In order to know the technological gap, it was necessary to design an instrument able to measure the different degrees of technology involved in industrial processes, which could be either "hard" or "soft". This instrument has three major components: administrative process technology, productive process technology, and technology involved in such new ways to organize work as teamwork, quality circle, etc.; due to its nature based on personnel relations, this soft technology is also called "social" technology.

On the other hand, the training activity variables were the working hours and investment involved for both company and workers, and the relative effort measured through a percentage that represents the investment on training over the total company payroll. Finally, the total annual amount TNC's invested in training was estimated as part of the manufacturing industry in the City of Chihuahua.

Table 1 shows the composition of sampled companies, where the number of workers determines the size; according to the official classification, small companies fall between 1 and 50 workers, medium companies fall between 51 and 250 workers, and large companies have more than 251 workers.

TABLE 1: COMPOSITION OF SAMPLED COMPANIES BY SIZE AND ORIGIN

<i>ORIGIN</i>	<i>SMALL</i>	<i>MEDIUM</i>	<i>LARGE</i>	<i>TOTAL</i>
LOCAL	113	14	3	<b>130</b>
FOREIGN	-	5	10	<b>15</b>
TOTAL	113	19	13	<b>145</b>

Most foreign companies are twin-plants or “maquiladoras”, which means they basically are the manufacturing unit, generally of intensive labor type, of a TNC or global company.

## Data Analysis

### a) Number of Companies and Workers in the Sample

The 145-company sample represents about 23% of a population of 624 manufacturing industry companies in the City of Chihuahua. The difference between the average number of workers in local (30) and foreign (721) companies, as shown in Table 2, basically is that local companies include small size companies, and foreign companies only include both medium and large companies.

TABLE 2: GENERAL DATA ON SAMPLED COMPANIES

<i>ORIGIN</i>	<i>NUMBER OF COMPANIES</i>	<i>AVERAGE WORKERS PER COMPANY</i>	<i>WORKERS</i>
LOCAL	130	30	3,900
FOREIGN	15	721	10,815
TOTAL	145	102	14,715

### b) Main Technological Investment per Worker

The main capital asset investment on both administrative and productive equipment was measured. The “Investment on administrative equipment per worker” variable, shown in Table 3, essentially considers the investment on computer equipment (software included) used for automation of such administrative functions as accounting, payroll control, etc., divided by the number of workers. The difference between the values for the two kinds of companies is small, mainly due to the relative low cost of Personal Computers (PCs) and their commercial software.

The “Investment on productive equipment per worker” variable considers all the investment made in machines required for the manufacturing process automation, from product design to packaging, e.g. CAD systems, material control, CNC machines, etc., divided by the number of workers. The relative low values (below 100,000 USD/worker) is because the economic structure of both kinds of companies is less capital intensive than labor intensive, like in the “maquiladoras” case.

TABLE 3: MAIN TECHNOLOGICAL INVESTMENT PER WORKER

<i>ORIGIN</i>	<i>INVESTMENT IN ADMINISTRATIVE EQUIPMENT PER WORKER (USD)</i>	<i>INVESTMENT IN PRODUCTIVE EQUIPMENT PER WORKER (USD)</i>
LOCAL	813.8	5,531
FOREIGN	935.1	11,388

### c) Process Technological Level

The four variables in Table 4 are index-constructed from the Likert scales of the questionnaire, expressed on a percentage basis, i.e. the measuring level of these variables is ordinal [6].

The administrative technology percentage refers to the automation level of the administrative process. In the case of the foreign companies, the intensive use of Information Technology (IT) can be noted, with an 85% automation, compared to local companies with 39%.

Productive technology measures the automation level of the manufacturing process, which, in economics terms, is a point in the continuum between labor-intensive process and capital-intensive process [8]. In the case of this sample, we can see relative low values (27.5 and 61), which means that the process in both types of companies is rather labor-intensive. These values are consistent with the low relative labor cost in the country, which is approximately two USD / hour in the northern states.

Organizational technology refers to new technologies based on work organization, where motivated, trained human resources play a central role; such technologies are also called “soft” or “social” [11], and they include teamwork, quality circle, lean manufacturing and continuous improvement techniques.

The “Total process technology” variable is made up with the three variables above, calculating and averaging the value between hard and soft technologies. A significant difference ( $t = 8.46$ ,  $p < 0.01$ ) can be noted between process technology in both local and foreign companies.

TABLE 4: MAJOR COMPONENTS OF PROCESS TECHNOLOGICAL LEVEL BY COMPANY ORIGIN

<i>ORIGIN</i>	<i>ADMINISTRATIVE TECHNOLOGY (%)</i>	<i>PRODUCTIVE TECHNOLOGY (%)</i>	<i>ORGANIZATIONAL TECHNOLOGY (%)</i>	<i>TOTAL PROCESS TECHNOLOGY (%)</i>
LOCAL	39.1	27.5	27.2	<b>30.2</b>
FOREIGN	85.1	61.0	66.9	<b>70.0</b>

Fig. 1 shows a boxplot chart with the “Total process technology” (GTEC\_TOT) variable values for both types of companies, where “nac” is for local companies and “Extr” is for foreign companies. A strong difference can be observed in the manufacturing process technology range for both local and foreign companies.

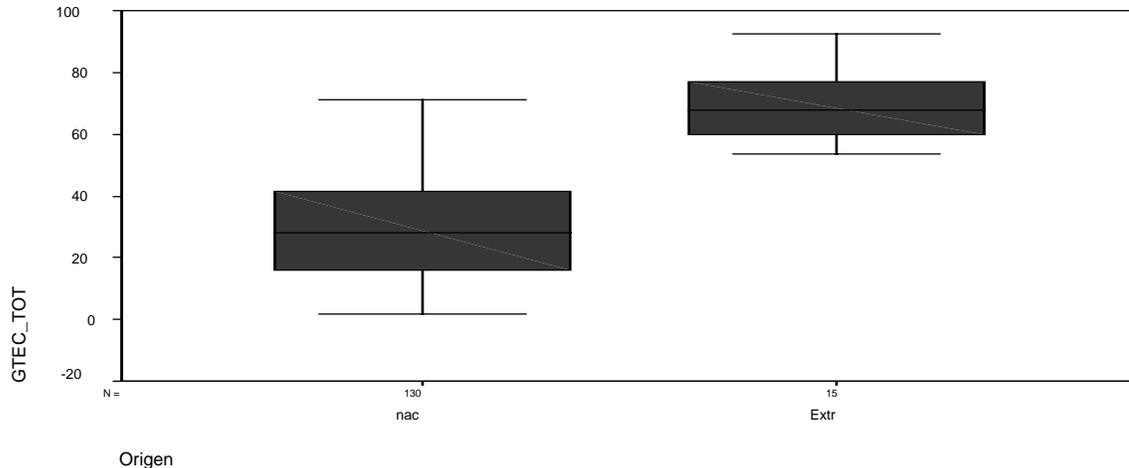

FIG. 1: CHART OF THE “TOTAL PROCESS TECHNOLOGY” VARIABLE BY ORIGIN OF COMPANY

**d) The Companies’ Training Efforts**

Table 5 shows a significant difference in the “Training Investment per worker” variable between the two types of companies ( $t = 2.025$ ,  $p < 0.05$ ), approximately twice as higher for foreign companies than for local companies [9]. These figures can be compared to the average value of this variable in the United States in 1999 [13] – 1,040 USD – which is five to ten times as higher as for foreign and local companies, respectively. On the other hand, these figures demonstrate the awareness of foreign companies on the importance of training, against local companies.

Likewise, we can note that the difference in training investment as a payroll percentage [4] is significant ( $t = 2.08$ ,  $p < 0.05$ ). These values can be compared to the 2.5% found for average American companies in 1996 [10], and the 5% found for American World-Class companies [13].

TABLE 5: ANNUAL TRAINING ACTIVITY BY ORIGIN OF COMPANY

<i>ORIGIN</i>	<i>HOURS PER WORKER</i>	<i>INVESTMENT PER WORKER (USD)</i>	<i>INVESTMENT IN TRAINING AS A PAYROLL PERCENTAGE</i>
LOCAL	29.8	104	1.4
FOREIGN	48.4	209	2.6

Table 6 shows the annual training investment by company, the total investment made by the sampled companies (145), and an estimate of total investment companies in the city industry (624) made. We can observe that foreign companies invest approximately 9 million USD to train local workers every year. This figure is a good estimation of the amount of technology TNC's transferred to the host country through training, mostly in two ways:

- a) Trained personnel are in permanent contact with their industrial and social context; this way, part of the knowledge is diffused to the local environment.
- b) Given that, sooner or later, trained personnel leaves the foreign company and can work for a local company; knowledge is then transferred.

TABLE 6: ANNUAL TRAINING INVESTMENT BY ORIGIN OF COMPANY

<i>ORIGIN</i>	<i>INVESTMENT BY COMPANY (THOUSANDS OF USD)</i>	<i>TOTAL INVESTMENT BY THE SAMPLED COMPANIES (THOUSANDS OF USD)</i>	<i>ESTIMATION OF INVESTMENT BY INDUSTRIES IN THE CITY (THOUSANDS OF USD)</i>

FOREIGN	150.69	2,260	8,738
TOTAL		2,665	10,501

Fig. 2 shows a bar chart with values of the estimated annual investment both local and foreign companies in the City made.

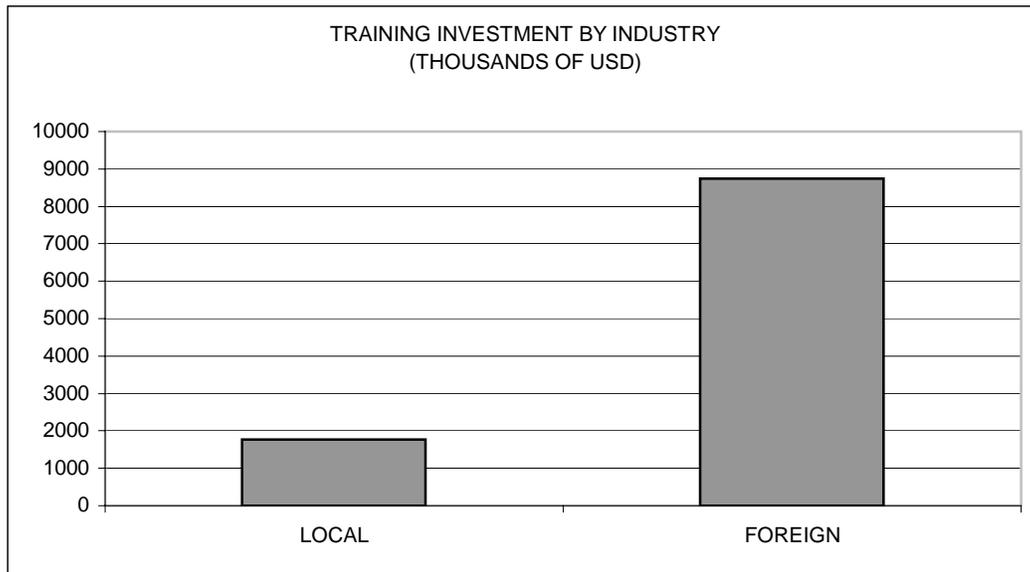

FIG. 2: ESTIMATION OF TRAINING INVESTMENT MADE BY INDUSTRY IN THE CITY

## Conclusions

The results above, which show the figures of the major variables in the technological and training process, allow us to come to the following conclusions:

1. Foreign companies that come from industrialized countries have a significant superiority in process technology over local companies in developing host countries. This finding was expected; however, the interesting point in this work is the measurement of the technological gap.
2. The efforts foreign companies make to train local workers and teach them the company's technology, is considerably high and comparable to those carried out in the country or origin.
3. Given that, sooner or later, local workers leave the foreign company and the technological knowledge they learned through training is transferred and diffused through the host country. The estimated annual amount the industry of the city invests in training that allows this transfer is over 9 million USD.

As general conclusion, we may say that FDI is an important, but not so known, way to transfer technology; however, this work showed that it was possible to make a conservative technology transfer estimate by tracing the path of training, which can be seen as a positive externality from TNC's to the host country.

Finally considering this conclusions, a recommendation could be: given the strong potential of technology transfer from the FDI, local governments in developing countries should consider this for investment regulations related to the design of technological strategies and policies in a general way, and to training support in a particular way.

# Foreign Direct Investment, Fiscal Competition & Currency Policy The Case of Slovakia

*Michel Doumont*

*Jozef Komornik*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

The main challenge the Slovak Republic is facing now, as a rather small new comer in the European Union, is to catch up as soon as possible the welfare standards of the Union. Recent studies ( World Bank, 2004) concluded that this country successfully encountered lot of reforms during the last period, putting it among the best performers of the post-transition countries. Two main reforms characterised the Slovak specificity of the last years: the unified flat "19%" fiscal reform - for individuals, corporate and value added - and other measures for attracting foreign direct investment. As a result, Slovakia is e.g. the first car assembler per inhabitant in the world. Its growth rate is above the average of the new EU member states. Such evolution is not without threats. Some partners of Slovakia seriously consider the risk of delocalisation in their production activity due to tax competition and state aid, not only as a consequence of globalisation but also as an effect of the European Unification. The debate on competitive corporate taxation is dominated by the following idea: if the interest in small economies indeed lies in the development of tax competition and "non cooperation", although the extra FDI thereby attracted seem marginal, the general interest does seem to be minimum coordination between Member States of the Union. Since the drop in Corporate Taxation rates has limited economic effects, in particular on the attraction of FDI flows, stress must be put on its fiscal and monetary consequences, in particular as regards the Central and Eastern Europe (CEE), which must respect their commitment to budgetary discipline, whilst at the same time funding their bringing up to standard of infrastructures and provision for education and training.

## Competing for FDI

Foreign direct investment is the category of international investment in which an enterprise resident in one country (the direct investor) acquires an interest of at least 10% in an enterprise resident in another country (the direct investment enterprise). Subsequent transactions between affiliated enterprises are also direct investment transactions. FDI has been accorded a central role in the post-communist economic transformation of Central and Eastern Europe. After the collapse of state socialism in Central and Eastern Europe (CEE), economists and multilateral institutions suggested that a successful 'transition' from the centrally planned economy to a market-based system could be facilitated by large inflows of FDI, considered as an engine for the development, a vehicle for the economic modernisation and a driving force for the productivity development in CEE (Petr Pavlínek, 2004).

Various factors are reinforcing the traditional impulses for foreign direct investment, such as a better access to natural resources, markets, and low-cost labour. With the rise of globalisation, technological progress in information and communication technologies, together with improved logistics, allow for production to be close to markets while taking advantage of the specific characteristic of individual production locations.

According to a recent econometric study (Rui Albuquerque, Norman Loayza & Luis Servén, 2002), global factors are drivers of foreign direct investment. The increased exposure of countries to the globalisation has been associated with increased flows of foreign direct investment into emerging market economies. While these findings constitute evidence on the relevance of push factors for foreign direct investment, pull factors, more locally related, like growth in local productivity, trade openness, financial depth, low government burden, and macroeconomic stability are also important, even though these latest have become less important for the last years in accounting for variation in foreign direct investment. This should not be seen as an endorsement for a "hands off" attitude of local governments towards foreign investment. Much of the integration of capital markets comes from policy initiatives

taken from within each country. In many emerging economies, the defence of existing reforms and the pursuit of further liberalisation policies represent a challenge for local policy makers that cannot be put off.

TABLE 1: POTENTIAL POSITIVE EFFECTS OF FDI IN HOST COUNTRIES

<b>Level</b>	<b>Opportunities</b>
<b>Enterprise</b>	continued and expanded production increased labour productivity access to investment capital access to worldwide sale and distribution networks transfer of Western technology and know-how improved competitiveness increased R&D
<b>Local economy</b>	consolidation and creation of jobs increased wages growth or real income increased tax base increased exports labour training provision of social services to local communities increased opportunities for local companies to supply foreign-owned companies

Source: Petr Pavlínek, 2004, *revisited*

Attracting FDI becomes a focal point of competition among developed and developing countries. This competition is maintained even when countries are pursuing economic integration at another level, such as the EU accession. While some countries are lowering standards for attracting FDI in a "race to the bottom," others praise FDI for raising standards and welfare in recipient countries.

Different methods are used by policymakers to attract FDI. Some countries rely on targeted financial incentives, such as tax concessions, cash grants and specific subsidies. Others have chosen a broader approach that focuses on improving their domestic infrastructure and local skills base to meet the demands and expectations of foreign investors or to improve the general business climate of a country by decreasing administrative barriers and red tape. Many governments have created state agencies to help investors through this administrative paperwork, as well as to promote FDI broadly (in Slovakia: SARIO) or entered into international governing arrangements to increase their attractiveness as investment locations.

TABLE 2: KEY FDI INCENTIVES

<b>Type of Incentive</b>	<b>Purpose</b>	<b>Elements</b>
<b>Fiscal</b>	to reduce the tax burden on the investor	tax credit, tax relief, tax rebate, exemption from customs duty, reduction of tax base, VAT exemption, accelerated depreciation, reinvestment allowance, loss accrual
<b>Financial</b>	to provide direct financial assistance	Soft loans, grants, sovereign guarantee on investment credits, export guarantee, insurance and credit, subsidised funding for various purposes
<b>Operational</b>	to increase the profitability/reduce the costs of the investment through non-financial means	preferential government contracts, real estate provided below market price, promotion of institutional investment, SME development programmes, customs free areas, special economic zones, industrial parks

Source: compiled by Magdolna Sass, 2003

To attract large FDI inflows, the CEE countries needed to develop appropriate institutional and policy frameworks to position themselves within flows of global capital. In this region, FDI typically results in rapid and profound restructuring of foreign invested enterprises, including organizational restructuring, technology transfer, worker training, the transfer of Western management structures and practices, and new production strategies and

organisation. Such influxes of production capital and transfers of Western factory regimes and technology resulted in rapidly increased quality and competitiveness of produced goods, productivity gains and expanding production and sales by foreign investing enterprises, both domestically and abroad.

Now that the novelty of EU membership is fading, corporate investors are anxious to see just how these markets perform given the challenges that the EU accession process poses. Among the leading perceived threats to the competitiveness of the ten new EU members states (NMS), global investors cited poor infrastructure, corruption, and the erosion of low-cost advantage. While EU reforms are expected to bring infrastructure investments and regulatory stability within the EU single market, the economic and social costs of adjustment remain high. EU law will likely add a new layer of bureaucracy and may undermine new members' relative FDI advantages in areas such as favourable tax and labour conditions, which could push investors toward neighbour countries, i.e. Romania, Bulgaria, the Balkans and Ukraine.

## **The Other Side of FDI**

Other aspects can impair the positive features of FDI, implying a more evenly balanced view about the benefits and risks of FDI. Four arguments suggest that the role of FDI in financing current account imbalances appears to be less beneficial than generally assumed.

- First, much of recent FDI flows were related to privatization activities. The supply of privatization opportunities is likely to shrink over the next years. The completion of privatisation programs as a risk to the competitiveness of these new EU countries is seen as a potential risk for FDI development in NMS. Nonetheless, the end of privatizations in the Czech Republic and Slovakia in part explain the region's FDI decline last year. This will then result either in reduced total private capital flows or in a changing composition towards more volatile components. Furthermore, by softening the balance of payments constraints, large privatization-related inflows can also exert a lastly negative influence. Inflows related to the privatization of firms (e.g. utilities) that do not subsequently raise the export potential can serve as a cushion against the pressure for urgent but politically difficult reforms. The upshot could be increased external vulnerabilities.
- Second, while the components of the machinery that is associated with FDI are relatively stable, FDI as such is no more than a capital inflow that, considered in economic terms, extends the liabilities of the host country's balance sheet. Hedging operations provide possibilities to withdraw an investment should the economy enter a time of downwards. These options are limited to unstable emerging economies, as functioning capital markets are needed to undertake the necessary hedging operations. While relatively well-developed financial markets are surely an asset in attracting foreign capital in the first place, they also set the stage for an easier repatriation of FDI. Likewise, extensive inter-company lending, which is usually made according to short-term financial considerations, can induce a high degree of volatility.
- Third, drawing on data for US firms, there is evidence that earnings repatriations tend to show a rather stable pattern if economic conditions worsen for the group as a whole. Not only does this translate into a potentially highly volatile pattern of reinvested earnings, but stable earnings repatriations may also aggravate a situation already characterized by private capital outflows.
- Fourth, due to the fact that multinational enterprises can trade goods and services internally at artificially increased prices, capital can be reallocated from host countries to other parts of the corporate network in an effort to raise profits or reduce taxes.

TABLE 3: POTENTIAL NEGATIVE EFFECTS OF FDI IN HOST COUNTRIES

Level	Threats
<i>Enterprise</i>	labour shedding disinvestment and downsizing of production transfer of R&D abroad
<i>Local economy</i>	local dependency on foreign capital external control of local economies attracting skilled and semi-skilled workers from local companies local firms unable to compete due to a lack of level playing field break in the development of new indigenous enterprises deskilling regional specialisation in low-skilled, labour-intensive production development of 'dual economy' branch plant syndrome instability of Western investment

Source: Petr Pavlínek, 2004, *revisited*

FDI is not risk-free in terms of the balance of payments, but so far it has been the least volatile of all private capital flows. As long as emerging economies are unable to borrow long-term in their own currency, FDI seems at present to be the best option. Even though the positive effects as a provider of capital and a stimulant of growth may depend on specific circumstances and not accrue with every long-term foreign investment, the empirical studies either indicate that it outperforms other types of flows in these regards or at least does no worse. Thus, while FDI might not be a panacea and there is every reason to monitor developments in the capital account closely regardless of the types of inflows, FDI does represent the least risky type of capital inflows.

### Current Situation of FDI in Slovakia

Slovakia has made good progress in improving its business environment and competitiveness in attracting foreign direct investment since 1999. The cumulative level of foreign direct investments has risen sharply from USD 2 billion in 1999 to approximately USD 9.5 billion at the end of 2002. In 1999, the Slovak government established a three-pillar strategy to attract foreign direct investments, which consisted of new legislation to improve tax incentives, the creation of a "one-stop shop" to assist investors and encouragement to cities to develop industrial parks. The foreign investment tax credit law came into effect in January 2001 and was later modified to conform to the EU laws on state aid.

TABLE 4: FLOWS OF INWARD FDI (\$ BILLION)

	Annual average 1985-1995	1999	2000	2001	2002
Czech Republic	0.54	6.324	4.595	5.639	9.319
Estonia	0.06	0.305	0.398	0.542	0.307
Hungary	1.035	1.944	1.957	2.440	0.854

Source: UNCTAD, World Investment Report 2003

In one of the biggest prospective green-field investments in Slovak history, the French PSA Peugeot-Citroen carmaker in January 2003 selected the Slovak city of Trnava as the site of a USD 750 million factory,

expected to come on line in 2005 or 2006. The other big green-field investment in Slovakia in this year is decision about the investment from South-Korean colossus Hyundai/Kia that plans to build its new plant in Northern Slovakia.

FDI in Slovakia has increased dramatically. Cumulative FDI has quintupled since the beginning of 2000 to USD 11.2 billion (June 2004). As of 2003, Slovakia has enjoyed per capita FDI of approximately \$2,080. Slovakia is becoming an increasingly attractive place for FDI, particularly for manufactures looking to set up or expand their operations in Central Europe and the EU at large. FDI in Slovakia totalled Sk23.376 billion (€590 million) in the first nine months of 2004, with Sk18.343 billion (€460 million) invested in the corporate sector and the rest in banks, wrote the central bank in its monetary review. From January to September, Sk12.637 billion (€320 million) was invested in industrial production and Sk5.604 billion (€140 million) into financial mediation. Retail and wholesale sectors, motor vehicle repair, motorcycles and consumer goods absorbed Sk4.634 billion (€120 million) of investment.

As the inflow of foreign direct investment (FDI) to Slovakia has started to gain importance, it is therefore important to understand the impact of FDI on the economy of Slovakia, primarily on the real sector. The Slovak economy grew 4.2% in 2003, the strongest growth in Central Europe, and is predicted to expand by more than 5% in 2004. Headline consumer price inflation dropped from 26% in 1993 to an average rate of 3.3% in 2002 but rose to 8.5% in 2003 as a result of increases in the subsidized prices of utilities ahead of Slovakia's 2004 entry into the European Union. Inflation is projected to be 7.5% in 2004, dropping to 3% in 2005. The Slovak economy has been growing faster than the economies of Hungary and the Czech Republic. In the first quarter of this year, GDP in real prices grew by 1.4 percentage points compared to the same period in 2003 and by 0.8 of a percentage point compared to the last three months of 2003.

The first quarter data shows Hungary and Austria as the biggest investors, these countries rank sixth and third, respectively, in the cumulative stock of FDI in Slovakia, behind Germany and the Netherlands, while over 77 percent of the investments flew to the Bratislava region what correlates with overall tendencies. Hungary's prime FDI donor role in the first quarter was driven by the MOL concern's purchase of Slovnaft shares (MOL's Slovak unit) from minority investors, while the investment of a banking group based in Austria took second place.

The Slovak Investment and Trade Development Agency (SARIO) announce 40 projects in the pipeline, chiefly in the field of the automotive industry. In the event of their successful implementation, new investments of €2 billion could arrive in Slovakia creating 6,000 to 10,000 new jobs.

Though the investments from the new projects would flow mostly to northern Slovakia, specifically to Žilina, Martin, and Banská Bystrica, the core of the FDI continue to target the Bratislava region, which leaves the problem of a widening gap between the wealthier west and the underfed east unresolved.

According to Slovak economic analysts Bratislava is the natural choice for foreign investors, given Bratislava and the surrounding region's developed infrastructure and proximity to core western European markets. There is little chance that the Bratislava region will lose its position as the prime destination for FDI anytime soon. Its lead, however, may gradually narrow, the tight labour market and rising wage costs in Bratislava will probably become the crucial motivation for foreign investors to explore other regions of the country as well.

If the Government accomplishes its plans for highway construction, the chances for investment flowing into those regions will increase. To a certain extent, the government's intentions to provide state support in the form of investment stimuli for regions with a high unemployment rate could present an opportunity for the eastern regions.

## **Corporate Income Taxation and FDI**

The opportunity of a low or declining level of corporate taxation (CT) in the New Member States (NMS) formed the main debate. Indeed, the latest enlargement has brought into the Union countries whose CT rates are clearly below the European average. For the States of the former EU15, the principal issue is the safeguarding of their tax revenues.

<b>Arguments in Favour of Tax Competition</b>	<b>Arguments in Favour of Tax Coordination</b>
<ul style="list-style-type: none"> <li>- The diversity of the collective preferences relating to the weight of the public sector in the economy and the distribution of the tax burden between its various components (CT, income tax, indirect taxation), with conceptions sometimes far removed from those defended by France or Germany for example, necessarily implies rates which differ from one country to another;</li> <li>- This is a margin for manoeuvre enabling States to attract and, <i>in fine</i>, “to keep in Europe” FDI which could otherwise be located somewhere else in the world;</li> <li>- Relatively low CT rates in the NMS help to compensate for low infrastructure levels.</li> </ul>	<ul style="list-style-type: none"> <li>- Declining CT rates appear hardly compatible with deteriorating public finances, six NMS currently being the subject of an excessive deficit procedure on the part of the Commission;</li> <li>- Specific tools exist in order to bring infrastructures up to standard, i.e. the structural and cohesion funds;</li> <li>- The CT rate only proves a determining factor in the choice of location for a small number of FDI; and the CEE countries comparative advantages appear “to be sufficient”;</li> <li>- Consequently, tax competition is of particular benefit to multinationals seeking tax optimisation and the transfer of their tax base</li> </ul>

Source: Ph. Brunel (2005)

The Slovak government opened doors for foreign investors and introduced competitive incentives schemes, including a 19% flat income tax for corporations and individuals.

Slovakia’s ambitious tax reforms, much welcomed by the business community, have attracted severe criticism from some western Europe Governments (France, supported by Germany and Sweden), who suggested that the new EU member states that have their taxes under the European average should receive less financial aid from the European Union if they allow their corporate taxes to fall below the EU average.

This outspoken statement provoked a wave of protest, both from the established member states and the new member countries. The architects of the Slovak tax reforms stressed that the country is merely adopting necessary reforms. Europe needs a larger market, more flexibility and better conditions for firms to develop.

The Slovak authorities further consider that the proposal to cut funding for the new members is groundless, because these countries are contributing to the collective European budget, which directly provides the structural funds, just as much as the original 15 member states.

They also argued that French proposal unfairly singles out new members, when some of the formative countries are also registering lower taxes than the EU average, yet Ireland, Great Britain, Portugal, Spain and Greece are eligible for drawing money from the structural funds. Furthermore, neither the accession agreement nor any other document pertaining to the new EU members, assumes any limitations on accessing structural funding, the ministry claims. To add support to Slovakia's stance, the European Commission also refuted the French proposals, saying that it rejected any links between tax rates and structural funds.

This point is fundamental as regards the attractiveness of new member States (NMS) for FDI. The redistribution of EU funds makes the accession countries more attractive as a location of FDI. The redirection of Structural and Cohesion funds from current to new Europe members according to some authors will effect the inflow of FDI in UK, the Netherlands, Belgium-Luxemburg and France in favor of Austria, Hungary, Czech Republic, Slovakia and Slovenia (Breuss, F., Egger, P. and Pfaffermayr, 2004) demonstrate the reallocation of structural funds foreseen in the Agenda 2000 and successive revisions, leads the financial perspectives for an enlarged Union to a redistribution of FDI by approximately 4-8 percent points in the 2004 scenario and up to 7-10 points percent in the 2007 scenario.

It is likely that a common policy on direct taxes would require opening the accession treaty, which has to be approved by all member countries. So far, almost all central European countries have refused such initiatives. The only exemption was the Czech Republic, which has a 28 percent income tax rate.

Corporate income tax rates have generally been reduced over the last decade, both in old and in new member countries. With more aggressive moves in recent years among the new member countries, statutory CIT rates are now significantly lower in the EU-8 than in the EU15, fuelling concerns among some old member states about unfair tax competition and renewed calls for harmonization of corporate taxes. However, these concerns should be put in proper perspective by comparing the overall cost of doing business in different countries.

- First, one should look at effective corporate income tax rates, which take into account differences in tax bases (arising from differences in depreciation allowances, treatment of losses, and inventory valuation methods).

- Second, one should assess the overall tax burden facing firms in different countries, including in particular taxes on labour (which are relatively high in the new EU member states) but also indirect taxes on goods.
- Third, production and distribution costs should be evaluated, in particular wages and productivity but also infrastructure and market access.
- Fourth, and perhaps most important, investment decisions whether by domestic or foreign investors are likely to depend more on the overall investment climate, including political/social/macroeconomic stability, the rule of law, business regulations, financial market development, etc. With generally higher returns to capital in the new member countries, and still limited labour market mobility from new to old member states, one would indeed expect capital to flow to these countries as part of the natural convergence process.

## Monetary and Exchange Rate Policies

With EU accession in May 2004, the international agencies' ratings generally improved, which led to a revaluation of the NMS's share in the international investors' portfolios. Next, the yields offered in the region are attractive, particularly in Hungary, Poland and Slovakia. Lastly, the CEE territories' competitiveness in the production of manufactured goods as well as certain services continues to stimulate FDI. As a consequence of those concomitant factors, the CEE countries face a nominal appreciation of their currencies vis-à-vis the Euro.

Some economists (Patrick Artus, 2004; Marc Lanteri, 2005) wonder whether the present appreciation in the CEE currencies ought not to prompt a revision of the central banks' inflation targets, which are considered too low, in particular in the Central European countries. Companies can draw two lessons from these analyses:

- The central banks' inflation targets appear ambitious and in 2005 inflation might be in the region of the current market consensus, which is slightly higher;
- Nominal appreciation of the currencies might become unsustainable.

The study of Patrick Artus (op. cit.) concludes with the need to raise the inflation objectives, the quantified result depends mainly on the assumptions made over the number of years necessary for prices and income levels to converge to the EU average level. In this study, the central banks' inflation targets look all the lower as the expected duration of convergence corresponds more to the bottom of the range

For the central banks, the capital inflows complicate the adjustment of their monetary policy. On the one hand, they seek to support the convergence of inflation towards euro zone levels, which implies a somewhat restrictive monetary policy and which might possibly also have a negative impact on growth and/or employment. On the other hand, high interest rates attract capital inflows and reinforce currencies; the price convergence caused by nominal appreciation of the exchange rates and inflation then aggregates, with a negative impact on the competitiveness of territories. Over the last few months, the following "anomaly" has been observed: actual and nominal exchange rates are appreciating simultaneously in Central Europe. Although the first phenomenon may be considered as "normal" in the context of a convergence of price and productivity levels, a nominal depreciation in the currencies should, on the other hand, accompany it, since the CEE, whose economic structure converges towards those of the high income economies of the EU, record higher inflation rates as well as budgetary and/or current account imbalances. Indeed, if the assumption is made that the relative PPPs hold firm, a somewhat fragile assumption, the variation in the real exchange rate ( $q$ ) equals the nominal exchange rate variation ( $e$ ) multiplied by the price ratio evolution between the two countries. If inflation is higher in the first country (as for the CEEC), then it "would be necessary" for " $e$ " to appreciate (nominal depreciation), but in a smaller proportion than the inflation differential, in order to allow the domestic price (real appreciation of the currency) the convergence to occur, as productivity and wages rise. Over the recent period, this situation occurred in Poland, Slovakia, Hungary and Romania.

What are the possible evolutions and the associated risks? According to Marc Lanteri (op. cit.), inflation could be slightly higher than the central banks' targets; this means, "all things being equal", that the central banks which have chosen to manage their exchange rate (the Czech Republic, Slovakia and Slovenia for example) should continue to act in order to limit a too strong appreciation (nominal and actual) of their currency.

Exports may suffer temporarily from an appreciation in exchange rates, but trade deficits are related above all to the intermediate position, which these countries occupy in the European division of labour, with trade balances improving in the long run. In fact, their evolution is relatively independent of the exchange rates and seems to be influenced more by sectoral logic and/or industrial specialisation.

An exogenous shock or a loss of confidence could cause a sudden reverse flow of that part of the capital inflows which obeys a strictly financial logic and a marked correction of the currency. However, in Poland, the recent appreciation may be partly justified by the expected improvement in public finances and a high growth rate. In the same way, in Romania, the acceleration in productivity gains now seems likely to compensate for the true appreciation of the exchange rate, and the budgetary efforts made also form a support for the lei. The risk of a correction exists above all in Hungary, where inflation remains high, twin deficits progress and the forint is close to the lower limit of its fluctuation margins. This context has just led Fitch to lower its rating on the Hungarian debt.

Lastly, even in the event of strong turbulence spreading throughout the region, the risk of an exchange rate crisis, which might, as in Thailand in 1997, extend to the banking sectors, seems unlikely. Indeed, the latter, mainly controlled by foreign banks, are restructured and cleansed, with “reasonable” levels of doubtful debts.

## Conclusions

As the phenomena was more recent in Slovakia, this country still lags behind its regional neighbours in attracting FDI relative to the size of the economy. For example, the cumulative stock of FDI in Slovakia amounts to around 30 percent of the country's GDP, whereas in Hungary it is over 40 percent and in the Czech Republic around 50 percent, respectively (let alone Ireland's 150 percent). Hence, there is still a lot more growing to do.

TABLE 5: STOCK OF FDI IN 2002

	\$ billion	% of total (CEEC-10)	\$ / inhabitant
Czech Republic	38.450	26.17	2 056
Estonia	4.226	2.88	2 011
Hungary	24.416	16.62	1 971
Slovakia	10.225	6.96	909
Slovenia	5.074	3.45	1 440

Source: DREE, Revue Enlargement, special issue on FDI, May 2003

The major reasons for the increased FDI are the recently adopted comprehensive supply side reforms and markedly improved business environment that provide the country with inherent competitive advantages, such as a relatively inexpensive yet productive labour force, good geographic location, and reasonably well-developed infrastructure, to come to the fore. In order to improve the capacity of Slovakia to attract capital, it was important to improve the general investment environment by eliminating macro-economic imbalances and by developing infrastructure as well as education and training.

Most studies have focused on the determinants of FDI flows, but conceptually one should distinguish these from “real” investments in another country which may differ both because FDI flows may be directed to mergers and acquisitions (which do not contribute directly to increasing the capital stock in a country) and because real investments may be financed from capital raised in the host country. The determinants of these decisions, including tax considerations, are likely to be quite different. Other than the effective tax rate prevailing in a host country, the manner in which multinationals are taxed globally should play a role. This relates not only to potential double taxation in some countries, but even when this is not an issue, it matters whether the country of origin has a tax credit or exemption system: in the former case (e.g. the U.S. and Japan and in the EU the U.K, Ireland, Spain, and Greece) the tax rate in the host country in principle does not affect overall taxes, while in the latter case (other EU countries) it clearly makes a difference as there is no relation between taxes paid abroad and at home.

The undertaking of FDI by multinational firms involves complex strategic decisions, based on considerations about ownership, location, and internalization. While taxes may impact on all aspects of the decision process, several studies have shown that other factors are likely to be more important. These include agglomeration

economies, proximity to key markets, an attractive investment climate (political, social, and macroeconomic stability, rule of law, low levels of corruption, good infrastructure, etc.), and other production costs (including notably labour). Taxes are more likely to matter at the margin.

Finally, the treatment of the corporate income tax (CT) as an incentive for Slovakia, a. o., to attract investment and the reduction of other taxes, contributions and local taxes was also be worth considered.

The debate on competitive corporate taxation is dominated by the three following ideas:

- Even though the latest EU enlargement was accompanied by a fall in the CT rates of some CEE, in the OECD countries this movement began in the mid eighties;
- If the interest in “small economies” indeed lies in the development of tax competition and “non cooperation”, although the extra FDI thereby attracted seem marginal, the general interest does seem to be minimum coordination between Member States of the Union;
- Since the drop in CT rates has limited economic effects, in particular on the attraction of FDI flows, stress must be put on its fiscal consequences, in particular as regards the CEE, which must respect their commitment to fiscal discipline, whilst at the same time funding their bringing up to standard of infrastructures and provision for education and training.

Nowadays, the authorities face three main challenges:

- First, their aim of joining the euro area as soon as the nominal convergence criteria will have been met on a sustainable basis sets a demanding macroeconomic agenda. A significant reduction in fiscal deficits is required; not only to meet the fiscal rules but also to pursue disinflation objectives without an excessive tightening of monetary conditions that would impact negatively on growth and employment creation.
- Second, the employment rate needs to be raised through radical changes in the incentives to both supply and demand of labour while maintaining households’ confidence and political support for government policies. The recently introduced legislation to strengthen work incentives should be fully enforced.

Following the EU accession, the emphasis may be shifted to financial incentives, with fiscal incentives diminishing in significance – while, because of the EU regulations, the differences in investment promotion between Slovakia and its main competitors will become smaller, and the regional incentive competition will lose some of its intensity. The system of investment incentives should be redesigned in order to use arrangements allowed and co-financed under the EU rules. At the same time we must keep in mind that the EU places emphasis on compliance with the aid ceiling rather than on the form of assistance. The institution system of investment promotion would also require considerable changes: a single, more independent, more proactive organisation would be needed with decision making powers and concentrating exclusively on investment promotion. That institution must have a co-ordination role in granting benefits.

# Changes in IT Investments Philosophy: Moving towards Strategic Importance

*Ram B. Misra  
Jeremy Briden  
Montclair State University, USA*

## Abstract

**This paper discusses the changes in Information Technology (IT) investment philosophy of companies in the United States of America. It analyzes the past and current behaviors of business investments in technology and the factors that have prompted companies to change their IT investment patterns. The paper discusses how the success of IT can not be measured with traditional methods of calculating return on investments (ROI) but must be evaluated in other ways. It highlights specific points proving that IT has slowly evolved over the years from an uncontrollable technological change to a strategic management tool that creates and increases competitiveness. In this strategic role, investment in IT has become a tool of growth for the companies.**

## Introduction

For the past decade, economists and information technology specialists have argued back and forth whether IT investments have generated return on investments and increased national output of goods and services. Businesses, fueled by high expectations on productivity growth generated by IT investments, heavily invested into computing power between the mid 1980s and the 1990s. It was generally accepted that IT spending would prove to be a valuable investments and would pay for itself in the long run. Growth and high return on investment were expected. A few years later, managers and business leaders were beginning to question the gains in productivity, which at best seemed to be in a state of status quo [Brynjolfsson, 1993]. Though a few success stories were recorded and praised, for most, information technology became a source of frustration and disillusion. The notion of the productivity paradox emerged. Companies, learning from the wasted billions in questionable IT investments, had to reinvent the way they did business to integrate their IT investments into their strategic planning. Today IT resources are specialized, tailored and customized to the needs of the company, and optimized to maximize companies' efficiency and output level. The transition phase has been a slow, lengthy, and painfully costly process.

This paper is part on a continuing research undertaken by Misra (2003) on the valuation of IT investments. This paper reports some glaring examples of large IT investments (projects) that have failed and the lessons that have been learned from them. This will include a discussion of a recent F.B.I. [New York Times, March 9, 2005] announcement to discontinue a \$170-million project to overhaul FBI's embedded computer software that would have enabled making searches across various databases easier and faster. The remainder of this paper is organized as follows: Section 2 discusses the conditions that led to questioning of the contribution of IT investments to productivity gains and other measurable returns such as ROI (return on investment). Section 3 presents three major examples of high profile failed IT projects. Section 4 analyzes the four stages of evolution of IT investments starting from the time of euphoria when no one questioned IT investments to the current (fourth) stage of the total (IT) integration management. Finally, Section 5 contains concluding remarks.

## Aftermath of IT Productivity Paradox and Slowing Economy

The IT paradox could be summarized as follows: in recent years computers have revolutionized the way companies do business with customers and other businesses; yet business data and other productivity statistics do not reflect any added growth. To solve this mystery, academic economists and scholars began collecting macro-economic data. The focus of the research mainly concerned many factors and labor productivity statistics. Economists discovered that both indices and the GDP dropped after 1973 when the first mainframe was introduced in the business world

[Hubbard, 2003]. In the late 1990s, the threatening Y2K bug forced companies to invest even more in IT resources to prevent a massive loss of data which many IT specialists predicted. Nothing happened and companies had more technology than needed and productivity growth was not going anywhere.

Many have written books and articles explaining this paradox. A great deal of time was also spent on detailing how to measure productivity. Economists just could not assess whether technology contributed to growth or negatively affected it. Productivity and GDP were still growing but at a much slower pace. Many argued that most analysts measured macro data when computer contribution can only be noticed on a micro level [Devaraj & Kohli, 2002]. Finally, the argued theories of the old economy and the new economy did not answer the problem or explain the paradox.

Researchers came to the conclusion that this paradox exists due to seven factors which mask proper measurements and analysis. These factors are: (1) IT investments only represent a small share of GDP. (2) Computers have a rapid rate of depreciation and obsolescence. (3) Old measurements do not apply in the new economy. (4) Poor analogy exists between the service sector (where productivity slowed down the most) and its heavy reliance on computers. (5) Computers have provided many intangible benefits. (6) A time lag exists between technology arrival and productivity benefits. (7) Web surfing, instant messaging and other nonproductive computer related activities have offset gains [Misra, 2003].

The attention given to measurements and assessments of IT contributions to the economy has changed the attitude towards investments in technology. In the beginning, IT expenditures were not subjected to major scrutiny. In the nineties, the bullish market pushed companies and businesses into a spending euphoria stage and expansion phase. IT spending was expensive, but due to the state of growth of the economy between mid-eighties and late nineties, few analysts, financial advisors and investors questioned the estimated payoffs of the IT investments. Today, however, growth has been succeeded by need to survive, and companies' strategic goals, choices and overall expenditures are under constant scrutiny from investors, shareholders and regulatory institutions. Time calls for conservation, savings and management to achieve economic profit. In order to remain solvent companies have had to optimize all factors of production and resource allocation. Most companies have adopted the "do more with less" policy and many have restructured, laying-off employees and changing or adjusting their business strategies and goals. Most companies strive to yield positive earnings in the past couple of years. Many industries such as the airline industry or the general retail industry have consolidated, strengthened and developed new strategic alliances to achieve such goals; yet only few have succeeded. The bearish economy increased the level of competition in a given industry, forcing each business to focus on increasing (at least holding) its market share rather than its size. New strategies have developed to establish, strengthen and augment a company's competitive advantage. This has translated into a greater coupling of IT strategy with the business strategy.

## **A Few Case Studies of Failed IT Projects: Learning from the Past Mistakes**

In order to understand the conditions that created changes in the attitude towards IT investment decision making, one needs to understand the causes of IT projects failures. We will discuss three prominent failed IT projects pointing out the key factors potentially responsible for their failure.

*The Case of Medicare Processing System in the Health Care Financing Administration:* In the article "Medicare Transactions: A \$50 Million Lesson in Project Management," Brian Friel (2000) studied the case of the Health Care Financing Administration (HCFA) which spent six years, from 1991 to 1997, developing a new IT system. This system was supposed to combine 14 Medicare systems located at 60 different sites and operated by more than 70 contractors. Each system was developed in different computing languages, different computing platforms and by different service providers between the 1960s and 1980s. After several years of debate, the agency concluded the systems were becoming unmanageable and decided to build one large, integrated system, which would handle all the agency's systems and programs. The new system was expected to generate huge cost savings over time once the system was implemented 5 years down the road. Although the inspector general of the HCFA warned the administration to develop a clearer strategy for MTS (Medicare Transaction System) before jumping into building a system, the administration went ahead and granted the development of the new system to GTE

Government Services. GTE developed a strategy to link these systems together; however, it became rapidly evident that HCFA was not clear on the needs and wants of the new system. In addition, GTE was not given enough information about Medicare complex processing. In 1994 and 1995 HCFA ignored the recommendations of the inspector general who warned of the danger of not giving GTE enough information. In 1996, due to considerable over-budget spending, Congress scheduled a hearing. HCFA ordered GTE to stop working on the project. The General Accounting Office estimated that HCFA spent \$80 million on project and the projected costs ballooned from \$151 million to \$1 billion. Furthermore, GTE estimated the project completion date not to be before the year 2000. In August of 1997, HCFA canceled the contract with GTE, and the MTS project was scrapped. During the congressional hearing, the General Accounting Office attributed the failure of the project to HCFA's lack of planning, strategic management, performance measurement and cost benefit analysis which would have allowed the administration to continually track the progress of GTE. HCFA was incapable of keeping track of its spending on the project while maintaining that it only spent \$50 million of the project.

*The Case of Russ Berrie and Company:* Russ Berrie & Company, the New Jersey based teddy bear manufacturer, also suffered from failed IT implementation [Songini, 2003]. In 1999, the bear maker contracted SAP AG to develop and implement a system that would migrate old applications such as homegrown distribution, financial and customer service systems toward Y2K compliant packaged ERP applications. The implementation of the project failed. As a consequence, the company was forced to "resurrect its aging Digital Equipment Corp system." and had to ensure that it was Y2K compliant. This process greatly strained both the IT department and the business units. The ordeal lasted three years and the total estimated cost of the failed project was \$10.3 million. This represented quite an investment for a company which had annual revenues averaging only \$230 million. In 2002 the company needed a working ERP and had to allocate new funds to the development of a new project. Even though it is not clearly stated in the case, one can easily conclude that the lack of strategic planning especially through the implementation phase was one of the key elements leading to failure.

*F.B.I.'s \$170 Million Virtual Case System:* Not much is known about this case except what FBI Director Mueller told the Congressional subcommittee hearings on March 8, 2005. He stated that the project suffered from technical, management and scheduling problems. If the system were allowed, he said, to be completed, it would have been an outdated system. He did not elaborate on what he meant by this. But, it can be safely assumed that the system would not have worked. He pointed out that the agency underestimated the required level of project/contract management skills and hence failed to assign the right people for the project. The Virtual Case File project was the third and last phase of a \$581 million effort to overhaul the embedded computer systems. Representative Frank R. Wolf of Virginia, chair of the subcommittee that oversees F.B.I. financing, has announced that his staff was opening a formal investigation into why the project failed. As the investigation of this case goes on, it will be interesting to find out the level of actual losses.

Unfortunately these scenarios of failed IT projects are not unusual. Johnson (1995) reported a study made by the Standish Group of the IT projects in the 1980's and 1990s. According to this report, 31% of new IS projects were canceled before completion, costing a combined bill of \$81 billion. In addition, nearly 53% of completed projects were 189% over the estimated budget, costing companies an excess of \$59 billion.

In another analysis of failed projects, Ewusi-Mensah (1997) identified some major and recurrent factors leading to project cancellation and implementation problems. The first was the lack of a clear statement of the new system's purpose and objectives which changed during the project development, decreasing further the chance of satisfying the need of the organization. The second element leading to project cancellation was an inherent problem rooted deep into the organization of the development team. Three sub-components were identified as part of the problem: (1) lack of structure and organizational purpose in the teams' efforts, (2) lack of leadership in the team and (3) lack of interaction between team members, often due to unclear lines of communication that created misunderstanding about requirements and design decisions, which encouraged individualism instead on team effort and synergy. The third element was the lack of system development methodology, which encompassed phase lifecycle approach which guided project team members through the development of each stages of the project. The absence of rigorous structures led to a status quo in the development of the project. Loose management and control of the development team was the fourth reason for development and implementation failure.

Often managers and executives, Ewusi-Mensah (1997) asserted, did not monitor and assess the progress of

the task. Problems were not identified early and only became bigger as the project development advanced. For obvious reasons, the technical knowledge and aptitude of the team should have been a must in the development of such project; yet many teams were under-qualified to develop the projects or the size of the project was too big for their competencies. He further stated that the size of the project was directly related to its level of difficulty. As the difficulty increased, so did the risks undertaken by the development team. Lastly, one of the last reasons for failure was the lack of cooperation and involvement from senior management executives in the development, assessment and progress of the project. Sufficient information and data were not given to the development team, and too often objectives were changed or new options were added considerably increasing the complexity of the projects and the risks of failure.

These failed IT projects quickly became a source of discontent and unease among senior executives and chief information officers. The main problem came from their inability to evaluate return on investment effectively as well as their failures to strategically plan and manage such project. Cramm (2001) stipulated that the lack of “adult supervision” of IT projects was responsible for their failure. Not enough attention was given to the payback of the IT investments. Executives adopted the “build it and revenue will come” philosophy for investment in technology. Cramm concluded that executives’ lack of understanding of the technology and their excessive faith in it gave them the authority to hold information technology above the common investments code of conducts which always required investment justification and measurements of expected returns.

Many books and articles began referring to IT investment as a necessary evil rather than a strategic management tool. Susan Cramm (2001) wrote: “Our faith in the devil we don’t know has given us permission to hold technology above the long established business codes of conduct that require investment justification and accountability for results.” However, after billions of dollars were wasted on failed projects and uncontrolled budgets, companies were more than ever dependent on computers and the needed information technology systems were still needed. Disclosures of many failed IT projects led to the questioning by the researchers and practitioners of the approval process used by the executives... Between the 1980s and mid 1990s, non-IT executive were in charge of approving IT projects. Due to subjective performance assessments, lack of relevant ROI measurements and investment management framework, IT became an expense to be minimized instead of an investment to be optimized [Cramm. 2001]. Incompatibility, lack of training or incurred mainframe upgrades cascaded into one problem or another. As a consequence \$5,000 software expenses lead to a \$50,000 or \$100,000 decision [Folio: Plus, 1999, July 15]. Realizing that IT investments were complicated and could not be treated as one time decisions, senior executives designated CIO’s to be responsible for IS developments. “It fell to them to wrestle back into reality the overblown promises and overrun budgets of information technology [Varon, 2003].” Project development became for the first time an incalculable risk. Uncertainty and incalculable risks forced IT development managers to rely less on science to evaluate potential value. It became an art. This new concept was the beginning of the so-called revolution [Andrew and Johnson, 2002] in making IT investment decisions...

## **(R)Evolution of Information Technology Investment Decision Making**

After reviewing many of the failed projects, we observe that IT investment decisions have evolved through four stages. The first stage was the age of euphoria and extreme optimism when not much attention was given to the return. Their success was taken for granted. The first stage evolved to a second stage in the aftermath of failed projects and disappointments. IT projects in order to get approved had to have detailed ROI justifications; life cycle costs (LCC) and total costs of operations (TCO) had to be accounted for. However, this did not improve the success of IT projects and people started to question the assumptions behind the calculations of ROI, LCC and TCO. The whole notion of justifying IT projects on financial returns came under attack. They did not do justice to the contribution of IT projects since they did not include (IT’s) strategic contributions to company’s business. The second stage evolved to yet another stage - the third stage. The decision matrix of IT investments included, in addition to the quantitative measures, an assessment of the impact on strategic factors [9]. The IT industry is still in this stage even though there are signs to expand the scope of the stage three decision matrix. We are calling it stage four – the stage of total integrated (IT) Impact. “It involves linking and influencing every segment of a firm’s

supply, production, distribution and service chains into a coherent whole using information technology,” [Rapp, 2002]. We are going to expand on each of these stages next.

This revolution of information strategy management has been a long and very costly process. Billions of dollars have been wasted and more than a decade passed before companies realized that they could not sustain such frivolous spending and not rely on the subjective art of senior executives’ evaluation system to assess the added value of their investments. IT investment became a necessary evil. Due to their high development failure rate, companies faced serious doubt concerning the actual and real value of such projects.

The lack of success and the billions spent on IT development raised many questions. Many tried to understand this phenomenon however asked the wrong questions: Why doesn’t this work? What’s the problem? How can we fix it? Most of these questions were reactive questions and lacked scope and perspective. The projects were poorly designed and structured and as consequence, implementation could not be executed or completed. It became apparent that strategic planning and strict project management were necessary to get control of these exuberant spending over the project life cycles. Projects needed to become highly structured. First hand managers had to strictly review and closely supervise goals, scope, target and logic behind the strategy. Companies came to the conclusion that there was no alternative to IT and was necessary for the company to remain competitive. Now companies desperately tried to reduce failure rates of IT projects, overall costs, increase viability and gain (or sustain) competitive advantage through information technology.

The primary driving force that resulted in revolutionizing IT investment decisions came from analyzing the managers’ past wrong doings. Andrews and Johnson (2002) called it the Waterfall effect leading to disappointing results. It is comprised of five “unrealistic assumptions” which managers tend to make during the development of an IT project. The first assumption was the expectations that the business environment would remain constant during the project. In the new information era, such conditions were unrealistic. The Internet has opened the doors to instant communication and access to desired information, considerably reducing the bounded rationality effect. As a consequence the business environment has constantly changed and evolved. Such assumption could have been made prior to the late 80s but not after that. Many managers still kept the same mentalities and failed to realize this constant evolution. The second assumption was that end users could exactly define in advance what they needed. Project failures and over budgeting cases have one common trend: users always want more. The third managerial assumption was that intricate problems could be entirely resolved on the first attempt. According to these authors, “classic methodologies assume a linear process where the problem is defined, a plan is created, the solution is implemented and victory is declared.” Complex problems require much more than a linear solving process and are much more demanding on the knowledgeable people and resources. An answer might not be found right away or not at all depending on the complexity of the problem. The fourth assumption implied that managers expected requirements to be known and defined before the software could be selected. Due to assumptions one and two, these requirements often changed and one specific type of software bundle could not be defined. Managers often choose one specific package and had to modify it due to the changing environment and customers’ needs. The switching costs were tremendous. The fifth and final assumption was that changes would be universally and happily accepted in the company. Once again experience and common sense should have dictated otherwise.

Over the past two decades, managers have had tremendous trouble linking IT projects to positive financial growth. Typical return on investment measurements does not seem to apply to IT projects. Return on investment has been in center of the economic debate that raged between economists and analysts during the 1980s and 1990s. Measurements along with the various factors affecting those measurements were scrutinized and criticized; yet no one gave tangible reasons why IT benefits could not be aggregately measured. Solovy and Chaiken (2003) showed that IT returns could be of three different types. The first type is financial, which either directly increases revenue or reduces overall cost. Operation returns are the second type of returns. Processes are done more efficiently, various errors are eliminated and the company’s overall daily operations are improved. The third type is structural. It resembles the operation type. It is slightly different because it involves improvement of customer care and services. These different types of returns render ROI method obsolete and require managers to re-evaluate what they expect from a project.

For many years the classical ROI calculations have limited the field of visions of managers. Specifically, two major shortcomings presented significant concerns from tactical and strategic points of view. According to

Northrop (2003), ROI calculations are based on “assumptions of possible project revenues and are often baseless, inflated or inaccurate,” and “the ability to accurately predict the investment component is highly questionable.” Due to these shortcomings, a transformation of ROI analysis was required. ROI are based on assumptions that often are not true. Continuing Solovy and Chaiken’s (2003) idea, Northrop explains that these assumptions were often based on an assumption of a static business environment. Furthermore, ROI analysis has proved to be of little use due to the failure and cost overruns in developing IT projects in the 1990s.

These traditional assumptions, which are the basis of ROI, cannot be applied to IT project development due to the simple fact that IT investment creates and improve many intangible benefits that cannot be measured. Mindsets are however in general difficult to change. Today, some managers still believe that if a strategy can not show a positive return within the first three years, it is a failure. IT has constantly challenged these managerial perceptions and expectations of various projects and development, therefore many managers have been forced to change their classical project evaluation methods.

We contend that there was no “IT revolution”, as claimed by some [Guidoni, 1993]. A revolution is a spontaneous and sudden change in behavior, patterns or regime. Changes in IT project management were slow, costly and have not been completely achieved. Undeniably, the environment and mentalities have changed and so have expectations of IT returns and use. However, IT project development processes and financial return measurements have not been revolutionized they have evolved and transformed. Evolution is a slow and rigorous process constituted of trials and errors. It comes after chaos and brings stability. Stability is achieved due to drastic control measures. The survival of the fittest has been evolution’s main control tool for billion of years. From a business viewpoint, IT investments and IT project development were chaotic between the mid 1980s and the 1990s. As previously mentioned, billions of dollars were wasted on failed projects and over budgeting. The explosion of the technology bubble and the following world wide recession brought rigorous control on project developments.

The evolution of IT investments has left many business managers discontented and burned because it has come at great financial costs. After the billions spent, no one can deny that IT investment has generally brought little tangible returns. At this point one may wonder the use of IT investments is and why one would spend more IT development. These questions are legitimate and many managers may wonder the same; yet it is very difficult to conceive the business world without technology and information technology. It is clear that information technology investments brought new elements; however, it is hard to pin point exactly what and measure it. One may look at the evolution of the business environment in the past two decades and may conclude that most of the IT contributions to the business environment are intangible elements.

A few examples are internet banking, supply chain management, the music industry and information accessibility. Undeniably, technology has become a greater part of our lives over the years. IT investments have not brought financial returns but have certainly brought value, growth, knowledge and increased customer care in more than one way. These intangible elements are extremely important in today’s economy and can create sustainable competitive advantage over competitors. It is very difficult to evaluate the impact and benefit of IT investments on Wal-Mart’s supply chain; yet it is undeniable that the company has managed to save billions in inventory costs and logistics. These savings have been passed on to customers who enjoy the company’s everyday low price strategy. Such IT investments create distinct and sustainable competitive advantage for Wal-Mart. K-mart back in the late 1990’s could not compete on such low margin and had to declare bankruptcy.

Kaplan & Norton (1996) developed a business management strategy called Balanced Score Card that could help answer these questions. This business strategy favors growth and emphasizes business improvement through development of intangible assets. The balance score card helps company develop competitive advantage and create real customer value. It "provides executives with a comprehensive framework that can translate a company's vision and strategy into a coherent and linked set of performance measures...used to articulate the strategy of the business, to communicate the strategy of the business and to help align individual, organizational and cross departmental initiatives to achieve a common goal." Over the years, companies' focuses changed from revenue growth and beating the street's analysis to meeting and exceeding customers’ expectations through learning, internal and customer strategic goals. These goals are then linked to financial elements to ensure the viability of such initiatives.

Only a handful of companies focused on future value and customers’ needs during the 80’s and 90’s. The trend was one of revenue growth and beating analysts’ forecasts to increase shareholder's equity. Today revenue and

economic profits are difficult to achieve, and companies must find different ways of growing. Companies have turned their attention toward intangible assets. "Branding, knowledge, customers and innovation are nearly impossible to numerically quantify, yet have a very significant impact on an organization's success and growth" [Northrop R. (2003)]. Information technology has developed and increased many of these areas for example online banking or logistics and many others. Managers are beginning to understand this concept and are now developing new strategy to integrate IT into increasing customer value and customer service. For instance, Wendy's recently announced that it would allow customers to use credit card to purchase hamburgers and fries. Customers will be allowed to use technology to simplify their transactions for their convenience. Wendy's strategy is to attract new customers and retain a greater number to ultimately increase market share and overall revenue.

Companies have taken proactive measures to link IT projects and business strategies. To fulfill this purpose, IT steering committees have been formed in many companies and have become widespread in the business world. These committees, while providing CEOs with information about IT usefulness, contribution and linkage to the company, ensure that "CEOs agree that IT has strategic importance to their company" [Varon, 2003]. These committees help decision makers to analyze more relevant data and simplify and clarify the decision making process. Overall, they help IT organization to concentrate on better execution of strategies.

Steering committees are not the only way CIOs and top managers can reach better decisions when it comes to IT investments and how to use IT to enhance strategies. In the mid 1980s, Congress was growing wary of the lack numerical proof of economical growth due to IT involvement. Many were concerned of the IT paradox. Considerable amount of government investment were spent on IT projects; yet no empirical data proved the investment to be worthwhile. Congress passed the Information Technology Management Reform Act on February 10, 1996. It is also known as the Chief Information Officers Act. It was enacted to reduce IT projects financial waste and "provide CIOs with several identified set of realistic and attainable actions to be taken to show American Tax Payers that IT investment are having a clear positive impact on outcomes"

In the recent years, the notion of Total Integrated (IT) Impact has emerged. "It involves linking and influencing every segment of a firm's supply, production, distribution and service chains into a coherent whole using information technology," [Rapp, 2002]. Such integration allows for cost cutting as well as better designed and more efficient delivery of products and increased customer satisfaction. It affects a firm's environment through increase relationship between its suppliers and customer care after sale and provides a tool to tie both sides closer to the firm's strategies to create new strategic partnership. Competitive advantage is gained through that process due to increased shared information between suppliers and the firm, reducing inventory cost. Customers' needs and expectations can be assessed faster and the company can adapt quicker and more efficiently its products to the tastes of consumers.

## **Conclusion**

In conclusion, this paper has shown that information technology investment decisions have evolved over the past twenty years. Some called it an IT revolution; however, we disagree because it delivered results only three decades after its development. Through various examples we have shown that the transition was not only extremely costly to companies but also very slow and lengthy. Revolutions are spontaneous and involve radical changes. Gradual change over several decades cannot be revolutions. It is clear that much can still be done to further improve its effectiveness and efficient use throughout an organization to further improve every aspect of the current business operations of companies. Return on investment will undoubtedly be difficult to evaluate and analyzed because IT mostly benefits companies' intangible assets such as customers service or brand recognition. Information technology investment should get the same level of scrutiny like any other financial investment. Its scope and impact should be well diversified. Managers should however not expect a fifteen percent return on investment. They should focus their attention instead on increasing market share, brand recognition, customer satisfaction and care as well as overall length reduction of their supply chains and its management.

## Abstract

Client-vendor relationship has been deemed to be vital to Information Systems (IS) outsourcing success. With the premise that relationship intensity should be affected by the business process of IS outsourcing, we focus on the interaction process of IS outsourcing and the resource capabilities as key antecedents of the process performance. Using the corporate IT resource and capability theories, we investigate the effect of the corporate IT capabilities on the IS outsourcing process. Subsequent casual relationships between interaction process, relationship intensity, and IS outsourcing success are modeled. The results of empirical testing support most of the hypotheses proposed in this study. Our research is distinguished in the sense of integrating corporate IT resource and capability theories with social exchange theory, which in most cases treated separately in IS outsourcing research.

## Introduction

Extensive researches have been conducted for the effective use of Information Technologies (IT) to enhance firm's competitiveness. IT in general and IS particular, are one of the firm's core resources to cope with rapidly changing environmental threat (Barney, 1991). Corporate IT capability is a comprehensive concept including firm's IT infrastructure, IT personnel resources, and intangible assets of the firm (Bharadwaj, 2000). In addition, based on the resource-based theory of firm, Wade and Hulland (2004) proposed managerial skills as an important factor required for IS development, operation, and maintenance in organization.

Capturing necessary firm's competitiveness, make-or-buy decision has been received focal attention, for instance, to define firm's optimal boundary. While a classical supply chain perspective emphasized effective business extension to either upward or downward, proliferation of inter-organizational information systems enabled by cheaper IT cost encourages firms to concentrate on core competences and to build trust relationships with business partners for effective collaboration. In a similar vein, IS outsourcing has become more popular as the scope and extent of IS outsourcing are continuously expanding. IS outsourcing is defined as to handling over the management of IT/IS assets, resources, and/or activities for required results to one or more than one third party (Willcocks & Kern, 1998). Over the last decade, one of the more widespread trend in meeting an organization's IT needs is the growth of the IS outsourcing (Dibbern, et al., 2004). Nowadays, IS outsourcing has become commonly accepted and growing practice as a means of meeting organization's IS needs.

Recently, an emerging stream of research has focused on managing the relationship between the outsourcing vendors and the client (McFarlan & Nolan 1995; Lee & Kim, 1999; Kern & Willcocks, 2001; Lee, et al., 2003). Accordingly, IS outsourcing relationship has already received considerable attention in the IS literature (Klepper, 1995; Willcocks & Kern, 1998). To create and sustain firm's competitiveness by exploiting the gains from IT resource capabilities, ensuring the success of outsourcing is so important. Thus, management efforts are focused on securing proper IT assets through IS outsourcing and effectively managing outsourcing relationship, thereby leading outsourcing success (Grover, et. al., 1996; Kern 1997; Kern & Willcocks, 2002).

In this paper, we investigate the effect of the corporate IT capabilities on outsourcing success through the enhancement of both client-vendor interaction and relationship. The motivation of the study mainly stems from the lack of literatures to link the corporate IT resource capabilities to outsourcing relationships. The majority of the

previous studies examines outsourcing relationships and success from the social and contextual aspects. With the premise that the relationship intensity should be affected by the business process of IS outsourcing, we emphasize the role of the interaction process of IS outsourcing as an intervening variable to link the causal relationship between corporate IT capabilities and relationship intensity. The importance of both interaction process and relationship intensity has been reported in various disciplines such as marketing, supply chain management, and so on. As illustrated in Figure 1, this study tries to explore the impact of client firm's IT capability on interaction process, relationship intensity, and IS outsourcing success.

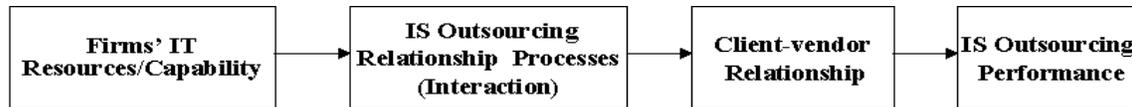

FIG 1: RESEARCH FRAMEWORK

## Background

IT capability is more than a specific set of sophisticated technological functionalities, as it is an enterprise-wide capability to leverage technologies for gaining and maintaining competitive advantage. Since IT capability is embedded within the fabric of the organization, it can be tacit and difficult to identify. The presence and effectiveness of the IT capability is reflected in business performance (Bharadwaj, 2000; Peppard & Ward, 2004). The capability includes organization-specific routines, processes, skills, and resources (Hejden, 2001).

Adopting the theory of resource-based view (RBV), IS researchers identified various IT resources that served as potential sources of competitive advantage (e.g., Bharadwa, 2000). Bharadwa (2000) defined firm's specific IT resources as IT infrastructure, human IT resources, and IT-enabled intangibles. IT as an enabler to achieve strategic objectives, Ross, et al. (1996) classified the firm's IT capability into a reusable technology base (technical asset), competent IT skills (human IT asset), and an intimate relationship between a firm's IT and business unit management (relationship asset). Lee et al. (1995)'s study on IS professionals suggested that industry would demand, in order to effectively lead organizational integration and process reengineering activities, a cadre of IS skills for the areas of technical knowledge and skills, business operations, management, and interpersonal. They emphasized IS managers' capability to understand and appreciate business needs, to co-work with functional managers effectively, to co-ordinate IS activities supporting other functional managers, and to anticipate future business needs.

Feeny & Willcocks (1998) characterized nine distinct IS functions as a set of core capabilities. They are IS/IT governance, business systems thinking, relationship building, designing technical architecture, making technology work, informed buying, contract facilitation, contract monitoring, and vendor development. Also, they mapped the nine capabilities with the skills and knowledge requirements framework proposed by Lee, et al.(1995). Although there are plenty of researches on IT resources and capabilities affecting business performance, only a few researches reveal the importance of the corporate IT capabilities required to successfully engage the service providers (Feeny & Willcocks, 1998; Shi et al., 2004).

On the other hand, extensive researches have been conducted to understand the outsourcing success by developing effective relationships between clients and their outsourcing vendors (Grover, et al., 1995; Kelpner, 1995; McFarlan & Nolan, 1995; Lee & Kim, 1999; Kern & Willcocks, 2002). Klepper (1995) addressed the importance of development of long-term relationships with good partnership building. He explored the mechanism enabling the development of long-term relationship between clients and vendors. Using transaction cost and social exchange theories, Dwyer et al. (1987) also developed the sequential stage model for developing outsourcing partnership. Grover et al. (1996) configured partnership as an intervening construct to ensure outsourcing success, and its measures were derived from the marketing applications (Anderson & Narus, 1990). Willcocks and Kern (1998) used a case study approach to examine the causality of interaction process and outsourcing success. Using power political and social exchange theories, Lee and Kim (1999) suggested an extended view on the set of

antecedents of partnership by distinguishing them into the determinants of partnership quality and the attributes of partnership itself.

There are many other researches studying IS outsourcing relationship and success (Henderson, 1990; Lasher, et al., 1991; Willcocks & Choi, 1995; Saunders, et al., 1997; Kern & Willcocks 2002). Whole body of the literatures emphasize that the relationship between clients and vendors plays a crucial role on IS outsourcing success. However, only a few studies capitalize the importance of the client firm's IT capability as an antecedent of the effective outsourcing relationship (Feeny & Willcocks, 1998; Kern & Willcocks 2002). This study attempted to fill this gap.

## **Research Model and Hypotheses**

### **Research Model**

The concept of the process theory implies the set of causations consisting of necessary conditions in sequence. Chance and random events merely occur to enable the necessity of causal relationships (Markus & Robey, 1988). The process theory ensures that this set of outcomes do not always occur unless all the specified set of events consisting a causation chain is fulfilled. In case that some events necessary for the outcome may fail to occur at any point in the chain, it derails all or some of the desired outcomes (Sho and Markus, 1995). The process theory is useful to precisely recognize and accept the complexity of the causal relationship (Markus and Robey, 1988).

The process-oriented approach is strongly supported by a growing number of researchers who advocate a process-assessment of IT business value. It is based on the argument that the first-order impact of IT investment is realized by improving either individual business processes or inter-process linkages, or both. The greater the impact of IT on individual business processes and inter-process linkages, the greater the contribution of IT to firm performance (Tallon, et al., 2000). Melvill et al.(2004) indicated that IT and complementary resources of the focal firm improve the performance of business processes, which ultimately affect organizational performance (Brynjolfsson & Hitt, 2000). As illustrated in Figure 2, our research model is developed to depict the successive causal relationships between the firm's IT capability, interaction process, relationship intensity, and outsourcing success.

Variables in the firms' IT capability are extracted from the existing IS literatures conducted mainly from the resource-based view (RBV). The RBV provides a theoretical foundation to explain the firms' IT capability and resource. Based on Lee et al. (1995) and Feeny & Willcocks (1998)'s studies, we introduce three variables to reflect the client firm's corporate IT capabilities that affect outsourcing success through interaction process and relationship intensity. The variables are IT capability consisting of technical IT capability and managerial IT capability, organizational relationship capability, and vender management capability. Technical IT capability refers to the technical knowledge and skills needed to develop applications in the firm (Lee, et al., 1995), while managerial IT capability refers to where and how to deploy IT effectively and profitably for meeting strategic business objective (Meta, et al., 1995). Second, organizational relationship capability can be defined as the relationship between IT and business groups within an organization that enables the business to constructively engage in IT issue (Bassellier et al., 2004). Finally, vender management capability refers to looking beyond existing contractual arrangement to explore the long-term potentials for suppliers to create win-win situation (Feeny & Willcocks, 1998).

Applying the Hakansson's IMP group model (1982), Kern and Willcocks (2002) conducted a case study to reveal the interaction process mechanism in IS outsourcing. Lee and Kim (1999) distinguished partnership-related factors as dynamic, static and contextual ones. The terms from the literature having similar meaning with interaction process variables are as follows: communication, information sharing, participation, cooperation, knowledge sharing, joint action, participation and conflict (Anderson & Narus, 1990; Morgan & Hunt, 1994; Mohr & Spekman, 1994; Ganesan, 1994; Henderson, 1990; Grover et al, 1996). Among them, three major variables - information sharing, communication quality and collaborative participation - are selected to represent the degree of the interaction process.

The relationship intensity has been referred as diverse terms such as relationship closeness, relationship quality, relationship strength (e.g. Bove & Johnson, 2001), partnership quality (Lee and Kim, 1999), and so forth. More & Spekman (1994) defined relationship as the purposive strategic relationship between independent firms

who share compatible goals and strive for mutual benefits to acknowledge the high level of mutual interdependence. Variables employed to measure the level of relationship intensity in the literature are as follows; trust, dependence, commitment and coordination (More & Spekman, 1994); trust, business understanding, benefit and risk share, conflict, commitment (Lee & Kim, 1999); communication, trust, cooperation, satisfaction (Grover et al., 1996). Bove & Johnson (2001) summarized the prior literature and proposed three key attributes of relationship intensity, i.e., trust, commitment, and interdependence. This study adopts them as main constructs of the relationship intensity.

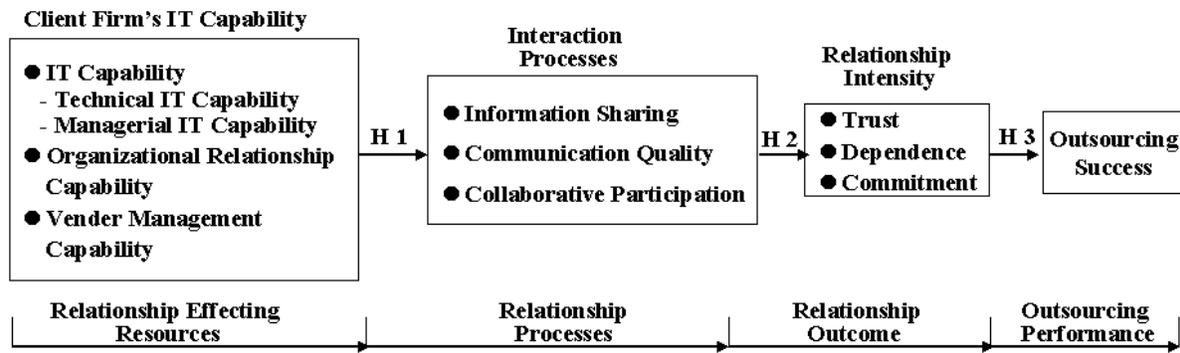

FIG. 2: RESEARCH MODEL

IS outsourcing success was analyzed from strategic, technological and economic perspectives (Grover et al., 1996). Saunders et al. (1997) added overall satisfaction to them. Lee and Kim (1999) extended the outsourcing success measures by adding the user perception of outsourcing performance. The perceived user satisfaction was measured with system reliability, relevancy, timeliness, accuracy, currency, and completeness of information. This study focuses mainly on business satisfaction (i.e., Grover et al's instrument) rather than user satisfaction of IS outsourcing.

## Research Hypotheses

As mentioned earlier, corporate IT capability includes comprehensive IT skills, inter-organizational communications, and management IS outsourcing functions. Rapid environmental changes are imposing firms to develop more diverse technical skills. Though the firm's IS outsourcing could reduce the burden to maintain such a broad IS capability, the client IT capability is a necessary condition to effectively leverage the vendor's technical and managerial skills. (Feeny & Willcocks, 1998; Kern and Willcocks 2002). For example, client firm's IT knowledge on IT trends can encourage vendors to share valuable information with their partners. It also makes sense that the firm having a clear IT standardization and blueprint should be in a better position to communicate with its vendors. That in turn improves the communication quality and vendor's collaborative behaviors. As such, our first set of hypotheses is derived for the causal relationship between the firm's IT capability and interaction process.

H1-1: The firm's IT capability positively influences the degree of information sharing.

H1-2: The firm's IT capability positively influences the degree of communication quality.

H1-3: The firm's IT capability positively influences the degree of collaborative participation.

Relationship between IT and business groups within an organization enables business people to more actively engage in IT issues (Bassellier & Benbasat, 2004). Besides, IT group's intimate inter-organizational relationship can convince the business people that IT people understand business goals and concerns to be cooperative in achieving business goals (Feeny & Willcocks, 1998; Bassellier & Benbasat, 2004). Many other researches are found to emphasize IT people's interpersonal skills (Lee et al 1995; Bassellier et al. 2003; Feeny & Willcocks, 1998). The importance of cooperative relationship between IT department and business groups is also addressed by Feeny & Willcocks, (1998) and Bassellier & Benbasat (2004). Close inter-organizational relationship

can induce more information sharing between the client and the vendor not only to correctly reflect business needs but also to achieve business goals. Even somewhat confidential information can be shared each other. That may lead higher degree of communication quality and more collaborative participation of the vendor. This can be stated more formally by the following hypotheses.

H1-4: The firm's organizational relationship capability positively influences the degree of information sharing.

H1-5: The firm's organizational relationship capability positively influences the degree of communication quality.

H1-6: The firm's organizational relationship capability positively influences the degree of collaborative participation.

Vendor management capability is one of the core IT capabilities for the firm to facilitate the outsourcing (Feeny & Willcocks, 1998). It helps vendors to successfully implement their services to satisfy all user's needs (Lacity et al, 1995). In addition to contractual obligations, formalized outsourcing management processes and work evaluation principles are required to have better communication and information sharing. Also the outsourcing vendor selected through well-refined processes will be more reliable and qualified to share corporate information. In other words, a good relationship cultivated by effective vendor management will create the win-win situation for future potential benefits (Feeny & Willcocks, 1998). Accordingly, the effective vendor management capability may necessarily influence the degree of interaction process. So, the following hypotheses can be proposed.

H1-7: The firm's vendor management capability positively influences the degree of information sharing.

H1-8: The firm's vendor management capability positively influences the degree of communication quality.

H1-9: The firm's vendor management capability positively influences the degree of collaborative participation.

Information sharing refers to the extent to which critical, often proprietary information is communicated to one's partner (Mohr & Speckman, 1994). Fundamental information sharing is ascertained by contractually agreed upon communication mechanisms such as regular meetings and report exchanges (Keen & Willcocks, 2002). By sharing information and being knowledgeable about each other's business, partners are able to act more productively to maintain the relationship over time (Mohr & Speckman, 1994). That is, relationship intensity can create a competitive advantage through the strategic sharing of organization's key information (Lee & Kim, 1999). Thus, the information sharing is an important predictor of the relationship intensity (Mohr & Speckman, 1994), as proposed in the following.

H2-1: The information sharing positively influences the degree of trust.

H2-2: The information sharing positively influences the degree of dependence.

H2-3: The information sharing positively influences the degree of commitment

Communication is defined as the formal as well as informal sharing of appropriate information between the parties, while communication quality represents the accuracy, timeliness, adequacy, and credibility of information exchange. Timely accurate and relevant information is essential to build a better partnership relationship (Mohr & Speckman, 1994). Anderson & Narus (1990) addressed the importance of the effective communication between partners to achieve the intended objectives. Therefore, following hypotheses are proposed.

H2-4: The communication quality positively influences the degree of trust.

H2-5: The communication quality positively influences the degree of dependence.

H2-6: The communication quality positively influences the degree of commitment.

The participation refers to the extent to which partners jointly engage in planning and goal setting (Mohr & Speckman, 1994). Collaborative participation between partners plays a significant role in enhancing the sustainability of their relationship over time (Henderson, 1990). The collaborative participation allows them to establish mutual expectations and specifications of cooperative effort (Mohr & Speckman, 1994). Effective working interactions are marked by collaborative actions directed at mutual objectives that are consistent across organizations (Narus and Anderson, 1997), which lead to higher relationship intensity.

H2-7: The collaborative participation positively influences the degree of trust.

H2-8: The collaborative participation quality positively influences the degree of dependence.

H2-9: The collaborative participation quality positively influences the degree of commitment.

Many researches have shown that relationship intensity is crucial to outsourcing success (Grover et al., 1996; Kern, 1997; Lee & Kim, 1999; Kern & Willcocks, 2002). Trust is defined as a firm's belief that another company will perform the action in such a way to result in positive outcomes for the firm, and not to engage in unexpected behaviors with negative outcomes (Anderson & Narus, 1990; Grover et al., 1996). Dependence can be

seen as a need to maintain the channel relationship to achieve the desired goals (Ganesan, 1994). Commitment is defined as an exchange partner's belief that an ongoing relationship with another is so important as to engage maximum efforts to maintain it. Accordingly, the relationship intensity can be a key determinant of outsourcing success. We hypothesize that:

- H3-1: The trust positively influences outsourcing success.
- H3-2: The dependence positively influences outsourcing success.
- H3-3: The commitment positively influences outsourcing success.

## Research Methodology

### Measures

This study adopted constructs that had already been used and validated by other researchers. Firm's IT capability variables were measured based on Lee et al. (1995), Bassellier et al. (2003), Nelson & Coopriider (1996), and Feeny & Willcocks (1998)'s studies. The interaction process variables were developed by revising the instrument proposed by Mohr & Spekman (1994) and Lee & Kim (1999). The measures of the relationship intensity variables were based on the commitment-trust theory (Morgan and Hunt, 1995) and the relationship theory (Ganesan, 1994). Finally, outsourcing success was measured in terms of strategic, economic, and technological outsourcing gains developed by Grover, et al. (1996). A five-point Likert-style questionnaire was developed.

TABLE 1: PROFILE OF RESPONDENTS

Sample	Response classification		Response frequency		Outsourcing type*
20 projects	Client Firm	84	Team leader	9	SI: 12 SM : 8
			Project Manager	11	
			Team Worker	64	
	Vendor Firm	101	Team leader	14	
			Project Manager	19	
			Team Worker	68	
Total	185		185		20

\* SI: Systems Integration; SM: System Management

### Data Collection

The initial version of the questionnaire was pretested by faculty members, managers in IT organizations, and IS workers in client firms. Each item was reviewed by them to improve content and construct validity. The final questionnaire consisted of 51 items for 10 constructs. Data collection involved 25 outsourcing project teams between clients and vendors. Totally, we collected 185 responses, consisting of 84 from clients and 101 from vendors, from 20 outsourcing projects. We summarize the response profile in Table 1.

### Reliability and Validity of the Measures

We analyzed the gathered data using the confirmatory approach. Before analyzing the structural model, the validity of the measurement model was examined. Among 53 items, 10 were discarded due to lower consistency between the measurement items. Finally, 43 items were used for the final analysis.

The reliability was then estimated by examining composite reliability. The value of composite reliability ranged from 0.842 to 0.883, as shown in Table 2, which is higher than a commonly used threshold for acceptable reliability, 0.7. Three types of validity were assessed: content validity, convergent validity, and discriminant validity. Content validity was established by ensuring consistency between the measurement items and the extant literature. This was done by interviewing the faculties and practitioners and during the pilot-testing of the instrument. We assessed convergent validity by examining composite reliability and average variance extracted (AVE). AVE for our measures ranged from 0.561 to 0.737, while the threshold for acceptable convergent validity is 0.5 (Hair et al.1998). For discriminant validity, it was assessed by looking at the square root of the average variance

extracted. The square root of the average variance extracted for each construct was greater than the correlations between all other constructs, as described in Table 3.

## Analysis and Finding

### Overall Model Fit

Before evaluating the structural model, we assessed the overall fit of the model to ensure that it was an adequate representation of the entire set of causal relationships. Three types of goodness-of-fit measures were assessed; absolute fit measures, incremental fit measures, parsimonious fit measures. As in Table 3, the chi-square result was nonsignificant ( $\chi^2_{(1131)} = 2114, p=0.00$ ), whereas the GFI (0.74) and AGFI (0.71) were lower than threshold values. Normed Chi-Square (1.86) for the model was found to be within acceptable threshold limits (1.0–2.0 or 3.0). Thus, overall model fit measures indicate that this model is marginally acceptable

TABLE 4: INDICES OF MODEL FIT

Measures	Recommended Level	Research Model
<b>Absolute fit Measures</b>		
Chi-Square/df (p-value)	p>0.05	2114/1131(P=0.00)
Goodness of Fit Index (GFI)	Higher	0.74
Root Mean Square Residual (RMSR)	lower	0.05
Root Mean Square Error of Approximation (RMSEA)	<0.08	0.06
<b>Incremental fit Measures</b>		
Non-Normed Fit Index (NNFI)	>0.9	0.96
Adjusted Goodness of Fit Index (AGFI)	>0.9	0.71
Normed Fit Index (NFI)	>0.9	0.92
<b>Parsimonious fit Measures</b>		
Normed Chi-Square	1.0~2.0/3.0	1.86
Comparative Fit Index (CFI)	High value	0.96
Critical N (CN)	>100-150	185
<b>Overall model fit Measures</b>		
Normed Chi-Square	1.0~2.0/3.0	1.86

**Testing the Hypothesis**

Path significance and its explanatory power were examined using LISREL 8.52. The hypotheses were estimated by calculating the significance of path coefficients. The level of significance  $p < 0.05$  ( $t > 1.96$ ) was employed. Looking at the results of the impact of vendor’s competence on interaction process, organizational relationship capability (H1-4~H1-6) and vendor management capability (H1-7~H1-9) are significantly related to information sharing, communication quality and collaborative participation respectively. But, the client firms’ IT capability is not shown to have significant relationships with information sharing, communication quality, and collaborative participation (H1-1~ H1-3).

Among the constructs consisting of interaction process, information sharing and collaborative participation are significantly related to trust (H2-1, H2-7), dependence (H2-2, H2-8), and commitment (H2-3, H2-9), respectively. In the meantime, communication quality is related only to trust (H2-2) and commitment (H2-6), while no significant relationship was revealed with dependence (H2-5). Also, significant relationships were found for both trust and commitment with outsourcing success (H3-1, H3-3), but dependence is not associated with outsourcing success (H3-2). In summary, the results of hypotheses testing are presented in Figure 3 and Table 5.

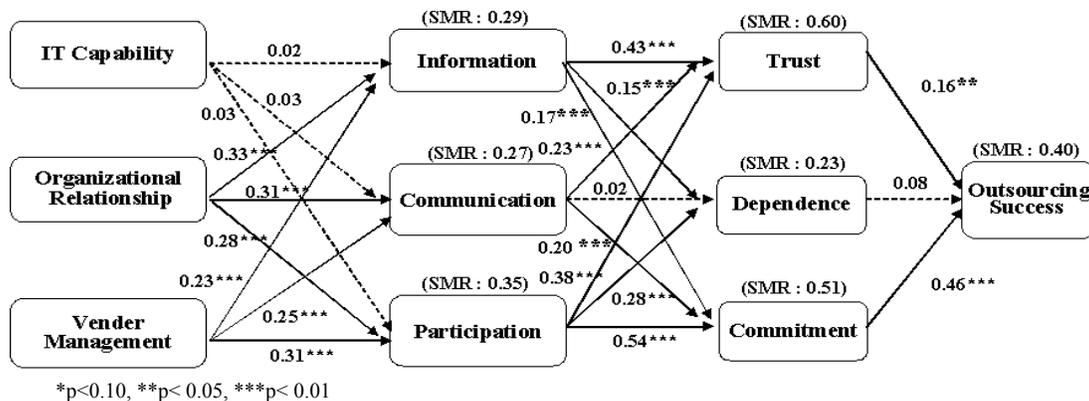

FIG. 3: RESULTS OF THE MODEL ANALYSIS USING LISREL

## Conclusion and Discussion

The contribution of this study is to develop a relationship model that encompasses the effect of firm’s IT capability on outsourcing success through interaction process and relationship intensity. The empirical testing results indicate that organizational relationship capability and vender management capability are critical antecedents to influence the outsourcing interaction process, whereas technical and managerial IT capabilities do not show statistically significant relationships. The plausible reason of the insignificant relationships is that in most sampling projects, the vendor firm’s competence such as technical skills and business domain knowledge might be sufficient so that less significant attention was paid to the client firm’s IT capability. It could be also possible that vendor’s relatively long prior engagement with the client could let the vendor take over client’s roles related to technical and managerial IT capabilities.

Trust, dependence, and commitment variables are defined as three components of relationship intensity. All associations between three variables of interaction process (i.e., information sharing, communication quality, and collaborative participation) and relationship intensity have strong statistical significance. One exception is between communication quality and dependence. Communication quality also shows marginal significant associations with

trust as well as commitment. Further, dependence displays an insignificant relationship with outsourcing success while other two variables, i.e., trust and commitment, do. The possible reason is attributable to relatively weaker perceived effect of communication quality on relationship intensity, compared to information sharing and collaborative participation. It also coincides with the result that dependence is the least perceived antecedent of outsourcing success.

We believe that the model provides a better understanding of the outsourcing relationship and of how it can be managed to ensure outsourcing success. Within limited knowledge of the authors, this could be the first empirical test to investigate the impact of client firm's capability on IS outsourcing relationship. By adopting the process theory, we incorporate the resource based firm's IT capability theories with outsourcing relationship.

The first limitation of this study was the composition of the sample. Somehow it lacks randomness in the sense that the number of project units is limited, and they are selected mostly via personal acquaintances. However, we believe that it does not significantly harm the research findings due to high quality data collected from random distribution. Second, this study was conducted as a snapshot research without considering the dynamic nature of outsourcing relationship. On the base of this research, further research could be recommended: vendor capability and contextual situations of IS outsourcing environment can be considered to extend the proposed model in this study.

# Managing ICT Risks of an Academic Institution

*Zuriah Abdul Rahman  
Noraini Ismail  
University Teknologi MARA, Malaysia*

## Abstract

Millions of dollars have been poured into almost a half-century of growth, expansion and development, physically, technologically and academically, but did ICT culture in terms of safety and security grow in tandem with the infrastructure growth in Universiti Teknologi MARA (UiTM)? This research found that although the academic staff of UiTM is moderately ready to embrace change in this technological era but they expressed feelings of discomfort and insecurity because the environment does not provide the necessary infrastructure for its smooth implementation and application in terms of security or risk control mechanisms to prevent potential abuse of the IT system; privacy protection on data; and potential system congestion and failure. A change within the organizational structure is necessary to ensure that the infrastructure for the safety, security, reliability and applicability of the information and technology systems is fail-safe.

## Introduction

Universiti Teknologi MARA (UiTM) an academic institution of reputable standing in Malaysia, with a student population of more than 100,000 introduced the concept of electronic learning (e-learning) or e-PJJ (Pendidikan Jarak Jauh or Distance Learning) back in the early 1990's. The first trial run of e-learning took effect in 1998. By the following year, numerous problems were encountered and the system had to undergo major improvements and by the year 2000 the predicament with the new era of learning was brought under control. Some of the reasons cited for the improvements were the engagement of the ICT specialist, Pointflex Co., both students and academicians were provided training on on-line learning techniques and the increase in the number of internet facilities in most branch campuses. Hence, at the initial enrolment of 300 students in 1998, this number grew to 3,000 in the year 2003.

Besides the e-learning program UiTM is also a storehouse for vast amount of information, students and staff personal records, research materials in the library, the research units, assets and finances under the treasury and many others. Even though UiTM went computerized in 1993, the upgrading process only occurred in the year 2000, with the introduction of the STAR (Staff Information System) and ISIS (Integrated Student Information System).

However, bringing a new technology into an organizational system does not come problem free. The computerization of the workplace and levels of IT dependency that exist, means the risks associated with the failure of IT systems owe one of the most potent sources of operational risk within any organization. Management may come up with indigenous ways of preventing or reducing risk with this new exposure, but new ways of committing crime are also emerging. The perils associated with storage of data include those of sabotage, theft of data, theft of computer time and espionage [Head, 1995]. Along with the damaging effects associated with computerization are risks that emerged with the advent of the Internet, in particular, the usage of e-mail (actions of staff), on-line-fraud (employees and non-employees) and system penetrations (actions of third parties) [Holmes, 2002]. To reduce losses from criminal activities of this nature, the organization has to adopt some form of physical/operational or security/control, procedural/administrative control and managerial/administrative control.

### Research Question

Against this backdrop, this study aims to address the following question:

What is the possibility of systems abuse when new technologies are introduced and adopted by UiTM?

### Research Objective

To examine the management role of preventing systems abuse through the introduction and adoption of new technology by the academic staff of UiTM.

### **Significance of the Study**

Adequate security system controls, (whether in academic institution or corporate sector) implemented against computer crime will alleviate a major cost to the organization and encourages a more conducive environment for the academicians and the students alike.

### **Research Methodology**

An opinion survey technique via a questionnaire using the dimension of:

Fidelity – controlling the potential creation of risk resulting from systems abuse associated with the adoption of new technology. The questionnaires were sent to the sample selected, which comprised of a portion of the population of academic staff of UiTM throughout Malaysia. The questionnaire was developed along the lines suggested by Head (1995).

A sampling frame was obtained with the aid of the registrar's office and for generalizability, a proportionate stratified random sampling was employed to select a total of 600 respondents. Questionnaires were first pilot-tested on 20 respondents also randomly selected to ascertain reliability. The final version of the questionnaire was sent to all 22 faculties in Shah Alam, the main campus and mailed to 11 branch campuses nationwide. A total of 152 questionnaires were returned giving a response rate of 25.3 percent.

#### **Research Contributions**

The results from the study will be able to determine whether the current provisions made by UiTM verbally or in writing is adequate and whether there is a necessity to initiate the establishment of an ICT policy to enable controlling the risks arising from computer usage.

### **Literature Review**

Bringing a new technology into a system has its inherent weaknesses. There is always a potential for abuse of the system by the users themselves, which may ultimately result in a financial loss to the organization. This is especially true for those risks associated with the usage of Internet. This service is opened to all kinds of risks associated with e-mails, electronic fraud and systems penetration [Holmes, 2002]. Yet another survey by Barker (2001) found that the main threat to e-business comes from current (11%) as well as former employees.

Baranoff (2004) says, like any property that we owned, computers are vulnerable to theft and employee damage, both accidental and maliciously. The author quoted from reliable sources that theft of proprietary information had reached US300 billion loss in the United States alone in 2001 and employees were usually the perpetrators. Organizations are also exposed to other forms of risks such as, liability risks, where a company is being sued for libel, defamation, and invasion of privacy, similar to the print media. Griffith (2000) suggests, that there are five major exposures that need to be protected: intellectual property (copyrights, trade secrets, trademarks, patents etc.), security (against viruses and hackers), business continuity (in case of system crashes) defamation (web-site content, postings on e-mail) and violation of an employee's right to e-mail usage.

Mizuno (1999) points out that unless a company takes the risks as a whole company problem and there is a leadership or corporate culture that is being nurtured to combat these risks, four risk management problems about the Internet will always exist, and they are:

1. It is not understood what kind of dangers exists.
2. It is not understood what should be protected.
3. It is not understood what kinds of measures are possible.
4. It is not estimated how much damage is suffered.

According to Erikson (2001), a significant percentage of corporations are under-prepared for computer-Internet or technology risks. Their claim of the global nature of e-commerce, the varying legal systems, and the speed at which innovations and technology are brought to the forefront complicate the challenges facing organizations.

How does an organization begin to tackle this problem? Griffith's (2000) advise is, first and foremost, a corporate strategy of risk management should be developed which should include a legal review of all web-site content; followed by a clear corporate guidelines on e-mail usage and to strengthen this with a virus detection and protection installation of security systems. The next step then, is to identify the risks and lay out the options for dealing with the risks.

According to Reza & Moeini (2002), academic institutions are ideal environments for hackers and intruders who are highly motivated to access and modify grades and other information and that while corporations are in a better position to put limitations on the Internet connectivity, academic or research institutions simply cannot function under such limitations. Electronic users of academic institutions need unrestricted and transparent access to Internet resources (on-line, library catalogs, preprints of papers, World-Wide-Web etc.) They also need unrestricted ability to publish and disseminate information to the masses. Therefore, academic institutions require newer and better security measures to be developed solely for academic institution's compatibility. While the experts in the field provided some suggestions on potential measures that could be implemented to combat these risks, Head (1995) combined all these elements and divide the measures for controlling computer crime into 3 categories:

**Physical Control**

Basically limit access to authorized personnel, screen for viruses, uses of password, block computer from potential vandalism, other external or electronic signals, shield from external interference or eavesdropping, and monitor users.

**Procedural Control**

This involves screening of present and new personnel for past computer-related crime, conduct frequent unannounced audits and transfer or rotate employees among positions.

**Special Managerial Control**

Management should undertake to educate personnel on features of computer-related crime, how the organization is combating it, counseling employee who are under financial or personal pressure (stress) and lastly to remain alert to changes in operating procedures or technology that might offer new opportunities for abuse of the system.

**Analysis and Findings**

	Dean	1	0.7
	Deputy Dean	4	2.8
	Heads of Program	12	8.5
	Coordinators	24	17
	Others	12	8.5
	None	86	61

A majority of the respondents are female academicians (88), representing 59.5% of the sampled respondents. About 51% (76) of the academic staff comes from the 36-45 years of the age category followed by 31.8% (47) from the 25-35 years. One hundred and thirty-two respondents (90.4) are Malay, followed by 4.8% (7) Indians and 2.7% (4) Chinese.

In terms of their academic positions, 62.6% (92) are lecturers, 23.1% (34) are associate professors while 10.9% (16) are senior lecturers. A majority or 39.2% (58) of the sampled respondents have only been with UiTM less than 5 years, 36.5% (54) have serviced the university between 11-20 years, while 16.2% (24) have been with the university between 5-10 years.

Of the 148 lecturers sampled, 77% (114) hold a masters degree, 12.2% (18) a bachelors degree and 9.5% (14) are Ph.D graduates. Sixty-one percent (86) of the sampled respondents do not hold any posts, 17% (24) lecturers are coordinators and 8.5% (12) are heads of programs or those that fall under the category of others (HEP, Campus director, Resident staff etc.).

TABLE 3: STAFF AWARENESS ON THE PRESENCE OF PHYSICAL CONTROL, PROCEDURAL CONTROL AND SPECIAL MANAGERIAL CONTROL ON COMPUTER AND INTERNET USE:

	Questions	Respondents Perception (%)		
		Yes	No	Don't know
<b>Physical Control</b>	Is there an organizational policy on computer usage?*	31	27	42
	Were staff informed about policy on computer usage?*	20	75	3
<b>Procedural Control</b>	Are the staff aware of policy on internet & usage?	6	25	69
	Are the staff aware of who developed the policy?			
	Top management	79	-	-
	Unit/Department	22	-	-
	Is the policy written?	27	73	
	Are e-mails accompanied with a disclaimer?	46	55	
	Are the staff aware of possible legal action for abuse of e-mail and internet usage?	10	90	
<b>Special Managerial Control</b>	Are the staff aware of possible disciplinary action for abuse of e-mail and internet use?	27	73	
	Is there any indication of monitoring of e-mails and internet use?	30	70	
	Staff opinion on possible action by UiTM for any policy violation	60	20	
	Have staff been counseled for financial and personal pressure?	7	93	
	Does staff feels insurance is a good measure to combat computer fraud?	1	25	74

\* Campus with the highest score for “Yes” for awareness on UiTM’s policy on computer usage is Trengganu and highest score for “No” is Faculty of Business Management, Shah Alam. The highest score for “Yes” for staff being informed about organization’s policy on computer usage is Pahang while the highest score for “No” is Faculty of Business Management.

In reality, the PSMB (Pusat Sumber Maklumat Bersepadu) unit, of UiTM charged with the preparation of an ICT policy has sent a draft to the relevant authorities but, in principle, has not been accepted at the senate level, therefore is not yet operative. In other words, UiTM staff has only hunch of its existence but could not verify. This explains for the high percentage of staff (94%) who are not aware of UiTM’s policy on computer and internet usage. Hence, the ensuing questions resulting in a high response of “No’s” and “Don’t know’s” is attributable to the non-implementation of the ICT policy as yet. Further tests conducted to determine whether there is any relationship between demographic variables: gender, age, race, academic position, length of service and current position and the 3 measures of infidelity: physical control, procedural control and special managerial control resulted in the following:

TABLE 4: ONE-WAY ANOVA FOR AGE GROUP

	25- 35 years	36 – 45 years	46-55 years	Above 55 years	F value
Physical control	3.20	3.59	3.37	4.10	2.17
Procedural control	2.90	2.73	3.32	2.67	.884

Infidelity	3.21	3.09	3.00	2.72	3.74

\*\*\*p < 0.01, \*\*p < 0.05, \*p < 0.1

The insecurity dimension amongst different academic position depicts that professors and associate professors are affected by the insecurity of the system, probably because they have a sound understanding of how the system in UiTM functions, having worked in the organization for at least ten years and above. Likewise, new lecturers are not bothered by the insecurity of the system probably because they are not in the know on how the system in UiTM functions. They are more bothered by actions that could be taken against them as new entrants to the organization for the potential breach of security system, and this has greatly shaped a general feeling of insecurity in their positions. The differences in educational achievements results indicated that the higher the educational level, (MBA and Ph.D), the more concern it is of the staff on the potential infidelity of employees in general. Any actions that are deemed to jeopardize the safety of information in UiTM are looked upon with great

fear. It would seem that, maturity (tenure and educational achievement) plays a significant role in establishing responsibility and accountability.

Lastly, for those holding positions in UiTM, there is significant difference in the fidelity level between Head of Programs (3.13) and Coordinators (3.36). These are people who come into contact with the system everyday in their role as administrators where, students' grades, staff performance and appraisal, researches and many other important data are stored in the system. Any acts of vandalism, information heist, hacking and the like could ruin so many years of hard work. Likewise, at the higher levels, deans, assistant vice-chancellors and deputy vice chancellors because these are people with higher positions and allocated with a personal assistant to do the menial tasks of data entries and protection, therefore, worries over computer failures and data loss or sabotaged is not within their domains. The rest of the other demographic variables showed no relationship to the fidelity measure.

## Conclusion and Recommendations

As Mizuno (1999) had explained earlier, if an organization treats an ICT problem as the headache of the division of information and system only, then the real risk associated with the use of ICT tool will never be addressed.

Findings from this study seemed to suggest that UiTM management seemed to fall into this category because it is perceived to be rather slow in tackling the problems of potential abuse of the system judging from the length of time it takes for the whole institution to take any forms of action to eliminate or reduce this risk. The task of risk control has been pushed to the PSMB unit, which act as an ICT tool protector. From the year 2000, until today, the ICT policy could not be implemented merely because of the absence of approval from the senate of the university as yet. Thus, with no protection and almost no information dissemination with regards to the rules and guidelines for the staff on ICT and its usage (more than 80% were not informed and are not aware of any policy on Internet and its usage), academicians were totally left on their own to decide on how best to manage this tool. Speed is definitely not within the corporate culture of UiTM in handling very important and pressing issues.

UiTM has given support to a progressive use of ICT in educational management with the introduction of the e-PJJ program, the bulk of research activity is conducted on line, confidential and pertinent data are stored within the IT systems, then the institution should aptly provide the infrastructure necessary for its smooth implementation, continuously upgrading, maintaining and monitoring the management of ICT equipment and systems against potential abuse, violation or improper conduct and infidelity. It is prophesized that with a change in the organizational culture and the policies in place, could bring about an effective adoption of new technology and safe use of ICT equipment in UiTM.

# Toward an Understanding of Participating Behaviors and Technical Tools used in Virtual Communities

*Richard L. Peterson  
Ram B. Misra  
Montclair State University, U.S.A*

## Abstract

With the advent of the Internet café, chat sessions, instant messengers, special interest e-groups and now blogs, people do not need to be physically close together for exchanging their ideas. The participants can have shared experiences that are instantaneous and pretty[d1] much of the same nature that is usually realized by the traditional collection of special interest people in close proximity. The members of these groups share their knowledge, cooperate with each other to solve problems, and feel responsibility for each other. In other words, they behave as if they belong to the same community – a virtual community in this case. Just as conventional communities are important for business, these virtual communities are expected to play a similar role. Internet based technologies have been the great enablers of virtual communities. This paper reports the framework of the research in progress. We first discuss, based on the published work in this area, the typical characteristics (behavior, expectations, etc.) of the members of various virtual communities. These people fall in one of the four groups – tourists, minglers, devotees and insiders. We make a stipulation that there are significant variations in the technology needs of each of these groups. As part of this research, we propose to develop a model that would map technology to each group. We will develop criteria to measure the effectiveness of technology in meeting the expectations of its members.

## Introduction

Virtual Communities (VCs) are the coffee houses of Internet space. It is here people gather, electronically, to talk and listen; to satisfy curiosities, to form and reinforce opinions, to learn, or to form and maintain relationships (Hagel and Armstrong, 1997). Every user is at once a producer and a consumer of information, providing self-selecting forums for those who care to listen—or talk—to each other. Users consider themselves members of a virtual community and attempt to guard the quality of that community, a unique bastion of cooperation, sharing, and information exchange. While self-fulfilling exchanges have flourished, rhetorical exigency - the type of shared communication exchange that underlies commerce - has not. [d2]For businesses, shared control co-mingles and homogenizes market segments, which is the antithesis of micro-marketing.

Much like coffee shops in real space, VCs are capable of increasing stickiness on the part of “customers,” drawing them into frequent repeat visits. Over time, the community members build trust, relationships, and commitments. These three customer behaviors may have powerful impacts on business in terms of relationship marketing, customer loyalty, and business image (branding). Virtual communities are abundant within specific market sectors: books (amazon.com), apparel (apparelex.com/bbs), steel (indconnect.com/steelweb), nanotechnology (nanothinc.com), coal (coal.ca/blog). VCs may provide ideal tools for e-commerce, e-marketing, and knowledge building.

To tap this resource, businesses need to understand the components of VCs, their types, the motivations of the participants, and the types of interactions taking place in VCs. Most importantly, to leverage the impact of VCs, businesses must know which technical tools most facilitate the types of participant behaviors that lead to stronger relationships, more positive images, all hopefully leading to greater sales at the end. This research, conceptual in nature, seeks to identify key behaviors of highly important participant groups and then to assess technologies used in VCs to determine which tools are of most benefit to businesses in achieving their goals for VCs. We have adopted an interpretive framework – an in-depth analysis of the specific significance that a VC has for its members. The findings suggest various research avenues that will be helpful in seeking to maximize business gains for VCs.

## Classification of VCs

The multi-disciplinary nature of VCs leads to many definitions, depending on one's perspective. Wang, Yu and Fesenmaier (2002) suggested that these perspectives are multi-disciplinary that include sociology, technology, business, economics, and e-commerce. Lee, Vogel and Limayem (2002) analyzed a number of studies and developed a working definition of virtual communities: "...A technology-supported cyberspace, centered upon communication and interaction of participants, resulting in a relationship being built up." The various definitions of VCs share four elements:

- Community, a feeling of belonging based on human relationships, not physical presence
- Place, a virtual location where the boundaries are defined by the people who are there and by the discussions they have
- Bonding, a sense of membership or connectedness to others in the community (Sproull and Faraj, 1997)
- Shared objective, a central purpose felt among the participants

Not all virtual communities develop and flourish with the same objectives. Hagel and Armstrong (1997) focused on classifying these virtual communities according to the underlying purpose or needs served:

- Communities of relationship where people with similar experiences come together and form meaningful personal relationships,
- Communities of interest which aggregate a dispersed group who share an interest or expertise in a specific topic,
- Communities of transaction where information is traded among participants, and
- Communities of fantasy for exploring new worlds of entertainment

Bressler (2000) modified the classification of virtual communities to a business perspective by considering the motivation(s) of participants:

- Purpose – people are trying to achieve the same objective,
- Practice - where people share the same profession or situation,
- Circumstance - similar to purpose, but driven by personal experiences rather than professional motivations, and
- Interest - people who share a common passion.

These virtual communities have also been variously classified by their focus (Jones and Rafaeli, 2000):

- Basic human needs - interest, relationship, fantasy, transaction;
- Use, social structure, or technology-base - (e.g., FAQ, expert knowledge (stewards accumulate and organize knowledge), news groups, web site, or social multiplier (e.g., friendster.com); and
- Motivation - communities of purpose, practice, circumstance, interest.

Across the various types of VCs, successful communities have a number of relationship outcomes (Grunig, 2004) among their members that represent attributes important to businesses. One, for example, is control mutuality, the degree to which parties feel satisfied with the amount of control they have over the relationship. Interestingly, this may be the antithesis of current notions of business-customer relations where businesses generate, and thereby control the flow of information to the customer. In the new economics of information, value will be assigned, even created, by the community members, not the vendors who would define organizations or markets. This value of knowledge will be derived from its shared context: the strong experiential and reflective elements of knowledge that make its underlying information content relevant and actionable. The "new" networked community will emerge with new communication patterns and new supporting technologies.

Trust, another VC relationship outcome, involves the confidence that both parties (either customer-customer or customer-business) have in each other and their willingness to be open to each other. There is a mutual reciprocity, perhaps with accountability, to each other, which leads to a feeling that the relationship is worth spending time on. [d3]Clark (1995) suggests that the type of relationship may develop in one of two, opposing ways. Communal relationships develop as responsiveness to the other person's needs. In these relationships, the parties do not like being repaid for favors, do not feel exploited when not repaid, and do not keep track of contributions. In

relationships built on the notion of exchange, the activities are governed by the need for equity; parties want to be repaid, feel exploited if exchange is not equal, and (they) like to keep track of contributions. In both types of relationships, satisfaction occurs when each party feels the other is taking steps to maintain the relationship.

## **Communication Patterns of VC Types**

Of most interest to business are those VCs, which are purposively structured around consumption (Kozinets, 1997; Kozinets and Handelman, 1998) of goods or services. In these VCs there is a shared enthusiasm for a product or service (ex. the collection of baseball cards) that invites commitment to the VC. This enthusiasm and its outcome of repeated visits create the stickiness that allows for repeated marketing messages. The attributes of stickiness seem to develop at different rates, depending on characteristics of the participants. Kozinets (1999) suggests two non-independent factors of participants in communities of consumption. First is the centrality (in terms of importance) of the consumption activity to the person; the more central consumption is to the individual and his/her self-concept, the more likely it is that person who will pursue and value membership in a VC on the type of consumption. The second is the intensity of relationships with other members of the VC vs. the intensity in real space. Other things being equal, the value of a membership in a real or virtual community depends on which fulfills the relationship needs better.

Kozinets (1999) suggests that these two factors define four types of VC members.

- Tourists have only a passing interest in the consumption activity and lack strong ties to the group.
- Minglers also have only a superficial interest in consumption, but have strong social ties to the group.
- Devotees, the opposite of minglers, have strong interest in the consumption activity and only passing interest in the social ties of the VC.
- Insiders exhibit both strong consumption activity and strong social relationships

Communication interactions within the VC are contingent on the type of member. Devotees and tourists focus on factual information without regard for social relationships in the community. Minglers and insiders tend to focus on the social relationships first. To Kozinets this suggested two other modes of interaction: recreational mode, a purely selfish, short-term entertainment carried on mostly by minglers and tourists and transformational mode in which communication is focused on longer-terms social gain. Devotees and insiders predominate this mode.

If businesses are to successfully leverage these types of members and their preferred mode of communication, the structure and tools of the VC must match the needs and requirements of the members. What are the structures and their characteristics? Kozinets suggested a number of types of virtual communities of consumption:

- Dungeons provide social interaction in a game-playing mode. Minglers and insiders appreciate this recreational mode.
- Rooms, as in “chat rooms” are synchronous social environments populated by minglers and visitors engaged in recreational and interaction modes.
- Rings, or web rings, are linked web sites used for information collection. Lists are linked. Both provide a transformational mode used by minglers and devotees.
- Boards are frequented by insiders and devotees who read and post messages sorted by date and subject.

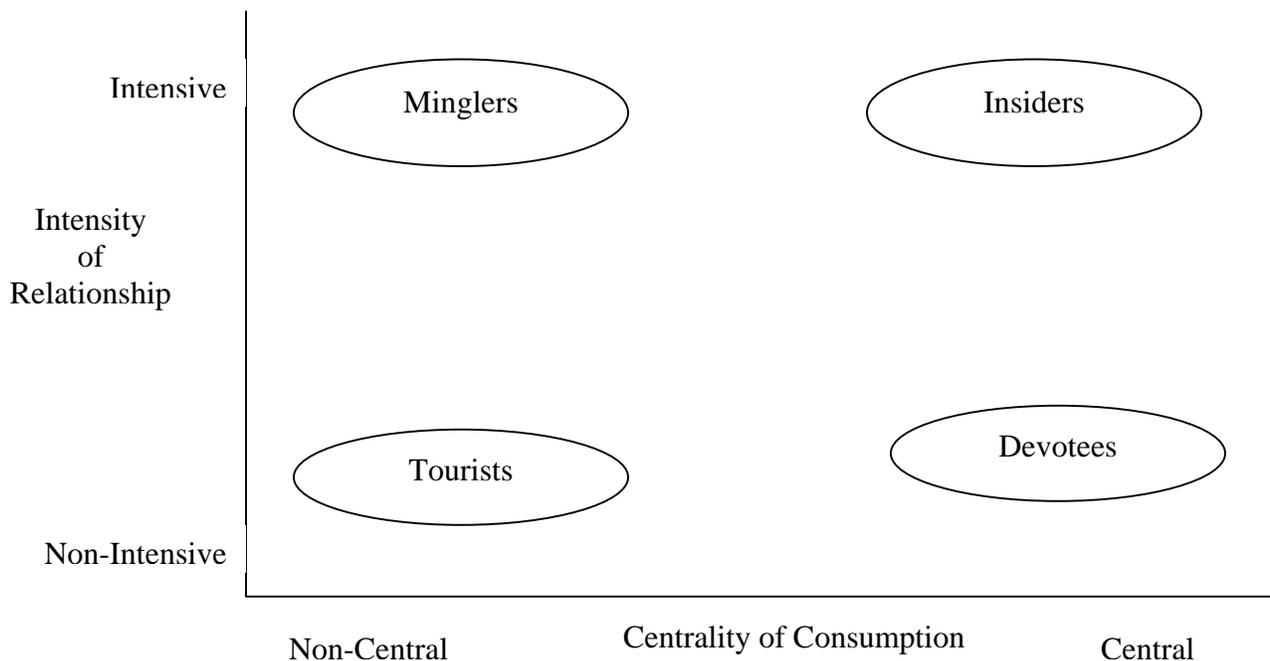

FIG. 1: TYPES OF VIRTUAL COMMUNITY MEMBERS BY CONSUMPTION CHARACTERISTICS

### Technologies Supporting Virtual Communities

Lazar, Tsao, and Preece (1999) suggested that such technologies as listservs, newsgroups, bulletin boards, Internet Chat Relay (IRC) and Multi-User Dungeon (MUD) support the communication within the community and help create its boundary. Two other technologies, Wiki and Blog are currently becoming very popular. Wikis are focused on the knowledge aspect of a subject matter and do not focus on the contributors nor on the chronology of their contribution. Blogs are (open) electronic diaries that have gotten the attention of even some CEOs.

We examined these technologies from two angles – the level of involvement required from the users (members of VC) and the quality of the information received by the members. Figure 2 displays how various currently available VC technologies map into these two dimensions. MUDs require the highest level of attention and deliver the highest quality of information. On the other end of the scale, email groups are the least demanding on the users and deliver the lowest quality information. We have also shown in Figure 2 the degree of sophistication (feature richness) of these technologies. There seems to be a direct correlation between the level of attention required from the users and the sophistication of the technology. In a way, this could point to a problem from user's point of view. This perhaps would keep many potential new members from using some of these technologies because of the notion that they require advanced level of technology IQ. One research question is if indeed there is evidence to support this.

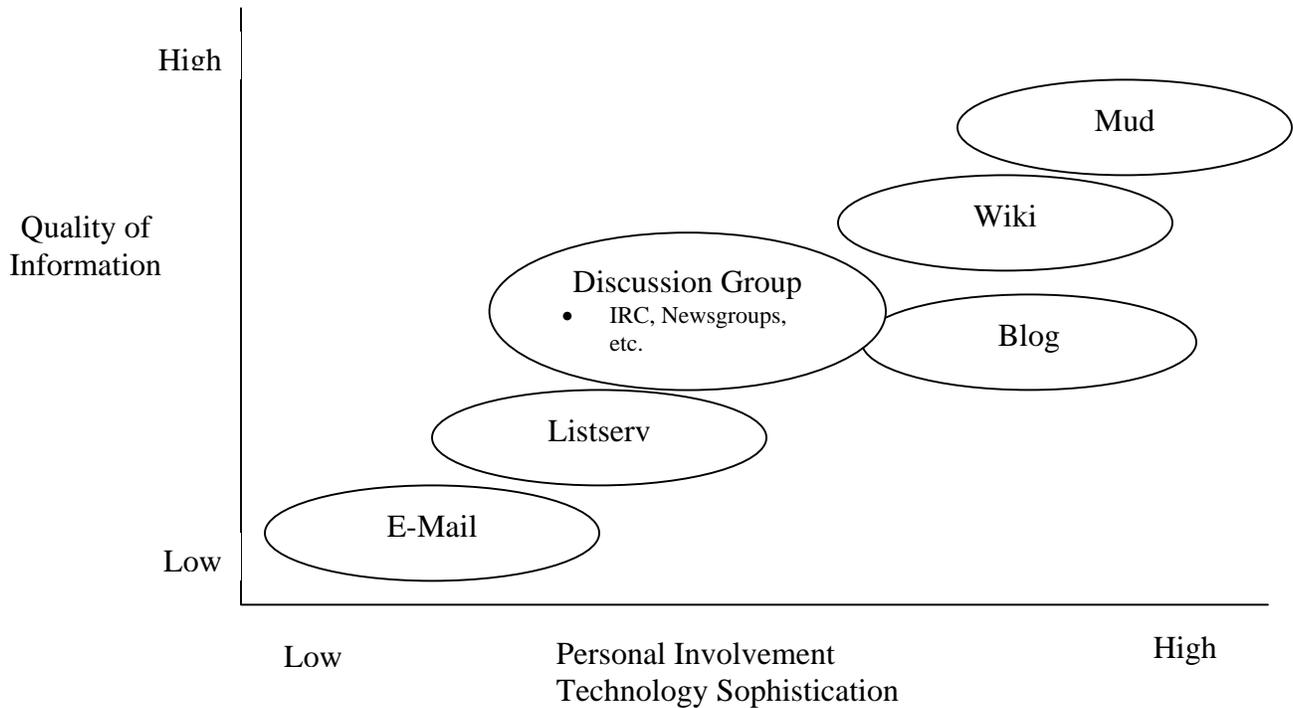

FIG. 2: LEVEL OF INTERACTION, QUALITY OF INFORMATION AND VC TECHNOLOGIES

It is expected that as VCs become more popular and established, the technology will adapt to the needs of VC members and vice versa, along the lines of what has been called the mutual shaping perspective (Boczkowski, 1999). According to Orlikowski, Yates, Okamura and Fujimoto (1995), technology must support special needs of a context and must continue to change to keep meeting the new context. Business drivers for the development of this technology come from the businesses that are going to use these communities as targets for selling their products or services. Here is the dilemma (Barnett, 1998). Businesses cannot just focus on their narrow marketing interests but have to consider all four human needs – transaction, interest, fantasy and relationship (Hagel and Armstrong, 1997) in developing fully functional websites for these virtual communities. What this really means is that even though there are specific applications of some aspects of technology, the composite technology (we can call them platforms), consisting of many technology products, will tend to support most of the needs of VCs. The analogy used here is that of Microsoft Office suit of products, which meets the needs of novice as well as advanced users.

The following represents a comprehensive list of technology features (Venkatesh, 1998; Wagner and Bolloju, 2005) that could be supported in such a platform:

- Privacy and Control Mechanisms
- Security (Knowledge/information protection in shared environment)
- Ease of Use (with minimal or no training)
- Benign (user-friendly) Mechanisms to keep community members information (login, password, personal data changes) current.
- Real time addition of information (ex. Real time publishing)
- Content indexing (time indexed and/or topic indexed)

- Threading or hyper-linking Capability
- Content Management (Purging)
- Multi-mode (one to one, one to many and many to many) communications
  - Interactivity
- Convenience (any time, anywhere)
  - Open standards and interfaces (API's)
- Individualized treatment to its VC members (mass customization)
- Information (News vs. Knowledge) Management
  - Information Packaging aimed at meeting the needs of Communities of Practice (APQC, 2000)
    - Help Communities
    - Innovation Communities
    - Best Practices Communities
- Performance Management Capabilities (message approval, ratings, polling, etc.)
- Inter-community communications (networking based on open standards, not like the current situation where one needs a separate logins for each instant messenger.)

