Directors	Internal Control	Aggressive Earnings Management
Ahold	••	•••	•	•••	•••
Enron	•••	•••	•••	•••	•••
WorldCom	•••	•••	•••	•••	•••
Xerox	•••	•••		•••	•••

The use of

- is where this issue had relatively minor significance in the corporate failure,
- indicate that the issue had moderate significance while,
- mean that the issue was of major significance.

## Appendix 2: Economic Crime Survey

For the purpose of the *PricewaterhouseCoopers Global Economic Crime Survey 2003* senior representatives of more than 3,600 companies in 50 countries were interviewed. The results of the survey provide interesting, valuable and unparalleled depth of insight into the perceptions, awareness and impact of economic crime on business across the world.

### Economic crime remains a significant threat

As much as 37% of respondents reported significant economic crimes during two years prior to the survey.

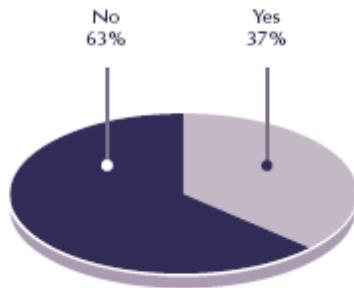

FIG. 1: VICTIMS OF FRAUD (WORLDWIDE) [25]

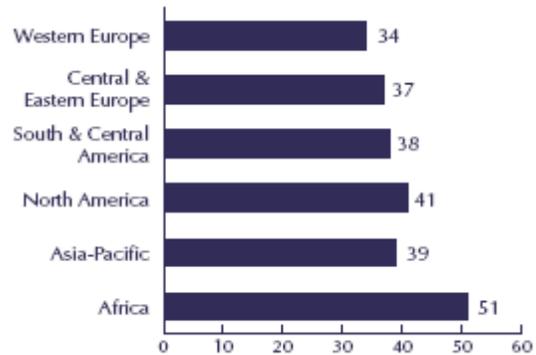

FIG. 2: VICTIMS OF FRAUD BY REGION [25]

The number of organizations reporting fraud in Western Europe has grown from 29% in 2001 to 34% in 2003 and in Central and Eastern Europe from 26% in 2001 to 37% in 2003. This increase appears to reflect two factors:

1. greater awareness of fraud leading to heightened detection rate; and
2. a growing desire for transparency, particularly in European Union 'accession countries'.

The highest levels of economic crime were reported by respondents in Africa (51%) and North America (41%). In contrast, respondents in Russia and Turkey reported no economic crime at all. There is clearly some way to go in both these countries to either improve detection or to promote greater transparency.

### Preventing Economic Crime

Companies that have suffered economic crime are more concerned about the strength and effectiveness of their systems to prevent fraud. They are also more likely to have taken proactive measures to reduce future exposure.

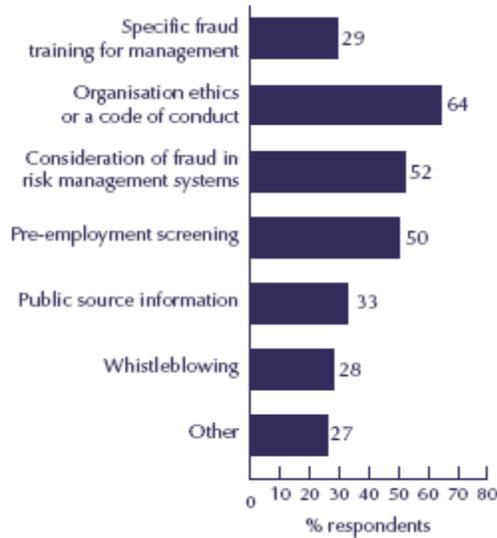

FIG. 3: TYPES OF CORRECTIVE MEASURES TAKEN (WORLDWIDE) [25]

Those that had not suffered fraud tended to rely on more intangible prevention tools such as codes of conduct or ethical policies. In contrast, fraud victims instituted more tangible measures such as management training and whistle blowing programs.

**Detecting Economic Crime**

As companies can only report crimes that have been detected, it is not possible to judge how much fraud goes unnoticed. What we can analyze is the means by which fraud is brought to light. The results vary considerably depending on the size of the organization concerned. Within larger organizations a combination of factors are likely to be involved in the detection of an incident. Control and risk management systems often detected fraud. However, in many cases this was accompanied by a finding from the internal or external audit function or from a tip-off. Smaller organizations detected a far greater proportion of economic crime through audit processes than by other means. Given the respective size of the organizations this is most likely to be via the external auditors – a worrying finding that suggests smaller companies may be placing too little attention on the development of effective controls and alternative checks and balances.

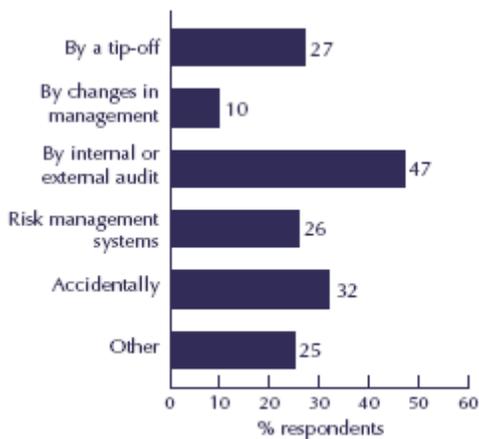

FIG. 4: HOW ECONOMIC CRIME IS DETECTED (WORLDWIDE)[25]

Many economic crimes at major companies are uncovered by accident, in this case, almost a third.

**Types of Economic Crime**

Of all victims 60% cited asset misappropriation as one of the frauds that they had suffered. It is the easiest crime to detect as it involves the theft of tangible items with a defined value.

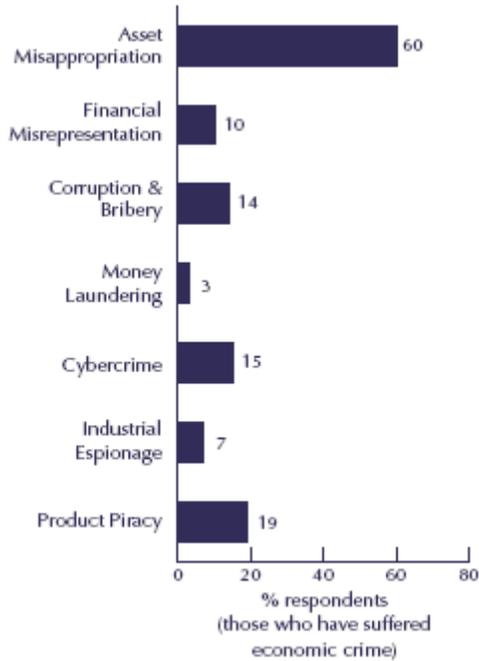

FIG. 5: TYPES OF FRAUD EXPERIENCED (WORLDWIDE) [25]

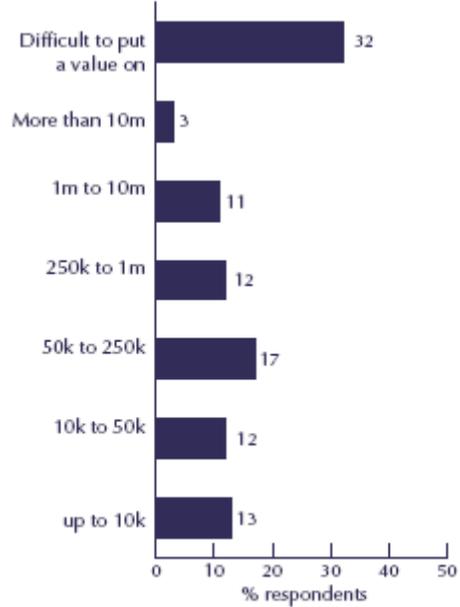

FIG. 6: FINANCIAL LOSS THROUGH FRAUD (WORLDWIDE) [25]

Asked to consider whether the collateral damage had a short or long-term impact on their business, most respondents believed the impact to be short-term (less than one year). This should not disguise the fact that approximately one third of respondents reported long-term effects of economic crime on their business.

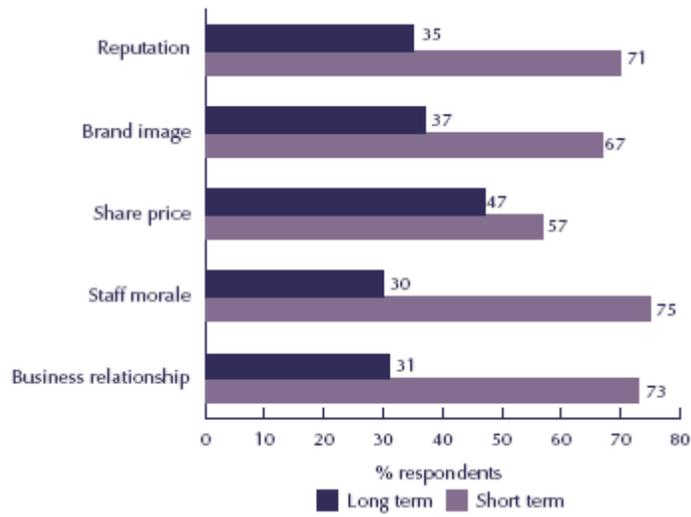

FIG. 7: THE LASTING IMPACT OF ECONOMIC CRIME (WORLDWIDE) [25]

Almost three quarters of victims of crime recovered less than 20% of their losses; only half of respondents had insurance against economic crime, but they recovered more of their losses.

# Cross Cultural Company Acquisitions: A Case of ‘Us versus Them’?

*Werner Soontiens  
Curtin University of Technology, Australia*

## Abstract

Although acquisitions are a popular way of internationalisation, the integration of acquired companies remains an arduous process that often impacts on the performance of the subsidiary or the overall organization. Difficulties associated with integration mostly relate to cultural differences, either national or organizational. This paper reflects on the experience of Finnish and Australian staff involved in the acquisition of an Australian company by a Finnish company. The paper points at problems and issues with business planning, vision sharing, effective management and leadership, cultural differences, cultural change, trust relationships and the integration environment as derived from literature and confirmed in the experience of interviewed respondents. The findings drawn from the case imply that it is imperative to avoid an ‘us vs. them’ atmosphere while both management and leadership must be strong and unbiased. Although a level of independence and identity should be allowed after the acquisition, integration of organizational cultures remains crucial for success.

## Introduction

To survive in today’s globalized business arena, companies must continually respond to numerous internal and external forces. The ability to adapt and change sets the scene for long-term success in the market. Many companies turn to acquisition as a means of gaining access to products, markets, technologies and other critical resources for their business. The over-riding purpose of mergers and acquisitions is to attain strategic goals more quickly and inexpensively than if the company acted on its own (Marks and Mirvis, 2001).

The real competitive advantage and performance benefits derived from acquisitions reflect a company’s ability to form and maintain effective internal and external relations between countries and cultures (Katz, Swanson and Nelson, 2001). The ‘cultural forces’ generated by the acquisition process are often misunderstood or not fully appreciated by business executives. During the rush to effectively utilize newly acquired resources, companies often overlook issues of national and corporate culture diversity in their new relationships. Acquisition integration strategies therefore often fail to consider cultural integration needs, misunderstandings, and difficulties between involved institutions, thus contributing to high rates of post acquisition failure (Marks and Mirvis, 2001).

Performance downturns following acquisitions are often attributed to the mixing of, and forced changes in, company cultures. Conflict and the process of finding ‘equal’ or ‘amicable’ cultural grounds between the acquirer and the acquire, often hinder business performance (Gallegos n.d.; Morosini, Shane and Singh, 1998). This paper considers arguments and models for acquisitions and subsequent integration and reflects on the nature of national and organizational culture. It furthermore reflects on a Finnish acquisition of an Australian company and discusses the experience and perceptions of key staff involved in the acquisition and integration.

## Background

The background section considers the acquisition rationale, the models of integration and the nature and impact of national and organizational culture from literature.

### **Acquisition and Integration of Companies**

The acquisition and subsequent integration of companies into parent organizations is an extremely disruptive process for any business operation (Kellogg, 2002). Although diverse forces of change causing disruptions have been widely studied, data suggest that acquisitions are poorly planned and do not benefit from experience. Marks

and Mirvis (2001) found that three out of four mergers and acquisitions fail to ever achieve their financial and strategic objectives.

Changes required to accommodate the new cultures and management activities during acquisition integration not only affect business performance, but also place considerable stress on employees and stakeholders. Business objectives need to take into account the human or cultural factors that can make or break a strategic focus (Simpson, 2002). Failure to place suitable emphasis on acquisition integration can easily negate the purpose or strategy of acquisitions (Marks and Cutcliffe 1988).

Whilst there are numerous reasons for acquisition failure, Marks and Mirvis (2001) suggests that many companies become too 'financially tunnel visioned' during the pre-combination phase of acquisition deals. The acquiring company, often non-operations oriented, tends to focus on the hard factors involved in the transaction (Simpson, 2002). Costs, values, transaction structures, tax implications and similar issues, overrule the 'softer' human resource management issues.

Successful acquisitions require acquirers to clearly define synergies and boundaries included in their initial assessment criteria. These acquisitions begin with a strategic intent which scrutinises an organization's own competitive and market status, its strengths and weaknesses, often referred to as the 'hard' issues. In addition, corporate and cultural orientations and human resource management often called 'soft' issues also impact severely on the acquisition and integration process. Both 'hard' and 'soft' issues therefore play an important part in the decision to acquire a company (Simpson, 2002; Marks and Mirvis, 2001). Such approaches appear to produce more effective cultural integration results.

#### **Models of Integration of Acquired Companies**

Various models explaining business integration impose differing cultural challenges on companies. These also tend to offer different outcomes of success following acquisition. Four models of acquisition 'integration' are outlined by Marks and Mirvis (2001): preservation, absorption, reverse takeover and transformation.

The preservation model of acquisition describes the situation where the acquired company faces a modest degree of integration and retains its ways of doing business. Typically, companies operating with this model strongly promote cultural plurism among business units and encourage localized business and product development. Effective integration requires protecting the boundaries of the subsidiary and maintaining effective business management control. In many cases, preservation allows a newly acquired subsidiary to maintain its original structures, systems and employees to continue performance levels prior to acquisition (Kellogg, 2002; Marks and Cutcliffe, 1988).

During absorption integration the acquiring company takes full control of the operations of a new subsidiary, without serious regard for the original cultures and operations of the acquired company. The cultures, structures and methods of the acquired company are assimilated to conform to those of the acquiring company. This is often associated with the appointment of new management in the acquired company, variations of staff roles and responsibilities, and the enactment of considerable change (Kellogg, 2002).

Reverse takeover is the opposite of the absorption model in that the acquired company dictates the terms of the integration and effects cultural change in the acquiring company. Reverse takeover acknowledges the acquired company as having more preferred management methods, structures and abilities and forces substantial change upon the acquirer.

Transformation based integration is where both the acquiring and the acquired companies find synergies between their operations and integrate to effectively capitalize on the 'positives of each system'. Benefits are gained from not only reorganizing the companies, but from reinventing the companies.

Although the model on acquisition integration impacts the functionality of either or both organizations involved, inherent organizational culture attributes will also impact on the process. The following section briefly outlines the nature of national and organizational culture.

## National and Organizational Culture

It is easy to oversimplify and miss the basic facets of culture, thus contributing to potential failure. As one of the earliest researchers on culture and organizations Hofstede (1980) described culture as the collective programming of the mind which distinguishes the members of one human group from another. Considering culture in the acquisition integration processes, three important issues need to be kept in mind. Schein (1999) summarizes these issues as follows:

- Culture is deep. The multilevel concept of culture shows that culture is an extremely complex phenomenon. Culture controls people more than people control culture. Culture allows people to develop beliefs and assumptions that eventually drop out of awareness and become tacit rules of how to do things, how to think about things, and how to feel.
- Culture is broad. Groups learn to survive in an environment through dynamics of its external and internal relationships. Culture affects all elements of individual or group life.
- Culture is stable. The members of a group want to hold on to their cultural assumptions because culture provides meaning and makes life predictable. This is important, since humans do not like chaotic, unpredictable situations and work hard to stabilize and 'normalize' situations. Any prospective culture change therefore contributes to anxiety and resistance to change.

### National Culture

The deepest and most powerful level of culture represents the accumulated values and behaviors that arise from a society's basic values and beliefs (O'Hara-Devereaux and Johanson, 1994). National culture is essentially permanent and can change only over generations, manifesting itself in the form of common language, common orientation to context, time, power, equality and information flow.

Hofstede's (1980) studies into national culture in the late 1970's and early 1980's provided insight to some of the dimensions involved in formulating national culture. The dimensions are not necessarily exhaustive and Hofstede and subsequent researchers have described cultural dimensions using additional dimensions and variables. Hofstede (1980, 1991) proposed four fundamental dimensions of national culture, which he believed to be independent of organizational culture. The dimensions include power distance, uncertainty avoidance, individualism (versus collectivism) and masculinity (versus femininity). The relevance and complementarity of these value dimensions in the business environment are confirmed by Yeh and Lawrence (1995), Barkema and Vermeulen (1997) and Chow, Harrison, Mc Kinnon, and Wu (1999). There is furthermore a positive relationship between power distance and behavior towards business objectives and goals (Hofstede, Van Deussen, Mueller and Charles, 2002).

### Organizational Culture

Like national cultures, corporate and organizational cultures within companies are not an espoused list of values developed and 'written up' by the executive team for all employees to read and abide by (although such actions may actually *contribute* to the developed cultures within organizations). The culture of an organization also operates at conscious and unconscious levels (Gallegos, n.d.).

Organizational culture is usually deeply rooted and shared by most members of an organization. Organizational culture refers to formal, written company policy and the informal, unwritten behaviors that have become accepted by the group (Stoppler 2002). Organizational culture drives the actions of a company and guides how employees think, act and feel. Hagberg and Heifitz (2002) argue that while organizational culture is dynamic and fluid, it simultaneously represents characteristics of an organization that are relatively enduring over time, and influence the behavior of people in the organization. Schein (1992, 1999) and other specialists have challenged beliefs about the 'content of organizational culture' and questioned its relationship to national culture (Gallegos, n.d.; Maurice, Sorge and Warner, 1980).

Traditionally research is focused on the boundary between national and corporate culture and their relationship to company performance (DeWitt, n.d.). Some researchers demonstrate that organizational culture in companies is a universal concept, inferring that managerial tasks are similar across borders, and national culture has little or no impact on organizational culture and performance (Hickson, Hinings, McMillan and Schwitter, 1974).

This school of thought argues that national cultures are moderated by organizational cultures and that people within an organization think and act similarly if working for the same organization, regardless of their home country culture (Adler, 1986; Florin, 2002; Maurice, Sorge and Warner, 1980).

At the same time Adler (1997) argues that significant differences in national culture are dominant over organizational culture, implying that national culture determines methods of management. Furthermore, national culture impacts on perceptions and behavior in organizational culture (Hofstede, 1980; Laurent, 1983; Gallegos, n.d.). National cultural differences are primarily a matter of 'values', while organizational cultural differences are primarily a matter of 'practices' (Hofstede, 1998).

In a Finnish – Australian interaction context companies contemplating acquisitions or mergers face an interesting set of demands and circumstances to achieve success. Whilst both countries are relatively technologically advanced, have well educated workforces and good relationships as international trade partners; they also experience a large geographic separation, widely differing climatic conditions, different languages and time zone differences. (CIA, 2001; Ryan, 1997). It is therefore expected that any merger between Australian and Finnish companies would be challenging.

## **Research Methodology**

This paper reflects on the acquisition and integration experience of a Finnish Engineering company (FinX) acquiring a smaller Australian engineering company (AusY). The case was studied to assess if different organizational backgrounds do inhibit effective integration of acquired companies. The study involved collection of primary data from 29 interviewees associated with the company's relevant business units, observation of artifacts and integration of information gained from literature. Due to the shortfalls associated with quantitative research methods, a number of researchers have begun to conduct more qualitative approaches to studying organizational culture, both in order to supplement quantitative design and to stand alone (Nicolson, 1998; Hatch, 1997; Schein, 1992). These shortfalls include the simplification of socially constructed and diverse realities and the focus to establish a cause – result relationship between variables. In contrast, qualitative research allows a more holistic understanding of a situation while accommodating individual experiences and interpretations (Fraenkel and Wallen, 2003).

Eighteen of the respondents involved in the data collection interviews were Finnish employees based in Finland; 9 were Australian employees based in Australia and another 2 were Australians expatriates in Finland. The interviews were conducted in person in Finland and Australia during early 2002. A questionnaire was constructed to collect data reflecting the perceptions and experiences of staff affected by and involved in the acquisition and integration. Although small in number, the respondents effectively represented the key individuals involved in the acquisition and integration process.

Interviews were conducted individually in open and informal settings. Time was allocated for an 'interview introduction' by the interviewer. This included delivery of information of what the study and information collected was to be used for and to give a brief background on the generalities of the concept of culture. The interview introduction also provided an opportunity to ensure participants that all information collected was to be kept anonymous and confidential. Time was spent on the introduction to improve the depth of information provided by respondents, to disarm individual suspicions that the company might have initiated the study and to confirm anonymity and confidentiality.

The 'base questions' in the interview originated from relevant 'open ended' questions previously used by Schein (1999). Whilst generally delivered as designed, questions were used mainly to act as 'prompters' for the interviewer and to entice open discussion of organizational culture issues. Respondents were invited to add as much comment and queries as possible at all times

### **Limitations of Study**

The major limitations of this study are associated with the depth and breadth of the study, which in turn questions the overall validity of the research data. As suggested in earlier sections, no study of culture can claim to be an 'absolute' investigation of the subject of culture due to the plethora of elements and dimensions involved (Schein, 1987). The authors acknowledge that this research has been limited to the identification and interpretation of

cultural issues central to the main (cultural) concerns in the company. The results and outcomes therefore, cannot be considered as 'typical' or 'normative' in any way and are reflective of the companies involved in the case. Another limitation of the study was that it did not dwell on wider aspects of company acquisitions and integrations. Only some cultural aspects of acquisition integration are considered while other aspects that are likely to influence acquisition integration are not. Although acquisition companies provide a situation to analyze the 'before' and 'after' performance scenarios (Gallegos, n.d.), the research fails to cover that aspect...

## **Case Environment**

The case environment explains the background of the two companies leading to the acquisition and the nature of the acquisition integration model. It also considers important issues of culture integration derived from the case data.

### **Background**

Before acquisition of AusY, the product range of FinX did not include all equipment and technologies required to design and supply base metal process plants. AusY's product line provided the 'missing link' to complete the equipment technology set. A major objective of FinX was to establish a world leading position to provide a 'total solution' service, offering process plant design and supply, using entirely in-house technologies and equipment.

AusY had been successful in the regions FinX was attempting to gain access into. Due to success in chosen regional markets of Australia, South Africa, USA and Canada in the past, AusY's management had not seriously considered expanding into other regions. Although AusY was profitable and successful, international competitors and anticipated market downturns threatened their position. The timing was therefore right to sell the company to a larger player that could effectively take the product to the 'next level' and globalize its distribution. For FinX, acquiring AusY would realise the total solution objective while potentially serving the expectations of AusY.

### **Acquisition Model**

With past apparent successes with German acquisitions (Kuisma, 1989), FinX was confident that their 'transformation' acquisition model was suitable for use in the Australian acquisition process. The Australian management however favored the approach of the 'preservation' model (Marks and Marvis, 2001). They believed their company had performed well over the past decade and that a change in ownership was no reason to disrupt the operations and functioning of the organization. AusY anticipated that historical achievements would translate into high levels of independence and preservation of culture, processes and systems. FinX in turn expected AusY to become part of their push towards a full range and global presence.

The actual execution of the acquisition and integration expectations differ even further with the strong ethnocentric management of FinX pushing 'transformation' towards the limits of 'absorption' integration. This was partly due to the different cultural expectations, both national and organizational, which points at the importance of managing the integration process.

### **Key Issues of Culture Integration**

Substantial differences in cultural dimensions were noted between the respective business units in the case. In many cases, it was difficult to separate the specific influences of national culture and organizational culture dimensions of each business unit. Concerns and issues evolved from differences in culturally derived assumptions and beliefs, which led to misunderstanding, mistrust and sometimes conflict between the business units. Respondents noted a number of culturally related situations and concerns as examples of poor integration and alignment or hindering overall business operations.

An analysis of responses allowed identification and inference of 'key factors' issues that the respondents believed would assist in the cultural integration process. The key factors identified were:

- Plan culture within the integration business plan
- Develop a shared vision
- Involve effective management and leadership
- Identify differences between cultures
- Manage cultural change

- Build trust
- Monitor the integration environment

#### **Business and Cultural Planning**

A complete organizational and cultural planning process includes 'reality testing' of potential synergies and differences in light of the two sides' structures and cultures and assist in establishing a desired and agreed relationship between the companies and members of management (Buono and Nurick, 1992). It also provides insight into employee attitudes towards conflict issues (Simpson, 2002). The process of formulating the cultural plan in itself would assist in uncovering potential cultural concerns, allowing suitable adaptation and facilities in the business plan to counter concerns before they arise (Marks and Cutcliffe, 1988; Simpson, 2002).

Employees cannot be expected to understand and accept new cultural influences if management did not fully research, inform, accept, understand and plan the management and facilitation of changes, influences and tensions expected during integration (Marks and Mirvis, 2001). To integrate successfully management requires a specific integration plan and then needs to be willing to modify strategies to accommodate cultural diversity between business units as new cultural differences, beliefs and assumptions are identified (Walton, 2001).

The most important element of effective planning is to ensure thought and consideration has been committed to various important elements and stages of business operations (Marks and Marvis, 2001; Buono and Nurick, 1992). A set business plan incorporating cultural assessment of business units and cultural planning would have been beneficial to the acquisition integration process.

In the case, it is important to differentiate between 'business planning' and 'cultural planning' activities. Evidently a degree of 'business planning' had taken place to facilitate integration. The physical and legal acquisition processes had taken place and the operations had officially been placed into 'integration', as per the Finnish integration business strategy.

The inferred approach to integration planning in the case lacks effective 'cultural planning'. This ultimately contributed to culturally derived difficulties experienced between the business units of the company. Additional cultural planning (as a sub-set of business planning) would have allowed management to better understand the artifacts, beliefs and assumptions of the different organizational cultures. Providing allowances and plans for these issues before integration would address organizational and cultural pressures experienced in the operations before they occur (Adams, 2002).

#### **Shared Vision**

A shared vision for the business units should provide inference of what management expects to be the 'end state' of the combination. Having a shared goal allows better demarcation of the shared vision amongst management and employees. With defined limits on how, where, when and with who to achieve goals people are able to focus their energy on common goals and the realities of the acquisition (Marks and Mirvis, 2001).

Employees need to perceive reasons behind the company's changes in a positive light and be given a context within which to see the actions in their own best interest. A shared vision, if understood and embraced by all personnel, would thus help to create a sense of commonality, belonging and purpose between the business units. The new combination of operations could then draw strength from individuals' desires to be connected to important undertakings (Senge, 2002). This is particularly the case for the Australian employees, who drew motivational strength from the strong business focus they had formed in AusY. Without the strong business focus and direction, respondents believed employees had little desire to exercise individual ambition and achievement.

Australian respondents indicated that the take-over led to the feeling of being 'let down' or 'betrayed' by management. These beliefs were based on negative assumptions that the future would not be as promising as the past. This downturn in employee morale is an expected reaction for many companies on the 'receiving end' of an acquisition (Marks and Mirvis, 2001). To counteract this trend, management of both companies need to focus on commonalities and positives to be derived from the acquisition which can be achieved by forming a strong shared vision, and communicating this to all individuals (Adams, 2002).

Australian respondents believe that promoting a strong shared vision would have assisted in restoring confidence and moral. It would also assist in dispelling negative feelings towards the 'sell-out'. Before the acquisition individual businesses operated with their own original missions and visions. The mission and operating vision promoted by the new parent company was not accepted as being relevant to the Australian operations due to

the culture that existed within the business unit. Australian respondents believed that the unfocused and unclear 'hollow' employee orientated Finnish visions did not apply to their strongly profit and achievement focused culture. Finnish respondents indicated that they believed the Finnish operations would continue as per their original visions due to the size of the organization and the stability of the bureaucracy, despite the addition of the Australian operations. Whilst the Finnish vision for the combined company had been formulated, it had not been effectively communicated and accepted by all business unit employees. Australian and Finnish respondents indicated that they were not 'working in the same direction' at all times. An effective, accepted and truly shared vision was needed by the business units to assist in 'bringing the business units together as one'.

#### **Management and Leadership Involvement**

Guillen and Gonzalez (2001) argue the importance to differentiate between the roles of management in 'management' processes, and the role of management in 'leadership' processes. The case suggests effective 'management' of the business units. Acquisition processes and directives for change had been handed down from the new owners, and business units were monitored. Business units did not however, experience the required 'leadership' guidance and were not being guided or transformed in a common direction. The case suggests that the only 'leadership' being provided to the respective business unit employees was from the original (pre-acquisition) founders of each organization. Beliefs and assumptions for operating the newly integrated organization therefore, continued to be derived from their original culture and management. Management involvement did not facilitate the transfer of integration plans, nor drive cultural integration change (Marks and Mirvis, 2001).

Management's role as leaders is also to ensure that key 'not negotiable' values, beliefs and norms are abided by and not rejected by differing organizational cultures (Simpson, 2002). It is imperative those leaders set the proper tone for the acquisition and that they articulate the principles for the new organization. The principles must then be executed and monitored, and management must be prepared to act accordingly (Marks and Mirvis, 2001; Duffy, 1999). Many of the concerns in the case were due to new systems, strategies and processes not being accepted by employees.

According to Schein (1992) and Iles (2001), the unique and essential function of leadership in the acquisition and integration process is its role in manipulating culture. Leaders can first gain an understanding of what needs to be done to manipulate the culture and then 'unfreeze' it so that meaningful change and acceptance can take place (McShane and von Glinow, 2000). Strong integration leadership between the business units would therefore provide assistance in re-aligning business unit management and employee attitudes. It would also provide opportunity to relieve situations creating error, misunderstanding and conflict between employees from different business units.

Respondents indicate that the business integration lacked management and leadership involvement. Effective leadership was particularly important in the process of allowing employees within the Australian business unit to feel that they were 'included' as an important part of the acquisition process (Hagberg Consulting Group, 1998). Australian respondents indicated that Australian employees had a relatively close 'bond', which was maintained by the 'business focus' and culture. Employees therefore believed and assumed that they deserved to be part of, or at least forewarned of management decisions. Australians also desired effective avenues to challenge management decisions if decisions did not suit the 'Australian' business situation. Strong leadership was required within the Finnish business unit to support the systemic and bureaucracy structures within the culture. Finnish leaders are expected to deliver directives to employees while at the same time support and challenge the bureaucratic system where needed. This was perceived necessary to accommodate cultural deviations and requirements during integration with the Australian operations.

#### **Cultural Understanding**

Achieving an awareness and understanding of differing national cultures within companies can be a difficult task (Hall, 1965; Iles, 2001). Hofstede (1984) argues that members of any particular national culture or organization either reject the notion of cultural dimensions being at play and feel threatened or upset by the concept, or find that gaining a better understanding of cultural differences is an enlightenment. Once employees accept the impact of cultural limitations and differences, understanding takes place.

There are no right or wrong perspectives when dealing with issues of culture. Assumptions, views and beliefs of any culture are elements bound in ethnocentricity (Schein, 1992) and translate in different ways and means

of achieving goals. Increased cultural openness allows staff to assess the situation within its cultural contexts and be more open to differing views. This assists in removing the 'us and them' syndrome, which often leads to disruption or conflict between international business units (Hofstede, 1984).

The lack of cultural understanding and appreciation for the 'other' culture appeared to be an important cause of difficulties experienced in the integration of the Finnish and Australian business units. There was little evidence by management or employees, acknowledging or accepting cultural differences as a way of explaining and approaching difficulties or tensions that arose during the integration process.

Steps to improve the levels of understanding and awareness of cultural differences in the business units would have benefited the operations of the company overall. Respondents provided no suggestion of specific formal culture training, assessment or planning being conducted in the company prior to, or during the integration. In addition, individuals from both business units had relatively low levels of cultural awareness or cultural 'openness'. Low levels of cultural awareness led to assumptions that most individuals operate on similar beliefs and underlying assumptions. Australians assumed that Finnish employees think and respond similar to themselves and visa versa.

#### **Cultural Change**

Academics and business leaders advocate that cultural change in young, newly acquired organizations should be limited (or even avoided) if an acquired organization is already successful. This is especially the case if there is little effective return from planned changes (Schein, 1992). Adams (2002) argues that anything that slides under the banner of cultural change is doomed to failure. One of the most fundamental mistakes is to imply to organizations that they can't maintain and live their own culture.

Change is usually difficult for people to accept, as it is natural for humans to hold on to established methods, beliefs and ways of doing things (Schein, 1983). Culture forms and acts to be a stabilizing force within a group or community and therefore becomes difficult in itself to change (Hofstede, 1980). Respondents indicated that they believed the 'other' business unit, or associated culture, was attempting to 'change' the way things were being done in their business unit. This was particularly the case with Australian respondents who complained that 'the Finnish owner had attempted to change almost everything within their business since acquisition.' The Finnish respondents also commented that the Australians were not responding particularly well to the owner's change initiatives.

The case confirms Kellogg's (2002) suggestion that people perceive their own organizational culture is the 'best' and 'most suitable' for post acquisition operations. Inevitably, what remains when the acquisition dust settles is an 'us vs. them' environment. Usually, the more established, 'stronger', and politically dominant company ends up applying rules and changes to the cultures of the 'weaker' company. Kellogg (2002) also promotes the concept that acquiring companies should 'not fix what isn't broke', and change should only be instigated where required in acquisitions. Australian respondents believed the business unit was being adversely affected by 'territory marking' change, having little reason and producing little benefit. Many of such changes were said to have served only to increase tensions and resource wastage.

Finnish embedded bureaucracy and size invariably contributes to dominance over the acquired companies (Fincham and Rhodes, 1999). In the case, change was reported to be promoted without considering reasons as assuming dominance was reportedly the 'mind set' of Finnish personnel while Finnish management assumed that directives were followed by employees. Australian respondents indicated a desire to maintain their original culture and believed they knew how to manage their operations more suitably than the new Finnish owners. Culturally 'unsuitable' and unsubstantiated change directives therefore, were criticized, or ignored by the Australian employees who reflect the Australian dislike for authoritarianism. Australian employees also require greater transparency and interaction before accepting change and management can expect continued resistance if employees are not totally 'sold' on promoted ideas.

#### **Building Trust**

The construction of trust is the culmination of numerous components within the relationships and operations of the company. Trust occurs when there are positive expectations of another party's intentions and actions in risky situations (McShane and von Glinow, 2000). Organizations cannot operate effectively without trust (Asherman, Bing and Laroche, 2000). Trust between individuals within business units was found to be a serious issue for many

of the respondents. The development of trust was identified and accepted as an important part of dismantling cultural barriers and improving integration of the units.

Close interactions and face-to-face meetings accelerate the accrual of trust. O'Hara-Devereaux and Johansen (1994) states that face-to-face encounters are irreplaceable for both building trust and repairing shattered trust. The violation of trust tends to affect ones approach to cross-organizational citizenship behaviors and interpersonal relationship behaviors. With continued violations of trust, employees' psychological contracts can move from being relational to transactional, making dealings between offices less cooperative (McShane and von Glinow, 2000). In the case situation, it was inferred that there were high levels of trust between employees within each business unit. There was also a degree of trust 'between' business units, although more fragile, difficult to accrue and exposure based. Respondents also indicated that the individuals in each business unit had little opportunity for direct contact, due to the distance between locations and the relative difficulty in communicating on a regular basis.

Maintenance of trust requires different input and output expectations in different cultures (Asherman, Bing and Laroche, 2000). For example, in Australia employees gained trust through delivering on time and carrying out commitments. Australian respondents felt a decline in trust of Finnish personnel if they did not effectively respond to operational requests. Whilst members of business units generally trusted each other from the start of the integration process, trust decreased between operations in particular areas.

A cultural integration plan must recognize the imbalance of forwarded trust between business units. As an effective basis towards building stronger trust between the business units overall, Cummings and Bromiley (1996) suggest proceeding in steps that promote trust, whilst advocating strong tolerance between employees to allow for the 'unknowns' of culture. In addition, Asherman, Bing and Laroche (2000) advocate encouragement of 'emotional bonding' and 'conceptual understanding' between global teams where possible. Emotional bonding can be achieved through greater opportunity for face-to-face meetings, 'after hours' activities, etc. Conceptual understanding is achieved through providing employees with an intellectual understanding of how cultural similarities and differences influence business transactions. Whilst difficulties in interpretations of assumptions are still likely to arise in operations, the method provides a positive basis upon which trust can form. At an operational level, higher levels of trust were offered to the Australians by the Finnish operations, than to the Finnish by the Australian.

#### **Monitoring the Integration Environment**

The basic goal of environmental monitoring includes being as specific as possible, determining the exact nature of problems and concerns (operational or cultural), identifying what it would take to resolve the situation, and whether employees had the resources or required understanding to deal with the situation (Buono and Nurick, 1992). Without environmental monitoring, employees can become frustrated and annoyed with issues. Some respondents indicate that visible attempts to monitor and identify issues of concern would have generated a more positive atmosphere for business integration – a feeling that management was actually interested in assisting or rectifying situations.

Management benefits from providing facilities to monitor, identify and manage the cultural integration process and at the same time create an opportunity to identify concerns within each of the business units (Adams, 2002). The monitoring of environmental conditions at the different business units would have provided management with a better understanding of cultural issues and needs of employees.

The case revealed a diversity of concerns and issues resulting from the integration process. Respondents believed that the issues were not effectively identified by the company or management provided no appropriate resolution and management has no realistic 'picture' of the post-integration company. Rather than finding solutions to concerns and issues, employees indicate they are left to 'fend for themselves' with difficulties and frustrations of the integration process. A failure to monitor the post-acquisition situation also meant that management was not fully aware of the knowledge and training needs of employees operating in the cross-cultural environment.

## Conclusions

The process of integration after acquiring an organization directly reflects the planning and actual approach of the acquisition. Even so, both organizations involved in the acquisition and integration contribute to the complexity by means of their national cultural background and the individual organizational culture. Although it is virtually impossible to measure the impact of culture differences on the moral and productivity, there is little doubt over the adverse impact of culture differences on the integration process.

The Finnish-Australian case indicates the dissatisfaction experienced by Australians, mostly attributable to cultural differences. Although the acquisition was characterized by some business planning there was no cultural planning to anticipate differences in business cultures and future problems for integration. An important aspect of successful integration is the establishment of a shared vision and understanding of purpose of either parties in the larger picture, a type of role identification. This exercise should not be done in isolation or without consultation and it is imperative that all concerned parties are involved in the process. The case implies that clear communication before, during and after acquisition and integration is deemed imperative to avoid the 'us vs. them' atmosphere. In addition, both management and leadership must be provided throughout the acquisition and integration, both in terms of hard (profit, structure) and soft (staff, culture) issues. While a clear overall vision and strategic goal is imperative to ensure cooperation, allowing business units freedom in identity is crucial to allow gradual integration. The most important aspect derived from the case implies the importance of understanding and managing organizational and national culture. Although not conclusive, evidence suggests that the nature and poor management of differences in organizational culture indeed sets an environment that can make or break initial successes of acquisition integration.

# Cultural Dimensions of Globalization in East Asian Economies

*Guy Schulders*  
*Université Paris I Panthéon-Sorbonne, France*

## Abstract

Globalization depends not just on the choice of economic policy, but rather on the important role played by culture in shaping economic behavior. In this paper, we review some historical aspects of cultural influences that have shaped the evolution of economic growth across countries in space and time. While culture itself can be influenced by economic dynamics, we examine here the reverse causality role played by culture in determining the speed with which countries in general, and those in East Asia in particular, influence the evolution of economic policy choices.

## Introduction

Throughout history, either by action or through reflection, different societies have responded in various ways to the major problems they have confronted. As this has taken place, it is clear that the major challenge has been to find fundamental solutions to the physical and moral problems that have arisen. This said, those responses that have been effective in shaping social order have been crafted to the specific conditions affecting different populations :

- At a cultural level, i.e., in the domain of the spiritual and the arts, through modes of reflection, behavior, religions, and beliefs :
- At a scientific level, i.e., in the domain of technical knowledge, modes of production, communication, and in terms of access to subsistence resources affecting human suffering and poverty.

Some cultures (as in those that have evolved around Confucian thought, Descartes, or Mohammed), and certain other civilizations (those of fire, of stone, the railroad, up through the information age) have progressively become zones of major influence in the current wave of globalization. Interactions across these cultures and civilizations have produced both absorptive and confrontational responses, each responding to some initial impulse. Among these events we note :

- Europe of the Enlightenment, the Protestant Reformation, and the Christian crusades of the Middle Ages
- China and other parts of Confucian Asia at the time of the Mongol empire of Genghis Khan, Bāber, and Tamerlane
- The Middle East of Mohammed and the successor Caliphates
- Islamic Africa after the destruction of Carthage by the Arabs in 698 in the footsteps of the Phoenicians, Romans, and the Vandals. Arabization of the North African Berbers took place even as powerful Berber dynasties such as the Almoravids and subsequently, the Almohads, ranged up to the center of Spain, and south to Senegal in West Africa.
- Pre-Colombian America, in particular, the spectacular Quicha culture of the Incas who founded a great empire in the 13th century before being overtaken by Spanish conquistadors in the 16th.<sup>1</sup>

Cultural differences from these exchanges have produced varying responses. The willingness of subordinate populations was driven by the extent to which dominant forces conveyed superior humanist values. Those who were less disposed to absorb the newly dominant ideas were treated by dominant powers as ignorant, miscreants, and were brought to conform by a combination of reason, conviction, and more than occasionally, by the force of arms.

Organization of economic, social, and political life flowed from the initial rounds of exchange. It flowed from respect for the same cultural values and consequently defined the expansionary group framework tied to a religion that evoked a common stakeholder sense and social conscience. In this regard, we note :

- Cultural cohesion led historically to a search for a balance of economic and political power associated with geographic domination. In more recent times, we have seen not only the balance of power among

countries, but equally in the balance of influence across regions.

- Asia in particular shows us how clearly modes of thought and religions, even those imported from elsewhere, have influenced entire continental cultures, from central to east Asia.
- On a larger scale, culture deepening and diversification stimulated or restrained the process of development. Whether it deepened or diversified depended on the degree of openness in receptor cultures, and thus posed profound implications for the prospects for economic, political, and social development.

#### **The Impact of Intercultural Dynamics on International Relations**

Only fifty years ago, it took forty days to travel from Paris to Hanoi and more than a week for arrival in Cotonou. The means of transport were the railroad, plus ocean passenger boat, as well as local roads. Now it takes one night and six hours to cover the same distances. When transport made travel a distant affair, so too was the likelihood of cultural exchange, a fact that has now collapsed into both air travel, satellite and cable television, as well as the internet.

It used to be that when a British engineer took up an expatriate position in India, or a French surveyor took up a position in the construction of the Dahomean railroad between Cotonou and Parakou, one left for a stay of several years. Now, an American, German, or French specialist who may be working for a branch operation in Shanghai, can take regular home visits for the holidays, in addition to a summer vacation. Today's expatriate worker is on the road more often than staying in one place, and undertakes far more consultative projects instead of staying in any one place over a professional career.

With the compression of space and time of today's world, once distinct western, eastern, African, and other zones of influence have come under increasing pressure to adapt to new forms of intercultural exchange. These speed of these interferences has, in very little time, shaken economic and commercial trading patterns, and thus the very spirit of diplomatic political and strategic initiatives that used to characterize international relations. These more rapid exchanges of today's globalizing world are shaping, in effect, the foundations of inter-cultural communication, as well as the scope of economic, commercial, political, and social relations.

On the scale of contemporary history, these changes are relatively recent. However, intercultural communication trends are causing Westerners, at least, to ask themselves what is the most efficient manner to engage in trade with newly globalizing countries, in particular, the Chinese and Indian markets, which by themselves have more than 2.5 billion consumers.

As Westerners have sought to adapt new strategies for trade, they also have confronted a periodic clash of values with their prospective eastern partners. Chief among them is the disruptive effects of the Chinese occupation of Tibet, and the pro-democracy demonstrations that took place in Tianenmen Square in Beijing in the 1980's and which led to considerable loss of life. China's leaders know full well the concern that these events have posed to prospective trading partners from the west. They have thus sought to downplay such displays of « hard » power in favor of more subtle economic innovations that could raise standards of living. Adoption of market-driven reforms have enabled Chinese consumers to enjoy for the past fifteen years annual rates of growth in income, and in which an increasing number of elites have gone to western institutions for training in the latest business and technical innovations<sup>ii</sup>.

In turn, Asian leaders have also wrestled with what kind of strategy would be most effective in their prospective opening to western firms and consumers. Mao Tse Tung's closed economic model offered few examples, and so it fell to others, notably Mao's successor Deng Xiaoping, to craft a suitable strategy. That strategy can be summarized as : China, a country with a Chinese spirit plus western technology<sup>iii</sup>.

Outside of Asia, other countries have also wrestled with the choice of an effective strategy for globalization. For many in Africa, globalization has involved new partnerships that have not simply produced a replay of former colonial strategies, i.e., outlets for finished goods and services from developed country producers while relying on primary resources that by default, African countries have for so long been producing<sup>iv</sup>. In short, whether we are looking at East Asia, Africa, the Middle East, or Latin America, the compression of time and space by newly developed technologies of travel and communication have cast a new light on the challenge of globalization.

#### **Changes in the Global Balance of Power and in Zones of Economic Influence**

Prior to any exchange, one usually proceeds on the underlying assumption that the values, beliefs, and convictions of one's background predetermine that superiority of one's cultural values, and scientific and technical methods. The question is when intercultural exchange takes place, what mode will predominate<sup>v</sup>.

History shows that when there are differing cultural models among newly globalizing economies, the inevitable clash of ideas produces a synthesis shaped largely by the balance of power. The resulting balance of power then determines the orientation of international relations. Moreover, it is not just that the resulting balance of power shapes relations within a country or region in terms of various ethnic groups, but also a re-orientation of relations between one region and another. Dominance thus shapes attitudes and perspectives at a regional level, and it does so not just in terms of state relations but also in terms of international business capacities and strategies. As evidence of this socio-economic dynamic, we note, for example, the following regional dynamics now in play.

In Asia, India, China, and Japan, as well as within ASEAN and APEC, historical conflicts have produced aggressive outward looking policies with dramatic results. For the past fifteen years, for example, China has enjoyed annual rates of growth in its GDP of over 9 percent, and with an increase in exports by 28 percent just between the 2001 and 2003 period. China's economic expansion exerts a strong influence on neighboring countries and makes it a new center of growth for its neighbors. In fact, until recently, there was much talk about globalization, but henceforth, the notion of a « Sino-global » model is redefining relations among all countries in the region. China is thus assuming the leadership mantle that was once largely associated with Japan.

In Europe, Germany, France, Great-Britain and Italy are adopting nationalist positions relative to the European Union. Part of this transformation has taken place in light of the uncertain identity of the European Union which has expanded from the original six members of the Common Market to its current membership of twenty-five countries, and a prospective expansion to twenty-eight. Much of this uncertainty derives from the legacy of formerly East European economies who have seen their political fortunes defined as much by trans-Atlantic relations during the Cold War as much as by the economic policies of the EU. One example of this was the decision by Poland to purchase US military fighters instead of those by a continental producer such as Dassault, and this decision took place after Poland had been admitted to the EU. What this signifies is that for many East European countries, they view NATO and/or the US as providing stronger security guarantees in comparison to the still-unfolding EU defense system.

In Africa, key countries such as Egypt, Libya, or South Africa project themselves as leading representatives on behalf of the continent. They do so in face of the difficult challenge of establishing closer ties among countries in the region, be that in terms of complex international organizations that are difficult to organize, to coordinate, to promote and preserve, examples of which include ECOWAS, SADCC, and the defunct EAU. Regardless of which country, or group of countries seeks to play a leadership role, the goal is to articulate a common vision for the continent as well as to define a common set of strategies in terms of globalization trends and negotiations to that effect, such as with the WTO.

Tables 1a and 1b below provide a summary profile of basic characteristics of key regions we have noted in the context of the ongoing debate over globalization.

TABLE 1A: ECONOMIC AND DEMOGRAPHIC PROFILE OF KEY REGIONS IN THE WORLD

Country	Population, in millions, 1988	Population, in millions, 2001	2001/1988 Ratio	Country	GDP, in \$billions, 1988	GDP, in \$billions, 2001	2001/1988 Ratio
China (+HK)	1,085.10	1,269	1.17	USA	4,488.0	7,182.0	1.60
India	781.4	1,016	1.30	Japan	1,923.7	3,954.0	2.06
USA	243.8	282	1.16	Germany	881.8	2,067.0	2.34
Indonesia	170.6	211	1.24	France	715.5	1,453.0	2.03
Brazil	141.5	171	1.21	Gt. Britain	586.7	1,447.0	2.47

### Mastery and Management of Leadership

For a given region or country, the balance of political and economic power can exert a major influence on not just the shape of local culture but also in terms of linguistic discourse<sup>vi</sup>. Culture may serve as the pretexte with economics as the end reference. Political dynamics, as much as economic ones, revolve around the quest for means of developing partnerships in the form of clients and suppliers, in such a fashion as to establish effective means of projecting influence and power, of states.

Diplomatic initiatives usually reflect strategic efforts to influence target countries in such a fashion as to influence local leaders (« vote as we do »), as well as local consumers (« buy our products »). Given this framework, contemporary globalization proceeds with shifts in the balance of power clearly in evidence, as can be noted in the following patterns :

- Creation, followed by a mechanism of control, on the evolution of forms of behavior
- Spread of cultural, artistic, and linguistic concepts.
- Mastery, including a manipulation of political, psychological, and economic determinants. This includes efforts to respond to local nationalist sentiment, emphasis on common historical ties or in a shared system of beliefs and values, as well as emphasizing mutual benefits of commercial ties.
- Coordination of the key levers of globalization as they pertain to international geopolitical strategies through a harmonization of modes of operation as well as fostering joint economic partnerships.

While these strategies are typical of western firms seeking to expand their operations in remote areas of the globe, they are no longer the only ones so engaged. As local populations become engaged in the global economy, the success of foreign firms depends on an ever more rapid adaptation to them as both consumers and as producers, in terms of their preferences as well as in terms of their purchasing power. This becomes even more challenging as demographic dynamics diverge : Europeans are aging while Asians and Africans are becoming younger as their populations expand at differential rates. As a result, marketing goods and services must take into account these widening differences.

Beyond demographic divergences, firms also confront shifts in the balance of natural resources. Primary materials, in particular hydrocarbons, are becoming more expensive, creating greater pressure on resource substitution and conservation strategies. The price of exhaustible natural resources depends first and foremost on the costs of discovery, extraction, production, refinement, and distribution. While recent increases in real prices have led to new incentives for exploration, there have not yet been comparable discoveries to those that were realized in the earlier decades of the twentieth century. This has caused in turn a more intensive shift to nuclear energy for electricity (as in the re-activation of uranium mines in Niger) as well as an expansion of basic research in the commercialization of renewable energy resources, in particular cost-effective increases in the efficiency of solar radiation technologies.

At the same time as the shift in primary resources proceeds, countries are experiencing shifts in the historical balance of comparative advantage. We see this with the diffusion of commercial nuclear energy technology and the attendant military risks that this entails. But it also takes place as firms seek to maintain competitive costs by closing homeland branches and outsourcing production to assembly plants in Asia and elsewhere. And this is not just limited to western firms. We see a comparable shift by Japan of many well known firms shifting production to less expensive areas, as in the shift of production to South Korea and more importantly, to mainland China.

One basic effect of this transformation is that newly globalizing economies such as China are able to enjoy more rapid increases in income, along with a fundamental shift to a more global standard of living. As this occurs, hitherto local national ideologies, as in the shared poverty philosophy of Gandhian India and Marxist China are being forced to adapt to the new global realities. Pragmatism, not dogmatism, becomes the order of the day. In places such as Vietnam, instead of relying on the Marxist vision of Ho Chi Minh and the historic struggles against French, Japanese, and U.S. domination, the code phrase today is « make money, not war. » This applies no less equally to China, where Confucian morality and the Marxist monopoly of the political reins of government are evolving into a mix of unbridled capitalism and corruption. This apparent pragmatism runs counter not just to local political ideology, but also to historical experience, where Buddhist, Shito, and Taoist religious beliefs defined for centuries the ethical basis of family action, professional identity, and political legitimacy.

What does this cultural clash imply ? While it may simply be a matter of time before dominant power redefines a local paradigm for governance and economic exchange, we see in the interim many far from resolved patterns of behavior. For example, in east Asia, four countries (China, India, Indonesia, and Japan) represent themselves forty-six percent of the world's population while producing 22 percent of the cumulative GDP of the 200 countries in the world (\$7 trillion out of \$31 trillion in 2004). As our comparisons in Table 1b have shown, the extraordinary transformation of China has yet to be understood not just in Asia, but in the rest of the world. Will, for example, China remain an outsourcing country for newly diversifying European, North American, and Japanese firms, or will its newly emerging economic strength change the global balance of power in ways that have yet to be understood or foreseen? <sup>vii</sup>

In other parts of the world, economic growth and development is far less dramatic. Many countries in Sub-Saharan Africa continue to stall in the face of both new global economic realities as well as ongoing continental crises. Sub-Saharan African countries continue to lose market share to Asian producers in global primary exports. In addition, ongoing epidemics such as the unchecked spread of HIV/AIDS destroy the ability of leaders to mobilize resources, with the result that some countries have become failed states in most senses of the term, as in the collapse of governmental institutions in Somalia, Sierra Leone, and more recently, in the Democratic Republic of the Congo and Rwanda. The prospect for these countries is not promising, despite the newly embraced Millennium Development goals.

As to Europe, we have already noted the issue of aging populations that creates higher dependency rates than ever experienced before. In addition, the newly expanded European Union creates higher administrative costs of adjustment, not just in the provision of welfare state services, but also in terms of agricultural subsidies that threaten to further drag down rates of economic growth.

While these shifts take place, historically trading surplus countries such as Japan and Germany find themselves less capable of financing structural deficits elsewhere (as in the U.S.), but also in terms of stimulating world economic growth and trade. This is akin to a zero sum game – each surplus must be lent, just as each deficit must be financed. If this remains an essentially north-north phenomenon, then little is left for stimulating the emergence of newly developing market economies, be they in Asia, Africa, or Latin America, and global economic inequality will most likely increase along with rising levels of frustration.

#### **Political and Economic Regional Responses to Globalization**

Autarky is no longer a choice for countries in today's global environment. Regardless of size, countries survive on the basis of productive international partnerships that respond to new levels of global competition. We see this evolving system of partnerships in various configurations: The European Union, with 25 countries, 750 million people, \$10 billion in cumulative GDP; ASEAN<sup>viii</sup>, a mosaic of ten countries, 500 million people, \$750 billion in cumulative GDP; NAFTA, consisting of the Canada, Mexico, and the United States, consisting of 420 million people, and a cumulative GDP of \$11.5 billion; and ECOWAS, with 16 countries, 263 million people, and a cumulative GDP of \$173 billion.

Multinational political re-alignments on a regional level proceed on the necessity of creating viable alliances for all, regardless of national cultural traditions or historical experience of each of a group's member states. As such, it is not surprising to find widespread divergences among each grouping: Indonesia's 220 million inhabitants with Brunei's 350 thousand; Thailand's \$125 billion GDP with the \$1.4 billion of Laos; A \$10.5 billion GDP of the U.S. alongside the \$600 billion of Mexico; Nigeria's 133 million population alongside 1 million Gambians. Nevertheless, neighboring alliances in a given region provide a bridge between purely national policies pursued at a single state level and the irreversible process of global economic integration.

Regionalization typically unfolds in an evolutionary pattern that brings together variable structures of exchange: bilateral agreements, free trade zones, customs unions, common markets, or economic and/or political unions. By their very essence, regionalization initiatives are driven by the pursuit of common objectives that seek, in theory at least, to raise questions that might otherwise divide a partnership. In Asia, for example, regional partnerships have focused on harmonization of product and service standards, as well as on greater coordination of policies within the respective financial markets of participating countries. One fortuitous byproduct of this process is the periodic meetings of country leaders who face sometimes difficult political choices but whose gatherings place primary emphasis on strategies for promoting greater economic and commercial ties. In this sense, these gatherings often facilitate an ongoing means of communication regarding political issues that otherwise might have few means of resolving.

In Asia, the process of regionalization operates with the search for consensus and a commitment to reduce political, economic, commercial, and cultural shocks that might otherwise unfold (« iron pots and clay pots »). In so doing, they have made it easier to address periodic differences, as in the Spratley and Parcels issue over the South China sea involving Malaysia, Vietnam, Singapore, and Brunei<sup>ix</sup>; as in the tension between Malaysia and Singapore over the development of the Malaysian railway system; as in the Indonesian and Singapore territorial jurisdiction

issue ; and as in a comparable issue between Singapore and the Philippines, among others. Table 2 provides a brief profile of the member countries of ASEAN.

TABLE 2: ECONOMIC PROFILE OF ASEAN MEMBER COUNTRIES(2003)

	Annual Growth Rate	GDP in \$billions	PPP GDP per capita in S.U.S.	Real Per Capita Income, in S.U.S.	Population, in millions	Exports, in S.U.S. billions	Imports, in S.U.S. billions	Trade Balance, in S.U.S. billions	External Debt, in S.U.S. billions

Source : *Asiaweek* April 27, 2004

Regional partnerships in Asia are consistent with research findings on strategic alliances. We find, for example that cross-border alliances in South-Asia work well in enabling ASEAN membership countries to take advantage of their respective factor endowments or to benefit from neighboring infrastructure, as in Indonesian links to Shenzhen province in China, but also ties between southern China provinces as Laos, Cambodia, and Myanmar. At the time of its creation, ASEAN was based largely on relatively rich capitalist market economies to provide a sanctuary against a relatively poor and largely communist group of potentially hostile neighbor countries (China, Vietnam, Cambodia, and Laos). Yet, following the end of the war in Vietnam in 1975, the end of the struggles between the Vietnamese and the Khmer Rouge in Cambodia, and finally the end of the Cold War in the 1980s, ASEAN took on a more dynamic character. Growing from six to ten members, it then emerged a mixed group of countries that looked for some measure of security within the context of a newly expanding China. Finally, China's post-Maoist turn to a more market-driven strategy brought about stronger ties with Japan and South Korea, with China now participating on an increasing frequency in meetings of ASEAN member countries.

#### **The Role of Culture on Asian Development Practices**

As we have noted, Asian economies reflect a strong presence of both Buddhism and Islam, with a philosophic perspective borrowed from Confucianism, Taoism, and Shintoism. Displaying personal discretion and moderation, Asian societies view their economic functions through these moral lens, and it shows in terms of actions and behavior in social organizations that acknowledge, reward, and reinforce political harmony. The corresponding hierarchical structure of society in Asia manifests itself in terms of attitudes of workers toward their superiors, of students toward their professors, and of citizens toward their leaders. This hierarchical model shows up in the economy with vast networks of reporting relationships, as in the Japanese *keiretsu* (that replaced the *zaibatsu* of the 1930s) and in the Korean *Chaebol*. One historical irony in all of this is that the Confucian model of hierarchical order can create the very alienation that Marx so strongly criticized of the emerging industrial capitalist world, yet which became the dominant ideology in China under Mao Tse Tung, and which persists among his successors even today<sup>x</sup>. Thus, while a corporate scandal can produce great turmoil when it reaches the highest levels of authority, in general, the Confucian model dominates most modes of social and political institutions, always with the underlying notion of a steady path toward nirvana<sup>xi</sup>. It is therefore not surprising that veneration for one's elders and ancestors translates into a similar attitude of deference toward an aging corporate or political leader.

A basic question is whether the subordination of individuality in this Asian model is a recipe for success. Where it becomes problematic is with the opening of an economy to international trade, and in the fixation of decision-making in such a fashion that innovation can proceed. What is increasingly clear is that once the winds of globalization become strong, there is less emphasis on a rigid hierarchical order and a greater acknowledgment of individual leadership in the face of risk. This is particularly true in the eastern part of China, where some 400 million live and work in a more dynamic global environment than those in the interior, and it also shows in Korea,

Vietnam, and China where increasing exposure to those trends erodes the once rigid approach to institutions that traditional Confucian values have upheld. « Make money, not war » has become a more dominant motto among the youth in many of these countries, where historically their closed borders reinforced a sense of distinction that open trade can no longer support. And it has begun to accelerate in China since its admission to the World Trade Organization, which reinforced the rapid economic growth that the economy has been experiencing, and which is changing the balance of power in fundamental ways throughout East Asia. In such circumstances, a deference to authority of elders is giving way to a more aggressive and entrepreneurial spirit. And it also has its political counterparts in periodic and ongoing uprisings for change, as in Indonesia and in the Philippines<sup>xii</sup>. One can thus ask what about the collision of values in many of these countries.

#### **Singapore: A Lumbering Dragon**

Singapore, with its mixed population of Malays and ethnic Chinese is an authoritarian parliamentary republic. Established in 1965 following its secession in 1965, wealth in this tiny state of 618 square kilometers came during the 1990s as global trade and finance expanded in the region. With a 2000 GDP of \$85 billion, Singapore's per capita GDP of \$28,000 makes it one of the richest countries in the region. Yet, the apparent success of this authoritarian state belies its underlying problems. What both President Lee Kuan Yew and his successor Goh Chok Tong have been compelled to acknowledge is the need to blend the religious beliefs of its Malay Moslem population with those of its Chinese Confucian merchants, a delicate balancing act that must be seen as rational to all. As a result, public whipping for petty crime is widespread, as well as an aggressive police force that zealously prosecutes all who smoke in public or throw trash on the ground.

Singapore's basic division lies between its Moslem Malay majority who dominate political life and its ethnic Chinese minority who dominate economic life. Of its population, Singapore consists of some 23 percent of min-nan Taiwanese descent, 12 percent of Chow Chew origin, 9 percent Cantonese, 5 percent Mandarin, with 11 percent Malay and Anglo-Australians at 5.2 percent. In terms of language use, Taiwanese Chinese accounts for some 40 percent of speakers, Malay represents another 12 percent, and Cantonese at 9 percent, with the rest speaking a mix of Tamil and English, sometimes referred to as « singlish » for « Singapore English », as it has come to be known. And within this mosaic, one finds a strong national sense of identity across all groups, and at the same time with respect for differing religious traditions.

Singapore's education system is highly developed, from kindergarten to the university. Social equality is meticulously upheld, and in which parents are free to choose which of Singapore's four language schools they may wish for the education of their children. At the end of secondary schooling, 87 percent of students speak correct English and 65 percent speak both English and Chinese.

A major driver in Singapore is its high level of trade dependency, at a level rivaled only by Hong Kong (with exports at \$145 billion and imports at \$128 billion as of 2001). What propelled Singapore to this role in part was the impact of the Cold War in the region. Both Hong Kong and Singapore came to function as entrepôts for trade among firms in Taiwan, South Korea, Japan, and China. Functioning first as a port of call, Singapore then evolved into a major industrial assembly economy.

Despite these advantages, Singapore has faced limits to its potential. Among them is the outbreak of SARS<sup>xiii</sup> in February-March of 2003, which resulted in an immediate quarantine on foreign trade, the firing of some 800 employees in the port as a result, and the growing strength of neighboring ASEAN<sup>xiv</sup> countries, thereby undermining Singapore's image of a full employment high growth economy. As a result, for the first time since independence in 1965, Singapore has seen its growth rate fall to below 2.5 percent, and was actually negative in 2001. What authorities have done in response is to accelerate parallel trade agreements with ASEAN member countries, notably Australia in 2001 and the US in 2003. Yet even these agreements may pale in comparison to the extraordinary growth of China, and which is attracting much investment from Singapore's ethnic Chinese toward both mainland China and Taiwan.

#### **Malaysia : Pragmatic Coexistence of Cultures**

Malaysia is a former British colony that evolved into an independent constitutional monarchy beginning in 1957. Its long peninsular configuration gives it some unique geographic advantages. With some 330 thousand square miles of land, it is separated by the South China Sea into the Malay peninsula (132 thousand square kilometers) and East

Malaysia (some 200 thousand square kilometers) on the island of Borneo. Borneo contains the provinces of Sabah and Sarawak, which joined the Malay federation in 1963.

Malaysia's population of 25 million has doubled over the past 30 years. It consists of a dominant Malay population (the Bumiputras account for 65 percent, and who dominate the civil service and government institutions) with ethnic Chinese at 26 percent (and who, as in Singapore are dominant in local and international business), followed by ethnic Indians at 8 percent, and who are largely dominant in large scale agricultural plantations. Malaysia has fostered rapid population growth as a means to counterbalance some of its larger neighbors, particularly in reference to Vietnam, which has a population of some 84 million. And of course, there always is the presence of China, with its 1.3 billion population. Together with South Korea and Japan, these countries have become the dominant partners in the regional ASEAN group, as can be seen in Table 3 below.

TABLE 2: BASIC PROFILE OF THE ASEAN +3 GROUP

	Population, in millions	GNP in \$US billions	Per Capita GNP, in \$U.S.
ASEAN	530	575	1,100
Japan	135	4,509	34,715
China	1,285	1,260	904
South Korea	50	500	10,000
ASEAN +3	2,000	6,400	3,200

Source: Data from *Etat du Monde 2005*, as noted in Table 1

Malaysia also has a large immigrant population consisting of some 2 million Indonesians as of 2003, and which provide the economy with a skilled labor force, especially in construction. This labor enables Malaysia to reduce its costs, and thus helps maintain a competitive international position in the current global environment. We also note that, as in Vietnam, Malaysia uses the latin alphabet for its main language, Hokkien. Hokkien is a dialect spoken by the Malay Chinese, which, along with Indian Tamil and English, account for the overwhelming number of speakers in the country.

Political dynamics in Malaysia are driven by a careful mix of ethnic participation. The dominant political party, UMNO, relies on support from MCA, the powerful Chinese political party, as well as from MIC, the Malaysian Indian party. In recent years, the Malaysia Islamic Party, or PAS, is exerting an increasing influence in elections and is becoming yet another force in the political landscape.

Islam is the official religion in Malaysia, accounting for some 55 percent of the population, even though government statutes call for protection of other religious groups. Government policy is built on the notion of respecting differing local cultures, and careful attention is given to assuring participation in the political process by these groups. Although Islam is the state religion, Malaysian authorities have gone so far as to place other religions on an equal footing, particularly in terms of recognition of various religious holidays. For this reason, Malaysia has more religious holidays on its calendar than almost any other country in the world<sup>xv</sup>.

Malaysia has faced a difficult balancing act in terms of its religious and political institutions. For more than twenty years, President Mohammed Mahathir established a record of sound and vigorous economic growth<sup>xvi</sup>. Since his retirement in 2004, his successor Abdullah Badawi, has faced the growing challenge of maintaining Malaysia's competitive position in the face of more dynamic growth from both China and India. While Mahathir came across as strident and anti-western during the stormy financial crisis of the late 1990s, Badawi (who completed his studies at the Islamic University of Penang) has adopted a more conciliatory tone<sup>xvii</sup>.

In this environment, foreign firms have adopted a policy of appeasement, and have thus made the succession of Badawi relatively smooth. At this point, foreign multinationals have made important investments in the country and bringing high tech jobs along with them<sup>xviii</sup>. Yet Malaysia has some of the same problems as Singapore. Both operate in an extremely competitive market with their less well off neighbors of China, India, and Vietnam, and yet must continue to attract foreign investment lest their growth slow down. So widespread is the recognition of this phenomenon that Malaysia has recently begun to allow wholly owned foreign subsidiaries to set

up operations rather than the historical practice of requiring a 30 percent Malaysian participation rate.

#### **Indonesia: Recurring Crises of Independence**

Indonesia is the largest Moslem state in the world and the most populous in southeast Asia. With a population of 220 million living among 14,000 islands that make up the Indonesian archipelago, of whom 180 million are Moslem. In contrast to other ASEAN Moslem majority states in the region, Indonesia has had greater ethnic tensions with which to contend, some of which have resulted in breakaway secessionist movements. In common with Malaysia and Singapore, Indonesians have a great deal of ethnic and linguistic diversity. Bahasa is the official language, whereas English serves as the language of commerce much as it does in other neighboring countries.

Indonesia is a presidential republic. Current president Susilo Bambang Yudhoyono was elected in September 2004, following the three year term of Megawati Sukarnoputri, Indonesia's first woman president. Megawati was elected following the downfall of the Suharto dictatorship whose interim ruler Abdurrahman Wahid (Gusdur) functioned during the transition to a presidential system.

Indonesia's sometimes turbulent political fortunes have turned not just on its oil wealth, but also on a lack of cohesion among its many ethnic groups<sup>xix</sup>. While Megawati had worked hard to reduce many of these conflicts in the aftermath of the East Timor secession, other revolts continued to fester and which caused foreign investors to look at the country as in a high risk category<sup>xx</sup>. And the lack of foreign investment has meant that even with oil, the country has not been able to achieve the kind of economic growth as have some of its neighbors.

Political turmoil has led some to call for the installation of Shari'a law as the official code of administration. However, even Indonesia's Moslem population, long known for a more tolerant brand of practice, did not provide enough support for this proposition, which failed in the 2004 elections. Some of this reticence reflected the careful diplomatic efforts of Megawati. She negotiated in September 2002 a peaceful commitment by the Islamic fundamentalist group Laskar Jihad, to stop fighting and to cease its operations. She also negotiated in December 2002 a cease fire with the Banda Aceh separatist rebels who had been fighting for independence on the northwest coast of Sumatra for the past several years<sup>xxi</sup>. Yet this latter accord began to unravel in 2003, and a fragile truce came about in response to the tsunami destruction of December 2004.

Current president Susilo Bambang Yudhoyono has sought to achieve political stability through a policy of stimulating economic reform while at the same time upholding an independent position in Indonesian foreign affairs. Thus, Indonesia opposed the United States on the war in Iraq, while at the same time looking for international assistance in strengthening the national army to preserve political stability. What has made this strategy particularly difficult to pursue is that Indonesia has not yet recovered fully from the Asian financial crisis that accompanied the devaluation of the Thai bhat in 1997, and which in 1998, produced a 13.5 percent contraction in Indonesia's GDP. While recovery is taking place at a current rate of 4 percent (as of 2003), it is below that of its neighbors and below what Indonesia was able to enjoy during the earlier 1990s. Key to the recovery is a healthy export surplus built on oil and natural gas, electronic components, wood and derivatives, along with various minerals. The current surplus stands at \$U.S. 29 billion (with exports at \$62 billion and imports at \$33 billion), out of a today GDP of \$220 billion. What remains is whether the destabilizing effects of the December 2004 tsunami will derail the careful recovery that had slowly begun to expand, for which such sectors as tourism in places like Bali have been hit hard.

#### **India: The Challenge of Castes**

Despite economic liberalization and an increasingly robust economy, India still has the achilles heel of an inherited caste system<sup>xxii</sup>. India's caste system has had a combination of effects on the economic and social order. Among them, we cite:

- Professional specialization and hereditary artisanry
- A rise in endogamous relations among members of the same caste
- A reinforcement of hierarchy and social order

Indian castes actually are more numerous than first appears. Traditionally, India has evolved with five distinct caste structures, each of which has its own hierarchy, or « varna », and often sub-divided into subgroups or « jatis »:

- At the top are the Brahmins, who originally constituted a priestly class. Brahmins served at marriage and

- funeral rites. They typically are vegetarian as eating any « living » thing is thought to be impure ;
- Next are the Kshatriya, who belong to a warrior caste somewhat less pure. Apart from their warrior tradition, other functions seem less well defined ;
  - Third are the Vaisya, who are production workers who have evolved essentially into a merchant class. Many follow vegetarian tradition, especially in West India ;
  - Fourth are the Sudra, who constitute an outcast class and represent the great majority of India's population. They are overwhelmingly peasants and small artisans.
  - Finally, there are the untouchables, those who fall even below the Sudra class.

Principles based on hereditary specialization, endogamous family relations and social hierarchy create some rigid distinctions that inhibit the full expression of skills and talents in Indian society. Birth right at one level translates into birth obligation at another, with little social mobility if at all.

Endogamy leads to monopolization in family relations. A 1993-1994 industrial survey noted that 90 percent of all private firms are controlled by families belonging to specific social castes<sup>xxiii</sup>. More specifically, the survey found that these families controlled 70 of the 100 largest Indian firms. A subsequent survey undertaken in 1997 showed that among the top 50 Indian family firms, 15 are controlled by members of the Brahmin class<sup>xxiv</sup>. Thus a single caste can, by virtue of a few socially connected families, dominate an important part of the national economy. By setting arbitrary constraints, the choice of markets, goods, and factors within caste-shaped firms leads often to an inefficient allocation of resources, and in which productivity gains are either lost or under-realized, thereby reducing the economy's rate of growth for a given rate of saving.

Over time, Brahmin dominance in the social order served at least two functions. First, it reinforced a set of elites who would provide a structure for social protection. And second, Brahmins would serve as instruments for interpreting and expanding Hindu thinking and beliefs. Within this tradition, being born into a particular caste is part of a process of purification from one's previous life. Passing to the Brahmin caste from successive previous lives conforms to the process of birth and renewal toward spiritual purification.

Against this rigid tradition, we should also take stock of the influence of Gandhi. Himself born a Brahmin, Gandhi spent the greater part of his life in struggles for social justice. These struggles involved not just non-violent resistance to British colonial rule, but also ongoing efforts to abolish India's caste system toward a broader ethos that focused on the less advantaged members of society. Today, we see some evidence of the relaxing of caste strictures, but it often carries a price. When a marriage involves a daughter from a lower caste, it typically is the case that the lower caste family must provide a large dowry to the family of the groom. The children of the family are considered to become the property of the family of the groom. In the event that no children are issued, the husband may renounce the marriage with no obligation to return the dowry in part or in whole. In some cases, there have been reports of « honor » killings by Brahmin individuals for a failure of a spouse's family to pay a dowry, or because the wife no longer wished to be married to her partner.

Educated women in India, particularly those that have succeeded in establishing professional careers, have taken the lead in criticizing the caste system and in promoting the extension of human and civil rights. Despite change in this area, India still functions with a social structure that on the one hand continues caste-based practices and tradition, even though civil law and India's constitution expressly forbid the use of social privilege as a basis for social relations. Thus, while India since the time of Gandhi has outlawed the caste system, in reality, it continues to operate in many sectors of society, and often to the detriment of India's enormous economic and social potential.

#### **Japan: Stress and Deception**

Of all economies in East Asia, Japan has not only been a pioneer in the adaptation of western technology, but also one of the most successful. What makes Japan somewhat exceptional is that this has taken place in a context in which great emphasis has been placed on social conformity, a reluctance to emphasize individual distinctions, and in which values of loyalty and devotion are paramount. As in the ancestral model of China, Japan has built a social system around a devotion to hierarchy and authority. What distinguishes Japan's approach to these Confucian values is its more authoritarian form. Much of this derives from the Japanese tradition of its samurai warrior class, who serve as first protectors of the divine authority of the Emperor. Bushido, the Japanese code of honor, places central emphasis on ritual adherence to authority, including the famous « hari kiri » suicide ritual that during the

Second World War, took the form of the famous suicide « kamikaze » planes that tried to destroy allied ships fighting imperial Japan.

The education system of Japan seeks to inculcate children with an inbuilt sense of deference to authority and in support of social harmony. Before the Second World war, the Emperor, or « Tenno », was considered the earthly symbol of purity, and whose Prime Minister functioned as the first « Shogun », or administrator of the Emperor's divine will. Decisions by the Emperor as administered by the Shogun would reinforce the virtues of honesty, patience, spiritual unity among all citizens upon pain of death. In this social order, each individual knew his or her place and how to translate that role into the service of the nation.

Within Japan's industrial system, each worker was called upon to display acts of loyalty, with decisions based on collective consensus all in support of a hierarchical social structure. Labor unions did not exist to bargain for better working conditions but to improve the tasks of production, and confrontation was to be avoided. Given this rigid conception of social order, when leaders of firms failed to protect the interests of workers, or when corruption took place at the firm or even political level, reactions could at time become violent.

Western firms seeking to do business often have confronted a veil of ignorance. This has not been due to language alone. It reflects a protective nationalist sentiment in Japan, and a general unwillingness to cede significant control over economic decisions to others than Japanese themselves. Thus, while Japan has become a more open economy since the Second World war, this opening, like the opening by Commodore Perry in 1853, has been accompanied by a will to acquire modern technology from the West and to then use it in the crafting of a mercantilist economic policy. Not surprisingly, in Japan today, as is the case of China and Korea, we see an absorption of Western products and technologies, but also with the view that trading surpluses are considered to be a benchmark of success rather than an imbalance to be redressed.

## Conclusion

In this review, we have seen that Western-centered economic models that have been used to explain economic growth and development have fallen short when it comes to non-Western economies. The principal reason for this gap is that the evolution of economics as a social science has been predicated on the application of scientific principles, principles that if they are to meet the standard of science, must have universal rather than partial validity.

In today's process of globalization, it is essential to take geographic and cultural differences into consideration if one is to understand why some countries succeed and others do not. Analyses of comparative costs in terms of literacy, health standards, the urban environment, or a ladder of professional success will inevitably differ beyond purchasing power parity estimates in various countries, be they in Burkina Faso, Benin, or Vietnam or Laos. Yet training in economics throughout the world continues to function largely on Western-centered theories and models. And here we are barely a generation from the great waves of political independence in which success is measured by formal mathematical models in which statistical tests are the norm but in which important qualitative dimensions reflective of cultural and political differences are largely unobserved, much as in the case of the economic weight of the informal sector in many developing economies. In our view, this unobserved behavior is as critical as the « residual » in the well known growth studies of the 1960s and 1970s in which changes in factor inputs explained only a portion of differences in rates of growth among major developed economies.

If there are challenges for strengthening economic ties between developed and developing economies, they are due in part to the failure to adopt a more comprehensive view of the determinants of economic growth and behavior along the lines we have elaborated on here. What traditional Western-centered mathematical economic models tend to reflect is an ignorance of local economic differences that may not be directly observable. When confronted with inconsistent results, these models call into question the universal pretensions of economics as a social science.

- Overcoming the theoretical and empirical gap between Western mathematical models and the socio-economic realities in globalizing economies will require taking explicit consideration of a number of phenomena. We emphasize the following :
- At the cultural level, determining how ideology, philosophy, modes of thinking, religion, beliefs, customs,

- and behavior differ across markets and regions ;
- At the geographic level, taking into consideration both population dynamics and natural resources into what may be treated as economic geography and its role in explaining economic phenomena ;
- At the institutional level, analyzing how economic and financial flows are organized in both the formal and informal sectors, including an examination of the determinants of an economy's infrastructure both physical and human (i.e., schooling and health).

When any one of these dimensions of development fails to function, it usually signals a form of economic and financial, not to mention political, crisis. Since globalization depends in part on managing the risks of crises, a clear understanding of cultural, geographic, and institutional factors can serve as an important building block to its success<sup>xxv</sup>. Given differences in the factors across economies and regions through time, individual countries can be quite rational in adopting their own national strategies<sup>xxvi</sup>.

From an expanded research perspective, it follows that educational systems across countries should embrace a study of their unique characteristics and then to engage in regional exchanges on which greater mutual understanding of economic and social ties may be pursued<sup>xxvii</sup>. It is also through such bottom up acquisition of knowledge that emergency policies in the face of global ones may be better crafted and in which their frequency may become less severe than the ones that we have seen in recent years.

## **Annex**

### **The Impact of Philosophy and Religion on Asian Culture**

The transformation of South East Asia from a model based on Marxist autarky to an export-driven market environment has produced profound consequences for the region. This transformation is all the more remarkable given historical differences in fundamental national values, behavior, and popular aspirations. Whether one looks at India, China, South Korea, Japan, or Vietnam, western-centered models fall short in providing a vigorous explanation of what has been taking place. We take in this position in consideration of several examples, notably :

- Marx never addressed less developed countries such as China or the Sudan in his writings ;
- Keynes never took into account how his theory of macroeconomic stabilization might differ in terms other than those of an advanced industrialized economy such as Great Britain ;
- Rarely have contemporary economic theorists chosen to go beyond the manipulation of traditional econometric models to take into consideration the importance of such phenomena as the informal sector in African and Asian economies (it represents approximately 40 percent of official GDP in Vietnam, for example), or informal credit and savings institutions such as the « tontines » in Sub-Saharan Africa whose functioning is well adapted to the local environment, or even how differences in local customs or the absence of infrastructure nevertheless does not prevent the emergence of dynamic economic relations.
- There also is an intercultural communications bias adopted by the great majority of economists, particularly as it pertains to their counterparts in the humanities and other social sciences. Often expressed in dismissive terms, economists often dismiss the methodology used by other social scientists as incompatible with the norms of scientific investigation, and in which they often cite that only economics has risen to the scientific standard of a Nobel Prize. In the never ending quest to establish an equivalence between economics and the physical sciences, economists thus overlook critical cultural and human aspects that are so often at the base of the very economic decisions they choose to study.

If the emergence of contemporary China has been somewhat of a mystery, it is in part because it has not a phenomenon in which one can use the typical reasoning of contemporary economic science. In our view, the key to understanding China's economic transformation must include an understanding of the practical philosophy of its leadership who at the same time can proclaim their communist credentials in a periodic critique of capitalism while at the same time fostering some of the most capitalistic forms of behavior that one could imagine. This seeming paradox reflects nothing less than the ongoing influence of Asian religious and philosophic values and customs, that reflect their Confucian, Buddhist, Hindu, Taoist<sup>xxviii</sup>, Shinto<sup>xxix</sup>, and Islamic heritage. In this sense, many economists are not likely to discover the underlying dynamic that shapes the emergence of Asian economies in the twenty-first

century. For this reason, we now look at how these influences have indeed created the kind of dynamism to which we are now witness.

### **Confucianism**

The great majority of Asian countries have developed institutions that are strongly influenced by Chinese cultural traditions that combine both rigor and superstition. Given that China's influence extends over a period of three thousand years, neighboring countries have had few choices as to how they would acknowledge the cultural role of China. While these countries have also engaged in periodic wars of conquest, they have nevertheless shared a common bond of essentially Confucian values. Established originally by Kong Fu Tseu<sup>xxx</sup> in the sixth century BPE, Confucianism is based on a system of philosophic principles and moral values for the ideal organization of human society, and all in the pursuit of social harmony.

Superstition plays a role in the Confucian value system. It is based on an integration of ancient notions of Chinese cosmology that provide a justification for political and social organization. Confucius emphasized an unflinching respect for social hierarchy. At the top of the social pyramid, the emperor represents the link between earth and the supernatural. He is thus the central figure who by his divine authority, mediates social harmony. Everything is directed around the emperor and everyone must obey his directives. In symbolic fashion, the emperor lives in the center of the palace, which is in the center of the capital, which is in the center of China, and in which China is the center of the universe. It is from this conception that China has derived the expression of the country as the center of great middle kingdom.

Surrounding the emperor is a large retinue of educated individuals who serve as civil servants devoted to establish the links between the emperor and the people. These bureaucrats thus carry out orders of the emperor and express the divine will of the emperor. In turn, and in a strictly hierarchical fashion, farmers, artisans, and merchants each constitute classes that must render homage and loyalty to the civil servants of the emperor.

This social arrangement operates with a view of promoting basic social harmony with the emperor at the center. Social harmony is the supreme goal of philosophy and Confucian values. In China, moral authority of each individual is sufficient to guarantee social harmony among all subjects within the empire.

When Japan adopted Confucian values, they were reinforced and became even more authoritarian. Armed forces such as the samurai warriors would provide proof of imperial strength in order to punish any transgression from a hierarchical model in which the emperor reigned supreme. The Samurai thus functioned in a more militaristic fashion as the counterparts to their more bureaucratic Chinese civil servants. As some have suggested, the emphasis on military strength to reinforce social hierarchy has produced both external aggression, as in the occupation of Korea in 1910, and in the expansionism of Japan during the Second World War, but also in terms of socially destructive behavior in contemporary times. The popularity of religious sects and suicides in Japan is more pronounced than in most neighboring countries.

The Asian notion of a harmonious organization of an obedient society expressing devotion to the emperor, the country, the business executive, the head of family, and one's ancestors explains much of the contradiction between a tradition of extreme hospitality, smiles, and suppleness side by side with a strong sense of closed negotiations in commercial relations, be that among partners or with one's competitors.

The sense of social closure manifests itself first and foremost among Asians themselves. A Chinese worker may work up to 14 hours a day, often including Saturdays, for very low salaries, and with practically no social service provision for those who are weak, old, or sick. The same sense of closure also shows up in terms of international relations with Western groups. This often produces misunderstanding, even to the point of resentment in such alliances as joint ventures in China and Vietnam. As a result of the closed sense of communication, foreign investors often find themselves drawn more often to projects in which they have complete control whenever law permits, but in which greater mutual understanding becomes a casualty.

Taken together, Confucian values and attitudes have a profound influence on social behavior in many Asian countries. It shows in terms of the organization of individual and social life, as well as in terms of international trade and trade negotiations.

### **Buddhism**

Buddhism<sup>xxxi</sup> constitutes a parallel development with Confucianism in Asia. From its origins in India, Buddhism spread rapidly across many countries in Asia, evolving in various ways as to how best understand both the concepts

and their applications. Although Buddhism gradually lost influence in its native India after the 12th century, it has continued to thrive in other parts of the world.

Buddhism embodies a means of spiritual reflection, a personal and social philosophy which at the same time is « agnostic » in that it has neither a god nor a body of saints. As a partial offshoot of Hinduism, Buddhism began along the Ganges in the sixth century BPE and evolved into a philosophy to understand human suffering, and from which one can find the path for its elimination by following the highest path. This awakening, from which the term « buddha » comes from the ancient Sanscrit, is based on the pursuit of knowledge and in the support of other members of society.

A single life is insufficient to achieve the golden awakening. Several are necessary. Through meditation and the gradual accumulation of wisdom, one moves ever closer to the divine path, with each cycle of rebirth and reincarnation. This philosophy corresponds simultaneously to the needs and aspirations of many Asians. It provides a timely spiritual response to the sufferings of the body and the soul.

Throughout one's life, each individual, whether rich or poor, passes from adolescence to maturity, to old age, sickness, and death<sup>xxxii</sup>. Recognizing this eternal cycle of renewal, it is incumbent on each individual to adapt a lifestyle that is built on the quest for universal harmony as expressed in the teachings of Buddha<sup>xxxiii</sup>. The emphasis on social harmony enables one to understand all walks of life, from those with means to the least advantaged.

The appeal of Buddhism lies in its various ways of fostering belief. The degree of austerity differs significantly among practitioners. To achieve the highest level of understanding, or nirvana, several instruments are possible. There is the Buddhism as a grand instrument, a small instrument, a golden instrument, a Zen instrument, among others<sup>xxxiv</sup>. Because there is no single way to nirvana, Buddhism has produced some offshoots that are built around cultish practices, as in the Soka Gakkai, Sukyo Mahikari, Sahaja Yoga, and others, to which we add that some also have taken on violent forms that are antithetical to most teachings of Buddhism. The sarin gas attack on the Tokyo subway was led by a cult, for example.

In terms of economic content, one dimension common to most forms of Buddhism is a renunciation of worldly possessions and consumption as they constitute obstacles to the path to nirvana along the continual process of destruction and renewal. In this sense, Buddhism is antithetical to most western notions of economic dynamics that revolve on savings and investment, productivity and technical change, and in which the assumption is the choice of scarce resources to satisfy unlimited wants.

It also is instructive to note that Buddhism is an alternative to the Eurocentric notion that, as Max Weber put it in 1904, the protestant ethic is the religious key to the industrial success of the western world. By placing emphasis on a continuous process of death and rebirth toward the state of nirvana, and by an active dedication to respecting the social hierarchy provides Asian economies an equally valid way to generate material wealth. The corollary respect given to one's elders and ancestors translates into devotion to the leader of a firm, as well as the leader of the country, all acting in concert in pursuit of a common goal of improvement. Indeed, it is this system of hierarchy that explains not just the militaristic impulse in some Asian societies, but also to treating the firm in near theological terms. Images of individuals placing jewels and other gifts to the Korean government to help it overcome a financial crisis such as took place in 1997, or the periodic suicide of corporate officials in Japanese firms when scandal or fraud was declared is testimony to the sense of subordination of the individual to the higher goals of society.

#### **Islam in Asia**

Islam has produced major political and cultural consequences not just in the philosophy and religious practice among Moslems, but also on intellectual, scientific, artistic, economic, and social life in communities where it has become the dominant religion as well as in countries where it is in the minority. Historically, Islam has functioned as a cultural intermediary that covers the pagan, agnostic, and other ancient religions, and whose cultures functioned under various dynasties such as the Pharaohs in Egypt, the Etruscans, Greeks, Romans, and the Middle Age up to and through the European renaissance.

In Islamic society, shari'a law has long served as the instrument for civil and criminal codes of conduct. Shari'a law derives from the Koran, which is considered as the earthly manifestation of Allah, the supreme being<sup>xxxv</sup>. Since the beginning of the Hegira, or exile of Mohammed the Prophet from Mecca to Medina in 622, Islam has evolved as a source of struggles for power and extension over large geographic areas in an effort to bring other

people to its rule. Following the death of Mohammed in 632, a civil war broke out between Ali, the nephew of Mohammed and the Sunni Umayyids over the succession of power. The Umayyid victory resulted in the establishment of the first caliphate dynasty, a struggle which also resulted in the assassination of Hussein in Karbala in 680. The martyrdom of Hussein became the rallying cry for the Shi'ites, who became the principal opposition to the then dominant Sunni Umayyid caliphate. With this passage, the Sunni Arabs then spread westward, conquering Carthage in 698, and proceeding westward to cross into Spain and then into France.

While Sunni conquests were aimed at conversion of all those in their path, some such as the Berbers of North Africa offered periodic resistance. In the Aurès region of present-day Algeria, for example, Berber populations maintained their historic and cultural identity, for whom the Kabyl have become well known<sup>xxxvi</sup>. Yet despite such resistance, some Berbers did use Islam to engage in a jihad against populations further south, notably the Almoravid invasions into the ancient kingdom of Ghana. But none of these changes produced a monolithic empire, as the Seljuk Turkish invasion of Baghdad in 1055 attests. The Seljuk invasion resulted in the domination and subsequent exile of the Umayyids by the Abbasids, after whom Ottoman power then went on to rule as far as Algeria for the next several centuries.