## Implications

Converting information to knowledge requires comparisons, connections of relationships, conversations (to determine what other community members think), and consequences (Davenport and Prusak, 1998). In this scenario, vendors will assume additional roles as navigators or facilitating agents of communities of knowledge (Evans and Wurster, 1997) using software such as “AntWorld” (Kantor and Menkov, 2000) that integrates humans as part of the enabling technology to help other humans navigate knowledge space.

Opportunities to facilitate the evolution exist for futurists who can define constructive communication paradigms for communities, for software vendors who can develop tools that support these new models, and for the academic community, which will be charged with preparing students for this future. Electronic communities will be defined more closely around common interests, needs, and applications. These groups, in turn, will create and maintain features and functions that are unique to these respective constituencies, even to the point of privatizing the intranet and requiring unique hardware, software, and transport configurations. The virtual constituencies will require transparent access and navigation across sub-networks. The underlying drivers of the Internet are control and, implicit in that, cost benefit. Two things seem likely: consumers not businesses, will lead the way, and the critical success factor will be the positive impact network-centric applications have on the customers. The common characteristic of these next networks will be a more customer-controlled environment established for a defined community of constituents--businesses--who are customers and suppliers to each other. This value of knowledge will be derived from its shared context. The 'new' networked community will not be a single community but hundreds, even thousands of communities. Each community will be virtual and consist of members that belong to a number of communities. This new community model will have distinguishing features that go beyond the present Internet:

- Every electronic community will be created by, for, and about its constituents.
- The underpinnings of the community will be in its functionality, the level of trust it engenders, and the sense of control it affords.
- New communication patterns and styles will emerge, shedding the common denominator of the current Internet for elaborate communication schemes.
- Members will compartmentalize their communications, not homogenize them.
- At least two objectives, alternatively, will influence communications characteristics: democracy and efficiency. The democratic leanings of community members will create communication paradigms similar to the current Internet. “Talk” will generally be free-flowing and non-directed and the *modus operandi* will be to overwhelm each topic with so much information that the "best" knowledge or decision will surely emerge. The communication paradigm based on efficiency will be more structured with each

communication measured for its value and contribution to the community. Here, the steps to the "best" knowledge or decision will be more scientific, more rigorous, more built upon previous knowledge.

Technical changes will be required to support these various communities and their communication patterns. The need for bandwidth, openness, predictability in the network, and ease of use are part of the evolution of Internet. But the "new" needs of the community constituents may not be so obvious. These needs, driven mostly by the nomadic nature of the community members, include: location independence, device independence, security, friendly interfaces, and partitioning of members' contexts. The strong experiential and reflective elements of knowledge make its underlying information content relevant and actionable.

Research is needed on a number of issues, including affiliation needs, uncertainty reduction, interactivity, dynamic experience, conflict reduction, low signal-to-noise, willingness to defending the boundaries of the community, and self-selected individual roles (information providers, facilitators, interpreters, leaders).

# Analysis of Link Power based on Web Link Structure and Information Resource

*Hyojae Joun*

*Korea Culture & Tourism Policy Institute, Korea*

*Namjae Cho*

*Hanyang University, Korea*

## Abstract

Popular websites as representing successful business in information use environment tend to become e-hubs that link large number of organizational agents for presenting and maintaining digital contents with supreme quality. Research and practice in digital information on the web have focused on finding and measuring artifacts, factors and attributes of web structure and contents from the perspective that information is a resource and property of products and services. This study identifies the relationships of the structure and resource on digitalized information in the Internet and examines how these effects are associated with structuration and resources of contents in the travel business websites. The logic of the view is theoretically and empirically analyzed based on the structurational theory and resource-based view through the link power of network density. This study provides managerial insights on organizations' virtual activities and systematic understandings about digitalized organizational information in the information use environment.

## Introduction

The web presence of a company is based on the network of web pages, where information and contents are connected and delivered across internal and external players, agents, and other stakeholders. Websites represent the status and strategy of a company's communication and technology (Cho and Joun, 2004). Information itself in the Internet has become the central part of values' creation for customers. Information and technology based on the web are also driving innovations in business processes intended to improve the possibility to survive, realize profit, and grow. In this sense, web strategies have led and been led by organizational activities, business processes and technology practices in the Internet age. Businesses use Internet (1) for intra-organizational applications, communication, and information sharing within the organization, (2) for creating virtual presence of the organization and analyzing responses, and (3) for conducting business with customers and business partners (Vadapalli and Ranamuthy 1997).

Recently, there has been a considerable interest in the growth properties of human interaction networks such as the World Wide Web (Albert et al. 1999). The emergence and widespread use of Internet created new business paradigm. Most of organizations have been opened their strategic channels for customers and suppliers through the Internet. A growing area of research in information science is the analysis of web-based documents, often using quantitative techniques (Thelwall and Wilkinson 2004), commonly known as Webmetrics. Much of these studies worked on Web links to reveal the structure and map of the World Wide Web.

In this research we attempted to conceptualize the characteristics and examine relationships of the link in perspective of network, websites' structure, and a resource-based view of web pages.

## Research Background

### Web Structure of Network Link

Technology has always been a central variable in organizational theory and information systems research (Orlikowski 1992). Successful websites provide new business values in response to present and future opportunities, especially within the domain of the web. New technologies and various application systems have been adopted to drive customer-oriented information for successful business. The importance of information systems strategies have been increasing as the role of technology becomes central to the competitiveness of enterprises' products and

processes (Levy and Powell 2000).

Despite the billion documents on the Web, nineteen degree of separation suggests that the Web is easily navigable. Big yet small. But the small world behind the Web is a bit misleading. To be sure, if there is a path between two documents, that path is typically short. But in the reality not all pages can be connected to each other. Starting from any page, we can reach about 24 percent of all documents. The rest are invisible to us, unreachable by surfing (Barabasi 2003).

Most of all, the core for successful and retentive competitiveness with technology and information use environment need to understand the structure and content of World Wide Web. Barabasi (2003) described the Web is consisted with Central Core, IN continent, OUT Continent, Tendrils, Islands, and Tubes. This structure is direct path; link. Most of the Websites has structured the incoming and outgoing links and internal links (Barabasi 2003; Kleinberg 1999; Li and Candan 1999). In viewing of website, Central core is a domain website which has many documents and URLs linked with internal link, IN Continent is consist of incoming links from search engine or authoritative web, and OUT Continent is target documents linked with outgoing link from Central Core. The Web site's structure based on link perspectives focuses on Central Core. It represents the domain and the characteristics of the website in the direct network.

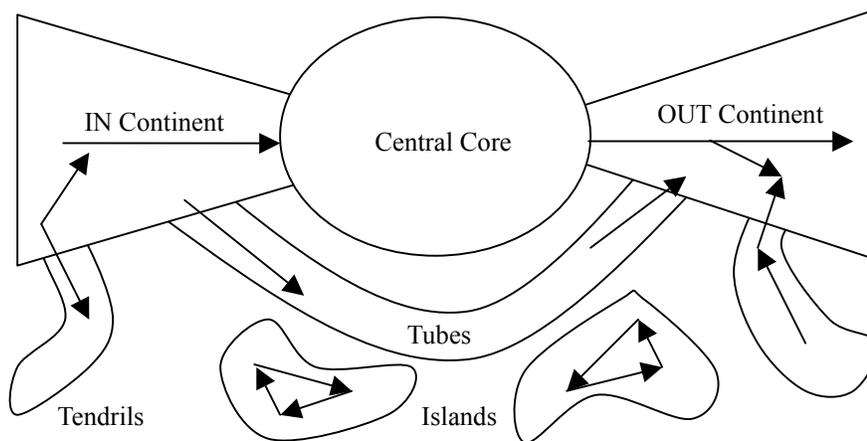

FIG. 1: THE CONTINENTS OF A DIRECTED NETWORK. (SOURCE: BARABASI 2003)

Link popularity is a part of understanding the Web structure and characteristics in serving information and contents. The link structure was obtained from a public available database created by crawler-based search engine to measure link popularity and this is a relatively mature Web-using area (Thelwall 2001a, 2001b; Thelwall and Wilkinson 2004). To travel the web, following links, returning some sort of information about the pages visited or the pages themselves. They are also known as spiders and bots. Remote site mappers and link checkers are special-purpose kinds of web crawlers. Crawlers that return HTML pages and the other files associated with web pages can be used for mirroring sites for archival purposes. As they download pages, they can also make the characteristics of the pages and files available for analysis <<http://irisresearch.library.cornell.edu/VRC/catcrawl.html>>. A search engine is a crawler based website that has millions (even billions) of individual pages in its database. Search engines are the most frequently-encountered web crawlers. Some examples of major search engines are: Google, Altavista, Excite, Lycos, and Hotbot. These kinds of search engines report the documents' popularity and accuracy. Internet users pursue to find the useful and fluent information through using Google, Altavista, Excite, Lycos, and Hotbot. The importance of target page by users is the result of search. The result of search is recommended pages or URL, favorite site, and popularity by rank. The rank is a promotional tools; alexa.com, google page rank, and etc.

Therefore the structure of website contains the incoming and out going link, domain and internal link, and is evaluated by popularity as performance. Alexa Traffic Rank (ATR) is visit frequency in user activities. Google

Page Rank (GPR) means the accuracy of correspondence to provide information about the number of page views and number of users that Web sites receive (<http://www.Alexa.com>).

*H1*: Total link with web link positively affects accuracy rank (GPR: 1 – low grade, 8 – high grade)

*H2*: Total link with web link negatively affects the number of traffic rank (ATR: 1 – high rank)

#### **Information Resource based on Links**

Recently the RBV is the dominant theoretical perspective in strategic management literature, and focuses on costly-to-copy attributes of a firm that are seen as the fundamental drivers of performance (Bharadwaj 2000). The RBV which has resource heterogeneity and immobility concepts is a potential framework for augmenting the conceptual analysis of IT's effects on firm performance (Christiaanse and Vankatraman 2002; Mata et al. 1995). IT has been mentioned for its possible role in creating sustained competitive advantages for firms (Mata et al. 1995).

Resources are either tangible or intangible in nature. With increasing effectiveness, the set of resources available to the firm tends to become larger. Individual resources may not yield to a competitive advantage. It is through the synergistic combination and integration of sets of resources that competitive advantages are formed. A capability is the capacity for a set of resources to integratively perform a stretch task or an activity. Through continued use, capabilities become stronger and more difficult for competitors to understand and imitate. As a source of competitive advantage, a capability "should be neither so simple that it is highly imitable, nor so complex that it defies internal steering and control." (Schoemaker and Amit 1993, 1994). The ability or capacity of a firm to turn its resources into customer value and profits is usually called a capability or competence (Afuah and Tucci 2000). Grant (1991) distinguishes between resources and capabilities and provides a classification of resources into tangible, intangible, and personnel-based resources. Resources are inputs into a firm's production process, such as capital, equipment, and the skills of individual employees, patents, finance, and talented managers.

In resource-based views, Link is connected with information and contents, individuals and organization, tangible and intangible resource, and technology and human. Links include organization's resource and represent the organization's capability. Link resource is what and where to connect based on the direction network. There are a lot of links in perspective of resource-based views. To conceptualize the structure of the Web focus on the direction. And the links of incoming and outgoing suggest the feature of web site; hubs, authority, and community (Barabasi, 2003). Most of all, the WWW structure is from the website structure. The nature of link resource is needed to analyze the documents or pages.

*H3*: Total link with web link positively is affected by direct link (*H3\_1*: incoming, *H3\_2*: outgoing link)

*H4*: Total domain positively affects web link structure but link negatively affects

*H5*: Web link structure positively affects accuracy rank (GPR: 1 – low grade, 8 – high grade)

*H6*: Web link structure negatively affects the number of traffic rank (ATR: 1 – high rank)

## **Research Methodology**

### **Model and Method**

The model of this research divided five dimensions; incoming and outgoing link and target domain in perspective of web documents, and network density of links by the structure in perspective of web sites (Kleinberg 1999; Li and Candan 1999). To improve the rank of web sites or pages is the key of successful business in the practice area. The rank is measured by the traffic, a number of members, score or point of satisfaction, and information quality of web sites. Rank in the major search sites is successful strategy for ongoing business and a set of ranking with given set of attribute (Salo and Punkka, 2005).

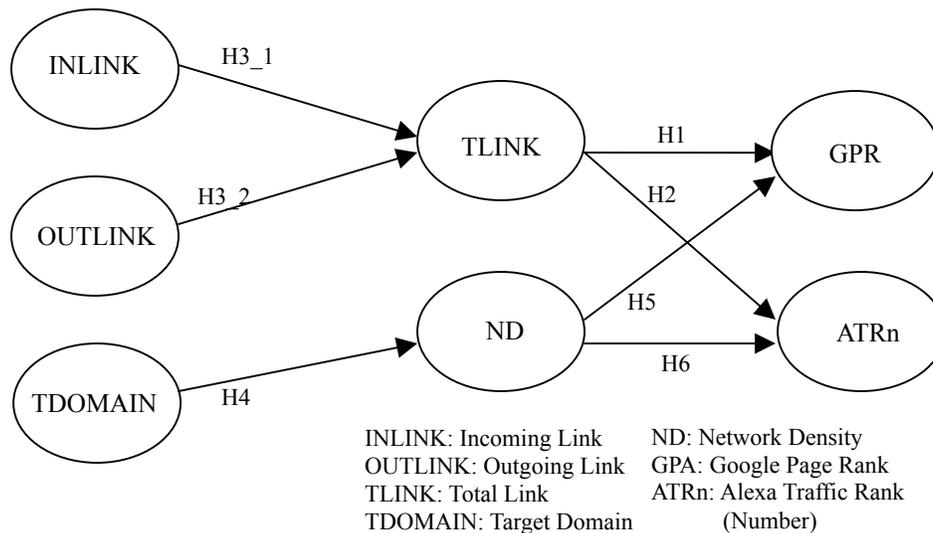

FIG. 2: RESEARCH MODEL OF WEB LINK STRUCTURE

Marsden (1990) defines the operational definition of network density as the mean strength of connections among units in a network. Density in social network density is the general level of linkage among the point in a graph (Scott, 2000). The percent of ties that exist in a network out of all possible ties. A density of 1.0 implies that every alter is connected to every other alter. A density of 0 implies that no alter knows any other alter (McCarty, 2002).

Network density ( $\Delta$ ) was calculated by employing the following mathematical formula:

$$\text{Network Density: } \Delta = \frac{\sum X_{pd}}{\alpha n(n-1)/2}$$

Where n= the number of nodes

$\alpha$ = highest possible value of relationship strength

$X_{pd}$  = relationship variable between node p and d

In this formula, the relationship strength is a perception between two people in social science. Therefore the relationship in viewing of network is  $\alpha = 1$  because the relationship strength is the connection between two nodes connected with link.

Network density reflects the overall proportion / strength of connections between network members (Sohn and Leckenby, 2004). In the Website the structure of linkage forms one of the architectures as players. Each of the websites or pages connected linked by URL. The connections of them make the WWW and the core of the Internet. Measuring the network density of link is one of the artifacts to conceptualize the web sites and pages and understand the flow and structuring process of information and technology.

The link structure was obtained from a public available database created by crawler-based search engine to measure link popularity and this is a relatively mature Web-using area (Thelwall 2001a, 2001b; Thelwall and Wilkinson 2004). Page Rank is an excellent way to prioritize the result of web keyword searches of its citation (Brin and Page, 1998). Page Rank means the accuracy of correspondence. Web usage information is utilized to provide information about the number of page views and number of users that Web sites receive. This data is to help people navigate the Web more efficiently by giving them all the information they need to make informed decisions about the sites they visit (<http://www.Alexa.com>).

This is used by Optitools 3.x in crawler-based search engine as formative method. Each of the web sites analyzes total link (TLINK), incoming links (INLINK) and outgoing links (OUTLINK), and target domain

(TDOMAIN) as formative analysis in perspective of resource. Network density (ND) is measured by total link and domains. And Alexa Traffic Ranking (ATR; 1 = top rank) measured by Alexa.com and Google Page Ranking (GPR; 7 is high grade) by Google as popularity compare with them.

**Data Collection**

Corporate cost-management consultants have found that travel and entertainment expenses are the third-largest controllable expense in business organizations (Johnston and Sherlock 1999; Chircu and Kauffman 2000). The tourism industry seeks to generate international demand for local product. Access to global market is critical. The tourism industry is an information intensive industry. The generation, gathering, processing, application and communication of information are important for the day-to-day operation of tourism businesses, making the effective use of information technology critical (Dargan and Prosser 2001).

Analyzing the tourism industry presents various interesting aspects both academically and practically. Corporate cost-management consultants have found that travel and entertainment expenses are the third-largest controllable expense in business organizations (Chircu and Kauffman 2000). The research samples are 190 (n + 3<sup>rd</sup>) of 697 travel agent companies chosen from favorite and top portal site (naver.com) in Korea. The available samples are 180 of 190 samples. The sampling used stratified sample method in business decision which user or surfer in the WWW searches and choose and click the URL in one of the search results (Lapin, 1987).

The leading search engines are 5 search sites to analyze the link popularity; Google.com, Alltheweb.com, Altavista.com, MSN.com, and Yahoo.com.

**Data Characteristics**

Table 1 as a result of descriptive analysis summarizes mean, maximum, and standard deviation of total link (TLINK), incoming link (INLINK), outgoing link (OUTLINK), and target domain (TDOMAIN) of 180 travel agencies websites. The mean of link in the sample websites have 54 Total links (TLINK), 6 incoming links (INLINK), 48 outgoing links (OUTLINK), and 23 target domain (TDOMAIN).

As a result, the incoming link is smaller than outgoing link. It means most of the websites focus on outgoing link to find information resource and reliability of information from other web sites. Additionally a few of authoritative websites have many incoming links. This descriptive result of the 180 samples has shown the characteristics of the Web.

TABLE 1: DESCRIPTIVE RESULTS FOR SELECTED VARIABLES

	Mean	Maximum	Std. Deviation
TLINK	54.23	1272.00	142.84
INLINK	5.79	163.00	17.51
OUTLINK	48.44	1270.00	134.09
TDOMAIN	23.93	465.00	43.94

As Fig. 3, the characteristics of sample websites have shown the minimum and infinitesimal authorities site by Barabasi (2003). The total link is gathering the 10th and target domain is concentrating 20th. And figure 4 reports descriptive of rank of visit traffic as information users' activities and rank of information accuracy and accessibility.

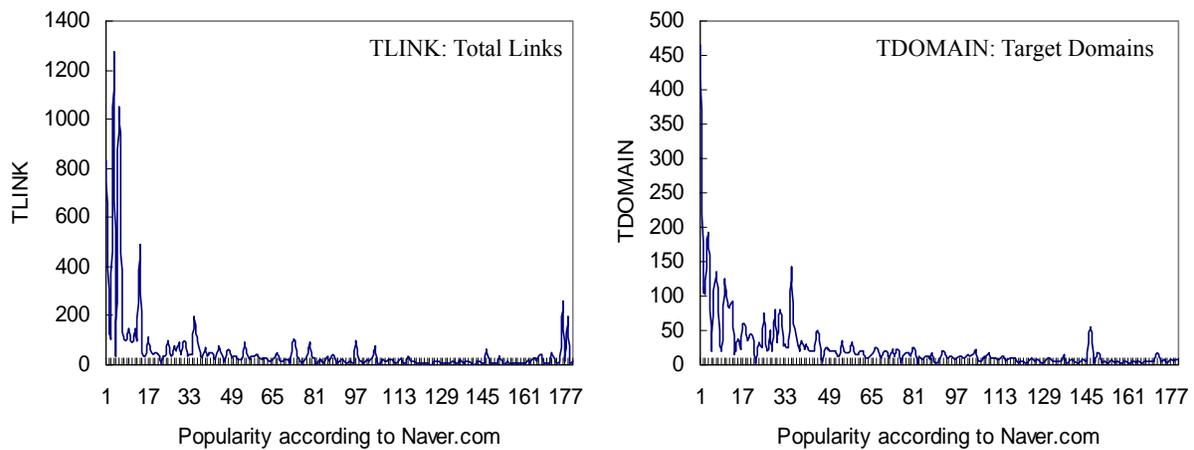

FIG 3: TOTAL LINK AND TARGET DOMAIN FREQUENCY

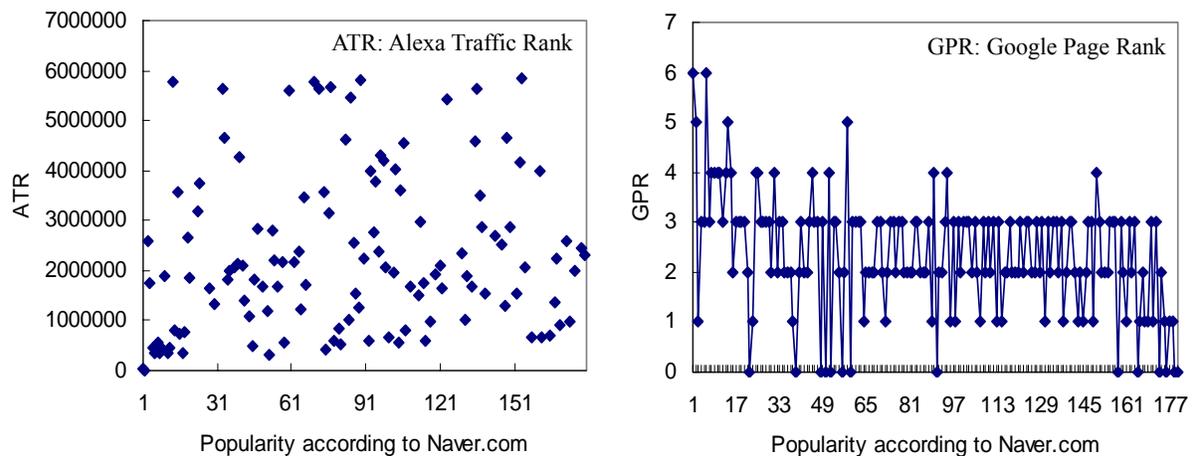

FIG 4: ALEXA TRAFFIC RANK AND GOOGLE PAGE RANK

## Results

Relationship of web link structure and information resource based on direct network has been measured by the Pearson correlation coefficient ( $\gamma$ ) which measures the strength of a linear relationship between two variables. Among the nine variables selected, there are 36 pairs – thus 36 coefficients. In 36 coefficients, available coefficients are 24 pairs in  $p < .01$  and 6 pairs in  $p < .05$ .

In perspective of link and domain, The correlation between TLINK and OUTLINK, TLINK and INLINK, and TLINK and TDOMAIN is positive indicating that outgoing links increase so do a number of total links.

The value of network density is modified Log function (LOGND) and Absolute Log function (ABSLogND). In viewing of network density, ABSLogND is proper to understand the web structure. The correlation between ABSLogND and TLINK and ABSLogND and TDOMAIN is positive indicating that network density to understand the web structure increases a number of total links and target domain. As performance of Alexa Traffic Ranking (1 – top rank) and Google Page Ranking (7 – high grade), the correlation between ABSLogND and ATR and TLINK and ATR is negative indicating that network density and total link increases a traffic ranking. And the correlation between ABSLogND and GPR and TLINK and GPR is positive that total link increases a grade of page ranking.

TABLE 2: PEARSON'S CORRELATION RESULTS

	1	2	3	4	5	6	7	8	9	10
1. TLINK	1.000									
2. INLINK	.546(**)	1.000								
3. OUTLINK	.994(**)	.451(**)	1.000							
4. TDOMIAN	.679(**)	.577(**)	.648(**)	1.000						
5. ND	0.109	.366(**)	0.068	-0.088	1.000					
6. LogND	-.191(*)	0.014	-.205(**)	-.583(**)	.475(**)	1.000				
7. ABSLogND	.339(**)	.319(**)	.319(**)	.645(**)	.209(**)	-.627(**)	1.000			
8. ATR	-.226(**)	-.230(**)	-.211(**)	-.255(**)	-0.009	.181(*)	-.221(**)	1.000		
9. LogATRn	-.349(**)	-.384(**)	-.321(**)	-.499(**)	0.026	.286(**)	-.341(**)	.811(**)	1.000	
10. GPR	.371(**)	.215(**)	.368(**)	.428(**)	-.173(*)	-.382(**)	.297(**)	-0.120	-.304(**)	1.000

\*\* Correlation is significant at the 0.01 level

\* Correlation is significant at the 0.05 level

As a result, there are relationships among websites link frequency, web link structure, popularity. Further more, although the sample size is small in a part of million or billion web page, network density is positive indicating to understand the web link structure and ranking in one of website' performances.

This is employed the structural equations modeling with AMOS (Arbuckle and Wothke, 1999). A structural model was estimated to assess path and explained variance estimates. The *Hypothesized* structural model yield a good fit ( $\chi^2 = 30.261$   $df = 7$ ,  $p < .01$ , CFI = .99, TLI = .97, RMSEA = .13). Figure 5 shows, 7 paths were significant (H1, H2, H3\_1, H3\_2, H4, H5, and H6). In sum the *Hypothesized* model was mostly supported.

In structuring process, network density of web link structure as technology world have been influenced by target domain. And network density world have an influence on performance of rank with traffic frequency rank by Alexa and keyword accuracy rank by Google.

Additionally in direct network by information resource, according to total links summing of incoming and outgoing links, total links world have an influence on traffic frequency rank by Alexa and keyword accuracy rank by Google.

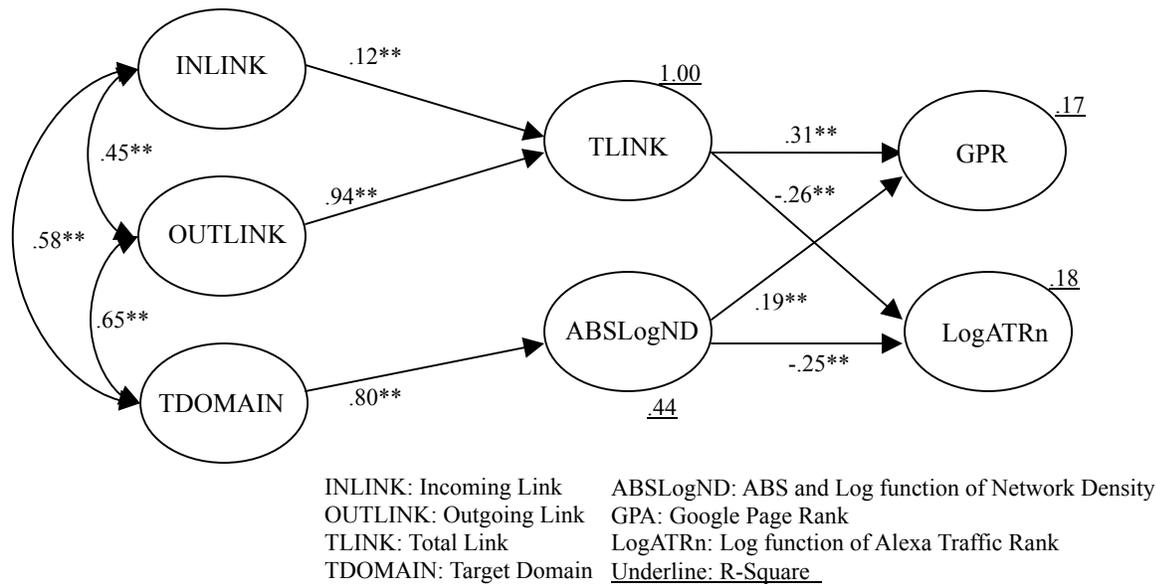

FIG. 5: STRUCTURAL MODEL RESULTS

## Conclusions and Future Work

Their websites in the Internet have been represented of the state of nowadays' business process and strategy for tomorrow's successful performances and outcomes using information technology. The connection in the network structure of the Internet has shown the backbone and the relationship between websites shown the link in the web pages; incoming and outgoing link. The link of web pages plays an important role of defining the characteristics of relationships in the websites.

Relationships of link power effects the ranking of websites' traffic as Alexa.com and the grade of page ranking as Google.com. In viewing of the web link structure, network density is available to figure and form the web link structure as an artifact of direct network. As shown in figure 5, it found the four strong relations and four weak and two negative relations. But two negative relations is a result of just the ranking number. Therefore traffic ranking is positive effect to improve the rank. In a direct network, we found that most of website except the minimal and infinitesimal authorities promotes the outgoing link to find the good information provider or web service in B2B and B2C.

The limitation of this paper focused on not the hubs and communities but the authoritative website. It is a part of the commercial one. And each of information resource is not the nature of resource but the direction.

# Why U.S. is Falling Behind on High Speed Internet

*Ruben Xing  
Montclair State University, USA*

## Abstract

**The high speed Internet with wired or wireless broadband will certainly leave no field untouched. While several Asia and Europe countries have quickly adopted and developed broadband, the U.S. lags behind the move. As Productivity growth and military power are now driven primarily by information systems, which are becoming heavily Internet-dependent, the high-speed telecommunications problem is becoming a major bottleneck in the U.S. and world economy.**

## High Speed Internet

High-speed Internet technologies are all about freeing people from having to be connected with regular telephone lines or cables, and letting them have speedier data connections than they ever imagined. The so-called broadband Internet encompasses all evolving high-speed digital technologies that provide consumers integrated access to voice, high-speed data, video-on-demand, and interactive delivery services, are a fundamental component of the communications revolution.

### The High Speed Internet State

According to BusinessWeek, South Korea, Japan and some other nations or regions such as Canada, Singapore, Hong Kong, Taiwan, Belgium, Iceland, and Denmark have quickly adopted policies to promote broadband years ago. In contrast, no U.S. administration has yet endorsed a comprehensive plan. In 2000, America had the world's third-highest broadband adoption rate. In 2003, it dropped to 10<sup>th</sup> place.

Currently, the U.S. phone companies sell 500K bit per second to 1 megabit digital subscriber line (DSL) connections for around \$30 a month, and the cable companies offer cable modems with maximum speeds of 3 megabits for \$40 ~ \$45 a month. Broadband is available to 89% of all U.S. households, but only 18% subscribe today. While the Europe's speeds and penetration are similar to those in the U.S., in South Korea, the recognized world's broadband leader, there are 73% of households subscribe to high-speed Internet. Most Koreans pay \$27 a month for a connection speed of up to 3 megabits. A few thousand choose to pay \$52 a month for a 20-megabit advanced DSL (ADSL) connection, which is much faster and cheaper than anything available to Americans. Japanese can get some of the fastest and cheapest broadband service in the world up to 26 megabit for about \$30 a month.

### The Wireless Internet

Actually, high speed Internet technologies all started with digital cell phones a decade ago, and now has exploded into a panoply of radio technologies – from wireless local area networks (WLAN) to smart antennae, ultra-wide band transmission and mesh networks. The 802.11b (Wi-Fi) standard created an entirely new market for wireless networks during the depth of telecom's worst recession and the time when the broadband Internet started booming. Wireless Internet networks are being deployed to previously underserved areas and are creating new competition for cable and DSL. According to Telecommunications' Future 2003-2008, analysts at Insight Research Corp. predict that the market for products and services based on the 802.11 specifications will grow from revenue of \$7 billion this year to \$44 billion by 2008.

## What Is Holding Up U.S. High Speed Internet

There were sayings that the U.S. high speed Internet was lag behind and moving slowly because of narrowed ranges of spectrum and interferences of useful frequencies. Demanded spectrum and frequencies for broadband communications are governed tightly by FCC. It sounds that technical limitations are major curbs of broadband

development in America. Historically speaking, the regulations governing the separation of broadcasting channels, to prevent neighboring stations from each other, were established 70 years ago, when the technical solutions were highly limited at the time.

#### **Not a Technical Issue**

Today, a radio is more likely to be a piece of software burned into a digital signal processor chip hopping from channel to channel during a nanosecond, while seeking gaps through which to send bursts of data. The channels of current broadband to communicate can be crammed with no buffer zones between them. Also, when such adaptive digital radios are allowed to co-operate with one another, the network's capacity can actually increase – rather than decrease, as was long believed with every new radio added. Therefore, the interference is irrelevant, and bandwidth, as a measure of communication capacity – is also irrelevant. So we believe that the biggest problem inhibiting broadband in the U.S. is the habit of reserving various radio bands for specific services. Historically, that made sense when it was hugely expensive to build radios that could be turned to more than a few adjacent bands. Today, digital radios that can dynamically jump all over the spectrum are to be had for the price of a microchip.

#### **What Is Holding Up**

As explained above, the so-called spectrum and frequency interference are not the reasons blocking Internet communications. The faster Internet speeds in other countries are less about technological prowess, they are more about policy. A clear fact in Korea or Japan that the government made the deployment of broadband services a national priority. Plus, Korean government deregulated what had been a monopolistic phone system and opened the market to competition. That stimulated a race among providers to wire up the nation quickly. Moreover, those countries are more densely populated than U.S., it made broadband deployment much easier and cheaper.

In the U.S., in addition to larger territory and population in the country, there are not sufficient broadband services and applications provided, such as online movies, concert or games that need higher speeds. More importantly, the conserved development is largely confined by U.S. telecommunication regulations. For instance, the Bells, the major U.S. telecom technology developer complain that archaic rules designed for traditional telecoms services rather than the Internet, curbed and discouraged them from providing faster DSL services. They further argued that those rules are ambiguous because a different set of overlapping regulations still requires them to share their lines with rivals at government-mandated prices. So far, the U.S. is not having a comprehensive and strategic high speed Internet plan. The U.S. Congress is unlikely to force politically powerful Bells to share their networks, even through lawmakers are expected to rewrite the telecom industry's regulations next year.

Another hitch for moving U.S. broadband quickly is that the best radio spectrum for wireless Internet isn't available. It is being used by TV broadcasters for analog transmissions. American broadcasters have been given another set of airwaves, for digital TV, but they're not eager to forfeit their freebie. (Catherine Yang, September 2004). As some of U.S. telecom developers complained that the wireless broadband is currently allocated to wrong spectrum and the result is hampering the growth of the technology, according to former Federal Communications Commission (FCC) chairman Reed Hundt (Roy Mark, April 2004). The problem is said that wireless broadband is being designed where the radio frequencies are very high, and as a result, the radio waves can not penetrate buildings. As this rule was defined by the 1996's Telecom Act, the U.S. congress has shown an increasing interest in reforming this rule.

### **U.S. Catch Up Plan**

To have any hope of joining the world's broadband vanguard, more deregulation is the key. The U.S. must create a viable third competitor (Catherine Yang, Sept. 2004). According to FCC, the U.S. aims to classify both the phone companies' DSL and cable operators' cable-modem operations as "information services". The Commission recently adopted its fourth report on the availability of advanced telecommunications capability in the United States, and that advanced telecommunications capability is being deployed on a reasonable and timely basis to all Americans. (FCC News Report, Sept. 2004)

FCC reported the significant development of new access technologies that has taken place. It highlights the growth in Wi-Fi Internet access hotspots, WiMax, third-generation mobile phones, personal area networks, satellite technologies, fiber to the home, and broadband over power lines, in addition to more familiar cable modem and DSL

services. Recently, FCC also described the development of new Internet-based services, such as voice communications over Internet protocol (or VoIP).

Chief among these rival services, 802.16-WiMax looks most promising. It can extend broadband wireless over longer distances and at higher speeds than current Wi-Fi or Bluetooth systems. Its access range is up to around 30 miles (48 kilometers), compared to Wi-Fi's 300 feet (91 meters) and Bluetooth's 30 feet. It supports data transmission speeds up to 75Mbps (bits per second), compared to the popular 802.11b Wi-Fi standard's 11Mbps or the 802.11a's 54Mbps. In addition to its distance and speed advantages, WiMax doesn't require line-of-site transmission. Many experts expect WiMax service to be deployed in rural areas, where high-speed cable infrastructure is either poor or nonexistent. Some also see opportunities to use the technology for backhauling traffic between Wi-Fi hot spots, as well as for creating large wide-area hot spots.

The recent FCC reports demonstrate that the United States is making substantial progress in closing the gaps in access for traditionally underserved areas. Those in rural areas, those with low incomes, and those with disabilities – who stand in particular need of advanced services—are finding advanced services more available. Federal and State governments can provide other incentives to create a third rival. Government can attract broadband to populated regions without tax dollars by creating pools of local buyers – a measure Canada has adopted to reach its vast rural expenses.

## **The Future Of Broadband**

Over the next few years, broadband connections will go into the air, the home, the taxicab, and the all businesses (Gabriel Allan and Evan Schuman, *Businessweek*, September 2004). High speed Internet will include a whole new suite of concepts. Those concepts will include everything from Internet security devices to audio and video, from video collaboration and file sharing to distribute computing and data storage. And the much-ballyhooed convergence of voice, data and multimedia also will be a factor.

The future of communication is high-speed, wide-band digital with interactive data and voice,” says David Robinson, president of the Motorola broadband communications sector. “A company that offers principally video or data will be able to offer competitive voice. For the business user, that will mean more control, more variety and more choice.” The future of broadband offers great opportunities, as long as executives think about and plan for it in advance. Executives will have exciting new tools for sales, marketing, product development and other business tasks that can be enhanced or simplified by using high speed Internet. But issues of security, robustness, pricing and coverage will continue to arise, and it's important to watch the changing landscape.

While several broadband leading countries are offering up online digital content market, which includes gaming, music, and video, most U.S. telecom providers are only just beginning to roll out services. The high-speed Internet connections running at speeds of 10 to 20 Mbps won't become available to most consumers for at least three to six years, according to Walt Megura, general manager of Nortel Networks.

## **Conclusion**

America lags behind several current leaders in the world on high speed Internet development. The cause is less about technological prowess and more about policy. Policymakers should make structural reforms in industry, policy, and the U.S. regulatory system. Appropriate measures include structural separation of switching, enhanced services, and data transport in the telephone industry; divestiture of content from transport in the cable television sector; mandatory open interfaces for interconnection; increased financial transparency and disclosure; and reforms in regulatory systems to increase their efficiency, high technology expertise, and political independence. In short, more deregulation is the key. A new era in the evolution of broadband is approaching, but it won't happen overnight.

## Abstract

With the accelerating globalization of the Information Technology (IT) solutions the paradigm of IT Outsourcing has become the media's punching bag du jour. The myriad advantages of the concept gratify this popularity. With the rapid progress in the global outsourcing, companies are embracing different models of outsourcing. Of all the models, offshore outsourcing has been particularly popular in the context of outsourcing to India. Starting with services like providing the talent pool, project execution, now the trend of offshore outsourcing is moving towards the higher value echelon of the IT value chain with activities like product design and development, consulting among many others. This paper provides a benefit-and-risk framework and presents different models of offshore outsourcing. The paper also discusses the paradigm of offshore outsourcing by providing a bird's eye view of the major IT services outsourced to India and predicts the possible changes of the nature of the services outsourced to India.

## Introduction

Outsourcing can be defined as an outside company's provision of the products and services associated with a major function or activity of the user organization [2]. In simple terms, outsourcing consists in conducting one or more organizational activities, using external agents [10]. Fuelled by the need for business flexibility to respond quickly to changing markets outsourcing brings with itself, inter alia, the advantages of improving the company's focus on its core competency, gaining access to the world class society, reducing investments in the non-core activities of the company, reducing the risks by sharing the investments, improving the production, abstraction of delays, creation of jobs due to the growing economy and so on. There are also challenges and associated risks as mentioned in Table 1. In the current scenario, where the recession of the US economy left no part of the world untouched, many companies are looking at outsourcing as a way to improve their bottom line while maintaining or even improving the service levels.

TABLE 1: BENEFITS ANDE CHALLENGES/RISKS OF GLOBAL OFFSHORE IT OUTSOURCING

<u>Benefits</u>	<u>Challenges/Risks</u>
<ul style="list-style-type: none"><li>• Lower cost</li><li>• Greater focus on the company's core competency</li><li>• Reduced project timelines/time to complete/abstraction of delays</li><li>• Increased IT department productivity</li><li>• Competitive advantage</li><li>• Internal customer satisfaction</li><li>• Improved quality of services</li><li>• Access to technological expertise</li><li>• Gaining access to the world class society</li><li>• Reducing investments in the non-core activities of the company</li><li>• Reducing the risks by sharing the investments</li></ul>	<ul style="list-style-type: none"><li>• Managing communication</li><li>• Cultural differences</li><li>• Lack of internal processes for specifying work</li><li>• Lack of internal customer management skills</li><li>• Additional costs including vendor selection, transition cost, legal/contract costs amongst others</li><li>• Service debasement</li></ul>

## Offshore IT Outsourcing to India

In the last decade, a tremendous growth and change in e-business has been driving the software industry to move to countries like India and Ireland [12]. India has been the favorite destination for many companies around the globe for offshore outsourcing because it cuts application development and maintenance costs while delivering the highest quality work and improving productivity. Approaches have ranged from subcontracting portions of software development projects to third-party companies or subsidiaries, to establishing truly virtual development teams [25]. With the rapid growth of outsourcing, several mix and match models of outsourcing are emerging. Companies can choose an on-site arrangement, off-site processing in the outsourcer's facility, near shore processing in a contiguous country, or an offshore model in which the processing is done in a country with a very low-cost structure [8]. The classification is elucidated in Table 2. Offshore outsourcing has been particularly a more suitable model for India; literature suggests – offshore outsourcing in India is not only the most popular management practice but also covers around 80 per cent of the offshore outsourcing market [5, 25].

TABLE 2: TYPES OF OUTSOURCING

	Onsite	Off-site	Near shore	Offshore
Cost savings	Low	Moderately low	Moderately high	High
Location of outsourcing	Close	Moderately close	Moderately remote	Remote
Outsourcer hiring the customer's personnel	Yes	No	No	No
Outsourcer hiring the customer's equipment	Yes	No	No	No
Level of control on the outsourcer	Low	High	High	Low
Level of cost saving for the customer	High	Low	Moderate	High
Focus on the relationship with the outsourcer	High	Low	High	High

Offshore IT outsourcing is an important and emerging field in the area of information systems [18]. IT outsourcing is defined by Loh and Venkatraman [13] as “the significant contribution of external suppliers in the physical and/or human resources associated with the entire or specific component of the IT infrastructure in the user organization”. Rajkumar and Mani [20] define offshore outsourcing as: “When the supplier of software development is from another country than the firm that decides to outsource Information systems”. Smith, Mitra & Narasimhan [22] define offshore outsourcing as software development that is done in other countries than those that have traditionally dominated the software development industry. Firms entering into offshore outsourcing aim primarily to gain access to highly skilled professionals at a reduced cost [1].

Bill Gates' prediction in 1999 that “India is likely to be the next software superpower” has largely been realized [6]. Terdiman and Karamouzis [23] claim that today, India dominates 80-90 per cent of the total of offshore development revenue worldwide and is expected to be the key leader in offshore outsourcing in the next 5 years. India's outsourcing export revenues now exceed \$7 billion, making it the country's largest export, and the country is home to some half a million IT professionals [17]. The other main factors fanning the potentials of IT outsourcing in India are - abundant English speaking talent pool, improving infrastructure, geographic location – leveraging time zone differences, galloping growth of the India economy, greater thrust of the government in supporting the IT sector et cetera. A detailed SWOT (Strength, Weakness, Opportunity and Threat) analysis of offshore IT outsourcing is given in Table 3. In the light of the present economic downturn, the primary motivation behind offshore outsourcing is cost reduction, especially lower per capita labor costs [7, 21]. Software development costs in India is estimated to be 30-40 per cent lower than those in developed markets [11]. Evident is the fact that the vast wage differentials are prompting companies to move their labor-intensive service jobs to countries with low labor

costs: for instance, software developers, who cost \$60 an hour in the United States, the world’s biggest offshorer, cost only \$6 an hour in India, the biggest market for offshore services [2].

TABLE 3: SWOT ANALYSIS OF OFFSHORE IT OUTSOURCING TO INDIA

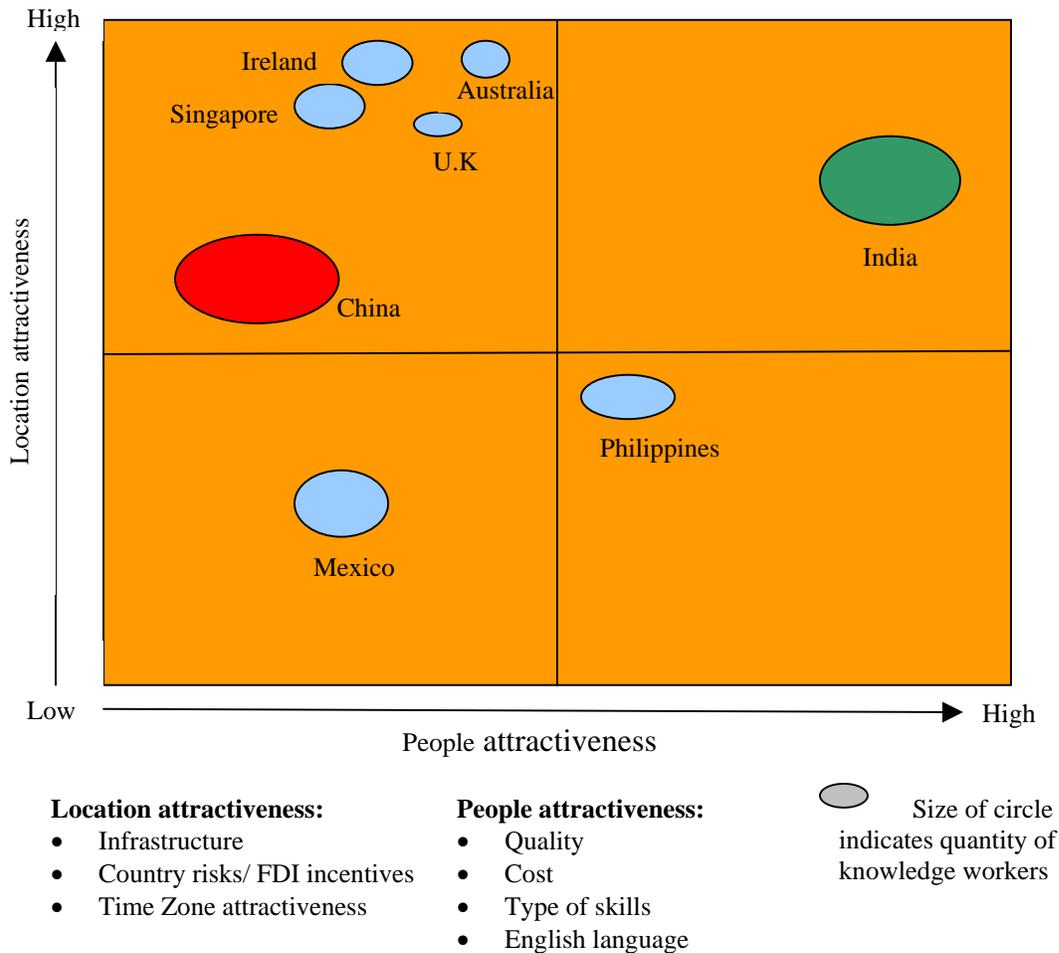

<p style="text-align: center;"><b><u>Strengths</u></b></p> <ul style="list-style-type: none"> <li>• Access to a diverse set of skills and support for new technologies</li> <li>• Competitive costs</li> <li>• Widespread use of the English language</li> <li>• Mature, experienced and stable vendors</li> <li>• Experience with remote engagement management</li> <li>• Ability to normalize demand for staffing</li> <li>• Accelerated delivery/reduced project timelines (leveraging time difference)</li> <li>• Highly trained workforce</li> <li>• Appreciation for software quality</li> <li>• Development disciplines</li> <li>• Government policies &amp; Taxation</li> </ul>	<p style="text-align: center;"><b><u>Weaknesses</u></b></p> <ul style="list-style-type: none"> <li>• High communication cost</li> <li>• Project management</li> <li>• Transition</li> <li>• Collaboration</li> <li>• Cultural issues</li> <li>• Continuing geo-political uncertainties</li> <li>• Sometimes intensive training needed for developers</li> </ul>
<p style="text-align: center;"><b><u>Opportunities</u></b></p> <ul style="list-style-type: none"> <li>• The offshore market expanding into the activities at the higher end of the value chain</li> </ul>	<p style="text-align: center;"><b><u>Threats</u></b></p> <ul style="list-style-type: none"> <li>• The rise of alternative geographies</li> <li>• Communication</li> <li>• Potential for backlash</li> <li>• Knowledge transfer</li> <li>• Time zone difference</li> <li>• Building engagements too rapidly</li> <li>• Cultural divergence</li> <li>• Immaturity of infrastructure*</li> <li>• Political flux*</li> <li>• Geographical distance between vendor and client*</li> </ul>

\*Challenges less acute in nature

However, it is worth mentioning that with the advent of Quality System Standards, quality is the new catchphrase of the industry. By meeting and exceeding the quality of the service offering, quality has become a more attractive grasp than the lower cost benefits involved in outsourcing IT services to India. Forrester research cited by [15] shows that almost two out of five Fortune 500 firms currently outsource some software requirements to India to gain advantages of the high quality IT workforce and low cost base. As mentioned earlier, the other grand advantages outsourcing has bestowed to the global business community is the strength to upgrade their core business while embracing the cutting edge technology. It is worth mentioning that as the market matures, opportunities based on the traditional rationale for outsourcing i.e., economies of scale and scope, are diminishing in value. Larger firms now outsource for strategic reasons to leverage their business benefits of IT/IS [4].

### Value Chain of the IT Outsourcing to India

In spite of the emerging threats to the existing domination in the offshore IT outsourcing arena, there are huge opportunities for India to continue with the on going state of dominance. Please refer to Fig. 1. Apart from IT, Indian companies are contributing a variety of outsourced services varying from customer care, transcription, billing services and database marketing, to tax processing, transaction document management, Web sales/marketing, accounting, telesales/telemarketing, HR hiring and biotech research.

Source: McKinsey analysis.

FIGURE 1: INDIA'S ATTRACTIVENESS VIS-À-VIS ITS CONTENDERS [17]

Value' activities are physically and technologically distinct activities a firm performs and are the building blocks by which firms create products valuable to its buyers [19]. Today, large companies are outsourcing a greater range and depth of services than ever thought possible. Recent innovations, e.g., offering by Application Service Providers, are providing additional opportunities for the outsourcing of functions that previously they would never have contemplated [9,3]. At present, application development is the most frequently outsourced activity. Other functions commonly sent offshore include call center, system administration/support and help desk. Many Indian vendors also offer management consulting services, infrastructure outsourcing services, help desk and desktop outsourcing services. The Indian IT-enabled services industry is set to move well beyond contact center, low-skilled work driven by the early success of the first movers [17]. Please note that in this paper, the analysis of the value chain does not include all the links in the value chain but provides an overview of the type of outsourcing contracts, the services offered.

## Trends of Offshore IT Outsourcing in India

The offshore IT outsourcing in India mainly consists of Product Component Outsourcing, Process Component Outsourcing and Total Outsourcing. Product Component Outsourcing deals with offshoring a part of the project to the client. This could be particularly suitable when the client may not possess the technology or skills needed for the complete assignment/ project. Process Component Outsourcing means outsourcing a part of the function of one or more of their processes. Complete Outsourcing deals with outsourcing all the phases of the project including the activities like design, coding, implementation et cetera. The next direction for the Indian vendors is to continue to move up the value chain by offering services related to Process Component outsourcing - architecture, design, and development and technology strategy services. Whereas in the past, Indian suppliers focused primarily on delivering application-related services, they now offer everything from applications support to infrastructure management (including data center outsourcing, network management, data center consolidation, strategic consulting, and help desk outsourcing) to various flavors of business process outsourcing (BPO) — or IT-enabled services, as they are typically termed [14]. This implies - in addition to its overall growth, the market is also diversifying and expanding to encompass non-application-related services. The top-tier Indian vendors exhibit a flair to move up the value chain and offer high-value consulting and project management skills in order to compete with US-based IT services firms. In addition, the current trend of moving to the higher end of value chain involves activities like product design, adding value thorough the R&D, predicting the future directions of technology. It makes business sense for Indian firms to move faster on the value chain ladder and get more involved in research & development (R&D), product creation, brand management and strategic consulting, and providing more net centric and ecommerce type interactive services to customers [18]. The other areas into which IT offshoring is likely to expand are – legacy, e-business application integration.

# **Does the Indian Business Process Outsourcing (BPO) Experience Provide the Role Model for Information and Communication Technologies (ICTs) in Developing Countries?**

*Colleen Vanderstaay  
Central Queensland University, Australia.*

## **Abstract**

**This paper explores the phenomenon of BPO particularly as it relates to India and poses the question as to whether this is the way forward for developing countries in using ICTs for economic development. The paper will consider the link between ICTs and development, the nature of BPO and its rise as one of the fastest growing ecommerce services, the phenomenon of BPO in India and the political backlash against offshore outsourcing and whether the Indian success story could provide a model for progress via ICTs in other developing countries. Factors predicting success will be identified. The perspective adopted is that BPO should be seen as part of globalisation and trade and not in isolation. What appears to be evolving is a global delivery model with potential benefits for both developed and developing countries.**

## **Introduction**

In recent years India has achieved considerable success in business process outsourcing (BPO) and other developing countries have sought to emulate this success. This paper considers the factors underlying India's success in determining whether the achievements by India can be replicated by others. In seeking to answer this question the following issues will be considered: the link between ICTs and development and whether outsourcing may provide the so far largely elusive link, the nature of BPO and its evolution from data processing to business process transformation, the various tiers of offshoring supply countries, the implications of extending globalisation to services trade, research showing additional economic benefits to the developed country, the models developed for evaluating national software industries, the Indian experience and the conclusions to be drawn regarding the likely success of other developing countries with BPO. Despite the political backlash in developed countries the available evidence would suggest offshore outsourcing will continue and expand in the future as it is an evolutionary process in trade and those not involved will be at a trade disadvantage. In this paper I consider the research and models proposed to evaluate future directions.

## **Link between ICTs and Development**

In recent times ICTs have been advanced as a means of propelling developing countries into the global economy and assisting with economic development. While this has been the focus of the development agenda by the international community the empirical evidence underpinning a link between ICTs and development in the developing world has so far been largely elusive. Research by Kirkman suggests that electronic commerce in some form could impact on the growth of developing countries while Heeks is of the view that the development agenda by aid agencies has been largely misplaced and that attempts to emulate India's success in software development will be unsuccessful.

In 1999 Kirkman (Kirkman 1999 at p 1) posed the question as to whether the leapfrogging of development through ICTs was feasible. His answer while not unequivocal did express some optimism. While he recognised that many claims regarding the potential of ICTs to overcome the problems of the developing world were extravagant nevertheless he was of the view that some manifestations of electronic commerce could significantly impact upon the economic growth of developing countries. The most promising area he considered to be technology-mediated information service processing (Kirkman 1999 p7). He saw the two main drivers behind this success as being the rising quality and declining cost of technology which allows services to be carried out over global networks and the continuing discrepancy in wage rates between developing and developed nations which allows firms to use a labour arbitrage model to contract out services to low cost service providers. Other factors, which drove the

competitiveness of offshore outsourcing models included language and time zone differentials. He saw trade in services as the driver in electronic commerce in developing countries since infrastructure problems would still impede other forms of international trade.

Heeks (Heeks 2000) has also been of the view that the development agenda of the international agencies has been misplaced. Heeks viewed this as being "a focus on the 'icing' and not on the 'cake'" (Heeks 2001 p1)). The implications for development he saw as three fold: (1) the focus on small firms and poverty re ICTs is misplaced as it has been large firms which have been the engine for development in industrialised and newly-industrialised countries (2) It is business to business (b2b) transactions where most activity is occurring not in business to consumer (b2c) or government to consumer (g2c) transactions (3) the new economy has not arisen from the use of ICTs in business, government and other sectors but rather from a boom in the production of ICTs – the IT producing sector. For developing countries this money goes to the US ICT producing firms (Heeks 2001 p 2).

Heeks asserts that at least 80% of ICT use projects in development fail leading to a massive wastage of investment and that the link between ICTs and development is unclear. His view is that the investment of aid money in such circumstances is misplaced. (Heeks 2000 p 3).

Heeks is also of the view that there are many myths regarding software development in developing countries and these myths may hinder other developing countries wishing to emulate India's performance. "India's apparent success in software exports has encouraged many developing countries to naively believe that they can follow the same path. But they cannot. Adding to its inherent linguistic and size advantages, India has spent more than two decades developing the requisite skills, contacts, policies and infrastructure that are so lacking in many other countries. As a result, it will continue to consolidate its position whilst squeezing out latecomers." (Heeks 2000 p 3) Even for India Heeks dispels some myths. Figures quoted on software are deceptive as exports are gross figures and much of this money leaves India to pay for travel and living expenses in the client's country, for marketing and for software and hardware imports.

Recent concerns have related to job losses in the west as a result of outsourcing to places such as India. Previous concerns regarding the exodus of manufacturing jobs abroad have again arisen in relation to service industries with a fear that countries like India will cause displacement in the United States and elsewhere.

A study by Forrester Research estimated that this type of labour migration, generally referred to as outsourcing if contracted to another company, or offshoring if run by a company itself, could send 3.3m American jobs overseas by 2015. India is expected to get 70 per cent of them. The concern is with job losses and the political pressures resulting from that. A reaction to the threat of job losses by legislating against outsourcing is counterproductive as outsourcing is just trade. (Walman 2003). What is occurring is the result of a shift in production as a response to comparative advantage.

Hence the issue has been defined as a trade issue, likened to what occurred in manufacturing several decades ago and also likened to the "flying geese" pattern of East Asian development (only in this case being "flying geeks") with India being the lead goose with other countries aspiring to follow its flight path. (O'Connor 2003).

There is a trend of developing countries developing a growing presence on the Internet even though this is concentrated in a small number of countries. China, Republic of Korea, India, Brazil and Mexico accounted for approximately 62% of all Internet users in the developing world. Estimates by the International Telecommunications Union (ITU) (UNCTAD 2004 b) were that about 12% of the world population (676 million) had access to the Internet at the end of 2003, almost 3 out of 4 Internet users in developing countries lived in Asia as did two thirds of all the new Internet users in the world. There is little doubt that Asia is the focus of the uptake of the Internet in developing countries. Refer to Fig.1 which shows internet users in developed and developing countries in 2000 and 2003 (UNCTAD 2004 b)

FIG. 1: INTERNET USE 2000 AND 2003. (DATA SOURCE UNCTAD 2004 E-COMMERCE AND DEVELOPMENT REPORT 2004.)

How feasible is it that outsourcing will provide an effective utilisation of ICTs for developing countries. To answer this we need to consider the nature of business process outsourcing (BPO) and consider what has occurred in India and why.

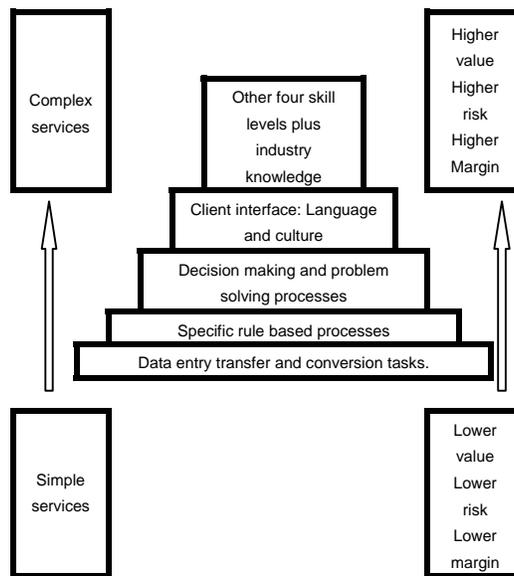

### Business Process Outsourcing (BPO)

While outsourcing has been used for some time for other purposes particularly manufacturing it has only been relatively recently that this has extended to information technology and business process outsourcing. The growth in this area has been attributed to advances in information and communication technologies (ICTs) together with the globalisation of the world economy. (UNCTAD 2003). The growth has occurred in information technology enabled services (ITES) and business process outsourcing (BPO).

The term offshore outsourcing "is now in wide use globally to describe outsourcing to a provider in another country" (UNCTAD (2003 p136). A definition of BPO is difficult to arrive at given that it is an umbrella term to encompass an increasing number of functions. Considerable caution has to be exercised in looking at figures on BPO as some include both software and IT enabled services whereas others just refer to the latter hence figures vary markedly depending on exactly what is included as BPO.

UNCTAD (UNCTAD 2003 p137) provides definitions of BPO by three firms, which are both BPO vendors and clients. "Accenture defines BPO as 'contracting with an external organisation to take primary responsibility for providing a business process or function. For Pricewaterhouse Coopers, BPO 'is the long-term contracting out of non-core business processes to an outside provider to help achieve increased shareholder value". Gartner defines it as 'the delegation of one or more IT intensive business processes to an external provider that, in turn, owns, administrates and manages the selected processes based on defined and measurable performance metrics" (UNCTAD 2003 at p 137)

BPO could encompass data entry services, human resources, finance, tele-marketing, management, legal and accounting services, medical transcription, website designing and credit card applications and many other functions. The trend in developing countries is to start out on lower level functions for example, data entry processing and move on to higher level functions for example, human resources. The movement is hence from transaction processing initially to business process transformation through outsourcing. Fig.2 (UNCTAD 2003 p 140) illustrates the BPO hierarchy of services.

Adapted from: UNCTAD: 2003 E-Commerce and Development Report 2003. Chap 5, at p140. UNCTAD/SIDTE/ECB/2003/1

FIG.2: BPO HIERARCHY OF SERVICES

UNCTAD recommends that developing countries should endeavour to move up the hierarchy of services rather than just increasing revenue via greater volume at the lowest levels of the hierarchy. As service providers move up the hierarchy additional skills are required and with this comes an increased employee cost. UNCTAD believes government support is vital to achieve a favourable environment for ICT in developing countries and included in this is a "capacity to identify potential niches and make the required investments in terms of telecommunications infrastructure, education, a legal framework and tax incentives to attract overseas clients" (UNCTAD 2003 p148).

"Outsourcing business processes to developing countries had its beginnings in the early 1990's when US companies began outsourcing to India the conversion of custom-made software programs from one operating system to another (Gupta 2002)" (UNCTAD (2003 p136). India is the main outsourcing provider among developing countries however other providers are emerging in China, the Philippines, Brazil, Russia and many others.

### Offshore Outsourcing is Globalisation in Action

While there has been concern in developed countries that offshore outsourcing leads to job losses and the migration of jobs abroad that aspect needs to be seen in context. Attempts to prevent such outsourcing are really a form of anti-globalisation, which could well impact negatively on a long term basis. The important point to note is that the economic benefits resulting from offshore outsourcing are just an illustration of gains from trade and specialisation. Outsourcing is just trade. The outsourcing of business processes is just a modern day equivalent of what previously took place in outsourcing manufacturing.

The figures themselves also need to be kept in perspective even though estimates vary as to just how big offshore outsourcing is likely to become.

"The current size of the offshoring phenomenon needs to be kept in perspective. First, whereas offshoring is likely to grow over time, most outsourcing remains predominantly a domestic affair; only a small proportion of

all business process outsourcing is international and, within that segment, much is outsourced among developed countries (Scholl et al 2003). Second, there is no sign of offshoring leading to a decline of similar services in home countries .... The 3.4 million service jobs that are forecasted to be offshored from the United States until 2015 (or about 300 000 annually over the next 11 years) seem insignificant compared with the average normal turnover of some 4 million every month.” (UNCTAD 2004a p176)

## **What is the Size of the Market**

In 2002, the market for offshore outsourcing of IT enabled services (mostly business process outsourcing) was estimated at \$1.3 billion– less than 1% of the global market for such outsourcing (Scholl et al 2003)...the total market for all offshore service exports was estimated at \$32 billion in 2001, most of which was supplied by Ireland, India, Canada and Israel, in that order (McKinsey and Co, 2003)” (UNCTAD 2004a p153).

BPO offshore outsourcing excluding software is expected to grow from \$1.3 billion in 2002 to \$24 bn in 2007 and correspondingly the international share of the market is expected to grow from 1% to 14% in five years.(UNCTAD 2004a p153)

The effects on employment have been predicted to be 3.3 million service jobs from the US to low income countries by 2015 according to Forrester Research. It is predicted that offshoring is likely to spread across industries and countries and that appears to be occurring.

Recent trends show companies having a global presence and the emergence of a new type of transnational corporation that supplies the services of other companies. Not only are US companies buying out Indian companies, Indian companies are also establishing a presence in the US and moving to set up a presence in other Asian countries and also central and eastern Europe.

While the US looks predominantly to India there is an increasing trend for European countries to look to outsourcing closer to home in central and eastern Europe. The Czech Republic, Poland and Hungary are securing many of the outsourcing contracts in Europe.

While various research classifies countries involved in BPO according to different tiers and this depends on exactly which services are being ranked a useful description is a Deloitte research report which shows the following:

“Deloitte’s four-tier offshoring supply countries list puts India as a distant leader in the first tier. The second-tier, which comprises ‘challengers’ with moderate offshoring capabilities, includes Canada, China, Czech Republic, Hungary, Ireland, Israel, Mexico, Northern Ireland, the Philippines, Poland, Russia, Spain and South Africa.

The third-tier, which comprises ‘Up-and-comers’ positioning for offshoring with limited experience, are Belarus, Brazil, Caribbean, Egypt, Latvia, Mauritius, Singapore, New Zealand, Ukraine and Venezuela. The fourth-tier comprises ‘neophytes’ with countries such as Bangladesh, Cuba, Sri Lanka, Thailand, Korea, Malaysia and Vietnam. The key factors considered while selecting an offshoring location are cost (38%), proficiency in language (22%), industry expertise (18%), technology infrastructure (9%), time zone (5%), political risk (4%) and climate (1\$).” (rediff.com 2004)

Refer to another classification in Fig.3 which classifies countries as the leader, challengers, up and comers and beginners. (Marriott 2003). Hence the global trends include an accelerating trend towards offshore outsourcing and this is part of a movement towards global sourcing. There are various movements underway with US companies establishing themselves in India and Indian companies moving offshore to the US and other lower cost nations eg China. There is a movement up the value chain in established locations such as India and with increasing wages there, lower value work is moving to cheaper locations. There is recognition that offshore outsourcing is trade and part of globalisation and the emphasis is moving from possible cost advantage to cost disadvantage if offshore outsourcing or global sourcing is not utilised.

Leaders		Up and Comers	
India		Belarus	Lithuania
		Brazil	New Zealand
		Caribbean	Singapore
		Egypt	Ukraine
		Estonia	Venezuela
		Latvia	
Challengers		Beginners	
Canada	Mexico	Bangladesh	Nepal
China	Northern Ireland	Cuba	Senegal
Czech Republic	Philippines	Ghana	Sri Lanka
Hungary	Poland	Korea	Taiwan
Ireland	Russia	Malaysia	Thailand
Israel	South Africa	Mauritius	Vietnam

FIG. 3: GLOBAL SOURCING POWER

### Opportunities in Services Trade for Developing Countries

There has been an outcry from the developed countries regarding outsourcing. An argument advanced in India (Bhaumik 2004) is that this outcry is really a protest by the advocates of globalisation when the implications of globalisation expanded from manufacturing to the entire gamut of business activities. For many developed countries their core strength is the services sector (accounting for perhaps 70% of their economy) and there had been pressure for developing countries to open up their services sector via the WTO (World Trade Organisation) and GATS (General Agreement on Trade in Services). What has occurred is a boomerang effect of the policies of globalisation for developing countries with skilled manpower. Hence developing countries have turned the push by developed countries into the services sector of their economies to their own advantage. A solution to this is not protectionism, which will just lead to impaired competitiveness but rather a move in developed countries to higher value-added activities. Perhaps the backlash from the outsourcing of services may be more pronounced than that for manufacturing since services provide up to 70% of the economy in the US even though most of these cannot be outsourced offshore.

Nielson and Taglioni (Nielson and Taglioni 2004) undertook a study into services trade liberalisation with two components: identification of concrete examples of services exports by developing countries and quantitative studies on the gains from liberalisation. From this they found clear evidence that developing countries have important service sector export industries including a clear comparative advantage in labour intensive industries eg data processing where technological advances together with a well-educated and cost effective workforce enabled them to export computer related services. The study specifically names the Indian performance over the last 20 years as evidence of this.

Under the General Agreement on Trade in Services (GATS) there are 4 modes of supply for trade in services. These are:

- 1) Cross border trade – where the service itself crosses the border
- 2) Consumption abroad
- 3) Commercial presence
- 4) Movement of natural persons

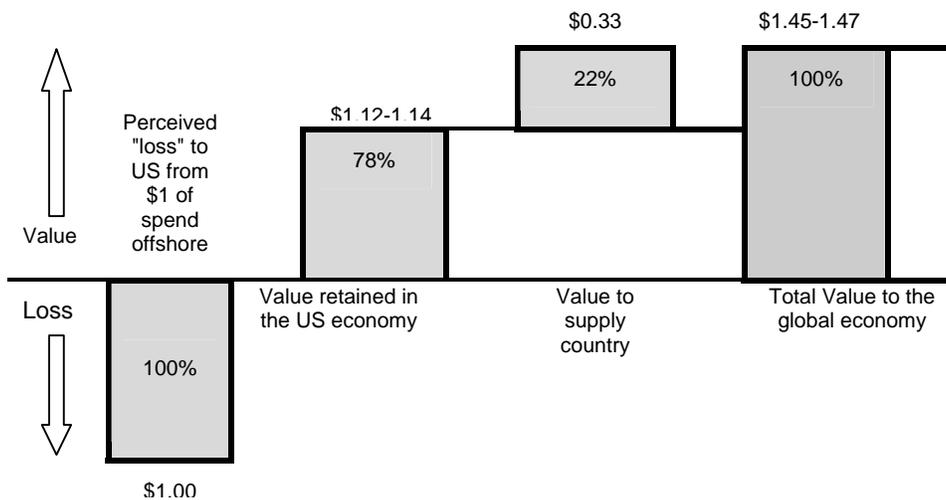

Bodyshopping where Indians worked in firms abroad supplying software services (the “flying geeks” phenomenon) is an illustration of the 4<sup>th</sup> mode of supply but it is the 1<sup>st</sup> mode of supply where the service itself crosses the border which is of increasing importance in BPO. The study specifically identifies modes 1 and 2 as offering potential for developing country service firms.

“Services make up a major portion of the world economy. In 2000, the estimated total value of world services production was US \$1.4 trillion.” (Nielsen and Taglioni (2004) at p 17). While developed countries dominate services trade, the importance of electronic supply of services for developing countries emerges strongly in the study. ICTs have created real opportunities for developing countries by dramatically reducing transportation costs and hence enhancing their comparative advantage. Hence the clear potential for future growth.

### **Can Outsourcing be a Win-Win Situation?**

Can offshore outsourcing be a win-win game? (McKinsey Global Institute 2003). The focus of much of the offshore outsourcing debate has involved the US and India. US businesses account for about 70% of the offshoring market and India is the clear leader as a global sourcing country. Forrester predicts that the number of US jobs lost to offshoring will go from about 400 000 in 2003 to about 3.3 million jobs by 2015. India does gain. McKinsey predicts the gain to be about 33c for every \$ spent offshore. What is the impact on the US?

Evidence available to McKinsey Global Institute suggests that 70% of US services cannot be offshored. Even if in the US 3.3m jobs do go offshore the job loss debate misses the point that offshore outsourcing actually creates wealth for the US. “Offshoring not only captures every bit of economic value, dollar for dollar, that exists in the US economy prior to the decision to offshore, but it also creates a net additional value for the US economy that did not exist before. The US will capture economic value through several different channels: reduced costs, increased revenues, repatriated earnings, and the redeployment of additional labour”(McKinsey Global Institute 2003 at p 7). “Far from being bad for the United States, offshoring creates net additional value for the US economy that did not exist before, a full 12-14 cents on every dollar offshored. Indeed, of the full \$1.45 to \$1.47 of value created globally from offshoring \$1.00 of US labour cost, the US captures \$1.12 to \$1.14, while the receiving country captures, on average, just 33 cents.” (McKinsey Global Institute 2003 at p 9). This offshoring value in the global economy is illustrated in Fig.4.

Source:McKinsey Global Institute 2003: Offshoring: Is it worth the Game?

FIG. 4: OFFSHORING VALUE IN GLOBAL ECONOMY

This is not to deny the hardship suffered by those directly affected and McKinsey Global Institute quotes a finding by the Bureau of Labor Statistics that 31% of those whose jobs were displaced by trade were not fully re-employed. Clearly the effects of displacement caused by offshore outsourcing need to be addressed. McKinsey Global Institute finds the benefits to the economy will however mean an increase in offshore outsourcing by 30-40% to 2008 which will result in a loss of about 200 000 US jobs a year in services over the next decade.

Even the term "offshore outsourcing" is increasingly obsolete as the phenomenon is really one of global sourcing and a logical extension of globalisation. Can it be stopped and is it desirable even if it could be. Even if protectionism were invoked it is unlikely to be successful long term. The argument is that if you choose not to do it your competitors will probably do so and gain the resulting competitive advantage. The trend already underway is that the "onshore" vs "offshore" debate will give way to global sourcing achieving the greatest efficiencies.

## Success Factors

Various models have been proposed for evaluating national software industries. In seeking to determine if other developing countries can emulate India's success in BPO the factors underlying India's success need to be determined and analysed.

Heeks and Nicholson (Heeks and Nicholson 2002) considered major software exporters of developing and transitional economies – the 3 I's – India, Ireland and Israel – and used the model developed as a result to investigate the potential of 3 second tier exporters: Russia, the Philippines and China.

What they found as critical for each of the 3 I's success was a shared vision within the country of what software could achieve for the country. They also found that while the 3 I's overlap in what they do the "the bigger picture is one of differentiation. India means software services; Ireland means product-related services for multinationals; Israel means home-grown product exports." (Heeks and Nicholson 2002 p 6).

Each of the 3 I's has followed a different strategic path. India started with bodysourcing program services and its strategy is to climb the value chain. Also 20 of the 37 recipients of the Capability Maturity Model highest level rating are Indian software exporters. Challenges facing India include increasing labour costs, brain drain and dependence on the US (2/3 of Indian software exports.) Ireland has a more diversified export country base but also faces challenges of increased labour costs and brain drain. It has diversified away from customisation of foreign

packages and into software services projects and niche market products. For Israel the challenges have been obsolescence of products and competition from other product firms as well as dependence on the military sector. Its strategy has been to focus on innovation and differentiation.

Heeks and Nicholson identified the following success factors for the 3 I's they looked at:

- International linkages and trust. At the root of linkages have been national diaspora which formed the basis for early contracts. Most of the larger firms in the 3 I's have formed bonds with single, large multinational clients. Usually these clients formed local subsidiaries or joint ventures. Trust has been established by ISO 9000 certification.
- Software industry characteristics. Common characteristics include competition between privately owned firms, clustering in a few locations – in India this is in Bangalore, Mumbai, Delhi and Hyderabad – and collaboration in areas of mutual benefit eg overseas marketing.
- Domestic input factors/infrastructure. There is a reliance on people and the skills, expertise and size of the local labour pool. Strong technical and scientific education, labour costs and the English language are important.
- Technology. A strong technological infrastructure together with government and foreign investment were present.
- Finance. Each of the 3 I's had heavy investment of overseas aid into infrastructure. For India this came from donor aid, for Ireland from the European Union and for Israel from the US.
- Research and development. All of the 3 I's have invested in software related research and development.

Applying these success factors to second tier exporting nations – Russia, the Philippines and China - Heeks and Nicholson found the following. For Russia its strengths are: human infrastructure with Russia ranking third in the world regarding per capita scientists and engineers with low labour costs, valuable international linkages and investments and clustering. Weaknesses include lack of clear vision and strategy for software export growth, human resource management skills eg poor knowledge of western business practices, limited English skills. There are also problems with piracy, a weak legal system and a perception of corruption and too much bureaucracy leading to weaker trust in relationships. For the Philippines its export activities fall within the broader IT related services including back-office data operations and call centre work rather than just software development. Its strengths are knowledge of western business practices, education and English skills. Difficulties relate to infrastructure, labour costs and issues of trust linked to perceptions of political instability, corruption and a poor legal system. China has a strong domestic software industry. Its strengths are a clear government strategy, strong telecommunications infrastructure and education system. Limitations include English language skills and knowledge of western business practices. It has trust issues with perceptions of corruption, piracy and potential for political instability. Its strong domestic market also diverts resources from exports.

The 3 I's have the advantage of being early entrants into software export markets and will probably attempt to squeeze out latecomers. The difficulty is in moving up the value chain from data services to software services to software products. India while moving from its bodyshopping origins to software services has had difficulty in moving further up to software products. This may not bode well for the Philippines to move from low value data services to higher value software services.

A difficulty for all is diversification eg India's reliance on the US. Determining a market niche based on the strengths of the country does appear to work for Russia with its strong scientific and technical skills, for China with Chinese language software and for the Philippines with its focus on data entry work. Heeks and Nicholson conclude that apart from determining market niches based on the strengths of the particular country the following factors are important:

- Make it easier for professionals to travel to other countries
- Encourage people, money and ideas to come in ie a climate conducive to foreign investment
- Facilitate relationships
- Build trust by reducing areas of perceived risk (eg on software piracy)

Carmel (Carmel 2003) takes this model further by classifying the new software exporting nations into four tiers instead of two: (1) US, UK, Germany, India, Israel and Ireland (2) transition – China and Russia (3) emerging

(4) infant stage of software nations. Carmel introduces what is termed the “oval model” of national software export success factors which also emphasises human capital and quality of life but places less emphasis on piracy or trust.

Carmel deems that “the strength of a nation’s human capital stems from a multi-generational tradition of science and engineering that has its roots in strong universities, polytechnics and vocational schools.” (Carmel 2003 p 4). This factor in the case of the 3 I’s dates back at least 1-2 generations and cannot come about in just a few years. Carmel also finds that the quantity of human capital is also important eg China is graduating about 50 000 new computer graduates each year and 465 000 are graduating in all science and engineering courses. A distinction is made between those possessing “talent” at the upper end of the spectrum and those possessing “skills” (something which can be learned in a few months or years) at the lower end of the spectrum. It is suggested that those with talent reside in clusters, which have quality of life factors which may not exist in some developing/emerging nations.

The wage factor or “race to the bottom” suggests that as wages increase firms turn to other cheaper countries. In terms of clustering these clusters are numerous in nations in tiers 1 and 2, less striking in tier 3 and often absent in tier 4. A success factor is the ability to pool resources into a national association eg NASSCOM (National Association of Software and Service Companies) in India, which also assists with branding. Success may also be gauged by the attaining of internationally recognised standards of quality – eg in India the Capability Maturity Model (CMM). In terms of capital most firms in tiers 3 and 4 lack sufficient capital to grow. With regard to linkages “the ‘brain drain’ has become a ‘brain gain’ in the ties and know-how that have been forged between firms in the home country and the country of the diaspora” (Carmel 2003 p9). New linkages include geographic linkages eg Mexico and Canada and their proximity to the US. Carmel downplays the issue of piracy as “the growth of software exports from high piracy nations such as Vietnam, China and Russia, attests to the irrelevance of piracy as a national factor.”(Carmel 2003 p10). A limitation for some in tiers 3 and 4 is that “most lower-tier software nations ...have insufficient domestic demand to catalyse a healthy software export industry” (Carmel 2003 p10).

Carmel’s conclusion is that “in order to gain a sustained competitive advantage firms must develop firm-specific resources or capabilities that are: valuable, rare or costly to copy. It is quite unlikely that being the low cost software producer by competing simply on low wages for commodity-type skills is a path to a sustainable position. National software industries that do not add value beyond simply being the low cost producer will soon see their work shift to lower-cost destinations. This is the ‘race to the bottom’ (of the wage scale) that typifies such commodity work. Software work moved first to India because of low wages” (Carmel 2003 p11).

## India

“By 2008, forecasts McKinsey, IT services and back-office work in India will swell fivefold to a \$57 billion annual export industry employing 4 million people and accounting for 7% of India's gross domestic product.” (Kripalani and Engardio 2003 p 4).

What has been the contribution of software to India’s economic development? Conclusions are that the impact has been limited to a small section of the economy and to be sustained requires a significant increase in domestic demand. Arora and Athreye (Arora and Athreye (2001) argue that “a potentially important and under-appreciated contribution of the software industry is thus its exemplar of good entrepreneurship and corporate governance to the rest of India”. They compared the ratio of labour productivity in software and found it twice that of India’s manufacturing and 1.3 times that of the US. There were relatively few linkages found to the other sectors of the economy.

Their view is that what has occurred with software can be replicated for other services to be delivered globally. A generic business model for software can be used eg for data entry. Changed management practices do have the potential to spill over to the manufacturing sector of the economy. Hence there has been a diffusion of good management practices from the software sector to other economic areas and this in turn will be to India’s gain. The poor linkage of the software sector to the rest of the economy has come about “because of the ‘service’ rather than the ‘product’ nature of the industry and its external rather than inward orientation” (Arora and Athreye 2001 p18). What have changed is management practices which may spill over into other sectors of the economy to make them more competitive and productive.

Initially the software industry in India relied on body shopping where firms in India would fly their professional staff to work on software problems at the site of their overseas clients. From this emerged the concept of “flying geeks”. However the term could also “suggest a possible kinship between the Indian software experience and the so-called “flying geese” pattern of East Asian development” where ‘it is India that takes the place of lead goose, with other countries in the region aspiring to follow its flight path’”. (O’Connor 2003). The flying geek concept has been a market entry strategy for Indian software firms. The “flying geek” model suggests the parallels to what occurred in manufacturing in East Asia and the attempts by various countries to replicate India’s success would suggest an aspiration for BPO to follow the pattern of manufacturing.

In 2004 the Indian BPO industry excluding software was a \$3.8 billion industry and grew 50% in 2003-2004. Gartner research predicts a 25% slide in Indian BPO by 2007, a significant drop from its present 80% market share. The strongest perceived threat is from China. To address perceived threats there is recognition of the need to diversify into other services where there is no significant challenge. According to estimates by NASSCOM the market for IT enabled services will continue to grow fast and could be worth \$17 billion by 2008. (UNCTAD 2004a). The call centre industry is projected to provide employment for 2 million people by 2009. The IT sector combined with BPO had exports of \$12.5 billion in 2003-2004. “Nearly 25% of the exports that involved 800 000 workers came from the top three companies in the sector: Tata Consultancy Services, Infosys Technologies and Wipro Technologies.”(Reuters 2004). A silicon.com special report indicated that software exports are on track to grow by 30% in 2004-2005.(Reuters 2004).

In 2003 South Asia received \$6.1 billion in FDI compared with \$4.5 billion in 2002. For India FDI grew by 24% with the services sector and in particular ICT industries the most dynamic for FDI inflows. (UNCTAD 2004a). Average FDI into services offshoring in India totalled \$300 million in 2001, or just over 10% of the country's total FDI that year according to McKinsey 2003 (UNCTAD 2004a).

What appears to be evolving from offshore outsourcing is a more sophisticated model based on a global network of multiple offshore locations. This global delivery model has no clear leader yet although Forrester Research has considered the capabilities of both the major Indian firms and non Indian firms. Tata Consultancy Services has begun to offshore its staff as a response to a rise in salaries in India and in 2005 Tata plans to have 3000 software engineers in China (ie 15% of their global workforce).

Perhaps one of the most significant effects of the Indian software success story is the boost to Indian confidence leading to increased expectations and innovative management and governance practices in this area have spilled over to other areas of the economy. The indirect effects on the Indian economy may be more profound than the effect of the technology itself in the longer term.

## Conclusion

Can India’s success be emulated and provide the role model in other developing countries? The answer would probably be a qualified ‘yes’ at least for lower level services and where there is a cost advantage provided by the country. For software exports entry and success is much more difficult to achieve. What appears to be evolving is a global delivery model which may benefit new entrants with a cost advantage. However sustainability would depend on the ability to move up the value chain and to identify market niches capitalising on the strengths of the individual country. Those countries which can identify some of the success factors identified by Heeks and Nicholson and refined by Carmel will have the greatest chance of success in this process.

# Manufacturer-Retailer Supply Chain Integration: Vertical and Horizontal Collaborative Logistic Strategies and Implication for Channel Power and Channel Efficiency

Pietro Genco  
Lara Penco  
University of Genoa, Italy

## Abstract

The present paper tests for empirical evidence on the effects of reorganisation of supply chain on the manufacturer-retailer relationship and on their strategic and competitive behaviour. The reorganisation of supply chain attempts the relationship between manufacturer and retailer, changing the balance of power in distribution channel and influencing the strategic behaviours in the horizontal (i.e. retailer versus retailer) and vertical relationship (i.e. retailer versus manufacturer). The paper shows some preliminary results of a wider research on distribution channels focused on the role of logistics in promoting collaborative strategies between manufacturers and retailers and on the linkage between logistic collaborative strategies and competitive advantage. A case-history explains the reorganisation of one of the most important Italian retailer\*.

## Introduction

Manufacturer – retailer relationship is a crucial topic in economic studies and it is examined from different academic perspectives [14], such as Industrial Organisation [12, 27], “Behavioural Marketing” [10, 13, 32]<sup>1</sup> and Strategic Management [25, 26, 31, 3]<sup>2</sup>.

The present paper studies the manufacturer–retailer relationship in the grocery industry from a managerial perspective, analysing and testing the effects of the reengineering of logistic system on the manufacturer-retailer supply chain and on their strategic and competitive behaviour. It shows some preliminary results of a wider research on distribution channels focused on the role of logistics in promoting collaborative strategies between manufacturers and retailers and on the linkage between logistic collaborative strategies and competitive advantage.

In the businesses in which big retailers operate and the speed of physical and informative flows are critical for matching strategic goals, the linkage between logistics and strategy is commonly recognised by academics and managers. Infact, retailers are attempting not only to meet consumers’ service demands but also to improve logistic productivity and efficiency through the supply chain: logistics is now viewed as an important source of competitive advantage that allows at the same time to cut costs and to improve customer service [29].

While several studies on manufacturer-retailer relationship focus on the process of restructuring the supply chain<sup>3</sup>, only few of them focus on the impact of the reorganisation of supply chain on manufacturer-retailer relationship and, then, on vertical competition.

The reorganisation of supply chain, infact, attempts the relationship between manufacturer and retailer, changing the balance of power in distribution channel, and influencing the strategic behaviours in the horizontal (i.e. retailer versus retailer) and vertical relationship (i.e. retailer versus manufacturer).

As retailers centralise the Distribution Centre, they centralise the negotiation phase and gain scale, outpacing manufacturers through an increase in bargaining power. Some retailers are actively taking control of the supply chain through explicit horizontal alliance with other big retailers, with the aim at improving the bargaining power.

On the other hand, the reengineering of the supply chain needs vertical collaboration between retailers and manufacturers in the management of logistic activities; collaborative information of different activities between the market partners and their process of harmonisation is regarded as a performance driver to overcome the unsatisfactory profit situation of stagnant grocery industry.

In other words, *which business model prevails? Competition? Collaboration?*

The paper is organised as follows: First, we discuss about the innovative features of supply chain, comparing it with the traditional logistic system, and we point out a few potential opportunities for the development of channel efficiency and efficacy. Second, we outline the impact of the reorganisation of supply chain on the relationship between manufacturer and retailer, focusing on the shift of channel power in the negotiation phase and the development of collaborative strategies in the logistic phase. Finally, we describe the restructuring of the supply chain made by one of the most important Italian retailer and discuss the potential role and tasks of logistics in promoting horizontal (retailer vs retailer) and vertical collaborative strategies (retailer vs manufacturer).

The case explains the reorganisation of such retailer by analysing the creation of an important logistic hub for the Italian Nord West Area. In particular it focuses on the issues that influenced the enterprise's choice of setting up its logistic hub from a local to an interregional level.

## **Innovative Logistics features in the Manufacturer-Retailer Supply Chain**

Logistics has become central feature to enterprises' strategies because it is commonly recognised that product is not a physical think: the right goods and services of the right quality and in the right quantity at the right time and the right place with the right services and support at the right price [21]. This is a service perspective that the traditional supply function is expected to meet.

Logistics plays an important role in delivering goods at the high service level and low costs demanded throughout the supply chain [18, 29].

The reengineering of supply chain was a strategic issue in response to reduce the total amount of "vertical interface costs" between retailers and manufacturers [23].

The reduction of supply chain costs must be consistent with the present characteristics of grocery markets that are:

- Stagnation of consumer demand in the grocery industry and the consumers' willing to find the best product at the best service and price;
- Increase of competitions among retailers and among manufacturers (horizontal competition).
- Increase of competition between retailers and manufacturers in order to gain the best contractual conditions in the negotiation activities (vertical competition) .

The rigid separation of the traditional roles of manufacturer (production and physical distribution of goods) and retailer (commercial activities) threatens the efficiency and efficacy of the supply chain: the reorganisation of logistic system and the rationalisation of the supply chain is more and more becoming a strategic issue and a competitive advantage source in the horizontal competition.

Because retailers and manufacturers are so closed intertwined as customer-supplier, the understanding of the complex interface operations (that generate costs) between the trade and the manufacturing industry is crucial in order to configure an efficient supply chain.

Considering that the negotiation phase is an area in which the bargaining power is stressed, this new reality requires a fundamental analysis of the most effective way of reducing the total amount of product costs (and consequently costs) without reducing the quality of product and the customer service.

Reducing "vertical interface costs" allows both manufacturer and retailer to improve their margins without price increasing.

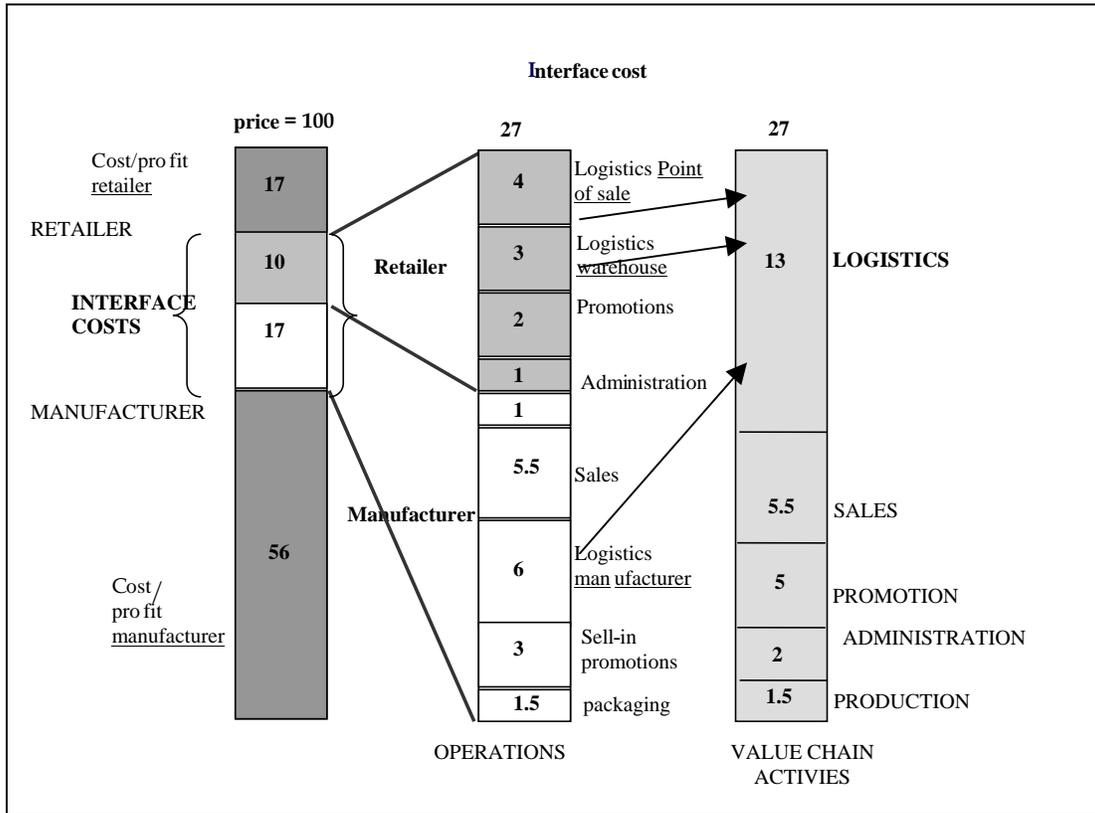

FIG. 1: THE COST AND FINAL PRICE STRUCTURE (Source: ECR)

As shown in Fig. 1, the 27% of Consumer Price is due to “vertical interface costs” between manufacturer and retailer, which are generated primarily by non-standardised operational practices and by the duplication of operations. Among these “vertical interface costs”, an half is generated by logistics operations, such as retailer warehouse (3%), logistics management of point of sale (4%), logistics of manufacturer (6%).

The rationalisation of the supply chain (and the consequent reduction of interface costs) in the manufacturer-retailer relationship has been made primary by the integration of logistic activities by retailers.

In the past, infact, logistics was controlled by manufacturers that had the responsibility of physical distribution of goods from factory to the single points of sales.

With the growing of scale dimension and with concentration of retailer industry, logistics is now driven by retailers that integrate warehousing and transport activities and reengineer the entire supply chain.

In retail industry logistics is becoming more and more important; retailer becomes a “pure logistics organisation” because it allows the transaction of goods and service from manufacturer to end consumers.

By investing in their own regional (o interregional ) Distribution Centre, many retailers have taken control of store replenishments from suppliers and wholesalers.

The Distribution Centre becomes the barycentre of logistic system in the channel of distribution and it is can be seen as the hub that serves the single points of sale (spoke) that operate in a certain gravitational area: in other words, the integration of logistics made by the retailer is implemented by the consolidation of the main logistic activities at the Distribution Centre level.

The main reasons that push retailer to integrate and consolidate physical and informative flows related to distribution of goods in the channel are:

1. The improvement of efficiency/efficacy in the bargaining phase, thanks to discounts made by sellers due to the optimisation of load transport and delivery/replenishment processes;
2. The improvement of efficiency in the operative processes by reducing stocks level and storing costs, by increasing labour productivity and the expositive surface of the point of sale.
3. The improvement of consumer services by reducing out of stock in the point of sales and by enhancing quality and freshness of goods

The profitability of retailer is related to the optimisation of stocks that, differently from manufacturer, are both a cost centre and a profit centre.

Stocks, infact, are costs because they are immobilised assets and need space and personnel but they produce revenues when stock turnover is faster than payment days to suppliers.

The integration of logistics by retailers help to reduce the logistic “vertical interface costs”: the hub and spoke system allows to cut retailer storing costs and to cut logistic manufacturer cost.

Manufacturers, for example, gain efficiency by delivering to a few number of warehouse-hub (instead of the singles point of sale), while retailers can exploit economies of scale in the warehouse management.

Big retailers, thanks to the integration and the centralisation of logistics, promote “every day low prices policy”, creating more value for consumers and “shifting away from in store sales and price promotion that had been an industry convention” [11].

As retailers integrate logistics and centralise warehouse in a single hub, leading companies in the retail industry realise that it is not enough only to optimise internal operations, but it is more and more necessary to integrate the supply chain at every link, from manufacturer to consumer.

The reengineering of the supply chain needs also vertical collaboration between retailers and manufacturers in the management of logistic activities [20].

The traditional procurement uses fact-based negotiation approach with suppliers.

With network relationships, common strategies and policies could be developed through solutions achieved in the alliance of supply chain.

For example, as both manufacturers and retailers suffer in the financial area from promotional out-of-stocks, they both must work together to solve the problem.

The ECR (“Efficient Consumer Response”) movement, for example, stress the importance of new principles of collaborative management along the supply chain, aiming at gaining efficiency in the logistic process and serving consumers in better ways, faster and at less cost [7,8,9].

This result is called win-win-win situation where all partners in the supply chain (manufacturer, retailer, and end-user) can gain profitability by doing more with less [33].

Manufacturers and retailers agree that the industry needs to focus on a reasoned and pragmatic approach to improve quality, velocity and dynamics within the chain.

The orientation towards supply chain integration is necessary for the implementation of some important projects aimed at improving the logistic efficiency and efficacy.

Among these projects, Continuous Replenishment (CPR) aims at decreasing stock levels and improving product availability at all points within the replenishment chain (i.e. from the point of manufacture to the point of sales) while remaining as near as possible to consumer demand, through partnership between the supplier and its customer<sup>4</sup>.

In a Continuous Replenishment environment, manufacturer is no longer simply the executor of an order placed by it’s customer-retailer but becomes a key player together with the customer in ensuring replenishment at the point of sale or in the warehouse. One of the major beneficial effect of the implementation of Continuous Replenishment is the reduction of fluctuations in stock levels and vagaries of production.

Among the techniques of CPR, we can find the Vendor Managed Inventory (VMI) in witch the supplier maintains the replenishment system; sales and inventory information must be transmitted by the buyer to the supplier as often as the replenishment system is executed. This information is used by the supplier's replenishment system as historical data for future requirement calculations and adjustments to the next production cycle.

When the replenishment system is co-managed (CMI), a proposal order is generated by the supplier, and revised and confirmed by the buyer.

On the contrary of vendor management Inventory, here the buyer maintains the responsibility for the replenishment in Co-Managed Inventory.

While the previous projects focus primarily on logistics and in particular on inventory management, Collaborative Planning, Forecasting, and Replenishment (CPFR) process is a wider project that co-joint retailer's and manufacturer's marketing and logistics aspects.

In this project, infact, the seller and buyer exchange information about their corporate strategies and business plans in order to develop a joint business plan. CPFR establishes guidelines for enterprises in order to integrate their planning processes across corporate boundaries.

The effectiveness of these projects requires real time information.

Information must be, therefore, available to the entire supply chain almost simultaneous.

Optimisation of the collaboration between all supply-demand chain partners can be achieved only through real-time communications.

Semi-automation of communication acts like requests or acknowledgements are possible through the application of intelligent agents or systems.

In this way, technology will be a critical success factor for retailers and manufacturers.

The impact of the digital age is manifesting itself in many ways within the retail industry. The EDI and, more recently, the Internet and Extranet enable trading partners to quickly share information on customer requirements, level of stocks, demand trend.

An increasing amount of data is widely available in the supply chain with more standardisation expected soon. Information and Communication Technologies (ICT) will remain an important area of investment for retailers and manufacturers as companies begin to make use of the volumes of data that currently overwhelm them.

Opportunities will come to develop new grocery products and to manage new ways of selling and buying from this information. In short, new technology will lead to a new way of doing business and will heavily impact areas such as promotions, transactions and logistics<sup>5</sup>.

## **The Potential Role and Tasks of Logistics in Promoting Horizontal (Retailer vs. Retailer) and Vertical (Retailer vs. Manufacturer) Collaborative Strategies**

To gain strategic benefits and logistics cost saving, leading retailers recognised that it is not enough to optimise the internal operations, but it is necessary to reorganise the entire supply chain (from manufacturer to consumer).

In particular, retailers are reengineering the supply chain following and implementing two strategic paths, that are:

- Horizontal logistics consolidation;
- Vertical logistics consolidation.

The *horizontal logistics consolidation* concerns with the fact that retailers centralise and integrate logistics activities by investing in their own Distribution Centre.

Big retailers organise logistics from a "point to point system" to "hub and spoke system".

This will become increasingly important because efficiency in logistics requests to reach high critical mass in order to gain economies of scale.

The common trend towards horizontal consolidation at the retailer level influences also the external organisation of some retailers that are actively taking control of the supply chain through explicit horizontal alliances in the negotiation phase.

In many EU countries buyer groups are emerging. There are two forms, representing either many small retailers (such as SISA, in Italy) or two or more larger retailers (such as Conad-Leclerc, at international level). The key aspect is that the buyer group purchases collectively on behalf of members that remain independent retailers, with the aims at obtaining from suppliers the same benefits and discounts of the largest integrated retailers.

The horizontal logistics consolidation allows the use of a common Distribution Centre to consolidate those goods that several retailers may sell in common: centralising some operations through shared facilities allows to cut the cost associated with the warehousing and carrying inventory.

With the horizontal concentration of retail (reached by horizontal alliances or by the internal consolidation of the negotiation and logistics activities), the structure of the supply chain changes considerably.

From a structure in which manufacturers have traditionally driven distribution by developing brands and using a network of wholesalers and retailers to sell and distribute goods to consumers, there has been a shift towards a structure in which it is now retailers the actor who drives and controls the supply chain.

The consequence of these organisational logistic actions is the pool of purchasing activities that brings to more bargaining power to highly concentrated suppliers. The manufacturers' market power has largely shifted toward retailers.

The oligopsonistic power of the retailers impacts on most manufacturers, especially those who do not possess power arising through brand power. Only those producers that have very strong brand power of their own may be able to resist retailers' increasing bargaining power.

The bargaining power enables large retailers to gain further competitive advantage over the other competitors (especially the smallest ones), which in turn leads to further consolidation at the retail level. The process is a virtuous circle for the very large retailers.

The horizontal logistics consolidation stresses the negotiation phase and the competition retailers versus manufacturers in order to obtain the best contractual conditions in the buying/selling phase.

Moreover, through aggressive bargaining strategies, including the use of de-listing tactics, and the increasing use of auctions for awarding contracts, retailers have been able to drive down the prices and margins that producers receive.

The *vertical logistics consolidation* concerns with the fact that both retailer and manufacturers have begun to act on the belief that for becoming and remaining a industry leader, it is necessary to improve the operations of the entire supply chain. Following this belief, vertical partnership have begun to emerge.

For several years, academics and marketers recognised that inter-organisational coordination in the distributive channel is a potential and fundamental competitive requirement [24].

Distribution channels have traditionally tried to meet competitive challenges by forcing manufacturers and their distributors to stock excess inventory or employ surplus personnel.

Recognising the inefficiency of this approach, leading manufacturers and retailers are willing to explore new ways of working together for mutual gain.

Strategic alliances between firms aim at reducing the duplication of resources and efforts and at decreasing the environmental and internal uncertainty.

In this way, supply chain management becomes the strategic issue oriented towards the linkage of organizations with the purpose of reducing operational costs through asset-specific investments that yield superior efficiency.

Retailers have been more proactive in their approach, developing partnership primarily in operational improvements such as delivery, storage and packaging patterns.

As we have showed, Continuous Replenishment Project (CPR), Vendor Management Inventory (VMI), Co-Management Inventory (CMI), Collaborative Planning Forecasting and Replenishment (CPFR) are the strategic logistics projects in which the collaborative orientation prevail.

Thus, vertical logistics consolidation becomes the basic area for formulation/implementation of wider strategic collaborations.

The focus on logistics, infact, brings retailers and manufacturers to co-project other strategic activities of the value chain as marketing and customer services.

For example, with the implementation of Collaborative Planning, Forecasting and Replenishment, retailers and manufacturers expand the commercial relationship beyond price and margin towards the development of differentiation strategies.

In defining logistics operational activities such as delivery and stocks level, manufacturers and retailers make a joint business planning on the basis of analyse of consumer demand and behaviour. This is critical in order to meet better than competitors consumers' needs, that, over the last decade, have become more demanding, sophisticated and knowledgeable.

More over, the research of logistic efficiency brings manufactures and retailers to co-project packaging systems, delivery and visual merchandising equipments which reduce both handling costs and environmental impacts.

As regards the environmental impact, the powerful environmental protectionist movement in EU, which is a very important variable for differentiation in marketing and customer service, brings retailers/manufacturers to manage the supply chain in a “green way”.

The push for environmentally responsible products and operations encourages retailers and manufacturers to implement some environmental protection measures, that have an impact on:

1. Forward logistics through the reduction of packaging materials;
2. Reverse logistics through the return of packaging to the previous link of the supply chain in order to recycle waste.

Another “green” area of collaboration can be seen in the increasing of nighttime operating hours for delivery vehicles, in order to reduce day-time emissions and traffic congestion.

From an organisational point of view, effective vertical collaboration demands a reorientation of resources – from “functional silos” to interdisciplinary focus.

Many manufacturers and retailers establish cross-functional teams and cross-enterprises teams.

Retailers’ and manufacturers’ logistics, marketing and financial resources cooperate with sales/buyer personnel to provide a single face to the counterpart and, at the same time, each cross-functional team collaborate with the counterpart’s team.

This organisational structure encourages team members to work for an increase in the performance of the entire chain.

The vertical logistics consolidation stresses the collaborative orientation of retailer-manufacturer relationship. The collaborative orientation is necessary at the same time:

- To enhance customer satisfaction;
- To make the logistics integration in the retailer’s control more effective.

This strategic orientation brings to Supply Network Strategies, that deal with how companies activate relationships with suppliers in order to become more efficient and innovative<sup>6</sup>.

Since late 70’s, a number of studies in relationship marketing have created the basis for research in the organisational area that shifted focus from the internal process of organizations towards the organization-environment interface [17].

Thus, a new perspective of research in marketing and strategic management which stressed the importance of dyadic business relationships [5] emerged: the dyadic perspective has then been extended to networks where several firms are linked in interdependent relationships and governance structures [16, 22].

Considering both the horizontal strategies, that are pursued in order to gain scale in logistics activities and in the negotiation phase, and the vertical collaboration strategies in the supply chain, that are oriented towards a better performance, it is natural to ask which business model prevails: competition or collaboration.

In the manufacturer-retailer relationship, the business model is going towards co-opetion, that combines competition and cooperation between partner belonging to the same value net<sup>7</sup>: co-opetition includes horizontal collaborative relations as well as competitive relations in vertical and horizontal directions at the same time<sup>8</sup>.

From a supply-chain perspective this implies that the characteristics of competition might change, as discussed within the literature on the theme, from single company vs single company to supply chain vs supply chain .

As Achrol and Kotler [1] pointed out “marketing outcomes increasingly are decided by competition between networks of firms rather than competition among firms”<sup>9</sup>.

In this way, the quality of competition could be driven by the ability of players to set up such partnerships and not based on prices.

## The Supply Chain Reengineering Developed within a Large Italian Retailer

The retail market in Europe has become increasingly concentrated both at national and EU level.

The highly fragmented retail markets, consisting predominantly of traditional independent retailers, have shifted towards highly concentrated market, driven by a process of growth and mergers by leading retailers.

The result is the “marginalisation” of small independent retailers, that continue to act as convenience stores, and market domination by a limited number of large-format, multiple-store retailers that attract great percentage of consumer spending [6]. As they reach saturation level in their home markets and as opportunities for expanding their business continue to develop, big retail corporations have also tried to extend their operations internationally.

However, the retailer industry in EU varies, according to stage of development and business model, from nation to nation and region to region. It is known, for example, that the Northern retailer industry is more concentrated and sophisticated than Southern one.

Focusing on the Italian grocery retailer industry, we can easily find that it is characterised by a lower level of modernization than other European Country.

The Italian retail industry is generally fragmented and it is characterised by the presence of both traditional shops and large retailers.

The small city shops, infact, struggle to resist the competition from larger retailers.

The strategy of larger retailers is to compete with the small city small shops through pricing.

Larger retailers use their stronger bargaining power with suppliers, especially in Southern Italy where the market potential is still huge.

Resistances to change of goods producers and local state institutions, as well as lack of infrastructure (with severe consequences on logistical management), are the major risks to be managed.

In general, competition takes place not only at manufacturers’ level (brand vs brand) but also at retailers’ level (retailer versus retailer and retail format competition, i.e. discount store against supermarket, supermarket against drug store, supermarket against hypermarket), leading to a decline of brand, product and retail format loyalty.

The Italian way of retailing is based on the growth of the associations among small shops (Cooperatives). Another way is the Cooperatives among Consumers, recognised by the Art. 45 of the Italian Constitution Law, that pursue the consumer interest defence.

As regards the competitive structure, competition among retailers (especially the big ones) is based primarily on price<sup>10</sup>.

This focus on price at the consumer level has increased the pressure on negotiations with brand producers.

This characterisation shows why it would make sense to establish partnerships without reducing competition.

Coop Italia is the largest Italian distribution chain; it is a Consortia of Cooperatives (among consumers) operating in all the Italian Regions.

Its shareholding is made up of around four and a half million people that are the members of the 206 cooperatives of consumer goods operating across the territory, which in turn manage a network of 1,320 sales outlets, with a staff of around 43,000 of people.

It operates with 31 hypermarkets, 245 large supermarkets, 964 small supermarkets and 130 discount stores. This complex store base was replenished in Italy through a centralized distribution network of 22 warehouses for dry grocery and fresh products.

Since 1995, Coop has been one of the major players in the Italian ECR projects, providing time and efforts of experienced people in the development of a more efficient supply chain.

In recent years, some cooperatives belonging to Coop Italia integrate themselves, creating big Cooperatives (as Coop Lombardia, Coop Adriatica, Coop Liguria, Coop Tirreno, etc.) operating at regional o interregional level, aiming at gaining scale in same critical activities of the retailer value chain, such as negotiation, marketing, logistics.

It is important to note that Coop Italia and biggest manufacturers negotiate al national level to define contractual national standard (discount and bonus criteria, new product penetration, price spread, etc.), while

contractual specification (quantity, quality, price and time to delivery) are defined at Cooperative level or, in case of particular product, at hypermarket level.

As regards logistics, big cooperatives have already centralised the Distribution Centre from local level to a regional level (one for Cooperative), with the aim at gaining economies of scale in the warehouse management.

This process of reorganisation of logistics towards the centralisation is continuing and is now stressed.

Coop Italia is, infact, now testing on the reengineering logistic model in the manufacturer-retailer supply chain.

In the Nord West, Coop Italia acts through CoopLiguria, CoopLombardia and CoopNova that operate at regional level.

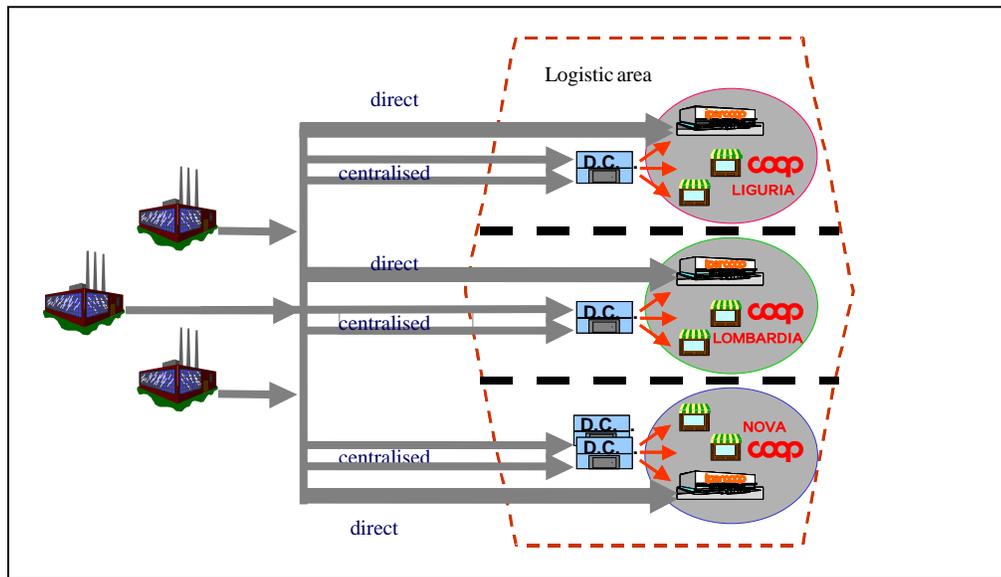

FIG. 2: THE PREVIOUS COOP LOGISTIC SYSTEM (Source: Coop Italia)

Since now, every single point of sales has always operated with a particular logistics system of replenishment (Fig. 2).

While Hypermarket (Ipercoop) orders directly to suppliers and has a personal warehouse, Supermarkets and Discounts send order-form to the regional Distribution Centre (D.C.) belonging to the same Cooperative.

Only for slow moving consumer goods, Hypermarket warehouse is replenished from the Distribution Centre (D.C.).

At the moment, Coop Italia is implementing a logistic reorganisation by the creation of an important logistic hub for the Italian Nord West Area, shifting the logistic hub from a local to an interregional level (*horizontal logistics consolidation*).

Coop Liguria, Coop Lombardia, Coop Nova are now co-jointed, from a logistic point of view, in a logistic area called *North West District Hub* which is served by a hub (D.C.) and four Regional Warehousing Points.

Logistically distinct management processes are projected both on groups of goods whose logistics requirements are similar regarding selling speed and on the distribution format (supermarket, hypermarket, discount store).

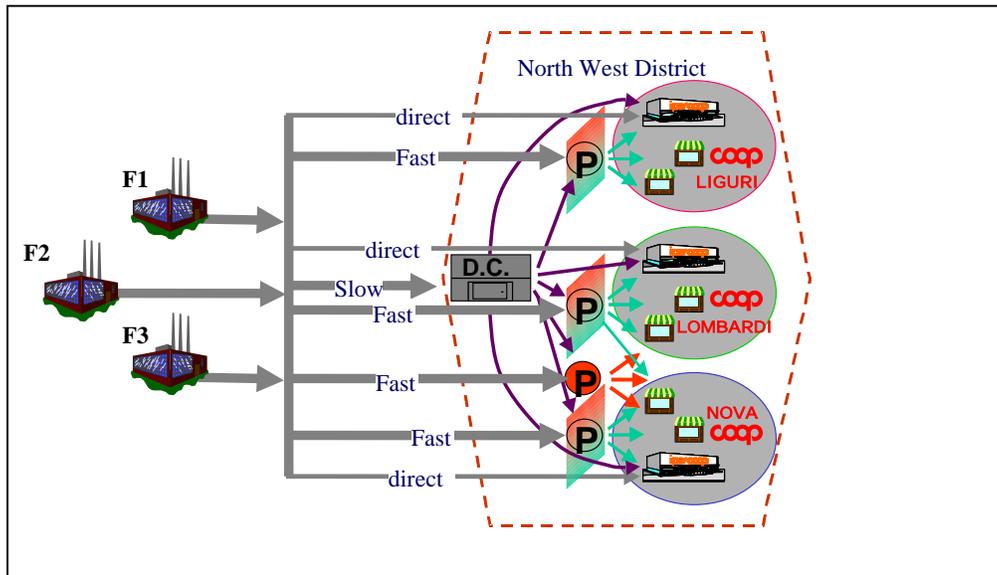

FIG. 3: THE DISTRICT LOGISTIC SYSTEM (Source: Coop Italia)

The *North West District Hub* stores and manages only slow moving consumer goods, while faster moving consumer goods (as fresh products) are stored by the Regional Warehousing Points (Fig. 3).

Because hypermarkets have wider and deeper assortment of goods, they are served contemporaneously by the Hub for slower goods, by Regional Warehousing Points for the fastest, and directly by manufacturers for goods that are sold only through this format, as, for example, non food goods.

Every regional D.C. limits its responsibilities to the storage and the transport of faster consumer goods to the points of sale (supermarket, hypermarket and discount), while the *North West District Hub* takes order and delivers directly to Hypermarket and to the four regional Warehouse Point for slower moving consumer good.

Faster moving consumer goods are replenished directly to the Warehouse Point (P.) or to hypermarkets.

The integration/centralisation of logistics has been supported by the implementation of significant investments in new technology (as EDI and extranet).

Coop Italia and North West District have implemented the EDI (EDI-enable) system in particular for the relationship with big and frequent manufacturers and extranet (web-enable) for contacts with small-medium or non frequent manufacturers. New Information and Communication Technologies are consistent with a supply chain managed as a pull and not a push system, according to the best practices defined by the Italian ECR initiative (ECR Italia).

The centralisation at the District level has provided significant opportunities for the three Cooperatives in reducing expenses, generating better returns on invested capital, and improving cash flows with a better stocks management.

Firstly, they can exploit economies of scale and optimise the use of resources and structural facilities; secondly the North West District Hub becomes a profit centre because manufacturers “pay” the economic benefits they obtained with the use of this logistic system through discounts and bonus for retailers.

The research for logistic efficiency and efficacy needs the manufacturers’ collaboration in order to co-project delivery process and delivery equipment that allow both to cut costs and to enhance consumer service (*vertical logistics consolidation*).

Manufacturers, infact, can benefit from the integration/centralisation of the logistic system implemented by Coop, achieving efficiency results that might not be achieved otherwise.

In particular:

- Cost transport reduction;
- Rationalisation of delivery process;
- Rationalisation of storage.

The centralisation of the logistic activities at the horizontal level is accompanied by the centralisation of other activities of the value chain such as negotiation with suppliers and strategic marketing.

As regards negotiation, the centralisation of logistics implies a centralisation of the negotiation phase (previously carried out at Cooperative level or at hypermarket level) in order to obtain better contractual conditions thanks to an increase in the bargaining power: it is, otherwise, obvious to observe that North West District buyers and manufacturers have to respect the contractual standards defined at national level.

As regards marketing, because the local differences in culture, taste, consumer preference and behaviour, the three cooperatives manage only commercial activities, focusing on the specific needs of the geographic area where they operate, while strategic activities are managed at District level.

More over, the implementation of processes of concentration of activities of the value chain in a local area may help to set up virtuous circles – through long-lasting and consolidated collaboration between resources belonging to different value chain activities– which could bring to an increase in the competitiveness of the entire North West District Hub and, consequentially, of the entire Consortia Coop Italia.

For example, marketing and logistics cooperate in defining promotion calendars and category management operational activities.

This characteristic shows how North West District Hub is different from a D.C. and from the Buyer Group, because of its responsibility on defining strategies and interregional marketing and commercial policies.

From an organisational point of view, some organisms allow the continuous and deep relationship between Point of Sales, Regional Cooperatives, North West District and Consortia Coop Italia.

The *Board of Directors of District*, formed by Cooperatives' Distribution Channel Directors (channel hypermarket and channel supermarket), the Consortia Managing Director and the Consortia Channel Director is responsible for the planning, the implementation, the control of strategies and the operational policies at Cooperatives and District level (relationships between Consortia, District, and Cooperatives).

The *Marketing Co-ordinator Board*, formed by District and Cooperatives' Marketing Managers, supports the Board of Directors of District in strategic planning, supplying data on local market and consumers (relationships between District and Cooperatives).

The *Operational Co-ordinator Board* is instead aimed at promoting continuous and intensive relationship among the single points of sale, the Cooperatives and the District, in order to collect data and experience useful to category management and Cooperative's Directors (relationship between point of sales and Cooperatives).

## Some Preliminary Observations

It is difficult to draw any final conclusions from the North West District project of Coop Italia.

It would be too ambitious to judge the effectiveness of actions aimed at enhancing the logistics efficacy and efficiency of Coop, only a few months after their institution.

However, we can attempt to make some preliminary observations.

The case-history suggests that the research for better performances in the retail industry is associated with organisational intervention in the logistic area.

In this area, infact, retailers can find inefficiencies whose cancellation (or reduction) could bring to gain better margins without increasing the final price.

The centralisation of D.C. at interregional level responds, in this way, to the necessity of gaining scale in the management of warehouse and in transport/delivery system.

The logistic reconfiguration becomes, also, the basis for a deeper changing process.

Firstly, also storage, marketing and strategic planning were centralised at District level: the governance of Cooperatives has changed significantly because the power has moved from Cooperatives to District.

Secondly, this centralisation has been implemented, aiming at having a powerful use of marketing and planning expertises and promoting the inter-functional collaboration (logistics, marketing, procurement).

Focusing on the role of logistics on the vertical relationship, it is obvious that the centralisation of Distribution Centre at District level is crucial to gain power in the negotiation phase, thanks to the consolidation of buying activities.

Otherwise, it is evident that the research for logistic efficiency and efficacy needs the manufacturers' collaboration in order to co-project delivery processes, packaging and delivery equipments that allow both to cut costs and to enhance consumer service.

As we have already underlined, the case shows that the prevailing business model is co-opetition that includes at the same time horizontal collaborative relations as well as competitive relations in vertical and horizontal directions.

It could be interesting to demonstrate whether the supply chain reengineering attempts the sources of competitive advantage for both manufacturers and retailers or for only one of the two members of the distribution channel.

It seems reasonable that retailers find in logistics an important source of cost competitive advantage.

The supply chain reengineering, instead, can't be seen as a source of competitive advantage for manufacturers, especially brand name manufacturers that pursue product differentiation. It rather represents a means of rationalising internal operative costs and reducing logistics facilities investments in order to focus better on their core business.

Further research could be targeted to confirming these preliminary findings.

<sup>1</sup> “Economic based arguments have largely been at the core of the channel literature so far. I has been used to explain how intermediaries emerge, what functions they perform, and on occasions to predict channel structure. The economic rationale is important but nevertheless incomplete; equally important strategic considerations are ignored”. Gattorna J., 1978, pag. 505: “The largely mechanistic orientation of the economic, institutional, and functional schools is partially offset and supplemented by the organisational and behavioural schools which introduce a necessary social element into the overall scheme”. Behavioral marketing “ to control the decision variables in the marketing strategy of any members in a given channel at a different level of distribution” (El Ansary A.I., Stern L.W., 1972, pag. 47).

<sup>2</sup> In the Preface of his Book, Porter said: “This book lies at the intersection between the mainstream economic research in Industrial Organisation and the preoccupation of research in business administration with the problems of the manager” (Porter M.E., 1976).

---

<sup>3</sup> The logistic literature focuses on minimizing total distribution costs via trade-offs - especially trade-offs between transportation costs and warehouse costs and studies the flow of materials from primary producer to end customer is at focus.

<sup>4</sup> Continuous Replenishment Programme (CRP) changes the traditional replenishment process of retailer generated orders to one of partnership amongst trading partners where the supplier determines the replenishment quantities based on information on stock and sales received from the customer.