#### **Islam in China**

Islam also spread farther east into Central Asia, and through a combination of military pressure and growing trade, extended its reach into western China. Yet it was mostly the Mongols who converted to Islam following the rise of Genghis Khan, followed by Tamerlane in the 14th century, and Bäber in the sixteenth, and Mongol power represented the greatest threat to China's imperial rule.

Immigration of Arabs into the western provinces of China had already begun by the eighth century, in large part through the growing trade in goods and for which the famous Silk road from Sian to the Middle East would become famous. Commercial success among the Mongols posed a rising threat to the Yen dynasty in China, especially with the imperial conquests begun under Genghis Khan. Mongol successes led to Islamic domination in the larger cities in western China, particularly in the Gansu and Yunan regions. Chinese perceptions of these converted peoples took the form of calling them the « hui-huis », and for whom their Islamic religion was known as « Qing zhen jiao », or the true and pure faith.

It is well known that Confucianism is based on the search for wisdom, harmony, and tolerance. Chinese thus had a certain level of hospitality toward these new believers and in the sixteenth century, the Chinese philosopher Li Zhi made efforts to articulate an Islamic-Confucian synthesis of beliefs. Given this context, Moslems in China have become well integrated within the local population. It was only in the nineteenth century that tensions began to break out, notably the uprising in Taiping that resulted in 30 million fatalities over a period of twenty years, and which in turn produced corollary uprisings in the south-west (1855-1873) and the north-west (1862-1877) between Confucian and Moslem Chinese.

Tensions between Moslem and Confucian Chinese during this period coincided with a major debate over the modernization of Islam. It was becoming increasingly clear that the surrounding world, notably the West, had achieved rapid material progress that created growing pressure to address the reciprocal relations between religion and the state. Chinese authorities expressed growing doubts over the role of Moslems in society, in particular the extent to which they viewed themselves as Chinese or as members of a non-Chinese community. Not surprisingly, in the turbulent years of the Cultural Revolution in the 1960s, revolutionary groups went about harrassing Moslems with the same intensity as they did other potential enemies of the state. When the Cultural Revolution ended a few years later, Chinese authorities did seek to make amends by inaugurating with great pomp a new grand mosque in Beijing in 1970. Since then, Chinese authorities have displayed a relatively tolerant stance toward Moslems, who today constitute some 13 million in the country, and thus an important national minority.

#### **Islam in Central Asia**

As Islam confronted pressures regarding modernization in China, so too was the experience in Central Asia. Many in Central Asia urged an evolution in Islam through modern schooling, and through social reforms that extended down to daily political life. Moslems in the region thus asked the same question as their Chinese counterparts, namely, « What can we learn from the West without losing our sense of identity<sup>xxxvii</sup> ? » Part of this self-examination took place as the once strong administration of the Ottoman Turks foundered on a frozen system in which little innovation took place<sup>xxxviii</sup>.

One central question that arose was the central issue of the secularization of Moslem states in which the role of the State began to diverge from Islamic religious authority. This process reflected several divergent tendencies, including the somewhat paradoxical one in which Shar'ia law was applied increasingly in efforts to provide protection for minority rights among the Christian and Jewish populations within the Ottoman empire<sup>xxxix</sup>. And as secularization proceeded, little attention was given to the protection of minority rights, often placing them in an ambiguous and uncomfortable role. Risks of genocide, of ethnic cleansing became more acceptable in Moslem states with the ironic decline of Shar'ia law and an ambiguous role of secular law.

In India, the Moghul empire began to fall apart over a series of generations. What created a pause in this process was the Sepoy rebellion of 1757, where local soldiers serving in the British colonial army resented military practices they viewed as inimical to their beliefs. In particular, what sparked the rebellion was a refusal to obey the British order to use their teeth to reload their bullet cartridges that had been greased with pork fat in their manufacture. While the Sepoy rebellion was put down by British forces, the rebellion also produced conflict between the Moslem Indians who wanted to restore the Moghul empire to its former Islamic glory from its decline after the death of Moghul Aurangzeb in 1707, and the Maharasha empire that consisted of Indian Hindu believers. The rebellion of 1757 set into motion a continuing chain of divisions between Moslems and Hindus, culminating with the separate states of India and Pakistan at the time of independence from Britain in 1947.

While religious divisions deepened within India, other countries took a different path in the waning days of the Ottoman empire. Interestingly, Turkey emerged from its Ottoman roots under the nationalist leaders Mustapha Kemal Ataturk, who not only abolished the caliphate, but used a firm hand to make Islam clearly subordinate to the newly emerging republic<sup>xl</sup>. Ataturk reinforced this separation by adopting a Western style civil code, and placed major emphasis on public schooling, the banning of headscarves, and other symbols of traditional Islam, thereby creating a legacy that has lasted since then. Today Turkey is viewed as one of the more modern states in the Moslem Middle East, not just for these reforms, but for others that created higher rates of schooling, guarantees for religious minorities, as well as providing for significant roles for women, including more recently, the election of Tansu Ciller, Turkey's first woman Prime Minister from 1993 to 1996.

In Persia, the Kadjar<sup>xli</sup> kingdom stood at some 10 million inhabitants at the beginning of the 20th century, of whom only some six percent lived in rural communities. However, the country remained poor during the first half of the twentieth century until oil was discovered in the 1930s<sup>xlii</sup>. Since then, a newly renamed Iran became progressively more important as oil resources were developed, contributing some 70 percent of government budget revenues, but not without ongoing political turmoil. Although Iran under the Shah (1953-1978) rode the oil price rises of the 1970s, it also led to political instability as import prices rose as well, and which culminated with the fall of the Shah and the creation of a revolutionary Islamic government under Ayatollah Ruhollah Khomeini in 1979. While Ayatollah Khomeini orchestrated the US embassy hostage crisis as a unifying means to solidify political power, his successors have presided over an ambiguous relationship in which an elected parliament, or majlis, proposes legislation but all final decisions reside with an unelected group of ayatollahs who have done much to resist any restraints on the dominant role of Islam in what was under the Shah a relatively moderate regime. Not surprisingly, foreign investors look askance at Iran as a high risk country and capital inflows have been meager for some time. And while Iran today has taken cautious steps to engage in economic and political reform, the country still faces an ambiguous future, and one particularly clouded by ongoing efforts to acquire nuclear weapons technology.

In Saudi Arabia, another set of tensions have also been put into motion. By far the country with the greatest proven oil reserves, it has adopted a political and religious arrangement in which the ruling house of Saud that came to power in the 1930s enjoy a level of political legitimacy in part because of their declared support for fundamentalist Wahabi, who enforce and propagate a strict version of Islam within the kingdom as well as promote its application abroad. Unlike Turkey, for example, Saudi Arabia, which is home to two of the holiest sites in Islam – Mecca and Medina – affirms the political legitimacy of the kingdom with its strict application of Shar'ia law.

Oil affords the Saudis the ability to pursue modernization of the country's infrastructure, including university education for women. Yet the contradictions of the modernization efforts show up with a strict separation of women from men, and other strictures such as a prohibition on women driving automobiles, as well as a strict gender separation at social functions.

In Tunisia, much progress has taken place during the time of President Habib Bourguiba, who was leader of the Neo-Destour party at the time of independence in 1957. Tunisia's constitution guarantees gender equality, forbids polygamy, and permits contraception and controlled abortion. Although Tunisia has no known petroleum resources, it has achieved relative economic success through modernization in its schools, and through setting some boundaries between religion and the state.

Finally, we note countries such as Indonesia in the far East, which have traditionally been known for practicing a more moderate and tolerant branch of Islam. This has been due in part to the spread of Islam in the archipelago by largely commercial contacts rather than wars of conquest and resistance. It also has made notable steps toward democratization in the political system, particularly in the period following the rules of Sukarno and Suharto from the 1960s to the early 2001 period<sup>xliii</sup>.

## **End Notes**

---

<sup>i</sup> je ne parlerai pas de l'Amérique Latine dans cette présente communication.

<sup>ii</sup> Guy SCHULDERS, « La Chine du Nouveau Départ », Editions L'Harmattan, Paris 1987 et Guy SCHULDERS, « Turbulences Chinoises », Editions L'Harmattan, Paris 1989.

<sup>iii</sup> Quand nous avons publié « La Chine du Nouveau Départ » en 1987, puis « Turbulences Chinoises » en 1989, l'économie chinoise n'intéressait pratiquement personne en France ; seules les considérations culturelles étaient alors évoquées. Maintenant, après que la sortie presque simultanée de deux films à succès ait rappelé à nombre d'Européens les charmes romantiques et doux de l'ex-Indochine, les candidats à l'investissement se sont précipités pour se déployer au Vietnam.

<sup>iv</sup> Il faut éviter, cependant, l'erreur qui consiste à considérer que les matières premières se trouvent dans les pays du Sud alors que les produits industriels sont exclusivement fabriqués dans les pays du nord. Le cas des économies asiatiques contredit cette présentation dualiste par trop caricaturale. Actuellement, l'Amérique du Nord, en particulier le Canada et les USA, figurent parmi les premiers producteurs d'un grand nombre de matières premières.

<sup>vii</sup> Bien qu'apparemment pacifique, ce pays usera-t-il de sa puissance économique spectaculaire pour imposer des solutions unilatérales aux difficiles problèmes de Taiwan, des Parcelles, des Spratleys, etc.

<sup>viii</sup> ASEAN (Association des Nations du Sud-Est Asiatique), créée en 1967 entre Malaisie, Singapour, Thaïlande, Philippines, Indonésie, rejoints par le Brunei en 1984, puis par le Vietnam en 1995, le Laos, le Cambodge et le Myanmar (Birmanie) en 1997. L'ASEAN avait à l'origine pour rôle de promouvoir la coopération économique et sociale dans la région du Sud-Est Asiatique ; en réalité le rôle politique de coopération régionale et d'atténuation ou d'empêchement des conflits s'est révélé fondamental.

<sup>ix</sup> Au niveau bilatéral, la Chine et le Vietnam s'opposent de manière périodique et parfois très tendue au sein de ce même conflit portant sur la revendication de territorialité de ces archipels.

<sup>x</sup> Karl Marx avait sur ce point adopté la « *théorie de l'aliénation* » de Ludwig Feuerbach, qui avait lui-même abandonné l'idéalisme hégélien pour prôner l'analyse matérialiste de l'Histoire.

<sup>xi</sup> Ultime étape de la perfection chez les Bouddhistes, caractérisée par la maîtrise des désirs, de la douleur, par la possession de la connaissance et de la vérité.

<sup>xii</sup> Nous n'aborderons pas les conflits plus politiques que culturels qui se sont manifestés aux Philippines au cours de ces dernières années. On se reportera à l'article de Carmen A. Abubakar, (Institut des Etudes Islamiques de l'Université de Manille) « L'interminable conflit de Mindanao », Le monde diplomatique, septembre 2003.

<sup>xiii</sup> SRAS : syndrome respiratoire aigu sévère ; les mesures de précaution et surtout les incertitudes des scientifiques à l'égard de cette pandémie, mal connue et non maîtrisée, ont conduit, parfois jusqu'à six mois en 2003, au blocage des transports et des échanges de nombre de pays asiatiques sur le plan régional comme mondial. La pandémie a fait officiellement 32 morts sur 200 malades à Singapour au printemps 2003.

<sup>xiv</sup> Voir note n°6

<sup>xv</sup> La politesse asiatique associe, bien entendu à ces fêtes, l'envoi de cartes postales. Lorsque les fêtes se chevauchent, comme se fut le cas pour certaines en 2002 et 2003, les imprimeurs ont publié des cartes biconfessionnelles sur lesquelles pouvaient figurer à la fois "merry christmas" et "happy deepavali". On trouve même à Kuala Lumpur des cartes où toutes les fêtes confessionnelles figurent en même temps : « merry christmas », « happy chinese new year », « happy deepavali » et « selamat hari raya » !

<sup>xvi</sup> PIB actuel : 105 milliards \$, dont 50% provenant des services et 41% de l'industrie ; revenu moyen /habitant : 3850 \$ ; taux de croissance: 5,2% ; exportations : environ 100 milliards \$ ; Importations : 85 mds \$ (données pour 2003).

<sup>xvii</sup> Etat de la côte nord-ouest de la Malaisie ; abrite la célèbre mosquée de Jalan Kapitan Keling.

<sup>xviii</sup> Honda, BP, Rolls Royce, Nokia, Ericsson, BMW, etc

<sup>xix</sup> Guy SCHULDERS & Serge BÉSANGER, « Les relations internationales Asie-Pacifique », Editions Alban, 1998.

<sup>xx</sup> Massacres de 1999 au Timor oriental, ancienne colonie portugaise à majorité catholique ; explosion d'une bombe sur l'île de Bali en octobre 2002, tuant 180 personnes, majoritairement d'origine étrangère ; attentat à Jakarta début août 2003 (5 morts), etc.

<sup>xxi</sup> Aceh, (située dans la partie nord de Sumatra) est l'une des quatre provinces les plus riches de l'archipel indonésien, avec les îles Riau, Kalimantan Est et la Papouasie occidentale. Cette province de quatre millions d'habitants recèle d'importantes ressources naturelles, notamment en gaz naturel liquide. Le « *Mouvement Aceh Libre* » revendique depuis 1976 son indépendance à l'égard des autorités de Jakarta. Ce conflit a fait trente mille morts en trente ans.

<sup>xxiv</sup> Business Today, août-septembre 1997

<sup>xxv</sup> Voir notre « Turbulences Chinoises », op. cit., publié dans la semaine des événements de Tien Anh Men en juin 1989. Le développement économique extrêmement rapide de la Chine nous paraissait alors s'effectuer beaucoup plus rapidement que ne pouvaient « l'absorber » les esprits longtemps étouffés ou bridés par un système communiste, où l'enrichissement personnel autant que l'individualisme étaient non seulement impossibles, mais surtout dénoncés et livrés à la vindicte populaire. La coexistence subite, à partir de Deng Xiaoping, du capitalisme dans les affaires et du communisme dans les esprits conduisaient, selon nous, à un inextricable syncrétisme et surtout à un risque de cassure systémique.

<sup>xxvi</sup> Guy SCHULDERS, « Développement : stratégie de l'urgence », Editions L'Harmattan, Paris 1990. Ce livre a été écrit lorsque nous nous trouvions en poste en République Centrafricaine, en tant que Directeur du Département d'Economie de l'Université de Bangui.

<sup>xxvii</sup> Nous avons personnellement vécu ce problème durant les dix-neuf années passées auprès des étudiants africains de 1973 à 1992.

<sup>xxviii</sup> le *Taoïsme*, procède d'une codification des pratiques et des traditions populaires des Asiatiques ; il s'agit d'un mélange de culte des esprits, de la nature et des ancêtres ; cette doctrine provient du philosophe chinois Lao-Tseu (VI<sup>e</sup> siècle av JC). Le Tao : « cours des choses » ;

---

Philosophie à l'origine du yin (éléments positifs) et du yan (éléments négatifs). Nous ne développerons pas les principes de cette philosophie dans cet article.

<sup>xxxix</sup> le *Shintoïsme* a été la religion officielle polythéiste d'Etat du Japon jusqu'en 1945. Elle honore les ancêtres et les forces de la nature. Les Japonais sont généralement à la fois shintoïstes (pour les grands événements de la vie) et bouddhistes (pour ce qui concerne l'au-delà).

<sup>xxx</sup> Les adaptations du nom de *Confucius* dans les alphabets occidentaux ne peuvent être qu'approximatives (Kong Tseu, Kong Fu Tse, Confucius, 551- 479 av. JC).

<sup>xxxix</sup> Le Bouddhisme a été officiellement fondé par Siddhârta Gautama dans le Sud Népal au VIème siècle av JC ; il existe environ 600 millions de bouddhistes dans le monde ; cette religion s'est rapidement étendue à l'Occident au cours des deux dernières décennies.

<sup>xxxii</sup> L'on comprend, dès lors, toute l'influence du Bouddhisme sur la philosophie allemande du XIXème et du XXème siècle : Hegel parlait de la « philosophie du devenir » (toute entité engendre son contraire ; la vie engendre la mort), Nietzsche évoquait la « généalogie de la morale » et la possibilité de l'amélioration progressive de l'être humain, Schopenhauer était également bouddhiste, Albert Schweitzer s'intéressera beaucoup à cette religion qui n'est pas incompatible avec la croyance en un autre Dieu. Alexandra David-Neel, la célèbre spécialiste britannique de l'Inde comptait également parmi les Occidentaux célèbres convertis. Des artistes contemporains très en vogue se déclarent également bouddhistes.

<sup>xxxiii</sup> L'humanité fait l'objet d'un cycle de morts et de renaissances (comme le croyaient déjà les indiens) à cause d'une loi universelle de causalité (*karma*) ; mais ce cycle se terminera lorsque l'homme aura vaincu son ignorance (par sa méditation) et sera éveillé (*Bouddha*) ; le Bouddhisme est donc la recherche de l'éveil par la méditation, l'orientation de l'être vers l'anéantissement suprême, le *nirvanâ*, considéré comme la libération définitive.

<sup>xxxiv</sup> le Bouddhisme "*grand véhicule*" (Mahayana), qui existe encore en Chine, au Vietnam, en Corée et au Japon. Il repose sur la recherche de compassion universelle ; le croyant refuse la trop grande austérité et recherche son « éveil » par la bienveillance, le don et la compassion. Le Mahayana voue un culte à Bouddha et à ses saints (bodhisattvas) ;

le Bouddhisme "*petit véhicule*" (Hinayana), qui existe encore en Thaïlande, en Birmanie, au Sri Lanka, au Cambodge ou au Laos repose sur la pratique d'un ascétisme et d'un renoncement strict permis aux plus éclairés (élitisme) ; le Hinayana se veut fidèle à la tradition des Anciens. Ses croyants sont regroupés dans les monastères, entourés de laïcs qui espèrent se réincarner en moines dans une autre vie ;

le Bouddhisme "*zen*" au Japon fait partie du Bouddhisme grand véhicule et prône la rigueur et l'ascétisme, ; il ne regroupe que des moines et procède généralement de lectures répétées de textes sacrés, en position za zen (assise), et de la pratique des arts martiaux. Cette forme de bouddhisme a fait naître l'esprit "zen", qui constitue l'éclairage au Japon des « samouraïs » en plus de cérémonies de thé, de l'art floral, de la calligraphie, du tir à l'arc, etc.

le Bouddhisme tantrique ou "*véhicule de diamant*" (Vajrajana) se retrouve encore en Mongolie et au Tibet ; il procède de rites plus ou moins secrets, de la répétition à l'infini de textes et de formules sacrées (tantras et mandalas), et de l'utilisation d'objets de culte (musique, chapelets, moulins à prière, etc.).

<sup>xxxv</sup> CORAN: Verbe incréé de Dieu (attribut de Dieu et non création de Dieu), révélé par le truchement du prophète Mahomet "en arabe clair". Le Livre est divisé en 114 chapitres (sourates)

<sup>xxxvi</sup> Populations du Nord-est de l'actuelle Algérie, dont sont issus les habitants des actuelles wilayas algériennes de Tizi Ouzou, de Bejaia, l'est de la wilaya de Boumerdès, le nord de celle de Bouira et, en pays arabophone, de la wilaya de Jijel et de la presqu'île de Collo. Encore aujourd'hui, ces populations sont caractérisées par une natalité très supérieure à celle du reste de l'Algérie. L'économie de cette région s'est développée très rapidement dans les années soixante dix, puis a connu une baisse notable de rythme —due en partie à un fort ralentissement des investissements— et enfin un « printemps berbère » en 1981, relevant d'une revendication culturelle et identitaire de « berbéricité » (tamazight).

<sup>xxxvii</sup> On se reportera à l'ouvrage de Pierre Chuvin « Samarkand, Boukhara, Khiva », Editions Flammarion, 2001.

# Culture's Constraints: The Effect of Culture on Performance Management: A Seven Country Study

*Alan R. Nankervis  
Curtin University of Technology*

## Abstract

Of all the available human resource management (HRM) processes, performance management (PM) is potentially the most powerful, if simultaneously the most problematic. This paper reports the findings of a recent research study of the usage, characteristics, and effectiveness of performance management systems across seven countries in the Asia Pacific region. Australia, Indonesia, Singapore, Thailand, Hong Kong, the Philippines, and Sri Lanka were surveyed. Whilst the sample sizes were widely divergent, ranging from only eight responses in Sri Lanka to almost one thousand in Australia, the themes which emerged are interesting not only for their similarity but also for their contextual differences. There are some signs of an increasing convergence between system types and usage, but as expected, this trend is undoubtedly mediated by specific socio-cultural differences.

## Introduction

The review of employee performance, and the management of their collective contributions to organizational effectiveness, have been perceived as a combination of informal and formal techniques which together have the potential to motivate individual employees and their work groups; to evaluate the efficacy of all human resource management (HRM) functions; and to provide organizations with a strategic advantage in their ongoing pursuit of competitive goals and imperatives. As a recent Australian National Audit Office (2004, p.13) report notes, "performance management provides a mechanism to systematically improve organizational performance by linking and aligning individual, team and organizational objectives and results. It also provides a means to recognize and reward good performance and to manage any identified underperformance".

However, despite its significant potential benefits to both individual employees and their organizations, including positive links to organizational financial performance (Rheem 1996, p. 3-4, McDonald and Smith, 1995), there is considerable empirical and anecdotal evidence suggesting that many managers and their organizations continue to regard performance management as a mechanistic and sometimes annoying annual ritual, with minimal understanding of the powerful HRM tool it can become. The effectiveness of performance management systems is determined largely by organizational philosophies and policies; the attitudes and skills of those responsible for their implementation and administration; together with the acceptance, commitment and ownership of appraisers and appraisees (Lawler, 1994, Hedge and Teachout, 2000). It may also be heavily influenced by national cultural frameworks and values, although this variable has seldom been explored.

Some critics of performance management have suggested that it "...nourishes short-term performance, annihilates long-term planning, builds fear, demolishes teamwork, and nourishes rivalry and politics" (Deming 1982, p. 102), and others (for example, McGregor, 1957, Levinson, 1970, Lawler, 1994, Glover, 1996, Glendinning, 2002), whilst supporting its underlying principles, are cynical about its practical implementation. Yet other authors (Gabris and Ihrke, 2000, 2001) emphasize the crucial importance of the notions of 'procedural fairness' and 'distributive justice' to the acceptance and efficacy of such systems. These latter dimensions may assume different meanings in diverse cultural contexts, but again there is little empirical data to date on such issues.

The globalization of business in recent decades has highlighted the importance of both nationally acceptable and internationally applicable management and human resource management paradigms, systems and processes, and has fuelled the contemporary debates on their convergence, divergence, or cross-vergence within Western and Asian contexts. If performance management is perceived as one of the most potentially significant

HRM tools, due to its capacities to measure and align employee and organizational performance; to motivate enhanced performance and employee satisfaction through demonstrable links between performance appraisal and associated remuneration and rewards systems; and to evaluate the overall effectiveness and utility of all other HRM processes, then a comparative study of the objectives, types, methods, outcomes, and difficulties of performance management systems used in a sample of Asia Pacific regional countries would seem to contribute significantly to the exploration of the differential applications of HRM processes within different national and socio-cultural contexts.

This is the intention of the exploratory study reported in this paper. Its significance lies in its contribution to the research data on performance management in a region which has had "...little research conducted... (and in which) the appraisal process may be misinterpreted as a signal of distrust or even an insult in some (regional) countries" (Vance et al 1992, p. 314). These authors go on to suggest that "...significance divergence in management styles across countries would lead to different employee needs and expectations for the effective design and management of the appraisal process" (ibid: 315-316), reflected in different variations and emphases in their chosen performance management systems. Accordingly, Habir and Lasarati (1999), interpreting Hofstede's (1982) cross-cultural research findings, posit that such Asian performance management systems would likely display "moral (rather than calculative) relationships between employers and employees...a strong need for harmony and face....paternalism... the acceptance of status differences...and reluctance to plan ahead"(p. 549). This paper attempts to ascertain the effects of these aspects on performance management systems in the chosen countries.

#### **Objectives of the Study**

The study proposed to:

- Obtain data on the purposes, types, and characteristics of performance management systems (PMS) utilized in a selection of Asia Pacific countries
- Explore the strategic focus of such PMS, and likely prospective changes
- Examine the perceived effectiveness of these PMS, and relevant success factors, and
- Compare and contrast the findings from the selected countries, with a view to determine the influence of socio-cultural factors.

#### **Methodology**

The research study was based on an initial pilot survey conducted by interview in 20 Singaporean companies (Mills, 2002), and with the author's permission, replicated in late 2003 throughout Australia. The latter study used a modified form of the Singapore research instrument, administered as an e-survey on the Australian Human Resources Institute (AHRI) website, and the findings have been separately published in both professional and scholarly journals. The Asia Pacific research project was conducted in early 2004, with the support of the Asia Pacific Federation of Human Resource Management (APFHRM), and administered by the various countries' HRM associations. This component of the study was conducted by conventional questionnaire method. This paper reports the comparative findings of the AHRI and APFHRM studies, including Australia, Thailand, the Philippines, Indonesia, Hong Kong, Sri Lanka, and Singapore, excluding the original Singapore data due to their different collection method.

The AHRI and APFHRM surveys used almost identical questionnaires, with only very minor modifications to reflect interpretive distinctions between Australia and Southeast Asian samples. The research instrument comprised nine (9) sections, including company and respondent demographics (e.g. industry, employee numbers, headquarters); PMS aims; system type and designer(s); strategic focus of the PMS (e.g. Balanced Scorecard); performance criteria/communication methods; performance appraisal methods and linkages; present and future trends; PMS training; and respondents' overall satisfaction with their PMS. Data from the surveys were analyzed using SPSS, and findings are reported only as frequencies.

#### **Limitations**

In all country samples, the respondents were HRM professionals and members of the respective professional associations, which skew the findings towards their perceptions, rather than those of employees, supervisors, middle and senior managers. Whilst this is an acknowledged limitation of the study, it may encourage more robust future studies, which will explore the perceptions of the latter groups. In addition, the relative sample sizes of the various countries range from n = 992 in Australia to n = 9 in Sri Lanka, with significant variations in between, supplying an

additional caution to the generalization of the findings. Rozhan et al (2000) and Salleh et al (2001) indicate that it is problematic to obtain representative research samples from Southeast Asian countries, an issue that needs to be addressed by regional researchers. However, despite these limitations, the data obtained from this regional study provide a relevant basis for subsequent more detailed research on PMS in the Asia Pacific region.

**Research Findings**

The detailed findings of the study are divided into the sub-categories of sample demographics; PMS purposes, types and designers; strategic focus and training; present and future trends, and overall effectiveness issues, for convenience.

**Sample Demographics**

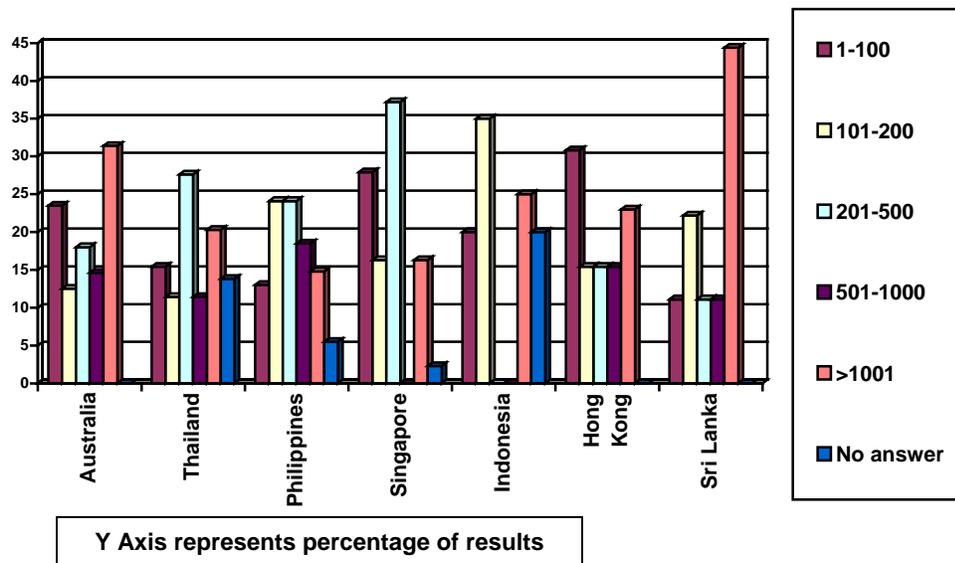

FIG. 1: DEMOGRAPHICS (NUMBER OF EMPLOYEES)

Fig. 1 shows the comparative distribution of the research sample with respect to company size (number of employees). As the figure shows, the sample includes respondents from small, medium and large organizations in all countries, with Sri Lanka, Australia and Indonesia having relatively greater proportions of large enterprises, but all countries having a broad spread of company sizes. The very small Sri Lankan and Indonesian samples obviously distort these findings, but the Australian and Thai samples are reasonably reflective of overall company sizes in those countries. All countries had more private than public sector representation, perhaps attributable to the sampling technique (i.e. use of professional associations), but all had broad industry representation, including general manufacturing, food and beverage, finance and related, electronic manufacturing, property and related, and shipping and logistics, sectors. Only the Australia and Thailand samples approximate their national industry sectoral distributions.

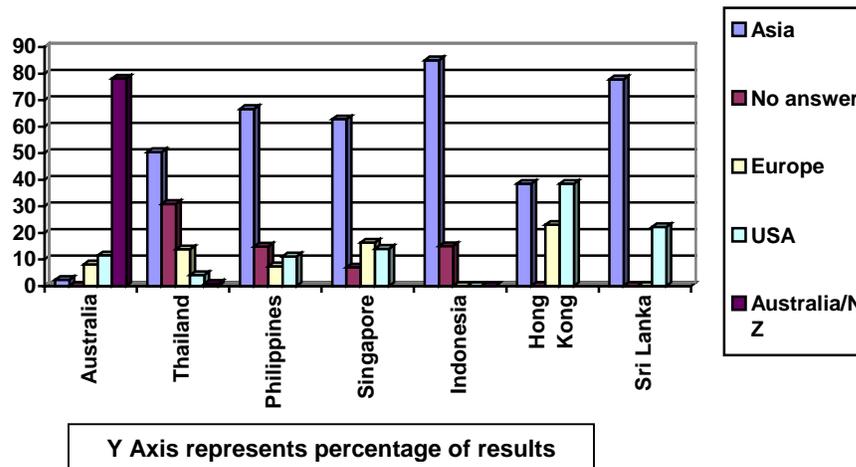

FIG. 2: ORGANISATION'S HEADQUARTERS LOCATION

As Fig. 2 shows, the survey respondents primarily came from locally-owned organizations, with only Hong Kong having a significant proportion of multinational parent companies. This is an important issue for this study, as it allows a clearer examination of the ways in which performance management systems are influenced by local rather than foreign cultural influences. As Laurent (1986), cited in Vance et al (1992, p. 314) suggests, “nationality (is) the most powerful determination of assumptions about performance appraisal”, and a predominance of multinational corporations in the study would likely have distorted these aspects.

**PMS Purposes, Types and Designers**

TABLE 1: PURPOSES OF PERFORMANCE MANAGEMENT SYSTEMS

Aims of PM/A	Australia (%) N = 992	Thailand (%) N = 123	Philippines (%) N = 54	Singapore (%) N = 43	Indonesia (%) N = 20	HK (%) N = 13	Sri Lanka (%) N = 9
Set performance objectives	2.4	50.4	75.9	76.7	75.0	76.9	66.7
Appraise past performance	88.9	50.4	92.6	72.1	50.0	92.3	66.7
Link pay to performance	50.7	50.4	79.6	93.0	30.0	84.6	44.4
Develop individual competencies	56.6	40.7	53.7	48.8	60.0	61.5	66.7
Determine training and development need	89.2	40.7	87.0	86.0	60.0	92.3	55.6
Assess future potential/promotion prospects	47.9	35.8	83.3	76.7	45.0	69.2	44.4
Assist career planning decisions	56.0	27.6	57.4	60.5	45.0	76.9	44.4
Retain high caliber staff	27.5	26.0	42.6	34.9	20.0	23.1	55.6
Change organization culture	28.0	13.0	22.2	9.3	25.0	15.4	11.1
Discipline/dismiss non-performing staff	28.9	12.2	53.7	32.6	50.0	61.5	22.2
Other reasons	4.2	1.6	1.9	7.0	5.0	7.7	0

Note: N = Number of respondents

As Table 1 illustrates, there are identifiable similarities and differences in the prioritization of the purposes of performance management systems (PMS) between the surveyed countries. Thus, all countries employ multiple purposes, with most (except Australia) setting performance objectives; appraising past performance; and fostering training and development outcomes, but there are interesting differences in the other listed aims. For example, the links between pay and performance are highest in the Singapore, Hong Kong, and Philippines samples, about half in

Australia and Thailand, and lowest in Sri Lanka and Indonesia. Similarly, the development of individual competencies; the assessment of future potential (except the Philippines and Singapore); the retention of ‘high calibre’ staff; organizational change; and discipline/dismissal, were not highly rated in most countries.

Whilst some of these similarities and differences might be attributable to the differential sample sizes, they may also have deeper explanations. These will be discussed in later sections, but as an example, the pay-performance link is arguably more problematic in a highly-regulated and more strongly-unionized country such as Australia (despite recent industrial relations changes) or ‘high context’ countries such as Indonesia, and somewhat easier to achieve and more socially acceptable in Singapore, Hong Kong and the Philippines. Similarly, the retention of staff, discipline and dismissal imperatives will likely depend on local macro- and micro- labor markets, traditional career patterns, or the degree of technological development, as well as socio-cultural influences.

TABLE 2: TYPES OF PERFORMANCE MANAGEMENT SYSTEMS

PM/A Systems Design	Australia (%) N = 992	Thailand (%) N = 123	Philippines (%) N = 54	Singapore (%) N = 43	Indonesia (%) N = 20	HK (%) N = 13	Sri Lanka (%) N = 9
Performance Management	63.9	49.6	57.4	60.5	30.0	46.2	33.3
Trait Based	12.5	25.2	51.9	39.5	45.0	38.5	55.6
Management By Objectives (MBO)	7.2	16.3	29.6	37.2	25.0	30.8	22.2
Team Performance Management	12.1	16.3	16.7	9.3	5.0	23.1	11.1
No Formal System	3.6	8.9	0	7.0	0	0	0
Hybrid System	21.1	5.7	22.2	16.3	25.0	38.5	22.2
Ranking system	0	0	27.8	20.9	10.0	7.7	11.1
360 Degree (Multi-rater) System	0	0	14.8	11.6	0	0	0

Note: N = Number of respondents

Table 2 displays the *types* of systems used to appraise employees, ranging from ‘performance management’ (which was defined in the study as ‘linked to the organization’s strategic direction and key measures’), ‘hybrid’ (defined as ‘a combination of system types’), ‘team performance’ (an element of team feedback), MBO and 360 degree/ multi-rating, to more traditional ranking and trait-based systems. As indicated, only a majority of Australian, Singaporean, and Philippines respondents employ the more integrative ‘performance management’ system type, whilst the majority of all country respondents (except Australia) use more conventional trait-based, ranking, and MBO types. Team performance and 360 degree systems are not reported as significant in any of the countries, but hybrid types have some support in Indonesia, the Philippines and Australia.

It is interesting that the use of Management by Objectives, which was the most popular system in earlier Australian studies (Nankervis and Penrose, 1990, Nankervis and Leece, 1995), has declined there considerably in recent years, but is still reasonably popular in Singapore, Hong Kong, the Philippines, and Indonesia. Future trends in the types of PMS are discussed later in the paper, but it might be noted here that the continuing usage of trait-based and ranking systems, and the lack of present support in all countries for team and multi-rater appraisals, are likely to reflect national social and cultural issues. These findings are arguably significant (and of concern) within an increasingly globally competitive business environment, which demands objective, comparative, and comprehensive performance data both individually and collectively.

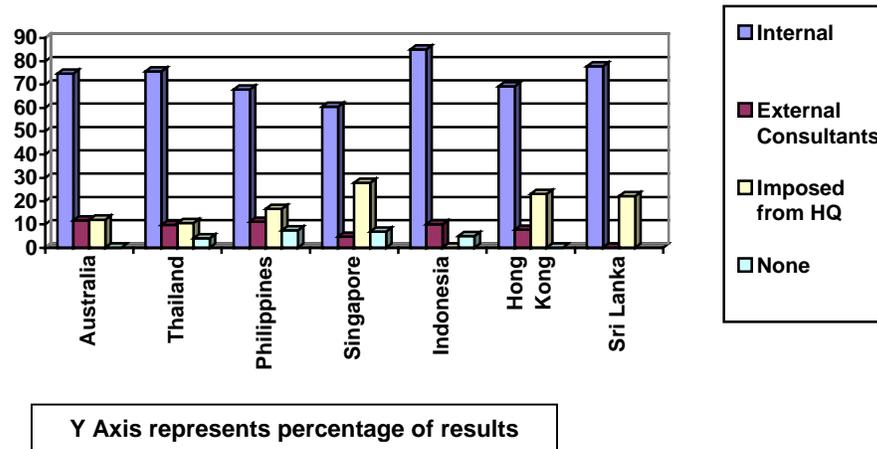

FIG. 3: PERFORMANCE MANAGEMENT SYSTEM DESIGNER

Fig. 3 shows that, in all countries, the *designers* of PMS are primarily internal organizational staff, presumably mostly human resource management professionals, with little use of external consultants, or systems imposed by foreign owners, consistent with earlier demographic data. It may be argued that a strategic approach to performance management demands both design by professionals with sound knowledge and understanding of organizational imperatives, and newer and more comprehensive PMS, which reflect these.

**Strategic Focus and Training**

This section of the study sought to ascertain the extent of the conscious integration of organizational and individual values and objectives within performance management systems, and in particular the degree of acceptance of the Balanced Scorecard (BSC) method. Fig. 4 below shows the prevalence of the use of vision/mission statements, critical success factors, organizational values, and the BSC. It demonstrates that, whilst vision or mission statements are popular in all countries; and that the promotion of organizational values is more used in Australia, Hong Kong, the Philippines, and Singapore; critical success factors (the link between individual and organizational objectives) are less employed in all surveyed countries. The Balanced Scorecard is also currently less popular, although the Philippines and Australia report reasonable usage, and future trends (see later) indicate a likely increase in several other countries.

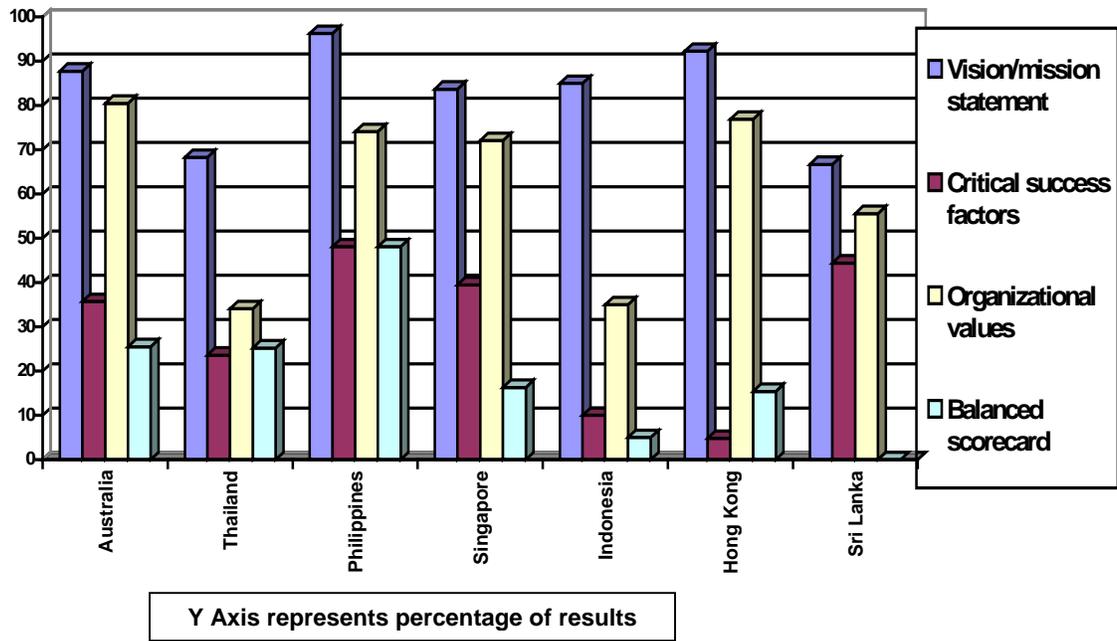

FIG. 4: STRATEGIC FOCUS OF PERFORMANCE MANAGEMENT

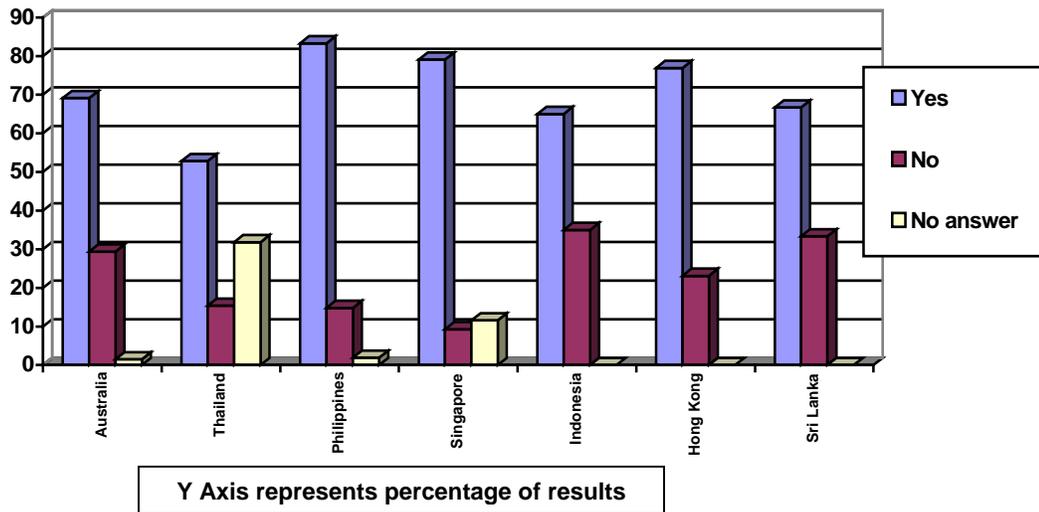

FIG. 5: TRAINING FOR PERFORMANCE MANAGEMENT

It can be argued that an important, if not crucial, determinant of the effectiveness of PMS overall, and a strategic bridge between individual and organizational objectives, is the degree and nature of training provided to

both the appraisers and appraisees. As Fig. 5 illustrates ('yes' responses indicate specific appraisal training), the proportion of training varies between countries, with the highest amount in the Philippines, Singapore, Hong Kong, and Australia, and the lowest in Thailand, Sri Lanka and Indonesia. In the Australian case, appraisal training has declined from around 85 percent in 1990-1995 to around 70 percent presently (Nankervis and Penrose, 1990, Nankervis and Leece, 1995), perhaps reflecting a lack of commitment to PMS. On the other hand, the Philippines, Singapore and Hong Kong report a higher degree of appraisal training than other countries. Training may of course be more or less acceptable, especially in relation to performance management, given its deep cultural connotations in several of the surveyed countries. These issues will be further discussed in later sections.

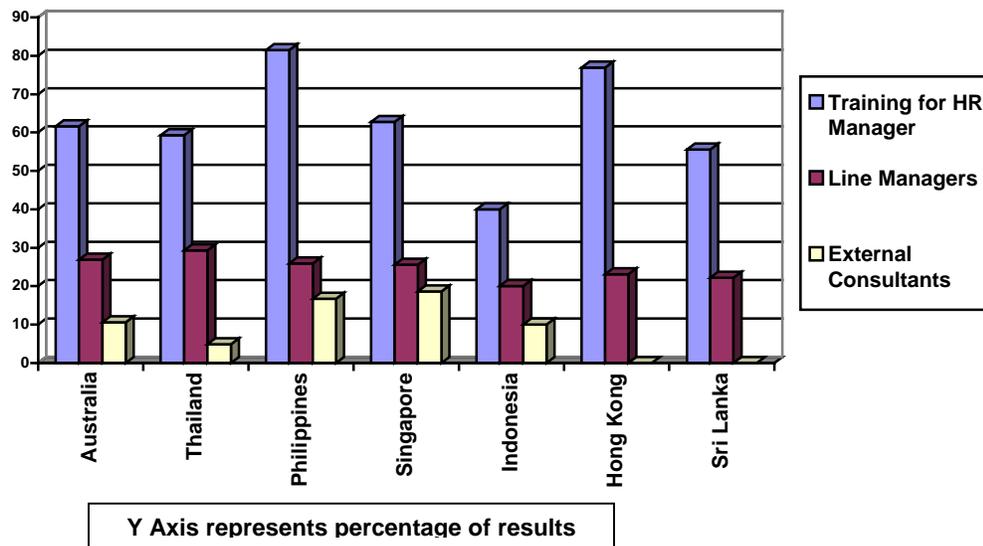

FIG. 6: PERFORMANCE MANAGEMENT TRAINERS

Fig. 6 shows the trainers employed and suggest that, as with systems designers (see Fig. 3); most respondents use their HRM professionals to conduct such training, together with line managers, and to a significantly lesser extent, external consultants. The choice of in-house specialists rather the external consultants may reflect cost issues, but it may also indicate the intention and ability to ingrain the linkages between individual and organizational performance as an important element of performance management systems within corporate training and development programmes.

**Present & Future Trends**

Tables 3 and 4 below detail the responses to questions concerning the present and projected future usage of a variety of performance management techniques and tools in the studied countries. The tables indicate that some change is occurring with respect to the methods used, albeit differentially in different countries.

TABLE 3: USAGE OF PERFORMANCE MANAGEMENT PRACTICES

**A. PRESENT – RARELY USED**

	Australia (%) N = 992	Thailand (%) N = 123	Philippines (%) N = 54	Singapore (%) N = 43	Indonesia (%) N = 20	HK (%) N = 13	Sri Lanka (%) N = 9
Balanced Scorecard	58.4	48.0	51.9	58.1	75.0	84.6	88.9

Employee Training	77.2	70.5	63.0	67.4	55.0	69.3	88.9

Note: N = Number of respondents

Presently, the *Balanced Scorecard (BSC)* is proportionally more common only in Australia (36%), the Philippines (33.4%), Thailand (26.8%), and Singapore (23.3%), but these proportions appear to be likely to increase significantly in those countries, and most others into the future. If a reliable trend, this may be important as the BSC represents an attempt to link strategically individual and employee performance towards enhanced organizational productivity and competitiveness, but may be more difficult to implement in some national contexts than others. The upward trend appears greatest in Thailand and Singapore than in other countries.

*Multi-rater (or 360 degree) appraisal*, perhaps the most inherently problematic of all performance appraisal systems, is currently only popular in Australia, and even there anecdotal experience suggests that it often fails to achieve its objectives. Despite this, Australian respondents suggest that usage will increase significantly, as do respondents from Hong Kong, Thailand, the Philippines, and Singapore. The findings from Indonesia and Sri Lanka are confusing. This appraisal method depends on positive and critical performance feedback from a variety of sources (for example, peers, supervisors, customers, suppliers, subordinates), and whilst theoretically valuable in providing a broader and deeper picture of employee performance, it is doubtful whether it would be acceptable or practical in countries where hierarchies and ‘saving face’ are essential elements of national cultures.

If 360 degree appraisal is difficult in such cultures, then *upward appraisal* (i.e. feedback from subordinates, either alone or as part of multi-rater appraisals) would seem improbable. Nevertheless, respondents report likely future usage, especially in the Philippines and Hong Kong. The Sri Lankan and Indonesian responses are again confusing. *Team appraisal*, on the other hand, would seem more attractive in countries classified as collectivist by researchers such as Hofstede (1982), and there is an apparent trend towards increased use in the future, especially in Thailand, Australia, Singapore, the Philippines, but less in Hong Kong. Again, the Sri Lankan and Indonesian data is unreliable.

*Forced Ranking (or the Bellcurve)* is a standardized, if arguably inequitable and discouraging, approach to performance appraisal, and is neither currently popular in Australia nor projected to become more attractive in the future. Usage is not predicted to rise in the future in any country except Singapore, which may be explained by national cultural issues. In some countries its use is projected to decline.

Perhaps a more disappointing finding is the present relatively low levels of manager (from 74.4% to 38.5%) and employee (66.7% to 46.2%) *appraisal training* in all countries, which rise only marginally in future predictions.

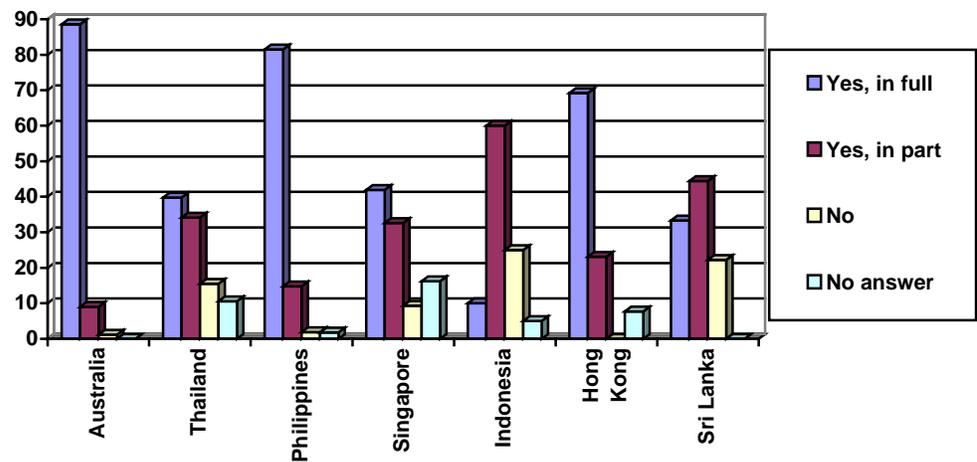

FIG. 7: EMPLOYEE DISCLOSURE OF PERFORMANCE MANAGEMENT REPORT

Fig. 7 illustrates the proportions of respondents who fully or partly disclose the results of performance appraisals to their employees. Whilst Australian and Philippines organizations are by far the most transparent, with between 80-90 percent full disclosures, Hong Kong provides a significant degree of feedback. Indonesian respondents provide high 'partial' disclosure, with Singapore, Thailand and Sri Lanka disclosing the least. The reported areas of least performance feedback include future potential, career and salary outcomes. Again, these findings may reflect hierarchical cultures, or the reluctance to directly give critical feedback due to socio-cultural issues.

### Overall Effectiveness

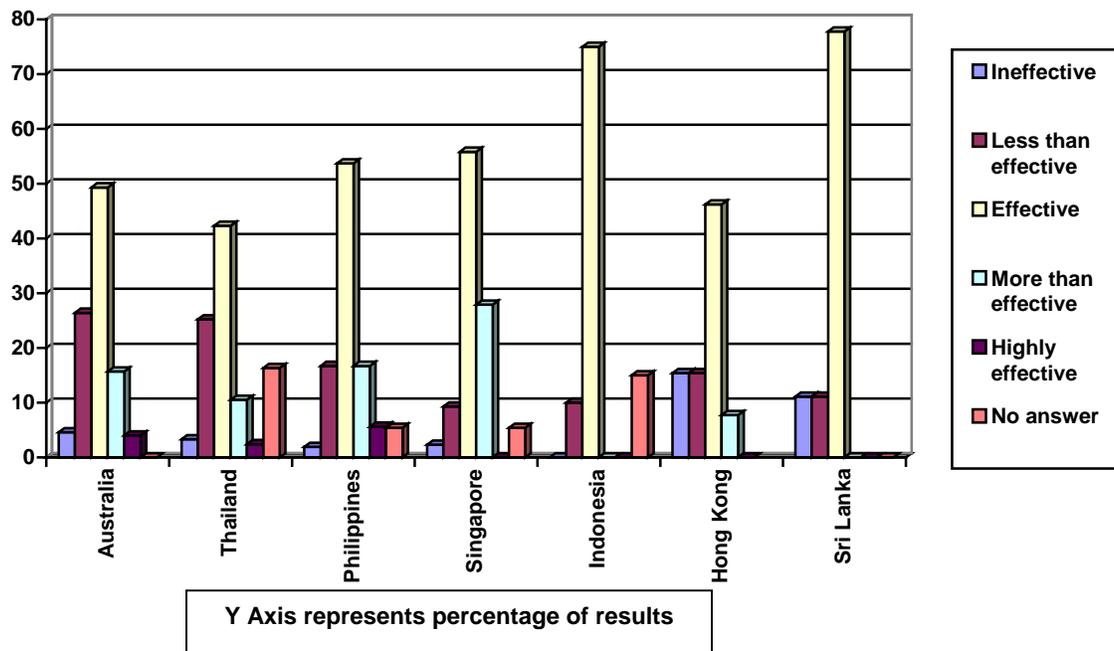

FIG. 8: PERCEIVED EFFECTIVENESS OF PERFORMANCE MANAGEMENT

As the Figure shows, the degree of perceived effectiveness of PMS varies by country, ranging from almost 84 percent in Singapore and around three quarters in the Philippines and Indonesia (and Sri Lanka), to approximately 70 percent (down from 84 percent in 1995 – Nankervis and Leece, 1995) in Australia, and roughly half in Thailand and Hong Kong. The best systems enshrine ideal principles of performance management such as the strategic alignment of organizational and employee goals and outcomes; user friendliness; consistency, equity, and transparency; and clear links between appraisal and salary review, human resource development, coaching and succession plans. The less attractive systems either fail to incorporate these qualities, or provide inadequate communication, employee feedback, and/or appraisal training.

*Some reflective comments on the positive features of systems included:*

“Sets individual goals linked to operational and strategic plans”

“Collaborative approach, senior management commitment, communication”

“It increases everyone’s awareness of their roles and how they fit into the organization”

“Open discussion, focused opportunities for discussion, active and useful dialogue, honest feedback, one-on-one communication”

*Less favorable remarks included:*

“Directors need to understand (sic) value of performance review”

“Computerized database is administered from (sic) US-cumbersome which creates pushback from employees”  
“I have yet to see a formal procedure that is effective. However I would use one if available”

#### **Discussion**

It is clear from this study that performance management is recognized universally as an important component of the HRM agenda, demonstrated by the continuing high reported levels of usage. However, as the research sample was comprised primarily of HRM professionals, it is not clear whether their senior and middle managers, and supervisory colleagues, fully recognize its value within an increasingly globalized and competitive business environment.

Whilst the findings of the study indicate high levels of usage of such systems, with some interesting differences between regional countries, they reveal both similarities and differences in their purposes, methods, strategic focus, present and future trends, and perceived overall effectiveness. Some of these similarities and differences may reflect individual countries' particular socio-cultural frameworks and influences, or their relative stages of economic development.

However, some caution in the interpretation of findings is required, due to the different sample sizes (from 992 in Australia to 9 in Sri Lanka) and the study's emphasis on the perceptions of (only) HRM professionals. In light of the notorious difficulties in obtaining representative research samples in the region (Rozhan and Poon, 2000, Salleh and Lailawati, 2001), future researchers may need to adapt more innovative approaches in order to explore the nature and effectiveness of PMS within individual countries and across the region.

Nonetheless, despite these concerns, the findings from this study contribute to scholarly knowledge and understanding of the convergence between performance management theory and practice in the region, including the influences of social and cultural issues.

Thus, the study canvassed the opinions of HRM professionals in seven countries – namely, Australia, Singapore, the Philippines, Indonesia, Hong Kong, Thailand and Sri Lanka – with a range of small, medium and large size companies, some balance across the public and private sectors, and broad industry coverage. The majority of respondents come from locally – owned organizations, and may thus reflect local social and cultural influences on their PMS.

The reported purposes of PMS in most countries are fairly traditional – setting objectives, appraising past performance, and linked to training and development – with little support for arguably more strategic objectives such as the retention of 'high calibre' talent, the assessment of future potential, or change-management. Links between pay and performance were highest in Singapore, Hong Kong and the Philippines, and lower in other countries. These differences may be explained by the greater competitive imperatives for performance in Singapore and Hong Kong, US influences in the Philippines, the constraints imposed by the industrial relations system in Australia, and cultural inhibitors in Indonesia and Thailand. It is interesting that links between pay and performance in Australia have increased significantly since earlier studies (e.g. Nankervis and Penrose, 1990, Nankervis and Leece, 1995), possibly due to flexibilities in employment conditions introduced in recent years. The absence of strong support for more strategic purposes of PMS perhaps suggests that HRM professionals have not yet come to terms with the potential of PMS to contribute to broader organizational outcomes. Local labor markets (e.g. Indonesia, Sri Lanka), different levels of technological development, and more traditional career patterns, may also detract from a more strategic perspective of the value of performance management.

With respect to the types of PMS presently used, many countries are still using conventional trait-based and ranking systems (Singapore, Hong Kong, Philippines, Indonesia), at the expense of arguably more strategic 'performance management' and 'hybrid' types (Australia and Singapore). MBO has retained its popularity, except in Australia where its use has declined considerably. Support for the more conventional types may reflect relational rather than transactional employment perspectives, based upon the acceptance of hierarchical management styles (Vance et al, 1992) and 'face-saving' imperatives.

Projected future trends include some movement towards more complex and innovative PM types such as 360 degree (or multi-rater) and team appraisals (Thailand, Singapore, the Philippines, Australia), with support for the more controversial upward appraisal limited to the Philippines and Hong Kong. Presumably the relatively low support for team appraisals in countries classified as 'collectivist' (Hofstede, 1982), such as Sri Lanka and Indonesia, is due to their reluctance to erode the authority of managers or to engage in forums which may provide both positive and more critical feedback. Similar factors undoubtedly underline the relative lack of full disclosure of

performance data to employees in countries such as Singapore, Thailand, Indonesia and Sri Lanka. Despite these explanations, the continued avoidance of innovative PM systems with the capacity to provide both more comprehensive and more objective performance data and feedback may diminish the contributions of PMS to organizational effectiveness and competitiveness.

On a more positive note, most respondents report that their organizations possess written vision or mission statements, and some (Australia, Singapore, the Philippines, Hong Kong) have developed articulated organizational values and critical success factors, with a rising use of the integrative Balanced Scorecard (especially in Australia, the Philippines, Singapore and Thailand). In an encouraging reversal of the prevalent HR outsourcing trend, PMS are usually designed by in-house professionals, who also generally conduct relevant training. HRM professionals are arguably in the best position to ensure the integration of individual and organizational performance, and to reinforce these links within performance management training programs. Training is however comparatively low, and declining in some countries.

As the primary designers and trainers of PMS, it might be expected that HRM professionals would consider their PM systems to be highly effective. This research sample suggests, however, that this is not the case. Satisfaction ranges from 84 percent in Singapore, reducing for the Philippines, Indonesia, Australia and Sri Lanka, with only half of the Thailand and Hong Kong respondents satisfied. The reasons for their satisfaction or dissatisfaction are detailed earlier, but they generally relate to the strategic contributions of PMS, the acceptance and commitment of senior management, and their user-friendliness. It would be interesting to assess the comparative satisfaction levels of their systems' end-users, namely managers, supervisors and employees.

## Conclusion

This paper reports the findings of a regional research study which explored the nature, types, usage and perceived effectiveness of performance management systems in seven neighboring countries. Despite considerable variations in sample sizes between the countries, the study reveals both similarities and differences. These similarities and differences are analyzed in the paper with respect to their possible causes and implications, including socio-cultural and strategic issues.

Overall, all countries use performance management systems extensively, but apply them differently in relation to their purposes, methods, present and future trends. All countries' respondents express limited satisfaction with the effectiveness of their chosen systems. There are concerns that the strategic value of PMS is constrained by cultural traditions, labor market differentials, and outmoded career patterns, which may disadvantage some countries within a global marketplace.

It is hoped that the study will stimulate more comprehensive country and regional research on a collaborative basis in the future.

# **The Strengthening of Canada-China Relations and the Importance of the Transference of their Chinese Ethnic Minorities: A Challenge for the Future of Canada-Mexico Relations**

*Renato Balderrama Santander  
Instituto Tecnológico y de Estudios Superiores de Monterrey (ITESM), México*

## **Abstract**

The China phenomenon is a very large and complex issue. There is sometimes a misunderstanding when we just analyze a bilateral relation linked with China, for example the relation Canada-China. The approach to this topic has to be the study of two economic regions confronted and, at the same, connected, Asia Pacific region and North American region. Inside this wider economic and commercial approach, we have the relation between the most important United States' trade partnership of and its second most important. In both cases, the strengthening of Canada-China relations affects the Mexican position, not just with Canada, but also with United States in the framework of NAFTA. The Canada-China relations has been more important, despite its lack of an economic agreement, thanks to people-to-people relation between the two countries, becoming a very important germ for a deeper relation despite the geographic position of Mexico and its special situation in the hemisphere.

## **Introduction**

*"I have come to the conclusion that, in this defying globalized world, Canada will not reach its full potential without compromising, connecting and benefiting from its relationship with China in the 21<sup>st</sup> Century".*

*Mr. Joseph Caron, Ambassador of Canada in China. 05/30/2002.*

The year 2004 not only represents the 60<sup>th</sup> anniversary of the reestablishment of diplomatic relations between the Canadian and the Mexican government, but also celebrates the first 10 years of the implementation of the North Atlantic Free Trade Agreement (NAFTA), which is in part responsible for the vertiginous increase in trade, direct investment, exchange of students, among other areas. However, this is also the time when both countries must revise deeply and with a long-term perspective, the structure in which its relationship has been based on, particularly focusing on the commercial aspect.

There are two factors that support this argument. On one hand NAFTA has not completely reached the principal objectives that justified its creation. On the contrary to what one might assume, the objective were not all about increasing the amount of the exports, but on creating, particularly for the Mexican economy, more and better employment, productive chains, stopping the migration flow, closing the income gap among social sectors and regions, for example. On the other hand, there is the presence of China in the international markets, consolidated as the world exporting platform, giving incentives for transnational companies, which need to be competitive in prices and production volumes, to move part or the total of their production into this Asiatic country.

Therefore, the most important United States and Canadian firms have started to switch their investments to the Chinese industrial development zones, affecting the amounts and destiny of these investments to Mexico, which have not only not grown, but also have been focused on buying plants or companies already installed or commercial banks,<sup>i</sup> contributing in an important way to the displacement of Mexico in both markets for the last two years by China.

In the particular case of the Canada-Mexico relation, it can be observed that at the end of 2003, when China achieved the position of the second commercial partner for Canada, displacing Japan, it also caused Mexico to fall to 4<sup>th</sup> place. Canadian imports from China in that year ascended to 13,764 million dollars and its exports reached the 3,397 million dollars, while the Canadian imports from Mexico, in the same year, were 8,109 millions dollars and its exports added only 1.582 million dollars.<sup>ii</sup>

The explanation for this reality has to do with two elements. First, with the economic reform in China, based on the configuration of the Strategic Economic Zones (SEZ), where the multinational corporations from the United States, Canada, Japan and Europe, have been located since the 1980's and 1990's. They have been exporting from there to their respective countries or to other markets, finished or semi-finished products, generating utility margins and strengthening the intrafirm commerce. And, second, having Chinese ethnic minorities combined with a multiethnic domestic policy and privileging a focus on the Pacific basin, have permitted to Canada to be one of the few countries that have been able to establish a multi-sector and multi-region long term strategic relation of mutual benefit, not only for their principal economic actors involved, but also for the ones from the People's Republic of China and Hong Kong,<sup>iii</sup> directing, in this way, the Canadian economy further to the Asia Pacific region.

## Historical Perspective of Canada-China Relations

Today, there has been much discussion about the process of globalization as the phenomenon of the XXI century, which has been possible in great part because of the advances in telecommunications and transportation. However, this process really goes back in time into the beginning of the II century B.C., when the Quin dynasty traded with the Roman Empire throughout the Silk Route. Although one of the principal motivations for this approach between these civilizations was, and continues to be, the commerce of goods, the cultural elements of each came in contact with trade. Moreover, it was the second more than the first that strengthened the commerce among diverse nations. The cultural developments of one civilization lead it to the creation of new artifacts and inventions that were highly valued in other latitudes. The relation between Canada and China, or better said between occident and East Asia, has this background.

It was the great motivation of the European traders, who saw their capital grow as a result of the selling of products from the "Indies" to the elite of the old continent, which led them to adventure dangerously through the sea. This took place once the "*Mongolic Pax*", the safest ground route that have ever existed between the Mediterranean and the Pacific coast had ended. The maritime race that was unleashed in the region, which is only comparable with the post-war space race, led to, among other things, the discovered and followed colonization of America, from what is today Canada francophone to the Patagonia. Since this moment the new continent would not stop to have contact and relations with the Asiatic one.

The Spanish empire, despite the fact that it had enriched itself with gold and silver mines of its new properties in the south of the Rio Bravo, never erased from its mind the richness and exotic products from the "Indies". Hence by 1571 the Spaniards, through the Chinese Nao or the "Galeon de Manila", achieve their goal to get profits from this route year after year, for more than two centuries. Therefore hundreds of products and cultural traditions went from East Asia, passed through Mexico and Latin America and finally reached Spain. The cultural heritage that was left in the New Spain and its metropolis is invaluable.

The first French and English who colonized North America through private companies arrived seeking the famous "North Route", a road that could allow them to reach the "Indies" avoiding the territory in Spanish control. The historic conditions in Europe ended with the seeking of the road and gave way to the establishment of pilgrims that fled from a continent that persecuted and threatened them for professing new beliefs. In this form, two new countries were created, the United States and Canada. Both share today an endless number of cultural elements, agendas, projects, etc., as well as a focus on the Pacific since the XIX century, when the United States built the train rail that connected its east coast with the Pacific Ocean.

Thus, the Chinese presence in Canada comes from that same century when the gold fever and the necessity to construct infrastructure were the principal trends in the territory. Since that moment until 1949, the bilateral relation was very unstable. Nevertheless, there are some episodes *sui generis* such as the presence and support of the Canadian doctor in medicine Norman Bethun in 1938 to the Chinese liberation army during the most difficult times for the cause of the communists, which created a strong friendship bond and approach between both countries. This situation however did not allow their governments establish diplomatic relations until 1970. The previous attempts for this objective in the 1960's made clear that, despite the potential political conflict with the U.S. government, Canada would establish a bilateral agenda with China and other communist governments congruently with its

domestic and foreign policy. For the Chinese, this marked a great precedent for the current strengthening of the bilateral relation with a tone of respect and mutual confidence.

In 1971, a Chinese embassy was opened in Ottawa and by 1973 the Canadian Prime Minister, Pierre Trudeau, traveled to China and opened consular missions and the Beijing embassy. Since that moment, year after year the understanding and closeness between both parts has increased, not only in the commercial, but also in the political and cultural areas. By 1978, the Canada China Business Council established a strong commitment to bilateral relations. In 1986, the Canadian Prime Minister, Brian Mulroney, visited China, opened the General Consulate in Shanghai, and established a support agreement with the Chinese government in its strategy to adhere to the GATT. In those years, multiple commercial missions were made in both ways; more consulates and government offices were opened, until 1999, when Canada signed the bilateral agreement so that China could enter the World Trade Organization (WTO). In the same year, the total bilateral commerce achieved was 11,400 millions of Canadian dollars. The Canadian investment in China went into 4,300 projects, making Canada the tenth commercial partner for China.

By 2000, the majority of the more important Canadian corporations were in China: Nortel, Bombardier, Power, New Bridge, Pratt & Whitney, among others. At the provincial level, China represented, for example, the second most important export market for Manitoba and its third world provider. From 2001 to date, the level of closeness between Canada and China has reached unexpected levels, placing China among the more important countries into the commercial and political Canadian radar, with the potential of strengthening even more in the next decade.

## **Economic and Commercial Canada-China Relations since Chinese Economic Reforms**

The Chinese economic opening, that took place at the end of 1979, started under the strategy known as the “Four Modernizations”, which embraces the idea of modernizing different sectors: the agriculture, industry, army, and research and development. The way in which this opening was handled was through the development of the Strategic Economic Zones (SEZ) in 1980. At the beginning, four cities were the first to have this preferential treatment: three in the Guangdong province and one in the Fujian province. The SEZ of Guangdong were: Shantou, Shenzhen and Zhuhai, the last two located exactly in front of Hong Kong and Macao respectively. And the SEZ in Fujian was Xiamen, geographically in front of Taiwan.

This four SEZ tried to translate into practice the “One State –Two Systems” theory, meaning the acceptance of elements of the market economy inside of a State in which a centralized socialist system would prevail. The fact that Shenzhen was the province in which the experiment of the Chinese economic opening took place is related to the new strategy of the new political elite of using the economic resources at hand, as well as, the knowledge of advance administration and the international market nets of the Chinese located in Hong Kong. Similarly, there was also the thought of bringing the ones in Taiwan and Southeast Asia, where the Chinese ethnic minorities control more than 60% or 70% of the market and of the more important industries, overall in the export business.

The experiment was extended to another 14 coastal cities by the mid 1980’s, among them the Delta Yangtze region, where is located Shanghai city, and Bohai Bay, where Beijing and Tianjin are located. In a short period of time these new zones of development, most of all of technology and industrial conversion with private and foreign capitals, began a third stage of opening including some cities of the interior. Thus, before China got its entry into the WTO, during the third ministerial meeting in Doha, Qatar, in November 2001, it had achieved the opening of 56 Economic and Technologic Development Zones, 53 High Technology Industries Zones, 4 Taiwanese Inversion Zones, 14 Economic Cooperation Zones, 34 Export Processing Zones and 11 Tourism Development Zones.

In this way, the Chinese government has managed to establish the most important export platform worldwide, through the implementation of the industrial policies in the SEZ and other opening areas, in contrast to the Mexican opening project via the “maquiladora” strategy (processing of raw materials for exports). In addition to the processing stage, economic activities were extended to other areas, such as agriculture, fishing, commerce, real estate, tourism, banks and insurance companies. These activities were accompanied with a strong source of

investment in infrastructure, as well as incentives for the investment of domestic capital. Therefore, through the implementation of the mutual benefit scheme, as part of a series of incentives, the Chinese government sustained its target to privilege the attraction of advanced technology over the creation of jobs and reception of foreign capital from exports.

The access of China to the WTO responded more to the approval of the principal economic powers through bilateral negotiation, rather than to a multilateral agreement and understanding. The most important negotiations took place between United States and China, and the latter with the European Union. The agreements reached in these negotiations basically conformed the scheme that the other countries involved in the negotiation followed. As for Canada, its major strategy at the time to negotiate with the Chinese government was that of seeking other areas and regions that did not confront the interests of both the United States and the European Union, and where it could obtain the most possible benefits.

For those reasons, and without leaving aside the Chinese east coast, the Canadian project is more involved with the West Development Strategy (WDS), which is interconnected with the development of industries that are related to the environment, new energies, aviation, automobiles, telecommunications, among others. Therefore, the Canadian government has supported agreements on the cultural industries with China through joint ventures in editorial houses, co-production of movies, television programs, as well as in education and entertainment programs for diverse areas. All of these, backed up by a net of bilateral public and private institutions that work through the diplomatic representations of both countries and by business and academic associations where Chinese ethnic minorities are strongly represented.

The year 1994 signaled a new era of approach between Canada and China, when the new elected Canadian Prime Minister, Jean Chretien, led the first great commercial mission.<sup>iv</sup> He was accompanied by businessmen, 400 of the most important in Canada, representatives of diverse industries and sectors, and the most influential federal and provincial ministers and as well as territorial and municipal leaders. On one hand, the diplomatic bonds were strengthened when the consulate in Guangzhou was opened and the “Four Pillar Stones” policy to China was established taking in count these issues: the economic relation, sustainable development, human rights and good government, and law, peace and security. On the other hand, the commercial linkages went through the same process with the signature of several cooperation agreements and one related to nuclear energy.

From that year on, Chretien visited China five more times:

- Shanghai in 1996 and in 2001 to participate in the APEC reunion.
- In 1998, when he opened a consulate in Chongqing.
- In 2001, after his third reelection, he led the largest mission sent to a foreign country in the

diplomatic history of Canada<sup>v</sup> and the biggest that ever arrived to China. In this trip he consolidated this relationship by the signature of three documents: 1) the Memorandum of understanding between the Commission of Planning for Development and the Chinese Minister of Energy about cooperation in the energy field; 2) a letter of intention on projects of cooperation in environment and climatic change, as well as in legal reforms (legal training), development of the western regions and the Chinese adhesion to the WTO and: 3) a program of student interchange. Moreover, 266 new businesses were signed, valued at an amount that exceeded the 5. 300 Canadian dollars (3, 460 US dollars). Finally, in 2003 he visited China for the last time as the Prime Minister of Canada.

## **What Benefits has the Entrance of China to the WTO Brought to Canada?**

The environment of economic and political collaboration and cooperation given by Ottawa and Beijing since 1994, led to the involvement in several Canadian sectors and industries in the negotiations to allow the Chinese access to the WTO. These, by 1999, concluded with the satisfaction to a good point of the objectives from both parts. The main elements in which the negotiation was based were: fair and no discriminatory treatment to commercial partners, transparency, predictability and the homogeneous rule of law and regulations.

As for the commerce elements regarding tariff reduction, there are:

1. **Automobile parts and motors:** from an average of 21% in 2001 to an 11.5% by 2006. This is of particular interest to the suppliers of GM in Oshawa, that ship parts from GM Shanghai, and for the parts industry as a whole.

2. **Telephone line equipment:** From an average of 13% in 2001 to a 0% by 2004; Nortel and Mitel are especially interested in this reduction.
3. **Malt:** The pre-accession tariff was of 26% and by 2002 it was lowered to 10%. Prairies Barley has a high interest in this.
4. **Paper without cover and carton:** This is most important to the paper industry of British Columbia, Ontario and Quebec. These products had a reduction from an average of 14% in 2001 to 3.5% by 2004.
5. **Frozen shrimp:** This in general was an extraordinary opening measure because of the difference of the averages: from 24% in 2001 to 5% in 2003. Atlantic fishery is one of the companies very interested in this measure.
6. **Whiskey:** This is an important opening measure, most of all to the producers in Quebec, Ontario and Manitoba, which had a tariff reduction of 46%, from 56% in 2001 to 10% by 2005.
7. **Polyethylene:** From an average of 16% in 2001, it will fall to 6.5% by 2008. The Dow plants in Alberta and Ontario benefit from it.
8. **Frozen meat:** It is of particular interest for all of Canada, especially for Alberta, as it will fall to 12% by 2004 from an average of 39% in 2001.

The few import quotas that are left will face a reduction process by January 1<sup>st</sup> 2005. The most important quota reduction for the Canadian industries is the one for wheat, which from 9 millions of tons will change to a 9% tariff in 2006. Furthermore, the USDA estimates that the Chinese market of imported agricultural goods will increase in 2.250 millions of dollars each year for the next decade.

Finally, the Canadian service sector will have also its benefits from the Chinese accession. China has committed to opening its financial and bank services market, including first floor banks, insurance companies, forwards, funds administration, legal services, and telecommunications, as well as other areas that include internal mailing services and distribution chains for sales. A large part of the success in this bilateral relation is due to the foundation that has been built between the two nations that has not only involved diplomatic cooperation among the federal governments, but also at the provincial level. In this way, the visits to China by the Canadian Prime Minister and by other high ranking federal and provincial Canadian administrators were successful, as well as, the reciprocity by their counterparts. The president of the People's Republic of China, Jiang Zemin, the Prime Minister, Zhu Rong ji, and the president of the People's National Congress, Li Peng, visited Canada in various occasions since 1993 with a widespread interest and an open political agenda.

It is important to mention that whatever has been achieved in the bilateral relation up to 1999 is part of a first strategic stage of negotiations and cooperation. It has been linked, since the end of 2001, to the Canadian vision to China for the XXI century based upon three important factors: 1) cooperation and participation in the West Development Strategy (WDS) of China, supported by strategic alliances at different levels and speeds, without ignoring the principal economic development areas of east China; 2) the position of one of the most important suppliers for the Beijing 2008 Olympics and; 3) the commercial relation with the Special Administrated Region of Hong Kong (SARHK). In all these, the Canadian government acknowledges that the Canada China Business Council, the most active Canadian association<sup>vi</sup>, will be the core of the strategy, and therefore, will be very important the role and knowledge of the Chinese ethnic minorities.

## **Perspectives of Cooperation and Business Development Projects with China**

The first important factor in the long term Canadian-Chinese commercial relation is based upon one of the great concerns for the Chinese government that basically consists of lowering the internal regional disparities that have exploded due to the rise of the east coast in the last 10 years. Thus, the West Development Strategy (WDS) has to focus on projects within the areas of infrastructure, transportation, and environment. However, there are also other areas of development and projects that include telecommunication technologies cooperation, bank and financial services, education, cultural industries, and entertainment. Moreover, each one of these areas provides an excellent opportunity for the Canadian business community. Furthermore, each project in which Canadian businesses have been involved is connected with the holistic vision of the Chinese government for the development of its country, in particular of the western region.

In this sense, the infrastructure projects range from the construction of new houses and industrial zones to the actualization of old buildings, always applying environment friendly intelligent systems. Similarly, the construction of infrastructure projects particularly in the transportation field is wide spread, including highways, airports, light trains and trams, and that will connect the cities in the interior and between the regions. It is of importance to mention that, in these plans, the utilization of intelligent technologies and alternative sources of energy, which respond to the same objective of care for the environment, are also favored by the Chinese government.

In order to illustrate the importance of such projects the following table presents information for some projects in the transportation sector. Specifically, it illustrates the type of investment as well as the location of those investments which shows the tendency for the western region. (See Figure 1).

<b>Project</b>	<b>Investment USD in billions.</b>	<b>Destination</b>	<b>Due date</b>
164 civil airports	\$26	Beijing Shanghai Guangzhou Guizhou Yunnan Sichuan Qinghai Xinjiang	2005
Shanghai International Shipping Center	NA	Shanghai	2010
6 ports	NA	Dalian Qinhuangdao Liangyugang Ningbo Wenzhou Shenzhen	2010
Subway net	NA	Northeast Bahía de Bohai Delta del Yangzi	2005
Light train service	NA	Guangzhou Shenzhen Hong Kong	2005
Urban transit services	\$24	Beijing Shanghai Tianjin Guangzhou Kunming Chongqing Nanjing Chengdu Qingdao Dalian Shenyang Shenzhen Changchun Harbin Xi'an	2006 <sup>vii</sup>

FIG. 1

The second factor of importance includes the objective of sponsor “green Olympics”, to take place in Beijing in 2008. Therefore, the Chinese authorities have pursued an emphasis in the construction of residential

infrastructure, transportation and communication with a high technological and environment friendly level tenaciously. These projects related to the 2008 Olympics, consist of a wide range of possibilities for Canadian companies because of the amount of investment placed upon them and the obligation to finish them by that summer. The total investment for the construction of necessary spaces for the Olympics will reach the amount of 2.556 millions of dollars.

Among the new constructions, two of the most important are: the creation of sport facilities and the Olympic village. The first one includes 5 competition places that will need construction work or remaking while 22 need to be constructed. The second will be constructed from cement and will cover a total area of 80 hectares, which will be designed as an ecologic park with the potential for the sustainable development of the place after the Olympics.<sup>viii</sup>

It is important to notice that, just as the village, every construction and design for the Olympic event is thought to be environment friendly. Therefore, the necessity of obtaining specialized technology that allows them to have self-sufficient buildings and transportation media with alternative energy. This is vital to fulfill the general objective of sponsor a “green Olympics”.

The concern about the environment is one of the principal interests of the Chinese government at all levels after reaching high levels of water, air and underground pollution. Some of the measures that are being implemented to counterattack the environmental contamination are focused on the renovation, and in some cases demolition, of old industrial plants and the reduction in water and air contamination by all means necessary. These measures are in accordance with the new Chinese law for environment protection based on international standards and national and local needs.

There are two industries that are also related to the WDS and the “green Olympics” project. One is the automotive industry that represents an area in which China is a potential market, as a consumer and as a producer. After its entry to the WTO, China became a great attraction for international capitals due to the gradual reduction of the geographic limitations and of the foreign investment percentage allowed. The other is the telecommunication industry because technology is a growing and dynamic market, within which the most promising part consists of the mobile communication sector. Although the telecommunication market is highly competitive, Canada has been able to maintain a privileged position. For example, Nortel Networks, JDS Uniphase, Celestica Harris, SRTelecom, Mitel y Nordx/CDT, have been the most successful companies.

Another great opportunity sector is the banking and financial services, which has presented advances due to the liberalization agenda that China has developed. It has allowed foreign banks to offer their services in foreign currencies, with geographic restrictions, to Chinese consumers, while for the local currency such limitations will gradually disappear in the next 5 years.<sup>ix</sup> Similarly, the foreign insurance companies can operate in the country in joint ventures with a maximum of investment of 50%, and they will also lift the geographic restrictions by 2005.<sup>x</sup>

In addition, there is a wide opportunity in the education and entertainment sector for Canadian businesses, which in conjunction with their government have identified a young market that aspires to a university education that is largely unsatisfied by their local and national educational opportunities. Because of the limited capacity of the Chinese universities there has been the rejection of more than 50% of the population that applies to them. Some elements of the strategy to attract this sector of the market has consisted in education fairs overseas, that have been organized by the consulate general and the embassy, as well as the indirect recommendation of the Chinese that are already studying in Canada or have studied there before. These two comprise important decision making factors for the young population that are considering studying in Canada.

In relation with this, there is a great interest that Canada places upon educational interchange because it is largely through it that commercial bonding is created with other countries and is also a way of studying and understanding other cultures. Therefore, there are many programs in this sector in which Canada participates. For example, teaching the English language in China, including using the Internet, and strategically training pilots due to the expansion of the Chinese aviation industry and the Canadian experience on the subject, where there is also fulfilled the Canadian interest in sharing cultural knowledge.

Another way of enhancing these objectives is given by the Canadian incursion in the Chinese cultural industry, principally throughout the production of motion pictures and joint ventures in editorial houses. The first has not yet obtained the expected success, primarily due to lack of investment. However, the second has raised a lot

of expectation because of the emphasis of both countries in the translation of books from Chinese to English and vice versa, particularly children's literature as a principal market.

The third factor, economic and political relations between Canada and Hong Kong, has a history of more than 100 years and has always been characterized as a priority for both governments and for their commercial communities. Thus, the size of immigration that approaches almost 200,000 Canadians settled in Hong Kong is the largest international community in that region of East Asia. Moreover, the Chinese population of Canada represents 20% of the total immigration that it receives, an equivalent of more than 50% of the Hong Kong total population that emigrate.<sup>xi</sup>

This impressive flow of people between both regions has contributed to the construction of cultural and commercial bonds that help consolidate this relationship. This is solidified by the amount of commerce<sup>xii</sup> as well as of investment<sup>xiii</sup>, suggesting that this relation will strengthen with time. The characteristics of Hong Kong, as a market completely self-regulated and of free access to investors and foreign enterprises have influenced Canadian businesses to be even more interested in it and have benefited from their knowledge of the culture and their contacts with its population. In this way, 150 Canadian companies have there their subsidies or representative offices and 450 have joint ventures.<sup>xiv</sup> Therefore, the Chamber of Commerce in Hong Kong is the biggest overseas for Canada and in some of the provinces they maintain some kind of representation in the region, such as Quebec, Alberta, Manitoba and Prince Edward Island.

Similarly, the greatest attraction Hong Kong has to offer to outsiders has always been that it serves as a commerce intermediary between the world and Mainland China. Moreover, it is a key center, because today not only is it an intermediary for China, but also includes the Southeast Asia region. In this sense, the potential in Hong Kong is still undeniable for foreign capitals, having the majority of foreign enterprises arriving there first; making contacts and acquiring cultural knowledge and the necessary experience, in order to then expand to Mainland China. This is precisely the strategy that the Canadian government recommends to small and medium businesses that do not have enough capacity to support the expenses of establishing successfully in China, especially if they have not had some international experience of their products.<sup>xv</sup>

## **Participation of the Chinese Ethnic Minorities in Canada as a Support of its Project of Approach with China**

Canada is a country of immigrants. In the first three decades of the past century almost 25% of the total Canadian population was migrants. The majority were Europeans, not only from Great Britain, but also from center and south Europe. The Asiatic, African and European migration did not become present in an important manner until the 1960's, when it represented 70% of the total male immigration.<sup>xvi</sup> Since that decade and until the beginning of the new millennium, the Asiatic migration has been increasingly rising. As for the migration of ethnic Chinese, it is of importance to take notice that it first began with wealthy families of Hong Kong, Taiwan, Singapore and from other Southeast Asian countries where there is a majority of Chinese ethnic minorities. It is not until recently when migrant flows from Mainland China started to arrive to Canada.

The Canadian migration policies and the multiethnic conformation of the country have allowed the diverse groups that live together in this territory to adapt quickly. Moreover, due to the Canadian state that allows and promotes the association among ethnic minorities, there are associations for the conservation and promotion of specific cultures. They are not the only case, but the major difference between the Chinese community from the Latinos or other groups, is the network that they have built and consolidated among the overseas Chinese, in North America, Europe or Asia.

For cultural and historical reasons, the Chinese communities not only tend to maintain a close relationship between each other at a family level, but also in the extended clan. For this reason in the case of Canada, the number of individuals in these communities has increased and strengthened over time. This is something that it can be seen easily in the principal cities of Canada, but most of all in the province of British Columbia, where there are entire suburbs, such as the Richmond, where the urban signs are in English as well as in Chinese characters.

The Chinese community was about 1.094.700 of a population of 29.639.035 in 2001, 3.7% of the total. The federal and provincial governments have found in this community new “Canadians” that play a central role in understanding and facilitating its strategy towards its relationship with China. An example of the effort to take advantage of the presence of this ethnic minority inside its borders is the creation and consolidation of the Canada China Business Council (CCBC). It is a private sector organization, without capital accumulation objectives, that was created in 1978 to facilitate and promote the foreign commerce and the investment between Canada and the People’s Republic of China.<sup>xvii</sup> Their objectives were: a) to stimulate and support the commerce of goods and services, the investment and the transference of technology, b) to achieve an economic growth and strengthen the relation between both countries, c) to provide practical and punctual assistance in businesses and, d) to be the voice of the Canadian business community in matters related to the Canada-China relationship. Among the sponsoring companies are the: Atomic Energy of Canada Limited, BMO Bank of Montreal, Bombardier, CITIC Canada, Export Development Canada, Nortel Networks Corporation, Power Corporation of Canada and Sun Life Financial.

The Chinese group “China International Trust and Investment Corporation” (CITIC), created by Deng Xiaoping in 1979 as a window to open China to the world, was conceived principally to attract and use foreign investment and introduce advanced technologies. Today, it is a great conglomerate with 44 subsidiaries (banks) in the United States, Canada, Australia, Hong Kong, etc. Their principal businesses include various areas that range from financial and investment industries to the services sector. At the end of 2003 their actives reached the number of 596.630 millions of RMB (people’s currency), with a utility after taxes of 1.600 millions of RMB.<sup>xviii</sup>

The CCBC council is composed by 25 representatives of the public sector especially from the minister of Foreign Affairs. The private sector is represented by the sponsoring companies, by the principal Canadian banks, insurance companies and law firms, as well as by prominent faculty from the most prestigious Canadian and Chinese universities. There are more than 250 companies and Canadian organizations members of the CCBC that are actively involved in the Chinese market and a growing number of Chinese companies interested in doing businesses with Canada. These companies represent sectors, that are quite diverse, such as: agro industry, energy business and manufacture, financial and legal services, and education and health. Each month they release a miscellaneous news bulletin about business opportunities for both sides, including studies and strategic investigations on new sectors, industries, markets and regions to invest and make strategic alliances. This institutional net is supported by the knowledge of these ethnic minorities that helps to strengthen day by day this relation of bilateral cooperation.

## **Challenges for the Canada-Mexico Relation in the XXI Century**

Because of the strong conditions of understanding between Canada and China and their wide and long-term cooperation agreements in strategic sectors, there is a big challenge for the future actions of the Canada-Mexico relation. Since 2000, Mexico has started to suffer the consequences of the recent closeness between the economies of Canada and United States with China.<sup>xix</sup> In the areas of overseas investment and foreign Canadian trade, China has displaced Mexico. The bilateral relation between Canada and Mexico has never been at a better level, nevertheless the one among Canada and China has never been at a better moment as well. The question to analyze here is the foundation of the structure of both relationships and their future.

The year 2004 not only celebrates the 60<sup>th</sup> anniversary of the diplomatic relations between Canada and Mexico, but also denotes the year when China displaced Mexico definitively from the third to the fourth place as a Canadian commercial partner. Mexico represents a strategic partner to Canada and a potential gate into Latin America and the Caribbean, but China represents that same opportunity, but for the rest of east and southeast Asia, where in terms of Gross Domestic Product (GDP) and of volumes of foreign trade the region has shown and maintains a sharp growth in the last 10 years. This means that in all these countries a domestic market of consumers of goods and services has been consolidated and in a much healthier way than in the polarized and increasingly poorer Latin America.

There are areas in the bilateral relation of Canada and Mexico that are really strong and where the prospective is very positive, such as the services sector<sup>xx</sup>. For example, in the case of tourism a million Canadians

visit Mexico each year and 160,000 Mexicans do the same in Canada, representing its third supplier in this area. In terms of migration and residency, the program of agricultural migrant workers (“SWAP”) has reached the amount of 11,000 workers per year. Most likely, more than 50,000 Canadians are Mexican residents and 40,000 Mexicans are under this status in Canada<sup>xxi</sup>. And, finally, with respect to cultural and academic relations, there exist nearly 400 cooperation agreements between universities from both sides. Each year more than 10,000 full time Mexican students enter Canadian universities and 5,000 travel for short courses, which turn Mexico into the third supplier for Canada in this area.

However, there are other sectors that have started to concern Mexicans, given the slowdown of the trade growth rates between Canada and Mexico, but especially because of the weakness in the base of their long term tendencies, as well as by the growing participation of Chinese products in the Mexican market. On one hand, there is the sector of foreign trade of manufactured products, where Canada and Mexico are still strategic partners. Canada maintains its position as the second destination for Mexican exports, which equals 1.8% of the total of Mexican exports for 2003. Similarly, Mexico represents for Canada its fourth export market with 2.1% of the total Canadian exports. Another point to highlight is that the goods being traded vary from the agriculture to automotive, machinery and equipment and other sectors, meaning that this is also a multi-sector relation.

Moreover, Canada has been displaced, from being the fourth commercial partner for Mexico, only after United States, Japan and Germany, to be the fifth, due to the placement of China into the second place. According to data provided by the Secretary of Economy in Mexico, in 2003 the trade with China reached 9.547 millions of dollars, representing 2.8% of the total, while the amount with Canada was 7.124 millions which is 2.1% of the total. It is important to mention that in 1997 China did not even appear among the first ten principal Mexican trading partners.

On the other hand, China not only has displaced Mexico in the Canadian market, but also Japan, that had maintained its position since the beginning of the 1990's. In 1997, Japan was selling Canada 12.550 millions of Canadian dollars, while China only 6.341 millions. This Japanese supremacy lasted until 2001, because by 2002 China had displaced Japan and as a consequence Mexico as well. In this last year, China exported to Canada 15.900 millions of Canadian dollars, representing 4.3% of the Canadian market, meanwhile Mexico only reached the amount of 12.720 millions. In 2003, China exported Canada 13.764 millions of Canadian dollars, 4.3% of the total. Furthermore, the principal Mexican exportation to Canada, automotive products, dropped 17% in the first four months of 2004, while in that same China's industry increased its participation in an 18%.<sup>xxii</sup>

Finally, as for the foreign investment scenario remains positive as Canada keeps investing important amounts in Mexico. In 2001 it was its third major investor, where more than 50% of this investment was designated to manufactures. However, as in the case of foreign trade, this is stagnated since 2000. Mexico received that year the major amount of Canadian investment of 3.871 millions of Canadian dollars, but it decreased to 3.100 millions by 2003 and has not yet increased. China receives a small amount compared with Mexico. In 2000, it only received 565 millions of Canadian dollars, but by 2003 that amount increased to 950 millions, reporting a growing rate of 168% in those years. Another point to highlight is that globally Canada has decreased its investment amounts in North America and Latin America, and has increased them in Asia and East Europe. For example, in 1990 the total invested percentage in America was of 69%, in Europe 23%, Asia 8% and Africa 0.2%. By 2002, the percentages changed. America only received 61%, Europe increased up to 29%, the same with Asia to a 9% and Africa 1%.

In Asia this increment was due to the fact that China and South Korea, in the same twelve-year period, had received almost zero investment and they by then represented a 2% of the total that Canada invest in the continent. The other case is Japan, which went from representing only 13% to 28% in 2002. The European example increased because of Hungary, that represented also almost 0% in 1990 and by 2002 received a 10%, and Ireland that went from 6% to 14% in the same period. As for the Canadian investment in United States, this decreased from 84% to 78% of the total Canadian investments in the continent, whereas in Mexico this has stayed at 1% since 1992.

## Final Considerations

Throughout this study we have illustrated how the bilateral relation with China has become one of the most important to Canada, positioning it as a priority only after the one that it maintains with United States. Similarly, is possible to observe that the Canadian commercial relation with Mexico does not face a deteriorated situation, but it does presents a stagnation since 2000 in percentage terms as well as in growth rates.

Hence, the principal problem facing Mexico is not the lack of trade or investment from Canada, but the decrease of its participation in the total percentage of both. Moreover, China continues on its advance, occupying a percentage portion that becomes larger every time in a short period. China has displaced Mexico as second and third provider of manufactures in United States and Canada respectively, not only in areas such as textiles, toys and shoes, but also in machinery and electronics, as well as in the automotive industry.

The economic reforms implemented in China within the third stage on the second half of the 1990's, have been successful due to the inclusion of new SEZ with innovative integral plans of opening that meant more incentives and benefits for the foreign direct investment. Thus, it also contributed, in part to the increase of the number of subsidiaries and firms from North America, Europe and Asia, which will establish in the diverse regions that China has stipulated for their installation.

An example of this is the recent announcement of the major vehicle manufacture companies such as Toyota, Nissan, GM and Volkswagen to place their industrial assembly plans and innovation and development centers in China, with a total investment estimated at \$13.000 millions of dollars for the next few years, tripling the Chinese annual productive capacity and including approximately 6 millions of automobiles.<sup>xxiii</sup> These actions go along with the desire of the Beijing government to turn China into the most important producer of vehicles in the world for the next decade. (See Figure 2)

Company	Projected investment in millions of dollars	Goal and time
Daimler Chrysler	\$1.200	Until it doubles its capacity
GM	\$3.000	3 years, until it doubles its capacity to 1.3 millions of vehicles per year
VW	\$7.000	Maintain the third of the market that it has currently. <sup>xxiv</sup>

FIG. 2

This presents a problem for the Mexican automotive exports, which has historically benefited in this area as a priority for the Canadian market. Although the current situation does not exhibit an imminent danger that harms this relation, due apparently to the benefits from NAFTA and the geographic proximity, there is early evidence that in the future, the success of the Canadian-China relation will have a negative effect on Mexico, removing it from its old position. The situation becomes complicated even more so due to the fact that China is today the “third producer of cars in the world,<sup>xxv</sup> after Japan and United States and by 2005, the General Motors Corp expects that China take the place of the latter as the most important world producer”.<sup>xxvi</sup>

Another factor that will affect Mexico in such displacement from the list of important bilateral Canadian trade relationships is the integration between the Canadian investments and the last stage of the Chinese project of regional development (WDS). This, has lead the Canadian government and its business community to focus part of their plan for years to come in strategic industries into the western part of China without leaving behind the east coast, where there are the scales economies at regional and industrial levels. The benefits that this represents for the Canadian businesses are very important and cannot be offered by any other market, at least not in this scope, including Mexico.

Perhaps the most worrisome is to take into account that Canada has started to experience a decrease in its exports to United States, its principal commercial partner, having as a consequence two issues. On one hand, its

exports fell for the first time into second place, principally the manufactures due to the increase in the Chinese in 2003. And, on the other, this situation has reinforced the objectives, policies, and actions of the Canadian businesses and government, including their plan of implementing and succeeding in their Chinese strategy for the XXI century, based on the three factors detailed previously, i.e. the implementation of the WDS, the objective of sponsoring a “green Olympics”, and improving the economic and political relations between Canada and Hong Kong, so that it can balance the lost suffered in the north American market.

For these reasons, Mexico urgently needs a reformulation of its plans to retake the lost ground in the United States as well as in Canada, and a reconsideration of the latter in particular and with the region in general. Thus, Mexico needs to not only compete with China, but also with the other emerging potential markets<sup>xxvii</sup> that threaten its position in the continent commercial relations.

Moreover, Mexico needs to face such competition in the political-diplomatic relation, including regions such as Asia and east Europe inside its priorities in the foreign policy agenda, specifically in the commercial area in order to focus its efforts in whichever potential sectors these have to offer. Likewise, these initiatives have to be implemented in conjunction between the public and private sector, with the final objective of creating an integral long term work agenda that allows Mexico to take advantage of all the opportunities for its development. Having information about which sectors and Mexican industries can enter and benefit from the advantages that offer the economic development of these regions, translates into a favorable situation for the creation of a “Team Mexico”, taking into consideration the Canadian and the American scheme, giving it a special emphasis in the small and medium businesses.

Finally, these cannot be implemented without a holistic long-term vision that establishes the beginning of a more competitive and of a wider international scope of the Mexican economy. It must be based upon a larger and better infrastructure, as well as in the attraction of high technology as a priority to allow Mexican industries to escalate in the composition of manufactures, and go from labor to technology and capital intensive.

## End Notes

- <sup>(i)</sup> Meanwhile the majority of the investment that China has received has been directed towards the creation of new industries and, as a consequence, for the creation of new sources of employment.
- <sup>(ii)</sup> The amounts in dollars are from United States until the contrary is specified. Likely, it is important to take notice that there is a strong difference among the commerce quantities given by the Canadian Statistics Office and the ones from the Mexican one, INEGI. This difference consists basically in that Mexico does not count the costs that are reported on the side of the United States, therefore reporting less than the Canadian data.
- <sup>(iii)</sup> It is important to mention that despite Hong Kong is under the direction of Beijing, designated as a Special Administrated Region, it will not be under the planning of national projects led by the center until 2047. Therefore, it will continue to regulate autonomously and will gradually integrate to Mainland China, allowing it to manage directly its relationship with Canada for the next 43 years.
- <sup>(iv)</sup> The first of great proportions to China of the “*Team Canada*”.

# Determinants of Willingness to Pay for Green Products in Malaysia

*Abdul Rahim Abu Bakar  
Nik Kamariah Nik Mat  
Yuhainis Mohd Yusof  
University Utara Malaysia, Malaysia*

## Abstract

Environmental issue is beginning to attract a lot of attention in Malaysia. However, the attitude of consumers towards some environmental initiatives such as recycling and buying green product is still unknown. Thus, the main objectives of this research are to determine the level of consumer willingness to pay for green products and also to determine the predictors of willingness to pay for green products. Independent variables consist of attitude, lifestyle and personality and income. Dependent variable for this research is willingness to pay for green products. Attitude is measured using 31-items scale, lifestyle (12 items), personality (11 items) and willingness to pay (5-items). A six-point Likert-scale of strongly disagree to strongly agree was utilized. Questionnaires were distributed to 224 respondents and 200 responses were returned (89% response rate) fully completed for analysis. Results show that the level of willingness to pay for green products is high (70%). Consequently, regression result shows that attitude, personality and income are significant predictors ( $R^2=0.55$ ) for willingness to pay for green products. Discussion and recommendation are discussed.

## Introduction

Environmental issues influence all human activities thus it is gaining significant attention from customers, marketers and governments alike. Green Society today has become more concerned with the natural environment, especially business has begun to modify their behavior in an attempt to address society's new concern (Polonsky, 1994). This evolution has resulted in an expanded issues concerning environmental responsibility. Straughan and Roberts (1999) mentioned that with the increased of social and political pressure, companies have moved beyond simply addressing pollution and waste disposal but also looking for alternative package composition and design, alternative products formulations and cause-related promotion in an effort to keep in step with the environmental movement.

The concern for the environment has led to increased demand for "green products" or eco-labeled products which address environmental issues through product design and innovation (Chen, 2001). Producers and marketers such as Bodyshop is known to be an environmentalist by producing cosmetic and toiletries which are environmentally-friendly to consumers. Similarly, McDonald and Xerox did some alteration to their end products so as to be more environmental friendly to consumer. Eco-labeling programs are flourishing in food industries worldwide where one can find eco-labeling programs that deal with the production of environmentally sound fruits, vegetables and milk (Maria, Jill and Ron, 2002).

### **'Ecologically Concerned' Attitude**

By definition, the ecologically concerned consumer's attitude must express concern for ecology (Kinnear, Taylor, and Ahmed 1974). The impact of ecological concern on consumption and voting behavior has frequently been assessed (Balderjahn 1988; Crosby, Gill and Taylor 1981; Crosby and Taylor 1982, 1983; Henion 1976; Kassarijian 1971; Kinnear and Taylor 1973). Researcher indicates that ecological concern is related to but not highly correlated with consumption behavior.

From the consumers perspective, academic research on consumer awareness and concern for environmental issues had been conducted elsewhere ( Straughan and Roberts, 1999; Sanjuan et al 2003, Schlegelmilch et al. 1996; Polonsky1994, etc). Schlegelmilch et al (1996) investigate the link between green purchasing decisions and environmental consciousness. Their findings suggest that attitudes are the most consistent predictor of purchasing decisions. Straughan and Roberts (1999) found that the factors that predict ecologically conscious consumer behavior (attitude) are perceived consumer effectiveness and environmental concern beliefs.

Additionally, attitude toward pollution has been found to affect one's attitude toward ecologically conscious living (Balderjahn 1988). Suggestion that those who are genuinely concerned about pollution is inclined to take measures to circumvent further pollution. Balderjahn (1988) also found that those who have a positive attitude towards ecologically conscious living participated in ecological buying and consuming of products. Attitudes have likewise served as predictors of energy conservation behavior, environmental concern, and recycling.

It is also likely that one's perception of the pollution problem could have a bearing on one's attitude toward pollution. Crosby, Gill, and a Taylor (1981) found that an individual concern with beverage containers contribution to pollution and litter had a strong positive relationship to one's ecological concern. However, they found little association between concern with litter and the purchase of returnable containers. Therefore, those who believe there is a solid waste disposal problem are likely to be more concern about pollution than those who do not, and vice versa.

Finally, the extent to which the consumer believes he or she can be effective in pollution abatement is considered to be a predictor of the ecologically concerned consumer (Kinneer, Taylor, and Ahmed 1974; Webster 1975). The ecologically concerned consumer believes in the power of the individuals, the more he or she will buy and use nonpolluting products (Balderjahn, 1988).

#### **'Green' Personality**

Studies on personality have been conducted by most environment researcher. The purpose is to study and to describe what type of personality for green consumer. Kinneer, Taylor and Ahmed (1974) found that personality variables to be better predictors of ecologically concerned consumers than socioeconomic variables.

Most of the studies on personality stresses on certain aspects such as alienation, dogmatism, personal competence, conservatism. For example Anderson and Cunningham (1972) measures alienation, dogmatism, personal competence status consciousness, cosmopolitanism and conservatism. Webster, (1975) measures personality by looking at dominance, tolerance socialization and responsibility.

Anderson, Henion and Cox (1974) found positive correlation between personality with regard to pollution, ecological concern and ecological scale. However, Balderjahn (1988) argues that this result is sometimes inconsistent for specific pro-environmental behaviors, such as green purchasing decisions. Webster (1975) added that personality variables have been shown to explain only a small part of the total variability of the behavioral measures used. Hooley and Saunders (1993) also suggest that caution should be taken in using personality variables for market segmentation.

#### **'Green' Lifestyle**

Logically, consumers buy green products to help the environment but more so as a mean to improve their living in general (Lambert, 1996). Sometimes lifestyle does affect our buying behavior. Research conducted in Spain by Sanjuan, et al. (2003) on willingness to pay for organic products has shown that lifestyles are summarized into three factors: natural food consumption, life equilibrium and health concern. Lifestyle accounted for 53% of the total variance in willingness to pay.

#### **Willingness to Pay**

In spite of the high claims in America that the majority of consumers are environmentalist (Donaton and Fitzgerald, 1992; Ottman 1992; Schlossberg, 1991; Schwartz and Miller, Gutfield, 1991), there are concerns among retailers who reported slumping sales for 'green' goods such as paper products (International Wildlife, 1992). Ironically, in a new survey conducted in 2003, findings show that 87% of the American polls are willing to pay more for green home features. Sanjuan et al (2003) contribute to the present field of research by indicating that neither consumers nor retailers, even those whose attitudes could favor organic consumption and distribution, are willing to pay higher prices for organic green product.

There are differences between environmentally-friendly products (green products) and other related products. According to Maria et al. (2002), these environmentally-friendly products have an unobservable quality attributes, which make them fundamentally different from other products. This makes the products more expensive than others. Sadly, not many consumers are willing to pay more for green products.

Conversely, researches have indicated that the level of willingness to pay more for services or products is high and related positively to matters that involve closely to health, safety and quality (Donovan, 2004; Krystallis, Arvanitoyannis and Kapirti, 2003). In many cases, consumers are willing to pay more for product which are well

described to them and contribute something to their health. For example, Huang et al (1999) found that Taiwan families with members suffering from a chronic disease and family with higher incomes are more likely to pay a premium for hydroponically grown vegetables, which are free of pesticides residues.

#### **Income**

Previous researches have found that consumers with higher and stable incomes are likely to purchase high quality products and willing to pay more for green products. Huang, Kan, and Fu (1999) studied consumers' response to hydroponically grown vegetables, which are free of pesticide residues in Taiwan. They concluded that families with members suffering from a chronic disease and families with higher incomes are more likely to pay a premium for hydroponically grown vegetables.

Govindasamy and Italia (1998) compared consumers' response towards traditional and an integrated pest management products. They found that consumers with higher annual incomes are more likely to express an interest in purchasing an integrated management products and less likely to strictly purchase a conventional products.

Based on the above discussion, it seems like there is still lack of research on environmental consciousness among the Malaysian consumers compared to the Western countries. The Malaysian scenario for green marketing is not too encouraging where not many manufacturers are eager to market green products. Only government and a few NGOs show some effort by doing an informative advertisement to show the importance of being responsible to the environment. Thus, this study attempt to pursue the following objectives: (1) to determine the level of consumer willingness to pay for green products in Malaysia. and (2) to examine which factor contribute to the willingness to pay for green products (personality, lifestyle, attitude, income).

## **Methodology**

### **Survey Instrument**

Attitude is measured using 31-items which is a combination and modification from Roberts (1996) and Schwepker and Cornwell (1991), to tap ecological conscious consumer behavior (ECCB). All items were measured with Likert scale anchored with "strongly agree" (6) and "strongly disagree" (1). These scales attempted to capture the following constructs: one's attitude toward litter (AL), perception on pollution (PP) and attitude towards ecologically conscious living (AECL). Ecologically-inclined lifestyle is measured using a 12-item statements adapted and modified from Value Added lifestyles (VALS) measure (SRIC-BI, 2003). Personality is measured using a 11-item statements based on sociability and conscientiousness factors of the big-five personality factors modified to suit environment conscious personality (Hogan, 1991). Willingness to pay for green products is measured using a 5-item statements adapted from Schwepker and Cornwell (1991).

### **Samples**

The respondents for this study are lecturers at a university in Malaysia. A total of 224 questionnaires were distributed to the lecturers selected using systematic random sampling. 200 responses were collected back representing about 89% response rate.

## **Findings**

Table 1 presents the demographic profile of the respondents. The sample consists of equal number of male and female respondents whilst ethnically they are mainly Malay (90%). Their mean age is 31 with an average monthly income of over RM3,000.

TABLE 1: PROFILE OF RESPONDENT

Variable		Number	Valid Percent (N=200) in %
<b>Gender</b>	Male	101	50.5
	Female	99	49.5
<b>Race</b>	Malay	190	95.0
	Chinese	6	3.0
	Indian	4	2.0
<b>Status</b>	Single	52	25.5
	Married	146	73
	Divorced	3	1.5
<b>Education</b>	Masters	187	93.5
	PhD	13	6.5
<b>Position</b>	Lecturer	182	91.5
	Senior lecturer	3	1.5

<b>Income</b> Mean=RM3228	RM2000 - 4000	191	95.5
	RM5000-7000	6	3
	RM8000-10000	3	1.5

**Descriptive Statistics of All Item Statements**

The mean and the standard deviation scores for all individual statements are shown in Table 2.

TABLE 2: QUESTIONNAIRE ITEMS

	Statements	Mean	Standard Deviation
<b>Attitude (Independent Variable)</b>			
1	I am concern with the amount of pollution in my city	5.03	0.86
2	Seeing litter in streets and parks bothers me	5.06	1.16
3	Seeing someone litters upsets me	4.92	1.01
4	I always ignore people when I see them littering in front of me ®	3.95	1.18
5	Littering campaign done by the government does not effect me at all ®	4.31	1.38
6	I don't see why we have to take littering as an important issue ®	5.45	0.91
7	It is normal for anyone to litter ®	5.10	1.15
8	It is ok if you forget to throw your rubbish in the area given by the authority ®	5.04	1.19
9	I always advise kids to avoid littering	4.87	1.29
10	I don't mind picking up rubbish and throw it in the right place	4.26	1.30
11	When I buy products, I try to consider how my use of them will affect the environment and other consumer	3.71	1.19
12	Whenever possible, I buy products which I consider environmentally safe	4.23	1.05
13	I recycle whenever possible	3.91	1.11
14	I normally make a conscious effort to limit my use of products that are made of or use scarce resources.	3.72	0.97

15	I will not buy products which have excessive packaging.	3.47	1.12
16	When there is a choice, I always choose the products which contribute to the least amount of pollution.	4.26	1.17
17	If I understand the potential damage to the environment that some products can cause, I do not purchase these products.	4.64	1.10
18	I have switched products for ecological reasons.	4.05	1.12
19	I use recycling center or in some way recycle some of my household trash.	3.42	1.23
20	I make every effort to buy paper products made from recycled paper.	3.52	1.13
21	I used low in chemicals detergent for my laundry.	3.83	1.10
22	I have convinced members of my family or friends not to buy some products which are harmful to the environment.	3.64	1.06
23	I have purchased products because they cause less pollution.	3.87	1.07
26	I always read whether the toilet paper is made from recycle paper or not before buying it.	3.01	1.21
27	I always make sure that I buy products in a biodegradable package.	3.54	0.97
28	I always make sure that I reused all the plastics bags from the previous shopping.	4.67	1.13
29	I don't care if I don't throw the tins and the bottles at the recycle bin.®	4.56	1.22
30	I don't mind if there is no recycle bin provided by the authority at my area.®.	4.72	1.08
31	I like the idea of different recycle bin for different products.	4.79	1.35
<b>Lifestyle (Independent Variable 2)</b>			
1	I always joined outdoor gathering with friends and family.	4.68	1.14
2	I love to make things I can use everyday.	4.39	1.12
3	I follow the latest trends and fashion.	3.15	1.19
4	I like outdoor activities.	4.36	1.27
5	I am really particular at things that I buy.	3.47	1.19
6	I consider myself as intellectual.	4.45	0.98
7	I like trying new things.	4.36	1.01
8	I would like to understand more about how the universe works.	4.55	0.86
9	I like buying leather products.	4.57	1.27
10	I like gardening. It is my routine activities.	4.24	1.42
11	I never bring my own bags to the supermarket.	2.86	1.28
12	I don't care about other opinion as long I am happy.	4.40	1.28
<b>Personality (Independent Variable3)</b>			
1	I am very tidy person. I don't like messy place.	4.71	1.11
2	I always make sure that my office is always clean before I leave the room.	4.42	1.14
3	I don't mind if the public toilet is dirty. We are not going to use it everyday.®	5.53	0.99
4	No matter how dirty my car is, I only wash it whenever I am free.®	3.90	1.53
5	I always cook my own meal, rather than eating out to ensure that the food is really clean.	3.97	1.43
6	I don't like to be in a crowded area or space (concert or supermarket)®.	2.72	1.43
7	Once in a while, I like to spend my holiday away from the city.	5.11	0.92
8	I will make sure that there is always trees and flowers around my house.	4.59	1.19
9	I prefer fresh flowers rather than substitute flowers.	4.90	1.08
10	I enjoy hearing the sound of the nature (singing birds, running water from the lake).	3.52	1.73
11	I don't like pets around my house.®.	3.49	1.73
<b>Willingness to pay (Dependent Variable)</b>			
1	I am willing to pay more for any products that are safe to the environment.	4.27	1.10
2	I am willing to pay more for any environmentally-friendly products although they are much more expensive then their substitute products.	4.17	1.05

	(E.g. cosmetics, Body Shop).		
3	I am willing to pay more for any products in a biodegradable packaged before buying similar products in a non-biodegradable package. (E.g. washing powder in box).	4.06	1.07
4	I am willing to pay more for any products in a recyclable package before buying the same products in a package which is not recyclable.(E.g. cans vs. polystyrene food container).	3.92	1.07
5	I am willing to pay more for any products in larger amount to reduce the buying frequency.	4.23	1.15

Table 3 presents the descriptive statistics for each dependent and independent variable after computation.

**TABLE 3: DESCRIPTIVE STATISTICS MEASURE**

Variable type	N	No. of Item	Minimum score	Maximum score	Actual study Means (SD) N=200
<b>Dependent:</b>					
Y = Willingness to pay	200	5	2.00	6.0	4.1(0.95)
<b>Independent:</b>					
X1 = attitude	200	31	2.61	5.61	4.2(0.56)
X2 = lifestyle	200	12	1.75	5.58	4.1(0.63)
X3 = personality	200	11	3.00	5.55	4.4(0.58)
X4 = income	200	1	2000	10,000	3228(1031.38)

#### Reliability of the Study

Table 4 shows the outcome of the pilot and the actual reliability test results. Cronbach alpha for all variables are well above the acceptable threshold suggested by Nunnally (1967).

**TABLE 4: RELIABILITY OF THE VARIABLES**

Variable	No. of Item	Alpha Coefficient (pilot) N=27	Alpha Coefficient (actual) N=200
<b>Dependent variable:</b>			
Y1 = Willingness to pay	5	0.96	0.92
<b>Independent variable:</b>			
X1 = Attitude	31	0.84	0.89
X2 = Personality	11	0.89	0.77
X3 = Lifestyle	12	0.75	0.64

#### The Level of Willingness to Pay for Green Products

To determine the level of consumers' willingness to pay for green products, the percentage of consumers who are willing to pay more for green products are computed based on willingness to pay for safer product, substitute product, biodegradable and recyclable products and the results are shown in Table 5. The average level of consumer's willingness to pay for green product is 71%.

**TABLE 5: THE LEVEL OF WILLINGNESS TO PAY FOR GREEN PRODUCT**

Items in Questionnaire	Respondent	
	Agree (%)	Disagree (%)
1. Safe	77	23
2. Substitute	73.5	26.5
3. Biodegradable	69	31
4. Recyclable	63	37
<b>Average</b>	<b>70.6</b>	<b>29.4</b>

### Correlation Result

Table 6 shows the correlation result for all variables. The correlation coefficient (r) shows significant positive correlation between willingness to pay and attitude and lifestyle but not with personality.

TABLE 6: CORRELATION RESULTS

Variable	Y	X1	X2	X3	X4
<b>Y = Willingness to pay</b>	1.00				
<b>Independent</b>					
<b>X1:attitude</b>	0.687*	1.00			
<b>X2:lifestyle</b>	0.199*	0.504*	1.00		
<b>X3:personality</b>	-0.031	0.304*	0.638*	1.00	
<b>X4:income</b>	0.16*	0.073	0.145*	0.098	1.00

\*\* Correlation is significant at the 0.001 level (2-tailed)  
\* Correlation is significant at the 0.01 level (2-tailed)

The overall correlation results in table 6 indicate that the variables are not highly correlated (ranging from r = 0.199 to 0.687).

### Multiple Regression Results

The regression result in table 7 indicates that 3 variables (ecological conscious attitude, personality and income) are found to be significant predictors of willingness to pay for green products. The variance inflation factor (VIF) indicates collinearity assumptions are fulfilled.

TABLE 7: REGRESSION RESULTS

Variables	Regression coefficients (B)	t-value	Sig. t	VIF
<b>Constant</b>	0.31	0.71	0.48	
<b>Attitude</b>	1.31	14.08	0.001	1.34
<b>Personality</b>	-0.40	-3.95	0.001	1.68
<b>Income</b>	0.00	2.71	0.01	1.02
<b>Lifestyle</b>	-0.08	-0.06	0.42	2.07

R<sup>2</sup>=0.553, F=60.35, p<0.001, df=199

Predictors: (Constant), income, attitude, personality and lifestyle

Dependent Variable: willingness to pay.

Table 8 shows three of the independent variables are entered into the stepwise regression equation: attitude, personality and income. Attitude explains 47.2%, personality explains 6.4%, and income explains 2% of the variance in willingness to pay respectively.

TABLE 8: STEPWISE REGRESSION RESULTS

Variables	B	R <sup>2</sup>	RA	Adjusted R <sup>2</sup>	t	Sig. t	VIF
<b>Constant</b>	0.32				0.73	0.48	
<b>Attitude</b>	1.28	0.472	0.472	0.47	15.15	0.001	1.104
<b>Personality</b>	-0.45	0.536	0.064	0.53	-5.46	0.001	1.109
<b>Income</b>	0.00	0.552	0.016	0.55	2.65	0.01	1.012

F=80.39, p<0.001, df=199

## Discussion and Recommendation

This study identifies three variables that predict willingness to pay for green product: attitude, personality and income. Attitude seems to predict willingness to pay for green products. This finding suggests that someone who is concerned about the environment, are likely to be proactive or contribute most of their efforts to the purchase of green products. Balderjahn (1988) also found that those who have a positive attitude towards ecologically conscious living participated in ecological buying and consuming green products environment.

There is a significant inverse relationship between personality and willingness to pay for green products. This negative relationship means that although their personality is great (neat person, active or even very playful), the tendency to buy green products is still low. Accordingly we can conclude that consumers with negative personality are more willing to pay for green product. Possibly, the consumers in Malaysia are indifferent or uncomplaining to the cleanliness of some of the public facilities provided, even though they themselves are tidy people. Furthermore, the knowledge on green products among Malaysian consumer is still new. Not many of them will buy green products because their price is far more expensive than other products in the market regardless of the personality they have. This result contradicts earlier findings by Anderson et al, (1974) who found positive relationship between personality and ecologically conscious attitude. Furthermore, inconsistency and caution were suggested by earlier researchers regarding the treatment of personality measures (Balderjahn, 1988; Webster, 1975; and Hooley and Saunders (1993).

Income to some extent is related significantly to willingness to pay for green products. This is proven when consumers with stable income are willing to pay for green products. Since green products are generally more expensive than normal goods, it is logical that only those with high income are willing to pay for these expensive green products.

Although the level of willingness to pay for green product has been found to be high (70%), however, more research should be conducted to determine whether those who are willing to pay would actually purchase green product. The level of awareness of consumers towards ecologically concerned attitude could be enhanced by marketers, non-government organizations (NGOs) and government to promote green marketing. Marketers should take into consideration the attitude of consumers and income when designing and marketing green products. Cheaper versions of green product are preferred in order to encourage the consumers to consume green products.

This study indicates that the level of willingness to purchase green product is quite high among Malaysians. The three determinants of the willingness to pay for green product are income, attitude and personality.

## Environmental Regulation in East Asia's Special Economic Zones

*Benjamin J. Richardson  
York University, Canada*

### Abstract

The problem this conference paper addresses is whether environmental regulation in East Asia's Special Economic Zones (SEZs) has been compromised by economic policies favouring rapid industrialization through foreign investment and export-oriented production and, to the extent that such environmental regulation has been compromised, to consider viable reforms that could be pursued to reduce the environmental impact of the SEZs. Over recent decades, China, Taiwan, South Korea, and other newly industrializing economies in East Asia have designated special areas for foreign investment and export production to which have been conceded favourable investment and trade conditions, and often exemption from certain kinds of regulation. The synergistic effects of high urbanization, rapid population growth and intensification of land use have created some severe environmental problems in East Asia's industrializing cities.

What do such conditions imply about the state of environmental regulation in the region? At first glance, most countries in East Asia have amassed sizeable collections of environmental laws and policies, often borrowing from leading Western precedents. But, in practice, these laws and policies have often not been effectively implemented. Is this general deficiency applicable to environmental regulation within the SEZs? The experience of East Asia's SEZs – particularly in China – suggests we need to re-think how we conceptualise the relationships between environmental law and foreign investment in the context of rapidly industrializing developing countries. Though a cursory look might suggest that SEZs are hot-spots for environmental mismanagement, these industrializing precincts have also pioneered some notable environmental policy reforms. Environmental regulation in China's Shenzhen SEZ, for example, tends to be stricter than in other parts of China's economy that have been shielded from the full brunt of industrial transformation. In many cases, the presence of substantial foreign investment has contributed to improvements in environmental law through the infusion of advanced environmental technologies and corporate environmental management systems. Indeed, solutions to East Asian environmental regulatory weaknesses may well reside in the areas most open to the market. They offer an arena where experiments can be conducted in environmental law and new regulatory techniques tested. Some environmental management advantages may ensue from the East Asia's growing engagement with the international market, which can offer environmental technologies, management techniques and financial resources not readily available domestically.

### East Asia's Industrial Transformation and Its Environmental Consequences

East Asia – stretching from Korea to Indonesia – contains many newly industrializing countries. They have similar economic ambitions, but differ considerably in their history, geography, demography, ethnicity, political ideology and level of economic progression. Despite their diversity, the state has played a pivotal role in the economic transformation of all. Economic policy has emphasized industrialization and quick economic growth. East Asian governments have accepted primary stewardship of growth and given it higher priority than their Western counterparts. It has been estimated that while it took the West some 400 hundred years to achieve a tenfold increase in per capita income, South Korea and Taiwan bolted to the same gain in merely 50 years (Dowling, 1997). Foreign direct investment (FDI) and international trade have been seminal elements in both types of economic strategies. From some US\$46 billion in FDI flows per year to developing countries over 1988-1993, this grew to over US\$240 billion annually by 2000 (UNCTAD, 2001).

Underpinning the economic transformation of East Asia has been the “developmental state” (Brodsgaard & Young, 2001). East Asia's economic “miracle” has not been a serendipitous consequence of a conflation of various market forces, but a result of specific economic policies and active intervention by governments. Unlike the earlier 19<sup>th</sup> century *laissez-faire* traditions of the West, state involvement in East Asia began not in the liberal mould of detached market regulation, but deep involvement in capital allocation and the restructuring of markets. After their independence, most postcolonial administrations in the region nationalized foreign companies, set up numerous state enterprises, and launched ambitious national development plans. Since the early 1980s, in line with global trends,

East Asian economies have been increasingly deregulated (Haque, 1998; Bernard, 1996). There has been a concerted effort to dilute central economic planning and state economic monopolies through a market-driven model based on neo-liberal assumptions such as rational individual choice, minimal state, market competition and efficiency, and free trade. The role of governments in the region has thus moved, but not entirely, from interventionist, nation-building activities, to being a facilitator of market forces in which the private sector plays the hegemonic role. One aspect of economic policy that survived virtually unscathed from this period was the SEZs.

## **Emergence of the Special Economic Zones**

A central component of the economic governance of East Asia is the special economic zone (Rondinelli, 1987). Taiwan and South Korea established Asia's first export processing zones in the mid-1960s. Special economic zones are geographically or juridically bounded areas designated by governments for foreign investment and export-oriented industrialization, to which are conceded favourable investment and trade conditions, and reduced red-tape. They have been established as windows for foreign investment and technology, to thereby act as catalysts for the modernization and growth of domestic economies (Vuoristo, 1994). There is a diversity of SEZs, which reflect different philosophies, objectives, and means of achieving them. This is evident by their nomenclature, which includes such various descriptions as free trade zones, export processing zones and technology development zones. Depending on the particular SEZ model adopted, the "specialness" of the zones stems from their subsidized physical infrastructure, favourable investment and trade conditions such as lower taxes and duty-free import of manufacturing equipment, and often exemption from certain kinds of regulation such as controls on project developments. Special economic production zones are intended to encourage companies to locate there to take advantage of the promised lower costs of production. In turn, the SEZs can benefit host countries through employment growth, poverty reduction, introduction of advanced technologies and foreign exchange earnings (Mutti, 2004).

In the 1980s, the Chinese Communist Party (CCP) took an active interest in SEZs, and decided to establish SEZs as discrete "laboratories for innovative domestic economic reforms" (Crane, 1990: 3), undertaken on an experimental basis in order to minimize potential wider social unrest and political conflict. Presently, China has the most extensive array of SEZs in East Asia – indeed, in the whole world. In the early 1980s, the CCP designated four SEZs, at Shenzhen, Shantou and Zhuhai in Guangdong Province, and Xiamen in Fujian Province. In 1984, Hainan Island was opened as the fifth SEZ. These flagship zones would eventually become the catalysts of modernization of the Chinese economy. In 1984, "open door" economic privileges were also offered to fourteen coastal cities. In 1985, the concept of open cities was expanded to "open regions", and a number of open coastal areas were proclaimed, mainly along the Yangtze River delta and the Pearl River delta. Today, the range of development zones in China is quite staggering; by 2003, there were estimated to be an astonishing 3,837 development zones in all (Yan, 2004).

Special economic zones and concomitant market stimulants have been introduced in other industrializing East Asian nations. Virtually all countries have pursued market deregulation policies in relation to trade, investment, capital flow, and exchange rate. Special economic zones were pioneered in the region by Taiwan and South Korea. Taiwan's first export-processing zone was set-up in Chien-Jiang, Kaohsiung City, followed by more zones opened in Nantze and Taichung in 1969 (UNIDO, 2002: 122). South Korea organized special industrial parks and export processing zones in the 1960s and 1970s to promote the advancement of laggard regions and thereby achieve a more decentralized pattern of development in areas away from Seoul, which had the lion's share of investment (Kim & Gallent, 1997). The first industrial parks for export production were set up in Ulsan in 1962 and Kuro in 1965. A late industrializing economy, Vietnam has also begun to authorize some SEZs in coastal and border areas to stimulate investment and economic growth, along with other policy reforms to lure foreign investment (UNCTAD, 2000: 113-15). Vietnam initially designated three SEZs: in Hai Phong city, the Chu Lai area of Quang Nam Province, and the Can Gio area of Ho Chi Minh city. Each SEZ is supervised by an Economic Zone Management Authority. Thailand is also using the SEZ model, and has designated several SEZs along its borders with Laos and Cambodia. Thailand's Investment Promotion Act 1977 provides various tax and non-tax incentives for both local

and foreign investors in areas promoted by the government. In addition, the Industrial Estate Authority of Thailand administers some 30 industrial estates, and a variety of financial incentives and market privileges are offered to companies accepted for investment in the industrial estates. Malaysia established its first SEZ in 1971 pursuant to the Free Trade Zone Act 1970 passed to entice export-oriented FDI (Warr, 1987). Presently, Malaysia's SEZs are regulated through the Free Zones Act 1990, which provides companies operating in the zones with reduced import and export procedural controls and customs concessions. The Philippine Special Economic Zone Act 1995 provides for the creation of "ecozones", offering tax holidays and other fiscal incentives, and superior transport and related service infrastructure, with the mission of accelerating employment generation and new investment. The Philippines has established some 75 ecozones to date (Mejia, 2003: 488). It set up the Philippines Economic Zone Authority in 1995 to coordinate the inflow of new FDI into the zones, with separate authorities for the Subic Bay and Clark free trade zones established on the sites on the former United States military bases.

East Asia's orgy of economic growth and industrialization has wrought extensive social and environmental changes. Studies sponsored by the World Bank, United Nations and other organisations offer some insights into the extent and severity of environmental problems in East Asia (Economic and Social Commission for Asia and the Pacific, 2000). The environmental transformation of East Asia's cities is also associated with urbanization and the emergence of mass consumption. Environmental conditions in some SEZs have attracted harsh criticism from media commentators. McElligott (1996) has lambasted: "in the Special Economic Zones located in southern China, ecology takes a back seat to profit in a country struggling to develop an industry with few financial resources". Similarly, Tester (1995) depicts China's SEZs as "an ecological disaster the likes of which the planet has never seen; the result of firing this modern industrial revolution with soft coal, of filling in thousands of hectares of rice paddies to make way for roads, homes and factories, of moving whole mountains in the process, of creating air, water and soil pollution problems that, by all reports, are the worst on the planet". However, other research suggests that environmental conditions in the SEZs are no worse than other areas, and indeed may be superior owing to the greater availability of pollution control technologies from foreign investors, as well as the more systematic land use planning in the zones (World Bank, 1992). But the intensive scale of development in the SEZs has tended to entail higher energy and resource demands than usual. The Asian Development Bank's (2001: 31) environmental survey reported "careful spatial planning and management of industrial activity" in the SEZs of the Philippines had helped minimize potential environmental effects. By contrast, Vietnam's SEZs are under environmental crisis, owing principally to extensive water and air pollution from their industrial enterprises.

## **Environmental Law in East Asia – the Path to Legal Modernization**

Throughout East Asia, environmental law and policy has ostensibly begun to reach maturity, manifested by extensive legislative initiatives, judicial activism and a consequential environmental jurisprudence, and the founding of environmental management agencies. Governments are modernizing their environmental management regimes to give effect to principles of sustainable development (Subedi, 2002). East Asian environmental policy-makers faced with the daunting task of devising and implementing effective regulatory regimes for their industrializing economies, "have at least one advantage over their historical counterparts in the West – they have several decades of environmental regulatory history to learn from" (Blackman & Harrington, 2000: 5). So far, the most advanced reforms have been pioneered in Singapore and Taiwan, while Thailand, Indonesia and Vietnam have among the least developed environmental legislation.

The plethora of environmental laws, institutions and policies governing East Asia's SEZs and other economic sectors masks a variety of structural weaknesses in the capacity of their legal systems to promote sustainable development. While Asian states have nearly all produced a substantial volume of environmental legislation, they have differed "in their ability to build more effective public sector environmental agencies that ha[ve] the legal authority and the tools to effectively monitor and enforce emission and ambient standards" (Rock, 2002: 96). According to the Asian Development Bank's *Asian Environment Outlook* report, "the root cause of the poor state of the environment in the region was a failure of policy and of institutions" (ADB, 2001: xv).

Environmental law regimes are unlikely to succeed unless anchored to wider reforms to promote good governance and rule of law. Law acquires its meaning and performs its social functions through processes of implementation and enforcement, without which it has little life in any given society. Heavy reliance on centralized, bureaucratic decision-making that excludes civil society, incompetent and corrupt administrative officials and judges, and limitations on access to justice, all undermine to various degrees the ability of East Asian governments to implement environmental policies and laws to address the effects of rapid industrialization. While some countries have made substantial progress in addressing these encumbrances, there has been a tendency for some states to naively import foreign precedents incompatible with local institutional and social conditions (Legrand, 1997: 119). Some measure of rule of law would seem to be a necessary precondition to effective environmental law. The notion of rule of law is a contested concept with various definitions and visions. Raz (1979) believed that at a minimum law must be able to guide behaviour. Peerenboom (2004: 2) has suggested “law [must be] able to impose meaningful restraints on the state”. Concepts of the rule of law have been criticised as narrowly reflecting a Western, liberal democratic tradition that is not necessarily germane to the circumstances of East Asia or other developing country regions (Dyzenhaus, 2000). Critical legal scholars, critical race theorists and feminists have shown that the seeming neutrality of the rule of law can reinforce existing power relations at the expense of certain vulnerable groups of the society (Unger, 1976; Mackinnon, 1989). The failure of the “law and development” movement of the 1960s and 1970s – a program and discourse for legal technical assistance and reform, as part of Western development aid programs – shattered the naïve belief that if laws are reformed and legal institutions strengthened, nothing can restrain the “rule of law’s” triumph. The law and development movement has re-emerged in a new guise recent decades, through the “New Public Management” and “Good Governance” prescriptions recited by the international development assistance community (Demmers, et al, 2004).

The pressures for legal reform in East Asia are growing as its members open their economies to global market forces and address the environmental problems of industrialization. Traditional rules, norms, standards alone may not be conducive to addressing the policy challenges. The development of modern economies has required the replacement of closed political and bureaucratic dealings with “rational” legal instruments. This entails improved legislative drafting, coordination and dissemination, restraints on the discretionary powers of bureaucrats, more independent and competent judiciary, and effective enforcement mechanisms. To be sustainable, however, legal reforms have to find sustenance in the markets and civil societies they purport to govern. Wang (2002: 28) warns that, “law becomes effective by social forces and pressures interested in and working for its implementation. Without a property institutional setting, the law will remain a fig-leaf, pretending action without changing social reality”.

It is possible to conceive of rule of law reforms without necessarily sacrificing local culture and institutions. Peerenboom, 2004: 3-6) argues that by differentiating between a “thin” and “thick” conception of the rule law, the core, universally valid elements of an effective legal system can be isolated without necessarily importing certain discourses about political morality. A thin conception embodies the functional or instrumental aspects of the rule of law – any legal system that is effective must have these elements – such as the existence of courts to interpret laws, laws made public, laws generally applicable, laws that are clear, consistent and stable, and laws that are enforced and accepted by most people. These minimal requirements of rule of law are surely compatible with considerable diversity of institutions, rules and practices in any given society. A thick conception of rule of law adds further elements of political morality, such as particular economic arrangements (free-market capitalism, administrative planning), forms of governance (liberal democratic, socialist) or conceptions of human rights (collectivist, libertarian). Through this distinction, each country’s culture, traditions and economic aspirations can be accommodated while respecting the need for certain core elements of any legal system. Thus, law reform guided by “Asian values” or other discourses can be conceived without importing inappropriate political and legal philosophies (Stoltenberg, 2000).

Obstacles to legal modernization are particularly acute in China, which is undergoing profound social and economic upheaval as it abandons socialist economic doctrine. The importance of social networks (*guanxi*), a history of privileging substantive justice over procedural justice, and a preference for avoiding formal law in favour of pragmatic, informal means of resolving disputes, have posed barriers to the implementation of a law-based order suited to an open, market economy. Historically and culturally, the Chinese have tended to guide social behaviour

though moral standards and local custom rather than formal legislation (Sims, 1999). In the post-war era, the addition of socialist legal theory has presented law as a management tool to preserve the state's interest. Whereas Western legal systems stress the virtues of generality, equality and impartiality, Chinese cultural traditions, whether Confucian or Maoist, "have rejected rule ethics and universal principles in favor of a context-specific, pragmatic, situational ethics" (Peerenboom, 1999: 324). Consequently, their legal system often cedes wide discretionary power to administrators to implement the law and make it workable in specific situations. This does not mean that the law is simply shunted aside, but that legal rules are adapted to meet specific needs and situations. Since the early 1980s, rule of law has re-entered public discourse in China, with an emphasis on legislation and institution building. The PRC leaders have accepted the need for legal reform as a means to enable China's economic transformation.

While cultural traditions and political ideologies have made it difficult to establish a law-based order in China, such factors have also existed in South Korea, Singapore and Taiwan for instance, all of which have managed to establish fairly robust legal regimes. And once institutions of reform are established, they can develop a momentum of their own "if for no other reason than path-dependent institutional self-interest" (Peerenboom, 2003: 62). During the 1990s, Taiwan and Korea embraced a Western style liberal-democratic version of rule of law, including constitutional and parliamentary reforms and the promotion of more effective administrative and judicial structures (Cooney, 2004: 417). South Korea and Taiwan's democratisation reforms have both fuelled various environmental activist movements, which in turn provide some feedback for the strengthening of environmental laws (Gao, 2001). By contrast, Malaysia and Indonesia are soft-authoritarian regimes where opposition parties and the media have been somewhat muzzled through security laws and other means of enforcing a non-liberal conception of democracy (Field, 1995: 105-08). Thailand has also been confronting fundamental constitutional issues such as the relationship of democracy to rule of law, balance of power issues between the different arms of the state, and protection of human rights (Muntarborn, 2004). Thai governments have been unstable owing to shifting parliamentary coalitions and excessive "money politics", as well as the interference from the military. Some countries in East Asia are plagued by more serious institutional weaknesses. The rule of law is a somewhat distant reality in Vietnam, for example (Gillespie, 2004).

## **Environmental Regulation in Special Economic Zones**

The development of SEZs in East Asia has been accompanied by substantial legal reform. Law has played a key role in the designation of SEZs, the control of foreign investment, land use planning and general economic management. However, the effectiveness of this regulation is another matter. The most informative evidence regarding SEZ environmental regulation in East Asia comes from China's SEZs. While many development projects proceeded with merely perfunctory consideration of environmental and social effects during the early years of China's SEZ reforms, authorities quickly began to take environmental regulation more seriously for several reasons (Profiaizer, 1993: 320-21). First, PRC leaders felt that stronger environmental regulation would help them regain political control over the SEZs, which were gaining notoriety for "excesses" such as corruption and financial mismanagement. Such problems convinced authorities of the need for more supervision of activities in the zones. Second, tighter environmental regulation was also an outcome of internal struggles within the CCP between conservative and liberal factions over the direction of the market reforms. The conservatives cited environmental problems as among various reasons to oppose the SEZ model, thus prompting the reformers to increase environmental regulation in the SEZs to forestall further consternation. Thirdly, the strengthening of environmental laws in the SEZs would, believed some CCP leaders, facilitate the reception of Western legal concepts and technologies, which could assist China's modernization.

In 1986, the central government issued the Provisional Regulations on Environment Control for Economic Zones Open to Foreigners. Applicable to domestic and foreign enterprises, the regulations have the stated aim: "to prevent and control environmental pollution and ecological damage, to ensure the health of human beings, to protect and create a sound investment environment and to promote economic and social development" (article 1). Among their specific provisions, the regulations require SEZ managing authorities to include environmental protection measures in local development plans (article 3), to conduct environmental assessment studies of new development

proposals (article 4), and to prohibit new projects that pose specified serious harms (article 4) Local authorities are permitted to adopt supplementary pollution control standards, which may be stricter than baseline provincial standards (article 5).

Besides this general template for environmental governance, local authorities in the Chinese SEZs and open cities have enacted environmental regulations tailored to their localities. Presently, Shenzhen SEZ has the largest collection of environmental rules (Wenfang, 1998). Similarly, Xaimen and Hainan SEZs have passed numerous local environmental protection regulations over the same period. In all these cases, the SEZ regulations encompass such matters as land use planning, provision of urban amenities, pollution licensing and waste disposal. Unfortunately, poor legislative drafting, reflected by vague or unworkable provisions, plagues many regulations. The SEZ environmental regulations are somewhat austere and authoritarian, and provide few opportunities for formal citizen participation in SEZ environmental decision-making.

The extensive decentralisation of responsibilities to municipal authorities in China has contributed to variable and inconsistent implementation of environmental regulations in the SEZs. An unprecedented nationwide probe of the country's development zones, conducted by the Ministry of Land and Resources in 2003, found rampant land use and planning law abuses (Yan, 2004). Legislation delegating powers to SEZ municipal authorities is vulnerable to being undermined by those authorities following local economic aspirations that diverge from national environmental protection objectives. From the reforms, municipal governments have become "fully fledged economic actors, not just administrative-service providers" (Oi, 1993: 1137). The power of local authorities is increasingly linked to local business interests, from whom they derive revenue and political support.

But when we look at China's flagship SEZs, subject to much greater central oversight, environmental regulation appears to be much more effective. Some of China's major cities with SEZs have experienced significant declines in pollution. For example, Wheeler (2001: 229) found that from 1987 to 1995 particulate airborne matter concentration in the sampled cities declined from almost 500 g/m<sup>3</sup> to about 300 g/m<sup>3</sup>. According to the State Environmental Protection Administration, only 11 cities met or exceeded national air quality standards in 2000, and these cities included all the SEZ municipalities in Fujian and Guangdong provinces (Rongrong, 2000). The relatively few states owned enterprises (SOEs) in the SEZ cities may partly explain their success in achieving environmental standards. In particular, pollution loads in Shenzhen are significantly lower than typical Chinese cities. Shenzhen has complied with national air and water quality standards, and has been described as "among the top five environmental enforcers in China" (Wenfang, 1998).

These achievements have been acknowledged by various environmental awards and honours. In recent years, Chinese authorities have begun to see the SEZs as places to showcase environmental excellence. A decade ago, Profaizer showed percipience to argue that China "should utilize the SEZs as an environmental laboratory to study how economic growth can proceed in cooperation with environmental protection" (Profaizer, 1993: 345-46). Since 1997, Chinese authorities have designated five places as "model" environmental cities - all of them located in the major SEZs. The city of Shenzhen (an area which includes the SEZ) has been showered with several accolades, notably International Garden City in 2000 (bestowed by the International Association of Gardens and Recreational Facilities), and the Global 500 Roll of Honour of the United Nations Environment Program (UNEP) in 2002. In bestowing the award, UNEP cited the city's array of environmental laws, large investments in environmental protection and extensive parks. Another Chinese open economic city to receive recognition for its environmental performance is Dalian. It has received a UNEP Global 500 award and the Dalian Economic and Technological Development Zone Administration was certified to the ISO 14001 standard in 1999.

The SEZs usually have the advantage of extra resources – financial and technological - to address environmental problems. Some of the environmental achievements of the SEZs appear to owe not so much to diligent regulation, but investment in environmental infrastructure and public works schemes, such as construction of sewage treatment facilities, recreational parks and afforestation initiatives. Shenzhen's environmental improvements have arisen thanks to investments in hard infrastructure such as modern sewage treatment works. Between 1991-1995, Xiamen city spent 1.5 percent of its total GDP on environmental protection (about double the national average of 0.7 percent), and for the 1996-2000 period this rose to three percent of its GDP (China Business Information Network 1997). Thus, the superior wealth and high national profile of the SEZs would appear to be factors that have enabled them to achieve superior environmental conditions, rather than as a result of innovations in

their environmental regulation *per se*. Some SEZs enjoy superior environmental conditions because they had a head-start over other Chinese cities; initially set-up in relatively undeveloped areas, SEZs were given an advantage to engage in more systematic, careful planning from the outset (Ng & Tang, 2004).

There has been comparatively less effort to develop environmental regulations tailored to the SEZs in other parts of East Asia. There is also some evidence that environmental standards may be waived or diluted for SEZ investments. Looking at South Korea first, the recent Act on Designation and Operation of Free Economic Zones 2002, provides that “the possibility of securing the environmentally sound and sustainable development” is a matter to be taken into account by the government’s Free Economic Zone Committee when selecting sites for designation as free economic zones (article 5(5)). Further, the plan for each new free economic zone must include a “program for environmental preservation” (article 6(11)). Controversially, the Korean legislation also permits the authorities to reduce or waive any applicable pollution levies, environmental improvement charges or water use fees, where they consider this necessary “for smoothly carrying out the development project of any free economic zone” (article 15(2)). Further, approval from the Minister of Finance and Economy of a zone’s implementation plan is deemed to supersede the need for any further administrative approvals under separate environmental and planning laws (e.g., for clearance of forestry reserves, diversion of farmland to industrial development or establishment of sewage facilities) (articles 9, 11). These latter provisions dangerously displace environmental protection regulations and standards, which may not be adequately incorporated into a zone’s development plan. Environmental and labour laws are known to have been waived in Masan SEZ, for investors (Trade Union Advisory Committee, 1996).

Like Korea, Taiwan has relied on miscellaneous provisions for environmental management and planning scattered among its economic and environmental legislation for managing SEZs. Thus, the Air Pollution Control Act 1975 mentions that “when developing special industrial parks ... air quality monitoring facilities shall be planned and installed within the boundaries of the parks or in appropriate zones” (article 15). Further, the Environmental Impact Assessment Act 1994 requires that environmental assessments be undertaken into proposals to establish any industrial park (article 5(1)). Vietnam has also promulgated a miscellany of regulations and guidelines that contain provisions on the environmental activities of foreign investors in its special industrial zones (Bryant and Akers, 1999). Management plans for the establishment of industrial zones are to include measures for environmental protection, although the relevant regulation contains no guidance on what specific measures should be incorporated into the plans. Among the taxonomy of investments enumerated in the 1996 Law on Foreign Investment in Vietnam that should be encouraged by authorities, are those for “protecting the environment or investing in research and development” (article 3(1)(c)). It is also stated in a 1997 administrative circular that industries prohibited from investing in the country’s industrial zones include those producing harmful chemicals, dyes and radioactive materials. But implementation of these measures appears wanting so far. One study has reported that the National Law on Environmental Protection and the National Environmental Agency “are relatively weak compared to the pro-industry sections of government and also to the various regional governments... The consequence is that the Export Processing Zones, like those in Ho Chi Minh City and Haiphong, experience minimal pressure to adhere to proper procedure” (Drakakis-Smith & Dixon, 1997: 24).

Among other nations, in Thailand all designated industrial estates are overseen by the Industrial Estate Authority (IEA). The IEA is a state enterprise attached to the Ministry of Industry, and pursuant to the Industrial Estates Authority of Thailand Act 1979 has a mandate to promote industrial development in accordance with land use planning and environmental protection measures (UNEP, 2003). The IEA is responsible for industrial pollution control and other environmental management within all of the industrial estates. It has set up environmental monitoring systems and a central wastewater treatment plant in each estate, though it usually subcontracts this work to private contractors. The Philippine’s Special Economic Zone Act 1995 contains just two brief clauses on environmental management. The Act provides that the Philippine Economic Zone Authority “in coordination with the appropriate agencies, shall take concrete and appropriate steps and enact the proper measures for the protection of the local environment” (section 33). The legislation unfortunately gives no hint as to what constitutes “concrete and appropriate steps”. Secondly, the Special Economic Zone Act also authorises the government to compulsorily acquire lands within or adjacent to an SEZ “for the protection of watershed areas and natural assets valuable to the prosperity” of the zone (section 29(c)). More helpful are the extensive environmental provisions in the SEZ laws enacted for specific zones. Thus, the Cagayan Special Economic Zone Act 1995 gives the Cagayan Economic Zone

Authority (CEZA) the powers, *inter alia*, “to protect, preserve, maintain and develop the virgin forests, beaches, coral and coral reefs within the Zone. The virgin forest within the Zone will be proclaimed as a national park and will be covered by a permanent total log ban. For this purpose, the rules and regulations of the Department of Environment and Natural Resources ... shall be implemented by the CEZA” (section 6(g)). The Act also gives the Authority power “to adopt, implement and enforce reasonable measures and standards to control pollution within the Zone” (section 6(h)).

## **Differential Environmental Regulation of Foreign and Domestic Enterprises: The Chinese Experience**

To properly understand the environmental sequelae of SEZs, we should assess how governing authorities have regulated and managed the environmental activities of foreign investors. Differences between the way foreign and domestic enterprises are regulated by environmental authorities would be expected in countries seeking to industrialize through FDI. One might believe that regulators would treat foreign investors - bringing coveted capital, technology and management skills - more favourably than domestic enterprises. Certainly, there are some notorious instances where authorities have waived environmental rules to avoid jeopardizing foreign investment deals. This is alleged to have occurred in the approval of Sony Corporation’s TV kinescope production facility in China’s Pudong New Area (Lo & Yip, 1999: 366). A similar story of expedited approval and perfunctory compliance with environmental procedures involved the Shell oil refinery project in Guandong (Gilley, 1996). But, in general, environmental regulators in fact seem more likely to treat domestic enterprises leniently, as can be seen from the case of China.

In general, Chinese environmental law ostensibly applies equally to all entities no matter their status, whether a foreign company, state-owned enterprise (SOE), a township and village enterprise (TVE) or a domestic private company. Within the corpus of its environmental law, there are few provisions that single out foreign investors. The procedures governing approval of foreign investments have included some environmental measures (Huang, 2003). Beginning in 1983, the NPC promulgated the Circular of China’s State Administration of Industry and Commerce concerning the Registration of Foreign Companies Undertaking Joint Exploitation of Resources and Contracted Projects in China, which contained a provision making polluters liable for environmental harm. In 1990, the Rules for the Implementation of the Law of the PRC on Foreign-Capital introduced a provision: “application for the establishment of a foreign-capital enterprise shall not be approved if the proposed enterprise would involve ... possible creation of environmental pollution” (article 5). The Rules also stipulated that an application to establish a foreign-capital enterprise must disclose the risks of “environmental pollution and the measures for tackling pollution” (article 15(10)).

China’s main regulations concerning the allowable scope for foreign investment are presently the Regulations for Guiding the Direction of Foreign Investment 2002 and its companion Catalogue for Guiding Foreign Investment in Industry (Wang, 2002: 188-93). They provide guidance to prospective investors on which foreign investment projects can be approved at a local government level, the preferential treatment that such projects will receive, and which investment projects are restricted or prohibited in China. Among the investment projects deemed to be encouraged by these regulations are ones that involve use of renewable resources, new technology or equipment for preventing and controlling environmental pollution; and projects that use new or advanced technology to save energy, raw materials, raise economic efficiency or alleviate shortages in the domestic market (Wang, 2002). Restricted categories of foreign investment include projects with an adverse effect on the environment or energy conservation; and projects involving the exploration for and/or extraction of rare or precious mineral resources. Prohibited foreign-investments, according to the Catalogue, include projects that pollute the environment or endanger human health; and projects that occupy large tracts of farmland.

Not only do the above provisions suggest that foreign investments are subject to greater environmental scrutiny than projects initiated by domestic enterprises, but in practice foreign investment projects “are almost always monitored at the national level ... because of the widely acknowledged fact that local regulators may be overly sensitive to the need to attract outside investment” (Hongiun & Ferris, 1998: 50). For instance, foreign

projects are more likely than domestic projects to be subject to EIA procedures. According to the Management Procedures for Environmental Protection in Construction Projects, the State Environmental Protection Agency is generally to be responsible for the review and approval of the EIA process for “mega projects”, representing investments larger than RMB 200 million (which will usually be foreign investment projects). Such projects must also be approved by the State Planning Commission (Hongiun & Ferris, 1998: 50).

The structures for the implementation and enforcement of environmental regulation also allow for some distinctions to be made between domestic and foreign enterprises. Hongiun and Ferris (1998: 49) argue that, “local enforcement practices may vary the application of the law with respect to domestic and foreign-owned operations, or even between foreign operations owned by different companies”. An important consideration is that China’s environmental regulations and policies have been institutionalised primarily within the SOE sector (Jahiel, 1997: 102). For example, a study by Wang and others (2003: 258) of China’s pollution levy system found that levy payments tended to be based on negotiations between factory managers and local environmental protection offices, and that private companies tended to have less bargaining clout than the SOEs over the size of levy payments. The mechanisms for collection of discharge fees, monitoring of environmental pollution and so on, arose principally for the SOE sector. Thus, policies aimed at expanding the market economy have posed challenges for Chinese environmental authorities that lack similar experience in regulating foreign companies.

Some research suggests that foreign investment in China, whether undertaken through a joint venture or a wholly owned foreign operation, is more stringently regulated for its environmental effects than domestic economic activity. In joint ventures, the domestic partner tends to leave the environmental management concerns to the foreign partner, and authorities usually target enforcement of environmental laws against that foreign partner (McElligott, 1996). Klee and Thomas (1997: 36) argue that, “because many Chinese officials consider international companies to have more resources and more experience in meeting pollution-control requirements, they often expect them to be in full and immediate compliance with the requirements”. Sims (1999: 1241) found that authorities are much more likely to collect environmental fines from foreign companies “that are believed to have deep pockets” than from SOEs, which are often at the margins of solvency. The first environmental law case in a Chinese SEZ was decided in 1985 concerning *Shenzhen Municipal Shekou District Environmental Monitoring Station v. Kaida Enterprises Ltd*. The case involved a Hong Kong based toy company, which was successfully prosecuted and fined for pollution based on violations of China’s Environmental Protection Law even though the company’s business contract with the SEZ authorities did not contain any environmental protection measures.

Whereas the letter of the law is more likely to be applied to foreign entities, a pragmatic and tolerant approach is often displayed towards local enterprises.(Clarke & Thomas, 1997). Surveys of the environmental regulation of Chinese firms reveal lax supervision and arbitrary enforcement practices (Steger, Zhaoen & Wei, 2003: 25). This is particularly the case with the SOE sector, despite the fact that the structures for the implementation of environmental regulation arose principally out of the SOE sector. Enforcement action against SOEs is less likely than against foreign or other domestic enterprises because SOEs function as more than mere factories. Because they provide important local social services to workers and their families, such as housing and health care, many SOEs are allowed to continue operations despite pollution emissions (Ma & Ortolano, 2000: 145). The fact that unprofitable enterprises benefit from lenient regulation reflects the continuing presence of socialist practice and principles. But, as China shifts to a market economy, tensions will arise between such socialist redistributive policies and the need to promote an efficient allocation of scarce resources.

## **From Economic Modernization to Ecological Modernization**

Industrialization and market transformation will continue to be an indelible feature of East Asia’s economic policy for some time. But the region’s long-term economic modernization will ultimately not be sustainable unless its economic policy is wedded to stronger environmental regulation. The challenge is to reform environmental law and policy to take account of East Asian circumstances without accommodating them so completely as to surrender all possibilities of improvement.

The developmental state has not disappeared from East Asia, and there often persists a big gap between the professed new market-oriented law and the traditional norms of central planning and administrative regulation (Wang, 2003: 32). Without the security of a well-functioning legal order and mature markets, businesses have sought to forge closer relationships with the authorities that control access to capital, technology, raw materials and development approvals (Wang, 2002: 55-56). Consequently, local authorities commonly interfere in the operation of enterprises and in disputes with third parties in an effort to protect local businesses in which they have a stake.

The problems of adapting environmental law to the transition from a planned economy to a capitalist, market economy are acute in China. It's still extant environmental legislation dating from the 1980s or earlier assumes enterprises are owned by the state. Some provisions of the Environmental Protection Law 1989 – such as those conferring responsibility for use of polluting technologies (article 34) and for disabling pollution controls (article 37) – can be interpreted as to apply only to government work units (*danwei*). Authorities seem to assume that national development plans can shape the behaviour of economic actors ever more responding to market signals – signals that might not be consistent with those plans. The laws do not envisage the vast and complicated array of corporate and other business entities that have proliferated since China's economic opening. An increasingly market-based economy requires policy instruments that offer incentives for businesses to improve their environmental performance.

A model of “ecological modernization” reform could offer major advantages to the more advanced economies of East Asia. Although criticized by some environmentalists as a compromise that alleviates rather than solves the environmental crisis, the advantages of ecological modernization would appear to outweigh its disadvantages, especially for economies rapidly industrializing (Welford & Hills, 2003). Ecological modernization doctrine promises a healthy synergy between economic development and environmental protection when economies and technologies are “modernized” to allow for more efficient and less wasteful production (Holliday, Schmidheiny & Watts, 2002). Modernization can occur through corporate environmental management systems and application of advanced, clean technologies, encouraged through policy instruments such as pollution taxes and corporate environmental reporting obligations. The ecological modernization model was the basis of Japan's successful response to air pollution in the 1970s, and the cleanup of West Germany's industrial and energy sectors after the acid rain-induced forest death in the 1980s (Young & van der Straaten, 2001). But ecological modernization reforms are probably not suitable for all East Asian economies. Command and control regulation is more apt for countries setting up an environmental regulatory apparatus in the first instance, a position that the poorer nations in Indo-China find themselves presently.

Command and control regulation in much of East Asia is gradually being supplemented by a mosaic of environmental governance mechanisms, spanning market incentives, business self-regulation, management system-based approaches, voluntary reporting schemes, and audit requirements designed to increase the transparency and accountability of industry and regulators. Economic instruments such as pollution charges, pricing policy, favourable terms of investment for environmental technology, market creation can yield significant environmental benefits (OECD, 1994). Financial mechanisms to encourage investment in clean technology are appearing. South Korea is promoting investment in clean technologies through its Act Relating to Environmental Technology Support and Development, 1994. The Singapore government is also advocating technologic solutions to its environmental problems, establishing National Energy Efficiency Committee in 2001 to forge programs to encourage more efficient use of energy by industries, homes, commercial buildings and vehicles. A similar financial mechanism was established by Thailand's Enhancement and Conservation of National Environmental Quality Act 1991.

Investment in clean technologies is also a high priority of Chinese leaders, particularly given the legacy of a state enterprise sector lumbered with old, inefficient and wasteful technologies dating from the 1950s. China's Clean Production Promotion Law (CPPL) of 2002 shifts China's environmental regulatory focus from traditional end-of-pipe controls to the products and processes from which pollution originates. The CPPL requires enterprises to recycle some specified products and packaging, and to report regularly on their pollution emissions. It also advocates some preferential measures for those who adopt the clean production model, such as preferential loans, tax cuts or exemptions.

Another sign of ecological modernization reform is environmental taxation. Air pollution charges have been levied in South Korea and China; and water effluent treatment charges exacted in Thailand, Hong Kong and

China; and water consumption charges exacted in virtually all countries (Asian Development Bank, 2001: ch. 11). Even Vietnam, with one of the most elementary environmental law systems in East Asia, has introduced regulations providing for the payment of environmental protection fees by developers (Government Decree on providing Guidance for the Implementation of the Law on Environmental Protection, 1994, articles 34-36) and a natural resources use tax (Ordinance on Natural Resources Tax 1993). The most widely used economic instrument in the region is wastewater charges, though they tend to have been limited to just a few big industries or large industrial estates (Asian Development Bank, 2001: 12). The emission and resource charges are used primarily to raise revenue, and the fees are usually not calibrated to reflect the marginal cost of ecological damage. Tradeable emission permits have hardly been introduced in the region.

The most extensively studied environmental charge in East Asia is China's pollution discharge levy. Introduced by the State Council in the early 1980s after three years of experimentation, China's discharge levy system formally requires that a fee be paid by any enterprise whose effluent or emission exceeds the legal standard. Charges are levied for water and air pollution, solid waste as well as noise. The scheme was arbitrarily implemented until about 2000, when new methods of collecting the levy were adopted, coupled with more recycling of levy revenue into pollution control projects. But fundamental problems remain because the levy rate is usually much lower than the costs of installing or operating pollution control equipment, and so polluters have little incentive to minimize their discharges (Jahiel, 1997: 91). In fact, enterprises typically find it cheaper to mothball existing pollution control mechanisms, which are more expensive to operate than the discharge fees. In practice, the amount of levy paid by a polluting factory ultimately depends on the result of its negotiations with the local environmental protection bureau. However, the potential for pollution taxes to help China's environment is clear. A study of 260 enterprises in Beijing and Tianjin with multiple water pollution sources found that an appropriately set emission charge would reduce abatement costs under the prevailing regulatory regime from US\$47 million to \$33 million annually (Dasgupta, et al, 1996).

Another way that governments can facilitate ecological modernization of their economy is by encouraging enterprises to comply with best practice corporate environmental management standards (EMSs), such as those embodied in the International Standardization Organization (ISO) 14000 series (Monsma, 2000; Stenzel, 2000). An EMS provides a framework of standards and processes for corporations to improve their internal use of materials and energy, and to provide a structure for companies to identify, appraise and minimise their environmental risks. At a higher scale, the concept of the "eco-industrial park" has been advanced by scholars to extend a corporate EMS to a group of companies on an industrial estate that cooperate to reduce environmental waste and improve resource efficiency (Allenby, 1999).

Although developing countries were not well represented in the negotiations of the drafting of the ISO 14000 series, the developing world including East Asia is increasingly viewing ISO 14000 as a means to stimulate corporate environmental responsibility and thereby achieve sustainable development (Mikulich, 2003: 120). Companies in East Asia are seeking certification for several reasons, principally for reputation enhancement and environmental materials and waste cost savings (Fryxell & Szeto, 2002). Among further motivations, export-oriented industries are seeking to avoid potential environmental-based trade barriers, and some large companies are responding to shareholder demands for corporate social responsibility. Some empirical research in East Asia shows that ISO 14001 certified companies have a record of better compliance with government environmental regulations and standards than companies not ISO-certified (Kwon, Seo & Seo, 2002).

But as some businesses may be reluctant to implement EMSs, especially in the small business sector – where shareholder and trade pressures are weaker or non-existent, governments are looking for ways to promote more corporate participation in EMSs. China adopted the ISO 14000 series as official state policy on April 1, 1997. The China Accreditation Committee for Environmental Management Systems Certification Bodies works to encourage domestic enterprises to adopt the ISO 14001 standard as a means of strengthening environmental enforcement in China, and to conduct trial certifications of Chinese companies (Mikulich, 2003: 145). The chief reason for adoption of ISO by the PRC is that it would enable China to bolster its environmental regulatory regime without sacrificing economic growth. Calkins suggests that China only takes "environmental steps if it sees a capitalist advantage" – thus, the economic benefits to be derived from ISO 14000 participation were seen as the "greater marketability of Chinese products, improved and streamlined raw material consumption, reduced cost of

waste management, reduced liabilities” (Calkins, 1997: 616). So far, ISO certification among Chinese enterprises has been slow, and has arisen mostly in the context of joint ventures with Western companies operating in the SEZs (Calkins, 1997: 615, 636). Surveys of Chinese firms suggest low levels of awareness and commitment to environmental protection, and a preference to adopt discrete, end-of-pipe technological solutions rather than holistic reorganisation of management practices as demanded by EMSs (Steger, et al, 2003: 22-23).

Elsewhere in East Asia, the Taiwanese government has fervently promoted certification of corporate EMSs, and introduced environmental reporting regulatory schemes into the Environmental Protection Administration regulations (Kinne, 2004: 93). The government offers financial assistance to firms wishing to invest in measures to acquire ISO 14001 certification. The South Korean government is also encouraging ISO 14000 certification. In 1994, it initiated a pilot certification scheme and in 1995 the Korean Standards Association established training activities jointly with certification bodies from the United Kingdom. South Korea is implementing ISO 14001 by requiring that companies adopt a general EMS, an environmental assessment of their manufacturing processes, and a plan for the improvement of environmental management (Mikulich, 2003: 147). The South Korean Ministry of the Environment reviews the applications, and companies deemed environmentally friendly must report annually on their progress and meet improvement plan indicators. In turn, these companies should enjoy reduced compliance inspections.

Other corporate EMSs available to promote ecological modernisation include the chemical industry’s Responsible Care program (Simmons & Wynne, 1992) and the European Union’s Eco-Management and Audit Scheme 2001 (EMAS). The EMAS, for example, seeks to promote continuous environmental performance improvement in industrial activities or company level operations, by committing certified entities to evaluate and improve their environmental performance and provide relevant information to the public (Orts, 1995: 1289). There is already evidence of growing interest in Responsible Care among East Asian companies (Tremblay, 1997). The EMAS is being adopted by a number of European companies engaged in business in East Asia (Markman, 1997).

Increased cooperation and assistance from international donors and lenders, and international environmental organizations, are vital conduits for ecological modernizing reforms. Many developing countries lack the financial resources, technical expertise and management systems to devise and implement sustainable development policies. Various countries in East Asia are reforming their environmental laws in collaboration with international organizations (Boer, 1999: 1513-14). For example, the United Nations Environment Program (UNEP) has assisted scores of countries through its Environmental Law and Institutions Programme Activity Centre in Nairobi, and its UNEP Regional Office for Asia and the Pacific in Bangkok. Environmental law training programs have also been funded by the Asian Development Bank and coordinated by the National University of Singapore and the IUCN Commission on Environmental Law.

Besides such support, the channelling of financial and technological assistance through treaties is vital to enhance the institutional capacity of NICs. Most East Asian nations have ratified the major multilateral environmental treaties, many of which provide the states parties with enhanced access to environmental technologies and financial assistance. For example, China’s success in reducing ozone-depleting chemicals owes principally to the financial and technological support it received from joining the Montreal Protocol on Substances that Deplete the Ozone Layer, 1987 (Zhao, 2002). The Kyoto Protocol will likely play an even more influential role, mainly by means of its dedicated funds (Dessai, 2003) to help developing countries abate CO<sub>2</sub> emissions through technology transfer for energy efficiency and by land use and waste management changes. The Kyoto Protocol’s Clean Development Mechanism (CDM) can also support investments in non-fossil energy projects in developing countries. China probably will become the largest recipient of CDM projects, and its authorities have already given priority to energy efficiency and renewable energy projects for CDM-finance (Tangen & Heggelund, 2003: 304). Bilateral and multilateral aid and loans can also provide a conduit for environmental assistance. Japan is the most generous bilateral donor in the region, and a significant number of its aid projects contain environmental improvement elements (Tremayne & Waal, 1998). The European Union (EU) is emerging as a major donor in the region, and its environmental initiatives include the EU-China Environmental Management Co-operation Programme (2001-2005), and the EU-China Liaoning integrated Environmental Programme (1999-2004). An increasing proportion of World Bank and Asian Development Bank finance is also tied to sustainable development practices (Gan, 2000).

## **Closing Remarks**

East Asia is industrializing very quickly, causing environmental policy to dangerously trail economic modernization. Its market reforms clearly present threats to the environment but also, ironically, some possible solutions. If the region is to avoid uneven modernization, policy-makers must prioritize long-term environmental health above short-term and possibly ephemeral economic gains. Interestingly, while the SEZs pose momentous environmental challenges, the zones do not appear to be suffering from pollution problems any worse than other parts of East Asia. There have been some problems associated with inappropriate relations between local administrations and businesses in the SEZs, but the environmental governance of SEZs appears to be generally at least as competent as other parts of East Asia's economies. Because the SEZs attract new industries often utilizing more advanced technologies and efficient production methods, those firms can often pose a lower pollution burden compared to the old, industrial state-run enterprises. Foreign investment can certainly be a force that exacerbates environmental problems in developing countries, but it can also offer some environmental and social benefits, as the experience of China's SEZs testifies. Because of their high profile and greater wealth, foreign investors in SEZs are also likely to be subject to stricter environmental regulation than local firms. So, the most pressing areas for environmental law reform are not necessarily those in the kernel of industrialization.

International environmental law and intergovernmental assistance are necessary elements in the modernization of East Asia's environmental regulations and policies. More use of economic instruments and other ecological modernization reforms will be vital to ensuring the sustainable economic transformation of East Asia's SEZs. But while external forces can provide a catalyst for some change, they alone will not secure a sustainable future. The region's legal and political systems pose a range of deep-rooted structural barriers to environmental reform. The rule of (environmental) law has yet to be firmly established in East Asia. A national constituency for law reform has to exist; it can neither be manufactured nor led from outside. While relevant laws, practices and processes of law reform from other countries can and should be assessed during the reform programme, the output has to be seen to be national, dovetailing into the existing corpus of law and appropriate to local circumstances. East Asian governments' growing preference for market-based governance would therefore appear to offer opportunities for ecological modernization policy reforms.

Most capacity-building efforts to date have focused on core national institutions but not on regional and local governments. Among the various problems is the need to enhance the institutional capacity of municipal authorities to be environmental regulators, and to change the incentive structure for taking environmental protection action. The extent to which national environmental policy goals are attained is strongly influenced by the effectiveness of the local implementation apparatus. Central governments should require all local administrations in the SEZs to establish environmental protection bureaux of first-tier status and equip them with adequate staff and resources. Some of the revenue from SEZs should be earmarked specifically for these bureaux. East Asian governments must also enhance institutional mechanisms for cross-jurisdictional environmental cooperation among local authorities.

# Macro-Environments of Business in a Developing Country: Barriers to Being Green?

*Azilah Kasim*  
*Universiti Utara Malaysia, Malaysia*

## Abstract

This paper provides a case study on how macro-environmental factors such as political economy, environmental expectations and industry specific policies may have failed to encourage tourism business in Malaysia to be 'green'. Using qualitative data, the paper shows an empirical support for the institutional theory that attributes an organization's strategic management practices to external forces that influence the creation and implementation of legitimacy strategies (Hoffman, 1997b) in the context of Penang, an island state in the northwest of Peninsula. Several conclusions were made relating to: 1) the influence of state control on business's reaction towards emerging issues such as environmental management; 2) the influence of regulations and social pressure on sustainable governance among businesses; and 3) the nature of tourism industry. From these observations, the paper recommended several crucial steps to precede a wider adoption of environmental management in the Malaysian tourism industry.

## Introduction

The concept of sustainable development needs no introduction. For business, sustainable development has been viewed from the economic, environmental and social aspects. As defined by the World Business Council on Sustainable Development (2003), sustainable development include 1) profitability, wages and benefits, labor productivity, job creation, expenditures on outsourcing and human capital; 2) the impacts of processes, products, and services on air, water, land, biodiversity and human health; and 3) workplace health and safety, community relations, employee retention, labor practices, business ethics, human rights and working conditions (WBCSD, 2003).

Following the Johannesburg Summit in 2002, business has been firmly asked to shoulder the responsibility of realizing the sustainable development paradigm. In the developed countries, the transformation of business towards sustainable development began through the concept of 'eco-efficiency', which according to DeSimone and Popoff (1997), is a business concept that emphasizes four aspects; 1) value creation with environmental business. This aspect stresses resource productivity during the entire process of production to create value for consumers, society and business itself; 2) the promotion of externalities (waste, pollution, and over consumption of non-renewable resources) reduction. The concept of 'zero defects' is proposed as a tool to achieve this, with an emphasis on a long-term commitment from companies; 3) the linking of environmental excellence to business excellence. In this regard, eco-efficiency functions as a management philosophy that business can use to address the requirements of all its key stakeholders; and 4) the recognition that pollution control needs to be extended beyond on-site measures to include integrated environmental considerations throughout the product chain. This is known as the 'sustainable production and consumption' concept.

Consequently, managerial approaches have been changed to reflect the eco-efficiency considerations particularly among the multinational corporations. This strategic awareness led to an important institutional development i.e. the formation of Business Council for Sustainable Development (BCSD), which highlighted the urgency of rethinking corporate strategy related to the use and management of natural resources through the concept of eco-efficiency (Schmidheiny, 1992). The council was formed in anticipation of the Rio Earth Summit of 1992.

Since Rio, many more events that signal heightened standards of corporate environmental management took place. Among them was the establishment of environment-related business network such as the World Business Council for Sustainable Development (a merger between BCSD and the World Council for Sustainable Development) in 1995 (Utting, 2000). This network aimed at diffusing eco-efficiency mentality to global businesses, including those in developing countries, by formulating international environmental management standards that

enabled 'globally operating businesses to abide by the same rules where the environment is concerned' (Hortensius and Barthel, 1997:19).

In the 1990s, the concept of 'voluntary initiatives' was promoted by a number of industrial associations and individual companies to encourage self-regulated activities that pre-empt governmental regulations. Voluntary initiatives provide an avenue for business to negotiate and develop mutually agreed standards with the government and NGOs. Strong voluntary initiatives came in the form of codes of conduct or guiding principles established by international or national associations. Environmental reporting such as 'The Coalition for Environmentally Responsible Economies' (CERES) Global Reporting Initiative (GRI) was also increasingly practiced during this decade, particularly by a small number of large corporations (Starkey and Welford, 2001).

The positive events and changes leading to business's increasing propensity to engage in responsible considerations, explained above largely reflect the experience of the manufacturing industries in developed countries. In developing countries, the situation was much less encouraging. The lack of civil movement pressure and governments' lack of interest, experience and resources to regulate business's impacts on the environment, absolved businesses operating in those countries of responsibility for their negative environmental impacts. Environmental regulations, where these existed, were often complex, contradictory and vague (Perry and Singh, 2002; Global Environmental Forum, 2000). Developing countries' strong desire to achieve economic development also contributed to the generally low regard for environmental management. High priority for economic development at the expense of the environment, coupled with lack of strong civil pressure, reflects the Malaysian experience in its development context in the 1970s.

The situation is even more devastating in the context of the service industry. The industry has largely escaped being blamed for environmental degradation despite representing a big section of a country's economy. This is true particularly for tourism, which in several developing countries has been highly prioritized to the extent that it takes over traditional economies such as cash crop agriculture and mineral extraction in terms of contribution to GNP, employment and export receipts (United Nations Economic and Social Council Report, 1999). Yet, tourism has essentially been perceived as a 'softer' economic option compared to manufacturing.

But, global agenda is now leaning towards putting environmental and social responsibility on the shoulder of tourism business as well. The *Agenda 21 for Travel and Tourism* developed during the Earth Summit in Rio has highlighted the role of service providers in environmental and social issues. For tourism, for example, the Secretary-General in a United Nations Economic and Social Council Report (1999: 11-12) emphasized the following:

The central challenge for the tourism industry is to transform itself, in all its forms, into a sustainable activity by reorienting corporate philosophy, practice and ethics to promote sustainable development through, *inter alia*, better environmental management and practices and close partnerships with Government and civil society...Tourism enterprises, both large and small, should integrate environmental management systems and procedures into all aspects of corporate activity in order to reorient their management at all levels towards sustainable development. This fundamental reorientation of management philosophy and practice will necessitate the implementation of; *inter alia*, environmental and social audits, lifecycle assessments and training of staff in the principles of sustainable tourism management.

Given this development, there is a need to see how tourism businesses can or are responding to their wider responsibility. This is particularly important in the context of developing countries where tourism is often embraced as an important revenue earner. Experiences from the developed countries show that business cannot act alone when dealing with emerging issues such as environmental and social responsibility. Instead, the cooperation of other major groups, governments and agencies is essential for business to engage in sustainable practices. As stated by Mark Moody Stuart, Chairman of the Business Action for Sustainable Development (in WSSD, 2002: 4):

Perhaps the most important element needed to facilitate the growth of economic activity, which was essential to achieving sustainable development, was sound governance systems at a national and local level in each and every country...whereby all sectors of society felt that their view had been taken into account and that the outcomes and that the outcomes were fair and equitable. That would include sound governance of business, with the rules and frameworks necessary for markets to operate fairly and openly in every country, and with appropriate environmental regulation applied impartially to all. However, it would also include such elements as the rule of law, security, human rights and intellectual property.

This paper tries to explain why tourism business in Malaysia is still lukewarm towards the idea of being 'green' (see Kasim, 2003). In other words, while there is a general appreciation and awareness about the importance of considering environmental and social issues in a hotel's daily operation, there are mixed attitudes towards actually including environmental and social issues in decision-making. It can be argued that the discrepancy between awareness and attitudes towards a hotel's expanding responsibility may be the accumulated result of exogenous influences that have moulded tourism's operation in Malaysia. Hence, this paper looks at the macro environmental context of hotel business in Penang and how this may have led to the lukewarm attitudes. Penang is a state located in the Northwest side of the Peninsula, where tourism is considered the second biggest foreign exchange earner. The term 'green' is used in this paper to represent the need to embrace sustainable tourism development by addressing hotel business's environmental and social responsibility issues.

## **Methodology**

For the purpose of this paper, qualitative data from documentary analysis and personal observations was gathered. The data was then analyzed using Miles and Huberman (1994: 9) proposition of 1) affixing codes to a set of field notes drawn from observations and interviews; 2) noting reflections or other remarks in the margins; 3) sorting and sifting through these materials to identify similar phrases, relationships between variables, patterns, themes, distinct differences between subgroups, and common sequences; 4) isolating these patterns and processes, commonalities and differences, and taking them out to the field in the next wave of data collection; 5) gradually elaborating a small set of generalizations that cover the consistencies discerned in the database; and confronting those generalizations with a formalized body of knowledge in the form of construct or theories.

## **The Findings**

The first macro environment analyzed was the political economy of tourism (particularly hotel) business in Malaysia. As one of the country's pivotal states, the political economy of Penang closely mirrors that of the country. For this reason, the political economy influencing the hotel sector in Penang may be understood by looking at Malaysia's political economy. This is necessary to determine what Rodan et al. (2001) term the degree to which the market is shaped by state regulation, intervention and liberalization. Although a comprehensive outlook on the Malaysian political economy is beyond the scope of this paper, two relevant key issues: the state-market relations under the New Economic Policy; and the state-market relations under the New Development Plan and the role of tourism trade and promotion in the country's economy are considered important in contextualizing business' attitudes towards business's environmental and social responsibility (BESR).

### **State-Market Relations under the New Economic Policy**

State-market relations in Malaysia have been influenced by strong state control over the economic direction of the country. After colonialism, the Malaysian government worked to change the laissez-faire capitalism that led the country to massive social divisions and inter-ethnic violence on the 13<sup>th</sup> May 1969. The New Economic Policy (NEP) was introduced in 1971 to eradicate poverty, restructure the identification of race with economic function and balance out interethnic economic imbalances, using ethnic quotas and targets to regulate access to state assistance, business opportunities, tertiary education and civil service requirement (Khoo, 2001; Gomez and Jomo, 1997). Through the NEP, the state has strong control over the country's economic orientation. This control is demonstrated via heavy regulation of business, both local and foreign, using legislative means (Industrial Coordination Act [ICA], 1975) and bureaucratic procedures (set up by the Foreign Investment Committee). The ICA grants the government powers over licensing, ownership structure, ethnic employment targets, product-distribution quotas, local content, and product pricing (Jesudason 1989)

The economic intervention of the state strongly influences the power balancing between the state and foreign and domestic capital. With the objective of significantly increasing the presence of domestic participation in commercial and industrial activities, the NEP targeted increasing Malay ownership, followed by the gradual increase in non-Malay shares of corporate equity. In relation to tourism, this probably explains the high rate of hotel

ownership by Malaysian conglomerates (though not necessarily self-managed). This intervention eventually led to the decline of foreign ownership from 63.3 percent in 1970 to 30 percent in 1990 (Khoo, 2001).

The strong state management of the economy, although considered essential to achieve the two-pronged objectives of eradicating poverty and achieving national unity, has been criticized by some quarters as being prone to abuse and unfair practices (see Jesudason 1989; Gomez and Jomo, 1997). The government's enhanced developmentalist capacity has been observed as favoring politically affiliated businessmen who, in return, tended to focus on businesses in the relatively protected import substituting manufacturing, services and other non-tradable or from, "complex paper-shuffling, asset stripping and other similar corporate maneuvers instead of from the more significant gaining in productivity or international competitiveness" (Jomo, 1995:46).

The post-NEP capitalists are also criticized as being 'rentier' and less inclined to do the difficult but ultimately necessary development of internationally competitive productive capacities. Rather, too much attention is given to accumulation of wealth through mergers and acquisitions. Most of these conglomerates focus on sectors in which state policies and protection made the difference between success and failure. They include banking, resource exploitation, construction, property and real estate, gaming, tourism, transport, utilities and services (Khoo, 2001).

From the political-economic context described above, two inferences may be made. First, the state has always been the driver of changes in the domestic economy. Business, on the other hand, has always been the subject of state control and interventions. Thus, in dealing with emerging challenges posed by environmental and social issues, Malaysian business's attitudes towards BESR depend on how strongly the issue is pushed by the state. State interventions have been proven to be successful in the past. Thus, it may also be a useful catalyst for improving business attitudes towards BESR.

Second, having been nurtured by protectionist policies and political patronage by the state, Malaysian business<sup>ii</sup> has not traditionally thrived on strategic competitiveness. Thus, such independence may lead business to be inadequately prepared to handle emerging issues such as corporate environmental and social responsibility. The implication is that without government intervention, business may fail to grasp the importance of the issue, especially from the global competitiveness perspective. Their attitude displays what Elkington et al.'s (1991) term as the 'timid oxen' that needs constant guidance and direction from the authority/legislators.

#### **Contemporary State-Market Relations and the Role of the Tourism Trade and Promotion in the National Economy**

The changing nature of challenges facing the country shifted the direction of Malaysia's economic advance. Having brought down poverty levels and enhanced national unity quite successfully, the country is seen as having shifted its attention from 'restructuring' to 'growth' with the replacement of NEP with a National Development Plan (NDP). NDP is a plan that is strategically designed to achieve a broad range of economic goals and socio-environmental changes. Through an intricate mix of market-augmenting macroeconomic policies that are 'pro-growth', 'pro-investment', and 'pro-market' in the NDP, the country's economy is opened up to domestic private investment, direct foreign investment and integrated with international trade. This has managed to turn the country from an agrarian economy into a second-tier newly industrializing country with high rates of export-oriented and manufacturing-led growth (Khoo, 2001). The positive growth rate is evident by looking at the country's Gross Domestic Product (Table 2), from the mid-1980s when Malaysia began to push privatization after more than a decade of promoting public sector growth.

If the past economic orientations have seen state interventions that increase domestic investment, the new economic pursuits encourage direct foreign investment instead. This enhances the power and influence of foreign capital. Yet, extensive state economic intervention is still in place, to advance the political agenda of restructuring the Malaysian society through reducing inter-ethnic economic imbalances (US-AEP, 2002).

Vision 2020 - the goal for Malaysia to transform into a developed country by the year 2020 - and the opening up of the economy to speed up the achievement of this goal through market-augmenting macroeconomic policies, has also unfortunately made Malaysia susceptible to speculative capital from the international money markets. Consequently, many business conglomerates were dependent on external borrowing and stock market capitalization, which enhanced business vulnerability during the 1997 East Asian financial crisis. Had it not been for the state's National Economic Action Council (NEAC) intervention through recapitalization, rescue and reflection of 'strategic economic sectors', many of these conglomerates would have been exposed to imminent insolvency. The

state's ability to minimize the negative impacts of financial crisis on business indicates that the state is still very much in control in the Malaysian political economy.