<sup>5</sup> Computer Assisted Ordering (CAO) is the preparation of an order through the use of computers that integrate information about product movement (as recorded by the point of sale equipment), outside factors that affect demand (such as seasonal changes), actual inventory levels, product receipts, and an acceptable safety stock level.”.

<sup>6</sup> . In recent years, increasing emphasis has been placed on the ways in which these relationships link companies in supply chains and networks.

<sup>7</sup> Co-opetition is a revolutionary framework that combines competition and cooperation (Brandenburger and Nalebuff, 1996) and is based on and on the principles of game theory.

<sup>8</sup> Brandenburger and Nalebuff (1996) suggest the concept of value net, which places a single company between customers and suppliers (= vertical dimension) who can be either complementors or competitors (= horizontal dimension).

<sup>9</sup> The focus is on the specific network aspects that impact development of other capabilities and resources or that strengthen competitive advantage or that improve efficiency and effectiveness in utilising other resources

<sup>10</sup> Especially in the food segment, great attention has been given to price positioning, because of the economic slowdown. Consumers are in a constant search for price, willing to change the shop, retailer and format.

# Opportunities of New European Countries in Outsourcing

*Ondrej Turza*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

Central and Eastern Europe has become attractive region for foreign investments since it joined European Union (EU) in May 2004. In the last 15 years it has gone through difficult period of transformation from state-planned economy to the world where relationships are market oriented. Decision of investors from USA, old EU states and regions from Asia where to outsource production of goods and services is influenced by several factors. The new states of European Union attract investors for many reasons discussed in this paper as well. The paper focuses on main problems of economic transformation and points to key factors why Central and Eastern Europe has become very attractive region for investors from other parts of the world. Author also suggests what reforms are necessary to keep attractiveness and what are the main obstacles preventing more companies from seeking opportunities in the CEE region. Finally paper compares advantages and disadvantages with traditional outsourcing regions.

## Introduction

The goal of this paper is to point out how transformation to market oriented economy changed the Central and Eastern Europe (CEE) and what advantages this process brought to this region. Accession process before May 2004 pushed these countries ahead of old countries of EU in the structural reforms. One of the results is increased interest of investors despite the transitional problems which are still present in this region. Moreover companies from old EU seek new opportunities in the new EU countries due to the lack of structural reforms in the old EU countries specifically the inflexible labor market and fiscal problems resulting in high and complicated taxation schemes.

The paper is divided into three parts. The first part sets transformation of the region into the context of the EU accession process and highlights factors which indirectly helped the new EU states to increase competitiveness among other regions. The second part analyses short and long terms comparative advantages which lead to positive decision on outsourcing process within the CEE. One of the examples is opening of Hyundai / KIA car manufacturing factory in Slovak Republic. The focus is also given on the specific reasons of labor market inflexibility and other unnecessary costs increase forcing business movement from old EU states to the CEE region. The last part of this paper compares conditions more globally with other traditional outsourcing regions.

### Transformation Process

The region of Central and Eastern Europe (CEE) started transformation towards the market oriented economy in 1989 after fall of the Soviet Union. The region suffered from 40 years of state-planned economy which produced unnecessary, obsolete and unwanted goods and services. While supply side produced weapons for countries under the Soviet influence and imported sandals from Vietnam, demand side was served by black market using foreign currencies especially German Mark and US Dollars.

In the early 90's of the previous century companies were state-owned with obsolete business plans and the economy suffered from over employment [2]. Visegrad region (Poland, Hungary, Czech Republic and Slovak Republic) started structural reforms in all sectors. The public sector was no longer able to create the exogenously imposed full employment. Moreover, it showed a diminished productivity and a shortage of fresh investments. At the same time, the private sector was unable to absorb the resulting unemployment immediately [2]. Reforms started in the early 90's with the excessive devaluation of currencies opening trade to the West with free market, currency convertibility and almost no restrictions [10] [6]. While the policy of total privatization worked in general, there are mixed views on its total effectiveness [1], especially in the sectors with tendency to natural monopoly, such as telecommunications or oil industry. New privatized companies tend to improve their efficiency by drastic cuts of labor force. General consequence of these policies resulted in a high overall percentage of unemployed population. Budget deficits dramatically increased because the CEE countries used widely the unemployment benefits.

Countries were unable to finance social transfers, which made it impossible to decrease the payroll taxes and the taxation level in general. This is still a big barrier to raise employment levels and prevents increase of net wages.

Quick and correct decisions of judicial systems still remain a problem of the region. One of the biggest mistakes was to give the full independence to the judicial systems without their deep structural reforms. Judges from the previous era still remain on their positions, and their decisions are often unpredictable which prevents the non-discriminative treatment of all involved parties. There are several opened cases that involved the corruption of judicial system representatives. Self-governing powers given to the courts are not used properly to manage the system without the interference of the government or parliament. In general, these cases lower the confidence of population and market players. Many cases are opened several years for no obvious reason and the self-management abilities of the judicial system remain at relatively low levels.

Despite of the fact that countries have to finish some of the structural reforms, the commitment of national governments to economic reforms and sound economic policies has exerted a strong influence on subsequent economic and labor market developments in the CEE region [9]. The environment of permanent economic and institutional transformation decreased social resistance to changes. Therefore it is more likely to adapt sometimes very painful reforms such as the social system reforms facing demographic crisis, or tax reforms. Compared to the old EU, there are few countries that adopted business-friendly flat tax or more flexible employment laws. Now the discussion spread out within the CEE region facing quick positive results in the countries that adopted these strategies.

#### **Long Term Comparative Advantages of the CEE Region**

The CEE region cannot compete with the old EU countries in terms of highways penetration or established infrastructure. There are EU infrastructure funds helping to build roads and highways but a lot of time and substantial investments of local governments are needed to make situation comparable to the old EU countries. Therefore, these countries seek other comparative advantages. Sustainable high GDP growth is necessary to close the gap between the old EU countries and 10 countries, which joined EU in 2004. Massive state expenditures is the least desirable way of how to achieve the growth because it inevitably causes tax increase or high budget deficit, which needs to be sooner or later paid. Moreover, both of these consequences have detrimental effect on the corporate environment. Therefore, comparative tax system, structural reforms including social system with investment friendly working laws, and high skilled labor force are advantages that can help these countries in the long run. Furthermore, the competitiveness among the countries in order to attract investors removes harmful pieces of legislation in connection with the corporate world.

The concept of the flat tax mentioned earlier has already shown quick short-term results, but additional benefits are expected in the long run. Primarily, it offers a lower rate of taxation, which also reduces incentive for tax evasion. An important characteristic of the flat tax system is that it taxes all income once and once only, as close as possible to its source. In the progressive tax system, some types of income, like fringe benefits, are never taxed at all. Other kinds, like dividends and capital gains, are taxed twice: once at the corporate level and then again at the shareholder level. Even worse, some types of income, such as interest income, can be either taxed or not, depending on the taxpayer's ability to avoid taxation. Therefore, radical simplification of the tax system by removing any deductions or relieves, and by eliminating double taxation, allows the system to get rid of these anomalies [3]. According to Robert Hall and Alvin Rabushka from the Hoover Institution the flat tax plays a crucial role in making the decision to outsource [4].

$$\begin{aligned} \text{Business Tax} = & \text{Flat Tax} \times [\text{Total revenue from sales of goods} \\ & \text{less purchases of inputs from other firms} \\ & \text{less wages, pensions paid to workers} \\ & \text{less purchases of plant and equipment}] \end{aligned}$$

Countries like Slovakia introduced zero percent tax on the dividends as well, which creates even more friendly business environment for foreign investors. This advantage is not included with the flat-tax system, and it is expected to be included in the flat tax system later on. However, it currently makes the country more attractive when considering investment decisions in the region. Last, but not least advantage of the flat tax is the simplification of the whole tax system, which makes investments more predictable and decreases transactional costs. For example, the old system in Slovakia included 90 exceptions, 19 sources of un-taxed income, 66 tax-exempt items, and 27

items with specific tax rates. Finally, there are other advantages of the system, like the elimination of special interest lobbying groups, more control over the income, reduction of interest rates, etc. All these factors tend to increase fairness on the market, and the clear and readable markets is even more important for foreign investors than the total percentage of taxation itself.

Primary function of the social system is to keep social cohesiveness and help the people in difficult situations. According to German social theorist Luhmann [7], in the “properly” functionally differentiated societies, economic decisions are made on the basis of the economic communication medium which is money. However, in societies where the state plays major role, investment decisions are made on the basis of the political power. Now, money is a much more suitable basis for making economic decisions than power [12]. This was exactly true during the first years of the transformation of the CEE countries. Big state-owned companies employed redundant people and the governments feared that the privatization raises unemployment levels. Consequently governments provided these companies with “pillows”, such as protective laws that prevent other companies to enter specific markets, for example through high customs duties or by financing the loss of these companies. Secondary effect of such a behavior resulted in the extension of budget deficits and sent false signals to the state-owned companies about the sustainability of their business plans. Moreover, protective customs tariffs led to the increase of general price level. True consequences appeared when the governments found out that there is not enough money to finance everything, and they tried to sell these companies or stopped financing their deficits. Almost all of them collapsed when the protective measures were cancelled. This resulted in big amounts of unemployed workers who could not find a job within their region because a state-owned company often employed almost the whole region. These workers were unemployable and became burden of the social system. The main problem became long-term unemployment, and people who lost their working habits due to being in a social net for several years. These people have no ability to compete on the market. They used to work for one company twenty or thirty years, and they have no self-selling abilities whatsoever. Another reason of why these people remained fed by the social systems was a minimal difference between the wages paid by employers and the amount paid by the state as unemployment and other social benefits. Additionally, a lot of people worked in a non-official economy and paid no taxes. The countries were losing twice – primarily on government social transfers, and secondary on income taxes. Another substantial cause of high unemployment levels were overprotective rights of employees. Once the employer hired a permanent employee it was almost impossible to cancel the contract with very few exceptions in some extreme cases. This polluted even healthy companies with temporarily less work and had an exactly opposite effect. These companies were afraid to hire anybody, which practically eliminated the possibility to find a job for long term unemployed people over fifty years or other discriminated groups on the labor market. In order to create a favorable environment for investors, the governments had to stop financing ineffective state-owned companies, and start to support the environment when being employed pays off more than being unemployed. Furthermore, they have to create flexibility allowing companies to keep adequate levels of employees. Described measures combined with private pension plans, which are not connected to the state finances. This relieved tensions on budget deficit, which creates more resources for primary function of the social system. Finally, lower level of social transfers creates opportunities to decrease the cost of work for employers, which still remains relatively high.

Whereas the formerly discussed comparative advantages can be seen as corrections caused by a state-planned economy or as a reaction to an unfavorable demographic development, the last discussed reform allows competition with global players and might become a crucial reason of the success in globalization. No doubts that a good educational system creates a long-term comparative advantage that divides the poor and rich both in terms of their income and intellectual potential. However, academic education does not necessarily imply higher income. Higher income depends on the ability of an individual to meet expectations of other individuals on the market and in the society. However, academic education gives the individual better than average skills on the labor market. Moreover, it ensures such individuals better income conditions and certain status in the society as a comparative advantage [11]. From the globalization point of view we can look on the labor market as a worldwide human resources market. Therefore, such individuals can be viewed not only above average within a specific country, but rather within their region or worldwide.

Posvaneć and Mitosinka from F.A.Hayek Foundation define the following basic principles to achieve a higher quality of education [11]:

- Participation of students on the cost of education
- Competition of universities on free market
- Independent rating agencies

Financial participation of students on studying expenses achieves that the students are treated more like clients which on the other hand improves the quality of the education process. Universities that meet basic standards must be allowed to enter the market without any obstacles from the government. In case the universities want to award diplomas recognized by the state, they must meet criteria set by the government. On the other hand the students attending these educational institutions push them to meet these standards. Free entrance to the market followed by the creation of a legal environment that allows merging of the universities, to share the expenses as well as closing them down when becoming less attractive to students. These decisions have to be made independently by the universities with no state intervention. For example the university makes a decision to close down having financial debt caused by failure to provide market expectations defined by decisions of students not to attend such school. Independent rating agencies can monitor and assess the quality and comfort of the schools from students' point of view so that new participants coming from high schools as well as those already attending those universities. Last area where the government can assist are the courses helping long the term unemployed people to match current requirements of employers. Result of the educational reform is a skilled labor force with up-to-date knowledge requested by the market, and it is long-term advantage assessed by potential investors.

#### **Short Term Comparative Advantages of the CEE Region**

Short and middle term comparative advantages are the state investment incentives, widespread tax relieves for investors, labor market barriers for new countries in EU region and low income level. The state investment stimuli are a short-term comparative advantage used within the CEE region to compete when few countries are in a final round of decision where to invest. The maximum level of the government participation is regulated by the EU. However, the governments argue that when there are multiple equally rated options to invest they must provide an additional extra reason to attract the investor. While the short history proves this claim to be true to some extent, investors always mention skilled labor force and low labor cost as well. Therefore, this instrument should be carefully used for several reasons. First, the government can direct investments into the regions with low infrastructure quality which would be otherwise avoided by the investors. More details are discussed in the paper published by National Bank of Slovakia (NBS) [5]. Second, this instrument distorts free market where the conditions for one company differ from another. This intervention causes less than optimal behavior of other market players, or it can create a monopoly within the region. Third, apart from the government supporting economically backward regions the stimulation can have the multiplication effect on big investments. Decision of Hyundai/KIA to invest in Slovakia induced investments of companies which would never come otherwise. Some economists [8] oppose and claim that the same amount of money invested in small enterprises would increase the employment level even more rapidly.

As a part of EU accession process, the old EU countries were given an option to protect their labor markets for seven years and effectively prevent people from the new EU countries to participate in the employment process within the region. Almost all countries with few exceptions, for instance Great Britain and Ireland, closed their labor markets. For example Germany plans to use maximum period possible. It seems strange why this is a short-term comparative advantage or an advantage at all. Again market powers have shown that any distortions is paid heavily. The EU region was built as a trade region allowing free flow of capital investment and flow of labor. Consequently, when one of the foundations of EU was broken, the market found its way to get over it. However, when people from the new EU countries could not come to Germany, companies from Germany created branches all over the new EU region. They employ labor people for less money thus making some of the positions on German labor market obsolete. This is one of the reasons why businesses are fully or partially closing their offices and raising the unemployment level in the old EU countries. This process started by outsourcing manufacturing processes and continues with call centers.

Low wage level is a short term or at most a mid-term advantage, and the remaining time of this "incentive" depends on the country initial level of unemployment and the degree of government pro-market policies. Labor markets are not flexible and we can see them as many markets based on different previous occupation. Transition is easier within substitute markets and the level of available people with requested or similar skills is relatively high.

Average income level in the CEE region is several times lower than the one of the old EU countries. Unemployment is relatively high comparing with the old EU than economically reasonable supply of positions due to structural unemployment after several reforms like removing over-employment within public sector and state-owned companies. This situation will remain within 10 to 15 years period when investors with low added value will move further on. This gives sufficient time to finish structural reforms. Output of educational reforms should be visible during this period. Even though some employers will move further on, the role of governments is to ensure that new labor force entering the market is able to fill positions with higher added value. After the short terms advantages are depleted, the countries with the long term comparative advantages mix most suitable for investors will gain sustainable growth both in terms of GDP and population welfare.

### The CEE versus Traditional Outsourcing Regions

Decision where to outsource is influenced by several factors. Comparison of those factors between Central and Eastern Europe region and other traditional outsourcing regions is shown in Fig. 1:

Reason influencing outsourcing decision	Details	CEE Region	Traditional outsourcing regions
Barriers	Market entrance barriers and money flows	No barriers, no customs tariffs	Barriers for capital flows, protective customs tariffs
	Legislative barriers	No barriers with some transitional protective periods, Goods and services harmonized in high degree	Legislative barriers preventing entrance of non-harmonized goods and services or limited amount of import per country, export of some goods is heavily subsidized
	Internal EU market protection	No protection on goods and services coming from internal market, free flow of capital and goods	Protection against imports
	Labour markets	Free working possibilities after transitional period	Work permits needed
Exchange rate risks	Euro / US Dollar exchange rate risk	Whole EU will adapt Euro currency after transitional period	Exchange rate risks needs to be calculated in price. The same remains for non-US Dollar currencies
Proximity	Cultural proximity	Problems are solved more efficiently due to common history background. Call centres are one of the example	Sometimes difficulty to understand where is the problem. Retail customers facing call centres often have problems if nontrivial request will come in.
	Language proximity	Many countries and regions have similar languages or people know more than one language used in EU	English is the only main language of communication.
	Time proximity	Business hours are the same or maximum 1 hour difference	Time difference prevents solving problems where interaction is requested. 24/7 shifts is not always an option
	Distance proximity	In case coordination meeting is needed in person it is smaller problem within Europe	Regions like India are more difficult to reach both in terms of people in case person-to-person meeting as well as when hardware or infrastructure needs to be delivered
Costs	Labor costs	Income level is expected to rise	Income level will stay competitive

FIG. 1: COMPARISON OF THE CEE REGION WITHIN EU AND TRADITIONAL OUTSOURCING REGIONS

Apart from labor cost, which will become comparative disadvantage new countries of the CEE region can use natural reasons like proximity with old EU countries or barriers imposed by European Union. There are several other reasons influencing decision on outsourcing but they are controversial or hard / impossible to measure like level of corruption or stability of judicial system.

## Conclusions

The region of Central and Eastern Europe enjoys the period of economic growth. Successful countries within the region performed deep structural reforms. Some of these reforms, like social system reforms or tax reforms, need to be adapted by the old countries of the European Union. The new EU countries use short and long-term comparative

advantages to attract investors both inside and outside European Union. Proximity of CEE region to the rest of Europe allows potential investors to use similar culture, language capabilities, and the same time zones for profitable investments. Lack of market barriers within European Union allows effective allocation of resources without additional costs. Some advantages of the CEE region will disappear in near future. The successful players have to continue in reforms and keep the investment friendly business system to be prepared for the challenges of the global world.

## Measuring the Value of Network Resources

*Tero Vuorinen*

*Elina Varamäki*

*Marko Kohtamäki*

*University of Vaasa, Finland*

*Timo Pihkala*

*University of Lappeenranta, Finland*

### Abstract

This paper is based on two perspectives, a system view and a view that considers networks as entities, by means of which we are trying to produce added value to discussion on networking. A network-level performance measurement system emphasizes win-win situations in the network between the leader company and the other members of the network. According to our framework, the network level performance measurement system is composed of factors enabling action and success, of processes, as well as of the productivity and profitability of activities. The main objective of the paper is to build a measurement system for analyzing the value of resources and competencies in the network as part of a network-level performance measurement system. The resource base of the network is comprised of the tangible and intangible resources of the individuals and the companies in the network, as well as of the compatibility and specialization of these resources.

### Introduction and Objective Setting

During recent years, the authorities have attempted to promote inter-firm co-operation very actively by trying to persuade small and medium-sized enterprises to enter different alliances. Nevertheless, the results have not always been flattering. Different promoters of networking have had limited knowledge about how to contribute to successful development in cooperative groups. Evidently, practitioners (consultants as well as entrepreneurs) do not have sufficiently effective tools at their disposal when trying to form networks. It is very conspicuous that there has been hardly any research about the management tools and the holistic performance measurement of SME networks. For instance, network accounting has been approached mainly theoretically, introducing some evident problems [Järvenpää, Partanen & Tuomela 2001; Tomkins 2001; Kulmala 2003]. Applying system level control mechanisms and performance measurement tools to a network is very important when managing networks. A network is not an intrinsic value but a tool to organize the operations between companies, and that is why there is so much interest in the ability of networks to succeed in their tasks. The companies in a network are interested in the benefits and costs of networking, the investors are interested in the revenue opportunities involved in a network, and the customers in the value chain are interested in the ability of the network to manage production tasks as well as or better than an integrated single company.

This paper is part of an ongoing study which is based on two perspectives, by means of which we are trying to produce added value to discussion on networking. These perspectives are a system view and a view that considers networks as entities. A network-level performance measurement system emphasizes win-win situations in the network between the leader enterprise and the other members of the network. Previous performance measurement systems have focused on the level of single enterprises.

According to our pilot study [Varamäki, Pihkala, Järvenpää & Vesalainen 2004], the suggested framework for a performance measurement system is composed of factors enabling action and success, of processes, as well as of the productivity and profitability of activities. The issues enabling success are (1) the values and culture of the network, (2) resources, competences, as well as the (3) modes of action of the network. The profitability of activities can be divided into the (4) profitability of internal processes, into (5) customer satisfaction and into the (6) financial key ratios of the network (see Figure 1). The *values and culture* of the network describe the mental state of the network through trust, commitment, partnership values and communication within the network, such as interaction

manners and openness. *Resources and competences* are connected in particular to the ability and capacity of the network to produce core output to business effectively and, on the other hand, to create and to develop new modes of action. The resource base of the network is comprised of the tangible and the intangible resources of the individuals and the companies in the network, as well as of the compatibility, specialization / overlapping of these resources. The *modes of actions of the network* describe the ability of the actors in the network to design and to exploit different modes of action in the network, for instance the elements and models of bilateral and multilateral co-operation.

In the network, the above-mentioned enabling elements (values and culture, resources and competences, modes of actions) are the *structural and operational choices, achievements and capabilities*, which are the seminal value drivers creating the base for the financial performance and profitability of the network. This performance could be evaluated by using the logic of the Balanced Scorecard (BSC). It is generally assumed in the causal logic of the BSC that a learning and well-being organization is 1) able to make innovations, and furthermore, 2) effective and high-quality processes. Moreover, if these innovations and processes are customer-driven, the firm or the network will achieve 3) satisfied and profitable customers. This customer satisfaction and profitability will be also reflected in the 4) overall financial success (profitability, solvency and liquidity) of the company/network, according to the logic of the BSC. In a well-run network, the profit is not divided in a zero-sum game, in which a profit increase in one part means a profit decrease in some other part.

Developing a performance measurement system for a network headed by a leader company is important from both a theoretical and a managerial perspective. The final research results will indicate how an ideally operating network headed by the leader company should operate. These results are needed in order to understand the successful and the unsuccessful development and performance of vertical networks.

In this paper, the focus is on resources and competences in networks headed by a leader enterprise. Resources are connected in particular to the ability and capacity of the network to produce core output to business effectively and, on the other hand, to create and to develop new modes of action. The resource base of the network is comprised of the tangible and intangible resources of the individuals and the companies in the network, as well as of the compatibility, specialization / overlapping of those resources. *The main objective of the paper is to build a measurement system for analyzing the value of resources and competencies in the network.*

When measuring their value, network resources can be divided, for example, into physical resources, human resources, competencies, capabilities, etc. In a broader scope, all the factors that are able to provide a competitive edge in the market could be considered as valuable resources. Hence, the value of the resource is the value of the process it enables, and the value of the process depends on the market. The challenge of resource measurement consists of recognizing at first the most valuable resources and of measuring then their value in their own context. The biggest challenge in developing and applying a network-level performance measurement system, however, is the level of analysis itself. By network-level analysis, in this study we mean a vertical network including a leader company and the first-level suppliers. Naturally, there are second-level suppliers, third-level suppliers and so on, but they have been left out of the analysis.

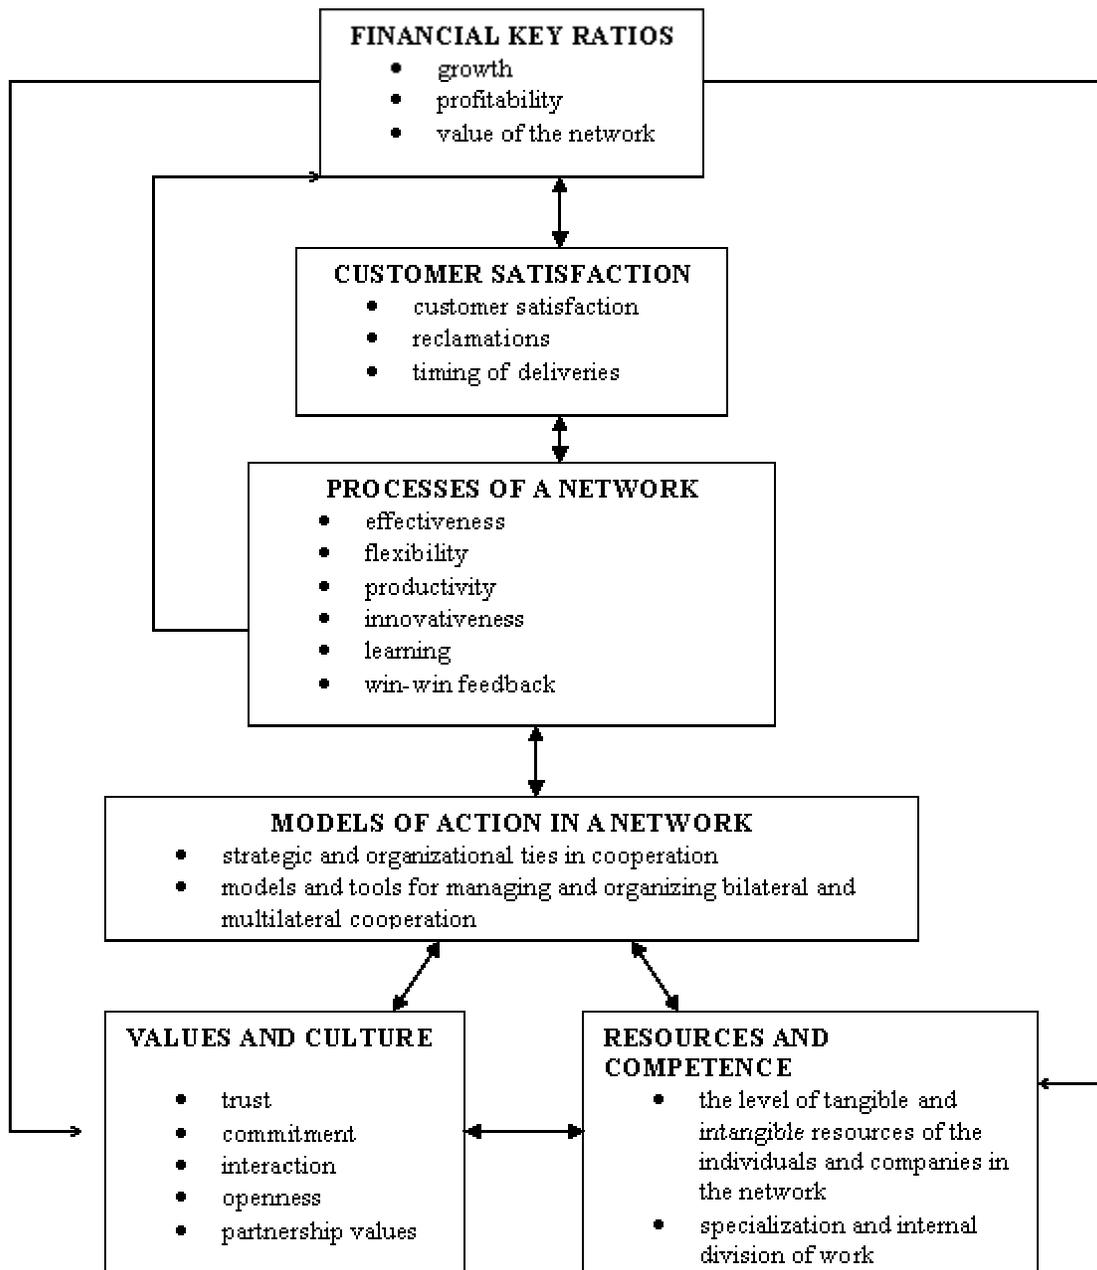

FIG. 1. A FRAMEWORK FOR ANALYZING PERFORMANCE MEASUREMENT IN NETWORKS.

### The Resource-based Theory of the Firm

The theory presented in this paper is based on the resource-based theory of the firm [or resource-based view, see e.g. Penrose 1959; Barney 1991; Peteraf 1993]. In the resource-based view (Rbv) the reason why firms exist is not the

avoidance of opportunism, as it is in the transaction cost theory (Tce) [see e.g. Williamson 1975, 1985]. Generally speaking, according to the Tce, the main purpose of the firm is to avoid negative and, according to the Rbv, to create positive [Conner 1991]. In the Rbv, the rationale behind the integration of economic actors is the ability of the firms to create, receive and exploit differential resources better because the value of the resource is dependent on the other resources and on the ability of the controller of the resource to exploit it. Hence, the value of the resource is different for each economic actor. Superior resources are able to generate rents, the profit that is not tempting other firms to compete for it, because of their less valuable resource-base and, therefore, higher costs or weaker competitiveness in the same market [Peteraf 1993; Mahoney & Pandian 1992].

The assumption in the Rbv is that, in an economy, the resources are not delivered equally, and, additionally, they are not perfectly mobile (Barney 1991). If the resources were delivered equally and they were perfectly mobile, every firm could choose and implement the same best strategy for the present situation, but, instead, firms implement the best suitable strategy depending on their resources. One solution to implement a more competitive strategy, which is not possible with the initial resources of a company, is to acquire the resources needed through cooperative arrangements. With cooperative resources, companies are able to do things they would not be able to do otherwise. Resource sharing has become the major explanation for cooperative behavior [see e.g. Combs & Ketchen 2003; Das & Teng 2000].

Resources are the factors of production owned or controlled by a company. They could be divided, for example, into material and immaterial resources or into technological, marketing and financing resources, or into physical, human and organizational resources [see e.g. Barney 1991]. Wernerfelt [1984: 172] considers resources as visible or invisible property permanently or semi-permanently connected to the company at a certain time, such as a brand, technological skills, skillful employee, contracts, machines, effective processes and capital. The range of valuable resources is wide, but to be taken into account as valuable, a resource must fulfill simple conditions: it must provide added value to the customer or it must have the potential to provide value in the future [Fahy 1999:5]. For example, certain organization form is a valuable resource only if it is able to provide added value for the business process [Lewin & Phelan 1999: 5], and we must also remember that resources *per se* are not valuable, they only have the potential of providing value adding processes. Production facilities or a brand are not valuable if the company is not able to use them to add any value to the customer. From the strategic point of view, a resource is valuable if, by the aid of the resource, the company is able to implement a strategy that decreases the costs or increases the incomes, when compared to the strategy without it [Barney & Arian 2001: 138].

Certain resources can yield sustainable rents, which is also the base of a sustainable competitive advantage (SCA) over other competing firms. Barney [1991] defines sustainable competitive advantage (SCA) as follows: a firm has a *competitive advantage* if it implements certain value creating strategy, which, at the same time, is not implemented by any of its competitors or potential competitors, furthermore, firm has a *sustainable competitive advantage* if any of its competitors or potential competitors is not implementing it and, additionally, is not able to implement it, either. A competitive advantage is sustainable if it still remains after attempts to copy it [Lippman & Rumelt 1982]. According to Barney [1991], to generate a sustainable competitive advantage, the features required for the resource are value, rareness, imitability, and substitutability. A resource has value if it provides better opportunities for the company to reach the opportunities or defend itself against the threats in the company's environment. The above-mentioned requirement for rareness refers to rareness among the competitors and potential competitors of the company, not to absolute rareness in the whole economy. On the other hand, in an economy, value always depends on rareness. Barney's concepts of imitability and substitutability are about the same issue, because what counts is the functional differences between resources, not the ways the function has been reached. Grant (1991) adds transferability and transparency to the list of value indicators, to which Collis and Montgomery (1995) further add durability and competitive excellence [see more e.g. Rumelt 1984; Mahoney & Pandian 1992; Amit & Schoemaker 1993]. Nevertheless, it is possible to reduce the list of value indicators suggested by different authors into the attributes of value, difficulty in copying and the owner's ability to utilize the resource [Fahy 1999: 5]. Resources that are easy to buy in the market could not be the source of a sustainable competitive advantage [Dierick & Cool 1989].

The above requirements for resource analysis were defined from the viewpoint of one single company. When considering the value of resources in a network environment, the features of resources appear in a different

light. In a network, the other companies might be cooperating partners, not hostile competitors. For example, in the network context, the transferability and visibility of resources could be considered as value generators, not value reducers. Furthermore, in the case of single enterprise, the value of resources depends on the initial resources of the enterprise, while, in a network, the value of resources depends on the complementarity and compatibility of the resources with the other network companies' resources. Hence, it is important for the network partners to see and to know each other's resources in order to utilize the whole potential of the network, not just the potential of their own. This and some others issues, considering primarily the Rbv and networks, are discussed below.

## Resource-based View and Networks

The confined view about limited resources can be extended to a more useful theory when supplementing it with the theories of organizational co-operation, co-operative strategies and reciprocal strategic dependence [Barney 1991; Young 1995]. According to the resource-based view, the competitiveness of a business network depends on the resources it possesses and the effectiveness of combining them. The resources that different companies bring to the network can be similar and complementary or new and additional. The effective operations of the network require the efficient exploitation of the resources in accordance with the objectives of the network. At the same time, the network may possess and suffer from unfitted additional resources and the surplus of complementary resources [Das & Teng 2000: 12].

Traditionally, the networking progress has been analyzed through the transaction cost theory, when trying to explain the ultimate reasons and logic behind the integration of individual economic actors into companies as well as companies' integration into business networks. Networks are considered as the intermediate control form of economic activities between markets and hierarchies [see e.g. Williamson 1975; 1985; Adler 2001]. The transaction cost theory emphasizes cost minimization in the sum of production costs and transaction costs while considering also the opportunities involved with networking and cooperative arrangements [Coase 1937; Williamson 1975]. In contrast, according to the resource-based view, the rationale of network co-operation is the value maximization of a firm through pooling and utilizing valuable resources [Das & Teng 2000: 4]. The firms, then, attempt to find the resource boundary that gives the best value when combined with their own resources. In the transaction cost theory, one essential term, asset specificity, is described with the term 'quasi-rent' (or 'Pareto-rent'), which is about the difference of the value of a resource in its best use and in its second best use. In the case of cooperation ending between two companies, if quasi-rent is involved in the relationship, the companies will lose the value of the quasi-rent. The same topic is also the key element in the Rbv, which considers asset specificity as a generator of firm-specific rents. According to the Tce, companies try to protect themselves from high quasi-rent and, correspondingly, in the Rbv, companies search for ways to earn rents and when rents are found, they try to protect them from their competitors as long as possible. The smaller the number of firms with the same valuable resource, the better the opportunities for the firm to earn rents. But we have to remember that access to the resource and the control of the resource, not the ownership of the resources, are the requirements for earning rents. This encourages companies to networking progress whereas the Tce sees networking progress rather as a risk. The aim and the rationale of a networking process, when considered from the resource-based point of view, is (1) to obtain others' resources; and (2) to retain and to develop one's own resources by combining them with others' resources [Das & Teng 2000].

Firms could be considered to earn rents also through acquisitions of other firms, if the new combination is then more valuable than the firms separately. This same logic is the rationale behind networking progress. Firms have different abilities to utilize the resources and rents could be earned by combining the resources of the firms within the network with the aid of cooperation [Ring 1996]. The success of the whole network as well as relational rents could then be earned, if resource utilization is then more effective or resource combinations are more valuable than they were initially. Ring [1996] defines the concept of cooperative sustainable advantage (CSA), which is the outcome of relational rents, based on the Barney's definition of sustainable competitive definition (SCA) as follows: *the implementing of certain strategy, which is not implemented by any other firm with whom the firm is not cooperating, and whose benefits the other firms could not copy without cooperating with each other* [Ring 1996:25].

In this article, we are considering rent giving resources in a broader sense, which includes all the assets and all the competencies and capabilities, as well. Invisible assets, competences and, especially, capabilities have recently been in the most critical role in the Rbv [see e.g. Prahalad & Hamel 1990; Stalk, Evans & Schulman 1992, Long & Vickers-Koch 1995, Teece, Pisano & Schuen 1997; Lippman & Rumelt 2003; Winter 2003; Helfat & Peteraf 2003; Adner & Helfat 2003]. The capability approach has begun to move resource-based thinking more towards the view in which the most critical and valuable resource is the resource that releases the value of the business process (capability), not the resource itself in the business process (competencies). Competencies and capabilities are sometimes difficult to separate clearly and opinions about them differ in the literature [see e.g. Long-Vickers & Koch 1995; Stalk, Evans & Schulman 1992]. The distinction between them is still relevant when considering the opportunities in network economy.

Capabilities (or core capabilities) add value by combining and coordinating the valuable resources such as core competencies [Stalk, Evans & Schulman 1992]. The core capabilities are the resources most difficult to copy, because they are based on interaction and complicated value adding processes [Collis 1994]. Compared to core capabilities, core competencies are considered to be more closely connected to a certain part of the value chain and to certain technology [Long & Vickers-Koch 1995].

Teece, Pisano and Schuen [1997] consider firms' abilities to combine, construct and to redeploy internal and external competencies to fit to the fast changing environment [see also Winter 2003; Blyler and Coff 2003]. They use the term 'dynamic capabilities' to define the flexibility of a capability. The dynamic capability approach gives new potential to the Rbv approach and additionally combines the Rbv, the Teece and the social capital theory to the context of networks. For example, Blyler and Coff [2003] consider social capital together with dynamic capabilities as the requirement for recognizing the resources, earning the access to the resources and for combining and releasing the resources. Their opinion is that without social capital and dynamic capabilities, resources would be more or less unfitted to the changing environment. Social capital could be seen as a source of opportunities and a source of continuous redeployment ability. The dynamic capability approach reveals the fact that some companies do not have strong physical resources or technical skills, but they still can offer added value to the companies in a network. In this sense, when considering the value of the resources in a network, we have to be able to measure, for example, the value of market information, entrepreneurial skills or relations to the customers or suppliers, all of which could be considered as capabilities or dynamic capabilities and, therefore, valuable resources, which some companies in the network might possess. When trying to measure the value of the resources, it is important to recognize the different roles of the resources in business processes, the different features of valuable resources and the connections and dependence between the resources in the network. The resource-based view facilitates the categorizing and analyzing of the resources in the business network. The categorization of resources is presented in Fig. 2.

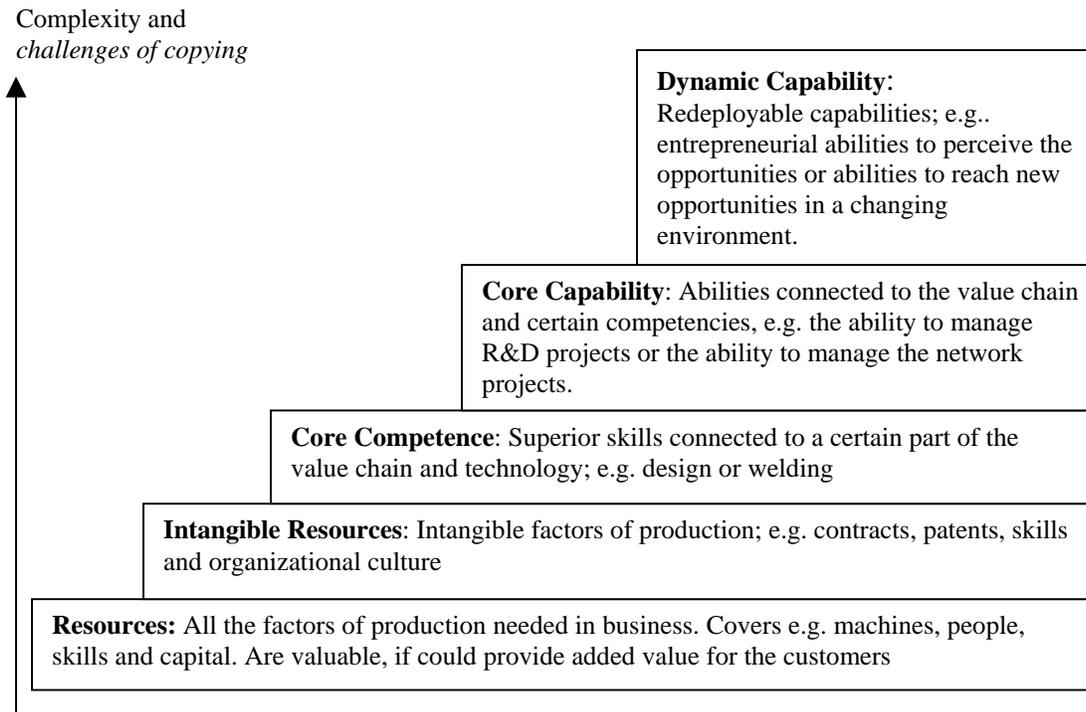

FIG 2. RESOURCE CATEGORIZATION.

The features of resources are more complicated and, moreover, more difficult to copy when moving up in the figure. At the same time, the challenges of exploitation get bigger for the companies controlling the resources. In the recent years, the focus of the strategy research dealing with resources has moved towards the analyzing of the upper categories in the figure.

### Resource Measurement in the Network headed by a Leader Company

When considering the resources in the network environment, the value of the whole network and its resources could be described as the sum of the (1) resources fit with customer needs, (2) the co-operation ability and willingness of the network and (3) the entrepreneurial capability of the network to reach new business opportunities. This means that the resources within the network are valuable only when particularly the leader company of the network is able to see the potential of the network resources correctly and is able to co-operate with the network resources and their owners and, at the same time, is able to coordinate the resources to fulfill the customer's existent or potential needs. In an ideal case, the network acts like an entrepreneur, who knows his resources and capabilities and is able to harness them to reach the emerging business opportunities. Compared to single entrepreneurs, the potential of the network to reach different opportunities is multiple, but also the difficult coordination of the network resources and friction between these resources could make the network less efficient and effective than single entrepreneurs.

This model of resource measurement within the network aims to be a tool for analyzing the subjective value of the network resources within their own context. The purpose is not to find the absolute values or market prices for the resources. The main contribution of this type of tool and measurement process could be that it allows the companies to see positive or negative progress within the network by the aid of longitudinal measurements. In many cases, companies are most interested in the direction of the change and do not regard accurate figures as essential.

The value of a resource depends on the process it enables, and the value of the process is determined by the market where it takes place. Hence, the demand of the market and the competition among the companies in the market are essential value drivers. The ultimate value of the resource depends on the resources fitted to the customers' needs. When operating in a leader enterprise network, the leader enterprise is the customer of the first-tier suppliers, and the suppliers in the first tier are the customers of the second-tier suppliers, etc. The important issue is how well the suppliers' resources fit to the resources of the customer. And, additionally, fitness is not the only requirement, because the ability to utilize the resource as well is also necessary and in utilizing it the biggest issue is the companies' ability to co-operate. The process that the resource of the supplier provides must have interaction with market demand through the customer's acts - in this case, the leader company's acts. Without the willingness and ability to cooperate, the resources of the network will not have that interaction and the value adding potential will be lost.

From the customer's point of view - in this case, from the leader company's point of view - one additional requirement for the full utilization of the resources in the network is the ability to recognize and to evaluate the resources correctly. Without it, the leader enterprise is unable to use the resources in the strategy. The strategy can be built upon the resources that are known and reachable. If the leader company does not know the resources of the network or makes an inadequate evaluation of them, it is forced to build its strategy upon its own resources. The sum of the perceived value of the network resources for the leader company is the comparative value of the suppliers' resources in relation to the value of the resources of their competitors and the leader company's valuation of them. The better the valuation, the better the opportunities to bring the resources into interaction with market demand. Again, without cooperative skills and willingness to cooperate, which could be considered as social capital, the evaluation process of the network resources is often too demanding and likely to be inaccurate.

The conspicuousness of resources can be evaluated by asking a supplier about his strengths and weaknesses and by comparing the information obtained with the customer's opinion about the supplier's strengths and weaknesses. The supplier can be expected to know his own strengths and weaknesses more accurately than the other competitors in the field; however, what is essential for the leader company and the network is the extent to which his customers are aware of them and how well the customers can utilize their potential.

In Fig. 3, the overall framework for the measurement process of network resources is presented. The measurement starts from **the resources of a single supplier**, continues with the evaluations of the **awareness**, **familiarity** and the **applicability** of the resources and ends with the evaluation of the **allocation and development practices** within the network. The logic in the measurement tool is that these dimensions will **provide the assessment of the value and of the value potential of the resources within** the network headed by the leader company. This framework constitutes a ground for operationalizing the value of resources in networks.

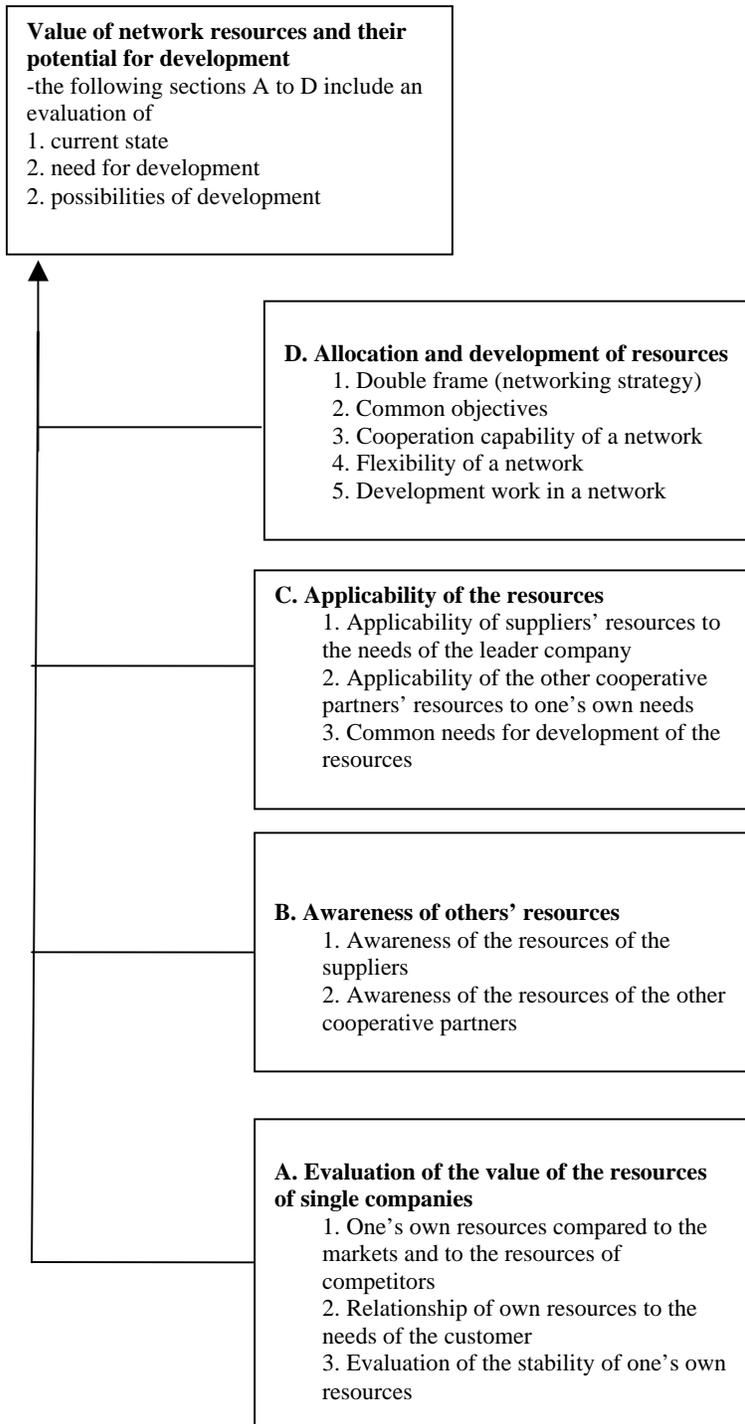

FIG. 3. FRAMEWORK FOR MEASURING RESOURCES.

In the following, the different sections of the framework have been operationalized.

**Questions related to Section A.** (Scale 1=strongly disagree – 5=strongly agree).

1. The technical service we offer our customers is rare in our region.
2. The integrated service package we offer our customers (delivery deadline, delivery reliability, price, capacity, extent) is rare.
3. In certain things, we are clearly better than our competitors.
4. The service we offer is essentially connected with our customer's core know-how
5. Our customer's activities are strongly dependent on our enterprise.
6. It is difficult for our competitors to copy our strengths.
7. Our relation with our customer would be difficult to replace by a new supplier.

**Questions related to Section B.** (Scale 1=strongly disagree – 5=strongly agree).

1. We know very well our suppliers' capabilities to serve us in relation to both quantity and quality.
2. We are aware of possible complementary know-how and resources with our suppliers.
3. We know the products and services offered by our customer well, regarding both quantity and quality.
4. We are aware of possible complementary know-how and resources with our customer.
5. We know the products and services offered by the other enterprises in the network, regarding both quantity and quality.
6. We are aware of possible complementary know-how and resources with the other companies in the network.

**Questions related to Section C.** (Scale 1=strongly disagree – 5=strongly agree).

1. The products and services offered by our suppliers correspond well to our needs, also in the future.
2. In their activities, our suppliers concentrate on factors essential for our strategy (e.g. product development, price, quality, delivery reliability, flexibility, etc.).
3. What we primarily want from our suppliers is a priority also in our suppliers' activities (e.g. price, quality, delivery reliability, etc.)
4. In our network (the other enterprises in the network), there is no significant overlapping know-how.
5. The know-how and resources of the other enterprises in the network complete our own know-how and resources.
6. The business activities of the other members of the network are mainly in lines in some way connected or touching our own activities..
7. The development of the resources among the members of the network would help us serve our customer better.
8. The joint development of the resources of the network is essential for the competitiveness of the network.
9. The joint development of the resources in the network would help us develop our own business activities.

**Questions related to Section D.** (Scale 1=strongly disagree – 5=strongly agree).

1. In addition to our enterprise's own strategy, we have a common network-level strategy, which also acts as a guideline to our own activities.
2. We feel we are "in the same boat" with the other enterprises in the network.
3. The enterprises belonging to the network have highly similar goals regarding their business operations.
4. The enterprises in the network are able to cooperate in a straightforward and fluent way.
5. Our suppliers adapt themselves rapidly to our changing needs.
6. We develop know-how and learn new things with the other members of the network.
7. We discuss the future investments of the network together with the other members of the network.
8. We seek to develop different roles for each enterprise within the network.

The above questions related to evaluation focus on the evaluation of the relative value of resources. However, we must bear in mind that, at each level, attempts can be made to assess also the absolute values of resources.

## Discussion

After the present theoretical part, the aim is to continue the study by testing the above-mentioned operationalized measurement system with four vertical case networks. Developing a performance measurement system for a network headed by a leader company is important from both a theoretical and a managerial perspective. The final research results will indicate how an ideally operating network headed by a leader company should operate. These results are needed in order to understand the successful and the unsuccessful development and performance of vertical networks. The benefits of this research for practical actors, entrepreneurs, small business managers, network promoters, authorities, and network investors will be the following:

1. It is possible to inform companies and other practitioners of how a network headed by a leader company acts ideally in different areas of networking.
2. Members of networks and investors in networks are able to use the ideal model for a network headed by a leader company as a tool for analyzing, evaluating and developing networks.
3. Within networks headed by a leader company, it is possible to utilize this model to consider a suitable networking strategy and to choose the most suitable level of networking.
4. The ideal model to be developed allows companies, consultants, authorities, and investors to use it as a tool for education.
5. The ideal model will produce new innovative methods and ways of action.

# Developing a Concept of Network Strategy The Theory of Network Governance

*Marko Kohtamäki  
Tero Vuorinen  
University of Vaasa, Finland*

## Abstract

Networks as a form of organization have achieved increasing attention in recent years. On the one hand, the interest has focused on vertical networks, researchers discussing about vertical integration and disintegration. On the other hand the interest has been on horizontal networks, from structurally loose cooperation forms to joint ventures. In this research, the object of this study is the management of a supply chain. The topic is approached through a semi-theoretical research, by which we mean a theoretical study, which uses examples. The main question of the research is: Which are the components of a network strategy?

## Introduction

Networks as a form of organization have been studied by the researchers since the late 1930's, when Ronald Coase (1937) published his article concerning the nature of a firm. Different approaches to networking have been developed. In this study we apply the transaction cost theory based on the new institutional economics. Transaction cost theory was developed by Coase and further developed by Williamson (1975; 1985). The ideas of this article are developed from the basis of the transaction cost approach (Williamson 1985). As the transaction cost approach discusses make-or-buy –decisions, it concerns the question of how to define the borders of a firm (Rindfleisch & Heide 1997; Klaes 2000). The latest research has added the third mechanism of governance to the theory: the social mechanism: a) trust and b) feeling of community. Transaction cost approach defined two mechanisms of governance: 1) price and 2) authority.

The theoretical discussion is wide and dispersed, but empirical evidence which is especially related to systemic model of governance mechanisms, which develops the concept of network strategy is lacking. Powell (1990) and Bradach and Eccles (1989) began the development of this idea of different governance mechanisms of partnerships and strategic networks on the basis of the transaction cost theory. A wide range of research has been conducted on the basis of the transaction cost theory, but less from the three dimensional and systemic viewpoint.

Some definitions need to be given. Governance is a concept, typically used in the studies of strategic network. By governance, we refer to management of the supply chain, and with strategic network we refer to supply chain governed as typical partnerships are. In the literature, researchers identify three forms of organizing (markets, networks and hierarchy) and three forms of governance (price, trust and authority) (Bradach & Eccles 1989; Adler 2001). In this research, the concept of network strategy is developed through these three different mechanisms of governance. Also the practical implications are made explicit.

The need for the concept of a network strategy arises from the empirical world. Often contracts are made and processes are described and developed, but the leader company has neither a pricing strategy nor a strategy concerning the social dimension of the relationships. This research includes a comprehensive model, which defines a complete network strategy combining the network and relationship literature to the logistics literature. The model introduced here, and based on the previous literature has three dimensions: 1) Markets (Price) 2) Hierarchy (Authority: working procedures and processes) 3) Networks (Trust and community: the social dimension of the relationship). The contribution here relies on the idea of network strategy and in the combination of logistics, pricing, and cultural aspects of relationships. These mechanisms of governance have been explored before, but without combining the strategy (supply management: contracting) with operations (buying, warehousing and supplying).

In this research, the case examples come from the Finnish metal- and electronic industry. Typically, in these industries the markets are imperfect. This means lack of competition between component- and system suppliers. Often the lack of competition is compensated either through authority meaning the usage of credible threats, or by using trust as a social mechanism. However, the usage of different mechanisms is neither conscious nor systematic. This explicates the need for the concept of network strategy.

**Governance of Strategic Networks: Dimensions of Network Strategy**

Within certain limits, organization theory focuses on governing behavior on different levels of society. Typically, researchers divide governance into a) society- b) regional c) network d) firm e) team and f) individual level. The authority (State, municipality, leader company, superior) needs to govern the attitudes, intentions and behavior of citizens. In this research, a partnership and further a strategic network is the unit of analysis.

The theory of governance is developed on the basis of the transaction cost theory created by Coase (1938) and further developed by Williamson (1975; 1985). The theory focuses on the decisions made when deciding whether to outsource or not. However, the theory concerns more about governing the behavior, as the two basic assumptions of the theory describe individual as 1) opportunistic actor, which is 2) boundedly rational. The first assumption implies that some individuals, not all, are willing to lie or cheat in order to gain advantage such as profit (Williamson 1985). This notion of an individual as an opportunistic actor is widely criticized by the researchers of organizational behavior (Ghoshal & Moran 1996). This kind of assumption is argued to develop into a self-fulfilling prophecy (Perrow 1986; Ghoshal et al. 1996).

The second basic assumption suggests that individuals are rational decision makers, but only limitedly so (Simon 1958; Williamson 1985). The neoclassical economics assumes that an individual is perfectly rational decision maker with perfect knowledge. The imperfect knowledge and bounded rationality develops the opportunities for entrepreneurs in the markets (Kirzner 1978). The Austrian school of entrepreneurship interprets the entrepreneur as a new opportunity seeking individual (Kirzner 1978).

In his classical sociological article Granovetter (1985) discusses of the problem of order. The mechanisms of governance provide different solutions to problem of order (Fig. 1). In this research the governing unit is the leader company of a strategic network. Sometimes the leader is defined as the peak company or an integrator company (Varamäki 2001; Vesalainen 2002). This discussion is divided into three different dimensions: 1) markets (price), 2) hierarchies (authority) and 3) networks (social). These different forms of governance form the framework for the discussion in this chapter.

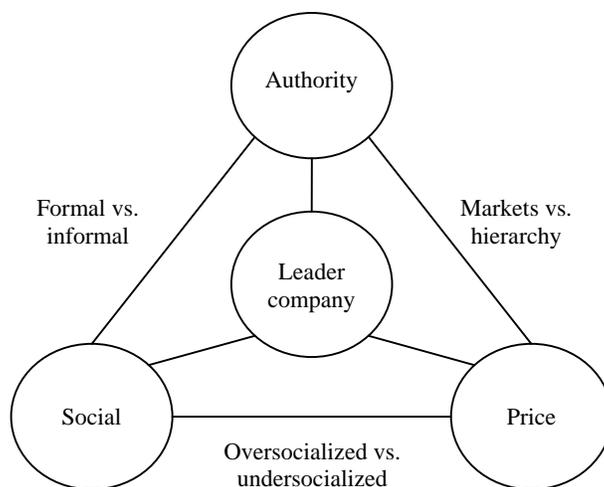

FIG. 1. THE GOVERNANCE MECHANISMS OF A STRATEGIC NETWORK (SEE ALSO POWELL 1990; BRADACH ET AL 1989; MITRONEN 2002).

Fig. 1 suggests that in their extreme forms the different mechanisms of governance close each other out or make the usage of any other mechanism than the one in its extreme form unnecessary. In the Adler's (2001) research, these dimensions exist in three different continuums in which the choices of the different leader companies' vary. The different mechanisms can be used simultaneously, as the Fig. 2 suggests. According to this argument, an organization can be simultaneously reasonably entrepreneurial, hierarchical, but also community like, which means that the members experience true feeling of community (Ouchi 1980; Bradach & Eccles 1989; Powell 1990).

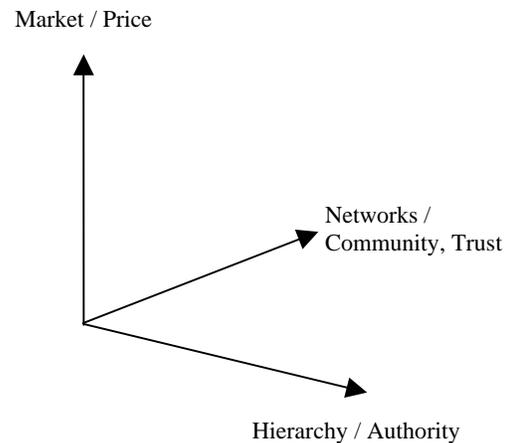

FIG. 2: THE INDEPENDENT EXISTENCE OF THE GOVERNANCE MECHANISMS.

**The Different Forms of Governance**

The theory of governance focuses on the solutions to resolve the free riding problem (Williamson 1985; Perrow 1986). The core of the discussion emphasizes the coordination of the social life on the macro level of a society, but also on micro level the coordination in the firms and strategic networks. Different institutions face the same problem of coordinating the behavior of individuals to act consistently with the strategies of the strategic network. The efficiency of the behavior is the other problem (the free riding problem). The different mechanisms of governance focus on resolving these problems.

**The Extreme and Intermediate Form of Price**

The extreme form of a market which uses price as a mechanism of governance develops into the hobbesian “war of all against all” (Hobbes 1968). It is argued here that in the perfect market the “hobbesian” war would prevail. This was the assumption of Hobbes (1968) when considering the nature of man. The war of all against all develops an interesting analogy to consider the phenomenon, which exists in the perfect markets. The argument is that from the individual point of view, the extreme market leads to harmful results even if the price mechanism in its intermediate form is often seen as a positive one.

TABLE 1. THE OBJECTS, MECHANISMS AND ANTECEDENTS OF PRICE

Dimensions	Components
Objects	<ul style="list-style-type: none"> <li>• Products</li> <li>• Services</li> <li>• Individual</li> <li>• Team</li> <li>• Organization</li> <li>• Strategic network</li> </ul>
Mechanisms	<ul style="list-style-type: none"> <li>• Price</li> </ul>
Forms	<ul style="list-style-type: none"> <li>• Market price</li> <li>• Value –based price</li> <li>• Cost –based price</li> <li>• Freedom</li> <li>• Risk</li> </ul>

Object of pricing is naturally the products or services, to which the price is determined. However, the mechanism governs the behavior of individuals, teams, organizations, and networks as they are the actors in the market.

The pricing strategy develops the basis for a dialogue concerning the strategy of the network. The development of the strategy builds up onto basis of pricing. Typically, firms use competition as the basic mechanism, for defining the price: price for the product or services is defined in the markets. However, in different industries exist suppliers without any local competitors. In these situations, pricing is often implemented basing on the costs. The third alternative that is often used in pricing is the value–based model. In this model the price is defined basing on the expected experience of the customer. However, companies also mix the different pricing models using the market and cost based pricing simultaneously.

The claim here is that the leader company should decide how to govern the strategic network, the individual supplier, and/or the suppliers of the different component types. What is the level of competition, how many competitors with the right price level are there and how long is the learning curve with the products? These elements basically determine the possibility to use the price mechanism.

**The Extreme and Intermediate Form of Authority**

Researchers have argued that the hierarchical rules, regulations, and authority are the governance mechanism of a network (Bradach ym. 1989; Powell 1990; Adler 2001). At the highest level of vertical integration, the network forms a company. However, in network the leader company may use extremely high level of authority. In the Machiavellian sense, the authority is used to subjugate the citizens, or the employees under the will of the authority. So instead of the price, the governance of the behavior of the suppliers relies on the authority.

TABLE 2. THE OBJECTS, MECHANISMS AND ANTECEDENTS OF AUTHORITY

Dimensions	Components
Objects	<ul style="list-style-type: none"> <li>• Individual</li> <li>• Team</li> <li>• Organization</li> <li>• Strategic network</li> <li>• Institution</li> </ul>
Mechanisms	<ul style="list-style-type: none"> <li>• Legitimate authority</li> <li>• Obedience</li> </ul>
Forms	<ul style="list-style-type: none"> <li>• Power / dependency</li> <li>• Regulations / contracts</li> <li>• Logistic processes</li> <li>• Orders</li> <li>• Instructions</li> <li>• Audits</li> </ul>

Behavior of individuals, teams, organizations, and strategic networks are sometimes governed through authority. The authority has to be legitimate in order to produce obedience in the actors. This dimension of authority is an important one combining the contracting and logistics. In the metal and electronics industry, this dimension is well developed.

The hierarchical organization is the second dimension of the network strategy. This dimension is typically far developed, especially in the metal and electronics industry. It includes the a) contracting, b) logistic processes, c) audits, and d) usage of the authority. Contracting is often in the interest of both of the parties. In the literature the academics discuss if it is possible to replace the contract with trust. However, these different elements of contracts and trust are not opposite. Often, trusting partners use contracts to structure the discussion. The contract is one way of making explicit the issues and agenda, which the partners have to discuss. Secondly, valid and explicit process descriptions develop a common understanding about the relationship (exchange) processes. However, often all the processes cannot be described because of the amount of the suppliers. Therefore, the most important partners should be defined as a part of the company's network strategy. Thirdly, companies use different audits in order to secure the quality of working procedures and products of their partners. As a part of their network strategy, a company should decide which suppliers should be audited and how. Fourthly, the use of authority is a mechanism meaning rewards and threats, which the actors of the leader company use to govern the suppliers. Typically the claims from which the threats follow relate to the target prices or the services the supplier provides.

**The Extreme and Intermediate Form of the Social**

The third mechanism is defined as a social one (Granovetter 1973; 1985; 1995). It is stated that the social mechanism may be the only mechanism found in the relationship. Researchers claim that in the extreme form, the social control leads to a system, where the social community subjugates the individual under the will of the community through norms the strategic network (community) sets to govern the behavior of its members.

TABLE 3. THE OBJECTS, MECHANISMS, AND ANTECEDENTS OF TRUST AND TOGETHERNESS (ADLER 2001, DEVELOPED FURTHER).

Dimensions	Components
Objects	<ul style="list-style-type: none"> <li>• Individual</li> <li>• Team</li> <li>• Organization</li> <li>• Strategic network</li> <li>• Institution</li> <li>• System</li> </ul>
Mechanisms	<ul style="list-style-type: none"> <li>• Propensity</li> <li>• Reputation</li> <li>• Calculativeness</li> <li>• Knowledge</li> <li>• Identification</li> </ul>
Forms	<ul style="list-style-type: none"> <li>• Predictability</li> <li>• Capability</li> <li>• Integrity</li> <li>• Benevolence</li> <li>• Honesty</li> <li>• Deterrence</li> <li>• Reciprocity</li> <li>• Shared purpose</li> <li>• Shared vision</li> <li>• Shared goals</li> <li>• Shared values</li> <li>• Shared rules</li> </ul>

The third dimension of the network strategy is a social one. The social governance is divided into two sub-

dimensions: 1) trust and 2) community. As the “forms” above suggest trust is divided here into seven sub-dimensions: a) predictability, b) capability, c) integrity, d) benevolence, e) honesty, f) deterrence, and g) reciprocity. Often trust is defined as a belief<sup>f</sup>, based on cognitive rationalization of feelings (Baier 1986; Kohtamäki 2003). Both, the trustor and the trustee are often defined as an individual, but as often as an organization (Cumming & Bromiley 1996). Researchers have defined five mechanisms of trust: 1) Propensity (individual’s propensity to trust) 2) Reputation (reputation and references) 3) Calculative (engaging relationship because of the possible benefits) 4) Knowledge (knowledge about trustee’s positive sides increases trust), and 5) Identification (identification to the same values increases trust) (Fig. 3).

The other sub-dimension of the social governance is the feeling of community. The feeling of community or, in other words, feeling of togetherness, is an important element of social governance. Sharing the same purpose, vision, goals, values, and rules may develop an atmosphere in which the feeling of community emerges (Ghoshal et al. 1996).

The social mechanism, as the third dimension of the network strategy concept is a difficult one, since trust, and the feeling of community as phenomena are to some degree vague in nature. However, the claim is that the social dimension, trust and community should be carefully and consciously developed. Of course, the question could be raised, how systematically these feeling –based phenomena can be developed.

The social relationship can be built through three different phases: a) calculative, b) knowledge –based, and c) identification –based phase (Lewicki et al. 1996) (Fig. 3).

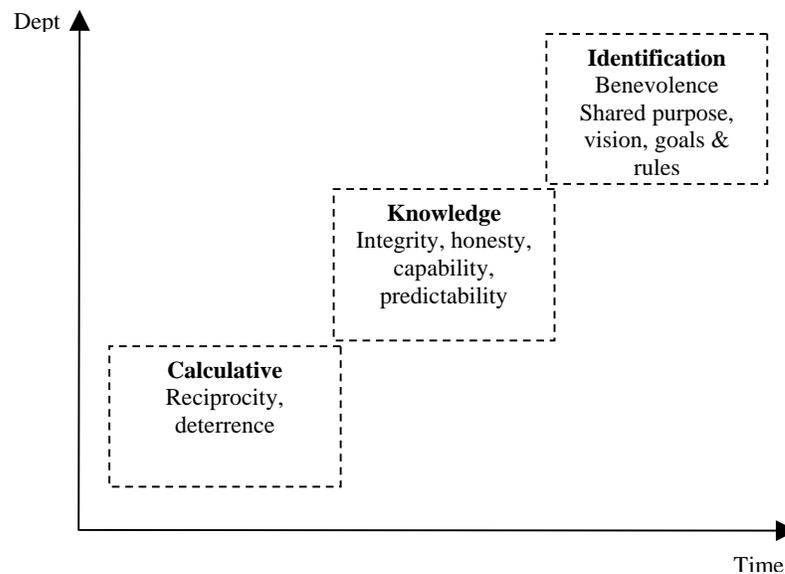

FIG. 3: BUILDING THE SOCIAL RELATIONSHIP (LEWICKI ET AL. 1996, DEVELOPED FURTHER)

In the calculative phase, the relationship can be developed through reciprocal exchanges. In order to gain the calculative trust, the partners have to experience the value of the relationship (What is in there for me?). In order to develop knowledge –based trust, different informal meetings have to be organized. Researchers claim that social relationships can be improved by unofficial, informal meetings and open communication. In an informal atmosphere, the actors gain positive knowledge about each other, this may increase trust, because trust is a knowledge –based phenomenon. The third and deepest level is based on the identification of the same vision, goals, values, and rules. Also the belief to the partner’s benevolent intentions and behavior is claimed to be important. This level of social relationship can be developed, but it often occurs through similarities. Some likeness between the partners should be recognized. Similarities, sharing, communicating about similar interests may “brake the ice”.

### **The Discourses between Mechanisms**

Three different discussions between the different mechanisms could be derived from the earlier literature (Fig. 1): Oversocialized vs. undersocialized, markets vs. hierarchies, informal vs. formal organization.

Oversocialized vs. undersocialized –discussion was raised by Granovetter in his classical article 1985, in which he criticized the notion of the undersocialized conception of man. Granovetter (1985) claimed that the conception, when analyzing (and developing) an organization, should neither be under- nor oversocialized. By undersocialized, it was meant that the economists tend to forget that the economic structures are embedded in the social world, in the individual relations. On the other hand the sociologists tend to forget the role of a man as a self-interest seeking and utility maximizing individual. Both of these conceptions should be equally considered. In the world of an entrepreneur, this would mean that an entrepreneur, even if striving for freedom, needs social community; strong ties to build his identity in interaction with his environment (Johannisson 1987; Berger & Luckman 1995).

The discussion of new institutional economics builds on the basis of the Ronald Coase's and Oliver Williamson's (1975; 1985) work with the transaction cost economics. Transaction cost economics (Transaction cost theory) focuses on the borders of a firm: on which basis are the borders of a firm defined in the markets? In the most operational sense, this question leads to decision whether to outsource or not (whether to make, cooperate or buy the components or services). This decision bases on different basic assumptions, environmental factors and especially the relation between the production- and transaction costs. The decision is made on the basis of the total costs. This means that when the transaction costs increase, there becomes the point in which it is more efficient to produce the good or service inside a hierarchy than in the markets or networks, as the hierarchy according to Williamson (1985) is the most adaptive form of governance.

The last discourse focuses on the discussion about formal vs. informal organization. This discussion focuses on the poles between authority and social governance. The community element relates to the idea of a clan (Ouchi 1980). Clan governs the behavior of its members through shared values and norms, as the hierarchy relies on legitimate authority executing rules and regulation of the hierarchy. As the organization has a certain official structure, line of authority, it also has an informal side. As the hierarchy emphasizes the formal procedures, the community raises up the informal dimension of a strategic network. Both of these sides of organization exist in the same organizations, so they also should be noted.

### **Developing a Concept of Network Strategy**

Three different governance mechanisms may be identified governing the economic systems. Some researchers have seen the mechanisms as distinct, but it has also been proposed that the different mechanisms can overlap to some degree in their intermediate forms. In their extreme forms the mechanisms close each other out, meaning that in the perfect markets, there exist neither community ties nor hierarchy. In the hierarchy there exist neither markets nor social relationships and in the community there exists neither competition nor authority. The different mechanisms have to be recognized when developing an organization or networks. On what basis do we build our network strategy?

In this research it was suggested that the network strategy of the leader company should be built on the basis of three different mechanisms of governance: Price, authority and the social mechanism. The idea of the pricing strategy includes the synthesis of a) market, b) cost and c) value –based pricing. As a part of the network strategy, the leader company should decide how pricing at different components is implemented.

Secondly, the network strategy of the leader company should include decisions concerning the use of authority. This decision includes every dimension of hierarchical organizing: a) contracts, b) logistic processes, c) target prices, d) quality systems, and e) information systems. Contracts include supply contracts, but they may also include quality contracts. With processes we mean the level of process description and development, which is required from the suppliers. Target prices refer to the price targets set by the leader company. Here it is argued that the target price setting done by the leader company is authoritarian rather than market –based. Lastly, the requirements concerning quality and information systems should be defined. Here it is argued that the authoritarian

rules and regulations should be defined as a part of the network strategy of the leader company.

Thirdly, in this research it was argued that the social mechanism should be used as systematically and consciously as the other dimensions of governance. It was argued that both a) trust and b) feeling of community may to some degree be consciously developed as a part of the network strategy.

The network strategy should include a decision how the leader company decides to govern the whole strategic network and the individual suppliers. The network strategy should be defined and implemented on the network level, but naturally it culminates in the dyadic relationship level. On the other hand, different components or component groups and their suppliers can be defined as an entity managed differently than other group of suppliers. In the end, the question is about the coordination of the social life. Whatever the governance structure should be, the developers should make conscious decisions of how to approach the governance problem (Powell 1990).

---

<sup>i</sup> Researchers divide trust to seven sub – beliefs: Predictability refers to the consistency of the attitudes and behavior of the partner. Capability means trusting the capability of the partner as benevolence refers to willingness to help. With integrity researchers’ mean the trustor’s belief that the partner will keep his word. Honesty means that the partners speak only what is the truth. Reciprocity belief builds on the basis of the social exchange literature meaning that the partners exchange but knowledge, also feelings. Deterrence –based trust means partner’s trust to deterrence created by the situation and the trustor. Reputation is one example of this kind of a hostage. (Kohtamäki 2003.)

# The Analysis of Network Structures as Social Capital

*Wei Zhong*  
*Nagoya University, Japan*

## Abstract

Since prior works have tended to focus either on structural dimension or relational dimension of inter-organizational network, researchers have produced contradictory and confusing implications regarding network structures organizations should form. In this paper, my objective is to identify the configurations of network that the focal organization should form. Network of ongoing cooperative relationship organizations accumulate over time constitutes a resource of potential value, which is called social capital. By clarifying the influence of the interaction between structural dimension and relational dimension of network on the behavior of the focal organization, I argue that (i) weak ties in the densely-connected network and (ii) strong ties in the sparsely-connected network are positively related to the performance of the focal organization. Furthermore, the benefits inherent in the network can vary with the specific relations organizations form with each other in the organizational field.

## Introduction

During the last two decades, alliances have become one of the most important inter-organizational forms. Globalization destroys the previous structural and competitive equilibrium among organizations, which enhances the value of some existing capabilities and diminishes the value of others. Meanwhile, it creates the need for a new set of capabilities. While organizations adapt to these challenges through internal changes, they are constrained by their limited capabilities. Cooperative relationship between organizations was uncommon before 1980's, however, after that, strategic alliances have been increasingly formed among organizations, and recently such relationship has a tendency of internationalization. These alliances are organized through a variety of contractual arrangements, ranging from strategic alliance, franchise, outsourcing, joint venture to virtual organization (Gulati & Singh, 1998).

## Previous Review of Research on Network

Organizations enter corporate relations with each other for a variety of reasons, using diverse organizational forms and governance structures (Parkhe, 1993). In this view, organizations create network to manage uncertain environments to satisfy their resource needs and consequently, gain access to critical resources and information maintained by other organizations in the long run. On the other hand, the behavior and performance of organizations is influenced and guided by the network because network can regulate the quality and quantity of resources and information exchanged among members (Konno, 2002). That is, network has two aspects: one is called networking which means that organizations create corporate relations with others; the other is called networked which means that the behavior of organizations is facilitated or impeded by the relations formed in the network. Currently, however, recent network research has led to the important and unanimous insight that building cooperative relations with others is considered to be potentially a valuable resource and the pattern of network is also meaningful in terms of competitive advantage (Ahuja, 2000; Rowley, Behrens & Krackhardt, 2000; McEvily & Zaheer, 1999; Gargiulo & Benassi, 2000; Uzzi, 1996, 1997; Burt, 1992). The opinions on "what kind of network, that is, the configurations of the network the focal organization should construct is preferential" manifold a lot (Gulati, 1998; Gargiulo & Benassi, 2000; Rowley, Behrens & Krackhardt, 2000; Konno, 2002).

Gulati & Gargiulo (1998) illustrate that it is significant to clarify the mechanisms of how network facilitates or impedes the behavior of organizations for designing the effective and efficient network. Prior work, however, is generally divided into two dimensions: structural dimension and relational dimension. Structural dimension of network refers to the overall pattern connections between organizations, that is, whom you reach and how you reach

them (Burt, 1992). In contrast, relational dimension describes the kind of inter-organizational relationship organizations have developed with each other through interactions (Uzzi, 1996). However, the previous analysis of network has tended to focus on either structural dimension or relational dimension. Moreover, there have been few attempts at comparing or integrating these two dimensions (Rodan & Galunic, 2004). As a result, network researchers have produced contradictory and confusing implications regarding how organizations should form corporate network (Rowley, Behrens & Krackhardt, 2000; Konno, 2002).

#### **Structural Dimension of Network**

The most important facet of this dimension is concerned with the presence or absence of ties between organizations from network relations as a whole. Coleman (1988) argues that since members in the closed network are likely to be connected with each other, these densely-connected ties promote the production of social norms and sanctions that facilitate cooperative exchanges among member. In a densely-connected network, members can trust each other to honor obligations, which diminish the uncertainty of their exchanges and facilitate collective monitoring and sanctioning to produce effective incentives for cooperation (Walker, Kogut & Shan, 1997). On the other hand, Burt (1992) suggests that members in the sparsely-connected network will enjoy information and control benefits. Organizations rich in structural holes- the positions between other organizations which are not directly linked-benefit from the diversity of information and the brokerage opportunities by engendering competition for the tertius' time, energy and resources. In other words, such network benefits lie between not within members (Rodan & Galunic, 2004).

As mentioned above, Burt's (1992) and Coleman's (1988) versions of network structures provide different benefits, and they are also useful for different purposes. Dense networks are advantageous for developing trust and cooperation but redundant information from multiple sources is often exchanged. Nevertheless, sparse networks provide the focal organization with diversified information but the structures cannot generate governance mechanisms to impede opportunism. Thus, organizations face a trade-off between networks that guarantee the safety of cooperation and networks that provide benefits through cooperation. In such an environment, organizations have a natural tendency to seek the safety of densely-connected network to secure the cooperation with members, on the other hand, organizational success depends more than ever on the advantages to build an efficient cooperative network (Podolny & Baron, 1997; Gargiulo & Benassi, 2000). In this view, Gargiulo & Benassi (2000) suggested that an inter-organizational network structure that is uniformly neither dense nor sparse is advantageous (Fig.1). Organizations have to strike an optimal balance between safety and efficiency of cooperative relations which may also depend on the strategic objectives of entrepreneurs. In such a complicated network, the structure is uneven, composed of blocks that are more or less filled with cooperative relations (Walker, Kogut & Shan, 1997).

#### **Relational Dimension of Network**

This dimension of network focuses on the particular relations organizations have with each other. It is through ongoing exchange relationship that organizations fulfill such strategic motivations to enter network (Nahapiet & Ghoshal, 1998). For example, two suppliers may occupy equivalent positions in the network with the buyer, but if the buyer's personal and emotional commitments to the two suppliers differ, their cooperative relations are likely to differ in important respects. Among the key facets are trust and trustworthiness (Uzzi, 1996, 1997), norms and sanctions (Coleman, 1988; Ring & Van de Ven, 1994), obligations and expectations (Granvotter, 1973; Coleman, 1988; Burt, 1992; McEvily & Zaheer, 1999). Thus, it is significant to identify the strength of bridging ties between organizations. Granvotter (1973) defines the strength of interpersonal ties based on a combination of the amount of time, the emotional intensity, the intimacy and the reciprocal services which characterize the tie. For the purpose of examining inter-organizational networks, we can measure tie strength by the period and frequency of interactions between members. However, on the one hand, these two factors alone may not be a sufficient condition for discovering and exploiting opportunities (McEvily & Zaheer, 1999), and the other two factors—the emotional intensity and intimacy—are pertinent for the individual-level relationship (Rowley, Kogut & Krackhardt, 2000), tie strength between organizations should be measured by a combination of the period and frequency of interactions between members and their level of resource commitment to the relationships (DiMaggio & Powell, 1983; Konno, 2002).

In the network of strong ties, the frequent corporate relations over a long time enable members to become separate from the narrow economic goals that originally constitute the exchange. And organizational survival is

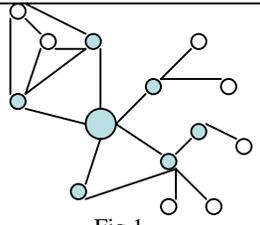

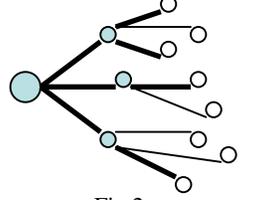

enhanced through resource sharing and commitment that is born from a concern for common benefits. Thus, strong ties are shown to provide members with three primary advantages (Uzzi, 1996). First, trust acts as the governance mechanism, which promotes voluntary, non-obligating exchanges of resources and governs behaviors, and consequently trust is beneficial for reducing monitoring cost. Second, the transfer of the fine-grained information and tacit knowledge through strong ties facilitates inter-organizational coordination and learning. Third, strong ties enable the members to jointly work through problems and quicken decision making, thereby they enrich the network with new solutions and combinations of ideas.

Conversely, weak ties in the network characterize the non-frequent and limited interaction, the lack of reciprocity, and narrow economic matters among members. These weak ties are beneficial, because they are often likely to be bridges to other distant organizations possessing new and different information and enable the discovery of unique opportunities. That is, new information is obtained through casual acquaintances. In support of this theory, Granovetter (1973) argues that a person's casual acquaintance, with whom only limited contact is maintained, is critical to discover new employment opportunities.

Therefore, weak ties benefits are different from the advantages gained through strong ties. However, either ties alone may not be a sufficient condition for organizations to enjoy the benefits from the connections among each other in the network. In a study of the New York apparel industry, Uzzi (1997) found that networks comprising merely weak ties or strong ties decrease organizational performance potential. He suggests that the best way for an organization to build its network is a mix of weak ties and strong ties (Fig.2). By means of strong ties, organizations can benefit from the exchange of thick information and weak ties prevent the complete insulation of the network and provide better access to novel information circulating in the network.

Overall, Table 1 summarizes the above-mentioned theoretical arguments on the configurations of network and the types of network structures the focal organization should build. The examination of those conditions under which dense/sparse network and strong/weak ties are positively related to organization performance suggests that each factor of them has different qualities, which is advantageous for different purposes. However, the performance of organizations is influenced not only by the properties of the relations maintained among members at a time, but also by the overall pattern of relations (Madhavan, Koka & Prescott, 1998). In this view, organizations can gain access to special opportunities from well-structured networks, but the bridging ties are dependent on how an organization exploits these opportunities to realize certain benefits (McEvelly & Zaheer, 1999). On the other hand, the benefits from bridging ties not only accrue to the individual organization of the network, but also to the network as a whole (Uzzi, 1996). Therefore, the influence of the interaction between structural dimension and relational dimension in the network on the performance of the focal organization should be clarified.

## Theories on the Analysis of Network

I have respectively outlined the main effects of structural dimension and relational dimension of the network on organization behavior and performance. As Table 1 demonstrates, like strong ties, dense connections can serve as governance mechanisms in the network, and like weak ties, structural holes can provide diverse information that such a position is assumed to afford. That is, the impact of the characteristics of “structural holes and weak ties” and “dense connections and strong ties” in the network on organization performance has high possibility to serve the same. Nevertheless, as discussed above, structural dimension refers to the network as a whole, while the relational dimension stresses the individual relationship between members in the network. Therefore, when we attempt to identify the configuration of the network organizations should built with others, the influence of structural dimension on organizations in terms of the network as a whole, and the influence of relational dimension on organizations in terms of the individual relationship, must be distinguished. This is to say that the two dimensions should not be considered individually. Indeed, the impact of the interaction between these two dimensions in the network on organization performance should be considered simultaneously.

### **Structural Hole and Weak Ties**

As discussed above, weak ties enable the organizations to gain access to new and diverse information. That is because the time and energy of organizations to build cooperative relations with others is limited (Burt, 1992), organizations might be better off establishing weak ties to many more organizations, rather than investing time and energy to form and maintain strong ties (Rowley, Kogut & Krackhardt, 2000; Konno, 2002). Furthermore, since strongly connected organizations are likely to interact frequently, much of the information circulating in the network is redundant (McEvilly & Zaheer, 1999).

However, Burt (1992) extends the strength of weak ties argument by asserting that it is not so much the strength of tie that determines its information potential, but rather the existence of structural holes between the focal organization and other organizations. Structural holes refer to the occasion where there is no connection between organizations in the network. In sparse network, being in a position that connects two other organizations which are not otherwise connected, the focal organization is associated with the different subgroups which are cut off. As a result, organizations can enjoy the benefits of novel and diverse information from different information flows and the advantages of brokering opportunities because they themselves serve as bridges spanning the structural holes.

Therefore, network rich in structural holes may provide organizations with timely information about new opportunities, but establishing and maintaining weak ties with many more organizations, can also prevent from receiving redundant information.

### **Dense Connections and Strong Ties**

Dense connections among each other in the network convey a clear normative order within which individual organization can optimize its performance. And this socially defined right to control an action, is held not by one organization but by all partners. That is, it represents a degree of consensus in the whole system which is effective, though sometimes fragile (Coleman, 1988). In dense network, network structure itself facilitates collective monitoring and sanctioning to guide actions and produces incentives for cooperation. Thus, members may share a vision or value at the network level and must deal with norms which are capable of punishing disobedience even if they do not have specific inter-organizational relationship (Tsai & Ghoshal, 1998).

Correspondently, on the occasion of strong ties established between organizations, trust develops when frequent exchange relationship is established and extra effort is given and reciprocated. Inter-organizational trust promotes commitment to exceed the contract, and organizations contribute more to the relations than is specified. Consequently, trust in another organization’s goodwill –willingness to consider each other’s interests–impedes the opportunism. However, closeness of individual organization’s relations is not enough to produce behavioral norms at the system level because the closure of the network is important for the existence of effective norms (Coleman, 1988). For instance, the focal organization A keeps cooperative relationship with organization B and C. Since B and C have no relations with each other, they can not combine forces to restrict the behavior of A, A can impose negative items on B or C or both. That is to say that no matter what kind of relationship exists with each other, the lack of closure of network makes it impossible for the norms to be produced.

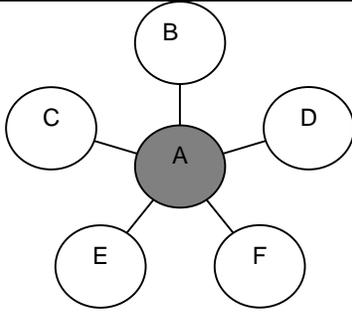

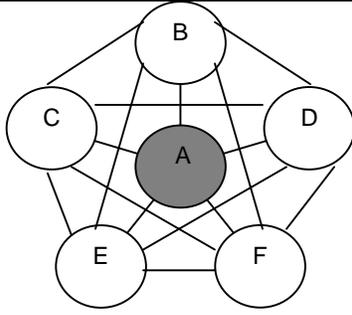

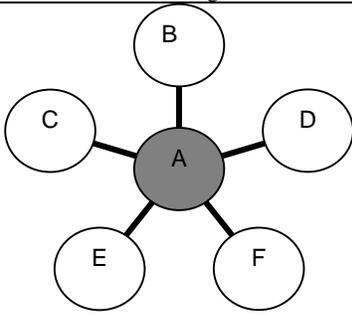

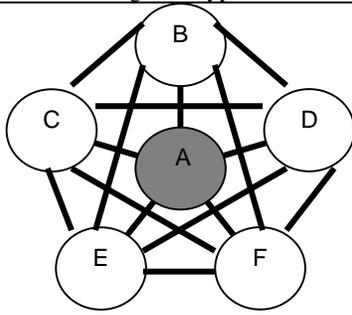

Therefore, while dense connections make norm creation at the network level possible, that is the

trustworthiness of the social environment in which obligations will be repaid, strong ties can also produce goodwill between partners and impede opportunism at the dyadic level, that is the actual extent of obligations held. In this view, interconnectedness and strong ties create trust at different aspects of the network, but both can serve as governance mechanisms (Rowley, Kogut & Krackhardt, 2000).

Overall, I argue that “structural holes and weak ties” and “dense connection and strong ties” are likely to provide organizations with the same benefits. Structural dimension refers to the setting of network for organizations to employ the strategy. It has its primary impact on the conditions of accessibility; however, how to exploit these opportunities is also an essential component of the strategy (Rodan & Galunic, 2004; Nahapiet & Ghoshal, 1998). For example, structural holes provide organizations with novel information and opportunities for brokerage, but we can expect the advantages of structural holes to be diminished if weak ties are not enough to act as governance mechanisms to monitor the behavior of each other and restrict the opportunism. Strong ties in dense network are possible to amplify the pressure to promote the ongoing commitments, and even generate a lock-in that isolates them from the outer world, keeping organizations tied to the partners that have lost their value.

Thus, when the focal organization establishes a dense network, will it gain any extra benefits from strong ties with his partners? Or when weak ties with his partners can convey diverse information, are there still advantages to the focal organization by maximizing structural holes? This suggests the importance of examining how network structures and network contents interact in shaping the network. When the focal organization attempts to form the network, it is significant and necessary to consider structural dimension and relational dimension simultaneously: whether the focal organization should form the network through strong or weak ties depends on the pattern of network structures. In view of this, four possible types of network can be identified. When members are sparsely connected, as Fig. 3 and Fig. 4 in Table 2 demonstrate, the focal organization can establish strong ties or weak ties with other organizations. Correspondently, when members are densely connected, as Fig. 5 and Fig. 6 in Table 2 illustrate, organizations may be connected with each other with either strong or weak ties.

TABLE 2: FOUR POSSIBLE NETWORK STRUCTURES

Weak ties	 <p>Fig. 3</p>	 <p>Fig. 6 Hypothesis 2</p>
Strong ties	 <p>Fig. 4 Hypothesis 1</p>	 <p>Fig. 5</p>

## Hypotheses

### Social Capital

Network is one of the forms of inter-organizational cooperation that involves significant exchanges, sharing, or co-development and thus results in some forms of enduring commitments between members (Gulati & Gargiulo, 1999; Parkhe, 1993). Network of ongoing relationship organizations accumulate over time constitutes a resource of potential value. Thus, like capital of any kind, social capital is defined as the sum of resources that accrue to an organization by virtue of possessing a durable network of inter-organizational relationship (Koka & Prescott, 2002; Nahapiet & Ghoshal, 1998; Burt, 1992). Although interdependence is the most common explanation for the formation of inter-organizational cooperation (Pfeffer & Salancik, 1978), entering the network to cope with an uncertain environment faces other uncertainty resulting from cooperation (Gulati & Gargiulo, 1999). However, it is insufficient not to explain that networks of relations that emerge over time as a result of alliances shape and constrain the strategic actions of organizations involved in them.

In this view, one of the functions that network serves is to provide members with capabilities and resources that are essential to pursue their goals but that are under the control of other organizations in the network. The other is to act as a governance mechanism and a means of enforcing norms of behavior in terms of governing the behavior and cooperation of members in the network. Therefore, network serves as an important function in the developments of interorganizational cooperation. For the purpose of designing the effective and efficient network, it is significant for the focal organization to consider the safety of cooperation and the efficiency of cooperation simultaneously.

### Network Structures that are Social Capital

As Table 2 illustrates, we can consider two extreme examples of network structures. At one extreme is an open network in which organizations are not connected with each other extensively. That is, in a network containing many structural holes, it is easier for the focal organization to assimilate diverse resources and information, and exploit the opportunities to play other organizations off against one another. For example, the organization, which buys the same products from the two other organizations, can carry out actions that impose negative externalities on either or both if they have no relations with each other. That is because their disconnected and competitive relationship among the sellers makes it impossible for them to combine forces to cooperate in order to constrain the actions of the buyer. As a result, structural holes in the open network define the social capital in terms of the information and control advantages of being the broker in relations between other organizations (Burt, 1997). However, on the other hand, although the pursuit of individual goals requires the active cooperation of other organizations, uncertainty about whether such cooperation is forthcoming will greatly impede the willingness of inter-organizational cooperation. It is no doubt that a diverse, disconnected network exposes the focal organization to conflicting preferences and allegiances within which it is much harder to optimize (Podolny & Baron, 1997). Thus, in the open network, efficiency mixes poorly with the safety of cooperation.

At the other extreme is a closed network in which organizations are connected with each other densely. Since all organizations in the network have relationship with each other, information flows would lead quickly to established norms of cooperation. When a norm exists and is effective, it constitutes a powerful form of social capital which depends on the trustworthiness of the environment which means that obligations will be repaid (Coleman, 1988). If the opportunism happens, information on deviant behavior would be readily disseminated and the behavior sanctioned (Walker, Kogut & Shan, 1997). Consequently, opportunistic behavior is less likely to arise because the threat of reputation loss with respect to multiple partners will discourage organizations from opportunistically. Furthermore, dense connections in the closed network allow organizations to gain prestige, enhance their status and amass resources. However, organizations may lack the opportunities to enjoy the advantages of brokering and exploiting opportunities. Thus in the closed network, the safety of cooperation mixes poorly with the efficiency of the network.

## **Optimal Network Structures**

In an effort to establish the effective and efficient network, as mentioned above, the safety of cooperation and the efficiency of cooperation should be considered simultaneously. However, either in the open network or in the closed network, the two factors mix poorly with each other. Therefore, the following will examine conditions under which how strong/weak ties in sparse/dense network are related to organization performance.

In the open network containing many structural holes among other organizations except the focal organization, since the closeness of inter-organizational interactions is not enough to produce effective behavioral norms at the system level to guarantee the safety of cooperation, the content of individual organizations' relations, that is, the strength of ties established between organizations, will alternatively play an important role. Inter-organizational trust can develop when frequent exchange relationship is established and extra effort is given and reciprocated. As a result, commitments to corporate relations are promoted and organizations are willing to contribute more to the relations than is specified by the contract. Thus, trust in another organization's goodwill-willingness to consider each other's interests-impedes the opportunism and the safety of cooperation can be achieved in the network sparsely connected with strong ties.

For instance, Toshiba had been immersed in a lower profitability compared with his rival Hitachi since 1970s. In order to get out of such unfavorable business conditions, Toshiba set up the strategy called group-intensification and took corresponding measures to cope with the changing environment. On the one hand, since all of the suppliers and manufacturers of accessory parts were not closely connected with each other, to some extent their actions were not constrained by the interactions and adaptation became much easier when relations were tuned to specific conditions. At least considered from the Toshiba side, there did exist many structural holes among the suppliers. Therefore, Toshiba, as the broker of such unconnected relations, could gain access to diverse and novel information from these unconnected relations and enjoy control advantages by playing off one against another if

Toshiba could keep cooperative relations with each favorable partner. On the other hand, Toshiba renewed the ranking of 800 enterprises or so with which they had kept close relations in the past. Toshiba paid much more attention to the “competitiveness” of the parts supplied, such as the price and quality of the parts transacted, and to the “importance” to his interests. Consequently those enterprises with less importance were rejected, and Toshiba continued to contribute much effort to keep much longer and closer corporative relations with those enterprises, which were regarded important in the long run. Indeed Toshiba invested a lot of special relational resources and so much as offer technique directions to accessory suppliers (Onishi, 1991). As proved later, the profitability of Toshiba has been keeping rising up and this group-intensifying strategy established good foundations for the global strategy after that.

In the densely connected network, the focal organization is not only connected with all the other organizations, the other organizations are also connected with each other. Such intricate inter-organizational relations facilitate the emergence of effective norms to guide the corporative behavior; they can also bind member organizations into network and consequently diminish their autonomy to gain their deserved benefits from the network. Therefore, for the purpose of exploiting extra opportunities and benefits inherent in the network, weak ties are positively related to organization performance. Firstly, that is because weak ties are conduits for novel information. Weak ties are more likely than strong ties to be bridges to partners possessing unique information since it is much more costly to maintain a network connected with strong ties. That is, if the relational investment is fixed, organization can establish many more relations with other organizations through weak ties than strong ties. Secondly, opportunity cost is decreasing. The benefits of increasing social constraints from establishing strong relations in the closed network are offset by a reduction in independence (Walker, Kogut & Shan, 1997). That is because in the close network, the focal organization’s behavior is constrained not only by the connections between the focal organization and its partners, but also by the connections among its partners. Given a limited amount of time and energy, an obligation to maintain relations that are no longer advantageous may lock the focal organization into endless mutual exchanges and hinder its ability to cultivate new cooperative relations.

For example, in the semiconductor industry, quite a lot joint-venture enterprises and strategic alliances are formed responding to the rapid changes of the technical characteristics of the industry and drastic international competitions. That is, one firm keeps cooperative relations with not one exclusive partner but many other various partners; as a result all of these cooperative relations constitute “a densely-connected network” of the organization (Management 21, 1992). As one of the members of Japanese semiconductor industry, Toshiba is coincidentally put in the semiconductor industry, and has established cooperative relations with many giant Corporations, such as Motorola, IBM, Siemens, National Semi-conduct etc since the middle of 1980’s. However, regardless to say, the strength of these cooperative ties is weak, and the cooperation area and intensity is limited. For instance, the collective development of the 256M DRAM with IBM was limited to the field of research and development. Either Toshiba or IBM could start productions by utilizing the fruits of collective research developments, and could decide the proceeding of production depending on his own judgment. Furthermore, in the densely connected network, although strong ties may temporarily be established between individual organizations, they become weaker and weaker along with the time. For instance, the cooperative relations between Toshiba and IBM expanded from the preliminary technique co-development to collective productions and sales at a time, however, several years later the jointly-established Northeast Manufacture Plant ended with selling-out shares totally to one side, and from then on can take free actions without being constrained by the cooperative relation between both sides (Matsuyuki, 2002). Thus, since competitors are connected with each other in the industry, weak ties enable Toshiba to gain special benefits from the network, such as diverse information and necessary resources, without diminishing his autonomy. Hence, I offer the following hypotheses:

Hypothesis 1: In sparsely-connected network, strong ties are positively related to the performance of the focal organization.

Hypothesis 2: In densely-connected network, weak ties are positively related to the performance of the focal organization.

## **Discussion & Implications**

### **Definition of Organizational Field**

No organization is completely self-contained because they are not in complete control of all the resources necessary for their survival (Pfeffer & Salancik, 1978). Therefore, network analysts routinely operationalize environments as flows of multiple resources (Freeman & Barley, 1990). Organizations may turn to some organizations for financing, to others for personnel, and to still others for necessary information and important raw resources and political support. When analyzed simultaneously across numerous organizations, since these multiple relations themselves define a complex system, the application of arguments occurs most appropriately and powerfully neither at the level of the entire society nor at the level of the individual organization but at the level of the organizational field (Scott & Meryer, 1994; Freeman & Barley, 1990; DiMaggio & Powell, 1983).

DiMaggio & Powell (1983) define the concept of organizational field as referring to “those organizations that, in the aggregate, constitute a recognized area of institutional life: key regulator agencies, and other organizations that produce similar services or products”. Organizational field has emerged as a critical unit bridging the organizational and societal levels in the study of social and community change (Scott & Meryer, 1994). This unit of analysis directs our attention not simply to networks of input-output organizations as does the organizational set (Kishida, 1985), but to networks of competing organizations, that is to the totality of relevant organizations that actually interact. As such, the notion of organizational field moves environmental and strategic theories beyond the level of the individual organization to the studies of relationship among organizations that term of a unique pattern of relations. To date, however, few network theorists have attempted to study the structures of networks in the organizational field (Freeman & Barley, 1990).

### **Appropriate Structure Patterns of Networks in Organizational Field**

The structure of an organizational field can not be determined a priori because it is likely to contain a variety of organizational forms defined by different patterns of resource exchanges that represent different organizational strategies. Organizations making rational decisions construct around themselves an environment that facilitates their ability. Therefore, the inter-organizational networks in the organizational field can be grouped into two broad streams by the relations organizations form with each other (Gulati, Nohria & Zaheer, 2000). One is the vertical network the focal organization forms with its input-output organizations. The other is the horizontal network the focal organization forms with its competing organizations.

In the vertical network, organizations engage in a range of activities, which are embedded in a complex chain of input-output relations. The focal organization relies on the resources supplied by the input organizations to manufacture its products, and meanwhile keeps good relations with the output organizations to assure the market of its products. That is, organizations depend on each other for the resources demanded and controlled by the other organizations. The higher the level of interdependence among organizations, the greater the information they must obtain from others and the greater the need for ongoing task coordination and joint decision-making between partners. Consequently, the great confidence in the predictability of each other’s corporative actions is required and the production of inter-organizational trust which obliges organizations to behave loyally, can guarantee the safety of cooperation by making it easier to access each other’s behavior and to enforce sanctions of opportunistic behavior. On the other hand, indeed inter-organizational relations in the vertical network are established when the resource exchange or sharing is involved. Thus, in an effort to gain access to resources at favorable terms, pure exchange relations are likely to be transformed into power relations. A dominant organization can insist on exclusive access to the capabilities it desires and can opportunistically favor the relations from which it most stands to benefit.

Based on these considerations, organizations forge linkages to gain access to those important resources, which they perceive will lead to an improved competitive position, and at the same time these linkages should mitigate competitive uncertainty and guarantee the safety of cooperation. The result of the dynamics of the cooperative relations in the vertical network will be a network with the following two features. Firstly, structural holes among other organizations enable the focal organization to obtain diverse information with regard to the

necessary resources and exploit the opportunities to play off one against another. Secondly, strong ties established between individual organizations can impede opportunistic behavior to guarantee the continuity of the resource exchanges.

Another stream to think about networks in the organizational field is to recognize the organizations competing in the similar niches. Because the cannibalism competition is deleterious to the economic interests of competing organizations, the benefits inherent in the network are likely to be greatest when they establish collusive channels between directly competing organizations both for diverse, novel information exchanges and cost sharing purposes. That is, effort is likely to be continuously duplicated within them if organizations independently invest in the development of related technologies. Therefore, to avoid this redundancy, network represents a means for organizations in the same field to eliminate duplicative efforts by pooling capital and technical resources. In these circumstances, networks may benefit organizations because of complementarities in the knowledge assets and the mutually absorptive capacity—the ability of organizations to assimilate new ideas and inventions from external sources (Stuart, 1998). However, these organizations ultimately have to compete for the same market by creating value-generating resources, which are difficult for competitors to imitate or substitute. It means that there may be diminishing benefits with the increasing closeness of mutual cooperation within a fixed time interval. Because information and technical knowledge must be exchanged in networks, organizations cannot choose to cooperate with a partner that is tightly tied to other organizations that they wish to keep at a reasonable distance. This constraint stems from managing both the potential for the conflicts of interest multiplies and the diminishing autonomy.

Therefore, it can be generally assumed that weak ties are positively related to the performance of the focal organization when inter-organizational cooperation is becoming common and significant among competing organizations, because in an environment in which social norms exist and obligations will be repaid, weak ties provide better access to information benefits and prevent organizations from being exploited by partners without diminishing autonomy.

## **Conclusion**

The importance of network formation with regard to inter-organizational cooperation has important consequences for organization theory. The arguments of this paper draw attention to three aspects that need to be considered in term of establishing an efficient and effective network for the focal organization.

First, this study highlights that within a network, structural dimension and relational dimension differ significantly in the mechanisms of benefits that they provide to the focal organization, although similar benefits are likely to be brought. By clarifying both dimensions, I argue that, under these circumstances, it is important to examine how network structures and network contents interact in shaping the network and they should be considered simultaneously.

Second, this study identifies the configuration of networks the focal organization should build. Either in the open network or in the closed network, the effectiveness and efficiency of network mixes poorly with each other. By clarifying that the benefits of network structures are contingent on the contents of ties, I argue that weak ties in the densely-connected network and strong ties in the sparsely-connected network are positively related to the performance of the focal organization.

A third aspect, closely related to the previous one, is that concerns about the benefits inherent in the network can vary with the specific relations organizations form with each other in the organizational field. In the vertical network of input-output organizations, the focal organization should keep strong ties with other organizations rich in structural holes to exploit the opportunities provided by network structures while the horizontal network comprising of competing organizations should be densely connected with each other with weak ties since social norms can facilitate trust and cooperative behavior.

In developing my idea, I have noted several limitations in this study. Although in this paper, I suppose that network structure is viewed as the relatively enduring pattern of relations, it does not mean that it cannot change upon the emergence of the key industry changes (Madhavan, Koka, & Prescott, 1998). That is to say that changes that can bring the horizontal transition of network structures in Table 2, should also be considered in the future

research. Second, little attention has been paid to how cooperative relations are associated with the industry context in terms of different demands from the internal composition of industry. Finally, and the most significant is that these theoretical hypotheses need to be evidenced and proved by the empirical studies.

### **End Notes**

I gratefully acknowledge the precious comments and suggestions from my supervisor Professor Tamiki Kishida, and I would like to thank Tsutomu Kobashi, Yukihiro Wakuta, Kaziyuki Kozawa, Tsuyoshi Yamashita, Tsai Zhanwei for their helpful comments on the drafts. I am also grateful for the sincere support from Zhang Liming on the final English check.

## **E-Government: Inside of the Public Agencies in Malaysia**

*Hazman Shah Abdullah*

*Abdul Jalil Mohamed Ali*

*Ahmad Naqiyuddin Bakar*

*Maniam K.*

*Universiti Teknologi MARA, Malaysia*

### **Abstract**

The ICT revolution is causing sweeping changes in the way the government conducts its affairs with the people and business. The E-government is prophesied to alter the character of governments – become more responsive, more engaging and more democratic. Many studies have surveyed the public side of E-government changes and the reports are generally positive. Few studies have examined the intra-organisational changes that are taking place in parallel with the needs of a more ICT driven government. This study examines the internal changes within 91 public agencies in Malaysia. The findings paint a picture of weak leadership, inadequate resource availability, dependence on vendors, strong role of central direction and leadership and overall planning to progress the E-government platform from the billboard or publish stage to more interactive stage. There is generally low level of readiness to make move e-government beyond the rhetoric of radical change.

### **Introduction**

The Internet has opened new possibilities for the government and the governed, just as it has for the businesses and its customers (Moon, 2002; Shedler & Summermatter, 2003; Curtin, Sommer & Vis-Sommer, 2003). Over the past decade many governments have planned and implemented programmes intended to launch the government into the digital realm (Curtin et al., 2003; UNPAN, 2004). The highly complex bureaucracies that grew to regulate the economy and society through the highly differentiated but usually lowly integrated machinery can eventually be reconstructed through information and communication technology (ICT). Governments of both developed and developing countries have embraced ICT to improve the quality of public service, increase public access to information and to energise more participation in civic affairs (Becker, 1998; Moon, 2000; Schedler, 2001). According to a United Nations study, 89% of its 190 member states used the Internet in some capacity to deliver information and services (United Nations Division for Public Economics and Public Administration, 2002). Despite the impressive growth of e-government particularly through the Internet in making information and services available to the people, the intra-governmental changes have been slow, adhoc and plagued by poor planning, management and leadership (Ho, 2002; Moon, 2002). Many researchers have opined that the easier first stage is over and the next stage in the e-government evolution will require fundamental changes in mindset, approach and even laws to make progress (Layne & Lee, 2001; Vivienne, 2000; Vintar, Kunstedj, Deeman & Bersic, 2003; Yong, 2003; Vriens & Achterberg, 2004; West, 2004). The online transaction stage require governmental organisations to massively digitize and integrate their back-end operations, develop new skills and resources, and bring down digital and legal barriers to enable seamless integration of services across government agencies and to cultivate greater trust in the public (Holmes, 2001; Reddick, 2004). The “transact” stage is not expected to proceed as smoothly or as rapidly as the first, given the tricky and risky nature of changes needed (Vintar et al., 2003). This study is intended to examine the internal readiness of Malaysian governmental organisations whose websites were examined as part of a larger study on e-government. The internal structural, human and managerial readiness is posited as the main impetus or barrier to further development of e-government in Malaysia.

## Review of Literature

The Internet is changing the way business is transacted globally, and is now changing the way governments interact with citizens and businesses although in ways much less ambitious than initially proclaimed (Cortada, 2002: 340; Drucker, 2002). West (2004) cautioned that the euphoric proclamations of virtual state and new governance were overstated. Although changes via e-government have improved public services, the socio-political factors continue to hinder large scale changes that transformations entail. Although governments were the first to adopt and use ICT, it was mainly deployed in the backroom operations of the government and government-to-government (G2G). The use of ICT in delivery of services is new to government (Shutter & de Graffenreid, 2000) and therefore the subject of ICT including Internet, has been examined from many perspectives namely, legal and constitutional (Kraemer, 1988), leadership and management (Vriens & Achterbergh, 2004), fiscal scarcity (Beckett-Camarata & Moon, 2004), citizen involvement (West, 2004), service delivery (Corrigan & Joyce, 2000) and external environment and change (Scavo & Shi, 2000). The popularity of Internet, the expansion of e-commerce and the use of Internet by governments to deliver services to the people have attracted quite a lot of attention. However, many basic and structural obstacles must be resolved before the full potential of the technology can be realized. Political, cultural, human and resources constraints are obstacles that allow incremental changes within the limits of the society and politics (West, 2004)

Mover (2001) surveyed the extent to which the British local authorities have utilized the Internet to reach and serve the people. He observed that the national plans and objectives set to deliver all service online by 2008 is a great push for the authorities to transform themselves. However, most authorities are in the early stages of the Internet use trajectory. He submitted that most authorities were at the 'publish stage' had along way to go before integrating their supply chain, transforming business and empowering the citizens. The last stage is admittedly most difficult as it involves substantial attitudinal change. He advised that more attention be given to the selection of technology, the general backroom capability, incentives for citizens to use the new channels and security of private data. Across the Atlantic, Norris, Fletcher & Holden (2001) surveyed e-government in city and county governments in USA. The provision of e-government services required, they observed, some reengineering of the service processes to accommodate the new interface. The employees also felt greater burden as more staff resources were devoted to e-government development. The local authorities also experienced a significant increase in demand for the services as it had become more accessible and hence stimulated more demand. An interesting finding of this survey was that not all employees had Internet access even though the authority maintained a homepage and provided information and services via the Net. This survey also indicated that few authorities had an e-government strategy or plan in place. More than half of the respondents were considering a plan in the near term. There is also a growing interest in outsourcing the web-related functions to obtain better technical support since the internal resources are limited. Ho's (2002) study of municipal government supported the assertion that public agencies are moving away from a bureaucratic model to a user-centred paradigm. He also noted that this transition was hindered by staff and financial shortages, unequal digital access and the lack of broader vision of e-government.

Scavo & Shi (2000) looked at the general state of ICT use in American government. It is their contention that the hype and excitement of ICT is overstated. The reality is much less promising and full of problems. Much of the acquisition and use cost are not fully understood and provided for. They warned that ICT might not serve the twin goals of democracy and efficiency without conflicts. Many of the ICT utilization programmes are aimed at reducing cost than increasing comfort and to make the service available to all those who need them. Again, they raised security as a major concern as government data are among the most private and confidential. Shutter & Graffenreid's (2000) nationwide survey of businesses and citizen on e-government produced several interesting and conflicting findings. The citizens who had e-commerce experience expected their governments to go the same route. Having tasted the ease and convenience of online services in the new economy, they are expecting their governments to adopt the same e-business models. The citizens who have e-commerce experience appear to be more convinced of the benefits of e-government than those who have not. Businesses make extensive use of online services and expect more to be available. They do not see why the government cannot adopt the same technology as the businesses in serving their customers. However, one big concern is the trust in the government to preserve

privacy and confidentiality of personal data. Both citizens and businesses have the same concern over security. To promote e-government, the government must adopt or evolve systems that will create greater confidence in government in the handling of private information.

Hale et al. (1999) surveyed websites of Californian municipalities to examine the impact of these sites on three issues namely, the provision of information about municipal services, the linking up with other local associations and groups to build cyber-communities and bringing the citizens closer to the government. In 1996, 118 of the 460 cities had websites and the number increased rapidly to 290 in 1997. Sixty-one cities had two or more sites. Hale et al. (1999) found that there were wide variations in website quality. The smaller cities had nothing more than electronically presented typed documents. Most sites provided basic information about the municipality. Less than 50% of these sites maintained links with other associations. The horizontal communications impact of the websites was limited. Again in terms of vertical communications (G2C), close to 50% did not have such a facility. In short, Hale et al. (1999) found the results of their website review to be generally discouraging. Internet helped lower the 'costs' political participation but mere presentation of information, according to Hale et al. (1999) will truly stir the democratic urge to participate in debating issues.

West (2000) analysed 1,813 websites of US federal and state agencies. He found that these websites have performed badly. Their email response was good but most websites fared badly when it came to interactivity, provision of online services, security and privacy and many other website attributes. Comparatively, the Federal agencies performed better than their state counterparts. He also found that the multimedia capability of the Internet has been poorly tapped for public service provision. OMB (2000) formulated a centric and performance biased definition of e-government to underscore the main objective of leveraging ICT for the business of government. The report identified 4 citizen groups that the e-government initiative must seek to serve; individual/ citizens – Government to Citizen (G2C); businesses: Government to Businesses (G2B); intergovernmental – Government to Government (G2G) and intra-governmental (G2A). This strategic articulation of the deploying of ICT or technology resources in government outlines the boundaries of potentialities. Though G2C has received much public attention and notice, the backroom of the government is also experiencing equally frenetic changes in communication of information between and among governments and agencies. OMB (2000) bemoaned that the huge investments in information technology has not produced the level of productivity gains that were expected and possible. The sub-optimal returns were attributed to the areas which have attracted the initial burst of ICT investments. The investments were targeted at agencies processes and needs rather than meeting citizen needs. The technology was used to automate existing processes rather than to create more efficient and effective solutions that were now possible because of commercial E-business lessons learnt. The technology investment has proceeded without much collaboration on the basic technological protocols. This consequently has created islands of ICT that has crated problems of interagency connectivity and interoperability. As a result, citizens and businesses have to interact with multiple agencies to get services because the information supplied cannot be shared. Finally, the budgetary processes and agency culture has divisions that do not find it easy to cooperate across units and divisions even though the gains are enormous.

A United Nations Division for Public Administration's (UNPAN) study of 190 web sites placed Malaysia's info-structure as above average but classified the local e-government as barely above 'interactive level' with "citizen-centric components ... only minimally present" (Reported in Raslan, 2002). Taylor Nelson Sofres(2002) - a market information services provider, found that 23% of Malaysians surveyed were ready to release credit card and bank accounts numbers online to their government which compared favorably with the other countries (Denmark: 40%, Singapore: 39%, Norway and Sweden: 32%). However, only 12% of those who trusted online services had actually used e-government services. Whether these subjects had provided the personal data over the net in course of obtaining the e-government services is not established. This paradox of high trust and low use point towards between the potential and actual. Inexperience in e-government may explain the readiness to provide personal data over the net.

There is a sort of digital divide among government agencies (Ooi, 2001). The resource rich agencies like Subang Jaya Municipality and Malaysian Tourism Board are able to outsource their web design and management. Most agencies have no overall Internet strategy, which is likely to result in wastage, lack of synergy, and unfocussed development of the set based services. Most agencies still had static content that were not regularly updated and

some were regularly not accessible. The design of these websites is still very amateurish and does show that usability has been a primary consideration. Without regular surveys of citizen perception of the website quality, agencies can go on without identifying the basic problems. Research shows that 40% of users who had negative experiences are unlikely to return to the site again (reported in Ooi, 2001). Hazman, Jalil, Maniam & Naqiyuddin (2004) carried out a survey of 168 websites of Malaysian public agencies in terms of their citizen-centricity, data currency, responsiveness, participation and online service. Most agencies were mostly using the website to broadcast or publish information and data. The web design structure mirrored the agency structure. There was very poor response to inquiries from the researchers.

An Accenture annual e-government report found that of the 126 services that could be delivered online, 64 were available to some degree indicating a service delivery breadth of 50.79% (Vivienne, 2000). Of the 64, only 5 services could be classified as transactional and interactive while the rest were classified as 'publish' (reported in Izwan, 2001). The same report indicated that Malaysian E-government services exhibited low service delivery maturity i.e. low integration of services across agencies, lack of single point of entry and low use of customer management techniques. The e-government development best described as 'platform builders' characterised by high level publication of information online with gradual but low level of depth in the service category. Human resources, justice and public safety, education, regulation democracy, transportation and postal were sectors that had low overall service maturity.

## **E-Government Readiness – A Conceptual Framework**

The relevant government's vision and strategies are important to chart the path of e-government given the resources, people's capacity to interact via ICT, the attitudes and political priorities. This statement of policy and direction must cascade down to all levels of the administrative machinery to develop adequate change momentum. The readiness of the agency level will to a large extent determine how fast these visions and plans can become reality for the people. Based on extant literature in e-government and change management a number of key variables are posited as playing a key role in readiness of the public agencies to progressively develop the e-service component of the total service delivery. The variable planning examines the commitment of the agencies reflected in the existence of plans and policies or intention to have policies and plans in the near future (Moon, 2002; Vriens & Achterbergh, 2004). These policies include Internet use policy, email policy and plans on e-government. The policy and planning dimensions indicate preparation for e-government beyond the usual rhetorical commitments expressed in reports and press releases (Schedker & Summermatter, 2003).

The resource variables examine the availability of human, technical and financial resources to support the e-government plans. Foremost of the human resources requirements is the presence of technical personnel who is charged with e-government responsibilities (Ho, 2002; Vriens & Achterbergh, 2004). The status and stature of this person is important indicator of the importance and influence ICT has in strategic matters (West, 2004). The influence of the unit under which ICT matters are placed is also an indicator of the view of ICT in the affairs of the organisation. The allocations for e-government expenditure are also captured to reflect on the budgetary priorities – which are more accurate indicators of the importance of e-government. The extent of use ICT vendors for e-government related expertise shows the ability to leverage on outside resources or the and also lack of sufficient technical know-how in-house.

The e-service variable relates to the range of agency services that are provided online or for which there are plans in the near future (Vivienne, 2000). The first phase of e-government has taken off quite aggressively. Important as this stage is, the pace of development of the following stages will determine if e-government will actually harness the full potential of ICT or merely engage in limited and sometimes symbolic e-government (Moon, 2002; West, 2004). The later stages require better planning, stronger leadership and user mindset. The internal work routines and processes must be linked and secure features built-in (Vintar et al., 2003).

The perceived benefits of e-government are a powerful motivator of adoption and change (Moon, 2002). Although a national e-government vision is convinced of the potential benefits of ICT deployment, this belief must cascade down and be shared by the agencies in terms of their more local and empirical experiences. The role of

positive affect on adoption of technological change has been widely theorized and tested (Hazman & Munirah, 2004). This variable examines the aspects of the benefits of e-government.

## Research Method

The study is a cross-sectional sample survey of 165 public agencies of the federal, state and local governments whose websites were evaluated in a different but related study. It is intended to examine structural and managerial state of development of the digital service of the agencies. Only 91 of the 165 mailed questionnaires were returned providing a response rate of 55%. The survey looked at the access to ICT infrastructure by the staff, technical human resources, the availability of e-government and associated policies and agency leadership. Based on the web-sites that was observed in phase I of this study, questionnaire was developed in both English and Bahasa Malaysia and pilot tested on 5 agencies and found to be without problems. The instrument to obtain data on the internal arrangement was adapted from a similar UN instrument.. The United Nation Public Administration Network (UNPAN) questionnaires were adapted for the specific purpose of this study. The objectives of this study require basic descriptive analysis. However, some post hoc analysis of the relationships was carried out to provide an empirical insight into possible correlations.

## Results

Table 1 shows the general profile of the agencies that were studied. Reflecting the rapid uptake of e-government, all but one agency have websites (UNPAN, 2002). Most (78%) of the agency websites were less than 5 years old with a third of the websites established less than 3 years ago. For a majority of the agencies a reasonable span of time has passed since their establishment and expectations of improvements and expansions are not unreasonable. State agencies comprise 46% of the agencies in the sample while federal and local agencies make up 32% and 21% of the sample respectively. There is a slight over-representation of the state agencies in the sample.

TABLE 1: AGENCY PROFILE

No	Profile	No	%	
1	Have Agency Websites	Yes	90	99
		No	1	1
2	Age of Agency Website	> 1 year	6	6.6
		1-2 years	11	12.1
		>2-3 years	16	17.6
		>3-4 years	20	22
		>4-5 years	18	19.8
		>5 years	18	19.8

		Part-time	15	16.5
		NA	33	36.2
4	Level of Government	Federal	29	32
		State	42	46
		Local	19	21
		NA	1	1

### Leadership - Policies and Plan

In 1995 e-government was identified as one of the 8 flagship projects under the Multimedia Super Corridor (MSC)

(Maarof & Soon, 1999). The Malaysian government has developed a national ICT and E-government vision to guide the transformation of the public sector in tandem with the private sector. The K-economy Masterplan also envisions rapid transformation of the government through the intensive and intelligent use of ICT especially the Internet to support the economy. Despite the strong national interest and leadership, the corresponding uptake of e-government as judged by the development of a documented e-government plan or strategy is low. Table 2 shows that about half of the 74 agencies which provided responses, did not have an e-government plan (Some agencies which did not respond to the question were asked again through telephone interview. The respondents did not know if such a plan existed. To be safe they did not answer this question). This lack of interest probably prompted the Chief Secretary of the Federal Government to urgently call for ICT blueprint (Hamidah, 2002). However, it is heartening to note that a majority of the agencies, which did not have an e-government plan, indicated that one will be developed within the next year (see table 3). There appears to be a correlation between the presence of an e-government and the location of e-government matters within the purview of the head of the agency or a technical department. Both influence and ability seem to occasion an e-government plan

TABLE 2: EXISTENCE OF E-GOVERNMENT PLANS

		Planning to Development one within a Year		Total
		YES	NO	
Do you have an E-Government Plan?	YES	1	1	2
	NO	28	8	36
Total		29	9	38

TABLE 3: LOCATION OF RESPONSIBILITY FOR E-GOVERNMENT POLICY

		Overall Responsibility for the Web				Total
		Agency Chief's Office	IT/MIS/Computer Dept.	Finance Dept.	Others	
Do You Have an Overall Strategy	Yes	12	17	1	2	32
	NO	4	0	1	2	7
Total		16	17	2	4	39

For e-government to progress beyond the publish or billboard stage, derivative policies must be developed to guide the employees actions and behaviour in the new realm (Yong & Koon, 2003). To begin with employees must be provided with emailing facilities. All employees in 38% of the agencies were provided with emails while in another 19% of the agencies only some of the employees had email facilities (see table 4). That less than half of the agencies had made emails available to all their employees is a serious set back. Without this communication tool the connectivity between the employees and the public cannot be developed. Accordingly, a minority of the agencies has a written email policy but there is a strong desire to develop one in the near future. Similarly, only 23% reported the existence of an Internet policy with 71% indicating that one will be available within a year.