The Asian financial crisis has adversely affected the country's economic performance by slowing down Malaysian real GDP growth (Table 2). Although numerous fiscal policies stimulated the economy in 2000, several factors including the slowdown of the US economy, the slow growth of the domestic financial sector restructuring and the fear of terrorism have slowed down progress in 2001 (ICEM-A/P Regional Conference Report, 2001). Modest recovery was seen for the year 2002, with GDP of 4.2. Growth of 5.2 percent was forecast for 2003 but because of the low rise in exports, private consumption, and fixed investment in 2002, the forecast was trimmed to 4.7 percent. The economy was also negatively influenced by the run up to United State's military action against Iraq, possible increases in fuel prices alongside soft external demand (Economist.com, 2002).

Nevertheless, the Malaysian tourism industry, which accounts for about 7 percent of GDP and expanded at an annual rate of 40 percent during 1999-2001, does not seem to be adversely affected by the aftermath of the Bali bombings of October 2002 (Asia Development Bank, 2003). Despite the setback in 1998, the Malaysian tourism sector continued to be a major foreign exchange earner, ranking third in 1997 then second for the year 2000 and 2001 (after manufacturing). In 2001, tourist arrivals reached a record high of 12.77 million, surpassing the previous mark of 10.2 million set in 2000. The influx of visitors has enabled Malaysia to earn RM24.2 billion in tourism receipts as compared to RM17.3 billion registered in 2000. Visitors from Europe increased by 19.9 percent from 581,599 in 2000 to 697,332 in the year 2001 (TravelMag, 2002). Looking as far back as 1995, the increasing strength of tourism's contribution to the Malaysian economy can readily be seen (Table 3).

The existing political and economic context described above implies an increasing vulnerability of the Malaysian economy to international developments and issues. Nevertheless, state intervention is still evident and has proven to be capable of influencing the economic direction of the country. Interestingly, the overall resiliency of Malaysian tourism shows the strong potential role of this industry within the country. Its growing importance, especially in relation to generating substantial foreign exchange and employment opportunities suggests the need for more government attention to the improvement and sustainability of the sector.

The second macro environment analyzed was the presence and appreciation of BESR concept in Malaysia and the role of regulation in generating awareness. As a background, the following observation in relation to the opportunities to support clean production and environmental management in Malaysia, the United States – Asia Environmental Partnership (US-AEP, 2002: 21) gives a clue about the presence and appreciation of green issues in Malaysia:

Malaysia has entered a key stage in its development; it sees critical needs for incorporating environment into its industrial development program but is increasingly concerned about the costs. It aspires to the high technology, value-added industrial development of Singapore but has not adopted the strong regulatory and incentive systems Singapore has applied to achieve "clean and green" results. Demands for devolution have also complicated Malaysia's pursuit of that approach. But conditions are highly favorable in Malaysia for a policy shift to integrate environment and development.

The rhetoric of environmental issues has indeed had an early presence in Malaysia. The concern for the environment and sustainability is said to be 'firmly rooted' in the Third Malaysia Plan (1976-1980) with the introduction of two landmark legislative initiatives, i.e. The Environmental Quality Act, 1974 and Environmental Impact Assessment (The Government of Malaysia, 1997). Meanwhile, social aspects of sustainable development have concentrated on issues such as poverty, demographics, health, education and human settlements. With the intention of generating "sustained rapid economic growth" focusing on "equitable share of economic benefits" and to critically acknowledge the "need to continue to protect the environment and Malaysia's natural resource base" (The Government of Malaysia, 1997: 2-3), the state seems to have spearheaded the incorporation of environmental and social issues into the economy. Among initiatives taken include the incorporation of environmental and social issues in the NDP through the concept of 'balanced development' in the Sixth and Seventh (1990-2000) Malaysia Plans and the country's participation in global conventions to reduce atmospheric pollutants, protect biodiversity and preserve national heritage. Its commitment to social development is demonstrated through the initiation of the Malaysian Quality of Life Index, to provide a comprehensive assessment of developmental impacts on quality of life.

Despite early awareness and exposure to environmental protection issues, the Malaysian government has been relatively passive in reacting to expectations of environmental responsibility compared to Singapore for example. Perry and Singh (2001) give two reasons for this: 1) Unlike Singapore, the Malaysian economy is not built largely on the investment of foreign TNCs, therefore the country is relatively less affected by international pressure; and 2) the country is still in transition to an industrial society, with half of the population living outside urban areas and a quarter of the workforce working in agriculture. This provides obstacles to any attempt to change the economic focus from 'growth' to sustainability.

However, since the success of voluntary initiatives in developed countries was largely driven by the regulatory component (Utting, 2000), it can also be argued that business in a developing country such as Malaysia needs regulation of the market and strong local governance in order to maximize its contribution to sustainable development. At present, the country's regulatory component is still relatively ineffective due to the complexity and difficulty of monitoring and enforcing environmental laws. In Malaysia, environmental enforcement falls under the jurisdiction of the Department of Environment (DOE) in the Ministry of Science, Technology and Environment (MOSTE). The key roles of the department include setting standards, monitoring and enforcing pollution regulation in order to prevent, abate and control pollution or to enhance environmental quality (IMPAK, 2000). However, DOE has to rely on the cooperation and assistance of the individual states in order to perform its second and third roles. There are several reasons for this. Firstly, Malaysia has a federal administrative system. This gives the government significant power on policy, budgetary and regulatory issues. However, as land and water matters fall under the jurisdiction of the state governments, the enforcement and monitoring of environmental laws are the responsibility of the states. DOE's jurisdiction over major concerns such as air pollution and water quality is limited by the Federal-State system (US-AEP, 2002). In other words, environmental monitoring in Malaysia is not centralized thereby impeding effective environmental enforcement. For example, environmental regulations for hotels fall under the jurisdiction of the Ministry of Science, Technology and Environment (MOSTE) and are enforced by Department of Environment (DOE), solid waste management falls under the jurisdiction of the Ministry of Housing and Local Governments (MHLG) and enforced by the state's municipal council. Meanwhile, the regulations on tobacco and food safety (i.e. the Control of Tobacco Products Regulations and the Food Safety Act – two other regulations applicable to the hotel sector) are under the jurisdiction of the Ministry of Health.

Secondly, DOE has a limited number of staff and only a small budget<sup>iii</sup> to fulfill its roles effectively (Perry and Singh, 2001). The consequent shortage of monitoring and enforcement capacity has been identified as a critical problem in the current Malaysian environmental policy regime. This has led to rather complacent business attitudes towards environmental responsibility in general. Despite EQA 1996, there has been high incidence of non-compliance (Markandya and Shibli, 1995; Rasiah, 1999). Markandya and Shibli (1995) observe that apart from the large establishments in the rubber and palm oil sectors, industries in Malaysia are largely self-monitoring. The shortage of monitoring and enforcement is not going to change for the time being, due to a freeze on civil servant recruitment. In addition, the Economic Planning Unit intended to limit DOE's role to that of planning, and expand the states' role in pollution-control (IMPAK, 2000). Therefore, the states now assume more responsibility towards environmental monitoring and regulatory enforcement.

However, the US-AEP (2002) report reveals that environmental enforcement often becomes weaker at the local and state government levels. SMEs in particular, are neither adequately monitored nor expected to comply with regulations despite their potential as major environmental polluters (Rasiah, 1999). This may have contributed to business's lack of enthusiasm towards environmental (and social) protection issues, thus adding to the slow adoption of voluntary initiatives. In addition, the Ministry of International Trade and Industry (MITI) – a key player in industrial development and international trade in Malaysia – has not aggressively pursued clean technology and environmentally-linked economic policies, since environmental protection is seen more as a problem rather than an economic and social opportunity (US-AEP, 2002). This could perhaps explain why, despite the strong history of state intervention in the market as described earlier in this paper, the government seems to avoid a 'command and control' approach in pushing the environmental and social agenda onto business. Instead, voluntary business initiatives are encouraged, particularly in the manufacturing industry. One example is the MITI's assistance plan to help SMEs with less than RM 1 million a year in revenue to be ISO 9000 certified, and special tax allowances for pollution control for all industries seeking to establish waste treatment facilities (Global Environmental Forum,

2000). The DOE, while seeking to strengthen environmental regulations, is implementing progressive environmental programs that emphasize pollution prevention in the manufacturing sector. These initiatives include the establishment of an Environmental Fund, the promotion of environmental management systems, the adoption of environmental audits, and the introduction of new regulations for controlling chemical substances (Global Environmental Forum, March 2000).

The government's growing interest in private sector voluntary initiatives may be linked to two reasons. First, the growing international pressure especially on the electronic industries seems to have played a role as it is realized that not conforming to the demand of international pressure may make Malaysian business lose its international clients. In addition, business not exposed to international pressure may otherwise be greatly disadvantaged competition-wise once the higher standards are widely accepted (Perry and Singh, 2001). Second, the government's own lack of effectiveness in environmental monitoring and enforcement may have led to the perception that business voluntary initiatives may be an alternative that could lessen the regulator's own burden. As reported in IMPAK (2000: 2), the Director General of Environment Malaysia states that, "Over the years, the DOE has been exploring new approaches in environmental management as our continuous effort to protect our environment....the Department has for quite some time been promoting the concept of cleaner production as a more effective and feasible option to reduce pollution from industrial sources..".

Although no specific national policy existed to encourage BESR at the time of the fieldwork<sup>iv</sup>, the introduction of the Environmental Management System (EMS) for business to systematically manage and minimize pollution from their respective business activities, could be taken as an initial indicator that the business environmental responsibility concept has been recognized and addressed. Firms that are implementing EMS can get certified through the MS (Malaysian Standard) ISO 14001, which was first published in 1995 (Penang People's Report, 1999). Agencies represented in the Department of Standard Malaysia<sup>v,vi</sup> are the Ministry of Science, Technology and the Environment, the Standards and Industrial Research Institute of Malaysia, the Ministry of International Trade and Industry, the Ministry of Health, the Ministry of Agriculture, the Chemistry Department of Malaysia, the Malaysia Cocoa Board, the Rubber Research Institute of Malaysia, the Federation of Malaysian Manufacturers and Universiti Sains Malaysia (Global Environment Forum, 2002; US-AEP, 2002). For ISO certifications in Malaysia, only one certification body has been accredited by DSM: the Standards and Industrial Research Institute of Malaysia (SIRIM).

As EMS offers an avenue for maintaining regulatory compliance, moving beyond compliance and being proactive in environmental management (Welford, 2000; Watts, 1999), the standard is seen by the Malaysian government as an important indicator of voluntary business commitment to environmental improvement (Perry and Singh, 2001) and is aimed at organizations of various sizes, types and locations. In IMPAK (2000), the DOE's Director-General asserts that a cleaner production process that results from EMS adoption will ultimately benefit industries through resource optimization and environmental impact mitigation. This opinion seems consistent with the 'win-win' argument proposed by Porter and van der Linde (1995) in the literature. As the government aims to adopt ISO 14001 as the national standard for the production of manufactured products, it has been actively helping business, especially SMEs, even to the point of subsidizing the consultancy fee (Penang People's Report, 1999).

In the Eighth Economic Plan, the government seems to have recognized the role of business when emphasizing the intention to promote an increased use of environmental performance measurements and market-based instruments to complement other environmental management methods and regulations (MOSTE, 2001; United Nations Development Program, 2003). The government's stand on business voluntarism appears to be shared by the national industrial associations such as The Malaysian Business Council for Sustainable Development (BCSDM) and the Malaysian International Chamber of Commerce and Industry (MICCI). BCSDM is interested in clean technology that enhances competitiveness and efficiency and the effective use of EIAs (US-AEP, 2002). MICCI members are interested in the ISOs, particularly ISO 14001 due to concerns that competitors may use it as a competitive advantage at their expense (Perry and Singh, 2001; Global Environment Forum, 2002). This commonality of perception is probably the underlying reason for an on-going public-private partnership at the national level to promote voluntary initiatives in the manufacturing sector. BCSDM, the Environmental Management and Research Association of Malaysia (ENSEARCH – an NGO representing environmental scientists and managers), the Federation of Malaysian Manufacturers (FMM) and MICCI worked together, with the support of

the Ministry of Science, Technology and Environment, Malaysia (MOSTE) to launch the 'Anugerah Hibiscus Perdana Menteri' (formerly known as Hibiscus Award) in 1996<sup>vii</sup>. This is the premier environmental Award for business and industry in Malaysia to, "honor the contributions of the industry and business which have made the most impact in terms of environmental commitment" (press release, Prime Minister's Hibiscus Award, 1998: 1). Effectiveness notwithstanding, such cooperation demonstrates an increasing awareness at industry level about the importance of environmental protection, which has seen the initiation of a multilateral effort to address the issue at federal level.

As voluntary commitments on environmental issues are pushed almost exclusively on to the manufacturing sector, there is an apparent lack of focus on tourism. However, it is difficult to relate lack of government attention to business attitudes towards environmental and social issues. The reason is that even in the context of business in general, there has been lukewarm response on the issue despite existing governmental involvement and initiatives. For example, even though ISO 14001 was introduced 10 years ago, only 307 firms all over Malaysia were certified by 2001 (MOSTE, 2001). The lack of takers for ISO 14001 has been attributed to lack of confidence in the system, a high emphasis on monetary returns and lack of education on environmental and social issues (The Star respondent, pers. comm.). In addition, unlike quality concerns, environmental concerns may be of relevance mainly to industries in certain environmentally sensitive sectors such as chemicals, with relatively little effect on other sectors such as tourism.

In the context of Penang, only fourteen (mostly export-oriented electronics and electricity industry) of the total ISO certified firms in Malaysia were located in the state in 1999. The Shangri-La's beach hotels, Shell Malaysia Trading (a service firm dealing with petroleum products) and CCB Metal (providing recycling services) are the only service firms in Penang (and in Malaysia as a whole) that have received this award (Penang People's Report, 1999). This indicates that the implementation of EMS in Malaysia is generally lagging behind, especially for the service sector including hotels. The reasons behind this are not immediately clear, due to the lack of published materials on the matter. This research contributes in this regard, by uncovering factors and motivations that influence business responsiveness to BESR.

In spite of the slow acceptance of the voluntarism concept, another concept – corporate governance - has also been introduced to the Malaysian business community more recently. This is actually not a new concept in the business world, as it involves promoting improved and transparent management procedures, particularly in finance. In other words, it is essentially an extension of the management systems concept. It is difficult to relate corporate governance with BESR. Nevertheless, the concept is worth noting because it has had a significant influence in Malaysia. Lackadaisical attitudes towards the enforcement of corporate governance was identified as the major cause of the financial crisis in 1997-1998 which, it is claimed, 'awakened' the business from the slumber of mismanagement and unethical firm practices (The Star, 2001- various issues).

The introduction of these two concepts shows, at least at a superficial level, that Malaysia is basically 'on-track' about issues of widening responsibilities. In other words, the BESR concept is gaining momentum at least at the governmental and industry level, particularly in the manufacturing sector. The lukewarm response to and acceptance of the concept from individual businesses however, indicates that much is yet to be done to promote the BESR agenda. Nevertheless, the low number of firms in the service sector being certified suggests a tougher challenge to convince hotel and other service providers of the importance of BESR. On the other hand, Utting (2002) assures us that rising incomes, a significant presence of TNCs and official acknowledgement of the issue among local environmental pressure groups promise a more widespread presence of voluntary initiatives in the business environment of a developing country, such as Malaysia.

In contrast to the private sector's reluctant involvement in environmental responsibility, this sector is voluntarily supportive of official poverty alleviation policies and programs (United Nation, 2003). This may be linked to the country's political economy discussed above. As the government has been prioritizing social development and stability since 1971 (through the NEP), this and the state's strong control over the marketplace may have shaped the private sector's attitudes towards social issues. However, specific to the interest of this research, i.e. the labor issue, the private sector is evidently expected to comply with a number of labor-related regulations.

These regulations are upheld by a tripartite cooperation among the Ministry of Human Resource, the Malaysian Employers Federation (MEF) and the Malaysian Trade Union Council (MTUC) – a national workers union that has also been quite vocal in pushing the workers protection agenda at the government level. A ‘Code of Conduct for Industrial Harmony and Areas for Cooperation and Agreed Industrial Relations Practices’ has also been established since 1975 between MEF (then known as Malayan Council of Employers’ Organizations) and MTUC. An Industrial Court also exists to, “seek to right unfair terms of employment in collective agreement” (The Star, 2002 – various issues)<sup>viii</sup>. One success story involving the hotel industry in Penang is the case involving Siti Fawzia Mohd Razak, who was reinstated in her job and given RM 142,450 in arrears for being wrongfully dismissed by the Evergreen Laurel Hotel Sdn. Bhd. in 1997 (New Sunday Times, 2002).

Despite the existence of strong regulatory infrastructure on worker’ rights and welfare described above, the government has taken a cautionary stand in relation to workers’ demands. In addressing a workers’ rally, the Prime Minister Dr. Mahathir Mohammad has criticized the notion that workers’ demands can only be satisfied through strikes. Strikes, he said, have been proven to be extremely damaging to the economy in the form of chain reactions that would eventually close down businesses and industries and ultimately ruin the national economy. He stressed that Malaysians should preserve its way of resolving industrial disputes through discussions and negotiations, as these are more sensible than staging massive demonstrations. Demonstrations, he said, are a way to express anger, which may or may not lead to the achievement of any objective (The Star, 2002 – various issues). The Prime-Minister’s stand shows that trade unions are not encouraged to use the ‘test of strength’ (i.e. through boycotts or strikes) to present their demands.

In summary, the problem does not lie in the lack of regulations. The problem lies in the strength of those regulations in inducing responsibility in business. As present, the numerous regulations are weakly implemented and monitored due to the contextual environments discussed above. This raises a question about the ability of regulations to drive BESR, particularly in the hotel sector.

#### **Tourism Policies and Legislation**

Tourism is considered Penang’s second most important revenue earner after manufacturing, contributing nearly half of the state GDP each year (SERI<sup>ix</sup>, December 2001). Consequently, state tourism also benefits from the conducive and ‘business-friendly’ policies and incentives provided by the federal government. These include incentives for infrastructure building and hotel upgrading, pioneer status, an open sky policy, partial exemption of import tax to local tour operators and the expansion of tourist service expertise (Ministry of Culture, Arts and Tourism, 2001).

Conducive tourism incentives from the government also have spillover effects on the hotel sector leading to a proliferation of hotels built over the years (Tables 4 and 5), particularly during the period of 1990 to 1996. In Penang, the total number of hotel rooms available by the 2001 was 12,953 not counting the numerous service apartments and hostels operating as long-stay hotels.

As state tourism policies in Malaysia are essentially an extension of the federal policies (PDC respondent, pers. comm.), the lack of emphasis on environmental protection in Penang actually mirrors Malaysia’s national tourism policies and legislation. In 1993, Maverick Ltd. – a consulting firm - was hired to evaluate Malaysia’s tourism products and provide recommendations on how to improve Malaysia’s tourism offerings. The report produced from this exercise has identified and highlighted a number of environmental and social impacts of tourism. The report also recommended, among others, that the Federal Government through MOCAT endorse and promote the PATA Code for Environmentally Responsible Tourism at the national and state level. Under this code, tourism providers are encouraged to recognise the necessity to ensure a sustainable future, to meet the needs of the tourism sector today and the future and so as not to compromise the ability of this and future generations to conserve and preserve the environment (PATA Malaysian paper respondent, pers. comm.).

However, apart from this generic suggestion, the report fails to specify concrete suggestions on how to enforce the code (TDC respondent, pers. comm.). Lack of knowledge and understanding on how to promote responsible tourism, exacerbated by the low sense of urgency about the importance of responsible tourism, further slowed the incorporation of sustainable attributes into the planning and development of tourism in the country. As local business’s actions are generally dependent on governmental push, the lack of urgency at the government level has probably influenced the private sector’s attitudes towards the matter also.

Nevertheless, the Eighth Malaysia Plan (2001-2005: paper 15) has emphasized the formulation of “an overall policy thrust” to “achieve sustainable tourism growth” and realize tourism’s full potential of employment and income-generation benefits at national, state and local levels. However, unlike Thailand’s Eighth National Economic and Social Development Plan which specifies select strategies of interests in moving towards sustainable tourism practices (Box 1), the Eighth Malaysia Plan does not do so. The report has nevertheless acknowledged that the, “long-term success of the tourism industry hinges on the successful implementation of sustainable tourism development” (p.446). The incorporation of local community involvement, the conservation of natural areas and the sustainable development of hill stations and highlands are emphasized as key plans of action to achieve sustainable tourism development.

Judging from the lack of emphasis on tourism’s role in the Plan, it may be concluded that the role of hotel voluntarism in promoting sustainable tourism is not yet recognized in national tourism policy. In other words, the private sector is not expected to play a leading role in the promotion of sustainable tourism, beyond compliance of existing laws and regulations. There is also no plan to impose a more stringent environmental regulatory mechanism on the private sector. The Plan does, however, emphasize a ‘holistic and integrated approach’ that promotes public-private sectors’ cooperation to ensure the success of ‘tourism programs and events coordination at all levels’ (p.446). But, if previous experiences hold true, these programs and events would mainly be promotional in nature, rather than anything else.

It does need to be mentioned, however, that a substantial amount of capital has been allocated for ‘beautification/cleanliness and environmental protection’ (Table 6). This can be seen as a positive step towards prioritizing the environment in tourism development. The impact of this, nonetheless, is subject to the planning and implementation of effective programs to achieve the goal.

#### **Penang’s Socio-Economic Conditions Relevant to Tourism and the Hotel Sector**

With a land area of only 293 square kilometres, Penang accommodated approximately 59,000 people in 1997. With the population expanding each year, most of its diverse ecosystems including coastal forests, hill forests, sandy coastlines and mangroves, are now urbanised or peri-urbanised to accommodate roads and other infrastructure. Nevertheless, the city of Penang has been ranked number 10 in 1996, number 5 in 1997, number 6 in 1998 and number 7 in 1999 in Asiaweek’s “Quality of Life Index”<sup>x</sup> (Table 7). This means that Penang stands as one of the most prosperous, ‘liveable’ and attractive cities in Asia.

On the other hand, the quality of tourism attractions in Penang can readily be observed<sup>xi</sup> to be deteriorating. Poor planning and haphazard urban development underlie many of the problems. According to several hoteliers, many foreign tourists complain that although Penang literally means ‘the island of betelnut’, this type of tree seems to be quite scarcely planted in and around the island’s landscape, except in some of the resorts’ premises. Rather, city planners seem to favor high maintenance imported palm species and steel light-decorated coconut tree replicas. This, according to many hotel guests, reduces the natural aesthetics of the island compared to nearby islands such as Phuket and Langkawi. Rapid development of the property sector has also seen the paving of hillsides to make way for new housing areas especially in the Ferringhi Beach area, which was supposed to be the tourist belt of the island. Many hotel respondents indicate how disruptive the process of developing the area is to their guests and other holidaymakers.

In SERI’s (2003) report, lack of maintenance as well as low quality service have been identified as lowering the quality of tourist products in Penang. Lack of maintenance is reported as causing concern among Meeting, Incentives, Conventions and Exhibitions (MICE) operators because Penang has to compete with other better-equipped MICE destinations such as Kuala Lumpur, Singapore and Bangkok. In addition, issues of cleanliness, traffic congestion, poor public transportation, and limited new products are said to be impeding further growth of tourism in Penang.

In addition, a host of environmental problems are causing concern, particularly to beach hoteliers. Among the concerns are increasing beaches, air and noise pollution. Beach erosion in Batu Ferringhi, Penang’s most famous beach (where all the beach hotels except Mutiara Beach Hotel, are located) is adding to the deteriorating environmental conditions of Penang. Jellyfish problems, which started in the 1980s, are still prevalent, stopping tourists from fully enjoying a swim in the sea. Littering of the beach, especially after a public holiday weekend, and the tendency of hawkers and food traders to throw wastewater and sometimes litter into the open drains, are

enhancing sea pollution as most of the waste ends up in the rivers and eventually the sea. Noise and smoke emitted by the ageing public transportation system further worsen the situation, as these emissions often become the subject of complaints by many tourists (Penang In-shore Fishery Workers Association PIFWA, pers. comm.; various hotel respondents, pers. comm.).

There have been proposals to improve Penang's tourism. One emphasis is on the need to address the deteriorating conditions of many state-owned tourism attractions. For example, the state government has been urged to focus on the erosion and cleanliness problems of the public beaches (Ong, 2001). However, from personal observation, it seems clear that many privately owned tourism attractions (for example, the Snake Temple) are also in need of attention. Therefore, public-private cooperation appears to be an important avenue to improve state tourism. However, considering Singrist's (2001) observation on the lack of leadership for such initiatives, coordinated private-public cooperation to improve the state tourism products may be a long way off. A general lack of cooperation within the state tourism industry has also been reported by SERI (2003).

On the social side, the state is also facing a list of issues. Oversupply of labor, a nationwide phenomenon, is one of them. Declining job opportunities met by high numbers of retrenched workers, fresh graduates and SPM/STPM (national high school examinations) students flooding the job market has caused a glut of manpower that needs to be addressed urgently. In the year 2001, a total of 16,051 people in the state became unemployed due to closure of firms, retrenchment exercises and the implementation of voluntary separation schemes (VSS). The dominance of the manufacturing sector in the state further worsens the problem as this is the sector that lays-off the greatest number of workers (refer to Table 8).

On the positive side, retrenchment by the service sector including hotels is quite small (Table 8) compared to manufacturing, considering that it became the second biggest employer in 1999 (Table 9). One of the contributing factors for the low retrenchment is the increasing practice of multi-skilling by hoteliers<sup>xii</sup>. Nevertheless, this is a 'double-bladed' issue. Complaints received from workers has led the National Union of Hotel, Bar and Restaurant Workers (NUHBRW) to conclude that multi-skilling is an unfair practice that should be stopped. Multi-skilling provides employers with the benefits of less recruitment, at the expense of the existing employees. By not hiring new employees, existing employees are made to more work than usual, without any additional compensation. The practice also indirectly contributes to the grave unemployment problem faced by the state. In addition, the training given in a multi-skilling exercise often involves only the operational (housekeeping, bartending, front desk and others), rather than the management tasks (ex-employee respondent, pers. comm.). This means that multi-skilling does not effectively address the issue of labour shortages in the areas of managerial, professional and skilled labor highlighted by the WTTC (1994) as a key social issue in tourism.

The hotel sector however, has a different outlook on this issue. According to the Malaysian Association of Hotel Owners (MAHO) representative, multi-skilling ensures that each employee is adequately trained. Consequently, it reduces the need to retrench a worker if his or her job becomes redundant as the person can easily be reassigned to another task. Moreover, multi-skilling reduces the cost of training new recruits thereby saving money for the hotel. As times are tough, the practice is considered as making good business sense.

The economic slowdown and the rise of unemployment gave rise to another social problem that, according to many hoteliers, 'threatens' the hotel business – illegal street hawking. Penang's hawker food is cheap due to low overheads and is easily accessible due to sheer numbers and convenient locations. It is a draw particularly for domestic and regional tourists and is considered a form of 'informal service sector' that helps support tourism and enhance its productivity<sup>xiii</sup>. Increased demand from tourists for hawker food would mean less demand for (the more expensive) hotels' food and beverage (F&B) outlets. As hotels F&B has high overheads, losing customers to hawkers is considered a major problem.

On the other hand, offering food on the street means possible problems of food contamination, sanitation and garbage disposal and is disapproved of by The Health Department. Some of the illegal hawkers also tend to further reduce their overheads by practicing unhealthy cooking methods such as overusing and 'recycling' cooking oils. The scattered positions of the street hawkers may be strategic to their business, but can sometimes pose traffic hazard to motorists also. Efforts have been made to organize food hawkers in one complex, but this was not very successful, largely due to public demand for the more conveniently located street hawkers (Penang People's Report, 1999).

To the authority, street hawking “is a problem as well as a solution” (MPPP respondent, pers.comm.). The problems are as described above. The solution is that street hawking provides a viable alternative for those without employment, as a coping strategy. In addition, the Penang People’s Report (p.77) has concluded that, “consuming fresh, unpacked and locally-sourced food (as that offered by street hawking) instead of imported or packaged food closes the ecological cycle and is therefore good for sustainability”. Street hawking is also considered good for the community because it, “provides decent livelihood and self-employment opportunities”, maintains “vital traditions” of outdoors eating and traditional culinary, and is considered a good way to mobilize support for economic and social interests<sup>xiv</sup>.

These discussions demonstrate the diverse and complex nature of environmental and social issues facing the island in general. There are evidently many environmental and social issues, which provide hotel business ample ways with which to address its responsibility. But, the complexity of these issues also creates a deterrent. For example, should hotels bear the cost of cleaning up beaches littered by public users, not their own guests? Should hotels help the community (including the street hawkers), when these hawkers serve as their competition? There are obviously no easy answers to these problems unless there is a mutual understanding (government, private, the public) about the need to address each of the issues and an integrated, participatory management of them.

On the positive side, Penang’s physical and social environments may be facing a better future, as the state is currently one of the few places in Asia that has taken an initiative to change itself to be sustainable. The initiative involves the setting up of SERI in 1997. SERI is a non-profit organization whose main responsibility is to conduct socio-economic and environmental research for the state and to recommend policy options in line with principle of sustainable development. Among its first initiatives was the Sustainable Penang Initiative (SPI) project to address the challenge of sustainable development by organizing popular consultations, creating community indicators, and channeling the inputs into the state’s strategic development planning (The World Bank Group 2003; Nasution, 2001). The goal is to create networks and partnerships for sustainable development involving state, NGO, private sector, media and academia. The project is internationally driven with the support from the Canadian government and international agencies<sup>xv</sup>. If successful, it could act as reinforcing condition for hotel business to react positively towards its environmental and social responsibility.

## Conclusion

Acknowledging the inherent weaknesses of qualitative data such as the difficulty for subsequent research to confirm or moderate a research’s interpretations and conclusions (Bryman, 1988; Wilson, 1993), the findings presented in this paper has demonstrated the influence of conditions such as state-market relations, level of awareness, the state of policies and legislations as well as the environmental and social conditions on business reaction towards emerging issues, at least in the context of Penang, Malaysia. It has been shown that due to strong state control on the country’s economic direction in the past, national business in Malaysia have traditionally played a weaker, non-innovative role. Business directions have been dependent on government’s interventions, and this may have had some influence on business’s passivity towards emerging issues such as BESR. In addition, national businessmen do not traditionally thrive on the base of global competitiveness. Thus, they may fail to see BESR from global competitiveness perspective unless the state is directly and strongly involved in pushing the issue.

Although the country’s economy has opened up to direct foreign investment and has been integrated into the international trade, extensive state economic intervention still exists, as is evident in the rescue of ‘strategic economic sectors’ during the Asian financial crisis that involved saving many national conglomerates from total bankruptcy. This further demonstrates the continued dependence of national business on the government, which may have influenced business’s attitudes towards emerging issues. The reluctant adoption of ISO 14001 among Malaysian firms is a demonstration of such attitudes. In addition, since tackling social (if not environmental and social) issues such as eradicating poverty has always been the traditional responsibility of the government, it may be difficult for national business to see the relevance of addressing environmental and social issues in their day-to-day operations unless led and guided by the state.

Notwithstanding the fluctuation of tourism income, the resilience of the Malaysian tourism industry throughout terrible events such as the Asian Financial crisis and the Bali bombing shows that it is an important industry to sustain. The declining state of the manufacturing industry (mainly caused by the slowdown of the US economy) signals the increasing role tourism plays in becoming the country's major earner. But, tourism is a business that highly depends on the state of the environmental and cultural resources of the host country. Thus, the importance of addressing environmental and social issues can no longer be denied. However, in the context of Penang, Malaysia, change is unlikely unless and until the country's tourism policies and legislation is reviewed to focus more on tourism sustainability rather than growth. This is important because as Malaysian business has always been dependent on state intervention, its attitudes towards environmental and social responsibility and willingness to engage in voluntary initiatives depends on the state's policies and legislations.

For the hotel sector in Penang the importance is even more so for three reasons: 1) it is among the most laggard sectors in adopting ISO 14001; 2) its growth has been based on business-friendly policies and incentives, therefore pressure to address environmental and social issues may be perceived as a threat or obstacle to business. Lack of concrete suggestion on business's role in the achievement of 'sustainable tourism growth' in the Eighth Malaysian Plan further dampens possible business's involvement in environmental and social issues; and 3) the worsening socio-economic conditions of Penang require urgency from hotel business to recognize and accept their widening roles.

Although it is recognized that change is a difficult, time-consuming process, it is nevertheless necessary considering the deteriorating environmental and social conditions as well as heightened competition brought about by globalization, and the emergence of new cheaper destinations. Therefore, at least in the context of Penang, conditions mentioned above have to be conducive before hotel business can be expected to respond positively towards its environmental and social responsibility.

## End Notes

<sup>i</sup> This refers to Malaysian businesses and not multinational corporations. The *modus operandi* of the latter would be more influenced by the 'norms' of their respective countries of origin, rather than the country they are operating in.

<sup>ii</sup> The term 'Malaysian business' is used to refer to businesses that are established, owned and managed by local businessmen without any foreign or international participation.

<sup>iii</sup> In 2000, DOE had approximately 572 staff, of which 200 were inspectors (IMPAK, April – June, 2000).

<sup>iv</sup> From the Minister's (MOSTE) speeches posted in the internet, the government launched the Malaysia's National Policy on the Environment on 14 November, 2002 (after the author's fieldwork). It specifically mentioned the 'Role of the Private Sector: commitment and accountability' as one of its objectives. The policy provides guidance on 'sustainable business', especially in positioning themselves in the regional and global market place (MOSTE, 2002)

<sup>v</sup> The accreditation and assessment system in Malaysia started in 1969 with laboratory accreditation for the rubber industry sector by SIRIM Laboratory Accreditation Scheme (SILAS). SILAS is the predecessor of the national laboratory accreditation system schemes SAMM (*Skim Akreditasi makmal Malaysia*), administered by SAMM National Council. The Council later expanded to become the Malaysia Accreditation Council (MAC) to enhance the organisational infrastructure of Malaysia's accreditation system. In 1986, MAC was renamed Department of Standards Malaysia (DSM) which gives accreditation to laboratories, certification bodies, and personnel.

<sup>vi</sup> It is noted that the Ministry of Culture, Arts and Tourism is not represented in DSM. This information may contribute to the explanation why the adoption of standards, particularly ISO 14001 is not prevalent among hotel businesses.

---

<sup>vii</sup> It is important to note that none of the tourism-related governmental or nongovernmental agencies are involved in this project. The interviews revealed a lack of knowledge or attention among hotel managers regarding the existence and/or benefit of the award.

<sup>viii</sup> However, a loophole in the existing system has been blamed for causing backlogs of cases in the Industrial Court. Specifically, it is the MHR's decision to restrict the Court's chairman contracts to short term ones, which is only open to renewal at the ministry's discretion. This is deemed as undermining the independence of the Court from suspicions of undue influence and pressure (*The Star*, 2002- various issues).

<sup>ix</sup> SERI is an institute responsible for initiating and conducting The Sustainable Penang Initiative, backed by several international development agencies – a project which addresses the challenge of sustainable development by pioneering a process of popular consultation for inputs into holistic development planning. The pilot phase of the initiative include several rounds of talks leading to the People's Forum and the publication of a People's Report in 1999 (SERI's Penang People's Report, 1999). SERI's position as environmental consultant to the state in the Penang Environment Conservation Strategy and as a secretariat to the Penang Educational Consultative Council provide the institution with access to state personnel and information, as well as many professionals, academic and social contacts. However, its dependence on government funding put it in a non-confrontational position. It has also been criticised as being inaccessible to grassroots, rural communities or non-English language communities.

<sup>x</sup> The index annually lists the 10 most liveable cities in Asia, and is probably the most widely known urban index for Asian cities (Khoo, 2001)

<sup>xi</sup> During the fieldtrip, I could observe several cases of what I consider as 'poor planning'. One obvious example is the building of a 20-story hotel apartment building in Ferringhi Beach on what used to be a green hillside. The building's height makes it seem out of place and to clash with the green environment surrounding the area, thus making it a real 'eyesore'. Another is the deteriorating condition of previously famous places of interests, for example, the Snake Temple has lost much of its charm due to lack of funding and maintenance. In personal communication with the hotel respondents, many complained about the loss of greenery to housing development, the increasing noise of the traffic, and air pollution.

<sup>xii</sup> Training existing staff with multiple skills so that the staff can accomplish multiple tasks whenever the need arises. For example, if someone in Housekeeping is absent or on leave or retrenched, someone from the front office can be asked to replace him or her. This reduces the need to hire a new employee to fill the vacancy

<sup>xiii</sup> Personal observation shows that even the Western tourists are increasingly drawn to hawker food. Some hotel managers voiced their concern over this (during interviews) because more and more tourists that stay in hotels prefer hawker food.

<sup>xiv</sup> Penang's hawker population appears to have significant influence over political parties on the island

<sup>xv</sup> The Sustainable Penang Initiative is organised by the Socio-economic and Environmental Research Institute (SERI) of Penang. The project is sponsored by the Canadian International Development Agency (CIDA) through the Canada-ASEAN Governance Innovations Network Programme (CAGIN), which is coordinated by the Institute On Governance (IOG). It is also supported by the United Nations Development Programme (UNDP) and the United Nations Economic and Social Commission for Asia and the Pacific (UN-ESCAP).

# **Environmental Management Regimes for Emerging Asian Markets: What Works and What Doesn't**

*Robert W. Taylor  
Montclair State University, USA*

## **Abstract**

Command-and-control environmental management regimes, generally imported from western countries, do not work well in emerging market countries. This is largely because the demands for economic growth outweigh concerns for environmental protection at the various levels of practical decision-making. As a result, emerging market economies have two options. They can seek to strengthen their regulatory enforcement regimes so that environmental laws and standards, already in place in most emerging market countries, can actually produce a stabilized or reduced amount of environmental degradation. Or these same countries, especially ones that are so positioned with the necessary determinants, - a robust democratic process, open print media, available and affordable communications technology, and active public participation in governance, - can utilize a second option, a civil society environmental management regime. This alternative environmental management regime places greater responsibility on local citizen involvement and public-private partnerships as ways to maintain governmental accountability, increase transparency, and deliver positive environmental performance. This paper reviews various indexes of environmental degradation, discusses the limitations of command-and-control regimes for Asian emerging market countries, and shows how the basic elements of a civil society environmental regime are already in place in the Philippines.

## **Introduction and Purpose**

In November 2004 a series of storms struck the people in Central Luzon, Philippines causing the death of more than one thousand people and major crop losses. While these storms can be considered as natural events, poor environmental management magnified their impact on the Philippine people and their economy. Consistent illegal logging has denuded steep slopes, precipitating flooding, soil erosion and devastating mudslides. The Philippines, a typical Asian emerging market country, is losing more than 100,000 hectares of forest every year due to illegal logging and with it an estimated US\$1.8 billion worth of taxable revenue. Also lost are the ecosystem services that forests provide, such as air pollution traps, carbon sinks, flood buffers, and water filtration systems with replacement costs into the billions. What is happening in the Philippines is symptomatic of what is occurring throughout most of the emerging market countries of Asia. The World Bank estimates that the cost of environmental degradation for the region ranges from 4% to 8% of GDP, and concludes that "if current trends continue, environmental degradation could constrain growth and undermine the regions' potential for future economic development."<sup>1</sup>

This paper addresses the question of how environmental degradation can be reduced in Asian emerging market countries through proper environmental governance, defined as appropriate environmental management and regulatory regimes. For the purposes of this paper, emerging market countries are defined as countries that are labeled "developing market members" by the Asian Development Bank, and consists of countries such as the Philippines, Thailand, Malaysia, Vietnam, Indonesia, and Myanmar. The paper has four objectives. First, it shows the extent of environmental degradation in Asian emerging markets by viewing various indexes designed to measure environmental performance at the national scale. Second, it identifies the standard environmental management regime that currently is in place and how it is deficient in dealing with environmental problems. Third, it delineates the establishment of a modified environmental management regime that is more conducive to the unique characteristics of these emerging market economies and assesses the determinants necessary for its success. And fourth, it draws on case studies from the Philippines to illustrate how the basic elements of this modified environmental management regime already exist there and can be replicated throughout emerging market countries provided certain preconditions are met.

## Measuring the Conditions of Environmental Degradation

Asian populations are expected to grow by 700 million people over the next fifteen years. This increased population most probably will accelerate the environmental degradation existing in the region. It is estimated that 28% of the productive land resources have already been degraded. Steady urbanization has produced increased air pollution in the form of high levels of particulate matter and sulfur and nitrogen oxide emissions. And, as much as 20% to 30% of the solid waste in the developing Asian megacities is going uncollected, causing the clogging of storm drains, increased flooding, and stagnant pools contributing to various diseases.<sup>2</sup>

A representative sample of six emerging market countries in Southeast Asia was selected to illustrate varying conditions of environmental impact and stress. While all six can be defined as “developing economies,” Table 1 shows how each country is different in wealth as measured by Gross National Income per capita and is subject to different degrees of population pressure as measured by density per square kilometer.

TABLE 1 WEALTH AND DENSITY INDICATORS FOR SELECTED ASIAN COUNTRIES

Country	Gross National Product per capita	Population Density per sq. km.
Indonesia	\$710	117
Malaysia	\$3,540	24
Myanmar (Burma)	\$735	74
Philippines	\$1030	268
Thailand	\$2,000	121
Vietnam	\$430	247

Source: World Bank Development Indicators (World Bank, 2004)

All of these countries are dealing with similar environmental problems. Trying to determine the extent of environmental degradation is difficult, but a number of attempts have been made. The most direct way to measure environmental degradation in Asian emerging markets is to identify changes in forest cover over a ten-year period. This data is relatively easy to obtain since it can be retrieved either by national forest inventories or by remote sensing capabilities. And forests provide a key environmental resource. They maintain water quality, provide habitats for many species, buffer flooding and other natural events, and provide valuable ecosystem services. The World Resources Institute’s “Earthtrends” datasets are relatively easy to use for this purpose. As shown in Table 2, Asian emerging markets have lost significant amounts of natural forest cover. Some natural forest has been replaced with tree plantations and other reforestation measures, but generally forest cover is still a major problem area.<sup>3</sup>

An attempt to develop an Environmental Sustainability Index (ESI) has been undertaken by the combined efforts of the Yale Center for Environmental Law and Policy and the Center for International Earth Science Network at Columbia University. While this index does not measure environmental degradation directly, it can help identify the capacities of various countries to engage in environmentally sustainable practices. It establishes five components that can be benchmarked for environmental performance: environmental systems; reducing environmental stress; reducing human vulnerability; social and institutional capacity; and global stewardship. The ESI provides a tool that can evaluate a country’s potential to avoid major environmental deterioration. As shown in Table 2, most Asian emerging economies show a weak score. A score under 2 would indicate a high level of environmental sustainability, as exemplified by Sweden with a score of 1.38. The index does contain some bias as it weighs carbon dioxide emissions higher than factors such as water quality. The United States, for instance, scores only 2.34 on this index. But it does show a positive correlation between high environmental sustainability and countries with civil and political liberties, robust political debates, fair elections, free speech, an engaged press, and active non-government organizations (ngo’s).<sup>4</sup>

TABLE 2 ENVIRONMENTAL INDEXES FOR SELECTED ASIAN EMERGIN MARKET COUNTRIES

Country	Changes in Forest Cover 1990-2000 <sup>1</sup>	Environmental Sustainability Index <sup>2</sup>	Environmental Damages Index <sup>3</sup>
Thailand	N -29% T -7%	2.42	3.00
Philippines	N -19% T -13%	2.92	4.41
Malaysia	N -13% T -11%	2.53	3.06
Indonesia	N -14% T -11%	2.53	3.31
Vietnam	N -3% T +6%	2.72	3.93
Myanmar	N -14% T -13%	2.69	3.65

<sup>1</sup> Data compiled from World Resource Institute's "Earthtrends." N stands for percentage of natural forest lost. T stands for total percentage of forest lost or gained based on reforestation/ plantation forests.

<sup>2</sup>Data compiled from the 2005 Sustainability Index and configured to a score of 1 to 5 with 1 standing for the best score and 5 the worst score.

<sup>3</sup>Data compiled from the Environmental Vulnerability Index based on a score of 1 to 7 with 1 being the best score and 7 the worst score.

Another index established to benchmark environmental degradation on a national scale has been the Environmental Vulnerability Index (EVI). This index was designed to identify a country's vulnerability to natural shocks. An Environmental Degradation Index (EDI) was established as a sub-index of the EVI in order to measure environmental degradation more precisely than the ESI and more comprehensively than the simple Earthtrends dataset. The indicators for this dataset are indicators of biophysical system damage, loss of diversity, extinction of species, natural vegetation loss, and fishing. All of the selected Asian emerging market economies exhibited a high environmental damages score.<sup>5</sup> It is evident from all three environmental indexes that Asian emerging market countries are performing poorly relative to environmental performance. The key questions are: why is environmental degradation so high and how can environmental performance be improved?

## Contrasting Environmental Management Regulatory Regimes

In the attempt to limit environmental degradation, Asian emerging market countries have established environmental management regimes designed to foster environmental protection. The way that most Asian emerging market countries have dealt with environmental governance is to develop a single central agency entrusted to enforce national environmental laws, an environmental management regime often referred to as "command-and-control." This regulatory regime has generally been exported to developing countries from the West, where it has been highly effective. In the United States, for instance, it has contributed to a significant decrease in environmental pollution over the last 35 years since its inception.

The "command-and-control" regulatory regime has four basic characteristics as described in Table 3. It calls on a designated governmental agency to administer environmental protection. It relies on the use of environmental impact assessment for decision-making. It establishes environmental protection through national laws that address specific environmental sectors. And, its regulatory apparatus relies on reports, permits, and fines for non-compliance. While many Western countries can meet the basic requirements of the command-and-control approach, albeit with different capacities, most Asian emerging market countries have difficulty in implementing this regime with success. In such countries, economic development considerations take precedence over environmental protection as investment decisions often cater to the narrow and immediate needs of investors and economic market determinants. Also emerging market countries often lack the funding to engage a well-trained and well-paid staff, a basic determinant for a well-functioning western-style "command-and-control" regulatory regime. In short, emerging market economics are clearly not equipped to deal with the prospects of further environmental deterioration. A report of the Asian Development Bank (ADB) stated: "the root cause of the poor state of the environment (in Asian member countries) was a failure of policy and institutions."<sup>5</sup>

TABLE 3 THE COMMAND-AND-CONTROL ENVIRONMENTAL REGULATORY REGIME

Characteristics	Limitations
Based on a designated governmental agency to administer environmental policy and protection.	Not multi-sectoral and does not evaluate how different agencies are impacting the environmental through conflicting policies.
Relies on the use of the environmental impact assessment tool for decision-making.	Is narrow and does not evaluate basic alternatives.
Establishes environmental protection through national laws that address specific environmental sectors, i.e. air pollution, water pollution, etc.	Does not link environmental policy to other national policies, particularly economic policy. Is not flexible and does not promote technological innovation.
A system of environmental enforcement that relies on a reporting, permitting and fine-based environmental protection system.	Requires the integrity of the regulated entity for truthful reporting and adhering to permitted standards. Fines for dysfunctional behavior often does not compensate for environmental damages

#### A Civil Society Environmental Management Regime

While laws and public environmental enforcement regimes are important, they need to be supplemented with a regulatory regime that is more appropriate to the actual conditions that exist in many Asian emerging market countries. The Philippines, for instance, is considered to have the most comprehensive forestry regulation in the region, but has also one of the fastest shrinkage in forest cover.<sup>6</sup> This supplemental or modified environmental management regime, referred to in this paper as a “civil society” environmental management regime in order to differentiate it from the traditional “command-and-control” regime, has the following characteristics. It is based on a decentralized governance structure that places greater responsibility on local government for environmental protection. It requires the wide participation of non-government organizations (ngo’s) in the formation and implementation of environmental policy. It utilizes modern communications technology for mobilization, public message conveyance, linkages between groups, and dissemination of governmental accountability. It emphasizes a multi-sectoral approach to environmental policy where environmental protection is delivered through a national set of guiding environmental sustainability principles. And lastly, it relies on significant private sector participation and public-private partnerships to achieve environmental goals.

TABLE 4 CIVIL SOCIETY ENVIRONMENTAL MANAGEMENT REGIME

Characteristics	Requirements/Determinants
Decentralized governance structure that places greater responsibility on local government for environmental protection.	National government legislation or local government code.
Significant participation of NGO’s in environmental policy.	International NGO and Foundation funding support to national, regional and local NGO’s.
Reliance on governmental accountability systems in place to ensure equity and transparency.	Technical assistance support for the establishment of performance measurement systems delivered over wide internet access.
Increased public participation in environmental policy and protection through the internet, mobile phone communications and a free print media.	Inexpensive mobile phone connections and text messaging costs, and easy and inexpensive access to the internet.
Greater reliance on public-private partnerships and a cooperative management style or shared governance between NGO’s, the private sector and government.	A strategy of industrial ecology integrated into environmental policy and an increase in transparent privatization.
Multi-sectoral approach to environmental policy where environmental performance goals are linked to economic development in public policy.	Establish a set of environmental guidelines similar to Agenda 21 through a national Environmental Code that is used to review all public policy decisions and decision-making.

For emerging market countries to improve environmental performance it is necessary for them to move toward a civil society environmental management regime. To do this, emerging economics must show a certain capacity by meeting a set of preconditions as seen in Table 5. First, national legislation must devolve some powers from the central government to regional and local governments. Second, a national set of guiding principles for environmental sustainability should be integrated into all policy areas, including economic decision-making. Third, a market for inexpensive communication technologies, i.e. internet, mobile phones, needs to be expanded through open competition. And finally, greater transparency should occur by increasing public involvement in environmental governance and by creating governmental accountability systems that measure performance and disseminates this information through the print media and internet. Table 5 reveals the present capacity of the selected emerging market countries to meet the requirements for the implementation of a civil society regime. Even a cursory analysis of Table 2 correlated with Table 5 shows that a emerging market economy like the Philippines, which scores poorly on the environmental degradation index, is well-positioned and has the necessary capacity to improve its environmental performance through adoption of a civil society regime.

TABLE 5 CAPACITY FOR CIVIL SOCIETY ENVIRONMENTAL MANAGEMENT REGIME

Country	Political Rights Score <sup>2</sup>	Civil Liberties Score <sup>2</sup>	Regulation Score <sup>3</sup>	Transparency <sup>4</sup>	Weighted Score	Capacity
Thailand	1.5	2	3	3.2	2.43	High
Philippines	1.5	2	4	3.7	2.8	High
Malaysia	3	3	3	2.5	2.88	High
Indonesia	2	3	4	4	3.25	Medium
Vietnam	5	5	5	5	3.7	Low
Myanmar	5	5	5	4.15	4.79	Low

<sup>1</sup>Scores based on 1 to 5 value for each category with 1 being the best and 5 being the worst.

## The Philippines: A Case Study

The Asian Development Bank's *Asian Environment Outlook 2001* reported that developing countries in Asia have placed too much reliance on their environmental regulatory bodies and have not incorporated environmental sustainability goals into broader public policy objectives.<sup>7</sup> This has produced a significant disconnect between environmental risk and more popular goals of modernization and economic development. In the Philippines, the Department of Environment and Natural Resources (DENR) is the primary agency responsible for environmental protection and conservation of natural resources. This regulatory regime is largely command-and-control. It was established in 1975 under Presidential Decree No. 1151, otherwise known as the Philippine Environmental Policy. It targeted environmental impact assessments as a main tool for environmental decision-making. After PD No. 1151, a whole spate of environmental laws were passed, such as the National Integrated Protected Areas System Act, Clean Air and Water Acts, Toxic and Hazardous Substances Act, and the Ecological Solid Waste Management Act.<sup>8</sup>

Under these environmental acts, DENR's main functions were to provide environmental compliance certificates, monitor environmental impact assessments through the Environmental Management Bureau (EMB); levy fines; and issue cease and desist Orders through the Pollution Adjudication Board. This regulatory regime does not always work smoothly. At times, DENR finds itself at odds with other governmental bodies that champion economic development over environmental considerations. Also, fines are often not punitive enough to discourage polluters; enforcement is inconsistent; and general departmental environmental considerations have largely prioritized resource conservation issues over industrial pollution issues.<sup>9</sup>

The limitations of the command-and-control regulatory regime are well known in the Philippines. As a result, various initiatives are moving that country toward a modified command-and-control model that embraces the

basic tenets of a civil society regime. Five concepts essential to the civil society regime are presented below within the context of their current implementation in the Philippines.

**A Set of Environmental Principles: Philippine Agenda 21**

In order to deal with the inefficiencies of the command-and-control regulatory regime, civil society groups have organized to implement a new Environmental Code based on Philippine Agenda 21, a local version of the global sustainable strategy originally drawn up in the Rio Earth Summit in 1992 and subsequently promoted in the follow-up Johannesburg meeting. Groups such as Earthday Network Philippines and the Council for Sustainable Development are spearheading attempts to produce a Civil Society Environmental Management Regime based on Philippine Agenda 21. They are interested in modifying the existing fragmented and sectoral-based regulatory regime into one based on a “clear set of unambiguous principles and ground rules agreed to by all stakeholders (government, civil society and the private sector) during their crafting.”<sup>10</sup> These principles present ecosystem priorities that are “non-negotiable,” basic tools for assessment and compliance, and the rights and obligations of stakeholders. Hence, through Philippine Agenda 21 and the Philippine Strategy for Sustainable Development, the goals of environmental sustainability have been disseminated through Philippine national planning. The Philippines has clearly taken a multi-stakeholder approach to national development planning and decision-making.<sup>11</sup> In fact, Philippine Agenda 21 has been incorporated into Plan 21, the Long-term Philippine Development Plan and establishes the basic framework for the Civil Society regime.<sup>12</sup>

**Decentralization of Authority: The Philippine Local Government Code**

One of the most important features of a Civil Society regime is equitable governance, where local Governmental authority over the environment and community participation is emphasized. Decentralization of political authority in the Philippines occurred with the passage of the Local Government Code of 1991.<sup>13</sup> In this far-reaching legislation, local government was assigned major responsibilities in creating their own revenue base as well as initiating and promoting their own environmental management programs. This was a significant devolution of political authority from the central government to the localities, and it has produced significant results. It has transformed local officials into development managers and integrated various spheres of governance, i.e. social services, finance, economic development, and environmental management.<sup>14</sup> It has also provided for people empowerment and local accountability through the involvement of NGO’s and People’ Organizations (PO’s) in management processes. And finally, it has promoted greater accountability from local officials on issues relating to environmental quality through petitions, initiatives, and the recall of local officials.<sup>15</sup>

**Industrial Ecology: Philippine PRIME**

An important part of the Civil Society regime is to incorporate industrial ecology into public policy. A concept that originated in Denmark, it has come to the Philippines by way of the Private Sector Participation in Managing the Environment (PRIME), an environmental project of the United Nations Development Program in conjunction with the Philippine Department of Trade and Industry and other public and private organizations.<sup>16</sup> The program was a new way for the Philippines to engage in environmental management by encouraging market forces and private company participation in environmental policy. It has as its “selling point” the concept of making environmental management as much a “profit center” as a “cost center.” It was also viewed as an alternative to a command-and-control regulatory regime that was inconsistent and clearly unable to deal with the immensity of environmental problems. One of its main features was creation of “ecological industrial parks,” a cluster of firms working together to reduce the use of raw materials, reduce waste, conserve energy and water resources, and reduce transportation requirements. It utilizes the idea of the industrial estate as managers of environmental quality through the use of by-product exchanges and other logistical information mechanisms. Incentives for firms to join the program rested in the expectation of expedited environmental clearance certificates and streamlined Board of Investment registration.

As part of its strategy to integrate a concern for environmental protection into economic policy, the ecological industrial park module of Prime was placed in the Board of Investments (BOI), a governmental body traditionally concerned more with economic growth rather than environmental quality.

The theory was that under the direction of the BOI the program was seen as less regulatory and more business-friendly. The goal was to integrate a sense of environmental management systems into industrial park business plans.

Five industrial estates were selected for the pilot program: Camelray Industrial Park; Laguna International Industrial Park; Light Industry and Science Park; Laguna Technopark, Inc.; and LIMA Technology Center. The economic costs of storing, treating and disposing of the waste from these five parks was estimated at more than nine million USD annually. A by-product database was established for 80 companies in the five estates to facilitate a waste-trading network. The managers of the five estates created an “Inter-Estate Working Group” that facilitated the program’s private sector focus and reliance on good business practices. The problems associated with the program are its poor coordination with different governmental authorities and its reliance on inconsistent governmental guidelines. Issues such as how to classify by-product waste from a customs perspective and differences between authorities responsible for waste hauling and waste treating all have produced major barriers to sustainable waste trading.<sup>17</sup>

For all its problems, these ecological industrial parks hold out the notion that industrial activities can be effectively managed to reduce environmental risks. Carmelray Industrial Park, which covers 230 hectares, already has 50 firms that are largely Japanese semiconductor manufacturers. Carmelray advertises its environmental management system as part of its corporate policies and seems to be so successful that other industrial estate managers are using it as a model for real estate marketing. Unfortunately, 70% of industrial facilities in the Greater Metropolitan Region lie outside of industrial estates. This means that if the program is to be successful it must extend to small and medium-sized firms and their trade groups and local government authorities.<sup>18</sup>

#### **Increased Participation of NGO’s in Environmental Governance**

Civil society organizations are increasingly playing a major role in environmental management in Metro Manila.<sup>19</sup> An example of one community organization that has strengthened recycling and encouraged the development of jobs in poorer communities is the Metro Manila Federation of Environmental Cooperatives, or Linis Ganda. Eco-aides are trained to buy recyclables from over 1.5 million households in Metro Manila and sell them to junk shop owners for reuse or recycling. They are responsible for an annual collection of 100,000 tons of recyclable materials, accounting for 4.3% of Metro Manila’s daily garbage output. There are over 2000 eco-aides supplying 572 junk shop members, who then sell to consolidators who ultimately transfer the materials to paper mills, glass factories, and plastics and metal plants. The Linis Ganda aids in the training of eco-aides who work directly for junk shop operators, and provides loans to junk shop operators for daily operations.<sup>20</sup>

Globalization is not just an economic phenomenon but a social one as well. Recent attention has been directed at how globalization is producing new communication tools, particularly text messaging and the internet, that have given the poor and under-represented in city-regions a new access to power and influence.<sup>21</sup> In the Philippines, 150 million text messages are sent out every day by mobile phone users, most of these in Metro Manila, at minimal cost that makes it a powerful tool for community organization. In fact, community organizing has gone global. When the Metro Manila Development Authority proposed a landfill in the towns of Candelaria and Tiaong in Quezon province that locals opposed because of its damaging consequences to the region’s coconut industry, a local environmental legal defense center received at least 150 signatures on a petition drive against the landfill from locals living abroad in such diverse locations as California, New York, and Canada.

No better example of the empowerment capacity of the new communication technologies is the case of Payatas, where one of the most notorious open dumps of Metro Manila is located. The barangay of Payatas is located about 20 kilometers from downtown Manila, where 3000 tons of garbage is trucked in every day, mostly from affluent municipalities such as Makati. Approximately 100,000 people or 18,000 families live around the dump, with an average income of USD 4 per day and an infant mortality as high as 30%.<sup>22</sup>

On July 10, 2000, after seasonal rains, a trash-slide occurred that killed or buried over 500 people. This tragedy gained international attention and acted as a catalyst to mobilize the poor for greater participation in metropolitan governance and to create strategies that would elevate the poor. In conjunction with NGO’s such as the Vincentian Missionaries Development Foundation and other faith-based groups, a major rescue effort was undertaken through the use of community volunteers.<sup>23</sup> People’s Organizations (PO’s), such as the Scavengers Association, multiplied as self-help representatives of the poor, and developed strategies that turned tragedy into a model of urban poor self-help.

First, PO’s used the courts to litigate, both criminally and civilly, against governmental officials for allowing the dump to increase to dangerous proportions by accepting solid waste from unauthorized

municipalities. Second, PO's, with the technical assistance of NGO's, formed international alliances with slum dwellers from India, Indonesia and Sri Lanka, where in August of 2000 a international meeting was held in Manila to showcase housing models and redevelopment plans.<sup>24</sup>

Through the active lobbying and community organizing of these PO's, the Asian Development Bank and the Japan Fund for Poverty Reduction both offered bridge financing for the development of new housing and the acquisition of land.<sup>25</sup> The Philippine Community Mortgage Program was utilized in this program to fund basic services such as water supply, sanitation and roads, provided loans for small business formation (micro-finance), and helped establish a community-based health insurance program. This outside help, while significant, was only a small part of an established program in Payatas where the highly organized Scavenger's Association had already created a micro-finance program.

The utilization of the media for visibility; the use of new informational technologies such as the internet and text messaging to coordinate activities and gain wider support, all testify to the increasing sophistication of the poor in the megacities of the developing world. The lessons from the Payatas experience are clear: the poor have the capacity to organize effectively and can astutely use the media and telecommunications to achieve equity and a share in governance; new technologies can be used by the poor to effectively lessen the advantages of metropolitan elites, both technological and traditional; and open informational pathways allow the poor to get their message out, thereby increasing their social capacity in civil society.<sup>26</sup>

The results of this empowerment are impressive. It demonstrates that the poor, who constitute a significant block in the Philippines, can be actively represented in a civil society regime and have an input into environmental policy. In the case of the open dump of Payatas, it has been reduced, as waste is now diverted to newer sanitary landfills. The area of the tragedy has been leveled, covered with a thick layer of earth and transformed into a residential area where the former squatters now have tenure rights coupled with on-site service upgrading.<sup>27</sup>

#### **Governmental Accountability: Local Government Performance Measurement System**

It is impossible to have a Civil Society Regime without significant governmental transparency. One hopeful project is the development of an internet-based performance measurement system that will encourage local governmental accountability. In the early and mid 1980's the Philippine Department of Interior and Local Government (DILG) developed a pilot project to establish a local performance productivity system based on the quantity of services offered by local governments. This project languished until the late 1990's when regional officers of DILG called for a tool that could make them more relevant to Local Governmental Units (LGU's) since the 1991 Governmental Code significantly altered the relationship between the national government and LGU's. This resulted in the development of two performance measurement instruments. Development Watch was developed as a software package that established indicators for largely social and environmental health through a citizen satisfaction index. This performance measurement tool was broadened with the creation of the Local Government Performance Measurement System (LGPMS) that added new performance sectors in governance, administration, and economic development. It is currently being field-tested in over 100 LGU's and is conceived as a self-assessment tool that can determine the capacities, service delivery and development conditions of local governments. Its goals are to encourage better LGU management; establish an empirical basis for allocating resources into policy reform; balance accountability with authority; and institutionalize a culture of performance management.<sup>28</sup>

The LGPMS is an internet-based system that has the ability to capture data on-line. Web-based capture forms are used to input data on-line and it is stored on a central database server. Passwords are used to log on and LGU's can assess two types of performance reports: one based on a "wheel-of-fortune" format and another based on a "spider-web" format. The data input format starts with five performance areas that divides into eighteen service areas, which further divides into indicators and sub-indicators.

The significance of the LGPMS system is its ability to generate up-to-date data and analysis of the strengths and weaknesses of each LGU in five performance and eighteen service areas. Through generated reports, each LGU has the capacity to allocate scarce resources and initiate reforms in deficient areas. By evolving from the Development Watch format that targeted social and environmental measures to the LGPMS format that gives equal weight to financial and budgetary concerns, it is linked to the real-life perspectives of many local governmental officials. Yet, because it links environmental performance indicators to financial and economic indicators through a measurement report, local officials must by necessity see their overall performance linked equally to both

environmental management and economic growth sectors. Hence, one sector cannot be isolated at the expense of another sector. Greater transparency and local governmental accountability is enhanced, a basic feature to any civil society regime.

## Conclusion

The main premise of this paper is that command-and-control environmental management regimes, generally imported from western developed economies, do not work well in emerging market economies. This is largely because the demands for economic growth outweigh concerns for environmental protection at the various levels of practical decision-making level. As a result, emerging market economies have two options. They can seek to strengthen their regulatory enforcement regimes so that environmental laws and standards, already in place in most emerging market countries, can actually produce a stabilized or reduced amount of environmental degradation. Or these same countries, especially ones that are so positioned, with the necessary determinants, - a robust democratic process, open print media, available and affordable communications technology, and an active public participation in governance, - can utilize a second option, a civil society environmental management regime. This alternative environmental management regime places greater responsibility on local citizen involvement and public-private partnerships as ways to deliver governmental accountability, increase transparency, and deliver positive environmental performance. As one writer notes in a recent article in a Philippine newspaper:<sup>29</sup>

*“There is one crucial tool (for protecting forests) that has not been fully utilized over the years. Since the government does not have enough resources to patrol and safeguard our forests with the current ration of one forest ranger for every 4,000 hectares, local involvement is a must. The need for active community participation to ensure protection of forests has been neglected in many localities. Illegal logging activities are unlikely to happen without the knowledge of local residents. They know exactly where illegal logging is rampant and who are responsible for cutting trees in their respective areas. If local residents are well-informed on the importance of trees for ecological balance, then there will be greater pressure on local authorities, military and police officials to carry out their job of safeguarding our forest resources. Also, there is less opportunity for corruption, which is said to be one of the main reasons why illegal logging has thrived.”*

# **Environmental Management and the Sustainability of Tourism**

*Mohammed Bayat*

*Emaad Muhanna*

*Cape Peninsula University of Technology, South Africa*

## **Abstract**

**In view of the fact that tourists have to visit the place of production in order to consume the output, it is inevitable that tourism activity is associated with environmental impacts. The highly polarised nature of development may generate intense environmental problems. Depletion of natural resources can result in water shortages; create great pressure on other local resources like energy, food, etc., that already might be in short supply or destroy beautiful scenic landscapes. Pollution from tourists has impacts on the global level that disturbs the local population of the caused community. Solid waste and littering in the nature spoils the natural environment. The more physical impacts are degradation and loss of wildlife habitats and of scenery, and disturbance and erosion of the local ecosystem caused by clearing forested land and construction of tourism facilities and infrastructure. Conservation of natural, cultural and built environment is an important motivation for the initiation of development projects. Moreover, some projects tend to deter locals from illegal use and overuse of natural resources as well as they try to integrate protected areas in development plans.**

## **Introduction and Overview**

The growth of tourism as the world's fastest growing industry in the 21<sup>st</sup> century has brought with it major environmental problems, which need to be addressed and resolved in order to achieve sustainability on the short and long term. Land degradation, pollution, desertification, waste, damage of species and inadequate utilisation of natural resources have caused many natural resources to be endangered or even destroyed.

On the national side; fragmented legislation, ineffective enforcement, inadequate health and safety and poor environmental practices for pollution and waste management and more importantly the lack of the involvement of people have contributed to loss of many natural resources.

As a result of natural depletion in many tourist destinations internationally, the world had gathered to discuss and present solutions to eliminate inadequate utilisation of natural resources. As a result many international protocols, conventions, and reports have been produced involving major governmental and nongovernmental bodies addressing the environmental crisis and providing solutions. In 1992, the world's efforts have resulted in producing the most significant document, where 178 countries gathered in a global conference in Rio and agreed on Agenda 21, which is considered to be an ideal blue print providing guidelines and recommendations to serve sustainable development and environment as a vital component of modern tourism.

In 1994, at the end of the apartheid era the South African announced its ambitious campaign to make tourism its number one industry in the creation of jobs and generation of foreign exchange earnings. South Africa following its transition to the democratic stream has always realised the importance of tourism as vehicle for poverty alleviation, economic growth and achieving socio-economic equality. Part of the South Africa transformation were major changes in its legislative and institutional structures, which involved drawing new legislation to serve the economic activities one of which is tourism with a special focus on environmental protection laws. The environmental management legislation involved both inter-governmental and public-private partnerships in order to promote and maintain the ecosystem services to serve the natural assets.

The environmental management actions by the South African government as well as public and private sectors have contributed significantly in producing and maintaining adequate utilisation of resources, elimination of air and water pollution, and biodiversity. The environmental management legislation has also enforced regulations regarding the consuming of water and energy, land use, reduction of pollution and protection of habitats and species.

Agenda 21 has been incorporated in the government legislation as guidelines to ensure adequate utilisation of natural resources. Furthermore, the concept of accreditation scheme has been implemented to provide standards and performance indicators for sustainable tourism. South Africa has at the stage no adequate certification scheme to provide guidelines and criteria to assess the tourism organisations' competencies and service delivery standards. Moreover, it has been noted through the research that the private sector has limited access to investment in most tourism development areas particularly protected areas, the government organisations and public sector have sole mandate to invest and manage protected areas with outsourcing of certain types of expertise from the private sector.

Tourism in South Africa has been dependant to a large extent on environment; yet, major environmental needs have received no proper attention to preserve the environmental assets for sustainable tourism today and for the new generations of tomorrow.

This paper provides a critical analysis of the current environmental management strategies in South Africa, providing recommendations to improve environmental management techniques to achieve sustainable tourism.

## **Tourism Environments**

It must be acknowledged that tourism takes place in a diverse range of environments; a landscape to observe and enjoy, activities to participate in, and experiences to anticipate or remember. Lew (1987, 359) had identified three broad approaches towards developing typologies that encompasses ideographic, organisational, and cognitive perspectives. The first and most important of these frameworks is the ideographic approach, which focuses on the concrete uniqueness of "environment" and, as such, stresses the differences between nature-orientated and human-orientated attractions.

The organisational approach focuses on the spatial characteristics of size and scale, carrying capacity, and the temporal nature of attractions. Finally the cognitive approach stresses classifications relating to tourist perceptions and experiences.

Each of these three main bases of classification reveals important characteristics of tourism environments, which in turn can contribute to understanding of developments and their impacts on the destination.

### **Mass Tourism**

According to Williams and Shaw (1997) mass tourism involves the movement of large numbers of tourists with relatively little surplus income. High gross income is yielded from relatively low expenditure per capita. Mass tourists are seeking more and more exotic holiday destinations. Given the income constraints, these can only be provided at relatively minimal levels of services and facilities.

This trend of mass tourism provided an ideal situation for South Africa as an affordable destination for many of developing countries, attracting large millions of people who seek affordable services and facilities. In addition, South Africa has the potential to attract an equal number of people from developed countries for many reasons, of which its political stability, beaches, richness of culture and natural sites.

### **Urban Tourism**

Jakle (1985: 246) states that tourists and visitors approach cities with definite expectations of its signs and attractions. Such expectations are formed not only by a variety of social experiences and information sources which produce distinct images of urban areas, but they also vary with the type of visitor.

Urban tourism can be also an ideal source of attraction for foreign tourists to experience its cultural and social heritage. Such trend will enable the country to create more jobs for locals and enhance local communities' participation in achieving tourism growth.

Policy-making process surrounding urban tourism projects is led by the demands of private investment. Clearly, this is not always the case, since there are a number of possible outcomes from mixed public and private tourism ventures. However, what appears to be happening is a shift towards urban tourism and leisure schemes becoming more institutionalised as they become strongly linked with economic policy. (Williams and Shaw: 1997: 207)

### **Rural Tourism**

Williams (1997) states that in the late twentieth century the growth of incomes, leisure time and mobility amongst all except the underclass has led to more intense demands being made on rural areas as locales for recreation and

tourism. At the same time, the social construction of rural areas has undergone further, often subtle changes. As a result, the conflicts over the use of the wilderness and national park areas are being replicated more widely throughout the tourist destinations.

The construction of the countryside as a zone of consumption necessarily results in a number of sharp contradictions. The first of these is the reality that in most tourist destinations, the vast majority of rural lands are in private ownership, which severely constraints accessibility. Second, there are many social constructions of rural areas. Such factors provide a potential for host-guest conflicts.

Rural and farm tourism can provide more jobs of rural communities as a secondary source of income, which will in turn reduce the unemployment rate in South Africa (Williams and Shaw, 1997: 231)

#### **Ecotourism: Planning and Development**

Ecotourism is one of the fastest growing trends in the worldwide tourism industry. The term ecotourism refers, as defined by Ziffer (1989), to a trend of tourism that is managed by the host country or region which commits itself to establishing and maintaining the sites with participation of local residents, marketing them appropriately, enforcing regulations, and using the proceeds of the enterprise to fund the area's land management as well as community development (Ziffer, 1989).

Policy-makers and planners must work with the knowledge that tourism can have negative impacts on personal security, transportation, urbanisation and cultural integrity. Good tourism management means assessing the physical and social carrying costs of tourism development (Tourism Policy Forum, 1991).

#### **Ecotourism Strategies**

A policy that promotes sustainable tourism development will be created when the efforts and active participation of three groups are coordinated in one joint enterprise. A new political paradigm of developing countries requires that each sector play a well-defined role in the planning and policy development process and that the combined efforts of all sectors be integrated into policy. If tourism leaders from all sectors work together they will eventually mobilise the human resources necessary to design and implement a series of tourism development policies and plans which truly address the enormous tourism potential of developing countries.

A four-strategy approach has been proposed by Williams and Shaw (1997, 267), these include;

#### **Consumer awareness and education**

Although the average consumer has been sensitised to environmental issues, such as global warming, depletion of ozone layer, more needs to be done to develop an awareness of tourists' responsibility to preserve and enhance environmental quality of the destination. It is essential to promote ethical standards concerning the use of natural and cultural resources and to assist consumers in choosing tour operators who follow conservation guidelines.

#### **Tourism Industry Action**

The private sector is responsible for delivering the products and services to tourists and therefore, they should take the responsibility for the protection of biosphere by minimising pollution, which causes environmental damage. The industry should also work together to develop guidelines for resort developments and concession operations, which utilise low-impact design criteria and the latest technologies for recycling and conserving resources.

## **Destination Planning and Development**

Government and non-government organisations need to share responsibilities for Ecotourism development. Listed below are some of the responsibilities that should be assigned to the government and non-government organisations;

- Governments: Undertake research into the environmental, economic and cultural areas of tourism.
- Support the development of tourism economic models to help define appropriate levels of economic activities.
- Assist and support lower levels of government to develop their own tourism development strategies.
- Apply a Sectoral and / or regional environmental accounting system for the tourism industry.
- Educate the public on issues of sustainable tourism development.
- Regulate and control tourism in environmentally and culturally sensitive areas.
- Non-government:
  - Be part of sustainable tourism advisory boards at all levels.
  - Seek local support for appropriate sustainable development.

Promote education of the public on the economic importance of sustainable tourism development and environment protection.

Be encouraged to identify and communicate to the appropriate agencies those issues related to sustainable development as well as solutions to those problems.

An extended concept of marketing Ecotourism

Traditional marketing has been described as the four Ps

- Price: assigned to the product or service offered to tourists.
- Promotion: a range of communication and sales activities are needed to stimulate actual potential customers to become aware of Ecotourism products and buy it.
- Place: the distribution system in which the customers buy Ecotourism products. This includes for-profit and non-profit organisations.
- Product: is a mixture of benefits, products and services (Williams and Shaw, 1997: 162-270)

### **Sustainable Tourism and Environmental Management**

The World Tourism Organisation defines sustainable tourism as “tourism which leads to management of all resources in such a way that economic, social and aesthetic needs can be filled while maintaining cultural integrity, essential ecological processes, biological diversity and life support systems. (WTO Report 2002:7)

During the 1980s, it became apparent that major global environmental changes were occurring suddenly and silently and those scientists had not predicted these changes. The world also became more aware that there was an element of uncertainty and risk in relation to the effect of a range of human activities on global environments. To rectify these problems, fundamental changes were required in our style of living.

Tourism is most ideally suited to adopt sustainability as a guiding philosophy. There are many reasons for that;

- Apart from transport, tourism does not consume additional non-renewal resources.
- A community’s resources, its culture, traditions, shops, leisure facilities, etc, represent the core resources base for tourism.
- Tourism use of resources, both natural and cultural, should be non-consumptive, making them renewable.
- Tourism represents one of the few economic opportunities available to remote communities.
- Tourism provides real opportunities to reduce poverty, create employment for disadvantaged people and stimulate regional development.
- Tourism has proven to revitalise cultures and traditions.
- Tourism can provide an economic incentive to conserve natural and cultural assets.
- Tourism has been shown to foster greater understanding between people and a greater global consciousness.

And so, sustainable tourism is really an issue of how best to encourage tourism growth while minimising costs (McKrecher, 2003:4). Sustainable tourism entails adequate utilisation and management of resources to achieve economic, social and cultural needs while maintaining social, cultural integrity, ecological processes as well as biological diversity for the present as well as for the future generations. Therefore, modern tourism with its trends and characteristics cannot be promoted without considering the environmental management as a main component of the economic aspects of tourism.

The principles of sustainable tourism are various one of which is the ecological sustainability, which entails the implementation of development that is compatible with the maintenance of essential ecological processes, biological diversity and resources.

As a result of the significant dependence of tourism on environment, maintaining the attractions of the tourism destination and its natural assets contributes to tourism growth and increase the popularity of the destination. Tourism through its ability to generate income is able to enhance environment, provide fund and preserve the cultural heritage of the destination.

On the other hand poor tourism planning can destroy vegetation, create overcrowding, pollute beaches, eliminate open space, and ignore locals’ interest. Various approaches have been introduced to maximise the

tourism's consideration to nature to retain popularity as an attractive tourism destination, these approaches include; Ecotourism, nature tourism, sustainable development and carrying capacity.

Ecotourism as one of South Africa's main tourist attractions, therefore, the ecotourism market can not be sustained with adequately protected environment, which requires not only from the government but also from the tourism industry to implement appropriate environmental management programmes.

Tourism as the world's largest industry is able to provide healthy and safe environment for the tourist market as well as for other industries. The co-operation between environmental and tourism issues was highlighted by the Manila Declaration (Edgell, 1990) as well as by the study by the Organisation for Economic Co-operation and Development.

In examining the possible implication for tourism, the WTTC expresses particular concern with respect to the depletion and pollution of land resources. It states that the long-term implications of resource depletion are obviously extremely serious. Even over the next few decades the travel and tourism industry could find that; Political instability or increased competition for land could lead to loss of potential new tourism destinations and degradation of existing destinations.

Loss of landscape and wildlife could cause a decrease in customer satisfaction with tourism products and hence lower propensity to travel to some areas. WTTC also presents a positive vision of tourism and the environment, stating that;

- Tourism is an integral aspect of modern societies.
- Global awareness of environmental damage is developing rapidly.
- The resources of the world's largest industry can and must be harnessed to achieve environmental goals.
- The industry has the potential to influence customer to achieve beneficial environmental effects.
- Environmental lobbies will add pressure to develop good environmental practice. (Goeldner, 2003:464)

## **Environmental Impacts of Tourism and its Sustainability**

As tourism moved into the 21<sup>st</sup> century, the enterprises have to make the environment a priority. Because tourism now is the world's largest industry, the environment is taking centre stage in tourism development. Tourism is not only a powerful economic force but also a factor in the physical environment as well.

Any form of industrial development brings impacts upon the physical environment in which it takes place. In view of the fact that tourists have to visit the place of production in order to consume the output, it is inevitable that tourism activity is associated with environmental impacts (Cooper et al. 1998:149). For that reason, traditionally some authors have pointed out that tourism can lead to environmental negative consequences.

The highly polarised nature of development also generates intense environmental problems. This reduces the quality of life for locals as well as for tourists and, ultimately, may threaten the viability of the tourist industry itself (Williams & Shaw, 1991). Depletion of natural resources can result in water shortages; create great pressure on other local resources like energy, food, etc., that already might be in short supply or destroy beautiful scenic landscapes. Pollution from tourists has impacts on the global level that disturbs the local population of the caused community.

Solid waste and littering in the nature despoils the natural environment. The more physical impacts are degradation and loss of wildlife habitats and of scenery, and disturbance and erosion of the local ecosystem caused by clearing forested land and construction of tourism facilities and infrastructure (UNEP, 2001). However tourism could be positive for the preservation of natural areas.

In many tourism projects the conservation of the natural, cultural and built environment is an important motivation for the initiation of the project. Moreover, some of the projects tend to deter local communities from illegal use and overuse of natural resources as well as they try to integrate the protected natural areas in regional and local development plans and programs. Therefore, tourism could and should contribute positively to environmental preservation. This sentence has more sense when we think about tourist motivation in visiting one specific place. The benefits and costs on environmental impacts are highlighted below;

TABLE 3: ENVIRONMENTAL IMPACTS: A COMPARISON

<b>Benefits</b>	<b>Costs</b>
-Conservation of natural areas and wildlife. -Re-evaluation of ecological values by the local population and authorities as a result of tourism interest. -Increasing awareness of the environment and nature in general among tourists. -Rehabilitation and often also transformation of old buildings and sites into new facilities. -Introduction of planning and management. -Tourism may be less damaging to nature compared to alternative economic sectors such as agriculture and forestry.	-Loss of aesthetic value. -Noise. -Generation of waste. -Deforestation for building accommodation or to obtain firewood, pollution of water and air -Disturbance of ecosystems, disruption of animal breeding patterns and habitats. -Destruction of beaches, dunes, coral reefs and many National Parks and Wilderness Areas through trampling and/or use the use vehicles. -Change of landscape –permanent environmental restructuring. -Seasonal effects on population densities and structures. -Conflicts over use of resources.

(Source: adapted from France, 1997: 83 and Cottrell, 2001: 2)

According to Cooper et al (1998: 164) there are no generally accepted models for environmental impacts. Basically, we need a wide overview in order to be able to develop tourism as carefully as possible, taking into consideration the wide range of possible impacts. In doing so, we will be able to achieve a satisfactory tourism development management. Environmental impacts are not unique to tourism and tourism receives a disproportional share of criticism for its negative environmental impacts.

The criticisms directed at tourism from an impact of development view have tended to focus on the deterioration of natural and cultural environments that tourism can cause. The development of tourism is frequently justified on the basis of its potential contribution to the broader socio-economic development of destination areas. Indeed, tourism is generally considered an effective vehicle of development, yet the meanings and objectives of “development” and the extent to which it can be achieved through tourism, is rarely questioned. Moreover, the relationship between tourism and development remains to be an under-represented area of study and research (Sharpley & Telfer, 2002).

WTTC subsequently proceeds to examine the key environmental issues under five headings, namely; Global warming, Depletion of ozone layer, Acid rain, Depletion and pollution of water resources, Depletion and pollution of land resources.

According to Goeldner (2003: 464) in examining the possible implication for tourism, the WTTC expresses particular concern with respect to the depletion and pollution of land resources. It states that the long-term implications of resource depletion are obviously extremely serious. Even over the next few decades the travel and tourism industry could find that;

- Political instability or increased competition for land could lead to loss of potential new tourism destinations and degradation of existing destinations.
- Loss of landscape and wildlife could cause a decrease in customer satisfaction with tourism products and hence lower propensity to travel to some areas.
- Higher fuel prices could lead to operational price increases and corresponding decreases in the number of travellers in the price-sensitive markets.
- WTTC (2003) also presents a positive vision of tourism and the environment, stating that;

Tourism is an integral aspect of modern societies.

- Global awareness of environmental damage is developing rapidly.
- The resources of the world’s largest industry can and must be harnessed to achieve environmental goals.
- The industry has the potential to influence customer to achieve beneficial environmental effects.
- Environmental lobbies will add pressure to develop good environmental practice. (Goeldner, 2003:464)

### **Carrying Capacity and Multiple-use**

Carrying capacity and multiple-use are two important concepts that enable societies to make more efficient use of tourist facilities and land resources. Carrying capacity is a notion which recognises that both natural and man-made attractions have upper limits in their capacity to absorb visitors.

Multiple-use is a strategy, which recognises that a limited supply of recreational land often needs to be used for several purposes. It is possible, for example for some forest recreation areas in Southern Africa to be used for logging as well as tourism.

### **Conservation/Preservation**

Conservation refers to planned management of sites and places. Plenty of positive evidence about tourism's part in conserving Europe's building treasures and historic sites, much less written about the sort of impact in the third world. Four main conservation influences are noted by Mathieson and Wall (1995) in their review of the worldwide literature, namely;

- There is the rehabilitation of existing buildings and historic sites.
- There is the transformation of old buildings to new uses
- There is the conservation of natural resources
- There is the introduction of planning procedures and control to ensure good management of the environment. (Adopted from John Lee, 1998:54-55)

## **Responsible Tourism and Environmental Impact on South Africa**

Tourism still plays a relatively small role in the South African economy and it has a long way to go if it is to fulfil its potential to significantly contribute to national income. Traditionally the main focus of governments has been on the growth in international arrivals and total foreign exchange earnings, and is now than on fostering entrepreneurial opportunities for the historically disadvantaged, poverty relief, employment and local economic development. Both domestic and international tourism can create employment; it is a relatively labour intensive industry and it employs a multiplicity of skills from accountants and hairdressers to tour guides and trackers. Tourism can provide very good skills development opportunities for local communities.

The White Paper concluded in 1996 that tourism development in South Africa had largely been a missed opportunity; and that the focus on a narrow market has reduced the potential of the industry to spawn entrepreneurship and to create new services, like local entertainment and handicrafts, and to drive local economic development. In fact formal tourism sector provides major opportunities for the informal sector. Tourists travel to the 'factory' to consume the product; they travel to the destination to enjoy their holiday. Tourism is a "final good", all the final touches have to be provided in South Africa and so the value is captured here.

The value of a taxi ride from the airport, wildlife viewing and restaurant meals all accrue to the local economy – the challenge is to maximise it by reducing leakages and developing the multiplier effect. Tourist enterprises attract domestic and international tourists and create opportunities for small entrepreneurs and economic linkages, for example agriculture, hunting, handicraft production, and a wide range of service industries which tourists are likely to consume in the destination.

South Africa is now beginning to work on maximising the local economic benefits which tourism can bring to an area; there is much to be gained from creating a more diversified tourism product and marketing a wider range of experiences, activities and services to tourists. Established enterprises can gain by encouraging and assisting the development of complementary product – the larger and more diversified the local tourism base, the more successful enterprises in the area will be.

The White Paper identified a wide range of opportunities for historically disadvantaged groups ranging from small guesthouses, shebeens and restaurants with local cuisine, through community tour guiding, music, dance and story-telling, arts and crafts, traditional hunting and medicine to laundry, gardening and speciality agriculture. Tourism provides particular opportunities for local economic development in rural areas where it can provide people with an alternative to moving to urban areas.

Tourism must be market related. If community-based and other tourism development processes are not planned, implemented and managed according to market demands then far too many South Africans, especially the poor, are facing not merely “missed” opportunities, but the hard realities of failed or under-performing products to which tourists simply do not come. The African cultural tourism experience needs to be woven into the fabric of the mainstream South African tourism product.

Responsible tourism implies a proactive approach by the tourism sector to the environment through the promotion of balanced and sustainable tourism. This is particularly important where the focus of the tourism sector and of the activities of tourists is the natural environment, as is the case with wildlife viewing, hunting and marine tourism. There are particular challenges in making nature-based tourism sustainable.

Furthermore, responsible tourism development has to be underpinned by sustainable environmental practices. In the environmental sphere only conservative decisions based on the precautionary principle can be considered responsible. Cultural heritage is also part of the environment, and the responsibility of the tourism sector towards the cultural environment was considered in the social responsibility guidelines.

Central to environmental responsibility is thinking about the life cycle impact of an enterprise or product, and so these guidelines apply to the stages of design, planning, construction, operation and decommissioning. The process of managing the business should be fully integrated with environmental management, throughout the project lifecycle (from conceptualisation to decommissioning). In constructing concessions and leasehold developments it is particularly important to ensure that during decommissioning it will be possible to remove all structures and restore the area. Larger businesses should be using Environmental Management Systems to exercise environmental responsibility; for businesses above a defined size in each sector it would be irresponsible to operate without one.

All tourism enterprises can make a contribution to environmental sustainability by exercising care in purchasing decisions – by seeking out and supporting responsible producers of the products that are required to run the enterprise, and by making clients aware of the responsible purchasing policy.

The practical guidelines and indicators that follow are organised around the key environmental elements of responsible tourism identified in the 1996 White Paper.

## **Environmental problems in South Africa**

The environmental problems in South Africa are many, most of which are a result of people and business organisations including those operating in the tourism industry. Early tourism development has given little consideration to natural resource limitations, impacts on wildlife and indigenous cultures. The human environment and development has been largely ignored. Within the process of globalisation local communities' participation and nature conservation are threatened and often overlooked.

If tourism is to be sustainable, it must improve the lives of local people, protect their environment and health and offer a better future. In many instances tourism can be seen as a vehicle to empower local communities and protect the environment through the development of new employment opportunities, the enhancement of local economies, preservation of indigenous knowledge and practices, public awareness and education.

Sustainable tourism can create positive opportunities for community development in remote areas. The business sector can choose sustainable tourism over other more polluting ventures. Long and short term development plans should be developed so that tourism and its benefits are spread within the area. To develop tourism in a sustainable manner it is necessary to define optimal tourism destinations in local areas and regions, ensuring enjoyment for the tourist and minimum impact or disruption for the environment and local communities.

Complex and broad based local communities' involvement in tourism development requires targeted investment strategies implemented by local decision-makers. Those strategies do not exist in many areas and the development of tourism is not planned. Tourism investments are too often imposed from the outside, and the potential for sustainable forms of tourism is weakened. Alternatives to mass tourism, e.g. cultural and ecotourism can be influential in changing the nature of tourism. Tourism can benefit both tourists and local communities and allow for two-way interaction and education.

Access to natural resources and environmental degradation:

Tourism is not, as many people assert, a clean and non-polluting industry. A major problem is the lack of a common understanding of what sustainable tourism or ecotourism mean. This ambiguity leads to violations of environmental regulations and standards. Hence, the environmental problems evolving from tourism are manifold. First of all the tourism industry is very resource - and land intensive. Consequently, the interest of the tourism sector will often be in conflict with local resource - and land use practices.

The introduction of tourism will imply an increased stress on resources available. An influx of tourists into the area leads to a competition for resources. Employees working at the tourist sites compound this competition. Almost as a rule tourists are supplied at the expense of the local population.

Tourist activities imply an intensified utilisation of vulnerable habitats. Investors and tourists do not necessarily possess awareness on how to use natural resources sustainably, and subsequently this utilisation often leads to a degradation of resources. Tourism is also a major generator of wastes. In most tourist regions, sewage, wastewater and solid waste disposal are not properly managed or planned. Lastly, tourism is also responsible for a considerable proportion of increased volumes and mileage in global transport and hence the associated environmentally damaging pollutant emissions. The tourism industry has not shown sufficient willingness to (internalise or) compensate the cost of conservation of biodiversity by for instance protected areas, even though they profit from it.

## **Ecotourism: Opportunities and Challenges**

There are various challenges and opportunities for Ecotourism in terms of sustainability and involvement of local communities. Ecotourism provides clearly a major opportunity for the South African communities as an emerging market, which holds a great promise for Ecotourism development. The relatively undeveloped and/or unexploited areas of the country possess a rich natural diversity and a unique cultural and historical heritage, which can provide a solid base for the nationally and internationally growing Ecotourism activity.

South Africa hosts a great variety of climate zones and eco-systems, for example Impressive nature and wildlife are potential tourism resources and many historic sites. Such historic sites and monuments together with the living cultures preserving traditions like the Zulu heritage provide today outstanding tourist attractions.

When exploiting this great potential, it is fundamental that Ecotourism development takes place in a sound planning framework that ensures the conservation of the resources that Ecotourism relies on and the meaningful participation of the host communities.

The challenge faced in South Africa is obvious: there is a need to preserve and protect the fragile natural sites, wildlife and ecosystems, and at the same time there is a need to educate people and to create employment in order to fight poverty and misery. If properly managed, sustainable Ecotourism can provide for both these objectives, as it depends on intact nature, rich local culture and many services carried out by local people. If natural resources are used wisely, for example, by providing sensitively designed tourist facilities in game parks and nature reserves and using the resulting income to manage those protected areas, conservation and development would become complementary forces. Ecotourism offers a win-win-situation for the benefit of the environment and the local economy.

## **Local Communities and Natural Resources**

In general, the tourism industry should engage in promoting sustainability as a hole-mark for investors. More specifically, the investors in tourism should strive to adopt environmentally sound technologies or other measures to minimise the consumption of the local ground water. Using various types of resources in a sustainable manner is of course also crucial.

There is a need to use ecological materials and installation of renewable sources of energy systems (solar energy) in all new buildings and new construction. Furthermore there should be an acceleration of installation or solar/wind power in all public work projects of communities where tourism will be introduced.

Pollution of ground and coastal waters must be prevented, and recommendations made (perhaps even legislation) for tourism investors to invest in proper sewage treatment facilities. Appropriate waste disposal systems and ways to separate garbage into organic and non-organic waste should be developed. Organic waste can be composted and possibly reused on hotel gardens or even for local farming. This could be done through collaboration with local residents. Residents could organise themselves, manage the allocated dumping sites, and hence benefit from the system in receiving payment from the hotel for services rendered. A system to separate the different materials, and recycle some should be in place at the landfill site thus reducing the waste even further.

To avoid degradation of the natural environment, tourism projects can help finance protected areas and safeguard ecologically sensitive regions against further environmental deterioration. By empowering local populations and have them participating in the entire process, sustainability will be ensured as it becomes accepted by and adjusted to the local communities. A protected area might certainly also be a suitable tourist-attraction, where tourists can experience amazing nature and learn about conservation and traditional uses of natural resources in the area.

Investors in tourism should always respect the traditional land tenure system in the area and the traditional user-right systems of resources. In regard to this the communication and consultation with the local communities about resource-use is important. Tourism investors should not exclude local people from using local resources, and thus take away what they depend on for maintaining their well being.

The tourism industry can and must take initiatives to implement the polluter-pays principle for pollution related to tourism operations. This may be organised and carried out through local tax systems or through funds established by the tourism industry for local community development. The polluter-pays principle should be applied for minor pollution only and should not be developed into a possibility for investors to pay a symbolic fine for imposed irreversible negative impacts on the local environment.

Inaccurate and/or mild environmental legislation may possibly attract more foreign investors contributing to fast economic growth and development but without environmental damage as a consequence. To avoid the dilemma, South Africa will have to face in choosing between economic development or environmental protection international and multinational companies enterprises must be committed to follow the environmental standards of the country.

## **Coastal Protection**

Tourism is one of many South African economic activities with a special focus on coastal areas. The two most popular locations for holidaymakers are the mountains and the coast. New concepts including the whole watershed area seem to be the best approach, especially when aquatic pollution problems are considered. Most problems are related to conflicts between different uses and access restrictions. Tourism leads to increased traffic flow and overcrowding in already densely populated areas. Therefore tourism adds substantially to the following pressures:

- Pollution by wastewater, garbage, heating, noise and traffic emissions.
- Encroachment of buildings, facilities and roads close to the coastline.
- Beach erosion due to building, dune removal and dredging.
- Excessive use of natural areas.
- Destruction of natural areas to accommodate tourism or other needs.
- Inter-Sectoral competition and conflict over (marine and terrestrial) space.
- Exclusion of local communities from any role of significance in decision-making.
- The loss of natural and architectural heritage in the face of rapid expansion.
- Strain on public utilities and facilities.
- Displacement of local population.
- Creation of restricted exclusive zones that are off-limits to the local people.
- Loss of business to the local enterprises as all-inclusive resorts supplies all the needs of their guests.

Additional typical tourism impacts are socio-economic conflicts as property and general costs of living are increasing and summer guests, changing the social structure significantly, can overrun small communities. Foreign customs and expectations can create conflicts and a deterioration of cultural and regional values.

## **Proposed Action Plan for Sustainable Tourism Development**

A proposed action plan includes;

- Promoting the development of tourism in harmony with the natural and cultural environment, through development, education, and training programmes, at the national, regional, and community levels
- Developing tourism strategic development plans that promote environmentally sound and economically, culturally, and socially sustainable development.
- Drawing up strategic plans to protect the health and safety of tourists, in close collaboration with health authorities, tourism operators and security service providers and the police in all areas, as an essential component of good service offered at different sites, as well as designing promotional activities that take into account the social-cultural and economic conditions of the country.
- Developing, adopting, and implementing legislation to promote responsible practices in tourism development.
- Collaborating with the private sector and local communities in formulating criteria for the sustainable use of natural resources.
- Involving local communities to design programmes aimed at raising awareness for the development of sustainable tourism at all levels of society, promoting and facilitating their full participation.
- Elaborating environmental impact studies for the design of tourism projects, in order to ensure sustainable development.
- Working with national authorities to use tourism earnings as one of the means to alleviate poverty and generate employment in the country.

### **Promoting Tourism towards Sustainable Development**

Tourism is considered a mean for income generating for the local communities. Actually the government has been considering helping the local government to develop income generating at the conservation area as an Eco-tourism base on the local community participation with exploring the potential ecosystem. Hopefully through these Eco-tourism activities the income generating for local communities will be increased and the ecosystem will be more protected with sustainable resources.

The government should manage the activities of local communities to achieve Eco-tourism by introduce recycling of domestic waste to a consumption product. Developing tourism for poor community's growth in the country has great advantages such as:

- It will increase the participation of local communities of the informal sector, which provides opportunities for producing handicraft of recycling products.
- Tourism areas that have an asset from cultural, wildlife, scenery, etc., will increase access of the poor to achieve additional income generating if they explore these potentials in a sustainable manner, such as developing the city which implement a cleaner production as a green city.
- Tourism can be more labour intensive if they could diversify the activities around the areas such as building and running hotels or cottages, improving management of domestic waste, involvement in minimising the use of non-renewable energy and materials, extensive use of recycled materials and Eco-farm implementation.
- Maximize the potential of tourism for eradicating poverty by developing appropriate strategies in cooperation with all major groups, local communities and indigenous.
- Increase of local community's capacity and capability on managing of their environment.

Such initiatives can achieve the following benefits;

- Increase the benefit (income generating, knowledge, etc.) from sustainable tourism resources for the population in the local communities.

- Maintaining the cultural and environmental integrity of the local communities.
- Enhancing the protection of conservation area.
- Develop technology of cleaner production for supporting tourism activities.
- Managing of local conservation resources.

**Proposed Scope of Work for such initiatives, include:**

- Technical assistance to local communities to develop sustainable tourism in tourism area.
- Training on sustainable tourism for local government, supporting system of tourism such as hotel, tourist guide and other relevant stakeholders.
- Inventories of endangered species and culture as an interesting object of sustainable tourism.
- Conducting research of current situations in the tourism areas determined as a pilot project.
- Promotion of public awareness to implementation cleaner production in the tourist and developing new tourism product with recycling program.
- Collaboration with other countries, which have similar object as a sustainable tourism.
- Creating an information system base and provide website for information and guidelines.
- Exchange experts between South Africa and donor organisations.
- Provide tourism infrastructure that promotes utilisation of environmental friendly technology.

**Proposed Activities**

- Encourage public awareness of local communities and private tourist agencies.
- Organise local communities in order to engage effectively in tourism and encourage them, such as utilise their house as a cottage for tourist.
- Cooperation with partner and donor countries to develop the sustainable tourism.
- Identification of interesting objective of sustainable tourism.
- Provide information of sustainable tourism with producing leaflet, advertisement, etc., and present of web-site.
- Build the infrastructure to conduct sustainable tourism in the tourist areas including health sanitation, emphasis on renewable resources and other facilities to support the areas.
- Launching Eco-tourism as a national program.
- Training, workshops and comparative study of Eco-tourism.
- Engage in exhibitions, competitions in the tourist areas without deteriorate of ecosystem.

**Expected Results**

- Increase income generating of host community by use of environmental or local products.
- Emphasis on renewable resources, comprehensive recycling and environmental friendly waste disposal.
- Increase capacity building in order to contribute to the strengthening of rural and local communities.
- Implementing cleaner production for supporting system of tourism in rural and urban.

**Coordination and Implementation Mechanism**

- Cooperation with partner and donor organisations at national level DEAT as coordinator will cooperation with appropriate with other departments, local governments and major groups. At international cooperation with other developing countries whose have similar object of tourism and with donor organisations for technical assistance and financial assistance.
- Identification of tourist location in each area for a pilot project with different criteria such as natural heritage, cultural, conservation areas and existing condition of local communities.
- Research of current situation in the area of sustainable tourism pilot project.
- Develop program including education and training through technical assistance of experts and engaging comparative study for training. Targets of training are local government and supporting system for sustainable tourism such as hotel, tourist guide and other stakeholders (informal private sector and the host communities).
- Provide plan of action for improving tourism as sustainable development.

- Assist of host communities in managing visits to their tourism areas for their maximum benefit (e.g. mechanism for improving income generating of host communities, tax for tourism activities, major authority for host communities and land tenure, preference for using local products and suppliers).
- Promote diversification of economic activities, through the facilities of access to markets and commercial information between partners.
- Infrastructure construction implementation by environmental friendly technology utilisation.

Many of the South African regions are homelands of indigenous peoples. At the same time, these regions are increasingly becoming tourist destinations; being economically and politically marginalized, indigenous peoples often bear a disproportionately large share of the costs of tourism development. The demarcation of protected areas, which are often being made available for Ecotourism use, often deprives indigenous communities of their hereditary land and their resources.

The traditional forms of economy of the indigenous cultures visited are very diverse. The diversity of the anthropogenic landscape is irretrievably linked to these. More than one eleven different indigenous languages nation-wide is still in use today. Most of the tourists come from the about six worldwide dominating consumer cultures with their respective behaviour patterns and languages. This contributes to the disappearance of the indigenous economic systems, local knowledge and the languages directly tied to this context. If all this knowledge, the economic systems and languages of these cultures fall into oblivion, this will have negative impacts on biological diversity. Therefore, the protection and sustainable use of biological diversity in South Africa cannot be achieved in a fair way without taking into account the cultural and social concerns of the local population. Various human activities, especially in traditional societies, have had a decisive influence on agro-biological diversity. The direct connection between the high diversity of species and cultural diversity has to be adequately taken into account.

Instead of prohibiting traditional forms of land use in protected areas and subsequently developing more or less successful forms of income (like tourism), traditional sustainable forms of land use should remain untouched. They might - in the framework of sustainable tourism development - be made usable in addition.

In this sense, the acknowledgement of the property rights of indigenous communities to their hereditary territories and of the use and administration of the natural resources has to be guaranteed in the framework of the community-based sustainable tourism (CBST).

In-depth, consultations with the communities concerned are the first step towards a full participation of the local population/indigenous peoples in the planning and implementation of tourism projects. In this context, it has to be considered that the local population is often not a homogeneous group and that there may be divergent interests. The communities concerned have to be put into a position of being able to decide if and in what form tourism projects are being realised in their catchments area.

If the indigenous communities want tourism development or the opening up to tourism, tourism concepts have to be developed which at the same time contribute to the conservation of biodiversity by the indigenous population and to the preservation of their languages. Therefore, Sustainable tourism projects should be based on the decisions made by the community, increase the value of traditional knowledge and reinforce cultural values.

Indigenous people have to be actively involved in the development of National Guidelines on Biological Diversity and Sustainable Tourism. If an ad-hoc Working Group is set up to develop National Guidelines on Biodiversity and Tourism, it is indispensable that it also includes representatives of indigenous groups.

## **Incentives and Regulation and the Impact on Tourism Development**

There were widely differing views expressed on what role regulation should have in the tourism industry but it is thought that it might be a mix of regulation and voluntary codes by the industry.

### **Incentives**

The ability of big and small operators to utilise their supply chain to support sustainable tourism could be an important driver for change. This might require financial support for SMME's to enable them to both change their own operational practices and also to understand the opportunities that they have in influencing the supply chain. The involvement of the community could also be an important marketing point.

The impact of media focussing on the health and safety programme of tourism is already having an impact. A similar approach for environment might also result in a positive incentive for the industry to take action.

### **Regulation**

There was disagreement about the need for new regulation at any level. On the one hand it was seen as necessary due to the differences in power of the relevant stakeholders. On the other hand it was seen as an obstacle, which might deter investment. Finally it was pointed out that the development of voluntary codes often leads to regulation further down the road.

## **Possible Tourism Industry Actions**

Promote sustainable tourism products, using market related instruments and incentives, such as contests, awards, certification, model projects, culturally sensitive quality labels covering both environmental and social sustainability;

- Reduce inappropriate consumption, use local resources in preference to imports in a sustainable manner; reduce and recycle waste, ensure safe waste disposal, develop and implement sustainable transport policies and systems, e.g. efficient public transport, walking, cycling in destinations.
- Provide tourists with authentic information, enabling them to understand all environmental and related aspects (e.g. human rights situation) of tourism when selecting any destination or holiday package; educate visitors in advance of arrival and give guidance on 'dos' and 'don'ts'; make tourists aware of their potential impact on and their responsibilities towards host societies.
- Provide information on respecting the cultural and natural heritage of destination areas; employ tour guides who portray societies honestly and dispel stereotypes.
- Ensure that the marketing of 'green' tourism reflects sound environmental policy and practice; use non-exploitative marketing strategies that respect people, communities and environments of destinations, dismantle stereotyping, integrate sustainable tourism principles when creating new marketing strategies.
- Train staff to foster tourist responsibility towards the destinations, encourage multi-cultural education and exchange.
- Actively discourage exploitative sex tourism, particularly sexual exploitation of children and tourism, which causes or contributes to social problems.
- Adopt, observe, implement and promote codes of conduct.
- Reduce financial leakage and support local economies by buying food and resources locally, develop long-term partnerships with local operators, businesses and suppliers; train and hire local staff and contract with local businesses, promote management opportunities for women; prefer accommodations owned, built and staffed by local people, promote locally made handicrafts and traditional products.
- Encourage clients to study and understand their destinations, respect local cultures and co-ordinate visits with local communities, authorities and women's organisations, being aware of and sensitive to local customary laws, regulations and traditions, respect historical heritage and scientific sites.
- Educate staff to avoid negative environmental and cultural impacts and create incentive schemes to promote sustainable behaviour.

## **Conclusion**

The concept of community-based tourism provides substantial benefits of resources utilisation at community level as well as encourages a more sustainable use of these resources. However, the management of resources and the community that utilises these resources becomes a crucial issue, and the research proposes that through building up a representative and transparent community based organisation can assist the national government in adequate management of resources and facilities, dealing with conflicts of interests as well as enforcing the government regulations in terms of environment protection, human resources development and sustainability of the area.

Community based tourism management creates suitable environment for tourism development to take place in the spirit of volunteerism and to strengthen the Non-government organisations to take part in the development process. Furthermore, community based tourism can;

Makes use of the traditional knowledge systems, and activities can be arrived at in line with the ability of the target group to deliver.

Be an effective and sustainable mean for making use of the available natural resources.  
Result in clear and substantial economic benefits with well-established and implemented strategies.  
Encourages community to claim access to land and natural resources.  
Encourage partnerships among all stakeholders.

# Reframing HIV/AIDS and sustainable development in Africa and Asia: A Reflexive Modernization Perspective

*David Pick  
Kandy Dayaram*

*Curtin University of Technology, Western Australia*

## Abstract

Despite global acknowledgement of the Human Immunodeficiency Virus (HIV)/Acquired Deficiency Syndrome (AIDS) reaching pandemic proportions with 37.8 million people (WHO/UNAIDS, 2004) living with the infection, progress towards developing effective international responses to curb the spread of the disease has been slow. The focus of current debate tends to focus on the medical treatment and prevention of HIV/AIDS, leading to emphasis being placed on the rapid increase in HIV infection as well as opportunistic diseases such as tuberculosis and malaria. The traditional view of responding to these challenges has been probing the high cost factors associated with antiretroviral treatment and burgeoning medical care needs. This paper argues that these responses are limited in their effect as they have a narrow, medical focus of the HIV/AIDS epidemic. This paper presents a broader perspective. It investigates the implications of HIV/AIDS to the goals of national sustainable development using theoretical standpoints provided by reflexive modernization, namely the concepts of 'risk' (Beck, 1992; 2002), 'reflexivity' (Beck, Giddens and Lash, 1994) and 'individualization' (Beck and Beck-Gernsheim, 2002). Attention is given to those regions of the world Africa and Asia – where both sustainability and HIV/AIDS are becoming acute policy issues.

## Introduction

In discussing the theory of reflexive modernization, Beck argues that industrial society is being dissolved and replaced by a new modernity. This transformation is 'changing the foundations of living together in all spheres of social action' (Beck, 1998: 17). Moreover, it has generated major ideas informing policy development around the world (Dannreuther and Lekhi, 2000). Whilst reflexive modernization has been subject to wide ranging discussion and debate, it puts forward key concepts that may help generate greater understanding of the multi-dimensional issue of HIV/AIDS and its deleterious effects on sustainable development.

The responses to the challenges which HIV/AIDS presents tend to focus on high cost medical care such as antiretroviral treatment and medical care needs in the acute stages of the disease. Although access to antiretroviral therapy is increasing globally (Ruxrungtham, Brown & Phanupak, 2004) making it work effectively while simultaneously expanding treatment to stem the flow of new infections, the spread of HIV/AIDS remains a real challenge in both Asia and Africa. At the 48<sup>th</sup> Commonwealth Parliamentary Conference (CPC), (2003), it was recognised that the HIV/AIDS problem has advanced so far that it cannot be looked on simply as a health care issue. It has social, economic, political, cultural, technological and environmental dimensions as well as medical proportions. The spread of HIV/AIDS also cuts across national boundaries. The disease is multi-faceted and poses significant policy issues in many spheres but it is ultimately a controllable phenomenon.

The connection between health and sustainable development is clearly set out by the United Nations Department of Economic and Social Affairs (DESA) in the Declaration and Plan of Implementation arising from The World Summit on Sustainable Development held in Johannesburg in 2002. The Declaration states that nations must 'place particular focus on, and give priority attention to, the fight against the worldwide conditions that pose severe threats to ... sustainable development'. These threats include, 'endemic, communicable and chronic diseases, in particular HIV/AIDS, malaria and tuberculosis" (UNDESA, 2002a, Paragraph 19). The Plan of Implementation also argues that 'the goals of sustainable development can only be achieved in the absence of a high prevalence of debilitating diseases, while obtaining health gains for the whole population requires poverty eradication. There is an urgent need to address the causes of ill health ... and their impact on development' (UNDESA, 2002b, paragraph 54).

In spite of efforts around the world to bring the spread of HIV/AIDS under control the global pandemic is escalating. There are approximately 40 million people world-wide who are HIV-infected, however, the spread is most acute in Africa and Asia where 1 in 4 of all new infections are occurring (Stephenson, 2004; UNAIDS 2004). In both of these regions, there is evidence that the HIV/AIDS epidemic is undermining sustainability.

Given the declarations arising from the Johannesburg summit and wide and rapidly developing knowledge of the magnitude of the HIV/AIDS epidemic and its likely future dynamics, it is not surprising then that HIV/AIDS has received wide attention. The seriousness of the developing epidemic in Africa and Asia lies not just in its effects on individual lives it also has the potential to compromise the sustainability of these regions. One of the more pressing consequences for many African and Asian nations is the huge and growing financial burdens on health systems, perhaps already so huge that the social and political systems of nations are now faced with urgent moral choices and questions. Many nations in Africa and Asia do not have the economic means to provide the medical facilities required to meet current demands without the added burden of wide-spread AIDS related illnesses. The question thus arises regarding prioritising the medical, political and economic choices as nations chart a course through this very difficult terrain.

The situation in southern Africa is reported-on by Greikspoor, Spiegel, Aldis and Harvey (2004, p. 396). They argue that HIV/AIDS is, 'one of the key underlying factors leading to food insecurity' through increasing levels of illness, reduced incomes and over-stretched social capital. Greikspoor et al (2004) contend that HIV/AIDS, whilst having a significant health component, its effects reach into a wide range of social, economic and cultural realms. In Asia, the picture is very similar. Sadik (1997) identifies HIV/AIDS as one of the key issues Asian nations must address to achieve sustainable development. Sadik (1997) maintains that the HIV/AIDS epidemic is a serious challenge to health and a critical human development issue with a range of interrelated socio-economic impacts and costs.

Though there are significant challenges posed by the spread of HIV/AIDS to sustainability, the area is relatively under-researched and under-theorized. The growing HIV/AIDS epidemic is one of the key threats to sustainable development in Africa and Asia. These threats and an alternative approach to the issue are conceptualised in this paper using theoretical perspectives provided by reflexive modernization.

## **Reflexive Modernization**

Reflexive modernization has the potential to significantly influence the way the social, economic and political effects of HIV/AIDS are examined and responded to. A decade ago, Beck, Giddens and Lash (1994), developed the thesis that society is going through a period of transition to a new modernity - a transition that is taking place unintentionally and unseen by the major social, economic and cultural categories and theories. In the theory of reflexive modernization, modern society dissolves as people bring into question and try to tackle its unintended side effects. This is not the catastrophic process of political crisis, economic meltdown and the collapse of global economic structures typically imagined by modern social theorists. From Beck's (1992) perspective, just as theoretical understandings of modernization conceptualises the dissolving of traditional society and the rise of modern society, the theory of reflexive modernization is conceptualising the dissolution of modern society and its gradual transformation into a new kind of modern. Reflexive modernization is a theoretical framework that includes recognition of uncertainty and fluidity in social, political and economic structures. In this respect reflexive modernization includes three useful concepts: individualization, reflexivity and risk.

### **Individualization**

Beck and Beck-Gernsheim (2002, p.22) refer to individualization as living 'a life of one's own in a runaway world'. For Beck, individualization is the 'exhaustion, dissolution and disenchantment of the collective and group specific sources of identity and meaning' (Beck, 1998, p.32). The significance of this is that it, on the one hand enables the invention of new forms of life, but on the other breaks down the traditional collective social and economic support systems (Beck, 1998). The overall implications of individualization has been discussed extensively by Beck (1994), Beck (1998), and Beck and Beck-Gernsheim (2002). From these accounts, three key aspects of individualization can be identified: differentiation, choice, and disembedding.

Differentiation – This is the breakdown or disintegration of people's lives into separate functional spheres. People are thus only partly integrated into society through its institutions as recipients of aid, voters, taxpayers, patients, etc. They are therefore dependent on those institutions that facilitate these interactions (NGO's, taxation office, government agencies, medical centres, etc.). There is a paradox here in that people's lives are differentiated and at the same time standardised by the legalities and norms set by society's institutions. So, it may be argued that differentiation actually means living non-identical lives that are mediated through institutions (Beck and Beck-Gernsheim, 2002).

The disintegration and differentiation of people's social lives means that people are only partly integrated into society through institutions. Once these institutions no longer recognise groups of people, or have difficulty in reaching them, they can be easily marginalised and forgotten. This can result in some groups being denied access to even the most basic of social support mechanisms such as family, housing and health care. Kidwai (2002) outlines an example of NGO workers in Lucknow, India being targeted by local police in a raid and charged with 'promoting homosexuality'. They were jailed for 47 days by the magistrate who labelled them 'a curse on society'. The local newspapers reported them as being part of a prostitution ring and sex club operating under the disguise of an HIV/AIDS awareness programme. This example demonstrates how major institutions in society, the police, judiciary and the media have marginalised people living with HIV/AIDS by differentiating them from the mainstream.

Choice – In this context, individualization refers to the notion that people must create their own biographies. The notion of 'choice' implies that people's life choices are no longer determined by the social class they are born into, gender roles, sexuality, race, etc. The institutions and structures of society are undermined and rendered obsolete by the structural, sociological transformation brought about by reflexive modernization. However, the idea of individual choice means that one has one's own life but this also includes one's own failures. This means the burden of risk tends to be shifted from the collective to the individual. 'Choice' means that people are being increasingly forced to take responsibility for their own health care, their own education, old age pension and unemployment.

With reference to HIV/AIDS, the idea of 'choice' can be seen as a way of considering the disease as being a result of individual behaviour. This makes it possible to transfer the blame for HIV infection to the individual. For example, the so-called 'A,B,C' approach (Abstain, Be faithful and use a Condom) focuses on individual responsibility for prevention (Ellwood, 2002) and sends a strong message that people who do not conform to this advice are 'choosing' high-risk behaviours and therefore contracting the disease is that person's fault. Governments can then marginalise people with HIV/AIDS and deny them assistance as it was their 'own fault' that they contracted the disease. Whilst widespread, this view is flawed in that it does not address the underlying social, economic and cultural conditions that encourage the spread of HIV/AIDS.

Disembedding – In living a reflexive life, people are freed from the structures of society by the process of individualization so that they become self-monitoring. They are disembedded from the taken-for-granted heteronomous social structures (family roles, class, race, gender, etc.) that formerly defined their lives as these structures are dismantled and replaced by heterodoxical contingencies (Beck, 1994). Beck (1994) argues that there follows a process of re-embedding into new forms of life as new means of integration and control are created. However, Baumann (2002) points out that there can be no re-embedding as the structures and institutions of society are in a constant state of flux, so any re-embedding that does take place will only be transient. Individualization results in people who are in a chronic state of disembeddedness.

HIV/AIDS has a disembedding effect. Contracting the disease leads to a person being disembedded from the social structures that define and shape their lives. People living with HIV/AIDS often, as these structures are dismantled and replaced by heterodoxical contingencies, have to adapt to the social and economic as well as the physiological effects of the disease. Ellwood (2002) reports that in Swaziland prominent politicians proposed that people with HIV/AIDS should be forced to wear identification badges and be segregated so that they could not contaminate 'normal people' and in Uganda compulsory testing, aimed at identifying those infected, is tending to drive sufferers underground (CPC, 2003). Reluctance to be tested is borne out of fear of censure and discrimination – of becoming disembedded. For people living with HIV/AIDS in Africa and Asia there can be no 're-embedding'

process. They are in a chronic state of disembeddedness which becomes more acute as the disease progresses from being HIV positive to developing full-blown AIDS and ultimately death.

Individualization can thus be used to give subtle insights into the effects of HIV/AIDS. The strength of this concept is that it makes HIV/AIDS not only an affliction that affects others, remote and far away. As Ellwood (2002) points out, HIV/AIDS was once a disease that affected homosexual men, and labelled the 'gay plague'. It is now a disease that affects mainly heterosexuals with 75% of worldwide HIV transmission now due to heterosexual sex. In many parts of the world HIV/AIDS is an *in here* phenomenon too, influencing intimate and personal aspects of not just the lives of people who are infected, but also their family members and wider community. In countries such as Malawi, the chronically sick adults and their children are among the most poor and least educated in society, these people are vulnerable and more often than not, infected with HIV/AIDS (Finch, 2004). Due to poverty and food insecurity, when food aid arrives the weakest receive the least food. There is a paradox for international health care responses of food aid for such communities. Whilst aid is intended to relieve malnutrition, it fails to address many of the humanitarian aspects of hunger. The main distress for such people lies not just in the direct effects of food shortages, it lies in the need for nutrition to combat the opportunistic diseases they suffer. Food donors such as the World Food Programme indicate a policy of support for people living with HIV/AIDS and their community but forget that their ability to help themselves is impaired due to under-nourishment (Finch, 2004). Repeated illnesses and nutritional deficiencies caused by the suppression of the immune system exacerbate the downward spiral of the health and well being of the individual and the community in which they live.

#### **Risk**

Risk is conceptualised in reflexive modernization theory as referring to the unintended and unforeseen side-effects of modernization, for example: nuclear accidents, global warming and ozone depletion. These risks are unprecedented in human history because they threaten irreparable global damage (Beck, 1996). Beck's conception of contemporary risks includes the idea that these begin to dominate public, political and private debates and conflicts. On the one hand, society still makes decisions and takes action according to traditional perspectives but on the other hand the interest organizations (eg NGOs), judicial systems, politics and governments are clouded over by debates and conflicts that stem from the dynamism of risk society (Beck, 1994). Beck (1992, p.21) defines risk as a 'systemic way of dealing with hazards and insecurities induced and introduced by modernization itself'. It is argued here that HIV/AIDS is one such contemporary risk. HIV/AIDS is a 'reflexive modern' disease of the late 20<sup>th</sup> and 21<sup>st</sup> Centuries.

As a 'reflexive modern' disease, its emergence and effects were unforeseen. The first case of AIDS was diagnosed in San Francisco in June 1981 (Cameron, 2001). The direct and indirect side-effects of this disease were not and could not have been forecast in the initial stages of what was to become a global phenomenon. Two decades later, the fast-mutating retrovirus has brought severe side-effects that have compounded its direct health effects. The HIV/AIDS epidemic has compromised human security, leaving behind fragmented families, orphaned children, and individuals shunned by society. What was initially thought to be a 'white homosexual person's' disease has in the last decade had severe effects on the heterosexual populations of Africa and Asia (CPC, 2003; Cameron, 2001; Ruxrungtham, et al., 2004). Within Africa, the effects of HIV/AIDS includes the growing incidents of other sexually transmitted diseases and children born with HIV/AIDS via mother-to-child transmissions (CPC, 2003; McIntyre 2003; WHO/UNAIDS, 2004).

In Africa, the hardest hit of continents, the virus is widespread in many nations. Within the region, the epidemic takes on different courses in different settings. In Botswana, 38% of adults are infected; in Zimbabwe, as many as one in four adults carry the virus, and in South Africa it is one in five (WHO/UNAIDS, 2004). Whilst the epidemic is predominantly heterosexual, most of those people live in resource constrained communities and possess little or no formal education (Cameron, 2001; McIntyre 2003). However, within Africa, the plight of children has become a familiar one where HIV/AIDS has left millions of children without parents and has afflicted thousands of others who contracted the HIV/AIDS virus through their mothers (McIntyre, 2003; Muula & Mfutso-Bengo, 2004).

In spite of the later start in Asia, the potential for widespread epidemics was not appreciated until the more extensive spread of HIV emerged in Cambodia, India, Burma and Thailand in the early 1990s (Ruxrungtham, et al., 2004). HIV epidemics in Asia show great diversity, in timing and severity. Recognising the trajectory of the HIV epidemic in Asia as being distinct from some African countries is no justification for complacency, because a 1

percent increase in the HIV prevalence in adults in countries such as India and China would result in an additional 5 million infected people (Rao, Ganguly, Mehendale & Bollinger, 2004) The epidemic is far from over and several countries including China, India, Indonesia and Vietnam have growing infection rates.

Culture, economics and politics shape the epidemic's course. Economic change in Africa and Asia has triggered huge migrations from rural villages to urban slums, leading to environmental threats, social fragmentation and high risk behaviours. Within Asia, the most prevalent factors affecting the rate and magnitude of growth of HIV/AIDS are the size of the sex worker population and the frequency with which commercial sex occurs (Ruxrungtham, et al., 2004). In some nations, men who have sex with men continue to play an important part in reported HIV infections. In the Philippines, 23 % of reported infections up to 2004 are attributed to such men (Ruxrungtham, et al., 2004).

In Asia, significant disparities of access to antiretroviral (ARV) treatment exist between the economically privileged societies and economically constrained societies. In Japan and Hong Kong broad access to ARV treatment and quality medical management is available, yet in larger countries, such as India, Indonesia and China access remains very restricted. Many Asian countries have chronically under funded healthcare systems, over population, high illiteracy rates, and weak social safety nets. This is compounded by an unwillingness of people to use condoms, governmental prohibition of harm reduction approaches to intravenous drug use prevention, and widespread discrimination against those living with and affected by HIV (Ruxrungtham, et al., 2004). Together, these make the prevention and treatment of HIV/AIDS a significant challenge.

This conceptualization of risk can be seen in terms of direct but unintended and unforeseen social, economic, political and cultural effects of HIV/AIDS. The risks associated with the spread of HIV/AIDS has forced people into situations of rule-finding, and reflexive or indeterminate judgment as they try to deal with the intractable and seemingly unlimited problems associated with the spread of the disease. Cognisance of factors such as cultural traditions and poverty in aid programs associated with HIV/AIDS are rare. Governments lack the economic resources needed to cope with the full extent of the problem (CPC, 2003) and for many people within the African and Asian regions they do not have the individual resources to develop effective life strategies to prevent or live with the disease. In spite of the more collective cultures in many Asian and African nations such as the African social norm of 'Ubuntu' (Mbigi & Maree, 1995; Cameron, 2001), people with HIV/AIDS are often stigmatised and marginalised.

The usefulness of the concept of risk, allows the HIV/AIDS epidemic in Africa and Asia, to be seen as a threat to the well-being of whole populations with serious and irreparable damage being done to the affected societies whilst also threatening environmental damage with potentially serious global implications. In short, it provides a perspective that can be used to view HIV/AIDS as a challenge to national, regional and perhaps global sustainability if it is allowed to spread unchecked. It means that it becomes possible to see the responses of national and international governmental organizations and NGO's as being critical in many ways that reach well beyond the epidemic itself.

### **Reflexivity**

There are two conceptions of reflexivity identified by Lash (1994a; 1994b) that apply to individuals and institutions: structural reflexivity, self-reflexivity and institutional reflexivity. Structural reflexivity refers to where people are set free from the limitations of social structures. This means that people are able to critically reflect on the rules and resources of existing social structures and how these affect their social conditions of their existence. People can then begin to create their own rules.

Self-reflexivity refers to the process by which, in creating their own rules for existence, people reflect on themselves (Giddens, 1994). People must make decisions based on a set of rules that only they can formulate, based on the knowledge they have accumulated about themselves and the world. However, this knowledge is itself in a state of continuous renewal and re-definition in response to the accumulation of knowledge and social interaction. Previous external monitoring, in which many aspects of a person's identity were given or taken-for-granted, dissolves and is replaced by self-monitoring in which people develop the freedom to organise their own biographies.

The ideas of structural and self-reflexivity can be used as a way of understanding how HIV/AIDS has spread so rapidly in Africa and Asia. In making decisions about sexual behaviour people are using having to rely on their own, personal resources and their interpretation of social norms. In Africa and Asia people often contract

HIV/AIDS due to social norms of behaviour that run contrary to effective prevention, such as the use of condoms which is reinforced by a lack of knowledge about the disease itself, how it is spread and how it can be prevented. In *The Guardian* report 'I live for today in the full' (2004) it is argued that health care workers can have a significant impact on the disease if they are equipped with 'the skills and knowledge to deal with people with HIV/AIDS without being prejudicial'.

Institutional reflexivity is different in that rather than focusing on individuals, it refers to a collective form of reflexivity. Just as people have become reflexive, institutions have also become reflexive in that they monitor and control their own performance, adjusting their practices over and over again in response to changed circumstances or information (Lash, 1994a; 1994b). As institutions make such continual adjustments, in spite of the efforts of those within institutions to plan and achieve outcomes, what transpires is not necessarily what was intended, nor is there necessarily an awareness of what is actually taking place and its consequences. The uncertainty and insecurity arising from institutional reflexivity undermines the capacity of organizations to exert control as its collective power is dissipated by the fragmenting, ever changing, and increasingly complex environment in which they must operate.

The responses of governmental organizations at the national, regional and global level demonstrate signs of institutional reflexivity in their approaches to the HIV/AIDS epidemic. Ellwood (2002) reports that in spite of a growing HIV/AIDS epidemic in Kenya during the 1990s a World Bank structural adjustment program instructed the Kenyan government to begin charging a user fee to people attending public requiring a test for sexually transmitted diseases. This was supposed to employ a 'user pays' system to support the clinics. However, it resulted in a dramatic fall in the number of people attending the clinics leading to far greater potential for HIV/AIDS to spread. This policy whilst designed to have one effect, had unexpected and negative consequences for public health in Kenya.

Increasing institutional reflexivity has also compromised the ability and willingness of political and social institutions to come to grips with the effects of HIV/AIDS. This is leaving chronically disembedded, self-reflexive individuals exposed to the pernicious combined effects of HIV/AIDS and poverty. The group of people most affected by this phenomenon is women. Not only are gender and poverty inextricably combined, with 70 percent of the world's poor being women, but poor women are also very susceptible to HIV/AIDS infection (Ellwood, 2002). Across the world, at least 600 million people, most of them women and dependent children, live in shelters that place their lives and health at risk. Some 50,000 people, mostly women and children, die as a result of improper shelter, polluted water and inadequate sanitation and over 2 million HIV infected women are pregnant each year, over 90 percent of them in developing countries (McIntyre, 2003).

Reflexivity can be used to provide new understandings about why HIV/AIDS is reaching pandemic proportions in Africa and Asia. The combined effect of structural, self and institutional reflexivity is creating a situation where prevention is a difficult task. For example, in South Africa, there are more than four million known cases of HIV/AIDS, the majority of whom are women (WHO/UNAIDS, 2004). This is due to an array of individual and institutional factors that fall into biological, social, cultural and economic areas (CPC, 2003; WHO/UNAIDS, 2004), including the inability of governments to improve the status of women. This has resulted in women often being powerless to protect themselves against infection due to limited political rights, violence, economic deprivation, a lack of recognition for economic activity, and unequal rights in marriage. In Asia, the situation is very similar. The lack of knowledge about HIV/AIDS and institutional incapacity in the face of the epidemic has created a situation where the chain of transmission spreads first among injecting drug users, followed by a spread among sex workers (mostly women), then into the general population via the clients of sex workers. Most women infected in Asia have been monogamous wives or regular partners of higher risk men. The final link in the chain of infection is to children who become HIV-positive through maternal infection (Ruxrungtham, et al., 2004).

## **Implications for Policy**

The spread of HIV/AIDS across Africa and Asia has a range of policy implications across many areas. In terms of broad social, economic and environmental policy, the HIV/AIDS epidemic has the potential to compromise the

sustainability of many nations. The emergence of a new class of people who are infected with HIV/AIDS who have, at least in part, been defined in terms of an individualization of social risk and personal inadequacy. The social crisis of HIV/AIDS is increasingly manifest as an individual crisis disconnected from its origins in the social realm. This emerging phenomenon and the acutely negative consequences requires urgent and coordinated policy responses before people living with HIV/AIDS in the poorer regions of the world are permanently consigned to short and impoverished lives on the fringes of society.

The application of a reflexive modernization perspective to examine the effects of HIV/AIDS in Africa and Asia allows us to analyse the context within which people living with HIV/AIDS exist in society and develop new and alternative policy responses. Using reflexive modernization, the overall effects of HIV/AIDS are that the society is categorising people with the disease as 'zombies' (Beck and Beck-Gernsheim, 2002). Drawing on Beck and Beck-Gernsheim (2002) it is possible to conceptualise the zombie category as referring to those who are 'dead and still alive'. As such it leads us to ask important questions: Who are the people with HIV/AIDS? What does it mean to them and the rest of society? Of course they are people with fundamental human rights – but we have demonstrated that these begin to disintegrate under conditions of poverty and ignorance.

There is a constellation of views about the HIV/AIDS epidemic occurring across Africa and Asia and different policy responses. People with HIV/AIDS get included and excluded without any means of participating themselves in the decisions of policy-makers. From the point of view of wider society, people with HIV/AIDS are defined and redefined by individual decisions and choices. Individuals must choose how they will relate to those with HIV/AIDS, particularly family members. Current social perspectives and policy approaches leads to people with HIV/AIDS living in society but not of it. To society they are already dead – they are zombies.

We are living with a rhetoric about the HIV/AIDS 'crisis' in Africa and Asia, but HIV/AIDS is not the cause of the historical disadvantage and gap between rich and poor it is but one surface upon which this phenomenon is visible. Everywhere HIV/AIDS strikes society, for example the spread by migrant workers, it is distorted into the personal sphere. In this case, migrant workers are the mode of transmission but the spread is caused by poverty and ignorance in both the source and destination community. This is compounded by the lack of institutional solutions leaving vulnerable people to negotiate the epidemic on the basis of their own, often limited personal resources. This is transforming how we can respond to the spread of HIV/AIDS.

In order to sustain the lives of those infected with the HIV/AIDS, the link between poverty and the disease has to be acknowledged as the poor have fewer means to fight the disease or minimise its effects. Since poverty plays a role in creating an environment in which individuals become susceptible and vulnerable to HIV/AIDS, poverty reduction will be at the core of a long-term sustainable solution. Apart from poverty being one of the major influences to the spread of HIV/AIDS, equally important is the recognition of income and gender inequalities which is demonstrated by the high prevalence of HIV/AIDS in regions such as Africa and Asia with large inequalities. Policy implications also include determining a political will to combat the epidemic and the stigma associated with HIV/AIDS. Furthermore, ignoring the serious threats HIV/AIDS pose to sustainability is no longer an option for governments and the privileged classes of developing nations, nor is it an option for western governments. Lessons learned in successful responses in Cambodia, Thailand and Uganda all point to the importance of leadership, commitment and continued effort from all sectors of society, including people living with HIV/AIDS to successful local, national and international responses.

In order to break the complacency of the advantaged regions of the globe, active use of global policies can help convince both world leaders and civil society of the consequences of action and inaction and assist in directing the responses to achieve the greatest effect. There is a need for reconsideration of the unsuccessful social evils approaches of individualism and a strengthening of international commitment to addressing the epidemic. Greater advocacy based on improved social understanding of specific situations and an understanding of the most urgent local prevention needs is needed to break the rate of complacency of privileged communities around the world.

## Discussion

Whilst there is no doubt that the reflexive modernization perspective is an influential and original formulation, there are several areas around which criticism has been focused. Two themes evident in the literature are relevant to this paper: an over-emphasis on the transformational power of risk and the problem of reconciling reflexivity and reflection.

In maintaining that regardless of social inequality we are all united in a shared community of fate, Beck claims that consciousness about inequality is eroded since we are all equally threatened by the same, inescapable global risks. Sooner or later, risks catch up with those who profit from them causing a kind of equalising effect. We are thus all confronted similarly by the same risk-fate. This study supports Elliott's (2002) claim that Beck does not adequately account for how individuals are drawn into the processes of reflexive modernization (eg individualization) which may embody the asymmetrical power relationships of social inequality evidenced in the widening gap between rich and poor communities and the socially excluded. The HIV/AIDS epidemic in Africa and Asia seems to provide examples of both Beck's and Elliot's claims. As Elliot argues, social inequality and social division rather than being equalised by the risks presented by the spread of HIV/AIDS is being accentuated. However, there is also no doubt that in Africa and Asia, social and economic well-being is no defence against infection, thus there is also an equalising effect.

Problems also arise in the way reflexivity and reflection are treated as separate phenomena in reflexive modernization theory. The 'reflexivity' of reflexive modernization implies unthinking and unknowing responses to modernization whilst the 'reflection' of reflexive modernization refers to a deliberate (knowing) response to the unintentional and unseen (reflexive) dissolution and endangerment. However, reflection does not necessarily follow-on from reflex. As Elliott (2002) points out, the problem here is that in splitting reflexivity and reflection into mutually exclusive categories, Beck has separated blind social processes and practices (reflex) from knowledge residing with social actors (reflection). Rather than reflex and reflection being separate, they are bound together in a complex relationship requiring the development of more heterogeneous, interpretive analytical methods. HIV/AIDS responses and intervention programmes may be seen as being somewhat reflexive rather than having an inclusive reflexive/reflective focus. Most early responses to the epidemic were centred around the identification of individual risk behaviours and the prevention of new infections through modification of such behaviours. A reflective approach recognises that policy settings acknowledge that individual behaviour needs to be considered within its economic, social and cultural context.

In sum, reflexive modernization may be criticised for placing too much emphasis on risk and ignoring the connections between reflexivity and reflection. Such problems have led Lichtblau (1999) to maintain that the concept of reflexive modernization lacks theoretical ambition and therefore cannot be taken seriously. However, in a time when we are confronted with paradox, contradiction and uncertainty, novel ideas, insights and methods are needed. Reflexive modernization is particularly useful in this respect with regard to providing a broad theoretical framework for examining the effects of the HIV/AIDS epidemic. It can help us begin to explore the connections between the medical, social, economic, cultural, political, environmental and technological contexts enabling these different levels of influence to be integrated and understood in their entirety.

Understandings of the HIV/AIDS epidemic and its implications for sustainability provided by the reflexive modernization perspective present a major challenge for policy-makers. Firstly, the issue of tackling social inequality is central for policy-makers. It is an issue that cuts across major areas of public policy critical to tackling the growing HIV/AIDS crisis in Africa and Asia (eg education, health, social security). Secondly the reconciliation of reflex and reflection coupled with the reality of difficult to track, discontinuous change, are challenges that policy-makers cannot avoid if they are to develop relevant and effective policy. For policy-makers it means confronting the difficult task of confidently tracking trajectories of discontinuous change. If the only responses to the challenges posed by the growing AIDS/HIV epidemic are narrow medically-based focussing on treatment for those with the disease and individual behaviour patterns for prevention whilst ignoring the broader issues of social, economic and environmental sustainability, then policy-making becomes at best a futile endeavour.

## Conclusion

In Africa and Asia, there is a tendency to marginalise people living with HIV/AIDS, forcing them to live on the fringes of society. The disease itself, and those affected by it, have attracted unique levels of opprobrium and social stigma (Cameron, 2001; Ellwood, 2002). Extreme ostracism forces sufferers out of society and into an anonymous, zombie existence (CPC, 2003). The stigmatization of the disease pushes such people further and further away into non-existence. A cycle of guilt, shame and denial is set in motion impeding treatment and prevention of infection.

The combined effect of poverty and HIV/AIDS has the potential to lock whole nations in Africa and Asia into a downward spiral of poverty, ill-health, lessened capacity to engage in productive activity, and compromised sustainability leading to even greater poverty. The reflexive modernization perspective allows us to break into that spiral by allowing a broad policy view of the complex issues that surround HIV/AIDS and sustainability. It recognises that there are social, economic, political, technological, cultural and environmental dimensions to the problem and policy responses must be equally broad and coordinated.

Reflexive modernization brings into focus the process of individualization as an important issue that should be recognised in order to begin bringing the HIV/AIDS epidemic under control. In addition the national and global institutions of government must begin to be more reflective rather than reflexive. Instead of simply responding to the epidemic and associated humanitarian crises in a reflexive way as they occur, institutions could also adopt a reflective approach in which events are anticipated and the consequences of current policy trajectories are examined not just in economic terms but also in the broad terms outlined above. People and communities in which they live can then be re-connected to social, political, cultural and economic institutions so that they are not left to their own fate reliant on their own, often inadequate resources. To allow this disconnection to grow unabated would be courting disaster.

In using reflexive modernization to examine the HIV/AIDS epidemic in Africa and Asia, it is possible to view HIV/AIDS as having direct or indirect effects that have implications at the local, national, and global levels. Direct effects are generally localised at the personal and community levels through people contracting the disease or having someone close to who is infected and the economic and social effects on the local community. Indirect effects are more difficult to identify but are perhaps more insidious and have much wider implications. Nations whose sustainability is compromised by HIV/AIDS may become failed states with all its attendant problems that have the potential to spill over national and even continental boundaries whilst compromised sustainability of the environment can also have significant side-effects far beyond national borders. Policy approaches towards HIV/AIDS that ignore these broader issues of society, culture, economy, politics and environment cannot be maintained. To continue on the present course, may be to consign whole communities, or even nations to the category of 'zombies', locked into a vicious, downward spiral towards unsustainability and collapse. To break this cycle requires a more reflective approach emphasising imagination, and forethought recognising the need for coordinated or joined-up government responses at the local, national and international levels.

# **The Contribution of Sustainable Tourism Development in Poverty Alleviation of Local Communities in South Africa**

*Emaad H. Muhanna  
Cape Peninsula University of Technology, South Africa*

## **Abstract**

The millennium declaration of the UN identified poverty alleviation as one of the most compelling challenges the world is facing in the 21<sup>st</sup> century. Tourism is already one of the most important sources for foreign exchange earnings and job creation in many poor and developing countries. The elimination of poverty can only be achieved only if benefits of growth can be redistributed to the poor or through brining the poor into the economic activities through creating of jobs or through entrepreneurial initiatives. This study attempts to provide a framework for tourism development to maximise the benefits of tourism for local communities. Furthermore, tourism has been contributing to poverty alleviation since the beginning of its existence, however, in the last few years Tourism has drawn the world's attention to the undisputable potential opportunities for local communities to benefit and overcome their economic problems.

## **Introduction and Overview**

Tourism is the world's fastest growing industry and is expected to continue to grow between 4 and 5 per cent per annum. The dramatic growth of tourism over the last 50 years is one of the most remarkable economic and social phenomena of this period. International tourism arrivals in South Africa grew, in real terms, from 25 million in 1950 to 698 million in 2000. That represents an average annual economic growth rate of 7% over a period of 50 years. (WTO, 2002d L: 51).

There were 692.6 million of international arrivals in 2001 (WTO, 2002e) and the World Tourism Organisation forecast for 2020 is 1.6 billion (WTO, 2001a). Since the 1950s, developing countries have received increasing numbers of the international tourists, largely from developed countries. They are attracting an increasing share of global international tourist arrivals from 3% in 1950 to 45% in 2001 (Moreno Melgarejo, 2003). Some explanations of these trends are raising standards of living in the developing countries, declining long-haul travel costs and increasing holiday entitlements. Changing demographics and strong consumer demand for exotic international travel have resulted in significant tourism growth. It is obvious that tourism is a big business, internationally; it represents one of the world's largest economic industries. As personal living standards and disposable income continue to improve, with fewer restrictions on travel and with more convenient and cheaper transport, both the contribution from tourism to the world economy, and overall number of tourists, are expected to grow. Without a doubt tourism is an increasingly important economic activity. (Godfrey & Clarke, 2000:1).

In this context, tourism brings relatively powerful consumers to the developing and least developing countries, potentially an important market for local entrepreneurs and engine for local sustainable economic development. Between 1985 and 1995 average gross receipt per tourist arrival increased by 117% in the Developed Countries, In the Developing Countries the increase was only a 75% rise from US\$ 401 to US\$ 702 in that period. This suggests that there is an economic and more specifically pricing pressure from Developed Countries on the Developing Countries and that there is scope for increased local earnings (Goodwin, 1998:2)

Moreover, in 2000, tourism ranked third among the major merchandise export sectors for both Developing Countries and Least Developing Countries. If petroleum industry exports are the major source of foreign exchange (only in OPEC countries), tourism is the primary source of foreign exchange earnings in 49 LDCs (WTO, 2002a:10). The special importance of the tourism industry represents a huge possibility for economic development in a significant number of countries in the world. In 2004 the world's travel and tourism is expected see real growth of 5.9% in total demand and generate US\$ 5,490.40 billion of economic activities, including 5.2% in GDP, 4.6% in employment, 4.2% in terms of capital investment and 2.8% in terms of government expenditures. (WTTC, 2004:2).

That is to say, tourism is a powerful tool for growth in the Developing Countries and the Least Developing Countries (LDCs).

The WTO concerns that the benefits of tourism should be widely spread in society and that the poor should benefit from tourism development. This organisation is convinced that the power of tourism can be more effectively harnessed to address the problems of poverty more directly. In order to achieve these goals, a new agreement has been established between the WTO and UNCTAD (United Nations Conference of Trade And Development), that is referring to Sustainable Tourism as a tool for Elimination of Poverty (ST-EP program). To meet this objective, the WTO and the UNCTAD concerned with advancing the development of the world's poorest countries, agreed in June 2002 to join efforts to implement a new framework to assist DCs and LDCs in poverty reduction through tourism.

Tourism development in Developing Countries is a complex phenomenon with many different factors affecting it and variables that can be controlled in one way or another. Furthermore, a focus on poverty alleviation through tourism should become a priority in tourism development strategies in these countries. Increased tourism always carries the risk of harming the very attributes that attract visitors in the first place, as well as putting pressure on the local infrastructure. Similarly, the social and economic impacts on local communities are not always as positive as one would expect. Therefore, it is necessary to better identify and understand all the impacts, in order to find out the right solutions.

Indeed, tourism is the key to the economic development for South Africa as one of the richest and economically most advanced countries on the African continent. For decades, however, the country's apartheid regime prevented it from achieving its potential, leaving widespread disparity and poverty in its legacy, and resulting in a high level of socio-economic inequality. (World Travel and Tourism Council report 2004:26)

In 1994, at the end of the apartheid era, the South African Government announced an ambitious campaign to make tourism the country's number one industry in the creation of new jobs and generation of foreign earnings by the year 2000. However, ten years on – while it has grown substantially and is now poised to overtake mining in respect of contribution to the GDP – South Africa's tourism industry has not delivered the ambitious job creation and economic growth anticipated. (World Travel and Tourism report 2004:27)

A great emphasis needs to be placed on communicating the government's vision and strategies necessary for educating the nation, this is required in order to create awareness of the socio-economic benefits of tourism and to fight ignorance of the negative social and economic impact of resistance to change our mindset towards being part of the new world. The awareness will ensure full support from leaders as well as local communities. Such strategies have been long developed by the government to implement an adult learning approach as well as educating the new generations in schools as well as in Higher Education to produce qualifying learners, who will be able to demonstrate and contribute in the execution of tourism strategies to achieve the nations' goals and objectives. The success of such approaches will lead to enhancement of quality of life and attaining the socio-economic equality and stability required for the new South Africa. This approach profiles the kind of learners who will be equipped to handle the demands of tourism in the 21<sup>st</sup> century. There is no doubt that the success of any policy or strategy depends on two critical success factors, Firstly, the suitability of the policy to the country and its residents in order to serve its purpose and achieve the objectives, which have been defined by the nation, and secondly, the strategy implementers and their commitment towards the strategy.

## **Sustainability: A Prerequisite for Tourism Development**

The World Tourism Organisation defines sustainable tourism as “tourism which leads to management of all resources in such a way that economic, social and aesthetic needs can be filled while maintaining cultural integrity, essential ecological processes, biological diversity and life support systems. (WTO Report 2002:7)

During the 1980s, it became apparent that major global environmental changes were occurring suddenly and silently and those scientists had not predicted these changes. The world also became more aware that there was an element of uncertainty and risk in relation to the effect of a range of human activities on global environments. To rectify these problems, fundamental changes were required in our style of living.

Tourism is most ideally suited to adopt sustainability as a guiding philosophy. There are many reasons for that;

- Apart from transport, tourism does not consume additional non-renewal resources.
- A community's resources, its culture, traditions, shops, leisure facilities, etc represent the core resources base for tourism.
- Tourism use of resources, both natural and cultural, should be non-consumptive, making them renewable.

- Tourism represents one of the few economic opportunities available to remote communities.
- Tourism provides real opportunities to reduce poverty, create employment for disadvantaged people and stimulate regional development.
- Tourism has proven to revitalise cultures and traditions.
- Tourism can provide an economic incentive to conserve natural and cultural assets.
- Tourism has been shown to foster greater understanding between people and a greater global consciousness.

And so, sustainable tourism is really an issue of how best to encourage tourism growth while minimising costs. (McKrecher, 2003:4)

#### **Environment**

As tourism moved into the 21<sup>st</sup> century, the enterprises have to make the environment a priority. Because tourism now is the world's largest industry, the environment is taking centre stage in tourism development. Tourism is not only a powerful economic force but also a factor in the physical environment as well.

WTTC subsequently proceeds to examine the key environmental issues under five headings, namely;

- Global warming
- Depletion of ozone layer
- Acid rain
- Depletion and pollution of water resources
- Depletion and pollution of land resources

In examining the possible implication for tourism, the WTTC expresses particular concern with respect to the depletion and pollution of land resources. It states that the long-term implications of resource depletion are obviously extremely serious. Even over the next few decades the travel and tourism industry could find that; Political instability or increased competition for land could lead to loss of potential new tourism destinations and degradation of existing destinations.

Loss of landscape and wildlife could cause a decrease in customer satisfaction with tourism products and hence lower propensity to travel to some areas. Higher fuel prices could lead to operational price increases and corresponding decreases in the number of travellers in the price-sensitive markets. WTTC also presents a positive vision of tourism and the environment, stating that; Tourism is an integral aspect of modern societies. Global awareness of environmental damage is developing rapidly. The resources of the world's largest industry can and must be harnessed to achieve environmental goals. The industry has the potential to influence customer to achieve beneficial environmental effects. Environmental lobbies will add pressure to develop good environmental practice. (Goeldner, 2003:464)

#### **Carrying Capacity and Multiple-Use**

Carrying capacity and multiple-use are two important concepts that enable societies to make more efficient use of tourist facilities and land resources. Carrying capacity is a notion that recognises that both natural and man-made attractions have upper limits in their capacity to absorb visitors.

Multiple-use is a strategy that recognises that a limited supply of recreational land often needs to be used for several purposes. It is possible, for example for some forest recreation areas in Southern Africa to be used for logging as well as tourism.

#### **Primary/Secondary Tourism Industry**

Primary industry refers to the industry role players that operate in the forefront of what is know as the tourism industry and generate income or revenue, such as travel agents, airlines, travel professionals, etc.

The secondary industry refers to the players that are on the periphery of the formal industry such as the public and private sector, tourism organisations such as IATA, PATA and ASATA, banks, souvenir shops and passport and customs control at the entry and exit gateways at airports and ports.

#### **Conservation/Preservation**

Conservation refers to plan management of sites and places. Plenty of positive evidence about tourism's part in conserving Europe's building treasures and historic sites, much less written about the sort of impact in the third world. Four main conservation influences are notes by Mathieson and Wall in their review of the worldwide literature, namely;

- There is the rehabilitation of existing buildings and historic sites.
- There is the transformation of old buildings to new uses.
- There is the conservation of natural resources.

- There is the introduction of planning procedures and control to ensure good management of the environment. (John Lee, 1998:54-55)

## Goals of Development

According to Sharpley & Telfer (2002), the goal of the process is, in effect, the self-actualisation of individuals within a society, embracing at least five dimensions:

1. An economic component - the creation of wealth and equitable access to resources;
2. A social component - the improvement of health, education, security, employment and housing opportunities;
3. A cultural dimension - the protection or affirmation of cultural identity and self-esteem;
4. An ecological dimension - which reflects the emergence of environmental sustainability as a guiding principle of all development policies; and
5. The full-life paradigm - the preservation and strengthening of the meaning system, symbols and beliefs of a society.

Development then is a complex, multidimensional concept which not only embraces economic growth and 'traditional' social indicators, such as healthcare, education and housing, but also seeks to confirm the political and cultural integrity and freedom of all individuals in society. It is, in effect, the continuous and positive change in the economic, social, political and cultural dimensions of the human condition, guided by the principle of freedom. It has been argued (in a rather romantic, idealistic sense) that underdeveloped, pre-industrial societies may, paradoxically better represent the 'good life' than developed societies: 'the world's most primitive people have few possessions, but they are not poor. Poverty is not certain small amount of goods, nor is it a relation between means and ends; above all it is a relation between people' (Shalins in Sharpley & Telfer, 2002).

## Impacts on South Africa as a Developing Country

Tourism is a growth industry, offering communities of all shapes and sizes a unique development opportunity. However, not every community is suited to tourism, nor for that matter is tourism development necessarily appropriate for every community. Tourism impacts can be both positive and negative, and the effect depends very much on the character of the area and the local circumstances (Godfrey & Clarke, 2000: 4).

Later on in the text, we will explain the essential role of local communities in tourism development. Later on, we will point out the importance of environmental, socio-cultural and economical impacts of tourism development. The contribution of tourism to regional economies is measured in similar fashion as that for national economies. Its share of regional income or output can be estimated either in terms of direct effects or, via multiplier studies, of direct and indirect effects (Williams & Shaw, 1991). Leakages and linkages are two interesting concepts and also explained in this chapter.

### Local Communities as Central Point

Of the variety of models addressing tourism impacts, Britton's (1989) approach, based on the "Dependency Theory", maintains that in order to understand the tourism industry one must consider the organisation of international tourism and examine the structure of the peripheral (host) economy. This framework is based on the assertion that large companies from the industrialized world exerting influence over or controlling tourist demand, transportation and accommodation dominate international tourism. Within the peripheral economy, Britton asserts that the multinational companies exert control through 'system determinants' such as ownership and the use of package tours and agreements which are unfavourable for the host country but which can be forced through due to the dominance of these companies. On the other hand, Preister (1989) considers Britton's "Dependency Theory" to be global for use at local level. He claims that locally affected people are not shaped passively by outside forces but react as well, at times even changing the conditions of the larger system, and that the outcome of tourism development is a negotiated process.

Communities are a basic element in modern tourism. They are the focal point for the supply of accommodation, catering, information, transport facilities and services. They're local natural environment, buildings and institutions, their people, culture and history, all form core elements of what the tourists come to see. Whether as towns, villages or cities, every community has tourism at one level or another, and is affected by the growth and development of the industry (Godfrey & Clarke 2000: 3).

Community based projects are the most suitable for a sustainable tourism development where the community is participating actively in the decision-making process. Clearly, governments should be involved in establishing guidelines and formulating laws to guide the planning and implementation of tourism development. However, this is not enough. Local community involvement is necessary to enhance or to further develop sustainable communities. An important precondition is that tourism development will be community based, yet it needs the support of locals, regional and national governments. Inskeep points out that host communities must have a right of voice in shaping their future community and has called for the maximum involvement of the local community to maximise socio-economic benefits of tourism for the community (In Tosun 2000: 616). In doing so, the first thing to achieve is the local communities' understanding on the importance and the repercussions of tourism development in their region in order to encourage an authentic participation and involvement. Local communities and the various stakeholders must be familiar with the process to appreciate it and thereby support it (Cottrell, 2001: 7).

#### **Environmental Impacts**

Any form of industrial development brings impacts upon the physical environment in which it takes place. In view of the fact that tourists have to visit the place of production in order to consume the output, it is inevitable that tourism activity is associated with environmental impacts (Cooper et al. 1998:149). For that reason, traditionally some authors have pointed out that tourism can lead to environmental negative consequences. The highly polarised nature of development also generates intense environmental problems. This reduces the quality of life for locals as well as for tourists and, ultimately, may threaten the viability of the tourist industry itself (Williams & Shaw, 1991).

Depletion of natural resources can result in water shortages; create great pressure on other local resources like energy, food, etc., that already might be in short supply or destroy beautiful scenic landscapes. Pollution from tourists has impacts on the global level that disturbs the local population of the caused community. Solid waste and littering in the nature despoils the natural environment. The more physical impacts are degradation and loss of wildlife habitats and of scenery, and disturbance and erosion of the local ecosystem caused by clearing forested land and construction of tourism facilities and infrastructure (UNEP, 2001). However tourism could be positive for the preservation of natural areas. In many tourism projects the conservation of the natural, cultural and built environment is an important motivation for the initiation of the project. Moreover, some of the projects tend to deter local communities from illegal use and overuse of natural resources as well as they try to integrate the protected natural areas in regional and local development plans and programs. Therefore, tourism could and should contribute positively to environmental preservation. This sentence has more sense when we think about tourist motivation in visiting one specific place. The basic attributes must be preserved as a main goal benefiting the sustainability of the project. In the next the benefits and costs on environmental impacts:

#### **Socio-Cultural Impacts**

Tourism has an amazing power able to reach the majority of the world's 10.000 distinct societies living in over 200 states. But, in doing so, it has created the risk of intercultural conflicts, and has also created the potential for tourism to be caught up in intercultural conflicts (Robinson, 1999: 6). According to Robinson (1999: 1), the desire to make contact with one's own culture(s) in all its forms, and the search for experiences of other cultures is very much at the heart of tourism. But the process by which tourists experience culture, and the way it is used by the tourism industry and host communities, are increasingly characterised by conflict. Providing opportunities for tourists to learn about and experience cultures requires consideration of both the positive and the negative outcomes for the host communities (Besculides, Lee & McCormick, 2002: 304). With the growth of tourism and its fragmentation into specialized forms, such as ecotourism and cultural tourism, there has been increased pressure placed by tourists and the tourism industry on indigenous people. It is obvious that tourism is bringing people with very different value systems into the territories where indigenous people have inhabited for centuries. However, these kinds of influences are not exclusive from the tourism industry. From a historical point of view, something similar has happened, whenever a social contact between to different cultures was overtaken.

TABLE 2: SOCIO-CULTURAL IMPACTS: A COMPARISON

Positive effects	Negative effects
-Developing positive attitudes about each other	-Developing negative attitudes about each other
-Learning about each other's culture and customs	-Tension, hostility, suspicion and misunderstanding
-Reducing negative perceptions and stereotypes	-Isolation, segregation and separation
-Developing friendships	-Clashes of values
-Developing pride, appreciation, understanding, respect and tolerance for each other's culture	-Difficulties in forming friendships
-Increasing self-esteem	-Feelings of superiority and inferiority
-Psychological satisfaction with interaction	-Communication problems
	-Ethnocentrism
	-Culture shock
	-Dissatisfaction with mutual interaction

(Source: Robinson, 1999:9)

### Economic Impacts

As we have already seen, tourism is rapidly emerging as an important economic sector in Developing Countries and LDCs. It offers opportunities for economic development in areas that have otherwise limited development activities. However, tourism is not a traditional industrial sector, and is best understood as a response to a particular consumer demand. The activity creates demand for a wide range of products and services purchased by visitors and tourism companies, including a range of products supplied by other industrial sectors (e.g. agriculture, building supplies, crafts and soft furnishings) which are not traditionally thought as part of the tourism sector but have been identified as tourism connected products in the Tourism Satellite Account methodology (WTO, 2001c: 59).

Tourism development has been traditionally been pursued for its impacts on employment and economic growth, and perhaps most significantly for foreign exchange earnings. During the period 1995-1998, tourism revenues were one of the five leading sources of export revenue for 69 Developing Countries. Among the latter, tourism revenue was the main source of foreign currency in 28 countries, its share in total exports ranged between 79 and 20 per cent; in 27 countries it accounted for between 20 and 10 per cent; and in the 24 remaining countries it was around 10 per cent.

Of the 100 or so poorest countries, tourism is significant in almost half of the low income and virtually all of the lower-middle income countries (UK Department for International Development (DFID), 1999. In WTO 2002a: 18). Tourism is a principal export (features in the top five) for 83% of developing countries and the principal export for one third of developing countries (Page, 1999. In WTO, 2002a: 18).

The economic evaluation of tourism is difficult to calculate. However, the WTO's proposal about "The evaluation of the economic incidence of tourism" has been the building of the Satellite Tourism Account (STA). Using the STA it is possible to identify the value of tourism to the national economy and its impacts through different industries. So, it is conceived to quantify the tourism effects in the national economy, in a way that can help the public responsible, the business managers and common people to take documented decisions based on credible, comparable and confirmed data with the rest of the national accounting (For more information see WTO, 2001d). It is not yet widely implemented in Developing Countries and LDCs. However, WTO is working on that process in order to get more homogenous tourism data among the country members. Among the most important advantages of tourism development we can find:

- Employment opportunities, economic diversification and growth (especially for small and medium enterprises), redistribution of wealth among the countries and regions. Among the primary reasons we have to point out that tourism offers, in principle, more opportunities for backward linkages throughout the local economy than other industries. Such opportunities include both direct links, such as the expansion of the local farming industry to provide food for hotels and restaurants, and indirect links with, for example, the construction industry (Sharpley & Telfer 2002). The contribution of tourism to the local economy is also often undervalued. The
- WTO defines five sorts of positive impacts on livelihood, any or all of which can form part of a poverty reduction strategy (2002a: 37):
- Wages from employment. We can distinguish three different types of employment generated by tourism (Kontogeorgopoulos, 1998: 315):

- Direct employment refers to those occupations directly derived from and dependant upon tourism and includes employment in accommodation establishments, shops, restaurants, night clubs, bars, and government tourism administration, and transport and tour companies.
- Secondary, or indirect, employment occurs in sectors supplying the industry and results from increased demand for souvenirs, food products and other such items affected by tourism demand.
- Finally, the spending and circulation of local tourism income creates induced employment in the local economy.
- Earnings from selling goods, services or casual labour
- Dividends and profits arising from locally owned enterprises
- Collective income which may include profits from a community run enterprise, land rental, dividends from a joint venture or levies – these incomes can provide significant development capital and provide finance for corn-grinding mills, a clinic, teachers, housing and school books.
- Infrastructure gains, for example roads, piped water, electricity and communications.
- Tourism encompasses a whole range of economic opportunities which have an impact on many different social and economic sectors, transport and communications infrastructure, water supply and sanitation, education, public security, cultural services, immigration and customs – as well as accommodation providers and their suppliers. Reflecting the diversity and complexity of the industry, it is one of the few sectors were development master plan are still produced. There is much scope for increasing the emphasis on pro-poor economic development in these plans (WTO, 2001c: 59-60).

### Leakages

As a modality of international commerce, tourism involves not only inflows of foreign financial resources but also outflows, referred to herein as “leakages”. When they exceed specific levels, these outflows can significantly neutralize the positive financial effects of international tourism (Diaz Benavides, 2001: 8). Pérez-Ducy de Cuello (2001) defines leakage as the process whereby part of the foreign exchange earnings generated

by tourism, rather than being retained by tourist-receiving countries, is either retained by tourist-generating countries or repatriated to them in form of profits, income and royalty remittances, repayment of foreign loans, and imports of equipment, materials, capital and consumer goods to cater for the needs of international tourism and overseas promotional expenditures.

According to WTO, “the average leakage for most developing countries today is between 40 and 50 percent of gross tourism earnings for small economies and between 10 and 20 percent for most advanced and diversified developing countries” (WTO, 1995: 55). Depending on the sources, some authors give more importance to the tourism leakage effect. According to Cottrell (2001: 1) in Thailand 70% of all money spent by tourists leaked out from the country (via foreign-owned tour operators, airlines, hotels, imported drink and food, etc). Estimations for other Third

World countries range from 80% in the Caribbean to 40% in India. A policy to reduce leakages will improve the chances for a more viable tourism sector. Leakages can be managed and need to be reduced. Management of leakages should allow the countries to profit as best as possible from the market expansion and the competitive factor that tourism demand represents for local industry and the local economic structure in all fairness to least developed and developing countries, without engaging in anti-competitive practices that contradict other WTO principles, and reduce the contribution of tourism to sound economic development (Díaz Benavides, 2001: 12).

At that point, it is interesting to point out that high-income luxury tourism it is not always the best strategy because it requires the provision of very high quality and high priced goods. It may actually result in increased leakage in some cases despite of the higher income it may generate.

#### **Linkages**

Tourism can provide an important diversification for other sectors of the local economy and create new ones, offering additional livelihood opportunities. From the tourism and a poverty perspective it is generally more productive to focus on the linkages with other economical sectors. If the linkages to the local economy can be increased, the extent of leakages will be reduced. One of the best ways to enhance economic benefits to the local community and to increase the contribution to poverty reduction is to increase the extent of linkages between the formal tourism sector and the local economy (WTO, 2002a: 38-39). The fact that the costumers come directly to the destination makes tourism to have a higher potential for linkages with the rest of the economy in the country. While tourism is a very big industry on a global scale, at the local level it is also very small. That is, the vast majority of tourism companies are small or medium sized operations, all offering a good range of goods and services to the traveller in one form or another (Godfrey & Clarke, 2000: 5). The linkages allow the revenues to circulate through the domestic economy, producing larger multiplier effects in terms of both employment and income for the local population (Brohman, 1996: 56). That is to say, use of local goods and services results in the creation of more jobs and opportunities especially for small and medium sized enterprises.

Many developing countries have found it important to improve the linking of tourism with the other sectors of the economy. Successful experiences of small economies and islands that have recently become emerging tourism destinations, such as Mauritius, Maldives, the Dominican Republic and other Caribbean islands, attest to the vital importance of the proper linkage of tourism with the rest of the economy (Prats in Díaz Benavides: 2001: 7). However, according to Díaz Benavides (2001: 7), despite developing countries efforts, the economic sustainability of tourism is being undermined by external factors beyond their control, notably the predatory behaviour of integrated suppliers which enjoy a dominant position in the originating markets of tourism flows.

#### **The Multiplier Effect**

The extent of integration of tourism in the national economy is known as the multiplier effect. The concept of the multiplier is based upon the situation that sales of one enterprise require purchases from other enterprises within the economy. This means that enterprises not only purchase primary inputs but also purchase goods and services produced by other enterprises in the local economy. “Thus, these supplying enterprises and the economic sectors also benefit from tourism, and multiply the economic benefits through creation of additional jobs, income and profits. The greater the integration of the national economy and linkages of its various economic sectors, the more benefits are accrued from tourism” (WTO, 2002c: 5). The tourism income multipliers refer to the amount of money generated in the economy by tourist expenditures, which is expressed as the percentage increase or decrease of the unit of currency spent. Income multipliers vary greatly from one country to another. For example, according to Cooper et al. (1998: 142), the multiplier is 1.73 in the United Kingdom, 1.59 in Sri Lanka, 1.27 in Jamaica, 1.23 in Egypt, 1.07 in Fiji, 1.03 in the Seychelles, 0.97 in

Mauritius, 0.82 in Philippines, and 0.79 in The Bahamas. For instance, '(a) study on Indonesia showed that the tourism multiplier (1.59) was the highest of all categories, including final demand and exhibit strong links to the agricultural sector, on which it had no direct effect at all' (Economic and Social Commission for Asia and the Pacific (ESCAP), in Díaz Benavides, 2001: 11). As would be expected, generally the multiplier is higher in larger more developed economies and lower in smaller less developed economies, especially island countries that must import a greater proportion of the goods and services used in tourism (WTO, 2002c: 5). Although the impacts of tourism may be broken down into discrete units such as 'environmental', 'socio-cultural' and 'economic', it is the way these impacts interweave and the way they are conditioned by political activity that determines their effects for good or bad (Brown, 1998: 78).

#### **Sustainable Development for Africa**

Since the United Nations Conference on Environment and Development, sustainable development has remained elusive for many African countries.

Poverty remains a major challenge and most countries on the continent have not benefited fully from the opportunities of globalisation, further exacerbating the continent's marginalisation. Africa's efforts to achieve sustainable development have been hindered by conflicts, insufficient investment, limited market access opportunities and supply side constraints, unsustainable debt burdens, historically declining levels of official development assistance and the impact of HIV/AIDS. The World Summit on Sustainable Development should reinvigorate the commitment of the international community to address these special challenges and give effect to a new vision based on concrete actions for the implementation of Agenda 21 in Africa.

The New Partnership for Africa's Development (NEPAD) is a commitment by African leaders to the people of Africa. It recognizes that partnerships among African countries themselves and between them and with the international community are key elements of a shared and common vision to eradicate poverty, and furthermore it aims to place their countries, both individually and collectively, on a path of sustained economic growth and sustainable development, while participating actively in the world economy and body politic. It provides a framework for sustainable development on the continent to be shared by all Africa's people. The international community welcomes NEPAD and pledges its support to the implementation of this vision, including through utilization of the benefits of South - South cooperation supported, inter alia, by the Tokyo International Conference on African Development. It also pledges support for other existing development frameworks that are owned and driven nationally by African countries and that embody poverty reduction strategies, including poverty reduction strategy papers.

Achieving sustainable development includes actions at all levels to:

- (a) Create an enabling environment at the regional, sub-regional, national and local levels in order to achieve sustained economic growth and sustainable development and support African efforts for peace, stability and security, the resolution and prevention of conflicts, democracy, good governance, respect for human rights and fundamental freedoms, including the right to development and gender equality;
- (b) Support the implementation of the vision of NEPAD and other established regional and sub-regional efforts, including through financing, technical cooperation and institutional cooperation and human and institutional capacity –building at the regional, sub-regional and national levels, consistent with national policies, programmes and nationally owned and led strategies for poverty reduction and sustainable development, such as, where applicable, poverty reduction strategy papers;
- (c) Promote technology development, transfer and diffusion to Africa and further develop technology and knowledge available in African centres of excellence;
- (d) Support African countries in developing effective science and technology institutions and research activities capable of developing and adapting to world class technologies;
- (e) Support the development of national programmes and strategies to promote education within the context of nationally owned and led strategies for poverty reduction and strengthen research institutions in education in order to increase the capacity to fully support the achievement of internationally agreed development goals related to education, including those contained in the Millennium Declaration on ensuring that, by 2015, children everywhere, boys and girls alike, will be able to complete a full course of primary schooling and that girls and boys will have equal access to all levels of education relevant to national needs;
- (f) Enhance the industrial productivity, diversity and competitiveness of African countries through a combination of financial and technological support for the development of key infrastructure, access to technology, networking of research centres, adding value to export products, skills development and enhancing market access in support of sustainable development;

- (g) Enhance the contribution of the industrial sector, in particular mining, minerals and metals, to the sustainable development of Africa by supporting the development of effective and transparent regulatory and management frameworks and value addition, broad-based participation, social and environmental responsibility and increased market access in order to create an attractive and conducive environment for investment;
- (h) Provide financial and technical support to strengthen the capacity of African countries to undertake environmental legislative policy and institutional reform for sustainable development and to undertake environmental impact assessments and, as appropriate, to negotiate and implement multilateral environment agreements;
- (i) Develop projects, programmes and partnerships with relevant stakeholders and mobilise resources for the effective implementation of the outcome of the African Process for the Protection and Development of the Marine and Coastal Environment;
- (j) Deal effectively with energy problems in Africa, including through initiatives to:
  - (i) Establish and promote programmes, partnerships and initiatives to support Africa's efforts to implement NEPAD objectives on energy, which seek to secure access for at least 35 per cent of the African population within 20 years, especially in rural areas;
  - (ii) Provide support to implement other initiatives on energy, including the promotion of cleaner and more efficient use of natural gas and increased use of renewable energy, and to improve energy efficiency and access to advanced energy technologies, including cleaner fossil fuel technologies, particularly in rural and peri-urban areas;
- (k) Assist African countries in mobilizing adequate resources for their adaptation needs relating to the adverse effects of climate change, extreme weather events, sea level rise and climate variability, and assist in developing national climate change strategies and mitigation programmes, and continue to take actions to mitigate the adverse effects on climate change in Africa, consistent with the United Nations Framework Convention on Climate Change;
- (l) Support African efforts to develop affordable transport systems and infrastructure that promote sustainable development and connectivity in Africa;
- (m) Further to paragraph 42 above, address the poverty affecting mountain communities in Africa;
- (n) Provide financial and technical support for forestation and reforestation in Africa and to build capacity for sustainable forest management, including combating deforestation and measures to improve the policy and legal framework of the forest sector.

## **Tourism Development and Poverty Elimination**

The governments of Developing Countries and LDCs must help create the right market conditions for developing tourism as a means to alleviating poverty. (WTO Newsletter, 2004:1).

Numerous academics, politicians and campaigners speak on the problem of poverty and underlying their discussion is the assumption that identifying the problem provides a basis for action upon which all will agree. Not everyone agrees on what the problem of poverty is, and the action advocated by different groups is not always the same thing.

Poverty amid plenty is the world's greatest challenge. Of the world's 6 billion people, 2.8 billion lives on less than \$2 a day and 1.2 billion live on less than \$1 a day. Even though the human condition has improved significantly, destitution persists. Faced with this picture of global poverty and inequality, there is a need for global poverty reduction strategies at the international level that would change this situation.

Most of South Africa's poverty has its roots in the legacy of apartheid. The current rate of poverty in South Africa is 45%. This translates into 18 million people who live on less than \$2 a day, as measured by the World Bank. The percentage of households reporting hunger in 1999 was 21.9 per cent. There are startling numbers for a country classified as "middle income" and reinforces the need for a poverty reduction strategy at the National level that will inform Provincial and District wide strategies. (World Bank report: 1998:17)

Access to quality employment is crucial to reducing poverty and vulnerability as well as reducing inequality in South Africa. Poor people are faced with both unemployment and the low quality of the jobs they otherwise occupy. The challenge is to create more employment opportunities for the poor. Creating a favourable climate for investment is one way of achieving this. But what is also required is investing in human capital to develop skills and improving well-being.

It is against the backdrop of poverty both globally and nationally that an analysis of poverty in South Africa is to be undertaken. Despite the Western Cape having the lowest overall percentage of people living in poverty in South Africa, large sections of its population continue to live in abject conditions. The Province suffers excessively from high levels of unemployment, low levels of human development and unequal access to physical and social infrastructure.

At the most fundamental level, poverty is extreme deprivation: the inability of people to afford the most basic needs for human life; food, clothing, shelter, health care and education. It robs children of their childhood. It condemns adults to illiteracy and it condemns many millions to disease. Until poverty is alleviated we cannot lay claim to being a compassionate society.

Africa is at the heart of WTO's concerns due to multiple handicaps it faces on the road to development, but also because the organisation is convinced that many of these obstacles can be overcome. Among these is poverty, which constitutes a scourge that can be reduced through tourism development. (WTO newsletter, 2004:1)

Furthermore, WTO believes that there is still a key role for the public sector in developing countries, to push ahead with the enabling conditions and strike the right balance between a market economy and necessary development.

The environmental and tourism adviser to NEPAD, Ms. Hespina Rukato, said that the partnership's goal is to reverse the underdevelopment and poverty on the continent. To achieve this, there is a need for African ownership of tourism facilities, the establishment of regional development programs and to set realistic targets. Moreover, she agreed that tourism development is an important component in the fight against poverty through increase in investment in both infrastructure and health.

Recognition by the international community of the importance of tourism as a potential driving force in the socio economic development of the third world countries suggests that tourism development can be an avenue toward a growing sphere of trading opportunities and accordingly, one of the most effective methods to avoid the risk of increased marginalisation from the global economy (which is systematic for most LDCs). A key element in this consideration is that in some instances poor people have ownership of resources such as cultural festivals and natural capital e.g. wildlife, forests, lagoons, scenery, etc, which may be utilised for tourism, hence the emergence of ST-EP. It is problematic to leave tourism development, especially in the context of Poverty Alleviation, to the private sector in many developing countries because of the existing financial constraints and weak institutional capacity of the private sector in such countries. This situation requires a partnership between the private sector and the national tourism authorities in order to design and implement an effective Sustainable Tourism for Eliminating Poverty (ST-EP) (UNCTAD, 2001).

#### **Sustainable Tourism a tool for Eliminating Poverty (ST-EP)**

For more than fifty of the world's poorest countries tourism is ranked first, second or third in terms of their economies, and tourism is the only service industry to show a positive balance of trade with flows from first world countries to developing countries exceeding those in the opposite by US\$ 66 million. Yet tourism has only very recently been recognised by some aid donors, some international funding agencies, and some segments of the industry as an appropriate instrument for poverty reduction. (WTO, 2000).

At the world summit on Sustainable Development held in Johannesburg, South Africa in August 2002, the WTO supported by UNCTAD, took a global lead in this field, launching the concept of "Sustainable Tourism as an effective tool for Eliminating Poverty" ST-EP, and beginning the process of putting a program in place to implement the concept. This initiative linked leadership on Poverty Alleviation that was the focus of the WSSD in Johannesburg in 2002. ST-EP may be seen as a response by the global tourism industry under the leadership of WTO to the UN millennium development goal to halve extreme poverty by 2015. (STCRC report, 2004:1).

ST-EP is not a new form of tourism. It is not a new kind of tourism product. It is an approach to tourism in which the tourism cake is titled so that benefits are specifically directed towards the poor. As a new field of endeavour for development assistance bureaux and international funding agencies there is no established track record on which they can draw to consider implementing their own policies. Hence a major component of the WTO program on ST-EP is to facilitate research and identification of best practice models. (STCRC report, 2004:1). Because tourism is often seen in narrow terms as purely a private sector, understanding its constellation of backward and forward linkages into all other areas of the economic activities, into society and culture, into the environment and into governments, are often ignored. However, once tourism is understood as a complex system its capacity to work as a positive tool for poverty reduction is enhanced. While ST-EP is relatively untried and untested, the pervasiveness of the tourism industry has impelled an

increasing number of agencies to develop policies designed to use tourism as a tool to alleviate poverty in these countries, these include notably the WTO, the Asian Development Bank, the World Bank and a range of UN technical agencies such as UNCTAD, UNEP and WCED.

### **Advantages of Tourism as a Development Strategy**

Tourism has considerable potential for growth in many Developing Countries and LDCs where it is a significant economic sector and growing; and that it has advantages when compared with other economic sectors. This can be summarised in the next points (adapted from WTO, 2002a: 33 / WTO, 2001c: 61 / Sharpley & Telfer 2002: 18-20):

- Tourism redistributes wealth. Both internationally and domestically, tourism is seen as an effective means of transferring wealth and investment from richer, developed countries or regions to less developed, poorer areas. This redistribution of wealth occurs, in theory, as a result of both tourist expenditures in destination areas and also of investment by the richer, tourism-generating countries in tourism facilities.
- Tourism is consumed at the point of production. Because of this the opportunities for individuals and micro-enterprises, in urban centres or marginal rural areas, to sell additional products (e.g. handicrafts and souvenirs) or services (e.g. guiding, music or dancing) to these potential consumers is therefore considerable.
- Most export industries depend on financial, productive and human capital.
- Tourism depends on these but also in natural capital and culture (e.g. natural parks, cultural heritage, scenery and beaches), which are assets that some of the poor have at the level to motivate travel. This is to say, tourism utilizes natural and cultural “free” infrastructure. This suggests that the development of tourism (and its subsequent economic contribution) is based upon natural and cultural resources that are free or belong to the country.
- No trade barriers to tourism. Unlike many other forms of international trade, tourism does normally not suffer from the imposition of trade barriers, such as quotas or tariffs.
- Tourism has particular potential in many countries with few other competitive exports.
- Tourism is a much more diverse industry than many others and can build upon a wide resource base. Diversity increases the scope for wide participation, and for the informal sector through livelihood diversification – for example where a farming household produces crafts or sells produce to a local lodge.
- Tourism is often reported to be more labour intensive than other productive sectors. Data from six countries with satellite account indicate that it is more labour intensive than non-agricultural activities, particularly manufacturing, although less labour intensive than agriculture (WTO, 2002a: 1999). - There is a greater uptake of jobs by women than in other sectors although it is not known if more jobs are taken by the poor and unskilled. (The percentage of female employment varies enormously by country, ranging from over 60% in Bolivia to fewer than 10% in some Muslim countries (DFID 1999. In WTO 2001c: 61).
- Tourism offers, in principle, more opportunities for backward linkages throughout the local economy than other industries. Such opportunities include both direct links, such as the expansion of the local farming industry to provide food for hotels and restaurants, and indirect links with, for example, the construction industry. As we have already mentioned the multiplier effect of this industry normally achieves a significant level.
- A variety of other, secondary reasons may also be suggested for the popularity of tourism as a development option. These include the facts that the development of tourism may lead to infrastructural improvements and the provision of facilities that are of benefit to local communities as well as tourists; that tourism often provides the justification for environmental protection through, for example, the designation of national parks; and, that tourism may encourage the revitalisation of traditional cultural craft and practices.
- Together they explain why virtually every country in the world disposes, to a lesser or greater extent developed a tourism industry.

### **Perceived Disadvantages of Tourism as a Development Strategy**

- The argument regarding dependency of tourism development in developing countries suggests that type and scale of tourism development in the developing world is to a large extent at the mercy of the international tour operators. In this regard, it may not be wrong to claim that developing countries are decision-takers, rather than decision-makers regarding the tourism development that has taken place in their territories. This is more obvious in mass-tourism destinations. For instance, there is evidence that international tour

operators and multinational companies in the tourism industry have shaped and directed the tourism development in Turkey and elsewhere in the developing world (Tosun, 2001: 298).

- Tourism can impose non-economic costs on the poor through loss of access to resources, displacement from agricultural land and social and cultural disruption and exploitation. In that way, negative impacts need to be managed. The issues of environmental management and planning at local level are real, and not unique to tourism. They need to be addressed through the good governance agenda (WTO 2002a: 34).
- Tourism is vulnerable to changes in economic conditions in the originating countries, which cause major swings in levels of economic activity in tourism in the destinations, and international visitor arrivals are also vulnerable to civil unrest, crime, political instability and natural disasters in destinations. However, it is not clear that the volatility of export markets for tourism is significantly greater than for other commodities (WTO 2002a: 34).
- It should be noted that, although there has generally been an upward trend in international tourism in recent years, not all global regions and countries have shared equally in that growth. Within most Third World regions, tourism has been monopolized by a few countries to the exclusion of the rest. For example, in Africa, three countries (Egypt, Morocco and Tunisia) accounted for 52.6% of the continent's international tourists in 1991, while seven countries (the above three countries and Algeria, Kenya, South Africa and Zimbabwe) represented 76.9% of the total (Brohman, 1996: 52).
- Tourism requires highly sophisticated marketing which budget requirement should be carried at national level (WTO 2002a: 34). Many developing countries have comparative advantage in tourism – or at least tourism constitutes one of their better opportunities for development. The disadvantages are more apparent than real when tourism is compared to other sectors (WTO, 2002a: 35). Tourism is an important industry part of the world economy of which it will become more and more important as we have already explained in this thesis. In this context tourism suffers and contributes from capitalism as a way of production. Some authors argue that capitalism is something unfair itself. For instance, D'Sa states that "Tourism is simply a product of the prevailing unjust economic and social underpinned by global capitalism. In any form of capitalist development, the primary goal is private profit for those with the means and the beneficiaries are invariably the business and political elites, (whether in the North or South). We have to cross the bounds of mainstream discourse and have the moral courage to acknowledge that capitalism is a flawed system with greed, inequality and exploitation at its heart. This order (and with it Third World tourism) is characterised by gross injustices, racism, the dominant role of Northern Trans-national Corporations (TNCs) and the erosion of ethical principles (D'Sa, 1999:

The Third World is already heavily in "debt" to the rich countries (mainly the G7, the richest of all) and has to sacrifice much of its health and education programs in order to pay up (D'Sa, 1999: 66). This is the reality we have to face and the reality which is asking for a severe reaction in order to achieve a "better" and more "fair" world. Tourism development drives in a sustainable way and should contribute something positive to this reality. Tourism brings northern tourist in direct contact with local communities. In this way, it is easier to create a social conscience about the situation of developing countries when tourists are forced to do it. While most of the time people use any kind of goods coming from Developing Countries and LDCs without asking themselves the way they were produced, or under what conditions, whenever a tourist travel to developing countries they find themselves facing a situation that should make them asking some questions.