Based on the data presented here on the existence of e-government plans, email and Internet policy, the progress of e-government in these agencies cannot be coherent, organised and hence, not rapid. The national level leadership in e-government and ICT is not matched by the agency level leadership as judged by the development of agency e-government plans and policies. Ad hoc and piecemeal development is likely to characterize e-government development without strong leadership to systematically integrate e-government into the agency strategic plans.

TABLE 4: INTERNET AND EMAIL POLICIES AND ACCESS

ICT Policies	Yes	No
Have an Internet policy	23.	77
Plan to have an Internet policy	71	29
Have written e-mail policy	29	71
Plan to create e-mail policy	71	29
Official email	%	
No employees	2.2	
Some employees	18.7	
All employees	38.3	
NA	8.8	

**Technical and Financial Resources**

E-government requires that staffs in the agency are trained to operate in an ICT environment. Just as firms need a Chief Information officer to plan and mobilize the use of the ICT resources to further agency goals more effectively, so must the agencies. There is a need for a dedicated officer to handle e-government issues. The existence of a full time officer to tend to the e-government matters provide some assurance that ICT needs are given some importance in the agency. Table 5 shows that 58 agencies that responded to this question, 19 had full time staff to look after the web based services. By and large, full time officers were available where there was an IT or MIS department. In 16 cases the responsibility for the web-based services was part of the responsibilities of other officers. There were also volunteers who minded the web in the agency. The presence of full-time ICT staff is indicative of the availability of technical resources to aid both planning and implementation of ICT projects and also to provide advisory services to agency managers who are not as ICT literate.

TABLE 5: STATUS OF WEBMASTER AND LOCATION OF E-GOVERNMENT RESPONSIBILITY

	Department with Overall responsibility for the Web			Total
	IT/MIS/ Computer Dept.	Finance	Others	
Full-time	16	0	3	19
Part time	3	0	8	11
Part of Another Position	16	1	7	24
Volunteer	1	0	0	1
Others	1	0	2	3
Total	37	1	20	58

It is therefore not surprising that 43% of the agencies used ICT vendors to manage E-government projects. This is because the needed skills are not available in house or unable to cope with the demands of the projects. It is also because approvals for new positions are not easy to come by with tight control of positions by central agencies. It is much easier to procure these services via private vendors. The use of vendors indicates the lack of technical resources to handle advanced ICT work within and also the trend towards outsourcing. More than half of the agencies still did not use ICT vendors. Majority of the agencies that used vendors were generally quite satisfied with their performance. Evaluation of the technical quality of the ICT services without full time ICT staff will be difficult.

TABLE 6: SATISFACTION WITH VENDORS (WEBSITE)

Web Services	Very Satisfied	Satisfied	Not sure	Unsatisfied
Website Hosting	9	74	17	0
Website Design	6	72	13	9
Website Management	9	56	22	13
Integration of Databases	10	58	19	13
Use of E-Government vendors	Yes (43%)	No(55%)	NA(1%)	

E-government does not come cheap. Large initial capital outlay is needed to create websites, acquire the hardware and software systems train staffs, to digitize old records, create new database systems to hold data and to develop security systems to ensure integrity of the system. Although central agencies fund and develop shared systems, most of the e-government projects have been funded by the agencies. Hence, the allocation for e-government is an indicator of importance of e-government in the agency. It must, however, be stated that some of the finances for e-government may be provided under other items like equipment, travel, services, maintenance etc. It is reasonable to say that the actual availability is more than the amount cited here. The allocation cited in Table 6 is not large in absolute terms but the true size can only be understood in relations to the total budget of the agency. These allocations would probably allow the agencies to continue to rely on the vendors to support the web services.

TABLE 7: ALLOCATIONS FOR E-GOVERNMENT IN MALAYSIAN RINGGIT (RM)  
(3.8 RM = 1USD)

Allocation	No	%
0-50,000	40	44
51,000 – 100,000	11	12
101,000 – 150,000	6	7
151,000 – 200,000	4	4
201,000 – 250,000	3	3
> 251,000	20	22
NA	7	100

### E-Government Services

The range of services provided via the e-government channel is limited (see Table 8). Between a quarter to a third of the agencies provided forms download, citizen relationship services, information services and document and data. This is symptomatic of the transact or publish stage in e-government transition. The effectiveness of the services are still in doubt. For example, a study of the responsiveness of the agency staff to inquiries produced dismal results with barely 2% responding (Hazman et al. 2004). A major obstacle to complete e-government services online is the question of making payments. Table 9 shows that 22 of the 78 agencies have e-payment for licenses and fees. This often relates to payment by users to their credits card issuers with whom the agencies maintain payment arrangements or through the Postal Corporation. For example, the motorists with traffic summons from the Police can settle it through authorized third party via credit cards (Sharifah, 2005). Public confidence and trust in Internet based payment is still low (Taylor Nelson Flores, 2001; Maniam & Hazman, 2004). The frequent reports of security breaches in banks have not helped develop public confidence in e-payment. Without e-payment services in place, e-government cannot go fully online. This stage characterizes much of the e-government in the world (Holmes, 2001; Yong, 2003).

TABLE 8: E-GOVERNMENT SERVICES

e-Government Services Provided	Provided	Plan to provide
Provision of forms	28(44%)	35(56%)
Application inquiries	9(18)	42(82)
Complaints of agency services	38(58%)	28(42%)
Information on rules and regulations	23(48%)	25(52%)
Client relations (FAQs, helpdesk etc.)	35(58%)	25(42%)

TABLE 9: ONLINE PAYMENT FOR AGENCY SERVICES

Type of Services	Provide	Plan to provide	No plans
Online payment of tickets/fines	1	11	88
Online payment of taxes	3	21	76
Online payment of licenses/fees	22	0	78
Other payments	8	0	92

Yet another indicator of how readiness the agencies are to go fully online is the extent to which supplies are e-procured. Both the confidence in e-commerce and technical sophistication that follows the use of e-procurement has positive spillover benefits for e-government. As can be seen from Table 9 the uptake of e-procurement is low with 96% responding in the negative but indications of future developments are there.

TABLE 9: E-PROCUREMENT OF SUPPLIES

No	Procurement	Yes	No	NA
1	Procurement of supplies over the net	4	96	0
2	Plans to procure supplies over the net	32	60	9
3	Post bids/RFP on the web	4	93	2
4	Plans to post bids/RFP on the web	34	54	12

**Perception of E-Government**

E-government is not merely a technology issue, it is as much a change management challenge. To motivate change the agencies must admit to and believe in the benefits of e-government (Jasni & Hazman, 2002). A high majority of agencies did not believe e-government reduced the need for staff contrary to the belief that efficiency gains are the instrumental reason for e-government. A majority of the agencies did not believe that e-government reduced time demands of the government. In fact 65% reported that e-government increased demands on the staff. The agencies are about equally divided about on the question of e-government changing the role of the staff. Paradoxically, the processes were reengineered with little improvements in efficiency. Revenues did not rise but administrative cost did. However, a majority of the agencies agreed that it is too early to assess e-government. Perhaps during the transitional phase where both online and conventional services are maintained, workload increases along side costs.

TABLE 10: EFFECTS OF E-GOVERNMENT

No	Effects	Yes		No	
		Freq.	%	Freq.	%
1	Reduced staff requirements	11	12	80	88
2	Changed role of staff	44*	49	46	51
3	Reduced time demand on staff	36	40	54	60
4	Increased demands on staff	32	35	59	65
5	Increased non-tax revenue	10	11	80	89
6	Business process reengineered	30	33	61	67
7	Business process more efficient	57	63	34	37
8	Reduced administrative cost	27	30	63	70
9	Too early to tell	34	63	57	37

**Discussion and Conclusion**

Most surveys of e-government have examined and concluded, on the basis of the digital service windows of the public agencies, the state of e-government in the world (Taylor Nelson Sofres, 2002; UNPAN, 2004). While the websites provided valid evidence of the state of e-government, it does not reveal all. The state of leadership within the agencies i.e. planning, policies and strategies, the availability of technical and financial resources, the plans to

launch services and perceptions of how e-government has impacted the agency are hidden from view. Consequently, the picture painted of e-government is a rather limited one at best and a distorted one at worst. The readiness to move from the 'publish' stage to the next 'transact' stage is lacking in most agencies surveyed. E-government plan at the agency level is mostly non-existent even though there is some interest in developing one in the near future (Hamidah, 2002). Perhaps, agencies still expect the central agencies like Malaysian Administrative Modernisation and Manpower Planning Unit (MAMPU) which developed plans and strategies to take the lead. As has been argued the transition to the transact stages will be slow. Without a carefully planned transition, the e-government evolution from the 'publish' to the 'transact' stage will be slow, chaotic, duplicative, insular and suboptimal. This stage requires careful planning of the information architecture and the digitization of the manual back-end operations. This stage represents a major re-engineering exercise with implications for staffing levels, training and retraining and many pockets of people who previous wielded influenced in the manual system will face elimination (Norris et al., 2001). The government agencies cannot retrench easily. The lack of plans and policies is also because of the unavailability of technical staff who can inform and guide these plans in the agency. Consequently, there is heavy dependence on the vendors who are likely, in the absence of strong client knowledge and specification, to chart the path that is profitable. While the use of vendors helps to offset the lack of in-house technical capabilities, excessive dependence can be exploited by the vendors to sell outdated and restrictive systems that create serious legacy issues when inter-agency connectivity is developed. However, the rising attractiveness of externalizing internal services to enhance efficiency and the promotion of outsourcing of internal services may actually delay the acquisition of in-house technical resources. The likelihood of e-government plans increases if the agency chief's office is responsible for it. Clearly, top management interest and commitment, as in all other change initiatives; seems to produce some planning for e-government.

The range of services presently provided is limited. A third of the agencies make available various application forms through the website. A majority of the agencies allow inquiries and complaints to be channeled through the use of emails. However, the effectiveness of these means in furthering the interactional quality is open to question. A recent study reported that a very small number actually responded to email inquiries sent to the agencies as part of a part of the public agency websites (Hazman et al., 2004). The relatively low level of Internet subscription among Malaysian public (12.4 %) in part explains the low interest and limited progress of the agencies in developing the e-government services (Malaysian Communication and Multimedia Commission, 2004). For the agencies that do not currently offer information and interactional opportunities, there is some interest in making these services available in the near future. Fully online services are highly limited contrary to some reports. Fee and summonses payments are presently enabled through the use of third party intermediaries. Many agencies like the local authorities, Royal Malaysian Police, Immigration and Road Transport Department offer online services via the National Postal Corporation network of branches. But these agencies still do not offer payment of fees online through the net. This approach appears to solve many teething technical problems for now for these agencies and offer a viable route to further development of e-government. The lack of online services is also due to strong concerns of security among the people despite fairly encouraging views about trust in government and perceptions of security (Razlan, 2002; Taylor Nelson Sofres, 2002; Maniam & Hazman, 2004; Economist Intelligence Unit, 2004:10, 12). Rapid development of e-commerce will help to extinguish these fears and enable e-government to move a notch higher to transaction phase. But the current state of e-government services is best described as infant and experimental in most cases. E-government is not only about how public agencies deliver services to their clients but also how ICT used to manage relationship all parties. In this connection, the use of ICT to link with the suppliers is also an important indicator of readiness within the agencies. The use of e-procurement is minimal even though the central agencies especially the Treasury has already rolled-out the application and is undergoing phased implementation.

Given the euphoric proclamations that e-government will transform the government radically by improving service delivery, remove agency silos, re-engage the public and generally promote participation and democracy, it is easy to believe in the infinite efficacy of ICT (Costada, 2002; West, 2004). The perceptions of the key managers in the public agencies determine to a large extent how fast e-government progresses. The respondents believe that e-government make additional demands on the staff time, expands the scope of work and does not reduce demand for staff. Therefore from a human resource standpoint the e-government is more hassle. From the process standpoint, a

majority of the agencies believe that the agency processes have not changed nor become more efficient. Administrative cost, contrary to popular belief, has not reduced either (Caldow, 1999). The case for e-government at the agency level is not a very compelling one. The e-government initiative is probably viewed as a national project driven from the top. Hence, the agencies in the periphery have to comply and make some progress. Locally driven change to e-government requires a strong shared believe in the efficacy of the ICT in the delivery of agency services. E-government probably suffers from a common disease that afflicts change initiatives – poor perception of utility. The negative perceptions can also be attributed to the e-government strategy of viewing e-government as alternative to the conventional service. Hence, the agencies have to cope with the dual system of delivery which necessarily makes additional demands on the staff who are less effective in the new ICT environment of work. The contribution of e-government to the agency may not be, at this early stage of e-government, commensurate with the resources expended. The negative perceptions of e-government are quite natural, understandable and expected. Hopefully further development of e-services, higher Internet penetration among the public and better e-payment systems, e-government will begin to deliver the benefits as claimed and also experience in many other jurisdictions in the world.

In summary, the level of e-government readiness in Malaysia portrayed in this study is quite inconsistent with the reports by many international surveys. As has been stated, this study examined the readiness by examining the leadership, the resource availability, e-services offered, e-payment and e-procurement and the perception of e-government at the agency level. The view of e-government from the quality of the website, although is a widely used approach in assessing e-government, is not adequate when investigating the readiness to progress from the ‘publish or broadcast’ stage to the ‘transact’ stage. The extent of planning and resource availability will determine the speed of change and also the quality of e-government that can be expected. Greater interest and commitment of the agency managers must be created by, not only issuing change circulars and national e-government vision documents, but also by providing more technical assistance to the agencies to plan and implement the changes, some of which are fundamental and demand new competencies. Without centrally guided planning and implementation of digitization of agency records and information, the next stage of e-government will be slow, chaotic and insular. The state of e-government readiness as etched out by this study is still massively wanting. The utopian conception of e-government as a singular portal with virtual departments and agencies is still a notion in the realm of technological possibility.

# Managing E-Business Initiatives in Turbulent Business Environment

*Abdul Rahim Abu Bakar  
Fariza Hashim  
University Utara Malaysia, Malaysia*

## Abstract

**This paper highlights the strategic decision making of firms in adopting e-business technology. It is hypothesized that firm adoption of e-business technology depends on the motivations of adoption. While it is posited that firm technology motivations influence e-business adoption, firm market orientation and its business environment lead towards the choice of organizational technology motivation. Our rationale is based on the strategic choice and or contingency theory perspective in tandem with the strategic implications of market orientation. In testing the hypotheses of this study, a survey was carried out consisting of 153 manufacturing companies in Malaysia. The findings substantiate our proposed technology motivation construct and its relationship with firm market orientation and its business environment.**

## Introduction

In responding towards the dynamic and competitive industry environment, firms have resorted to technology in order to meet market demand or improve firm competitiveness (Gagnon and Toulouse, 1996). Numerous researchers have agreed that the adoption of new technology is a strategic issue and is essential for firms to be successful (Gagnon and Toulouse, 1996; Porter, 1980). The “explosion” of the digital economies has further magnified the importance of this area for further understanding. Hence, adoption of innovation continues to be an important area of research inquiry in marketing for many years (Plouffe et al., 2001).

Nevertheless, the process of new technology adoption is often plagued with uncertainties. Although managers in adopter firms want to make an appropriate decision, it is not a simple task. The “abundance” of technology options and the “overlaps” of technology applications could confuse managers in deciding technology that is appropriate for their situations. With regards to the emergence of new technologies like e-business, firm “innovativeness” in adopting these technologies varies distinctly. In addition, the study by Datamonitor (Lord, 2001) reveals that the industry has different levels of adoption in the four areas of e-business which are enterprise resource planning (ERP), customer relationship management (CRM), supply chain management (SCM), and e-commerce.

## Problem Statement

Studies on organisational technology adoption have identified various factors that influence firm propensity to adopt new technology (Meyer and Goes, 1988; Gopalakrishnan and Damanpour, 2000). However, previous studies on innovation adoption have primarily taken an organisational theory perspective and explored the organisational determinants of innovation adoptions (Damanpour, 1988, 1991). These organizational characteristics consist of “visible” features of an organization. We take the position that although these studies are useful in providing insights toward the understanding of organizational innovation adoption, we agree with Mohamed (1995) that adoption does not guarantee usage. Studies of organizational innovation adoption show that although firms could “technically successful” in adopting new technology, the adoption could “fail organizationally” in that people do not actually use it (Keen, 1981; Urban, 1974). Behavior-related problems (Markus, 1983) are commonly recognized as reasons why the “appropriate” organizational culture is pertinent in accommodating new technology.

This is corroborated by Cravens et al. (2002), who asserted that the assessment of innovation success in organizations often points to the importance of delivering a culture committed to innovation. Nevertheless, there is not a single study to date that has examined the effect of culturally-based organisational characteristics as predictors in studying organisational technology adoption or e-business adoption specifically. Therefore, this paper fills the gap

in the innovation literature by studying the influence of the culturally-based organisational characteristics (market orientation) as predictor in organisational technology adoption.

Apart from organizational characteristics, firm business environment has been commonly examined to influence the decision making of new technology adoption. The firm response to the environment could be hypothesized as either from a contingency theory perspective (Kast, 1973) and /or strategic choice perspective (Child, 1972). We argue that whatever perspective is adopted, the firm's response to the environment is "channeled" through the firm "technology motivation", where the adopted technology is a manifestation of firm's analysis of the environment and its taken course of action. Given that innovations are adopted with the intention of increasing organisational performance (Damanpour, 1990; 1991), it is surprising that there is very little information on firm motivations of new technology adoption.

## **Theoretical Background**

### **Market Orientation**

Market orientation has been recognised to reflect a philosophy of doing business that can be considered a central ingredient of a successful organisation's culture (Hunt and Morgan, 1995; Slater and Narver, 1990). The culturally based behavioural perspective defines market orientation as "the organisational culture that most effectively and efficiently creates the necessary behaviours for the creation of superior value for buyers and, thus, continues superior performance for the business (Narver and Slater, 1990)." The authors inferred that market orientation consists of three behavioural elements which are customer orientation, competitor orientation and interfunctional coordination.

The relationship between market orientation and innovation has been discussed and noted by various researchers (Atuahene-Gima, 1996; Hurley and Hult, 1998). Deshpandé et al. (1993) suggested that the success of a firm's innovation is probably the excellent visible manifestation of its market orientation, along with the success of the firm. The researchers, after finding firm's performance to be linked to both market orientation and innovation, speculate on a causal relationship of market orientation, innovation, and performance. Reiterating the earlier statement of Deshpandé et al. (1993), Slater and Narver (1994) reason, "Innovation and new product success are more likely to result from being market-driven". Surprisingly, however, the noted relationship has been merely intuitive and remains anecdotal, due to limited empirical evidence (Han et al., 1998; Hurley and Hult, 1998; Lukas and Ferrell, 2000).

Jaworski and Kohli (1993) have suggested that because a "market orientation essentially involves doing something new or different in response to market conditions, it may be viewed as a form of innovative behaviour". Although Jaworski and Kohli (1993) do not deal with innovation explicitly in their model, their subsequent work (Jaworski and Kohli, 1996) suggests that market orientation is an antecedent to innovation. Slater (1997) briefly comments on the idea that "successful innovation is the product of a market orientated culture coupled with entrepreneurial values". In addition, Jaworski and Kohli (1996) have recognised that innovation has been inappropriately absent in models of market orientation.

In this study, we have taken the view that market orientation and innovation relationship is mediated by technology motivation. Our rationale is based on Hurley and Hult's (1998) argument that market orientation is a source of new ideas and motivation to respond to the environment. The motivation to respond to the environment may consist of a balanced mix of the components of market orientation (Narver and Slater, 1994) or there may be an emphasis on one of the components. Deshpandé et al. (1993), for instance argued that customer orientation is the most fundamental aspect of a corporate culture. Thus, although a firm is market-oriented, their motivation in responding towards the environment depends on their perspective and emphasis.

### **Firm Business Environment**

The ability of an organization to adapt to changing environmental circumstances is the key to organizational survival (Lawrence, 1981) and the effectiveness of the adaptive response is dependent on aligning the response to the environmental circumstances faced by the organization (Hambrick, 1983; Miles and Snow, 1978). The firm's response to the environment could be hypothesized from a contingency theory (Kast, 1973) or strategic choice perspective (Child, 1972). The contingency theory postulates that the effectiveness of the organization depends on

the congruence between elements of the organization subsystem and the demands of the environment, while the strategic choice perspective suggests that through choices made, key decision-makers have considerable influence over an organization's future direction. We argue that whatever perspective is adopted, the firm's response to the environment is "channeled" through technology motivation, where the adopted technology is a manifestation of firm's analysis of the environment and its taken course of action. The firm business environment adopted in this study is environmental hostility.

Environmental hostility is defined as unfavorable business climate, featuring intense competition for limited resources or market opportunities (Miller and Friesen, 1982). Environmental hostility represents the perceived frequency of change and turnover in the marketing forces of the external/task environment (Aldrich, 1979). In addition to rapid continuous change, sudden discontinuous changes are also prevalent (Sutton et al., 1986). Changes in technology, customer preferences and competitive action are some examples of environmental hostility. Uncontrollable changes in the market evolution, technological evolution, or changes in the value-added system can bring about dynamic, turbulent environmental conditions (Bourgeois and Eisenhardt, 1988; Utterback, 1979). This construct has also been referred to as environmental dynamism, variability or volatility (Child, 1972), and is considered a dimension of environmental uncertainty (Scott, 1992).

Under this market conditions, profit margins are characteristically low among firms in these environments (Potter, 1994). Therefore, survival rather than competitive excellence is often viewed as a noteworthy accomplishment (Covin, Slevin and Heeley, 2000). In addition, in a hostile environment, strategic decision making can be particularly difficult, as it is hard to predict the likely importance of these changes as they occur (Sutton et al., 1986). There are clear risks with being too aggressive in the face of environmental hostility. A firm can commit to technologies, production resources, and markets that ultimately do not become dominant or significant. Such investments in wrong technologies are very costly. On the other hand, if a firm possesses the distinctive competences needed to succeed in the changing market, waiting too long to enter may result in missing a strategic window (Abell, 1978; Day, 1986).

#### **Technology Motivation**

The technology motivation construct adopted in this study is based on previous studies that used perceived benefits as their theoretical basis. In exploring firms' adoption of new technologies, various studies have used Rogers' (1983) perceived benefits as their predictor variable (e.g. Iacovou and Benbasat, 1995; Premkumar and Roberts, 1999). The perceived characteristics of an innovation can be considered as cognitive indices (or beliefs) reflected in an attitude towards the innovation (Le Bon and Merunka, 1998). Le Bon and Merunka (1998) elaborated that there is conceptual and empirical evidence that, in organizational settings, attitudinal components mediate the influence of external variables, such as motivation, on behavioral intentions.

Although perceived benefits have been shown as an important predictor of firms' new technology adoption, there is not a single study that seeks to determine the "antecedents" of the construct (Min and Galle, 2002). This is an unusual phenomenon because a firm cannot evaluate the need for or benefits of a new technology without a clear notion of what the technology encompasses. In today's technology, for instance e-commerce or e-business, what is meant by the term itself varies (Banaghan and Bryant, 1998; Peterson, 1997). These technologies include so many activities that it can be difficult for managers to decide where and how to use them in their businesses (Schneider and Perry, 2000). Hence, there is a pressing need that the technology motivation construct is developed.

#### **E-Business Technology**

In defining e-business components, we used Porter's value chain analysis (Porter, 1980) to refer to the 'original' context of the technology. Initially, e-business is defined as any form of commercial or administrative transaction or information exchange that takes place via an information communication technology-based, computer network (Moodley, 2002). The process may range from internal production processes such as the usage of an enterprise resource planning (ERP). Meanwhile, back end management includes supplier chain management (SCM) to integrate with supplier's inventory and demand forecast systems. The front-end management includes sales and marketing-focused processes which consist of business transaction and customer management. Business transactions include marketing and selling activities which normally focused on e-commerce technology. Finally, customer relationship management (CRM) integrates customer information systems and customer service.

## Hypothesized Relationship

The information technology (IT) literature has shown that firm investments in IT are driven by operational or strategic considerations (Sriram and Stump, 2004). In pursuing specific motives, firms critically evaluate the various choices of available technologies that could fulfill their needs or intention. Rogers (1983) stated that not all innovations are relevant to an organization. Hence, although e-business technologies attempt to link firms with strategic and operational considerations, firms have to select the “appropriate” technology. This is because different e-business applications fulfill different adoption motives. Therefore, compatibility with firm needs is a critical variable in determining the specific e-business application that would be adopted (Sarrina Li, 2003). In addition, the mechanism adopted by firms can be either a response to the changes in the business environment or as a pre-emptive action to influence the business environment. Therefore, we argue that there is a relationship between firm technology motivation and technology adoption. Consequently, this leads to our central hypothesis:

**Hypothesis 1: There is a positive relationship between firm technology motivation and e-business technology adoption**

E-business technology components such as e-commerce, ERP, SCM and CRM, for instance, are contingent on having a culture that fosters cross-functional sharing of information (Ingram et al., 2002; Thompson, 2001). Our argument is consistent with Schein’s (1985) definition of corporate culture as “a set of basic assumptions - invented, discovered, or developed by a given group as it learns to cope with its problems of external adaptation and internal integration - that has worked well enough to be considered valid and, therefore, to be taught to new members as the correct way to perceive, think and feel in relation to those problems”. Hence, organizational culture can also be conceived as a solution to a managerial problem. Therefore, there is appropriate justification to argue that organizational culture influences the probability of a firm’s adopting new technology.

A market orientation culture is prevalent in organizations that would engage in “innovative” solutions. The motives for market oriented firms engaging in new technology adoption (e.g. e-business) are both operational and strategic. Many e-business technologies are particularly suited to supporting a market orientation by providing a responsive and interactive medium through which an organization can gain and respond to in-depth knowledge with respect to competitors’ and customers’ profiles (Peterson et al., 1997). Customer information could also be used to predict or assess customer demand where firms could tailor their products to meet the unique needs of their customer. Finally, e-business could also be used to detect competitor’s initiatives, and thus, keep abreast of their rival’s market profiles. Hence, this leads to our subsequent hypotheses:

**Hypothesis 2: There is a positive relationship between a firm’s market orientation and its technology motivation**

Firm’s motivation in responding to the environment has been noted to vary. Miller (1987) found that firms adopt market differentiation strategies to avoid direct competition and as means for creating and sustaining distinctiveness. Meanwhile, Parker (1990) observed “efficiency” strategies, characterized by efforts to control costs were common responses to the intense hostility of the textiles industry.

Hall (1980) study of survival strategies among 64 large manufacturing in eight hostile industries found effective cost leadership strategies were characteristically observed supported by investments in modern, automated process technology. In environment where economies of scale exist, firms that do not subject to geographical market constraints may be able to reduce costs structures through volume production and compete effectively on a price basis. Edelstein (1992) corroborates the argument that serving broad geographical markets is important under hostile conditions. Finally, Gagnon and Toulouse (1996) reported that firms adopt technology in order to respond to market demand and to maintain or improve their competitiveness. Thus, as explained by the above literature, firm’s motivation in responding to the hostile environment may comprise of creating or sustaining competitiveness, efficiency and effectiveness and market growth. Consequently, this leads to our following hypotheses:

**Hypothesis 3: A firm’s technology motivation is likely to be greater, the more hostile the business environment**

**Figure 1: Research Theoretical Framework**

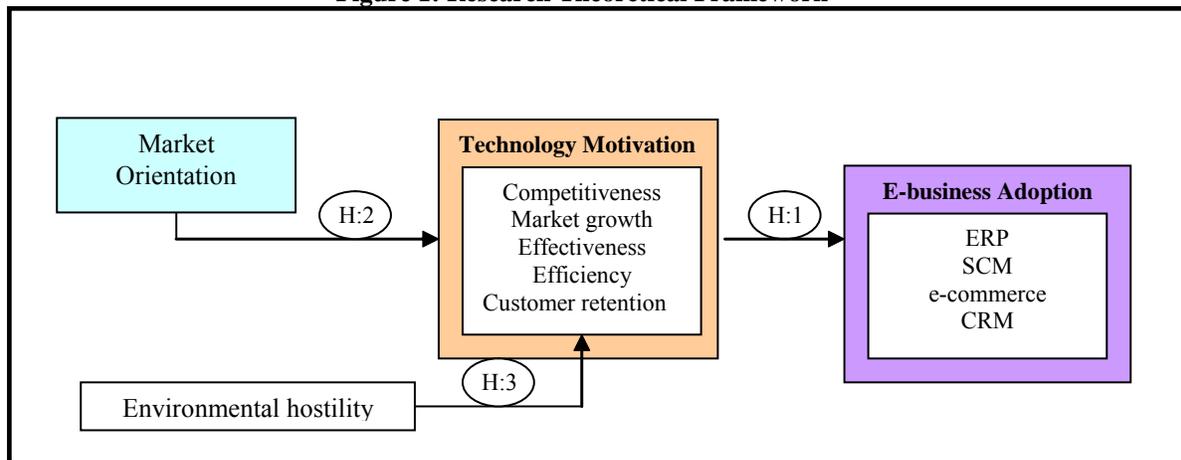

FIG. 1: ILLUSTRATES THE RESEARCH THEORETICAL FRAMEWORK THAT DESCRIBES THE ABOVE THEORETICAL UNDERPINNINGS

## Methodology

### Data Collection

After piloting the questionnaire and making amendments to the layout and ordering, the main survey was administered by post to a sample of 1700 corporate managers. Responses were required from key informants knowledgeable in a variety of tactical and strategic activities (Bowman and Ambrosini, 1997). Thus all the questionnaires were address personally to the most senior manager of the firm. The sampling frame is based from the Federation of Malaysian Manufacturers (FMM) Year 2001 directory. All respondents received a package containing a letter explaining the purpose of the study, requesting their participation and promising confidentiality, the questionnaire and a postage-paid return envelope. A summarize findings of the research were offered to the respondents as an incentive for response.

### Response Rates

From the 1700 questionnaires that were sent, 220 questionnaires were returned due to wrong address, cessation of operation and company relocation. 160 completed questionnaires were received. 7 of those questionnaires were discarded because large sections of the questionnaires were incomplete including missing pages. This comprised an effective response rate of about 11% which surpassed its predicted response rate, based on nationality, of only 4.8% (Harzing, 1997).

### Sample Characteristics

The final usable sample contained 153 responses from various industries such as automotive and component parts, pharmaceutical and medical equipment, electrical and electronic parts, industrial and engineering products. This is consistent with the industry population. In terms of firm size, the sample comprised a fairly mixed number of SMEs and large firms. Finally, all respondents were key informants who were knowledgeable concerning their firm, industry and the phenomenon being studied. This is depicted in the sample composition, which comprised 5.2% owner/manager, 7.2% CEO/President, 20.9% managing director, 22.9% general manager and 43.8% senior manager/manager. The majority of the firms sampled had been established more than 10 years where only a mere 10% had been established for less than 5 years.

Potential non-response bias was assessed by comparing returned questionnaires on key variables (Armstrong and Overton, 1977). No significant differences were found between the early and late respondents. Thus, we are reasonably confident that non-response bias would not pose a major problem.

### Research Instruments

The measures for technology motivation and e-business adoption were newly developed for this study. In

establishing the scale development and validation procedure, the suggestions of Churchill (1979) and Gerbing and Anderson (1988) were followed.

#### **Market Orientation**

To measure the market orientation construct, we choose the scale developed by Narver and Slater (1990). For the purpose of consistency with the rest of the scales, the original 7-point Likert scale was rescaled to a five-point Likert scale ranging from strongly disagree (value 1) to strongly agree (value 5). Although market orientation construct produced a low goodness-of-fit score, we would continue to use the construct for our analysis. Sigaw and Diamantopoulos (1995) investigation of the dimensionality of Narver and Slater (1990) market orientation measurement using CFA also produced similar results. Nevertheless, as argued earlier, Narver and Slater (1990) market orientation scales continue to be used in many studies (Greenley, 1995; Han et al., 1998; Harris and Ogbonna, 2001, Hooley and Cox, 2000).

#### **Environmental Hostility**

Respondents were asked to assess their firm's business environment by indicating their strength of agreement from strongly disagree (value 1) to strongly agree (value 5). The environmental hostility scale was adopted from Jaworski and Kohli (1993). Environmental hostility was initially assessed by asking the respondents in a five item scale the competitive intensity in the industry. Following similar purification analysis, the remaining four item scale yield an alpha value of 0.70.

#### **Technology Motivation**

A fifteen-item scale of technology motivation was initially developed specifically for this study using 5-point Likert-type scale items. In this instance, the measure was developed in stages following the guidelines of Churchill (1979). Based on the review of the literature (Lal, 2002; Morrell and Ezingard, 2002; Vlosky et al., 2000) and field interviews with managers, we generated a pool of items for the technology motivation constructs. It emerged from our exploratory study that firm's technology motivation consists of five components which are competitiveness, market growth, efficiency, effectiveness and customer service. We later tested each of these items with a number of academic experts, who critically evaluated the items for representativeness, item specificity and clarity of construction. We used the feedback we received in this stage to further refine the items.

Respondents were asked to assess the importance of their firm's motives, as they perceived them, in coming up with the decision to adopt e-business technologies. These motives were assessed on a continuum from not important (value 1) to critically important (value 5). Only six items were left representing effectiveness (three item scale) and customer service (three item scale) after EFA and CFA were applied to the measure. The overall internal consistency reliability (alpha) of technology motivation scale developed in this study was 0.93.

#### **E-Business Adoption**

A total of seventeen items were developed for this study using a 5-point Likert-type scale items. These items were developed based from a combination of previous studies of e-business technologies and from our exploratory study. Consistent with the previous literature review, it emerged from our interviews that managers cognitively clustered e-business activities as pertaining to suppliers, the internal operations of the business and to customers. Similar steps were followed as in the development of technology motivation measure. Subsequently, EFA and CFA were done on the measure, which resulted in eleven items being deleted from the e-business construct.

E-business adoption in e-commerce activities was measured by a two-item sub-scale that assessed the firm's application in customer's online ordering and firm's participation in online business portals. E-business adoption in the SCM was measured with a two-item sub-scale that assessed online order placement with suppliers and participation in online supply side marketplaces. E-business adoption in CRM was measured with a two-item sub-scale that assessed the respondents view on their firm's application of email like facilities in communicating and responding to customers' enquiries and quotations. The two items to measure e-business adoption in ERP were dropped due to poor internal consistency reliability ( $\alpha = 0.44$ ) after EFA.

In summary, e-business adoption is a construct represented by e-commerce, SCM and CRM. The items in this measure were scaled as '1' indicating no (not adopted), '2' indicating under implementation, '3' indicating implemented 0 to 1 year, '4' indicating implemented 1 to 2 years and '5' indicating implemented over 2 years. The internal consistency reliability (alpha) of the sub-scale developed in this study for e-commerce was 0.89, SCM was 0.57 and CRM was 0.74. The reliability of the scale as a whole was 0.70. Finally, the whole constructs were

subjected to a more rigorous testing of construct and convergent validity. Table 1 shows the goodness-of-fit indexes, composite reliabilities (Cp) and average variance extracted (AVE) scores for the whole constructs. With the exception of market orientation, the whole constructs exceed the recommended goodness-of-fit index including the more stringent measure of internal stability which is Cp and AVE. (Bagozzi, and Yi, 1988; Diamantopolous, and Siguaw, 2001).

TABLE 1: GOODNESS-OF-FIT INDEXES

Item	NFI	GFI	df	Chi Square	Cp	AVE
Environmental Hostility	0.9947	0.9973	2	0.61	0.7359	0.4135
Market Orientation	0.6376	0.682	77	375.27	0.9323	0.5016
Technology Motivation	0.9719	0.9096	38	62.89	0.7601 0.9172 0.9324 0.9552	0.6131 0.7873 0.8213 0.8767
Technology Adoption	0.90	0.91	13	37.64	0.8951 0.9445 0.7966	0.749 0.895 0.6654

## Findings

Following Anderson and Gerbing (1988) the items were later used simultaneously to estimate the measurement and structural model. We used structural equation modeling to test the significance of technology motivation as the mediating variable in the market orientation, environmental and e-business adoption relationship. The structural model as shown in figure 2 has a poor fit. The relatively poor fit in these models was not because of poor measures as the results of CFA showed that the model fit for all the measurements were very good (with the exception of market orientation). The reason could possibly be the treatment of technology motivation and e-business adoption as one construct rather than broken down into specific factors. Further analysis of the separate influence of the specific dimensions would be beneficial in future studies. In addition, market orientation scales should be subjected to similar rigorous testing of convergent validity in future.

The findings reported in Table 2 support H<sub>1</sub> as the (standardized) parameter from technology motivation to e-business adoption is positively related (.44) and significant ( $t = 4.31$ ). The results also support H<sub>2</sub> as market orientation positively influences technology motivation (.24) and significant ( $t = 2.50$ ). For business environment, the results support H<sub>3</sub> where firm's business environment is positively related to technology motivation. Figure 2 provides the parameters for our theoretical model and the following table provides the details for parameters and  $t$ -values.

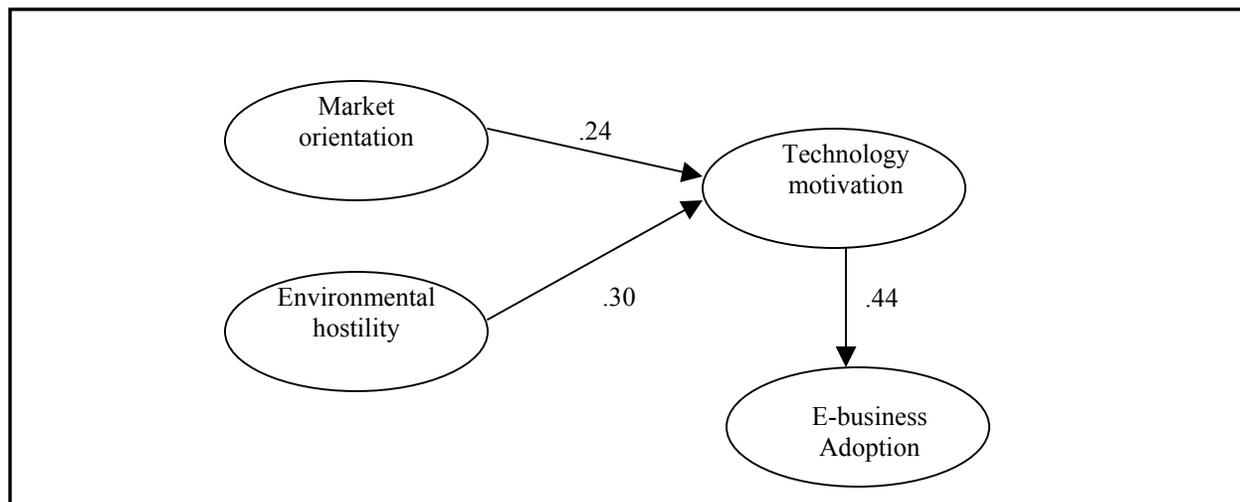

FIG. 2: THEORETICAL MODEL PARAMETERS  
 Model Fit: Chi-Sq.1517.91, d.f. 697, G.F.I. 0.5963, p=.000

TABLE 2: RESULTS OF STRUCTURAL EQUATION MODELING

Path to	Path From	Hypothesis	Standardized structural Coefficients	t-values
E-business adoption	Technology motivation	1	0.44	4.31
Technology motivation	Market orientation	2	0.24	2.50
Technology motivation	Business environment	3	0.30	2.58

## Discussion

This study explored the relationship between technology motivation and e-business adoption. The central hypothesis is technology motivation mediates the relationship between the key determinants of adoption and e-business adoption. The results provided evidence that firm’s technology motivation positively influences e-business adoption. Thus, the higher the firm’s technology motivation, the higher the likelihood that the firm would adopt e-business technology. This correlates with previous studies that show firm’s motivation helps drive technology adoption in firms (Kaplan, 1999). Gagnon and Toulouse (1996) inferred that each motivation represents an opportunity for the organization and such opportunities are widely considered as a clear driver for adoption. However, the usage of overall composite score in technology motivation obscures the possible relationship whether firm’s adoption motive influences the adoption of a specific type of e-business technology. The discovery would reinforce Sarinna Li’s (2003) argument that compatibility with the needs (motive) is a critical variable in predicting whether a technology will be adopted. As each e-business technology ‘promise’ a particular benefits to the adopter, it is reasonable that firm adopt a technology that correspond with their motive.

The findings in this study also provided some insight in the market orientation and innovation adoption relationship. The results depicted market orientation is indirectly related to technology adoption through technology motivation. This substantiates our argument that market orientation is a source of new ideas and provides motivation for firm’s to respond (Hurley and Hult, 1998). Their responds to the environment will however depend on their perspective and emphasis that may result in a balance or skewed market orientation. The in-depth interviews conducted in the earlier period of this research also reveal that the decisions to adopt e-business technologies in firm were generally based on firm’s reaction towards their customers. The entire companies interviewed attempt to keep track of their customers and market. These companies take significant attempt to improve their customers’ satisfaction by responding towards their complaints and suggestions. The companies also emphasis on quality

communication among their employees by setting up substantial infrastructure. Thus, various new technologies were adopted in the process. The findings conform to previous study that market orientation facilitates organizational adoption (Han et al, 1998). It also highlighted Venkat (2000) study that found higher market orientation seems to lead to higher e-commerce adoption. Venkat (2000) reasoned that e-commerce benefits that are responsive to customers could have lead to e-commerce adoption although he stated that the relationship has never been explored.

In determining the business environment and technology motivation relationship, the results provided substantial evidence that firm's business environment positively effect technology motivation. This conforms our argument that firm's business environment provides motivation among firms to respond through their interpretation and perception of the environment. As shown in previous studies, firms may react by taking either an operational measures through 'efficiency' and 'effectiveness' strategies or strategic action through market expansion and improving competitiveness (Parker, 1990; Hall, 1980; Edelman, 1992; Gagnon and Toulouse, 1996). Our qualitative findings found companies in hostile environments reveal that their reasons for adopting various technologies such as email and ERP were to improve firm's effectiveness through cost savings and reduction in mistakes. In addition, firms adopt e-commerce technologies with the intention to improve their corporate image and as an avenue for market extension.

## Conclusion

This paper attempts to fill the gap in the organizational technology adoption literature where existing explanations have been focus on firm, market characteristics and the technology itself. The concept of technology motivation put forth in this paper has provided significant findings especially in the adoption of e-business technology. The hypothesis driving the study revealed that understanding the diversity of motivations which influence organizations' technology adoption is central to managing the adoption process. It is through an understanding of the various motivations that variations in preference for adoption will be revealed.

# A Study of Factors Influencing Adoption of Wireless Internet Banking Services

*Gi Soon Lee*  
*Doo Hee Lee*  
*Sang Yong Kim*  
*Korea University, South Korea*

## Abstract

With widespread use of Internet banking and high penetration of such devices as PDA, cellular phones, wireless notebooks, etc, financial services through mobile telecommunication are increasing rapidly. Especially, mobile financial services provide convenience and promptness to customers along with a cost-saving benefit. With this reason, banks are interested in expanding their market through mobile services. This study using TAM (Technology acceptance model) identifies factors influencing mobile banking service adoption. Specifically, we focus our attention on the perceived risk, usefulness and trust that affect the adoption of wireless Internet banking.

## Introduction

Mobile commerce refers to commercial transactions conducted through a variety of mobile equipment over a wireless telecommunication network in a wireless environment (Barnes, 2002; Coursaris and Hassanein, 2002; Gunsakar and Ngai, 2003). Currently, these wireless devices include two-way pagers/SMS (Short Message Systems), wireless application protocol (WAP)-equipped cellular phones, personal digital assistants (PDA), Internet-enabled laptop computer with wireless access capacity, and consumer premise IEEE 802.11(a/b) wireless network devices (Leung and Antypas, 2001).

With the explosive growth of the mobile telephone population, combined with the development of wireless technologies, m-commerce is becoming increasingly important to many businesses nowadays (Hung et al., 2003). According to the Wireless Week (2004), there are currently 94.9 million M-commerce users in 2003 worldwide and the segment is expected to grow to 1.67 billion by 2008. In addition, global revenues from m-commerce is \$6.86 billion in 2003 and expected to reach \$554.37 billion in 2008 (Wireless Week, 2004).

Especially, mobile financial services provide convenience and promptness to customers along with a cost-saving benefit. With this reason, banks are interested in expanding their market through mobile services. Traditional, branch-based retail banking remains the most widespread method of conducting banking transactions in South Korea and other countries. However, mobile and wireless technology is rapidly changing the way personal financial services are designed and delivered. For several years, commercial banks in South Korea have tried to introduce mobile banking systems to improve their operations and reduce costs. Despite all the efforts aimed at developing better and easier mobile banking systems can easily remain unnoticed by customers, or are seriously under-used despite their availability. In 2004 in South Korea, according to statistics from the Bank of Korea, there were 7,287 million subscriptions to mobile phones. However, less than 1.5% of banking transactions in South Korea were conducted through mobile handset. Mobile banking services are still in their infancy, leaving a great deal of room for development. There is a need therefore, to understand users' acceptance of mobile banking and to identify the factors affecting their intentions to use mobile banking.

## Conceptual Development

### Perceived Risk

Perceived risk is commonly thought of as felt uncertainty regarding possible negative consequences of using a product or service. It has formally been defined as "a combination of uncertainty plus seriousness of outcome involved" (Bauer, 1967), and "the expectation of losses associated with purchase and acts as an inhibitor to purchase

behavior” (Peter and Ryan, 1976). Perceived risk has been captured with Likert scales measuring the perception of dangerous events occurring or the presence of the attribute inherent in the service.

#### **Facets of Perceived Risk**

Cunningham (1967) identified two major categories of perceived risk-performance and psychosocial. He broke performance into three types- economic, temporal, effort; and broke psychosocial into two types- psychological and social. Cunningham (1967) further typified perceived risk as having six dimension-(1) performance, (2) financial, (3) opportunity/time, (4) safety, (5) social and (6) psychological loss. He also posited that all risk facets stem from performance risk. A rich stream of consumer behavior literature supports the usage of these risk facets to understand consumer product and service evaluation and purchases. The e-services research context does not incur any threat to human life (Featherman and Pavlou, 2003); therefore, measure of (physical) safety risk were not included in this study. A newly developed risk facet tapping privacy concerns that replaces this safety risk will be introduced below.

Jacoby and Kaplan (1972) inferred from Bauer’s seminal work (1967) an overall measure of perceived risk. He theorized it as consisting of several independent varieties of risk after as risk “tradeoff” behavior occurred. For example, a large automobile may reduce physical (safety) risk but increase financial risk. This measure of overall perceived risk is also tested here. Bellman et al.(1999) reported on the importance of time considerations and found it the significant predictor to on-line buying behavior. Their research found that “harried” consumers with less time were more likely to purchase over the Internet in order to save time. The current research similarly proposes that consumers are very time oriented and concerned about potential risk of “wasting time” implementing, learning how to use, and troubleshooting a new e-service. These time-conscious consumers likely guard against the possible loss of time risk, and are less likely to adopt the e-service that they consider, as have high switching, setup and maintenance costs.

Privacy risk may be particularly salient for the e-payments product category. Recent research results have indicated that people concern for the theft of their private information, or simply its misuse by the company collecting it (Aladwani, 2000; Ramanujan, 2002; Sathye, 1999). Thus privacy risk as a common concern that inhibited adoption, items tapping this phenomenon were developed, grouped and modeled as a deterrent to perceived usefulness and adoption.

#### **Trust (Online)**

Online trust share similar characteristics to those of offline trust, but there are some important distinctions that are unique in an online environment. These distinctions can serve as starting points for seeking a deeper understanding of the nature of trust in and online context. Gefen (2002) examined trust from a multi-dimensional perspective. According to the researcher, the specific beliefs of integrity, ability, and benevolence were seen as antecedents to overall trust. In the case of e-commerce, integrity was the belief that the online merchant adhered to stated rules or kept promises. Ability was the belief about the skills and competence of the online merchant to provide good quality products and services. Benevolence was the belief that the online merchant, aside from wanting to make legitimate profits, wanted to do good to the customer without regard to making a sale.

Based on the literature from multi-disciplines, Kim, Song, Braynov and Rao (2001) investigated the determinants of online trust and divided the determinants into six dimensions, namely information contents, product, transaction, technology, institutional and consumer-behavioral dimensions. These dimensions, which were further broken down into many sub-dimensions or properties, formed a theoretical framework of online trust, covering the different stages that a consumer went through to complete an online transaction. In differing from most researchers Kim et al.(2001) proposed that the consumer could perceive trust before, during or after the online transaction. The researchers further concluded that different determinants of trust were associated with different stages of the transaction.

With the increasingly high penetration rate of Internet application, people are anxious about the diverse type of risks presented when engaging in online activities or transactions. When customers are uncertain about product quality, brand and online services they may worry about an unjustifiable delay in product delivery, providing payment without receiving the product and other illegal activities and fraud (Pavlou, 2002).

Credit ratings, bank balances and financial data could be changed without the owner knowing during online transactions. Some users perceive potential risk from immature technology. Other hesitates before trusting

online transactions and other activities. The reliability of online transactions is still far from perfect. Cognitive and affective factors are important variable that prevent people from trusting online service.

### **Technology Acceptance**

A growing body of academic research is focused on examining the determinants of computer technology acceptance and its utilization (Davis, 1989; Davis et al., 1989; Mathieson, 1991; Moore and Benbasat, 1991; Taylor and Todd, 1995). Among the different models that have been proposed, the Technology Acceptance Model (TAM) (Davis, 1989; Davis et al., 1989), adapted form the Theory of Reasoned Action (TRA)(Ajzen and Fishbein, 1980; Fishbein and Ajzen, 1975), appears to be the most widely accepted among information systems researchers. The main reason for its popularity is perhaps its parsimony, as well as its wealth of recent empirical support (Agarwal and Prasad, 1999). While the TRA is a general theory of human behavior, the TAM is specific to IS usage (Mathieson et al., 2001). The TAM posits that a user's adoption of a new information system is determined by that user's intention to use the system, which in turn determined by the user's beliefs about the system. The TAM further suggests that two beliefs-perceived usefulness and perceived ease of use-are instrumental in explaining the variance in users' intention. Perceived usefulness is defined as the extent to which a person believes that using a particular system will enhance his or her job performance, while perceived ease of use is defined as the extent to which a person believes that using a particular system will be free of effort. Among these beliefs, perceived ease of use is hypothesized as a predictor of perceived usefulness.

Information systems researchers have investigated and replicated the TAM, and agree that it is valid in predicting the individual's acceptance of various corporate IT systems (Adams, Nelson and Todd, 1992; Chin and Todd, 1995; Doll, Hendrickson and Deng, 1998; Segars and Grover, 1993). However, the TAM's fundamental constructs do not fully reflect the specific influences of technological and usage-context factors that may alter the users' acceptance (Moon and Kim, 2001). As Davis (1989) noted, future technology acceptance research must address how other variables affect usefulness, ease of use and user acceptance. Therefore, perceived ease of use and perceived usefulness may fully explain behavioral intentions towards the use of mobile banking, necessitating a search for additional factor that can better predict the acceptance of wireless Internet banking. Specially, we focus our attention on the perceived risk, usefulness and trust that affect the adoption of wireless Internet banking.

### **Hypotheses**

Stated in formal fashion, our study tests 7 hypotheses:

- H1: Perceived risk comprises the facets of performance, financial, time, psychological, social, privacy.
- H2: Perceived risk has a negative effect on trust.
- H3: Perceived risk has a negative effect on the adoption of wireless Internet banking.
- H4: Perceived risk has a negative effect on the perceived usefulness.
- H5: Perceived usefulness has a positive effect on trust.
- H6: Trust has a positive effect on the adoption of wireless Internet banking.
- H7: Perceived usefulness has a positive effect on the adoption of wireless Internet banking.

### **Research Model**

Based on these arguments, our study using TAM(Technology acceptance model) identifies factors influencing mobile banking service adoption. The constructs of perceived usefulness and behavior intention to use were adopted from TAM. Two other variables, perceived risk and trust, were also integrated into the model, as depicted in Fig. 1.

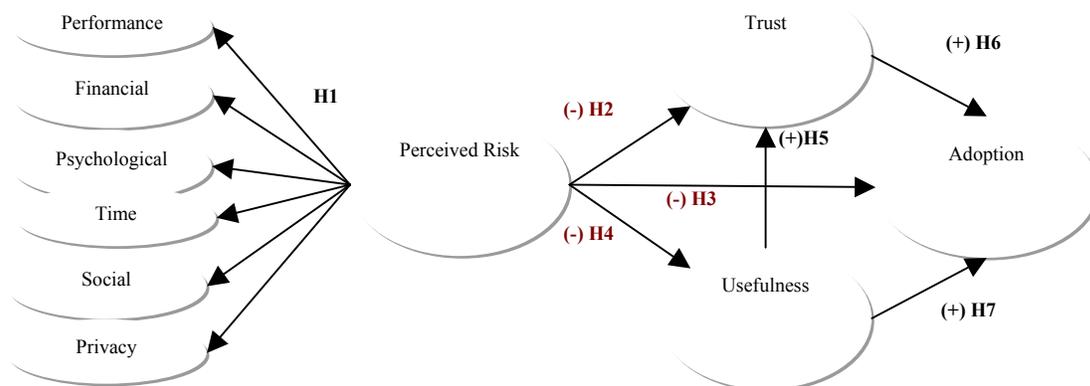

FIGURE 1. PROPOSED RESEARCH MODEL FOR WIRELESS MOBILE BANKING

## Research Methodology

### Measurement Development

Previous research was reviewed to ensure that a comprehensive list of measures were included. Those for perceived usefulness, behavioral intention to use were adapted in our model from previous studies on TAM (Davis, 1989). The construct for perceived risk was adapted from the studies of Featherman and Pavlou. And the trust was adapted from the studies of Kim and Prabhakar (2000).

The survey questionnaire consisted of two parts. The first recorded the subject's demographic information. The second recorded the subject's perception of each variable in the model. The demographic variables assessed were gender, age, level of education and the purchase experience using a cell phone. The second section asked each subjects to indicate his or her degree of agreement with each item. Data were collected using a seven point Likert-type scale (1-7), with anchors ranging from "strongly disagree" to "strongly agree" were used for all question, except for the items measuring demographic variables. Pre-testing of these measures was conducted through selected consumers from the wireless internet banking field, as well as experts in the e-commerce research area. The items were modified to make them relevant within the context of wireless internet banking.

### Data Collection Procedure

The data for this study were made available via a Web survey of Internet banking uses. We created a site for the Web survey. Then, Internet banking users of Korea were requested to participate in the survey. In total, 179 cases were gathered over about 1.5 weeks, from December 11 to December 20, 2003. There are no missing data in the sample because participants could not submit their responses with missing values.

Sixty-seven percent of the respondents were male, and 33 percent were female. Almost all respondents were in their twenties or thirties. About thirty-five percent of the respondents had experience with wireless e-commerce for over 1 year. Detailed descriptive statistics relating to the respondents' characteristics are shown in Table 1.

TABLE 1: DESCRIPTIVE STATISTICS OF RESPONDENTS' CHARACTERISTICS

gender	n(%)	wireless e-commerce experience	n(%)
Male	119(66.48%)	Used(>1)	64(35.75%)
Female	60(33.51%)	Never used before	115(64.24%)
Age	n(%)	education	n(%)
20~25	17(9.49%)	Senior high school	10(5.58%)
26~30	57(31.84%)	Some college	28(15.58%)
31~35	28(15.64%)	College degree	64(35.75%)
35~40	74(41.34%)	Graduate school	49(27.37%)
40~45	3(1.67%)	Graduate(above)	28(15.64%)

**Reliability**

The instruments were initially examined to establish the reliability of scale. The Cronbach's alpha coefficients range from 0.609 to 0.912 that exceed recommended values of 0.5(Hair et al., 1998; Nunnally, 1978). These values show good internal consistency among scales employed for the present study. These alphas equal .85, .91, .69, .79, .85, .60, .61, .89, .86 and .82 for perceived risk(performance-financial, psychological, time, social, privacy), trust(bank, telecom corporation, wireless mobile banking), usefulness and adoption, respectively (Table 2).

**Validity**

To ensure content validity, a through examination was made of the relevant literature. To further reduce the possibility of non-random errors, a pretest was conducted using a group of 15 graduate Marketing students to review the questionnaire for validity (measuring what is intended), completeness (including all relevant variable items) and readability. Several questionnaire items were reworded based on the pretest.

Prior to testing our hypotheses, the measures were subjected to a series of validity checks. First, the different multi-item scales were evaluated on the basis of item-to-total correlations and exploratory factor analysis. We eliminated 2 items, originally hypothesized to measure time risk and privacy risk, on the basis of this analysis (Table 2). Following this initial analysis, the item set was subjected to confirmatory factor analysis to establish unidimensionality.

TABLE 2\_1: EXPLORATORY FACTOR ANALYSIS (PERCEIVED RISK)

Item <sup>i</sup>	f1	f2	f3	f4	F5	cronbach's $\alpha$	eigen value	% of variance
P1	.603					.845	6.689	25.554
P2	.703							
P3	.483							
P4	.739							
F1	.500							
F2	.809							
F3	.671							
F4	.760							
PS1		.589				.912	2.281	13.911
PS2		.595						
PS3		.481						
T2			.681			.699	1.808	12.525
T3			.718					
T4			.479					
S1				.601		.790	1.438	10.437
S2				.537				
SE1					.756	.850	1.112	7.719
SE2					.713			
SE3					.593			

TABLE 2: EXPLORATORY FACTOR ANALYSIS(FINAL RESULTS)

Parameter		Initial items	Final items	cronbach's $\alpha$
Perceived risk	Performance-Financial	8	8	.8455
	Psychological	3	3	.9121
	<b>Time risk</b>	<b>4</b>	<b>3</b>	.6994
	Social risk	2	2	.7906
	<b>Privacy/Security</b>	<b>4</b>	<b>3</b>	.8503
trust	bank	6	6	.6098
	Telecom corporation	5	5	.6154
	Wireless internet	5	5	.8937
usefulness	Perceived usefulness	4	4	.8698
adoption	Wireless mobile banking	2	2	.8243

The proposed research model was evaluated using structural equation modeling (SEM). The data obtained were tested for reliability and validity using confirmatory factor analysis (CFA). The CFA was computed using the LISREL software. The measurement model test presented a good fit between the data and the proposed measurement model. We show the results in Table 2, Table 3. Whereas the overall chi-square statistic for the model is significant ( $\chi^2=469$ ,  $p<.005$ ), as expected given the sample size, the other fit indices (comparative fit index[CFI]=.869) represent evidence of good model fit. Thus the measurement model has a good fit with the data, based on assessment criteria such as RMR (.004), GFI (.931) and AGFI (.878).

TABLE 3: CONFIRMATORY FACTOR ANALYSIS

Parameter		ML Estimate( $\lambda$ )	S.E.	T-Value
Performance-Financial Risk	P1	1.00		
	P2	0.62	0.054	11.42

	SE2	0.73	0.052	14.15
	SE3	0.56	0.055	10.15

## Results

Perceived risk has been theorized as comprising all of these facets. Results presented in Tab. 4 were promising, indicated a good fit to the data, and partly supported H1.

Hypotheses 2, 3 and 4 examined the impact of one customer's belief on another: perceived risk on trust, perceived risk on the adoption of wireless Internet banking, and perceived risk on perceived usefulness. Perceived risk had a significant negative impact on trust ( $\beta=-.597$ ,  $t= 12.498$ ,  $P<0.01$ ). Perceived risk has a significant negative

impact on the adoption of wireless Internet banking ( $\beta=-.047$ ,  $t= -2.940$ ,  $P<0.05$ ). The impact of perceived risk on perceived usefulness was not significant. We therefore accept hypotheses 2 and 3.

In hypothesis 5, we investigated the impact of perceived usefulness on trust. The usefulness towards using wireless Internet banking had a significant impact on trust ( $\beta=.055$ ,  $t= 2.035$ ,  $P<0.05$ ). Therefore hypothesis 5 is supported.

Hypotheses 6 and 7 examined the impact of the customer’s belief on the attitude toward using wireless Internet banking. It is observed that trust had an impact on the customer’s attitude towards using wireless Internet banking at the 0.01 significant level ( $\beta=.091$ ,  $t= 2.552$ ,  $P<0.01$ ). As suggested by the original TAM, the positive impacts of perceived usefulness of use ( $\beta=-.523$ ,  $t= 21.918$ ,  $P<0.01$ ) on the attitude towards using wireless Internet banking were confirmed here. Hence, we accept hypotheses 6 and 7.

TABLE 4: HYPOTHESIS TEST RESULTS

## Abstract

Due to the intangible and indirect nature of e-commerce benefits, it is very hard to measure the contribution of e-commerce to a firm's competitive advantage. Based on the modified Balanced Scorecard (BSC) framework, this study suggests a methodology to measure the contribution of e-commerce to a firm's performance. Firstly, this study categorizes critical success factors (CSFs) for e-commerce success. While reviewing and categorizing CSFs appeared in the literature, this study shows the way in which Kaplan and Norton's BSC framework is modified to accommodate the effect of e-commerce on a firm's business processes. Secondly, this study empirically investigates into what components consist of each perspective suggested in the modified BSC. Then, based on the questionnaire survey this study analyzes causal relationships among components across five perspectives to help practitioners to trace down how to get the desired performance.

## Introduction

Electronic commerce and the Internet dramatically affected the conduct of business, and changed communication patterns between the firm and its customers. Moreover, e-commerce is known to have a pervasive influence on the firm's value chain. Through the e-commerce system, a firm may link one activity with others, both within the firm and with outside suppliers, channels, and customers. Most organizations, however, are concerned about if there are benefits from e-commerce requiring much investment in terms of people, resource, and time. This situation leads to an increased need for useful measurements of e-commerce performance. There have been many studies on methodologies of how to measure the performance of e-commerce in a firm. However, there are few methodologies for practitioners to adopt in the real world because most methodologies have not accommodated the intangible and indirect nature of e-commerce benefits.

Providing the integrated framework which can be adopted in the real world, this study adopts and modifies the Kaplan and Norton (1992)'s Balanced Scorecard framework to suggest a methodology to measure how e-commerce is affecting a firm's business processes. Firstly, this research developed a conceptual model incorporating elements relevant to both e-commerce functions and general business processes for assessing e-commerce benefits based on the critical success factors (CSFs) for e-commerce success. Secondly, this study tests this model using survey data from 225 firms in the various industry sectors. The data analysis is carried out by structural equation modeling (SEM).

## Literature Review

E-commerce is rapidly becoming an integral part of the many different ways organizations do business and is therefore an area of strategic concern to most organizations (Hasan and Tibbits, 2000). Gaining and sustaining a competitive advantages and operational effectiveness by means of e-commerce requires a measurable tool. Grembergen and Amelinckx (2002) conjecture that many e-business projects have failed because there have been no tool to monitor how e-business projects are associated with a firm's business processes. As there is not much historical data and experience for managers to draw upon when developing or applying metrics, and many economic benefits of e-commerce projects are seen as difficult to measure (Epstein, 2004), measuring such an association between e-commerce and business processes can be a daunting challenge. Further, because of the intangible,

indirect, and strategic nature of e-commerce benefits, it is difficult to measure the contribution of e-commerce (Grembergen and Amelinckx, 2002; Brown, 1994; Giaglis and Paul, 1999).

To gain a balanced view on how e-commerce is affecting business processes, this research adopts the Balanced Scorecard (BSC) framework developed by Kaplan and Norton (1992). The BSC framework overcomes the limitations of the metrics discussed earlier. Further, it can help avoid the misleading signals for continuous improvement and innovation obtained from financial measures alone (Kaplan and Norton, 1992; Tiwana and Ramesh, 1999).

There have been several studies based on BSC framework for the measurement of e-commerce performance (e.g., Tiwana and Ramesh, 1999; Hasan and Tibbits, 2000; Grembergen and Amelinckx, 2002; Epstein, 2004). Hasan and Tibbits (2000) proposed an e-commerce scorecard using a modification of Martinsons et al. (1999)'s IS BSC and suggested how the basic concepts and philosophy of the BSC can be retained in its adaptation to the strategic management of e-commerce. Grembergen and Amelinckx (2002) proposed a generic E-business BSC in order to measure and manage E-business projects, using an extension of IT scorecard (Grembergen and Bruggen, 1997; Grembergen and Timmerman, 1998), and described its development and implementation. Epstein (2004) developed an e-commerce metric in order to monitor the cause and effect relationships evidenced in the e-commerce causal linkage model. While these studies analyze various aspects of e-commerce, the empirical evidence of the causal relationships among perspectives and its elements appeared in BSC has been scant and primarily limited to a specific company.

Rockart (1997) defines CSFs as the limited number of areas in which results, if they are satisfactory, will ensure successful competitive performance for an organization. Veen-Dirks and Wijn (2002) devise a framework which combines the BSC and CSFs. This method based on market-oriented CSFs can help managers to effectively deal with the tension between strategy implementation and strategy formulation. The CSFs method and the BSC are therefore complementary and can supplement and support each other in an integrated performance management system.

After reviewing the literature, this study categorizes the CSFs for e-commerce success based on the Kaplan and Norton (1992)'s BSC perspective as summarized in Table 1. While reviewing and categorizing CSFs appeared in literature, this study finds that Kaplan and Norton's BSC framework needs to be modified and extended because e-commerce functions and technology aspects were not classified by generic BSC perspectives.

## Research Model

This study develops a modified BSC framework to assess e-commerce benefits based on the CSFs summarized in Table 1. The modified BSC framework for e-commerce is composed of five perspectives listed below with its definition:

- Financial Perspective: “If we succeed, how will we look to our shareholders?”
- External Relationship Perspective: “To achieve our vision, how must we look to our external stakeholders (customers, suppliers/partners)?”
- Internal Process Perspective: “To satisfy our external stakeholders, which processes must we excel at?”
- Future Readiness Perspective: “To prepare for the future, how must our organization learn and improve?”
- Web Application Perspective: “To achieve e-commerce success, how must our channels look to our e-commerce users?”

To evaluate both overall e-commerce performance and the specific aspects of e-commerce that lead to revenue enhancement or cost savings, this study constructs a conceptual model of causal relationships among elements of the modified BSC as described in Fig. 1.

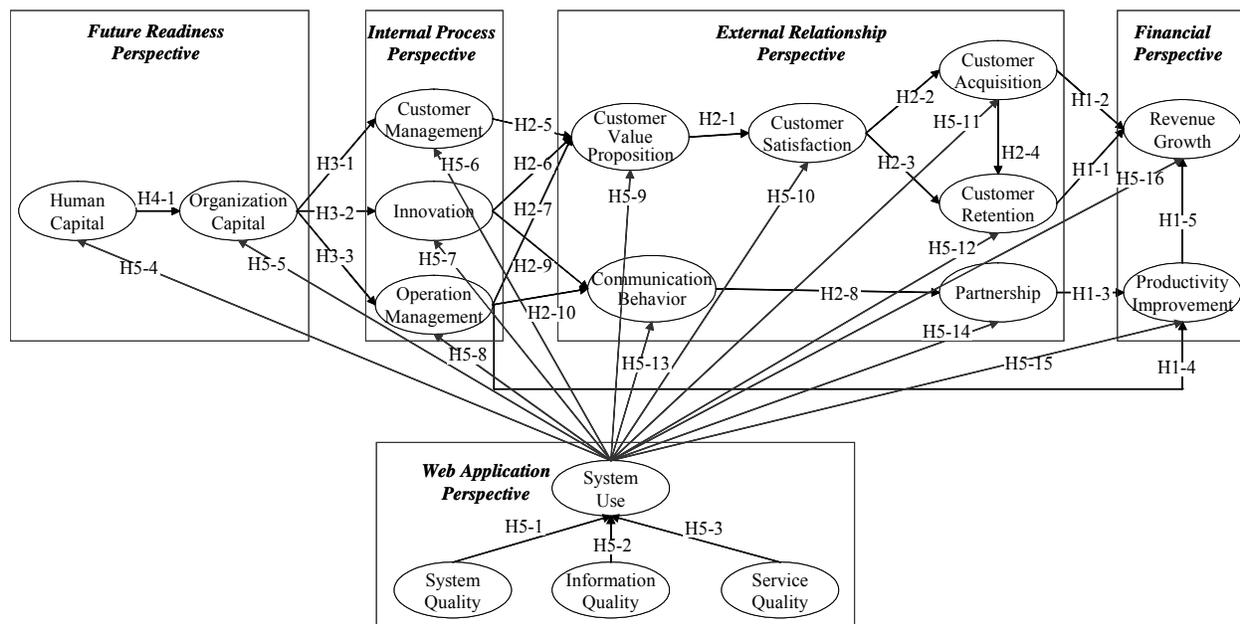

FIG. 1. CONCEPTUAL MODEL

### Hypotheses within Each Perspective

The financial perspective defines the long-run objectives of the e-commerce usage. The financial performance measurements indicate whether the firm’s strategy, implementation, and execution are contributing to bottom-line improvement (Kaplan and Norton, 1992). In our model, financial perspective has two components: revenue growth; productivity improvement. We propose that the cost reduction and asset utilization may enhance short-term revenue (*H1-5*).

E-commerce enables interdependent relationships between the firm and its external entities: customer, supplier, and partner (Hasan and Tibbits, 2000). Thus the quality of supplier and partner relationships must be measured. In our model, external relationship perspective includes both customer view and supplier/partner view. In terms of customer view, several researches (e.g., Bruhn, 2003; Bowman and Narayandas, 2004) have shown that product and service’s attributes affects customer satisfaction (*H2-1*). Following many researchers’ arguments (e.g.,

Kalpan and Norton, 1996; Mohr and Spekman, 1994, Morgan and Hunt, 1994), we propose that customer satisfaction has a positive relationship with customer acquisition (**H2-2**), and customer retention (**H2-3**). We also propose customer acquisition is positively associated with customer retention (**H2-4**). In terms of supplier/partner view, we propose that communication behavior between the firm and its supplier, partner is positively related with the quality of partnership (**H2-8**).

The traditional learning and growth perspective emphasizes how well the firm is preparing for meeting the challenges of the future through leveraging its organizational and human assets (Epstein and Wisner, 2001). These intangible assets seldom affect financial performance directly (Kaplan and Norton, 2004). In our model, future readiness perspective has two components: human capital; organization capital. In terms of future readiness perspective, higher levels of human capital may be positively associated with greater levels of the organization capital (**H4-1**).

To execute e-commerce applications, companies need the right information, infrastructure, and support services (Turban et al., 2004). In our model, web application perspective was classified four components using a modification of the DeLone and McLean (1992)'s IS Success Model: system quality; information quality; service quality; system use. In terms of web application perspective, some researchers (Molla and Licker, 2001; DeLone and McLean, 2003; DeLone and McLean, 2004) found that system use is affected by system quality (**H5-1**), information quality (**H5-2**), and service quality (**H5-3**).

**Hypotheses among Components across Perspectives**

Based on many researchers' arguments (e.g., Keaveney, 1995; Gemme, 1997; Reinartz et al., 2005; Ellram, 1991; Stuart, 1993; Scott et al., 1994), we propose that there is a positive relationship between customer retention and revenue growth (**H1-1**), between customer acquisition and revenue growth (**H1-2**), between partnership and cost reduction (**H1-3**), and between operational excellence and cost structure improvement (**H1-4**). Based on the argument of Soteriou and Zenios (1999) and Bowman and Narayandas (2004), we propose that customer management, innovation, and operation management are positively related with customer value proposition and communication behavior (**H2-5, H2-6, H2-7, H2-9 and H2-10**). Between future readiness and internal process perspective, some researchers (Patterson et al., 2004; Carmeli and Tishler, 2004) examined the relationships the relationships between organizational capital and internal process (**H3-1, H3-2, and H3-3**).

Web-application is known to bring much benefit across perspectives appeared in BSC (Zhu and Kraemer, 2002; Lu, 2003; Mogollon and Raisinghani, 2003; Zhuang and Leader, 2003; Zhu et al., 2004; Straub et al., 2004). We categorize those benefits by each perspectives viewpoint as summarized in Table 2.

TABLE 2. E-COMMERCE BENEFITS

Perspective	E-commerce Benefits		
Financial	<ul style="list-style-type: none"> <li>• Reduced Operating Costs</li> <li>• Increased Sales</li> </ul>	<ul style="list-style-type: none"> <li>• Increased Productivity</li> <li>• Increased Profit Margin</li> </ul>	<ul style="list-style-type: none"> <li>• Increased Revenue Per Employee</li> <li>• Improving Asset Management</li> </ul>
External Relationship	<ul style="list-style-type: none"> <li>• Increasing Services to Customers</li> <li>• Market Expansion</li> <li>• Increased Customer Base</li> <li>• Customer Satisfaction</li> <li>• Customer Retention</li> </ul>	<ul style="list-style-type: none"> <li>• Customer Acquisition</li> <li>• Potential for Increasing Customer Knowledge</li> <li>• Alternative Communication Channel to Customers</li> </ul>	<ul style="list-style-type: none"> <li>• Enhancing Perceived Company Image</li> <li>• Reducing Transaction Costs with Business Partners</li> <li>• Improving Coordination with Business Partners or Suppliers</li> </ul>
Internal Process	<ul style="list-style-type: none"> <li>• Inventory Management</li> <li>• Internal Process Efficiency</li> </ul>	<ul style="list-style-type: none"> <li>• Improving Production Planning</li> <li>• Back-end Efficiency</li> </ul>	<ul style="list-style-type: none"> <li>• Improving Resource Control</li> <li>• Reducing Workflow</li> </ul>
Future Readiness	<ul style="list-style-type: none"> <li>• Increasing Employee Productivity</li> <li>• Employee Retention</li> </ul>	<ul style="list-style-type: none"> <li>• Managing Know-how</li> </ul>	<ul style="list-style-type: none"> <li>• Improving Employee Morale</li> </ul>

Although many researchers have suggested the relationship between web-application and other perspectives of BSC, most research has been either descriptive or theoretical/speculative. There is a lack of empirical evidence to measure the effect of e-commerce effect (whether direct or indirect) on the overall business performance. Thus this study attempts to bridge the gap that exists between theoretical benefits and actual benefits in the real world by investigating hypotheses (*H5-4 ~ H5-16*).

## Research Design

### Item and Scale Development

To empirically investigate the conceptual model described in Figure 1 and the associated hypotheses, a survey questionnaire was designed on the basis of the literature review. The questionnaire has been refined through several pilot tests in terms of terminologies and sentences. Each item on the questionnaire was reviewed by a panel of IS and business managers, as well as IS academics, to obtain their views on which items are appropriate to include. This version of the e-commerce and business performance measurements contain 84 items: 16 for the web application; 11 for the future readiness; 12 for the internal process; 14 for the customer relationships; 20 for the supplier and/or partner relationships; and 11 for the financial performance. A five-point Likert-type scale was used for all of the items.

### Sample Demographics

In order to select the company sample set, a web exploration was first made to investigate the adoption of e-commerce websites. Among them, 1,000 companies were randomly selected. In order to revise questionnaire, we carried out structured interviews with five companies. A total of 229 questionnaires out of the 1,000 distributed were returned, giving response rate of 22.9 percent. After removing incomplete answer, the final dataset used for the analysis is of 225 data. Summary information regarding the size and industry distribution of the sample is represented in Table 3.

TABLE 3. SUMMARY OF FIRMS IN THE SAMPLE

Industry	Number of	Percentage	Employee	Number of	Percentage
	Firms			Firms	
Manufacturing	96	42.7%	< 100	106	47.1%

Public	7	3.1%			
Missing	15	6.7%			

## Data Analysis

### The Measurement Model

Exploratory factor analysis (EFA) was first conducted to check if the proposed factor structures are indeed consistent with the actual data. The factor structures suggested by the EFA match the one proposed in the research model. Next, confirmatory factor analysis (CFA) was conducted to check the reliability and validity of the measurement model. In this measurement model, no unidirectional path was specified between any latent variables. This measurement model was estimated using LISREL 8.54.

### Instrument Validation

This research assessed construct reliability, convergent validity, discriminant validity. The measurement properties are reported in Table 4.

TABLE 4. SUMMARY OF THE MEASUREMENT MODEL

Latent Construct	Items	Standard Loading	Composite Reliability	Variance extracted	Latent Construct	Items	Standard Loading	Composite Reliability	Variance extracted

Customer Management (CUST)	4	0.792; 0.909; 0.891; 0.823	0.916	0.731	Revenue Growth (REVE)	2	0.801; 0.921	0.853	0.745
Innovation (INNO)	4	0.830; 0.826; 0.848; 0.775	0.891	0.673	Cost Reduction (PRD1)	4	0.742; 0.605; 0.783; 0.566	0.772	0.463
Product/Service Attribute (PRO1)	4	0.782; 0.937; 0.904; 0.588	0.884	0.663	Asset Utilization (PRD2)	2	0.874; 0.963	0.916	0.846
Customer Relationship (PRO2)	3	0.862; 0.927; 0.910	0.927	0.810	Productivity Improvement (PROD)	2	0.889; 0.832	0.851	0.741
Customer Value Proposition (PROP)	2	0.865; 0.923	0.889	0.800					

NA: Because the variable is composed of a single item, no reliability and validity analysis is conducted.

The construct reliability measures the degree to which items are free from random error and therefore yield consistent results. In our measurement model (Table 4), all constructs have a composite reliability over the cutoff of 0.70, as suggested by Straub (1989). The construct validity is also tested for convergent and discriminant validity. Convergent validity is assessed by reviewing the *t* tests for the factor loadings (Thong et al., 1996; Barua et al., 2004). The discriminant validity is tested by comparing the variance extracted of each latent construct to the square of correlations between this construct and every other construct (Fornell and Larcker, 1981). The validity of all constructs and their indicators is also supported by the above tests. Therefore, on both theoretical and empirical grounds, the conceptualization of modified BSC construct seems justified.

#### The Structural Model

The structural model tested in the present study is shown in Figure 1. This model was estimated using LISREL 8.54. Table 5 lists several goodness-of-fit statistics to assess how the above-specified model can explain the observed data from three aspects: absolute fit, incremental fit, and model parsimony. This research examined five incremental fit indices: normed fit index (NFI), relative fit index (RFI), incremental fit index (IFI), non-normed fit index (NNFI), comparative fit index (CFI). The incremental fit indices are all above the conventional cutoff of 0.9 (Hair et al., 1998), suggesting an excellent model fit compared to a baseline model. As to the parsimonious fit, the normed  $\chi^2$  is below 2.0, the upper threshold suggested by Carmines and McIver (1981). Root mean square error of approximation (RMSEA) is below the typical cutoff value, 0.08. Hence, the overall model satisfied these recommended criteria.

In conclusion, the overall fit statistics, validity, and reliability measures collectively lend substantial support for confirmation of the proposed model. This also reflects the fact that the items have been pretested and refined over several rounds of data collection.

TABLE 5. FIT INDICES OF STRUCTURAL MODEL

Absolute fit			Incremental fit					RMSEA
$\chi^2$	df	$\chi^2 / df$	NFI	RFI	IFI	NNFI	CFI	
454.959	264	1.723	0.974	0.967	0.989	0.986	0.989	0.057

The results of estimating the structural model are presented in Figure 2. In the overall framework, most constructs are appeared to have a significant SMC. Thus, this study believes that the web application usage have significantly explained data variations for general business performance and its underlying dimensions. In the Figure 2, most paths, except the path linking from the system use to other constructs (H5-4 ~ H5-16), are significant and positive, supporting the corresponding hypotheses. Focusing on the relationship between web-application and other perspectives of BSC, a summary of hypotheses test is described in Table 6.

## Discussion, Limitations, and Future Research

To understand e-commerce benefits and its impact on general business performance, this research has empirically tested the modified BSC framework, as well as 35 hypotheses within that framework. Empirical analysis demonstrated several key findings, which are discussed below.

### Major Findings and Interpretations

With 20 out of 22 hypotheses, except the paths from web application perspective to other perspective (H5-4 ~ H5-16), supported, the empirical results provided strong overall validation for the modified BSC model. Overall this study finds strong support for the causal relationship among the four perspectives (financial, external relationship, internal process, and future readiness). This study also finds that internal process excellence generated through the organization capital.

Kaplan and Norton (1996) propose the causal relationship among the four generic perspectives. Norreklit (2000), however, indicate that the generic BSC has problems with some of its causal relationships. Moreover, Ittner and Larcker (2003) indicate that such assumptions are often half-baked or wrong. Heskett et al. (1994) also developed the service-profit chain for establishing relationships among employee satisfaction, customer satisfaction, customer loyalty, market share, and financial performance. However, there are few empirical evidences for these causal relationships. The empirical results in Figure 2 provide that the entire chain of cause-and-effect relationships was established through the generic four BSC perspectives. Thus, this study believes that the causal relationships pervaded four perspectives of modified BSC.

As shown in Table 6, within the modified BSC framework, the future readiness (H5-4 and H5-5) and internal process perspective (H5-6, H5-7 and H5-8) are appeared as the direct benefits of e-commerce usage, while external relationship (H5-9, H5-10, H5-11, H5-12, H5-13 and H5-14) and financial perspective (H5-15 and H5-16) are not appeared as the direct benefits of e-commerce usage. However, e-commerce usage's overall (direct and indirect) effect on external relationship and financial perspective is supported.

### Limitations and Conclusion

Using the BSC framework to investigate the e-commerce performance, this study integrated the general business performance and e-commerce functions. The integration provides a theoretical perspective to study the contexts and conditions under which e-commerce contributes to a firm's business performance. This study finds that the entire chain of cause-and-effect relationships are indeed established through the generic four BSC perspectives. Moreover, this study finds that the e-commerce usage directly affect human capital, internal process, communication behavior with firm's supplier/partner and indirectly affect external relationship and financial perspective. The empirical analysis provides a theoretical framework to understand how e-commerce is affecting general business performance (whether direct or indirect). This result will help bridge an existing gap in our understanding of expected and actual benefits of e-commerce usage.

This research is subject to some data-related limitations. First, although we have invested considerable effort in data collection, our data set is limited to the manufacturing sector (42.7 %) and small size firm (47.1 %). As such, the finding reported here cannot be generalization to other types of firms in other industries and large size firm. Second, firm performance data are self-reported and could potentially induce certain biases. However, several checks within the data collection process that multiple responses were used in data collection should work to reduce such biases.

*Dongguk University, Korea*  
*Kyoung Jun Lee*  
*Kyung Hee University, Korea*

### **Abstract**

For the systematic planning and implementation of e-business, an objective and quantifiable evaluation metric should be developed. Such an e-business evaluation methodology is a pre-requisite for the good e-business policy making of government as well as for the e-business decision and implementation of companies. Since 2002, Korea's Ministry of Commerce, Industry and Energy (MOCIE) have developed e-business Index. Based on the Ser-M model (Cho & Lee, 1998), a new paradigm of strategy theory, the E-business Index has five main areas for the evaluation of e-business of a company: 1) People, 2) Environment, 3) Resources & Infrastructure, 4) Process, and 5) Value. The survey result is analyzed using regression analysis, correlation analysis, and structural equation model. Especially, the structural equation analysis confirms some hypotheses of the Ser-M paradigm. In addition to the academic results, the E-Business Index study produces various and interesting business and policy implications such as supporting the efficient development of e-business strategy through the self-diagnosis of individual enterprise.

### **Conceptual Construction of the E-business Index**

For the systematic planning and implementation of e-business, an objective and quantifiable evaluation metric should be developed. Such an e-business evaluation methodology is a pre-requisite for the good e-business policy making of government as well as for the e-business decision and implementation of companies. Since 2002, Korea's Ministry of Commerce, Industry and Energy (MOCIE) has developed e-business Index, KEBIX (Korea E-Business Index) cooperating with Korea Institute of Electronic Commerce, The Federation of Korean Industries, and Steering Committee of E-Business Index.

The e-business index is based on the Ser-M model (Cho & Lee, 1998; Cho, Kim, and Rhee, 1998), which is a new paradigm of strategy theory. 'SER-M' is the abbreviation of the notions as follows:

- 1) Subject ('S') is the competence of major actors. It can be identified and compared with each actor's strength and weakness.
- 2) Environment ('E') is the influence of circumstances, which can be evaluated by their emerging forces as threats and/or opportunities.
- 3) Resources ('R') mean physical and mental resources, natural and cultural resources, which are the main capabilities of organization. So the actual and potential ability can be enumerated by these concrete variables related with.
- 4) Mechanism ('M') is the management system (as is the corporate governance) and the constraining variables (as is the regulation system) are the main sources of organizational culture and organizational development.

The four components of the KEBIX come from the four components of the Ser-M and the fifth component 'Value' is added. Therefore the index has the five main areas for the evaluation of e-business of a company (Figure 1): 1) People ('Subject' in Ser-M), 2) Environment ('Environment' in Ser-M), 3) Resources & Infrastructure ('Resources' in Ser-M), 4) Process ('Mechanism' in Ser-M), and 5) Value.

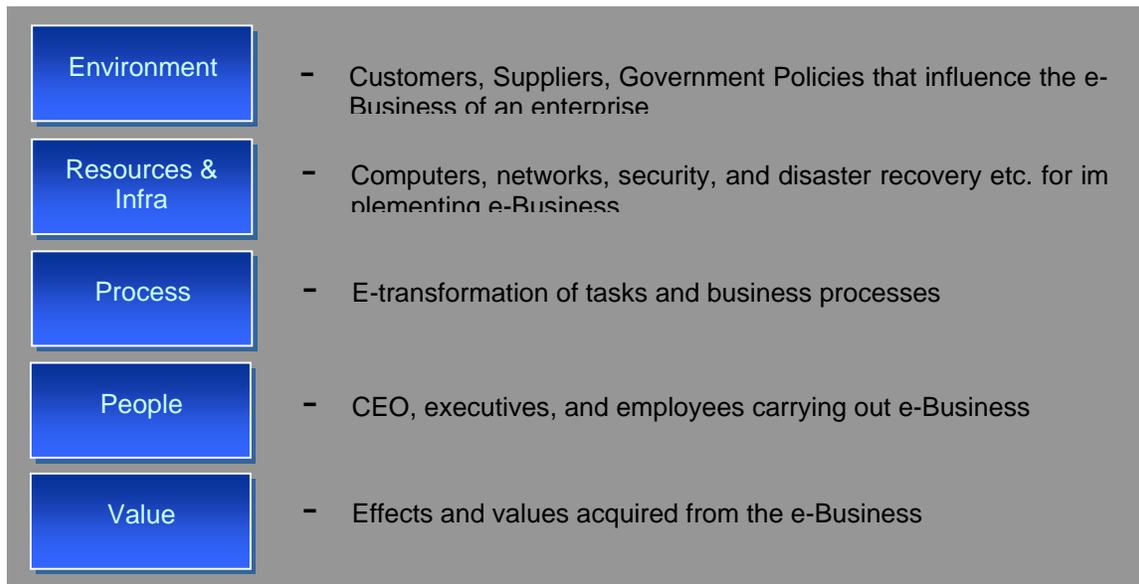

FIG. 1: COMPONENTS OF E-BUSINESS INDEX

The 'people' include the subcategories such as CEO, executives, and employee carrying out e-business. The CEO and the executive category measure the recognition and the will of CEO and executives on e-business respectively. The employee category measures the capability and support of e-business organization and personnel and the e-business mind and readiness of the whole organization and personnel.

The 'environment' includes the subcategories such as customers, suppliers, industry, and the government policies that influence the e-business of an enterprise. The customer environment measures the readiness and infrastructure of customers, the supplier environment measures the readiness and infrastructure of suppliers, the industry environment evaluates the related associations and leading companies, and the policy environment evaluates the legal & institutional environment.

The 'resources & infrastructure' measures IT investment (financial resources for e-business initiative), the implementation level of computers & networks, system/process/guideline for security & risk management, database & integration, and IT personnel & institution for implementing e-business.

The 'process' measures the e-transformation of tasks and business processes such as supply-side process (e-business in work processes for procurement), operation process (e-business in production and service development), sell-side process (the e-business in sales and customer management), and supportive process (the e-business in personnel/financial/intellectual management).

Finally, the 'value' means the effects and values acquired from the e-business. Therefore it includes overall value which means the value & benefit creation from e-business general and the value by process which means the value & benefit creation in primary activities. One thing to note is that the evaluation on the value is not included in the e-business index score, but employed for analyzing the relationship between e-business and its performance.

## Index Development and Survey

Based on the conceptual structure explained in the previous section, we develop the evaluation sheet which has 100 questions (Therefore the highest score is 100). The steering committee of KEBIX selected 11 industries (Costume, Petrochemistry, Steel, Mechanics, Electronics, Automobile, Construction, Distribution, Transportation, Telecom, and Finance industry) and 500 companies in the industries. The companies responded to the survey using email,

mail, and interview from 2002/08/01 to 2002/10/31. The 43.5% of responding companies have annual revenue from \$80M to \$400M and the 43.8% established after year 1980.

In order to derive the weights of the components, we use Delphi method and the expert opinions are integrated based on AHP (Analytical Hierarchy Process) technique. Table 1 shows the weights to calculate the e-business index. Since the processes of the firms are much different according to their industries, we derive the different set of weights for each industry as the right columns in Table 1.

TABLE 1: THE WEIGHTS FOR THE CONSTRUCTION OF THE E-BUSINESS INDEX

Main Category	%	Middle Category	%	Industry	Supply	Operation	Sell	Supportive
Environment	15	Customer Environment	30	Costume	32	24	27	17
		Supplier Environment	30	Petrochemistry	21	40	27	12
		Industry Environment	20	Steel	24	34	26	16
		Policy Environment	20	Mechanics	32	27	27	14
Resources & Infra	20	IT Investment	24	Electronics	28	25	28	19
		Computing & Network	18	Automobile	33	28	27	12
		Security & Risk Mgt.	17	Construction	40	25	17	18
		DB & Integration	19	Distribution	21	16	51	12
		IT Personnel & Institution	22	Transportation	13	44	25	18
Process	35	* industry-specific weights		Telecom	20	23	42	15
People	30	CEO	44	Finance	17	25	41	17
		Executives	23					
		E-biz org. & Personnel	18					
		Whole Org. & Personnel	15					

The survey result is analyzed using regression, correlation analysis and structural equation model (Kline 1998; Wheaton, Muthén, Alwin, & Summers 1977; Carmines & McIver 1981; Chin & Todd 1995). The average e-business index was 50.8 and the highest is financial industry (60.7) while the lowest is costume industry (38.7) as in Table 2. The electronics industry is the highest among manufacturing industries (55.4) and the transportation industry is the lowest among non-manufacturing industries (48.4). Among the e-business index components, the Environment and Resources/Infra are relatively high while Process and People are relatively low. Despite good environment and infrastructure, the utilization of e-business process is relatively insufficient.

TABLE 2: E-BUSINESS INDEX COMPONENT SCORES

	Environment	Resources & Infra	Process	People	Total
Costume	51.9	40.6	35.0	35.1	38.7
Petrochemistry	59.8	49.8	52.5	54.1	53.5
Steel	54.8	44.7	46.9	41.5	46.0
Mechanics	59.2	44.0	45.7	42.1	46.3
Electronics	67.4	51.5	53.1	54.7	55.4
Automobile	64.5	49.5	56.7	49.4	54.2
Construction	57.5	47.4	50.0	48.0	50.0
Distribution	61.4	50.3	48.7	50.5	51.5
Transportation	59.6	47.1	46.4	45.9	48.4
Telecom	67.6	64.1	50.4	58.0	58.0
Finance	68.2	65.0	58.6	56.6	60.7
<b>Total</b>	<b>60.7</b>	<b>50.1</b>	<b>49.2</b>	<b>48.3</b>	<b>50.8</b>

## Strategic Implications from E-Business Maturity Matrix

Based on the survey result, we try to classify the industries. For the classification, we propose the two dimensions: E-Biz Readiness and E-Biz Utilization. E-business readiness is the function of Environment, Resources & Infra, and People, and the e-business utilization is the function of Process. Using the two dimensions, we can classify the industries into four types as in Fig. 2.

Using the e-business maturity matrix, we can derive e-business strategy. For the industries such as Costume, Steel, Mechanics, Transportation, Construction industry, which have low-level of e-business readiness and low-level of e-business utilization (Type C in Fig. 2) we need to emphasize e-business mind and will by promoting e-business itself and its education. For these industries, we also need industry-level infrastructure and policy, which includes cooperative system such as Digital Industry Cluster, Enterprise Integration and support on value chain, and industry-level infrastructure.

For the Telecom and Distribution industry, which have high-level of e-business readiness but a low-level of e-business utilization (Type B in Fig. 2), we need to complement e-business infrastructure by extending the scope of e-business process. For the Finance, Electronics, Automobile and Petrochemistry, which have high level of e-business readiness and e-business utilization (Type A in Fig. 2), we need to emphasize more e-business utilization and systematic evaluation on the e-business performance. As such, by the utilization of E-Business Index, we can support the efficient development of e-business strategy through the self-diagnosis of individual enterprise.

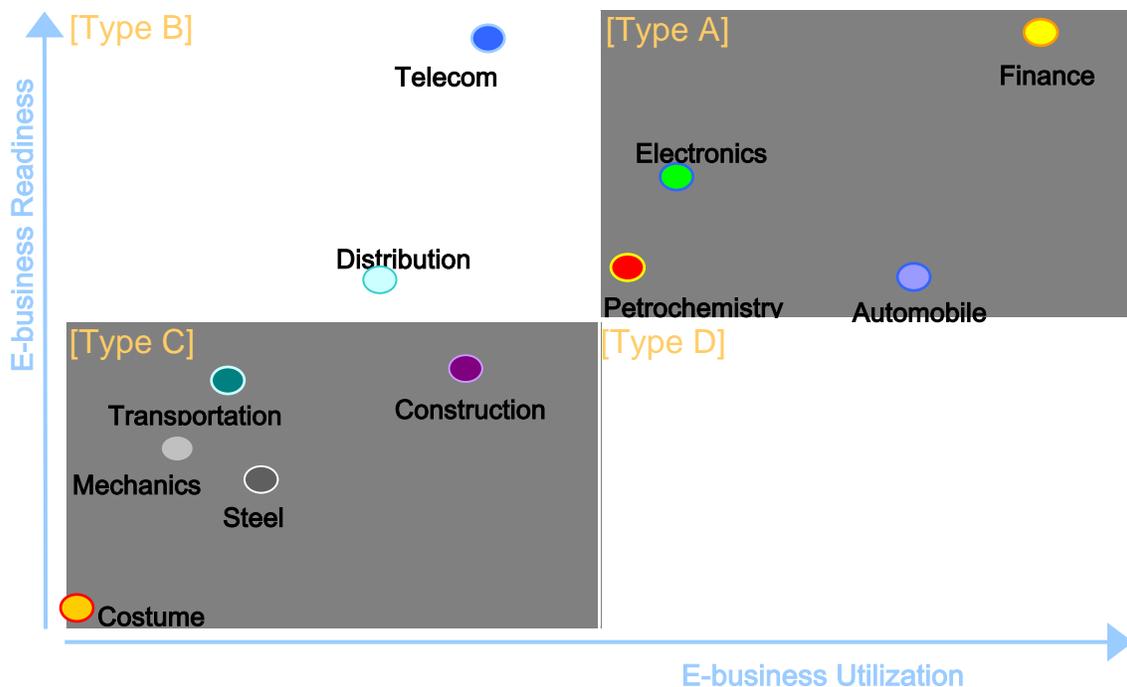

FIG. 2: E-BUSINESS MATURITY MATRIX

## Hypotheses from Ser-M Model and the Confirmation

The Ser-M model claims that in the early stage of a company the 'subject' will be the most important factor affecting the company performance. As the company grows, the important factor is claimed to be sequentially

changed to ‘environment’, ‘resource’, and ‘mechanism’. Therefore, according to the Ser-M theory, the expected sequence of important components in E-business index is People, Environment, Resource & Infra, and Process.

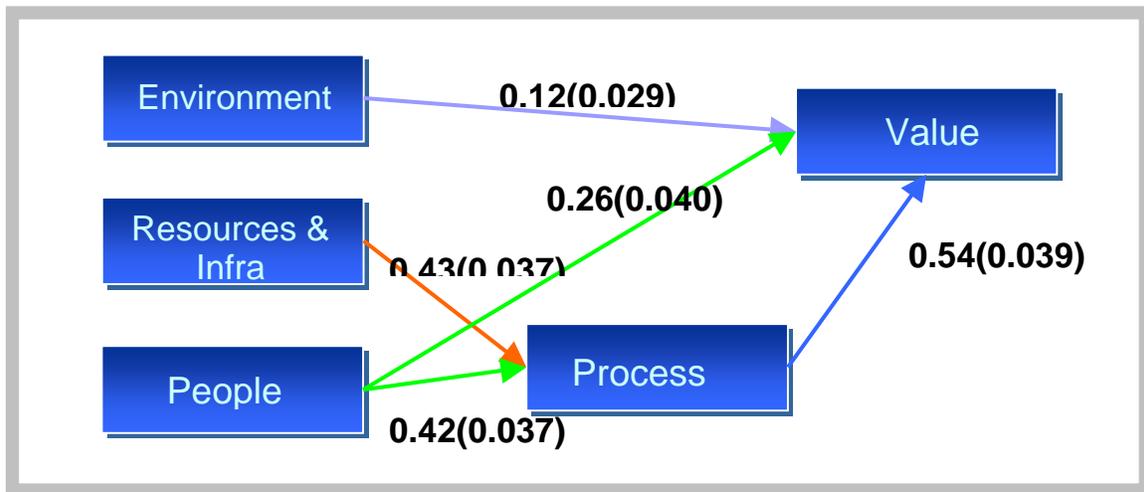

FIG. 3: STRUCTURAL EQUATION MODEL FOR THE E-BUSINESS INDEX

We use structural equation model for analyzing the causal relationship between the variables. Figure 3 presents the LISREL estimates for all free parameters and their standard errors (written in parentheses). All of the parameters are statistically significant at the  $\alpha = 0.05$  level. The  $\chi^2$  for the test of the model has a probability level of 0.185, indicating a good fit. In addition, adjusted goodness of fit index (AGFI) is 0.98, which also indicates a good fit. As we see in Figure 3, the most important component for value creation of e-business is process. People are also a major variable impacting on the value as well as process. This implies that for the e-business success the will of CEO including executives, the capabilities of e-business organization, and the readiness and mind of the whole employee are very important. Resource & Infra variable was insignificant in our structural equation analysis.

Next, under the same structural equation model in Figure 3, we tried to see the revenue-dependent variation of the impacts of e-business components on the value of the firm. For this we classified 500 companies into three revenue groups, and then fit the structural equation model for the index score data of each group. The results of LISREL estimates and the probability values ( $p$ -value) of  $\chi^2$  test for the model fit are listed in Table 3. As we see in Table 2, the impact of e-business environment on the value creation of e-business is insignificant to the small or large-size business group while statistically significant to the mid-size business group (It confirms the conjecture of the SER-M!). The impact of e-business resource on the value creation of e-business is insignificant, but the importance of people in e-business has a trend decreasing with the increase of revenue size (It also confirms SER-M!). The importance of people in e-business is the largest in the small-revenue business group (It confirms SER-M!). The importance of process in e-business is the largest in the large-revenue business group (It confirms SER-M!).

	Annual Revenue			Established Date		
	\$0.8B ~	\$80M ~ \$0.8B	~ \$80M	~1969	1970-89	1990 ~
ENV-VAL	0.01	<b>0.22*</b>	-0.03	0.10*	<b>0.13*</b>	0.09*
RES-VAL	0.04	0.08	0.00	0.03	0.05	-0.02
PEO-VAL	0.21*	0.23*	<b>0.32*</b>	0.23*	<b>0.29*</b>	0.26*
PRO-VAL	<b>0.59*</b>	0.42*	0.58*	<b>0.56*</b>	<b>0.50*</b>	<b>0.53*</b>
RES-PRO	0.44*	0.45*	0.35*	0.50*	0.48*	0.22*
PEO-PRO	0.42*	0.37*	0.33*	0.43*	0.36*	0.53*
<i>p</i> -value	0.329	0.402	0.396	0.366	0.372	0.413

TABLE 3: SUMMARY OF SEM ANALYSIS (“\*” DENOTES THAT PATH COEFFICIENT IS STATISTICALLY SIGNIFICANT AT THE  $\alpha = 0.05$  LEVEL)

Next, we try to see the age-dependent variation of the impacts of e-business components on the value of the firm. Again we classified 500 companies into three age groups, and then fit the structural equation model for the index score data of each group. As seen in Table 2, the impact of e-business environment and people on the value creation of e-business is the largest in the middle-age business group. However, the impact of e-business resource on the value creation of e-business is insignificant. The importance of process in e-business is the largest in the old-age business group.

## Conclusion

For the systematic planning and implementation of e-business, an objective and quantifiable evaluation metric should be developed. There have many attempts to measure e-business readiness, utilization, and the effect in various contexts (Barua, Konana, Whinston, & Yin 2001; Bharadwaj 2000) such as B2B e-procurement (Subramaniam & Shaw 2002), B2C Web site (Saeed, Hwang, & Grover 2002), B2C channel (Devaraj & Kohli 2002), online-brokerage (Chen & Hitt, 2002), and Internet business (Kim, Lee, Han, & Lee, 2002). Such an e-business evaluation methodology is a pre-requisite for the good e-business policy making of government as well as for the e-business decision and implementation of companies. Since 2002, Korea's Ministry of Commerce, Industry and Energy (MOCIE) have developed e-business Index. Based on the Ser-M model (Cho & Lee, 1998), a new paradigm of strategy theory, the E-business Index has five main areas for the evaluation of e-business of a company: 1) People, 2) Environment, 3) Resources & Infrastructure, 4) Process, and 5) Value. The survey result is analyzed using regression analysis, correlation analysis, and structural equation model. Especially, the structural equation analysis confirms some hypotheses of the Ser-M paradigm. In addition to the academic results, the E-Business Index study produces various and interesting business and policy implications such as supporting the efficient development of e-business strategy through the self-diagnosis of individual enterprise (Fig. 4).

## **EU-Lisbon Strategy on E-Europe: A Realistic One?**

*Dusan Soltes  
Comenius University, Slovak Republic*

### **Abstract**

**The paper deals with some aspects of the so-called Lisbon strategy of the EU especially from the point of view of its main goals as formulated at the EU Summit in March 2000 in Lisbon and their comparison with the current status as achieved until now. In our paper, taking into account also the mid-term evaluation as conducted by the so-called W. Kok's High Level Group commissioned by the EU we came to conclusion that the whole Lisbon strategy if should meet its main objectives, among others it would need also a qualitatively completely new approaches and the implementation strategy. With some aspects of this new approach and/or strategy we are dealing in this paper.**

### **Some Background Information on the History of the Lisbon Strategy**

The European Union on the summit of its Council in Lisbon in March 22-23 2000 has adopted its now already famous and well known so-called "Lisbon Strategy". The main goal of this strategy formulated as the main EU's development strategy goal for the beginning of the 21<sup>st</sup> century has been to create from the Union "the most dynamic and competitive knowledge based economy in the world, capable of sustainable economic growth with more and better jobs and greater social cohesion and respect for environment" [1]. In this respect and mainly due to its main objectives, the Lisbon strategy is at least as important and thus fully comparable with such other EU's former important strategies like its Internal Market, CAP, CFSP or Euro. This more than an ambitious strategy has been formulated in such a way that the above main goals have to be achieved by year 2010. That in short and in other words means that in year 2010 the EU should be the most dynamically developing and competitive knowledge based economy in the world i.e. one more advanced than e.g. the USA, etc.

Soon after the adoption of the Lisbon strategy on the e-Europe - as the main product of its implementation has become known - the whole process of the gradual implementation has started. One of the first and the most important steps in this respect has been taken by the EU on 19-20 June 2000 in Feira in the end of the same Portugal's EU presidency. There has been approved and launched the EU's e-Europe Action Plan. The main objectives of this Action Plan has been to bring Europe closer to gradual meeting the main strategic objectives of the whole Lisbon strategy. In particular, the main actions and targets of the e-Europe Action Plan (e-Europe Progress Report) has been:

- Making Internet use cheaper and faster as the main backbone of the whole Lisbon strategy on e-Europe
- Providing modern public services online i.e. providing them cheaper and faster through the most widely available Internet and all its main functions i.e. web sites, e-mails, etc.
- Progressing in creation of a dynamic e-business environment as one of the key and the most important parts of the whole Lisbon strategy on e-Europe.

As the whole Lisbon strategy on e-Europe and its Action Plan have been adopted at the time when it has already been quite clear that the EU will sooner or later be enlarged by up to 13 at that time candidate countries for accession to the EU it was necessary to adopt also for these future member states of the EU - and/or at least for some of them i.e. the best prepared ones - a plan that would lead them to their future obligations and responsibilities towards e-Europe as well.

Hence, also all candidate countries have soon been included to the process of the implementation of the Lisbon strategy. On the Gotheborg European Council in June 2001 in the end of the Swedish presidency the original Action Plan of 15 existing members of the EU has been mirrored and supplemented by the e-Europe+ Action Plan. The sign + (plus) in this Action Plan means that it is the plan concerning future enlarged EU that would become reality definitely before the final year of the whole Lisbon strategy i.e. before the final year of 2010. But at the time

of its adoption in Gotheborg it could not yet been clear neither how many new members and when they would finally join the EU and thus also becoming co-responsible for the implementation of the whole Lisbon strategy. However, this Action Plan has not been the last one in the relatively complex and sometimes rather unclear structure of various Plans, Actions Plans, Strategies and their national versions, etc. Just for illustration, an another strategy of the EU has been endorsed by the European Summit in Sevilla on 21 June 2002 in the form of the e-Europe 2005 Action Plan that has foresaw the establishment of “an European e-business support network (e-BSN), federating existing European, national and regional players in the field with a view to strengthening and coordinating actions in support of SMEs in the field of e-business”. Hence, it has been an another Action Plan with the mid-term horizon of year 2005 and as usual followed by an another Action Plan e-Europe 2005 + i.e. extended to the future new member states but as the later development has demonstrated not all the above various political decisions have found also the proper place in the developing of the e-Europe 2010 as we call the final goal of the entire Lisbon strategy and as it is quite clearly and rather critically stated also in the W. Kok’s report [1]. In order to make the overall situation with various strategic documents even more complex, one could meet also documents with a strategy of e-Europe 2003 and its “plus” version i.e. the e-Europe+ 2003 [2] that could be understood as a partial strategy for the first 3 years of the overall implementation.

However, in addition to the above various political decisions regarding implementation of the Lisbon strategy that to some extent made the whole implementation rather too complex and mutually overlapping, there has almost instantly been opened also an another important problem related to the enlarged EU. From the very beginning it was quite clear that after the next enlargement the whole Union would be automatically less developed entity than the original EU-15. It has been so mainly because of the fact that practically all future new member states but perhaps Slovenia have been on a much lower development level regarding the overall macroeconomic performance and thus also much lower standard of living than the original EU. That all of course has had also a very negative impact also regarding the situation with the ICT and knowledge based society in the future enlarged EU than in the original 15 member states. This has been from the beginning of the implementation of the Lisbon strategy one evident and quite logical obstacle - however, mostly overlooked - in reaching the particular final goal by year 2010. As on the 1<sup>st</sup> May 2004 the EU has been enlarged (to some extent quite surprisingly and originally not expected by so many countries) by 10 new members this potential obstacle has become a reality. From the point of view of the whole Lisbon strategy as originally adopted it is clear that with these ten new members the gap in ITC application and utilization between the EU and the USA could definitely just further increase as almost all key Information Society indicators have become less favorable and/or positive in the case of the EU-25 in difference to the USA where the natural and steady development has continued in spite of all various difficulties e.g. after the 9/11, etc. In addition we have still to take into account that this latest enlargement has not been the last one before the target date of the year 2010. In year 2007 another two and even less developed countries from the CEE viz. Romania and Bulgaria will join the EU and thus not increasing the Union to the EU-27 and in terms of the e-Europe thus further increasing the particular gap towards the USA. As this author has several times recommended on various forums organized on e-Europe by the EU, it would be highly desirable if all those various partial strategies after the last enlargement would be unified to the one only: e-Europe-25 2010 i.e. e-Europe strategy of the current 25 member states with the horizon of the final year of the Lisbon strategy i.e. 2010 (possibly in 2007 after the accession of Romania and Bulgaria to be modified to e-Europe-27 2010!

**The Latest Enlargement to EU-25 and later to the EU-27 has not been and will not be in Favor of the Implementation of the Lisbon Strategy**

In general, however, it would be an oversimplification if for all the negatives and insufficiencies in not meeting so far the main strategic objectives of the Lisbon strategy, only the latest enlargement would be blamed. But on the other hand it is true that the Lisbon strategy in this respect had to be more visionary and at the same time more realistic i.e. perhaps less ambitious in formulations of its goals and various Strategies and Action Plans and more pragmatic and realistic in the tools how to reach them. Especially, from the very beginning it was necessary to mobilize better and more completely all the resources that the EU unquestionably has, in support of the implementation strategy and not to rely so much on the responsibility of the member states and their dedication to the Lisbon strategy and its practical implementation in their respective own countries Perhaps it would be in this respect also more beneficial if the EU and its member states would learn more from the USA and its experiences

from developing its Information Society although without anything like any specific national wide e-USA Strategy. Because after all, the Lisbon strategy is not about creating something like individual e-member states and then somehow to combine them together but from the very beginning it has been mainly about creating e-Europe as a whole. It means e-Europe with all its member states irrespective if of original 15, or enlarged to 18 or 20 what were at the beginning of 2000s the most realistic expectations regarding the future number of the enlarged EU. For almost the whole pre-enlargement process it was expected that only best prepared 4-5 candidate countries would become new members of the EU. As we know the reality has been much more ambitious and the current enlarged EU of 25 member states has been comprising also such members that are in many indicators and not only in ICT on the levels of only 35-50% of the average of the EU-15.

It is the case not only of indicators on the average GDP per capita as one of the most important indicators regarding preparedness of the candidate countries for accession into the EU. In the whole history of all previous enlargements of the EU it was expected that in time of accession that indicator would achieve at least 60% of the average of the EU. In all previous enlargements that average was always met even by such relatively at that time poor new members like Ireland, Portugal, Spain or Greece. But in the case of this last enlargement out of 8 CEEC only Slovenia has been over that threshold, all other were and still have been below that. And of course that has a negative effect also on the situation in these new member countries regarding their preparedness and readiness for the challenges of the e-Europe and the whole Lisbon strategy. It is quite an illusion to expect that a country where according to the EUROSTAT 30 per cent of population is living on or below the national (i.e. a very low of about only 150 Euro per month) poverty line, with 18-20 per cent of unemployment and an average monthly salary of only 400 Euro (gross), that the implementation of the Lisbon strategy would and could have any massive support and/or a healthy and prospective environment for the development of e-business, etc. It is absolutely true - although many experts do not like to hear that - that for a citizen living on or only slightly above the poverty line or below the above average monthly (gross) salary of 400 Euro (moreover, if 70% of working people's salaries are below that average gross monthly salary) it is quite ridiculous to think in terms of e-business, e-purchases or e-banking, e-education, etc. if their incomes hardly enable them to pay bills for basic living essentials like food, utilities, rents, etc. This is by itself one of the weakest aspects of the whole Lisbon strategy i.e. that it has to some extent totally separated the goals and objectives of the e-Europe from the overall macroeconomic and socio-economic situation in the current enlarged EU where about 100 million of its new citizens are still and be for some time, living in a system of surviving "from a pay-check to the next month pay-check". In our opinion, e-Europe cannot definitely be considered only in terms of ICT, number of PCs, links to Internet, etc. but it has to have also its socio-economic dimension.

#### **The Lack of Commitment and Support to the Implementation of the Lisbon Strategy**

In addition to the problems of the e-Europe regarding negative effects of enlargement and overall socio-economic development especially in the new member states there are also some other problems that are negatively effecting implementation of the overall Lisbon strategy. Another evident obstacle to the overall process of successful implementation of the Lisbon strategy has also been the fact that the EU has not managed as yet to mobilize so many resources, capacities and funding in support of the Lisbon strategy, as it would have been needed for its currently most important development strategy. By any objective standards and/or criteria the Lisbon strategy has to be undoubtedly the most important and most strategic goal of the Union for the whole first decade of the new millennium and to this strategic goal also all other various strategies, programs, plans, budget provisions, etc. have to be clearly, absolutely and fully subordinated. Unfortunately, as also quite recently the mid-term evaluation of the Lisbon strategy has clearly stated [1], not all involved and especially not the member states themselves and their respective governments have made the Lisbon strategy truly and fully also the main parts of their national strategies in their respective countries.

However, it is not only the member states of the EU that have not yet made enough in support of the so far completed stages of the Lisbon strategy. It is quite evident that also on the higher level of the whole EU i.e. on the level of its supranational institutions - but again to the large extent probably mainly due to the overall stance of the member states and their governments - not everything has been prepared in such a way that the implementation of the Lisbon strategy would have got such a budgetary, legislative, institutional, research and other necessary supports as it would have been required. Such an ambitious strategy as undoubtedly also the Lisbon strategy is, simply cannot

be relying only on nicely formulated strategies, action plans, development programs, national initiatives, etc. but has first of all to be based on an absolutely adequate mobilization of all available resources, etc.

As it has been in this connection stated also in the mid-term W. Kok's evaluation report of the Lisbon strategy [1] there is necessity to adopt an urgent action across five key areas of the overall policy of the EU:

- The knowledge society – the EU has to become more attractive and supportive to the development of the research and development, making R&D the top priority especially in the areas directly related to the knowledge based and/or Information Society i.e. in the areas of ICT
- The Internal market – it has to be completed so to say completely i.e. including all free movements of goods, capital but also all kind of services and also people as after the last enlargement this last and the most important free movement has been not provided for the citizens from the new member states
- The business climate – it requires first of all reduction of the overall administrative burden, improvement of the quality of legislation, a more adequate support to the new start-up enterprises and creating more supportive environment for businesses especially in the category of SME
- The labor market – in addition to the above absolutely free movement of persons and thus also workers, researchers, developers, entrepreneurs, students, etc. it is required to support for all various forms of lifelong, informal education and learning
- Environmental sustainability – various policies are needed for supporting long-term and sustained improvement in productivity through eco-efficiency.

It is quite clear that the particular report is quite right in identifying the above key areas of the necessity to foster further development especially in the above five priority areas as all of them are quite crucial for achieving the final goal of the whole Lisbon strategy i.e. to become the most advanced knowledge based society in the world by year 2010. In addition to them we would again underline also another important aspects of the whole remaining period of implementation of the Lisbon strategy and that is achieving a social cohesion and overall standard of living especially in the new member states that in year 2010 will represent more than 20% of the total population of the Union of 27 member states.

#### **What are the Main Problems and what is needed in Order to Accelerate the Whole Process of the Implementation of the Lisbon Strategy**

On the basis of also our own experiences from active participation in various EU funded projects from the area of IST – Information Society and Technology research and development [3], [4], [5] and while taking into account also the above recommendations from the Kok's report we could formulate the following main conclusions and recommendation that could help in bringing the Lisbon strategy to its successful completion by its target year of 2010:

It is quite evident that one of the key and the most crucial elements for the whole further successful implementation of the Lisbon strategy is – according also to the first above recommendation – especially the systematic and long-term support to the R&D particularly in the areas directly related to the Information Society and ICT. Unfortunately, so far existing situation in this area is quite far from any optimal one. There are quite evident shortcomings in the organization of the R&D on the Union as well as national levels:

- Especially, the overall budgetary support is in this respect absolutely inadequate. If for example we take that in the USA for the R&D is allocated 2.9% of the budget and in Japan even 3.0% so in the EU it is only 1.9 and in Slovakia less than 1%! According to the W. Kok's report only two out of 15 member states of the EU are currently reaching 3% of the budget expenditures on the R&D.
- On the level of the whole EU one of the most striking indicators on an insufficient support to the R&D is the allocation of the funds from the EU budget. For the whole research and development under the 6<sup>th</sup> Framework Program) that represents the main financial and legal instrument of the European Commission to implement the ERA – European Research Area as something like the common “internal market” of the EU in the area of research and development altogether only 17.5 million Euro has been allocated for the whole period of its operation i.e. years 2002-2006. It means that for. 5 years that according to the all accounts could be considered as the crucial for the start of the practical implementation of the Lisbon strategy as its start followed quite systematically the adoption of all crucial documents as we have

mentioned them above in years 2000-2002 i.e. the Lisbon Strategy, the Action Plans, etc. then we see there a clear under-budgeting. When we compare the total amount allocated for their practical implementation we find that for five years it is “only” 17.5 billion Euro i.e. 3.5 billion Euro per year or about 3.5% of the annual central budget of the EU. But we have to take into account that the upper limit of contributions to the EU budget is only 1.27% of the GDP in the member states. On the other hand only the CAP – Common Agricultural Policy alone gets every year almost 50 billion Euro or 50% of the total budget. Although it is clear that the agricultural sector is definitely not one of those where one could expect any substantial contribution to anything like “knowledge based economy” or a basis for creation of “more and better jobs” as in general it is a sector that is in the overall decline regarding its share on employment, GDP generation, technological progress, etc. In this respect a completely new and revolutionary reallocation in the EU’s central budget would be needed especially from the over subsidized agriculture to under-budgeted R&D and especially to those its sectors dealing with ICT, knowledge based society, e-Europe, etc. One of the possible solutions could be also to use “saved” subsidies for CAP in new member states on the level of only 25% of the “old” members for the support of e-Europe+ i.e. helping new member states and thus reduce their delay and existing “digital divide” between old and new members of the EU

- Also from the point of view of its overall structure the 6FP gets no specific priority to the IST – Information Society and Technology research area as the key area for the implementation of the Lisbon strategy and e-Europe. In general it is only one of the 7 priority areas together with various other priority research areas like e.g. Aeronautics and space or Food quality and safety, etc. This is not to say that all other areas are not important for the further development of the EU and for its citizens. In fact in their opinion, probably the Food quality and safety has higher priority than Information society, etc. But in any case, the main strategic goal and objective of the whole Union regarding its future leading place in the ongoing processes of globalization and regional integration, in generating more (in order to reduce existing almost 10% unemployment in comparison with that in the USA of only about 5%) and better jobs should have an absolute priority. It is clear that only well functioning e-Europe could create conditions for properly functioning knowledge based society, e-businesses and thus also of more and better jobs and all in all creating also in the EU conditions for full employment, a higher standard of living of all its citizens, etc.
- Even within the IST itself not everything is fully in support of the main strategic objectives of the Lisbon strategy. Among various research and development projects being supported within the 6FP is quite often an evident overlapping and thus not the best utilization of the still rather limited capacities, resources, etc. For example, this author has in year 2002-2003 coordinated participation of Slovakia in the SIBIS – Statistical Indicators for Benchmarking Information Society [3], [4] as one of the crucial projects for the measuring the progress in achieving individual goals related to IS as such through newly designed statistical indicators and to compare them with the USA or Switzerland, but... at least two other similar projects on benchmarking, indicators, etc. were solved by two other research institutions and their respective consortia. What was even worse in this respect it has been the fact that the budget of the SIBIS project has not allowed to cover all candidate countries so e.g. Cyprus and Malta were not covered by the particular surveys although they became new members of the EU together with other 8 CEEC. On the other hand, Bulgaria and Romania that will become the members of the EU only in 2007 were included in the particular project. Hence, the comparability of the current EU-25 with the USA is not quite exact. And in order to make it even more complex, the whole SIBIS project has been implemented as a single act i.e. without any conditions created for the continuing comparisons and measuring of the progress in the further development of the IS in the enlarged (not absolutely precisely, but anyhow) EU-25 vis-à-vis the USA. That all in spite of the fact, that the SIBIS project has had almost an ideal timing as its initial benchmarking and comparative data base of statistical indicators has been created in year 2003 i.e. closely before the last enlargement but... There was no financial support available for keeping that invaluable data base permanently updated so it could serve as a basis for comparing the progress of the EU towards its final goal of becoming the most advanced knowledge based society in the world in year 2010. It was just enough to

coordinate better various similar partially overlapping projects funded by the EU and the necessary funding would be easily available

- That the e-Europe is not by all involved considered as the absolute priority of the EU's R&D could be documented also by another practical experience of this author. On 14 January 2005 he has participated in the NEST – New Emerging Sciences and Technologies Conference organized by the European Commission in Brussels. Even without any special interest and involvement in the e-Europe, one would implicitly expect that an absolute priority also in this program dealing with “new and emerging sciences and technologies” would belong to those related to the main strategic objectives of the whole Lisbon strategy i.e. IST but...On my particular question in that respect, my question was by the moderator characterized as a “strange” one as according to his explanation, those related to the Lisbon strategy, e-Europe belong to the IST priority area as we have mentioned above and not to the NEST?! One could hardly understand such a “categorization” and/or “exclusion” from the Community funded research especially if it is regarding an area that should secure the most important strategic goal of the entire Union and if we take into account how insufficient is the funding of the R&D and especially that one related to the IST
- That the support to the main goals of the Lisbon strategy is not as it should be; we could bring many more examples. But instead of all, we bring at least one of them. As we have already mentioned, the e-BSN – Business Support Network has been created as a direct response to conclusions of the EU Summit in Sevilla on 21 June 2002. Although, there it has been directly identified as one of the main its objectives that network should “... federating existing European, national and regional players in this field...to strengthening and coordinating actions in support of SME in the field of e-business”. However, the budgetary support to this network from the 6FP is almost nil and participating national experts – who represent the most valuable source of know how and ideas can hardly expect even a reimbursement of the travel costs for their participation in individual workshops, etc. not to expect any technical, budgetary, incentive support to their research and development activities in e-BSN related activities. It means in the area of e-business i.e. that area of the future e-Europe that first of all has to generate new and better jobs, employment, products for consumption by the citizens of the EU but also to all global markets, to generate financial resources for FDI, etc. It is clear that no other area of the future e-Europe could fulfill the same objectives but ...the financial support to this key area of the IS has been almost zero. Again it is perhaps worth to mention that in the USA about 80% of the new jobs and GDP have been generated by the small and medium businesses
- One of evident lacks in the support of the implementation process of the Lisbon strategy has been also an institutionalization of the whole process. Although, otherwise, and in general, the process of accession of the new members from the CEEC to the EU has been accompanied by a creation of various and numerous institutions and regulatory offices, etc. It has been so even in the areas where the particular country does not have any specific needs for such an office, as e.g. it is in the case of the Slovak Republic in civil aviation. The civil aviation of the country is almost non-existing as the national carrier never has had more than 3 (three) originally Russian built aircraft and when it has been finally overtaken as a company permanently being in “red figures” by a foreign investor it has had only 1 remaining and aging aircraft but the particular Office of the Civil Aviation has had to be created and operated. Similarly various other offices have been established like Telecommunication Office, Office for Public Procurement, Antimonopoly Office, Office for the Civil Service, etc...but somehow no office for the e-Europe or Informatization of the Society has been mandatory requested although we do not repeat it again it is the area of the strategic importance for the future of the whole EU!. Hence, some countries like Hungary, the Czech Republic or Slovenia have such an office or ministry. But as it has not been mandatory to have such an office and/or ministry many countries among them also Slovakia such a coordinating institution do not have and the whole implementation of the Lisbon strategy has been very often in the hands of several institutions crisscrossing their competencies what definitely is not the best way for coordinating the most important strategic goal of the whole EU and all its member states. After all, the European Commission until recently has not had also

a Commissioner who would be responsible only and solely only for the e-Europe. There was only a combined portfolio for Enterprises and the Information society.