## **Tourism Strategies versus Mass Tourism**

Disillusionment with mass tourism and the many problems it has triggered has led many analysts to turn away from past methods of tourism development in favour of "alternative tourism". According to Brohman (1996: 63) several authors have suggested that, under some circumstances, alternative tourism strategies might be promoted to encourage more community participation in tourism planning, a more equitable distribution of the costs and benefits of tourism, and more culturally appropriate and environmentally sustainable form of tourism. Even if some authors criticize this term because of its broad meaning (see Butler, 1992), Brohman provides a definition of this concept using a few recurring themes appearing in the alternative tourism literature (Brohman, 1996: 64):

1. Alternative tourism is thought to consist of smaller-scale, dispersed, low density developments. Often these developments are located in and organized by villages or communities, where it is hoped that they will foster more meaningful interaction between tourists and local residents.

2. Ownership patterns in alternative tourism are weighted in favour of local, often family owned, relatively small-scale businesses rather than foreign owned trans-nationals and other outside capitals.
3. Alternative tourism encourages community participation in local/regional planning concerning tourism and related development by creating mechanisms to allow local resident to participate in the decision-making process.
4. Alternative tourism emphasizes sustainability, in both an environmental and cultural sense.
5. Alternative tourism should not denigrate or damage the host culture; instead, it should try to encourage sensitivity and respect for cultural traditions by creating opportunities for education and cultural exchange. However, it is necessary to mention that every country has particularities which should be taken into consideration when deciding its own tourism development strategy. "Whatever alternative tourism strategy a country chooses, it should focus on the individuality, uniqueness, and particular strengths of its communities and regions.

## **Benefits of Tourism to Local Community**

### **Holidays**

When people go on holiday they usually think first about possible destinations, a relaxing program, good service, and how much it will cost. Holidays are a way to recharge their batteries away from home. The last thing on their mind is usually how the local people benefit from their holiday. It even seems they forget about this issue.

I will try to illustrate how regular tourism and community based tourism differ in terms of benefits and costs to the host communities, and not only economic, but also developmental, social, environmental, and cultural.

### **Passive or Active in Tourism**

"Just visit and leave"

Regular tourism is passive for both tourists and hosts. Tourists usually travel to get some peace, experience a different climate and landscape, see different cultures and have fun. Villagers in the host community just wait for them, pose for photos, and receive little money from their visit.

"Learning, Sharing, and Participating"

Community-based tourism, in contrast, is an active type of tourism. Both villagers and tourists learn from each other, share their experiences of their different ways of life, tourists participate in the daily life of local people, and both actively learn about differences between their cultures.

### **Local Benefits**

In regular tourism, tourists believe they provide some benefits to the community in different ways. They buy handicrafts, give candy or pens to the children, put money in the community donation box, or donate some used clothing to the villagers. The tourists truly believe they are benefiting the community, but in many cases it may not at all. How do they know where their money is going to? It could be shared among the community, but it may well go to just one or two influential people. Giving things to children only creates more problems of dependency, rather than encouraging self-reliance. If the local people are allowed to think and design their own vision of tourism in their community, they will be able to mitigate many of the negative impacts of regular tourism. Local communities can manage their own tourism program and get benefits from tourism. But of course, in most cases, it does not happen by itself. It does need the right guidance and facilitation, at least in the beginning stages, in order to be feasible and successful.

### **Community Based Sustainable Tourism (CBST) in the active role.**

CBST is a type of tourism that emphasizes the sustainability of the environment and society. Decisions are made by the community and programs are managed by the community. In this way the communities are the owners of the program and have a right over the way tourism is managed, with the purpose of encouraging sustainability and enabling learning among visitors to the community.

## **Role of Stakeholders**

There is a fundamental impasse between market values (profit, competition, survival of the fittest, acquisition, individualism) and community values (self-identity, sharing of wealth, cooperation, support of the weakest, spirituality, harmony with nature).

Apart from governments to provide basic protection to powerless communities and their environment, the tourists and the NGOs need to develop solidarity with local communities through education in the outbound markets.

#### **National and Local Government**

A more appropriately planned tourism development process is needed which would both spread its costs and benefits more equitably and which would be more sensitive to its social and cultural impacts. There is much that only governments can do – in terms of policies, regulations, and co-ordination. The government must;

- Incorporate pro-poor elements into tourism, rural development and growth strategies.
- Establish the necessary guidelines and legislation for planning and starting tourism projects considering pro-poor initiatives.
- Create and to start up a tourism development policy benefiting alternative tourism projects.
- Use planning controls and investment incentives to encourage private operators to make and implement pro-poor commitments.
- Provide technical assistance as well as training to facilitate the integration of poor population in the tourism projects.
- Point out the high potential economical linkages with other economic sectors.
- Reinvest benefits provided by tourism taxes in social improvements, creation of new services and infrastructure.
- Consult with poor residents when making decisions about tourism.

#### **Tourism and the Private Sector**

Tourism business and poverty reduction may seem very different. However, two facts deserve consideration (Roe et al., 2002):

- Tourism depends on a stable operating environment within a destination. Tourism is particularly vulnerable to local or international instability and extreme poverty could become an instability factor.
- Tourism to poor destinations is growing. Market trends reveal growing consumer awareness of socio-economic issues. Taking into consideration these two facts, tourism private sector should (Roe et al., 2002 and WTO & Moreno Melgarejo, 2003).
- Provide tourists with information on the importance of pro-poor tourism and highlight local enterprises and attractions that they can support.
- Provide advice and information to tourists on local cultures and traditions, encouraging them to dress and behave appropriately and to support traditional crafts and culture.
- Request local representatives to keep up to date with, and support, local initiatives.
- Provide a facility for tourists to donate to community projects. For instance, schools, clinics and so on.
- Provide business advice to local community wishing to establish complementary enterprises and eventually develop joint ventures and other types of partnerships with local people.

#### **Donors and Development Agencies**

Donors and development agencies can encourage tourism development by:

- Promoting tourist development as a tool for poverty alleviation emphasizing the strategies within the sustainable development.
- Funding the implementation and the generalization of pro-poor tourist strategies.
- Increasing funding towards sustainable tourism projects. At this point, it is necessary to remind the recommendation of destining 0.7% of the global GDP in cooperation and development aid.
- Ensuring that funding is well structured and satisfies all the needs within the tourism projects.
- Working jointly with the rest of stakeholders to obtain the optimal results in the common objectives of tourist sustainability.
- Improving tourism projects performance attended by these organisms through a better accessibility to the markets.

### **Community-Based Tourism: Strategic Recommendations**

Developing and disseminating knowledge concerning the links between demographic trends and factors and sustainable development

Basis for actions

- Demographic trends and factors and sustainable development have a synergistic relationship.

- The growth of world population and production combined with unsustainable consumption patterns places increasingly severe stress on the life-supporting capacities of our planet. These interactive processes affect the use of land, water, air, energy and other resources. Rapidly growing cities, unless well-managed, face major environmental problems. The increase in both the number and size of cities calls for greater attention to issues of local government and municipal management. The human dimensions are key elements to consider in this intricate set of relationships and they should be adequately taken into consideration in comprehensive policies for sustainable development. Such policies should address the linkages of demographic trends and factors, resource use, appropriate technology dissemination, and development. Population policy should also recognize the role played by human beings in environmental and development concerns. There is a need to increase awareness of this issue among decision makers at all levels and to provide both better information on which to base national and international policies and a framework against which to interpret this information.

#### **Objectives**

The following objectives should be achieved as soon as practicable:

- (a) To incorporate demographic trends and factors in the global analysis of environment and development issues;
- (b) To develop a better understanding of the relationships among demographic dynamics, technology, cultural behaviour, natural resources and life support systems;
- (c) To assess human vulnerability in ecologically sensitive areas and centres of population to determine the priorities for action at all levels, taking full account of community defined needs.

#### **Means of Implementation**

- A) Financing and cost evaluation and implementing of the activities.
- B) Strengthening research programmes that integrate population, environment and development
- C) Developing information and public awareness
- D) Developing and/or enhancing institutional capacity and collaboration
- E) Promoting human resource development
- F) Developing local strategies for improving the quality of life and the environment.
- G) Strengthening urban data systems
- H) Encourage partnerships among the public, private and community sectors in managing land resources for human settlements development;
- I) Strengthen community-based land-resource protection practices in existing urban and rural settlements;
- J) Establish appropriate forms of land tenure that provide security of tenure for all land-users, especially indigenous people, women, local communities, the low-income urban dwellers and the rural poor;
- K) Accelerate efforts to promote access to land by the urban and rural poor, including credit schemes for the purchase of land and for building/acquiring or improving safe and healthy shelter and infrastructure services.

## **Conclusion**

The tourism industry in the transitional economy of South Africa faces specific problems resulting from the rapid change in its social and economic systems. The rapid switch to a free market economy holds the danger of mis-development. Radical opposition to any type of government control over the economy may generate a free market euphoria, which may in turn lead to development jeopardising social security, resources and public welfare. On the other hand, the unbridled development of tourism can cause severe problems in the regions concerned, caused by uncontrolled growth of private transport, loss of bio-diversity, decline in agriculture or the exodus from rural regions.

These trends must be counteracted in good time by adopting strategies aimed at safeguarding sustainable development throughout and beyond the tourism sector. Time is a ripe to fix the framework conditions for such forms of sustainable tourism which:

- a) Helps to preserve the unique natural and man-made landscapes in these countries;
- b) Raises the quality of life of their population, and
- c) Improves the mutual understanding between peoples throughout the world.

# **Site Attractiveness and Sustainable Tourism: The Case of Perhentian Islands, Malaysia**

*Noraini Ismail*

*MARA University of Technology, Malaysia*

*Muhammad Jantan*

*Science University Malaysia*

## **Abstract**

The driving force of the tourism industry is represented by the attractions offered by the destination and that travelers have no reason to visit destinations that have nothing to offer. This paper examines the site attractiveness of Perhentian Islands in Malaysia by exploring the attractiveness attributes perceived by those who are attracted by them. As competition among tourism destinations increases and tourist funding decreases, it is of vital importance to evaluate the inventory of existing attractions and the perceptions that travelers have of those attractions [1] so that viable strategies can be undertaken to preserve their attractiveness. Whilst it is often asserted that tourism is an industry that provides an important source of income for many groups, nonetheless it can also pose a potentially serious environmental problem for others. This paper also investigates the impact of tourism development on the quality of life of the people on and the environment of both the islands.

## **Introduction**

The tourism industry is often asserted to be the largest industry in the world [2,5]. It employs approximately one in nine workers worldwide, comprising 6% of global gross national product (GNP) and, in many nations, (particularly in lesser developed countries) has been seen as a panacea for solving many social problems and for driving economic growth [3].

Malaysia, in 2003 had managed to reap almost RM22.1 billion (USD5.82 billion), [RM26.9 billion (USD7.08 billion) in 2002], in revenue from the tourism industry [4]. Although from one aspect this industry is said to contribute to the generation of income and the development of economy of a country, nevertheless from another it poses a potentially serious problem for others. The potential environmental and social impacts of tourism are significant, and although in the past tourism was almost always considered to be beneficial for both host and home countries, more recently the negative aspects have been recognized and more closely analyzed [5]. On one hand, local community involvement in the form of small-scale entrepreneurship may contribute significantly to the social and economic benefits for the sustainability of tourism. On the other, there is a likelihood of a number of socio-cultural and environmental impacts including small conflicts between operators and other evidence of evolution with positive and negative elements [6] that need to be examined for sustaining development.

The impacts of tourism are well known to the people in this industry so much so the notion of "sustainable tourism" appeared not long following sustainable development that was raised in the 1980s. Sustainable tourism suggests that proposed tourism developments should have economic advantages, create social benefits for the local community and not harm the natural environment [3].

## **Study Objectives**

This paper has two objectives. The first is to examine the site attractiveness of Perhentian Islands in Malaysia by exploring the attractiveness attributes perceived by those who are attracted by them. Factor analysis will be utilized in ascertaining the destination attributes influencing travel. The general purpose of factor analysis is to summarize the information contained in a large number of items into a smaller number of factors.

The second objective is to investigate the impact of tourism development on that island. This objective is to unravel elements (that exist from the perceptions of the local community) arising out of the development of the industry that are impacting its socio-cultural, socio-economy and environment make-up. To achieve this objective, analysis of a focus group interview with some individuals representing the local community will be conducted. Although a small discussion group will rarely be a representative sample, nonetheless this technique allows people to discuss their true feelings, anxieties and frustrations and to express the depth of their convictions in their own words [7].

## **Literature Review**

Tourism research has demonstrated that attraction studies are necessary in the understanding of the elements that encourage people to travel [1] and tourism phenomenon consists of two essential components: an origin and a destination. The first is labeled as the tourism demand (guests/tourists) and the second is described as tourism supply (hosts). The procedural analysis of site attractiveness generally begins with identifying a specific area. They are normally defined under administrative territories such as countries, states, regions or provinces. Usually, the bigger the area the more important its identification, selection and categorization becomes [8].

Tourists' attraction to a destination depends significantly on what that destination has to offer. Middleton and Hawkins (1998) [9] have reported that tourists want quality environment where preserved nature and heritage become the focus of their visit. Their research is supported by that of Swarbrooke and Horner (1999) [10] who saw an increase in the number of tourists referred to as "green or eco-tourists", who are inclined toward preserving the nature. Nevertheless, research by Buhalis (1999) [11] reported that pollution will occur when the exploitation of natural resources can no longer be curbed and as long as economic gains surpasses everything else.

Hu and Ritchie (1993) [12] found in their research that touristic attributes are of relative importance in contributing to the attractiveness of a travel destination since they will implicate marketing and development initiatives.

Subsequently Baloglu and Uysal (1996) [13] noted that if the interaction between the dimensions of "push" (the desire to travel) and "pull" (actual destination) motivations are known, then marketers and destination promoters in tourism should keep in mind when designing promotion campaigns, that the most successful products are those which respond best to a bundle of needs within a given market segment and should give more marketing efforts to matching a destination's major attributes to the tourists' diverse psychological needs.

Whilst tourism has been credited with providing a number of benefits to destination communities such as the generation of revenue and employment, regional development, and overall economic prosperity, there have also been growing concerns about its negative social, economic and environmental impacts [6]. Previous literature has reported with explicit examples of how tourism has contributed significantly to degradation of culture, compounding social problems like prostitution, nudity, crime [14], drug abuse, demonstration effect, and displacement of economic and industrial activities [15, 16]. Furthermore, local community involvement in the form of small scale entrepreneurship, although may contribute significantly to socio-economic benefits, its impacts however may give rise to conflicts between local small operators and those from outside the region [6] and create social distress.

Hence research energy should be channeled into practical ways of assisting all forms of tourism to move the industry towards sustainable development. This must include social and cultural impacts of tourism development [17].

## **Perhentian Islands**

The motivation to travel is normally influenced by the attractiveness a site has to offer. Perhentian Island is situated offshore about 21 km or 1.5 hours by boat from Kuala Besut at 108 km north of Kuala Terengganu, Malaysia. It comprises of Pulau Perhentian Besar and Pulau Perhentian Kecil. The two Perhentian Islands are rated as one of the most beautiful islands in the world [4]. Covered by exotic tropical greenery, sandy beaches and coral filled seas, it is undoubtedly a sanctuary to holiday seekers.

Perhentian Besar is the bigger island and there are resorts spread over two beautiful beaches, namely Teluk Pauh situated in the north part of the island and Teluk Dalam located on the island's south east coast. As for Perhentian Kecil, the most popular beach is Pasir Panjang or Long Beach as it is popularly known amongst tourists. Both islands are perfect for nature lovers and water sports enthusiasts and the best time to visit the islands would be between the months of May to October.

## **Methodology**

### **Data Source**

The study used data from a research study sponsored by Tourism Malaysia and prepared by the Planning and Research Division, Malaysia Tourism Promotion Board <sup>1</sup>. For the first part of the study, a total of 108 personal interviews averaging 15 - 20 minutes in length were conducted on both islands. Respondents were 15 years of age or older who are on a vacation trip at Perhentian Islands, selected systematically at random.

For the focus group interview, 6 individuals were interviewed in Perhentian Besar (the bigger island) and 7 individuals were interviewed in Perhentian Kecil. The individuals were amongst those who were resort managers, a teacher, a school principal, boat operators, a village head and a fisherman. The interviews were conducted in two separate occasions averaging 90 minutes per session. The participants were a mix of female and male.

### **Questionnaire**

The 19 items developed to determine destination attributes influencing travel intention (independent variables), and travel intention (dependent variable) were rated on a 5-point Likert-type scale ranging from 1 (strongly disagree) to 5 (strongly agree). Respondents were asked to rate whether they agree or disagree with the given statements when assessing the attractiveness of Perhentian Island as a tourist destination. This study examines the attributes adapted from Gearing et al., (1974) [18] involving the Islands' natural factors (general topography and environment), recreational and shopping facilities (water activities and gift shops) and infrastructure, food and shelter (highways and roads, safety services, hotels and vacation villages) that constitute the independent variables. The 6 items for measuring travel intention includes statements pertaining to the length of stay, extended stay, recommendation of the destination to others and intention to return.

### **Data Analysis: Site Attractiveness**

To determine factors influencing travel intention, the Statistical Package for Social Sciences (SPSS) was used in the analyses. First, Kaiser-Meyer-Olkin's test was run to measure sampling adequacy prior to conducting factor analysis. Factor analysis was utilized to group the 19 items into the above-mentioned attributes. Since there is a suspicion that these items are interrelated in a complex fashion, factor analysis was used to untangle relationships into their separate patterns [19]. Only items with factor loadings > 0.5 were selected. Following this, reliability analysis was conducted to ascertain the degree that the measures are free from error and yield consistent results. Variables having reliability measures of Cronbach alpha > 0.6 will be accepted for further analysis. Next, Pearson correlation analysis was used to measure the strength of linear association between two variables. Finally multiple regression analysis was conducted to examine the relationship between the independent and the dependent variables.

## **Results**

A demographic profile of tourists vacationing at Perhentian Islands indicated that 72 respondents (66.7%) identified themselves as foreign and 36 (33.3%) as local tourists; 55.6% were female and 44.4% male. A descriptive analysis of the respondents revealed that respondents were more likely to be single (62%) and most had received university education (67.6%). They represented all age groups: 49.1% between 25-34; 21.3% between 35-44; 12% between 20-24; 11% between 15-19; 5.6% between 45-54 and 0.9% between 55-64. A majority of the respondents (38%) was vacationing with friends, 29.6% with family and relatives, 16.7% as couples and 12% on their own. Out of the 108 respondents, 76.9% indicated that this was their first time at Perhentian Islands and there were 7.4% more tourists in Perhentian Kecil (the smaller island) compared to Perhentian Besar.

Table 1 below reports Kaiser-Meyer-Olkin measure of sampling adequacy and it depicts a value of 0.722 while Bartlett's Test of Sphericity denotes an approximate chi-square of 490.346 with a significance of  $\alpha=0.000$ . These indicate that there is sufficient number of significant inter-correlations amongst the items for factor analysis.

TABLE 1: KMO AND BARTLETT'S TEST

### Factor Analysis

Factor analysis conducted on the 19 item-statements measuring destination attributes noted the items grouping into 2 major factors. Table 2 below illustrates the extraction of the 2 factors. Only factor loadings > 0.50 were selected.

Extraction Method: Principal Component Analysis. Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 8 iterations.

Factor 1 relates to the elements of natural attributes of the general island topography like beaches, ecosystem and wildlife. However, it is interesting to note that this factor also incorporates the particular activities relating to nature like water activities and turtle watching, those which Gearing et al., (1974) identified as recreational facilities. Hence for this study this factor was named nature and nature’s recreational activities (NnRa).

Factor 2 is highly loaded with statements pertaining to physical facilities, transportation, food and accommodation, those that Gearing et al., (1974) identified as infrastructure, food and shelter. This factor was named infrastructure and facilities (InF).

Factor analysis was also run on the 6 items measuring travel intention and all items were loaded on a single factor, and show factor loadings > 0.5. Other factors were dropped, as they were single item factor that were typically unstable and would raise the question of reliability.

**Reliability Analysis**

After the factors were captured through factor analysis, reliability analysis was conducted on all the 3 major factors of nature and nature’s recreational activities, infrastructure and facilities (independent) and travel intention (dependent) in order to ascertain their consistency in responses. Table 3 below depicts the reliability analysis of these factors.

TABLE 3: RELIABILITY ANALYSIS

Variable	No of items	No of items deleted	Cronbach’s Alpha
Nature and nature’s recreational activities (NnRa)	12	6	0.780
Infrastructure and facilities (InF)	7	2	0.751
Travel Intention (TI)	6	-	0.833

All three factors indicate Cronbach’s alpha greater than 0.6 (which is normally the cut off mark for exploratory studies [19] ) and hence can be further analyzed.

**Correlations**

Table 4 illustrates the bivariate correlation between the 3 variables. The variable nature and nature’s recreational activities (NnRa) is positively correlated with travel intention and significant at the 0.01 level whilst infrastructure and facilities (InF) is also positively associated with travel intention (TI). Nature and nature’s recreational activities factor is also positively associated with infrastructure and facilities although weakly.

TABLE 4: PEARSON CORRELATIONS

	Mean	Std D	Nature R_activities	Infra-Facilities	Travel Intention
Nature_R activities	3.995	0.654	1	.251(**)	.575(**)
Infra-Facilities	3.629	0.755	.251(**)	1	.590(**)
Travel Intention	3.716	0.738	.575(**)	.590(**)	1

\*\* Correlation is significant at the 0.01 level (2-tailed).

**Regression Analysis**

In order to determine the relationship between the 2 independent and dependent variables, simultaneous regression using enter method was employed. Table 5 below depicts the regression analysis for the study. This analysis is to determine the best prediction of a dependent variable from several independent variables [20] once the independent variables are found to be correlated with one another and also with the dependent variable (Table 5).

TABLE 5: REGRESSION ANALYSIS

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics					
					R Square Change	F Change	df1	df2	Sig. F Change	Durbin Watson

	NATURE_A	.897	.260	.795	3.446	.001
	FACILITI	.926	.306	.948	3.021	.003
	INXNIF	-.119	.077	-.655	-1.541	.126

a Dependent Variable: Travel Intention

From table 5 above it could be seen that nature and nature’s recreational activities on its own contribute 33.3% of the variance in travel intention and it is a significant predictor. Also, from the R Square Change statistics and the significant F Change Value, it is noted that infrastructure and facilities makes a significant contribution of 21.2% to the variance of travel intention after nature and nature’s recreational activities. When both independent variables are entered into the regression, both become significant predictors. In other words, nature and nature’s recreational activities on its own, is a salient predictor of travel intention and its effect is also significant in combination with infrastructure and facilities. However the impact of infrastructure and facilities ( $\beta = .476$ ) is greater than nature and nature’s recreational activities ( $\beta = .455$ ) on travel intention (Table 5a). Furthermore, the impact of nature and nature’s recreational activities and that of infrastructure and facilities on travel intention are

independent of one another (Table 5b). Hence tourists' travel intention is primarily more dependent on the availability of basic infrastructure and facilities and its attractiveness is further enhanced by its nature and nature's recreational activities.

**Data Analysis: Focus Group Interviews**

Based upon the normal qualitative process of data analysis, a few important themes could be highlighted with respect to the positive or negative impacts of tourism development on the islands of Perhentian. Fig. 1 illustrates these impacts and the subheadings that follow dictate the comments given by respondents on the various issues.

**Attitudes**

Tourists present themselves in many colors of behaviors and it is up to the local community to interpret these colors as acceptable to and fitting their norms or otherwise. As quoted by Respondent A from the focus group interview, "It depends on us on which examples we could emulate from these tourists. Skimpy dressings which is their normal dress code but against our culture and religion, need not be followed. But behaviors like keeping the surroundings clean (some foreign tourists even go to the extent of keeping banana skins in their pockets until they found a dustbin to dispose it, a good example to follow), killing time reading, we could learn something from that".

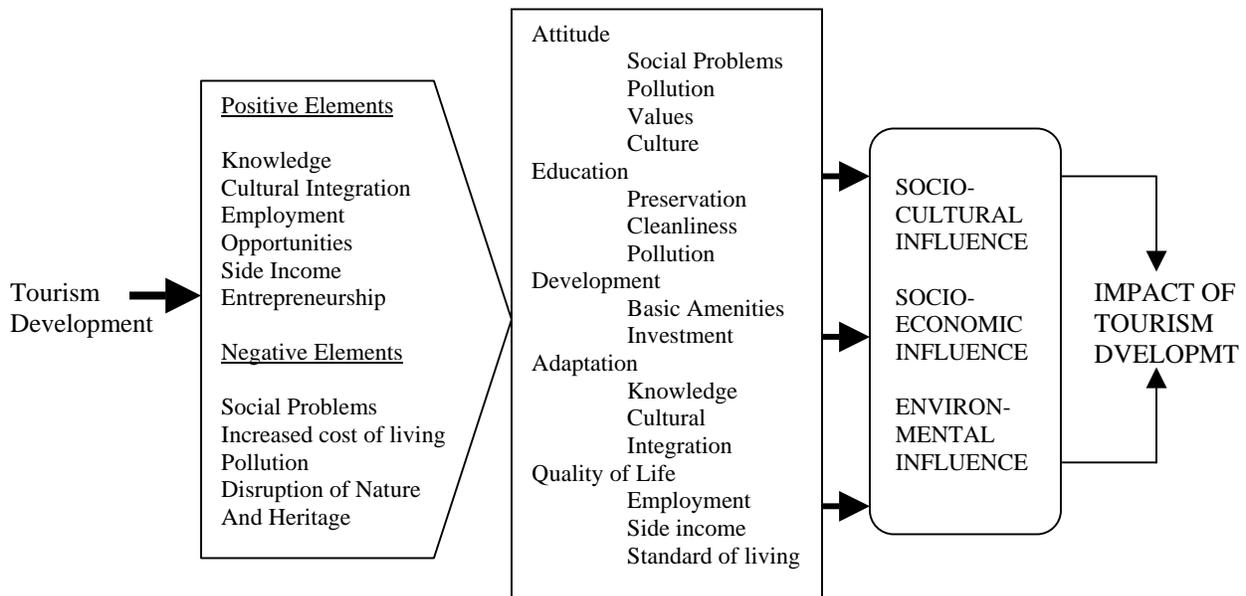

FIG. 1

**Adaptation**

The ability to adapt to the development of the tourism industry constitutes an important factor. For example, the opportunity to opening up new businesses, learning new cultures and integrating knowledge from foreign tourists flooding the islands calls for the local community to go for a paradigm shift in this industry. From what had been gathered from Respondent B, "Local youths have become more enterprising when they see viable business opportunities that can be tapped. They tend to learn and adapt to the wants and needs of these tourists when offering their services". However, Respondent C seemed to think otherwise. According to her, "We see many chalets being erected to support this industry but we also see tons of wastes being generated as a result of this development".

**Education**

There are certain things that people can learn from each other, and the local community of Perhentian islands is no exception. In order for them to be able to assess if the invasion of foreign values have left a devastating impact especially on the second generation of the islands' population, education and the process of educating play important roles. As reportedly quoted by Respondent D "I suppose we have to start educating our children at a very young age regarding cleanliness and the preservation of our natural environment" and supported by Respondent E "In fact I

was scolded by a tourist to stop open burning, it shows how high their level of awareness regarding the preservation of the environment is”.

#### **Quality of Life**

With the correct exposure and the zest to tap opportunities, a better quality of life is indeed possible. For locals, the arrival of tourists had opened up a myriad of business opportunities. Many were enterprising enough and had become chalet owners, boat operators, stall operators and many more have seek employment from resorts. As mentioned by Respondent F, “With the establishment of resorts and chalets, people that we know are being employed”. In addition, “The Fishery Department is issuing licenses to local fishermen to transport tourists and this is good income to them” added Respondent G. “On the other hand, quipped Respondent H, the time supposedly spent with the family is taken away because of the long working hours”.

#### **Development**

The people of Perhentian islands hope that in the midst of supporting the tourism industry, a balance development is attained. Although the construction of resorts and chalets are being welcome, nevertheless, basic development for the local community of Perhentian islands is long overdue. For example, as mentioned by Respondent I, “ We worry sometimes about the medical facilities available on the island. If something were to happen and requires immediate attention regardless whether you are a tourist or a local, I think it’s going to be a problem.”

People of Perhentian also voiced their grievances especially with regards to basic amenities. Said Respondent J, “Every time the tourists come we have interrupted water supply and this goes on until they are gone”. Added Respondent K, “We hope there will not be big ferries. We don’t want Perhentian to be another Langkawi island where the development phase is very rapid and it becomes over commercialized”.

## **Discussion and Implications**

The motivation to travel is indeed influenced by the attractiveness a site has to offer. Although motivation is only one variable explaining tourist behavior, it is regarded as one of the most important variables because it is an impelling and compelling force behind all behavior [13]. Furthermore, to effectively market a particular destination, it is necessary to understand factors influencing destination attractiveness and the strength of interaction between these factors in influencing its attractiveness. An understanding of its interaction in influencing site attractiveness may then provide a basis for segmenting those travelers and providing an innovative way of reaching out to them.

Interestingly, factor analysis revealed that items relating to the general island topography together with the items relating to the type of tourist activities are bundled together into a single factor. We suspect that this is a result of an immediate and simultaneous outcome of the attractiveness of the destination. In other words, it is obvious that the activities tagged to the site attractiveness must naturally be site specific, but it is even more profound when satisfaction of these attractions can only be derived if both are enjoyed simultaneously. Perhentian islands offer a myriad of factors and activities capable of alluring tourists. Their beaches are still highly rated, its natural surroundings are still preserved and some of its corals and ecosystem are still in its virgin state. Vacationing at Perhentian without dipping into its waters and being immersed in its water activities is definitely a sin. Like the nails on our fingers, these activities are inseparable. Hence when promoting Perhentian as a destination spot, in addition to advertising the beauty of the islands, and in order to attain a meaningful vacation, tourists must directly be involved with activities that the islands have naturally provided.

Evidently this survey portrays that tourists seek various attributes of a destination to satisfy their travel pleasures. They seek to satisfy not one single need but a multiple of distinct needs simultaneously [13]. The findings of this survey had significantly shown that 2 major factors; (1) nature and particular recreational activities ubiquitous to any general island topography and (2) infrastructure and facilities, are salient attributes in pulling crowds into Perhentian islands. Although their natural environment in itself is instrumental for site attractiveness, nevertheless primary emphasis must be given to the provision and maintenance of its infrastructure and facilities (quality public amenities, better jetty and physical facilities, efficient transportation system and a wider spread of local cuisine). These combined attributes will make Perhentian islands appealing to tourists and vacationing for tourists more memorable and worthy of their stay. Thus, this is one of the reasons why some islands that have the

potentials of a tourist destination are not because of the absence of basic amenities, infrastructure and facilities. The findings revealed seemed to support Baloglu and Uysal's push and pull motivations. As such local authorities and relevant bodies must cooperate and collaborate with the local community to ensure that the islands' heritage is preserved. One of the ways is to ensure that basic amenities and facilities are well constructed, and the system of sewer and waste management is properly in place before making way to tourism.

Unfortunately however, the current focus of tourism destination development does not address many of the broader social, cultural and community aspects of sustainability [5]. Destinations like Perhentian islands may receive only a small return for the exploitation of an increasingly scarce resource – its natural environment. But such destinations not only bear costs in terms of environmental degradation when paving ways for tourism development, in fact due to their low level of development, these islands can rarely afford restorative measures. In Penang (another island in Malaysia) for instance, the grouse of the local community is that the State government will only develop infrastructure if it affects tourist industry while neglecting their needs. Often locals complained that during holidays, the traffic gets so congested that locals are quite against the expansion of the tourist industry. Hence local government must educate the locals to be more aware of the economic benefits of tourism and must develop projects to benefit the locals first.

Subsequent findings from the focus group interviews have revealed that although tourism brings social benefits by widening peoples' interest in world affairs and a new understanding of foreigners and foreign tastes, it also creates social problems, and this is in tandem with the findings reported by Khan et al., (1990). As such, in addition to the costs borne due to environmental degradation, these islands also bear social costs of nudity, drug trafficking, explicit sex, and crime, thus risk values and cultural erosion of their local community when doors are opened to the world without adequate preparation and education. Whose responsibility is it to monitor such menaces and address the predicaments of the local community? Who will pay for the future of our children and their children after theirs that have been contributed by tourism to the bastardization of their culture?

We agree with Welford, Ytterhus and Eligh, who noted that issues of sustainable development focus primarily on the supply side and neglect the influence of the demand side. Tour operators have had considerable influence on the way tourism has developed over the past 30 years in many destinations. They contribute directly and indirectly towards the negative environmental and socio-cultural impacts due to their short-term objectives towards destinations and the overriding concern for financial success. Hence to achieve incremental and sustainable benefits for hosts and guests, a greater level of participation is required by both the supply and the demand side. While the supply side needs to take responsibility for the planning, organization and implementation of a coherent and sustainable tourism policy, the demand side may need to focus more on the issues of education and respect for each destination and its idiosyncracies.

## Conclusion

The findings of this study suggest that there is a significant relationship between destination attributes and the intention to travel. It also suggests that we need to strike a balance between the benefits (social, cultural, and financial) and the cost of tourism development (host and guests). Poor policies and lack of sound tourism development strategies may invite a holocaust from over development and oversupply. This implies that the trajectory the tourism industry should take must be in tandem with sustainable development.

## **Abstract**

In the era of Hi-Tech fastest ever changes, creation of Global Competitive Advantages, Sustainable development, competition at war footing, fastest ever knowledge transformation and many uncertainties managing business has become the game for those JUGGLERS who can effectively and efficiently handle the multifaceted Balls moving without a single fall. This jugglery requires every corporate manager to be like a master-craftsman who creates only masterpieces every time and achieve the best always. In the changing scenario and context, every resource is governed and managed by supreme resource i.e., the human resource. The human resource are gifted with tremendous competencies, capabilities and unlimited creativity along with potential. The organisations, which have identified such power and have realized the vitality of their human resource are nurturing the human factor as a center of all activities and are reaping the fruits of success in every parameter at every dimension and at each level in the knowledge driven economy. Be it a private or public sector, a manufacturing or service industry, a domestic or multi-national corporate, every industry today is now enlightened to accept the strategic importance of human power which has the Herculean power to visualize, accept, apply, speed-up and mould the change drives within an organization. The human power can be seen as vision-builders, change masters, alliance managers, relationship-builders, reformers or organizational architects, who can lead the organisation from the front desk and can make it forge ahead even in the turbulent environment. Keeping such scenario in consideration, a case study on “Continuous Learning Environment (CLE) is being presented by authors which brought HRD excellence Award at National level which is a movement, a way of life, a breakthrough in sustainable development effort.

## **Introduction**

Hindustan Zinc Limited (HZL), an internationally known market leader in Zinc and Lead metal production in India, became a member of Sterlite Group, another Group with strong presence in Non-Ferrous Metal Industry in the Country, in April 2002, pursuant to the disinvestment process of Government of India. The Company has its own Mines and Smelters, located in seven different places and currently employs over 6000 employees.

HZL continues to be a profitable company since inception; since privatization in 2002, it has further improved its production and profitability in the last year. Already, the company has initiated steps to double its Zinc and Lead production in next two years, with associated expansion of its Smelting and Mining capacities.

## **Backdrop**

The key concern post disinvestment was to manage change and anxieties in the minds of people on the one hand and to also challenge their abilities to achieve much more than whatever the people and processes have achieved so far. One of the key components of this was imparting “new knowledge” that is available at global level; another aspect was to make people own and accept this and operationalise the knowledge acquired thus.

In case of executives, we took up strong and effective steps to put in place executive education programs and cover more than 1100 participants through these programs. Apart from this, we also identified various critical projects within the Units, which were to de-bottleneck the operations and increase production, productivity, all of which were taken up by the executives. Last year, more than 108 projects, involving over 400 executives worked together and made significant difference.

In case of workmen, the above approach was found to be slightly difficult. We had the issue of multi-locations and also the apprehensions in minds of workmen post privatisation. It was felt that a prescriptive approach to learning would have had much less acceptance at the learner level and thus would have failed. Also, the sheer number of people to be covered was enormous. Another aspect was that most of the workmen have been doing their roles over many years and if we started off from the company to identify gaps and offer training, this could also create a negative feeling, as the unions and workers could perceive this effort as an exercise to isolate people with lesser competence and deal with them differently.

All this, created a challenge for us. The need was to create a method of identifying training needs without being prescriptive and also to create a method of learning delivery that encouraged people to come out in the open and embrace new learning without barriers.

Clearly, this then meant that we needed a model, which focused on “adequacy” of employees to know what they know and also what they do not know and an acceptance that people are OK in their roles and if any improvement we wanted to offer, it was just to make their work on the roles, simpler, enjoyable and effective. We decided consciously to avoid focus on productivity improvement as a goal. We also felt this should be a collective process with ownership at the shop floor level. Another conscious decision we took was to avoid talking of change in “attitude” which would have then made people think “public sector” versus “private sector”. Hence our focus became only “knowledge and skill”. In nutshell, we decided to depart from a standard process and experiment with an open-ended model, which had both the learners and the teachers together in it.

## **The Concept Stage**

We started to work on the above approach and could not come across a similar experience elsewhere in any other industry, to the best of our efforts. Then, we decided to start this as a pilot in one of our Units. We chose our Vizag Smelter as the unit to start this process

Vizag smelter produces around 45,000 Tonnes of Zinc in a year and currently employs about 800 people (734 workmen & 79 executives). When we started the new learning process, the Unit employed close to 1000 people. We identified a few major steps in initiating the process as below:

- Getting the opinion and buy-in of most of the workers, peers, union office-bearers, first line executives and the managers
  - This was necessary to allay any apprehensions or misinterpretations later on and also to get their views on the approach
- Based on the opinion / inputs of the above process, design the methodology for obtaining the training needs data from people
  - Respective groups of workers in a function / department to collectively reflect and indicate areas of competence that make a difference in the jobs being done in that department
- Consolidate the data and group them in relevant manner and discuss with front line supervisors and managers
- Work with the groups of workers to identify the resource person, who, in their perception were the best suited to deliver the knowledge / skill
- Getting these resource persons together along with the first line supervisors and managers to finalize the plans for “Learning Delivery”
- As most of the resource persons would be shop floor workers, who may not have the expertise to teach, we decided to put in a module where these resource persons would be trained on “teaching methods”
- Then the next step was to document the task that each of resource persons would carry out and to ensure that there is a mechanism which took a sustainable care of the learning process
- Then the actual commencement of learning – teaching at shop-floor

Even though we charted the above process, we were apprehensive about this process-taking root in a significant way.

## **The Initial Steps**

As this involved massive and new effort, we put one of our HR Managers with training background to be full-time co-ordinator, facilitator and implementer of this process. He was stationed at Vizag and was responsible to evolve a workable process.

## **Buy-in Phase**

The co-ordinator first met the senior management team of the Unit and explained the approach. Most people felt not so enthusiastic about the success of this; however, they agreed to support.

The second effort was to meet the union representatives – here, the apprehensions like use of information to separate people with lower competencies, use of data in future VRS, what will company give if productivity increased and so on had to be answered. This almost resulted in making this initiative as an initiative not driven by Personnel Department. We promised that information given is purely for planning the learning and not for any other use. We also agreed that any worker who felt like not participating, we have no issues and there would be no stigma on such persons.

The third step was to move to shop-floor workers and first line managers and talking about this approach. Here, after initial phase of doubt, we got the real breakthrough. Suddenly we could see lot of enthusiasm and an expectation that we genuinely would like to work with people.

With this feedback, another round of meetings and discussions were held with the Managers, Senior Management team, and Trade Unions. This time round, we got the support of these people also in full. This then encouraged us to move ahead. We decided to start with only the shop-floor workers and leave out office people in this process.

## **Data Generation Phase**

We got workers from each identifiable work area / function in groups and along with their first line supervisors and brainstormed on how to go about mapping the areas for learning. This lead each group to identify in broad terms, the tasks / activities about which people working in that group need to have knowledge / skill. This became the base fabric for next step. Nine such broad functional areas evolved.

Based on these inputs, we designed a format listing the areas of “competence” as identified by the Group and also left many open rows for individuals to come-out with any other area that they may like to add. These formats were distributed to 685 workers, asking them to indicate the areas of learning that they would like to have, to make their job simpler, enjoyable and effective.

After initial hesitation, this exercise of filling the forms became an overwhelming and exciting process for all workers. There was cross-consultation and participation of peers and across departments etc. At this stage, lot of enthusiasm and significant level of participation occurred. A general sense of good feeling evolved and even the Managers expressed a feeling that this is something unique. This then further strengthened the process and support from managers and unions.

From out of 685 workers, 671 workers submitted their forms. 14 workers did not submit. This was clearly a question people were watching as to what we would do with those 14 who had not given the forms. We advised our managers and front line supervisors, not to even ask them why they did not fill the forms. In fact we made it clear that it is ok for some people not to seek any learning and we have no issues with it. When we established this clearly, acceptance of our process as non-threatening and non-prescriptive increased. Another off shoot of this process was, even among the workers, some of them took the lead to complete this process and emerged natural leaders, some of whom later became teachers also.

### **Data Consolidation & Finalization of “Teaching” Process**

All the information so received through formats were consolidated in a Computerized form and analysed for grouping according to the broad areas / disciplines. This was massive in the sense that we were dealing with 107 training areas covering 671 people. Even in this process, we had interesting experience. Seeing the enthusiasm generated among the shop-floor people, many of the young first line managers voluntarily joined this phase and some of them worked day and night to complete the analysis and grouping work.

This consolidated list was sent to respective first-line supervisors who, along with those workers who took lead in the data collection process. They together segregated the major sub-areas of the list and identified the concerned workers in each sub-group and then organized meetings and shared the outcome. In this process, the concerned group came out with (1) Training / teaching methodology, (2) Duration of such training & (3) Name of resource person for each specific area, from among his own colleagues. This was captured in a format. Here, we again departed in letting the Learner choose his Teacher, instead of the traditional mode of we choosing the Teacher. Also, with the Teacher being a co-worker, all apprehensions or hesitations that might have stopped the worker from seeking or sharing his concerns got addressed effectively, even in design stage.

This information was again re-processed and re-grouped and final document prepared indicating the individual wise – areas of learning, period of learning and persons responsible for teaching. Also, as a result of the above process, 93 resource persons were identified. As these resource persons did not have any teaching experience etc., the groups identified 56 trainers, who were to train these 93 Resource Persons. The Resource Persons were named “Champions” and were then trained by the Trainers and also by the Project Co-ordinator in teaching methodology etc. This was to create confidence among the resource persons.

### **The Implementation Phase**

With trained Champions covering all areas of training needs identified with the involvement of almost all the workers, the next step was to implement this process. By this time, the process got christened “Continuous Learning Environment” (CLE). Fig. 1 is a summary of the step-by-step journey to CLE process. In a meeting with the Champions before commencement of actual teaching etc., a point came up about knowing the benefits of the teaching / learning efforts. The Champions suggested that they would take an “objective type written test” of their trainees before training and after training in each concerned area and establish the learning or otherwise. They also suggested that we must track improvement in performance on the job over a period of time. This resulted in generating an evaluation format to guide people towards documenting this.

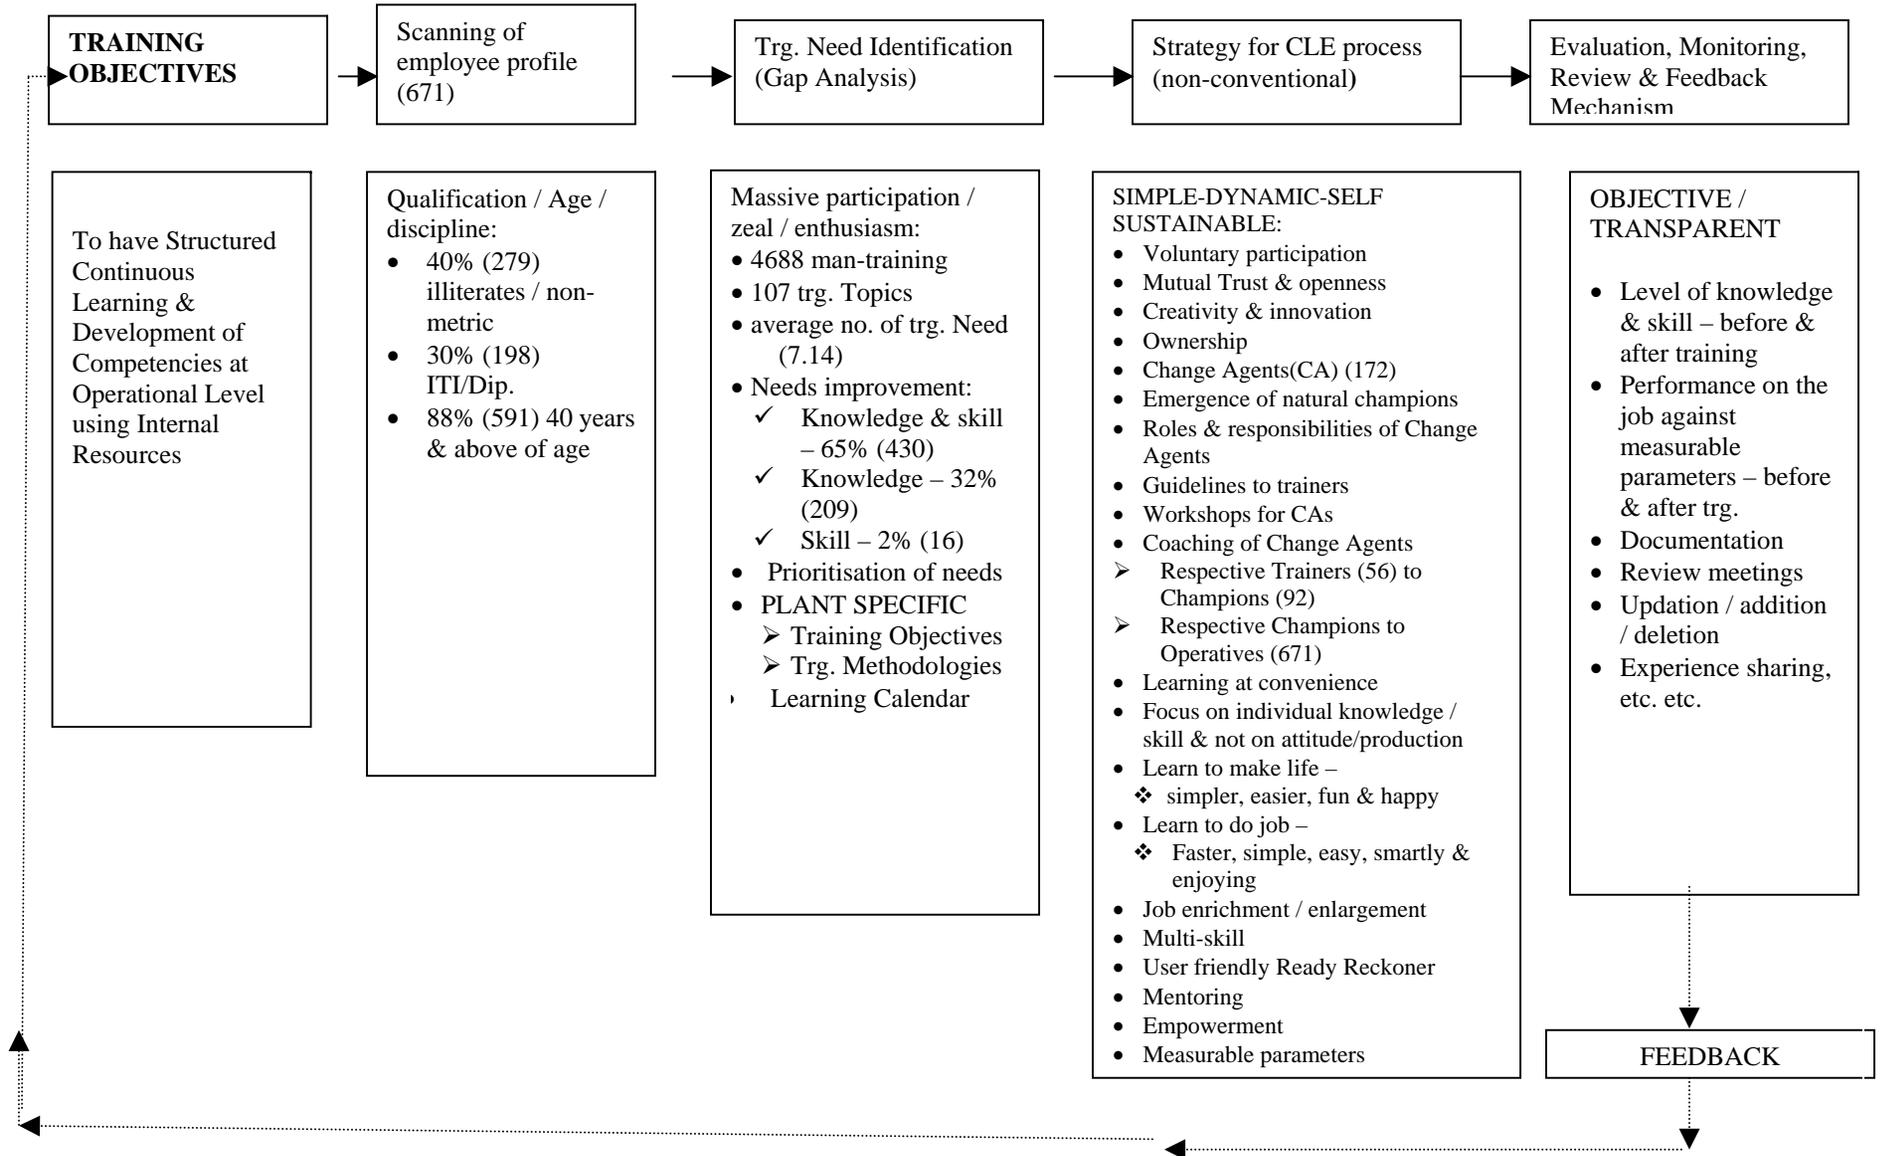

Normally, in various company programs, if any internal resource person was utilized, company gave a honorarium of about Rs.200 per lecture. This issue came up before all the Champions and the co-ordinator and it was a pleasant departure where all agreed that CLE cannot be into this mode. The Champions were clear that they would willingly and voluntarily offer their services and not for any honorarium.

Another issue was the venue and timing for teaching. It was clearly brought out by champions that, being a knowledge and skill program to facilitate people on their jobs, such a training need to be close to the workers and flexible in its timing. This then made us jointly agree to “Teach any where and any time”. One more departure was made in letting the learner and teacher choose where, when and how they would teach/learn. This also loosened up all apprehensions of the First Line Managers monitoring etc.

The last step was to put in place a management support process. This we achieved by identifying Owners and Implementers, who were typically the Department Head and Functional Head. With this in place, the process started off on 15<sup>th</sup> October 2002, just after 6 weeks of our commencement of the journey.

While the process was to start simultaneously in each Function / Department, we found that some were taking greater interest and moved very fast. In some cases, there were difficulties like “we cannot spare people” or “we do not have time at present” etc. Feeble suggestions came that we should talk of some time-off etc. from some first line managers and a few workers. When we discussed this with Champions and First line managers on this, it clearly emerged that we should not offer any time-off concept but motivate the managers of those departments to

FIG. 1: STAGES OF EVOLUTION OF CLE

spare their people as and when possible to complete the learning, which will only benefit the concerned departments. The Champions also suggested that they will teach their “learners” before or after normal duty hours and even in informal contexts like in houses, rest-rooms etc. It was clear that the “Champions” felt responsible for their trainees and were confident of making their trainees get the desired knowledge in whatever manner possible. It is a sight to see champions and learners sitting and working after their shifts, in canteen, in restrooms and even at house in some cases.

As a result of this, till March 03, 404 workers have been trained through 155 programs, covering almost all areas identified by the individuals. Others are being covered now. The table at Annexure V summarises the progress made till March 03 in respect of improvement in knowledge/ skill and also performance against measurable parameters.

As shown in fig 2, the whole approach has been graphically depicted with a slogan “Development of the People, by the people and for the people” and displayed at prominent places in the Unit. It has become CLE and every worker knows what it is. We have been meeting the champions, owners and implementers regularly and have obtained their feedback as well as from the learners. The most important part of this whole process is that – this is not top driven and actually, the Champions now drive this process. In effect, we believe that we have created a sustainable learning model.

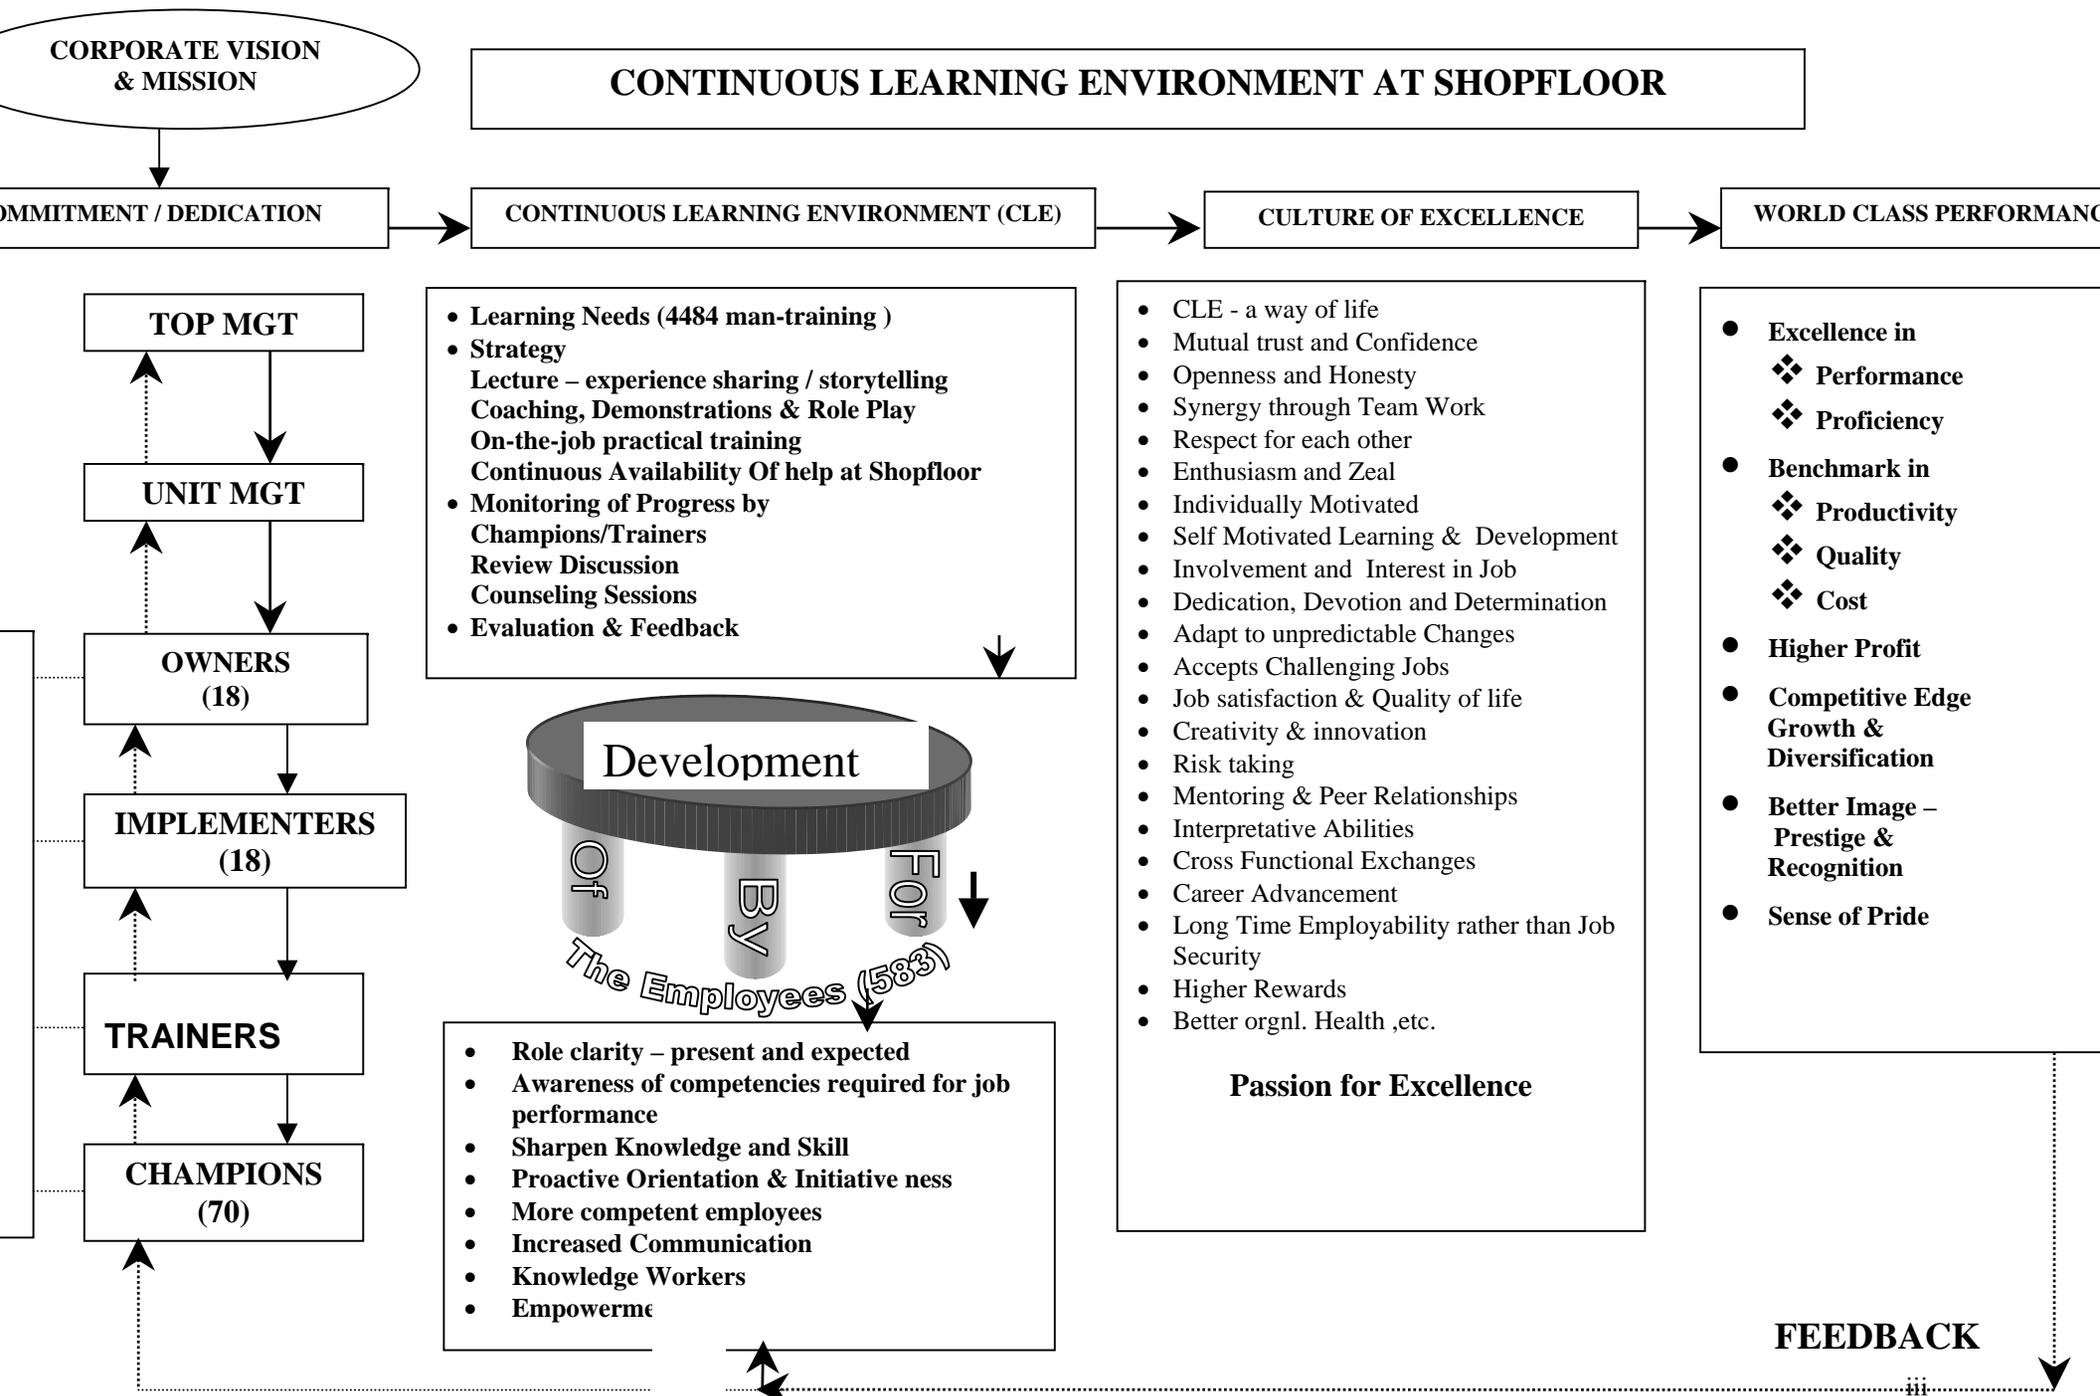

### **Benefits of CLE – A Few Indicative Tips**

Many successful experiences / benefits are being reported from different shop floors regarding implementation of creative & innovative ideas – small and big – making everyone a feeling of achievement and satisfaction. A few indicative tips are:

CLE has -

- Become a platform for effective communication among all levels/ voluntary participation to improve skills and knowledge
- Brought more people together, improved team spirit & increasing trend in competency level
- Created enthusiasm among employees to know more about their area of work and activities
- Become an effective hrd tool for change management, innovative approach, competitive spirit, positive attitude, etc..
- Created atmosphere for learning, mutual trust, role clarity, belongingness, cost consciousness & responsibility sharing
- Awareness about why, what, who, how and when of plant operation has increased
- Employees willingly taking more responsibilities, initiativeness, develop multi-skill and more faster & smarter
- Record production, productivity & profitability even with reduced manpower
- Improved recovery efficiency.
- Innovative approach for the jobs, better house keeping, reduction of downtime, learning of interdisciplinary skills, spontaneous response for attending problems of other sections, etc.
- Improved work culture & reduced absenteeism
- Cle prepares operatives to meet the changing scenario, removes road blocks in the mind set, etc. Etc.
- Cle now spreads to non-planned areas
- Words not enough, one has to feel the difference.....

.....**ONLY A BEGINNING.....STILL A. LONG WAY TO GO.....**

## What Makes CLE Process Better than Traditional Training:

Table 1 summarises the important features of the massive grass root level learning movement which make CLE process better than tradition training.

TABLE 1: WHAT MAKES CLE PROCESS BETTER THAN TRADITIONAL TRAINING

Parameter	Traditional training	CLE Process
Initiative /Ownership / Drive / Interest	Management	Grass root level operatives/ Learners
Resource person (s)	External trainers/internal front line Engineers	Competent colleagues from the shop floor volunteered themselves
Honorarium/fee to faculty /Financial implication	Yes, Sizeable amount	No – self motivated
Focus	Group size of 20-30	Individual care & collective approach
Training	Formal	Voluntary (autonomy)
Place	Class room + training aids	Work place / mutual convenience
Time	Scheduled by management	Flexible / mutual convenience
Learning	Structured – one time	Unstructured – continuous – learning with fun & self convenience
Content	Management / Trainer	Individual concerned
Methodology	More theory/behavioural – group centred	More practical – individual centred
Responsibility /ownership	Management	Learners
Interest taken	Management	Learners
Objective of training	Limited emphasis / clarity	Clarity & collaboration
Participation	Limited & sponsored	Active & voluntary
Problem solving	Limited	Synergise creativity & innovation
Decision	Centralised - rigid	Empowered & participative - flexible
Communication	Filtered / limited	Free-frank-open-transparent
Interpersonal relations	Limited	More – multiplying effect, promotes harmony
Competency level	Ignorant	Awareness of competencies – present & expected
Availability of Learner/Trainer on-the-job / after training	Nil / little	Continuous availability of help at shop floor
Application of learning on the job	Not readily known	Evident and continuous
Continuous hand holder learning	Not provided	<b>Is the way of life</b>

During the National level competition held in New Delhi on 31 July, 2003, the eminent panel of judges expressed that the CLE process emerged as a grass root level learning movement is a powerful innovative HRD concept. They strongly recommended for its introduction and institutionalisation in other organisations also.

Right now, our focus is on bringing up the knowledge of our Champions to the next level, by exposing them to new ways of working etc. in relevant areas and they becoming our change agents. The most interesting feedback we receive from many managers is that “people’s attitude on their jobs has turned positive and good”. This we feel is strengthening our belief that a competent and capable team will have positive attitude.

We now have requests from the learners to move ahead to new areas of learning; in our typical sense, these are areas of multi-skilling. We now feel if we offered these learning, our desire to make most of our workers multi-skilled will fructify faster and with minimum difficulty. By not focusing on any financial reward system linked to learning or teaching etc., this has remained a pure “education & learning” process. This has brought out Voluntarism from the people and today, many of the learners want to be Champions. In fact, even today, some Champions are also Learners. We feel that we have established a healthy manner of knowledge dissemination on a voluntary and sustainable basis in this process.

## Conclusions

The path-breaking CLE process provides a dynamic and innovative learning platform for the individuals to excel and derive pleasure and pride from being recognized in the organisation as well as in the family and society. It is a collective process with ownership at the shop floor making the roles simpler, enjoyable and effective.

It is now time for CLE to move to next level, where every individual in the organisation is able to build a competitive spirit – the spirit to excel on one's own achievements. The most powerful path to success is to exceed one's own achievements every time. We have to compete with ourselves and not with anyone else. The spirit of self-propelled focus to do better everyday on everything that one does would make the person to enjoy every moment of living. CLE is capable of delivering this great knowledge and skill to make each of us compete against our own best, every time we attempt something. In short, CLE could lead each of the members to lead their lives powerfully and in an enjoyable manner.

# The Emergence of Korea's Aggressive Legalism in the WTO and Implications for the 'Post-Developmental State'

Sungyoung Kim  
The University of Sydney, Australia

## Abstract

There has been a *dramatic shift* in the foreign trade policies of Korea since the emergence of the World Trade Organisation (WTO) in 1995. What does this *dramatic shift* look like and how can one explain this new strategy led by the Korean state? Does this strategy shed new light on the changes occurring in the emerging 'post-developmental state'? These are the key questions which this paper addresses. This paper argues that Korea's new foreign trade policy is best described as 'aggressive legalism', a concept originally applied to Japan. Under the WTO, Korea's 'aggressive legalism' is requiring the state to adapt and play an evermore active role in three principle areas: defending developmental institutions, implementing WTO rulings and commitments, and litigating on behalf of national industries in the WTO Dispute Settlement Unit (DSU). While the core ingredients of the developmental state no longer resemble what they were in the high-growth era, a 'post-developmental state' which adapts to challenges in the international political economy such as the rise of the WTO, is emerging.

## Introduction

If the developmental state in Korea and Japan no longer exists or has significantly changed, what is this new 'post-developmental state' called? This is the puzzle that propels the research conducted for this paper. Since the bursting of the bubble, Japan scholars have for long focused on the perennial question of: how can the Japanese economy return to high levels of growth? Since the financial crisis of 1997-1998, scholars of Korea have also focused on a similar question: how can the Korean economy be reinvigorated to achieve the growth rates of the 1960s and 70s?

These are important questions and the answers have grave implications but an area which has received scant attention by scholars has been in the *dramatic shift* in Japan's foreign trade policies under the World Trade Organisation (WTO) best described as 'aggressive legalism'<sup>1</sup>. What has received even less attention has been the *dramatic shift* in Korea's foreign trade policies since the emergence of the WTO. Such changes deserve greater attention as it may provide insights into the new economic model emerging in post-developmental states and more generally, the continuing relevance of the state under supranational organisations such as the WTO.

Thus the aim of this paper is two-fold. Firstly, to demonstrate that the concept of 'aggressive legalism' is not peculiar to Japan but can be extended to describe the dramatic shift in Korea's foreign trade policies. This is about using the substantive legal rules embodied in the WTO as a 'shield' for controversial domestic policies and as a 'sword' to attack the perceived unfair practices of trade partners. Secondly, to show how Korea's use of the legal rules as a 'shield' and 'sword' reflects the adaptation of the state to changes in the international political economy such as the emergence of the WTO. This provides clues specifically in terms of what the emerging 'post-developmental state' may look like and more generally, the future role of the state in governing the national economy.

This paper proceeds as follows. I begin by defining the concept of 'aggressive legalism' as originally applied to Japan. Following on from this, I apply the concept of 'aggressive legalism' to describe Korea's dramatic shift in foreign trade policies by tracing out the evolution of this strategy. I then discuss in detail a selection of WTO cases involving Korea that demonstrate how the state in Korea is using WTO rules as a 'shield' to continue developmental policies and as a 'sword' in the domestic arena to implement reforms in politically controversial industries and in the international arena to legitimately challenge the perceived unfair practices of trade partners. I then make clear the significance of 'aggressive legalism' for shedding new light on the emerging 'post-

developmental state' model in Korea. The final section states the implications of these findings in the much broader globalisation debate. I will then offer a conclusion to this paper.

## **Japan and 'Aggressive Legalism'**

Works by Saadia Pekkanen have been leading in bringing to light Japan's emerging trade strategy through the use of the rules of the WTO. Japan acceded to the GATT on 7 June 1955 but had very little importance to Japan's foreign trade policies. From 1955 to 1986, Japan avoided the GATT's dispute settlement and aimed instead for bilateral resolutions before the complainants requested the establishment of a Panel and this is true for all 11 cases which involved Japan as a defendant. Only in one case was Japan forced to appear before a Panel involving import restrictions for leather, the outcome of which there was an adverse ruling. As a complainant, Japan only initiated four formal disputes until 1988 (Pekkanen 2001: 709).

It was not until 1988 that Japan won its first case in a Panel ruling as a defendant. Canada had complained against Japanese tariffs on Canadian lumber while allowing 'like wood products' enter freely from the US. The Panel found that Canada had provided insufficient evidence to show 'like products' and that the Japanese tariffs had specifically been designed to discriminate against Canadian lumber exports (Pekkanen 2001: 710).

It was this case which began a change in attitude towards the use of legal rules as a source of international power. Firstly, during the 1990s officials in the foreign trade policy establishment located in the Ministry of International Trade and Industry (MITI) and the Ministry of Foreign Affairs (MOFA) began to push for a strengthened dispute settlement process in the Uruguay Round. MITI officials in particular supported this as a way of constraining American unilateralism (Kahler 2000: 563). And secondly, from 1992 the Subcommittee on Unfair Trade Policies and Measures under the WTO Committee of the Industrial Structure Council, which is an advisory body part of MITI, began to produce a report on the WTO 'consistency' of Japan's trade partners. This purpose of this report was to evaluate foreign trade policies and measures as that embodied by the rules of the now, WTO. Thirdly, in terms of administration, greater human resources were invested into establishing WTO legal expertise across various divisions. All three changes signify a change of attitude towards using legal rules to contend with trade partners (Pekkanen 2001: 712).

Pekkanen (2001: 707-708) is the first to coin the term 'aggressive legalism' to describe the emergence of this strategy. This new strategy 'is not about the oft-heard distinction between bilateral and multilateral approaches to dispute resolution. Rather, it is far more precise and constraining, because it is about the use of the international legal rules'. Japan's new trade strategy is based on using the rules of the WTO to counter the perceived unreasonable actions of its foreign trade partners. The WTO agreements and treaties are being used as instruments of power and means of persuasion against trade partners in a totally legitimate manner as is allowed under the WTO. Legal rules are being made to matter in Japan's trade diplomacy. Aggressive legalism then, is 'a conscious strategy where a substantive set of international legal rules can be made to serve as both 'shield' and 'sword' in trade disputes among sovereign states' (Pekkanen 2001: 708).

If Japan's new foreign trade policy can be described as aggressive legalism, is this only applicable to Japan? How has the foreign trade policies of other post-developmental states changed since the emergence of the WTO? While there was some misunderstanding in applying the developmental state concept, there is a clear difference between the Northeast Asian developmental states of Japan, Korea, and Chinese Taipei and the Southeast Asian states which displayed very little developmental capacity. For practical reasons, it is far too early to draw conclusions from Chinese Taipei's involvement in the WTO as it has only been a member since January 2002 but can any conclusion be drawn from Korea which has been a WTO member since 1995? In this regard Ahn's works has been leading in providing a detailed legal perspective to WTO dispute settlement involving Korea and East Asia in general<sup>ii</sup>. This study differs from Ahn's legal perspective on WTO dispute settlement by focusing on Korea's engagement with the WTO through an international political economic perspective.

Since 1995, there has been a dramatic shift in the foreign trade policies of the Korean Government in using the rules of the WTO. As in Japan, this is a deliberate strategy that is best described as aggressive legalism. I follow on from this point through briefly discussing the evolution of Korea's new strategy.

## The Evolution of Korea's Aggressive Legalism

It was not until 14 April 1967 that Korea formally acceded to the GATT. As part of a rush to be recognized as an independent state after the Second World War, Korea had first sought to enter the GATT in 1950 but domestic ratification could not be completed due to the onset of the Korean War from 1950-53. Two other reasons explain why Korea's formal accession occurred 17 years after the original application. Firstly, the economic benefits of joining the GATT were in doubt but during the 1960s, there was new focus on development issues in order to gain greater involvement from developing countries. Secondly, utilisation of the GATT's dispute settlement procedures had virtually become dormant during the 1960s. These two factors were favourable terms for Korea's developing nation status at the time of accession. (Ahn 2003a: 599)

Under the GATT, Korea aimed to avoid formal dispute settlement as much as possible. Korea was challenged on only two occasions, first in 1988 in *Korea – Restrictions on Imports of Beef* and the second time in 1992 in *Korea – Anti-Dumping Duties on Imports of Polyacetal Resins from the United States*. In both cases the Panels concerned ruled against Korea. Korea was a complainant in the GATT only on one occasion in 1978 in *EC – Article XIX Action on Imports into the U.K. of Television Sets from Korea* of which resulted in Korea withdrawing the complaint and settling on a Voluntary Export Restraint (VER). (Ahn 2003a: 602)

This overall lack of involvement in the GATT can be explained by well-known problems such as the behind-the-scenes bargaining and deal-making and the ability for countries to 'opt out' of specific disciplines (Hoekman 2002: 41-46, Watkins 2002: 78). Another important reason is that Korea tried to play a low profile in maintaining the provisions allowed as a developing nation in Korea's accession to the GATT such as non-reciprocity, infant industry protection, and balance-of-payment protection measures (Ahn 2003a: 599). A third reason has to do with the Cold War alliance with the US and the reliance on the US market. While the US may have tolerated Korea's protectionist measures, Korea's dependence on the US market and the continued security threat from the North, restrained Korea from retaliating against US measures. For example, from 1975 until 1994, among 98 Section 301 cases Korea had been targeted 10 times (Ahn 2003a: 608). And yet on no occasion did Korea initiate a dispute against the US in the 28 years since Korea's accession to the GATT. This of course has changed with the emergence of Korea's aggressive legalism and where the bulk of complaints have been directed at the US.

From 1995-2004, Korea has appeared as a respondent in thirteen different cases, six of which have led to the establishment of a Panel and four of which have led to the establishment of an Appellate Body. As a complainant from 1995-2004, Korea has initiated eleven cases against other countries, ten of which have led to the establishment of a Panel, and three of which have led to the establishment of an Appellate Body.<sup>iii</sup> The figures speak for themselves. There has been a dramatic change towards using the legal rules of the WTO to resolve trade disputes compared to Korea's involvement in the GATT.

What are the motivations behind this dramatic shift? Bilateral pressures for liberalisation principally from the United States that began under Reagan best provide answers to this question. From the mid 1980s until the onset of the Asian Financial Crisis in 1997, the US sought to redefine the terms of the Cold War alliance in relation to the economic relationship with Korea. The US was faced with increasing competition from emerging Asian NICS and straddled with a large current account and fiscal deficits in the early 1980s; the US began to attack the state's interventionist policies and demanded greater market access.<sup>iv</sup> Added to this, the continuing US threat of trade sanctions under the 'Super-301' provisions of the Omnibus Trade Bill against Korea's active exchange rate policy<sup>v</sup> and US unilateralism in general as experienced under the GATT best explain Korea's move to seek a more effective method to curb US bilateral demands through the legal rules of the WTO. The WTO's Dispute Settlement Unit (DSU) offers many advantages over its predecessor, the GATT but a key hallmark of the system is the how the enforcement of decisions made pursuant to the DSU is decentralised, if respondents refuse to comply with Appellate Body rulings, winning complainants can impose retaliatory sanctions (Garrett & Smith 2002). Thus, the WTO offers a far more reliable forum than the former GATT.

The change in Korea's approach to the use of legal rules emerged two years after the birth of the WTO in 1995. In all five cases initiated against Korea in 1995 and 1996, Korea chose to resolve these before reaching the establishment on a Panel. It was in 1997 where a definitive change in Korea's approach to the WTO is clear in

terms of litigating cases as a defendant with the full use of the DSU (Panel and Appellate Body hearings). It was also in 1997 that Korea initiated its first two complaints in the WTO.

Three key landmark cases are crucial in reinforcing Korea's commitment to the using the legal rules of the WTO as the basis of the dramatic change in Korea's foreign trade policies. In January 1999 for the first time in Korea's history with the GATT/WTO Korea won a case in *US – Anti-Dumping Duty on Dynamic Random Access Memory Semiconductors (DRAMs) of One Megabyte or Above Originating from Korea*. The realisation of the potential power embodied in the legal rules of the WTO as a 'sword' was further buttressed by the realisation that the same rules could also be used as a 'shield' after Korea successfully defended a case for the first time in *Korea – Measures Affecting Government Procurement* in May 2000. By now Korea's confidence in using the legal rules of the WTO was evident. This was reinforced further by the fact that for the first time a team comprised only of Korean Government officials successfully litigated a case without the use of foreign private counsel in February 2002 in *US – Definitive Safeguard Measures on Imports of Circular Welded Carbon Quality Line Pipe from Korea* (Ahn 2003a: 622).

A sign of this new shift towards aggressive legalism is also evident in changes in the state bureaucracies. As part of the government reorganisation reforms in 1998, the Ministry of Foreign Affairs was reorganised to become the Ministry of Foreign Affairs and Trade (MOFAT) incorporating the newly established Minister for Trade<sup>vi</sup>. While in principle the Minister of Foreign Affairs and Trade is responsible for trade matters but in practice, authority rests with the Minister for Trade whose position was specifically set up to 'comprehensively establish and conduct foreign policies on trade, trade negotiations and foreign economic affairs' (WTO 2004: 18).

MOFAT has also established a 'WTO Division' under the 'Multilateral Trade Bureau'. In fact, specialised 'international trade law' or 'WTO divisions' have been institutionalised across many ministries involved in trade policy formulation including: the Ministry of Commerce, Industry, and Energy (MOCIE), the Ministry of Finance and Economy (MOFE), the Ministry of Agriculture and Fishery (MAF), Ministry of Information and Communications (MIC), Ministry of Construction and Transport (MOCT), and the Ministry of Maritime Affairs and Fisheries (MMAF) (WTO 2004: 18).

Since 1998, MOFAT has operated 16 sectoral Trade Policy and Negotiation Private-Sector Advisory Groups in areas such as agriculture, automobiles and telecommunications to exchange views on trade policy formation. MOFAT also regularly consults with peak business organisations such as the Korea Chamber of Commerce and Industry (KorCham), the Federation of Korean Industries (FKI), and the Korea Federation of Small Businesses. Various ministries are involved in regular meetings with the private sector to exchange views on multilateral trade negotiations through five Sub-Committees of the Government-Private Sector Joint Forum on the WTO Doha Development Agenda which covers agriculture, services, non-agricultural products, intellectual property rights, and the environment. (WTO 2004: 19)

Thus, it appears that the newly established MOFAT and MOCIE (in charge of industrial policies and implementation of trade remedies) is leading the charge in Korea's new shift towards aggressive legalism but regular consultations between the sector specific ministries stated above also play important roles in trade policy formation.

I have briefly discussed the evolution of the dramatic shift that has occurred in Korea's foreign trade policies and this strategy is best described as aggressive legalism. Like Japan, Korea's new trade strategy is based on using the rules of the WTO to counter the perceived unreasonable actions of its foreign trade partners. Legal rules are being made to matter in Korea's trade diplomacy. Korea's aggressive legalism is a very deliberate strategy where a substantive set of international legal rules embodied by the WTO can be made to serve as both a 'shield' and a 'sword' in disputes with trade partners. In the two sections below I discuss important WTO cases which demonstrate the 'shield' and 'sword' aspects of aggressive legalism at work

## **The 'Shield' at Play**

The first five cases Korea responded in the WTO were all resolved through mutually satisfactory solutions. Korea obviously did not want to litigate these cases through the DSU but as from 1997 onwards, Korea began to utilise the

formal mechanisms of dispute settlement through appealing disputes to Panel and Appellate Bodies. The following two cases show how the state in Korea is using the rules of the WTO as a 'shield' to protect developmental practices in procurement policies.

#### **Procurement**

This next case called *Korea – Laws, Regulations, and Practices in the Telecommunications Procurement Sector* was the first case which involved attacks on Korea's procurement policies. In May 1996, the EC initiated consultations with Korea's procurement practices in the telecommunications sector and the lack of market access for European suppliers. The two major Korean companies in the domestic telecommunications market were Korea Telecom (KT), a government invested company and Dacom, a private company<sup>vii</sup>.

The EC argued that the Minister of Communications (MOC) was responsible for the development and implementation of promotion of telecommunications technology which includes the financing of research institutes. The MOC, it was maintained, could require network operators to make financial contributions to such institutes and select companies as research subjects for these institutes, to promote the domestic production of telecommunications equipment. The EC also stated that the Government Procurement Fund Act covered government and local agencies but also 'other agencies' such as KT, a government invested company. The Act also made provisions that procurement of goods and services from foreign suppliers occur only when they are not available on the domestic market.

The effect of these regulations restricted 90% of KT's procurement to local suppliers of which the Europeans did not have access. The second major Korean company in the telecommunications market, Dacom, allegedly applied internal procurement rules which allowed foreign purchasing only if it was not available on the domestic market. The EC questioned the WTO legality of the Government's role in Dacom's procurement policies. The Europeans were questioning not so much the WTO consistency of KT's actions and the regulations involved, as they would appear to be consistent under Korea's obligations under the Government Procurement Agreement (GPA), but rather the Europeans targeted the fact that while Korea's procurement practices may have been WTO consistent, benefits accruing to the EC, in terms of market access were in question. This is also made clearer by the fact that the EC also brought to light that US products were given an advantage after Korea-US bilateral telecommunications agreements required KT to partly open its procurement of network equipment to US companies.

Perhaps to avoid the possibility of further litigation or a lack of experience in the WTO, the dispute was resolved through consultations, notified to the Dispute Settlement Body (DSB) in October 1997<sup>viii</sup>. But what is important to note is that in response to Korea's accession to the GPA, it would appear as this case exemplifies by the target of the EC's claims, that Korea's procurement policies had been adjusted to meet those restrictions. But judging from the procurement policies of a privately owned company, Dacom, administrative guidance still exists as a developmental tool for the state even under the rules of the WTO.

This case however, was only the first attack on Korea's procurement policies. The next case called *Korea – Measures Affecting Government Procurement* was appealed before a Panel and it is also the first case that Korea won in the WTO.

In February 1999, the US initiated consultations with Korea over the WTO consistency covered by the GPA, of the procurement practices in the construction of Incheon International Airport (IIA). At issue was whether the 'entities' responsible for the procurement of the new airport were covered under the GPA and if so, were in violation of provisions of the GPA through its procurement practices<sup>ix</sup>.

The US alleged that the 'entities' covered under the GPA were the Ministry of Construction and Transportation (MOCT) and the New Airport Development Group (NADG) which was a part of the MOCT and had assumed responsibility for the IIA project, the Korean Airport Authority (KAA), the Korea Airport Construction Authority (KOACA), and the Incheon International Airport Corporation (IIAC)<sup>x</sup>.

The key issue was whether the KAA, KOACA, and the IIAC were 'central government' entities as subsidiary organisations of MOCT. If so, then the US was correct to claim that these three agencies were part of the MOCT and therefore were government authorities covered under the GPA. Korea however, argued that KAA, KOACA, and the IIAC were in fact independent legal entities which conducted contracts on its own behalf and subject to its own procurement regulations and thus were not 'central government' entities. The Panel ruled in favour of Korea, noting that there were errors made when negotiating Korea's accession to the GPA, in terms of the

definition of the ‘entities’ covered by the agreement but that the entities in the construction of the airport were not in fact covered by the GPA<sup>xi</sup>. The US did not make an appeal.

Korea as a member of the GPA since 1994 had abided by the rules of the WTO and successfully defended discriminatory procurement practices. The procurement of the IIA was conducted by KAA, KOACA, and the IIAC that discriminated against foreign suppliers through four mechanisms: requirements to have manufacturing facilities in Korea, domestic partnering, the absence of challenge to procedures, and inadequate deadlines<sup>xii</sup>. And these mechanisms under the full glare of the international community were ruled as WTO consistent.

Perhaps what is even more significant about this case is that developmental tools such as administrative guidance are also being defended in the WTO. The Korean Government has often established special task forces or committees with special mandates such as the KOACA, whose legal foundations are obscure as is prescribed by the Government Organization Act (Ahn 2003a: 615). The KAA, KOACA, and the IIAC are in a WTO legal sense, independent entities and yet practice discriminatory procurement policies. Thus in a highly legally innovative method, Korea has been able to be both protectionist and consistent with WTO rules. In Korea developmental tools such as administrative guidance, *Haengjong Chido* in Korea (and *Gyosei shido* in Japan) are very much alive and persist even under the WTO (Woo-Cumings 2003: 201).

## The ‘Sword’ at Play

I now turn to how Korea is using the rules of the WTO firstly as a ‘sword’ to implement reforms in even the most politically sensitive industries such as alcohol and rice and secondly, to attack what is perceived as the unfair practices of trade partners through litigation in the WTO. These complaints have been lodged on behalf of three main industries: semi-conductors, steel, and shipbuilding.

### The ‘Sword’ in the Domestic Arena: The Alcohol and Rice Market

In April 1997 the European Communities and the United States in May of the same year initiated consultations with Korea over the issue of taxes on alcoholic beverages. *Korea – Taxes on Alcoholic Beverages* was the first case in which Korea dealt with the entire WTO dispute settlement procedure that involved rulings by the Panel and Appellate Body. The measures at issue was the imposition of a differential and preferential tax rate through the liquor tax and education tax on diluted *soju* relative to other alcoholic beverages such as whisky. Under the Liquor Tax Law of 1949, Korea had imposed various categories of distilled spirits on which it imposed different tax rates regardless of whether the product was manufactured in Korea or not. The Education Tax Law of 1990 is a surtax imposed on a variety of product categories and covers most alcoholic beverages. In other words, it is a tax which is determined as a percentage of the established liquor tax. This tax structure had resulted in a 30% surtax for imported distilled alcoholic beverages such as whisky. Of all distilled alcoholic beverages, only *soju* and liqueurs were subject to the lesser 10% surtax.<sup>xiii</sup>

The case was very similar to a dispute initiated by the EC, Canada and the US in *Japan – Taxes on Alcoholic Beverages*. The Panel and Appellate Body in this dispute found the Japanese tax system to be discriminatory against imported alcoholic beverages over a Japanese alcoholic beverage called *shochu* (Ahn 2003a: 612). The Panel and Appellate Body in *Korea – Taxes on Alcoholic Beverages* also ruled that *soju* and other alcoholic beverages such as whisky were directly competitive or substitutable products and Korea therefore had taxed the imported products to protect domestic production<sup>xiv</sup>. Korea subsequently amended the Liquor Tax Law and Education Tax Law and imposed flat rates of 72% in liquor tax and 30% in education tax (Ahn 2003a: 612).

This dispute gathered enormous media attention and much public discontent. The *soju* manufacturers also objected perhaps not so much in terms of the WTO ruling but more because the Korean Government substantially raised the price of *soju* rather than reducing the tax on imported alcoholic beverages. The rationale behind this was to both implement the WTO’s ruling and also to minimize the potential adverse impact on public health (Ahn 2003a: 612).

If the increase in the price of *soju* implemented with the legitimate power of WTO rulings in the hands of the state are considered controversial, then the continuing liberalisation of the rice market will be the biggest test of the new power in the hands of the state.

International rice prices are generally more than four times cheaper than rice produced in Korea and during 2004; Korea held more than 50 rounds of talks with rice exporting countries. The two major players in opening Korea's rice market are the United States and China which account for 85 percent of Korea's rice imports. During the Uruguay Round of talks in 1994, Korea was granted a 10 year grace period to allow rice imports to reach 4 percent of domestic consumption. The Ministry of Agriculture agreed to increase the quota to 7.96 percent for the next ten years until 2014. This will essentially allow imported rice not only to be used in snacks and processed foods but allowed to be sold directly to consumers. In other words, for the first time the Korean rice market will be opened in a real sense. Despite the Agricultural Ministry's promise of increasing various subsidies and benefits, falling incomes among farmers have led to fierce demonstrations by civic groups and by the Korea Peasants League representing more than 100 local farming communities.<sup>xv</sup> Agriculture in any industrialised country is a sensitive issue but the point is that Korea is using the newly found power in WTO rules to implement changes even in the most politically sensitive industries such as *soju* and even in rice.

It matters less whether such reforms have occurred due to pressures from the WTO. The point is that, it is the state in Korea which is implementing such controversial measures in industries which had long been protected by political interests. This may be due to the fear of retaliation by trade partners if Korea chooses non-compliance and also to maintain legitimacy in the eyes of the international community and thus giving Korea a 'moral' advantage in future trade disputes. As Pekkanen (2001: 734) puts it 'aggressive legalism is a double-edged sword'. In using the legal rules of the WTO to attack trade partners, Korea's trade practices is also now more vulnerable to foreign scrutiny and open to challenge. But it is ultimately the state, which chooses to implement WTO decisions and commitments based on the political calculations involved in the WTO legal game. I now focus on how the 'sword' is also being used in the international arena to resolve disputes against trade partners in the WTO.

#### **The 'Sword' in the International Arena: Semi-Conductors**

It was not until two years after the birth of the WTO that Korea launched a complaint. In July 1997, Korea began formal consultations with the US over the imposition of anti-dumping duties on Samsung color television receivers. This case was quickly resolved when the US revoked the duties and Korea withdrew the request for the establishment of a Panel and the proceedings were terminated.