- The legislative support to the Information society has also not been so far fully corresponding to the actual needs and importance of the implementation of the Lisbon strategy. Altogether, so far over 40 (according to our latest records it is 42) acts of the *acquis communautaire* (Community legislation) have been adopted mostly in the form of various directives but their transposition and/or implementation has not been so far as efficient and as fast as the urgency of the e-Europe development process would have required. According to the recent statement of J. Borrell, President of the European Parliament (*Hospodarske Noviny* of 19 January 2005) only 7 (seven!) has been fully implemented. For example, in the Slovak Republic a law on the electronic signature has been enacted already as the new Law No. 215/2002 i.e. three years ago but even now in the year 2005 it has not been implemented and one just simply cannot use it in practice. Thus the practical utilization of an e-signature has still been waiting for creation of all necessary organizational, technical and other necessary infrastructural and other preconditions. And of course very similar situation has been also in other member states of the EU.

In this list of some inconsistencies we could continue also with other examples on the lack of the support to the implementation of the Lisbon strategy on e-Europe in the area of the R&D in the area of the preparation of the future knowledge based society, but the scope of this paper does not allow us to continue in this respect. So at least briefly we will identify the main problems in the remaining four areas of policy as identified in the W. Kok's Report [1]:

- It is absolutely inevitable that the Internal market will be completed in all basic four free movements. In this respect in addition to the free movement of services, goods and capital must be fully secured also a free movement of persons. That last kind of the free movement has some how not appeared in the Kok's report. Although it is clear that one of the main "secrets" of the success of the USA is its absolutely free movement of persons that to the large extents enables much higher employment and lower unemployment than in the EU. The whole "secret" of this success is right the free movement of persons. They are not waiting for new jobs while those jobs would come to them but they are just simply going wherever in the USA such jobs exist. The EU in this respect has already had one substantial and only hardly removable obstacle i.e. national, cultural and mainly language barrier with its 22 official languages (the UN with 190 member states manages to handle all its various global agendas with altogether 5 languages)! In order not to make it even worse there should not be imposed any other artificial ones like restrictions on free movement of persons from new member states for up to 7 years. Probably it is only by an unwanted accident that those seven years cover the whole remaining period for implementation of the Lisbon strategy. It is not only "unconstitutional" in respect of the basic provisions of the Treaties but it is directly also against the very basic principles of the e-Europe and the whole Lisbon strategy and its successful and full implementation in year 2010.
- Another important restriction negatively effecting the very basic functioning of the labor market of the EU is the whole set of various restrictions imposed by rather strict age limits. Although officially, there should not be any discrimination on the basis of age, in practice in many sectors age of over 35-40 rises already some questions regarding hiring even well qualified people for some professions. The age between 40-50 is already more than restrictive for finding a job in general and the age over 50 means already almost a total exclusion from any hiring process. Unfortunately, in spite of various legislative acts protecting in this respect a non-discriminatory approach, the reality is such that even in the Institutions of the EU, most probably one of the basic selection criteria for hiring their staff is an age of a candidate as even for the most senior posts as e.g. the post of the Director general of the Joint Research Centre i.e. the main hub of the overall research activities in the EU the experience is limited to "12 years postgraduate professional experience" what in general means an age of about 34-35 years or an age when usually otherwise young scientists are completing their PhD. studies or in a better case are preparing their associate professorships. In other words it means that young not-so-much experienced scientists have a clear priority before their much more senior mentors, professors, etc.. What a difference again against the USA or Canada where the

particular personal questionnaires even refrain from information on the age of a candidate and in general the most important indicator for hiring a new employee is only professional competence, experience and to some extent also a formal education. It is then again no surprise that in the USA are equally successful youngsters in their twenties and something (who in the EU have sometimes problems to find their first jobs because of their non-existent practice) as well as seniors in their seventies or even eighties and not only as porters, watchmen, etc. but as highly valued top governmental officers including ministers, chairmen and/or corporate top executives, chiefs executive officers, etc. Only this variety and an equal opportunity also from the aspects of age and experience can bring so important a full functioning labor market without any restriction but professional competence

- As we have already mentioned above, the overall business climate especially for its latest and the most innovative part i.e. e-business has not been very favorable especially in the new member states. In addition to the low standard of living that does not enable people to enjoy the benefits of the e-commerce, e-marketing, e-banking, etc. an another evident obstacle has been an accessibility of the latest computer and communication technologies and services and that all not only in the technical but also financial aspects. It is an absurdum in this respect if the computers or telecommunication services and/or Internet as the essential technological preconditions for the future e-Europe are more expensive especially in the new member states of the EU with average salaries of about 40% of the minimum wage in the USA than in the States. Not to speak about the discriminatory high fees for Internet, phone calls, etc. In summary, regarding more favorable conditions for the development of the e-business we could state that it is difficult and rather too naïve to expect any fast growth in the e-business if there is not enough customers for such a type of business and if also the necessary technological basis is prohibitively expensive. It is something totally different if an US citizen could buy a lap top computer for a fraction or less than 50% of the minimal wage or if it costs several gross monthly salaries or if local telephone calls are for free or if they are again prohibitively expensive and many people are just paradoxically in the period of implementation of the e-Europe strategy forced rather to cancel their fixed telephone lines than to pay permanently still higher various fixed fees, etc. Under such conditions even the most favorable legislation for establishing new SME will not help much if there are not enough customers, clients and especially if there is not “more favorable environment” including all communication and computer network infrastructures, etc.
- With the issue of the needs of an absolutely free and open labor market we have already dealt, as such it has to be fully available for all citizens of the EU similarly like it is in the USA. That is only way how the proper mobility and full utilization of the available workforce including still insufficient numbers of the ICT specialists can be achieved. If the EU really and truly wants to become the most advanced knowledge based society in the world than if nothing else it has to use the same strategies and tactics like those whom it wants to overtake. It is like in sport competitions, you cannot win with your opponents if you are not able to overcome their strategy and/or tactics if you do not know their strengths and weaknesses.. In this respect the EU needs to improve its overall system of education especially regarding education in the latest ICT and their practical applications. One could hardly expect any significant improvement in utilization of already existing e-business, e-banking, e-working opportunities if people just simply do not know even the simplest elementary principles of working with computers, Internet, web sites, etc. According to the latest survey e.g. in the Slovak Republic it has been found out that almost 80% teachers have never touched computer and not surprisingly their pupils whom they are supposed to teach are in many cases much better in using the latest ICT than their teachers?! It is very positive that in the new European Commission has been created also a new portfolio for education but it is important that the particular Commissioner will be able also to make something reasonable in forcing a kind of the modern, ICT oriented education not only for the young generation but especially for all the citizens of the EU. The e-Europe and the practical implementation of the Lisbon strategy just simply cannot wait while the current young generation will enter the common labor market of the EU. Unfortunately, so far there has not been seen any evident break through in this respect although time to the target date of year 2010 is running very fast and the main competitors of the EU regarding its future leading post in the knowledge based society are definitely not

waiting idly. On the contrary their educational systems in the latest ICT are very innovative, efficient and attractive for students. Especially in the case of the USA they are annually attracting thousands of students, PhD students, young scientists from all over the world – mainly thanks to various attractive scholarship schemas, stipends, etc. - who to the large extent are then further enriching and enhancing progress in education, research and development, etc. Just for comparison, this author among his students in the 4<sup>th</sup> year of graduate studies in management has had among his over 150 students only 4 (four) of them who were studying specialization in management of information systems i.e. one of the majors that in the comparable schools in the USA are attracting if not hundreds than definitely at least tens of students in every such a course and coming from all over the world. This is also saying something how attractive it is to work in the area of the ICT in comparison to e.g. financial management, banking, etc. It is then no surprise, that the huge and promising labor market of the EU has so far been attracting more unskilled unqualified immigrants from the periphery of the EU especially the Northern Africa than those who would be attracted by ICT related studies, research, jobs, etc. as there has still been missing any comparable scholarship, educational, employment programs similar to those in the USA.

- One of the evident deficiencies of the otherwise huge, ever growing and thus very promising common market of the EU has been that it has not been attracting as much FDI into the new and latest ICT as it is in the case of the USA. In difference to that especially the new member states of the EU are slowly but steadily becoming an area of various heavy and/or machinery oriented industries especially those regarding car production, etc. In difference to the above ICT oriented industries and R&D in the USA that are “environmentally friendly“ and really are creating conditions also for generating more and better jobs, for example the car industry is not only very high investments demanding, not-so-much environmentally friendly and especially from the point of view of the Lisbon strategy that industry is not creating neither better nor more jobs. Every job created in the car industry is demanding much more investment, requires much more of space very often on a valuable agricultural soil and as every kind of such industrial production requires also a lot of various natural and energetic resources, an expensive transport infrastructure and is also environmentally more hazardous. Not to mention that especially car industry is rather volatile and reacts very negatively to any decline in the customers demand and thus very much inclined to labor redundancies, lay offs, etc. After all, right now we have been witnessing massive layoffs practically in the case of all major carmakers in the world. Also in this case it is necessary to follow an example of the USA that has been mostly orienting its industrial development and R&D towards the latest ICT. Hence, in this case it is also relevant to repeat again that like in sport one cannot win over his/her opponent if not being knowledgeable of the main strategy, tactics and strength but also weaknesses of the latter. In the case of the USA, perhaps their only weakness in this respect is that they do not have anything like an e-USA strategy i.e. something like a systematic nation-wide strategy but on the other hand they are for such a non-existing strategy creating such a favorable conditions that the particular development in the ICT applications has been steadily and efficiently progressing. Creation of these conditions has to inspire also the EU and its e-Europe Lisbon strategy.

## Conclusion

If in view of the above, in the end we would try to answer the question from the title of this paper i.e. if the Lisbon strategy is not only an ambitious but also a realistic one, the answer is not so simple. Not only according to this author it is not realistic one as long as its ongoing implementation would be continuing in the same pace, direction and a lack of the true commitment as until now.

On the other hand it could still be a realistic one as there are still more than five years to go but that would require a completely different approach from all involved. As properly mentioned also in the W. Kok's report: "...To achieve the goals and higher growth and increased employment in order to sustain Europe's social model will require powerful, committed and convincing political leadership. The member states and the European Commission

must re-double their efforts to make changes happen...Greater focus is required to build understanding of why Lisbon (strategy) is relevant to every person in every household in Europe”.

This is exactly what also had in his mind this author when identifying some existing problems and deficiencies in implementation of the Lisbon strategy, how in many cases without any extra special measures it would be possible to improve substantially conditions for its more efficient implementation in still more than five years till 2010. It would just need as mentioned above that the member states and the European Commission will re-double their efforts to make those changes happen e.g. in the re-allocation of the EU budget, in improving existing business environment, a still rather rigid and not-fully-open labor market, insufficient education, an overall industrial orientation, etc. Then only the Lisbon strategy could meet its main strategic objectives by year 2010 and the e-Europe would really and truly become the most competitive knowledge-based society in the world with more and better jobs and a greater social cohesion e.g. between old and new members, etc.

Otherwise, if those adequate and sometimes definitely quite painful political decisions like e.g. about the CAP, unrestricted free movement of persons are not adopted very soon the whole Lisbon strategy and the dreams on e-Europe could just remain another one nice and ambitious but finally unsuccessful strategy.

SECTION 6  
NEW TECHNOLOGY & EDUCATION

2005

# Ahead of the Storm: Designing an Online First Year Management Unit

David Pick

Mandy Miller

Curtin University of Technology, Western Australia.

## Abstract

In seeking to develop a more engaging, motivating and interactive learning experience for external students, switching to an online learning environment was seen as an effective strategy. However, the design and technical requirements for developing a pedagogically sound and professional-looking web site that promotes effective learning requires a broader skills effort than can be reasonably expected of individual academic staff working alone. This paper presents a design and development process used to put into action an online learning program that meets constructivist objectives. The authors address the debates in the literature regarding online learning and social constructivism and the key elements of design and pedagogy are examined. It is argued that social constructivism is the most appropriate theoretical perspective for informing the online development of content, teacher-student and student-student interaction. Specific attention is given to instructional design considerations and support, and the team-based approach used to deliver the unit.

## Introduction

The growing adoption of online learning strategies in higher education is a controversial and much discussed topic in educational literature (eg Bonk, 2004a, b and Bowles, 2004). Whilst there is much debate about pedagogy, participation and access, practitioners and researchers agree that information and communications technologies (ICT) are dramatically altering the higher education landscape (Blass & Davis, 2003; Bowles, 2004; Welsh, Wanberg, Brown, & Simmering, 2003). Indeed, Bonk (2004a, b) argues that online learning in higher education has created a 'perfect e-storm' where technology, learner demand and developing pedagogies are merging to generate waves of opportunities for developing learning environments that are motivating, collaborative and highly interactive. Bonk also recognises that this 'storm' is intensified by declining budgets. Universities are thus under increasing pressure as they are unable to fund the infrastructure, staff development and organisational arrangements necessary to keep ahead of the oncoming 'perfect storm'.

The aim of this paper is to offer a practical case study in response to Bonk's (2004a, b) 'perfect e-storm' of how technology, learners and educational theories have been considered in the design and development of a fully online unit: *Management 100*, an introductory undergraduate unit at Curtin Business School. The Business School has a significant external studies programme with Management 100 being one of the five foundation units. During 2003/2004 Management 100 was reviewed and re-written to update the content and introduce constructivist principles in teaching and assessment. Part of this review process was the development of a significant on-line presence for all Management 100 students (approximately 600 in Australia and 300 in internationally). The focus of this paper is the improvement of the existing paper-based mode of delivery for external students using ICTs. Each semester approximately forty external students enrol in Management 100. This change was driven by the recognition of a need to provide external students with a more engaging and motivating course of study that would improve the retention rate. Under the paper-based model, the attrition rates regularly exceeded 50%, this was considered unacceptable and the introduction of an online unit was seen as a possible strategy for reducing this high rate. The University provided a small grant of \$8,000 to assist with the project. The team consisted primarily of an academic leading the development in partnership with an instructional designer, with the support of a programmer and web designer.

Interestingly the advantages (and criticisms) of online learning are not due to the technology *per se* (Clarke, 1983, Salomon, 2000), but to the way in which it is used. Thus, due to the impact that instructional design has on

the learning experiences of students (Keppell, 2003), a reasonable responsibility of any designer of education (in this case the academic and instructional designer) is to 'declare' the underpinning theoretical assumptions (Koschmann, 2000). As such this paper begins with a review of recent literature to present an overview of the key issues that should be considered when designing for the online environment. Relevant theoretical perspectives are then examined and used to develop and articulate the guiding principles along which Management 100 has been designed. In spite of recent criticism we argue that social constructivism is the most appropriate framework for developing adult learning strategies, particularly in the realm of online learning. Through the use of sound pedagogy, effective design, adopting a team approach and the appropriate application of online technologies we argued that it is possible to implement an online introductory management unit that provides an effective student learning environment.

The team assembled to develop Management 100 as an online unit are not just trying to 'ride' Bonk's 'perfect storm' but, more importantly, are responding to his challenge which is to attempt to get ahead of the storm and develop innovative strategies to take advantage of the emerging technologies and the opportunities they present to design and develop high quality teaching and learning programs. They found themselves in a complex situation in which the rules and conventions of teaching and learning in the online learning environment are not as clearly developed, or widely accepted as it is in the face-to-face situation. The convergence of issues identified by Bonk is changing the foundations of teaching and learning in higher education. With all its breakdowns and new departures, the emerging contours of online learning are difficult to identify and will most likely only be fully understood in hindsight.

## **Online Learning Concerns**

The growing adoption of online learning in higher education has led to a healthy critical stance towards its use (eg Clegg, Hudson & Steel, 2003; Bowles, 2004). An overview of the key criticisms can help recognise and avoid their pitfalls. Criticism, for example is levelled at practitioners of online learning who accept, unquestioningly, learning technologies and their associated pedagogical approaches without considering how appropriate they may be to the learning requirements (Clegg, et al., 2003). The use of discussion boards and chat facilities are examples of technologies that facilitate communication between students and teacher. Communication is obviously important to learning, however 'uncritical acceptance' of these tools means they may be used without regard for their benefit or appropriateness to a particular learning outcome (Clegg et al., 2003). Asking students in a learning group to post answers to a calculation question on a discussion board where there is only one correct answer may be meaningless as they can see each others answers before they send their own (it would be a totally different case if the students' answers were subjective, and thus review of peer postings would improve their understanding). Similarly, the uncritical use of technologies just for the sake of using them can make learning materials unnecessarily complicated, inaccessible and difficult to use. Audio and video are often over-used in circumstances where a text alternative would easily suffice.

Clegg et al. (2003) also warn against the proliferation of unsubstantiated online learning strategies that may occur when organisational pressure to implement online learning solutions compromise the ability of teachers to ensure sound pedagogical practices. This is evident in the over-reliance on online multiple-choice quizzes for assessment. Teachers new to the online environment accept the tools provided, in this case multiple-choice quizzes. This practice discounts sound educational design as multiple-choice questions, for example tend to test low-level knowledge and comprehension and seldom foster advanced cognitive processing. The lure for teachers is that quizzes are easy to create, especially when supplied free from publishers and are automatically marked by the learning management system—appreciably reducing teaching time.

Similar to distance education, online learning programs have attracted criticism for being 'boring, poorly conceived and designed, and unable to provide individuals with the knowledge they need' and thus not conducive to effective learning (Bowles, 2004, p. 17). Two issues might account for this. The first is that the development of quality online learning is not a skill that traditional university teachers normally have so may inhibit their ability to create effective online offerings. Skills required for online learning include an understanding of human-computer

interaction, online knowledge and information architecture, use of learning management systems and associated tools, and experience in strategies for managing online students—skills normally attributed to professional online learning instructional designers. Graphic design, programming and project management skills are helpful though not vital skills.

The second issue is the danger of a gap developing between students' expectations and experiences of online technologies and those of their teachers (Oblinger, 2003). One report of high schools in the United States, for example, showed that students felt more 'Internet-savvy' than their teachers and found teacher use of technology as 'uninspiring' (Oblinger, 2003, p. 39). If the expectations of users of online learning technology over estimate the capabilities of the technology then an aspiration-reality gap may develop, leading to disillusionment, disappointment and eventual failure of online learning initiatives (Ottewill & Wall, 2002). This is not surprising considering the tendency for learning institutions to adopt a one-size-fits-all online solution simply as a means of saving money (Bowles, 2004). It is no wonder that online learning has been viewed with scepticism.

#### **No Significant Difference**

Despite the criticisms there are ample articles reporting on the advantages of online learning. Perhaps one of the best known is for distance education students for whom the use of communication tools such as e-mail, discussion boards and chat facilities help reduced feelings of isolation (Ottewill & Wall, 2002). Similarly, the asynchronous discussion environments are less threatening as they allow a sense of anonymity. Students who find the face-to-face tutorial too confronting are participating more in online discussions. Given its asynchronous nature, discussion boards also allow students more time for reflection and more time to express themselves. This can be particularly important for students who find writing a more difficult task—for example foreign language student. Finally, the nature of online learning media has supported more consideration of flexible learning practices that frees students and facilitators from the boundaries of location, as well as redefining some of the time restrictions, especially those traditionally imposed by attendance at lectures and tutorials.

A number of major studies into the effectiveness of learning technologies comparing student assessment results in face-to-face versus online learning environments consistently report no significant difference (Hiltz, 1998; Fabos & Young, 1999; Russell, 1999; Meyer, 2002; Neuhauser, 2002). Moreover, the advantages listed above can be more easily associated to the unique combination of attributes of the educational technologies used, which can influence learning if they support the appropriate cognitive processes (Salomon, 1979). However, the combination of attributes alone is not sufficient to ensure effective learning. The no significant difference phenomena strongly supports the argument that a greater focus on applying appropriate design principles based on sound educational theory will benefit students' learning in the online environment more than a consideration of the educational technology and communication media used (Clark, 1994).

## **Learning Principles**

### **Constructivism**

Constructivism is a theory of learning in which individuals construct their own meaning. It contrasts with the empty vessel notion whereby students could be filled by a knowledgeable teacher and a sound body of information. The implication with constructivism is that each student needs to go through an individual process of learning to enable their cognitive processes to link with and make sense of new information in relation to their existing understanding of the world (Kintsch, 1998). This brings into question traditional teaching practices such as lectures and teacher-centered seminars during which students may be passive recipients of information rather than engaged in active cognitive development. Effective learning, according to constructivist principles, demands a paradigm shift from teaching to a focus on learning. A growing body of evidence argues that constructivist approaches are appropriate for learning, particularly with regard to adults (Huang, 2002; Weasenforth, Biesenbach-Lucas & Meloni, 2002).

Social constructivism, a subset of constructivism, posits that through interaction with other people—either directly or via communication protocols such as written or spoken language—our cognitive structures are formed and shaped (Dewey, 1916; Piaget, 1973; Vygotsky, 1978) allowing the learner to actively learn and construct new meanings based on their prior knowledge and experience (Huang, 2002). Communication between and among

students, their facilitator and the content is thus vital to the meaningful construction of knowledge (Ernest, 1995). Social constructivism includes a range of learner-centered approaches including: social negotiation strategies: collaboration, authentic/experiential tasks, reflection, group assessments, etc.

#### **Critique of Constructivism**

The constructivist approach is not without criticism. Matthews (2003) questions some of the assumptions that underpin constructivist approaches on three counts. First, he contends that there is no empirical evidence to support the key notion that matching teaching and learning style has any effect on educational outcome. Second, Matthews argues there is an overstated claim by constructivists that contextualization is necessary for learning to occur. He states that constructivists 'reject a huge body of research on the importance of decontextualised learning, as anyone who ever played tennis, a musical instrument, or learned to drive a car will attest' (Matthews, 2003, p.58). Thirdly, Matthews does not accept the argument put forward by constructivists that drill, corrective feedback and the use of incentives inhibit the learning process. On the contrary he maintains that the evidence from the literature does not support the notion that external incentives should not be used to try and encourage learning. Matthews (2003) concludes that the literature supports the claim that increased instructional time and the use of external reinforcers increases student performance and that students can and do learn in decontextualised settings.

In contrast to Matthews cautionary approach, Elkind (2004) argues that the problem with constructivism is not that it is unsuitable or ineffective. Indeed, he argues that constructivism is the best educational philosophy that is currently available because it 'is generated by genuine pedagogical concerns and motivations' (Elkind, 2004, p. 307). Elkind conceptualises the problem as one of 'readinesses in teachers, curricular and society. He argues that when these three forms of readiness are in alignment, then the implementation of constructivist principles will be successful. Elkind argues that ICTs may provide the impetus for reform that will facilitate this readiness through bringing about this alignment of readiness in teachers, curriculum and society. Whilst generally supporting the adoption of a constructivist perspective, the development team took Matthews' critique as a reminder that a cautious approach should be taken when adopting this, as well as any other, perspective.

#### **Constructivism and Online Learning**

There are ample references in the literature to suggest that constructivism is well suited to the online learning environment and consequently we considered it to be appropriate for developing Management 100 as an online unit. Weasenforth, et al. (2002) emphasize the value of the interactive and distributed nature of online learning technologies in that they encourage and facilitate active collaborative construction of knowledge and the engagement of students in contextualized, authentic learning in a less controlled environment.

Wu (2003) and Weasenforth, et al. (2002) demonstrate how the application of social constructivist strategies and techniques in an online environment leads to effective learning. This led them to use electronic communication tools in the deployment of a number of teaching/learning strategies including structured interaction, authentic tasks, ordered questioning strategies and group assessment to enhance student experiences. Wu argues that training students in the use of electronic communication tools and the use of modelling effective behaviours, feedback and coaching also encourages effective discussion and learning. Wu concludes that the effective deployment of constructivist strategies in the electronic environment leads to effective learning.

Furthermore they contend that the online learning environment encourages thoughtful reflection and empowers students who then develop an ownership of their knowledge (2002). Huang argues that online learning technologies are breaking down the barriers of traditional distance education faced by students, particularly, the lack of interaction and communication. He concludes that, 'Constructivist principles provide ideas to help '... create learner-centered and collaborative environments that support critical reflection and experiential processes' (Huang, 2002, p.35).

The assumption underpinning the development of Management 100 is that, as an online unit, the learning principles-i.e. social constructivism-should be no different than for face-to-face students. However there is little to be gained by trying to imitate the traditional face-to-face teaching as the techniques required for effective facilitation in an on-line environment are quite different (Brower, 2003; Salmon, 2000). As such academics preparing and delivering online courses would benefit from the development of new facilitation skills (Blass & Davis, 2003) as they move beyond the 'sage on the stage' model (Bowles, 2004).

## Design and Planning

The considerations given to design for the online environment generally are very similar to those for any distance education programme. Teaching and learning processes must be integrated in order to anticipate and replicate the communication that is characteristic of effective learning, irrespective of environment. This may include: well-written materials; scaffolded support where learning problems are anticipated; learning outcomes that are well-mapped to learning materials, and; ample opportunities for feedback (Ngwenya, Annand & Wang, 2004).

Many instructional design and development models have been adopted from the software development industry where methods of project and design planning have been honed to a fine art. Some of the common stages that bear the scrutiny of time and success include: analysis, development, evaluation, implementation and improvement (Bowles, 2004). The order is not static as an overall principle of iteration of key steps offers the opportunity to refine and change the 'product' according to each cycle. Management 100 was designed in this fashion with the expectation that each semester will provide opportunities for evaluation and improvement.

The aim of the Management 100 design was to go beyond a traditional structure of teaching. Furthermore, the teaching and design team wanted to integrate principles of social constructivism into the unit to improve the 'poverty of pedagogical innovation' that characterises much web-based learning (Reeves, 2002, p.19). The following sections detail how social constructivism informed the design of the unit focusing on: student centred learning, social interaction, authentic tasks, scaffolding support and design support.

### **Student-Centred Learning**

Applying social constructivist theories in the learning environment has seen a significant shift from teacher to student-centred learning. Twigg (2001) describes this best as providing students with a wide variety of online resources and learning opportunities from which they can 'pull' what they need at a time in their learning that is most appropriate to them. This is in direct opposition to the traditional teaching method where lectures, tutorials and seminars were 'pushed' out to a group of students who were all deemed to be at the same place in their learning requirements. This does not mean students are given free rein to do what they like. It is still important to provide clear boundaries, establish expectations and clearly communicate the success criteria for learning and assessment.

Management 100 provides a clear unit structure and framework that delineates administrative information, assessment requirements and study materials. The unit schedule is the central navigation screen in Management 100 from which students can access any content, resource, learning activity or assessment item, according to a weekly structure. This provides a map as to what learning outcomes are required per module. From these learning outcomes, students are provided with a range of learning resources and tools they can choose from to help achieve their weekly goals. This ensures adequate flexibility for learners while keeping them on track. The online resources and learning activities attempt to cover a range of learning styles and activities—brief notes that overview theoretical components, newspaper articles providing case studies journal articles that stimulate critical thinking about current theoretical debates, online quizzes to test for key concept understanding, and individual and group-work tasks.

### **Social Interaction**

Social interaction has become a common theme in educational theories due to the crucial role it plays in the development of cognitive structures and the way we think (Ernest, 1995; Vygotsky, 1978). Management 100 students are divided into working groups at the beginning of the semester and encouraged to get to know each other through ice-breaker activities. This allows them to learn to use the communication tools while establishing relationships with peers. These groups are required to work together throughout the semester and are encouraged to support each other as an online community—a feature supportive of the online learning process (Brook & Oliver, 2003). Each group has a discussion board, virtual chat environment and file sharing facility. The whole class also work together in the main discussion board. Communication is also available with tutors and the unit controller via email and discussion board allowing students to decide when they need help and input.

### **Authentic Tasks**

One of the major arguments of constructivist theory is that learning is achieved by the individual who constructs meaning and new knowledge structures internally. This process relies on cognitive functions that link new inputs to

existing knowledge structures or mental models (Kintsch, 1998); the greater the convergence of new elements with existing mental models and greater stability in making meaning of new concepts. From a cognitive perspective, engaging in authentic tasks means that existing mental models are activated as a framework to help understand the new concepts being applied. The learning activities in Management 100 require students to do authentic tasks based on experiences they would encounter in the work force. These learning experiences develop in complexity and become more ill-defined, requiring more creative problem solving and offer increased real-world relevance. For example, one of the major assessment tasks in Management 100 uses a case study of the Melbourne Hotel located in Perth, Western Australia. This assessment requires students to form groups of three or four and take on the role of a management team charged with addressing the issues of recruitment, retention, training and motivation of staff. The students are provided with detailed background information provided by the hotel management from which they then develop their report and recommendations. In addition, students are required to develop a group contract that details their expectations of group behaviours etc. and undertake a self and peer assessment of their own and their group members' performance. Students are also assessed on the quality of their participation in online discussions and the quality of their self/peer assessment.

#### **Scaffolding Support**

Students enrolling for Management 100 are first year undergraduates who have self selected for distance education mode. Most either have never studied at tertiary level, or may have completed a first semester. Either way, the development of their study skills and technical know-how of the online tools will require some support.

Curtin Business School uses a third-party online learning management system called Blackboard. This system includes standard online educational tools— asynchronous (discussion board, email, document retrieval) and synchronous (chat) tools—capable of facilitating high levels of interactivity. Students must be proficient at using these tools if they are to learn effectively. To help students learn to use the discussion board, each learning activity that occurs in this environment has been designed to introduce new skills and functions to students, thus increasing the success of students to work constructively together. Clear rules of engagement have also been written so students know the function of each tool and the standards that they need to adhere to in their communications (for example, postings should be kept to less than 300 words and follow the discussion board rules). Similarly, professional and study skills taught as part of the unit, for example, group work, reporting, and summarising have also been identified and introduced in varying levels of complexity and difficulty.

At Curtin University, online learning as an attendance mode is restricted in its flexibility to operate within the standard study periods. In other words, students enrolled in a semester period must start and finish their studies at the same time as students studying on campus. This means that students could be given tasks to do in groups, pairs and as individuals, ensuring optimal chances of peer support and collaboration. This was seen as an important structure given that the students are mainly in their first year and would require more scaffolding and support in their studies. This is more manageable if students study at the same pace.

#### **Design and Support**

To prepare new units to be available fully online, the Curtin Business School provides unit controllers with instructional design, graphic development and programming support from its Online Teaching and Learning (OTL) Facility. Whilst graphic development and programming are vital steps in the development of a quality online unit, their value is one of technical application, which is outside the scope of this paper. The design support issues addressed in this section relate to the instructional design processes applied in the development of Management 100 as an online unit with the aim of illustrating their alignment to, and application of, the epistemological and pedagogical theories discussed earlier in this paper.

The online learning environment is capable of supporting rich forms of interaction and collaboration and, as such, is able to support the principles of social constructivism (Jonassen & Reeves, 1996). The task of the instructional design process for Management 100 was to establish opportunities for meaningful interaction with facilitators, peers and content, thus improving the chances for the social construction of knowledge.

The instructional design phase begins with planning. At this stage there is no consideration for the online environment, only for sound educational principles. The planning phase is a mapping process. Firstly, the unit is split into modules or logical sections of unit content. Outcomes are specified for each module using Bloom's taxonomy (Figure 1) to clearly articulate the level of required cognitive performance of students. Bloom's

taxonomy outlines five key levels of cognitive processing and development—each, in ascending order, demanding more advanced cognitive skills and building on the previous level.

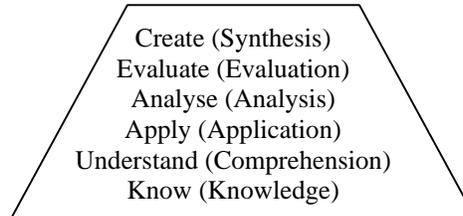

FIG. 1: BLOOM'S TAXONOMY (ADAPTED FROM: KRATHWOHL, D.R. (2001). *LEARNING TO TEACH*. (5<sup>TH</sup> ED). MCGRAW-HILL. BOSTON, USA).

Recognising the level of cognitive processing for outcomes guides how the learning activities, assessment, feedback, learning resources and materials are designed. For example, drill and practice learning activities are appropriate if a learning outcome only requires recall of information, but would not be a suitable activity if students were required to evaluate or synthesise ideas.

The aim of this process is to map the key components of the learning design, recognising that the required outcome affects all the learning components, especially the learning activities, self-evaluation and assessment. It is critical that the learning activities allow students to perform at the cognitive level specified in the outcomes, and that the assessment evaluates students' performance at that same level. A template is used to aid this process. Table 1 is an excerpt from the Management 100 template:

TABLE 1: ACHIEVING THE PLANNED OUTCOMES FOR MANAGEMENT 100

	Module	1		
		Outcome 1	Outcome 2	Outcome 3 etc...
A	Outcomes	Apply knowledge and understanding of team-working to own experience. Students produce a critical reflection on their own team-working skills and abilities.		
B	Cognitive level	Application Analysis Evaluation		
C	Learning materials	Robbins, Bergman, Stagg and Coulter (2003) <i>Introduction to Management</i> , Chapter 11 Gordon, J. (2002), 'A perspective on team building', <i>Journal of American Academy of Business</i> , Cambridge, Sep, pp.185-188		
D	Learning activities	As you read the article by Gordon (2002) <i>A perspective on team building</i> , answer the following questions: 1. List the characteristics of an effective team. 2. Briefly describe a 'team-able person'. 3. List the personal traits a 'team-able' person has. 4. Write a short (200 word) report examining the extent to which you are a team-able person. 5. List the skills you need to develop to be a better team leader. 6. Post your answer to question on the Main Discussion Board and comment on the postings of other students.		
E	Feedback	From student peers and facilitator		
F	Assessment	Feeds into major assignment 1		
G	Do A, B, D & F align?	✓		

The aim of row ‘G’ is to actively check to ensure that the key learning components are aligned. In the planning of Management 100, development of this document allows easier review of the learning activities required. Once the learning activities are established it is possible to then review which online features and tools students will use.

The next step was to map the skills required in Management 100 according to their associated learning activity. This way each skill could be reviewed according to when it first was required of students, the unit controllers expectations for success criteria were made explicit, and the unit controller could decide where in the online unit the instructions, ‘rules’ and success criteria for each learning activity could be articulated to the student (Table 2).

TABLE 2: IDENTIFYING SKILLS AND DEFINING SUPPORT REQUIREMENTS FOR EACH LEARNING ACTIVITY.

Module	1
	Outcome 1
A Outcomes	Apply knowledge and understanding of team-working to own experience. Students produce a critical reflection on their own team-working skills and abilities.
B Cognitive level	Application Analysis Evaluation
C Learning materials	Robbins, Bergman, Stagg and Coulter (2003) <i>Introduction to Management</i> Chapter 11 Gordon, J. (2002), ‘A perspective on team building’, <i>Journal of American Academy of Business, Cambridge</i> , pp.185-188
D Learning activity	As you read the article by Gordon (2002) <i>A perspective on team building</i> , answer the following questions: 1. List the characteristics of an effective team. 2. Briefly describe a ‘team-able person’. 3. List the personal traits a ‘team-able’ person has. 4. Write a short (200 word) report examining the extent to which you are a team-able person. 5. List the skills you need to develop to be a better team leader. 6. Post your answer to questions 4 and 5 on the Main Discussion Board and comment on the postings of other students.
Skill(s) required	Critical reflection Write succinctly
Assumed level of current student skill*	Basic
Scaffolding required? (Y/N)	Yes—First weekly learning activities will be submitted to peers for peer assessment according to the success criteria. Tutor will facilitate to ensure groups discuss all key aspects.
Your success criteria	Highlight the critical factors in being able to work in a team. Show understanding of theoretical perspectives from weekly readings. Explain arguments logically and coherently Write clearly, efficiently Answer should be grammatically correct
Location in materials of your success criteria	In Module 1, under the description of the learning activity Generic points (2-5) will be highlighted in Unit Outline under section ‘Success criteria for written activities’
E Feedback	From student peers and facilitator
F Assessment	Feeds into major assignment 1
G Do A, B, D & F align?	✓

\*novice, basic, intermediate

Once the full planning process has been completed, the document acts as a valuable blueprint when the unit needs to be updated, submitted for audit or re-designed for a different student group or learning environment. As a foundation unit, Management 100 attracts hundreds of student enrolments each year. Equitable instructional methods and learning experiences are essential across a number of learning environments (face-to-face, distance

education (paper-based), fully online, off-shore mixed mode, etc.). This model of design allows easy review of learning components that may be modified to make best use, or avoid the pitfalls of different learning environments, such as online. It also highlights areas where academic staff may require training for use of educational technologies or new teaching/facilitation strategies.

## **Discussion**

This development project has illuminated several key pedagogical issues relating to elearning. The convergence of emerging technologies, growing demand, pedagogical development and restricted budgets identified by Bonk (2004a, b) have placed increasing demands on universities and presented many challenges. There is a need to examine the effectiveness and desirability of applying constructivist perspectives to provide evidence on which further development can proceed. There is also the issue of 'authenticity' in learning activities and assessment. Further development of the idea and scope of 'authenticity' in management learning is needed as well as more critical assessment of its value.

There is also a need to further investigate the question of interaction and group work in an online environment. One of the key professional skills taught and assessed in Management 100 is team working. This meant pushing the pedagogical and technical boundaries of the online learning environment. The main pedagogical issue was to ensure that the facilitator had the skills to encourage student participation whilst ensuring this participation remains within the rules laid-down for online interaction. The main difficulties came in the technical area. The technical efficacy of the software platform being used was a critical factor in the delivery of the unit. Management 100 required dividing up the students into groups of around 20 then again into sub-groups of three or four. The Blackboard learning management system does not lend itself easily to this, meaning that whilst it was technically possible to divide the students into groups as required, navigating into the group areas is not as seamless as required. Furthermore, to use the 'chat' tools students had to download software which was time consuming (in future semesters this will be mailed out to students on a CD before that start of semester). It also took the student three weeks to fully come to grips with the environment and the expectations of participating in online discussion. This meant that much of the facilitation was regarding the use of discussion boards rather than tackling the weekly study topics.

In addition to the broad pedagogical and technical issues, the development of this unit raised a number of organisational issues that are of general relevance. The development of Management 100 illustrates how undertaking such an exercise frees-up the learning environment and provides greater support for the development of important practical and academic knowledge and skills. Students studying externally are no longer tied to a rigid set of paper-based learning activities, isolated from other students simply because of their mode of enrolment. The development of the unit also allowed the design of learning activities that encouraged and supported critical thinking through the use of scaffolded learning activities, situated case studies, and discussion.

The act of transforming the unit from a paper-based format to an electronic form has brought advantages in terms of ensuring the quality of the unit in that it has catalysed the adoption of continuous improvement. One of the direct benefits of the change has been a reduction in the attrition rate from 50% to 25%, signalling that perhaps students have found the unit motivating and engaging and receive appropriate peer and teaching support. The unit is now under constant review and can be changed easily and without large scale re-vamping of printed materials. Also the electronic version acts as a repository of knowledge which can be built on through subsequent iterations. The cumulated knowledge and expertise of the team of staff who contribute to this and subsequent re-designs can be preserved and improved.

Now that this introductory management unit has been implemented in an online learning mode for external students, the unit and the model for development will be evaluated during Semester Two, 2004. This evaluation will contribute to the further development of not only the unit itself but also the design and development model. The experiences gathered here will be used to inform and improve the design and development of further units that are being reviewed for electronic delivery to distance education students. These experiences will also be used to enhance the quality of learning in units offered internally and overseas. In many respect it presents an opportunity

to develop new models of teaching and learning in offshore locations. In sum, the review of Management 100 marks the beginning of a process that will transform the educational profile of the School of Management.

## Conclusion

The experience of developing and implementing this unit taught those involved that electronic learning is more than just a way of transferring knowledge. This development of Management 100 as an online unit illustrates the possibilities presented when good design principles are applied to providing effective integration of learning technologies with engaging pedagogy. Electronic learning is an effective method of adding value to learning programs, particularly with regard to bringing external students into a learning community. This has the potential to allow those students opportunities to develop new knowledge in ways that were previously not possible. Through an effective design process a new learning culture has been established amongst external students. This approach is not a technologically sophisticated way of delivering a pedagogically mundane set of learning activities as some detractors of elearning might argue. Instead, a rich interactive environment has been created in which students and academics become part of a learning community. An environment such as this cannot be created by a technically adept academic working alone nor can it be achieved through using technicians simply putting existing face-to-face courses online without academic input. What is required for the successful development and implementation of an online unit is a team of people with complementary skills ranging from subject and pedagogical expertise through technical specialisation, proof reading, organisational ability, etc. The experience of developing and implementing Management 100 as an online unit also highlighted the need for more research into facilitating and assessing effective group work in this environment.

Getting ahead of Bonk's 'perfect storm' requires the academic to be but one member of a team of highly skilled and qualified people. They must also be backed-up by an appropriate, reliable and fully supported technological infrastructure. This depends to a large extent on university leaders and management to make the commitment to online learning to ensure that the organisation is fully prepared to make a successful leap into the new environment. Universities can then effectively use ICTs to enhance the learning experience of students. Students are progressively developing more sophisticated IT skills and their expectations of education are undergoing a concomitant shift and online learning is becoming an integral part of learning, particularly at higher education where students are expected to develop higher learning skills and independent learning. As student expectations of online learning rise, the imperative is to ensure that online course development is based on sound pedagogical and design principles.

# Complementary Use of Web Sites for Learning

*Won Jun Lee*

*Youn Jung Kang*

*Hee Soo Won*

*SungKyunKwan University, Korea*

## Abstract

In recent years, web sites are increasingly used as a teaching medium. When compared to the traditional classroom environment, the use of web sites can significantly improve the quality of interaction between instructors and students, and thus enhancing the learning effectiveness. Although most of the recent theoretical development is relevant to the pure on-line teaching, many instructors use the web as a teaching tool to complement the instruction in the traditional classroom setting. This study focuses on the interactive use of web sites to support the learning process where most of the instructions take place off-line. Based on a review of relevant literature, we first propose the online interactivity as a multidimensional concept consisting of learner control, two-way communication, and synchronicity. We then hypothesize that the interactive nature of web sites leads learners to a flow state and helps them to have stronger perception that web sites successfully complement the classroom instruction. We also hypothesize that the flow state and the complementariness of the web use enhance both self-efficacy and satisfaction of learners.

To test the hypotheses, we surveyed college students who are taking or have taken at least one course where the instructors use web sites to complement the offline classroom instruction. We collected 319 responses from students enrolled in four universities and analyzed the data using the statistical package, SPSS. The statistical results show that all the hypotheses are supported. The implications of this study can be summarized as follows. First, the complementary use of Web sites is intimately associated with learner self-efficacy and satisfaction. Therefore web sites can make significant contribution in improving the quality of instruction even when they are used as just a part of the whole instruction. Second, in spite of its partial use to complement the off line instruction, interactivity of web sites can enhance self-efficacy and satisfaction for learners through the online flow state and the stronger perception of complementariness.

## Introduction

As the Internet becomes more prevalent in society, it is no wonder that it is also widely used in schools. This paper is particularly interested in the use of the Web by the instructors to improve the effectiveness of their teaching where the main instruction takes place in traditional classroom settings. The use of the Web is known to help the learners experience a higher quality of learning and thus help them achieve a higher level of performance (Arbaugh, 2004). This is attributed to the Web-specific features such as synchronicity and interactive responsiveness which the classroom instruction can hardly offer to a sufficient degree. Instructors can place lectures notes and course-related information on the web, and can also exchange ideas with learners. Learners can control the pace and can have interactive communication with the instructor and the peers as well (Leidner & Jarvenpaa, 1995). Exploiting these features of the web, the instructors can utilize it in such a way that it can complement the classroom teaching which lacks in its interactivity (Parikh & Verma, 2002; Garrison & Kanuka, 2004).

The complementary use of the web, often termed as “blended learning,” is essentially somewhere in the middle between e-learning and classroom-based learning, and represents the increasingly prevalent practice of the convergence of Web-based learning with face-to-face learning approaches. Although this convergence of the learning approaches has a volatile impact on traditional campus-based institutions of higher education (Garrison & Kanuka, 2004; Parikh & Verma, 2002), little is known about what determines the effectiveness of the blended learning.

The purpose of this study is to examine the effectiveness of blending online and offline learning where online learning plays the role of complementing what is deficient in the offline classroom-based learning process. This study will be most useful to instructors who use or intend to use the web in a complementary manner. Specifically we will explore multidimensionality of interactivity and analyze the relationship between the

interactivity and the outcomes of “blended learning.” We will empirically demonstrate that perceived interactivity is positively related to the level of complementariness and flow, both of which in turn yield positive learning outcomes. The research findings here are expected to deepen the understanding of the complementary use of web sites in the high-education settings.

## **E-Learning**

E-learning relies on Web technologies in the process of teaching and learning. Closely related terms include computer-assisted instruction, web-based virtual learning, or online learning. CAI primarily serves as reliable and consistent delivery sources of course material (Leidner & Jarvenpaa, 1995). Virtual learning environments is defined as “computer-based environments that are relatively open systems, allowing interactions and encounters with other participants” and provides access to a wide range of resources (Wilson, 1996, p.8). The advances in web technologies lead to development of a more interactive communication system in e-learning (Leidner & Jarvenpaa, 1995). E-learning provides high levels of control, supports participant contact and interaction throughout the learning process, and provides an opportunity to restructure the learning experience (Piccoli, Ahmad, & Ives, 2001). Learners are able to communicate more easily with the instructor and other learners as well. This interactive nature of the web technology provides learners with a tighter control over the sequence of information presented to them and leads them to more active participation in class. As the instructor communicates interactively with learners, the learning tends to become more effective (Bannan-Ritland, 2002; Bluemink & Jävelä, 2004; Garrison & Kanuka, 2004; Osguthorpe & Graham, 2003).

## **Complementary Use of Websites**

The blended learning as teaching methodologies defines the thoughtful integration of classroom face-to-face learning experiences with online learning experiences (Kamel, 2000; Osguthorpe & Graham, 2003). This teaching methodology combines strengths of both online and offline teaching. For example, shortcomings of the traditional classroom teaching include lack of time flexibility, limits in space and infrastructures. Furthermore, it is instructor-centric because only limited amount of interaction and communication is allowed. The instructor transfers knowledge and information to multiple learners by one-way communication, and learners are passive participants without control over the contents they learn. On the other hand, the strength of online learning is that learners can interact with instructors and with other learners. Learners can control the contents and the pace of learning. Hence, online learning can be viewed as learner-centric learning environments. However, the online learning process is essentially that of self-service and occurs in isolation from others. For that reason, effective learning may not be realized unless learners have relatively a higher level of motivation.

Overall, the current practice of using the web for instructional purposes has not empirically evidenced (Piccoli et al., 2001). Most of the past studies in this area of research remain at the conceptual level (Garrison & Kanuka, 2004). The purpose of this study is to empirically demonstrate that the complementary use of the web or the blended learning yields higher level of learner satisfaction and self-efficacy. As will be discussed in detail, we hypothesize a positive relation between the perceived interactivity of the web and the perceived level of complementariness and flow. We also hypothesize that the higher level of complementariness and flow lead to higher level of satisfaction and self-efficacy.

## **Interactivity**

As a central characteristic of on-line media, interactivity has important implications for user’s behavior. Definition of interactivity can vary depending upon what is deemed important. Rafaeli (1988) defines interactivity as the extent that in a given series of communication exchanges, any third (or later) transmission (or message) is related to the degree to which previous exchanges referred to even earlier transmissions. Therefore, Rafaeli (1988) recognizes interactive communication as interactivity in the communication sequences. Steuer (1992) and Novak, Hoffman and

Yung (2000) also defines interactivity in terms of the communication process. Steuer (1992) recognizes vividness, depth, and speed as the features of interactivity in the communication sequences. Similarly Novak, Hoffman and Yung (2000) look at interactivity during the communication process, but focus on the time dimension of interactivity – length of time elapse between human and computer interactions in computer-mediated environments.

Many studies explore the multi-dimensional nature of interactivity. (Liu & Shrum, 2002) classifies interactivity into three types; user-user, user-computer, user-message. These three types of interaction are then measured along the three dimensions of interactivity – two-way communication, synchronicity and control. (McMillan & Hwang, 2002) also view interactivity as a multi-dimensional concept consisting of user control, two-way communication, and time. Their study is confined to the interactive communication with the web and participants. Piccoli et al. (2001) propose that the interactivity can be represented by the learning experience in a technology-mediated setting. They measure interaction in terms of timing, frequency and quantity of interactions in online learning settings.

Although there appear to be many different definitions of interactivity, its dimensions tend to converge to the following three: time, user-control and two-way communication (Liu & Sally, 2002; McMillan & Hwang, 2002). Likewise, Bluemink & Jävelä (2004) in their recent study on e-learning have focused on analyzing student's interaction in web-based learning environments, using these three dimensions. The present study also utilizes the three dimensions of interactivity and attempt to explore the relationship between each of the three interaction dimensions and the learning outcomes through the mediating effects of complementarity and flow.

## **Flow**

The flow has been proposed as important for understanding consumer behavior on the World Wide Web, and as a way of defining the nature of compelling online experience (Novak et al., 2000). Flow is characterized by an experience of intense concentration and enjoyment (Csikszentmihalyi, 1975, 1990). Novak, Hoffman and Yung (2000) presume that the flow results from interactions – both the exploratory, and often time-consuming, use of the computer and the person's sense of being in control of the computer (Ghani & Deshpande, 1994). Under the flow state, people become absorbed in their activities. The state of flow stimulates the user to participate in web activity with spontaneous motivation. As the result, user performed it successfully and satisfied (Massimoni and Carli, 1988). Therefore, interactivity of the web in blended learning environments is also expected to increase the likelihood of the flow state for the learners, which would then enhance their satisfaction and academic performance.

## **Self-Efficacy**

Self-efficacy was introduced by (Bandura, 1977), who defined it as “how much effort people will expend and how long they will persist in the face of obstacles and aversive experiences.” This concept applied to a variety of domains since self-efficacy is known to have a strong positive relation with outcomes. Therefore self-efficacy is an important motivational factor in learning and has been found to contribute to better learning performance (Liu & Shrum, 2002).

In the present study, two types of self-efficacy are considered. The first is concerned with using the computer and web technologies whereas the second is related to learning the subject materials. The first or computer self-efficacy can be proposed as an antecedent to the successful e-learning. (Ong, Lai, & Wang, 2004) define computer self-efficacy as “an individual's perceptions of his or her ability to use computers in the accomplishment of a task rather than reflecting simple component skills.” (Compeau & Higgins, 1995) suggest that the belief that one has the capability to interact with a given technology plays a significant role in users expectations and performance.

Since blended learning involves using the web, computer self-efficacy is expected to play an important role in determining the performance of blended learning. We consider subject self-efficacy and satisfaction as the outcome variables. Especially subject self-efficacy is highly likely to be influenced by the computer self-efficacy.

## Development of Hypotheses

Our research model attempts to establish the relationship between interaction and learning effectiveness when the web is used as complement to the traditional classroom teaching. In particular, we consider three variables for the interactivity based on the literature: user control, two-way communication, and synchronicity. This study investigates the role of the interactivity in improving learning effectiveness in the context where the web sites are used to complement classroom instructions by providing the convenient and effective communication medium. Learning going in the process, investing any attributes to be related more to the complementariness and the flow in learning process. Learning outcome variables consider that typically form the foundation of educational methodology research. Most of the research discussed thus far examines one or more of these learning outcomes variables.

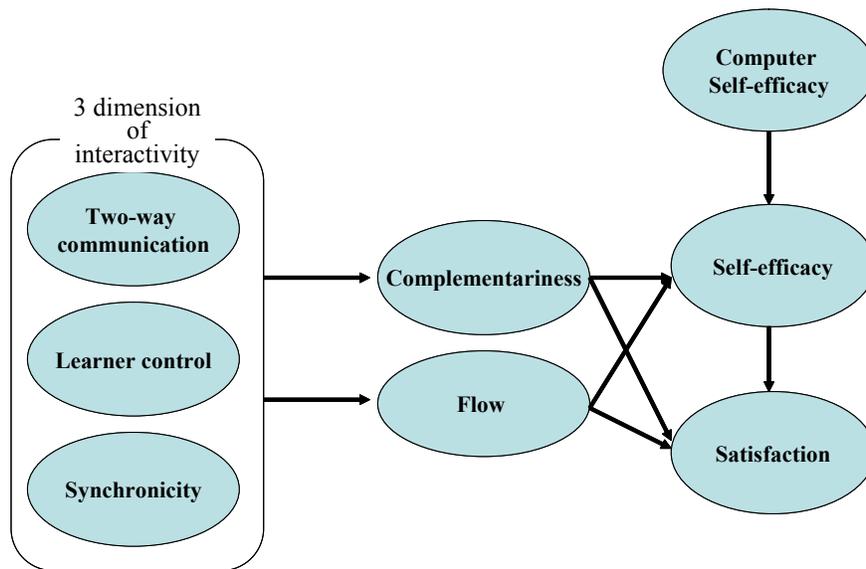

FIG. 1: RESEARCH MODEL

- H1: Two-way communication is related positively to flow.
- H3: Learner control is related positively to flow.
- H5: Synchronicity is related positively to flow.
- H2: Two-way communication is related positively to the complementariness of the web site use.
- H4: learner control is related positively to the complementariness of the web site use.
- H6: Synchronicity is related positively to the complementariness of the web site use.
- H7: Flow is related positively to learner's self-efficacy.
- H: Flow is positively related to learner satisfaction.
- H8: The complementariness of the web site use is related positively to learner's self-efficacy.
- H9: The complementariness of the web site use is related positively to learner's satisfaction.
- H10: Computer self-efficacy is related positively to learner's self-efficacy.
- H11: Self-efficacy is related positively to learner's satisfaction.

## Research

### Measure

To ensure content validity of the scales, the items must represent the concept about which generalizations are to be

made. Items selected for the constructs were adopted mainly from previous research. Respondents were asked to indicate the extent of agreement with each statement in a measure using a seven-point Likert-type scale. Five doctoral students in MIS area who are in their dissertation stage were asked to review the questions for wording and item importance. Further, they examined the extent to which average students would possess the knowledge necessary to provide appropriate responses. The items are listed in Table 1.

TABLE 1: MEASUREMENT OF VARIABLES

	<b>Definition</b>	<b>Measurement</b>
<b>Learner control</b> (Miheim & Martin, 1991; Piccoli et al, 2001; McMillan & Hwang, 2002)	The degree of discretion that students can exert over the pace, sequence, and content of instruction in a learning environment.	Chose the material that is personally relevant Chose the sequence of contents that learner need Chose the pace of contents that learner understanding Enable totally control the contents, pacing, sequence.
<b>Two-way communication</b> (Piccoli et al, 2001; McMillan & Hwang, 2002)	Interactive communication with instructor and among learners	Enable comfortably interactive communication with instructor Enable make feedback and Q & A well with instructor Enable comfortably communication with learners Enable actively communication with learners.
<b>Synchronicity</b> (Piccoli et al, 2001; McMillan & Hwang, 2002)	The perception of the extent of response speed at which message exchange.	Loads to fast the material on the web site Loads to slow the material on the web site Immediate answers to questions Accepted my the claims postulated
<b>Complementariness</b> (development)	The extent of useful combination that online	Web site is a complement to interactivity The material on the web is helpful to supplement Web site is related to the instruction of offline Web site a helpful to understanding the off-line class. Totally, web site has a role of complementary in the off-line class.
<b>Flow</b> (Hoffman & Novak, 1996)	The extent of concentrative sate of a situation.	Concentration my attention upon learning on the web absorption oneself to learning on the web enthusiasm about learning on the web Immersion in learning on the web
<b>Computer self-efficacy</b> (Gist, 1987; Compeau et Higgins, 1995)	The belief of his or her ability to complete a task using computers	To extent of easy to use the computer without assistant people To extent of easy to use the computer without the Help function To extent of easy to use the computer when I had seen someone else uses it before truing it. To extent of easy to use the computer when someone showed me how to do it first.
<b>Learning self-efficacy</b> (Bandura, 1997)	The belief of his or her ability to perform learning as new instruction.	To extent of belief successful perform learning in this environments To extent of enable comprehensive contents in this environment. To extent of confidence oneself for learning outcomes. To extent of conviction of the overall contents in this environments. If someone showed me how to do it first
<b>Satisfaction</b> (Wang, 2003)	The extent of satisfaction of the using web site for complementing classroom.	Overall satisfaction Helpful to understanding the learning. Useful instruction to perform the learning. Good experience Recommend to others.

## **Subjects**

The data for this study were collected through questionnaires using the survey of the students of department business that use complementarily the website or the internet community for effectively enhancing the business classroom at the 4 Universities near to Seoul in Korea.

Questionnaires were surveyed to 400 students of university. A total of 348 responses were received. 65 questionnaires were eliminated due to missing data, leaving a final sample of 319. Questionnaires were returned by 319 students, representing a response rate of approximately 83%. Most respondent consisted of university student (98%). They had to use internet over average 5years (27.9%), used internet used over 10 hours in a week (14.7%). Males represented 69% of participants while 29.5% of the participants were females. The subjects who took part in the data collections were highly comparable in these demographic dimensions.

## **Results**

### **Data Analysis of Measurement Validity**

We evaluated the instrument's validity in terms of reliability and construct. Reliability was examined using Cronbach's  $\alpha$  -value. All constructs exhibited an  $\alpha$  -value greater than 0.8, exceeding the common threshold value recommended by Nunnally (Nunnally, 1986), thus passing the test of construct reliability.

All variables were subjected to separate principal component analysis, followed by Promax with Kaiser Normalization rotations. Results indicated the presence of eight constructs (74.276 % variance explained) were extracted with eigen values exceeding 1.0 that is exactly equal to the number of constructs specified in the model. As shown in Table 2, there no cross-loading items. Additionally, items intended to measure the same construct exhibited prominently and distinctly higher factor loading on a single construct than on other constructs. This result suggested that our instrument had encompassed satisfactory convergent and discriminate validity.

## Model Test

To test hypotheses we conducted multiple regression analyses and correlation using the SPSS 12.0. Descriptive statistics and correlation coefficients are shown in Table 4. one-tailed Pearson correlations were computed for the 11 hypotheses. Correlations have provided meaningful findings and were preferred to multiple regressions because the social scientists have recommended that there be predictor variable for conduction multiple regression. The relation of variables has the significantly positive relation.

TABLE 3: PEARSON CORRELATION MATRIX

	Learner control	Two-way Communication	Synchronicity	Flow	complementary	Learning Self-Efficacy	Computer Self-Efficacy	Satisfaction
Learner control	1							
Two-way Communication	0.145(**)	1						
Synchronicity	0.194(**)	0.331(**)	1					
Flow	0.250(**)	0.208(**)	0.260(**)	1				
complementary	0.337(**)	0.273(**)	0.418(**)	0.284(**)	1

(\*\*) p<.001

Multiple regression using ordinary least squares having stepwise option tested each hypothesis. The result can be seen in Table 5. It shows that the data support all hypotheses. The multiple regression revealed that the interactivity variables were significantly positive related to the flow,  $F(16.882)=14.419$ ,  $P<.001$ . The regression model explained 11.3% of the variance in flow. It shows that the data support H1, H3 and H5. Regressing the interactivity variables and complementariness showed significant positive regression,  $F(33.169)=36.124$ ,  $P<.001$ . The regression model explained 25.1% of the variance in complementariness. It shows that the data support H2, H4 and H6. There is the regression analysis that the complementariness, flow and computer self-efficacy with learning self-efficacy positively effect on the learning self-efficacy,  $F(56.912)=69.031$ . The regression model explained 39.3% of the variance in learning self-efficacy. It shows that the data support H7, H8 and H10. The Regression analysis with flow and complementariness were performed using the satisfaction measures as dependent variables. The regression showed statistically positive significant,  $F(392.472)=146.931$ ,  $P<.001$ . The regression model explained 39.3% of the variance in satisfaction. It shows that the data support H9 and H11. The scatter-plot of the standardized residuals against the standardized predicted values shows that there is no apparent change in the variability of the residuals, thus suggesting the absence of heteroskedasticity. A visual examination of the normal probability plot of the residuals of the dependent variable suggested that they were normally distributed (Chatterjee et al., 2000). The VIF (variance inflation factor) and tolerance value indicate the multicollinearity. The VIF has over 2 and tolerance has closer 1. Thus the dependent variables are effected the muticollinearity.

TABLE 4: MULTIPLE REGRESSION ANALYSIS

Dependent	Variables	Beta	T.	Sig.T	Tolerance	VIF
Flow (R <sup>2</sup> =0.113)	Two-way communication	0.054	2.112	0.035	0.883	1.132

\*: P&lt;0.05

Interactivity as the characteristics of media influence to the complementary course and to learner concentrates the online course. That result increase the learner oneself pride to can bring to successful performance. Learner would be highly satisfied the learning to the complementary web site in offline learning process. The finding of the flow and the complementary represented the relation with interactivity. The two-way communication positively affects the flow in learning process and synchronous effect the complementary. The dependent variables are the satisfaction of complementary courses and the self-efficacy.

## Discussion

A growing number of college professors choose the web site to make up for what is hard to be offered through traditional classroom teaching. This study provides empirical evidence that the web as a complementary teaching tool lives up to what is expected by the instructors. The survey results show that a high perceived interactivity of the web makes the learners a stronger perception of complementariness. Our research context considered the flow and the self-efficacy for investigation the effect to the online medium in internet learning process. The flow reflects the learner's cognition of interactivity and the self-efficacy is related to the learner's motivation for improving the performance.

Without understanding the interactivity, it would be difficult for learner to realize the benefits of this new form of learning. It's feature based thoroughly on interactive communication (Bluemink & Jävelä 2004; Piccoli et al., 2001; Webster & Hackley, 1997). Our result shows that the interactivity has positive attitudes toward the complementary use of web site and the flow in classroom. The synchronicity among the other attributes of interactivity more effect to the complementary course and the learning experience. Because the complementary learning offer to learner as the simple asynchronous text-based learning in online, learner has less learner control and two-way communication than the multimedia online learning and they know well the online environment offered. However the synchronicity in our research is the response time that learner want, need not immediately response. We have the anxiety for use the new something.

We consider carefully the belief the one's ability for perform it. Because of our research context considered using the web technology and the new teaching method, we proposed the computer self-efficacy and the learning self-efficacy. The computer self-efficacy would be the motivation to use the new teaching method. The authors ascribe these results to the perception by students in the virtual learning environment that they had to work harder than usual. In general, when individuals are confronted with a new technology-intensive learning environment, they tend to have negative attitudes that lessen, but don't entirely disappear, over time (Wetzel et al. 1994). The hypothesis tested is the positive relation and the other the complementary and the flow. The sate of flow and the complementariness and the computer self-efficacy would be constituted the motivation to use the web site for learning. Learner has the maturity and motivation have been linked to academic success in virtual learning

(Leidner & Jarvenpaa, 1995; Piccoli et al., 2001). Steinbronn and Merideth (2003) suggest that self-efficacy may be most important determinant of motivation. Therefore both the teacher and learner need to be considered an integrated into the design and implementation of online support for teaching and learning.

We investigated the complementariness and the flow as the mediate variable to learner's satisfaction, because of accomplishing the in the learning/communication process. We tested that learner's satisfaction of the complementary course is influenced on learning self-efficacy, complementariness and the flow. The effectiveness of information technology in contributing to learning will be a function of how well the technology supports a particular model of learning as the appropriateness of the model to a particular learning situation (Garrison & Kanuka, 2004; Leidner & Jarvenpaa, 1995). The blended learning combined strengths of on/offline instructions are more effective for the single e-learning to replace of offline instruction (Bluemink & Jävelä, 2004; Friedman & Deek, 2003).

The comprise the engagement of information technology in academic environments respond to current trends and future demands of educational innovations as moving toward complementary, even comparable strategies in the digital age (Friedman & Deek, 2003). The examining these types of changes are very important because the examination results allow institutions offering complementary course to know whether the courses are improving over time. Thus this research examines the more use of the technology for learning in a field setting. The result of prior study of online learning that use the networked technology show the low and equal effectiveness compared the classroom based learning (Piccoli et al., 2001). Recently, several researches suggested the blended learning is more the learning effectiveness compared online and classroom learning. Future study, we should investigate the learning effectiveness to compare the complementary course and the traditional course. Instructor designs the complementary course for the quality of the classroom experience.

## Conclusion

Using the initial model as a theoretical framework, this study helps practitioners and researchers better understand which dimension of interactivity effect to the complementariness and the learning experience (flow), how the web site is used to complement classroom-base learning, and how learner will respond to learning effectiveness. Also, it can help researchers considerate our findings for development and evaluation of e-learning theory.

Results suggested that many of the important to the relation between interactivity and the complementary use. Prior study proposed conceptually that the interactivity positively effect to complement for classroom-based learning (Bannan-Ritland, 2002; Bluemink & Jävelä, 2004; Garrison & Kanuka, 2004; Osguthorpe & Graham, 2003). Our research tested their relations. That evidence of this result overall could make a sense the complementary. Especially we consider interactivity not overall concept but as 3 dimensions for investigation the impact of each attribute interactivity to the flow and the complementary. Referring the result, the instructor could make a plane and design the complementary course for improving the complementary and learning experience.

Another contribution is the learner's satisfaction, the blended learning bring to the more effective than e-learning and classroom-based learning. There is not tested. Alavi (1994) and Parikh & Verma (2002) doubted the impact of the technology in the traditional classroom-based education. As our study's result, the technology used in the learning bring to not only the learner's satisfaction but also complement the limited interactivity of classroom learning.

Limitation of this study should be noted. The findings and their implications are obtained form a single study of a particular technology in Korea. Thus, caution needs to be taken when generalizing our findings. Second, the R-square reported by the current research represents another limitation. There may be a need to search for additional variables to improving our ability to predict usage intention more accurately.

The comprise the engagement of information technology in academic environments respond to current trends and future demands of educational innovations as moving toward complementary, even comparable strategies in the digital age (Friedman & Deek, 2003). The examining these types of changes are very important because the examination results allow institutions offering complementary course to know whether the courses are improving over time. Thus this research examines the more use of the technology for learning in a field setting. There are

several implications for e-learning management based on our findings to practitioners and to the researchers.

Every instructor should come to understand that successful imparting of information and skills lies in the ability to incorporate a variety of technologies that, directly or indirectly, help communication between student and teacher (Friedman & Deek, 2003). As pointed out in this study, Instructor could make a plan and design the complementary course considering the interactivity, flow, computer self-efficacy and learning self-efficacy for improving the learning performance.

To the researcher, our study model provides the comprehensions of using the networked-technologies for complement the constraint things in classroom-based instruction. So they could consider our findings for development and evaluation of e-learning theory.

# Criteria and Indicators to Quality Assessment in Higher Education Institutions (HEI)

*José Sánchez  
E. Georgina González  
Universidad de Guadalajara, México*

## Abstract

The variety of elements for evaluation, accrediting and certification, demonstrates the heterogeneity of criteria and factors with the works without methodological sustenance with homogeneity, that indicate that HEI must assume the leadership to encourage that quality and evaluation culture evolve the educational system. The development of higher education evaluation mechanisms that truly should have and impact in quality improvement, it demands participation of the Universities. Based in the suggestions that UNESCO, World Bank (BM), Inter-American Bank Development (IADB) and Organization for Economic and Cooperation Development (OECD), in topics related to higher education for developing countries; and analyzing the studies in some countries as France, Mexico, Netherlands, Australia and Finland about quality assessment in Higher education, demonstrate the criteria and indicators to evaluate quality in HEI, moreover studies performance in Mexico. With this information, is developed a strategy to implement criteria and indicators to quality assessment in HEI.

## Introduction

The evaluation constitutes a field relatively not very developed, but very important to guarantee the control, adjustment and possibility of actions improvement of the human groups, of its plans, programs and projects. As it can be observed, the name of assessment, it associates a value with an action; but It's difficult to demonstrate that in this field can be achieved, as some specialists suppose, "objective evaluation" or a "evaluation without values", that is to say, independent of certain references of value for individual or groups preferences.

Assessment processes not only use the research; but rather in several ways, this generate elements for object to evaluate in the research or of the reality to apply, with a peculiar orientation that it underlines making decisions and it get less emphasis in theory developed or the general principles establishment.

## Reflexions about Assessment Culture

Assessment constitutes an intentional process that responds to people, human groups and institutions' natural needs. However, few habits and structures have got generating that we could know as "formal assessment resistance subculture".

The main problems that it faces the formation of assessment culture are the following:

- 1°. Absence of clear assessment concepts;
- 2°. Ignorance of different functions with those that can used;
- 3°. Confusion between assessment process and research process;
- 4°. No linking between assessment and planning process, making decisions and other social and institutional processes;
- 5°. Inadequate selection of assessment methods and technical;
- 6°. Ignorance of the main characteristics that should have the assessment information: validity, reliability, utility, opportunity;
- 7°. Lack of precision of the elements to evaluate in each field and the focuses that are more appropriate in each case;
- 8°. Inadequate use of evaluation outcomes;
- 9°. Absence of conditions that make feasible an evaluation process; and
- 10°. Condition of social environment that impose a resistance subculture to the formal evaluation.

## Conceptualizing the Assessment

The modern educational assessment as today knows, it exist with more than a century of history, but its more distant antecedents can be behind from 2000 years when the Chinese established exams to value the aptitude of those who aspired to occupy public positions (Jiménez, 2000).

The assessment as expert's trial. The assessment is assigned a value to an object or an action or how outline it others, the assessment allows determining the merit or value of some object (Scriven, 1967 and Pérez Jousts, 1986:31).

Assessment as measurement. This considers the assessment like a research activity and makes emphasis in instruments design or in the elaboration of those denominated "objective tests", based on the premise that some way is possible to measure the learning and people behavior changes (Cronbach, 1963).

There is who schematize in simplistic way the systems theory and consider context assessment, inputs, processes and products; but don't consider that to select an input and to apply, coordinate or control a process, also constitute true outcomes or intermediate products, and forget the specific measure that organization and structure have on the institutions (Tyler, 1950:69).

Some authors consider that assessment constitutes a process that allows identifying, obtaining and integrating useful information on decision alternatives with the purpose of achieving a better understanding of their elements under conditions of giving solutions (Stufflebeam and Shinkfield, 1987:183)

Among the main elements that integrate an assessment system, are the following:

- Information has more than enough necessities, problems and resources
- Action alternative
- Making decisions responsible
- Value system
- Selection of alternatives
- Change or modifications of the action
- Outcomes of these changes, and
- Information feedback

Ernesto Schiefelbein observes that the stages should be considered rather as logical moments and not chronological of the process, proposing as phases the diagnosis, programming, discussion-decision, alternatives, instrumentation and assessment.

Daniel Stufflebeam (1987) analyzes different definitions, proposes the following: the assessment is "the process of delineating, obtaining and proposing useful information to judge decision alternatives." This definition makes a clear emphasis in the process that supposes the assessment and that should be given to its products or results. For Marvin C. Alkim, the assessment is "the process of determining interest decision areas, to select appropriate information and to analyze this information."

Marck Thompson (1989) considers that the assessment is "the classifications of information with the purpose of improving decisions."

To conclude this section, and considering the antecedents, it proposes the definition or description following:

The assessment is the estimate or verification of achieving objectives or goals, based on common approaches, previously established and that it considers the needs to satisfy, required work volume, utilized resources, context conditions, positive and negatives foreseen impacts and the unexpected results.

## UNESCO, DIB, WB, and OECD Opinions about Assessment

United Nations for Education, Science and Culture Organization (UNESCO) (1998) define as mission and functions of higher education:

1. The mission of educate, forming and research;

2. Ethical, autonomy, responsibility and prospective;
3. Opportunities for all people to develop a new higher education vision;
4. Reinforce the participation and promoting women access;
5. Promoting the knowledge with research in science, art and humanities and divulging results;
6. Long term orientation with relevancy;
7. Reinforce cooperation with business world and analysis of society needs;
8. Diversifying as way to equal opportunities;
9. Innovators educative methods: critical thinking and creativity;
10. Quality assessment;
11. Potential and technology challenges;
12. Improve the management and financing in higher education;
13. Brains flight and their returns;
14. Associations and alliances.

World Bank (WB) in the denominated document “Higher Education in Developing Countries: Peril and Promise” (2000), developer by a teamwork integrated with specialists from 13 countries, establish that it’s necessary more and best education to achieve the benefits on a global economy based on knowledge.

This document comments that without planning and assessment in higher education, generate quality deterioration and inequity continuous in regions and countries, participating in mobility in different places and supporting the institutions with lower levels that want to be in better conditions.

Developed Interamerican Bank (DIB) present a document “Higher Education in Latin America and the Caribbean: Strategy Paper” (1997), were establish the arguments about higher education Latin-American with big differences in the countries and sectors, considering as main functions academic leadership, professional work, trying to get continuous quality improvement and evaluation.

The Organization for Economic and Cooperation Developing (OECD) comments that exist evidence about Latin-American universities are beginning to establish a quality assessment system, including the accreditation with the accountability objective.

Accreditation as evaluation favorite method suggests the following factors:

1. Global situation to introduce assessment mechanism in higher education (Kells 1992), most of them with accreditation way;
2. The promise into free commerce agreement to promote professionals international flow with accreditation;
3. The accreditation is the political element less controversial in higher education reform.

Assessment systems in Latin America are in charged with organisms councils or commissions integrated by faculty and institutions representatives linked in higher education. Some of them are Chile Higher Education Council (CSE), Dominican Republic Higher Education National Council (CONES), Mexican Evaluation and Accreditation National Commission (CONAEVA), Colombian Accreditation National Council (CAN).

Professional quality in these assessment councils is success key factor for evaluation, and generate that quality must not reduce resources.

Excepting graduate summative assessment in Brazil and several financing mechanisms linked to summative evaluation in the region, the higher education assessment in Latin America is oriented toward quality improvement as main objective.

## **Assessment Experiences in France, Mexico, Netherlands, Australia and Finland**

### **University Of Lille Iii-Charles De Gaulle France**

The Charles de Gaulle University of Human Sciences, Letters and the Arts was established in Lille at the end of the 19th century but, following an increase in student numbers, transferred to Villeneuve d’Ascq in 1974. The explosion in student numbers, which had been encouraged not only by improved standards of living and a higher birth rate but also by a powerful political will to democratize education, was a factor that characterized the 1980s. The University now has 23 000 students distributed among 16 departments of education and research.

As far as evaluation was concerned, therefore, it was a question of measuring performances relating to these practices; this was done essentially by using two types of indicator:

- Student exit: the number of students successful in competitive recruitment served as an evaluation;
- Evaluation of teaching: this was directly linked to the previous point (in this context, the quality of teaching depended on the number of successful students).
- These methods no longer appear to be appropriate for the following reasons:
- Diversification of types of employment taken by students;
- Difficulty in assessing the number of real jobs taken by students;
- The need for less stable learning (knowledge versus competences) in a more fragmented, unstable world characterized by uncertainty;
- The need to incorporate new tools and methodologies;
- The need for administrative, 'secretarial-administrative' (Taylorian model) staff as well as technical and technical-administrative staff with in-depth knowledge in their specialties which enabled them, for example, to oversee matters such as research.

As a result, it has become necessary to re-think evaluation practices in the light of the changes currently taking place in universities.

The most recent evaluations: the observatory of costs study

One of the objectives of the CNE was to increase the need in institutions for internal evaluation; the University has gradually adopted these practices. It was no longer a check or inspection, but rather an asset that enabled the institution to develop management tools and improve the way it functioned in the fields of administration, teaching and research; it provided an element of transparency.

#### **First Stage: Drawing up a Protocol of Co-operation**

A protocol of co-operation was drawn up to formalize reciprocal undertakings that had been made by the University and the Observatory of Costs in Higher Education Institutions.

#### **Second Stage: Composition of the Team**

A project team was established as soon as the visit of the Observatory of Costs was confirmed.

It was composed of people who came from a variety of backgrounds: specialists trained in evaluation and management techniques (Observatory of Costs consultants) teacher/research fellows who acted as facilitators and two people from Lille III, a teacher/research fellow and a female research engineer.

#### **Third Stage: Consideration Given to Methodology**

After discussion on the team, the questionnaires were adapted so that they more accurately met the need for an analysis specific to literary universities.

#### **Fourth Stage: Presentation of the Surveys**

The Observatory's mission was presented to all staff.

Observatory surveys are presented in seven registers:

- Register I contains an introduction to the institution.
- Register II deals with course years.
- Register III relates to the provision for depreciation and maintenance of equipment.
- Register IV covers teaching staff costs.
- Register V covers the costs of IATOS employees.
- Register VI deals with operating expenditure.
- Register VII deals with beneficiary departments.

#### **Fifth Stage: Collecting the Data**

Members of the Observatory team met nearly all University employees individually. During this period, it was necessary to explain the questionnaires again to everyone; people needed convincing and sometimes reassuring.

#### **Sixth Stage: Data Processing and Validation by the Services Concerned**

Some difficulties remained at the data capture stage. Meetings were organized with the services concerned to explain each item of information; discussion centered on management and improving the quality of education.

### **Quality and Complexity**

From evaluation based on quantitative data to evaluation of a model

If the study of costs and the setting up of indicators aimed at improving management are necessary, it is not only in these terms that quality can be measured. When everything is taken into account, change in the University inevitably has to take place on all fronts:

- At the research level,
- At the teaching level, or by setting up new study tracks that are more effective at enabling students to find jobs
- At management level, given the uncertainty and lack of clarity on the outside.

### **Competences Aimed at Achieving Quality**

A number of actions are also being carried out in parallel; they include an inventory of functions and a map of competences in all services. This survey is taking a long time as it is based on detailed interviews with all IATOS employees in all services and all managers; it will be completed by the end of this university year.

### **A Budget Designed to Meet Objectives**

A study has been initiated into criteria for distributing budgets between component units of the University; it involves making use of more complex and, one imagines, fairer criteria.

### **Computerization and Organization**

The introduction of information technology management tools must go hand in hand with consideration of how the structures that jointly manage these tools are organized.

### **Planning the Use of Space**

The University has been obliged to make use of old premises, that is to say the old Law Faculty building with its unique architecture including immense amphitheatres adjoining tiny classrooms and offices.

### **Actions to be Undertaken**

With a view to pursuing the objective of marrying quality, management and decision-making, new tasks have been planned and will be implemented on an ongoing basis:

- A University flowchart that more effectively identifies the 'academic complex' and 'central' services.
- A more accurately focused student admission and reception system. The review will be reviewed at the end of the first semester and possibly amended;
- Consideration stream by stream of the linkage in the acquired knowledge/required competences relationship as a function of sectors in which employment may be found.
- There is a need for an evaluation of teaching that focuses perhaps on what is taught, but mainly on the sought-for match between a concern for rigorous education (in the subject-based sense) and implied promises of finding employment;
- A powerful linkage between this dual requirement and research work.
- Medium-term forward planning of teaching work,

## **Universidad Nacional Autónoma de México**

The Mexican Higher Education System comprises a heterogeneous set of institutions, which provide education to a population of 1 359 057 students, with the participation of more than 100 000 academics. The Mexican Federal Government co-ordinates and regulates the MHES through the Ministry of Public Education, which is responsible for its policies, priorities and strategies.

Education at the university level is generally offered through study programs, which prepare students for a specific professional career; that is, the curriculum is based on a group of courses within specialized subject areas with little or no flexibility to deviate from it. Currently, the MHES has hundreds of study areas at the professional or undergraduate level covering all fields.

The participation of women has increased noticeably: they now account for 45 per cent of the total student population. The graduate population accounts is only 4 per cent (54 910) of all students enrolled in higher education programs. Graduate students are concentrated in specialization and master's degree programs. Fewer than 4,000 students are registered in doctoral programs.

The academic staff in the MHES consists of 135 128 faculty members, 85 per cent of whom are in universities and technological institutes at the undergraduate level, 8 per cent in teachers' colleges and 7 per cent in graduate programs. Diagnostic studies of the System also bring out several weak points: only 28 per cent of the academic staff devotes itself full time to university activities, and only 31 per cent have a graduate degree.

**Evaluation in the Mexican Higher Education System**

Quality began to appear in the public discourse regarding higher education in the late 1970s, perhaps as a reaction to the quantitative growth taking place in the education system. In 1978, policies and measures in that direction were specified, when the National System for Planning in Higher Education was established. The 1981-1991 National Plan for Higher Education was announced with state, regional and national coordinating units for planning. This is considered the first instrument in Mexico that addressed the development of higher education on a long-term perspective.

**The National University of Mexico**

The National University of Mexico is Mexico's largest and oldest institution of higher education, as well as the main institution of the MHES.

UNAM is a research university, therefore carrying out both the training of human resources and the generation of knowledge in sciences, technology and humanities. Its former mission is carried out through 22 schools located within the metropolitan area of Mexico City, attended by 140 000 undergraduate students and 15 000 graduate students. Research is conducted at these schools, but in addition, UNAM has close to 70 entities (46 institutes, 11 centers and 10 university programs) specifically dedicated to research in all areas of knowledge.

**Internal Methods of Quality Assurance**

At UNAM, the concept of quality has varied over time. In this century, three different concepts are present, all linked to the university mission, but varying with the changing objectives and priorities of Mexican society. The first one refers to quality as viewed by a society which considered higher education as a means for social mobility; another is that viewed by employers who needed a steady supply of well prepared professionals and technicians; and yet another is that taken by politicians and government officials who consider that universities should respond fast and uncritically to government policies and initiatives.

Currently, the UNAM evaluation system is complex, multidimensional and versatile. It combines tradition and innovation in a way in which one works with the other to promote, sustain and improve institutional quality in a comprehensive manner. In describing the evaluation system now applied at UNAM, we have to consider all aspects covered by the system: academic staffs, students, curricula and study plans, research activities, facilities, support personnel, and management. University management embodies all the other aspects and provides institutional coherence.

The links between the different aspects or variables considered in evaluation are shown in the Fig. 1.

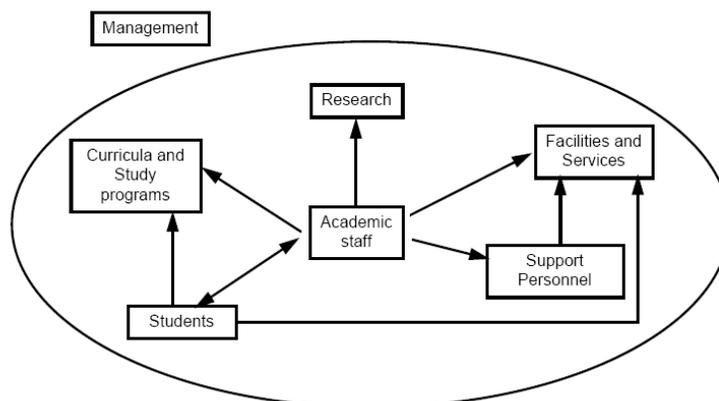

FIG. 1 VARIABLE CONSIDERED IN EVALUATION

Internally, there are two evaluation processes within a well-established feedback system: one is on an individual basis beginning with self-assessment followed by peer evaluation and concluding with collegiate body evaluation.

The institutional self-evaluation process in turn starts with an evaluation at a local level of projects and group development followed by a self evaluation of the complete organizational unit (school, institute, etc.), moving to a review assessment of a whole area or system within the university, and concluding with a review report at the institutional level.

These various evaluation review exercises vary in frequency and period covered, except at the unit level, which is invariably performed on a yearly basis; they also vary in depth, purpose and objectivity.

#### **Academic Staff**

Academics are evaluated on joining the university, for promotion, for tenure, and, recently, to receive salary bonuses according to their performance. The evaluation mechanisms vary according to the type of position held (of the 24 000 academic staff members in the institution, only 27 per cent hold a full-time position) and the purpose of the evaluation.

UNAM decided to boost the quality of its academic staff through different schemes, all based on collegiate body assessments that provide grants, rewards and salary incentives according to performance in teaching, research, extension and institutional support activities:

- The Rewards Program for Full-Time Personnel established in 1990.
- The Incentives Program for Lecturers and Part-time Personnel began in 1993.
- University Awards once a year since 1985.
- University Distinctions for Young Academics. Since 1989.

#### **Students**

The Institution uses several student evaluation schemes, some specifically oriented to help in deciding student admission; others to assess their academic progress.

- Admission. Since 1970 students are admitted to the University through one of two schemes. The first, applicable only to those students who graduated from UNAM's high school system, requires them to have a grade average of seven (in a one to ten scale) in their pre-university studies. The second mechanism is through a competitive written exam both on general subject questions, as well as questions related to the specific field of study they wish to pursue.
- Diagnosis. In addition to the entrance examination, a few years ago (1993) the University began to apply a placement test, which assesses the knowledge level of UNAM's freshmen.
- Ordinary academic progress assessment. At the University the mechanism regularly used to assess the progress of students is the application of exams at the end of each individual course. These are generally designed, applied and marked directly by each individual professor; although in some cases departmental (i.e. non-specific) exams are used.
- Honors Program. In 1991 UNAM started a streaming program based on a voluntary commitment of both students and academics.
- Graduation requirements. Before awarding a diploma and in addition to a successful completion of their coursework, the University requires of its students to prepare a research report or a research essay.

#### **Curricula and Study Programs Assessment**

At UNAM, curricula and study programs are always designed, formulated, evaluated and changed by collegiate body actions.

#### **Research Evaluation**

UNAM has a high reputation in nearly all fields of learning, mostly as a result of its research activities.

Program for Research and Technological Innovation. Successful projects receive financing for up to three years.

Teaching Improvement Program. This program is aimed at developing and strengthening the education basis and teaching innovations of the University.

#### **Support Personnel Evaluation**

Program for Quality and Efficiency on the Job. Started in 1994 and provides salary bonuses to those members of the support staff who through their job performance contribute to the overall quality and efficiency of the services

provided.

#### **Facilities Evaluation**

The National University of Mexico has built a strong tradition in construction planning, building maintenance, and materials and equipment procurement, as it owns more than 1 000 buildings all over the country, which have to be equipped, maintained and served. UNAM also houses the largest book collection, the greatest computer capability and one of the most extended telecommunications network in the country.

#### **Institutional Evaluation**

The University's program of activities is defined in the yearly Institutional Plan comprised by the aggregation of a Central Plan and the local plans of the different organizational entities.

#### **Impact of Evaluation at UNAM**

The internal and external evaluation processes conducted at UNAM have no doubt contributed to an improvement on the quality of a significant number of activities carried out in the Institution. The University decided rather, to motivate its academics through programs designed, formulated and explicitly initiated to expand their horizons, but according to a critical path design which at the same time led to the reawakening and consolidation of academic concerns. Concrete measures were taken, all framed within the characteristic participating style of decision making at UNAM, to set the guidelines for the development of the institution, renovate its management policies and plan an ongoing and systematic evaluation of its members.

The University was in essence redefining its concept of quality, and doing it based both on its own characteristics and reality, and on the concepts and paradigms from other countries and institutions. Quality was encouraged more through the previously mentioned institutional measures and programs than through changes in by-laws and regulations.

The efforts required to move forward now require a change of strategy, one based on policies, programs and efforts to:

- Balance the University's missions, particularly teaching and research;
- Assume accountability (academic and administrative) as the new paradigm;
- Establish a federated system.

Accountability should replace quality as an evaluation paradigm for the Institution as a whole, affecting each and every academic unit, collegiate body, or administrative office. An integrated dynamic process for planning, budgeting and evaluation must be put into operation.

Academic development should be achieved by giving UNAM a federated structure with academic goals as the cornerstone of its decision-making processes; promoting functional and flexible collegiate decision making; facilitating the use of the accountability concept as a fundamental parameter of evaluation; and enabling each of its academic units to develop their full potential within an organized institutional framework.

## **Delft University of Technology the Netherlands**

#### **The Dutch System of Quality Assessment**

The Dutch system of quality management was initiated with the publication of a policy document of the Ministry of Education and Science called "Higher Education: Autonomy and Quality". In response to this government decision, the Dutch universities started a system of reviewing the quality of each education program in a six-years' cycle. This system is primary based on a self-analysis of the educational program itself and on peer reviews.

After a faculty has compiled a self-analysis, which is a performance report on the contents, management and academic level of the program, a review committee of independent external experts pays a site visit to gain in situ information about the program and the management processes. The committee interviews staff and students and evaluates the level of exams and final theses of the students.

This procedure of external quality assessment of educational programs is monitored by the Inspectorate of Higher Education, which has been established by the Ministry of Education, Culture and Science. The Inspectorate advises the Ministry on the follow-up of the assessment and visits the institutions involved two years after the assessment in order to investigate which activities have been taken in response to the assessment.

The Dutch system of quality assessment is basically a national operation, though foreign peers often

participate in the visiting committees, in particular in the committees for research. Given its ambition to achieve quality in an international dimension, and to be recognized internationally as a top-level technical university, a national quality assessment is not enough for DUT; the quality of the university should be established in an international perspective. Therefore, DUT plans to have the education, research and management performance of all faculties periodically evaluated by an internationally qualified and authoritative body.

The DUT's system of quality assessment and control in education is focused on three 'areas': quality of the educational programs; quality of the educational process and quality of the education organization.

## **The Australian Higher Education System and Quality Assurance**

### **Perspectives**

In Australia the development of quality assurance in higher education has been influenced by significant changes in government policy and societal expectations.

Five independent but inter-related factors can be cited:

- Changes in the system of higher education in Australia and status allotment;
- Expansion and diversification of student bodies since the 1970s;
- Federal government general policy directions and quality initiatives;
- Federal government research policy directions and quality initiatives;
- Exploration of new approaches to quality assurance.

Generally, federal quality initiatives have challenged institutions to demonstrate, in the context of their mission and goals, the effectiveness of their quality assurance policies and priorities, the excellence of their outcomes and the efficiency and effectiveness of their operations.

Quality assessment procedures were thorough in terms of the examination of issues, which contribute to quality assurance. The New South Wales Higher Education Board through its Academic Committee undertook the approval, review, and evaluation of new and ongoing courses at both government and non-government colleges of advanced education. All courses, which were federally funded, were required to undergo this approval process; in addition courses, which were privately funded sometimes voluntarily, sought the status of such recognition.

The push for the inclusion of indicators as measures of quality occurred as government funds diminished and higher education expanded. Such factors have contributed within Australia to moves to develop performance indicators of both a qualitative and quantitative nature to assist in the judgment of quality and the efficient application of resources.

## **Quality Assessment – Finland**

### **Evaluation in Finland National Discipline-Based Evaluations**

The university degree system underwent considerable changes at the end of the 1970s: degrees based on subject levels were replaced by degree or study programs, a credit called a "study week" was introduced as the basic unit for measuring the studies, and the lower university degree (Bachelor's degree) was abolished in the humanities and natural sciences.

The reform of the degree system met strong opposition particularly in the field of the humanities and the arts. In some other fields, the reform did not change practices to a similar extent.

On 25 March 1991, the Ministry of Education appointed a committee to evaluate the standard of education and the functionality of the educational system in the humanities. The committee's task was to evaluate the quality of undergraduate and post-graduate teaching as well as academic degrees in relation to the goals set in the degree statutes and in comparison to international standards.

The committee was also to make suggestions about the division of work between undergraduate and post-graduate studies as well as about monitoring and assessing the quality of teaching.

The project group involved in evaluating and developing the degree system in education consisted of often members from different universities, the National Union of Finnish Students and the National Board of Education.

The results of the evaluation:

- The project group involved in evaluating and developing the degree system in education recommended a similar four-tier degree system to education as was already suggested for the other evaluated fields.
- The group wanted to abolish the basic degree programs.
- Also, in order to acquire the teacher's qualifications, the higher basic degree would be required.
- In the project group's opinion, the studies in education should be developed towards the direction of creating learning environments that foster self-direction, initiative, co-operation and community, and the use of information technology. The emphasis should be shifted towards post-graduate education, a professional licentiate degree and academic researcher education.

## **Towards Improved Quality of Teaching**

### **The Tampere Experience**

In the University of Tampere a project to evaluate teaching was carried out in 1994 and 1995. After a process of self-evaluation in the various departments, a peer review group of external experts continued the evaluation. Another aim of the project was to create a quality control system; for application in Tampere and, perhaps, also in other Finnish universities.

The current approach is self-evaluation, in which the institution itself scrutinizes its own work and commitment to its main functions, teaching and learning.

The objective was rather to secure a commitment from the faculties and departments, and if the departments could be seen to accept the projects as advantageous to their work, the project could be rated a success. The goal was to provide the departments with more knowledge of their activities, and to help them to analyze their problems.

The aspects of teaching that needed some improvement (problem areas) were to be pinpointed, remedial action was to be mapped out, and after this had been carried through, a new evaluation was to be made, resulting in better teaching.

This was no mere evaluation of a status quo, but rather the beginning of a continuous improvement in teaching standards. The objective was emphasized to be a new mode of operation, a new culture, characterized throughout by recognition of good teaching, with a view to making teaching merit count in addition to academic merit, e.g. in making job appointments.

As students' views were greatly desired, an extensive questionnaire including both structured and open-ended questions was used. Aspects of particular interest included the atmosphere in the department, staff-student relations, and students' conceptions of teaching and of their own progress. Students were asked to describe their own best and worst experiences of teaching and also of supervision when writing theses.

The crucial factors in quality control and maintenance were considered: 1) commitment to the development of teaching; 2) continuity of activity; 3) user-friendliness of methods and 4) openness of the activity. It is pointless to apply methods, which the department considers useless. Monitoring must be continuous, but the procedure must be simple and the interpretation of the results must be as unambiguous as possible. The autonomy of the department and faculties must be respected. There is little or no advantage of a procedure designed to assure quality if the department does not accept it.

## **University of Helsinki, Finland**

The University of Helsinki has long traditions in institutional assessment, such as evaluating the learning performance of students and assessing teachers in connection with the filling of teaching posts, for example when nominating professors. Throughout the history of the University research has also been assessed. Other types of assessments, however, such as the institutional assessment of the entire university, faculties or departments, are a phenomenon of the 1990s, and the present decade could well be called the breakthrough period of assessment.

The assessments have characteristically been received rather well within the University, and have been carried out by the University's own personnel. Many assessment committees have also included representatives of

the student body. The assessments carried out at the University of Helsinki have been internal assessments.

The assessments have also not been based on any specific management models, such as the TQM or the SWOT model of management by result. Rather, the starting point has been local operational problems and the pragmatic conclusions derived from them

In addition to the University of Helsinki, the Universities of Jyväskylä and Oulu and the Vantaa AMK Institution are participating as Finnish pilot units in the IMHE project. They have co-operated with the University of Helsinki in producing a report on the national context of institutional assessment, which is to be found as an appendix to this report.

Different types of operational assessments did not become commonplace at the University until the 1990s. Institutional evaluation of the operations of the entire University has been carried out, as well as assessment within faculties and departments. In addition, evaluations of teaching, time management, adult education, etc., are being carried out.

The evaluations carried out at the University of Helsinki have focused on the quality of teaching, conditions for and the quality of research, and the administration. The evaluations have thus focused on the most central issues. On the basis of the evaluations, many practical measures have been planned and implemented, and these seem to be of great practical significance, at least in terms of improving the framework of University operations. For example, methods of assessing the quality of teaching have been developed and put into use. Wide-ranging personnel development programmes have been planned based on the feedback obtained in these assessments. Assessments of the quality of teaching have also been reflected in the sometimes far-reaching curriculum reforms.

The benefits of the evaluations can also be seen in many areas of strategic planning, such as in the formation of the University's objectives and general policy aims and in its research policy. In January of 1996 the University Senate discussed a report on its future entitled "The University in 2015," which outlined visions and strategies for the future; another report addressed issues such as improving the conditions for research, and strategies for communications, computer and data-processing technologies, adult education, bilingualism and internationalization. Most of the strategies are being developed further.

Many factors have characterized the evaluations. First of all, the University has been relatively self-sufficient in carrying out the assessments. Most of them were conducted as self-evaluations, and outside experts have been used very little. For example, the institutional assessments of the University have completely relied on the expertise of the university staff. Although it may be that such an inward focus creates its own set of blinders, the University leadership believes that the assessments have provided much information which is useful as a basis for future development.

The institutional self-evaluations were strongly supported by the national discipline-based evaluations carried out at around the same time. These have influenced the development of curricula and teaching practices. Another characteristic feature of the evaluations has been the participation of students in the assessment work. Although student organizations have not invariably been satisfied with the degree and forms of participation they have been offered, the experiences have been predominantly positive from the point of view of the University leadership and other administrative levels. For example, there have been very few actual conflicts of interest between the students and University personnel - rather, there has been an understanding that both sides are working together to develop a common University. The student representatives have also been motivated to invest much time in the various projects.

In the future, a philosophy of evaluation will be central to the operations, research and teaching activities and administration of the academic community. Critical assessment of one's own activities as well as those of others, and the giving and receiving of feedback will form a natural part of this way of thinking. In recent years, a number of significant policy changes have taken place within the University. Traditionally, different departments and faculties have been treated equally in matters like resource allocation. A few years ago, performance and quality have been added to the allocation criteria, and this fact has steered the development of assessment procedures. Indicators for identifying centers of excellence in research and for rewarding departments and individuals providing high quality teaching have been developed. Support for outstanding achievement seems to be emphasized in future strategy planning as well.

One of the future trends is the University's increasing openness towards the non-academic community. The

University is increasingly interested in student job placement after graduation, in increasing co-operation with other organizations, and in finding new sources of funding. The University is also interested in its image in the eyes of the students, its personnel and the non-academic community. This opening up also has an influence on the kinds of information the University will be seeking through assessments.

As a summary of the evaluations carried out at the University of Helsinki in the 1990s, it can be said that a relatively positive evaluation atmosphere, which solidly supports the development of the University, has emerged. The goal is that supporting evaluation processes taking place in various parts of the University and developing effective tools for evaluation would lead to a situation where evaluations form a normal part of University operations. When the results of evaluations are presented as reports to the department heads, deans and the university's central administration, the evaluations will become a management tool in addition to being part of the internal development work of the various units.

## Normative Implications of Assessment and Evaluation

The critical literature around the 'quality movement' points to unresolved tension in quality theory and practice between the dual purposes of control and improvement or learning. Similar concerns are evident in the literature on quality in higher education. Harvey (1998) notes, "there is little analysis of the rationale behind the methods [of quality monitoring] because there is little exploration of what 'quality' is in a higher education context". Quality has become mired in instrumental responses to the accountability expectations of 'others' and demonstrating "fitness for purpose" without much debate on the meaning of fitness, clear identification of purpose or exploration of the complex interrelationships that ultimately impact on key stakeholders. In practice quality as compliance is winning out over quality as learning and transformation.

These observations indicate that fundamental questions in key sub-themes of the quality in higher education debate remain unresolved, namely:

- What is quality in an educational context?
- Who decides measures and controls it?
- Can diverse stakeholder interests be fairly reflected?
- How should quality be measured?

### Assessment and Evaluation as Technologies of Quality

[Assessment is] a mechanism to control students... more pervasive and insidious than most staff would be prepared to acknowledge ... based on bad habits copied from the past and a lack of critical thinking about what we do.

We are locked into patterns of assessment, which cannot be justified on any educational grounds...

We must focus unerringly on our educational goals and not be distracted by apparent short-term convenience (Boud, 1998: 135)

Tension exists between purposes of assessment as control and learning: summative assessment certifies; formative assessment prompts learning. In the first case, assessment is directed towards an external audience and its 'quality' is judged in relation to how accurately it portrays what a student knows, can do or is prepared to progress to: assessment is a technology of control. Formative assessment is directed to students and its 'quality' is judged in relation to the richness and usefulness of the feedback provided and its contribution to learning: it is a technology for improvement. In relation to evaluation similar tension exists: summative evaluation certifies; formative evaluation prompts improvement. In the first case, evaluation is directed towards an audience external to the immediate learning environment: it is a technology of control. Formative evaluation is directed to lecturers to provide feedback and contribution to learning: it is a technology for improvement.

Given this tension, policies and practices ought to be dominated by hard questions of purpose. The key questions should be:

For assessment of learning

- Why are we assessing?
- Who benefits?
- What should we be assessing?

For evaluation of teaching

- Why are we evaluating?
- Who benefits?
- What should we be evaluating?

However, efforts often seem to be absorbed in issues of administration and fixes for symptoms rather than in pursuing solutions to fundamental issues. The instrumental question ‘how can we do ‘it’ effectively?’ dominates the search for answers. Those fixes often are underpinned by common assumptions that remain uncontested.

Some common and, from Boud’s perspective, erroneous assumptions about assessment are:

- Assessment merely measures what a student knows; it does not influence or change it.
- Assessment is about creating league tables of the brightest and best.
- All students must be treated identically/judged equitably.
- Students are congenital cheats and will do everything in their power to do better than their peers.
- The unseen examination is the yardstick against which all assessment practice must be judged.

Boud presents a partial answer: that the source of expertise of the assessors (lecturers and administrators) lies mostly in their own experience of being assessed and “because of this assessment has become charged with a degree of emotion that does not act in our own interests or those of our students”. ‘Bad’ practice and the continued influence of assumptions that are no longer tenable are the consequence of history and the environment. Evaluation is likely to be influenced of unquestioned assumptions because of the lack of history. Evaluation of teaching is a relatively new technology in universities.

Another partial answer may lie in the apparent absence of a systemic framework and methodology for critique that prompts reflection on purpose and meaning rather than simple, bounded reflection on technique. Critical Systems Thinking and Critical Systems Heuristics may offer such a framework and methodology.

Problems of practical reason require a mechanism which facilitates meaningful participation between two groups of unequal expert status and which extends critique beyond considerations of technique. Ulrich’s Critical Systems Heuristics (CSH) examines the assumptions that underlie social system designs and force the stakeholders to be up front about the inevitable normative content that makes up such designs.

CSH explicitly recognizes that the knowledge claims of experts rest on boundary judgment that has no ultimate rational justification. Provided boundary judgments can be identified and debated, then there are no experts and meaningful participation is then possible. Under CSH, boundary judgments are identified by employing 12 critically normative questions that examines sources of motivation, control, expertise and legitimacy.

Four groups of three critical heuristics centre on what might be termed loosely the human element of the system design, (S):

- The client: who benefits?
- The decision taker: who has control?
- The expert: what source of legitimacy guarantees the design?
- And the witness: what is the legitimate basis of the design?

CSH operates in two modes reflecting the here and now, and the possibility of alternative designs. When the answer to the “is” mode is compared with answers to the “ought” mode the normative content of the system’s design is revealed to the planners. Other possible system designs can also be developed. CSH allowed the researchers to better understand the limitations of the assessment and evaluation policies and practices of a university and to see what basis of legitimacy they rely on.

## **Proposal**

Based in the analysis of proposals into different organisms like UNESCO, OECD, WB, IDB, and the studies of universities, the following proposal consists on generating criteria and indicators to achieve quality assessment, presented in Table 1

TABLE 1: CRITERIONS AND INDICATORS FOR QUALITY EVALUATION IN HIGHER EDUCATION INSTITUTIONS.

Criteria	Indicators
Institutional and organizational factors	<ol style="list-style-type: none"> <li>1. Organizational Structure</li> <li>2. Strategic vision and Mission</li> <li>3. Roll of the collegiate committees</li> <li>4. Academic leaderships</li> <li>5. Academic Development</li> <li>6. Knowledge Management</li> </ol>
Context Factors (external and internal)	<ol style="list-style-type: none"> <li>1. Interaction with society</li> <li>2. Linking projects with business, government and social sectors</li> <li>3. Agreements of national and international academic mobility</li> <li>4. Institutional communication</li> <li>5. Sources of financing</li> <li>6. Knowledge Management and development</li> <li>7. Graduated databases</li> <li>8. Respect to the rights and the academics' freedom</li> <li>9. Critical and creative thought</li> </ol>
Inputs Quality	<ol style="list-style-type: none"> <li>1. Update of programs and study plans</li> <li>2. Financial and formation supports for research.</li> <li>3. Administrative supports for faculty</li> <li>4. Computational technology and information strategic centers</li> <li>5. Students' skills</li> <li>6. Facilities and plant physical</li> <li>7. Attention on demand</li> <li>8. Motivation and responsibility of academics and students</li> <li>9. Autonomy in making institutional decisions</li> </ol>
Processes Quality	<ol style="list-style-type: none"> <li>1. Empower the faculty</li> <li>2. Systems of continuous self assessment</li> <li>3. Innovators teaching model based on learning</li> <li>4. Development of directive's skills</li> <li>5. Curricular Model with vision of modernity</li> <li>6. Academic and students exchange abroad</li> <li>7. Integration of teaching, research and extension processes</li> <li>8. Use appropriate of institutional resources (human, materials and financial)</li> <li>9. Generation of entrepreneurs and environment transformers</li> <li>10. Effectiveness in social service processes and internship</li> <li>11. Processes of students' tutorship</li> </ol>
Products Quality	<ol style="list-style-type: none"> <li>1. Study programs accredited as national as internationally</li> <li>2. Faculty Certification</li> <li>3. Administrative Processes Certification</li> <li>4. Recognitions for research or exchange projects</li> <li>5. Students' certification</li> <li>6. Answer speed to the changes in knowledge field</li> <li>7. To anchor and to evaluate knowledge development</li> <li>8. Promotion of environmental and sustainability culture</li> <li>9. High-performance Programs</li> <li>10. Social recognition in quality</li> <li>11. The students' global competitions</li> <li>12. Update databases of Graduated.</li> <li>13. Consultantship and training Agreements with sectors</li> </ol>

For quality assessment, it is necessary to make decision of carrying out a change, which is suggested with:

1. The convincing and formation of the high direction. High directives have the commitment of involving in the change, supporting, participating, convincing and integrating whole institution.
2. Deploy in whole institution that includes the formation of quality system in all University levels, where should be formed the commitment groups, where each member contributes their talent, experience and knowledge, which should be integrated to reach a common purpose. The teamwork favors creativity, innovation and commitment toward the quality continuous improvement.
3. Then, all should participate in continuous improvement processes; development of institution members is only possible efficiently with the application of favorable conditions. Total involvement in improvement processes is the teamwork.
4. Lastly, the development and constant performance in quality culture of institution members should remain. The society is the customer; it is the beginning and closing point in service cycle, witch is part of quality system.

## **Distance Education as e-Service to Support Higher Quality of Education**

*Michal Greguš*

*Eleonóra Beňová*

*Nora Hlivárová*

*Comenius University, Slovak Republic*

### **Abstract**

Distance education is an educational method that instead of direct contact of a student and a professor introduces mediated contact. To learn at distance means to be able to study independently without the presence on a traditional form of teaching-hour. Every participant of this process sets his/her own educational goals adjusted to his/her needs and the rhythm of life. Education plays ever increasing role in today's dynamically changing business environment, managers have to adapt to these changes. The need for higher quality part-time education grows. The solution for the governments and universities lies in e-learning. The effort to support distance education is reflected also in various development programs of EU and also of national governments and reflected in new higher education laws. We are going to discuss what considerations are influencing university education, analyze the trends and discuss the ways to support higher quality of distance education.

### **Introduction: Changes as Stimulus to Continuing Revolution**

We live in a changing environment and therefore constantly need to adapt to changes with which we are confronted. Our ability to adapt constantly to this changing environment is what distinguishes us from other species. To adapt is, of course, to learn. This ability together with our ability to think ahead, and therefore to imagine the future results of today's actions, before they are actually finished, made us what we are today. Continuous adaptation, learning and facing new challenges keeps our minds in motion. Stopping this process would make us stagnate and eventually lose.

Changes in our environment do not necessarily need to be radical. Most changes are, in fact, insignificant and adaptation is a process not even realized by most people since this process is natural: It is like sitting in a boat. One is not conscious of movement until one looks around and watches the world passing by.

Learning process should be a natural constituent of our lives. It seems maybe unnecessary for those who are not wishing any changes, but preserving a status quo is unnatural for us, as it means moving backwards from the view of the changing environment.

### **New Technologies Force Adaptations**

The Internet, as a worldwide platform to exchange all kinds of information, to trade products and offer services lets boundaries vanish and facilitates trading with partners all over the world. This globalization process brings new trends and new technologies, which change all the ways of life faster than ever before. The influence can be felt and seen everywhere. Communication has changed to hyper-communication, business has acquired new dimension – e-business, distance education has changed into e-learning.

As we are confronted with changes, we adapt our actions to the new situations. We develop and enhance new technologies, and as our point of view changes with respect to these new technologies, we adapt our behavior to these technologies to full capacity. Let us take mobile phones as an example: Not too many years ago, people owning or using mobile phones in public were easily considered as pretenders, who tried to act more important than they were. Today everybody has a mobile phone and uses it wherever he wants. We have adapted our thinking and our behaviors to the new technologies as we started to use them.

Mobile phones and the development of the Internet, from an US military project in the sixties of the last century to a worldwide civilian and commercial network, which it is today, take part in making information

available almost everywhere and at any time. „The ability to streamline the structure of information and to influence and control its flow is a dramatically more powerful and cost-effective service than is that of moving and manufacturing physical products. The information surrounding a product or service is more important than the product or service itself<sup>i</sup>

The role of information in today's markets cannot be overestimated. Information is one of today's most valuable products. Contrariwise the validity of information decreases tremendously, since it can be spread throughout the world in seconds by using the new technologies. Debates about first-mover advantage therefore become a history lesson; execution is all that matters.<sup>ii</sup> Information becomes worthless if it is not used.

## **Distance Education as E-Service**

Problems with adapting the classical forms of education to the needs of educating the adults, growing population of the world, as well as with economic and technical evolution are growing due to fast and deep changes that are caused by the development of new technologies and many scientific innovations. The growth of importance of information in the process of production, marketing, services and public sector is causing that classical forms of education has become inadequate. The crises that national educational systems go through are the evidence of the difficulty to put into harmony the classical mission of the school – build up, maintaining and development of knowledge – with the new requirements it must face, namely the design of new structures and types of education adequate to new challenges, especially new requirements of the market.

Telecommunications, computer networks, multimedia, information and communication technologies and World Wide Web have opened up completely new way for education and learning for every kind of institutions, be it academic, or business. Those who study can work, anywhere in the world and communicate among themselves and with the professors creating virtual organizations. Information and communication technologies are thus used for dissemination of knowledge and empowerment. They (the ICT) enable delocalization of knowledge by placing it on the global computer network and thus making it available to public. Distance education has the potential to become widely available and at the same time on the other hand serving the needs of the individual.

Distance education is becoming due to continually growing educational wealth of the web a permanent part of university education. We know as on-line education, telenautics and most commonly under the name e-learning and its importance is growing from year to year. Today it serves mainly as supporting service to traditional education, but it has a potential to become an alternative of direct interactive synchronous education from the following reasons:

- The need to increase educational offer for graduates of secondary schools, because today the state (public) and private universities have no physical places for them. Educating young generation is for any country one of the best possible investments. It is also a possibility for lifelong education since today's information society exerts enormous pressure on its members to study and acquire new knowledge all the time. Only a small part of the population can find time and place on postgraduate courses on universities. Majority will opt for short and intensive on-line courses, which it can take at a convenient time and location.
- The need for new professional qualification, especially for those, which are in professions that are likely to cease to exist in near future. It can be an answer to the dynamically changing labor market.
- To support educational activities of students both in full-time and part-time studies (with the aim to improve its effectiveness and efficiency) and still improve the quality of learning. To this aim one can use virtual (networked) classrooms.

### **Synchronous and Asynchronous Systems in Distance Education**

When we want to use e-learning method of education we computers connected to a global computer network Internet. During the process of learning we need to use such an environment that stimulates the active participation of the student. In e-learning we can distinguish four levels of such an environment:

- Databases. Indexed databases of data containing the explanations of problems connected with the educational program and instructions enabling to go step by step through the given tasks.

- Didactic on-line support. It functions similarly to databases. It permits to use discussion forums, chat rooms, bulletins, e-mail or some communication system. This form is more interactive than the database one.
- Asynchronous education. It uses all forms of asynchronous communication and various activities as chat, virtual seminars, computer simulations in virtual laboratory, team projects, lectures and exercises on CDs or DVDs.
- Synchronous education. It includes lessons in real time. The participants can join the lecture or seminar at any moment when it is running. Teacher may use a virtual blackboard, which serves for presenting various information. The student can pose a question any time during a lecture (or answer a question). Videoconferences belong to the form of synchronous education, too.

Of course, synchronous education is the most advanced environment for distance education from “technical” point of view. From the point of view of educational psychology we can identify three domains, which can affect the learning process: the affective, psychomotor and cognitive domain:

- **Affective learning** is demonstrated by behaviors indicating attitudes of awareness, interest, attention, concern, and responsibility, ability to listen and respond in interactions with others, and ability to demonstrate those attitudinal characteristics or values which are appropriate to the test situation and the field of study.
- Psychomotor learning is demonstrated by physical skills; coordination, dexterity, manipulation, grace, strength, speed; actions which demonstrate the fine motor skills such as use of precision instruments or tools, or actions which evidence gross motor skills such as the use of the body in dance or athletic performance.
- Cognitive learning is demonstrated by knowledge recall and the intellectual skills: comprehending information, organizing ideas, analyzing and synthesizing data, applying knowledge, choosing among alternatives in problem-solving, and evaluating ideas or actions. This domain on the acquisition and use of knowledge is predominant in the majority of courses. Bloom identified six levels within the cognitive domain, from the simple recall or recognition of facts, as the lowest level, through increasingly more complex and abstract mental levels, to the highest order, which is classified as evaluation.

Researchers have spent much time investigating the study methods of successful and unsuccessful students at university to see what learning skills and strategies have been consistently used or ignored by these students. The results indicate that there is no set of techniques guaranteed to produce high grades, nor is academic success dependent on using “proper” techniques. In other words, there is no correct or “right” way to study.

Researchers have been able to identify three characteristics related to studying that distinguish successful from unsuccessful students. These are:

- Successful students organize their studies so they do not fall behind in their courses. They have developed appropriate course management and time management skills.
- Successful students favor a deep processing approach to their learning, as opposed to a surface approach.
- Successful students have acquired meta-cognitive skills.

Meta-cognition is the awareness and knowledge about one's own learning and the ways that knowledge is used during the learning process. It involves the awareness of the task of learning and the ability to self-regulate different approaches to specific learning tasks.

Learning strategies are the cognitive approaches used to acquire, access, organize and use knowledge; an approach to a task that is consciously planned that enables the learner to reach a learning goal in an optimal manner. A strategic learner is one who has developed an awareness of the task demands; an understanding of the purpose of the learning activities; and flexibility in responding to different demands appropriately.

#### **New Trends in Management Development**

New conditions in management development require application of new methods. Among the most effective, very perspective and nowadays more and more preferred ones belong the participative methods. Participative methods awaken interest among the participants; allow more effective learning and development of knowledge, more efficient transformation of knowledge into practice through the one own experience. The knowledge acquired through these methods are more lasting. The attention is on the student, not on the lecturer. Important is to learn what the student wants to learn, not what the lecturer wishes to lecture. The student is more responsible for the result of the course, since the lecturer's role is that of a facilitator, mentor, or advisor. He becomes a member of the team, expressing his ideas how to solve the problem.

We can say, that application of the participative method of education:

- Requires active participation of all students.
- Uses full inner participation
- Builds on experiences and abilities.
- Develops, widens knowledge and abilities.
- Teaches actively solve and overcome problems.
- Allows easier transformation of the learned into practice.

The use of participative methods requires very careful planning and preparation. The development programs that use participative methods use the experience, abilities, knowledge and aims of participants. The experience and knowledge is here revised, the attitudes analyzed, abilities developed further. The participants form a group, they work in small teams. Indelible part of the process is to encourage the participants to apply the results in real environment. It is a good idea if the participative methods are combined with lectures.

When we use participative methods it is important:

- To use structured and understandable materials.
- To use visual aids.
- To support independent research.
- To require active listening.
- To support social learning.
- To support active participation.
- To simulate (model) reality.
- To discuss.
- To use functional games, feedback, role playing.
- To create mutual acceptance and emotional participation of students.
- To ensure open communication.
- To solve conflicts (if any) constructively.
- To create the rules of behavior accepted by all.
- To carry the (mutual) responsibility for attained results.

## Conclusion

The educational opportunities that distance education offers are exciting, but institutions face several problems that need to be addressed before such projects can be made real. Among the challenges are the development of:

- Appropriate organizational and business strategies.
- Appropriate definitions of intellectual property rules with faculty and other developers.
- Teaching methodologies that recognize new styles of learning.
- Suitable online student services and support structures.
- Adequate faculty support structures.
- Defining study programs and how many courses will be accepted for a degree.
- Administration and financing.

Distance education methods can increase the quality of higher education through:

- Enhanced learning experiences.
- Improved access to education.
- Greater flexibility of study programs.
- Setting the individual pace of study.
- Access to more educational resources
- Increased interaction and collaboration globally.

Distance education will become important part of higher education's future. As it is said in EU development program the e-learning program is a further step towards realizing the vision of technology serving lifelong learning. It focuses on a set of actions in high priority areas, chosen for their strategic relevance to the modernization of Europe's education and training systems.

# Elements of Usability Perceived by Mexican Students in Two Commercial Web Sites (A Study Performed in Guadalajara, Mexico)

*Juan Antonio Vargas Barraza  
Universidad de Guadalajara, México*

## Abstract

Electronic commerce has had a considerable development in the world. Some authors have stated that the lack or presence of Usability's elements could bring the success or the fail for a Site in the Internet. Despite the attractiveness and the problems attached to the e-business, little research about Usability and Electronic commerce has been performed in developing countries. To find some Usability's elements, 122 students from two Mexican Universities were requested to simulate an on-line purchase in two different Internet sites, being one American (English), and the other Mexican (Spanish). The age of the students oscillated between the 20 and 23 years. Using ANCOVA as statistical analysis to measure which Site's features prompted to the participants the following elements: Interest for the Site, Sensation of Security, Sensation of Confidence, and Desire to Return to the Visited Site. Finally some future work and possibilities were described, together with the conclusions.