In August 1997 only one month after the initiation of the case above, Korea initiated another dispute in the WTO. In *US – Anti-Dumping Duty on Dynamic Random Access Memory Semiconductors (DRAMs) of One Megabyte or Above Originating from Korea*, the US was brought to the WTO over the refusal to revoke anti-dumping duties on semi-conductors (DRAMs) from Korea. Korea argued that semi-conductor producers had not dumped their products for three and one half consecutive years as required by the DOC and that this had demonstrated that future dumping would not occur. What was really at issue however, was the regulations and standards used by the US DOC which allowed the anti-dumping duties to continue on the basis that the resumption dumping was 'likely' to occur<sup>xvi</sup>.

The Panel ruled that those US DOC regulations and standards in question were inconsistent with WTO rules and that the final review process of the anti-dumping duties were also WTO inconsistent<sup>xvii</sup>. This first win in the WTO as a complainant occurred shortly after Korea had lost its first full litigation as a respondent in *Korea – Taxes on Alcoholic Beverages*.

The US and Korea agreed to an eight month implementation period, that is, by November 1999, for the duties to be revoked and the WTO inconsistent regulations of the DOC be adjusted. By March 2000 however, Korea had resorted to Article 21.5 of the DSU in referring the dispute back to the original Panel, arguing that while the US DOC had deleted the 'not likely' standard and incorporated the 'necessary' standard of the WTO Anti-Dumping Agreement (ADA), the regulations were still in contravention of WTO rules and that the anti-dumping duties had resumed<sup>xviii</sup>.

On 21 September 2000 Korea requested the Panel to suspend its work and on 20 October 2000, the US and Korea had notified the DSB that a mutually satisfactory solution had been achieved with the revocation of the anti-dumping duties on Korean DRAMS after the results of a five-year US DOC sunset review<sup>xix</sup>. There was however, no mention of a WTO consistent adjustment to the US DOC regulations in question.

While this case was the first win for Korea in the WTO as a complainant, trade remedies against Korean semi-conductor exports would again lead to litigation several years later. In July 2002 the European Commission

initiated a countervailing duty investigation on Korean semi-conductor producers arguing that the Korean Government had provided illegal subsidies under the WTO Subsidies and Countervailing Measures (SCM) Agreement (Ahn 2003a: 616).

As is well known, the Kim Dae Jung Government undertook corporate restructuring measures as part of the IMF programs to overcome the 1997-1998 financial crises<sup>xx</sup>. The European Commission alleged that illegal subsidies were given to semi-conductor producers when the Korean Government intervened through debt-for-equity swaps and debt forgiveness for struggling *chaebol* conglomerates. The countervailing duty investigation resulted in import duties of up to 30-35 percent on semi-conductors produced by Hynix, a company founded on the merger between Hyundai and LG Electronics<sup>xxi</sup>. Closely monitoring the restructuring efforts under the Kim Dae Jung Government, the US also initiated a countervailing duty investigation in November 2002 resulting in countervailing duties of up to 57.73 percent on Korean semi-conductor manufacturers (Ahn 2003a: 616).

The legality of these trade remedies by the EC and US have important implications for all industries which were part of the Kim Dae Jung Government's restructuring efforts and thus in June and July of 2003, Korea initiated formal consultations with the US and EC respectively. At this point, it appears Korea will be disputing the legality of the countervailing duties on the basis of breaches of the SCM Agreement. In general, Korea has argued that the US DOC, US ITC, and the European Commission lacks the evidence that would: firstly, show that a 'financial contribution' was made by the Korean Government as defined under the SCM Agreement and secondly, demonstrate that a 'benefit' was conferred onto the semi-conductor manufacturers given market benchmarks<sup>xxii</sup>.

While these two recent cases are pending a Panel ruling, the point is that Korea, like is putting faith into the dispute resolution process and aggressively using the rules of the WTO as a 'sword' to counteract what is perceived as the unfair practices of trade partners.

#### **The 'Sword' in the International Arena: Shipbuilding**

In a prelude to the 2002 investigation concerning Korean semi-conductors (DRAMS) by the European Commission, in October 2000, the European Commission initiated an investigation into the Korean shipbuilding industry. Under the EC's Trade Barriers Regulation (TBR), the Committee of European Union Shipbuilders Associations filed a complaint with regard to the financing structure of Korean shipyards. In what was to be targeted in the Korean DRAMS investigation, the European Commission found aspects of the corporate restructuring programs after the financial crises of 1997-1998 to be violation of WTO agreements. The outcome of the investigation was that the corporate restructuring programs and the assistance through taxation for shipbuilding companies that occurred under the Kim Dae Jung Government's reform efforts constituted illegal subsidies as defined under the WTO SCM Agreement (Ahn 2003a: 616). Subsequently, the EC and Korea held two rounds of bilateral negotiations in August and September 2002 which failed and thus the EC initiated formal consultations with Korea in October 2002.

Within two months after initiating formal consultations with the US and EC over the issue of countervailing duties on Korean DRAMS, in September 2003, Korea initiated formal WTO consultations with the EC over allegations of illegal subsidies to the European shipbuilding industries. Korea responded to the European challenge by arguing that various forms of export guarantees and guaranteed loan recovery schemes in states throughout the EC, constituted illegal subsidies as defined under the WTO SCM Agreement<sup>xxiii</sup>. But Korea's backlash against the EC accusations did not end here.

In February 2004, Korea initiated a second dispute against the EC's shipbuilding industry. In *EC – Aid for Commercial Vessels*, the WTO legality of European regulations such as the TDM Regulation came under attack. Korea argues that the TDM Regulation provides various forms of aid through government owned or government controlled financial institutions, which actually provide subsidies in favour of the commercial shipbuilding industry<sup>xxiv</sup>. Both disputes against the EC are pending Panel rulings.

The point of this discussion is again to show that as part of the dramatic change in Korea's foreign trade policies, the rules of the WTO are being used as a 'sword' to counteract the perceived unfair practices of Korea's trade partners. This will also be shown in how Korea is using the rules of the WTO to challenge the trade practices in the US steel industry.

#### **The 'Sword' in the International Arena: Steel**

The three disputes Korea has initiated in regards to the steel industry have been directed against what is perceived as the abusive use of trade remedies allowed under the WTO. These specifically relate to the calculation of anti-

dumping duties imposed by the US and the determinations in imposing safeguard measures again by the US, on various Korean steel products. The following three cases will demonstrate that the dramatic change in Korea's trade strategies is very real and the multilateral rules of WTO are being consistently utilised to resolve even the most politically sensitive disputes against Korea's old Cold War ally, the United States.

The first case Korea initiated involving the US steel industry concerned the imposition of two separate anti-dumping duties by the US DOC on stainless steel plate in coils (plate) and stainless steel sheet and strip in coils (sheet). The anti-dumping duties on plate were originally calculated between the 1 January to 31 December 1997 and a preliminary dumping duty of 2.77 percent on Korean exporters (including Pohang Iron and Steel Company 'POSCO') was issued by the DOC. The investigation was held during the financial crisis and the value of the Korean Won was subject to extreme fluctuation and thus the DOC's final dumping margin was recalculated to 16.26 percent. Anti-dumping duties on sheet were calculated by the DOC during the period 1 April 1997 to 31 March 1998, again during a period of extreme fluctuations in the value of the Won during the financial crisis. The DOC issued a preliminary dumping margin of 58.79 percent for the Taihan steel company and 12.35 percent for other Korean steel exporters such as POSCO (the margin for POSCO was revised to 3.92 percent after allegations of miscalculations). The final dumping margins issued by the DOC were maintained at 58.79 percent for Taihan and 12.12 percent for POSCO and other Korean steel exporters. (Ahn 2003a: 620)

In July 1999, Korea initiated the case *US – Anti-Dumping Measures on Stainless Steel Plate in Coils and Stainless Steel Sheet and Strip from Korea* and questioned the WTO consistency of the calculations of the anti-dumping margins described above. The calculation of anti-dumping margins by the US DOC permitted 'various price adjustment(s) to find "ex-factory" prices but no modification for volatile exchange rates except for averaging'. The Panel found the US measures inconsistent with WTO rules in respect of double currency conversion and the use of multiple averaging periods in light of the extreme fluctuations that had occurred during the DOC's periods under investigation. To illustrate just how extreme the fluctuations were, in October 1997 the value of the Won was steady at close to 900 Won for one US Dollar; by January 1998 the Won was valued at just over 1700 Won to the US Dollar. (Ahn 2003a: 621)

This was the first case that Korea initiated against US measures in the steel industry and the first 'win' after the success in *Korea – Measures Affecting Government Procurement* and contributed significantly to the confidence in the WTO's multilateral dispute resolution process even against important political allies and trade partners such as the US. It contributed to the perceived impartiality inherent in dispute resolution based on legal grounds.

Korea launched a second dispute in June 2000 involving the US steel industry in *US – Definitive Safeguard Measures on Imports of Circular Welded Carbon Quality Line Pipe from Korea*. The target of Korea's dispute was on the safeguards imposed by the President on 11 February 2000 that were far more restrictive than that recommended by the ITC and exempted Mexican and Canadian suppliers from the safeguards. The duties involved disproportionately injured the largest suppliers of line pipe that is, Korean exporters. Korea disputed the procedures and determinations that led to the imposition of the safeguard measures as well as the legality of the safeguard itself. The Panel and Appellate Body accepted Korea's arguments in large part and the US Government agreed to increase the in-quota volume of imports from 9,000 to 17,500 tons and to lower the safeguard tariff to 11 percent. But the time involved in the WTO dispute settlement meant that in practical terms, the implementation of the WTO DSU's rulings would end basically with very little more than the original expiry date of the safeguard measure itself. (Ahn 2003a: 622-623, 626)

Despite this problem, which is a systemic problem in the WTO with regards to the implementation of disputes involving safeguards, this case is important in that it was the first case handled entirely by Korean Government officials. In previous cases, foreign legal counsel had played primary roles in Korea's WTO litigations (Ahn 2003a: 622). This case was the second 'win' for Korea as an initiator of disputes after the success in *Korea – Measures Affecting Government Procurement* and the total involvement of Korean Government officials makes clear that this case made concrete Korea's confidence in the WTO and enhanced the capacity of officials to gain much needed legal expertise for future disputes.

In one of the most controversial and highly publicized disputes, Korea initiated consultations with the US in March 2002 over the issue of US safeguard measures on ten related steel products and related laws including Section 201 of the Trade Act of 1974 and Section 311 of the NAFTA Implementation Act<sup>xv</sup>. In *US – Definitive*

*Safeguard Measures on Imports of Certain Steel Products*, apart from Korea, the EC, Japan, China Switzerland, Norway, New Zealand, and Brazil also filed complaints regarding the same issue (Ahn 2003a: 624). The complainant parties targeted three main areas against the US measures: firstly, in showing a justifiable case for 'increased imports', secondly, the methodology used to determine the 'causal link' between any increased imports and serious injury, and thirdly, the methodology used for determining 'parallelism' between the imported products and 'like' products<sup>xxvi</sup>.

The Panel ruled against the US safeguard measures and in August 2003 the US appealed to the Appellate Body where parts of the Panel's rulings were reversed but largely upheld<sup>xxvii</sup>. Korea made the first compensatory request but when the US did not agree on satisfactory compensatory arrangements, the EU, Japan, Norway, China, and Switzerland proposed suspension of concessions. But instead, Korea chose to postpone potential retaliation for three years until 19 March 2005 (Ahn 2003a: 625). This of course was a political gesture by Korea in maintaining the legitimacy of the WTO as the original US safeguard measures were set to expire on 20 March 2005 anyway. Korea's actions show that while it could have also agreed to suspend concessions, it did not and thereby create a sense of responsibility and greater legitimacy to Korea's place in the WTO. This is just further testimony to Korea's interests and commitment to maintaining the still fragile WTO as the main instrument of counteracting the unfair practices of trade partners.

## **The Emerging 'Post-Developmental State'**

Above, I have traced the evolution of Korea's dramatic shift towards aggressive legalism detailing a selection of cases. The three key ingredients of a developmental state found in Northeast Asia during their high-growth era are: firstly, transformative goals (closing the technology gap between themselves and industrialised countries), secondly, an insulated pilot agency which coordinates that transformative project, and thirdly institutionalised government-business cooperation (Weiss 2004b: 155, Wong 2004a: 350-353). The unraveling of this model in Korea from the 1980s is well documented and the Asian Financial Crisis was seen as the final blow to the dismantling of Korea's developmental state. The key question of veteran researchers is to what extent dismantling will occur or whether there will be a significant return to a developmental outlook (Weiss 2004: 154-157). Findings from recent studies have focused on changes within the Korean developmental state and argue that while changes are still underway, it is far too early to state that there will a transformation of developmental institutions, rather than 'adaptive' change consistent with historical precedents or 'path dependency' (Weiss 2003b: 268, Woo 1999: ix-xiii). Christopher Dent's (2000: 294-295) recent study of Korea's foreign economic policy in the aftermath of the financial crisis supports such claims of continuity rather than change.

In a study of the development of the biotechnology industry in Korea, Wong (2004b: 513) argues that while Korea's dominant state model of the past is no longer a realistic portrayal of Korea's current economic model, a developmental state adapting to the new challenges of innovation rather than 'catch-up' is in progress and is marked by three key changes. Firstly, although there is a lack of a coordinative pilot agency, there is now 'cooperation through competition' between different state ministries in biotechnology development. Secondly, state agencies have become partners with private industry rather than a state that coordinates R&D from a top-down perspective. Thirdly, high-tech innovation has been led by the R&D activities of Small and Medium Enterprises (SMEs) and government efforts have been at an arms-length and indirect. Therefore, at least in the biotechnology industry, one does not find a complete dismantling of developmental institutions but rather a developmental state adapting to changes in the international political economy.

The findings presented in this paper suggest similar findings of 'adaptation' rather than transformation of developmental institutions in relation to foreign trade policies. While a key pilot agency like that of the Economic Planning Board (EPB) with wide ranging powers no longer exists, the newly constituted MOFAT and MOCIE (in charge of implementing industrial policies and trade remedies) has been leading Korea's dramatic shift in using the legal rules of the WTO. And as was mentioned previously, these two ministries have been active players in institutionalising links with peak industry associations in trade policy formation.

Korea's 'aggressive legalism' demonstrates how the state is adapting to new challenges through carefully implementing policies that are both developmental and still WTO consistent. The point to make clear is that it is the state which is implementing reforms, defending developmental institutions, and making the decision to initiate cases on behalf of industries in the WTO. As the cases on government procurement demonstrate, discriminatory practices still exist and institutions such as administrative guidance are very much alive. Indeed in the aftermath of the crisis a body of opinion rose that a primary cause was the absence of the 'rule of law' and the preference for informality in Korea such as the use of informal mechanisms of state intervention such as administrative guidance (Woo-Cumings 2003: 200). Korea's active adoption of the legal rules of the WTO may appear to show that there is a change towards greater respect for the 'rule of law' embodied in common law traditions (found in the US, UK, Australia) as opposed to 'rule by law' embodied in civil law (found in Korea, Japan, and Germany) traditions. Such a conclusion could be drawn based on explanations which portray regional or international institutions as reflective of domestic legal culture and institutions (Kahler 2000: 550). But my findings suggest that a civil law system continues in Korea and cannot magically be replaced by a common law system and confirms the views of Woo-Cumings (2003: 201-202) that in fact different law traditions have nothing to do with economic development or the use of administrative guidance. The emergence of aggressive legalism in Korea has little to do with reflecting national legal traditions and as the government procurement cases show, informal mechanisms of state intervention such as administrative guidance continue even under the nose of the WTO and is being *legally* defended with those same rules.

At this point it is necessary to clarify the strengths and weaknesses of my findings. I am not claiming that Korea's 'aggressive legalism' is more strategic or different from what other countries such as the US may be doing in utilising the legal rules of the WTO. State activism in foreign trade policies is well recognised in studies of US foreign policy as an area distinct from the neo-liberal institutions of the US domestic arena<sup>xxviii</sup>. In this respect, the findings of this paper are hardly surprising considering the historical developmental trajectory of Korea's economic development. The findings are however important in bringing greater scholarly attention to the dramatic shift in Korea's foreign trade policies. This is an area which has received very little focus and deserves to be explained. The more important implications of studying Korea's aggressive legalism is that, whether or not countries such as the US are pursuing aggressive legalism, it does shed new light on the changes occurring in Korea's emerging 'post-developmental state' model. I now locate these findings within the much broader globalisation debate.

## Implications for the Globalisation Debate

In recent times the standard 'radical' view that globalisation has or will lead to the total extinction of the nation-state has been replaced with that of the 'constraints' school which posits not the demise of the state but the transformation of the state into a much reduced role in governing the national economy<sup>xxix</sup>. The 'constraints' school proposes two key propositions. The first is that financial openness through the 'electronic herd' is forcing the state into the straightjacket of fiscal conservatism, cutting budgets, taxes and spending causing constraining effects on fiscal, welfare, and industrial-technology policies. Governments continue to try to attract and retain mobile capital by meeting the preferences of multinational corporations (MNCs) and financial markets, by failing to do so governments face the 'exit threat'. Thus, 'financial openness and corporate mobility are expected to exert downward pressure on fiscal and social policy, forcing welfare retrenchment, corporate tax cuts, and shifts in the tax burden from capital to labour' causing a 'race to the bottom'. (Weiss 2003a: 7-8)

The second proposition of the 'constraints' school is that states are losing their autonomy or independence to pursue national economic goals as their room to manoeuvre is increasingly constrained by the rise of international agreements and organisations such as the WTO. The multilateral rules embodied in such organisations are stripping away the authority to pursue trade, industry, and financial policies in the national context. Therefore it is not just the state's policymaking capacity that is being reduced but that the state itself is being downsized and transformed with the authority to govern the national economy being divided between other local, national and international actors. (Weiss 2003a: 8-9)

### **Legalism and the Diminishing Authority of the State?**

A key implication of the 'constraints' school is that the increasing legalisation of the international economy would also mean that the political power of the state is being divided and transferred to authority invested in the WTO's DSU which administers these legal rules. One cannot deny that at no other time in history has international economic law reached such prominence in the international political economy. Furthermore, the fact that a country which has traditionally steered away from formal litigation but is now an active participant in the DSU is a victory for legal scholars who emphasize the importance of international economic law and the continuing legalisation of the global economy<sup>xxx</sup>. But has greater legalisation replaced power and interest politics?

Korea dramatic shift towards a legalised trade strategy is very specific involving and constrained by the rules of the WTO. It is more than just the simple dichotomy between bilateralism versus multilateralism. The process involved in the WTO's DSU may be seen as a bilateral forum where one sovereign trade partner or partners respond to or complains against another (Pekkanen 2001:712). Thus, greater legalisation has not replaced power and interest politics in the WTO instead it can be seen as a way to render commitments more credible especially in dealing with major trade partners such as the US who have the most to lose by risking the very legitimacy of the WTO by not complying with adverse rulings (Kahler 2000: 571).

Garrett and Smith (2002) make clear that non-compliance among the major players pose a real threat to the perceived authority of the DSU considering the EC's ban on beef hormones and US safeguards on steel. Their study reveals the political maneuvering inherent in the short history of the WTO. In the pre-dispute phase of litigation, complainants have often chosen not to press a case when it is feared defendants would not comply with adverse rulings. Even in the litigation phase, it is found that the Appellate Body has been very active in facilitating compliance by losing defendants through tailored rulings. In terms of the compliance phase, the Dispute Settlement Unit (DSU) provides litigants with considerable discretion in the timing and form of compliance. The legitimacy of the WTO does indeed rest on fragile foundations, power and interest international politics is still very much alive in the DSU's short history.

Korea is using the legal rules as a weapon, seizing upon the political maneuvering and exposing the perceived abuses of their major trade partners. The 'wins' and 'losses' in disputes matter less than the simple truth that Korea is using the legal rules of the WTO as the key basis of foreign trade policies.

To use Weiss's (2004a) terminology, global institutions such as the WTO are indeed constraining in terms of abiding by the rules of the WTO but also 'enabling', Korea's aggressive legalism is about using those same rules to implement politically controversial reforms, pursue and protect developmental ambitions, and initiate disputes against other countries. Korea's dramatic shift towards the legalisation of dispute settlement also shows the willingness to use the issue of legitimacy to affect outcomes in trade disputes particularly with major trade partners. Thus one can observe the political 'entwinement' of national and global networks rather than the independence of global networks from the national as the 'constraints' view posits. As Korea becomes a larger player in the WTO legal game, the WTO's legitimacy will also come to rely more on Korea's continuing compliance of WTO rulings and commitments.

### **Conclusion**

The aim of this paper was two-fold. The first aim was to demonstrate that the concept of 'aggressive legalism' is not peculiar to Japan but can be extended to describe the dramatic shift in Korea's foreign trade policies. Korea's use of the legal rules of the WTO is truly a dramatic shift when considering that in the space of 28 years from Korea's accession to the GATT, Korea was involved in only two Panel proceedings as a respondent and only one case as a complainant. Since the emergence of the WTO in 1995, Korea has been involved as respondent in thirteen disputes and as a complainant in eleven disputes. Korea's 'aggressive legalism' is about using the substantive legal rules embodied in the WTO in two main ways: Firstly, as a 'shield' for controversial domestic policies as the cases on government procurement demonstrate. Secondly, the legal rules are used as a 'sword' in the domestic arena to implement reforms in politically resistant areas such as *soju* and rice. And in the international arena the legal rules

are used to attack the perceived unfair practices of trade partners particularly in the semi-conductor, shipbuilding and steel industries.

The second aim was to show how Korea's 'aggressive legalism', that is the use of the legal rules as a 'shield' and 'sword', reflects the adaptation of the state to changes in the international political economy such as the emergence of the WTO. The state plays an evermore active role in defending developmental institutions, implementing WTO rulings, and litigating disputes on behalf of national industries in the WTO's DSU. And even under the WTO, mechanisms of state intervention continue to persist such as 'administrative guidance'. While a key pilot agency no longer exists, Korea's WTO strategy has been coordinated between MOFAT and MOCIE and these two ministries have been leading in institutionalising links with peak industry associations.

This is yet an unfolding strategy but considering the continuing presence of US unilateral acts such as the use of Section 301 of the Trade Act, coupled with the significant 'wins' Korea has achieved in the WTO, 'aggressive legalism' will most likely remain as the basis of Korea's foreign trade policy. The changes in the 'post-developmental state' in Korea are also unlikely to become dismantled particularly in the regards to Korea's foreign trade policy establishment. The state will continue to play, if not a more, active role in governing the national economy.

# **Economic Growth and Sustainability of Emerging Nations of the Eastern Caribbean via the International Financial Services Sector**

*Agatha E. Jeffers  
Montclair State University, USA*

## **Abstract**

The main industries in the Organisation of Eastern Caribbean States (OECS) have ceased to be viable economic options, hence the countries have shifted from agriculture to tourism and international financial services to ensure their economic survival. However, recently, the financial services sectors have come under severe challenges, thus resulting in a slowdown in economic growth in these countries. In addition, these countries face special developmental challenges due in part to their small size, mounting debt burdens, vulnerability to external shocks and natural disasters. Furthermore, these countries currently have very few prospects for economic growth, diversification and sustainable development. It is therefore imperative that these countries devise diversification and other strategies to ensure their short and long term survival. My paper examines the challenges faced by these nations and the importance of the international financial services sector. The paper concludes with general recommendations for the way forward for these emerging nations.

## **Introduction**

For many obvious reasons, the international financial services sector has emerged in small island economies like those in the Organisation of Eastern Caribbean States (OECS)<sup>1</sup> and have played on an ever increasing role in their development. Over the years, the main industries in the OECS were sugar, cotton, banana and other agricultural crops. However, about 25 years ago, these sectors ceased to be viable economic options for these small island economies. With the realization of this fact, the OECS countries were encouraged by the larger developed nations and multi-lateral institutions to diversify into other sectors. As a result, the OECS countries began to shift away from agriculture to services, particularly tourism and international financial services and more recently, to telecom-related services. Accordingly, all of the OECS countries adopted frameworks for the provision of international financial services and expended a great deal of resources to develop their people and their infrastructure to meet the needs of the international financial arena. Although few would argue about the contribution of the sector to these economies, the issue of whether the international financial services sector is the way forward for sustainable development remains in question. Furthermore, the countries of the OECS face special developmental challenges. This is due in great part to their small size, mounting debt burdens and vulnerability to external shocks and natural disasters. In addition, many of the countries have relied exclusively on one agricultural crop and on preferential trade arrangements which now face certain dismantling as a result of the World Trade Organization's (WTO) rulings. The purpose of this paper is to examine the challenges faced by the small island states of the OECS, assess the importance of the international financial services sector to their economies and discuss the potential viability of the international financial services sector to the diversification and long-term sustainability of their economies. The paper concludes with recommendations for the way forward.

## **Unique Characteristics of the OECS Countries**

The Caribbean is the world's most tourism dependent region, with tourism representing over 31% of the regions' GDP. The sector accounts for an average of 15.5% of total employment and in some of the countries, this figure is as high as 50%. There are 9 countries comprising the OECS region and for most, tourism is the primary means of accessing foreign currency.

All of the OECS nations are small economies with a total population of only 540,000. The combined GDP of the OECS countries, of approximately US\$3 billion pales in comparison to that of developed countries.

An issue affecting the nations of the OECS emanates from their substantial trade deficits. Over the years, the respective governments have been spending more than what they earn under conditions where imports are consistently greater than exports. This has led to increased borrowing and has resulted in escalating debt burdens and high interest payments in nations such as Antigua & Barbuda, Dominica and St. Kitts & Nevis which are now ranked among the top ten most indebted emerging market economies in the world. From 1997 to 2003, the average public debt to GDP ratio increased from 62 percent to 85 percent, making the Caribbean one of the most indebted regions of the world. The Economic Survey of the Caribbean 2003 - 2004 undertaken by the United Nations Economic Commission for Latin America and the Caribbean (ECLAC) found that domestic debt represents 34 percent of GDP, and foreign debt has reached 54 percent of GDP.<sup>2</sup>

A further attribute is that the OECS countries are characterized by little or no appreciable natural resources for growth and diversification. These nations do not enjoy the large land masses of Brazil, the United States or Canada, which are filled with natural resources, therefore the small size of their domestic markets affect the ability of their local firms to engage competitively in the global marketplace. As a result, the small firms in these nations have greater difficulties reaching economies of scale, attracting foreign business partners, developing marketing programs, benefiting from market intelligence and development activities, and investing in research and development.<sup>3</sup>

Of further concern to these nations is the high rates of HIV/AIDS infection which pose a serious health challenge in many of the small nations of the Eastern Caribbean.

Of particular concern is the vulnerability of the OECS countries to natural disasters that pose an ever-increasing threat to the region and can reverse decades of economic progress. These disasters come in the form of hurricanes, coastal erosions, volcanic eruptions, earthquakes and floods that frequently destroy the infrastructure, erode the environment and disrupt key economic activities. In August and September 2004, hurricanes Charley, Jeanne, Frances and most notably Ivan, a category 5 hurricane, wrecked havoc on some of the Caribbean islands, including Grenada and St. Vincent & the Grenadines. Losses to the OECS region were assessed at billions of dollars. Grenada received a direct hit from hurricane Ivan, which destroyed over 90 percent of the island's infrastructure, left 25 persons dead, more than 60,000 homeless, and the agriculture industry in ruins. The entire important nutmeg industry of the island was wiped out and their banana crop devastated. It is estimated that it will take 15 years for the nutmeg industry to return to its previous status and several years for the banana crop to return. The destruction from Hurricane Ivan wiped out much of the gains made by Grenada in recent years. In addition, since the countries of the OECS depend heavily on their natural resources such as their beaches, coastline, flora and fauna to attract tourists to their shores and given the growing importance of eco-tourism, the impact of the recent hurricanes to the tourism industry of the affected islands will take years to rebuild. However, it may be noted that in contrast to the tourism sector, after a natural disaster, the international financial services sector can be up and running in only a matter of days or weeks.

Of further concern is that some of the OECS countries are forced to live off of their exports since there is insufficient domestic demand. This is evident particularly in the Windward Islands of Dominica, Grenada, St. Lucia and St. Vincent & the Grenadines which rely heavily on banana exports. This dependence on export markets causes these countries to be particularly vulnerable to external shocks and other local, regional and international political factors.

## **Main Short and Long Term Issue**

It is clear that there are numerous challenges facing the nation states of the OECS. Despite these many challenges, the OECS countries currently enjoy relatively strong social indicators and a relatively high standard of living combined with a much higher life expectancy than many other countries. Notwithstanding this reality, it is believed that the main challenge over the short term will be how to maintain or increase growth levels while at the same time

containing indebtedness as well as inflation. For the long term, the challenge will be to enact diversification strategies to ensure economic development and sustainability of these small island nations.

## **The International Financial Services (Offshore) Sector**

The International financial services sector (offshore) was born because of the perceived need for flexible tax frameworks in the international arena. The central issue was one of high taxation but also stringent financial regulations in onshore jurisdictions.<sup>4</sup> Investing Offshore simply means the placement of an investor's assets in a tax jurisdiction other than where the investor lives. An offshore financial centre is a country or jurisdiction in which the conduct of international business is generally facilitated by more lenient financial and banking laws coupled with higher standards of privacy than in one's home country. Therefore, any country can be considered offshore. For example, the countries of the OECS are considered offshore for citizens of Switzerland, the US or the UK, while their countries are offshore for the citizens of the OECS countries.

Over the past thirty years, offshore financial centers have become an increasingly major part of the emerging global financial system. Estimates of the size of the global offshore financial services market range between US\$10 and US\$12 trillion. This represents approximately 60% of the world's financial resources.<sup>5</sup>

There are approximately 70 offshore financial centers worldwide. The principle offshore centers are London, Switzerland, Hong Kong, Singapore, Bahrain, etc. These centers are full service environments and have sophisticated settlement and payment systems. On the other hand, small jurisdictions, or most commonly small island states, like the OECS (except the British Virgin Islands)<sup>6</sup> have been most commonly considered as secondary or tertiary centers since they are basically company registries that provide limited banking and other value added services. The bank accounts and assets of the companies registered in these smaller jurisdictions are generally held in the principle or developed countries. Nevertheless, many of the services offered in the smaller offshore jurisdictions continue to be in heavy demand.

### **Reasons for Going Offshore**

Individuals and multinational corporations generally invest offshore for a variety of reasons. Some of these reasons are to enhance income tax planning strategies, to facilitate gift and estate planning via the use of family and protective trusts or as an alternative to a will, for long-term benefits to beneficiaries and for accumulation of investment income.

Structures incorporated in offshore jurisdictions offer investors greater diversification of their assets and investments as well as a number of other advantages such as income tax deferral. They also offer increased confidentiality and privacy. These characteristics are extremely important to many persons and multinational companies that legitimately utilize offshore structures.

Companies operating in the offshore jurisdictions (or tax havens) generally operate through the use of International Business Companies (IBCs). These IBCs are granted government guarantees from income taxes as long as they do not operate in that country and their business revenue does not come from within that country. An examination of most of the Fortune 500 and many of the biggest multinational corporations would demonstrate that they currently invest offshore. These companies include Firestone, Boeing, Exxon, Caterpillar, Sears and a host of other corporations. Also included are many financial institutions and banks such as American Express, Citibank, Chase and Bank of America. One very attractive reason for the financial institutions using offshore jurisdictions is that banking and financial service profits from interest dividends and capital gains in offshore financial centers are generally higher than can be obtained in their domestic markets and may be virtually tax free to the financial institution. Furthermore, offshore banks and institutions are not subject to the vast amount of constraints with respect to their investments and thus have a much wider horizon of opportunities in which to invest than many of the banks in the developed countries.

Moreover, the offshore financial services jurisdictions, through the use of asset protection trusts offer greater protection such as from frivolous litigation which is rampant in some developed countries. In fact, in recent years, there has been a significant increase in the number of frivolous litigation and Product Liability Lawsuits,

particularly in the United States. As a consequence, persons and institutions are very concerned about protecting their assets and thus may utilize structures incorporated in offshore jurisdictions to achieve this objective.

## Development of the Offshore Sector in the OECS Countries

Table 1 demonstrates that in the past two decades, all of the OECS countries have enacted legislation for the establishment of frameworks for the provision of offshore financial services.

TABLE 1: JURISDICTIONS & DATES OFFSHORE CENTER ESTABLISHED

JURISDICTION	YEAR SECTOR ESTABLISHED
Anguilla	1994
Antigua & Barbuda	1982
British Virgin Islands (BVI)	1984
Dominica	1996
Grenada	1997
Montserrat	1980
Nevis	1984
St. Kitts	1993
St. Lucia	2000
St. Vincent & the Grenadines	1982

## Contribution of the Offshore Sector to the Development of the OECS

Over the years, the offshore financial services sector has become increasingly important to the economies of the OECS and to their citizens and accounts for an increasingly substantial proportion of their economies. The sector has generated foreign exchange earnings, which is vital to the economies. Furthermore, the sector has contributed to government revenues and to the overall Gross Domestic Production (GDP). The sector provides “the means for enabling economic diversification and provides an alternative to national revenue generation.”<sup>7</sup>

The sector has proven to be a harmonious marriage with the high-end tourism product of these nations. It has conferred several direct and indirect benefits on the economies of the islands and provided a credible means of development for little islands that have little appreciable natural resources for growth and diversification.

### Direct Revenue

Direct benefits accrue to the OECS governments in the form of revenues derived from registration of companies, renewals, licenses and other fees. This results in a sizable direct contribution from the offshore sector. In some of the OECS countries, such as the British Virgin Islands and to a much lesser extent, Nevis, Grenada, St. Vincent & The Grenadines and Anguilla, the sector currently accounts for a significant portion of government’s recurrent revenues. In the British Virgin Islands, the contribution is over 50% of the Government’s recurrent revenues and in Nevis, this amount is approximately 15%.

### Indirect Contribution

At the same time, the local economies are bolstered from expenditure on goods and services, the rental of office space and residential accommodation as well as the spin-off effects to other sectors of the economy such as tourism, construction, communications, technology and the wider financial arena. Furthermore, the sector has provided jobs that are so necessary to the social, economic and fiscal well-being of the islands and to their citizens. For example, in Nevis, the indirect contribution is approximately 30%. Consequently, any decline in the offshore financial services sector would threaten the very fabric of some of these small island states.

Despite the current realities, the question of whether the international financial services sector can provide a viable mode of sustainable development for these small island economies remains in doubt. This uncertainty stems from the myriad of challenges that continues to face the small emerging nations of the OECS.

## Challenges to the International Financial Services Sectors

The events of the recent past, namely, the difficulties presented by globalization, the world economic recession, the terrorist attacks of September 11, 2001 on the United States of America, followed by the other attacks in the global arena, as does the continuing threat of global conflicts and compounded by the other developmental realities have presented ongoing challenges to governments, economies, businesses and private sector practitioners of the OECS region.

The nations of the OECS have also been hampered by the challenges posed by the unilateral actions taken by the developed nations. These challenges first started in March 2000 when the Financial Stability Forum categorized all offshore jurisdictions in three categories, with most nations in the Caribbean being placed in the category of lacking in supervision of their financial institutions. This was followed by the Financial Action Task Force (FATF) blacklist in June of 2000 and by the Organisation for Economic Cooperation and Development (OECD) blacklist of a number of jurisdictions in the same month.

The FATF, composed of 29 developed nations<sup>8</sup> stated that the 15 listed countries, including 5 in the Caribbean<sup>9</sup> were not doing enough in the fight against money laundering.

The OECD, composed of 30 developed nations<sup>10</sup> also published a list of 35 countries, including 15 in the Caribbean, and accused them of being tax havens with preferential regimes that are harmful to tax competition.<sup>11</sup> The initiatives of the OECD were motivated by worries that offshore financial centers were, by trying to entice multinational companies, depriving other countries of tax revenue. The OECD threatened to impose sanctions against the listed offshore centers unless they agreed to cooperate with them and make specified changes to their tax regimes and policies.

These listings were further compounded by various financial advisories from the United States Treasury, the United Kingdom, Canada and other countries, where persons and institutions were advised to carefully scrutinize all financial transactions emanating from or routed through the listed countries. This led to some of the banking institutions in these listed countries losing or facing the possibility of losing their correspondent banking relationships with banks in developed countries and posed a severe threat to the stability of the entire financial system of the OECS region.

The listings also led to several monetary authorities sending out advisories to their banking institutions to exercise caution and conduct extensive due diligence on companies incorporated in the listed jurisdictions. These advisories required that intermediaries undertake extensive due diligence. This resulted in greater costs to the intermediaries hence loss of lucrative business to the listed jurisdictions.

To date, all of the OECS jurisdictions have been removed from the FATF and OECD lists. Table 2 shows the FATF de-listings of the OECS countries and other Caribbean countries from its non-cooperative countries and territories in the fight against money laundering. This occurred following numerous face-to-face meetings<sup>12</sup> and the enactment of anti-money laundering legislation; the establishment of independent Financial Services Commissions to regulate the industry; the creation of Financial Intelligence Units within the Police Force to investigate money laundering and other financial crimes, the amendment of their existing legislation to promote transparency and a host of other measures.

TABLE 2: REMOVAL OF CARIBBEAN COUNTRIES FROM FATF'S LIST

The Bahamas	June 2001
The Cayman Islands	June 2001
Dominica	October 2002
Grenada	February 2003
St. Kitts & Nevis	June 2002
St. Vincent & the Grenadines	June 2003

The OECD removals of the OECS countries from its list of un-cooperative tax havens were undertaken after the respective OECS countries made commitments to improve transparency and effective exchange of

information in tax matters.<sup>13</sup> The countries also agreed to participate in the OECD Global Forum to develop standards that are applicable to all in the global arena.<sup>14</sup>

Notwithstanding the removals from the FATF & OECD lists, the economies suffered and the scars to the economies remain. The listed OECS nations experienced significant declines in the registration of companies and other entities due to the fact that these nations became less competitive than other Onshore and Offshore Centers that were not listed and hence were not required to implement the onerous compliance requirements forced on by the OECD. These attacks posed severe challenges to the economies of the OECS nations and threatened the very existence of the industry that had been so critical to the well-being and the very livelihood of the citizens of the OECS region.

It may be noted that the removals from the negative lists constituted an added attraction to businesses by strengthening the view that the countries of the OECS are viable and reputable financial services centers. Due to the more stringent requirements and regulations, individuals and multinational corporations can now have greater assurance and confidence in their investments in these countries. Furthermore, since the provision of international financial services is the livelihood of many of these offshore jurisdictions and are needed for the well-being of their citizens, these countries tend to be very careful with the way they conduct business.

## **The Way Forward for the OECS Nations**

It is apparent that the challenges posed by globalization as well as those resulting from actions of the developed nations have severely hampered the development of the international financial services sector in a number of OECS jurisdictions. This is evident in the case of Dominica and Montserrat where the sectors no longer contributes in any significant manner to Government's revenues. In addition, St. Lucia, the last OECS jurisdiction to enact legislation for the provision of offshore financial services, does not seem to have gotten off the ground. However, in the case of the British Virgin Islands and to a lesser extent, Nevis, Grenada, St. Vincent & the Grenadines and Anguilla, it appears as if the international financial service sector has the potential to provide a credible vehicle for development. It must be noted though that as a result of the numerous pressures and challenges and the increased cost of doing business in the offshore financial services sector, that the opportunities for significant growth is limited. It is therefore imperative that the nations of the OECS aggressively undertake initiatives and programs to explore other opportunities for diversification so as to guard against the threats and to ensure the long-term sustainability of their economies.

Notwithstanding these factors, it is clear that the international financial services sector has the potential to provide a limited avenue for continued development of the OECS nations. However, great care must be taken to develop and implement measures and strategies to guarantee success. Several recommendations are delineated in the next section.

## **General Recommendations for the Development of the OECS via International (Offshore) Financial Services**

### **Develop Strategies to Enhance Economic Progress**

The collective threats posed by the onerous regulatory standards that have been implemented and the passage of other initiatives, such as the US Patriot Act,<sup>15</sup> suggest that it is even more essential that the countries of the OECS enact sound, long-term strategies to protect and further enhance the economic progress that they have made over the recent years. With this in mind, each of these countries must pursue a diversification strategy which is focused on consolidating, stimulating and modernizing their traditional economic sectors of tourism, international financial services and to a lesser extent, agriculture while creating new areas of growth which would allow the islands to embark on higher levels of development and lay the groundwork for sustainable advancement in the various economic sectors. It is imperative that proactive as opposed to reactive strategies be implemented in order for these nations to respond dynamically to the challenges that will ensure their survival.

**Respond Dynamically to Change**

The financial services industry is under-going a process of change. The international markets are extremely volatile and several large multinational corporations are facing bankruptcy. This situation is aggravated by the state of the world economy, the war in Iraq, and the increasing threat of international terrorism. Some governments have responded by introducing burdensome regulations on banks and other financial institutions in an effort to fight money laundering and other financial crimes. These developments have seriously threatened the future viability of some businesses and offshore centers like those in the OECS region.

Furthermore, although the island states of the OECS are small in size, they must realize that size is not a factor in the provision of the offshore financial services. With the advancement in technology, borders are now broken down and small countries now have to compete directly with centers in the developed countries. This trend requires that both Governments and the private sectors plan more effectively, search for new opportunities, carefully assess risk, and adjust to change.

**Enhance the Infrastructure**

It is also imperative that the Governments of the respective OECS countries implement the necessary infrastructure to establish themselves as successful, modern and diversified economies that are resilient enough to withstand any negative impact from external forces.

**Educate the Citizens and Practitioners**

Of priority to the Governments of the OECS must be the investment in the education of their citizens in order to ensure a well-skilled workforce and a generous supply of highly intelligent people who are dedicated to the continued success of their countries. In addition, this focus on education will serve to better prepare the practitioners for meeting the needs of a very dynamic international financial services industry. To assist in achieving this goal, it is necessary for the OECS Governments to work with established local, regional and international institutions and organizations that are vibrant and dynamic and can provide education, information and networking to its members and interested persons.

**Renew Commitment to a Proper Regulatory Regime**

The Governments of the OECS countries must jealously guard their reputation and demonstrate their serious commitments to the development of reputable international financial services sectors. Consequently, extensive due diligence and other measures must be undertaken to ensure that only persons with the highest degree of integrity are permitted to conduct business activity on the islands.

**Collaborate with the Private Sector**

It must be recognized that service providers and individual managers also have a critical role to play in improving the quality and reputation of the jurisdictions, since they are the ones who interact with the clients. Hence, it is the reliability and efficiency of that relationship between the service providers and the clients that will determine whether or not the clients decide to utilize the services offered by the jurisdictions of the OECS. It is therefore important that the Service providers in each jurisdiction be encouraged by the Governments to provide high quality and efficient service to their clients. In addition, it must also be recognized that it is extremely important that all relevant persons, financial institutions and government authorities be properly familiar, trained and updated on the workings of the financial service systems and the measures that need to be undertaken to ensure that only reputable operators are permitted to operate on their islands.

**Maintain Competitive Advantages**

It must also be recognized that in order to remain competitive in this industry, the OECS nations will have to develop new products to complement what already exists. These countries must therefore seek the advice of relevant and committed experts along with input from service providers to draft high quality and user-friendly legislation for new and innovative products. In addition, amendments must also be made to existing legislation with the objective of targeting niche markets. Moreover, the OECS countries must ensure that they comply with international best practices.

**Develop Collaborative Approaches**

It is necessary for small island states like those in the OECS to share in the benefits of globalization. This is necessary in order to ensure a peaceful coexistence among the large and small nations of the world and to enhance the preservation of democracy. This objective will only be achieved through the process of inclusion and

constructive dialogue between the small and large nations. The larger developed countries should be encouraged to refrain from unilateral actions and policies that hinder the development and progress of the smaller jurisdictions. It is therefore essential that the Governments of the OECS nations appeal to the larger nations to adopt the principles of mutual cooperation and understanding and seek to work together for the common good of all mankind.

To this end, the nations of the OECS must collaborate with local, regional and international organizations and bodies as well as larger countries to undertake initiatives that will be of mutual benefit.

#### **Maintain a Healthy Macroeconomic Environment**

Finally, it is imperative for the countries of the OECS maintain the requisite macroeconomic environment and continue to pursue investments in human, physical and institutional capital that would enable their citizens to fully exploit their potential in the global economy.

## **Conclusion**

All of the OECS countries have pursued the development of the international financial services sector as a means of further integrating into the global economy. To this end, they are attempting to differentiate themselves and develop competitive advantages by implementing unique offshore financial sector products or frameworks. Despite the many challenges faced by these small island economies from economic shocks, natural disasters, disadvantages due to size, mounting debt burdens combined with the added pressure from the developed countries and the demands resulting from globalization, it is apparent that the financial service sector constitute the potential for a limited but important tool for diversification and long term development of the OECS economies. Notwithstanding this reality, the OECS countries must however be mindful that other avenues of diversification must be explored in order to ensure long term economic development and sustainability. It will be a monumental mission to ensure success, nevertheless, the countries of the OECS must recognize that they cannot be overwhelmed by the magnitude of the task that lay ahead of them, but must be mindful of the fact that they can seek to turn challenges into opportunities and look to the future with confidence as they enact measures to ensure short and long-term growth and sustainable economic development of their countries.

## End Notes

I would like to thank The Center for International Business, School of Business at Montclair State University and the Hanyang University, Seoul, Korea for presenting this event and the many sponsors for making this conference occur on such an important and timely subject as global business and economic development.

<sup>1</sup> The Organisation of Eastern Caribbean States (OECS) established in 1981, brings together seven member states and two associates in the Leeward and Windward Islands. The members are Antigua & Barbuda, Dominica, Grenada, Montserrat, St. Kitts & Nevis, Saint Lucia & St. Vincent & the Grenadines while Anguilla and the British Virgin Islands are associate members. Six of the island nation states enjoy full political independence, with the Federation of St. Kitts and Nevis are recognized as one country but with two separate financial service jurisdictions, while Anguilla, the BVI and Montserrat are United Kingdom Overseas Territories. The OECS Secretariat is located in Castries, St. Lucia.

<sup>2</sup> Economic Survey of the Caribbean, 2003-2004 by the United Nations Economic Commission for Latin America and the Caribbean (ECLAC) quoted in Caribbean Life Newspaper, Courier-Life Publications, In. Brooklyn, NY. October 19, 2004.

<sup>3</sup> Zaragoza, Jose, The Canadian Foundation for the Americas (FOCAL). The Canadian Foundation for the Americas (FOCAL). Established in 1990, FOCAL is a non-governmental organization that fosters informed and timely debate and dialogue on issues of importance to decision makers and leaders in Canada and the Western Hemisphere.

<sup>4</sup> Bardouille, Nand, The Offshore Services Industry in the Caribbean: A Conceptual and Sub-Regional Analysis. International Journal of Islamic Financial Services, Vol 2. No. 3.

<sup>5</sup> Despite its significant size, the offshore financial services sector is an area that still remains one of the least understood in the field of international finance.

<sup>6</sup> The BVI is in a league of its own. It is the most popular jurisdiction in the world for International Business Companies (IBCs), with over 500,000 currently registered, and over 50,000 incorporated in 2003 alone. Further, it has numerous international banks and is considered the 5<sup>th</sup> largest captive insurance jurisdiction in the world. The BVI is also considered one of the most prosperous jurisdictions in the Caribbean area. The major reason for this phenomenon is its status as a British Overseas Territory and the only territory to have been given responsibility for managing its own financial services industry.

<sup>7</sup> Jeffers-Gooden, Agatha, International Financial Centres Yearbook, Euromoney Publications, 2004.

<sup>8</sup> The member countries and governments of the FATF are Argentina, Australia, Austria, Belgium, Brazil, Canada, Denmark, Finland, France, Germany, Greece, Hong Kong, China, Iceland, Ireland, Italy, Japan, Luxembourg, Mexico, The Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. It also includes two international organizations, namely: the European Commission and the Gulf Cooperation Council.

<sup>9</sup> These countries were Bahamas, The Cayman Islands, The Commonwealth of Dominica, The Federation of St. Christopher (St. Kitts) & Nevis, St. Vincent & the Grenadines. Grenada was subsequently added to the FATF list in 2001.

<sup>10</sup> The members of the OECD are Australia, Austria, Belgium, Canada, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Korea, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States. In addition, the Commission of the European Communities is a participant.

---

<sup>11</sup> The OECD initially identified the following countries as tax havens: Andorra, Anguilla, Antigua & Barbuda, Aruba, Commonwealth of Bahamas, the Kingdom of Bahrain, Barbados, Belize, British Virgin Islands, Cook Islands, the Commonwealth of Dominica, Gibraltar, Grenada, Guernsey/Sark/Alderney, Isle of Man, Jersey, Liberia, The Principality of Liechtenstein, the Republic of the Maldives, the Republic of the Marshall Islands, The Principality of Monaco, Montserrat, the Republic of Nauru, Netherlands Antilles, Niue, Panama, Samoa, The Republic of the Seychelles, St. Lucia, The Federation of St. Christopher & Nevis, St. Vincent & the Grenadines, Tonga, Turks & Caicos, U.S. Virgin Islands, and the Republic of Vanuatu.

<sup>12</sup> The author represented The Federation of St. Kitts and Nevis in negotiations and other initiatives with both the FATF and OECD nations and which resulted in the twin-island Federation being removed from the negative lists.

<sup>13</sup> These committed jurisdictions are referred to as non-OECD participating partners.

<sup>14</sup> The OECD countries working with the participating partners within the Global Forum on Taxation developed international standards for transparency and effective exchange of information in tax matters. A sub-group developed the Model Agreement on Exchange of Information on Tax Matters. In addition, the Joint Ad Hoc Group on Accounts is still working to develop standards for the transparency requirements as they relate to Accounting.

<sup>15</sup> The Patriot Act, a USA legislative bill was signed into law on October 26, 2001. Enacted in response to the September 11, 2001 Terrorists Attacks, the Act imposes stringent requirements on how financial organizations screen existing customers and process new customer information.

# **Sustainability of E-governance Projects -The Indian Experience**

*S. Jagadish  
Indian Institute of Management, India*

## **Abstract**

Using Information and Communication Technology (ICT) for supposedly enabling more efficient government, particularly in the area of offering services to the citizens, has become the order of the day, all over the world. How many of them actually, result in providing meaningful value to the beneficiaries is a concern. It is also noticed that plenty of hype is often created over an e-governance project when it is first implemented; but, shortly thereafter the initiative fades out into oblivion. Even in cases where they don't fade, it is noticed that they fail to achieve the original objectives with which they were initiated. This may be true all over the world but this paper tries to address the problems of sustenance of e-governance in the Indian environment. It uses case studies available in literature and based on the author's own experiences to understand what results in sustainability and whether a meaningful framework can be suggested that make e-governance more sustainable, in the Indian context.

## **Introduction**

E-governance projects are launched with great fanfare and, often, with greater belief in its capabilities. In India, in particular, employing ICT (Information and Communication Technology) in government functioning, especially where it is related to interaction with the public, has been driven with a "me too" surge.[6] The expected benefits are highlighted and recorded as a success, once the system begins working without any technological flaw.

In the year 2000, the Stockholm award on e-governance in a developing country was awarded to an initiative undertaken in a remote rural district of Dhar in the state of Madhya Pradesh. This ICT deployment was christened Gyandoot (meaning, messenger of knowledge).

Using dial-up telephone network, this project was able to connect personal computers to the Internet through which a host of services, desired by the villagers, were offered. These PCs were installed in kiosks, run by semiliterate villagers, also created a new form of business for them. The kind of services it offered is as follows:

1. Birth & death certificates.
2. Complaints requiring maintenance of agricultural pump sets.
3. Complaints about non-receipt of pension money.
4. Market prices of seeds and agricultural produce.
5. Advice on fertilizing and pest control.
6. Platform to advertise or communicate about offers and requests.

In addition, the kiosk owners could offer any computing services like training in programming, word processing and printing, etc.

The charges varied anywhere from Rs. 5/- to Rs. 15/- depending on the service requested.

The box below, gives a brief glimpse of things that happen through Gyandoot:[6]

***“A complaint costing Rs. 10 made available drinking water to a tribal hamlet of 39 households:***

*A small hamlet of village Mafipura, named Baidi Awar has only one hand pump for clean drinking water for 39 households. The hand pump was out of order for six months and villagers were fetching their drinking water from over 2-km distance. The villagers lodged complaint to the concerned department officials and were not responded properly. One villager named Ramesh Gobaria went to nearby Soochanalaya to lodge a complaint. Initially he was very sceptical about the payment of Rs.10 for sending a complaint, as he was not sure that the complaint would be properly attended to. To the surprise of the villagers, a hand pump mechanic reached the hamlet within two days of filing the complaint at Soochanalayas and he repaired the hand pump within three hours.*

*The incidence built the confidence level of the villagers and they become habitual of using Gyandoot services.*

***“A cow for rupees three thousands:***

*This is the first real e-commerce transaction in the rural area of the tribal district. Kalsingh of village Mirjapur wanted to sell his cow. He registered at Soochanalaya of nearby Gunavad village to put up his offer of the animal on-line. He received four trade enquiries on his account and he finally sold his cow to the highest bidder Premnarayan of village Dilawara.*

*The auction facility of the Gyandoot enables trading of commodities like milch animals, cultivable land, tractors, agricultural tools etc, creating virtual market place to benefit villagers from expanded horizons and increased competitiveness. The facility has really done its job in providing true market to the villagers of the tribal hinterland and benefited them economically. The service is becoming very popular making the virtual market place deeper and wider.*

***“256 milch animals vaccinated in one day:***

*Hiralal sent an e-mail from Gunavad Soochanalaya that an epidemic has broke out amongst the milch cattle of the village Kot Bhidota. A vetenary rescue team was despatched on the same day by the district head of the veterinary department. The team was informed that there was no death due to the epidemic. The disease of haemorrhage septicaemia was detected. The team promptly started curative treatment and vaccinated the rest of the animals against the disease. They also made search and survey operation in the neighbouring villages for detection of any disease symptoms and did preventive vaccination.*

*Tivradoot facility of the Gyandoot caters to natural calamities and epidemics providing instant information to the right government functionary. An instant relief and preventive measures are possible due to timely availability of information.”*

It was no wonder that this created quite an excitement and was flaunted with great enthusiasm as an example of India's successful inroads into e-governance and in taking ICT to the rural masses.

One can imagine the amount of groundwork that was required before launching this service. It was all done with tremendous sense of commitment by the then district collector and his team.

This team, in fact, became advisors to other state governments, offering consulting services in implementing a similar programme.

In 2005, “Gyandoot” is a very small fraction of what it was, even though some additional investments in the form of technology were made. It is only in the record books can one refer to the glory that was Gyandoot. The then district collector was transferred and he later on took up independent studies on e-governance, and the subsequent administrators took minimum interest in building Gyandoot further. Initial funding for the infrastructure and project work came from international funding agencies and the fund for sustenance, to be given by the state government, has been less than required.

The story of Gyandoot is not unique. Such projects taken up the government seem to all achieve a peak popularity status and then slide down into total decay or a run of the mill “government” activity providing no particular value.

## Some More Cases

Around the same time, the government of Andhra Pradesh introduced what was purported to be a flagship e-governance venture, Computer-aided Administration of Registration Department, or CARD.

**CARD** is a catchy name given to the comprehensive project of computerizing one of the oldest wings of the Government "The Registration & Stamps Department". The project was originally conceived in August 1996 and implemented at two test sites in August / September 1997. Judging the project by its initial success and the immense potential it has in transforming the concept of public service, the Government decided to replicate it all over the state. Thus began an intensive and dedicated effort, which is now the watchword of the Department...**CARD**.

This project also enjoyed high publicity and a shower accolades. Much was made of it, the manner in which the whole process of land registration was made transparent giving little scope for skullduggery. The system was deployed in several sub-district level zones and seemed a clear winner for the cause of Information Technology in contributing to good governance.

The success of this contributed to the officer, who managed this project, to be subsequently appointed as the Secretary of Information Technology of his state. According to his own statement, in a new journal, later, CARD was not doing all that it was expected to do because of many officers at the stations subverting the system in their varied interests.

CARD exists today, only as archival project, and one wonders to what extent it is being used for land registration.

Computerization of Check posts in Gujarat received plenty of hype. This system enabled freight trucks to complete the formalities at the border check posts without having to wait very long. For the regulatory authorities, it meant the ability to verify documents more accurately and thus to ensure that freight carriers declared their goods honestly and paid correct taxes. It was declared that the collection of taxes because of this more than paid up for the investment in technology in just one year.

The system consisted of scanners, electronic weigh bridges, video monitoring, computers and trade databases, etc. Contract personnel carried out some of the manual operations.

We are told that the same enthusiasm does not exist today as it did in the year of its inception. The governmental authorities and freight carriers have been successful in exploiting the loopholes of the system in collecting bribes and evading taxes, respectively.

One can quote several such examples from the Indian scenario. An e-governance initiative is launched with much fanfare, newspaper articles are written about them; some even get a World Bank report written about them. After a year or two, they seem to go underground and the sustenance and growth expected never happen.

A classic case is that of "Mukhya Vahini", introduced in Karnataka state. The objective of this was to monitor the smooth deployment of all projects invested in by Global players, right from the chief minister's office. It was slated to subsequently grow into a full-blown portal for all departments of the State.

The government even published a handbook with complete details about the project. The objective stated in the brochure goes as follows:

### **"OBJECTIVES**

- Improved information availability both in terms of quality and timeliness.
- Strengthening, modernizing and speeding the existing information systems of the departments
- Improved response to citizens' petitions, representatives' request and information needs
- More focused review of the departments

The hope is that this project will act as a catalyst to improve the information systems in the government."[3].

The system passed its pilot stage and was to have been deployed in full. The officer in charge was transferred to a different department and the next incumbent took charge of the project though the progress slowed down. However, shortly thereafter, a new post called, "Secretary, E-governance" was created in the State the incumbent of which would be responsible for all E-governance projects in the state. These projects were the responsibility of the department of Information Technology, earlier.

The new secretary of e-governance became interested in identifying and promoting new projects, blatantly ignoring projects initiated by the earlier regime.

The chief minister's secretariat made some weak attempts to support and pursue "Mukhya Vahini" but let it slip into the back burner due to lack of organizational competence and passion to pursue it.

One reason for poor sustainability of e-governance emerges directly from the experience of this case: absence of the champion! Another reason that is clearly implied is political games that are a part of governmental processes and structures.

## **Sustainability**

Mckenny [10] refers to a Maestro who understands the languages of both the business as well as technology and whose presence is essential for the success of any Information Technology initiative. The champion is equivalent to the Maestro because, in most cases (and all of them cited above), the officer who champions a particular ICT intervention in government also happens to be reasonably familiar with information technology. Once he or she is transferred or moved out of position, the e-governance initiative suffers unless the new incumbent is equally passionate about the same project. This does not happen and this is where the political factor comes into play. This kind of political power play, often played at a very subtle level, is a factor for success or failure of any IS implementation.

This particular case is quite similar to that of the Financial Information Systems at Golden triangle Corporation, described by Lynne Markus in his paper, "Power, Politics and MIS Implementation", where the person chosen to head the corporate controller's office, in the restructured organization, turned out to be an old rival of the head controller of the chemical company divisions, which got subjugated to a new corporate entity on account of mergers (with the latter actually having hired the former several years ago).[9]. It is not surprising that the system met with implicit but very strong resistance from the division.

Thus, at least two factors seem obvious for the sustainability of e-governance: the continuity of the maestro and a non-destructive political climate. Not only is this demonstrated by the cases above but are also supported by Information Systems theory.

Bhoomi (meaning earth) is an e-governance implementation in the state of Karnataka, again, which has received global attention. It is an ICT implementation that has made the entire process of registering one's land holding, mutation, sale, etc., into a paperless one. It has not only resulted in very high reduction in transaction time but also deters tampering of land records. It has minimized possibility of corruption through disintermediation.

The utility and the economic worth of the Bhoomi may be questioned, but the fact that it has sustained the hype created over it and has remained a steady example of e-governance over a period of as long as eight years, is because the officer who 'championed' this project continues to be in this position for eight years without being transferred to a different post— the normal tenure of any officer in position being 3 years. Thus, enough time was given for this initiative to take root and also see it through its phase of consolidation, through one leader. It is assumed that even if he were to be moved out now, enough systems have come into place for Bhoomi to continue without failing.

The implementation of any MIS has deep rooted problems - resistance by various forces being the major one. When it comes to e-governance, this issue becomes graver since, more often than not, a particular implementation depends on the assumption that all actors that interact with the system are rational and that the initiator and managers of the system can objectively determine what is of value to these actors. Any mismatch results in resistance. [5]

Any technology based solution requires change in existing processes and, in the governmental structure where existing processes have evolved over long periods, through socio-political patronage, required changes are bound to meet with resistance. So the moment the pressure of novelty and hype are withdrawn, the system has a tendency to collapse.

The often cited case of the Washington Licensing Department, illustrates how both these issues were addressed:[2 ]

The “champion” demonstrated considerable leadership skill in pushing the project in spite of all odds and bought away any future resistance in ensuring a “win- win” situation for all the actors.

This takes me to the next theory, that of Barry Boehm, called, “ Theory W”. The essence of this theory is that unless a software product is built around the “Win” requirements of all the stakeholders, the chances of its failure is very high.[1].

A good example of this is the classic case of software runaways, namely, the automated, integrated baggage conveyor system at the Denver International Airport. In spite of the experience and technical expertise of BAE, the contractor of this system, it became a scandalous failure because, among other things, it failed to take note of the Denver mayor’s win requirement, which was to show case this system during his reelection campaign.

We can already note that there are enough theories of IS that can be applied to e-governance initiatives in assessing their sustainability.

In the Indian scene, the reasons for non-sustainability of e-governance can be over simplified to the fact of non- continuity of the officers during the initiation of the project and the political environment not being supportive enough. It is actually far more complicated, however, and very difficult to analyze.

Oftentimes, what appears to have sustained itself over a period of time may only be artificially so. Either that the whole truth is not known or that it is kept alive by regulatory measures – like life sustaining apparatus.

## **E-seva**

Take the example of a high profile e-governance initiative of the government of the state of Andhra Pradesh, called e-Seva (seva means, help). Originally, implemented to serve citizens only of the capital, its aim was to provide a “single-window” facility for payment of utility bills, like electricity, water, telephone, etc.

The system is based on heavy 3-layer architecture, connected through ISDN lines, where the payment windows are privately owned kiosks. The infrastructure is owned by the government. The kiosk owners are required to pay a percentage of their revenue to the government. As mentioned earlier, the system was deployed only in the capital city with the contention that it will be expanded to cover all the other districts of the state by the year 2000.

One did not see any promised expansion even by 2004. Only then did some extensions take place but not exactly the way it was visualized. The expensive architecture became too inflexible to be extended and so the only expansion that took place was to a neighboring district.

The issue of sustainability is whether this system would have survived without the government compelling the citizens to make their utility bill payments through these kiosks, by barring all alternative means of payment? Could the citizens be given the option to choose the method that they found cost effective to them?

Probably as a means of moral justification, e-seva, was shortly promoted, not just as a utility payment gateway but as a portal for general citizen services of what has been categorized as GtoC (government to citizen) and BtoC (business to citizen) services. It is not clear how much of these services are used, or even actually activated.

The irony of it is that these agenda would clash with that of the portal of Andhra Pradesh, called, AP online, which was originally and still intended to offer all citizen services. This appeared to have originally been very similar to what was Ukgovonline, of United Kingdom (now, “direct.gov.uk). So, this duplication is seemingly an ad hoc requirement of the system, introduced only to sustain e-seva.

A privately set up internet access in the rural areas, in Tamil Nadu state seems to be doing great business by offering services to villagers through private entrepreneurs. [4] While the kiosk owners seemed quite happy with the situation, one of the functions that they said was in great demand was to be able to pay their utility bills through these kiosks instead of having commute to the district headquarters every time. This service is not available to this private network. In fact, such services make more sense for the remote rural areas than for urban metropolis that e-seva serves.

As Hirscheim and Klein point out, there are several explicit and implicit assumptions upon which information systems design are based and each of them is likely to result in a different set of solutions [5]. To arrive at a proper solution and, hence a sustained solution, these assumptions should be close to reality.

A peep into the some of the assumptions on which e-seva was built – as shown in the box below indicates the strong corporate business orientation that was followed in designing its architecture.

### III. Principles

Principle 1: Business needs should have priority when making systems management decisions.

- System management must facilitate the business process. Business unit needs should play a primary role when identifying requirements and selecting technology and applications. Business units are assuming a larger role in driving technology selection and its application.
- Whenever a business need conflicts with a systems management need, the business need must take priority.
- Business units should have as much autonomy as possible to select applications that meet their needs. As long as the business functionality justifies the cost and the business unit is willing to pay the price, then the selected application is acceptable. Support costs should be considered by the business unit.
- To support business processes, systems management must focus on increasing system stability and availability while reducing costs. It can achieve these goals by setting standards, establishing guidelines and centralizing systems management functions along business functional lines.
- Centralization/standardization should occur within a business function. However, a single standard does not apply to all lines of business. For example, all operators using the same system should have a minimum standard hardware and software configuration to meet their needs. Operators using other systems may require different tool sets to meet the needs of their unique business applications. Configurations can be different, however all configurations can be based on the same architectural components.

This is ideal and, one presumes, a strong wish list of the decision makers. But the reality may be far from this. This is a socio-political situation and one cannot go only by a single presumed premise that serving the citizens by the government runs on the same lines of corporate business.

Jenson Hoff analyzes very well the relationship between the use of ICT and the citizen in his paper on a Theory of Democracy for the Information Age. [8]

Information Systems theory, again talks about secondary users as an imperative for robust systems. It applies to e-governance projects as well.

There are primary beneficiaries that the system addresses first, but then, it should be designed to penetrate its value to the secondary (even tertiary levels) too. [11]

For example, in the Bhoomi initiative discussed above, the primary target consists of the citizens who have to transact a land deal and obtained certificates related to their landholding, etc.

Financial institutions that may be approached by a landholder for loans against the land become the secondary beneficiary. The systems cater to them to the extent that its information gains credibility among them in terms of authenticity and security. Its value gets enhanced when the secondary beneficiary is drawn into the system by giving them direct access to its use.

The privately managed service of Nlogue , while it offers a variety of services to a villager, has also roped into several partners into offering a value system to the user. To quote from its experience:

“It is possible to deploy ICT for the development of the rural masses in ways that are economically viable, and hence, sustainable.

Private parties should be encouraged to take up such initiatives.

Services should be based on user needs and not government priorities – the services should sell themselves to the villagers.

Finally – the most important factor – required services should be co-opted into partnership. The current problem of all government initiated “e-governance” services is that they are department centric rather than service centric. [7]

This looks at yet another factor leading to sustainability of e-governance.

The e-governance initiative of India that has not only stood its test of time but has also made a tremendous change in the way that the citizens have benefited from it is the online railway reservation system.

The Indian railway is owned by the government and covers a network of nearly 109,000 kilometers, with 11,000 trains carrying 7,000 passengers in a day.

The passengers used to be put into enormous inconvenience whenever their travel involved transitions at different points. At best they could pay for telegraphic messages to these transit stations to reserve their seats, which were rarely honored, or look for some known person out there who would book their tickets for onward journeys. Even where the journey was a direct point to point one, the passengers would have stand in long lines only to be at the mercy of the ticketing agent to give them a reservation. More often than not the agents exploited the system and indulged in high skullduggery.

With the online reservation system, a passenger can book for any combination of routes from any station. This kind of convenience was not even dreamt of by citizens whose expectation from government offered services have always been low.

This system has extended itself through levels of users making so robust that it no more depends on a champion or patronage of the government through benign budget sanctions.

## **Conclusion**

So, what is the framework by which one can assess whether an e-governance initiative will be sustainable or not?

One thing that is certain is that if an initiative is the pet peeve of a single person only and that the person is transferable, the chances of its survival is very poor. However, for any successful implementation, a Maestro is required but more in the form of continuous concept than an ephemeral individual.

The tragedy of “Mukhya Vahini” clearly shows that an e-governance project should receive the backing of the political structure. Otherwise, it is likely to get subsumed by the political interests of the actors.

The third point is that the requirements of the e-governance initiative itself should be derived from the win requirements of all the actors, mainly the beneficiaries of the system.

Thus, we have a three dimensional measure for the sustainability of e-governance. A balanced approach along these dimensions is a must.

These three dimensions are the minimum requirements for sustainability. If it fails on any of them, there will be no need for further analysis, because beyond, this it becomes a very complex issue.

All the theories related to successful, robust, information systems, in general are equally applicable here. Long-term sustainability, for instance, cannot happen unless the system extends itself beyond its primary services to secondary and tertiary levels. The general theories of IS sustainability essentially, refer to penetration, impact, participation and effectiveness of the implementation.

Fundamentally, almost all the e-governance initiatives are based on the assumptions of what the citizen’s priorities are. In reality they may be entirely different. The example of providing for utility payments inside a modern city is a case in point: alternate channels are available to the urban elite, like credit card companies and banks. On the other hand, as has been pointed out, this service is not made available in remote rural areas where the requirement is felt more intensely.

In fact, one can perceive the presence of strong political motives behind the e-governance projects in India. They become the source of publicity, strength and future career growth for the officers concerned. Consequently, only those projects are taken up that attract media attention, glamorizes the protagonists as patrons of high technology and provides them an artificial sense of achievement. On the other hand, as the railway reservation

system shows, true sustenance is achieved by addressing a social need that enhances the quality of life radically. Most of the projects discussed, as can be seen, on the other hand, deal with marginal changes with low penetration. Such systems, however economical and technologically advanced it might be, are unlikely to be sustainable (except through life support systems provided by the government, like in the case of e-seva).

Thus, behind those minimum requirements for sustenance, stated above, the discussion on sustainability becomes very complex. From available literature, this seems to be true for all places and not just to India.

It also appears that these projects' definitions get embroiled in technology sophistry rather than social realities.

This takes me to the real issue of sustainability of e-governance – it has very little to do with technology or skills of project management. The true paradigms of sustenance should actually be provided in the political and social domain. It is audacious to treat it as much simplicity as has been attempted here.

All the discussions that I have seen about success and failures of e-governance in India are about what functions can be provided and what technology is best to use. None of them ask about what kind organizational structures are to be considered and how to assess true requirement as a solution to a quality of life problem.

To achieve sustainable e-governance programmes, the initiators and implementers should first give up their cavalier approach towards it.

# Looking Back to the Future: Hai'er, Lenovo and SAIC in Historical Context

Tim Beal

Victoria University of Wellington, New Zealand

## Abstract

Chinese corporations such as Hai'er, Lenovo and Shanghai Automotive Industry Corporation, have captured much attention recently for what appears to be an unprecedented rapid surge into world markets. For many years China has been seen as the factory of the world, but now we are seeing Chinese corporations, and their brands, taking a position in the global economy that outstrips Japan's expansion in the 1960s and 1970s. This paper locates that Chinese expansion within the context of the historical importance of China, and Asia, in the global economy and its resurgence from the late 20<sup>th</sup> century.

## Introduction

Chinese corporations such as Hai'er, Lenovo and Shanghai Automotive Industry Corporation, have captured much attention recently for what appears to be an unprecedented rapid surge into world markets. For many years China has been seen as the factory of the world, but now we are seeing Chinese corporations, and their brands, taking a position in the global economy that outstrips Japan's expansion in the 1960s and 1970s. This surge has been staggering, because few people other than China specialists, and the Chinese themselves, had heard of these corporations even a few years ago. Now it is widely predicted that a growing number of such corporations will become household names before long [18]. The Chinese, as the Japanese and South Koreans before them, they have entered world markets in basically two ways. One is as low-end producers of labor-intensive products, especially textiles, a pattern which had been set originally by Britain in the 18<sup>th</sup> and 19<sup>th</sup> centuries [3]. The other method was to establish a reputation as an Original Equipment Manufacturer (OEM). This has acquired various meanings over the years but is used here in the sense of a company which manufactures either components or whole products which are sold under another brand name. This again was the route by which Japan and other countries which had developed a comparative advantage in manufacturing, with an appropriate, but constantly evolving mix of quality product at relatively low cost, but which lacked the marketing expertise and power in target countries entered advanced markets [13]. This continues to be a mainstay of Chinese exports, and is likely to remain so for some time [34]. However, something new is happening.

Firstly, Chinese corporations are acquiring parts, or the whole, of prestigious Western companies. These are not hostile take-overs, so far, but usually a result of the Western company looking for a foreign bail-out. The two major instances of this currently are Lenovo's purchase of IBM's PC division, and the projected entry of Shanghai Automotive Industry Corporation (SAIC) into the British car industry.

IBM's sale of its personal computer division to Lenovo (formerly Legend) was a highly symbolic and significant event. IBM, it will be recalled, had been slow moving into the market for what were then known as microcomputers, leaving the field to upstarts such as Apple and Tandy, while it focused on mainframe computers. When it belatedly entered the market it soon established a leading role, and introduced 'personal computer', or PC, into the lexicon. Part of the strategy was to buy in generic components which allowed other manufacturers to produce clones, the IBM-compatibles [28]. Over time PCs have been commodified, so much so that retailers, such as Dell, have assumed the leading role. It was perhaps not surprising that IBM decided it was time to get out, but nevertheless it was widely seen as the 'end of an era' not just for 'Big Blue', as IBM is known, but also for US industry itself [32].

According to the *Washington Post*, the sale to Lenovo was an IBM initiative. When Samuel J Palmisano took over as president and chief operating officer of IBM in 2000 he moved to transform the business from one selling hardware and software to 'one whose main function is selling its expertise' [16]. The deal with Lenovo

involved not merely the sale of the PC division, and its brand, but also the expertise in technology, management, marketing and distribution to turn the Chinese company into a 'global enterprise' [16]. Whether this strategy is wise for IBM only time will tell. The Chinese are quick learners and IBM will need constantly to replenish and advance its expertise to stay ahead and that may prove difficult.

SAIC is bidding for a majority holding in Britain's historically famous, but perennially ailing, MG Rover car company. The British automobile industry has long been the 'sick man' not merely of Europe, but of the global motor industry. At the time of writing the SAIC deal is not completed, and it may yet fall through [22] [24] [25]. SAIC's acquisition of South Korea's Ssangyong carmaker in 2004 was a protracted affair, and the merger of the two companies has not gone smoothly. Significantly, according to Korean sources, this is because the Chinese executive assigned to Ssangyong, Jiang Zhiwei, speaks neither Korean nor English [6]. Whatever the current deficiencies of foreign language, and foreign experience skills, amongst SAIC executives, the company does have huge resources, sufficient to enter the top 500 global companies [11]. It seems likely that the global knowledge of its executives, especially the emerging middle-ranking ones, will grow rapidly with international exposure and experience. Presumably one of the reasons for the merger strategy, as with Lenovo, is to acquire 'mentoring' from established global players in the acquired company [11]. In the meantime the deal has the strong support of the British government, with the Chancellor, Gordon Brown, making it a focus of a visit to China in February 2005 [23] [35]. SAIC itself aims to be the world's sixth largest automobile manufacturer by 2020, with its own brand [36].

There are a number of other Chinese corporations making their way on the world stage, including Kelon (fridges), Galanz (microwaves), Guangdong Donlim (kettles), GD Midea Holding (rice cookers), TCL (TVs and DVDs) and Hisense (TVs) [8] [36]. However, the one capturing the most attention is Hai'er (also frequently, if incorrectly, spelt Haier). Hai'er originates from the port of Qingdao, home to China's most famous beer, and arguably its first global brand, *Tsingtao* [18]. 'Tsingtao' is merely an older spelling of the city name. Hai'er stands out because of its rapid growth in China, diversification across industries and aggressive expansion into global markets. What is significant is that while this expansion has usually involved some sort of deal with companies in the target market, it has been conducted increasingly under the Hai'er brand. This is happening even though many customers, un the US at least, cannot pronounce its name [38]. India is currently the only country where Hai'er operates with a wholly-owned subsidiary [1]. Hai'er entered the US market selling through the 'superretailers' such as Wal-Mart and Target [11]. Attention to distribution has been one of its characteristic strengths, both at home and abroad. For instance, in late 2004 just before the Chinese retail market was opened to foreign companies in compliance with World Trade Organisation (WTO) agreements, Hai'er entered into a sales joint venture with Suning Appliance Chain Store, China's second largest home appliance chain store [31]. However, what is significant about Hai'er's operation in the United States is that it has gone beyond the expected, and virtually obligatory, deals with the dominant retailers into production. It started selling in the US in 1995 under other names before establishing its own operation in 1999 [29]. The following year completed a \$40million factory in Camden, South Carolina, moving to an area where wage rates were ten times what it was paying in China [38]. The Japanese had reluctantly opened up production in the United States in the 1980s in order to circumvent and deflect American protectionism fueled by a large trade deficit. The Hai'er investment has echoes of that, because America's deficit with China has replaced that with Japan as a major concern but there are considerable differences. The Japanese were hesitant not because of any disparity in wage rates but because they considered American workers inferior to Japanese. Hai'er has given various reasons for the Camden factory such as being able to respond quickly to orders from retailers while maintaining a low inventory, and cutting transportation costs from China but arguably the main one is the strategic desire to establish the perception of Hai'er as an 'American company', and nationalist pride [14] [38]. Nevertheless, the Hai'er investment may be starting a trend, with American regions vying for Chinese FDI in that way they sought Japanese investment in the past [12].

Hai'er has a charismatic leader, Zhang Ruimin, who besides being a vigorous and visionary business leader, is also a member of the Central Committee of the Chinese Communist Party [17]. The Hai'er story has spawned already spawned a film, a book, articles in academic journals, and a number of Harvard Business School case studies [21] [37] [5] [15] [27].

The Chinese expansion in global markets, as exemplified by Hai'er, Lenovo and SAIC, has been extremely rapid and has taken most observers by surprise. However, if we look back into history we can see harbingers of the

present, and future, in the past. We can also trace the early historical ascendancy of China, and Asia, its decline and resurgence. Within this historical perspective the Chinese global offensive becomes less unexpected and even takes on an element of inexorability. Looking back, it seems clear that when the major Asian civilizations regained their political independence and made the transition to modernity, the two being linked together, then it was virtually inevitable that they would soon take a leading, perhaps dominant, role in the international economy. Japan led the charge, followed by the Newly Industrialising Economies (NIEs), initially the 'Four Little Dragons (South Korea, Taiwan, Hong Kong and Singapore), the leading ASEAN economies, China, and latterly, India [4]. The reasons for the order in which this happened, and the process and modalities are immensely complex and contested, but once the geopolitical foundations had been laid it was unlikely that the historical ascendancy of Asia would not be regained to a substantial extent and in some way.

## The Past Regained

Two quotations can be used to delineate our perception of pre-modern China's economy and its attitude to foreign trade. First there is the famous edict of the Qianlong emperor to Britain's George III in 1793 rebuffing British attempts to open up trade relations:

The Celestial Court has pacified and possessed the territory within the four seas. Its sole aim is to do its utmost to achieve good government and to manage political affairs, attaching no value to strange jewels and precious objects. The various articles presented by you, O King, this time are accepted by my special order to the office in charge of such functions in consideration of the offerings having come from a long distance with sincere good wishes. As a matter of fact, the virtue and prestige of the Celestial Dynasty having spread far and wide, the kings of the myriad nations come by land and by sea with all sorts of precious things. Consequently there is nothing we lack, as your principal envoy and others have themselves observed. We have never set much store on strange or ingenious objects, nor do we need any more of your country's manufactures [33].

This condescension and incomprehension was to lead to disaster in the next century, with the British battering their way into the China market with the Opium Wars, and where the British went, others followed [2]. However, the Chinese emperor had a point. We can see now that Britain was embarking on the Industrial Revolution which was to transform the world but at the end of the 18<sup>th</sup> century Britain did not really have any products superior to the Chinese or able to satisfy actual or potential Chinese needs and wants (which is why opium came into the equation). 'Strange or ingenious objects' such as mobile phones, TVs and computers, for which China is now the largest consumer in the world, would have been as inconceivable to George III as they were to the Qianlong emperor. Moreover, in terms of pre-modern commercial activity, China was still perhaps ahead of Britain. Even half a century later, after the first of the Opium Wars had made China's weakness manifest, a Frenchman, the Abbé Huc, traveled from Tibet, down the Yangtze and over the Meiling Pass to Canton in 1850-51 and revealed a surprising view of the Chinese interior. He is here describing the towns of Hanyang, Wuchang and Hankou which together form Wuhan. His is the first important foreign description of the city, some ten years before it became a treaty port:

European productions will never have a very extensive market in China....As foreign commerce cannot offer them any article of primary necessity [that is, which they do not already produce themselves (Murphey's note)] nor even of any real utility, they will interest themselves very little in its extension, and they would see it stopped altogether not only without uneasiness but with a certain feeling of satisfaction....China is a country so vast, so rich, so varied that its internal trade alone would suffice abundantly to occupy that part of the nation which can be devoted to mercantile operations. There are all the great towns important commercial establishments into which, as reservoirs, the merchandise of all the provinces discharges. There is a constant bustle going on about them, a feverish activity that would scarcely be seen in the most important cities in Europe.

The immense populations of China, the richness of its soil, the variety of its product, the vast extent of its territory, and the facility of communication by land and water, the activity of its inhabitants, all

unite to render this nation the most commercial in the world....The stranger is struck by the prodigious bustle and movement going on everywhere under the stimulus of the thirst for gain....From north to south, from east to west, the whole country is like a perfect fair....And yet when one has not penetrated to the centre of the Empire and seen the great towns Han-Yang, Ou-tchang-fou, and Han-keou, facing one another, it is impossible to form an adequate idea of the amount of internal trade [26].

The snapshots complement the historical picture we can reconstruct from statistics. Two main sets of data are used here to trace the historical process. The first is from a couple of studies for the Organisation for Economic Cooperation and Development (OECD) by Angus Maddison looking at long term trends in the world economy [19] [20]. He does not use 'long-term' lightly, and his data runs for 2000 years. This data gives estimates of wealth, both national Gross Domestic Product (GDP) and individual (per capita GDP), and population. Firstly we look at the world as a whole, in terms of regions, and then a comparison of China and West Europe.

The second set of data comes from the World Trade Organisation (WTO) and is solely concerned with merchandise trade.

#### **Wealth of Nations**

Maddison divides the world into a number of regions, some of which I have conflated better to focus on China. Maddison's 'Asia' includes the Middle East, or West Asia but not Central Asia, which is included under 'former USSR'. His 'Western offshoots' is an amalgam of USA, Canada, Australia and New Zealand. It is a rather strange phrase given that it does not include Latin America (which is a separate region). Latin America was settled by the Spanish and Portuguese, and you cannot get much further west in Europe than the places they came from. It may be that including the less successful with the more successful diminishes his argument about the vitality of the 'Western model'. Figures for GDP are given in '1990 international \$' which allows comparison over time (1990 being the benchmark) as well as globally.

Fig. 1 shows GDP by region over these two millennia. Firstly, it is interesting to note that in the year 1000, Africa was the second richest region, second only to Asia, accounting for 11.8% of world GDP. Thereafter it declines and currently (i.e. 1998) it is only 3.1%. Eastern Europe plateaus in the late nineteenth century before declining rapidly with the collapse of the Soviet Union, at the end of the twentieth. Latin America does not 'take off' with European colonization (its share is lower in 1870 than in 1000) but does grow substantially to a new, stable level, in the first half of the twentieth century, helped presumably by escaping from the two world wars. However, it is Western Europe and Offshoots' (WE&O) and Asia which capture our attention. WE&O has been, from the beginning of this period, which was when the Roman Empire was at its height, a major part of the world economy, but it is with the period of European expansion and imperialism that it starts to claw its way to a dominant position. Nevertheless, it is not until the 19<sup>th</sup> century that it overtakes Asia and it looks as if its place at the top will not last much longer. Asia was in long term relative decline from the beginning of the period, mainly because of the rise of WE&O; it should be remembered that we are discussing shares, not absolute amounts of GDP which increase for all regions over this period, apart from Eastern Europe which plummets from \$2.1 trillion in 1973 to \$1.8 trillion in 1998.

Asia and WE&O are clearly the major players in the global economy and their relative shares move inversely to each other. As WE&O colonizes the world and establishes empire, formal and informal, so does its share of world wealth increase. 1950 marks Asia's nadir and WE&O's zenith. Asia begins to rebound with the end of colonialism. This, in itself, does not prove a causal relationship, but it is suggestive.

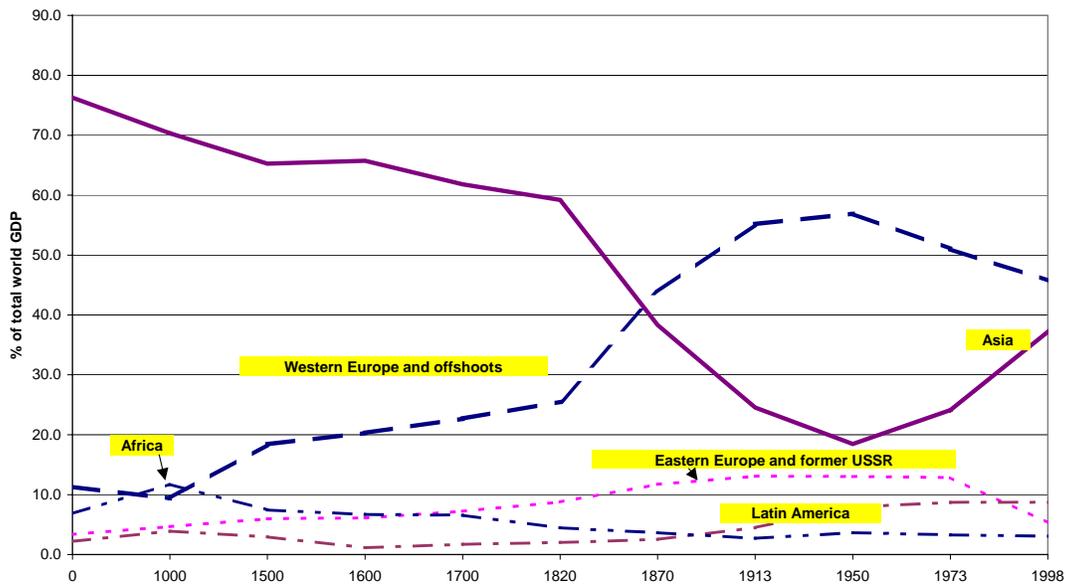

FIG. 1: REGIONAL DISTRIBUTION OF WORLD GDP, 0-1998

The next set of data takes this further by focusing on China, rather than Asia as a whole, and West Europe, shorn of its offshoots; that is without North America, Australia and NZ. There are two sub-sets of statistics in this group – GDP and per capita GDP (pc GDP). These statistics are graphed in Figs 3 and 4, with the underlying data tabulated in the Statistical Appendix (Table A2). Each graph follows the same format. The main data series (GDP, pc GDP) are plotted as columns, with their Y-axis, giving the value, on the left. Also plotted is a line showing the Chinese figures for that variable as a percentage of that for West Europe. The Y-Axis for this line is on the right. Also shown is the 100% level where China and West Europe are equal; above that line China is larger in that variable than West Europe and below it, smaller. Taken together, this enables us to get a pretty clear picture of change, and relative change, in these two key variables over two millennia.

The first dataset relates to GDP, or what we may roughly consider as ‘national wealth’ (Fig 2). This is immensely important as a motivating artifact in myth and fable as well as in actuality. Up until the 19<sup>th</sup> century, the Chinese economy was considerably greater than that of all of West Europe combined. Even as late as 1820, according to Maddison, it was as half as big again as Europe’s. Whether Maddison’s estimates are correct or not is in many ways of less consequence than the perception in early modern Europe that distant Cathay was a prize of great wealth. This was the lure that set Christopher Columbus, in 1492, ‘sailing the ocean blue’, and provided the motivation for the funding that made his journey possible. Columbus, as we know, stumbled across America, with momentous consequences that are still with us, but the search for sea routes to China continued. If there was one holy grail that served as a beacon for European expansion, which included the settling of the ‘Western Offshoots’, it was the fabled riches of China. The image of China as a place of vast wealth continued into the 19<sup>th</sup> century, fuelling the imperialist squabble over East Asia and the unfortunately, but accurately, named Opium Wars. Even when reality dashed the hopes of easy picking, the myth of the ‘vast China market’ continued to entice business even during the century of China’s most abject economic and political prostration. It burst into fresh life during the last quarter of the 20<sup>th</sup> century and although its realization still eludes many foreign companies it grows more powerful by the day, helped by China’s accession to the World Trade Organization.

‘Myth’ is used here in the sense of an inspirational image rather than as something divorced from reality. The reality, in as far as we can know it, is that the Chinese economy was much larger than that of West Europe through most of history and even at the lowest point in this dataset, in 1950, its GDP was \$239.9 billion, or 17% of

that of the whole of West Europe, and probably as large as the biggest single economy in it. Since those dark days there has been astounding growth, both absolutely and relatively, and in 2001 China had climbed back to 61% of the European level, and with no indication of slowing down. Unfortunately, for business and government, GDP does not automatically or easily translate into market opportunity.

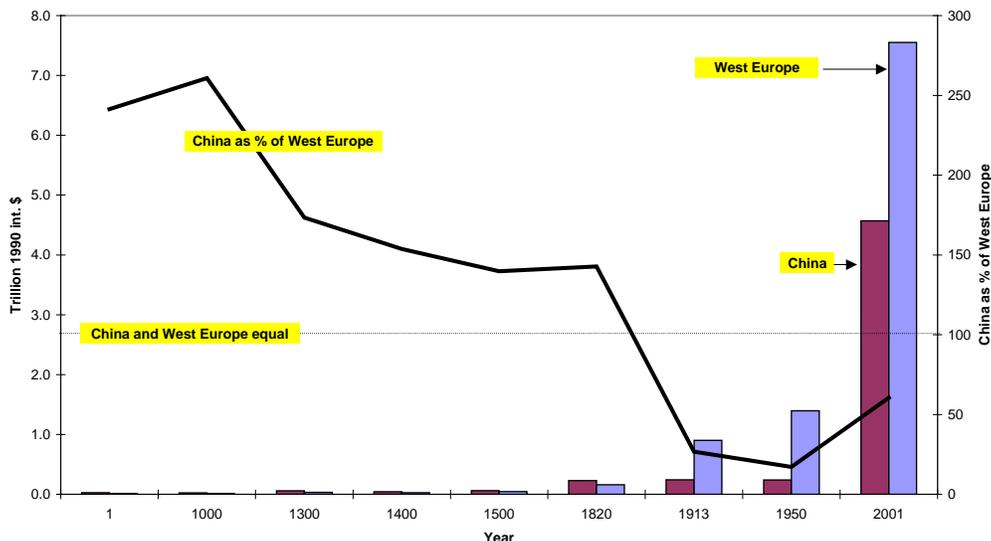

FIG. 2: CHINA AND WEST EUROPE: GDP, 1-2001

One of the reasons that national wealth, or GDP, does not necessarily provide a market is that it must be related to population. Wealth spread over many people creates consumers with little spending power; when that wealth is spread very unequally, as it is, most people are not market consumers at all, and most of those that do participate in market relations can only buy the cheapest of foreign goods, if they can at all. Fig 3 looks at this key measure of per capita GDP or average wealth.

In the beginning, in AD1, the average Chinese was as wealthy (or as poor) as the average West European and things continued this way until 1300. By 1500, the Chinese level was only  $\frac{3}{4}$  of the European, and as West Europe moved into global expansion, so did pc GDP expand hugely, leaving China (and much of the rest of the world) far behind. According to Maddison, Chinese pc GDP in 1950 was \$439, slightly less than the \$450 it had been close on 2000 years before. West Europe, on the other hand, had seen its pc GDP grow from the same level as China's in AD1 (\$450) to \$4,579 in 1950. In that year, China's pc GDP stood at just 10% of the West European level (which would have been substantially behind that of the US). When Westerners encountered China, from the mid-nineteenth to the mid-twentieth century, most Chinese were, in their terms, abysmally poor. In addition there was civil strife, disease, poor sanitation and health (eg opium) and general decay, or lack of modern progress, in governance, social, political, military and civil. It is not too surprising if foreigners at this period regarded Chinese (and other Asians) as lesser beings. There is a limit to how far we can empathize with people whose situation is so different from ours. We might be able to say, 'there but for the grace of God go I', when faced with other's misfortune, but only to the degree that we can envisage it happening to us. When the gap is great, and the prevailing ideology is one of racial, and national, superiority, then it must be difficult for most people, perhaps impossible for all people, to make that leap of faith into a recognition of a common human vulnerability to the consequences of political and economic forces, and the vagaries of fate. There might be sympathy, and the Christian missions to Asia would be evidence of the strength of that, but how many of those who gave generously in church on Sunday would have welcomed a poor Chinese family emigrating and moving in next door?

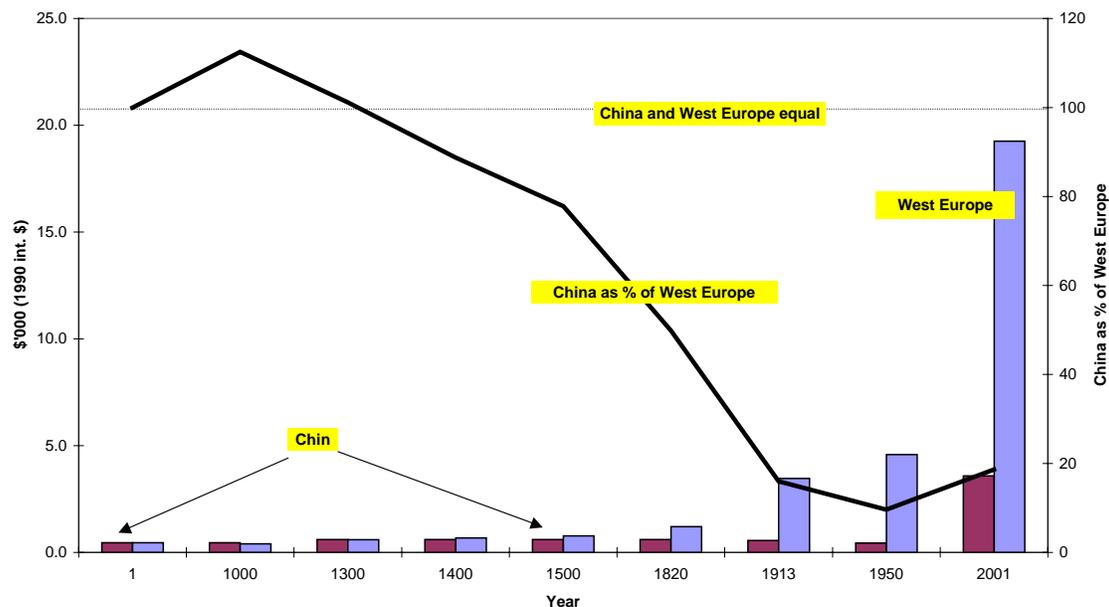

FIG. 3: CHINA AND WEST EUROPE: PC GDP, 1-2001  
Source: as Fig 2

However, in the second half of the twentieth century, Chinese pc GDP began to grow rapidly and by the beginning of the next century, in 2001, it was \$3,583, eight times more than it had been 50 years before and now 19% of the West European level. Moreover, the catch-up was continuing, and it was conceivable that before too long Chinese pc GDP would reach advanced world levels; if the world's environment did not burst under the strain, but that is another story.

Fig. 4 puts China, and the other leading Asian economies, within the context of current distribution of world wealth amongst countries. The data is from the CIA and is calculated at purchasing power parity which gives substantially higher US\$ figure for 'poor' countries such as China and India, and a lower figure for rich countries such as Germany, than exchange rate calculations.

Fig. 4 brings home just how big some of the Asian economies now are, and gives part of the explanation for the rapid global growth of Hai'er and its fellows. Traditionally, the size, and sophistication, of the US domestic market was a prime reason for the success of US corporations in global markets. The Japanese later benefited from their very large and increasingly affluent domestic market [13]. China is now moving from its large domestic market and its huge production base for foreign companies, into global expansion by Chinese companies and Chinese brands [30]. When Chinese companies expand abroad they, like their US and Japanese predecessors, do so from a strong domestic position. Hai'er for instance, celebrated its 20<sup>th</sup> anniversary in 2004 with predications that it would achieve \$12 billion in global sales. It claimed that it had built up 'a network composed of design, manufacturing, sales and service, with 18 design centers, 10 industrial parks, 30 overseas factories and manufacturing bases, 58,800 sales offices, and 96 product group categories around the world' [10]. But behind that global push was its size and dominance in the Chinese market. It has 34% of China's home appliance market [10]. With water heaters, Hai'er has 31% of the home market, and the largest production facilities in the world [19]. Not merely does Hai'er have large production facilities, with corresponding economies of scale, but it also has the marketing prowess to beat off foreign companies in China. America's Whirlpool Corporation., the world's largest appliance maker, moved into China in the late 1990s, "with quite a bit of bravado" but paying insufficient attention to customers. Hai'er, on the contrary, produced compact products that better fit the needs of Chinese consumers who, like most people in the world, have smaller houses than Americans [29].

Had China, and other parts of Asia, just got richer in isolation, with no contact with the rest of the world (as had been the case in the pre-modern period) that that would have been that, with no particular consequence for anyone else. However, there were all sorts of economic and other linkages, so what happened in Asia inevitably impacted elsewhere. The easiest relationship to trace is that of merchandise trade, and we look at that next.

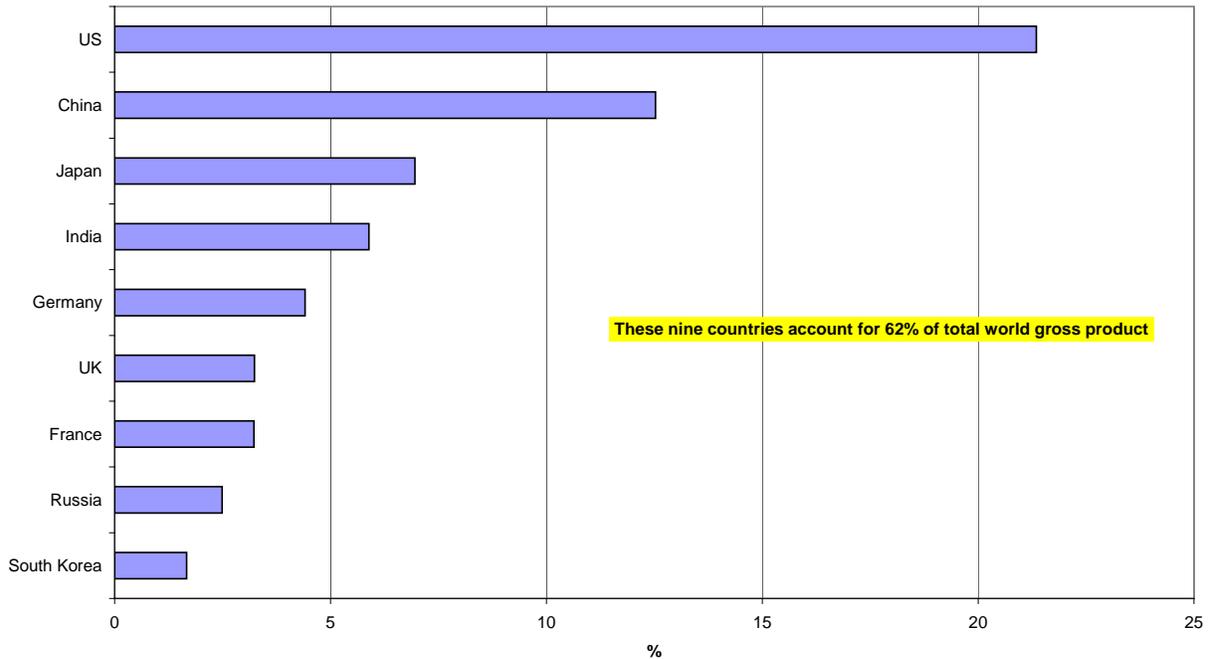

FIG. 4: SHARE OF WORLD GROSS (DOMESTIC) PRODUCT, 2003

**Merchandise Trade**

Fig. 5 and 6 take World Trade Organisation data and plot the share of Asia, and the United States for comparison, in world imports and exports, respectively.

These two graphs tell rather different stories with common elements. The US position in world trade in the late 1940s was unsustainable when (or if) other parts of the world recovered from the ravages of the Second World War and its aftermath. But Asia not merely recovered from the war, it also regained its independence. This is a broad description and the reality was obviously very complex but it does encapsulate the key characteristic of the change in Asia's situation, a change that enabled it, with varying degrees of wisdom and success, to have more control over its economic policy.

Asia's increase in share of world trade over this period is quite dramatic. Its share of world imports went up from 9.9% in 1948 to 23.5% in 2003 and its share of exports from 10.1% to 26.9%. However, while Asia's share increased for both imports and exports, America charted a different course. Its share of imports fell behind that of Asia, but still increased over this period. The US proportion of world imports rose, with fluctuations, from 13.0% in 1948 to 16.8% in 2003.

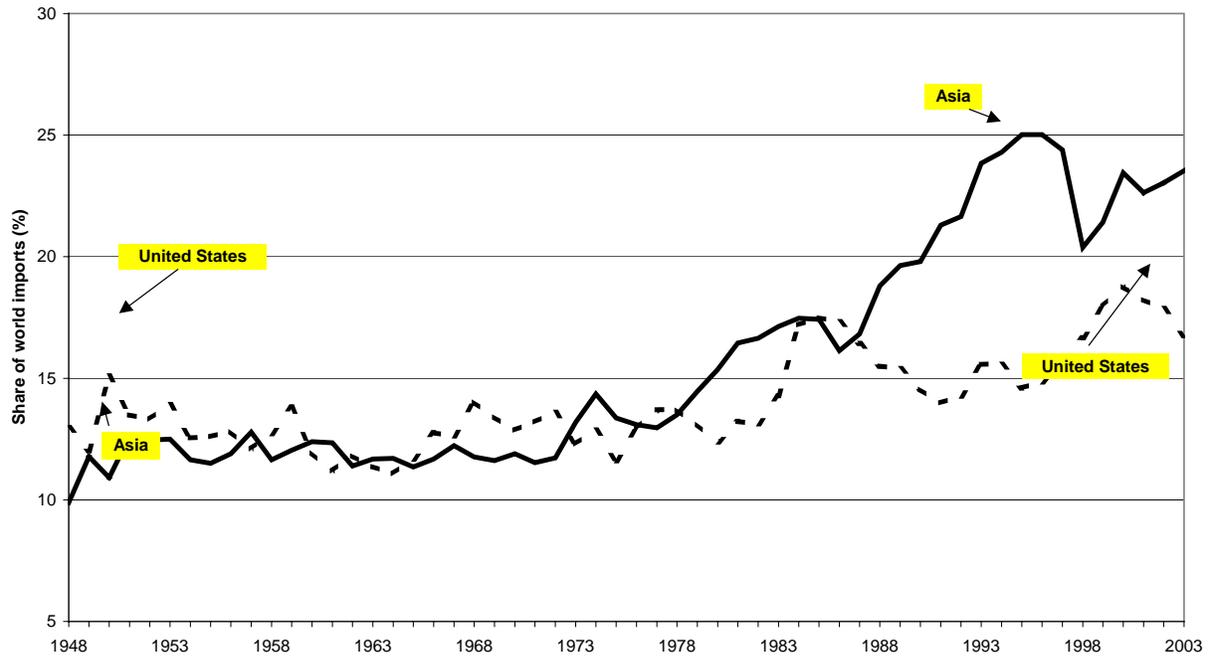

FIG. 5: SHARE OF WORLD IMPORTS, 1948-2003, ASIA AND US

However, the US share of world exports fell from 21.7% to 9.6% in 2003 (Fig 6)

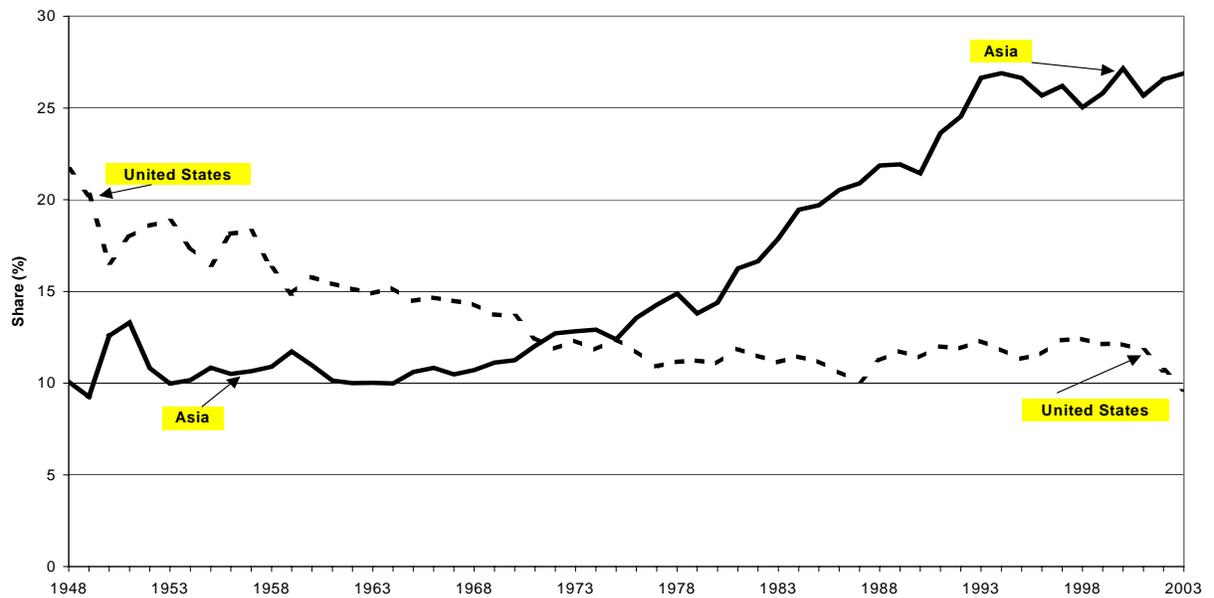

FIG. 6: SHARE OF WORLD EXPORTS, 1948-2003, ASIA AND US

Inevitably this poor export performance was reflected in a growing balance of trade deficit. Asia's balance has been effected by events such as the oil shocks but has moved into a strong positive position (Fig. 7)

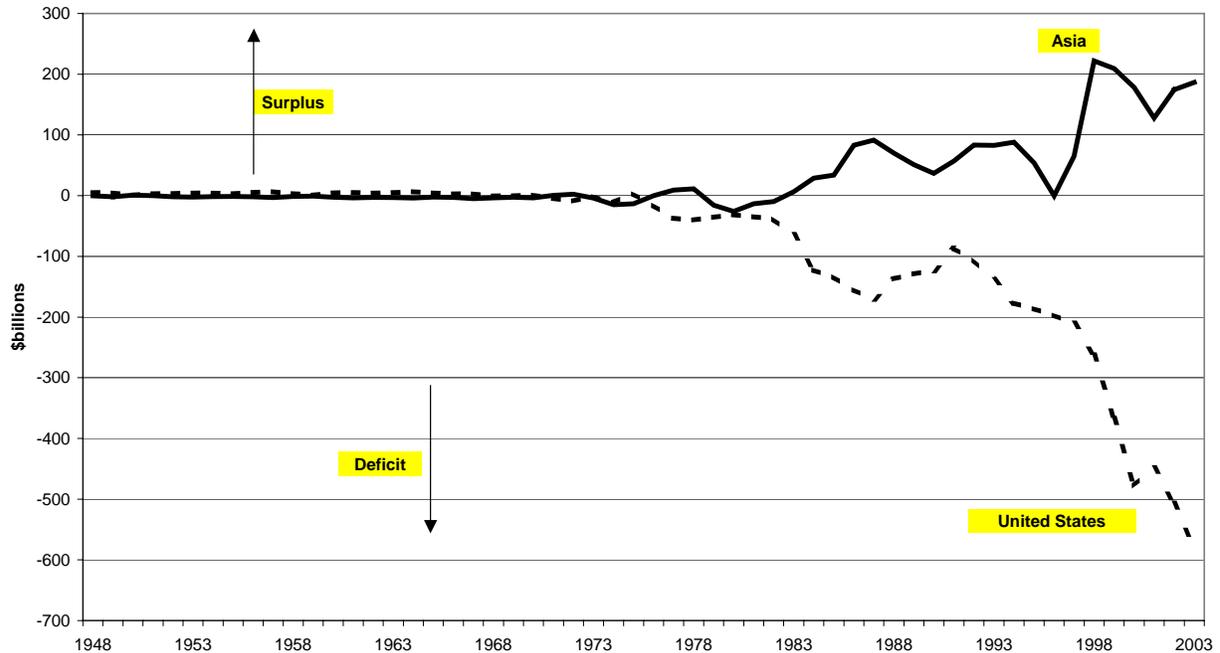

FIG. 7: BALANCE OF TRADE WITH THE WORLD, 1948-2003, ASIA AND US

Asia's surplus and America's deficit is both a cause of, and a manifestation of, the advance of Asia corporations such as Haier into world markets. Even if the United States manages to tackle its trade deficit, it is unlikely that the Asian advance will be halted. What we are seeing is China, and Asia in general, reclaiming its traditional place in the world economy. As Andre Gunder Frank put it, after having noted how Germany and North America had displaced Britain,

Alas for some, today their place in the sun is also being displaced by the "Rising Sun" in East Asia. One of the theses of this book is that these developments should come as no surprise, because parts of East Asia already were at the centre of the world economy/system until about 1800. In historical terms, "the Rise of the West" came late and was brief [7].

## Challenges of the Expanded Europe: A Cultural Perspective

University of Primorska, Slovenia*

### Abstract

Globalization is constantly changing the appearance of the modern world. The most intense processes of integration are taking place in Europe in the framework of the European union (EU) enlargement. Though the formal process is more or less concluded, the subtle in informal ones still have a long way ahead. Social structures (institutions, organizations, norms, etc.) are with the transfer in the direction west-east and north-south truly converging, but the question is, whether they “are placed” into acceptable cultural environments; for the structures do not exist by themselves alone. Structure and action are merely two reflections of the same phenomenon, which in the end depend on the cultural environment in the narrower sense of the word - human perception and values. This poses the basic question, whether the cultural orientations of the new (or soon to be) EU member states are compatible with imported social structure.

### Introduction

Drafting a cultural image is very important when assessing the development potentials of individual societies. In this sense we are particularly interested in the process of transition from post communist countries into (post)modern societies, which beside a structural has a cultural component as well. The former assumes the adaptation of fundamental institutional, legal and behavior standards, which are valid in developed western societies. It depends on socioeconomic resources, human capital, capabilities, will and interest of social elites for structural reforms. The resources are heterogeneous, thus some transition countries successful than others. While the assumed normative and behavioral patterns, as well as organizational and institutional structure can be under favorable conditions rather quickly ‘standardized’, at the core of culture i.e. at value systems the problem is more complex. If a critical mass of modern values does not exist, it can additionally and in the long-term hinder the transition process. The process of cultural ‘synchronization’ should not be understood as unilateral transmission and as process of taking over certain cultural patterns from Western Europe, because it would lead to cultural assimilation. On a global level Ronald Inglehart (1997) is finding the processes of changing of cultures in the direction of postmodern, discovering that the changes are not occurring linearly.

On the cultural differences cannot be looked upon as achieving different civilizational stages in development-genetic sense (e.g. on the line premodern-modern-postmodern). Some cultural orientations are simply different and it is not necessary, that they are lower or higher on the evolutionary scale. Therefore e.g. in a society mass culture stands opposite of masses of subcultures, it exists so called organizational and other sorts and kinds of cultures, but on international, as well as on national and regional level, different distinctive cultural entities are emerging. Therefore cultural diversity should not be placed into development models (Inglehart 1997; Berger & Huntington 2002; Höhmann 1999). Even less appropriate it would have been to derive from starting point of unification (where the globalization processes are heading for). Quite opposite, they should be humanly managed and preserved as invaluable asset.

Despite everything it can be assumed, that in the transition societies cultural sediments, which obstruct the enforcement of modern social structures and principles, are still present. These sediments function as contra-cultural<sup>1</sup>.

Due to lack of suitable data bases assumptions about cultural changes of Slovenes cannot yet be defined. Although on the basis of available international comparable research and selected theoretical model can be determined what it is like and where is the placement of Slovenia in the context of European culture.

## Methodology

The research will be based on 26 units, i.e. European countries, which are included into European values survey (EVS): Austria, Belgium, Bulgaria, Czech republic, Denmark, Estonia, France, Great Britain, Greece, Ireland, Italy, Latvia, Lithuania, Luxemburg, Hungary, Malta, Germany, Netherlands, Poland, Portugal, Romania, North Ireland, Slovak republic, Slovenia, Spain, Sweden.

For determining the cultural characteristics of Slovenes the Hofstede's research model with five cultural dimensions will be used. In the empirical part they are measured with the following indexes:

- **Power distance<sup>ii</sup> (PD)** – Hofstede describes it with the relationship towards equality and hierarchy in society, above all, to what extent and in which way people are accepting uneven distribution of social power, particularly those, which do not possess it much [Hofstede 200: 33, 412];
- **Individualism (IND/COL)** – this cultural dimension lets us know, how individual societies are assessing individualism, i.e. person's orientation towards him/herself (or his/her family), pursuing own goals and interests or society, where social ties among family members are not firm. The opposite term is collectivism, which is connected with positive evaluation of devotedness, loyalty and placement of the individual in the collective, into "we"-group, where he feels protected [Hofstede 2001: 410-411];
- **Masculinity (MAS/FEM)** – is a cultural component opposite from femininity. It is characteristic for societies with firmly fixed differences in role distribution between genders [Hofstede 2001: 412]. In societies with lower value of MAS index – in the so called feminine cultures – the borders between traditional roles are vague, cooperation is highly appreciated as oppose to competition or rivalry [Apfelthaler 1999: 59];
- **Long-term orientation (LTO/STO)** – "Confucius dynamics<sup>iii</sup>", as this variable is called other wise, is a national cultural component, which expressed long-term or short-term orientations of the members of a certain culture. Long-term orientation is all about fostering virtue, directed at future success, especially thriftiness and persistence; short-term orientation on the other hand is about retaining values, which are linked with the past and future. In the forefront are respect for traditions, preserving reputation and fulfillment of social obligations [Hofstede 2001: 411-412];
- **Uncertainty avoidance (UA)** – signifies the perception of society members being under threat before the unknown and uncertain situations [Hofstede 2001: 411]. This dimension refers to reactions of some culture to uncertain future, especially its mastery with the help of the law, technology, rules and rituals. Cultures with high UA index show little tolerance toward so called unstructured situations, ambiguous relations and uncertain future. They try to handle the feeling of being uncomfortable by following strict rules of standardized behavior.

At every cultural dimension we will (like Hofstede) measure the value relation to the chosen problem, on two levels. First we will search the variable, which fits the relation to the chosen problem, on the individual or social life level (school, work, family), then on the general level (politics, state, ideology, societal norms...). Values of both variables will represent one cultural dimension.

When drafting the empirical model we have leaned it on contemporary empirical research approaches of culturologists Hofstede<sup>v</sup>, Trompenaars<sup>v</sup>, Apfelthaler and Inglehart<sup>vi</sup>, where values have a central place in cultural orientations.

## Empirical Analysis of European Cultural Orientations

### Power Distance Index (PDI)

How Slovenes are comprehending (a)symmetrical power distribution? Some cultures except it absolutely uncritical, as externally given (Venezuela, Panama, Thailand, China etc.), others (USA, Great Britain, Australia, Canada, the Netherlands etc.) pass critical judgment from the principle of equality point of view [Hofstede 2001: 72]. We can compare Slovenia in the existing data base with EU member countries and accession countries.

1. On the level of family ties, lower or higher power distance is reflected on parents-children relationship. High value of PDI means, that parents raise their children as obedient, well behaved, respectful [Hofstede 2001: 48]. Value of PDI can be therefore made out from answers to a question, whether 'obedience' is an important characteristic, which children gain from their parents' upbringing, or not.<sup>vii</sup>

Slovenes put above average importance on obedience as imparted attribute of the children (high value of power distance index – PDI.1) (Tab.1). This is distinctive for some other countries as well, like Germany, Austria, Denmark, Sweden, Czech republic, Greece, Romania etc. On the other side there are countries, where obedience as virtue is not appreciated e.g. Great Britain, Spain, Belgium, North Ireland and Ireland.

2. On the social relations level there is interesting relationship towards the way of ruling. According to Hofstede high values PD are associated with oligarch or autocratic orientations [2001: 56]. Intriguing question arises, whether Slovenia together with most other candidate countries, which have had half a century era of totalitarian regime, still bare the burden of the past in cultural sense? Citizens of European countries included in the research have expressed their attitude towards the system, in which a 'strong leader' would rule without elections and parliament. EVS indicates, that Slovenes have lower value of the PD in comparison to European average, which means, that in this dimension it has some positive supposition for development of democracy. Low index (named PDI.2) have Germany, Denmark, Greece, Czech republic, Italy and Austria. Romania, Bulgaria and Luxemburg have high PDI.2 value, which correlates negatively with democracy. The latter can be named autocratic syndrome<sup>viii</sup>.

Own calculations from EVS 1999

**Index of Individualism (IIND)**

According to Hofstede [2001: 92-102] the collectivistic cultures are the ones, where collective interests come before individual ones, where the dominant role of the state in the economy prevails, where ideology of equality predominates the ideology of free will, where the equilibrium and consensus are the highest goals etc. In the forefront of the so called individualistic cultures the interests of individual prevail over collective, the right to privacy is highly appreciated value, state has a limited role in the economy, because it is based on individual initiative, political power is executed by electors not by interest groups, freedom of the press is asserted, liberty comes before equality and self actualization of the individual is the highest aspiration.

1. Individualistic and collectivistic orientations will be compared by measuring European (collectivistic) attitude towards dilemma will be measured, whether 'the state should control private companies more or should they be given more freedom'<sup>ix</sup>.

The results show, that what role of the state in the economy are concerned, collectivistic values in Europe are not prevailing, although there is an exception (Luxemburg). Distinctive collectivistic cultural orientations are exhibited by citizens of Latvia (73,0 %), Slovak republic (72,4 %), Hungary (62,6 %), Luxemburg (61,2 %), Estonia (60,2 %), Poland (61,0 %) and Czech republic (55,7 %) (Tab.2). On the other hand distinctive individualistic orientations are displayed in Sweden (17,6 %), Austria (23,4 %), Denmark (26,6 %), North Ireland (27,9 %) and Malta (28,9 %), Lithuania (30 %) and Great Britain (34,3 %). Slovenia together with the rest with value of ICOL<sup>x</sup> 45,6 % is placed in the group of countries, where nor one or the other distinctive orientations prevail. Despite this

fact it can be determined, that citizens of developed western countries express predominantly individualistic while the rest (besides mentioned exception) above average collectivistic value orientations.

2. What are the individualistic orientations on the personal level like? This will be measured with the help of index of individualism (IIND), which measures the evaluation of independence on the basis of parental opinion, whether 'independence is especially important quality the children can be encouraged to learn at home'.<sup>xi</sup>

Countries with the lowest IIND are mostly those, which still have a patriarch pattern of upbringing embedded in their culture. To this group belong some of the transition countries (Estonia Poland, Romania) and Western societies with predominant catholic culture (France, Spain, Portugal, Malta and Italy). IIND is particularly high in the so called protestant countries such as Germany, Denmark and Sweden and in some middle European countries (Austria, Czech republic, Hungary and Slovenia); in this group of countries is also Lithuania.

Therefore it can be concluded, that Slovenia on the individualism-collectivism scale is showing two faces. On the general state level are the Slovenes more collectivistic oriented, though not exaggeratedly. This is a consequence of etatistic mentality, which is still being maintained as a cultural rest over of the previous collectivistic economic system, partly as corporatevistic tradition, which has even before communism held back the domination of pure liberal concepts as well in economy as in politics. In this aspect Slovenia resembles to other societies with predominant catholic orientations. On the personal level the individualistic dimension in Slovene culture is more explicit, this was also proven in other sociological research (Zver 2002, Bobek, Sruk, Treven, Zver & Zivko 2003). In Slovenia the patriarch family ties are very loose; the so called big family is practically non existent. The nuclear family is prevalent, though it is loosing its meaning. 'We' thinking has almost disappeared; the family members are primarily working on individual identity. Family relations are more equal not just between genders, but also in parents-child relations. The traditional family communication "vikanje" (children addressed their parents formally) has almost completely disappeared, though less than century ago children were sill "onikali" their parents. According to the measured variables we can say, that Slovenes are predominantly individualistic oriented<sup>xii</sup>.

Own calculations from EVS 1999

### **Masculinity index (IMAS)**

Masculine culture is oriented towards success and efficiency. It is characterized by power, upbringing is gender differentiated and conflicts are dealt with rivalry. Masculine type of culture is associated with values and concepts of successful economic society, growth is of great importance and the stronger are being favored, society is repressive, power and victory are given priority over compromise [Hofstede 2001: 137-148]. So called feminine culture has marked early modernism and postmodernism, as well as Western civilization circle. In feminine societies gender relations are more equal, humane relations are priority, sensibility is a virtue, the weak are sympathized with, the emphasis is on equality, justice, solidarity and compromising. The quality of life is referenced over success.

1. Masculine society is determined by clear gender role division, e.g. woman is ascribed to the primary role in taking care of household and children's upbringing. From EVS database we have measured the percentage of those, which have agreed with the following statement: 'It is OK if a woman is employed, but what she really wants is home and to have children'<sup>xiii</sup>.

Europe according to this dimension is more masculine oriented. Even in this variable we are able to classify countries into groups, which coincide with either with religious affiliation or general civilization development. In order to explain the similarities and differences between countries, both components must be considered. The highest IMAS (Tab.3), which depicts the degree of masculine culture, can be observed among transition countries (Lithuania, Romania, Germany, Bulgaria, Poland, Czech republic, Hungary), that is in the societies, which have in the past lived under totalitarian regimes and publicly proclaimed gender equality, but gender segregation was actually ruling in mental structures.

Religion is a very decisive factor in the inculturalization process. This can be once again viewed in a group of countries, where IMAS is less evident. The least masculine culture can be found in Denmark, followed by Northern Ireland and Ireland<sup>xiv</sup>, Sweden, Great Britain and Germany, which values are below the average of 50 % as well. These societies can be considered as feminine cultures. Again masculine element is more emphasized in catholic societies, e.g. in France, Italy, Portugal, but not as much as in the transition economies. Feminine culture therefore coincides with protestant religion, level of economic development and secularization.

Slovenia with emphasized masculine culture (IMAS.1 = 64,7 %) together with Estonia, Latvia, Hungary, Slovak republic, Belgium, France and Italy belongs to the European average.

2. Indexes of masculinity and femininity can be measured with otherwise. We have already established that masculine cultural posture on the meaningful level is associated with money, power, competition, material possessions etc., feminine culture on the other hand thrives toward care for fellow human, more than money and possession people, good personal relations and quality of life are important. In EVS the interviewees were asked, whether it would be good, if there would be changes from our current living style in the future, for example 'less importance should be given to money and material possessions'<sup>xv</sup>.

High value of the index can be viewed in countries, where according to Inglehart post modernistic values find most expression in, especially in France, Great Britain, Hungary, Spain, Belgium, Denmark, Sweden, North Ireland, Ireland, Malta and Luxemburg. Above average high is index in Greece, a little above average also in Romania and Slovenia. In other societies the characteristics of masculine culture are more evident. Especially in Latvia that is least feminine oriented.

Slovenia is partly on the track towards post modernistic culture, where Weber's values of rational capitalism should loose their importance. In Western societies, also in Slovenia, the process of feminization of masculinity and masculinization of femininity is taking place, which means that gender differences are loosing their societal relevance<sup>xvi</sup>.

TABLE 3: INDEX OF MASCULINITY/FEMININITY (IMAS/IFEM)

Own calculations from EVS 1999

**Long-term Orientation Index (ILTO)**

Culturologists give more importance to another cultural dimension called long-term or short-term orientation. The theory of socialization looks upon long-term orientation as a feature of mature personality. An individual with short-term orientation strictly obeys tradition, gives great value to his social duties and is declined to investment. Long-term orientation adapts tradition to modern circumstances; it emphasizes saving, future investments.

1. If we can choose among some work aspects, than people with short-term orientation would as most important choose good pay, people with long-term orientation on the other hand job security, good promotion prospects etc. This question, on the basis of which STO and LTO respectably will be measure, was part of EVS.

The average value is our border line, which builds two groups of countries, which partly explain long-term and short-term orientation. Salary in Europe still remains the most important choice factor for work and profession. Despite this we can conclude, that in the developed countries this orientation is less expressed as in lesser developed ones. Most long-term oriented are citizens of Denmark, Sweden, Luxemburg, Belgium, Austria, France, Netherlands, Germany, Latvia and Czech republic (Tab.4). The other group, where “easy money” is regarded as value, consists of mostly transition countries, as well as less expected ones (Great Britain, Italy and Spain).

2. We have already mentioned that one of the core features of long-term orientation is saving, which is a result of several factors. We assume, that people in less wealthy countries lack saving funds and that they have to live on “day by day” basis, while in the reach countries there are enough resources for saving and investments. We can also assume that in transition economies, which fought with high inflation, saving (in their national currency) was not very reasonable and it is therefore unknown in their culture and behavior. Moreover we assume that saving is one of

the core characteristics of so called protestant work ethic, which Weber wrote about and it is supposed to have influenced the development of capitalist economic system as the most rational one. The Calvinist commend about thriftiness and modesty is supposed to have start the formation of accumulation in Western economic systems, which later on enabled faster economic development in general, people were inspired by this living style in hope for salvation. Due to this presumption we can justified assume, that this value is the most important in predominantly protestant societies.

Our results show the opposite. Lower LTO have mostly developed countries, e.g. Netherlands, North Ireland, Romania, Great Britain, Germany, Italy, Portugal, Sweden, Czech republic and Slovenia. Other group with more explicit LTO represents Latvia, Luxemburg, Malta and Austria.

It can be concluded that saving is not important cultural orientation of Western societies anymore; definitely it can not be placed into the corpus of post modernistic values, typical for the West. Bigger saving volume in the cultural pattern of transition economies could be explained that these countries not long ago became capitalistic and that it is as an early modernistic value necessary on the general (in economic sense as capital accumulation) as well as on the personal lever (mostly as an active form of surmounting uncertain future).

In short, virtue of saving does not correlate with level of economic development, not even with certain work ethics, but it is rather a result of new system living conditions, in which people from transition economies found themselves in<sup>xvii</sup>.

Own calculations from EVS 1999

## Uncertainty Avoidance Index (UAI)

As we have already mentioned an important cultural difference between societies is a way, how people who find themselves in unknown risk situation, e.g. in uncertainty, overcome them [Hofstede 2001: 180-193].

Low UAI means that people confront these risks and uncertainties firmly, they are not afraid of changes, which could be possible to handle. Competition is highly valued, encouraged are vertical and horizontal mobility. Such cultures, which feel strong enough, accept uncertainty as normal and do not adopt special measures, they face them automatically.

1. According to this dimension we are able to distinguish typical state regulations. Countries with weak uncertainty avoidance have little laws and rules. Normally these countries are more democratic, because people are accepted as competent for (self)decision-making, even participation is higher. The citizens of the other type (regulation with strong system of uncertainty avoidance) have negative inclinations towards institutions and politics, conservatism, xenophobia and oppression of minorities are predominant. In short, these societies favor democracy less. They show various kinds of fundamentalism and are inclined toward ideological rationalization and expertocracy.

Even this variable, which according to theory should differentiate countries with higher level of democracy than others, we got some surprising results. High percentage of positive answers, that all rules at work should be obeyed, even without conviction, that they are correct, can be found even in developed northern countries like North Ireland, Great Britain and in Hungary and Portugal. Low values of UAI show Slovenia, Lithuania and Estonia (Tab.5). How can the phenomenon of liberal perception of rules in transition countries be explained? Most probably it can be explained with anomie, which means general neglect of moral and legal norm or loss of rights, which occurs in the periods of the most intense changes of established value patterns. Especially in former communist countries of mass number of rules and norms, which were set by the regime, they were not accepted by the citizens. On one hand due to the high number of (forced) rules and because the state tended to determinate all the areas of human life, on the other hand these norms and rules did not match the value orientations most of the people. In view of this contradiction people tend to follow as much as possible their own internal orientations, not the external pressure.

Below average is UAI in Netherlands, Austria, Italy and Malta can be explained with post modernistic culture, a value of individual autonomy of life in the work place.

2. Low UAI is associated with democratic orientations. EVS included a question, which kind of state governance do interviewees find suitable. They were able to choose the option, that it is the best for the state, that 'experts and not the government are decision-makers'. The power of science is in contemporary society exceptional. The experts usually solve problems their way, most often their decision is based on cold scientific calculation of profitability, efficiency and impartial legality. People often demand that branch of knowledge should decide in a certain matter. Many find the democratic decision-making inefficient, irrational and too expensive.

Extraordinary high value of UAI can be found in transition countries, especially in Slovenia, Bulgaria, Romania, Hungary, Slovak republic and Poland. This is a direct consequence of people's dissatisfaction, which had higher expectations regarding democratic development in these countries; it also means peculiar kind of no confidence in the political elites.

The lowest UAI value is in Greece, Denmark, North Ireland, Swede, Estonia and Great Britain (Tab.5); with exception of the first, are these the countries with predominant protestant religion. A little high AUI value has Germany, Italy, Spain, Portugal and particularly Austria (except the first one they are all catholic states). This could result from explicit corporativistic mentality and practice and can be partly seen in Slovenia as well. Democracy, which is based on rivalry, is not adequate to solve social and economic problems of society. They demand that politics should be replaced by branch of knowledge<sup>xviii</sup>.

TABLE 5: UNCERTAINTY AVOIDANCE INDEX (UAI)

<i>countries</i>	<i>UAI.1</i>	<i>UAI.2</i>	<b>UAI</b>
France	33,4	50,4	58
Great Britain	44,4	47,0	54

Own calculations from EVS 1999

### Comparison of National Cultural Orientations

National cultural orientations are compared on the basis of similarities and differences of values of individual variables, which we have merged with Hofstede's research model of cultural orientations. To summarize: the results have shown that Western countries (like Great Britain) do not accept hierarchy, inequality and authority as opposed to transition countries (like Romania). Slovenia is in respect to the latter among the average. The most individualistic cultural orientations can be find in the west (like Denmark), most collectivistic in the transition economies (like Poland, Estonia). Slovenia is above average individualistically oriented in Europe (Tab.6). Most feminine cultures are in Scandinavia (Denmark, Sweden), least again transition economies (Lithuania). Masculine orientations are predominant in Slovenia. The last two dimensions did not show a clear division between western European and transition countries. Slovenia is regarding Confucius's dimension under the European average, as well as in the area of determination and self-confidence in facing uncertainties of life.

TABLE 6: REVIEW OF »CULTURAL« INDEXES

<i>countries</i>	<i>PDI</i>	<i>IIND</i>	<i>IFEM</i>	<i>ILTO</i>	<i>UAI</i>
France	51	47	52	35	58
Great Britain	62	61	61	26	54
Germany	48	68	55	31	54
Austria	51	74	54	41	57
Italy	56	52	52	25	61
Spain	63	46	67	25	54
Portugal	52	38	52	28	55

Bulgaria	34	47	41	24	41
Greece	53	46	47	26	72
Malta	61	51	56	33	69
Luxemburg	36	44	58	41	60
Slovenia	51	62	49	24	50
average	50	53	52	28	56
the West	53	56	59	29	60
transition economies	46	48	41	26	50

On the basis of statistical processing of our database (SPSS programme, cluster analysis, Ward method) we got two large groups of countries:

- Lithuania, Latvia, Bulgaria, Romania, Slovak republic, Poland, Estonia, Portugal, Hungary and Czech republic (transition economies with exception of Portugal),
- countries, which can be divided into two subgroups:
  - ⇒ Spain, Great Britain, Ireland, North Ireland, Greece, Netherlands, Malta, Italy, Luxemburg, Belgium and France (developed countries with exception of Malta),
  - ⇒ Denmark, Slovenia, Germany, Sweden and Austria.

The position of Slovenia and Malta in dendrogram (Fig.1) is quite incentive, because as to cultural orientation they belong to wider circle of developed western European countries.

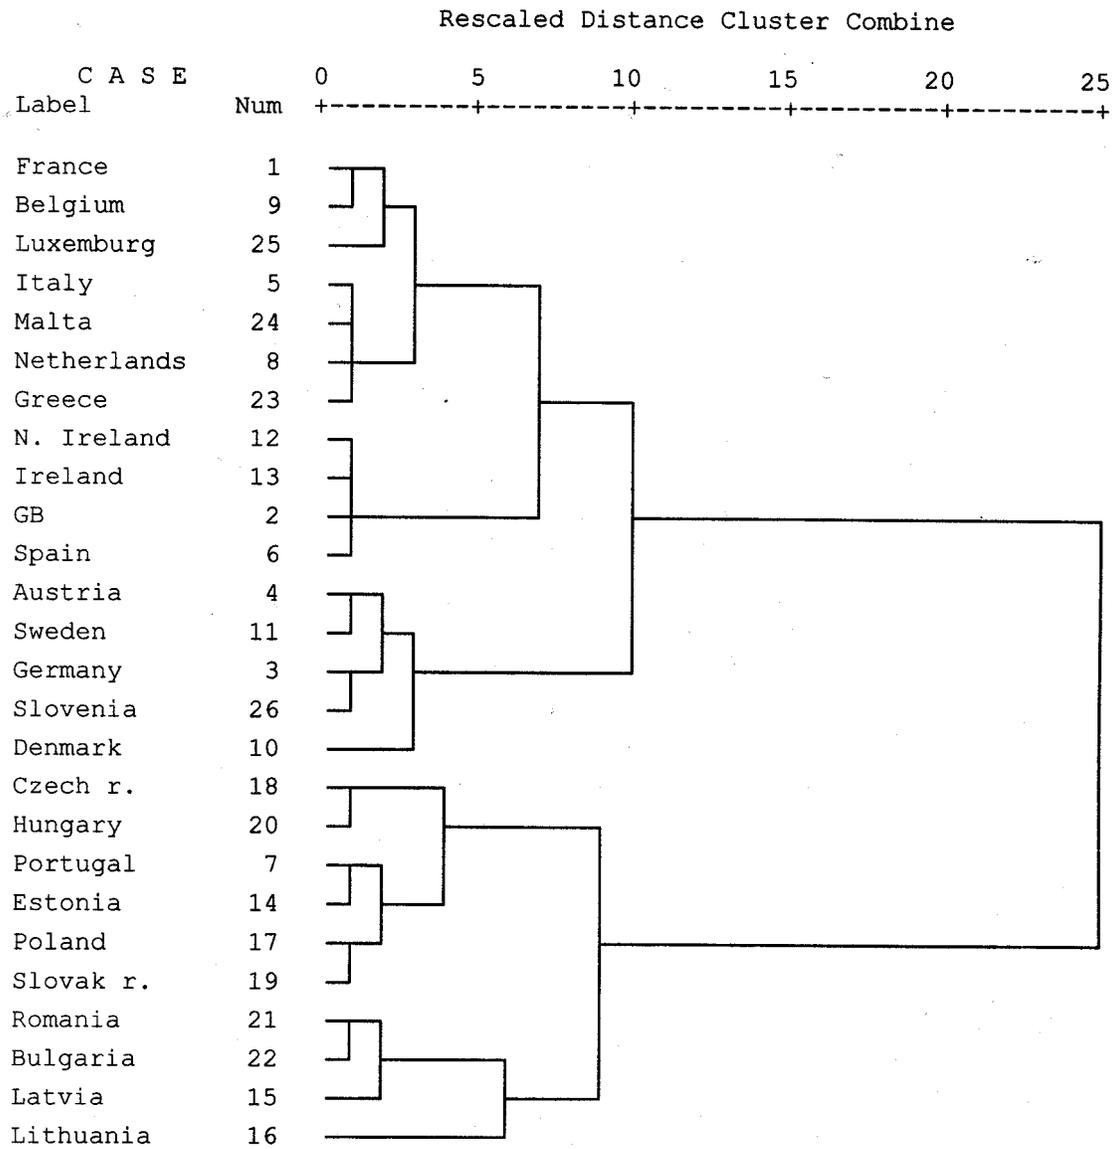

FIG. 1: COUNTRY CLUSTERS OF CULTURAL ORIENTATIONS IN EUROPE

### Conclusion Remarks

Inglehart (1997) has already included Slovene cultural orientations in his research and placed them in respect to our studied cultural dimensions, though at that time Slovenia was not considered as a separate entity. Its data was derived from Yugoslav part of his research. From the point of view of valid sampling it could be questionable, as well as his findings on predominant ex-communist cultural sediments among Slovenes. On the other hand our analysis, which is based on more current database from the year 1999 and includes Slovenia as a separate entity, in comparison with Inglehart's does not give reliable cognitions about big changes, at least not regarding the topics and to the extent they were encompassed into our empirical analysis. Predominantly is Slovenia part of modernistic

cultural circle, though there are still present symptoms, which are from West-cultural point of view considered as pre modernistic or even contra-cultural (e.g. authoritarian or expertocrate syndrome). In spite of this Slovenia belongs to Western cultural circle, closest to Germany.

In the end we can conclude that in Europe there are not only significant differences in cultural orientations on the national level, but also similarities. The differences can represent obstacles while introducing and enforcing uniform modern social structures, especially in transition economies, which still preserve pre modern cultural orientations, which are going to deepen the so called democratic deficit in these societies, not abolish it.

From the point of view of meaningful compatibility of structures and cultures we can expect difficulties in functioning of democratic institutions in transition economies. Trust in the fundamental democratic institutions, which the stability of democratic system depends on, is already now barely adequate. If there is a lack of trust in these structures, they do not function and if they do not function, then a structural crisis occurs. Democratic stability does not only depend on cultural factor (suitable democratic political and economic culture), but also on certain level of economic development. In bigger social or economic crises people can turn their back on expensive and inefficient democracy (this is Hitler's secret of success in the 30ies in Germany), which has only in the recent years become a general accepted norm of European culture. Transition countries therefore have double problem: cultural and economic.

Cultural variety on its own does not represent an obstacle for introduction of modern social structures in Europe, at least democratic ones, if we are going to evolve them in poliarchic direction. The existence of common cultural core in the European space it is most welcomed. The latter by all means does. The problem is that it does not include all post-communist countries. Most importantly, Slovenia is a part of it. The purpose of this paper was to resolve this dilemma.

## End Notes

<sup>i</sup> The meaning of contra-culture's symptoms is the negation of modernistic and post modernistic culture. In the research (Bobek, Struk, Treven, Zver & Zivko 2003) they are shown as the rate of decline of democracy, acceptance of autocratism, expertocratism, system of privileges, acceptance of non democratic economy, state control versus free, justification of tax evasion etc. (see Zver 2002).

<sup>ii</sup> PDI is, as mentioned above, the statistical measure for the level of 'power distance' in individual national culture and it is based on Hofstede's research (questionnaire was being filled out by IMB employees worldwide). In empirical part of our paper PDI will have the same meaning, it will have more moderate size and quantity-wise it will express values of other variables, which will still have to clearly define mentioned cultural dimension. The same goes for other cultural dimensions.

<sup>iii</sup> Most important assumptions of Confucius are the following [Hofstede 2001: 235-236]:

1. Social stability is based on unequal relations between father-son, older-younger brother, man-woman etc.
2. Family is a prototype of all social organizations. An individual is not primarily an individual, but family member.
3. Virtuous behavior – other should be treated the same as we are (the golden rule of individualism).
4. Virtue (in respect to our own duty in life) means, that we try to gain certain skills and knowledge, to work hard, but not more that absolutely necessary, patience and persistence.

<sup>iv</sup> According to Hofstede culture is 'software of mind', which guides human behavior and among characteristics gained by socialization, also has the following principal attributes: it is shared, collective and serves for group distinction [2001: 411].

<sup>v</sup> Trompenaars, who has formed a useful model of cross-cultural differences, differentiate three levels of cultural expressiveness: the highest is national, the middle one is corporate or organizational, the lowest professional culture (1993).

<sup>vi</sup> Ronald Inglehart has more than two decades been researching cultural, economic and political changes in many world countries (World values survey). These changes occur in the direction from pre modernism and modernism towards post modernism (1997).

<sup>vii</sup> EVS Q49: Here is a list of qualities which children should be encouraged to learn at home. Which do you consider to be especially important? Please name five at most. Possible choices were: good manners, independence, hard work, feeling of responsibility, imagination, tolerance and respect for other people, thrift, saving money and things, determination, perseverance, religious faith, unselfishness, obedience.

<sup>viii</sup> Calculated index of obedience is transformed into  $v$  PDI.1, index of autokraticism into PDI.2. Because the lower value of PD correlates with western that is modernistic-post modernistic cultural orientation, we have to invert the values of both indexes. In the EVS results we have considered answer 'important' for the first variable, for the second one the answer 'bad'. Both dimensions are added up (PDI.1 + PDI.2), PDI represents their average. Unites (countries) will be later on compared on the according to the values of indexes of other cultural dimensions.

<sup>ix</sup> Interviewees were able to answer on a scale form 1 to 10, where 10 means 'Government ownership of business and industry should be increased' and 1 'Private ownership of business and industry should be increased'. Values between 6 and 10 mean different intensive etatic or collectivistic orientation and will statistically represent index of collectivism (ICOL).

<sup>x</sup> Index of collectivism is opposite pole of IIND – index of individualism.

<sup>xi</sup> Interviewees could choose 'important' or not choose this characteristic at all.

<sup>xii</sup> For further empirical analysis it is crucial, that we merge both measures into one dimension. Because we have for ICOL actually measured the opposite pole of IND, we have to transform it:  $IIND = (IIND.1 + (100 - ICOL))/2$ . Values of individual indexes will be first showed in table separately, than together.

<sup>xiii</sup> Interviewees could choose from 1 'agree strongly', 2 'agree', 3 'disagree' and 4 'disagree strongly'. Index MAS is the sum of answers 1 and 2.

<sup>xiv</sup> Interestingly, in this group we also find traditionally catholic Ireland, though in respect to other parameters we could anticipate different result.

---

<sup>xv</sup> Options for the interviewees were 1 'would have been good' in 2 'would have been bad'. On the basis of answers 1 we measure in index FEM.

<sup>xvi</sup> Based on this dimension we measure the whole IFEM, which is composed out of average of the sum IFEM.1 + (100 – IMAS.1).

<sup>xvii</sup> Whole value of ILTO is an average of the sum of the first and second variable ILTO.1 + (100- ILTO.2).

<sup>xviii</sup> We have calculated DPI from the average of the following sum: (100 – IPN.1) + (100 – IPN.2) for each unit separately.

# Emerging Global Economic Order: Trends and Prospects

*Suresh Desai*  
*Montclair State University, U.S.A*

## Abstract

The stalemate at the fifth ministerial summit of the World Trade organization (WTO) at Cancun, Mexico opened the season for the blame game. The developed as well as the developing countries, the global business communities and the non-governmental organizations are pointing the finger at each other. The paper argues that the stalemate is the necessary outcome of a conflict between the two policy regimes that have evolved in the last 30 years and are attempting to govern economic interactions in the global arena. These two regimes are inconsistent and sometimes are in open conflict with each other. The one regime, guided by free market ideology, aims at ushering in a borderless economy, polity and homogenized (Americanized) human world. The other policy regime, seeks to establish a regulatory framework to promote ecological stewardship, equity and cultural integrity. This paper suggests that the real cause of conflict is the difficulty of achieving the goals of equity and ecology within the framework of global-finance led process of economic growth.. It offers an alternative model of globalization that can meet the challenges of ecology, equity and economic growth in a socially-fragmented world.

## Introduction

The standoff at Cancun has been described as a setback, a debacle, a disaster sinking the WTO into oblivion, and, a tragedy for the world's poor. This failure has been blamed on intransigence and brinkmanship by both rich and poor countries; on the irresponsible and inflammatory behavior of the NGOs and the deeply flawed decision-making system of the WTO itself. The search for an optimal institutional superstructure for the emergent post-capitalist global village has been in the forefront in the public square for the last four decades. This search has exhibited two strands. One strand has been to establish a rule-based judicial system backed by an ability to impose sanctions against non-compliant parties. The GATT negotiations, culminating in establishing WTO in Marrakech in 1994 represents this strand. I refer to it as the Marrakech approach. The acceptance of such decision-making process depends upon criteria for evaluation and boundaries of acceptance which in turn depend upon sharing of an unified ideology by those who accept and ultimately support the judicial authority. The Marrakech approach articulates an ideology of free market economy. The other strand, labeled by me as the Rio approach, is to establish the rules of the game or global codes of conduct through compromises that reflect the diverse interests and opinions of participants. There has been persistent effort by the rich countries to shift more issues from the Rio approach to the Marrakech agenda. The Cancun stalemate reflects the failure of this effort.

The failure can be the result of the irrational, myopic or strategic behavior of all participants, resulting in a sub-optimal Nash equilibrium. This is however, unlikely in a situation of repeated encounters. The paper offers an alternative explanation. The inability of the WTO mechanism to earn, maintain and deepen its legitimacy is due to a perception that the free market ideology that undergirds this mechanism is unable to meet the central issue of the 21<sup>st</sup> century: How to achieve economic growth in an ecologically sustainable way in a socially fragmented world? This erosion of faith and of commitment to the ideological framework is partly responsible for the inability to achieve consensus on the scope and content of the institutional framework of the WTO.

## Three Major Expectations (3Es)

The new global economic institutional framework will have to meet three major expectations of the global community. There are (A) Economic Growth, (B) Ecological Sustainability and (C) Economic and Social Equity. The post World-War II social compact between the rich and the poor – within nations and among nations – has

emphasized economic growth as a primary goal of developmental policy. Internationally, the emphasis was on the state acting as a main agent and private sector as a junior partner to achieve the desired economic growth rate. Foreign aid was the primary means of development. The 1972 Stockholm Conference on “Human Environment” attempted to raise the issue of ecology. The poor countries in the South, rallying under the banner of “poverty is the worst form of pollution,” pushed for adding the right to development (through a demand of respect and justice but, in practice, equated to economic growth) kept the focus on economic growth. The 1992 Rio conference on “Environment and Development” ended up with a strong emphasis on development (meaning economic growth) rather than on environment. As a sideline, Rio also raised the issue of vertical equity among nations by highlighting the principles of common but differentiated responsibilities, burdens and benefit-sharing and advocating technological transfer and financial assistance from the North to the South. In short, in principle, the North had accepted the principle of vertical equity, had agreed to act first, bear a large part of the adjustment burden, share environmentally safe technology and provide financial assistance to adopt them and then the South will commit itself to any caps on future emission levels. Meanwhile, they will abide by same reporting duties. The south insists, and the North accepts, that there will be no ecology without equity among nations.

On the ground level, there has been some progress in building structures and policies to ensure ecological sustainability but no progress on the vertical equity front. The withdrawal of U.S. and possibly Russia from the Kyoto Protocol and the inability of other industrialized nations to complete the ratification process reflect the conflict between ecology and economic growth. The hesitancy in moving forward by the North arises primarily from the desire to protect the process of economic growth (which at present, is contingent on high fossil energy use). The absence of the process of technological innovation focused on low-energy use in the North and the active pursuit of high fossil-use growth path by the South dims the hopes of any progress from the demand side on the ecological front. The structural adjustment policies of the IMF and the WB, the debt relief programs of G-7 and the failure of social summit in Copenhagen shows clearly that the North is uninterested in meeting its commitment on the vertical equality front. The new developmental consensus that views transnational corporations (not states) and global financial flows (not multilateral aid) as the main agents of development makes it impossible to achieve vertical equity among nations. There is a conflict between the goals of economic growth and equity.

The rise of anti-globalization movement, the growth of nongovernmental civic organizations (NGOs) and the upsurge of fundamentalist movements asserting respect and dignity of different social groups have raised the issue of vertical equity, not only among nations, but also among various social groups as well as interpersonal equity within nations. The 2002 Johannesburg World Summit on Sustainable Development ended up with a focus on ways to deal with poverty and achieve equity in human society. The World Bank’s 2003 report talks of transforming institutions to achieve economic growth with equity (quality of life for all groups) in an environmentally and socially sustainable way. Equity has taken place alongside economic growth and ecology as a major societal expectation.

These three expectations are at present on the collision course. We need an ideology – a mental construct – that provides a roadmap about how and with what “rules of game” we can resolve these conflicts. This ideological base then can provide a blueprint for individual behavior, for institutional reorganization and for evolving coherent policy regimes. The WTO-IMF-WB institutional and policy regimes embody an ideology that asserts that free market – especially in the financial markets – will achieve efficiency and a higher economic growth that is a necessary condition for achieving equity (among nations and among groups within a nation) and ecology . The WTO as a judicial arbiter makes its decisions within this framework of ideology and it is this ideology that links the exercise of its powers to the support and acceptance by the member states. This ideology, sometimes referred to as Washington Consensus, is enforced by the IMF and WB with their financial clout.

## **From Uruguay to Cancun**

The dominance of financial interests emerging from fluidity of finance across national boundaries in the developed countries has led these countries to bring more issues under the WTO agenda. This effort began with the Uruguay round when negotiations on agriculture and services were included as a “built-in-agenda” along with discussion on

further tariff reductions and the implementation issues. Doha added negotiations on trade and environment as well as on intellectual property rights on the agenda. At Singapore; four more issues - (A) trade and investment, (B) trade and competition policy, (C) transparency in government procurement policies and (D) simplification of trade procedures – were recommended for inclusion on the agenda. There was also an attempt at Doha to bring the examination of the relationships between trade, debt and finance as well as between trade and transfer of technology under the preview of the WTO. Cancun was supposed to authorize the start of negotiations on these matters.

## **Free-Market Ideology**

The free market ideology that undergirds the WTO-IMF-WB institutional complex can be summarized in three propositions.

- (1) Globalization of trade and finance will lead to higher economic growth. The proposition is not extended to globalization of labor flows. Witness the debate on outsourcing of skilled jobs and immigration laws concerning unskilled labor.
- (2) Higher economic growth will improve equity by reducing poverty and inequality.
- (3) Higher economic growth will also create potential for progress on ecology front. It is politically and socially easier to devote a portion of GDP increment to solving ecological problems instead of redeploying a part of stagnant or slow growing GDP.

These propositions present relationships for which both analytical argument and empirical evidence, to say the least, is ambiguous.

## **Trade and Growth**

The relationship between openness to trade (removing or lowering of trade barriers) and economic growth is not clear-cut. The outcome, as Sirinivasan points out, depends upon whether the forces of dynamic comparative advantage pushes economy towards or away from the direction of activities that stimulate long term growth.<sup>3</sup> Frankel and Romer's attempt to unravel the causation between trade and growth<sup>4</sup> suffers from a weakness that they link growth with trade outcome (exports, imports) measures, rather than trade policy (tariffs and non-tariffs) measures.<sup>5</sup> Even World Bank has recognized the fact that greater globalization does not imply adoption of pro-trade policies. The rise in trade may have been due to other policies or even to pure chance.<sup>6</sup> Even if there is a link, it does not say anything about the direction of causality per se. Has trade caused faster economic growth or faster growth has led to more exports which in turn enabling more imports, has lead to high trade –GDP ratio. Faster growth may be accomplished by high productivity growth reducing per unit cost making exports more competitive. It is analytically possible that causality may be in the reverse direction.

The only evidence offered is anecdotal. China, India and East Asian countries are usually cited as fastest growing economies and their achievement is attributed to their increased integration with the world economy. Yet, both India and China had achieved their high rates of growth prior to their opening up process. India had achieved these rates in 1980's, a decade before it embarked on its policy of liberalization. China picked up its growth rate since 1979, before it opened up its economy for world integration. East Asian countries, e.g. South Korea; had pursued a policy of import substitution (behind a tariff barrier) initially followed by active exports promotion policies as part of its industrial policy. Sub-Saharan African countries have a high trade/GDP ratio and their growth performance is below that of India and China who are relatively the less globalized and the less open economies. Both of them had raised their investment rate in previous three decades and had a large public sector concentrating on building social and physical infrastructure. These factors also contributed to their high growth rate in recent decades. This does not mean that trade is disadvantageous. It only means that an opening up process can be managed within the framework of an active industrial policy pursued by a country. It is even less unclear that openness to global finance will bring more foreign direct investment (FDI) and/or foreign institutional investment (FII) and will lead to higher economic growth.. FDI and FII (portfolio) investment historically has gone to countries that have

vibrant economies. Even China was able to attract more FDI only in the 1990s; after a decade and a half of liberalizing its economy and even with the presence of overseas Chinese to serve as a conduit for such transfer of capital. India has exceptionally low levels of FDI for an economy of its size and its growth ratio. In recent years, openness to global finance has led to severe financial crisis in several countries. India, China, Malaysia were able to escape or minimize the impact of financial crisis in East Asia through controls on flows of global finance. Certainly, FDI can bring more resources and may bring new technology and management. Yet, that is not the only way to improve productivity of domestic resources. These flows and their timings and sequence can be controlled and managed within the framework of an innovation policy adopted by a country.

## **Trade and Equity**

The weakness of the first proposition undermines the strengths of the other two propositions. The World Bank has estimated a decline of 200 million in the number of poor in the world between 1980 and 1998<sup>7</sup>. The estimate is contingent upon the definition of poverty line and the methodology used. Another World Bank report estimates constancy in the number of poor between 1987 and 1998.<sup>8</sup> Deaton explains this inconsistency in terms of a lag in the emergence of information on poverty trends.<sup>9</sup> These estimates are heavily influenced by the high growth rates in India and China. Estimates of national average are weighted by country population in estimating global distribution of income in these calculations. High growth rates for both these countries are bound to show a reduction of the degree of inequality between the developed and the developing countries.

We are not interested in international equity (equity among nations) but equity at the global level or between different social groups at the domestic level. The ideal indicators will be the ratio of per capita income of the top decile with that of the poor in the lowest decile, either globally or domestically in each country. A broad consensus among scholars on this issue is that inequality in this sense has worsened since the 1990s.

This should not come as a surprise. Globalization based on frictionless mobility of capital accompanied by the absence of globalization of labor (e. g. immigration laws) is likely to shift income distribution from labor to capital. Demand for labor will become more elastic for each country. This cannot but increase income inequality both globally and domestically.

The issue of equality also encompasses the issue of equity among different human groups; i.e. religion, regions, gender etc. That raises the question about who participate in the process of globalization and who benefits or bears the costs of globalization. The present focus on the comparison of the mean income of different countries does not deal with these dimensions of equity.

## **Trade and Ecology**

The pursuit of high economic growth via globalization based on unrestricted mobility of capital and goods is unlikely to lead to ecological sustainability. There is no evidence that transnational corporations are willing to embark upon a low emission path. Both industrialized and new industrializing countries are pursuing a growth path predicted on high energy intake. The struggle among them centers on who will get how much of limited environmental resources. The real losers in this process are marginalized and economically vulnerable traditional and indigenous communities that directly live from nature. The elite groups in all societies, as primary beneficiaries, are interested in economic growth (via global finance-led growth process) and ignore the costs imposed upon these marginal, locked-out groups. There can be no ecology unless we develop low-energy-use growth-path. There will be no ecology within the present high energy-intake growth-path.

This failure of the free-market ideological complex to meet the three major expectations of human world has eroded the ideological commitment and fidelity of the member states. Hence their unwillingness to expand the ambit of the WTO. The stalemate at Cancun is the visible expression of this ideological breakdown. In the absence of an alternative coherent ideology that reconciles these major expectations; the effort to establish a judicial regime are doomed to failure. It is this poverty of ideas that is reflected in the Cancun stalemate. Till then, decisions and

policies will be the result of a social drift; of compromises that represents interests, opinions, and aspirations of different parties. These compromises will be logically inconsistent, wasteful, reactive rather than pro-active and will lack a coherent vision. Yet, they will be flexible and responsive to the crisis and the urgent needs of different groups. The Rio approach, at present, seems to be the more effective and viable approach in making our collective choice regarding the emerging architecture of world economic system.

## **Association between Communication Apprehension and Emotional Spiritual Quotient among Malaysian Students**

*Che Su Mustaffa*

*Nuredayu Omar*

*Munif Zarirrudin Fikri Nordin*

*Universiti Utara Malaysia, Malaysia*

### **Abstract**

Communication skills and emotional spiritual quotient are important for employees to achieve organizational goals and mission. In order to achieve the organization's objectives, the level of communication apprehension must be low and emotional spiritual quotient must be high. This research intend to find out the level of communication apprehension and emotional spiritual quotient of students, whether significant relationship exist between all the dimensions of communication apprehension and emotional spiritual quotient, and whether there exist any differences between the communication apprehension and emotional spiritual quotient based on demographic factors. A total of 340 respondents were selected using the stratified random sampling method. The results indicate that there exists a significant and positive relationship between communication apprehension and emotional spiritual quotient. There are no significant differences between communication apprehension and emotional spiritual quotient based on demographic factors.

## **Creating Computer Literate Employees: Challenges for Office Managers**

*Samsudin Wahab*

*Hasan Bahrom*

*Mohamed Ishak Hj Badarudin*

*Universiti Teknologi MARA Terengganu, Malaysia*

### **Abstract**

The role of office managers in seeing that employees are equipped with the latest office technology skills is challenging what more with the existence of different age groups in the organization. Previous studies have focused on the identification of knowledge and skills that individuals need to successfully adapt to changing work environment (Daley, 1997; Kozlowski, 1995). This paper tries to answer the opinion of the employees' and problems adopting computer technology in the workplace. Selected senior office workers were interviewed and their responses were analyzed based on the theme of the research. Participants are 7 senior office workers who have worked for at least 15 years in a various government departments. This research found that most of participants perceived computers as a means to enhance their career development. Many of them declare that they used to learn the use of computers informally with less effort by employers. This finding proves that the management can still contribute a lot to the creation of computer literate employees regardless their age.

## **Limitation Period of Action for Specific Performance in Contract of Sale of Land: Conflicting Legal Contention**

*Nuarrual Hilal bin Md. Dahlan  
Universiti Utara Malaysia, Malaysia*

### **Abstract**

In all legal systems based on common law, limitation period plays an important part in all its civil actions. Failure to comply with the limitation period would diminish the action instituted. The limitation period for all actions founded on contract pursuant to section 6 of the Limitation Act 1953 is 6 years. However, based on the decided cases, the limitation period for action of specific performance of a contract of sale of land, notwithstanding that this action is unequivocally founded on contract, is 12 years, not 6. This is because all actions for specific performance of contract of sale of land were and are held in the decided cases to be actions 'to recover land'. Pursuant to section 9 of the Limitation Act 1953 all actions for the recovery of land, their limitation period is 12 years. However, in the author's view, the limitation period of action for specific performance of contract of sale and purchase of land should instead of 12 years, be 6 years as well, as this action too is an action founded on contract. However this is contrary to the judgements found in the decided cases. This article examines these cases and also provides the grounds to support the contrary contention of certain learned legal author in regard to the limitation period of specific performance for contract of sale of land. This article will attempt to unveil and study the grounds and policies of the courts concerning the issue.

# **Managing Organizational Change and Development: A Human Resource Management Perspective**

*Mohamad Zainol Abidin Bin Adam*

*Reynaldo Gacho Segumpan*

*Juhary Haji Ali*

*Roos Niza Mohd. Shariff*

*Universiti Utara Malaysia, Malaysia*

## **Abstract**

No one in any organization is indispensable with the challenges brought about by change. All members in an organization should be dynamic to cope with the demands and ordeal of change. With the advent of globalization, top management is put to test in the frontline vis-à-vis employee and corporate productivity. Then, how can executives effectively manage change and development in the light of human resource management?

This paper revolves within the context of managing change and development in institutional setting. Specifically, it discusses sources of resistance to change. It also examines the changing environment of HRM. Likewise, this paper advances that everyone in the organization needs to grapple with all types of change. The paper also spells out that to implement change, the top management needs to develop a shared vision and communicate it; empower employees; involve employees throughout the change process; establish a sense of urgency; and, lead by example.

## **Replacing Foreign Workers with Locals: Saudization and Service Industry in Saudi Arabia**

*Muhammad Asad Sadi  
King Fahd University of Petroleum & Minerals, Saudi Arabia*

### **Abstract**

The Kingdom of Saudi Arabia, like several other states in the Arabian Gulf region, is seeking to reduce its dependence on oil and promote a new economic order which will be characterized by greater diversity. One important element of the policy, at a time of rising unemployment, is that of maximizing job opportunities for locals and reducing the size of the expatriate workforce by installing Saudi nationals in public and private sector posts previously held by foreign workers. This job localization program has been termed the Saudization Drive and the government is vigorously pursuing ambitious targets with a view to realizing the perceived benefits of the process for individuals, organizations and society. The background to the Saudization initiative and its features are explained in this article which focuses on implications for the Kingdom's service industry, identified by the government as a growth area of the future. Information used in this study was obtained from published research, service sector experts and the authors' own observations made during his employment for a five years term as a faculty member in a premium university and as a management consultant in Saudi Arabia.

## **Skills and Other Requirements for Supporting Vendor Development**

*Abdul Aziz Ab. Latif  
Hamzah Dato' Abdul Rahman  
Zolkaflī Husein  
Univerisiti Utara Malaysia, Malaysia*

### **Abstract**

As Malaysia steps forward to achieve a developed country and as well as to achieve the objective of Vision 2020, Malaysia has to extend its export market which was traditionally agricultural-based economy to manufacturing and production-based economy. At the same time, local market had increase simultaneously with current trend.

The dynamic economic growth in 90's decade had promoted Malaysia as an example among the developing countries. However, success is thorny to arrive at. Together with growth in manufacturing, attention also had been given to increase the usage of local resources so as to create job opportunities in the country.

The current economic growth indicates that economy currently is in the process of recovery after the recession. Therefore, all the economic activities will get back to where it was before the recession period. Thus, to achieve the economic growth before recession, government had introduced several programs to encourage the production sector such as Vendor Development Program (VDP).

This paper will discuss the development and issues relating to vendor development program in a regional development organization.

# **Technology Adoption and Risk Management in the Malaysian Agriculture Industry**

*Yon Bahiah Wan Aris  
Zuriah Abdul Rahman  
Ahmad Fadhly Arham  
Universiti Teknologi MARA, Malaysia*

## **Abstract**

Of late the agriculture industry in Malaysia has been given the attention that is long overdue. Hailed as a sector that is ailing and in the sunset industry, the agriculture sector is very much overshadowed by the manufacturing sector. The need to transform this industry is realized when food import bills rose to a staggering high of RM11.3 billion. The government is determined to transform this sector and turned it to a modern and money spinning industry. Research and development projects are underway to produce crops of high productivity and newer methods of managing the land. Nevertheless, not much research is being conducted to look into the loss exposures and risk management measures employed by the farming community. This research attempts to explore risks faced by the farmers and the methods used to mitigate these risks. It also examines the farmers' perception and also acceptance forwards the adoption of new technology (such as crop Insurance) in minimizing their loss exposures.

## **The V-Factor in Decision Making: Its Impact on Organizational Development**

*Ahmad Nawir Abu Amrin  
Samsudin Wahab  
Hasan Bahrom  
Universiti Teknologi MARA, Malaysia*

### **Abstract**

This paper looks into the significant of values in the decision-making process and the impacts they have on organizational development that one cannot ignore even at the slightest fraction of a second for it is able to determine the outcome of what is to be implemented or carried out. More so, when we take into account that Organizational Development is associated with how people, individuals and groups of various levels with values intact or non-existed, act in an organization.

No doubts that values practiced are based on the set-up or background of one's ethnicity, culture and religion, still their universality when identified is, nevertheless for all to consider. The differences are no obstacle to a global understanding on what values to come into play when a decision is about to be reached in order to bring about planned changes. To this effect, once a decision is made, its impacts are far reaching. On a global scale, the ever increasing of white collar crime rates of several giant conglomerates, for instance, is at best cases of values ill-considered or worst still not considered prior to decisions that have all but gone haywire.

## **Which Strategy? To Exit or To Defend? A Dilemma for the Malaysia's Rubber Industry in Facing the Globalization Onslaught**

*Zainal Abidin Mohamed  
Universiti Putra Malaysia, Malaysia  
Haim Hilman Abdullah  
Universiti Utara Malaysia, Malaysia*

### **Abstract**

Rubber has been Malaysia's main income export earner for almost a decade. Since Independence in 1957, the total area planted under this plantation crop has increased and reached at its peak a staggering 1.2 million hectares. There were 300,000 rural dwellers that were involved in the production of the rubber produce. The price at an average of USD 1.00 per kg of processed rubber in the world market had made Malaysia achieved a respectable economic growth rate and was able to finance the country in its development program. Come 1980's, Palm oil became the number one agricultural crop earner. The country's wealth and the standard of living improved such that the laborious job in the plantation turned to be no longer preferred. With the competition from synthetic rubber and the cheap labor force of the neighboring countries, Malaysia suddenly discover that rubber production and its revenue obtained from the rural areas is no longer a preferred choice. Losing to the neighboring countries in terms of cost of production, land and labor, is a reality. The competitive advantage that it once held has dwindled. The basic indicator namely the total planted area is declining steadily (900,000 hectares in 2000). Government has been propping the industry up but is it worth it? Or should the life- support program be plugged out? This paper will discuss some possible exit as well as protective/defensive strategies open to the country. It is going to be a strategic decision and who dares make the final decision?

## **Global Variety and Multinational ERP Project Management**

*Bongsug Chae*

*Chwen Sheu*

*Kansas State University, USA*

*David Olson*

*University of Nebraska, USA*

*HsiuJu Rebecca Yen*

*Yuan-Ze University, Taiwan*

### **Abstract**

Information system project environments are rapidly changing, with greater diversity in technologies, people, and boundaries. One of the major driving forces behind this emerging paradigm in IS/IT project management is the deployment of global enterprise-wide information systems such as enterprise resource planning (ERP) systems. Growth in global systems has been driven by multinational organizations and by expanding networks of supply chains. Global systems often face increased variety in conditions, caused by national differences in cultural, language, and regulation differences, as well as different opportunities to obtain professionals. This paper intends the extension of current understanding of the nature of global variety. It considers four cases of multinational ERP implementation projects. Kirsch's (2000) contingency model is used to evaluate project characteristics of multinational ERP implementations. Findings identify three categories of global variety (socio/psychological, economic/political, and demographic/geographical) and confirm their effects on multinational ERP implementation practices. Implications for general multinational IS project management are drawn.

# **Marketing Problems of Small and Medium Size Enterprises (SME) faced in International Markets and their Importance in Economic Development (A Case of Turkey)**

*Biröl Tenekeciođlu  
Nezihe Figen Balta,  
Anadolu University, Turkey*

## **Abstract**

Different economic systems have appeared between countries of world and the policies of some countries acting together have resulted in arising free trade zones, customs union and economic union in several levels. The abilities and desires of firms to expand foreign markets and their determinations to accomplish this task indicate not only their success but also their contribution to development of country.

The sizes of business have changed in nowadays according to economic conditions in the growing industrialization process. Because of their position in the markets and their competitive power together with contribution of the employment, these firms are very important to our country that is a tool for economic development. Turkish economy has followed a closed model till 1980's. In the 1980's, the policies of liberalization were valid. Because of these improvements, SMEs have become more important as a tool for economic development. Since their dynamic and flexible structure, at the same time, SMEs have been very important economic unit on structural change and technological harmonize and SMEs have been a tool that they reduced inequality between regions and social classes. In addition, SME's marketing activities play a key role on accumulating of capital, increasing in productivity and creating new products and so forth.

In this paper, we would like to find some solutions for SME's marketing problems with collecting data via the interview. The problems facing the SMEs have been examined in both international and domestic levels and because of this, it has been tried to discover advantages and disadvantages of SMEs in the competitive environment. In this way, the problems facing in international and national levels have been compared to each sector and then we discussed their contribution on economic development, we used Paired t ways and Wilcoxon because of sample size

# **Intra-Day and Inter-Day Price Volatility as a Measure of Trading Friction in Domestic and International Equity Markets**

*Deniz Ozenbas  
Montclair State University, USA.*

## **Abstract**

The ability of an equity market to accommodate a series of trades and incorporate information into stock prices with minimal price volatility is an important aspect of its quality. We use return series with various differencing intervals that are as short as half-hour and as long as two weeks to investigate the short-term volatility accentuation in five equity markets: Nasdaq and the NYSE in the US, and the London Stock Exchange, Deutsche Boerse and Euronext Paris in Europe. Variance-ratio statistics are employed and results confirm an intra-day reverse J-shaped pattern of half-hour volatility. In addition, we find evidence of an intra-week pattern in volatility with higher volatility on Monday opening periods and Friday closing periods. The evidence also suggests an accentuation of volatility during longer periods, such as 24-hour intervals. This accentuation appears to subside when we extend our differencing interval to longer periods such as one-week or two-week returns.

## **Regionalism in Hiring Practices of University Business Schools-A Canadian Study**

*Ina Freeman*

*Birmingham University, United Kingdom*

*Peter C. Knight*

*University of Guelph, Canada*

### **Abstract**

The need for university instructors in the higher education system is melded within a world environment that has increasingly become global in both commerce and information systems, resulting in increasing competition to meet these needs. The potential of global educational standards and qualifications is recognized by the World Trade Organization (WTO) which enforces the General Agreement on Trade in Services (GATS) agreement. However, in reality, education as a service is not included in mutual trade agreements for many members, being restricted as a national service (AUCC, 2003a). The inherent regionalism in higher education tends to mitigate a free flow of academics between countries and regions to develop the increasingly global perspectives required by business students in all regions of the world.

Universities serve as a means through which national culture is questioned, researched, and formulated. The Canadian culture that values cosmopolitanism, internationalism, and respect for diversity and tolerance, is increasingly becoming unique within North America (AUCC 2003b). The Conference Board of Canada recognizes the importance of both Canadian students studying abroad and international students studying in Canada as key indicators of the countries' economic well being (Canadian Broadcasting Corporation, 1999). However this is not recognized by Canadian federal government funding sources that spent less than \$1 (Cdn) per capita on international exchange programs for Canadian students. Less than one percent of Canadian students participate in international exchange programs (AUCC 2003b).

A review of academic staff who listed their qualifications on Canadian Business School websites indicated there were 642 (or 25.7 percent) who listed their terminal degree as originating in a Canadian University, and 657 (or 26.3 percent) who listed their terminal degree as originating in the United States. Of Ph.D or equivalent degrees obtained outside of North America (235 or 9.4 percent), the largest number was obtained in England (101 or 4 percent), with the next closest being from France (64 or 2.6 percent). The number of professors with degrees obtained in countries other than the 4 countries listed above is a mere 2.7 percent. There were 525 (or 21 percent) who did not disclose information about either the origin of their terminal degree.

Questionnaires were also emailed to Deans and Directors of Canadian University Business Schools where the primary language of instruction is English. 18 of the 45 Canadian University Business Schools surveyed responded to the questionnaire for a credible response rate of 40 percent. The schools responding represented nine of ten Canadian provinces, (six provinces with at least 2 responding Universities) and were representative in terms of size and known teaching vs. research orientation. The survey was designed to examine two concepts related to practices of hiring new (first hire) faculty candidates: 1) perceptions of the relative desirability of various candidate attributes including world region or country of the candidate's terminal degree (results- Table 1) and 2) capture of perceptions of Ph.D. candidates with terminal degrees from the UK.

TABLE 1: PERCEPTION OF PH.D. CANDIDATES BASED ON COUNTRY OR REGION OF TERMINAL DEGREE SCHOOL

Graduates from schools in:		Mean	Perceived as Superior to with Statistical Significance (Paired T tests $p < .05$ )
Perceived as Superior to Cdn. PhD Grads	US n=21	2.80	Western Europe, Eastern Europe, India, Pacific Rim, Other
	Canada n=21	3.00	Western Europe, Eastern Europe, Pacific Rim, India
Perceived as Inferior to Cdn. PhD Grads	*UK n=20	3.16	India
	Western Europe n=21	3.47	None
	*Eastern Europe n=14	3.86	None
	*Pacific Rim n=15	3.47	None
	*India n=15	3.87	None
	*Other n=12	3.29	None

Overall the candidate's publication record and the research reputation of the candidate's terminal degree school are most important. AACSB accreditation of the candidate's terminal degree school was important primarily only to research- oriented schools. A minority but substantial perception of UK graduates that they are less suitable than Canadian PhD graduates is based on the UK program being based on independent research and the Canadian system being course based with a research component, similar to the US pedagogical model

While it is recognized that Universities are crucial to the continuing post secondary educational needs of the population and of society's continual striving for advancement, it appears that Universities face a dichotomy in the precepts to their educational staff. University professors receive their terminal degrees in schools that are primarily known for their focus on research. If these schools are located in North America, the terminal degree includes a teaching component as well as research. If these schools are located in the UK, the course work is far less structured with increased emphasis on research. The research that is taught or learned in UK institutions, however, is perceived in this survey of the academics in Canadian schools to be more "narrow in focus", not as well grounded in research methods and philosophy, and not based as well in the foundations of knowledge. This may stem from the North American increasing dependence on quantitative research while the UK more readily acknowledges the different uses of different methodologies, leaving the discrepancies between the two models as a source of on-going debate.

On a more general note, the global reality of the world of commerce today seems to be understood by many Canadian universities to exist. The 9.4 percent population (2.7 % when degrees from UK and France are removed) of non North American Ph.D. degrees as represented in the 50 Canadian University business school web pages seems to belie this emphasis.

The need for standards and a levelling of educational requirements and expectations is recognized by the WTO although the nationalistic retention of control over education denies this. With the increasing globalization in commerce and communication, world events are increasingly impacting the North American continent. The Conference Board of Canada recognizes the importance of international education. Yet from the results of this survey, this trend is not recognized by the educational institutions that are preparing tomorrow's business leaders. Replication of this type of study in the US, Europe and the Pacific Rim as well in emerging economies would seem to be of interest to the global business education community. It is the author's belief that Canada is far from alone in terms of regionalized hiring practices in an increasingly global business education environment.

# **Development of the Securities Market in Bangladesh Over the Past 50 Years: A Critique**

*Sheikh Solaiman  
University of Wollongong, Australia*

## **Abstract**

The Bangladesh securities market came into being in 1954. Despite its operation for half a century, its growth is not impressive. The factors leading to the stagnation of the market include, inter alia, the existence of weak legal and regulatory frameworks, the absence of active market professionals, the predominance of individual investors, and a serious dearth of foreign and institutional investors. Legal and regulatory weaknesses are considered to have critically hindered the market's potential growth. Some important laws are outdated, and the regulator has introduced some unrealistic reforms over the years. Most of the reforms accomplished thus far concentrate on incentives to investors and issuers alike, but nothing significant has been done to provide protection to the investor. This study suggests that the issue of investor protection be addressed on a priority basis in order to achieve real growth for the ailing capital market.

## Historical India – Historical MNE? An Initial Enquiry

*Shahid Siddiqi*  
*Long Island University, USA*  
*Rajeshwari Narendran*  
*M.L. Sukhadia University, India*

### Abstract

The purpose of this paper is to conduct a preliminary enquiry into the proposition as to whether the multinational enterprise (MNE) *could have* originated in historical India. For the purposes of this paper, the historical period is defined as recorded Indian history ending with British colonization of India. Given this assumption, it is self-evident that there is no such extant Indian MNE which predates or was concurrent with British colonization of India. The MNE is defined as per the broad definition offered by the Organization for Economic Cooperation and Development (OECD) and the United Nations Center for Transnational Corporations (UNCTC) : “ an enterprise that engages in foreign direct investment (FDI) and owns or controls value-added activities in more than one country” (Dunning, 1993).

We start with an assertion that there is no linkage between historical India and historical MNE. This is suggested by the celebrated work of Max Weber (2001) on ‘the spirit of capitalism and the protestant ethics’. From the economic philosophy perspective, our research belongs to the context of capitalism. From the economic and business history perspective, our enquiry relates to the research of Moore and Lewis (1999) on the ‘birth of the multinational’ in the 2000 years preceding the early Christian era and possibly associated with the Assyrians, Phoenicians, Greeks and Romans . Research of this genre permits the antithetical perspective that given the historical existence of the MNE, there could have been the possibility of the MNE in historical India. However, both these works, belong to a relatively proximal space – that of the Occident. In that sense, the ‘strategic geography’ is relatively similar (Kemp and Harkavy, 1997). Our research shifts to the Orient, and more specifically to India, with a comparatively dissimilar ‘strategic geography’. The time period is somewhat similar. Indeed, our enquiry springs from the Moore and Lewis (1999) research.

Our preliminary investigation explores

- Birth of the MNE:
- History of Globalization:
- History of Capitalism
- Mohanjadaro and Harappa were the twin cities of the Indus Valley Civilization.
- Spice Route (& silk Route)
- Division of Labor in historical
- Organization of the Indian Village
- Role of Colonial Powers

Whether the historical MNE could have or could not have originated in historical India has fundamental consequences for research on the Indian context as well as on the theory of the MNE. The above issues are pulled together to examine the possibility of whether historically India had the necessary context for the origination of the MNE. If it was not so, the obvious question is what factors need to have been in place to give birth to the historical MNE, or else, the absence of what critical factor (s) prevented the MNE’s fruition. The study, however, should be considered a preliminary enquiry.

# **Analysis of US Public Companies Disclosures of Audit and Non-Audit Fees Before and After the Sarbanes-Oxley Act**

*Ramesh Narasimhan*  
*Montclair State University, USA*  
*Shifei Chung*  
*Rowan University, USA*

## **Abstract**

Due to the failure of the auditing firms in U.S. to detect manipulations of financial statements in the late '90s and early in this century, a lot of scrutiny was placed on the manner in which the profession governed itself. After the sudden collapse of Arthur Andersen, following the Enron scandal, Congress enacted the Sarbanes-Oxley Act, primarily to address the issue of the perceived loss of independence of the auditing firms. One area addressed in the act is the issue of the provision of nonauditing services, which is proscribed for most non-audit services. The purpose of this paper is to analyze the disclosures made by U.S. companies in their financial statements for the amounts paid to auditors for audit and non-audit fees prior to and after the enactment of Sarbanes-Oxley. The results of the study will enable us to understand if the theory of audit fees being "loss leaders" for auditing firms to derive primarily non-audit services is true, as the audit firms would have to adjust their fees to reflect the actual costs of the audit absent the income from non-audit services.

## Costa Rica and Jamaica's Trade Balance: Co-integration and Error Correction Modeling

*Glennville Rawlins*  
*Montclair State University, USA*

### Abstract

During the second week of January, 2004 the leaders of the countries of the America's met in Monterrey, Mexico to finalize a date for the commencement of the Free Trade Area of the America's. When President Bush in 2002 received "Fast-Track" negotiating authority from Congress, it made it all but certain that within five years almost all of the nations of this hemisphere would have acceded to a Free Trade Area of the Americas (FTAA). The crisis in Mexico months after the 1994 initiation of NAFTA made many in Congress leery of approving "Fast-Track" precisely because of the perceived ubiquity of macroeconomic stabilization problems within FTAA. Against this checkered background this paper examines the relationship between the trade balance and the real exchange rate for two countries in the western hemisphere: Costa Rica and Jamaica.

Starting from a static Monetary/Keynesian two-country equilibrium model of international trade, the estimable form of the trade balance can be expressed as:

$$B = f(\text{Rex}, Y_d, Y_w)$$

Where B is the trade balance, Rex is the real exchange rate, Y<sub>d</sub> is domestic income and Y<sub>w</sub> is world income.

A cointegration test is then carried out on the long run elasticity, with the Bickerdike-Robinson-Metzler condition being validated if a real currency depreciation improves the trade balance. Next, an error correction model would be developed to investigate the dynamic adjustments in the short run to chart the longevity of a real depreciation. This exercise tracks the percentage of the path back to long run equilibrium that is completed in the first two years. Knowledge of the short run dynamics allows for the development of appropriate export promotion policies that are consistent with the likely FTAA rules.

## Evidence and Perspectives on Arrangements of Exchange Rates System in Asia

*Katsuji Okachi*  
*Ryukoku University, Japan*

### Abstract

There has been a common understanding among people that world prosperity will not be achieved without the continued prosperity of the Asian economy. The prosperity of the Asian economy will not be achieved without achieving monetary stability in the Asian region.

I have been working on a project concerning the monetary stability problem in Asia. The most contentious point about the monetary stability problem in Asia is how to establish a concrete exchange rate system in Asia. Policy makers in any country involved in monetary transactions have had strong concerns about the use of exchange rate regimes because of concern for their own country's interests in international monetary flows.

In seeking to refine the analysis, I will argue that arrangements of exchange rates should be based on an academic survey which has been conducted with academics, business persons, journalists, governmental policy makers, and so on in the Asian region.

The main arguments described in the academic survey are listed as follows:

1. What significance can be seen in establishing the optimum currency area based on the Japanese Yen in Asia?
2. Would the basket system be more preferable including Japanese Yen, US Dollar, Euro, and other Asian currencies?
3. What currencies in Asia should be included in establishing the basket system in establishing the monetary stability in Asia?
4. Should a single currency system be established in Asia?
5. In establishing the single currency system, what conditions should be maintained in Asia?
6. Should the Asian Monetary Fund be established in Asia to maintain monetary stability?