## Introduction

The greatest benefit of the Internet has been its global presence. Nowadays it is possible from our house to access to an established Website in for example Russia, Nepal, United Kingdom, etc. Places that would be almost impossible to visit via another way. This feature, - as well others such as the evolution of the communication protocols, speed of the computers, and the security for the commercial transactions in the network, - has been taken by people and/or companies to make what it is known as electronic commerce.

Some researchers have compared the expansion of the Internet and its commercial potential to the growth of the radio in the first quarter of XX century: The radio was becoming from a cheap alternative for a market niche, to a phenomenon of consumption, that implied changes in the way to make publicity, and introduced the concept of Mass Culture. The dilemma also arises from how making the radio profitable, and also how to attract listeners, and keep them. It took the radio 38 years to achieve 50 million of listeners, while for the Internet was a single period of 4 years, (for the TV, it took 14 years to obtain that amount of users). [6]

The same questions that arose in the beginning of the radio are now being retaken for the Internet: How to make a site profitable? How to attract purchasers? How to make them return? How to make them buy for the first time, and repeat the purchases? Despite those resemblances, there is a significant difference between the radio and the Internet: radio is a one to masses communication, and Internet makes possible an one to one interaction and communication, and it does not hold to specific schedules. Also, as I said previously, a website can be visited from any place of the world, this feature has caused that the scholars begin to think and to propose diverse approaches in order to give the websites an universal character, to attract different types of potential customers. Then, we may say that some features of a website are important to obtain the approval of prospective consumers, to increase the rate of the visits, and create them the conditions to stop and buy in the site, and finally, make those purchases a repetitive action.

The Internet, with its multimedia capabilities, must provide to the client a way to please him during the time he is spending in the site. The developers of a website must take into account the visitor's characteristics, but also the perception that the visitor takes from the site. For example, if we see from the point of view of the client and its cultural surroundings, two approaches exist: Standardize or to globalize a Webpage [11], so that it is the same one anywhere in the world, or the concept "to think global, to act global", in other words, to adapt the internet sites to the different characteristics of a population that takes itself like objective. For the design of the sites, or taking the concept also called internationalization [15], where the process of design and improvement of a product becomes

free of cultural distortions, in opposite with the location [15], where the product, in this case the site, is adapted or accommodates to an specific area. All these problems: cultural and security approaches, trust, trust, etc., are always related to the appearance in which a Website is going to be designed, now, here is when the concept of Usability comes in. Consulting companies are already entirely dedicated to answer questions related to what is usability and how manage it. These companies are mainly from U.S.A. and the United Kingdom. In the Spanish-speaking countries the guideline in the studies about usability is Spain, where one university has established a usability laboratory [16].

One of the Internet fastest growing Hispanic countries is Mexico, where the increasing of the computer use and the e-business looks promising: one of each 10 homes has a computer, and at least 300 cities are already connected to services of Internet by optical fiber wiring. Mexico is one of the countries with greater number of connections of Internet by population. The country is placed in number 24 of OECD countries with services of broadband. The future for electronic commerce in Mexico is quite promising, and has the interest of the private sector. Some Mexican companies, and Hispano Americans have begun to use models that have been proven of successful way in the U.S.A., as much in the form of auctions, direct sales and financial services. Sites like Amazon.com, Patagon.com, and ebay.com, already influence the Spanish speaking market: Submarine.com, español.com, deRemate.com, MercadoLibre.com, Zonafinanciera.com, StarMedia.com and UniversoOnline.com [7], which have had different luck in Internet. This added to the increase of the number of personal computers between the population. Nevertheless, in the year 2000, only represented 0,17 % of the sales in the national economy, although it is hoped that this proportion will grow to 1,2% for 2004. In relation to the clients and the electronic commerce, the problems that appear in Mexico have been similar to which they appear in other countries, like the U.S.A. [12].

Despite their growth and good expectations, the studies on usability in Mexico have been nonexistent, although some works have appeared, they have been made by foreigners who look for how to determine which usability's elements are perceived by users in different countries, some examples: The icon to send an electronic mail (mailbox, or postcard), or to indicate that they handle versions of the site in different languages (*English*: flag of the U.S.A. or the United Kingdom. *Spanish*: Flag of Spain, or the Latin American country where the Web site was created.).

## The Usability Concept

The word usability has been mention lines above, but still there have not been a definition of what usability stands for. An exact meaning is complicated. Usability is, to say it somehow, the measurement of quality that a user gives to a site, in other words, that the users are able to make in an easy way the tasks associated with the use or navigation of a web site. The criteria to consider what is USABLE, and how we can measure it, are different for each Web site and for each person [5]. There are even ISO standards to define what is Usability, and some authors [1], have incorporated them to their studies to measure it:

ISO/IEC 9126: "the usability talks about the capability of a software to be included/understood, to be learned, to be used and to be attractive for the user, in specific conditions of use". In this definition, the emphasis is placed in the product, and the importance of its attributes, external or internal, those that help the user. A relation exists then user-product.

ISO/IEC 9241: "understood for which a product can be used by a specified user, to reach goals with effectiveness, efficiency, and satisfaction in a specified context of use". Here the definition is centered in the concepts of quality of the tasks that a user makes, and its effectiveness.

The usability concepts that the ISO standards talk about, allow us to define some elements in which usability is cradled (See Table 1). Before the expansion of the Internet, the concept of usability in the information systems was in any case a key group of five elements (See Table 2).

Together with the expansion of the Internet, the concept of usability has also been extended and begun to be the center of deeper investigations, some of the characteristics that have been added to the concept are: 1) *Navigation*, 2) *Time of Response*, 3) *Credibility*, and finally 4) *Content*. In other words: an easy navigation, with the

minimum of time for a page to download, and with contents of quality [13]. Sears suggests that more investigations for usability should be done around the effects of the media in the following areas: Network delay, designing decisions, navigation strategies, user's characteristics, and tasks of the user for usability's based systems in the WWW [17]. Many of the works that have been made to find measurements of usability are focused on the characteristics of the sites, in order to be able to determine which features of a website are attractive to the users, this researches are within the areas that Sears mentions in the vein of investigation sources.

TABLE 1: CONCEPTS OF USABILITY DEFINED BY ISO. ADAPTED OF BEVAN AND MACLEOD. [3].

<b>Elements of usability</b>	<b>Based on:</b>
Facility for Learning	Predictability, synthesizes, familiarity, the generalization of the previous knowledge and the consistency
Flexibility	The variety of possibilities with which the user and the system can interchange information
Robustness	It is the level of support to the user who facilitates the fulfillment of his objectives

TABLE 2: ELEMENT OF INTERNET IN THE INFORMATION SYSTEMS. ADAPTED OF PALMER.[13].

<b>Elements</b>	<b>Definition</b>
Consistency with the interface	Placing in a common way the navigation tools, as the buttons and bars
Time of downloading	Focuses in the speed in which the system provides an answer to the activity with the navigator or visitor
Mapping and Metaphors	Addresses the navigation from a place to another one within the system and the adoption of "metaphors" you specify, as they can be the "shopping cars" that means that selected products are kept to buy
Styles of Interaction	Is concentrated in the messages of the system that are generated in answer to the activities of the visitor or user
Multimedia and audiovisuals	This is the degree in which the capabilities of multimedia are incorporated in the development of the system

## Previous Works

The problem that face most of the designers of Websites belongs, as we have seen, to the scope of the usability: Characteristic that make my page or website useful, and produce a pleasant experience visiting the site. A very key issue is the trust that a site generates to a possible buyer. Since the internet shopper is not going to have "a physical" exhibition to the product, meaning that it will not exist a contact with the product he/she is buying, the trust must be something very important at the time of making an on-line purchase. Some differences between the products that are been sold through Internet exist: There are products of a high level of contact, those are the goods that the customer prefers to physically inspect before buying them, such as: clothes, antiques, and even food [14]. Also, there are products with a low level, or with no need of contact, such as: financial software, computers, music, services trips, books, videos, etc. (Nevertheless, it also has been discovered that some products of high level of contact are sold well by Internet: clothes, shoes, flowers, food and wine.). [10]

Other researches have worked with user groups where pages of products or companies are visited and analyzed, looking to find key factors related to the design of the page, information of the site, proximity towards the users, etc. In general terms, they point out items like: loading time of the page, content, efficiency of navigation, security, proximity to the consumer and marketing, personal clinch, useful information, simplicity of the design, desire to establish a relation [1]. With respect to quality of the information, this can also be divided in: accessibility to the information, quality of the graphs, meaning of the graphs, etc.

The Microsoft's guide of usability works with 5 referring categories [9], and their subcategories:

**Content:** Which assures the information and the capabilities of transaction of a Website This is subdivided as well in *relevance* (importance of the content for the users), *Use of the media* (appropriate use of the multimedia content), *depth and width* (the appropriate rank and detail of the subjects), *Information on time and current* (if the content of a site is present or not).

**Ease to use:** The cognitive effort required for use a site. Also it is subdivided here, being the subcategories: *Goals* (related to clear and comprehensible objectives), *Structure* (Focused in the organization of the site), and *Feedback* (in the understood that the Website gives information to the user).

**Promotion:** The publicity of a site in the Internet and other media. It is considered critic to be a magnet for other navigators into one specific Website.

**Made for the Media:** The form or measurement of a site to cover the particular necessities to a visitor. Their subcategories are: *Community*, (where it is possible to see if the offers to a visitor to be part of an on-line group), *Personalization*, (the possibilities of adapting a site technologically, like the control to download multimedia programs to see archives or to listen music), *Refinement*, (the importance gave to new proposals).

**Emotion:** the one that produces us affective reactions to certain sites of Internet. Their subcategories are: *Challenge*, (the difficulty, in the sense of being able to overcome it, instead of the site's complexity), *Trace*, (the way a site moves the interest of the users), *character strangeness*, (related with the credibility), and finally, *Peacefulness* that site can provide to the visitors.

Among the studies that have tried to measure the characteristics of buyers in the world, special attention should be made to the one completed by Lynch, Kent and Srinivasan, where, even though the experiment was not made to determine usability issues, they tried to find which elements in a portal of Internet can increase 1) the desire of the clients to make a purchase and 2) the desire to return to the site [10]. The elements to determine these two factors were: the quality of the site, the trust, and the attitude towards the site. The trust turned out to be the most significant element for the purchase intention, and for loyalty towards the site, the trust was again the most significant element. The experiment used students of 12 countries (Germany, Argentina, Brazil, Canada, Denmark, Spain, the United States, France, Italy, Mexico, and South America - it does not distinguish which countries are part of this group). The results were given in a global form, without indicate which regions are more susceptible to the investigated elements.

Gibbs, Kraemer, and Jason working on aspects of electronic commerce, found some points in common that the consumers have noticed. The visitors want from a websites, to provide valuable and useful contents, a better usefulness, improvements for the way of life and a greater selection for product and services. Users from U.S.A. mention that a greater selection as a key issue for the success of a site, however in Japan, Singapore and China only the young users pointed that, and for Brazil, Mexico and Taiwan its lack is mentioned as inhibiting in the diffusion of electronic commerce B2C. [4].

## Measurements and Development of Hypothesis

The following hypotheses were considered:

H1: *Elements such as emotion, promotion, time of response, ease of use, experience, content, made for the media cause the feeling of security in the user.*

H2: *Elements such as emotion, promotion, time of response, ease of use, experience, content, made for the media cause the feeling of trust in the user.*

H3: *Elements such as emotion, promotion, time of response, ease of use, experience, content, made for the media cause the feeling of interest in the user.*

H4: *Elements such as emotion, promotion, time of response, ease of use, experience, content, made for the media cause the feeling to return to the site in the user.*

H5: *Navigation Strategies, User's tasks, and the characteristics of the users affect the feeling of security, interest, trust, and desire to return to the site.*

ANCOVA was used as method of analysis to find these relations, due to this type of test analyzes the relation between a dependent variable and the two or most independent ones, and also eliminates and controls the

effect of at least one of these independent variables. A regression perspective is used; because it is desired to examine the effect of the categorical independent variables and the variables quantitative continuous over our independent variable. In addition to all of these, this method eliminates unwanted influences in our independent variable, caused by our sample.

The elements used as independent variables were: sensation of trust, security, interest in the site and desire of return to the site. Why these elements are selected? Well, already it has been mentioned [1] that for a business to be successful, it is necessary that the potential buyer knows that the site exists, visits the site, make them to be interested in the offered products and the site, dares to buy (the customer would have the security of a transaction made without problems), and continue returning to make purchases in the same place. The fourth dependent variable analyzed in this work is the trust. If we observe trust from the point of view of the traditional commerce, it is necessary for a customer to have trust in a store or a seller, before he/she can make a purchase. It is important to detect which usability elements deal with the diffusion of trust in the electronic world, where the potential buyer cannot "touch", perceive or feel the displayed products. [10].

It was decided to work with two sites that use B2C type of electronic commerce, the B2C is the most extended type of e-business, also this type of e-commerce must be the most universal because it tries to penetrate different types of users. It was set to use a site in English and another one in Spanish, where both had the following characteristics:

1. Selling diverse types of products
2. The possibility "of seeing" those products
3. To accept all type of credit cards
4. That they were known
5. Both sites were handled in a single language, being one in English, and the other in Spanish

The site in English, has already been mentioned by other authors as a reference for a B2C type: [www.amazon.com](http://www.amazon.com), for the site in Spanish, the chosen one was one of the so called "clones" of Amazon [20], close to the English site in its features, and also famous because the constant media bombing (TV and radio), this site was [www.esmas.com](http://www.esmas.com), that belongs to Televisa, one of the biggest media corporation in Latin America, and the biggest in Mexico.

The survey was designed to measure several perceived usability values. A non-probabilistic sample from two Universities in Guadalajara was used: the University of Guadalajara, and the ITESO (Institute of Superior Studies of the West, as writing in Spanish). Two groups of bachelors level by university, and were chose, and also a group of graduated students from the University of Guadalajara. All the students were Mexicans. The total number of selected students was of 160. They were asked to answer a questionnaire. 122 surveys returned answered (76,25%). The bachelors degree students were compensate with extra points on their final grades, there was no compensation for the graduate students. The students were instructed to fill the survey wherever they wanted, just keeping in mind a dead line for returning.

The questionnaire was divided in three parts. The first one was demographic data and questions related with the Internet connections of the participants. The survey's questions were based in the work published by the Mexican Internet Association [2]. The second part were instructions to make a purchasing simulation. Half of the participants, randomly selected, were requested to work in the site in Spanish; the other half must work in the site in English. The categorical independent variables were taken from these two parts, and related to the points that Sears suggests [17] (Table 3).

A series of questions representing different elements from usability, were placed in the third part of the survey, and used as continuous quantitative independent variables. This part of the questionnaire was also divided in:

- a) A series of questions requesting to describe the visited site. (Table 4).
- b) Questions about the feelings of the user respect to the site. (Table 5).

In both parts the questions were based on the questionnaire elaborated by Palmer, with answers using a Likert's scale of 7 values, (1 = poor under that excellent measurement, 7 = in that measurement.) [13]. To simulate the purchase, first they had to look in the assigned site, and try to find a compact disc from a rock band, whose name was specified in the instructions, second, to see if exists the capability for listen some extracts of one of

the songs in the compact disc, and if so, do it. After those actions, add the disc to a cart of purchases, close the purchase, and enter their personal data, including electronic mail. They must search for the payment method, for the ones that have credit card, to use it, and before close the purchase, canceling the payment action and close the website.

TABLE 3: CATEGORICAL INDEPENDENT VARIABLES. OWN ELABORATION.

Questions	Points
Previously knowing of the site	Navigation Strategies
Site	User Tasks
Gender	User Characteristics
To speak English	User Characteristics
To have a credit card	User Characteristics
Type of Internet connection	Navigation Strategies
Place where the users connects to Internet	Navigation Strategies
Time being Internet user	User Characteristics
Previous Internet purchases Experience	User Characteristics

TABLE 4: QUESTIONS RELATED TO THE QUALIFICATION OF THE SITE. OWN ELABORATION

Question	Usability element
Effectively Organized	Ease to use
Gives good information of the products that sells	Content
Displays a variety of products	Content
Provides useful information and Aid (like FAQs)	Interaction
Provides feedback	Interaction
Provides the capability to adapt it to my system	Made for the media
Provides user interaction	Interaction

TABLE 5: QUESTIONS RELATED TO THE FEELING TOWARDS THE SITE. OWN ELABORATION.

Question	Usability element
Having previous knowing of the site existence gives security	Experience (learning)
Easy to operate the site	Ease to use
The site was amused	Emotion
The visited site was frustrating	Emotion
The links are appropriate	Promotion
The sequence of pages from the beginning to the end	Ease to use (Structure)
The design of the page made easier to finish the task	Ease to use (Structure)
Concern to provide personal data in the visited site	Credibility
The speed with which the computer provides information	Response time
Understandable Instructions	Ease to use (Structure)
Enough amount of images	Content
Likeliness to return in the future to the Site	Emotion
Better than others	Promotion
Willingness to recommend the site	Promotion
Impatience by the time of response	Response time
Fear to the site	Ease to use

## Results and Discussion

The proportion of women and men in the experiment was equal, 50% and 50%. The users of the site [www.esmas.com](http://www.esmas.com), (e), were slightly greater, (53.23%), than the users of [www.amazon.com](http://www.amazon.com), (a), (46.77%). Most of the Internet connections were made from their homes (58.87%), followed by the school (20.97%), the work (11.29%) and finally cyber-cafe (8.87%). Three quarters of the participants had no previous experience purchasing

in the Internet, (76,23% against 23,77% that had). 68.33% of all the students who answered the survey spoke English, against 31,67% that did not. Although the majority felt that their level of English was acceptable 43.21%. (6,17% excellent, 38,27% good, and 12,35% bad, no one considered it terrible).

For the case of the trust, (Table 6), the variables that were perceived as trust elements were: “variety of products” and “frustration level”. The element “variety of products” agrees with the founded by Gibbs, Kraemer, and Jason, where they point out that the lack of this element was a trust’s inhibitor in Brazil, Mexico and Taiwan [4]. The other perceived element, “frustration level”, is considered to be inside the emotion elements, being those that produce affective reactions to us with the visited site. Possibly a site design to produce a pleasant visit generates more trust.

TABLE 6: ANALYSIS OF COVARIANCE FOR “TRUST”.

Type III - Sums of Squares.					
Source	Sum of Squares	Df	Mean Square	F-Ratio	P-Value
<b>Covariates</b>					
Variety of products	8.40162	1	8.40162	6.6	0.0129
Frustration Level	5.3044	1	5.3044	4.17	0.0459
<b>Residual</b>	71.239	56	1.27212		
All f-ratios are based on the residual mean square error.					90% acceptance.

For security, (Table 7), the students perceived again that the variety of products was an important element. “Made for the media” contains the capability to be able to download multimedia elements; the importance pointed for this element is possibly explained because they were requested to listen some tracks of the compact disc. Again, some elements for emotion appeared: “frustration level” and “the site was amused”, probably a site with some emotional or touching reactions that can tie visitors to it, and be perceived as secure.

Small differences exist in the appreciation of these factors, depending on the place where the students were connected, (Fig. 1): participants connected from the school or in cyber-cafe, perceived more security. A possible explanation could be that in the work is more difficult or punishable, to use Internet for personal purposes. Although all the connecting sites were inside the positive area for the security appreciation, it was expected that people felt more secure to make this type of simulations from home.

Both sites were perceived as secures; however [www.esmas.com](http://www.esmas.com) was perceived safer than [www.amazon.com](http://www.amazon.com). (Fig.2). A possible explanation for this was that [esmas.com](http://www.esmas.com) is a site in Spanish, and the small difference of more students that worked in that site. On the other hand, the fact that they spoke English was not significant for the security matters.

People having previous purchasing experience in the Internet, (Fig.3), vaguely felt more secure the visited site, although both types of groups, those who had experience and those who had not, were within the threshold. Its important to make notice an important fact, the number of persons that have not bought in internet is, by much, greater than that of the ones that have bought. Nevertheless, the sense of security of the people who have bought previously is greater, this could explain that experience help and make learn more about what is offered by these sites raising their security, and even more if the previous experiences have been positive.

For the desire to return to buy, Table 8, this was greater if the site were perceived as amused, an element of usability framed within the emotion, which could be stated that if the experience was pleasant, the desire to return increases. Adequate links also increase this desire. An important element was that relations between the perceptions of security at the time of filling the blanks with personal data, and desire to return to the site, it can be say that a higher level of perceived security, higher the desire to return. Possibly recommending the site to others emanated from the positive experience that the users felt, and from desire to return again. There were differences from the desire to return and the gender of the users, (Fig. 4), more men displayed greater desire to return than the woman, a possible explanation could be that the purchase simulation was for music from a rock music band, it should be

interesting to see if this element changes if the requested compact disc were from a artist oriented artist to the feminine market.

TABLE 7: ANALYSIS OF COVARIANCE FOR SECURITY.

Type III - Sums of Squares.					
Source	Sum of Squares	Df	Mean Square	F-Ratio	P-Value
<b>Covariates</b>					
Variety of products	6.05655	1	6.05655	6.92	0.0110

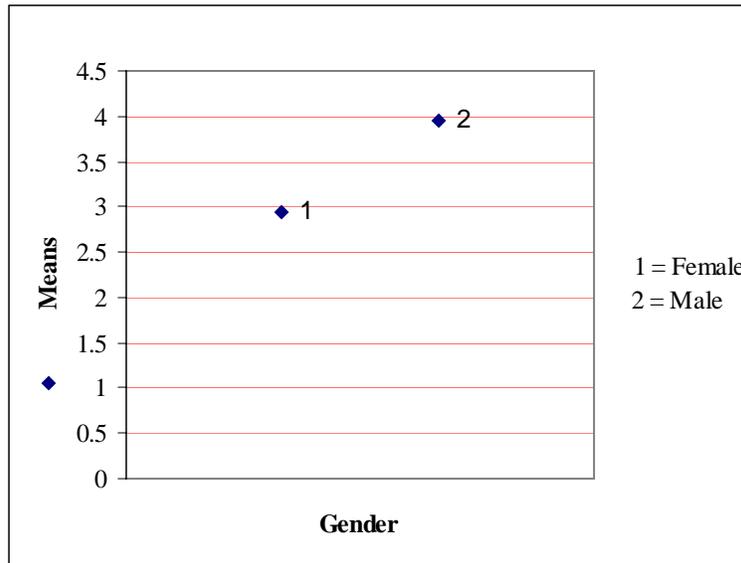

FIG. 4: MEANS FOR GENDER OF PARTICIPANTS.

Regarding the desire to return to buy, Table 8, this was greater if the site were perceived as amused, an element of usability framed within the emotion, which could be stated that if the experience was pleasant, the desire to return increases. Adequate links also increase this desire. An important element was that relations between the perceptions of security at the time of filling out the blanks with personal data, and desire to return to the site, it can be said, the higher the level of perceived security, the higher the desire to return. Possibly recommending the site to others emanated from the positive experience that the users felt, and from desire to return again. There were differences in the desire to return and the gender of the users, more men displayed greater desire to return than the women, a possible explanation could be that the purchase simulation was for music from a rock music band, it should be interesting to see if this element changes if the requested compact disc were from an artist oriented to the feminine market.

TABLE 8: ANALYSIS OF COVARIANCE FOR “DESIRE TO RETURN TO VISITED THE SITE AGAIN.”

Type III - Sums of Squares.					
Source	Sum of Squares	Df	Mean Square	F-Ratio	P-Value
<b>Covariates</b>					
Site was amused	27.1926	1	27.1926	13.11	0.0006
Adequate Links	8.72784	1	8.72784	4.21	0.0448
Perception of security	8.70407	1	8.70407	4.20	0.0451
Better than others	9.56838	1	9.56838	4.63	0.0357
<b>Main Effects</b>					
Gender	15.9071	1	15.9071	7.67	0.0076
<b>Residual</b>	118.19	57	2.0735		

All f-ratios are based on the residual mean square error.

90% acceptance.

About Interest for the site, (Table 9), this factor had a greater amount of elements of usability perceived by the participants: the provided information, existence of feedback, amused, with understandable instructions, with an amount of images acceptable, and willingness to recommend the site. Most of these elements fall into the interaction, emotions and content areas. It could be suggested, according to what the experiment showed, that a site,

besides to be a positive experience for the visitor, must keep the attention of the user, and to avoid become at the time of being performed a purchase. An important factor that it was thought to be important was the speed of downloading, because it could cause impatience to the user during the time the site downloaded information and pictures, but this element didn't appear during the test, possibly because the users considered that the amount of images was adequate. In previous works it has already seen that a relation exists between the downloading time [8] and the amount of images [18].

TABLE 9: ANALYSIS OF COVARIANCE FOR "SITE WAS INTERESTING".

All f-ratios are based on the residual mean square error.					90% acceptance.

## Conclusions and Future Researches

With the obtained results in this experiment we could find out that usability elements are perceived by a group of Mexican students. These elements can be very useful for a web designer, even more, emphasis can be made for a site designed to sell compact discs. A good disc variety can be suggested as first approach, with clear and precise instructions and information for the user on how to perform a purchase on-line, with no excessive amount of images. All these may generate a pleasing experience for the user when visiting that site. Also, adding the possibility to appreciate what it is planned to buy (capability to listen some extracts of a song, for example), it could very probable to fulfill the expectations that the visitor can have at the time of visiting the site with desire to buy some disc. If this happens, then the possibilities for interest in the visited site, the trust in the offered products, and a sense of security at the time of buying the products, can be greater. Also if these feelings were fulfilled, it would be a high probability that the visitor will continue returning. To have trust in the site is a factor for recommends it to others users, which will guide to a greater amount of visitors and possible buyers.

It is important to know what market the designer and the seller think to retail, since the experiment showed that women reacted different for the desire to visit the site in the future. If the site is exclusively directed to the male sector, then, the detected elements of usability seems to be enough, but if the idea is to include both markets, female and male, it is necessary to perform more researches about what can attract women. Although there were not enough evidences to say the site in English was perceived as insecure, the site in Spanish was slightly perceived as more secure, so, if a designer will propose a new site for a Spanish speaking market, then the site will be consistent with market sector, make it or not bilingual will not bring an added-value for security reasons. A future work could be focused in the origin of a site, a search to see if a site, never less is showed in English, but knowing the fact that the website is Mexican, influenced in the feelings of trust or security for foreign visitors.

This work was a first approach to the usability in some Mexican students, but one of the limitations of this experiment was that a purchase was not really made. Globally, the greater preoccupation of the people who have not made purchases in the Internet has been the security [19], feeling that is safer to make the product purchases in a store. For future works it should be good to integrate a real purchase, not only in commercial sites, also in sites with different market sectors such as: sites of auctions, or sale dedicated stores of specific product (tennis, clothes, posters, etc.), or to make comparison between sites of diverse types of electronic commerce, (B2C, B2B, C2C, etc.). Another restrictions, the survey was made only with students of a single city, Guadalajara, it should be important to

see how other students in other cities perceive the usability's elements, and not only students, also different type of users. Although the economic profiles of the two participant universities are different, the experiment did not make an emphasis of this, but it would be possible for future researches to include the economical variable within the categorical independent variables. Deeper researches in elements like speed of connection and downloading, and response time, affecting perceptions of security, trust or desires to return, could be done. Often the speed and the response time of a site depend on the amount of images. As much the designers spent time drawing complex graphs for a website, a possible problem could be cause to the users at the time of downloading the image. In this work the delays and the amount of images could not be controlled, so future works with these elements would be suggested, like putting different groups of users in equality conditions of Internet connection, to see their reaction about it could be perceived as slow or fast, and its relation with the amount of images. About the experience of the users, it should be interesting to see if those that had more time surfing and purchasing in the internet are more critical about the contents of a website, and how easy or hard they find information, or if the information were well organized. It seems as more information a website has, more interest a user has on it.

It was clear that the use of some navigations-aids are recommended, and makes a website more attractive, there were not evidence of how many images improves the good perception that the user have for the site, it was found that some graphics can help the user to have a better navigation, and to have interest in the site, but a deep investigation is needed to see which symbols can be very sensitive for the users, and giving also attention to the cultural meanings of the image, the size and how many images are enough. Although the English level of the participants didn't give evidence of problems, a future work could include it and how could this affect the perception of security and trust of a web site. Being the English the language of businesses, some advice could be give such as the use of simple and direct questions, and the avoidance of colloquial speech, or to eliminate the, still, a deeper research is suggested.

# Knowledge Acquisition and Dissemination for Emergency Situation

*Ku Ruhana Ku-Mahamud  
Norita Md Norwawi  
Universiti Utara Malaysia, Malaysia*

## Abstract

Emergency situation is highly uncertain, dynamic, time pressure in making decisions and involves multi organizations and multi jurisdiction level. This paper presents a conceptual architecture that can be used by emergency response taskforce in assisting the victims of the disaster. Flood disaster is used as a case study. The architecture describes the knowledge and communication for flood emergency response management.

## Introduction

Emergency is a condition caused by natural disaster such as earthquakes, floods, storms or man-made disaster resulting from industrial accidents and terrorist attacks with extreme peril to the safety of persons and property. The main goals in emergency interventions are saving human lives and protecting properties. The emergency response operation requires effective and efficient coordination and cooperation among many organizations and various levels. [1] defines an ineffective response operation by the number of lives needlessly lost. On the other hand, inefficient response operation means that the overall cost of saving one lives is overwhelming. This may be caused by many factors such as poor facility, lack or prompt information, missed communication between organizations, unclear responsibility of each organization and inefficient use of resources [2], [4], [6].

Technology can support emergency managers working under stress in terms of supporting crisis decision-making or as a decisional aid to decision managers, managing information overload, supporting first responders, capturing vital information at its source and situation assessment [3], [4]. Emergency management encompassing four main phases: preparedness, mitigation, response and recovery. Failed management in emergency and catastrophic situation resulting from inefficient and ineffective operation drives the adoption of information technology for knowledge acquisition, sharing and communication. Human have to be an integral part of the total socio-technical system, working hand in hand with machine, computers and organization [1]. With the appropriate use of structured information processes and current information technology, the rate and efficacy of organizational and inter-organizational problem solving capabilities in a complex dynamic environment such as emergency situation can be improved.

[8] identifies some of the requirements of an emergency response information system that can provide collaborative knowledge systems to exchange information among relevant communities. He emphasized the needs of a highly flexible, adaptive and structured group communication system. Learning from experiences is an important phase that can help improve future preparedness plan and activities [5]. [2] commented that existing software programs for crisis managements have not successfully met the managers requirements for four main reasons (i) lack of flexibility in representing diverse perspectives in a dynamic situation (ii) lack of familiarity with the systems and knowledge based (iii) programs are designed for single organization use (iv) no existing system includes intelligent reasoning component that can assist managers.

This paper presents a study that has been done on knowledge acquisition and dissemination of information for emergency situation. Flood emergency response management in Malaysia is used as a case study and is presented in section 2. Section 3 describes the proposed architecture for emergency response management and concluding remarks are given in section 4.

## Case Background

Flood is the most common natural disaster occurring in Malaysia which includes flash floods, monsoon flood and mud floods. It is usually widespread in large geographical area and involves large number of victims requiring large scale response operation. Emergency response centre (EOC) will be open based on flood level, to control and manage the situation. Flood EOC in Malaysia is managed manually through a multi-organizational team which follows the standard operation procedure for disaster management produced by Prime Minister Department. The standard operation procedure consists of rules and procedures in handling disaster. There are three levels of flood operation, namely the federal, state and district level. A minister from the Prime Minister Department will chair the committee for the federal level while the State Government Secretary will chair the state committee level. For the district level, the District Officer will chair the emergency committee.

There are more than ten organizations (emergency committees) involved in the EOC, namely the Drainage and Irrigation Department (DID), Royal Malaysian Police Department, Malaysian Army Force, Malaysian Fire Brigade and Rescue Department and others. Each of the organization has their responsibility and plays an important role during and after the disaster. DID of the Ministry of Agriculture is assigned the role of the flood control, forecasting and warning services.

Fig. 1 illustrates the mechanism of disseminating real-time flood information on the WWW used by the DID of Malaysia. Sensors were placed to collect rainfall measurement, river and reservoir water levels at strategic locations identified all over Malaysia. Data from these sensors will be automatically collected and send to the State Master Stations in the form of emails. These data will then be emailed to Ministry of Agriculture server. The DID National Flood Monitoring Centre server will extract the email and display the data on the website. Any flood warning messages will be sent through mobile short messaging service (SMS) to the DID top management officers mobile phones. The event will be informed to the flood management committee if it is an emergency situation. Response task force will be formed and response operation will take place until the flood ends.

[7] highlighted problems in the Malaysian flood warning systems and steps for improvements. Overall, the public main concern is the timeliness of the authority responding to flood problems. In order to achieve timeliness, the use of rainfall instead of water level as a triggering mechanism as practiced in the United States for smaller rivers was recommended.

Several issues in management of emergency response such as how right decision be made based on the data/information received, communication and coordination among the rescue organizations involved, alerting the right party and which part should be the first to know and first to inform with regards to flood. A systematic set up of the emergency management has to be formed to improve the current flood response system. Successful operation depends on effective inter organization coordination and this requires dynamic and distributed decision making with shared common goals and distinct role.

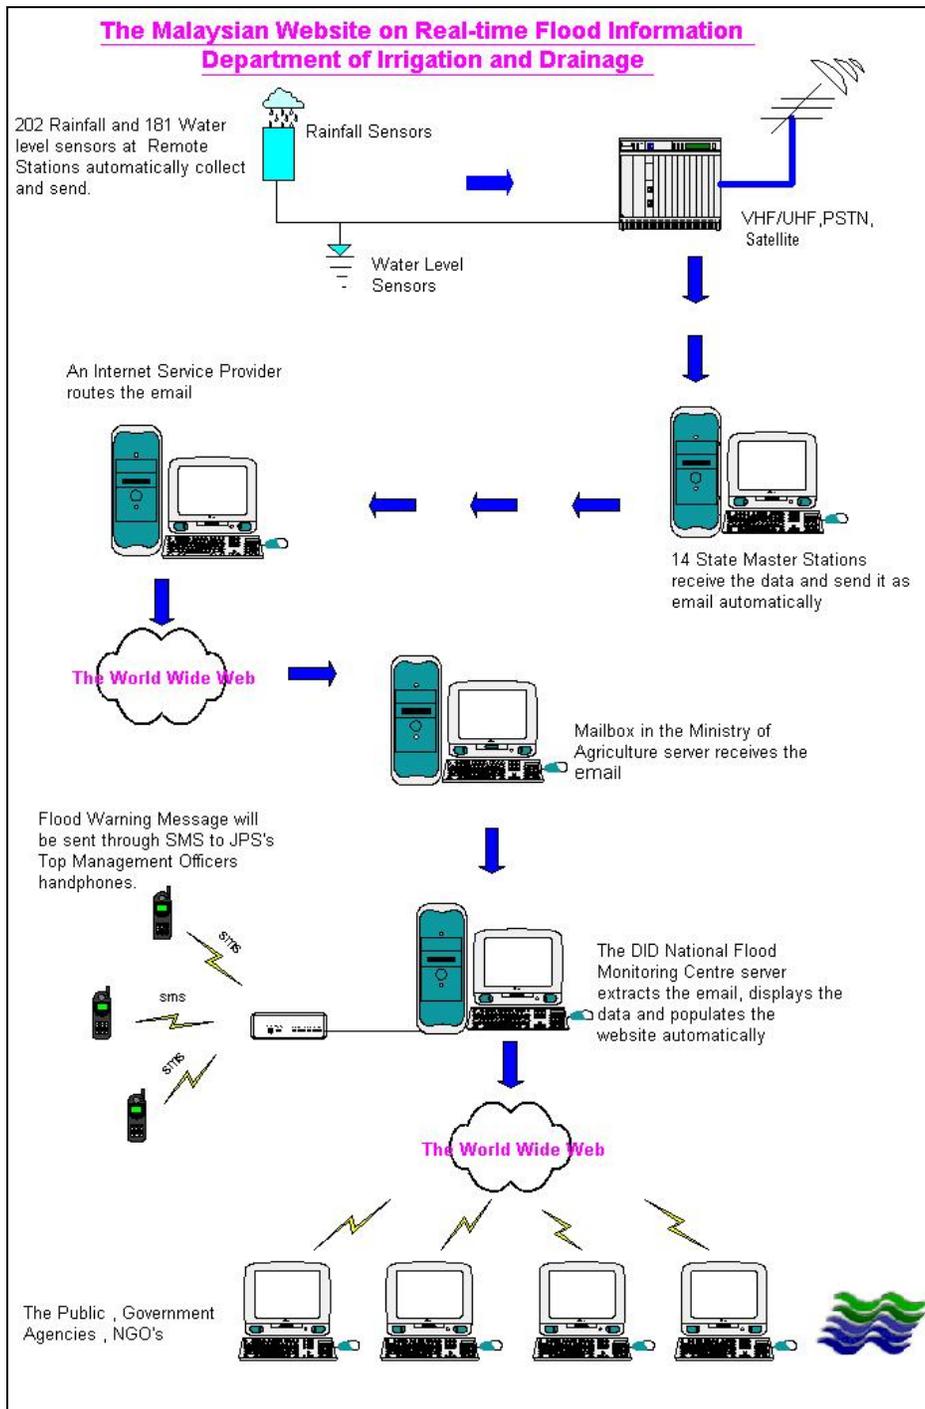

FIG. 1: MALAYSIAN WEBSITE ON REAL-TIME FLOOD INFORMATION

## Proposed Architecture

This study has adopted the knowledge engineering step of designing the architecture for emergency response management. Five steps were taken in constructing the conceptual architecture. The first step of the study is focused on the problem domain where knowledge acquisition is conducted through interviews with domain expert, document reviews and site observation study. Next, knowledge conceptualization is performed where formal description of domain knowledge in terms of primitive concept and conceptual relationship were represented using semantic network. The third step involved ontological analysis and knowledge formalization. The conceptual architecture was designed using UML modeling tool in the fourth step. Finally a non-execution testing using UML walkthrough were conducted for model verification.

The ontology is use as the backbone for building structured and reusable knowledge models. In this study, the ontology is a knowledge model representing concepts and relation between concepts in the flood emergency management. It represents the conceptualization and formalization of the knowledge that has been acquired from domain experts. Fig. 2 and 3 show part of the developed ontology.

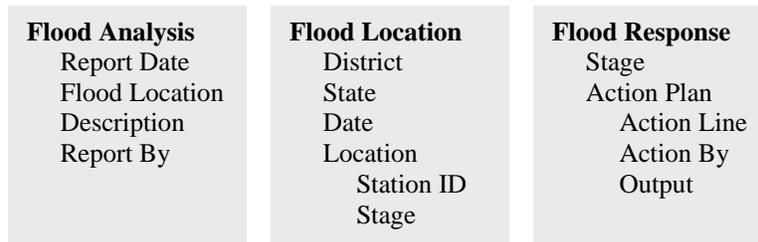

FIG. 2: CONCEPT CLASSIFICATION TREE OF FLOOD ONTOLOGY

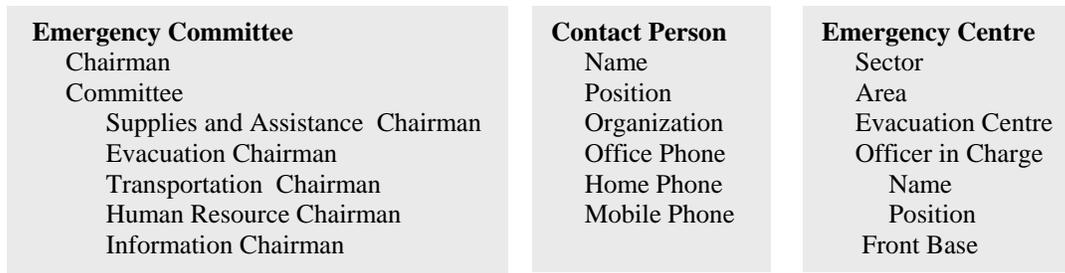

FIG. 3: CONCEPT CLASSIFICATION TREE OF EMERGENCY MANAGEMENT

The proposed conceptual architecture of the flood emergency response management is as depicted in Fig. 4. The architecture consists of seven main modules, which are the user authentication, administration and management of preparedness, recovery, response, mitigation and document.

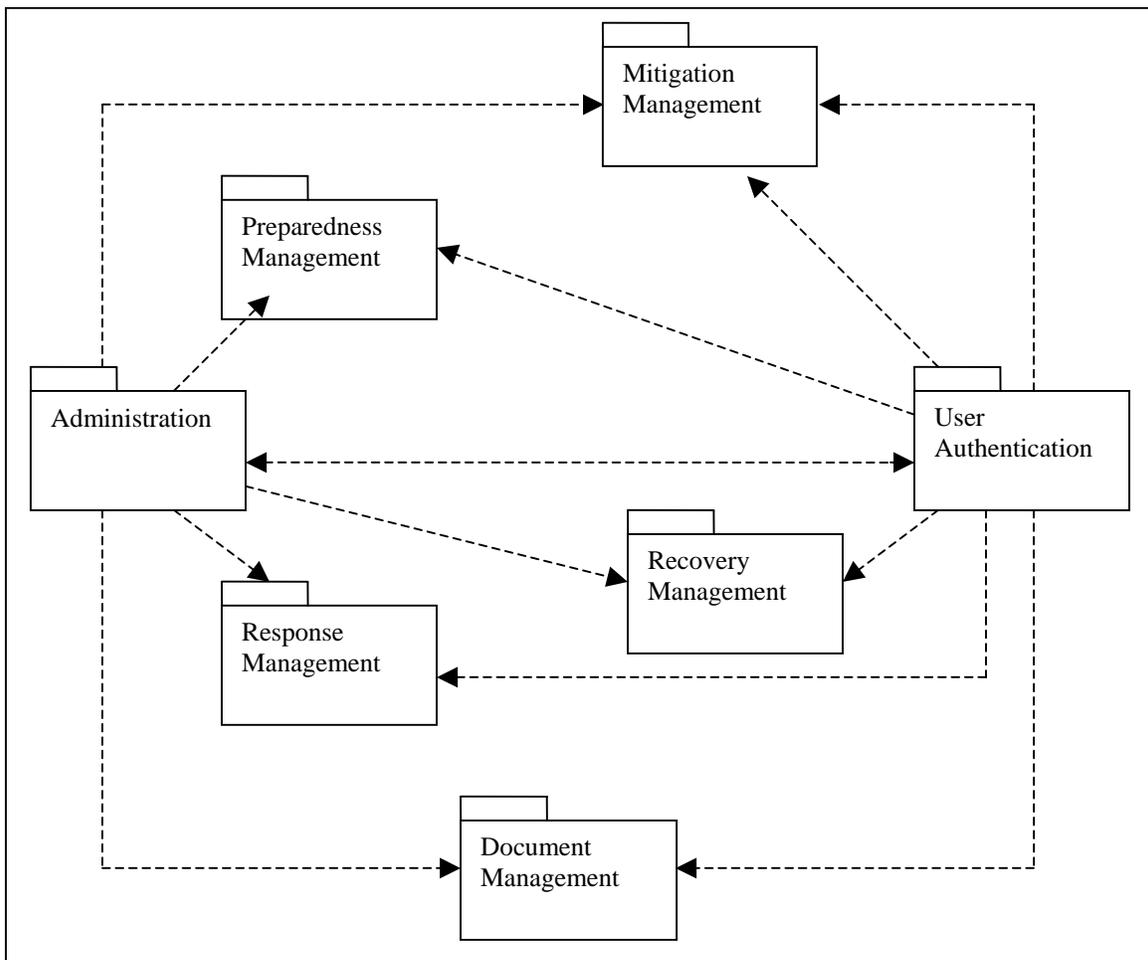

FIG. 4: FLOOD EMERGENCY RESPONSE OPERATION MANAGEMENT ARCHITECTURE

The architecture can be used to implement as a web-based system where information can be obtained and communication can be performed at anytime and anywhere. Intelligent agent based for the purpose of providing autonomous and intelligent component can be incorporated especially in document management module.

## Conclusion

Floods are one of the mother's nature unpredictable events. The unpredictability causes the uncertainty in the situation. The situation is continually changing which brings out the dynamic and complexity of the environment. Efficient and structured emergency response management in this environment has to take into consideration the dynamics, uncertainty and complexity of the situation. Emergency response efforts need to be continually upgraded such that it will reduce the impact of the disaster to the citizens.

# **Learning Business Management by Doing in a Multicultural and Collaborative Environment: The Case of the Marketing and International Business Department of the University of Guadalajara and the Global Learning Community of the Ohio University**

*Celestino Robles  
Universidad de Guadalajara, México*

## **Abstract**

This paper examines the characteristics, advantages and disadvantages of a collaborative project developed by the Ohio University's (OU) Global Learning Community (GLC) and the Marketing and International Business Department (MIBD) of the University of Guadalajara (UG). The project was designed to build a multicultural collaborative environment where undergraduate students from both universities work together to solve different management related tasks and projects. The aim of the project was to implement the Problem Based Learning (PBL) methodology in a project designed to develop management skills in undergraduate business students from the UG and OU, interested to engage in an international learning experience. It also examines the PBL methodology, and analyzes a way to implement the methodology in a collaborative multicultural business environment. It also describes the way it was implemented using online tools to improve the way students communicate with each others on the early stages of their tasks.

## **Introduction**

One of the features characterizing university education in the 21<sup>st</sup> century is a focus on professional competences development and a vocational emphasis. This is accompanied by greater attention to developing the skills required to be a lifelong learner who can adapt effectively to new situations and respond to changed circumstances. Another notable feature is the extensive use of information communications technologies (ICTs) and the acknowledgement of the need to teach students with and about these technologies. Never before in history, businesses, large and small, have been so deeply involved in and affected by international business. Globalization of the markets and the economy has made management education a multicultural task. Understanding business making in all cultures is increasingly important for any business professional in order to succeed.

All of these have increased in recent times the interest in the potential of PBL for management education. Indeed, traditional approaches to business education curriculum have been increasingly criticized for having little relationship with what is important for succeeding in business (Pfeffer & Fong, 2002).

## **Problem Based Learning**

Problem-based learning, which was first conceptualized in the 1970s to better prepare students for careers in medicine (Boud & Feletti, 1997), grew out of a response to the still common complaint by employers that many university graduates are not adequately prepared for the working world they enter after school. Among other complaints, critics of the traditional educational system say that graduates' knowledge is overly theory-based as opposed to being reality-oriented, that graduates lack communication skills and that they are not aware of important issues in their fields or in society in general (Wilkerson & Gijsselaers, 1996). PBL strives to rectify these problems and more fully prepare students for the challenges that await them in life. In order to accomplish this goal, a shift in the concept of education and learning is necessary, moving from being *transmission of knowledge* to becoming a *guided process of discovery* (Dewey as cited in Boyer, 1998). Throughout this process, students "learn how to learn" and actively participate in their learning by thinking critically and analytically. After emerging from PBL projects, students have acquired a number of skills, including leadership, communication and research skills that they can transfer to their careers in a variety of ways (Duch, Groh, & Allen, 2001).

While PBL projects differ in many aspects, three basic features are common among them (Wilkerson & Gijsselaers, 1996):

1. PBL is learner-centered. Students are active in the learning process as they determine what will be learned and why, ask questions and offer possible explanations.
2. Teachers in PBL courses are facilitators rather than disseminators of knowledge. Their role remains crucial, but it changes to one of giving constructive feedback, indirectly leading students through questions and knowing when to allow students to work through difficulties on their own and when to step in with guidance.
3. Problems are the framework for learning. These problems are inherently interesting, complex, multidisciplinary, real-world based, and many times have no one right answer. They require that students be able to analyze, synthesize and evaluate information.

PBL represents a shift from the traditional perspective, focusing the teaching methods, to a perspective that puts the students' learning in focus and that brings consequences for the education as a whole (Albanese and Mitchell, 1993; Barrows, 1986; Boud and Felletti, 1991). PLB has three distinctive features (Dahlgren, M.A. Castensson & Dahlgren, L. O. 1998):

- Real life situations as a starting point for the learning.
- Self-directed learning.
- Work in groups.

Real life situations as vignettes for the learning help the students to get a notion about the kind of context within which the knowledge is to be applied. Learning is thus *self-directed* which means that the students themselves take responsibility for their learning. It also means that they have to integrate aspects from different knowledge areas as they relate to the case, problem or situation they wish to resolve.

In PBL problem-solving is integrated with the learning process to enhance self-directed learning and problem-solving skills, which are essential components of professional competence. The aim is to promote learning of how to formulate problems and find proper information, how to apply the knowledge and how to evaluate ones own work. These skills are also emphasized in most of the assessment schemes.

One of the most characteristic features of PLB is the work in small groups, the tutorial sessions, comprising between five and ten students who work together, assisted by a tutor or a tutor team. The function of tutorials within PBL programs differs from what we think of traditionally as tutorials, which often occur as an event where the students are supposed to apply and discuss content already conveyed to them via lectures or acquired via independent studies. In PBL, the tutorial is instead the start of the learning process, where students are supposed to problematise vignettes in order to formulate their learning needs as questions. After studying independently, the students then return to the group to discuss and synthesize their new knowledge.

As to the teacher role in education, the intentions of PBL methodology are to change it from traditional transmission-oriented perspective to an interaction-oriented tutor's role. This change is most prominent as regards the teacher's role in the tutorial sessions, and is sometimes referred to as of a facilitator.

A PBL project begins with a problem, query, or puzzle that is based on complex, real world situations. Information is purposely withheld so that students will need to use critical thinking and prioritizing skills. A typical sequence of events in a PBL project is discussed by Engel (1997): After reviewing the project, the learners work either in their permanent teams or together as a class to organize ideas and previous knowledge on the subject. They then pose questions, defining what they know and don't know, and eventually discuss resources and assign responsibility for questions. At this point, individual team members research their topic and then reconvene to explore their newly learned information and refine remaining questions and/or generate new questions. Guest speakers may be brought in to clarify issues for the students, and occasional student-team presentations on project status are common as well. The PBL process is cyclical—students continue to evaluate their information, seek and find new information from a variety of resources and hone their findings until they have the necessary information to make a recommendation. This learning process is thus a very active, integrated, and cumulative one (Watson, 2002).

There are numerous benefits to using PBL projects in university courses. One major benefit is that students become life-long learners—the set of skills and sense of empowerment they develop will enable them to succeed in a variety of challenging situations throughout their lives (Boud & Feletti, 1997). Also, they are more fully prepared to

succeed in the complex and information-laden world outside the classroom (Boud & Feletti). Linked to this benefit is the fact that students' self-confidence increases as they meet goals that they may initially think are unattainable or are otherwise beyond their ability. In addition, students are able to use their own knowledge and experiences as they learn new information and skills (Ross, 1997). A fifth plus is that students are able to sift through and use up-to-date materials and content (Boud & Feletti). In fact, it is crucial that students find only relevant and recent material as they make their decisions. Developing strong teamwork and communication skills are two other benefits for students working in PBL projects. Additionally, as students work through these projects, they acquire the ability to divide large projects into smaller, manageable components. Regardless of the student's field, this is an indispensable skill. Finally, PBL projects generate enthusiasm in both students and faculty (Boud & Feletti). While these projects can undoubtedly be frustrating at times, they are equally rewarding when students realize the magnitude of their accomplishments.

Context, defined here as the circumstances that give meaning, plays an important role when designing the locus of control and the nature of the case for the problem solving situation. Context has been pinpointed as a critical ingredient of PBL. Edens (2000) notes,

Those authentic contexts are vital to the many fields that requires specific professional training. That, of course, is a dramatic shift from the traditional view of cognitive development resulting from one's reception of knowledge transmitted by the instructor. PBL holds promise as a teaching tool that provides for the acquisition of problem solving skills to meet the challenges of the twenty first century workplace. (p. 5)

Although PLB offers the potential for authentic context, the management education literature has yet to formally address what elements of PBL context are important or how to bring that theoretical knowledge into practice.

Sherwood ((2004) contends that through active design and management, context is a critical ingredient to successful learning with problem-based approach, and proposes a framework to facilitate the decision making for context design in PBL management education. Table 1 presents this decision-making framework. It includes both social and physical dimensions of context that are important for learning the tacit and explicit knowledge.

TABLE 1: A FRAMEWORK FOR CONTEXT DESIGN FOR PROBLEM-BASED LEARNING IN MANAGEMENT EDUCATION

<i>Social Dimensions</i>	<i>Physical Dimensions</i>
Participants (internal and external) Who will participate? What level of real-time interaction between participants	Goals (internal and external) At what levels will goals be established?
Social structure (internal and external) Where will relationships be established between participants? What types of relationships will be established?	Technology (internal and external) To what degree will the physical workplace be developed? To what degree will the process being applied to the problems be segmented or holistic?

Source: Sherwood, A.L. (2004) Problem-Based Learning in management education: a framework for designing context. Journal of Management Education, 536-557

In order to obtain the benefits of PBL, it is important that a number of things be taken into consideration (Wilkerson & Gijsselaers, 1996). The project problem must be constructed carefully. It should be interesting and achievable for the students and appropriate for the goals of the course while at the same time being complex with no obvious and/or single solution. Also, teachers should guide without being either too passive or too aggressive. Withholding information or providing too much of it can seriously damage the success of a PBL project. Finally, curricular structures must be flexible enough to allow for the unpredictability of a PBL project. Schedules may change, problems may arise, new discoveries may redirect the project's direction and goals may become modified.

Problem-Based Learning has been used effectively in many types of university classrooms, from medical, to business, to science courses. Students in these courses benefit not only from the skills they develop, but from the creativity they unleash and the close community they build. Teachers benefit by forming more meaningful relationships with their students and developing their own ability to guide students through the messy process we call learning.

## **Project Background**

### **The Marketing and International Business Department of the University of Guadalajara**

The University of Guadalajara is a public decentralized body of the State of Jalisco Government in Mexico,, whose objective is to prepare and update the technical, bachelors, professional technicians, professionals, graduates and other human resources required for socioeconomic development; to organize, perform, foster and divulge all scientific, humanistic and technological research; to rescue, preserve, increase and divulge all culture, science and technology. The education extended tends towards the students' holistic development, their capacities' and personality's full development; to foster in them the tolerance, the love of country and humanity, as well as the solidarity conscience in democracy, in justice and in liberty. Is directed by a social solidarity purpose, holding it above any other individual interest; Regulates its activities, in accordance with the constitutional principles of liberty of teaching, of research and cultural diffusion; Examines all currents of thought and historical and social processes without constraint, with the objectivity of its academic nature; Guarantees the participation of the university community in the collective definition and determination of its policies, plans and programs oriented towards meeting its goals, the development of activities inherent to its academic and social service functions and the compliance of its responsibilities with society; Seeks the harmonic linkage between the teaching, research and extension functions; Contributes, based upon the results of its academic business, either by itself or in coordination with other physical or judicial persons, to the advancement of the Mexican and Jalisco people, to the study and solution of its problems as well as to the preservation of national sovereignty; and Makes no discrimination either by reasons of ideology, religion, moral, social, ethnic, sex, nationality, or of any other nature.

The Marketing and International Business Department of the University of Guadalajara is part of the CUCEA (Economic and Administrative Sciences University Center) which in turn is part of the University Network in Jalisco State. Its mission is to educate quality professionals in the areas of marketing and International Business. It focuses in developing a high sense of social responsibility among their students; creative professionals, able to solve the problems they face, with an international vision balanced by the respect to the national values and a willingness to maintain a commitment with the local, regional and national development of our society.

### **The Global Learning Community**

Ohio University's Global Learning Community was designed in 1996-97 by a university wide committee of faculty and administrators. The purpose of this undergraduate program is to provide opportunities to internationalize curricula across campus. It offers a thirty-credit, two year undergraduate residential certificate. Admission is competitive and open to all majors, and the certificate is intended to complement all undergraduate degree programs at the university. Its program of study is based on team-based projects having international themes, which are in some cases undertaken in cooperation with real-world clientele (Manhire, Emery, Mould, & Noland, 2002). Two international experiences abroad and two years of language study (or equivalent proficiency) are required to fulfill certificate requirements. Faculty in the GLC is competitively selected from across campus to deliberately form a multidisciplinary teaching team. Typically, there are three core faculty serving the GLC by way of half-time temporary appointments. These faculty returns to their full-time permanent faculty appointments after two or three years. In this way, since its inception, the GLC has drawn its faculty from the university's colleges of arts and sciences, business, communication and engineering. A permanent director, who is also a faculty-team member, leads the GLC.

While the foundation for the intellectual *content* of the GLC's program of study consists of international themes, academic and vocational *processes* are also important. These include developing student proficiencies such as the ability to identify and conduct appropriate research, many times using computer resources, the ability to work

in multidisciplinary teams and the ability to communicate effectively through writing and public speaking. Students are thus able to develop professional skills applicable to life-long learning as they work within a global and societal context (Manhire et al, 2002). Also important in the GLC is the sense of community. Many students live together in Bromley Hall, which is also where the GLC's classroom, computer laboratory and administrative office is located. Also included in the communal component are extracurricular student-faculty activities such as dining together and arranging and attending cultural events together (Manhire et al, 2002). Certificate requirements include eight GLC project-courses (five in the first year and three in the second year), two international experiences abroad, and proficiency in a foreign language through the sophomore level. In all project courses, students work in teams on projects having international themes.

First year courses include:

- Global Learning Community Introductory Project
- Business and Communication in Transitional Societies
- Building Cross-National Alliances
- Communication and Development
- Global Leadership Conference

Second year courses include:

- Global Economic Trends and Strategic Alliances
- Global Competition and Industry Trends
- Starting a New Venture/Initiative
- Continuously scheduled courses include:
  - International Internship
  - The Global Experience

The first international experience requirement is fulfilled through the course "Business and Communication in Transitional Societies," in which GLC students collaborate with students at a foreign university. After communicating online through the GLC database for five weeks, GLC students spend two weeks overseas, completing their projects, giving final presentations and submitting a final bilingual report. The second international experience is satisfied either through a formal GLC internship abroad (or an internationally-oriented domestic internship) or by completing one of the more traditional study abroad programs available at Ohio University. GLC students are advised to complete auxiliary coursework in (cultural) anthropology, micro- and macroeconomics, geography, (nonwestern) history, political science and sociology.

The intellectual and professional development of GLC students is achieved primarily through project- and team-based learning concepts from problem-based-learning pedagogy (PBL).

#### **Methodology of the Joint Consulting Project**

In their efforts to develop better ways to improve the quality of their students, the Marketing and International Business Department ([http://www.cucea.udg.mx/paginas/gestione/d\\_mkni/index.php](http://www.cucea.udg.mx/paginas/gestione/d_mkni/index.php)) of the University of Guadalajara (<http://www.udg.mx>) signed an agreement with the Ohio University's (<http://www.ohio.edu>) Global Learning Community (GLC) (<http://www.ohio.edu/glc/>) to join the program designed by the GLC to improve their students skills and capabilities through the use of an undergraduate program designed to provide opportunities to internationalize their curriculum. The project was developed from September 2002 to May 2003. During this period, two programs were developed, building bi-national, bi-lingual student teams formed with mixed students from both universities and guided by a team of professors from both universities as well. Eight project teams were formed in the first part of the project, with five OU students and five UG students each one. Every team had two professors (one of each University) tutoring the activities. The first phase of the project included the visit of thirty-four OU students and three faculty members to spend nearly three weeks in Guadalajara, completing their projects, giving final presentations and submitting a final bilingual report. Five project teams were formed in the second part of the project with five OU students, two UG Students and two professors (one of each University). The second phase of the project included the visit of ten UG students and three faculty members to spend two weeks in Athens, completing their consulting projects, giving final presentations and submitting a final report.

UG students picked up to join this project were selected from the population of sophomore and junior students from marketing and business majors interested in developing an international learning experience. Students were required to speak English to join the program.

The OU implemented an online intranet where students and professors met online to develop the initial part of the projects. Final part was made in situ when both, students and professors traveled to the UG facilities (in the first part of the project) and OU-GLC facilities (in the second part of the project) to make a presentation and report to the client at the end of the project.

Consulting projects in Mexico included:

- Development of teaching strategies for a school for children with disabilities (Centro para la atención múltiple, School for children with disabilities)
- Marketing research for entry mode and penetration strategy plan to US for restaurant La Chata
- Marketing research for “Casa Canela” fine arts and crafts retailer in Mexico and marketing plan to improve sales.
- Marketing plan for a Disco Neon Hair Gel for Industrias Gane, a Mexican manufacturer of cosmetic products. Students also researched into the possibility of international sales of the item.
- Development of a strategy to introduce MEXLUB’s (Mexicana de Lubricantes S. A., a Mexican oil lubricants producer) new line of lubricants Akron, to the Mexican market.
- Students on Team Card Systems were asked to investigate the possibility -and desirability- of entering the US market.
- Team BQM developed a research on the US market for alternative medicines, they played special attention to legal issues, costs patents, trademarks, etc.
- Team Sombrillas pursued various avenues of primary and secondary marketing research to develop a promotional strategy for a small restaurant located in Guadalajara downtown (Las sombrillas del Hospicio).

Consulting projects in US included:

- Development of a market research study for Carburundum Inc., an industrial company attending the auto parts industry, interested in attending the Mexican market.
- Marketing research for Global Cooling, Inc. a company engaged in the design, manufacturing and selling of solar powered refrigerators interested in developing the Mexican market.
- Marketing research for Easy Grout, Inc. a company with a patent suitable for improved house building interested in entering the Mexican market.
- Twin City Foods team engaged in the search of Mexican suppliers of fresh vegetables and fruit concentrates for this Ohio company interested in developing new suppliers for their raw materials.
- Black Diamond team researched the Mexican furniture industry for the Ohio’s company Black Diamond, Inc, who were interested in expanding their activities into Mexico.

## **Learning Outcomes and Results from the Mexican Students’ Perspective**

As has been stated, PBL is centered on problems and on student learning. To gain insight into the success of the joint consulting program, a review of the Mexican students’ feedback was undertaken. Forty Mexican students involved in the project were asked to self-report using standardized Likert-type as well as open-ended questionnaires focused on learning. The 7-point Likert-type scales asked Mexican students to either rate the effectiveness (1=completely ineffective; 2=somewhat ineffective; 3=moderately ineffective; 4=not relevant; 5= moderately effective; 6=somewhat effective; 7= completely effective) of the pedagogy in terms of learning or to rate the courses against similar traditional courses. The open-ended questions asked the students to comment on what contributed to their learning, and what were the major disadvantages of the pedagogy and the experiment itself.

It is important to state that the measurement instrument was not tested for reliability and therefore the results can only provide directional evidence rather than statistically significant findings.

The questionnaires were not intended to measure the success of the project nor the PBL methodology specifically, but the results provide indications about the degree of success achieved by the project and the methodology. The key and representative results are shown in Table 2 and described below.

One of the main objectives of PBL is the development of useful professional competences. The results of the questions toward this show support for effectiveness. The overall qualitative comments were positive and even somehow enthusiastic. As one student stated “The program is designed to mentor students, not to hand-hold. It doesn’t open doors for you. It teaches how to break them down”.

Other important objective of PBL is the development of reasoning and problem-solving skills. Both, quantitative and qualitative data demonstrated support that this objective was met. Student reported the project challenging and interesting. Additional insights that the problem solving was enhanced can be found in the qualitative answers. One student commented: “Participating in the joint consulting project was a highly rewarding experience. Our team did extensive market and industry research pertaining the expansion of La Chata Restaurant. The information was then compiled into a presentation, which our client loved!”

TABLE 2: RESULTS OF QUANTITATIVE MEXICAN STUDENTS’ FEEDBACK ON LEARNING OUTCOMES

<i>Items</i>	<i>Population size = 40 M/SD</i>
The course helped me in developing self-esteem and confidence	6.40/0.32
The methodology applied turned me into a more independent learner	6.50/0.27
I found the course challenging and interesting	6.10/0.64
This methodology helped me think independently about the task at hand	5.25/0.80
My interest in the subject area has increased	6.12/0.51
I had to use and apply knowledge gained in other courses to solve the problems encountered	5.82/0.89
I studied and put effort in my class	6.82/0.23
The instructor willingness to listen to student questions and opinions was appropriate	5.10/0.65
My learning increased in this course	
Rate the quality of instruction in this course as it contributed to your learning	5.89/0.72
	6.50/0.23

A not less important objective of PBL is the development of self-directed learning strategies. When asked if the course was effective in helping them to think independently about the subject matter, Mexican students indicate that this was more so than in other courses. Qualitative data also indicate students developing self-directed learning strategies. One student commented “Working with Card Systems de Mexico in Guadalajara was interesting and fun. Our task at first was to research and decide if Card Systems de Mexico would be able to expand into the North American region although after some research it was quickly decided that they had a lot of work to do before thinking about expanding. Therefore, we provided Card Systems de Mexico with suggestions on how they can rise above the national competition and grow before going internationally. We suggested marketing strategies which included ideas and prices about a website, and magazine advertisements. Along with this we suggested distribution techniques and organizations they should consider joining”.

Other important objective is to increase motivation for the learner. Here again, students rated this course as highly interesting and that their interest in the subject area increased. A Student noted: “I would have to say that this trip educated me more than any amount of classes I could take in a quarter at my University. The Director of Marketing of Mexlub was very interested in what we have to say, and we also provided them with the marketing research they needed to make some very important decisions for the company in the future. I felt that our group had incredible communication even though there were few teammates that spoke the other’s language very well. Overall, I couldn’t imagine not having this experience because it changed me and my views on many different things”.

The objective of becoming effective collaborators was not measured quantitatively, but the qualitative data supported that this objective was met as well. A representative comment from an US student was: “The trip to Mexico and the joint consulting partnership with the University of Guadalajara was a wonderful and worthwhile venture. I am confident in the friendships that I made and the work we did for Casa Canela. I learned many things

about Mexican culture, working together in a team, and things about my own personality and prejudices. I am truly grateful for the experience”.

## Conclusions

In summary, it was found that all students in the project measurably improved their professional competences, and demonstrated a higher level of commitment to their studies. Third and perhaps the most important is the finding that PBL methodology also develops a strongest self-esteem in the students. They have to be able to handle uncertainty; to acquire information by they self; get feed back from teammates after the use of the information; do not avoid discussions or cognitive conflicts and practice together but learn individually. All of these help them to become more certain of their knowledge and capacities. PBL offers great potential. As more experience is gained using this approach for management education. We will be able to refine and improve a methodology that promises to develop in the management students competences very difficult to develop through traditional courses.

# Learning Organization Dimensions and its Impact on Private Higher Learning Institutions' Financial Performance

*Naresh Kumar*  
*Binary University College, Malaysia*

## Abstract

Although the learning organization concept has been established few decades ago, the review of literature reveals limited studies on the linkage between learning organization dimensions and financial performance particularly in the higher learning institutions context. Thus this study seeks to address and fill the gap in the body of knowledge on this issue. This study, which is part of a larger study, provides a model that links the select institutional characteristics, learning organization dimensions and perceived financial performance. The learning organization dimensions found to be positively related to the financial performance. On the other hand, three of the institutional characteristics: age of the institution; level of institutional commitment to institutional/professional service and institutional level of commitment to effective teaching and learning were jointly affecting the financial performance. This paper is able to provide comprehensive empirical information for human resource development (HRD) scholars and practitioners on their endeavor towards developing a learning culture in their organizations.

## Introduction

No doubt, businesses are amenable and keen to embrace the idea of a learning organization. The rapidly changing marketplace is forcing leaders to identify new ways to develop organizations that would be skillful at continuous adaptation and competent to look forward to the need for change (Goh & Richards, 1997). Indeed, to sustain competitive advantage in today's global education market, private higher learning institutions (PHLIs) need to increase the learning capacity and make paramount shift from the traditional vertical organization (bureaucratic organization) to learning organization paradigm that works well in the turbulent environment (Daft, 2000; Robbins & Coulter, 2002, Power & Waddell, 2004). According to Marquardt (1996), learning organization is a new form of organization that is capable to:

1. Anticipate and adapt more readily to environmental impacts
2. Accelerate the development of new products, processes, and services
3. Become more proficient at learning from competitors and collaborators
4. Expedite the transfer of knowledge from one part of the organization to another
5. Learn more effectively from its mistakes
6. Make greater organizational use of employees at all levels of the organization
7. Shorten the time required to implement strategic changes
8. Stimulate continuous improvement in all areas of the organization (p.2)

The new learning organizations will be able to transform the way of thinking and "harness the collective genius of its people at the individual, group and system levels" (Marquardt, 1996, p.2). They also be capable of systematically improve performance and effectiveness, which is crucial to face the challenges of globalization and information and communication technology (ICT). Without a doubt "managers who succeed in today's turbulent business environment are those who learn quickly and apply that learning to unpredictable rapidly occurring new situations" (Daudelin & Hall, 1997, p.13). Moreover "it is hard to find a manager today who does not give at least lip service to the importance of building a learning organization (Garvin, 2000, p.ix). Indeed, it is increasingly and widely accepted that at the present time, one of the most important source of competitive advantage is the ability of an organization to learn faster than its competitors (Burnes, Cooper & West, 2003; Campbell & Cains, 1994; Chan, Lim & Keasberry, 2003; Dixon, 1997; Marquardt, 1996; Marquardt & Reynolds, 1994; Schein, 1996; Schwandt & Marquardt, 2000; Senge, 1990).

In response to the global education market challenges, PHLIs must grow steadily with a dynamic learning culture whereby the future success of the institutions relies on continuous learning and adapting to the myriad of changes prevailing higher education industry. It is believed that “while culture in particular has the ability to manifest itself in the overriding ideologies and established patterns of the day, an organization’s learning capacity will determine its strategic direction” (Murray & Chapman, 2003, p.275). On the way to bring systemic change in PHLIs, the ability to learn collectively is the biggest concern. Facilitating organizational learning is the most effective way to improve academic learning and revitalize the institutions where the pursuit of intellectual interests and professional collaborations are supported and encouraged. Besides this, PHLIs must continue to develop and build on the strengths of academic and non-academic members who are the pillars to promote financial performance.

Leaders in PHLIs must use their invaluable knowledge and experience in creating a tangible structural support system that will foster the development of a learning culture. Indeed, developing and promoting a learning culture is one of the most appealing roles of the leaders at the present time. Yang (2003) asserts that a learning culture is a notion that “reflects organizational behavior from the perspective of learning and development” (p.152). In addition, the development of a learning culture facilitate private colleges to employ their “knowledge and experience for establishing and achieving desired goals and learning about wisdom as the process of discerning judgments and action based on knowledge” (Wang & Ahmed, 2003, p.11). Perhaps, the ability of the PHLIs to learn and adapt to their environment besides their capacity to change and develop all together, depend on cultural forces that challenge their capability to learn (Murray and Chapman, 2003). Wong (2003) says:

A learning culture allows its people to behave as proactive problem solvers and learners while a learning leader believes in its people and their ultimate good human nature. A learning culture has the basic assumption that solutions to problems derive from a pragmatic search for truth and that truth can be found anywhere, depending on the nature of the problem. The ... [leader in an organization] has to build a learning culture that continues to learn and s/he has to realize that s/he does not know and must teach others that s/he does not know (p. 245).

A review of the literature reveals that learning organization is likely to lead for increased organizational performance. Nevertheless, guidelines to help implement the idea has been lacking and less empirical research exist to support the significant relationship between learning organization and organizational performance (Chaston, Badger & Sadler-Smith, 1999; Ellinger et al., 2002,2003; Hedges, 1997; Jashapara, 2003; Phillips, 2003; Mayo & Jank, 1994; McHargue, 1999, 2003; McHugh, Groves, & Alker, 1998; Power & Waddell, 2004; Reynolds & Ablett, 1998, Selden, 1998, 2001; Wang & Ahmed, 2003; Yeo, 2002a, 2000b, 2003a, 2003b). Thus, this study intends to fill the gap in the body of knowledge pertaining to learning organization and organizational performance with specific focus on Watkins and Marsick’s (1993, 1996) learning organization dimensions and perceived changes in financial performance of private colleges in Malaysia. This study addressed the following questions:

1. To what extent do the dimensions of the learning organization independently explain observed variances in perceived financial performance improvement measure?
2. To what extent can select institutional characteristics independently explain observed variances in the dimensions of the learning organization?
3. To what extent can select institutional characteristics independently explain observed variances in perceived financial performance improvement measure?
4. To what extent do the dimensions of the learning organization and select institutional characteristics jointly explain the observed variances in perceived financial performance improvement measure?

## **Relevant Empirical Studies**

Selden (1998, see also Selden & Watkins, 2001) has evaluated the relationships between the characteristics of learning organizations and company characteristics and knowledge and financial performance in family-run firms. Selden used the Dimensions of the Learning Organization Questionnaire (DLOQ) developed by Watkins and Marsick (1993, 1996) as the evaluation instrument for his study. Selden (1998) found that all of the seven dimensions of the learning organization were significantly correlated with financial performance. Of the seven

dimensions of learning organization, systems to capture learning represented the most variance in financial performance. In addition, empowering people to a collective vision also largely represented the variance in financial performance.

Another study has been carried out by McHargue (1999, 2003) to examine the relationship between organizational characteristics and learning organization dimensions and three performance outcomes, namely financial, knowledge and mission performance in nonprofit 501(c)(3) human service organizations. McHargue (1999, 2003) made slight alterations on the DLOQ so that it can be used successfully in the nonprofit sector. In her study, the seven dimensions of the learning organization were found significantly related to financial performance. Systems to capture learning established the strongest relationship with financial performance.

Hernandez (2000, 2003; see also Hernandez & Watkins, 2003) studied the ways in which learning organization dimensions impact the process of tacit knowledge transfer, knowledge performance and financial performance within private manufacturing organization in Colombia. Hernandez translated the DLOQ into Spanish so it could be used with Spanish-speaking populations while preserving the original ideas across the linguistic and cultural boundaries. Hernandez found a positive structural relationship between the seven learning organization dimensions and the transfer of tacit knowledge process. The transfer of tacit knowledge process consecutively showed a positive influence on financial performance. In fact, the DLOQ were strongly correlated with knowledge performance compared to financial performance.

Ellinger et al. (2002, 2003) examined the relationship between the learning organization concept and firms' financial performance. To assess this association, the authors obtained managerial responses to the Watkins and Marsick's DLOQ along with both perceptual and objective measures of the firm's financial performance. The secondary financial data (return on equity, return on assets, Tobin's q, and market value added) was drawn from the COMPUSTAT (1998) and the Stern Stewart Performance 1000 (1998) financial databases. This study suggests a positive association between the learning organization concept and the perceptual and objective financial outcome variables.

## **Conceptual Framework**

Watkins and Marsick's (1993, 1996) learning organization model has the capacity for integrating people and structure to budge an organization towards continuous learning, change and development. The approach taken by Watkins and Marsick has seven distinct but interconnected learning organization dimensions: (1) creating continuous learning opportunities, (2) promoting inquiry and dialogue, (3) encouraging collaboration and team learning, (4) establishing systems to capture and share learning, (5) empowering people to a collective vision, (6) connecting the organization to the environment, and (7) provide strategic leadership for learning. These seven learning organization dimensions were adopted as the independent variables for this study, while the dependent variable is perceived financial performance improvement measure which was adopted from Watkins and Marsick's (1997) Dimensions of the Learning Organization Questionnaire (DLOQ). The select institutional characteristics for this study were age of the institution, number of full-time employees, perceived level of institutional commitment to research productivity, effective teaching and learning, institutional/professional service, and community service. The research framework for the present study is shown in Fig. 1.

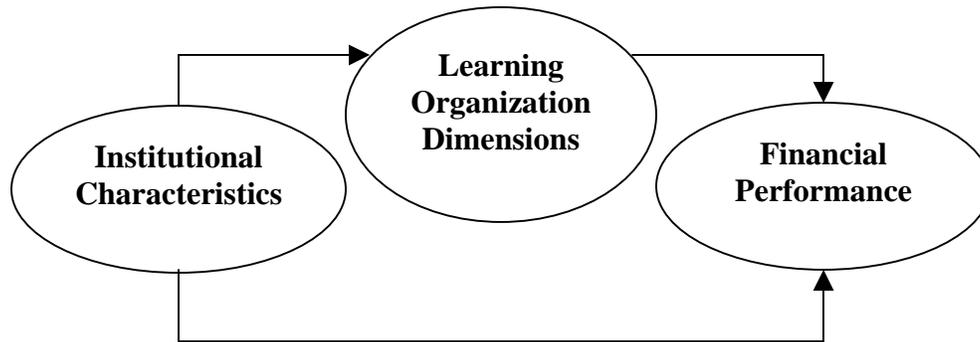

FIG. 1: CONCEPTUAL FRAMEWORK

## Methodology

The survey instrument for this study comprised Watkins and Marsick's (1997) DLOQ to measure seven action imperatives of the learning organization and perceived changes in financial performance. The DLOQ used a six-point Likert Scale (1 = almost never to 6 = almost always). Several studies have been conducted to establish the reliability and content and predictive validity of the DLOQ (e.g., Ellinger et al., 2002,2003; Hernandez, 2000, 2003; Hernandez & Watkins, 2003; Lim, 2003; McHargue, 1999, 2003; Selden, 1998; Selden & Watkins, 2001; Sta. Maria, 2000; 2003; Sta. Maria & Watkins, 2003; Watkins & Marsick, 2003; Yang et al., 2004; see also Watkins, Selden, & Marsick 1997; Watkins, Yang, & Marsick 1997; Yang, Watkins, & Marsick, 1998 in Selden 1999). The Cronbach's Alpha value in the previous studies for each of the dimensions of the learning organization ranged from .70 to .90. All the Cronbach's Alpha coefficients for the financial performance cited in previous studies exceed .70 except Selden's (1998) study, which showed an Alpha value of .68.

The unit of analysis for this study was private colleges with non-university college status whereby they were represented by human resource managers or personnel who were believed to be at the right position in responding to the survey questionnaire. Based the latest directory issue of the Study in Malaysia Handbook (4th International Edition, 2004), as of January 2004 there were 468 private colleges operating in Malaysia and of which 350 was selected as the sample for this study. In view of the fact that the private colleges with non-university college status were geographically dispersed, stratified proportionate random sampling method was used so that the colleges located in the thirteen states of Malaysia represent the sample of this study.

A self-completion mailed questionnaire was used to collect data from the selected sample. A total of 238 responses were used in the final analysis for this study. This final sample represented 51% of the total population of private colleges in Malaysia. The collected data was tabulated and analyzed using SPSS version 12.0. Research question #1, #2, and #3 called for the examination of bivariate relationships. Simple regression was used to measure the bivariate relationships. Coefficients of determination, R square ( $r^2$ ), which provides the indication as to the amount of variation in the dependent variable that could be accounted for by the independent variables (Raymondo, 1999) were calculated to interpret the regression coefficients. Finally, research question #4 called for exploratory multiple-regression analysis.

## Findings and Discussions

Research question #1 asked to what extent do Watkins and Marsick's seven dimensions of the learning organization independently explain observed variances in perceived financial performance improvement measure. Simple regressions, between the seven learning organization dimensions and financial performance showed that all the seven dimensions were significantly correlated with perceived financial performance measure ( $p < .0001$ ). The result of this analysis is in Table 1. The positive and significant relationships of the seven dimensions of the learning

organization and the performance improvement measures support the findings of other studies (Hernandez, 2000; McHargue, 1999; Selden, 1998).

TABLE 1: SIMPLE REGRESSION COEFFICIENTS OF THE DIMENSIONS OF THE LEARNING ORGANIZATION WITH FINANCIAL PERFORMANCE

Learning Organization Dimensions	Standardized Coefficients ( $\beta$ )	Coefficients of Determination ( $r^2$ )	p
Continuous Learning	.634	.402	.0001
Inquiry and Dialogue	.413	.171	.0001
Team Learning	.582	.339	.0001
Embedded Systems	.638	.407	.0001
Empowerment	.557	.310	.0001
Systems Connections	.485	.235	.0001
Provide Leadership	.662	.438	.0001

Among all the seven dimensions of the learning organization which were positively and significantly related with financial performance ( $p < .0001$ ), provide leadership showed the strongest relationship at ( $\beta = .662$ ,  $r^2 = .438$ ). Provide leadership can explain fourth four percent of the financial performance in the Malaysia's private colleges. This indicates that leaders in Malaysia's private colleges support their employees requests for learning opportunities and training, share up to date information across the institution, empower their staffs, being a good mentor and coach, look ahead in favor of opportunities to learn, and ensure that the institution's actions are consistent with its goals. However, the higher percentage of the variance in both the perceived performance outcomes represented by the dimension provide leadership could be credited to the fact that respondents were at a higher rank in the institutions. The value placed by the respondents on providing strategic leadership for learning and its influence on financial performance may perhaps support their role as leaders (Selden, 1998). Thus, this should be seen as one of the limitation of this study. However, the present finding is consistent with a great deal of the literature on learning organization and leadership.

Continuous learning ( $\beta = .634$ ,  $r^2 = .402$ ) showed the second strongest relationship with financial performance. This dimension represented 40% of the variance in financial performance. This is intuitively understandable. In order to improve the financial performance, the PHLIs need to provide quality services to their students, which can be achieved if both the academic and non-academic staffs constantly improve themselves. Since the education industry is highly competitive, continuous support and opportunities for learning are apparently made available to the staffs by the respective leaders of Malaysia's private colleges. Nowadays, the demand for advance knowledge arises as driven by changes in the workplace brought about by globalization and ICT. Thus such demand, change and challenging nature of ones job inspires the creation of continuous learning opportunities to the institutional members (Marsick & Watkins, 1999). Moreover, it is strongly believed that lifelong learning is a norm in higher learning institutions. Indeed, scholars have consistently found that continuous learning significantly contribute to financial performance (Hernandez, 2000, McHargue, 2000; Selden, 1998).

The dimension embedded systems also shows a very strong relationship with financial performance at ( $\beta = .638$ ,  $r^2 = .407$ ), representing 41 percent of the variance in financial performance. Embedded systems were constructed based on the use of two-way communication, accessibility of information, up-to-date database of employee skills, and availability of systems to measure performance gaps. Embedded systems allude to the systems that are needed for knowledge management where it is concerned with acquisition, development and storage of individuals' knowledge and making the information available and accessible for everyone. Moreover the management of knowledge becomes necessary for any learning institution in sustaining and maintaining competitive advantage. Jones, Herschel and Moesel (2003) also point out that "capturing valuable information and having the ability to effectively use and share it can help an organization maintain a sustainable competitive advantage" (p.54). "As information is an appropriate vehicle for representing, storing and distributing knowledge, information and communication technologies (ICT) play an important role in developing many knowledge management

applications” (Owen, 1999, p.7). Perhaps, the existing systems to capture and share learning in the institutions can be technologically advanced or other way round. In other words, it is not indispensable to have high level of information management technology to share learning; nevertheless technology generally becomes a tool for an institution to capture and share learning among their members in fast and easy mode. In fact, the learning that occurs in the organization can be shared through informal and formal gathering, bulletin boards, regular meetings and so forth. It is interesting to note that the finding of this study is also consistent with the work of Hernandez (2000), McHargue (1999), and Selden (1998). These studies together with the current findings signify that availability and accessibility of information across the organization for the purpose of making a good decision will lead to a positive financial performance (Selden, 1998).

Of the seven learning organization dimensions, inquiry and dialogue indicator exhibited a weak relationship with financial performance ( $\beta=.413$ ,  $r^2=.171$ ). About 17 percent of the variance in financial performance was explained by inquiry and dialogue. However, the relationships between the variables are significant. The items used to develop this dimension are practice of giving open and honest feedback across the institution, do individuals take into account the viewpoint of others, level of freedom to question superiors, and existence of a trust culture among employees in Malaysia’s private colleges. The weak relationship between the two variables could possibly be due to the institutions’ culture where the practice of openness is poor and very little time is spent on building trust and questioning each other. Perhaps, the nature of job in private colleges requires that institutional members pay more attention in providing quality service and maintain a good relationship with their stakeholders, especially students, have limited the interaction among the members in the institution itself. Again, this finding is consistent with the work of Hernandez (2000), McHargue (1999) and Selden (1998) in three different contexts. The final output of these three studies confirmed that inquiry and dialogue represented the least variance in financial performance.

Research Question #2 asked to what extent can select institutional characteristics independently explain observed variances in Watkins and Marsick’s seven dimensions of the learning organization. Out of forty-two possible relationships, only nineteen significant relationships were obtained. Thirteen of the coefficients were significant at  $p=.01$  or better and the others were significant at  $p<.05$  level. All the seven dimensions of the learning organization were significantly related with one of the institutional characteristics, level of institutional commitment to institutional/professional service. All the learning organization dimensions except embedded systems were significantly related with age of the institution. On the other hand, all the dimensions except provide leadership were significantly related with institutional level of commitment to effective teaching and learning. Other institutional characteristics, namely, number of full time employees, level of institutional commitment to research productivity, and level of institutional commitment to community service do not show significant relationships with any of the seven learning organization dimensions.

Age of the institution, level of institutional commitment to effective teaching and learning, and level of institutional commitment to institutional or professional service were significantly related to continuous learning, and team learning dimensions. As in the research question #1, continuous learning showed the second strongest relationship with financial performance. It is obvious in the case of private higher education institutions in Malaysia that maturity or the tenure of an institution strongly influences the presents of continuous learning opportunities as well as team learning. In other words, the institution that operates for a long period of time tends to provide more learning opportunity for its members and supports team learning as well. Perhaps, as an institution stays longer in the industry, it may gain higher market share or financially they may be stable. This further strengthens their ability to provide learning opportunities across their institution. Additionally, as the institution grows from year to year, their members experience new things or being receiving constant challenges from the environment, which require more collaboration and team learning to face the environment challenges tactfully and successfully.

Undeniably, the institutional level of commitment towards effective teaching and learning, and institutional/professional service also has positively created pathways for the development of continuous learning opportunities. In order to achieve these goals organizational members need to grow professionally which needs professional development programs and activities. The findings of this study show that embedded systems were significantly related with institutional level of commitment to effective teaching and learning, and institutional or professional service. These two commitments may perhaps encourage Malaysia’s private colleges to investment

more in technology to facilitate the dissemination of valuable resource to all of their members. Information technology is vital in the sense of building the knowledge capacity of the institutions. Through this knowledge, both the academic and non-academic members of the institutions will be able to provide quality and excellence service to their customers especially students. The quality services of an institution are probably the main factor that attracts students to enroll in any programs offered by the respective institutions. Thus, these institutions will perform financially better than others in due course of uniqueness of their academic and non-academic programs as well as their superiority services.

Leadership was significantly related with age of the institution and level of institutional commitment to institutional/professional service. This indicates that along with the institutional growth, leaders of the private colleges have gained reasonable experiences on different types of management practices and thus they might put more efforts in providing learning opportunities for their valuable members. Indeed, the leaders themselves might have given priority for their own personal development and growth, which is very important to lead an educational institution. The level of institutional commitment to institutional/professional service also had a strong influence on providing leadership. Education industry is being very competitive recently and as a result quality institutional or professional services become a mandate to sustain competitive advantage. Hence, charismatic leaders realize that knowledge of their members is one form of their capital, which can be accelerated through continuous learning efforts and supported by systems to capture and share learning within the institution.

On the whole, among all the relationships between the seven learning organization dimensions and institutional characteristics, institutional level of commitment to effective teaching and learning had the strongest influence on inquiry and dialogue ( $\beta = .506$ ,  $r^2 = .256$ ). In the educational institutions, open communication and positive dialogue is important to challenge one's mental model. Indeed, Watkins and Marsick (1993) have stressed that the inquiry "is a dialogue in which people mutually explore ideas, questions, and potential actions. It takes place through talk...talk reflects the way individuals think and is a key to learning through interaction with another" (p.73, see also Hernandez, p.122). Certainly, knowledge is critical to success in this information age, whereby members of the Malaysia's private colleges seem to be highly recognizing the importance of open communication even though the culture of openness in Malaysia perhaps still at the infant stage.

Research question #3 asked to what extent could selected institutional characteristics independently explain observed variances in perceived financial performance improvement measure. Three of the regression coefficients were significant at  $p < .01$  level. The institutional characteristics that showed significant relationships with the perceived financial were age of the institution, institutional level of commitment to effective teaching and learning, and institutional level of commitment to institutional/professional service. Despite the fact that these institutional characteristics explain only a small percentage of the variance in the perceived financial performance, all the characteristics were statistically significant. Age of the institution, level of institutional commitment to effective teaching and learning, and commitment to institutional/professional service explained three percent, six percent and ten percent of the variances respectively in financial performance.

Based on the research question #2 and #3, level of institutional commitment to effective teaching and learning, and commitment to institutional/professional service had a more frequent and stronger impact on both learning organization dimensions and perceived financial performance improvement measure of Malaysia's private colleges selected for this study. The significance of the institutional characteristics in this study of Malaysia's PHLIs is that construction of precise goals inspires the respective institutions to develop a learning culture. In short, the development of a learning culture and performance of PHEIs in Malaysia are superior when these institutions inculcate specific goals that become one of the motivating factors for future progression. The age of an institute probably reflects their maturity and stability and thus it was believed to be influencing the development of a learning culture among Malaysia's private colleges. This is further alleged to improve financial performance among these institutions, which is crucial in maintaining competitive advantage in this globalized educational environment.

Research question #4 asked to what extent Watkins and Marsick's dimensions of the learning organization and selected institutional characteristics are able to jointly explain the observed variances in perceived changes in financial performance of private colleges in Malaysia. Exploratory multiple regression analysis was used to answer this research question. All the independent variables, seven learning organization dimensions exhibiting significant predictive power for each of the dependent variables, perceived financial performance were tested to produce a

“best” model that maximized the perceived financial performance improvement measure. All the dimensions of the learning organization together with three institutional characteristics: age of the institution, level of institutional commitment to effective teaching and learning, and level of institutional commitment to institutional/professional service were put into a single simultaneous multiple regression as independent variables and financial performance as the dependent variable. The SPSS procedure for least squares regression, ANOVA and stepwise method was run.

The financial performance model (see Figure 2) revealed that fifty eight percent of the variance in financial performance could be attributed to the joint effect of continuous learning provide, leadership and embedded systems. On the other hand, these three learning organization dimensions were individually predicted by three of the institutional characteristics: age of the institution, level of institutional commitment to effective teaching and learning, and institutional/professional service. The institutional level of commitment to institutional/professional service is the only variable impacting provide leadership ( $r^2 = .143$ ), continuous learning ( $r^2 = .112$ ) and embedded systems ( $r^2 = .144$ ). Additionally, level of institutional commitment to effective teaching and learning related to continuous learning ( $r^2 = .134$ ). Age of the institution only related to continuous learning ( $r^2 = .032$ ). The findings supports the idea in the learning organization literature that an institution which provides ongoing learning opportunities, have leaders who recognizes the importance of learning, and appropriate systems are in place to capture and share learning across the institution are more likely get better in their financial performance. The financial performance improvement is a sign of more effective use of financial resources, greater productivity per employee, effective use of time to promote the institution to obtain greater market share, and fast feedback to customer complaints. In brief, the findings of this study confirm that the learning organization dimensions do influence financial performance of the selected private colleges.

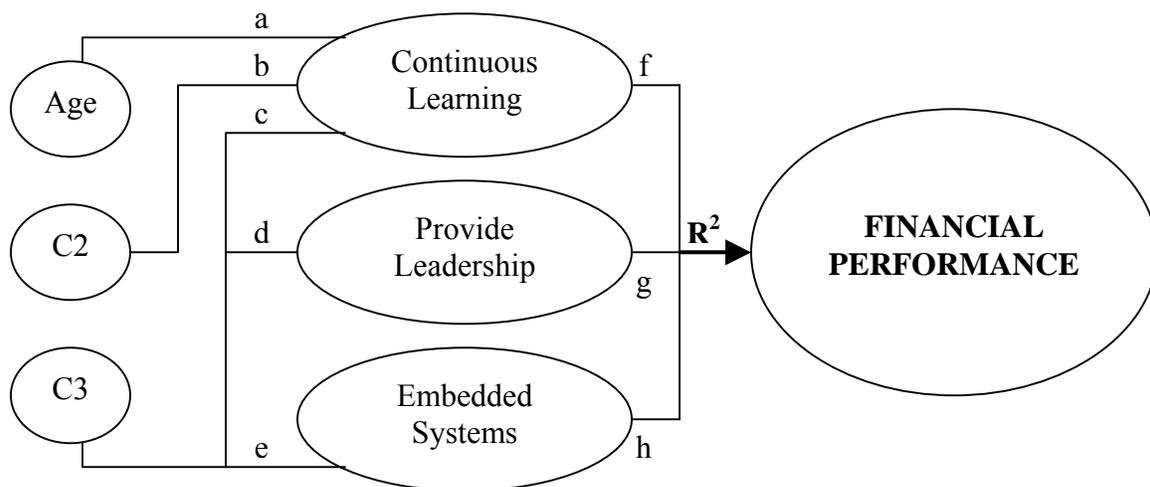

FIG. 2: FINAL MODEL FOR FINANCIAL PERFORMANCE

**Note:** Age = Age of the institute  
 C2 = level of institutional commitment to effective teaching and learning  
 C3 = level of institutional commitment to institutional/professional service

**R<sup>2</sup> = .584**

a = [  $\beta = .180$ ;  $r^2 = .032$ ;  $p = .005$  ]

b = [  $\beta = .366$ ;  $r^2 = .134$ ;  $p = .0001$  ]

c = [  $\beta = .334$ ;  $r^2 = .112$ ;  $p = .0001$  ]

d = [  $\beta = .378$ ;  $r^2 = .143$ ;  $p = .0001$  ]

e = [  $\beta = .379$ ;  $r^2 = .144$ ;  $p = .0001$  ]

f = [  $\beta = .374$ ;  $p = .0001$  ]

g = [  $\beta = .344$ ;  $p = .0001$  ]

h = [  $\beta = .187$ ;  $p = .005$  ]

## **Validation of the Financial Performance Model**

All the residuals plots (normal probability plot of regression standardized residuals; scatterplot of studentized deleted residuals versus standardized predicted values; and scatterplot standardized predicted values versus observed values) have provided a visual basis for checking the violations of the multiple regression assumptions. The residual plots supported that the financial performance model fit the data quite well or in other words, the model was appropriate for the data collected for this study since the residuals follow a normal distribution as well as other assumptions for a regression analysis were met. Moreover, it was confirmed that the multicollinearity problem do not occurs between all of the predictor variables in this study. The variance inflation factor (VIF) values were used to assess collinearity or multicollinearity among the independent variables. All the VIF values were below the commonly accepted threshold value of 10.00 (Cooper & Schindler, 2003; Neter, Wasserman, & Kutner, 1990, SPSS Applications Guide, 1999).

## **Conclusion**

The empirical study explored the relationships between seven learning organization dimensions and perceived financial performance improvement within private colleges in Malaysia. The findings provides some empirical evidence that suggests PHLIs to some extent do follow learning organization practices and it is proved to be successfully improve the financial performance. Therefore, other higher learning institutions in quest of becoming competitive are strongly encourage adopting the learning organization dimensions. By focusing on leadership for learning, embedded systems and continuous learning which were the strong predictors of financial performance, PHLIs are possibly can achieve a position of eminence in the globalize education industry. Additionally, institutional characteristics that jointly affect the institutions' financial performance were age of the institution, institutional level of commitment to institutional/professional service, and institutional level of commitment to effective teaching and learning. Thus, PHLIs need to consider this factor as they move forward in building and nurturing a learning culture. On the whole, the findings of this study have brought forward the importance of developing a learning culture and its impact on financial performance with the intention to provide comprehensive empirical information for HRD scholars and practitioners.

# Managerial and Economic Knowledge and the Scientific Method

*Alessio L. Lokar  
Michela C. Mason  
University of Udine, Italy*

## Abstract

The aim of the paper is to find a framework for understanding if scientific methods can be applied in managerial and economic studies. The purpose is to answer to the following question: has economic and managerial rationality a sure scientific nature? The paper proceeds as follow. Firstly, the main aim of the work and research questions are presented, secondly, we illustrate what we mean for scientific method and we pay particular attention to relationships between scientific method and managerial and economic studies. Thirdly we propose our interpretative framework, analysing in details its components.

## Introduction

There is a large number of scholars nowadays carrying out research in the fields of Management and Economics, so that the question posed by this paper about the relationship between these research areas and the scientific method is not idle: can all this work be labelled as being part of the scientific method?

The researchers working in the described areas could think that there is no such a problem, but observations from reality, in our opinion, tell something different. In order to support the thesis that a problem exists, we are putting forward the following consideration: successful scientific models in a given area, make it possible for scholars to foresee the development of phenomena.

An example of predictability in astronomic sciences is the work of American NASA and European ESA, which seven years ago sent toward Saturn the spacecraft CASSINI HUYGENS in gravitational orbit. During the flight it behaved exactly as forecast and after a small correction, also part of the scientific plan, it entered into SATURN'S orbit, sending back magnificent images of the heavenly bodies. The probe HUYGENS even landed on TITAN, one of SATURN'S moons, by means of a complex manoeuvre, sending back pictures of the satellite's surface. A successful scientific and research achievement!

On the other hand, an example of low predictability in managerial sciences: some days ago, it was reported that CARREFOUR, the largest European retailer, is in trouble and was compelled to sell some of its overseas operations, notably in Mexico and Japan. But one or two years ago we were reading quite opposite declarations: CARREFOUR was in a winning mood, priding its global results and planning to conquer the Japanese, the Chinese and other markets. In that occasion, some experts were even doubtful if these ventures would be so easy as CARREFOUR managers were proclaiming, given the known difficulty for non-Japanese companies to obtain winning results in that market, but the representatives of the company were confident about their strategies against all odds. How could high-level professionals become wrong in so short a time?

A second example from a more general economic area: when establishing Maastricht criteria, German experts and politicians pressed EU members to introduce fiscal deficit limits at the renowned 3 per cent limit. The measure was meant to keep monitoring member countries with a history of disordered finances. What happened afterwards in the reality was quite opposite to forecast: Germany was the first member to break the rules initially proposed by itself.

Of course, there are explanations for both cases. But ex-post. Science would ask for ex-ante explanations. But in Management and Economics this is very rare, if not practically non-existent. These cases, and many others, repeat the initial question: has economic and managerial rationality a sure scientific nature?

The problem of what is scientific and what is not, is not new and is discussed in Epistemology<sup>1</sup>, the discipline trying to understand the problematic of scientific thought.

We will quote only some epistemologists, those who, in our opinion, gave relevant contributions to the problem.

At first we would like to mention Carnap<sup>ii</sup>, who introduced the idea that science is built through mental models, which are proved in practice, until they fit to the reality. Models are simplified descriptions and explanations of the phenomena observed. In philosophical terms this kind of thinking activity is called induction, as we induce from what we observe in the reality, to thought models, i.e., theory.

Another relevant epistemologist, was Popper<sup>iii</sup>, who considered the evolving of models in time, concluding, we guess, under the impression of the substitution of Newtonian cosmology with Einstein's Relativity, that mankind, if at a certain historical moment relies on a certain explanatory model. There is another one looming in the future, better fitted than the first one to explain the phenomenon. In Popper's view, science cannot find a final model in a given area of knowledge, as evolution of thought is always working. What science can do, is to recognize previous models as false. Therefore, science is based on the principle of falsification, and not on that of finding the truth.

Kuhn<sup>iv</sup> noted that many scientific models are not mere hypotheses, which could tomorrow be easily changed with a new idea. Areas like physics, chemistry, biology and medicine can today rely on firm knowledge. Also the relationship between Newton and Einstein cosmologies is not that of one theory substituting the other. They are both true in particular circumstances. Even if we cannot say that we have reached the point of total and exhausting truth, Kuhn's message could be expressed as follows: the advancement to complete truth is through steps, called paradigms; the final result of the advancement is always wanting, but the steps are firm enough so that our understanding of the phenomena can rely on them. From the point of view of the step where we stay now, we can forecast improved actions in the future, as this happened already in the past.

But are the thoughts of the past all wrong? The present-day people tend to think that ancient men and cultures were mostly very primitive. But today's knowledge is built on the previous one. This aspect was pointed out by Lévy-Strauss<sup>v</sup>, who got the merit of showing how also primitives have been rational, if we take into consideration their very circumstances. Many areas of knowledge and many technologies derived from them and were invented by mankind in the past and are nowadays substantially still valid.

Consider the case of the invention of fire. We must use a scenario as we don't have a report.

Once upon a time, not long after the exit from Eden, a tribe of primitive men was squatting down in a cave located on the African highlands, close to the Great Rift Valley, the great rip in the earth crust, extending from the mountains of Lebanon, through the Red Sea, to East Africa.

Suddenly the walls of the cave start to tremble: the mountain is in the reality a volcano, turning into an eruptive state. On the slopes appears a river of molten lava, flowing down the valley.

The members of the tribe run away, trying to put as much distance as possible between them and the natural phenomenon, but a young and more intelligent member stopped after a while turning his head, in order to observe the phenomenon in all its terrorizing magnificence. Once the curiosity prevailed on mere terror he started to sense also the positive effect of the warmth which the lucent lava flowing spread into the environment. As he went closer, the sense of benefit won over the cold of the night of the highland. After a longer period, lava flowing stopped, starting to cover with a solid crust, like a healing wound.

The young man observed the glowing substance inside the cracks. After a while, he started to play with a wooden stick, pushing it inside and observing what would happen. A lively flame appeared. The fire emitted warmth, and he came to the idea of transporting the flame to a bush and to a pile of woods. In the end he would transport the woods to his native cave, and when he saw that the flame tended to die out, he would appoint a clan member as fireguard.

We shortened a story which probably required centuries to be realized, but it is not totally an arbitrary invention: still at Roman times priestesses existed, called vestals, who had the task of guarding fire, as part of an antique tradition.

The scenario shows the modalities of how rationality operated in the pre-scientific man, already able to make inventions and develop simple technologies. His rationality, in contrast to pure instinct typical of the animals, showed up in overcoming the atavistic fear, in stopping in order to observe natural phenomena, in exhibiting curiosity and finally in playing and experimenting, by means of primitive instruments based on senses, in first place

eyes and hands. After having assimilated the basic elements of the phenomenon he tried to transform them in a most convenient way for him and for his kin. This is already the invention of a technology, having the scope of using the phenomenon whenever necessary, independently of the natural happening. Other phases were developed later, when people learnt how to ignite fire without a volcano at hand.

Many centuries and even thousands of years passed, after the described scenario, but man didn't stop, trying to understand the phenomenon. For instance, old philosophers, like Tales, divided nature in basic categories, one of which was fire.

More precise observations of the phenomenon have been carried out when man came closer to modern times. Alchemists, for instance, classified substances into two categories: flammables or combustibles and not combustibles. This work was done with the goal of finding a method in order to transform vile metals in gold. They were trying to burn metals, thinking that the procedure would bring them closer to their objective. They observed that flammability depended also on temperature: some metals burnt, but you had to get the system very warm. As a consequence the categorization in flammables and not flammables was good, but not perfect: some substances were easily flammable, others were less and some were not flammable at all. Something was missing in explaining exactly the phenomenon of burning.

Anyhow, taking into account their observations, the alchemists proposed for the burning phenomenon the explicative model<sup>vi</sup> shown by the following equation, where we put inputs on the left and outputs on the right side of the equal sign:

Combustible substance + Ignition Temperature = Phlogiston + Ash + Warmth (Model 1)

Phlogiston was the hypothetical fire substance. Model 1 appears as rational if observations are based on normal body senses, in first place view and touch: during combustion a kind of fluid is seen lifting over the flame and an emission of warmth is sensed. At the end of the process, and when they are cold, the ashes can be touched. The normal ashes of combustible substances weigh only a fraction of the input combustible. Therefore, their weight, in a first approach, can be considered as negligible. Many combustible substances, for instance oil, do even not produce ashes.

If the combustion experiment is carried out, using metals as combustible substances, a higher ignition temperature is needed, but model 1 looks as confirmed, if the ashes are not weighted.

Lavoisier<sup>vii</sup> came to the idea to weigh the inputs and outputs of the metal burning<sup>viii</sup>. The result of the experiment was astonishing: the output ashes weighted more than the input metals. It was something unexpected and not observable by means of view and touch. After some deductions, he proposed model 2:

Ignition Temperature + Combustible Substance + Oxygen = Oxidation Substance (Ashes) + Warmth (model 2)

In order to prove that model 1 is false in all possible circumstances it is necessary to develop more complex experiments, as the mere weighting of solid ashes. In the combustion of wood or coal, for instance, gasses are produced and one must be able to estimate the weight of them.

At last model 1 was found false in all possible circumstances, whereas model 2 showed up as the first step of the paradigm of a new science, chemistry, substituting previous alchemy. Alchemy is nowadays totally cancelled from modern awareness, as it is considered intrinsically false.

## **The Scientific Rationality: An Interpretative Framework**

Taking into account the precedent considerations, scenarios and examples, we guess that the stages of scientific rationality could be described as a sequence of the ego activities, observing the objects outside themselves, going through the following stages:

1. Simple observation of facts and/or objects and their description in words. The objects and facts present diverse facets. The observer tries to find a conducting thread in this multiplicity. Veda philosophy affirms that "man looks for the one in the multitude". In that phrase there is some truth, but the scientific method, compared to philosophy cannot neglect details. Therefore a step forward is made by:

2. The creation of categories: in order to produce categories, the observed multitude has to be divided into groups or sets. If we want that categories make sense, they must be built up in such a way that every observed object or fact fits into one and one only category. Categorization is the better done, the more this principle is maintained.

It is interesting to underline that categorization has a double function: on one hand categories separate, making it possible to distinguish the sub-phenomena, on the other hand, they are oriented toward unity. This last aspect is due to the fact that the number of categories must be inferior than the number of observed objects, as one category must be able to collect various objects of observation. It is like ordering disparate objects in a reduced number of drawers. The result is a numerical reduction of the observed phenomenology, equivalent to the advancement in the direction of unity. Often, such kind of categorization is not easy.

The easiest way to carry out categorization is to divide the observed objects into two parts: a partial set and the rest. Such kind of categorization is always possible. The two sets can be subdivided at new at a second level, than at a third one, at a fourth one, and so on. Every thinking mind is doing that in all possible cases.

Categorization can be done in many different ways, depending on the object as also on the modelling strategy.

3. Once the above exposed conditions are met, the categories can be named. A name is a semantic element, symbolically representing the category. That way we substitute the multitude put into the category, by a unique symbol, expressed in a language. It is a new step toward unity, as the categorical multitude is now represented by the one symbol. Already Plato and Aristotle found out the abstract character of names. Let's consider the word "tree": in the rein of nature, there is no concrete tree, but only the precise oak in front of our window, or the pine in the middle of John's garden. As a matter of fact "tree" is the name of a category of objects observed in the realm of nature, outside our ego. By denominating categories we introduce symbolism in the rationality procedure, where now the deductive aspect starts to prevail over the inductive one.

There are several languages at disposal of man's rationality: vocal, pictorial, pictographic, alphabetic, graphic, algebraic, matrix, computer, photographic, physic. Every language chosen presents advantages and disadvantages, as far as explication is concerned. Therefore, as a general rule, using a combination (mix) of various languages, a better explicative result is obtained.

Moreover, it is necessary to point out that languages are less and more complex. In order to distinguish this aspect we might use the quantity of effort needed to learn a given language. The vocal speech is learnt after birth, the alphabetic at school, the graphic and algebraic languages also at school, but at a higher level, as it is asked for an added effort, and it must be based also on previous knowledge<sup>ix</sup>.

4. After having produced categories and their names, we can try the subsequent passage of the scientific method, which is given by quantitative measurement. In order to obtain this result we must introduce one or more scales, creating an association between the grades of the scales and the categories, obtained in the previous stage. If we are able to obtain that type of result, the categories don't have only names, but also numbers and they may be more precisely classified.

Example: the heavenly bodies are subdivided into the categories/names of stars, planets and satellites. Table 1 brings the categories and some measurements of them. Table 1 is a categorization in matrix, word and numeric language.

TABLE 1: CATEGORIZATION OF PART OF THE PLANETARY SYSTEM AND SOME DATA OF IT

Categories	Stars	Planets	Satellites	Average distance from centre (10 <sup>3</sup> km)
Names	Sun			0
		Mercury		57,91
		Venus		108,2
		Earth		149,6
			Moon	0,3844
		Mars		227,94
			Phobos	0,938
			Deimos	0,124

Measures are important: if matrixes would be only visual or qualitative, we had the determination of categories, but it wouldn't be possible to establish a more precise relationships between them. In order to realize measurements, we often need sophisticated instruments, like telescopes, microscopes and others. The measure instruments are the ones that make it possible to overcome the limits of our body-senses: with the telescope we see further than only our eyes alone would permit.

5. The next step is the construction of a model, i.e., the trial to connect everything in a system.

Suppose we determined n categories of a given phenomenon, named:  $x_1, x_2, \dots, x_i, \dots, x_n$  and suppose also that the  $x_i$  varies in time, than the model can be expressed as:

$$Y = f(x_1, x_2, \dots, x_i, \dots, x_n) = f(\underline{x}) \quad (3)$$

and the task of the researcher is to find the form of f.

From a systemic view-point (3) is connecting the output Y to inputs  $x_i$ , which in this case are the categories. Equations (1) and (2) regarding burning tried to obtain exactly this kind of result.

To find the form of f, it is not an easy task, and in order to get it we must do it by means of comparing the model to the reality. We can show this aspect by the system in graphical language, Fig. 1.

Fig. 1

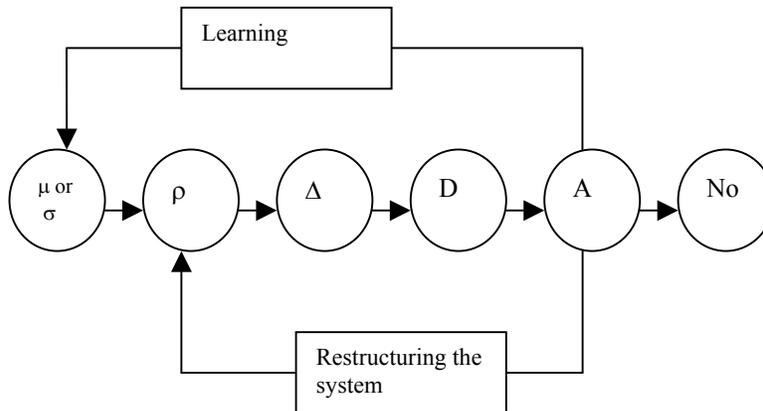

Fig. 1 is the general graphical representation of the system of control and checking used also in managerial areas of knowledge. It represents the sequence of activities through which management carries out its tasks<sup>x</sup>:

- a. The first stage is given by the construction of the model which was described previously through the points from 1 to 5. The model is here named most generally with the symbol  $\mu$  or  $\sigma$ :  $\mu$  for model and  $\sigma$  for standard, as it is often possible to express a model with few or even only one number, which is than conveniently called a standard<sup>xi</sup>.
- b. The model is compared to the reality named here  $\rho$ .
- c. The difference  $\Delta = \mu$  or  $\sigma - \rho$  is evaluated and
- d. A decision D is taken in order to:
- e. A, act correctively
- f. No, don't act correctively, if the difference  $\Delta$  is not significant or
- g. Act on the reality if the difference is significant and the reality can be corrected. This is a stage of management: in management we try mostly to correct the reality by means of organization.
- h. To act on the model if we think that it is unrealistic. Changing the model means learning. Learning can be defined as change of existing models to new ones, better fitted to reality. It is also the first stage of innovation, as by changing models we find out new models, which can aftermath be used to make new products and/or services, i.e.: innovation.

The interesting point to show from the point of view of Epistemology is the following one: the sequence of activities from a to h (a  $\rightarrow$  h) is the same either we are managing a company, or we carry out a scientific research. Thus, this is the very reason why, it is so difficult to disentangle the two activities, management and research, getting a clear separation of the two. The difference is not in the theory but in the practice. What we do in practice research activities is that we concentrate in transforming mental models until they fit to reality. This is better achieved if we carry out a laboratory experiment. The term laboratory means that we keep reality  $\rho$  in so called controlled, or fixed condition and then we change or move the model  $\mu$  or  $\sigma$ , until it fits to the reality  $\rho$ . But this consideration is not to take in a totally strict meaning. Also if we carry out experiments we must, for instance carry out some organization. Hence, also in this case we have some managerial operations. But the core activity is research, transforming models in order to fit them to reality.

When the activity is typically managerial, than the follow-ups f and g are the more frequent: we don't intervene if the forecast model is right, or we intervene in the reality of the company and/or the environment around the company, if we must reach the goals of the model. This would mean that we still believe that the forecasting model is true, but we must do some organizational work to meet it. These are typical aspects of managerial activity.

We see here the subtle difference existing between research and managerial activities. It is only a difference in dosage between the activities of building models, checking them with reality and correcting models and/or reality. If we tilt on one side it starts to be research, if we tilt on the other it is management.

Another problem is connected with the quality of the models at disposal. We exposed previously the procedure of building models by means of the sequence from 1 to 5 (1  $\rightarrow$  5). The question is: is it possible to carry out this procedure in the same way in all areas of knowledge? The procedure in itself is totally general, we know it from long experience. We think that we can affirm that human rationality goes always through the described steps, but it could be that in certain areas of knowledge the topic treated makes it difficult to apply. Again this is a practical and not a theoretical problem.

## **The Scientific Rationality in Managerial and Economic Knowledge**

In Marketing, a typical area of Managerial knowledge, categories are called Marketing variables and they display as shown in Fig. 2.

Theoretically it would be possible to write an equation like (3), where  $x_i$  are the input variables and  $y$  the result of a marketing action; but in practice this is not feasible because  $x_i$  are synthetic variables, which can be divided in sub-variables, these again in sub-variables and so on. It is always possible to make categories, as categorization is the very work, as previously explained, to put different objects in one set, but this is not yet a

guarantee, that the sets are apt to model building. Possibly, another categorization would be needed to that end, but at the moment we have only this one at hand. There is also possibly another danger: the objects and/or facts which we put in one category, could also fit in other categories, and for this reason the categories do not make a clear cut of the reality observed, but they overlap.

At this stage of the investigation we can hence conclude that the observed phenomenon is complex and that the division in sub-phenomena is difficult and scarcely productive for the aim of a unifying model.

**FIG. 2.: CATEGORIES OF MARKETING VARIABLES**

Marketing variables	Active or business variables	Product	
		Price	
		Place	
		Promotion	
	Passive or environmental variables	Micro	Suppliers
			Middlemen
			Competitors
			Company's culture
			Customers
		Macro	Demo-geography
			Economy-income
			Politics-law
			Culture
			Politics-Law
			Technology
			Naturale environment

We have similar situations in many areas of economic topics. The consequence of it is that the models used do eventually not comply with Popper's falsification principle.

Let's take, for instance, International Economics<sup>xii</sup> a topic advancing through several steps denominated by the Authors of the various models: Smith, Ricardo, Heckscher-Ohlin, Samuelson, the model of the Economies of Scale, the Model of the International Life-Cycle and the Model of the Multinational company. None of those explanatory models can be declared as false. Even the first historical models, like that of Adam Smith, may be useful in order to carry out an explanation of the reality in the area.

We have another example from more general Economics: until approximately a decade ago, one of the most important Authors in economics, either theoretical, or practical, was considered Keynes<sup>xiii</sup>. As a mathematician working in Economics he developed a simple model explaining the economy of a nation, which was attractive for scholars, for its clarity, and for politicians, for its simplicity in application. Keynes advanced the opinion that by

means of the so called “deficit spending” it would be possible to foster the development of a given nation. His message was widely received by politicians as it gave them an easy receipt for the solution of many troubles.

But the experience gathered finally was not so good as the theory proposed: where deficit spending was done consistently, the outcome obtained was not so much development but the so called stag-flation, economic stagnation together with inflation. The forecast of what would happen was wrong again. As a consequence of it, scholars turned from Keynes’ ideas. But, and this is typical for economic models, not totally! For instance, as we already said, Maastricht criteria still permit the EU member countries, a limited deficit spending of 3% per year.

Therefore, we can say that Keynes’ model was not falsified in Popper’s sense, but it is also not totally true. It looks to be true in a small dose, like some drugs: they can be used, but only to some extent.

We think that it is important to understand the real nature of the models in the vast area going from Economics to Social Sciences and their relevance for application. Otherwise it could happen like with Marxism: some decades ago it was considered as a scientific truth regarding human relations and society, but when it became evident that reality didn’t behave like foreseen by the model, i.e.:  $\mu \neq \rho$ , terrible actions followed in order to “correct”  $\rho$ . It is interesting that also Hitler<sup>xiv</sup>, thought that Nazism was based on a scientific truth, and that also the consequences of that social and political model application have been terrible. The caution is therefore more than justified, even more as the public is longing for a scientific truth in economic, social and other similar areas of knowledge, close to the every day interests of mankind.

So then, what now? Shall we abdicate from our impetus to understand everything and to subdue everything to the scientific mind? Shall we return to a kind of pre-scientific culture? We don’t think so, this would be again an extremism. It is too much connected with human being the trial of understanding the world which surrounds us, and to lift the veils between us and the external phenomena.

## Conclusions

At this point, it is only necessary to admit that there are vast areas of knowledge and interest, where the scientific method in its canonical form is difficult to apply and doesn’t produce the results eagerly looked for by mankind.

Sometimes it could be even ridiculous to try to force them out, as, for instance, it happens in Economics, by means of a trend of complex mathematical application. This could be justified, in our eyes, only if it produces results. But the algorithms could produce results only if the checking between models and reality is carried out, as expressed by means of the system of Fig. 1. Mathematics is a form of deduction, that doesn’t create inductive results by itself. But nowadays, entire economic books are devoted to economic phenomena described by mathematical algorithms. Out of them almost nothing could be factually applied in day-to-day management of business and economic systems, so that eventually two worlds developed: on one hand more and more abstract mathematics and on the other the use of trivial heuristics. Until now, for instance, nobody was able to prove that a -3% fiscal deficit for a given country is better than -2 or -4, or 0, or +1. -3% is based just on the proverbial “rule of the thumb”.

The impression goes that to push ahead research and findings in these complex fields of knowledge, a more precise determination of the scientific methods would be needed, in order to establish how to proceed to be more productive. But this point opens a new chapter, which we leave for future contributions.

- <sup>xi</sup> In English the word “standard” appears first with reference to the “Battle of the Standard” in 1138. A contemporary writer, Richard of Hexham, relating the story of the battle, describes the “standard” there used as a mast of a ship, with flags at the top, mounted in the middle of a machine which was brought into the field. He quotes a Latin couplet written on the occasion, which says that the standard was so called from “stand”, because “it was there that valour took its stand to conquer or die”. Originally, the word “standard” meant the flag, pennant or other symbol, affixed to the top of a pole, and served as the rallying point for troops in battle. The soldiers in each unit were expected to recognize their own standard, so that they could reorient themselves from time to time in the heat of battle. The modern primary meaning evolved through symbolism: “a quality or measure which is established by authority, custom, or general consent”. A standard is a concrete example of an item or a specification against which all others may be measured.

# Managing Digital School in the New Paradigm Shift

*Issham Isa  
Ku Ruhana Ku Mahamud  
Rahela Abd. Rahim  
Universiti Utara Malaysia, Malaysia*

## Abstract

As the world goes online, so are many schools. Today, in order to complete globally schools should enter the new technology paradigm, which is to shifting the traditional school environment into an e-school environment. Furthermore, in the new millennium, schools face many challenges that are affected by the dynamics of information technology (IT). IT is the main source of competitive advantage that enables schools to embark on a global platform. Society is undergoing a fundamental transformation from the Industrial Age to the Information Age. All the people, organisations, societies and nations are affected, although not at the same pace or to the same degree. Those who realign their practices most effectively to Information Age standards will reap substantial benefits. This paper discussed the proposed e-school, the components and the IT infrastructure for e-school.

## Introduction

Throughout the history of the world people have characterized its existence by time periods or ages. Today we have moved into another age that is different from any other – The Information Age, a time when knowledge is power (Haag, Cummings, Dawkins, 1998).

The Information Age has brought greater challenges especially in school environment throughout the world especially in the new millennium. The fundamental challenge is to provide an excellent service in terms of administration, management and teaching. As a result, every effort is taken to ensure that every students and offices are equipped with the state of the art technology. These are to ensure students are able to fulfil the national human resources requirement and simultaneously to provide knowledge and basic analytical skill to every individual. This paper proposed information technology architecture as an effort in turning traditional schools into digital school also known as e-school and the components that contributes to its success in the future

## Background

To be able to deliver world-class education and school management system, school can adopt the information technologies to create an information technology infrastructure capable of coordinating the activities of entire school and even entire education sector. This new IT infrastructure provides a broad platform for learning and administration and the emerging digital school. This new IT infrastructure is based on powerful networks and Internet technology. The new IT infrastructure links desktop workstations, network computers, LAN and server computers in an education enterprise network so that information can flow freely throughout different parts of the school. The education enterprise network may also be linked to kiosks, PDA, digital cell phones and PCs and other mobile computing devices as well as to the Internet using public infrastructures. Student, teacher and administrators can be links to the education portal through this new IT infrastructure.

Connectivity is a measure of how well computers and computers based devices can communicate with one another and share information in a meaningful way without human intervention. It is essential for the hardware; software and network components work together to transfer information seamlessly with the school environment.

## Proposed E-School Model

The information technology paradigm has changed from legacy computer systems to network open computer systems. Network is considered a computer nowadays. An e-school should operate at high performance level. For school to achieve its e-school vision it has to be supported and committed by all levels of people. To begin its conquest, school must be fully networked with gigabit technology with asynchronous transfer mode (ATM) for its wide area network. The server systems should be running on Linux or NT Operating System. Hence, to conquer and conquer the paradigm shift and be able to go electronically we proposed the e-school model that consists of people, technology and business process as illustrated in Fig. 1.

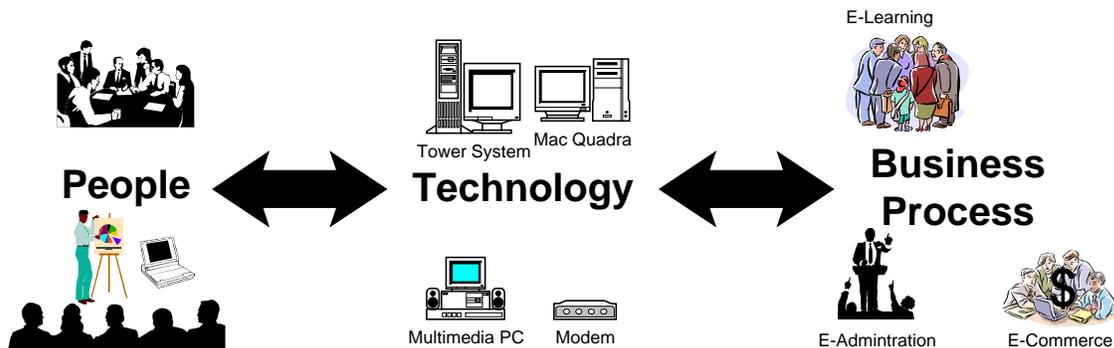

FIG. 1: PROPOSED E-SCHOOL CONCEPTUAL MODEL

### People

The elements of people consist from all levels based on their field of expertise and responsibilities. In addition, they need to understand all aspects of the organisation and reach certain level of competency to be known as Knowledge Workers. Knowledge Workers are people who spend most of their time communicating and collaborating in teams and workgroups. They also create, use and distribute information (O'Brien, 1999). People in the context of e-school can be categorised into three different groups:

- Administrator
- Teacher
- Student

### Technology

For school to meet its vision, it needs to have a high performance info-structure – Information Super Highway as illustrated in Fig. 2. Thus, school should strategically planned to build the following info-structure (Isa *et al*, 2004):

- Super Highway (Campus Backbone: Gigabit Technology) that is fully connected.
- One-to-One Workstations or PCs.
- Latest application software: Internet, Intranet, Groupware, Workflow

This info-structure should be implemented with high performance. In order, to keep up with the latest technology, school must regularly evaluate all the indicators above so that they are align with the school development.

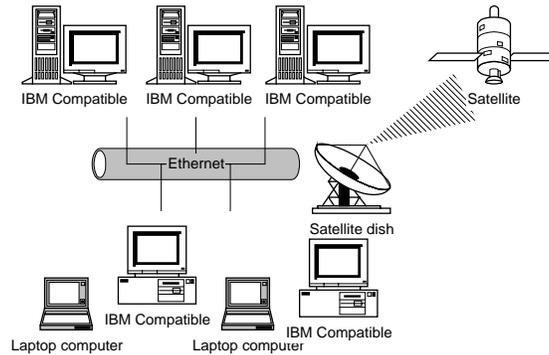

FIG. 2: CONCEPTUAL HIGH PERFORMANCE INFO-STRUCTURE

### Business Process

Information technology role is to make major improvements in the organisational business processes. Investment in information technology which school can adopt can help make its operational processes substantially more efficient and its administrative processes become more effective. School will be able to operate its business process by specific functional areas such as Financial Management and Student Affairs management as an example. Some examples of business processes or activities involved are illustrated in Table 1.

### E-Administration

Empower trained staff and business alliances with computers and telecommunications technologies to make governance stronger (Toregas, 1999). To lead school into the new paradigm shift, e-Administration is initiative to reinvent itself. E-Administration is hoped to improve both how the school operates internally as well as how it delivers service to the public. It seeks to improve the convenience, accessibility and quality of interactions with school environment. This will also improve information flows and processes within the school administration to improve speed and quality policy development, coordination and enforcement among departments. Hence the *vision* of e-Administration is a vision for people, business processes and technology working together for the benefit of school and its entire citizen. The e-Administration applications are divided into three parts:

- Enterprise-Wide Information Management System
- Enterprise-Wide Communication System
- Enterprise-Wide Collaboration Management System

### E-Learning

The E-Learning is the creation, delivery, and management of learning and training via CD-ROM, school intranet and Internet. It allows organizations to take full advantage of their existing desktop/portable PC's and their computer network technologies. E-learning can be delivered directly to learner's computers, when and where it is convenient, and teachers can easily track learner progress (Click2Learn.com, 2000). The essentials of e-learning are of some possible reasons (Working Group Secretariat, 1998):

- To overcome limited physical resources.
- To assisting in changing trends of education to cater for more inquiry based learning styles.
- For easier access to subject experts around the world.

Turning to e-learning will lead to school be able to meet such goals:

- To broaden their marketplace by delivering knowledge to the students rather than forcing the students to find knowledge.
- To extend the presence of teachers to larger audiences beyond traditional classroom.
- To deliver new products-provide lifelong learning curriculum to individuals.
- To reduce the cost and improve the quality of teaching – provide tools for students to access to the best teachers.
- To provide better management environment for the teachers – from creation of courses until completing a course of study.

### E-Commerce

Before 1994, e-commerce as illustrated in Fig. 3 did not exist. Today, after a few years more that 30 million consumers in American alone are expected to spend about US65 billion purchasing products and services on the Internet (Dykema, 2000). It is important to realise that the rapid growth and change that has occurred in the first five to six years of e-commerce represents just the beginning. It appears likely that e-commerce will eventually impact nearly all commerce or that all commerce will be e-commerce by the year 2050 (Laudon and Traver 2001).

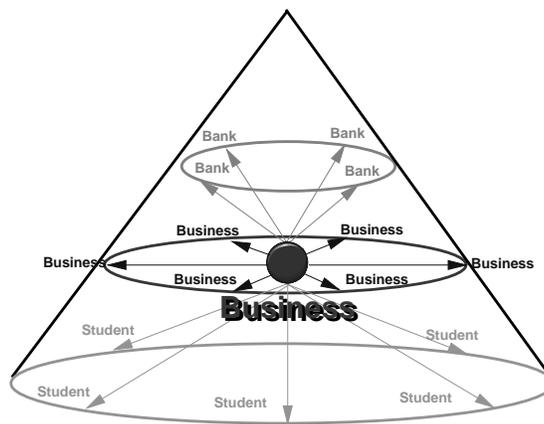

FIG. 3: E-COMMERCE CONCEPTUAL MODEL

School should take this brave step because of a huge return of investment (ROI). Based on reports and initiative experiences reported. ROI promise of earnings over 100%. Moreover, this effort is in conjunction with the Malaysian government's initiative in its mega project the Multimedia Superhighway Corridor (MSC) (MAMPU, 1997a, 1997b and 1997c).

## Information Technology Infrastructure for Digital School

To be ready and able to conquer education challenges for the new millennium, firm can use the information technologies to create an information technology infrastructure capable of coordinating the activities of entire school and even education sectors. The new IT infrastructure will provide a broad platform for e-school in term of learning, teaching and managing. This new IT infrastructure is based on powerful networks and Internet technology as illustrated in Fig. 4. The new IT infrastructure links desktop workstations, network computers, LAN and server computers in an enterprise network so that information can flow freely throughout different parts of the school and available links. The enterprise network may also be linked to kiosks, point of sale terminals, PDA, digital cell phones and PCs; and other mobile computing devices as well as to the internet using public infrastructures. Students, parents and others may be links to the school through this new IT infrastructure.

Connectivity is a measure of how well computers and computers based devices can communicate with one another and share information in a meaningful way without human intervention. It is essential for the hardware; software and network components work together to transfer information seamlessly from one part of the organisation to another. Strategic steps that has to be taken in implementing this e-school (Salleh *et al*, 2000, Othman *et al*, 2000, Basri *et al* 2001, Basri *at el* 2002, Isa *et al*, 2004)

- Plan and Implement the *Info-structure*
- Plan and Implement the development of *Knowledge Workers*
- Plan, Identify and Implement the *Streamlining Business Processes*

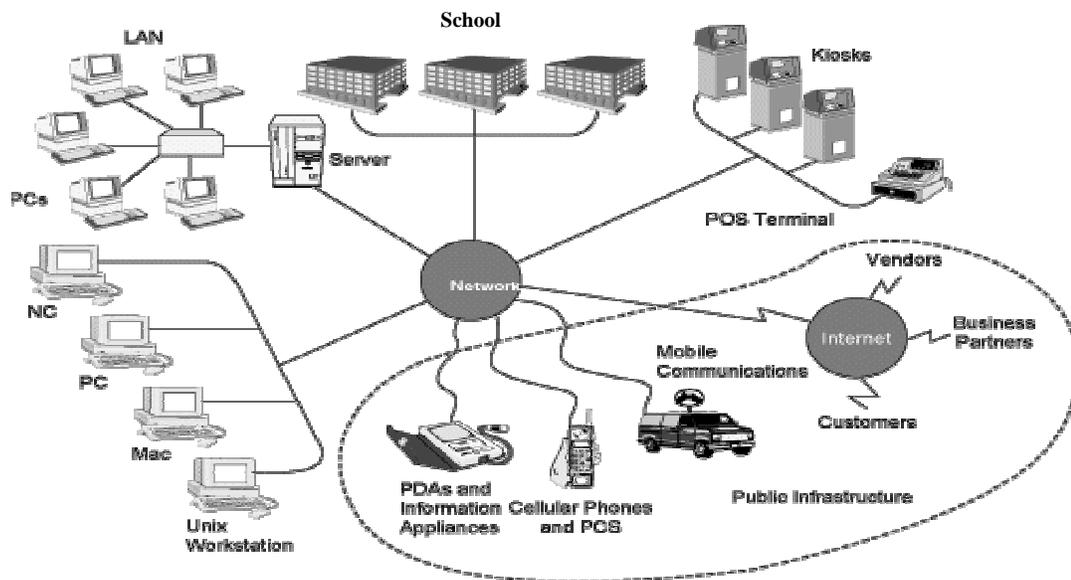

FIG. 4: THE NEW INFORMATION TECHNOLOGY INFRASTRUCTURE FOR DIGITAL FIRM (SENN, 2004)

## Conclusion

The introduction of new technology is considered to be one of the primary causes or sources of change within education system in the effort to increase the quality of communication both within and outside of the school. However, this sometime would require a substantial amount of investment, where risk is perceived as a solution to achieve competitiveness - a way to the new information technology era.

The management of technology is one of the most important aspects in managing e-school. It is not only the need to deal with the technical issues of the technology but the responsibilities lie beyond that. Issues like education structure and culture; and individual conflicts and resistance to change process must be address adequately. In addition, to be successful e-school must fully utilise its three main components, which consist of administrative, technology and business process.

# Offering On-line Education in the South Pacific through ICT: A Case Study of an IP based Network used to Offer a Postgraduate Computer Science Course

*Prakash Narayanan  
Nicholas Szorenyi-Reischl  
Univeristy of South Pacific, Fiji Islands*

## Abstract

The University of the South Pacific (USP) offered a post-graduate course CS493 'Advanced Information Technology for Small Business with Open Sources' using the IP based video conferencing mode in partnership with National University of Electro-Communications (UEC) in Japan. The technology used to create the learning environment was the IP based network link up using the satellite SuperBird-C, Earth receiving station, a satellite router, polycom digital camera linked to 20 computers in a local area network (LAN). This was made possible with the assistance of Japan International Cooperation Agency (JICA) office in Suva. This mode of offering computing science courses has added a new dimension to the mode of teaching and learning in the Mathematics and Computing Department (MACS) of USP. Efforts are being made to embrace the newer IP based technology that the digital domain offers. This mode provides student and staff with the opportunity to be part and parcel of the larger global community. Thus by using this technology we are able to participate in the sharing of knowledge and expertise with others whilst still being located at USP. The utilization of IP based network really opens up newer horizons and is a bonus for a regional university like USP which serves 12 other regional countries of the South Pacific. This also contributes significantly in terms of quality of medium to the distance teaching and learning (DTL) modes of courses. JICA has contributed significantly to make this project a reality here at MACS department of USP. This provides us a window to the current up to date technology options available today in the developed industrialized countries. This Internet based linkup is an excellent option for countries in situations where Internet speeds are low due to low bandwidth between countries. However whatever the technology utilized, this should not overshadow the teaching and learning component. A number of issues are raised by this trial project are discussed in this paper. This paper approaches the trial from this perspective; viz. to evaluate the benefit to already professionally trained post graduate students of access in real time to high level expertise from another country. Questions arise about the effectiveness of the technology, language differences, cultural influences on the interaction, learning outcomes and cost/benefit ratio.

## Introduction

Within a context of rapid technological change and shifting market conditions, the education system is challenged with providing increased educational opportunities using the latest technology. Many educational institutions are answering this challenge by developing distance education programs through the use of Information Communication Technology (ICT). These types of programs can provide adults with a second chance at a tertiary education and reach out to those disadvantaged by limited time, distance or physical disability. Distance education, through ICT, also opens a window to the utilization of contemporary expertise from higher education institutions worldwide. Much recent emphasis has been on on-line learning, with higher education institutions re-working their courses to suit on-line delivery. This has led to discussions in the literature on the time required by academics to design such courses (for example, Bender et al. 2004); the need for learning support for on-line learning (for example, Tait & Mills, 2003); and the theoretical base for on-line learning (for example, Jung 2001).

The University of the South Pacific (USP) is also moving into on-line provision and satellite based distance education through its USPnet program. USP is a regional institution owned by 12 member countries, (all are small island states), and is charged with delivering education to a widely dispersed group of students.

The Distance Teaching and Learning (DTL) mode is greatly encouraged in the Mathematics and Computing Science Department at USP and at present there are some Computer Science (CS) courses offered in USP's Distance and Flexible Learning (DFL) mode:

In the Video Broadcast (VBC) mode:  
CS112 Data Structures and Algorithms  
CS122 Information Systems II  
In the print and on-line mode  
CS222 Database Management Systems

More computing science courses are planned to join this list in semesters to come.

USP faces a special challenge in relation to the development of its post-graduate program: the desire to enhance research undertaken by university staff and to develop the research profile without postgraduate students having to go to overseas institutions to complete their specialized studies. This can contribute to reduced cost by strengthening in-house capabilities and give growth to the development of a culture of research in the University. In the case of Computer Science, the problem is exacerbated by the rapid growth of technology and the relative isolation of the University from the sources of that growth.

This paper approaches the trial from this perspective; viz. to evaluate the benefit to already professionally trained post graduate students of access in real time to high level expertise from another country. Questions arise about the effectiveness of the technology, language differences, cultural influences on the interaction, learning outcomes and cost/benefit ratio.

So, through the assistance of JICA (Japanese International Cooperation Agency) a trial program was set up in 2004 to deliver one post graduate course in Computing Science to students in the Laucala campus in Fiji from Japan through satellite linkup. This paper reports on the outcome of this trial. This project raises all the issues of staff time, technological efficiency, student support needs and effective models of delivery through ICT, which are common for courses using the new technologies. But it also returns to an idea which sits at the very beginning of the conceptions of the potential benefits of ICT: the use of real time access to expertise at the highest level. Such an idea has seen benefits in other fields such as the medical field with access to specialists at distances remote for treatment.

The experience gained in this program maybe very useful for other courses or even other institutions looking to up-grade their teaching input through access to key experts in other locations. After all this was one of the hopes of access to ICT.

### **1. The Organizational Setup**

For the first semester of 2004, Mathematic and Computing Science Department (MACS) of USP offered a post-graduate course CS493, called “Advanced Information Technology for small Business with Open Sources” in the Distance Teaching and Learning (DTL) mode. This was done using a satellite link up with University of Electro Communication (UEC) in Tokyo, Japan. This was made possible with the collaboration JICA (Japan International Cooperation Agency), Suva office, NICT (National Institute of Information and Communication Technology), ARIB (Association of Radio Industries and Business) and CRL (Communication Research Laboratory).

This trial project required significant role sharing amongst the organizations involved. This course was conducted as a USP normal post-graduate course, using USP’s administrative procedures. USP also provided the basic equipment such as computer labs and a tutor.

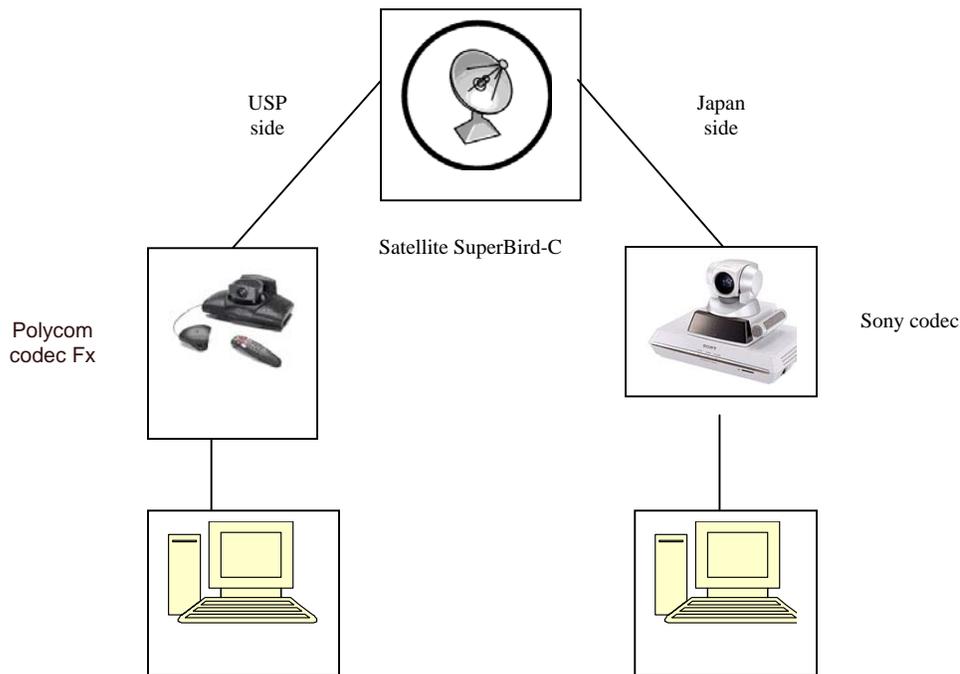

UEC provided the lecturer, course content material and made arrangements for the network connections.

ARIB and CRL provided network engineers and fee for satellite connection.

The JICA office at USP facilitated the technical setup, logistics and finance of equipment of this project.

### **2. The Technical Setup**

The central campus of USP, which is the main platform for its delivery of distance programs, is situated in Fiji. Fiji faces a monopoly situation in its telecommunications which has resulted in very high costs for bandwidth, despite the close proximity of the Southern Cross cable. This has created significant problems for distance education which relies on speed through good access to bandwidth. This trial has sought to work with IP based network delivery using a satellite linkup as a consequence. However with the introduction of ARNET at USP, the situation will surely evolve exponentially.

The lecture is projected onto the screen and the voice through the speakers whilst the student sits in front of a computer linked to the server in Japan

The response from the students is viewed on a plasma TV. (audio and visual)

THE FIGURE ABOVE SHOWS THE LOGICAL SETUP OF THE “LECTURE ROOM” TO CARRY OUT THE LECTURE

A brief understanding of the technology utilized:-

**IP based network:** Modern digital technology allows different sectors, e.g. telecom, data, radio and television to be merged together. This occurrence is drastically changing the way in which both people and devices communicate. At the center of this process, forming the backbone and making convergence possible, are IP-based networks. To start with, circuit switching requires that a circuit be set up end to end before communication begins. Packet switching does not require any advance setup. Setting up a path in advance also opens up the possibility of reserving bandwidth in advance. If bandwidth is reserved, then when packet arrives, it can be sent out immediately over the reserved bandwidth. With packet switching, no bandwidth is reserved, so packets may have to wait for their turn to be forwarded. If a circuit has been reserved for a particular user and there is no traffic to send, the bandwidth of the circuit is wasted.

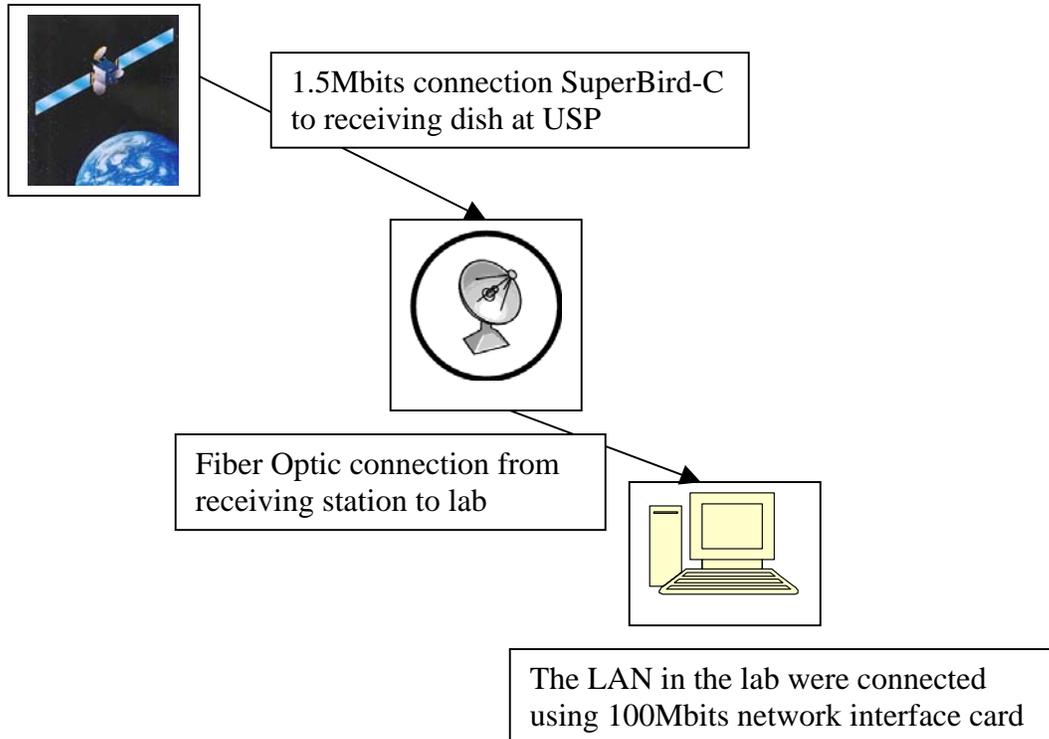

To understand this better lets briefly say something about the communication technique.

*The circuit-switched network* is used in traditional telephone systems. It creates a closed circuit between the two nodes in the network to establish a connection. Once a connection is established, the communication is dedicated between the two nodes.

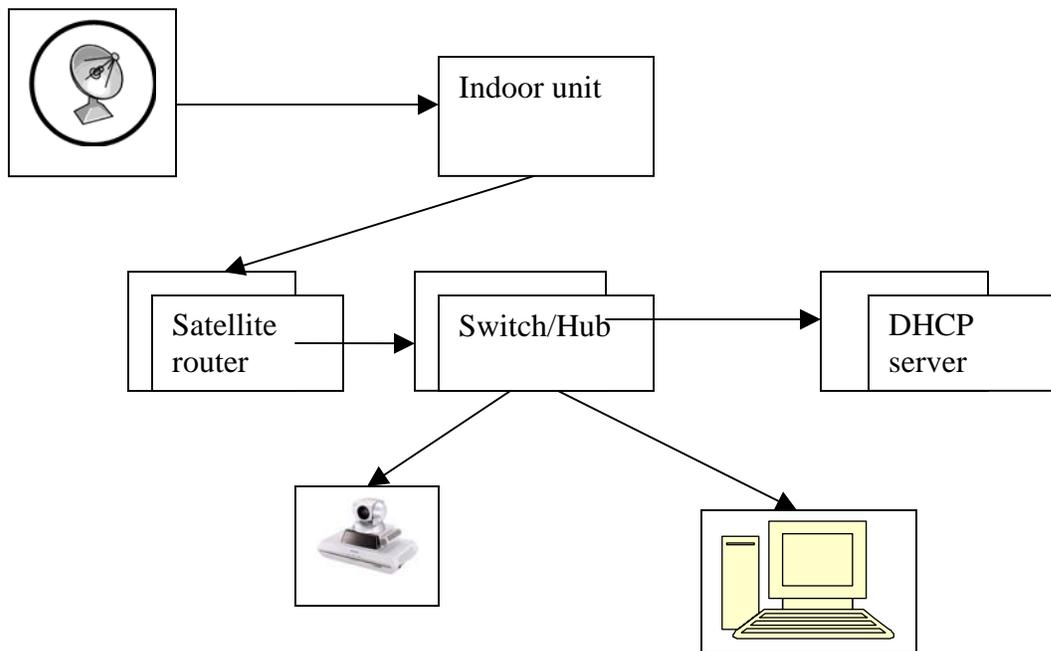

*The packet-switched network:* Used in IP-based networks. Messages are first divided into packets containing a Destination Address (DA). Then each packet is sent over the network with every intermediate node and router in the network determining where the packet goes next. A packet does not need to be routed over the same links as previous related packets. Packet based switching uses the capacity more efficiently and minimizes the risk of possible problems, such as disconnection. Packet switching is more tolerant than circuit switching.

The technology utilized at USP's end for this project included the following components:

- Satellite SuperBird-C
- Satellite receiving dish
- Satellite router
- Switches / hubs
- Pologom digital camera
- DHCP server
- Local Area Network (LAN) of 20 computers

THE FIGURE ABOVE SHOWS A SUMMARY OF THE CONNECTION SPEED UTILIZED AT USP'S END

THE FIGURE ABOVE SHOWS THE CONFIGURATION LAYOUT OF COMPONENTS UTILIZED IN THIS PROJECT

### 3. The Learning Environment Set Up

The creation of a learning environment could be broken down into the following:

- Class room: The linkup setup described above formed the base for the distance digital class room. The lecturer was projected onto the wide screen. Students had audio access to the remote lecturer via the two central and movable microphones placed in the lab. The students with the computer in front of them used the Telnet service to log into the remote server located in Tokyo, Japan.
- Distance lecturer: The lecturer based in Tokyo was projected onto a multimedia screen at the prescribed times of the fortnightly lecture. It took a few minutes to establish all link up arrangements to be operational.
- Local Students: A group of 21 students were enrolled for this offering of the course. They came from several member countries that make up the University of the South Pacific (USP).
- Support facilities: The class was supported through the use of a local tutor, who was responsible for liaison between the lecturer in Tokyo and the students at the USP Suva campus, as well as highlighting the technical needs of the students.

### 4. The Educational Framework

The course content aimed to provide students with concepts and applications used in the modern information technology (IT) environment for business. The class focused on open computer network systems, taking into consideration computer security, and commercial laws and intellectual property. Students had the opportunity to do hands-on exercises, building dynamic homepages and open source database PHP and PostgreSQL.

### 5. Methodology

Participant observation was used to gather information on the progress of the course, with the author acting as tutor for its duration. Records were kept weekly covering the issues of likes and dislikes about the course, effectiveness of

tutoring support and potential information. 14 students answered the one page questionnaire as part of USP's requirement for all courses at the end of each semester.

## **6. Discussion**

*Learning issues:* Students from the region are still coming to terms with independent or self learning. The education system in the South Pacific generally does not encourage the independent learner (Kazim, 2000). Students have been almost exclusively inducted into a model of education in which information is transmitted through face to face delivery. Despite encouragement in various forms, students are still not readily doing their assigned weekly readings let alone the suggested complementary readings on their own. At the same time, most students across the region are culturally oriented to collaborative learning in which close personal interaction is important (Dakuidreketi, 1995). Tutorials are an essential element in the support which needs to be provided (also experienced in other developing countries: Corry & Lelliot, 2003). But tutorials alone will not guarantee success. Consequently this trial provided the opportunity to examine both issues in the technical delivery of the course and its success as a learning exercise in the Pacific context. It became clear that the students appreciated the real time face to face contact with the lecturer in Japan, although at a distance. Students were well aware of the trial nature of the course and some Hawthorne affect can be predicted. Nonetheless, compared to distance mode teaching where contact with lecturers and tutors is more at arms length, this experience was met with universally positive comments from the students. At the same time, the students also were very positive in terms of the tutorial backup. The tutor was engaged with the students in the reception and progress of the course with further immediate face to face contact. The outcome was very encouraging with 18 out of 21 students sitting the exam and passing. The trial was provided in distance mode, but with strong face to face structure. As such it has worked very well as a learning experience.

Distance mode students who do get access at USP to audio tutorials through USPnet, sometimes complain of the difficulties of understanding arising from accents of staff with which they are not familiar. In this case, there was a lecturer from Japan. The issue of an accent was not a major factor as the distance lecturer in Japan had teaching experience also in Australia.

*Technological aspects:* The availability of Internet facilities is the pride and treasure of any institution but the question that needs to be addressed is how much of these facilities actually trickles down to the student's level. Network security is a predominant concern of most network administrators. However from the educator's view point as many services as possible should be made available to the students to better utilize the whole range of possibilities of the Internet; services such as FTP, telnet, etc. to name a few. Network administrators are typically very influential in planning an institution's distance education program; they should not lose contact or forget to relinquish control to educators or lecturers somewhere along the line.

Efforts should also be made to reduce idle time for students. Students were observed to lose interest rapidly when set up of link between Tokyo and Suva campus took time.

### *Education aspects:*

Without a local tutor, the teaching model would be too reliant on student's willingness to engage in independent learning. In the traditional mode, students and lecturers alike have become accustomed to the face to face environment. In the DTL mode the students are left on their own to supplement their knowledge. If students have not yet been able to appreciate the importance of reading or browsing the internet for relevant documents on their own this can be a major hurdle to the good advancement of discussions in a distance class setup. The library has to accommodate the change by adapting to providing the latest up to date literature. Access to professional scientific databases is to be encouraged. Several students observed in their questionnaire that library materials needed to be more up to date. The use of a local tutor was critical in the success of the course as it enabled pressure to be put on the students to read the materials.

The most significant issue to emerge is that the technological innovation has not replaced the importance of face to face support at the receiving end. This is now a commonplace of distance education discussion (Tait & Mills, 2003). But in this case, firstly the specific educational needs of students in the region need to be understood and integrated into the program. This means a level of personal teaching support and interaction which encourages collaboration and one to one interaction. In other words, the course taught using the distance mode still needed a committed tutor at the user end, and as such represented no saving in terms of staff commitment from within the department. However if this was to be the only criterion under which the trial was assessed, something important

would be lost. The expertise and sense of access to current information provided by the program are very important. Students were aware of the value of this access. This value is especially important in the postgraduate program at USP. Access to current expertise world wide opens the possibility for USP's postgraduate students to feel that their physical remoteness is not disadvantaging them in their studies.

*Organizational aspects:*

The two institutions operated under different academic calendars thus some adjustments were necessary, such as the availability of the lecturer. Some adjustments was required for student grading due dates because of different academic calendars for each university. JICA office with its counterparts will be offering a postgraduate computing science course again in the first semester of 2005.

Library services for distance learners are more labor intensive than campus services. Campus students use the library in a self-service mode, but providing documents to off-campus students requires library staff for retrieval and dissemination.

**7. Cost/Benefit**

The administrative aspect was taken care of by the USP regulations and overall cost shared by all concerned.

Academic staff cost: The distance lecturer was provided by UEC and the local tutor by USP

Technical staff cost: The technical staff from JICA office helped prepare the computer labs before each class setup.

.Lets us presume the academic staff and technical staff cost are covered. The remaining costs are:

Satellite cost: Satellite connection rate was FDJ 1000\$ per hour. 3 hour classes were conducted over 9 weeks for a total of \$27,000.

Student fees: The normal USP postgraduate fee of \$715 was charged to the students, for a total of \$15051.

As a consequence the cost of project was \$11985. Given the benefits to the students, it can be suggested that the cost/benefit comes out just about even. With the introduction of AARNET this cost will be significantly reduced as a result the project will become viable.

**Conclusion**

Using DTL mode, postgraduate education in the South Pacific can be enhanced by making use of the contemporary expertise from various locations. As a result more students can benefit in our Pacific region and not only a privileged few or sponsored individuals who can afford the high cost of overseas education can gain access to the better institutions. DTL mode can also provide a window for the academic staff as to what is happening in the international arena in a realistic manner. This can also go towards stimulating the departments aim in developing its research profile.

This was an exciting pilot project that did provide the chance to better explore and adapt this new technology in our teaching methodology. The new experience did stimulate the students to understand the IP based network technology as well as giving them first hand experience.

This case study demonstrates that this process has a strong potential, but it must take into account the educational framework which produces learning outcomes for students in terms of the educational support they need.

It is not clear that the teaching model has been the most appropriate. It may have been a temptation taken too quickly to give over the teaching of whole course to provision via the link. A more carefully thought out teaching model, may have retained the high value of access to front line expertise, which is so needed in the region, but used it as a supplement to a course which was primarily taught locally. This alternative model has the potential to keep the key aspect of access to expertise, while cutting back on cost and organizational difficulties. In terms of cost/benefit the introduction of AARNET to the region will the project will become viable in terms of cost.

However, more debate needs to be undertaken regarding this mode as DTL link up with renowned institution maybe the a good way forward but then the regional intuitions will be rendered insignificant or just a satellite campus.

### Abstract

Distance education involves different types of technology and at many different levels (Kearsley, 2000). Online education employs primarily the computer, Internet, and Web technologies. Two-way interactive video, also called videoconferencing, by taking another aspect of the telecommunication technology, has also been standing out as an effective distance learning technology, particularly in higher education. Online education and two-way interactive video are both in the realm of information technology and have received extensive studies as to their functions and effectiveness in higher education in recent years. However, minimum research has been found on students' attitudes toward these two technologies used in the classroom. No research has been found on students' attitudes toward the two technologies compared across the two platforms, e.g., the attitude difference toward the two technologies between students taking online courses and students taking two-way interactive video courses. This study is to investigate on students' attitudes toward technologies used in online and two-way interactive video courses.

### Introduction

Distance education is not a new phenomenon in American education (Brenner, 1997). It started about a hundred years ago in the form of correspondent courses. As information technology advances and we have entered the new millennium, distance education has varied into many forms, with the Internet courses and two-way interactive video (videoconferencing) courses taking the lead, especially in higher education. This type of education does not require the student and teacher to be time- and space- bound, and it is the fastest-growing instructional pattern in the world (Cartwright, 1994, & Hall, 1990).

Ever since it became available in higher educational institutions in the late 1980's Internet has been adopted as an instructional tool. Educators found that the Internet could be used to effectively communicate information and instructions, and education does not have to be bound to the four walls and a physical location (DeNigris & Witchel, 2000). University of Phoenix established their online campus in 1988, probably the first online campus ever to be. Later on, as local area network, campus network, and wide area network became commonplace in higher institutions, many colleges and universities began to offer online and two-way interactive video education, such as Purdue University, University of Memphis, and Stanford University (DeNigris & Witchel, 2000). In recent years, an increasing number of higher institutions begin to offer different levels of programs on the Internet and the Web, ranging from undergraduate to doctoral programs.

“Education has changed from an orderly world of disciplines and courses to an infosphere in which communication technologies are increasingly important” (Molnar, 1997, p.68). Online education involves different types of technology and at many different levels (Kearsley, 2000). It may include, in addition to computers, multimedia and large-scale public networks such as the Internet or small local area networks in a particular building or room. Also it may take place at many different levels. For instance, it can be at the level of higher education, K-12 schools, corporations, government agencies, homes, etc. Some of the online education programs are offered in a formal course curriculum, while others may be short training courses, or in other formats.

Meanwhile, two-way interactive video, also called videoconferencing, by taking another aspect of the telecommunication technology, has also been standing out as a popular distance learning technology, particularly in higher education. Wilkinson and Sherman (1991) found in the early 1990s that most frequently used form in distance learning programs in higher learning institutions was video-based technology. Unlike its predecessor TV course, which is only one-way delivery, two-way interactive video takes the advantage of digital video/audio compression technology to send and receive video and audio concurrently, making possible the education interactive between the instructor and the students and even between the students in different locations. Today's two-way interactive video courses are mostly offered at university, college, and community college levels. It is primarily because the technology involves high-cost equipment for the infrastructure and knowledgeable technicians to operate. However, some school districts also have two-way interactive video environment, providing distance education to middle schools and high schools. In this study, only online and two-way interactive video students in higher education were selected as subjects.

Technically speaking, online courses in higher education today involve basically computers, e-mail, Internet chatting (discussion room), World Wide Web and sometimes streaming audio/video technologies. Students do not have to be online at the same time, except when required by the instructor for specific discussions, thus an asynchronous education so is it termed. The e-mail system disseminates messages between instructors and students or between students. Syllabi, assignments, instructor's notes, and the like, are accessed via the instructor's Web page. In some institutions, such advanced Web tools as Blackboard or WebCT is used in the classroom. In two-way interactive video courses, a central classroom or site is usually equipped with both a camera for the instructor, and a camera for the students. Also there is a viewing monitor for the instructor or the student and another monitor for the remote site(s). There is also, mostly, the same equipment setting on the remote site(s) so that the central classroom can see and hear the remote site(s) the same as the remote site(s) can see and hear the central classroom. The instructor operates a control panel at the teacher's station. There is normally a computer, document presenter, and a microphone equipped with the teacher's station. On the student's side, microphones are present, but no computers are available in general.

One of the major issues in distance education, either online or two-way interactive video, is interaction. With new technology, today's students can have immediate access to information from any online resources, but if the information is only a non-interactive one way flow, it may be wondered what the difference is between the old correspondent distance education and today's distance education on information highway. Thus, interaction becomes one of the key issues for distance education to survive and thrive. This issue will, probably, last for a long time in the future. Today's information highway endorses students to demand instruction to include high level of interaction among students and between students and instructors. This demand for interactivity in the learning process has required not only a new focus on instructional design, but also new two-way interactive technologies to mediate the delivery process (Parker, 1999).

Online education and two-way videoconferencing are the two selected technologies for distance education because they provide instructors with the ability to vary both the method and the media. However, the functions and the teaching effectiveness of the two technologies are not equivalent. Online course is usually less time- and space-bound than two-way videoconference, whereas the two-way videoconference is more interactive than online course. Both online education and two-way interactive video distance education have received extensive studies as to their functions and effectiveness in higher education in these recent years. However, only a limited number of researches have studied students' preference of the type of distance education, or their attitudes toward each type of distance education technologies. No research has been found on students' cross-platform attitude toward the two technologies, e.g., the attitude difference toward the two technologies between students taking online courses and students taking two-way interactive video courses. Though both types of technology provide students with distance education, students' choice of certain technology determines the survival issue of certain type of distance education format. In order to better serve distance education students, we believe that it is necessary to conduct an investigation on students' attitudes toward technologies involved in the two formats of distance education courses. In this study, both online course students and two-way interactive video course students were asked the same questions about their attitudes toward the technologies involved in online and two-way interactive video courses to find out the difference in their attitudes toward the technologies between the two groups of students.

It is our hope that the results and findings from this research would: 1) help distance education instructors make better selection of the technologies for distance education; 2) help distance education instructors in their instructional design of distance courses; 3) empower the administrators of higher education institutions in their decision-making on distance education; 4) improve overall distance education programs; 5) enhance our knowledge about distance education. Additionally, the findings may provide valuable information for the technology industry, leading to new development in each of the particular technologies.

This research and its results can be a step-stone for further studies that we plan to conduct. The possible research topics for further studies may include: Is learning styles (such as field-dependent and field-independent) a significant factor that affect a student's attitude toward online and videoconference education? Do online and videoconference courses authorize students to question their ideas and beliefs, thereby, encouraging provocative and interactive construction of personal knowledge?

## Research Questions and Hypotheses

The research questions of this study are: Is there a significant difference between the attitude of students taking online courses and students taking two-way interactive video courses toward online education technology and two-way interactive video technology? Based on the above-mentioned question, the following null hypotheses were developed:

1.  $H_01$ : There is no significant difference between the attitude of students taking online courses and students taking two-way interactive video courses toward computers.
2.  $H_02$ : There is no significant difference between the attitude of students taking online courses and students taking two-way interactive video courses toward multimedia.
3.  $H_03$ : There is no significant difference between the attitude of students taking online courses and students taking two-way interactive video courses toward the Internet.
4.  $H_04$ : There is no significant difference between the attitude of students taking online courses and students taking two-way interactive video courses toward two-way interactive video.

## Methodology

### Subjects

Graduate students enrolled in online and two-way interactive video courses in the College of Business of a university were selected as sample subjects. Students enrolled in online courses at the College were recruited as the subject for online course. Students enrolled in two-way interactive video course at the College were recruited as the subject for two-way interactive video course. Among them some may have been cross-taking courses in both online and two-way interactive video courses. The sample was consisted of both male and female students.

Students in two-way interactive video course group was coded GROUP 1 in the data collection and data analysis. Students in the online course group was coded GROUP 2 in the data collection and data analysis.

### Instruments

A Semantic Differential measurement scale was used to measure students' attitudes toward the information technologies used for online and two-way interactive video courses. Semantic Differential technique was developed by Osgood, Suci, and Tannenbaum (Osgood, Suci, & Tannenbaum, 1967). They found that some of the clusters of adjectives with evaluative dimensions, such as *good* and *bad* or *valuable* and *worthless*, have the most significance for attitude measurement. According to Ary, Jacobs, & Razavieh (1990), the technique can measure the meaning of an object through the pattern of an individual's rating of that object on the bipolar adjective scales. Attitude scales are constructed by selecting a number of pairs of adjectives representing the evaluative dimension. The adjective pairs are presented along with seven response scale categories, which direct the respondent to select one of them to indicate the extent to which each adjective describes the object.

The questionnaire used in the survey for this research was an adoption of the questionnaire on Teachers' Attitude toward Information Technology developed by Knezek & Christensen (1998), with minor modifications by

the researchers to fit the purpose of this study. The questionnaire is consisted of four technology categories. They are: computer (coded C), multimedia (coded M), Internet (coded E), and two-way interactive video (coded TV). There are ten pairs of adjectives with evaluative dimensions that measure students' attitude toward the technology in each technology category. The ten pairs of adjectives in multimedia, online, and two-way interactive video categories have the same ten pairs of adjectives such as *important* and *unimportant*. The ones in the computer category are different with such pairs of adjectives as *unlikable* and *likable*. The points in the Semantic Differential scale are assigned on a 1-to-7 scale, with 7 representing the most positive response. The adjective pairs are listed in both directions in order to minimize a response set, that is, a tendency to favor certain positions in a list of options. In addition, a personal information inventory was developed to record subjects' classification and demographic information including gender, age, ethnicity, employment experiences and the experiences with computers.

The validity and reliability of the questionnaire were established by Knezek & Christensen (1998) in their research studies measuring teachers' attitude toward information technology.

The subjects of this study were distance education students. Most of them were not available to complete the survey on campus. Therefore, a Web page was developed to host the questionnaire and record the subjects' responses. Subjects were notified by the instructors in class or via the instructors' student e-mail lists.

#### Data Analysis

Attitude ratings of students who were taking online courses or two-way interactive video courses toward the use of technologies were compared by using Mann-Whitney *U*-Test. Mann-Whitney *U*-Test was selected is due to the difference between the populations. Mann-Whitney *U*-Test may be a more powerful tool for detecting differences between or among populations than the equivalent parametric test (Scheffler, 1988).

Data were analyzed in two ways. One way was to compare the average of overall ratings of each technology category, e.g., computer (C), multimedia (M), Internet (E), and two-way interactive video (TV). The other was to compare the attitude ratings within each individual technology category.

## Results

Table 1 and Table 2 (See the tables in Appendix) list the data analysis results of the overall average mean ranking of each technology category. The statistics in Tables 1 and 2 show that there is a statistically significant difference ( $p = 0.004$ ) between GROUP 1 (two-way interactive video students) and GROUP 2 (online students) in the overall mean ranking of C (computer) category at  $p = 0.05$  level. The  $p$ -value of 0.004 is well beyond the 0.05 level, allowing us to reject  $H_0I$ . GROUP 2 (average  $n_2 = 22$ ,  $m_2 = 30.20$ ) has a significant higher average mean ranking over GROUP 1 (average  $n_1 = 28$ ,  $m_1 = 20.23$ ). This result indicates that students of GROUP 2 have a more positive attitude toward computers than those of GROUP 1. In other words, online students regard computers as more *pleasant* and *natural* than two-way interactive students do.

No significant difference was found in the overall average rating comparisons between GROUP 1 and GROUP 2 in their attitude toward other technology categories, e.g., multimedia, Internet, and two-way interactive video. Possible attributes to the results of no significant difference in these categories will be discussed in Conclusion, Discussion, and Implications section.

Data analysis results of student attitude rating comparison within each individual category are listed in Tables 3 to 10. Statistics in Table 4 show that there is a significant difference ( $p = 0.016$ ) between GROUP 1 and GROUP 2 in C7 (*artificial* and *natural*) area. The  $p$ -value of 0.016 is less than the 0.05 level, which allows us to reject  $H_0I$  in the C7 area. The mean ranking difference indicates that students of GROUP 2 ( $n_2 = 23$ ,  $m_2 = 31.43$ ) consider computers as more *natural* to them than the students of GROUP 1 ( $n_1 = 28$ ,  $m_1 = 21.54$ ) do. C2 (*unhappy* and *happy*), C3 (*bad* and *good*), and C10 (*suffocating* and *fresh*) have a significance level of  $p = 0.052$ ,  $p = 0.053$ , and  $p = 0.054$ , respectively. These  $p$ -values are very close to the 0.05 level, posing almost no difference from 0.05. Assuming that the  $p$  level was set at 0.1, then all these ratings would show a significant difference. Thus, we think that there is still a significant difference between the two groups' ratings in C2 (GROUP 1:  $n_1 = 28$ ,  $m_1 = 22.52$ ; GROUP2:  $n_2 = 23$ ,  $m_2 = 30.24$ ), C3 (GROUP 1:  $n_1 = 28$ ,  $m_1 = 22.77$ ; GROUP 2:  $n_2 = 23$ ,  $m_2 = 29.93$ ), and C10 (GROUP 1:  $n_1 = 28$ ,  $m_1 = 22.11$ ; GROUP 2:  $n_2 = 22$ ,  $m_2 = 29.82$ ). These results suggest that online students regard

computers as *happier*, *better*, and  *fresher* than two-way interactive video students do. By a closer examination of Table 3 we found that the mean ranking scores of GROUP 2 in the rest areas are all higher than those of GROUP 1 even though GROUP 2 has smaller  $n$  numbers in those areas and the scores are not statistically significant higher than those of GROUP 1. These higher scores tell that online students have a higher rating score on computers in all areas in this category than two-way interactive students do.

In Multimedia category, significant difference ( $p = 0.041$ ) was found in M7 (*fascinating* and *mundane*) in Table 6. This  $p$ -value is less than 0.05, allowing us to reject  $H_02$  in M7 area. The significant difference between the two groups implies that multimedia is more *fascinating* to online students ( $n_2 = 23$ ,  $m_2 = 30.43$ ) (See Table 5) than to two-way interactive video students ( $n_1 = 28$ ,  $m_1 = 22.36$ ).

In Internet category, no significant difference was found between the mean rankings of GROUP 1 and GROUP 2 (See Table 8). Thus, there was not enough evidence to reject  $H_03$ . However, by examining the mean rankings in Table 7 we found that the rankings of GROUP 2 in all the areas are consistently higher than those of GROUP 1. The higher rankings of GROUP 2 than GROUP 1 indicate that online students have a more positive attitude toward Internet in all the areas in this category than two-way interactive students do although statistically the rankings do not show a significant difference.

In Two-Way Interactive Video category, no significant difference was found between the mean rankings of the two groups. In spite of this, higher mean rankings were found with GROUP 2 in the following areas: TV2 (*boring* and *interesting*) ( $n_2 = 21$ ,  $m_2 = 26.21$ ;  $n_1 = 27$ ,  $m_1 = 23.17$ ), TV4 (*exciting* and *unexciting*) ( $n_2 = 21$ ,  $m_2 = 26.95$ ;  $n_1 = 28$ ,  $m_1 = 23.54$ ), TV6 (*appealing* and *unappealing*) ( $n_2 = 21$ ,  $m_2 = 27.52$ ;  $n_1 = 28$ ,  $m_1 = 23.11$ ), TV7 (*fascinating* and *mundane*) ( $n_2 = 21$ ,  $m_2 = 26.33$ ;  $n_1 = 28$ ,  $m_1 = 24.00$ ), TV8 (*worthless* and *valuable*) ( $n_2 = 20$ ,  $m_2 = 25.58$ ;  $n_1 = 28$ ,  $m_1 = 23.73$ ), and TV9 (*inviting* and *uninviting*) ( $n_2 = 21$ ,  $m_2 = 27.00$ ;  $n_1 = 28$ ,  $m_1 = 23.50$ ). In these areas, the paired adjectives all have a strong connotation in expressing one's emotional feelings of favorable preference or liking (comparing with other pairs such as *important* and *unimportant*, *relevant* and *irrelevant*). Though not statistically significant, the mean ranking difference between GROUP 1 and GROUP 2 in these areas can still suggest that students of GROUP 2 have a more positive attitude toward two-way interactive video than GROUP 1 students do.

## Conclusion, Discussion, and Implications

Based on the results discussed above, we can now conclude that there is a statistically significant difference in the attitude toward computers between online and two-way interactive video students. The ratings of online students toward multimedia are significantly higher in M7 area than those of two-way interactive video students. The significant differences tell that as compared with two-way interactive students, online students have a more positive attitude toward computers and multimedia. As to the Internet, online students have consistent higher ratings toward Internet in all the areas than those of two-way interactive video students though the differences are not statistically significant. The positive attitude of online students toward computers, multimedia, and the Internet can be attributed to the fact that online students have to use computers and the Internet, sometimes multimedia, to complete their online courses. Most online courses require students to meet face-to-face at the first class meeting of the semester. After that, students meet online with their instructors and their classmates. Computers and the Internet are their primary tools to access and share course information, interact with course instructors, submit assignments, and even take exams.

In terms of two-way interactive video technology, online students have higher ratings on two-way interactive video over those of two-way interactive video students in several areas. These higher ratings, though not statistically significant, can still suggest that online students are preferably in favor of two-way interactive video technology. We believe that their preference for two-way interactive video technology is not by chance. They rated higher on two-way interactive video probably because, to them, the computer, multimedia, and Internet technologies involved in online courses are not as *interesting*, *exciting*, *appealing*, *fascinating*, *valuable*, and *inviting* as two-way interactive video technology involved in two-way interactive courses.

As technology categories, Multimedia, Internet, and Two-Way Interactive Video do not show an overall

significant difference in the mean ranking between online group and two-way interactive group. One of the most possibly relevant attributes is the smaller sample size. By examining the mean ranks tables of these categories, we can easily find that a larger sample size of over 50 or higher in each group could possibly produce much better results in terms of statistical significance. Another possible explanation is that the sampled students of the online courses might not have had an online course with the Web technology such as Blackboard or WebCT yet. If what they were using was the traditional Internet technology, such as just e-mail, chatting, list-serve, etc., it might not have encouraged them to rate multimedia and the Internet with higher scores.

To online instructors and instructional designers, the research results of Computer, Multimedia, and Internet categories may suggest that computers are regarded as a primary tool for the students. High quality computers with multimedia capability play important roles in the delivery of online courses. Course design should incorporate multimedia. Using instructional tools, such as Blackboard, may enhance the quality of course delivery and student learning, especially by integrating multimedia. To distance education instructors and administrators, students have stronger preference of taking distance education courses with two-way interactive video technology than with online technology. Therefore, offering distance education courses by using two-way interactive video technology may attract and encourage more students to take distance education and achieve better student retention and learning outcomes. Administrators need to plan and balance their budgets to provide more distance education courses with two-way interactive video. An expanded technical service team and administrators may be necessary to accommodate the growth in this area.

The research results may be valuable to leading education technology firms. Knowing that students have stronger preference of two-way interactive video technology, leading educational technology firms should allocate more resources in their research to improve the technology because a larger market is “reserved” for such a technology. Lowering their product price and building a closer relationship with potential higher educational institutions may be another strategy to keep their competitive advantages.

## **Limitations and Suggestions**

Subjects in this study were recruited from students taking online and two-way interactive video courses in the College of Business of a university in a particular semester. Due to the number of registered students in these distance education courses, the sample size of the study is limited, which may affect the significance level of the statistics. The larger the sample, the less likely we fail to reject the null hypothesis when it is actually false (Borg & Gall, 1998). However, the results and findings of the study were based on the mean rankings of student rating. They do reveal meaningful conclusions and implications.

For future duplicated and/or similar studies, a larger sample size, say at least 50 (over 100 would be the best), in each group is strongly recommended. That would increase the statistic power to reject the null hypotheses proposed by this study and produce more significant results. Another suggestion is to run the same study in more than one institution at the same time and compare the results. Comparison of the same studies in more than one institution may generate more persuading statistical results. With better statistical results, stronger arguments can be formed for distance education instructors to better off their instructional design, for administrators to promote a wider use of distance technology that students prefer, and for the industry to serve distance education with more affordable equipment and lead to new development toward the state-of-the-art technology in distance education.

# Studies of International Knowledge Transfer in Different Contexts

*Chi-Yu Huang*  
*I-Shou University, Taiwan R.O.C.*

## Abstract

As going international is almost inevitable for business expansion, particularly for those companies that utilize developing countries as a path. Entry mode as an important and distinct area in management research in international business has received substantial recognition. Various terms and definitions have been adopted by plenty of research in communicating the conception of knowledge transfer (KT). Knowledge management issue is prevailing in this new economy that initiating from the end of last century; the phenomenon booms for another vertex in the academic streams would be feasible. In our study, we wish to explore how companies chosen their entry mode, and how such choices affect KT efficiency consequently? 27 papers were chosen as sample from top tier journals that are generally accepted as major vehicle for international business studies. Focusing on KT, we performed comprehensive contrasts and comparisons to reveal the distinctiveness of these works in terms of the definition per se, the measurement, the operational definition, the scales used, and the key findings. This research recommend that some biases, including unit of analysis under the sections of research design, sampling, and statistics that are present respectively in these papers shall be carefully avoided to ensure the generalizability.

## Introduction

As business becomes more global and international management (IM) issues play a more central role in business practice, the importance and relevance of IM research increases. Internationalization has become a popular path for expansion (Ohme, 1989a), particularly among companies, which are base in countries with small domestic economies. As such, international entering mode of management has gained recognition as an important and distinct area of management research. More, we would like to respond Steve Werner (2002), he review analyzes recent trends in the international management (IM) literature from 1996 to 2000 from 20 top management (and management related) journals, and discussed about internationalization of journal. His finding about knowledge transfer is not very board and popular in top 20 journals, and at this article, we try to review more other top journals, for example, international business review between recent years from 1998 to 2003. Then, a recent development in strategic management is to analyze and develop a firm's strategy by focusing on its resources instead of the external environment. This more inward looking knowledge-based theory of the firm. Under this knowledge –based view, strategic alliance can be interpreted as “ the transfer of an intermediate good, called knowledge, which embodies a firm's advantage, whether it be the knowledge underlying technology, production, marketing or other activities” (Kogut & Zander, 1993, p. 628).

## Origins and Overview of Knowledge Transfer

Over the last few years, there has been an upsurge in interest among scholars on the importance of knowledge management in firms. This more inward looking approach is known as the resource-based view (see Wernerfelt, 1984; Conner, 1991; Mahoney & Pandian, 1992). By focusing upon knowledge as the most strategically important resource of the firm, some scholars are in the process of developing a knowledge-based theory of the firm (e.g. Grant, 1996; Spender, 1996). However, Steve Werner (2002) argues IM research may be divided into three categories. One of three categories is comprised of studies that look at the management of firms in a multinational context. Stated differently, this research emphasizes the international aspects of management that do not exist in domestic firms (Ricks, 1991). This includes studies looking at the internationalization process, entry mode decisions, foreign subsidiary management, expatriate management, etc. In this study, we follow Steve Werner (2002) to review

about articles of international of knowledge transfer.

### **Knowledge Transfer in Acquisitions**

Our literature review revealed little if any research explicitly directed at this phenomenon. Most relevant is the so-called “process” school, which is concerned with the creation of value through post-acquisition integration (Lindgren, 1982; Shrivastava, 1986; Haspeslagh and Jemison, 1991; Hakanson, 1995; Greenwood et al, 1995). Haspeslagh and Jemison (1991), for example, discussed the issue of knowledge transfer, but their focus was on how knowledge transfer may lead to overall value creation, not on the factors facilitating knowledge transfer per se. There has also been some recognition at an aggregate level that resource redeployment can have an important impact on value creation in acquisitions (Capron, 1996), but of course such studies do not provide much insight into the processes of resource redeployment. Finally, a related body of literature has looked at the acculturation process (Berry, 1982) when two different organizations are brought together. The essential contribution of such studies to the current work is that knowledge transfer between the merging organizations depends on the development of a cooperative relationship.

### **Definition of Knowledge Transfer**

Knowledge transfer is an elusive concept that has been classified and defined in a variety of ways. The concept of transfer is also difficult to capture. The issue here is that no definite distinction between transfer and creation of new knowledge exists (Granstrand, 1982; Sahal, 1981). As Zander (1991) observes, “Recipients would normally be obliged to devote substantial resources to assimilate, adapt, and improve upon original technology. Modification and further development of the technology are thus very often an integrated part of the transfer.” Along the same lines, Hayami and Ruttan (1971) introduced a distinction between kinds of transfer according to the degree of change the knowledge is subjected to during transfer. Thus, a literature search reveals that what some call knowledge transfer, others define as knowledge combination, knowledge creation, or learning (Bartlett and Ghoshal, 1989; Westney, 1993; Hedlund, 1994; Nonaka and Takeuchi, 1995).

For example, Bresman et al., (1999) & Zander et al., (1991) argue knowledge transfer refers to the process of knowledge being passed on from the transferor to the recipient, such that the recipient accumulates or assimilates the new knowledge. Similarly, Robin Cowan et al., (2001) argue knowledge transfer be taken to mean “the process by which knowledge travels from a knowledge holder (a person or organization possessing the knowledge) to a knowledge recipient (a person or organization receiving the knowledge) through one or a greater number of transfer channels”. However, Gallouj (2000) explained transfer of knowledge, just like the transfer of any good, can be seen as having two main aspects- a mere “physical movement” and an “economic circulation” (involving transfer of ownerships). For international context, Downes & Thomas (2000) argue expatriation as a means of transferring knowledge; in essence, the transfer process is cyclical, with the subsidiary location as the recipient of general knowledge during expatriation and the corporate location as the recipient of market-specific knowledge during the assignment as well as upon the manager’s return. From within organizational context, knowledge transfer can be defined as the integration, by individuals and groups in its own knowledge base, of new external knowledge that will modify its beliefs and routines and that can be used in commercial activities (Rolland, 2000).

In order to complete this definition, we take into consideration the work of Argote, Ingram, Levine and Moreland (2000) that define knowledge transfer as the process through which a unity (individual, group, department, organization) is affected by the experience of another. We keep these two definitions because they develop a dynamic and organizational aspect of knowledge transfer linking experience, organizational learning and network concept.

### **Dimensions of Knowledge Transfer**

In defining the dimensions of knowledge transfer, we inspire our classifications from the study of Lahti and Beyerlein (2000) concerning knowledge transfer in consulting firms, and from the work of Seufert, von Krogh and Bach (1999) where they described a framework of knowledge networks including knowledge architecture (IT tools) and knowledge work processes (social interaction and communication processes). Among Maqtusik and Hill (1998), firm use formal and informal integrating mechanisms in order to facilitate the transfer of existing knowledge to different areas of the firm. We consider three dimensions in knowledge transfer propensity:

- The impact of IT tools on knowledge transfer propensity;
- The impact of social networks on knowledge transfer propensity;

- Inter-individual learning between colleagues.

*The impact of information technology tools on knowledge transfer propensity.*

“Whilst information technology should be seen as a necessary tool to knowledge transfer, new computing and telecommunications technologies allow organizations to communicate quickly and effectively with subsidiaries and business partners around the globe. The advances in information technology have significantly influenced people’s ability to share and transfer information and knowledge, and also to reduce the costs and accelerate the process of transferring best practices” (Bender and Fish, 2000). The proliferation and compulsory integration nowadays of information technology tools in companies, is not a widely “accepted” transformation for all employees. In fact, some employees are resistant to change, and it implies education, training and lost of time to adapt their working habits. However, the growing importance of IT tools change several work processes in companies. What could be interesting in building a scale of knowledge transfer propensity is to assess the perception of employees of these tools in terms of knowledge sharing (frequency, quantity, ease). Several researches could be of great help (Williams et Wilson, 1997; Warkentin et al., 1997; O’flaherty et Williams, 2000).

*The impact of social networks on knowledge transfer propensity.*

Social networks are the best way to transfer knowledge, and above all, tacit knowledge. In fact, social networks are composed of individuals that are pooled together towards a defined goal. Therefore, individuals cooperate, share knowledge without any restriction. In this perspective, communities of practice seem to be a great way for transferring knowledge. Snyder and Wenger (2000) described the crucial role played by communities of practice (Brown and Duguid, 1991; Hildreth et al., 2000; Salk and Brannen, 2000; Stork and Hill, 2000) in firms, in terms of tacit knowledge transfer. Their constitution is free, nothing is formalized which accelerate the knowledge transfer process because there are no barriers between individuals. Everybody makes part of this kind of community because it is its own will. Moreover Weick (1976) argued that informal organizational entities are more adaptive because they are less constrained by the organization system of which they are part. Therefore, communities of practice have two advantages: the ability to transfer knowledge easily because it is its own purpose, and the flexibility that characterized this group of individuals constituted on its own. “Communities of practice are seen as an effective and flexible mean of bringing both skills and expertise to specific problems and tasks” (Hildreth et al., 2000). The story telling described by Orr (1990) enabled copier technicians to exchange tacit knowledge and to find a solution to a problem. “Over time, this solution was passed around the technicians and became part of the stock of knowledge of the community” (Hildreth et al., 2000).

Finally, it is important to differentiate communities of practice and teams. In fact, in communities of practice, as members know each other better, have a deeper confidence in each other and trust each other, they gain legitimacy. This legitimacy gives every individual the willingness to go deeper in their relationships, to share more knowledge, best practices, to participate more to organizational events and success. We think that the existence of such groups of people constitute a wonderful support to knowledge transfer. The existence of communities of practice in companies appears to be very important in measuring employees’ knowledge transfer propensity. This is based on several studies (Snyder et Wenger, 2000; Hildreth et al., 2000; Salk et Brannen, 2000).

*Inter-individual learning between colleagues.*

This dimension of knowledge transfer propensity is the last identified. It could be interesting to measure knowledge transfer between colleagues in terms of learning. “Transfer of knowledge occurs everyday in the work place, when juniors are taught the tricks-of-the-trade by their seniors” (Sveiby, 1996). Therefore, we try to assess the importance of colleagues in employees learning. This form of inter-individual learning is based mainly on Cohen and Levinthal (1990) and Szulanski (2000) articles.

**Knowledge Transfer under Different Modes of Governance**

While knowledge transfer in acquisitions has received very little explicit attention, there has been considerable attention devoted to the related questions to the related questions of knowledge transfer within a single organization, knowledge transfer in alliances and joint ventures, and knowledge transfer between independent organizations.

Here we follow and modify Henrik Bresman et al., (1999), they finding as a prelude to focus on the specific case of acquisitions.

*Knowledge transfer within the organization*

Research on intra-organization knowledge transfer has a long history emanating from studies on choice of

international technology transfer mode (Pavitt, 1971; Mansfield et al., 1979; Vernon and Davidson, 1979). Scrutiny reveals a focus on a relatively small number of variables. One line of search on the timing of transfer has shown a dramatic increase in transfer speed from product introduction to transfer of technology to subsidiaries (Mansfield and Romeo, 1980; Davidson, 1980; 1983).

Another line of research on transfer costs has generally found that experience is an important factor (Teece, 1976; 1977; Mansfield et al., 1979). More recently, Zander (1991) and Szulanski (1996) have taken a broader approach to internal knowledge transfer. Zander (1991) found that the tacit-articulated dimension of knowledge had an important impact on the smoothness of transfer of tacit knowledge was more difficult to accomplish than the transfer of more articulated knowledge. Szulanski (1996) focused on the transfer of best practices within firms, and the difficulties experienced in the transfer process. His finding was consistent with Zander's. When analyzing factors causing difficulties in the knowledge transfer process, Szulanski found that, the tacit-articulated dimension explain more variance than any other factors, such as motivation.

#### *Knowledge transfer in alliances and joint ventures*

Research into knowledge transfer through alliances and joint ventures is a relatively recent phenomenon. Kogut (1988) was the first to explicitly argue that joint ventures could be motivated by an organizational learning imperative. He proposed that a joint venture "...is used for the transfer of organizationally embedded knowledge which cannot be easily blueprinted or packaged through licensing or market transactions" (Kogut, 1988: 319). At around the same time, Westney (1988), Hamel (1991), and Inkpen (1992) developed related perspectives on the ways in which learning can be achieved through alliances and joint ventures. Since then, there has been a proliferation of research into the knowledge transfer process across alliance and joint venture boundaries (Inkpen and Crossan, 1995; Doz, 1996; Mowery et al., 1996). The common thread in the results of these studies is that the ability to re-evaluate and learn is key to success.

#### *Knowledge transfer between independent firms*

The transfer of knowledge between independent organizations has not received nearly as much attention as the modes of transfer discussed so far. Obviously managers would prefer that valuable knowledge not get transferred to other organizations, but the reality is that the process does occur, through some combination of imitation, reverse engineering, movement of personnel and business intelligence. Mansfield (1985), for example, found that a decision to develop a major new product or process was known to competitors within 12-18 months. Levin et al., (1987) studied the cost of imitation, and showed that "major innovations" incurred higher imitation costs than "typical innovations". Further, Zander (1991) found that the level of difficulty of an intra-organization knowledge transfer is not necessarily the mirror image of the level of difficulty of its imitation.

## **Review Empirical Research of International of Knowledge Transfer**

This review provides an integration and synthesis of 27 empirical KT articles published from 1981 to 2003 in academy of management journal (2), international business review (4), journal of international business studies(8), Organization Studies(5), Strategic Management Journal (8). To identify articles for potential inclusion in this review, we conducted a comprehensive literature search using electronic database in business and social science, indices of top journals from conceptual and empirical KT articles. In aggregate, we believe that our selection of articles provides a representative, though not exhaustive, selection of empirical work on KT that is of interest to both of non-individual level and multinational organization. A summary of the sample, focal variables and method of these studies is provided in Appendix. The antecedents of the various types of knowledge transfer include various firm, partner, and venture factors. Transaction cost models, organizational forms, and the use of experts have been shown to relate to the processes of knowledge transfer. The consequences of knowledge transfer include general, business, and HR performance, information processing, cycle times, efficiency, venture outcomes, firm value, relationship commitment, and customer satisfaction. Again, consequences are the most studied sub-topic. However, a wide range of firm level consequences has been explored.

Our review centers around a set of three specific questions: (1) In what context has KT been applied? (2) What methods have been used to investigate KT? Then, we would try to discuss how useful is KT's conceptual

framework?

#### **In what Contexts has Knowledge Transfer been Applied?**

Drawing from its industry origins in manufacture and service, knowledge transfer explains a variety of problems of cost, for example, time and culture. Knowledge transfer's analytical diversity is clearly evident among studies in our review. Specifically, these studies can be classified within one of four main contextual domains: (1) MNCs parent-subsidiary, (2) stakes of ownership, (3) international strategic alliances, (4) international joint venture, (5) take over, (6) buyer-supplier, (7) all mode of internationalization.

*Knowledge transfer within the organization as MNCs parent-subsidiary.*

The most common applications of international knowledge transfer focus on the parent-subsidiary. These studies focus on all of industries. Most studies measure their performance by marketing and R&D knowledge and few by FDI (Xavier Martin, Robert Salomon, 2003). More, most studies measure with formal rules, for example, firm size and sales and few by informal methods, for example, informal discussions and communication.

*Knowledge transfer in alliances and joint ventures.*

**International Strategic Alliances:** This is next to MNCs parent-subsidiary. These studies focus on the technology industry. As industry characters, most studies prefer about the R&D knowledge and some of marketing knowledge. Also as parent-subsidiary, most studies measure with formal rules, for example, firm size and sales and few by informal methods, for example, informal discussions and communication (Bernard L. Simonin, 1999; Ranjay Gulati, 1999).

**International Joint Venture:** These studies focus on the manufactory industry, its more board than international strategic alliances. Most studies measure a whole knowledge by both formal and informal (e.g. trust) rules (Peter J. Lane, Jane E. Salk and Marjorie A. Lyles, 2001; Marjorie A. Lyles, Jane E. Salk, 1996).

**All Entry Mode:** Anoop Madhok and Thomas Osegowitsch (2000) and Jaideep Anand, Andrew Delios (2002) used a dynamic capabilities perspective to measure knowledge transfer by a long-range and large secondary data in the international Biotechnology and others industries. In Anoop Madhok and Thomas Osegowitsch (2000) study, we found they use alliance mode to measure different knowledge transfer effects between countries that is different diminution to observe. But, Jaideep Anand, Andrew Delios (2002) focused on the brand, marketing skill and R&D knowledge.

*Knowledge transfer between independent organizations.*

In this study, we just found a study of buyer-supplier between independent organizations. Axele Giroud (2000) use different measure methods observe electric industry. He argues knowledge transfer in buyer-supplier relationship would not only focus on organizational knowledge, but also include a completely market-oriented, for example, market strategic, and kinds of products.

#### **What Method has been Used to Investigate Knowledge Transfer?**

In addition to its contextual diversity, the KT literature also displays a substantial degree of methodological diversity. We highlight important methodological issues and summarize the data collection and measurement approaches employed in the knowledge transfer literature.

*Data collection.*

Among the studies in our review, the most common means of data collection are surveys and secondary data. Some studies of data collection are case studies and interviews, because it is difficult to interview top managers. These are usually directed to large-level executives at large U.S. manufacturing organizations or to their partners/subsidiaries. These key informants usually have a functional responsibility for some element of both informal as communication (Bresman, Birkinshaw, Nobel, 1999), visits and meetings articulability of knowledge (Bresman, Birkinshaw, Nobel, 1999), time (Phene, Almeida, 2003; Bresman, Birkinshaw, Nobel, 1999), culture (Bernard L. Simonin, 1999), relational context (Vermeulen, Barkemam 2001) and formal as knowledge base, experience, rules and routines in all studies of reviews. However, secondary source would not include informal question.

Although survey research appears to be the data collection mode of choice, a sizable number of knowledge transfer studies use secondary data collection techniques. For example, Vermeulen and Barkema (2001) obtain secondary data on 1349 observations included in the annual reports of these firms from 1966 to 1994. Similarly, Simonin (1999) gathered data on the secondary report published information in the Corptech directory. Other secondary data sources used by researchers include the International Fabs on Disk database (Matin, Salomon, 2003),

CATI database (Mowery et al., 1996), Trade Administration at the Department of Commerce (Anand and Delios, 2002) and Corptech directory (Simonin, 1999).

In addition to these secondary publications, another rich source of secondary data frequently employed by scholars comes from contractual agreements between exchange partners, as Makino and Delios use Toyo Keiza (1992)'s data which combined with new data.

Moreover, we found to research multi-alliance governance or multi-countries, researchers would collect data from secondary source (Freek Vermeulen, Harry Barkema, 2001; Anoop Madhok, Thomas Osegowitsch, 2000; Xavier martin, Robert Salomon, 2003; Jaideep Anand, Andrew Delios, 2002). However, not all secondary source just only used by multi-alliance governance or multi-countries, that be used on every contexts.

#### *Measurement.*

Because of its contextual and methodological diversity, the empirical knowledge transfer literature presents a host of measurement-related issues for potential analysis. We focus our discussion on issues related to the operationalization of knowledge transfer constructs. These issues are especially important for future knowledge transfer investigators, because many of the studies in our review have faced measurement-related difficulties. Specifically, our discussion addresses the operationalization of knowledge transfer's key dependent (knowledge transfer) and independent (tools/formal or social networks/informal) constructs.

**Knowledge Transfer:** Among the studies in our review, the most common components of knowledge transfer are knowledge base and performance. The operationalization of performance is financial performance, and FDI. The operationalization of knowledge base is 4P of marketing and R&D knowledge.

**Impact of IT Tools:** Among the studies in our review, the most common operationalization of IT tools is language ability, job's relative knowledge and experience, firm size, located of firm, experience and distance of organization.

**Impact of Social Networks:** Among the studies in our review, just only two articles used this communication component of social network dimension. The operationalization of communication is informal communication, visits and meetings times. However, among the studies in our review, we found some of independent variable of knowledge transfer of multi-national studies was not included in common dimensions. That is different modes of governance, as entry mode, for example, Aydin and Terpstra (1981) and Almeida, Song, Grant (2002). That is the multi-nation's specific character of independent variable.

## **Discussion**

In a broad sense, our research provides amount of empirical evidence for the factors influencing international knowledge transfer. As we repress prior section, knowledge transfer is not a clearly identify. As showing the table 1, knowledge transfer's dimension including knowledge learning, sharing, experience, et al. More, many researchers used various names and definitions similar with the conception of knowledge transfer to active their researches. We argue knowledge management is a popular issue from 20 century. In the academic word, this theory is new and developing, so it is need to clear more.

On the Table 1, most of the studies were belong to tools dimension, joust only two studies about social network dimension. Whether international knowledge transfer or not, these two dimensions were both important measurement, especially social relationship in Asia. Many researchers argue tacit knowledge is more important than explicit knowledge, and then most of tools dimension are just only to measure the explicit knowledge. Most of the tacit knowledge could not collect from secondary data, and it could collect from questionnaire about informal discussion, for example, off-job talking, actives, attitude of talking and doing, ant so on and communication frequency, place, time, context, and so on. We argue if two alliance of organizations active frequency together more and more, their knowledge transfer would be more effective because they were closely more as one organization. Social relationship dimension was not being discussed in these studies that were very unfortunately to waste time and data.

In the international knowledge transfer dimension, we argue should be adding one more dimension is "international governance mode" as entry mode. In fact, entry mode is a contingency factor in many international researches. However, it cases serious bias of measure result of the international knowledge transfer. It would affect

top managers or CEO makes wrong decision.

TABLE 1: DIMENSIONS OF KNOWLEDGE TRANSFER

Dimensions	Components	Themes	Citations
Impact of IT tools on knowledge transfer	Perception of IT tools in terms of knowledge sharing	Knowledge sharing	Vermeulen and Barkema (2001); Kostova, Eric W. K. Tsang (1999); Hasegawa (2000); Phene and Almeida (2003); Giroud (2000); Lord and Ranft (2000); Madhok and Osegowitsch (2000); Aydin and Terpstra (1981); Lyles and Salk (1996); Grosse (1996); Makino and Delios (1996); Simonin (1999); Bresman, Birkinshaw and Nobel (1999); Lam (1997); Almeida, Song and Grant (2002); Shenkar and Li (1999); Schulz (2003); Martin and Salomon (2003); Mowery, Oxley and Silverman (1996); Simonin (1999); Gulati (1999); Dussauge, Garrette and Mitchell (2000); Lane, Salk and Lyles (2001); Gupta and Govindarajan (2000); Belderbos (2003); Anand and Delios (2002).
		Social relations	
	Learning		
	Modernization		
	Perception of exchanges with IT tools in daily work	Experience	
Impact of social networks on knowledge transfer	Existence of social networks that promote knowledge sharing	Informal discussions	Birkinshaw and Nobel (1999)
		Communication quality	
	Existence of communities of practice	Communities of practice	
Inter-individual transfer between colleagues	learning	Learning	Not our research dimension

## Appendix

SUMMARY OF SELECTED KNOWLEDGE TRANSFER STUDIES

	Author	IV	DV	Research method	Sample	Statistic	Alliance types
1	Freek Vermeulen, Harry Barkema, 2001	survival, acquisition/Greenfield	number of preceding green fields and acquisitions, preceding green fields in familiar markets/new markets, preceding acquisitions in unrelated/related domains	annual reports, if incomplete data will content with telephone and fax	1349 observations included in the annual reports of these firms between 1966 to 1994, 61% of these affiliates were located abroad.	survival analysis, logit model	international strategic alliances
2	Tatiana Kostova, Kendall Rothm, 1999	institutional profile, relational context	practice adoption (implementation, internalization)	questionnaire to managers and employee	Based on the sample from 534 managers and 3238 non managerial employees in 104 subsidiary locations from ten countries.	ANOVA, regression	parent-subsidiary
3	Eric W. K. Tsang, 1999	language ability, some job's relation knowledge and experience, before job experience in China, mature personality	Performance of IJV, good relationship with partner of China, closely working with china employees	The choice of companies was dependent upon access.	12 Singapore multinational corporations in several manufacturing industry with respect to their foreign direct investments in China.	-	parent-subsidiary
4	Harukiyo Hasegawa, 2000	corporate culture, production systems and industrial relations of a British firm which was taken over by a Japanese company	dialectical process of capitalist KT	none	a British firm	-	international strategic alliances
5	Anupama Phene, Paul Almeida, 2003	time	Innovation activities & scale of multinational subsidiary ; external of KT, technology innovation	mail questionnaire	Our sample of MNE subsidiaries is derived from six US semiconductor firms that had overseas patenting activity between 1981-1992. Total of 268 observations of 26 foreign subsidiaries in 12 countries.	ANOVA	parent-subsidiary
6	Axele Giroud, 2000	firms size, kinds of product, market order, pursue strategic	KT	questionnaire	The 49 questionnaires are the result of a field research carried out in the Malaysian electrical and electronics sector in the second half of 1996.	logistic	buyer-supplier

7	Michael D. Lord, Annette L. Ranft, 2000	tacit ness, corporate HQ office, corporate centralization, linkage of incentives	internal transfer of local market knowledge	On-site interviews with 31 corporate and divisional managers. These seven firms served as sites for pre-testing and refinement of a survey instrument.	a sample of 133 divisional entries of diversified, U.S.-based firms into three host countries(China, India, and Russia) by telephone, both to describe the study and to solicit their participation.	regression	parent-subsidiary
8	Anoop Madhok, Thomas Osegowitsch, 2000	alliance mode	Europe. and U.S, who get more knowledge	secondary data	The sample is on transactions between the US and Europe between 1981-1992, and at least one commercial party.		all
9	Nizam Aydin, Vern Terpstra, 1981	Company variables, parent company variable ; others》、 industry variable, different teams of marketing experience	Marketing knowledge (planning, research, product policy, distribution policy, promotion policy, price policy, and performance)	interview	At the field study were 92 foreign subsidiaries manufacturing in Turkey.	None	parent-subsidiary
10	Marjorie A. Lyles, Jane E. Salk, 1996	Learning ability, goal, knowledge type from foreign partner (marketing or R&D), explicit knowledge, educational training, culture, ownership over 50% or not, trust	Knowledge acquisition and performance	Hungarian interviewers, and pre-tested the survey instrument. Surveys were translated and back-translated to avoid any language misunderstanding.	The sample consists of 201 small/medium-sized IJVs with an average employee size of seventy-two employees. The majority of the IJVs were in manufacturing of machinery, electronics, textiles, and food processing.	multi-regression	international joint venture
11	Rober Grosse, 1996	ownership ratio, alliance years, internationalization situation, alliance of specific knowledge(manager /employee ratio	Case: the key technology of industry and function  Quantity: technology transfer	By telephone first, then interviews. In each country the objective was to obtain three interviews in each industry, at least on firm not based in the United States.	Primary data compiled for this paper come largely from a series of interviews at home offices and Latin American affiliates (subsidiaries, branches, partnerships, and other kinds of affiliates) of transnational corporations in five service industries: advertising, commercial banking, computer software, hotels, and management consulting.	Bivariate regression	parent-subsidiary
12	Shige Makino, Andrew Delios, 1996	Exist local partner or not, post experience years of foreign, post experience years of joint venture, and their interaction.	financial performance	Used Toyo Keiza(1992)'s data	Based on a sample of 558 Japanese joint ventures located in southeast and East Asia.	logistic regression	international joint venture

13	Bernard L. Simonin, 1999	Knowledge specific, partner specific	ambiguity	The questionnaire design, and the implementation and conduct of the surveys were based on the TDM.	151 completed questionnaires were collected, majority of respondents were top executives in some of America's largest corporations.	LISREL VIII-SEM	international strategic alliances
14	Hhenrik Bresman, Julian Birkinshaw, Robert Nobel, 1999	communication, visits and meetings articulability of knowledge, time elapsed	acquiring to acquired and acquired to acquiring	questionnaire	Three MNCs had acquired companies with as main objective to gain access to the acquired companies' R&D. In addition, Fifteen large Swedish MNCs in the questionnaire study received 42 effect questionnaires from R&D by mail and telephone.	OLS& binomial regression	parent-subsidiary
15	Alice Lam, 1997	governance forms, task structure, knowledge structure, job system of partner	performance	observation	The case is an example of a technological partnership in knowledge-intensive industry. The Japanese and British partner firms are both global competitors in the electronics industries	case study	international strategic alliances
16	Almeida, song and Grant, 2002	Alliance mode ( multi-nation, alliance, market )	Knowledge building	three samples of firms, sample A-the MNCs, sample B-the alliance, sample C-the market	A, B, C: 21 mnc, 10 samples of each, total 146	Binomial regressions	international strategic alliances
17	Oded Shenkar' Jiatao Li, 1999	Management, marketing, technology, right of joint venture, international alliance	Searching for management , marketing, and technology skill	use FIDA designed the questionnaire	data from 90 partner-seeking firms in China	logistic regression	international strategic alliances
18	Martin Schulz, 2003	Local knowledge, extra-unit knowledge strategic context	Knowledge inflow by horizontal or vertical	mail survey-questionnaire	570 subsidiaries in the population, 238were located in Denmark, and 332 were located in the United States.	regression analysis	parent-subsidiary
19	Xavier Martin, Robert Salomon, 2003	Accumulating learning	FDI	To collect data in the International Fabs on Disk database, from the list to exclude 35 Taiwanese plants.	Final sample is 386 observations from 84unique parents, 102 are foreign direct investment.	Probit regression	parent-subsidiary
20	Mowery, Oxley and Silverman, 1996	Alliance types, international alliance, R&D density, sales.	KT between organizations	secondary report from CATI database get all data	A total of 792 alliances from the Cooperative Agreements and Technology Indicators data base.	Regression	international strategic alliances

21	Bernard L. Simonin, 1999	Knowledge character ( tacit, specificity, complex ) , experience, partner selfness, culture distance, organization distance	ambiguity, KT	Secondary reported concentrations of SA. A multiple-group analysis is advocated that requires the sample to be divided into a high and low group along each of these variables (median split)	A sample of 147 from 1000 public and privately owned U.S. companies was randomly drawn from the Corptech directory. This study targeted large and medium-size companies operating in high-technology sector.	LISREL VIII-SEM	international strategic alliances
22	Ranjay Gulati, 1999	Cligue, new density, experience of alliance	If firm take please alliance in specific year	interviews with managers	Interviews with 153 managers in 11 large multinational corporations over a two-years period. To collect data on a sample of 166 firms in new materials, industrial automation, and automotive products.	panel probit estimate model	international strategic alliances
23	Pierre Dussauge, Bernard Garrette and Will Mitchell, 2000		Alliance result	secondary data from journal and annual report	A set of 227 alliances formed in a range of manufacturing industries. All the alliances involved competing firms that operated in the same industries.	logistic regression & regression	international strategic alliances
24	Peter J. Lane, Jane E. Salk and Marjorie A. Lyles, 2001	Trust, relative absorptive capacity, culture coordination, present learning, IJV elasticity, object/goal, management support, specific, IJV strategic, training of foreign partner, prior learning, prior performance, relative	Knowledge learning, performance	secondary data from Hungary's Central statistic database and on the survey data Lyles and Salk collected in 1993	The sample built on the survey data Lyles and Salk collected in 1993 using data from a second survey in 1996. More, included 123 data in our new interview.	multi-regression	international joint venture
25	Anil K. Gupta and Vijay Govindarajan, 2000	Subsidiary size (employee),relative economic level, main incentive, formal integration mech, vertical socialization mech, decentralization	KT (inflow, outflow)	Collected through questionnaire survey and secondary sources. Through interview to pretest and then develop questionnaire.	A total of 374 questionnaires were returned. The number of respondents for U.S., Japan, and European MNCs were 117, 112, and 145, respectively.	multivariate OLS regression	parent-subsidiary

26	Rene Belderbos, 2003	non-development experience, parent R&D strength, internationalization experience of parent company, R&D strength of parent company, interaction with few joint venture partner, alliance type, acquisition affiliate experience	affiliate R&D strength	Secondary data. Benchmark Survey on Foreign Direct Investment	Data from the fifth Benchmark Survey on Foreign Direct Investment held in 1993.	censored regression (tobit) model	parent-subsidiary
27	Jaideep Anand, Andrew Delios, 2002	Technology ability, brands, sales force	proportion of entries by acquisition	Secondary data. Trade Administration at the Department of Commerce, published annually in FDI in the U.S.	A sample of entries made into the United States in the 1974 to 1991 period. The major investing countries were Japan (4160 entries), the U.K. (2778), Canada (2316), Germany (1540), France (924), the Netherlands (745), and Switzerland (556).	chi-square	all

# The Role of Anonymity in Online Communications

*BJ Gleason*

*University of Maryland, University College, Korea*

## Abstract

There are many reasons to be anonymous on the Internet, ranging from free speech to privacy protection. However, for every positive aspect of anonymity, there is a negative aspect as well – it can be used for spamming, harassment, and other criminal activities. This paper examines the role of anonymity in online communications. It describes the different levels available, the positive and negative aspects of anonymous communications, and presents a policy framework for controlling its use.

## Introduction

Everyday, millions of people participate in various forms of online communications: chats, email, virtual classrooms and newsgroups. Each person has a user name, and by participating, becomes part of a community. Whether online or face-to-face, each community has rules that the members are expected to abide by, or face retribution from the other members. However, unlike the face-to-face world, the online world allows users to create new identities, where users can separate themselves from their physical identities, and present a new persona. This artificial persona is no longer linked to the physical persona, and allows the user new freedoms in the virtual world.

Lazar and Preece [10] indicate that people may not be comfortable in speaking out, due to possible retribution from the other members of the community. They illustrate this point with several examples, including an online sport community where any member posting criticism of a specific company would find that their posts were deleted; a forum where new teachers were uncomfortable posting their true feelings and thoughts since their supervisors could read the posts and possibly effect their future assignments; and a company forum where employees feared losing their jobs if they were to openly criticize their managers.

While the Internet can provide new opportunities for anonymous dialogue in the area of free speech: political discourse, whistle-blowing, providing information to news media; this anonymity can also allow unacceptable and criminal activities: spam, phishing, and harassment; because it is difficult to hold users accountable for their actions.

## Types of Anonymity

Kling, Lee, Teich, and Frankel [9] identify two major forms of anonymity: Pseudonymous and Anonymous. In pseudonymous communications, the user establishes a pen name representing their true identity. While we do not know who sent the message unless they decide to reveal themselves, we can respond to them via the pen name they have established. These can be set up easily via the hundreds of free email systems such as Hotmail, Gmail, and Yahoo.

It seems as if most Internet emails fall into this category of pseudo-anonymity. When many users sign up for an Internet account, they often find that someone else is already using *their* name, especially if it is a common name, and they then have to resort to using a nickname, or a pseudonymous representation. While their intention is not to hide their identity, and they often reveal their true name in the signature of their messages, this screen name doesn't reflect their true identity.

In anonymous communications, Kling, Lee, Teich, and Frankel [9] indicates that user establishes an account with an anonymous remailer, a communication system that strips out any information of the originator's true address, and forwards the message on to the intended recipient. While in a pseudonymous remailer system the recipient can respond to the originator's address, in an anonymous remailer, no records are kept of the original sender, and therefore, no reply is possible.

While it is possible for law enforcement to intervene and force the owners of the anonymous remailer to reveal their system logs, this is often difficult since the remailer is often located in a different country and outside the reach of local law enforcement. From a technical aspect, while it may be possible to trace an email through one remailer, it becomes almost impossible if the sender decides to employ multiple remailers in multiple countries [9].

## **Positive Aspects of Anonymity in Online Communications**

Whether pursuing self-help for embarrassing personal problems, reporting on corporate corruption (Whistleblowing), avoiding persecution for expressing unpopular ideas, or just wanting to maintain their personal privacy, there are many legitimate reasons why people prefer to cover themselves in the cloak of anonymity provided by the Internet.

In an online classroom setting, Chester and Gwynne [3] found that their students participated more, and were able to develop a stronger and more confident voice online than in the classroom. Foreign students were able to participate more since they were not inhibited by their verbal skill or societal norms. Bell [1] also found that anonymous online role-playing was an effective learning process and increased the participant's involvement and comfort level. By removing the emotional risk and potential criticism, participants were freer to express themselves.

VanSoest, Canon and Grant [14] found that in discussing sensitive social issues, such as racism, anonymous communications allowed students to express themselves without fear of retribution. During the online sessions, there was a lot of discussion about white guilt, homosexuality, whites are racist, racism among minorities, institutionalized racism, and reverse racism. One gay student even disclosed his sexual orientation during the session. There was even a meta-discussion on how difficult it was to discuss these issues without offending others. While over half of the students surveyed indicated that they were comfortable discussing sensitive issues in class, they overwhelmingly appreciated the ability of making anonymous comments online. Some students even expressed a preference to online discussion as they were concerned that the "forum hindered their classroom participation because they were afraid that they would reveal their anonymity on the Web." [14]

Huffacker [7] indicates that the physical person is separated from their body via a virtual identity, this is similar to Jung's concept of a public *mask*. While online the user can choose a new name, either reflecting their offline persona, or reflecting that they wish to become. With programs such as The Sims, a person can even create not only a new identity but also a new body to inhabit.

Reingold [11] reinforces these concepts. While online, other users cannot view our physical characteristics. They do not know if we are fat, thin, tall, short, or have any physical handicaps or other characteristics that make it difficult to interact within a physical group. By using pseudonyms, participants can no longer determine ethnic origins or detect any accents in a voice. The recipients of the messages must focus on the ideas expressed in the messages, not the messenger. In short, when people participate online using some degree of anonymity, the "virtual communities treat them as they always wanted to be treated - as thinkers and transmitters of ideas and feeling beings" [11].

## **Negative Aspects of Anonymity in Online Communications**

While there are numerous reasons to encourage anonymous online communications, there seems to be even more reasons to discourage its use [3, 6, 9]. While many of these papers indicate that anonymous communication has its advantages, they also provide a long list of problems associated with its use. Spamming, phishing, deception, hate mail, impersonation and misrepresentation, online financial fraud, bad behavior, harassment, swearing, and other illegal activities, are just a sampling of some of the problems associated with anonymous communications.

According to Sipior, Ward, and Bonner [12], unsolicited bulk email now accounts for approximately 60% of all email. All this spam has had an impact on the users: Over 50% have less trust in email, and 25% use email less frequently. False email identities increase the possibility that spam will be able to bypass all the filters and get to the user. Many spammers make use of free email services, and by forging email information, the senders can conceal their identities.

The other major fraud that is currently taking place online is phishing. It is estimated that these anonymous attacks have cost consumers between \$500 million and \$2.4 billion. There has been a rise of these attacks during the past few months, with some users indicating they have received at least one message a week. These email messages appear to be from the consumer's bank or credit card agency and request the user to log into the site via a link in the email message. That link takes them to a hacker's site, where their personal information is captured and passed on to the criminals [4].

Davis [6] believes that anonymity and the resulting deindividuation can lead to a more pronounced anti-social behavior in online communications. Anonymous users experience diminished social presence, and do not recognize other users as *real*. Combined with the fact that they are unlikely to ever meet the other users in a physical environment, their actions have little consequences. If ostracized or rejected by the group, an anonymous user can simply change identities, and re-enter the community with a new persona, and not have to deal with the backlash aimed at the abandoned identity.

This inappropriate behavior can cause problems within the communities. Bertera and Littlefield [2] expressed concerns that if users were not held responsible for their comments, the fundamental social controls will break down, which will result in more aggressive or malicious behavior, and defeat the purpose of the forum. Davis [6] reports that 56.1% of survey respondents indicated that they avoided online environments where other users acted inappropriately, and that 79.3% had left an online environment for the same reasons. Some of the inappropriate behavior included users making inappropriate sexual comments, swearing, and harassment. Davis attributes anonymity, combined with a lack of accountability as two of the primary causes of inappropriate behavior, and recommends that online environments make an effort to strengthen the sense of community and social presence by using online profiles, and reputation systems.

A user's 'reputation' is an important consideration when deciding whether or not to interact with them online. A peer-based reputation system [8] is one of the techniques employed at online auction sites, such as Ebay, where user profiles are linked to a seller's pseudonym address. Each user has a profile consisting of information as to when the user account was created, the number of transactions the user has made, as both a buyer and a seller, and access to a feedback mechanism where other users can rate their transactions. A buyer on Ebay can examine all of this information, and make a decision as to whether they trust the seller, as represented by their online pseudonym.

Bertera and Littlefield [2] indicate that being identified in an online forum discussion appears to have several advantages, including higher perceived learning, improved relationships, and most perhaps most importantly, a greater appearance of honesty than those who remained anonymous.

## **Establishing Policies for the Use of Anonymity**

Teich, Frankel, Kling and Lee [13], believe that anonymous communication on the Internet is an important and valuable feature, if properly used. They have put forth a policy framework for dealing with anonymous communications.

1. Anonymous communication online is morally neutral. No technology is ever good or evil. Guns can be used to protect as well as destroy. Peer-to-peer, while used for music piracy, can also be used for information sharing. Anonymous communication is just a tool, which can be used to allow freedom of expression, or harm to others. Policies should be put in place to discourage the harmful uses, while encouraging the productive ones.
2. Anonymous communication should be regarded as a strong human right; in the United States it is also a constitutional right. Just as freedom of speech allows people to say what they want, it doesn't require anybody to listen to what they are saying. Users can choose to ignore anonymous communications.
3. Online communities should be allowed to set their own policies regarding the use of anonymous communication. Just as cities, counties, states, and countries have their own laws, online communities can establish their own laws on the use of anonymous communications. It is then up to the individuals of that community to decide if they want to participate under those rules. According to Lazar and Preece [10] we

can influence people's behavior by establishing the community's purpose, the participant's roles, and establishing community standards.

4. Individuals should be informed about the extent to which their identity is disclosed online. When an individual chooses to participate in an online service, it should be made clear to them the policies regarding anonymity, privacy, and confidentiality. They also need to be informed before those policies change.

Not everyone agrees with this policy framework. Davenport [5] argues that anonymity is not only destroying the Internet, but is also causing serious problems within the legal system. He believes that the first two policies: that online anonymous communications is morally neutral, and that it is a human and constitutional right; are fundamentally flawed. He believes that "the price of our freedoms is not, I believe, anonymity, but accountability. Unless individuals and, more importantly, governments can be held accountable, we lose all recourse to the law and hence risk our very freedom" [5].

## Conclusion

Anonymous communications is simply another tool that can be used for either good or evil. Just like in modern society, there is a time and a place for anonymous communications. As we can see from the flood of spam, phishing attacks, and other scams on the Internet, perhaps widespread anonymity is inappropriate and potentially harmful. But within certain settings, on a smaller scale, anonymity can actually facilitate discussions, and allow people to express their ideas and feelings without fear of retribution.

# **Students' Evaluation on Personnel (Lecturer and Administrative Staff) In Evaluating Private Colleges in Malaysia**

*Nooraini Mohamad Sheriff  
Faridah Hj Hassan  
Universiti Teknologi MARA, Malaysia*

## **Abstract**

The objectives of this study are firstly, to determine students' perception on the important qualities of personnel (lecturer and administrative staff) in their evaluation of alternative private colleges in Malaysia. Secondly, students' perceived influence of the evaluation criteria used to assess their choice of private college in Malaysia. Thirdly, the relationship between students perceived importance of personnel and evaluation criteria for selection of private colleges were ascertained. Data were solicited from 808 newly enrolled students in 72 multi-disciplined private colleges in Malaysia via the Simple Random Sampling method. The research uncovered that qualities of a lecturer deemed important to students in their evaluation process are lecturer knowledge of the subject matter, skilful lecture delivery and good time management. Administrative staff on the other hand should be knowledgeable in their job, helpful to students and polite to students.

## **Introduction: Contemporary Status of Private Higher Education in Malaysia**

In Malaysia the system of higher education comprises of the public and private higher education (Tan, 2002). A key characteristic separates the private higher educational institutions from its public counterpart. The private higher educational institutions are privately funded for profit. No funds, grants or endowments are channeled to them by the government or private organizations. Henceforth their primary source of revenue stems from shareholders funds, student fees and business activities related to the education business. Nevertheless despite of their financial independence private higher educational institutions are strongly encouraged to adopt the curriculum prescribed by the Ministry of Education (Soon, 1999).

The 1990's represented an era of rapid development for the Malaysian private higher education industry. This was evident with the growth in number of institutions, variety of courses offered and course structure adhered. According to Hassan (2003) as cited by Rohana, to date there are approximately 706 registered private higher educational institutions in Malaysia. There are also an estimated 40,000 students and 50,000 teaching staffs attached to private higher educational institutions in 1998 (Ministry of Education, 2001). In addition, private colleges too offer different categories of study namely:

- a) Internal award at certificate and diploma levels. The local private colleges would develop the curriculum and forward them for approval to the Ministry of Education/National Accreditation Board.
- b) Provides tuition for external professional examination. Key emphasis is to conduct the respective professional programs and prepare students for the respective external examination such as MACPA (Malaysia), ACCA (U.K.), ICSA (U.K.), CIM (U.K.) and TOEFL (U.S.A.).
- c) Bachelors, Masters and Doctorate of Philosophy awards. Conducts courses leading to the abovementioned degrees via collaborative efforts with local and foreign universities. Common modes of partnership are Split Degree Arrangements (Twinning, Credit Transfer and Advance Standing Program), Entire Degree Arrangement (External Program, Distance Learning and Franchised: 3+0, 4+0) Shamsul (2001), Kamaruzzaman and Kelch (1999).

To complement this wide range of study qualifications, private colleges conducts studies in numerous disciplines such as accounting, business and commerce, economics, technical/vocational, engineering, creative studies, performing arts, law, medicine tourism, IT/Multimedia and computer studies, fashion design, architectural and building studies and secretarial science. In short, the presence of hundreds of private higher educational

institutions, offering a variety of program structures, in a multitude of disciplines has undoubtedly contributed to heighten competition within the industry.

### **Importance of Private Higher Education in Malaysia**

The erection and development of private higher educational institutions has gained good support from the Malaysian government. Their presence has enabled the vacuum left by the public institutions of higher learning to be filled-up (see Table 1).

TABLE 1: TOTAL STUDENT ENROLLMENT

Higher Institution	Number of Students
i. Public higher educational institution	143,971
ii. Private higher educational institution	203,381

Source: Ministry of Education, Education Quarterly, September 2003

Other reasons supporting their presence in the Malaysian higher education system are:

- a) To complement the effort of the public sector in churning out highly skilled and trained professionals. This would aid the nation’s effort to develop knowledge-based workers deemed critical for the attainment of Vision 2020.
- b) To contribute towards the development of the Malaysian economy. It is hope that as the private higher education sector evolves and excels, it would be able to woo foreign students, thus contributing to the economy via foreign exchange. According to Hassan as cited by Izwar (2003) the number of foreign students, have shown a marked increase of 23,400 in 2002 to 36,466 in 2003 (an increase of 77.73%). Among the countries with significant student enrollment are China (11,050), Indonesia (7,503), India (1,409), Thailand (1,369) and Singapore (1,296).
- c) To minimize the outflow of foreign exchange resulting from a large number of Malaysian students pursuing higher education abroad. It is estimated that there are about 60,000 Malaysians studying abroad and this has resulted in an outflow of funds amounting to RM2.5 – RM3 billion annually (www.edu.usm.my).
- d) To promote Malaysia as a center for educational excellence in this region, at par with Singapore and Australia. With the manpower, physical and financial resources available, this intention can certainly materialize.

### **Challenges of the External Marketing Environmental Forces to Private Colleges in Malaysia**

The Malaysian private higher educational institutions as prescribed by the Private Higher Education Act 1996 includes private colleges, private university and university colleges, foreign university branch campus and distance learning centers (Soon, 1999). Over a span of 70 years (since its inception in 1930’s) private colleges have mushroomed in Malaysia (Disney and Adlan, 2000). These numbers are relatively big and there is always a chance of it getting bigger. The real issue here is not about their numbers alone but would these institutions, particularly private colleges have an optimum student enrolment to operate profitably? Based on the estimated 160 active private colleges, 12 private universities, 4 foreign university branch campuses with distance learning centers, and the available total market potentials of 350,000-400,000 students, it can be inferred that the market potentials of private colleges is rather limited. This concurs with claims by Gilbert as cited by Zalina (2003), that there is an estimated 20% decline in student’s enrollments across the board among private colleges. This would be especially true for the smaller private colleges whose student number ranges between 400-500 students (Zalina, 2003). Hence, private colleges would have to identify a sustainable basis to compete with private universities, foreign university branch campuses, distance learning centers and overseas institution for their share of market.

Besides the stiff competition, several statutes govern the conduct of private higher education operators. They are the Education Act 1996, Private of Higher Education Institution Act 1996, National Accreditation Board (LAN) Act 1996, University and University Colleges (Amendment) Act 1996, National Higher Education Fund Corporation Act 1997 (Disney and Adlan, 2000). These statutes were enacted with the intention of liberalizing the government's education policy to promote growth and quality education by the private sector.

The Department of Private Higher Education has taken serious measures to enforce the Private of Higher Education Act 1996. This is evident by the number of private institution of higher learning being served with closure notices, their license revoked, show cause letter's issued and directive to cease the offering of certain programs. Between November 2002 and January 2003, 171 private higher educational institutions (PHEI) were directed to stop their operation (Rohana, 2003). Because of this, the number of PHEI's were reduced from 706 to 535 (Rohana 2003). Similarly, in April 2003, another 7 PHEI's were directed to close down their operation because they were operating without the approval of the Department of Private of Higher Education. An additional 10 PHEI's were directed to stop offering courses, which have not been granted approval (Izwar, 2003). The National Accreditation Board on the other hand has played an active role in the accreditation of programs offered by private colleges. According to Abdul Aziz as cited by (Rohana 2003) in March 2003, 72 PHEI's were awarded accreditation for 317 programs offered. In addition according to Hassan as cited by Rohana (2003) each accreditation from the LAN is valid only for a period of 5 years. As such private colleges must apply for their renewal upon expiry.

Private colleges advertising efforts too need to adhere to the advertising guidelines as specified in Section 75 of the 555 Act (Rohana, 2003). Non-compliance would liable a private college to a RM50,000 compound or six months of imprisonment. The enforcement here has been strict lately because of incidences of private colleges misrepresenting the public by using the Ministry of Education and National Accreditation Board logo in their advertisement. In fact last year the Department of Private Higher Education issued 128 notices to private higher institutions for breaching this Act.

There is also realization among private colleges that education has taken on a new meaning with the development of information technology and systems. As a consequence private colleges have widely adopted information and communication technology such as technology infrastructure, network and systems use, course development, administrative system, E-planet and etcetera. Private colleges especially the big leagues have started to experiment with numerous technological applications such as computer power and applications of 'smart' products, teaching and learning technology and efficient methods of distributing education through E-Learning.

To sum, it can be postulated that the competitive, legal and technological environment has posed private colleges with greater competition. With this competitive environment and heighten sophistication of consumers, private colleges are increasingly faced with greater demands to deliver quality. Quality is judged by the standard of service and this makes the role of employees (personnel) in the service organization critical to maintain quality standards. The inseparable nature of service too has resulted in the personnel element being part of the service package. The personnel element encompasses not only the service personnel but also the role of other people namely, customers who are part of the service delivery process. This is particularly true with education where students are an important part of the service, since they must participate in the learning process. As such it is essential that the learning process is effective. In Malaysia, the education policy is aimed at developing the potentials of individuals in a holistic and integrated manner so as to produce individuals who are intellectual, spiritually, emotionally and physically balanced as well as harmonious (Johari Mat, 2000). To adhere to this policy, college lecturers must be a subject matter expert, acquire a new repertoire of teaching skills, help others learn what they know and be responsible for students learning and outcomes (Kennedy, 1999). However in the Malaysian private colleges the main function of a lecturer is predominantly to teach (Mahdzan, 1999). As a result of this, it is questionable as to how much of the other roles they are able to assume. This situation is made worse as private colleges too are faced with a shortage of qualified lecturers with the right kind of experience (Najib, 1999). Moreover in education, where the degree of intangibility is high, employees such as lecturers, administrators, technical support and maintenance staff plays an important role in their interaction with customers to deliver the service (Doherty, 1997). In view of this it is important that quality in education is preserved by ensuring that

lecturers prepare and plan their lectures as well as effectively deliver them (Entwistle, 2001). Students too expect lecturers to be punctual, presentable, sensitive and nurturing when providing feedback (Blaskie, 2001).

Consequently, customers would evaluate the service personnel's contact skills such as courtesy, attitude, helpfulness, appearance, availability and timeliness as important determinants of service quality in higher educational institutions (Oldfield and Baron, 2000). This is evident as they determine the quality of service rendered. Such skills are essential for service personnel because customers perception of quality are, often influenced directly by the action of the service personnel, which in turn results in a level of satisfaction or dissatisfaction. In fact, the unmatched service attitude of the service organization, especially among its front line personnel is its real source of competitive advantage. As such, the role played by employees is critical since they would influence consumer's perception of service quality, which in turn affects an organization's productivity, quality and success.

Such requirements would have a direct impact on the recruitment, training and ongoing mentoring of employees, particularly service personnel. Training, authority and management support is highly essential to ensure that their important but yet brief encounters with customers would result in a satisfactory outcome. This is because personnel would constitute a key Input to the education system as depicted in the diagram below as adapted from Yin and Wai (1997) legitimacy model of education quality (Figure 2). This model holds the view that educational institutions would be able to survive in a competitive environment only if they are able to offer high education quality. This is true of the private higher education industry in Malaysia specifically private colleges. With the increase in parental participation on choice of private college and heighten accountability among the key stakeholders in education, management of private colleges would have to undertake the needful measures to deliver education quality.

### **Personnel Strategy and Their Influence on Students Evaluation of Alternative Private Colleges in Malaysia**

Numerous consumer behavior models both simple and comprehensive (Simmons, 2000; Rice, 1997, 1993; Loudon and Bitta, 1993 and Schiffman and Kanuk, 1990) have advocated the influence of marketing factors on the various stages of consumer decision making for the purchase of goods. However with some minor modifications of the purchase process to include (Pre-purchase, Service Encounter and Post-purchase; Lovelock, 2002; Lovelock and Wright, 1999) the models can be extended to include the purchase of services. Marketing strategies for services would encompass seven key elements; service product, promotion, placing, pricing, personnel, process and physical evidence/servicescape (Kotler, 2000; Rust, Zahorik and Keningham ,1996; Payne and Ballantyre, 1991 and Booms and Bitner, 1981).

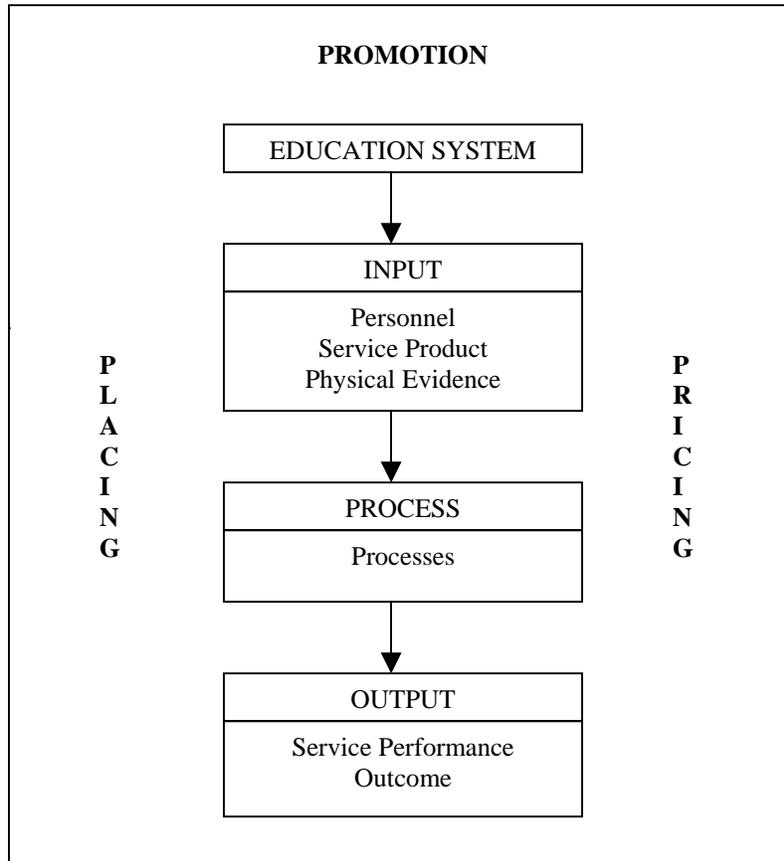

FIG. 2: INPUT, PROCESS AND OUTPUT FOR THE EDUCATION SYSTEM COMPLEMENTED BY MARKETING ACTIVITIES

Source: Yin, C.C. and Wai, M.T. (1997), Multi-models of Quality in Education, Quality Assurance in Education, Vol.5 No.1, p 22-31

At the evaluation stage of the decision making process consumers would use a set of evaluative criteria that have been identified through information search to determine which alternative would solve their problem or help them attain their desired state. Evaluative criteria are the dimensions utilized to judge the merits of competing options (Solomon, 1999). These evaluative criteria constitutes product/service features that are essential to consumers as they deliver benefits they seek (Govoni, Eng and Calper, 1986). They include quality of curriculum/program, teaching staff, administrative staff, location, facilities, efficiency of processes and price (Aldridge and Rowley, 1998; Connelly, 1997; Joseph and Joseph, 1997 and Hill, 1995). However these criteria have been established in empirical studies carried out in the West. Therefore it is still unclear if prospective foreign students seeking to pursue private higher education in Malaysia are adhering to the same criteria.

### Research Objectives

The objectives of the research are to ascertain:

- a. Qualities of personnel (lecturer) students perceive as important in influencing their decision making process to select a private college.

- b. The relationship between students perceived importance of qualities of personnel (administrator) and evaluation of alternative private colleges.
- c. Evaluation criteria students perceived as influential in making their choice of private college.

## Hypotheses

- Ho There is no significant relationship between a private college's personnel strategy (marketing activity) and evaluation criteria of alternative private colleges.
- Ha There is a significant relationship between a private college's personnel strategy (marketing activity) and evaluation criteria of alternative private colleges.

## The Questionnaire

The unit of analysis for this study is newly enrolled students at private colleges. They were asked on the qualities they perceived as important on two categories of personnel namely private college's lecturers and administrators to their evaluation activity of alternative private colleges. Their perceived influence of a list of evaluative criteria was also solicited. Questionnaires were distributed to the multi-discipline private colleges through the drop-off method. The researchers personally delivered and collected the questionnaires from the respective colleges. This has enabled the researcher to explain the purpose of this research to the respective colleges so as to elicit their cooperation.

The questionnaire comprised of two main sections. The first section addressed the background data such as gender, age, level of program and country of origin. The second section requested the respondents to indicate their perceived importance of numerous qualities of a lecturer and administrative staff during their evaluation process of the education services rendered by private colleges. In addition respondents too were asked on their perceived influence of selected evaluation criteria on their choice of private college. Their perceptions were indicated on a scale of 1 (low) to 7 (high) and 0 if an item is not applicable. Values of 1 to 2 were considered as low levels of importance (personnel)/ influence (evaluation criteria), 3-5 as moderate level of importance (personnel)/ influence (evaluation criteria) and 6-7 as high levels of importance (personnel)/ influence (evaluation criteria). Descriptive statistics was initially performed on the quality items of lecturers and administrative staff. This was followed by the inter-item correlation to establish if these quality items are related. Lastly the score of each quality item was indexed to obtain a composite score for the personnel and evaluation variable. The Pearson correlation was executed between the personnel variable (independent) and evaluation criteria (dependent) to test the constructed hypothesis. However, prior to hypothesis testing the data was treated to a Cronbach Alpha reliability test to determine the reliability of the data. The Cronbach Alpha value obtained for personnel (0.8717) and evaluation criteria (0.8241). The values obtained are above the minimum requirement of 0.6, thus indicating satisfactory internal consistency reliability.

## The Sample

Private colleges would be defined as the population for private institutions of higher learning in Malaysia. This research included 72 (60%) multi-discipline private colleges in Malaysia from a total 120. The colleges were selected via the Simple Random Sampling method based the list of multi discipline private colleges enlisted in Wencom's Higher Education Guide, 3<sup>rd</sup> edition. The ultimate inclusion of the colleges was subjected to their consent to participate in the research. Newly enrolled students (up to one month) were selected from each private college via Simple Random Sampling method. However not all the questionnaires were returned. The researchers are of the opinion that newly enrolled students would be more objective in indicating which global marketing attribute were important to them as they have just gone through the purchase process while minimizing the influence of their current college environment.

## Sample Characteristics

Out of the 1440 questionnaires distributed 822 (57%) were returned. An additional fourteen were rejected as there were numerous missing values, thus resulting in the actual number of response to be 808 (56%). Twenty eight% were to be enrolled in diploma programs, 58% for undergraduate programs and 14% for masters program. The 22-25 age groups made up the largest group of respondents with 62%. This was followed by 18% for the 17-21 age group and 12% for the 22-30 age group. The remaining 8% were above the age of 30. 36% of the foreign students were from China, 28% Indonesia, 14% Maldives, 7% Thailand 8% India, 4% Pakistan and 3% others.

## Analysis and Findings: Quality of Personnel (Lecturers and Administrative Staff) at Private Colleges and Evaluation Criteria Influencing Students' Choice of Private College

Lecturer's quality was operationalized with the use of six items. They include knowledgeable on subject matter, skilful lecture delivery, positive attitude towards teaching, care for students, good time management and punctuality. Five hundred and fifty students (68.1%) perceived that it is extremely important for lecturers to be knowledgeable of the subject matter at hand. In addition 535 students (66.2%) and 442 students (54.7%) perceived that extremely important attributes of a quality lecturer is their skilful lecture delivery and positive attitude towards teaching respectively (Table 2).

TABLE 2: FREQUENCY FOR STUDENTS' PERCEIVED IMPORTANCE OF LECTURER'S QUALITY AT PRIVATE COLLEGES

Scale/ Lecturer's quality	0	1	2	3	4	5	6	7	n=808
Knowledgeable of subject matter. (%)	12 1.5	5 .6	2 .2	18 2.2	38 4.7	62 7.7	121 15.0	550 68.1	M=6.31 SD=1.334 V=1.778
Skilful lecture delivery (%)	9 1.1	2 .2	10 1.2	15 1.9	39 4.8	53 6.6	145 17.9	535 66.2	M=6.32 SD=1.285 V=1.651
Positive attitude towards teaching (%)	14 1.7	6 .7	10 1.2	31 3.8	53 6.6	98 12.1	154 19.1	442 54.7	M=5.44 SD=1.748 V=3.057
Care for students (%)	3.3 4.1	7 .9	21 2.6	36 4.5	81 10.0	123 15.2	253 31.3	254 31.4	M=5.44 SD=1.748 V=3.057

Note: 0 – Not Applicable; 1 – Not Important; 7 – Extremely Important

Knowledgeable lecturers, skilful lecture delivery and lecturers positive attitude towards teaching are well supported with literature from Entwistle (2001), Blaskie (2001) and Kennedy (1999). As lecturers constitute a key resource input to the education process such traits are deemed critical to develop the potentials of individuals in a

holistic and integrated fashion. Only then educational institutions would be able to produce students who are intellectually, spiritually, emotionally and physically balanced as well as harmonious (Johari Mat, 2000).

In table 3 positive correlations were obtained for all the six items representing lecturer's quality at private colleges via Pearson correlation. High correlation was seen between lecturer's knowledge on subject matter and skilful lecture delivery (0.714). In addition modest correlation was registered for skilful lecture delivery and lecturer's positive attitude towards teaching (0.683), positive attitude towards teaching and good time management (.677).

TABLE 3: CORRELATION FOR PERSONNEL (LECTURERS) OF PRIVATE COLLEGES

	Knowledgeable	Skillful delivery	Positive attitude	Students well-being	Good time management	Punctuality
Knowledgeable	1					
Skillful delivery	.714**	1				
Positive Attitude	.631**	.683**	1			
Students well-being	.495**	.459**	.503**	1

Punctuality	.516**	.606**	.560**	.306**	.529**	1

\*\* Pearson correlation is significant at 0.01 levels (2-tailed)

The six items included to explain the quality of administrative staff are knowledgeable about job, prompt service, disseminates accurate information, helpful to students, courteous to students and politeness to students. Four hundred and thirty four students (53.7%) perceived with extreme importance that administrative staff at private colleges should be knowledgeable about their job. To add 427 students (52.8%) perceived with similar importance that they should be helpful to students while 402 (49.8%) perceived that politeness to students is extremely important (Table 4). Being support staff the importance of administrative staff is undeniable. They perform numerous services for students ranging from administration and record, payment/collection, examination, counseling and alike (Doherty, 1997). As such it is important that these personnel are well versed of their duties and responsibilities and are equipped with the appropriate contact skills such as helpfulness, politeness and courteousness. Oldfield and Baron (2000) in his study on determinants of service quality in higher educational institutions identified similar contact skills to be crucial. Such skills are important, as they would influence customer's perception of quality that translates into their satisfaction or dissatisfaction.

TABLE 4: FREQUENCY FOR STUDENTS' PERCEIVED IMPORTANCE OF QUALITY OF PERSONNEL (ADMINISTRATIVE STAFF) AT PRIVATE COLLEGES

Scale	0	1	2	3	4	5	6	7	n=808
Quality of administrative staff.									
Knowledgeable about job (%)	17 2.1	20 2.5	13 1.6	32 4.0	57 7.1	115 14.2	120 14.9	434 53.7	M=5.82 SD=1.710 V=2.923

Note: 0 – Not Applicable; 1 – Not Important; 7 – Extremely Important

In Table 5, Pearson correlation on the above mentioned six items attained positive correlation with high correlation observed between the administrative staff delivery of prompt service and ability to disseminate accurate information (0.783). Additionally moderate correlation exist between the administrative staff being knowledgeable about their job and ability to disseminate accurate information (0.632) and administrative staff disseminating accurate information and being helpful to students (0.621).

TABLE 5: CORRELATION FOR PERSONNEL (ADMINISTRATIVE STAFF) OF PRIVATE COLLEGES

	Knowledgeable job	Prompt service	Accurate information	Helpful to students	Courteous to students	Polite to students

Literature has indicated that students' evaluations of the alternative higher educational institutions are often based on one or more criteria. Basing on this, students evaluating private colleges in Malaysia are given a number of

criteria such as program quality, lecturer’s quality, administrative staff efficiency, up-to-date facilities, price and simple processes to reflect their perceived influence on the choice of private college they select. In Table 6, three criteria were distinctively perceived to have strong influence on the student’s evaluation of private colleges. They are program quality (50.7%), lecturer’s quality (38.1%) and price (36.1%). These three key evaluation criteria which have strongly influenced students perception of private colleges concurs with findings established by Alridge and Rowley (1998), Connelly (1997), Joseph and Joseph (1997) and Hill (1995).

TABLE 6: FREQUENCY FOR STUDENTS’ PERCEIVED INFLUENCE OF EVALUATION CRITERIA ON THEIR DECISION-MAKING PROCESS TO CHOOSE A PRIVATE COLLEGE.

Scale	0	1	2	3	4	5	6	7	n=808

\*\* Pearson correlation is significant at 0.01 level (2-tailed).

Based on the earlier literature and model on input, process and output for the education system complemented by marketing activities by Yin and Wai (1997), the hypothesis testing between the personnel (marketing activity) and evaluation criteria was conducted. Marketing strategies/ activities for services would encompass seven key elements; service product, promotion, placing, pricing, personnel, process and physical evidence/servicescape. In Table 8, Pearson correlation between the aggregated personnel strategy (marketing activity) and evaluation criteria displayed the highest moderate significant correlation (0.400). This suggests that the null hypothesis of no significant relationship between personnel and evaluation criteria of private colleges would be rejected at 5% level of significance.

TABLE 8: RELATIONSHIP BETWEEN MARKETING ACTIVITIES AND EVALUATION CRITERIA OF PRIVATE COLLEGES

MARKETING ACTIVITIES	EVALUATION CRITERIA
Service product	0.058
Pricing	0.231**
Placing	0.298**
Performance outcome	0.177**
Promotion	0.183**
Personnel	0.400**
Process	0.381**
Physical Evidence	0.307**

\*\* Correlation is significant at the 0.01 level (2-tailed). 0.19 & < - very low correlation, 0.20-0.39 – low correlation, 0.40-0.69 – moderate correlation, 0.70-0.89 – high correlation, 0.90-1 – very high correlation (Cohen and Holiday, 1982).

## Conclusion

In terms of qualities of personnel (lecturers) students perceived as important in influencing their decision making process to select a private college, 550 (68.1%) perceived that it is extremely important for lecturers to be knowledgeable of the subject matter at hand. In addition 535 students (66.2%) and 442 students (54.7%) perceived that extremely important attributes of a quality lecturer is their skilful lecture delivery and positive attitude towards teaching respectively (Table 2). Knowledgeable lecturers, skilful lecture delivery and lecturers positive attitude towards teaching are well supported with literature from Entwistle (2001), Blaskie (2001) and Kennedy (1999). As

lecturers constitute a key resource input to the education process such traits are deemed critical to develop the potentials of individuals in a holistic and integrated fashion. Only then educational institutions would be able to produce students who are intellectually, spiritually, emotionally and physically balanced as well as harmonious (Johari Mat, 2000).

The relationship between students perceived importance of qualities of personnel (administrator) and evaluation of alternative private colleges are concluded as follows. Four hundred and thirty four students (53.7%) perceived with extreme importance that administrative staff at private colleges should be knowledgeable about their job. To add 427 students (52.8%) perceived with similar importance that they should be helpful to students while 402 (49.8%) perceived that politeness to students is extremely important (Table 4). Being a support staff the importance of administrative staff is undeniable. They perform numerous services for students ranging from administration and record, payment/collection, examination, counseling and alike (Doherty, 1997). As such it is important that these personnel are well versed of their duties and responsibilities and are equipped with the appropriate contact skills such as helpfulness, politeness and courteousness. Oldfield and Baron (2000) in his study on determinants of service quality in higher educational institutions identified similar contact skills to be crucial. Such skills are important, as they would influence customer's perception of quality that translates into their satisfaction or dissatisfaction.

In Table 6, three criteria were distinctively perceived to have strong influence on the student's evaluation in making their choice of private colleges. They are program quality (50.7%), lecturer's quality (38.1%) and price (36.1%). These three key evaluation criteria which have strongly influenced students perception of private colleges concurs with findings established by Aldridge and Rowley (1998), Connelly (1997), Joseph and Joseph (1997) and Hill (1995).

The results support the hypothesis that there is a significant relationship between the aggregated personnel strategy (marketing activity) and evaluation criteria students' use in arriving at their choice of private college to enroll with. This concurs with literature from Simmons, 2000; Rice, 1997, 1993; Loudon and Bitta, 1993, Schiffman and Kanuk, 1990, thus, implying that consumers of private colleges in Malaysia are aware of the significant contribution of personnel to their education process. As such the personnel factor was given due consideration during their evaluation process. This is to ensure that the core resource to their education process is being well-managed as it is a significant determinant of their total development upon graduation.

It is recommended that other critical issues of late on personnel strategy and other marketing services such as on counseling, counter services, research lecturers versus teaching lecturers should be further research as the customers (students, parents and stakeholders) are becoming more demanding and educated. The above results may also differ with different level of programs, age category, mode of study and/or discipline of students.

# Barriers to China-US Textiles and Clothing Trade in the Post-Quota Period and Chinese Tactics

Li Na  
Fuzhou University, China

## Abstract

The year of 2005 indicates the coming of the post-quota period in the trade of textiles and clothing, which will lead a virtual change in China-US textile and clothing trade. The paper would try to find out this virtual change on the basis of analyzing the opportunities and the new barriers from the U.S. for China's export. The analysis shows that the prospects of China's textile and clothing export to the U.S. in the post-quota period may not be as optimistic as expected, because various kinds of potential barriers would emerge though the quota is eliminated. It argues that the barriers are against the spirit of free trade that is advocated by WTO and it will also bring down the welfare for both countries. At the last part of the paper, it tries to pose some tactics for China's textile and clothing exports.

## Analysis on the change of China-U.S Textile and Clothing Trade in the 3 Years After China's Accession to the WTO

China is one of the largest textile and clothing export countries in the world. And the textile and clothing industry is one of the pillar industries in China, which depends on the advantages of the unique natural resources and the labor-force resources to take up a high share in the world market. The U.S is the main textile and clothing import country. Therefore whether China-U.S textile and clothing trade can go well will bring large influence on China's exports. As the large amount of China-U.S textile and clothing trade, the frictions will also be more than that of other kinds of products. And two important events happened in the 21-century –China's accession to the WTO and the elimination of quotas in the textile and clothing trade- will bring a new situation to China-U.S textile and clothing trade.

### Analysis on the Change of the Amount of China-U.S Textile and Clothing Trade in the 3 Years After China's Accession

China's accession to WTO in 2001 brings many new chances for foreign trade, the same as the textile and clothing industry. It also means that the U.S should comply with the rules of ATC<sup>1</sup> that is to eliminate gradually the quotas for importing China's textile and clothing. According to the timetable of ATC, the U.S should give China's exports an increase of 25% calculated on the basis of the original quotas after China's accession, while in 2002<sup>2</sup> it should eliminate the quotas on some products such as baby clothing, knit cloth, gloves, trousers, overcoats, outer clothing and so on. It should eliminate all the quotas before Jan 1, 2005.

ATC brings the new vigor into China-U.S textile and clothing trade. Table 1 shows that on the turning point of 2001, the amount of both China and the U.S exports has increased to a great extent, especially for China's exports that broke \$100 billions in 2003. In order to illustrate the problem clearly, Fig. 1 using the year of 2001 as the based period calculates the index on the change of China-U.S textile and clothing trade. It shows that the amount of the U.S imports from China appears a trend of growth. But the trend of rise before China's accession appears gentler than that of the next 3 years. During the period from 1995-2001, there came into a small upsurge and the average rate of increase reached to 17.34%, but the average rate of other years was not more than 6%. However the average rate after 2001 reaches to 36.35%. At the same time, the amount of the U.S exports to China also appears a trend of continuous rise. But its increase is more stable than that of the U.S imports from China, except a little descent in 1996. That reflects that though the amount of trade itself has a gradually increased process, the U.S textile and clothing imports from China has a quick rate of increase after China's accession. It also means that the U.S textile and clothing imports from China have entered into an unprecedented upsurge.

On another side, Fig. 1 also shows that the U.S has always been in trade deficit in China-U.S textile and clothing trade. And the trade deficit enlarges very quickly. The year of 2001 also becomes the point of demarcation. Except a little descent in 1999 and 2001, the enlarging trend appears gentler than that after 2001. It suggests that the

U.S. trade deficit on textile and clothing has also entered into an upsurge. And the reason mostly comes from the imports of China's products.

TABLE 1: CHINA-U.S. TEXTILES AND CLOTHING TRADE: 1999-2004.1-11  
(In thousands of dollars)

Year	The U.S. Imports from China	The U.S. Exports to China	The U.S. Trade Balance
1995	4,800,131	62,981	-4,737,150
1996	4,889,640	53,238	-4,836,402
1997	6,023,518	67,200	-5,956,318
1998	5,900,389	72,318	-5,828,071
1999	6,128,820	81,886	-6,046,934
2000	6,527,482	112,617	-6,414,865
2001	6,536,315	136,981	-6,399,334
2002	8,744,041	172,132	-8,571,909
2003	11,608,828	225,185	-11,383,643
2003.1-11	10,679,275	203,322	-10,475,953
2004.1-11	13,496,041	250,838	-13,245,203

Source: calculated on the basis of Table 1

#### Analysis on the Change of China Textile and Clothing Share in the U.S. Market

China textile and clothing share in the U.S. market changes as the import from China forms an upsurge. Fig. 2 chooses 4 countries and areas whose amount of exports in the U.S market list at the top. They are China, ASEAN<sup>3</sup>, CBI<sup>4</sup> and Mexico. China's share reached 14.27% and replaced Mexico to take up the first place in 2002. Fig. 2 shows that China's share enlarges by 3% every year and appears a trend of growth. However the share of ASEAN, who takes up the second place, goes up slowly and appears a little descent in 2004, while the share of CBI, who takes up the third place, appears a clearly descent. And the share of Mexico, who once took up the first place during 1998-2001, descends below 10%. Regarding to the above analysis, as a result of China's accession and the elimination of the quotas for some products, the cost of the quotas disappears and the competitive force of China'

products improves, and China's exports increase quickly while the share of other countries and areas experiences a descent.

The analysis can be concluded as follows:

In the first 3 years after China's accession to the WTO, Chinese textile and clothing exports to the U.S increase quickly as well as China's share in the U.S market, while the share of the original main export countries appears descent. One thing that should be mentioned here is that the above analysis is on the basis of the statistics from the U.S, therefore the data may be larger than that counted by China as the result of the different counting methods. However it can also beat the alarm bell for Chinese enterprises. It's inevitable that the situation of Chinese products will attract more attention from the U.S. government and textile industry. There still exists the serious potential worry about the growth of the frictions. At the same time, the elimination of quotas will also lead to the contradiction among the countries that were restricted by the quotas before. And the next part will go step further to talk about the barriers.

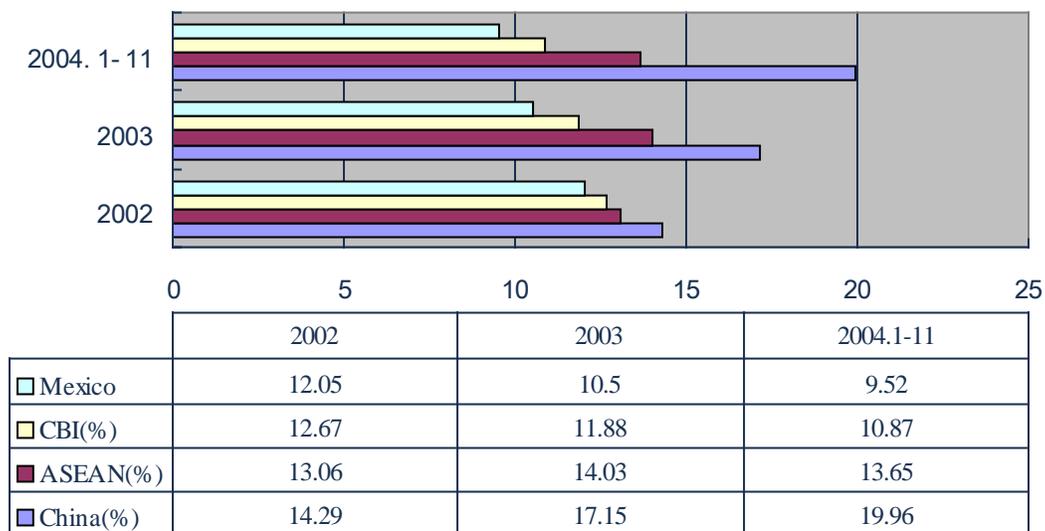

FIG. 2: INDEX ON THE CHANGE ON THE SHARE OF THE MAIN EXPORTS COUNTRIES  
Source: calculated on the data from U.S. Department of Commerce, Office of Textiles and Apparel

## Barriers to China-U.S. Textile and Clothing Trade in the Post-Quota Period and the Trend

The first part reveals that there exists the potential worry about the growth of the frictions, which implies that the textile and clothing trade is not absolutely free, and that China will still face various kinds of barriers. With regard to the referring documentary and materials, the potential barriers can be divided into 3 types.

### Barriers Based on WTO Rules

In order to protect the relevant industry in the textile and clothing import industry, WTO drafts some rules with the purpose of promoting the fair trade. However these rules often become the tools of protectionism. This type existing in China-U.S. trade usually includes Anti-dumping, VER<sup>5</sup>, Specific Safeguard Measure and General Safeguard Measure. These rules are used frequently as in the frame of the WTO. The U.S government also drafts the detailed relevant national trade acts to carry out these rules.

Anti-dumping Act of 1974 is the most perfect and detailed national anti-dumping act in the world. The number of cases that the U.S. has carried out to China is more than 80 and one of the main objectives is for China's textile and apparel products. The U.S. hasn't admitted that China is a market economy country. It usually used the price of a third country as the standard of the judgment in the process of the adjudication. In that case, it may

influence the fairness of the adjudication. Further to say, no matter which party wins, each phrase of the implementation, from investigation, register to lawsuit and judgment, would make the answer party spend much time and energy. Once the case is adjudicate to dumping, the defendant will be levied the countervailing duties, which sometimes would be very high. That will restrict the imports from China indirectly.

The quantitative restriction mainly includes VER, Specific Safeguard Measure and General Safeguard Measure. In China-U.S. Agreement, China promises to fulfill the obligations of reducing the textile and clothing exports to the U.S. beginning at 2005. At the same time it had another 12 years of General Safeguard Measure. And in China Accession Packages, China has a promissory of Specific Safeguard Measure that textile and clothing import countries can restrict the imports from China for 1 year before Jan.1, 2009 if there exists some evidences that China's products damage the relevant industry in the import countries. The U.S. producers can also put forward the application of import relief according to Trade Act of 1974. The implementation of the quantitative restriction is easier than that of Anti-dumping as its conditions are simpler and it just requires a shorter time while the effect is better because it can restrict the quantity directly. Especially for the Specific Safeguard Measure, if China and the U.S. can not reach the agreement in 90 days, the U.S. can still restricts the imports from China by itself. During 2003-2004, the U.S. has launched 2 cases of Specific Safeguard Measure for China's textile and clothing imports. Therefore the quantitative restrictions are also used frequently in the post-quota period.

#### **Various Kinds of Technical Barriers**

In the post-quota period, the technical barriers will also become the main barriers as its intrinsic concealment. The U.S. has various kinds of technical standards including Security, Health, Environmental Protection and so on. For example, the textile and clothing without the composition approved by FTC<sup>6</sup> rules would not be allowed to enter into the U.S. market. The recent standard, SA8000, stresses to defend the rights of the laborers in the enterprises, referring to not allowing using child laborers, compelling work and punishing measures, requiring to keep health and safe in the work environment...These technical barriers act directly on the increase of the cost which would lead to offset the advantages of China products and then reduce the imports from China.

#### **Regional Trade Barriers**

NAFTA<sup>7</sup>, which went into effect in 1994 and took the U.S. as the core, uses the method of advancing gradually to enlarge the preferential conditions to its member countries. This free zone brings a large trade transferable effect to its member countries. The effect in the textile and clothing trade is to import more products from the member countries instead of the other countries, which produced a large influence on China's exports. Take Mexico for example, before 1998, China's share took up the first place in the U.S. market. However Mexico overcame China to the first place in 1998 and kept its position until 2002 with the help of preferential conditions from NAFTA. Therefore it exists a large possibility that the U.S. would carry out the regional barriers if it wants to protect its relevant industry. In fact, the U.S. has sign the free trade agreement with Mexico and Tunisia, both of which are the textile and clothing countries. It suggests that the U.S. would consider carrying out the regional trade barriers. Although regional barriers refer to multilateral cooperation and it's difficult to coordinate the interest for all the parties, its threat is still larger than that of the former types.

Table 2 can summarize the above analysis. It can draw the conclusion that in post-quota period, non-tariff barriers will become the main means and its general purpose is to restrict the imports from China. The regional barriers are the greatest threat but have difficulties in the implementation, therefore Barriers Based on WTO Rules and Technical Barriers would be used more frequently in recent years.

TABLE 3: THE CONTRAST OF THE QUANTITY AND PRICE AROUND THE IMPLEMENTATION OF THE SPECIFIC SAFEGUARD MEASURE IN 2003

Category	The Imports from China			Pw (\$)		Pc (\$)	
	Qa	Qb	Qb/ Qa*100%	Pw0	Pw1	Pc0	Pc1
222(kg)	8,852,890	11,303,454	127.68%	5.65	5.51	4.46	4.37

Source: calculated on the basis of the data from U.S. Department of Commerce, Office of Textiles and Apparel

And secondly, it is to discuss the change of the prices. Table 3 shows the amount of the restricted products one year before the restriction from November, 2002 to October, 2003 to divide the quantity of that and the average price of one year before the restriction, taking 'P0' to represent it. And uses the amount from November, 2003 to October, 2004 to divide the quantity of that and gets the average price in the restricted year, taking 'P1' to represent it. It also takes 'Pw' to represent the average price of the imports from all over the world, while takes 'Pc' to represent the average price of the imports from China. The result shows that except the category 647, the average prices of the imports from all over the world descend to the different extent after the restriction and the highest margin of the descent reached to \$7.91. Therefore it can be considered that  $Pw1 < Pw2$ . Then as for the average prices of the imports from China, except he category 650, they are lower than that of the imports from all over the world, which is  $Pc < Pw$ . And after the restriction the average prices experienced the descent, which is  $Pc1 < Pc0$  and the highest margin of the descent reached to \$5.60. So it's obvious that the price after the restriction went down but not went up. That is to say the purpose of bringing up the price still didn't come true.

The above analysis shows that the forecasted purpose of the restriction in Nov.17, 2003 hasn't come true, which means the U.S. producers haven't or have just got a little gain from the restriction. The restriction can only increase the damage from distorting the trade and bring down the efficiency. To some degree, the result reflects the barriers to trade are unworthy. Barriers bring not only the damage to the export country that encounters the barriers, but also the descent of the welfare of the consumers in the import country while the degree of the protection for the local producers is very limited. Therefore, to abandon the barriers to trade, promote the free trade and return to the spirit of the WTO may be the best choice.

## China's Tactics

### The Fundamental Strategy is to Accelerate the Restructuring in Textile Industry

Now we mainly rely on the negotiations to resist these barriers. But this measure can only resolve the overwhelming urgency. If China's textile industry doesn't try to search the fundamental methods on the basis of self-examination, the negotiations will be meaningless and form such a situation: one friction has been just solved while another complaint arises. Therefore, China's textile industry should consider the causes of the complaints and accelerate the restructuring.

### Restructuring Should be Established on the Basis of Developing the Comparative Advantages

An unarguable fact is that China has a large number of abundant and low-priced labor forces. In 1999 IMF calculated the payment of manufacturing industries in some countries and areas from Asia and had a conclusion that the lowest average wages were paid in the mainland of China, which brought a overwhelming advantage in the aspect of the cost. Five years latter, this advantage is challenged by many new factors: some countries and areas from Asia and Caribbean also have abundant labor force resources; the economic development in China leads to an increase in payment. However the cost of labor forces in China will still have its comparative advantage in the long run as the result of the long-term policy of deflation in currency which brings a low rate of inflation, and at the same time China's supply market of labor forces just meets an unprecedented peak period. Some researches show that the average cost per operator hour, including social benefits, in spinning and weaving in 2002 was \$0.69 in the coastal

areas of China, compared with \$6.15 in Hong Kong, \$5.73 in Korea, and \$7.15 in Taiwan.<sup>8</sup> This advantage attracts more and more multinational corporations to invest in China. So China's textile industry should also take the advantage of resources and develop the comparative advantage in the aspect of the cost of labor forces. Therefore restructuring in textile industry doesn't mean to cast aside the original advantage, but to restructure on the basis of developing it.

#### **The Key of Restructuring is to Change Comparative Advantages into Competitive Advantages**

A typical characteristic of China's textile industry is to rely on the abundant and cheap labor force, which is purely depended on the endowment of natural resources. However the endowment of natural resources is of static, which is not enough to form competitive advantages. Competitive advantages include not only the price but also the factors of brand, quality, technology, culture and so on. These factors are the key ones deciding whether a product would survive or not. But nowadays the success of Chinese enterprises just purely relies on cheap price gaining little benefit and easily causing the trade frictions. So Chinese enterprises should put the key of resources on transferring comparative advantages to competitive advantages.

#### **Chinese Government's Tactics**

Although the key to solve the problem is the restructuring of China's textile industry, it also requires Chinese government's efforts to cope with the trade frictions.

#### **Negotiate Positively to Coordinate the Difference in the Method of Statistics between China and the U.S.**

It is one of the important factors that the trade deficit between China and the U.S leads to the friction in textiles. It's true that there exists the trade deficit, but the gap that is estimated by the U.S government is much larger than that estimated by Chinese government. It's the difference in the method of statistic that leads the U.S government to seriously overestimate the trade deficit, and then leads to the surficial unbalance in interests. Therefore it requires Chinese government to negotiate with the U.S government positively in order to coordinate the rules of statistic. But it is easier to say than do. The Chinese government and trade delegations have been negotiating positively with the U.S. government but the result is not so optimistic. There are mainly two handicaps: one is that the U.S. hasn't admitted that China is a marketing economic country and doubts the truthfulness of China's method of statistics and data, the other is that China's data lack of transparency and the supervisory system and the public is difficult to find the detail data. Therefore Chinese government should negotiate with American government and fight for the widely approval of China's marketing economic position in the international society with demonstration and revolution, besides Chinese government should public the data in time to make it transparent.

#### **China should carry out the Promissory of the WTO Accession Package**

It is clear that the friction in the textile and clothing trade is just one part of China-U.S. trade frictions because China's accession brings up the trade frictions for China as well as the increase in the amount of trade. It is certain that China, as a great trade state, would attract more attention from other partners. At the same time, the large trade deficit every year also brings a great pressure for American government, who should also face the pressure from its local groups calling for some effective measures to Chinese exports. The dispute in the field of textile and clothing is just the epitome of this pressure. In that case each relative group would focus on whether China can carry out the promissory of the WTO Accession Package. If Chinese government can execute that, it will bring more trade chances for China instead of frictions. On the contrary, if Chinese government cannot, it would not only bring down the trade chances, the more serious thing is to cause a large influence on China's whole economy.

# **China-Thailand Business: The Increasing Internationalization of a Relationship**

*John Walsh*

*Shinawatra International University, Thailand*

## **Abstract**

Although Chinese migrants have been living in what is now Thailand for hundreds and perhaps thousands of years, the level of economic exchange between the two countries remained limited. Migrants might have become involved in import and export and in trade with China and elsewhere, while others traded on their labor, yet businesses formed in Thailand did little to increase the level of interaction between the two countries. More recently, the institution of the Open Door policy and economic liberalization in China has made it much more possible for inward and outward investment into and out of that country. Further, the improvements in IT and related technology make it much more convenient to operate international business operations remotely. As a result, cross-border economic activities between the two countries have both deepened and widened. Chinese-Thai companies such as CP Foods have led the way in the internationalization of the Thai economy through expansion to China. These activities will be vital as the country searches for ways of creating better value added and branded products. Based on a program of qualitative and quantitative research, this paper investigates the changing nature of these interactions and highlights the economic impacts that they have had both in Thailand and China. The challenges and successes that organizations from both sides have faced are evaluated and lessons are drawn for management practice. The impact on labor markets will also be considered, with special reference to the Chiang Rai area of northern Thailand, where longstanding cultural contacts have developed into extensive Chinese investment in the region. Government policy options will be considered in both Thailand and China in the light of these findings.

## **Introduction**

China and Thailand are neighbours and have a long history of economic interactions, as well as political interaction and migration from north to south. However, lack of accurate historical data, for various reasons, means that much of this interaction is poorly understood and, where there is lack of understanding, there is a greater chance of inefficiencies and inequities. This paper seeks to spread some light on current Thai-Chinese business activities with the hope in part of reducing the possibilities for such inefficiencies. The focus is on the historical perspective of the interaction and the current nature of foreign direct investment by Chinese firms in Thailand, particularly in the northern region around Chiang Rai, as well as Thai investment in the southern Chinese province of Yunnan, which is the closest to Thailand in terms of both geographic and psychic distance.

This paper reports on work in progress concerning an ongoing research project dealing with the Globalization of the Thai Economy and Society. This project aims to provide immediately useful information both for academics and for practitioners.

In the next section, the historical perspective of Thai-Chinese economic interaction is discussed, together with current modes of border and riverine trade. This is followed by a discussion of the benefits and implications of hosting foreign direct investment and then evaluations of the prospects for investment within the two studied areas.

## **Historical Context**

The Chinese have been active in the Thai economy for many centuries. Their roles have been critical in leading development in various ways but this has in many cases made them unpopular and the potential victims of xenophobia, especially during times of economic downturn. The large Chinese community in Thailand has become one of the most integrated into an overseas society of all overseas Chinese communities. Many Chinese have intermarried with Thais and have taken Thai names. No political party has been formed specifically to represent

Chinese interests and, in recent years, Chinese have been assuming leading positions in many political parties (McCargo and Ukrist, 2005, p.4). This has represented something of a change from previous prominence in business but not state-level politics.

Chinese have been present in mainland Southeast Asia from probably around the C6<sup>th</sup> CE and individual travelers would have passed through even earlier. The Chinese diplomat Chou Ta-Kuan noted the presence of Chinese migrants in the Khmer empire at Angkor in the C13<sup>th</sup> and observed how they enjoyed the leisurely pace and ease of life (Chou Ta-Kuan, 1993, p.). The Chiang Mai Chronicle, among tales of Chinese bandits and invaders, also includes vignettes of Chinese living in Siam, as it then was, with mixed fortune. In the 1460s, for example, King Borommaracha hired a Chinese Muslim to poison some rivals, which ended badly for the would-be poisoner, who ended up being thrown into a river to die (Wyatt and Aroonrut, 1998, pp.100-1). Subsequently, after the burning of Ayutthaya by the Burmese in 1767, the founder of the Rattanakosin era, King Taksin, was the son of a Teochiu Chinese father. From the Ayutthayan period onwards, Chinese had been of central importance in regulating and conducting international trade. By accepting tributary status to China, Siam had enabled trade with the empire but still required Chinese traders to gain access to many otherwise-closed ports. Chinese officials administered Siamese international trade, to a large degree, and Chinese supervised the building of junks in Siam.

Under King Rama III, a new economic system was introduced to raise state revenues entailed Chinese being divided into two entrepreneurial groups, one of which involved tax farmers, who had the opportunity to run monopolies in opium houses, liquor shops and gambling dens. Tax farmers worked under a royal contract under which they were required to submit a portion of taxes collected from tenants to the crown. A second group consisted of merchants involved with mostly domestic trade and international trade too, to a lesser extent. European traders were obliged to rely on Chinese compradors to complete their trade activities. Chinese merchants in both groups took opportunities to move into the rice milling industry (Gambe, 1999, p.101). Chinese were awarded these privileges until the death of King Chulalongkorn (Rama V, the Great), after which they became subject to various forms of state and royal persecution as being considered to be exploiting their privileged positions.

The numerical dominance of the Teochiu Chinese has continued, with the largest proportion of Thai Chinese still originating in that region. Other Chinese derive from Hainan Island or are Fukien or Hakka dialogue speakers. Migration from China to Thailand topped 100,000 per year in early years of the twentieth century, with many being ship deck passengers aiming for the tin and rubber industries in the South of Thailand and others joining related Chinese-owned ventures in urban areas, mostly Bangkok.

Currently, Chinese cultural traits are declining in importance in Thai Chinese to only a limited extent and quite slowly. Younger generations are starting to think in terms of studying English rather than Chinese, for example. This has also affected the importance of Chinese connections in doing business, although these too retain significance. At the same time, prejudice against Sino-Thais from other Thais has been declining in vehemence and it is now inconceivable that laws promoting ethnic discrimination could be passed in the Kingdom. Some personal bigotry continues to be expressed but this too is lessening as understanding of the dangers and problems caused by racism infuses Thai society.

Sino-Thais in economic life are most commonly represented as rice millers and merchants and, while there is a basis of historical fact to this representation, it is now no longer accurate.

“Although until very recently Sino-Thai have been stereotyped as shopkeepers without an interest in manufacturing investment, we can often trace the roots of local industry in Thailand to modest beginnings by local Chinese a generation or two ago” (Ueda, 2000).

Diversification of interests together with efficient business practices and the use of personal network connections have enabled some Chinese to become leaders and managers of large and internationalized business concerns. Some of these concerns have undertaken activities of various sorts in China and others are set to do so in the future. The choice of China as a resource- or market-seeking location has been determined partly by geographical location, partly because of personal and network connections and partly by other considerations. However, not all Sino-Thai corporations have been uniformly successful. Many were implicated in bad practices during the 1997 financial crisis, especially with respect to substandard risk management policies (Brown, 2000).

## Mekong River and Border Trade

Historical patterns of both caravan trade and guanxi are evident in the border trade linking Thailand and China. This has occurred for centuries and frequently involves ethnic minority groups such as the Akha as intermediaries and instigators (Toyota, 2000). The large communities of Muslims in Yunnan province, many of whom derive from the large-scale importation of Muslim officials resulting from the Mongol conquest, also are influential in maintaining the ancient caravan routes from Kunming to Chiang Mai and elsewhere (Berlie, 2000).

Accurate figures for the border trade that occurs here are hard to obtain, not least because of the informal or unofficial nature of much of the activity. Most goods exchanged are low value-added manufactured items, which are then retailed in periodic markets throughout the area. However, this form of trade is now being supplemented and in some cases superseded by the large scale movement of Chinese fruit and vegetables made possible both by the signing of a free trade agreement between the two countries and the building of a new road through northern Laos that which has gone some way towards rectifying the problems with infrastructure linking together the nations of the region.

TABLE 1: BORDER TRADE IN YUNNAN, 1999-2000

Year	Total of imports and exports (RMB million)	Imports (RMB million)	Exports (RMB million)
1990	1,079	676	336
1995	1900	969	932
2000	2,949	2,302	647

Source: Yunnan Statistical Yearbook 2001 (in Chunkai and Zhilong, 2004, op.cit.)

The informal nature of much of the border trade has led to the presence of unofficial workers and to the association with crime of various sorts. Unregistered workers suffer from potential exploitation and the lack of access to government support services when needed. Indeed, those ethnic minority hilltribes people who wish to settle in Thailand have experienced great difficulty in obtaining official identity papers and, hence, have been subject to occasional harassment as well as being unable to obtain services. The problem with crime relates not just to the long-established smuggling of narcotics but the more recent creation of human trafficking networks, largely involving the provision of Chinese women into the sex trade in Thailand and further afield.

An additional issue to be considered is the environmental impact of the Mekong river trade. To enhance the amount of trade possible, Chinese authorities have been blasting upstream rapids to permit larger vessels to carry cargo. It is not clear exactly what impacts this will have downstream but it is unlikely to be beneficial to the many thousands of people who rely on the Mekong for sustenance and livelihood. Damming the river upstream, which is also under development, will also have negative impacts further downstream.

## The Role of Foreign Direct Investment in Promoting Regional Economic Development

Inward foreign direct investment (FDI) has long been accepted as an important possible tool for stimulating regional economic development. However, many states have evinced a reluctance to accept such FDI for fear of loss of economic sovereignty and the transfer of resources overseas. In the context of a history of colonial oppression, it is perfectly reasonable for many states with a long and bitter history of exploitation by overseas powers to be wary of permitting large-scale inward investment. To manage such investment, states have in some cases attempted to isolate or quarantine the effects of FDI by limiting it to specific areas, to specific industries or permitting it only to representatives of particular, privileged overseas states.

In China, for example, the well-known policy developed to a large extent by Jiang Zemin featured the identification of Special Economic Zones (SEZs) in coastal areas where overseas firms could establish commercial and production bases. By limiting zones spatially, it was believed that learning the required management and technical skills necessary to provide successful local economic development could be effected incrementally and

then transferred to other parts of the country. The areas selected to be part of SEZs were generally those with a history of international trade and with strong links between local people and overseas Chinese who could utilize guanxi links to promote co-operation (Chen, Chang and Yimin, 1995). Guanxi is a term implying a personal network connection uniting two or more people deriving from such sources as family membership, common origin in a village or membership of the same alumnus association. Although lessening in importance as western business methods become more prevalent, guanxi is still a significant part of business practice in China and throughout East Asia, since the network connection denotes a higher level of trust and hence lower transaction costs and therefore is considered to be an efficient business practice.

FDI promotes local economic development through such impacts as:

- Direct employment and upgrading of skills and income of local people. Some workers are subsequently able to establish their own enterprises as a result of skills learned and income earned;
- Spillover effects and externalities. These terms refer to the otherwise unanticipated effects of hosting FDI and are divided into the positive and the negative. Positive effects include the improvement in skills and professional attitude and ability acquired by workers in FDI ventures and in their suppliers and other partners. They also include the additional income generated in the area for third parties. Negative effects include maldevelopment effects associated with overseas ownership and migrant workers and the possibility that local industry will be strangled by the presence of more efficient overseas competitors, who will therefore be able to soak up all available investment and skilled scarce inputs;
- Changing the nature of traditional production patterns to utilize newly perceived competitive advantages or to use existing ones in new ways. Workers may be taken away from agricultural production to work in low-skilled and comparatively lowly-paid factories, for example or, else, are moved from the same agricultural production into more highly value adding production using the same inputs (prepared frozen chicken meals as opposed to unprocessed chicken).

In any case, it is important to bear in mind that government has a vital role to play in maximizing the benefits available from hosting FDI and minimizing the negative effects. The exact nature of government intervention continues to be a contested issue but one possible summation is as follows:

"... create and effectively communicate to their constituents a distinctive and challenging economic vision .... Ensure that the institutions responsible for translating that vision into reality are both willing and able to adjust to the changes required of them by a learning and innovation-driven economy ... ensure that the availability, quality and cost effectiveness of general purpose inputs match up to the standards of their global competitors ... create and sustain an institutional framework and ethos that facilitates a continuous upgrading of the resources and capabilities within its jurisdiction ... do everything to encourage and nothing to impede the formation of micro-regional cluster development (Dunning, 1997)."

The extent and nature of government policies to support FDI in Thailand and in Yunnan Province of China will be described in the next section.

## **FDI in Thailand**

Recognizing the historical importance of continuing trading links between northern Thailand and Yunnan province in China and other provinces, the Thai government has recently announced plans to upgrade the infrastructure in that area to promote further inward Chinese investment. Approximately 1.35 billion baht has been allocated to Chiang Rai province and some 256 million baht to neighboring Tak province (Supamart, 2005). Chinese businesspeople have already taken advantage of benefits flowing from the Thai-Chinese Free Trade Agreement to establish operations in the area, particularly near to the Mekong River at Chiang Saen. It is reported that a score or so of Chinese men have married local Thai women, with the main purpose of such marriages being to register businesses in the wives' names and thereby obtain a greater level of benefits (Subin and Thirawat, 2004). Thais are sending their children to school to learn to speak Mandarin to be able to become involved in this investment, which is largely focusing at present on the import and export of comparatively low value produce such as fruit and vegetables. An

influx of low cost Chinese vegetables and fruit has already required many Chiang Rai and other northern farmers to abandon their traditional agricultural patterns to search for more competitive goods.

This form of investment is useful for the local economy but there are opportunities for the government to upgrade the level and quality of further investment so as to help provide better employment opportunities for local people and more value-adding opportunities for local businesses. Chiang Rai and the north are among the poorer regions of Thailand, largely as a result of the lack of infrastructure and distance from large urban centers.

TABLE 2: WAGE RATES IN CHIANG RAI AND THAILAND

Region/Province	Minimum Wage per day (baht) <sup>1</sup>	Average daily wage (baht/day)	Average monthly wage (baht/month)	Average wage (baht/month)
Whole Kingdom	-	163.9	8,665.1	6,445.7
Bangkok	170	195.3	11,176.8	9,445.1
Northern Region	-	140.1	5,255.6	4,125.5
Chiang Rai	133	117.6	4,384.7	3,658.5

Source: Report on Analysis of Wages, Earnings and Working Hours 2002, Department of Labor Protection and Welfare, Ministry of Labor.

Local people have not greeted the arrival of the Chinese with unalloyed joy. In addition to concerns arising from the FTA, local people have voiced concerns that they may be frozen out of local business networks.

Plans are underway to create a second river port in Chiang Saen in the Golden Triangle region, the better to accommodate the 3,000 ships visiting from China. Plans to upgrade rail and road links (also including northern Myanmar [Burma]) are also underfoot. Tea plantations will be doubled in size while their will also be significant investments in high-technology production and facilities for a duty-free zone and commodities city (Gagliardi, 2004).

---

BOX 1: BOARD OF INVESTMENT INCENTIVES FOR INVESTMENT IN THAILAND

The Kingdom of Thailand is divided into three zones for the purposes of inward investment. Zone 1 consists of the capital Bangkok and five surrounding provinces. Zone 2 consists of other provinces close to Bangkok in central Thailand, while Zone 3 consists of the remaining 58 provinces of the country, divided into two broad areas.

All provinces in Zone 3 receive the following incentives:

Exemption of import duty on machinery

Corporate income tax exemption for 8 years provided that a project with capital investment of 10 million baht or more (excluding cost of land and working capital) obtains ISO 9000 or similar international standard certification within 2 years from its start-up-date, otherwise the corporate income tax exemption will be reduced by 1 year

**Note: The total amount of corporate income tax holiday is capped at 100% of investment capital.**

Exemption of import duty exemption on raw or essential materials used in the manufacturing of export products for 5 years

In addition, Chiang Rai and other provinces in one of the two broad divisions within Zone 3 also receive the following incentives:

(1) A project located within industrial estates or promoted industrial zones is entitled to the following privileges:

(1.1) 50 per cent reduction of corporate income tax for 5 years after the exemption period;

(1.2) Double deduction from taxable income of transportation, electricity and water costs for 10 years from the date of first revenue derived from promoted activity;

(2) For a project located outside industrial estates or promoted industrial zones, a deduction can be made from net profit of 25 per cent of the project's infrastructure installation or construction cost for 10 years from the date of first sales, and net profit for one or more years of any year can be chosen for such deduction. The deduction is additional to normal depreciation.

---

In addition to these formal incentives, the BOI also offers various benefits such as a one-stop service and assistance with work permit procedures and the like.

Source: BOI, Board of Investment Privileges by Location, downloaded from: [http://www.boi.go.th/english/about/boi\\_privileges\\_by\\_location.asp](http://www.boi.go.th/english/about/boi_privileges_by_location.asp)

FDI in Thailand has maintained a good level and was projected to increase at the end of 2004 into 2005. Investors still retain confidence in the Kingdom as one of the most stable and business-friendly in the region (see **Error! Reference source not found.**). However, a number of issues in the closing months of 2004 and beginning of 2005 will pose renewed threats to that stability and the perception of it. The recurrence of avian influenza ('bird flu') has raised further questions about the hygiene levels in much of Thai agro-industry, while the tsunami disaster followed by high profile subway and speedboat accidents have cast doubts about security. The continued violence and unrest in the South of Thailand as some separatists continue to make their unwelcome presence felt is also a potentially disruptive influence.

Nevertheless, the Board of Investment (BOI) continues to attempt to streamline its operations and to improve its list of inducements to potential foreign investors. Services now account for around 70% of all inward flows of investment and, as well as traditional sectors such as trading and financial services, business services, telecommunications and electricity are all showing more prominence (Chatrudee, 2004).

TABLE 3: INVESTMENT START-UPS IN THAILAND, 2003 AND 2004

		2003 (Jan-Nov)			2004 (Jan-Nov)	
	No.	Thai reg.	Foreign Reg.	No.	Thai reg.	Foreign reg.
Total Investment	228	22,699	13,818	256	30,767	16,024

## FDI in Yunnan Province of China

Yunnan province occupies the southwestern part of China. It ranges from the mountainous Tibetan plateau through the plains areas around Kunming and Dali down to the semi-tropical region of the Xishuangbanna (Sip Song Pan Na). It is home to many of the ethnic minority peoples of China and, according to some scholars, is the original home of the Tai peoples who migrated south over a period of centuries to form the state of Siam. Certainly there are many ethnic Tais still living in Yunnan and the linguistic and cultural similarities are very apparent.

As a region, Yunnan has only been closely integrated into the Chinese state in comparatively modern times. Although it was incorporated within its bordering its entirety when the Mongol armies destroyed the Kingdom of Nanchao which had previously held sway there, it was not until the late years of the Qing dynasty before it really became bound closely to the centre. Partly as a result of this, economic development in Yunnan has lagged behind other regions and it has remained a largely agricultural society, together with industries extracting resources. However, during the economic reform period of China's history since 1978, Yunnan's growth and development have been rapid, if uneven and its GDP has been increasing at an average rate of some 9.9%.

There have been three stages of reform and growth since 1978. Firstly, from 1978-84, attention was focused on rural reform and the improvement of conditions in all forms of existing industry. This continued in the second phase from 1985-1991 but was also accompanied by great fluctuations in growth and inflation as rising incomes led to higher expenditures but with resource allocations still being conducted by central planning there were, inevitably, supply and demand mismatches. Since 1992, official permission of and encouragement for the marketisation of society has reduced the problems with supply-demand mismatches and, consequently, economic growth has followed a smoother trajectory (Chunkai and Zhilong, 2004).

Despite this growth, Yunnan has still found it difficult to attract much inward FDI. The continued low level of infrastructure in the province combined with the high transaction costs of dealing with the bureaucratic provincial authorities have tended to make it a low priority for potential investors. However, its large and productive agro-industries make it a possible target for Thai firms wishing to leverage their knowledge and skills in terms of large-scale agro-production, distribution and marketing.

---

#### BOX 2: CASE STUDY: CPF: CHAROEN POKPHAND FOODS PLC

Charoen Pokphand Foods PLC (CPF) is one of the largest Thai companies. Its main activities involve a diversified range of agricultural food products, which are exported from Thailand. Over the last few years, overseas operations have been established, to take advantage of local assets and also to avoid problems with accusations of dumping and hygiene concerns within the Thai industry.

According to the 2003 annual report, 6% of total sales were accounted for by overseas operations, more than 80% of which resulted from a US broiler facility. The company was first established in 1978 and grew to be floated on the Stock Exchange of Thailand on 1987. The first international subsidiary to be created was Charoen Pokphand (USA) Inc, in 2000, with Aqua Beauty, Inc. created as a distribution arm for seafood products in the USA the following year.

Six subsidiaries were established in 2002, two of which were in mainland China: CP Aquaculture (Beihai) Co., Ltd., manufactures and distributes aquatic feed in China as well as operating aquaculture farms; while CP Food Product (Shanghai) Co. Ltd., operates Thai restaurants on the mainland. In 2003, CP Aquaculture (Hainan) Co., Ltd., was established to produce and distribute animal feed in China and other investments were made in India and Turkey, as well as Europe and the USA.

Thai management knowledge and technical can be applied to natural resources and market demand in China. The personal connections between CP managers and Chinese officials facilitate this connection.

---

The Thai Prime Minister Thaksin Shinawatra has on many occasions expressed his belief in the importance of China for the future of the Thai economy and, indeed, in the economy of the region in the future. His company, Shin Corp, has arranged co-operative deals with the China Railway Communication Asia Pacific (CRC-AP) to work together with international telecommunications (McCargo and Ukrist, 2005, p.58). Subsequent agreements have led to Chinese firms taking a bigger ownership and leadership role in the Thai economy. Nevertheless, there is still great scope for further interdependence.

## Conclusion

Future research will shed light on the Chinese investments in the Chiang Rai region and issues of international business development resulting from that. This investment is very likely to have an impact on labor market issues and may necessitate some restructuring of the vocational education system to provide human resources more closely associated with the types of skills and competencies required by Chinese owned firms. At the same time, research

will also be conducted into the issue of Thai investment in China and, similarly, the issues and problems faced by Thai owned corporations in seeking to become established there.

This relationship between China and Thailand is a vital and dynamic one in a part of the world exhibiting long-term economic growth and understanding it better should provide many useful lessons for application elsewhere.

## Development of Foreign Exchange Market in Slovakia

*Róbert Bohyník*

*Jozef Komorník*

*Comenius University in Bratislava, Slovak Republic*

*Magda Komorníková*

*Slovak University of Technology in Bratislava, Slovak Republic*

### Abstract

This paper describes Slovak Foreign Exchange Market (Forex). As the conducted research found out, the market underwent significant development not only in term of volume but also the diversity of derivatives. They have a significant role in the process of the currency risk redistribution among market players with different objectives and attitudes towards risk. Further development of the market is however limited by the steps that Slovak government and National bank of Slovakia (NBS) take on the way towards European Monetary Union (EMU). In an appendix to the paper we applied modern techniques of time series analysis (regime - switching models) to the series of the exchange rates EUR/SKK in the period January 1993 – December 2004 that exhibits two dramatic changes of behaviour, the first one following a complete change of Slovak government coalition after the elections in 1998 (and subsequent substantial changes of monetary strategies of the Slovak National Bank) and the second one accompanying the country's accession to the European Union in 2004.

### Introduction

Slovak Forex market underwent significant development from the beginning of its existence in 1993. Rigorous measures of transactions and conversions of Slovak crown vs. Major currencies (i.e. USD, DEM, GBP) were step-by-step liberated together with the rules and direction of the monetary policy designed and executed by NBS. From rather strict USD and DEM (later EUR) currency basket to rather flexible management of Slovak crown (SKK) exchange rate vs. EUR that is in place these days. These changes (among others) gave an impulse to the financial market participants and they started to trade currency derivatives with SKK.

Slovak Forex market is very small in comparison to the market of other V4 countries (Poland, Czech Republic, Hungary) as we can see in table 1. This fact is derived from the size of the „real“ economy and amount of necessary conversions done by Slovak entities as well as from the demand of foreign investors and their “hunger” for financial assets denominated in Slovak crowns.

TABLE 1: DAILY VOLUME OF SPOT TRANSACTIONS ON FOREX MARKET IN V4 COUNTRIES

Country	Daily volume - Spot Transactions (in mil. USD)
Slovak Republic	153
Czech Republic	1000
Hungary	500
Poland	8000

Source: Monetary Survey of NBS and ČNB, BIS Forex Market Activity Data<sup>1</sup>

Despite the small size in comparison to its neighbors the growth of volume of derivatives transaction on Slovak Forex market in last five years was dynamic as we can see from the data in table 2. This growth is in our opinion driven by two significant factors. By the growth of foreign direct investments and growth of export capacity of the economy on one hand and by growing attractiveness of financial instruments denominated in Slovak crowns after the lift of credit rating of Slovakia to investment grade level on the other.

TABLE 2: DAILY ACTIVITY ON SLOVAK FOREX MARKET

	2004*	2003	2002	2001	2000
Total Number of Transactions	180	175	150	120	100
Total Volume (Spot, Forward and Swap Transactions in mil. USD)	1767	1540	920	420	282
Volume of Spot Transactions (in mil. USD)	153	136	117	59	45

Source: Monetary Survey of NBS<sup>11</sup>

**Shortcomings of the Market (Market Inefficiencies)**

While the trading of SKK derivatives grows over time driven by the factors mentioned above, there are nonetheless two significant issues that players on the market have to take into account. First, there is liquidity issue driven by the fact that the vast majority of SKK derivatives' volume is traded during European trading hours, while other V4 currencies are at least partially liquid also during New York trading hours as can be seen on Picture 1.

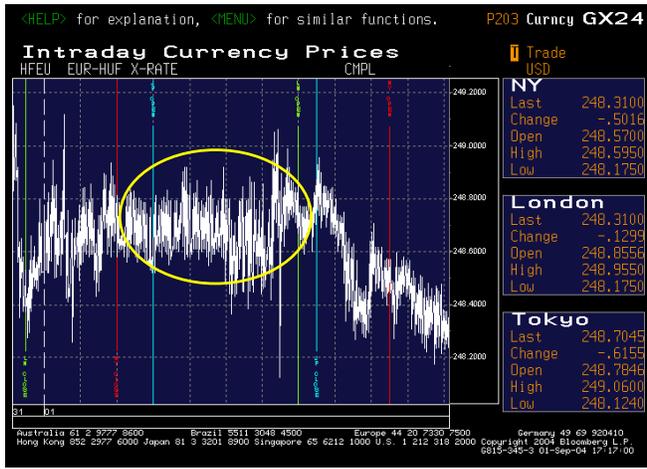

EUR/SKK

EUR/CZK

EUR/HUF

EUR/PLN

FIG. 1: 24 HOURS INTRA-DAY QUOTES OF V4 COUNTRIES' SPOT RATES

Secondly, SKK derivatives are not traded over different electronic platforms. Majority of simple spot transactions are traded over Reuters electronic trader and there is a possibility to trade SKK vs. other major currencies via EBS Trader system, while diverse crosses of other V4 currencies can be traded via various electronic platforms (i.e. Saxo Trader – web based platform of Danish Saxobank).

Third issue is small number of local market makers. Most Slovak banks play only the role of intermediaries, only some of the make market for spot, forward or swap transactions. (3 major local banks trade 90% of SPOT transactions' volume). While there is market for simple derivatives, the market for structures or exotic options is virtually non-existent. This means that there is no reliable benchmark for prices' quotations and creates opportunities for interbank players to execute arbitrage trades. Table 3 compares spreads on OTC at the money plain vanilla options' volatilities across the V4 countries. The size of implied volatility spread is almost 3 times higher on EUR/SKK volatility than on EUR/PLN implied volatility and it clearly shows how much inefficiency there is on the market.

TABLE 3: IMPLIED VOLATILITY OF THE PLAIN VANILLA AT-THE-MONEY OPTIONS<sup>iii</sup> EUR VS. V4 CURRENCIES

	EUR/PLN				EUR/CZK			
	bid	ask	ask-bid	(ask-bid)/ask	bid	ask	ask-bid	(ask-bid)/ask
1W	7,60	9,20	1,60	<b>17%</b>	4,55	5,95	1,40	24%
1M	8,35	9,15	0,80	<b>9%</b>	5,05	5,75	0,70	12%
2M	8,90	9,70	0,80	<b>8%</b>	5,25	5,95	0,70	12%
3M	9,25	10,00	0,75	<b>8%</b>	5,50	6,15	0,65	11%
6M	9,75	10,40	0,65	<b>6%</b>	5,70	6,25	0,55	9%
9M	9,95	10,55	0,60	6%	5,80	6,35	0,55	9%
1Y	10,05	10,65	0,60	6%	5,80	6,35	0,55	9%
	EUR/HUF				EUR/SKK			
	bid	ask	ask-bid	(ask-bid)/ask	bid	ask	ask-bid	(ask-bid)/ask
1W	6,00	8,00	2,00	25%	2,50	4,50	2,00	<b>44%</b>
1M	7,20	8,20	1,00	12%	3,60	4,60	1,00	<b>22%</b>
2M	7,75	8,75	1,00	11%	3,70	4,70	1,00	<b>21%</b>
3M	8,05	9,00	0,95	11%	4,05	5,00	0,95	<b>19%</b>
6M	8,85	9,65	0,80	8%	4,60	5,40	0,80	15%
9M	9,00	9,80	0,80	8%	4,75	5,55	0,80	14%
1Y	9,05	9,80	0,75	8%	4,85	5,60	0,75	13%

While there is clearly the chicken and egg question of whether there are no market makers for respective instrument because of no clients interest in trading it or there are no clients interested in using respective instrument for trading or hedging purposes because of no market makers, the following results of the research conducted in Slovak banks (intermediaries of derivatives trading and advisors to corporate clients) as well as in Slovak corporate sector (hedgers of currency risk) shows that SKK derivatives and their use already grab attention of diverse market participants and it is evolving, in our opinion in the right direction.

#### Supply of Forex Services

Slovak Forex market is organized as an interbank OTC market and is part of global OTC Forex market. Slovak banks (due to their size and activities of parent companies) play mostly the role of an intermediary for their corporate, institutional as well as individual clients. This means that (apart of some exceptions) they do not have significant currency risk exposure. Currently Slovak clients have an access to full scale of currency derivatives on so called major currencies (USD, EUR, JPY, GBP, CHF, AUD etc.) and the supply of currency derivatives on SKK is growing too. Spot, forward and swap transactions are standard operations as well as plain vanilla options and some more advance derivatives (binary or barrier options).

If required some of Slovak banks are able (via their parent companies' branches in London, Vienna or Milan) to provide their clients the possibility to trade structured derivative transactions. What one can observe across the whole Slovak market is growing activity of respective banks and their efforts to expand their services in this area.

The aim of the research conducted in Slovak commercial banks was to find out what is current scope of services in comparison to the services year ago. The research was conducted in the form of standardized questionnaire and responses were collected in August 2003 and 2004.

The Table 3 shows that results of the research strongly confirm positive development in the area of services provided by Slovak banks to their clients in the following areas:

- Market research and analysis reports provided to clients on regular (daily, weekly, monthly) basis
- Broader supply of various currency derivatives (binary, barrier options and various structures)
- Active search for possible client, communication and advisory services in the area of the currency risk management.

Above mentioned activities can be seen across the whole market not only among the biggest Slovak banks (Slovenská sporiteľňa a.s., VÚB a.s. a Tatra banka) and those historically focused on corporate clients on the Slovak market (ING Bank, Citibank Slovakia a.s). Moreover, in the first half of this year some banks introduced structured investment products that were constructed via SKK currency derivatives for retail clients that were given an opportunity to participate on attractive yields once the strategy the product followed went correctly while the loss (in case an investor was wrong) was limited to the accrued interest of the initial deposit. **Results of this qualitative research indicate that there are attractive opportunities on Forex market on such small markets as is the one in Slovakia.**

#### **Market Participants**

Apart of bank there are other financial intermediaries that provide Forex investment services to Slovak clients and they can also trade basic transactions via internet-based brokers or banks (i.e. Saxo Trader product of Danish Saxo Bank).

When considering clients active on Slovak Forex market, there are two strong and significant groups: hedgers - corporate clients who are trying to protect their extra cash flows and fixing the exchange rate of Slovak crown vs. other currencies (mostly EUR and USD) and financial investors (or speculators) – mostly international institutional investors who are entering the market in order to profit from the volatility or interest differential between SKK and other currencies, or both.

#### **Demand for SKK Derivatives**

There are two majors groups of SKK derivatives' users – hedgers and speculators, those who need to get rid of respective risk and those who are willing to undertake specific risk for some premium. As the demand for respective derivatives arises from hedgers, intermediaries are trying to match them with financial institutions in order to provide them with an opportunity to hedge their risks.

Due to the fact that Slovak economy is very small and open, majority of corporate sector is sensitive to currency risk in some way and it is assumed that the demand for investment services connected to the currency risk management is high. While this was not the case for some time in the past (due to development of the financial market) it is one of the important topics of recent period. Favorable development in Slovakia led to SKK appreciation and exporters face their revenues decline and costs rise in SKK terms.

In following lines we present results of the research focused on currency risk management and use of SKK derivatives in major non-financial Slovak companies presented. Results are based on data from 129 of 200 biggest companies in Slovakia in terms of revenues in the year 2003. Slovak Banks' Supply of Services in the Area of Currency Derivatives 2003, 2004

**Explanatory Notes:**

- \* Binary Options, Barrier Options and Structured Strategies
- A The bank is providing respective service
- a The bank is in preparatory stage or considering providing of respective service
- N The bank is NOT providing respective service

### Value of Transaction in Other Currency than SKK

The need to focus attention of financial managers on currency risk issues is underlined by the fact that the share of transactions in foreign currencies is more than 50% of revenues value. There are significant differences in this ratio among different industries, the highest share of foreign currency transactions was in energy and metallurgy while the smallest in transport and construction industry.

EUR is the key foreign currency for more than 75% of companies followed by CZK and USD as shown in table 5. Data in the table do not take into account the volumes of transactions realized by respective companies it rather defines which currency is important for respective company.

TABLE 5: SHARE OF RESPECTIVE FOREIGN CURRENCY ON TRANSACTIONS

Foreign Currency	Share
EUR	75,9%
USD	6,9%
CZK	9,3%
Other Currencies	7,75%

Source: Authors' research

The share of EUR in volume terms is lower while the USD volume is higher than the abovementioned table suggests. It is driven by the fact that USD transactions in high volume are executed by small number of companies in respective sectors (energy, metallurgy).

### The Perception of Currency Risk

The perception of currency risk is not the same across the whole spectrum of companies. Following table underlines two significant patterns that seem to have an influence on this risk perception and management identified: i) size of the company and ii) share of foreign currency transactions on revenues.

TABLE 6: PERCEPTION OF CURRENCY RISK IN SLOVAK COMPANIES

Is the currency risk management an important issue for the company?	Yes	No
<b>All companies in the sample</b>	<b>79,8%</b>	<b>20,2%</b>
Top 20% biggest companies (by revenues)	87,6%	12,4%
Bottom 20% companies (by revenues)	69,2%	30,8%
Companies with the share of foreign currency transactions to turnover >50%	82,6%	17,4%
Companies with the share of foreign currency transactions to turnover <25%	64,2	35,8%

Despite the fact that managements of majority of companies claim that they perceive currency risk management as an important task, not all of them actually manage it. The research found that only two thirds of companies manage it directly or via the parent company/ within the group. Separate treasury divisions are domain of only a handful of biggest companies.

Of those companies that manage their currency risk financial manager executes respective transactions in more than 50% and surprisingly general manager is directly involved in hedging process in more than 13% of companies. This is driven by the responsibility and control mechanisms that are in place in respective companies. Positive finding is that in more than one third of companies, actively managing their currency risk exposure there are specialists who focus on this risk management and are trained by companies for that purpose.

## Derivatives in Use

While SPOT transactions are used by all companies (as they, in one or another way, use foreign currency) other instruments are not that much in use. Forward contracts (the simplest instruments for hedging future cash flows denominated in different currency) are used by less than 70% of companies and only about 27% of companies use plain vanilla currency option contracts.

Surprisingly, structured (and more sophisticated) contracts were used by 34% of companies. This confusing finding can be however explained by the fact that many companies used structured contracts in combination with money market products to profit from respective move of SKK vs. EUR or other currency (for example double no touch option in combination with deposit transaction, where the maximum potential loss is equal to the interest earned on underlined amount deposited).

Majority of transactions are executed with banks as counterparties, other financial institutions (brokers) are counterparty in only fraction of transactions. Apart from transactions execution Slovak companies hedging against the currency risk use research papers and various reports prepared by bank analysts for them and consult with their bankers their hedging strategies. Almost all companies use more than one financial institution for services connected with their currency risk management (research and analysis, strategy design, trade execution) as table 7 suggests.

TABLE 7: INVESTMENT SERVICES PROVIDERS

	No. of investment services providers
<b>All companies in sample</b>	<b>3,6</b>
Top 20% biggest companies (by revenues)	5,3
Bottom 20% companies (by revenues)	2,3
Companies with the share of foreign currency transactions to turnover >50%	4,8
Companies with the share of foreign currency transactions to turnover <25%	2,1

The research suggests that bigger companies and companies with higher ratio of foreign transactions tend to have more providers of investment services as they diversify credit risk via trading with more counterparties while smaller companies look more at the costs side of the hedging transactions.

## Conclusions

1. Despite the market for SKK derivatives is young and small the need to manage currency risk in an environment of strengthening SKK created opportunities for both hedgers and speculators as well as intermediaries.
2. Together with steady growth of volume on basic derivatives (forwards and swaps) the market for other instruments (options and currency structures) is emerging with its opportunities and higher degree of following risk:
  - a. Liquidity
  - b. Squeezing
  - c. Vulnerability
3. Improvements are driven by activity of market players who actually decrease abovementioned risks via exploring opportunities – first mover advantage, due to undertaking these risks. However possible improvements have to be accompanied by economic viabilities – activity must pay off – and one has to take into account that the SKK market is to be over in couple of years.
4. Slovak financial institutions are only middlemen in majority of Forex transactions but the level of their services has significantly improved over recent years as well as the portfolio of their services.
5. The perception of currency risk among corporate financial managers improved - the bigger the company and the more volume of its transaction is in the foreign currency, the more steps are taken in order to manage it. Still there are many of them who do not manage it properly or at all. EURO is in the centre of their radar screens due to number of transactions followed by the USD and CZK.
6. Majority of companies use banks for executing the strategy designed with advisors (not necessarily banks only).

## Appendix

The final part of this paper is devoted to an application of techniques of regime-switching models to the time series of the exchange rates EUR/SKK in the period January 1993 – December 2004 (Fig.1).

FIG. 1: TIME SERIES OF EXCHANGE RATES EUR/SKK

There has been a dramatic increase of the values of EURO (expressed in SKK), following the elections in October 1998 (and subsequent changes in government and in economic policies as well as in the monetary policy of the Slovak National Bank). This change is clearly demonstrated in the results of fitting in the regime-switching class. Another switch of the regime is indicated by the recent behavior of the modeled time series, when SKK has been appreciating in connection with Slovakia's EU accession and positive development of FDI. The second switch of the regime is not yet statistically distinguishable from random disturbances in the investigated series. It is however, strongly supported by macroeconomic arguments.

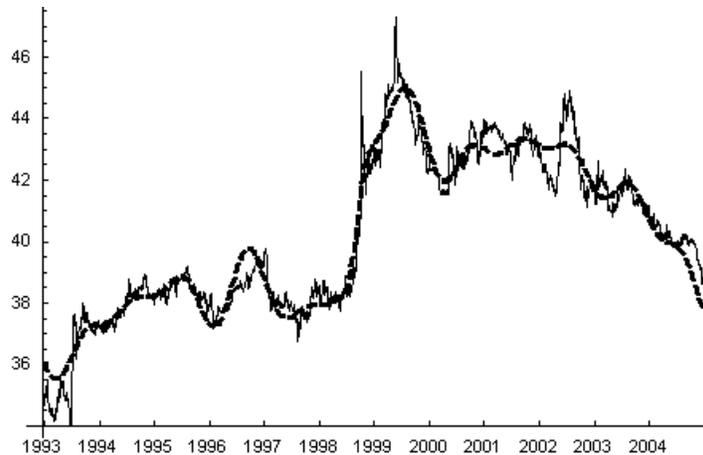

FIG. 2: RESULTS OF FITTING BY A REGIME-SWITCHING MODEL.

# Trade Openness and the Competitiveness of the Malaysian Electronics Sector: An Empirical Analysis

*Mahendhiran Nair*  
*School Of Business Monash University of Malaysia*  
*Karunagaran Madhavan*  
*Deviga Vengedasalam*  
*University Technology MARA, Malaysia*

## Abstract

**In this paper, the impact of trade openness on the Malaysian electronic sector in for the period 1970-2000 was examined. The Auto-Regressive Distributed Lag (ARDL) formulation was used to assess the impact of capital, labor and trade openness on the electronics output. The empirical results showed that the electronics output was co-integrated with labor, capital and trade openness. In the short run, labor and capital have positive and significant impact on the output of the electronics sector. In the long run, capital has a positive and significant impact on the electronics output. However, the trade openness has a negative and significant impact on the electronics Key strategies and policies to enhance the competitiveness of the Malaysian electronics sector are discussed in this paper.**

## Introduction

For the past four decades economists and policy makers have been debating the impact of trade openness on the economic growth. Some economists have argued that trade openness, i.e., reduction of trade barriers will promote export and increase the productivity through comparative advantage. Several empirical studies provide evidence that trade liberalization has a positive impact on economic productivity (see for example, Nishimizu and Page, 1982; Tybout et al, 1991 and Harrison 1996; Ghatak, Milner and Utkulu, 1997; Edwards 1998; Baharumshah and Rashid, 1999; Renuka, M. 2002).

A more recent study by Jayanthakumaran (2002) showed that trade openness and exposure to foreign competition have increased technical efficiency, increased importing capacity, thus industrial efficiency and reduced allocative inefficiency in developing countries. Alvarez and Fuentes (2002) showed that technical efficiency could be increased when the domestic firms compete in international markets. They also argue that when markets are protected, there is a tendency for monopolistic behavior. This can lead to inefficiencies in production.

Other economists have argued that economic growth is not solely dependent on open trade. They have argued that factors such as abundance of traditional factors of productions (land, labor, and capital), absorbability of the human capital in the country, innovative capabilities of the domestic firms, and the level of advancement of the infrastructure and institutions in the country are also important factors that will increase productivity and economic growth.

In many developing countries over the last two decades, the proportion of contribution of the electronics sector to the national output of these countries has been on an upward trend. Global demand for electronics goods during this period increased significantly. However, the numbers of suppliers have also increased over the same period. Thus, competition for global electronics market share has intensified over the years.

Malaysia a developing economy like many other developing countries embarked on an ambitious plan in the 1980's under Prime Minister Dr. Mahathir Mohamad to transform Malaysia into an industrialized economy. The 'Look East Policy' in the 1980s saw greater participation of the Japanese and Korean firms in the Malaysian economy. During this period, significant fiscal and non-fiscal incentives were provided by the Malaysian government to foreign firms to invest and develop the Malaysian electronics sector. Increased participation by the Japanese and Korean electronics firms resulted increased technology transfer between these firms and Malaysian firms. By the 1990s, Malaysia became one of the leading producers of electronics components and goods.

The electronics sector makes up a significant proportion of the manufacturing export of the country. Since the middle of the 1970s, the electronics sector has experienced significant growth compared to the other sectors of the economy (refer to Fig. 1).

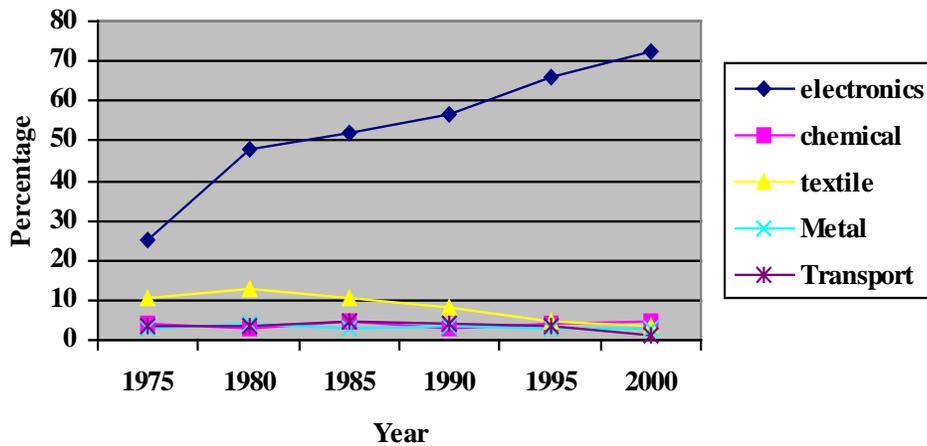

FIG. 1: MALAYSIA'S MAJOR MANUFACTURES EXPORT IN PERCENTAGE

The increase in export of electronics sector was attributed to the increase in all major sub-sectors such as semiconductor, electronic equipments and parts as well as electrical products. The top four major importers of Malaysian electronics goods are the US, Singapore, Japan and the European Union.

Since the 1980s the Malaysian electronics sector has attracted significant foreign direct Investment (FDI). Table 1 shows the sectors and the proportion of inflow of FDI into these sectors. Note that the electronics sector attracts the largest FDI into the country. In 2000 the electronics sector attracted 26.4% of the FDI into the country. Major sources of the FDI are from Japan, the NIEs-4 (Asian newly industrializing economies: Singapore, Taiwan, Hong Kong and South Korea) and US.

Competition for FDI, especially in the electronic sector has intensified over the last decade. The increased in competition for FDI was due to the emergence of new countries (e.g. China and several countries in the Latin American and Eastern European countries) in the production of electronics goods and components.

The aim of this paper is to empirically examine the impact of trade openness to the Malaysian electronics output from 1970 to 2000. The empirical analysis hopes to assess if trade openness has benefited the Malaysian electronics sector. This paper will also examine strategies and policies to increase the competitiveness of this key sector of the economy.

The paper is organized as follows. In Section 2, a brief literature review on trade openness and economic performance. The empirical model used in this paper is described in Section 3. The data and the properties of the data series are discussed in Section 4. In Section 5, the empirical results are reported. In Section 6, strategies to enhance the competitiveness of the Malaysian electronics sector are discussed. In Section 7, the concluding remarks are given.

## Literature Review

There have been numerous research papers that have examined the relationship between trade openness and the performance of various sectors of the economy. However there are few studies that examine the relationship between trade openness and the competitiveness of electronic sector. In this section, a brief review of the literature on the impact of trade openness and competitiveness of the electronics sector will be examined.

Suarez-Villa and Pyo-Hwan (1990) showed that the growth in the South Korean electronic sector is attributed to the rapid technological developments. Competitiveness of the South Korean electronic sector was also due to the large pool of highly skilled and low cost labour. Mah (2000) empirically examined the import demand for certain information technology products for Korea. The findings show that price elasticity relatively high compare to

income elasticity. This would imply that lower tariff rate under the WTO negotiation would lower the import price for these products. As a result the import for these IT related products would increase substantially in Korea. A decrease in import cost of IT products will reduce the production cost for the electronic industry. Thus, making the South Korean electronic sector more export competitive.

Gorg and Ruane (2001) empirically analyzed the extent of local backward linkages between foreign firms and locally based firms in the Irish electronic sector. Further the determinants of these linkages and the related indirect employment generated in domestic firms was analyzed from 1982 to 1995. They found a non-linear relationship between the linkages and length of time of foreign firms located in Ireland. This is due to foreign firms' start with relatively low extent of local linkages but as they get accustomed to local sub-supply environment, they proceed to develop local input linkages. The finding of this study is consistent with the past studies that growth in employment has a linkage between upstream supplier firms with the development of downstream firms in the Irish electronic sector.

Tamamura (2002) examined the structural changes in international industrial linkages and export competitiveness in electrical and electronic in the Asia-Pacific region. The study showed that Asian countries are more competitive in the electronic sector due to low cost of labour. However, the supporting industries in this region have not been developed for more than a decade.

A study conducted by Bee-Yan (2002) examined the impact of research and development (R&D) and direct foreign investment (FDI) on the productivity growth of the Taiwanese electronic sector. The author used firm-level panel data from 1986 to 1991. The empirical results showed that R&D and FDI have a positive and significant impact on the productivity of the Taiwanese electronic sector. The study also showed that direct and indirect effects of technological activities lead to the development of Taiwanese small and medium level industries rather than its large firms.

Bhaduri and Ray (2004) investigated the factors that impact the export competitiveness of two R&D intensive industries in India, i.e., the electrical and electronic (E&E) and pharmaceuticals industries. The study found that technology and R&D have a positive and significant impact on the export competitiveness of the E&E firms in India.

## The Empirical Model

In this section the ARDL approach is used to examine the impact of capital, labour and trade openness on the output of the electronics sector. The framework employed in this study is similar to that used in Wadud and Nair (2003). The output of the electronics sector is characterized as follows:

$$y_t = f(\text{cap}_t, \text{lab}_t, \text{open}_t, T) \quad (1)$$

where  $y$  is the electronics value added output;  $\text{cap}$ ,  $\text{lab}$ , and  $\text{open}$ , represent capital and labour inputs, and an index of trade openness, respectively. The variable  $\text{open}$  was measured as: (export of electronics goods + import of electronics goods)/real GDP. The variable  $T$  in (1) is the linear trend representing the Hicks neutral technical progress.

In this paper, the ARDL method proposed in Pesaran et al. (2001) was used to estimate the relationship between the electronics output and the regressors. The present empirical formulation has two major advantages over the traditional and widely used econometric methods proposed by Engle and Granger (1987), Johansen (1988) and Johansen and Juselius (1990). First, the bounds test can be conducted irrespective if the regressors are *stationary* ( $I(0)$ ) or a *random walk* ( $I(1)$ ). Second, the estimated parameters are super-consistent for small sample.

Consider the following vector autoregressive model of order  $p$  (VAR ( $p$ )) that characterizes the relationship between the electronics output and its determinants:

$$\mathbf{z}_t = \boldsymbol{\mu} + \boldsymbol{\delta}T + \sum_{j=1}^{p-1} \boldsymbol{\phi}_j \mathbf{z}_{t-j} + \boldsymbol{\varepsilon}_t, \quad t = 1, 2, \dots, \quad (2)$$

where,  $\mathbf{z}_t = [y_t, x_t]'$ ,  $\boldsymbol{\mu}$  is the vector of constant terms  $\boldsymbol{\mu} = [\mu_y, \mu_x]'$ ,  $T$  is a linear trend,  $\boldsymbol{\delta} = [\delta_y, \delta_x]'$  and  $\boldsymbol{\phi}_j$  is a matrix of VAR parameters for lag  $j$ . In the context of our problem,  $\mathbf{x}_t = [cap_t, lab_t, open_t]'$ . The variables estimated are in natural logarithms, so that the estimated coefficients are the elasticities. As mentioned in Section 1, the data series  $x_t$  can either be  $I(0)$  or  $I(1)$ . The error term  $\boldsymbol{\varepsilon}_t$  can be partitioned conformably as  $\boldsymbol{\varepsilon}_t = [\varepsilon_{y,t}, \varepsilon_{x,t}]'$  :  $\forall (\mathbf{0}, \boldsymbol{\Omega})$  where  $\boldsymbol{\Omega}$  is positive definite, where:

$$\boldsymbol{\Omega} = \begin{bmatrix} \omega_{yy} & \omega_{yx} \\ \omega_{yx} & \omega_{xx} \end{bmatrix}. \quad (3)$$

The specification (2) can be written as an Autoregressive Distributed Lagged, ARDL[ $p, q, r, s$ ] model such as:

$$\begin{aligned} \Delta y_t &= \alpha_0 + \alpha_1 T + \varphi_y y_{t-1} + \psi_{cap} cap_{t-1} + \psi_{lab} lab_{t-1} + \psi_{open} open_{t-1} \\ &+ \sum_{i=1}^{p-1} \beta_{y,i} \Delta y_{t-i} + \sum_{j=0}^{q-1} \beta_{cap,j} \Delta cap_{t-j} + \sum_{k=0}^{r-1} \beta_{lab,k} \Delta lab_{t-k} \\ &+ \sum_{l=0}^{s-1} \beta_{open,l} \Delta open_{t-l} + \varepsilon_t \end{aligned} \quad (4)$$

where  $\varphi_y$ ,  $\psi_{cap}$ ,  $\psi_{lab}$  and  $\psi_{open}$  are the long run multipliers. The parameters  $\beta_y$ , and  $\beta_{cap}$ ,  $\beta_{lab}$ , and  $\beta_{open}$  are the short run multipliers.

Using the specification in (4), we can test if  $y$  is co-moving with the regressors. The ‘bounds test’ proposed in Pesaran et al. (2001) was used to test if the electronics output was co-moving with the other factors. The model in (4) was estimated using the ordinary least square (OLS) method. Then, we test the absence of a long-run relationship between  $y$  and  $cap$ ,  $lab$ , and  $open$  by restricting the coefficients of  $y_{t-1}$ ,  $cap_{t-1}$ ,  $lab_{t-1}$  and  $open_{t-1}$  to be zero. The bounds test is similar to the Wald-type test ( $F$ -statistics), where the null and alternative hypotheses are as follows:

$$\begin{aligned} H_0 &: \varphi_y = \psi_{cap} = \psi_{lab} = \psi_{open} = 0, \\ H_1 &: \varphi_y \neq 0, \psi_{cap} \neq 0, \psi_{lab} \neq 0 \text{ and } \psi_{open} \neq 0. \end{aligned}$$

The asymptotic distribution of the bounds test statistic is non-standard under the null hypothesis of no cointegration relationship between  $y$ , and  $cap$ ,  $lab$  and  $lab$ . The computed  $F$ -statistics under the null hypothesis is compared with the critical values given in Pesaran et al. (2001). Here, the computed  $F$ -statistics ( $F_{Bounds}$ ) is compared with the Lower Critical Bound ( $LCB$ ) and the Upper Critical Bound ( $UCB$ ).

<p>If <math>F_{Bounds} &gt; UCB \Rightarrow y</math> is cointegrated with <math>cap</math>, <math>lab</math>, and <math>open</math></p> <p>If <math>F_{Bounds} &lt; LCB \Rightarrow y</math> is not cointegrated with <math>cap</math>, <math>lab</math>, and <math>open</math></p> <p>If <math>LCB \leq F_{Bounds} \leq UCB \Rightarrow</math> Result is inconclusive</p>
--

In the latter case, the order of integration of the regressors needs to be ascertained before a conclusive outcome can be drawn regarding the long-run relationship between  $y$  and the regressors.

The rejection of no cointegration relationship implies that there exist a stable long-run relationship between  $y$  and the regressors. In this case, we can use the two-step strategy of the ARDL method proposed in Pesaran and Shin (1999) to estimate the long run and short run coefficients (elasticities) for our model. The estimation of the ARDL, the bounds test, the short run and long run elasticities are carried out using MICROFIT 4.0.

## The Data

In this study, we used annual data from 1970 to 2000 and the data for  $y$ ,  $lab$  and  $cap$  were obtained from the Department of Statistics Malaysia. The export, import and real GDP for the  $open$  variable were obtained from the *Quarterly Bulletin of Statistics (Bank Negara)*.

We examined the order of integration of the variables using the Phillip-Perron (1988) unit root test (PP test). The PP test was used because it allows for milder assumptions on the distribution of errors. Further, the test controls for higher order serial correlation in the series and is robust against heteroskedasticity. Based on the Phillip-Perron test, all the variables were found to be *random walk* (integrated of order one,  $I(1)$ ) (refer to Table 2).

TABLE 2: TEST FOR UNIT ROOTS FOR THE VARIABLES USING THE PHILLIP-PERRON TEST

<i>Variable</i>		<i>Test statistic</i>	<i>Order of Integration</i>
<i>y</i>	Level	-0.606	
	$\Delta Manu$	-6.916*	$I(1)$
<i>Cap</i>	Level	-0.481	
	$\Delta cap$	-6.509*	$I(1)$
<i>Lab</i>	Level	-1.804	
	$\Delta lab$	-5.900*	$I(1)$
<i>Open</i>	Level	5.716	
		-5.368*	$I(1)$

1% Level of significance based on the MacKinnon critical values.

The test was conducted with intercept and trend. The optimal lag was chosen using the Newey-West automatic truncation lag (Newey and West (1994))

## The Empirical Results

To select the appropriate model in (2), we estimated the  $ARDL[p, q, r, s]$  using the different lag length i.e.,  $\{p, q, r, s\} = \{1 \text{ to } 5\}$ . We did not proceed with  $\{p, q, r, s\} > 5$  due to loss of degree of freedom. Several specifications with different lags were tested for statistical significance and for consistency with the cointegration method. The Akaike Information Criterion (AIC) was used to choose the appropriate lag length for the ARDL model.

### The Unit Root Test

The long run relationship between the electronics output, capital, labour and open was tested using the 'bounds test'. Based on the 'bounds test' (given in Table 3), the computed  $F$ -statistic is 5.12, and the 5% and 10% critical bounds [Lower Critical Bound-LCB, Upper Critical Bound-UCB] are [4.01, 5.07] and [3.47, 4.45], respectively. Since the computed  $F$ -statistics is above the  $UCB$  at the 5% and 10% significance level, there exist a long-run relationship between electronics output and the regressors (capital, labour and open).

TABLE 3: BOUNDS TEST FOR COINTEGRATION ANALYSIS

Computed $F$ -Statistics ( $F_{Bounds}$ )	5.12	
Critical Bounds (5 percent)	LCB: 4.01	UCB: 5.07
Critical Bounds (10 percent)	LCB: 3.47	UCB: 4.45

Critical Bounds are from Pesaran et al. (2001), Table C1(v): Case V with unrestricted intercept and trend in the model, page 301.

**The Long-run Elasticities**

The estimated long-run coefficients for the ARDL model are given in Table 4. In the long run, the capital was found to have a positive and statistically significant (at the 5% significance level) impact on the electronics output. A 1% increase in capital will result in a 0.9852% increase in electronics output. On the other hand, labour has a positive impact on the electronics output. However, the impact is not statistically significant at the 10% significance level. This implies that the electronics sector in Malaysia is capital intensive.

In terms of trade openness, we observe that trade openness and electronics output is negatively correlated. The negative relationship is significant at the 5% significance level. The elasticity is -1.0788. That is, a 1% increase in trade openness will result in a fall in 1.0788% in electronics output. The technical progress was found to be positive but statistically not significant at the 10% significance level.

TABLE 4: ESTIMATED LONG RUN ELASTICITIES BASED ON ARDL[5,4,5,5] MODEL

Dependent Variable:		
Sample Period: 1975-2000		
<i>Variable</i>	<i>Coefficient</i>	<i>T-Ratio</i>
<i>Cap</i>	0.9852	5.2355**
<i>Lab</i>	0.4615	1.4839
<i>Open</i>	-1.0788	-3.3510**
<i>T</i>	0.1114	2.2264

\*, \*\*, \*\*\* significant at the 1%, 5%, and 10% significance level.

**The Short Run Dynamics and the Adjustment towards the Long Run Equilibrium**

The short run dynamics and the adjustment towards the long run equilibrium for the estimated ARDL model is given in Table 5. The overall capital and openness have a positive and significant impact on electronics output. Labour on the other hand has a negative and significant effect on the electronics output.

The short run adjustment process is measured by the error correction term (*ECM*). If the *ECM* value is between 0 and -1, the correction to electronics output in period *t* is a fraction of the error in period *t-1*. In this case, the *ECM* tends to cause the electronics output to converge monotonically to its long run equilibrium path in relation to changes in the exogenous variables. If the *ECM* is positive or less than -2, this will cause the electronics output to diverge. If the *ECM* is between -1 and -2, then the *ECM* will produce a dampened oscillation in the electronics output about its equilibrium path.

From Table 5, we see that the *ECM* is between -1 and -2 and is statistically significant at the 1% significance level. This implies that, the error correction process converges with a dampened oscillation to the equilibrium path relatively quickly. The statistical significance of the *ECM* confirms the presence of long run equilibrium between the electronics output and the regressors (capital, labour and trade openness).

## Strategies to Increase the Competitiveness of the Electronics Sector

The Malaysian electronics sector has undergone major restructuring over the last three decades due to growing global competition from other developing countries in the ASEAN, Latin American and Eastern European regions. In this paper, we empirically estimated the electronics output as function of labour, capital and trade openness.

The empirical results suggest that the Malaysian electronics output and its determinants are co-moving. That is, there exist a long run relationship between the electronics output and the determinants. From the estimated results, trade openness and capital have positive and significant impact on the electronics output in the short run. Overall labour has a negative and significant effect on the electronics output in the short run. In the long run, capital has a positive and significant effect on the electronics output, while the impact of labour is not statistically significant. Trade openness has a negative and significant effect on electronics output. Thus, liberalizing the Malaysian electronics sector over the sample period has had a negative impact on this sector. The Hicksian technical progress was found to have an upward trend in the long run, however the trend is not statistically significant.

To enhance the competitiveness of the Malaysian electronics sector, the following *supply-side policies* and *demand-side policies* should be considered to raise the competitiveness of the Malaysian electronics industry. First, given that Malaysia's workforce is smaller than that of neighbouring countries such as Indonesia, India and China, labour-intensive segment of the production process of electronics should be exported to countries that have larger work force. Only capital intensive and value added component of the electronics goods should be encouraged to be produced in Malaysia. Thus, outsourcing labour intensive production processes will keep the cost of Malaysian electronics goods globally competitive.

Second, there should be a concerted effort by the government and Malaysian electronics firms to make the electronics sector more technology and knowledge driven. Increased investment in new technology and ICT would help Malaysian electronics firms to enhance the delivery systems, productivity, and market reach. A knowledge- and technology-driven electronics sector will be able to pursue economies of scale and economies of scope.

The increase in investment for new technology in the electronics sector should be complemented with an increase in human capital development, especially in training the workers in this sector to use these new technologies. Better fiscal incentives should be given to enhance new technology adoption and training, especially among small and medium enterprises' (SMEs) in Malaysia.

Third, higher level of innovation would enhance the competitiveness and the output level of Malaysian electronics firms. This can be done in several ways, incentives should be provided to enhance the level of innovation among Malaysian industries and small medium enterprises (SME). The incentives can be in the form of infrastructure support for R&D and fiscal incentive (tax credits for R&D and R&D grants). Other research support can be in the form of financial support for new product development and improve the delivery systems. Funding to support technology and knowledge transfer between universities/research centers to SMEs in the country should be encouraged.

Fourth, policies to attract foreign direct investment (FDI) to develop the local electronics sector should be encouraged. Introducing various fiscal incentives such as lowering corporate tax can increase the inflow of FDI into the country. For example, Ireland had one of the lowest corporate tax rates in Europe (10% marginal tax rate). This was successful in attracting FDIs to Ireland, especially in high-end electronics sectors.

The various incentives for increasing innovation mentioned above should also be available for foreign electronics firms that undertake R&D activities in Malaysia. This will not only increase the inflow of capital into the country, it will also facilitate technology transfer between local and foreign electronics firms. Thus, increasing the innovative capacity of Malaysian electronics firms. Strategic cooperation between universities and industry should be encouraged, and these interactions should transcend national borders.

On the demand side, Malaysian electronics firms should seek opportunities overseas. Government jointly with the private sector should establish trade offices as a one-stop place to promote electronics goods manufactured in Malaysia. These trade offices should also be the source of information to potential investors on the various incentives available in the electronics sector in Malaysia. Further, these offices can play a key role in assisting Malaysian and foreign electronics firms to develop strategic partnerships for R&D, product development, and marketing.

## Conclusion

In this paper, we examined the impact of trade openness on the output of the Malaysian electronics sector using the ARDL model. The long run dynamics between the electronics output were tested using the bounds test for cointegration. The empirical method used in this paper has two important advantages over the traditional approaches used in the literature. First, the bounds test for cointegration can be conducted irrespective if the regressors are *stationary* ( $I(0)$ ) or a *random walk* ( $I(1)$ ). Second, the estimated parameters are super-consistent for studies with small samples, such as the present study.

The empirical analysis showed that the Malaysian electronics sector is capital intensive. However, trade openness has a negative and significant impact on the electronics output in the long run. Several strategies to increase the competitiveness of the Malaysian electronics sector were discussed in this paper.

# Is AFTA Trade Creating or Trade Diverting?

*Philippines*

*Helen Cabalu*

*Curtin University of Technology, Australia*

## Abstract

**This paper examines the changes in intra-regional trade patterns before and after the implementation of AFTA. It also shows whether AFTA for the ASEAN-6 has resulted in trade diversion (where low cost production in the rest of the world is displaced by higher cost production in the partner ASEAN-member country) or trade creation (where ASEAN member countries shift away from reliance on high-cost domestic industry to imports from the lower cost partner member-countries). The paper uses the shift-and-share analysis to compare the extent of trade that member countries have with each other and with the rest of the world. It is found that AFTA resulted in trade creation rather than trade diversion. This was achieved with the change in the major composition of trade from mineral fuels to machines and transport equipments. Trade diversion was not supported because ASEAN members' major trade partners are outside the region.**

## Introduction

The ultimate aim of economic integration in Southeast Asia is the formation of an ASEAN (Association of South East Asian Nations) Economic Community (AEC) in 2020. The AEC is envisaged as a single market and production base where goods, services, investments and skilled labor are free to flow. One of the measures toward the realization of the AEC is the establishment of the ASEAN Free Trade Area (AFTA). AFTA was formed in January 1992 at the Fourth ASEAN Summit meeting when Brunei, Indonesia, Malaysia, Philippines, Singapore and Thailand (referred to as ASEAN-6) signed the Singapore Declaration and Framework Agreement on Enhancing Economic Cooperation. The other ASEAN member countries later joined: Viet Nam in 1995, Laos and Myanmar in 1997, and Cambodia in 1999.

The agreement involves the elimination of intra-regional tariffs and non-tariff barriers in the region. Its strategic objectives are to expand trade among the more than 500 million people comprising the region, increase the ASEAN's competitive edge by integrating the economies into a single production base and eventually, with economies of scale realized, attract more foreign direct investments into the region. For the ASEAN-6 members, the deadline for the comprehensive tariff reduction program was initially set for 2008 but was moved forward to 2002. The four remaining countries were given longer time frames in which to complete the program: Viet Nam in 2006, Laos and Myanmar in 2008 and Cambodia in 2010. As AFTA has only been virtually completed by the ASEAN-6, it is necessary that we focus on this countries.<sup>1</sup>

This paper assesses the trade effects of AFTA on intra-regional trade by examining changes in the trade patterns of each member country prior to AFTA and during its implementation. The paper also identifies commodity groups that were significantly affected by the initiative and shows whether AFTA has resulted in trade diversion (where low cost production in the rest of the world is displaced by higher cost production in the partner ASEAN-member country) or trade creation (where ASEAN member countries lowering their tariffs shift away from reliance on high-cost domestic industry to imports from the lower cost partner member-countries).

There are a number of difficulties in evaluating the effects of AFTA. As there are a number of other things happening at the same time as its implementation, it is by no means an easy matter to isolate the effects of AFTA. The Asian financial crisis of 1997/98 may have influenced the trade flows during the AFTA implementation. Although the agreement came into effect in January 1992, not all tariffs between the original six ASEAN members were removed on that date. Indeed, for most commodities, there was a schedule over a 10-15 year period during which tariffs would be phased out. Hence, trade flows in 1992 and afterward were not entirely free of duty. Trade liberalization both under the World Trade Organization and unilaterally by some countries are being undertaken at the same time as AFTA's implementation, and undoubtedly affected trade patterns.

This paper is organized as follows. Section 2 reviews the literature and explains the methodology used to analyze the effects of AFTA. Section 3 describes the general trends in ASEAN trade in the last two decades. Section 4 provides a general background of the AFTA agreement and its current status. Section 5 presents the shift-and-share analysis and results to identify the effects of AFTA and section 6 concludes.

## Previous Studies

In the analysis of regional trading agreements (RTAs), there are two empirical methods commonly used. One is simulation with a gravity model, which is generally applied ex-post. This approach is used to search for effects of RTAs after they have been implemented. In contrast, the second technique, counterfactual simulation with partial or general equilibrium trade models is a way to analyze the implications of proposed RTAs.

The basic gravity model of trade shows that trade between two countries should increase with their size (based on GDP, population, and land area) and decrease with transaction costs (such as distance and cultural similarities). To estimate the effects of RTAs, the basic gravity model is extended by adding a pair of dummy variables. The first dummy variable takes a value of 1 when both countries are members of the same trading bloc. Its coefficient is interpreted as the added volume of trade between two nations in the RTA relative to their trade with countries outside the bloc. Therefore, a positive coefficient indicates trade creation. The second dummy variable takes a value of 1 if only one of the countries is a current member of the bloc. The coefficient on this dummy variable is taken as the extent of abnormal trade between nations in the trading bloc and a country outside the bloc relative to a random pair of countries. A negative coefficient would suggest trade diversion.

Winters and Soloaga (1999), World Bank (2000), Cernat (2001), Gilbert, Scollay and Bora (2001), Jong Wha-Lee and Innwon Park (2004) and Coulibaly (2004) used gravity models to analyze the effects of AFTA. Winters and Soloaga (1999) applied the gravity model to annual non-fuel imports data from 1980 to 1996. Their estimates showed that on average, ASEAN's propensity to import from bloc members was significantly lower in 1995-96 than in 1986-88. On the other hand, ASEAN's overall propensity to import was higher in 1995-96 than in 1986-88. Likewise, the World Bank's (2000) estimates for ASEAN show that there is substantial increase in the coefficients for extrabloc trade, accompanied by a fall in that on intrabloc trade. Cernat (2001) finds that South-South RTAs are less trade diverting than theoretically predicted. The variable for trade creation was well above unity indicating that AFTA countries were trading more than four times by 1996 and 1998. At the same time, imports of AFTA countries from third countries were also more than four times by 1994 and more than double the level of trade between two otherwise comparable non-AFTA countries in 1998. Gilbert, Scollay and Bora (2001) show positive and significant openness coefficients of AFTA within the bloc and outside it. Moreover, they conclude that ASEAN has (thus far) been successful in promoting manufactures trade both among its members and nonmembers. Meanwhile the bias for agricultural trade in the bloc declined after 1992. Jong Wha-Lee and Innwon Park (2004) find that the majority of RTAs, AFTA included, contributed to an increase in trade between members and non-members, as trade among members increased to an even greater extent. Coulibaly's (2004) results show that AFTA has been net export diverting and intra-bloc export creating. Except for Brunei Darussalam, AFTA members appear to have experienced a decrease in their extra-regional export after the creation of the RTA. This negative result on AFTA members is a direct consequence of the net export diversion of the RTA. These studies have shown that AFTA has been both net trade creating and net trade diverting. These conflicting results call for further studies to properly assess the trade impact of AFTA.

A downside to the gravity equations is that they cannot control for all of the factors determining trade flows. They also do not contain details about tariff rates and product supplies and demands that are needed to establish whether changes in trade flows are really beneficial or damaging. An alternative way to execute this is to construct a full computer model of the economies under study, and then simulate the effects of the policy changes associated with the FTA. The microeconomic structure of this model enables it to predict changes in production in each sector and changes in factor prices and real incomes. Its major weakness however, is that it is not usually fitted to data as carefully, nor are they subject to the same statistical testing as econometric models. The cost of the

microeconomic detail is a complexity that makes rigorous econometric estimation impossible. (World Bank, 2000, p. 50)

Simulations using the general equilibrium models on AFTA's trade impact find substantial potential gains from trade liberalization. Adams and Park (1995) used a linked CGE system to quantify the macroeconomic effects of external shock, domestic policy, and regional-grouping and market-opening efforts through tariff reduction policies among ASEAN countries. Their empirical results indicate that ASEAN would be better off from AFTA, and the volume of trade within ASEAN would rise substantially. De Rosa (1995) finds in his simulations of the model that AFTA does create trade. AFTA is estimated to expand total trade within ASEAN by as much as US\$2.9 billion, or 19 percent. The simulation results also reveal that the ASEAN countries' expansion of production and exports in various economic sectors under the AFTA plan follows those expected under MFN liberalization. On agricultural production under AFTA, this is found to rise slightly in Indonesia, Malaysia, the Philippines, and Thailand., In Singapore, however, agricultural production declines under AFTA because more manufactured goods are sourced from the city-state within ASEAN that were previously imported chiefly from the major industrial countries. Finally, Adams and Horridge (2000) proves the trade-enhancing effects in each AFTA region of tariff reductions. All AFTA regions are projected to experience large increases in trade volumes, with the greatest increases occurring in regions with the highest initial levels of protection on imports from AFTA countries.

## **Methodology**

This paper follows Krueger (1999), which employs the shift-and-share technique to test the net impact of AFTA. Trade creation occurs when higher trade is generated among member countries as a result of their membership to a free trade area. The freeing up of trade barriers, tariffs in particular, lead countries to import commodities from lower-cost member countries away from high-cost domestic industry. In this way, economies in a free trade area produce more output by concentrating on commodities where their comparative advantage lies. Trade creation therefore, increases specialization in member countries and with economies of scale, improves their productive efficiency (Manzano and Mortel, 2003).

Trade diversion in contrast, occurs when member countries reduce their imports from low-cost, more efficient non-member countries to high-cost less efficient (partner) member countries. This is made possible by the discriminatory protection in place, as imports from non-members continue to face high tariff barriers effectively becoming more costly than tariff-free imports from less-efficient member countries.

The methodology employed to determine trade diversion effects of AFTA is the shift-and-share analysis to examine the changes in values and patterns between commodity groups and among AFTA countries and the rest of the world (ROW). This method compares the extent of trade that member countries have with each other and with the rest of the world before and after the establishment of AFTA.

To carry out the analysis, a base year (prior the establishment of AFTA) is first chosen to represent the benchmark or hypothetical trade patterns such as import shares among ASEAN-member countries and ROW (non-member countries) prior to AFTA. Using the average of 1985 and 1986 as a base, the difference between actual and hypothetical imports of member countries from ASEAN will be the shift. If there is an increase in the imports of a member economy at the expense of trade with the ROW (non-member countries), then there has been a positive shift. On the other hand, if the shift is negative, then there is no evidence that the member-country imports increased at the expense of trade with ROW. Lastly, if the shift is equal to zero, then there is evidence that the formation of AFTA did not affect trade flow during the said year.

The shift-and-share analysis provides limited evidence or indication that AFTA is either trade creating or trade diverting. Moreover, several other events or reasons apart from the formation of AFTA that can affect trade patterns would be enough to suggest caution in the interpretation of findings.

## **The AFTA Agreement: Background and Current Status**

The main implementing instrument of AFTA is the Common Effective Preferential Tariff (CEPT) scheme which requires that tariffs levied on goods traded within the ASEAN region that meet a 40 per cent ASEAN content requirement be reduced to 0-5%.

ASEAN members may exclude a product from the CEPT in three cases: 1) Temporary exclusions; 2) Unprocessed agricultural products; and 3) General exceptions.

Products under the temporary exclusion list are protected temporarily by a delay in tariff reductions. Tariffs on these products will ultimately be lowered to 5 per cent and below. In 1993, temporary exclusion was granted to machinery and electrical appliances in Brunei; chemicals in Indonesia, vehicles in Malaysia and Thailand; and textiles in the Philippines.

Unprocessed agricultural products are also not included in the CEPT scheme. However, all member countries have included a number of products, which fall under this category in the CEPT. Thus, only a small number of unprocessed agricultural products are actually excluded from the CEPT.

Finally, under the general exception list, products that a country considers necessary for the protection of national security, public morals, the protection of human, animal or plant life and health, and protection of articles of artistic, historic, or archaeological value are excluded from the CEPT.

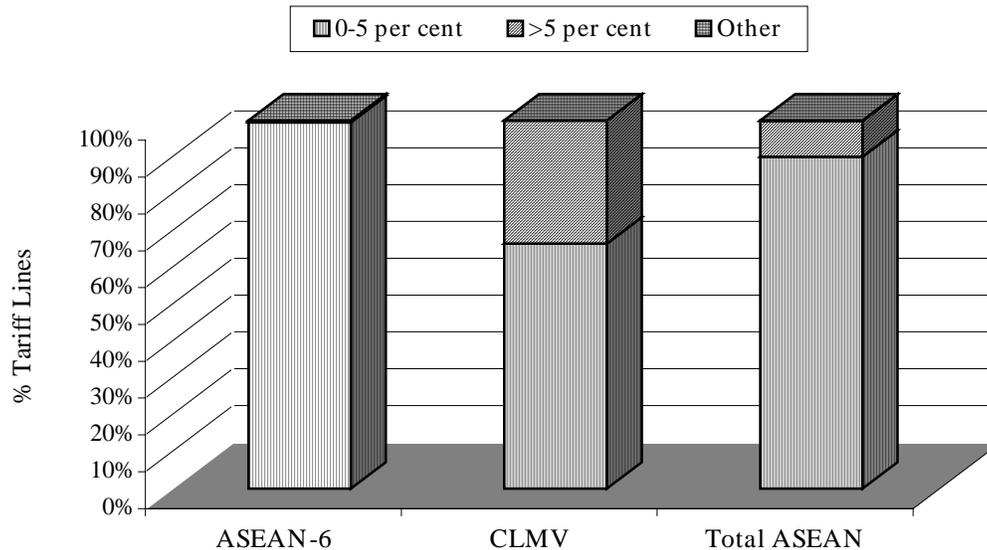

The CEPT package has 44,361 tariff lines in the inclusion list (IL) or almost 99 per cent of the total tariff lines. By January 2003, tariffs on 99.6 per cent (44,160 out of a total of 44,361 tariff lines) of products in the CEPT package of the ASEAN-6 have been reduced to the 0-5 per cent tariff range. In fact, in 2003, almost 50 per cent (or 21,626 tariff lines) of these products have zero tariffs and by 2004, tariffs on 64 per cent of the products have been eliminated (Fig. 1).

The average tariff in the ASEAN-6 under the CEPT Scheme in 2003 was 2.4 per cent, down from 12.8 per cent in 1993 when the tariff cuts began. It further went down to 1.5 per cent in 2004.

The implementation of the CEPT Scheme was significantly boosted in January 2004 when Malaysia announced its tariff reduction for completely built up (CBUs) and completely knocked down (CKDs) automotive units to gradually meet its CEPT commitment one year earlier than scheduled.

Products that remain out of the CEPT Scheme are those in the highly sensitive list (i.e., rice) and the general exception list. A review is being undertaken of all the items under the general exception list to ensure that only those items that conform to the CEPT Agreement are included.

The ultimate objective is for a free trade area where there is free flow of products within the region. Thus, the target for tariffs to be completely abolished is 2010 for ASEAN-6 and 2015 for the more recent members. Tariffs on some sensitive products were given until 2018 to be eliminated.

## Trends in ASEAN Trade

Intra-ASEAN trade grew by an annual average rate of 5.7 per cent between 1980 and 2002. In particular, the period 1987 to 1996 witnessed the strongest intra-ASEAN trade growth of 16.6 per cent, before the financial crisis in 1997/98 temporarily derailed the upward trend. Since then, growth in intra-ASEAN trade has moderated to an average of 2.1 per cent in the period 1999-2002. Interestingly, the average annual growth rates in intra-ASEAN trade during the pre- AFTA years (1987 to 1991) and during the years of implementation (1992-1996) were very similar at 17.1 per cent for the former and 16.3 per cent for the latter.

ASEAN's largest markets are outside the region (Tables 1a and 1b). In terms of ASEAN's trade relationship with the rest of the world, we can see similar pattern in the trends. ASEAN's trade with the rest of the world grew by an average rate of 3.9 per cent per annum between 1980 and 2002. The strongest growth in ASEAN trade with the rest of the world was between 1987 and 1991 when an average annual growth rate of 14.5 per cent was posted. During the period of AFTA implementation, average annual growth of 10.4 per cent was achieved between 1992 and 1997 before it dipped in 1998, only to recover after that.

As share of total exports, intra-ASEAN exports rose from an average of 19.3% in the years preceding AFTA to 23.3% in 2002 when tariff reduction targets have been achieved (Table 1a). Consequently, the share of ASEAN's exports to the rest of the world dropped from 80.7% in 1985 to 76.7% in 2002. Intra-ASEAN exports peaked in 1995 at 23.6% before falling to 20.3% during the financial crisis.

The same upward trend is evident in the percentage share of ASEAN's imports in the region's total imports. From 19.4% in 1985, intra-ASEAN imports rose to 24.2% in 2002. Unlike intra-ASEAN exports, imports from ASEAN as a share of the total has been declining in the pre-AFTA years and did not recover from its 1985 level until 1998, the height of the financial crisis, when it reached 21.3%. Thus, the Asian economic crisis may have worked to support AFTA rather than derail it by creating a stronger desire to source imports from within the region. During the time of the financial crisis, perceived problems of credibility and confidence in the region by the industrialized world, comprising most of ASEAN's principal export markets, forced the ASEAN countries to turn inwards and to focus on their local markets (Elliot and Ikemoto, 2004).

TABLE 1A: ASEAN TRADE: EXPORTS (IN BILLION US DOLLAR AND PER CENT)

Year	Total Exports of ASEAN	Exports to ASEAN	% share in total exports	Exports to the rest of the world	% share in total exports
1985	72.4	14.0	19.3	58.5	80.7
1990	142.1	27.4	19.3	114.8	80.7
1995	312.8	73.9	23.6	238.9	76.4

Source: International Economic Data Bank, Australian National University

Hence, the aggregate statistics convey a reasonably clear picture: that trade ties among the ASEAN partners intensified in the 1990s after the implementation of AFTA. It is possible to disaggregate the data to some extent, and to examine the behaviour of exports and imports of commodity categories. At the SITC one-digit level, there are 10 categories in the UN commodity trade data. Using data from 1985 to 2002, we make some inferences (Table 2).

Of the 10 one-digit commodity categories, two — mineral fuels, lubricants and related materials and machinery and transport equipment, demonstrate notable trends. In both intra-ASEAN exports and imports, mineral fuels, lubricants and related materials started as a very significant commodity category which accounted for approximately 40% of ASEAN's trade in 1985 but progressively declined to around 12% by 2002. In contrast, machinery and transport equipment showed the opposite trend of gaining importance as a commodity category by 2002 when it accounted for more than half of ASEAN's trade from about 18% share in 1985. Table 2 highlights these trends. One reason for this trend is the increasing pace of industrialization in ASEAN countries, which led to the increase in share of heavy equipment trade. Moreover, the increasing reliance of the manufacturing sector on intra-regional production networks where parts, components and other intermediate goods are produced across the ASEAN region and brought together in one location for final assembly has also contributed to this trade pattern (Elliot and Ikemoto, 2004)

As can be seen, there are distinct differences in the behaviour of other commodity categories in intra-ASEAN trade. Food and live animals, crude materials excluding fuels, animal and vegetable oils and fats, basic manufactures, all had declining shares from 1985 to 2002. On the other hand, beverages and tobacco, chemicals, miscellaneous manufactured goods and goods not classified by kind had increasing shares of intra-ASEAN trade during the same period.

TABLE 2: INTRA-ASEAN TRADE, BY COMMODITY GROUPS (PERCENTAGE SHARES, ONE DIGIT SITC CATEGORIES)

	1985	1990	1995	1996	1997	1998	1999	2000	2001	2002
<b>EXPORTS</b>

One can examine trade data to ask whether there are commodity categories in which the level of imports from the rest of the world fell as intra-AFTA trade increased. To the extent that declines in import volumes from third countries were associated with increasing imports from AFTA countries, there would be a suspicion of trade diversion. At the one-digit SITC level, however, there are very few commodity categories in which imports of AFTA countries from the rest of the world fell while rising within AFTA (Table 3). During the period 1992-2002, intra-AFTA imports of crude materials, excluding fuels (SITC 2) and basic manufactures (SITC 6) grew at the expense of AFTA's imports from the rest of the world. For the rest of the commodity categories, there was simply too much growth in trade in the global economy during this period. Hence, on the basis of the data, one certainly cannot infer a strong evidence of trade diversion.

TABLE 3: AVERAGE GROWTH IN INTRA-AFTA IMPORTS VERSUS ASEAN IMPORTS FROM ROW, 1992-2002 BY COMMODITY GROUPS (PER CENT)

Commodity Group	Growth in intra-ASEAN imports	Growth in ASEAN imports from ROW
TOTAL	8.0	4.1
SITC-0 (Food & Live Animals)	3.3	3.7
SITC-1 (Beverages & tobacco)	18.2	0.9
SITC-2 (Crude materials, inedible, except fuels)	0.5	-0.3
SITC-3 (Mineral fuels, lubricants & related materials)	4.6	8.2
SITC-4 (Animal & vegetable oils, fats & waxes)	2.4	2.7
SITC-5 (Chemicals & related products, n.e.c.)	9.3	2.5
SITC-6 (Basic manufactures)	3.3	-0.9
SITC-7 (Machinery & transport equipment)	12.9	5.4
SITC-8 (Miscellaneous manufactured articles)	4.7	3.7
SITC-9 (Goods not classified by kind)	54.2	39.1

### Is AFTA Trade Creating or Trade Diverting?

The aggregate data are sufficient to indicate that there has been an expansion of trade, both absolutely and as a percentage of total trade, among the AFTA countries since the 1990s, after AFTA was implemented. One question, however, cannot be answered on the basis of the aggregate data. That question refers to the extent to which the increase in trade among AFTA members reflects trade creation and shifts of production to locations of comparative advantage, and to what extent it reflects trade diversion and a shift from low-cost producers in the rest of the world to higher cost producers in the ASEAN countries.

This section examines the extent to which increases in intra-AFTA trade took place at the expense of the shares of trade of countries outside AFTA. Using commodity data from 1985 to 2002 at the one-digit level, we examine the shifts in shares of AFTA exports to the region to the shifts in shares of AFTA exports to the rest of the world (ROW) (Table 4). If the increase in AFTA imports from AFTA countries were associated with declines in import volumes from ROW this would provide a strong presumption of trade diversion.

Table 4 shows that overall ASEAN exports have gained shares in both the ASEAN and ROW markets. In the early 1990s, ASEAN exports appear to lose share in the region but posted positive net shares in the latter half of the decade. This confirms that AFTA had been trade creating rather than trade diverting. The gains in shares are most pronounced in machinery & transport equipment (SITC 7). Other commodity groups, which showed positive gains in net shares, are basic manufactures (SITC 6), miscellaneous manufactured goods (SITC 8), chemicals (SITC 5), animal & vegetable oil fat (SITC 4), and beverages and tobacco (SITC 1).

The result of this study is consistent with previous research, which does not support trade diversion in AFTA. There are several reasons for this. First, the share of intra-AFTA trade in total imports of AFTA member countries remains very small. As can be seen in Table 1b, it is only about 24% in 2002, which indicates that major import sources for AFTA member countries are outside the region (pre- and post-AFTA). Second, the absence of trade diversion is due to AFTA countries having similar production and trade structures and would source most of their imports from the rest of the world.

Finally, the simultaneous increase in ASEAN shares in both ROW and ASEAN markets suggests that ASEAN has improved its competitiveness and has therefore become more attractive as a source of imports for the world in general. The currency devaluation during the Asian crisis would have made ASEAN exports less expensive and should have further contributed to the increase in the competitiveness of their products with the rest of the world. At the same time, the crisis also forced ASEAN to turn inward and focus on their local markets.

TABLE 4: SHIFTS IN SHARES AT THE ONE-DIGIT LEVEL, INTRA-ASEAN TRADE (IN BILLION US DOLLAR AND PER CENT)

Commodity Group and Year	Total ASEAN imports	ASEAN actual exports to ASEAN	ASEAN exports if constant share of Total ASEAN imports	Change due to change in ASEAN share	Total imports of ROW	ASEAN actual exports to ROW	ASEAN exports to ROW at constant share	Change due to change in ROW share

## Conclusion

This paper has shown that the ASEAN Free Trade Agreement (AFTA) for the ASEAN-6 was more trade creating than trade diverting. It was able to invigorate the trading environment in the region. But to spur trade, the paper also has identified that the composition of trade has to evolve from the simple processed items of mineral fuels and the like to machinery and transport equipment, which involved more elaborate processes. This change is further indicative of the establishment of linkages in production between the ASEAN-6 member countries in keeping with ASEAN's goal of turning the region into a single production base.

There was no evidence of trade diversion largely because ASEAN members' major trade partners are outside the region. This finding suggests that trade liberalization on a multilateral scale would produce greater benefits to ASEAN. The efficiency and productivity of the region would be enhanced further under multilateral trade arrangements.

# Potential of Synthetic Fiber Exports: The Emerging Asia

*K.F. Au*

*M.C. Wong*

*The Hong Kong Polytechnic University, Hong Kong*

## Abstract

The global synthetic fiber trading has undergone a dramatic change over the past two decades. Synthetic fiber exporting has gradually shifted from Western developed nations to newly industrializing countries, especially those in the Asian regions. This study examines the extents and reasons for the substantial growth of synthetic fiber exports of Asian regions, including both developed and developing economies in Asia. Time-series regression modeling was employed to analyze the trends on the world share of synthetic fiber exports for the selected Asian countries from 1990 to 2003. Results showed that both developed and developing Asian nations have been able to enhance their market potential in global synthetic fiber exports by providing the right – type of synthetic fibers based on the technological level of the country and culminated in increases of world shares for synthetic fiber exports.

## Introduction

Nowadays, world synthetic fiber trading is a growing market and regarded as one of the most important export sectors in the global textile complex. Polyester, nylon, and acrylic are the major synthetic fibers as they have distinctive properties and applications for both functional and aesthetic appeal in textile applications. This constitutes intense and direct competitions with other natural fibers. The world consumption and production of synthetic fibers have already outperformed the natural textile fibers like cotton and wool in quantity. The assured growth can be attributed to the increasing world population, surging economic growth in the 1980s & 1990s, the increasing scope for the substitution of natural fibers coupled with the development of new end-uses. Fig. 1 illustrates the worldwide consumption of major fiber categories from 1982 to 2003, which reflects that the fiber consumption of synthetic fibers has already surpassed the natural fibers; hence it is worthy to conduct a comprehensive study on the global export pattern of synthetic fibers.

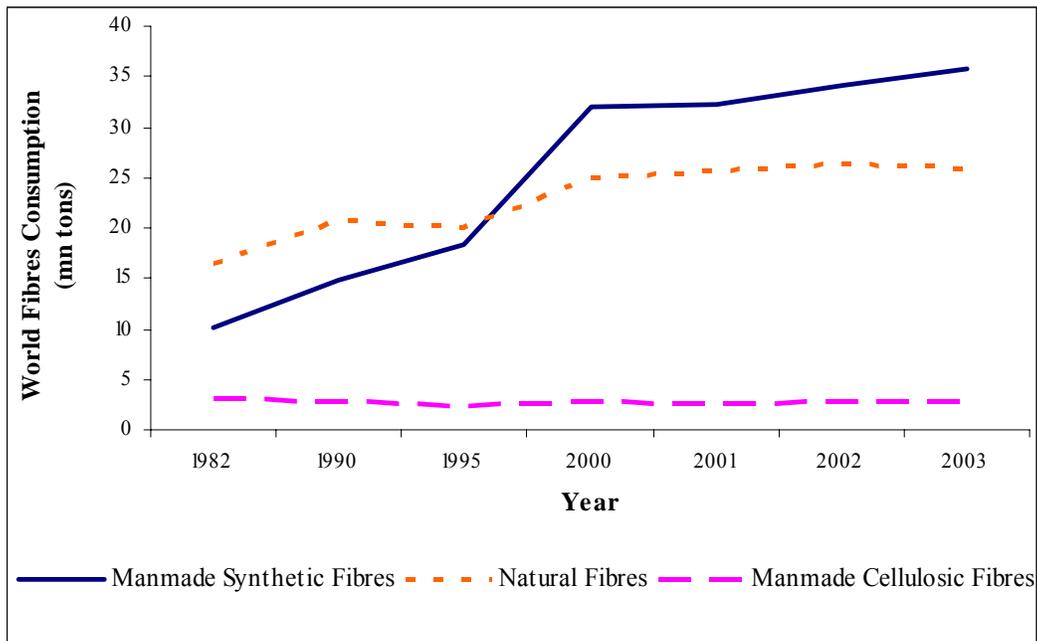

FIG. 1: WORLDWIDE CONSUMPTION FOR MAJOR FIBERS (MN TONS)  
Source: Compiled from Fiber Organon, *various issues* [7]

World synthetic fiber trading had demonstrated a substantial growth since the 1980s. World synthetic fiber trade valued at US\$ 2.75 billion in 1980, and increased by more than 100 % to US\$ 5.54 billion in 2003.

The trading patterns of the global synthetic fibers had changed markedly over the past few decades. In the 1970s and 1980s, industrial advanced states such as the United States, Western European countries including Germany, Italy, France and Japan in Asia were leading synthetic fiber exporters in the world. They dominated the world synthetic fiber export trade and took up about three-quarter of the global synthetic fiber exports in the 1970s. With technology becoming more mature, these industrialized nations tried to seek production in other low cost countries and hence migrated their investments to the Far East Asia. Since the mid 1980s and 1990s, two Asian NICs – Chinese Taipei and South Korea have emerged to become the global synthetic fiber exporters and accounted for 30% of the world's total synthetic fiber exports in 1999. Entering the new millennium, other less-developed Southeast Asian countries, such as Thailand, Malaysia, Indonesia, and the China PRC have been actively engaged in the global exporting of synthetic fibers. Their aggregate world shares had also witnessed significant increases, from 3.5 % in 1995 to 9.3 % in 2003. Global synthetic fiber exports have undergone dramatic changes with major exporters first began with the most developed countries, then shifted to the NICs, and further to the less-developed nations. This paper attempts to delineate the changing patterns of the global synthetic fiber export trade and tries to explain the observed phenomenon with international trade theories.

### Literature Review on the Changing Export Patterns of World Synthetic Fibers

Synthetic fiber trade is now regarding, as a globalized activity as there is an increasing number of countries engaged in the world's synthetic fiber production and export. Globalization has increased the international flows of trade, technology and foreign direct investment, which altogether contributed to the changing patterns of the global synthetic fibers export trade.

International technological knowledge diffusion is widely recognized as a fundamental factor for long run growth. However, the influence of technological change on trade and specialization is largely ignored in most of the

neo-classical trade theories [8]. The original technology gap model proposed by Posner [14] asserted that countries have a faster rate of innovation will tend to export technologically advanced goods to countries with slower rates of innovation in return for more standardized and labor intensive products. The innovating country still sustained her technological advantage until the new technology is imitated by her trading partners. Hence, the innovating countries may enjoy a temporary advantage in the production and export of that particular product due to the time lags through the diffusion of technological knowledge internationally. Fagerberg [6] and Verspagen [17] claimed that the successful adoption and use of new technologies is “a costly activity that requires investment in indigenous capabilities, capital equipment, and infrastructure etc.”

Another major theoretical effort to explain the observed changing trade patterns was the International Product Cycle Theory (IPLC) proposed by Vernon [16]. He stressed that each innovative product goes through a product cycle, being produced and exported first by the industrial advanced countries and then, after technology diffusion, by other developed countries and then the less developed economies. Lancaster and Wesenlund [9] examined the product life cycle theory for international trade based on the empirical analysis and applied it to the textile industry. Lutz and Kihl [11] investigated the rise of the newly industrialized countries as exporters of manufactured products from the perspective of the shifting pattern in comparative advantage and the product life cycle theory of trade. Lau, et. al [10] extended the IPLC to describe emerging economies and provided a framework for explaining the globalization of export-oriented productions by MNC's affiliates in emerging countries.

Moreover, foreign direct investment (FDI) is also an important vehicle of technology transfer from developed countries to developing countries, usually in the form of multinational corporations [12]. Since the production costs at home were much higher and the local currencies continually to appreciate, many industrialized-advanced economies, like the United States, Western Europe and Japan began to seek out new locations in other parts of the world. Latin America and the Far-East Asia thus became important new locations for them. This explains why there were an increasing number of manufacturing plants established by the industrialized countries in NICs, such as Chinese Taipei, South Korea and other South and Southeast Asian countries. Dunning proposed an eclectic framework with three conditions to explain FDI flows between different countries, including ownership-specific advantages, internalization incentives advantages and location-specific advantages [5]. The empirical evidence supported that the most important ownership advantages for FDI appear to be technological sophistication [18]. The technology know-how diffused internationally from the developed home country to the developing host countries through FDI. Recent studies of Chuang and Hsu [4] asserted that the presence of foreign ownership has a positive and significant influencing effect on domestic firms' productivity. Moreover, trading with more advanced countries helps the developing countries to gain access to new technology and information, which improves their productivity and enables them to compete in international markets. Balamoune-Lutz [2] examined the relationship between FDI, exports, and economic growth using a Granger causality model. The empirical results provided evidence to support bi-direction between FDI and exports, as well as a positive influence from exports to economic growth. More importantly, the author had emphasized the role of FDI in enhancing the economic growth of the host country.

## **Trends in Global Synthetic Fiber Trade**

In the last decade, global synthetic fiber trade had grown steadily. World trade in synthetic fibers reached US\$5.5 billion in 2003 compared with US \$4.30 billion in 1990, which represented an annual increase of about 2%.

### **The Leading Global Synthetic Fibers Exporters**

Table 1 lists the 20 largest synthetic fiber exporters in 2003 and also indicates their performance in 1990. From the data, it reveals that – on the whole - the shares of these listed countries in world synthetic fiber trade have assumed a steady performance, which was 73.7 % in 1990 and 76.3 % in 2003. In 1990, there were only 7 developing countries as shown in the top 20 synthetic fiber-exporting nations. However this number has been increased to 11 in 2003. The most remarkable gainer was Thailand, which ascended from beyond the top 20 ranking in 1990 to the 5<sup>th</sup> position in 2003. A similar increasing trend was also witnessed in other Asian economies like South Korea, Chinese Taipei, China PRC, Indonesia and Thailand.

On the contrary, the industrialized countries had lost their competitive advantages in the world synthetic fiber exports. In 1990, there were totally 13 developed nations included in the top 20 synthetic fiber exporters. However, this number has significantly reduced to 9 in 2003. Germany was the largest synthetic fibers exporter in 1980, however she only attained the 11<sup>th</sup> position in 2003.

For Chinese Taipei, data obtained from Bureau of Foreign Trade – <http://www.trade.gov.tw> [3]

\* Belarus attained its independence in 1991 and data of Former USSR was used

† Only export values of 1999 obtained (US\$30mn)

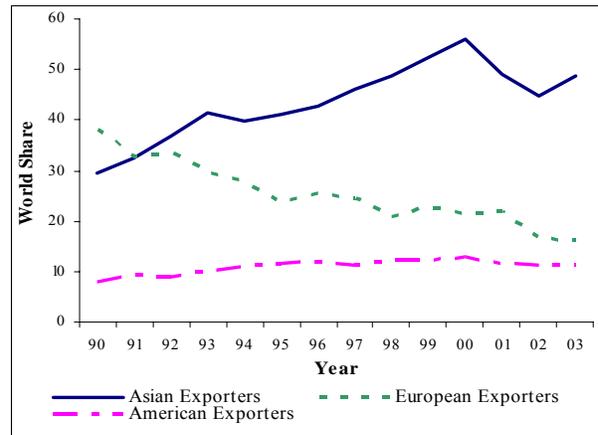

There was not much change in the composition of the top 20 synthetic fiber exporters in 1990 and 2003. Except that Netherlands, Hong Kong, Austria, Switzerland, Denmark and Peru had disappeared in the top-20 exporters' ranking while Thailand, China PRC, Belarus, Ireland, Indonesia and Malaysia joined the top listing. In 1990, the export values of the top 20 synthetic fiber exporters were US\$ 3,604 million, which accounted for about 84% of the world's total exports. The latest statistics revealed that the export values witnessed a steady increase to US\$ 4,228 million, and constituted about 76% of the world's synthetic fiber exports in 2003.

In 1990, there were six industrial-advanced countries regarded as major global exporters of synthetic fibers and each assumed more than 5 percent of the world's total synthetic fiber exports [1]. Most of them were Western industrialized countries. However, entering the 2000s, the Asian NICs gradually emerged to become the leading synthetic fibers exporters. In 2003, there were four economies, which achieved more than 5 percent of the global synthetic fiber trade with South Korea taking the lead. During this period, the number of Asian countries among the top 20 synthetic fibers exporters had increased from 5 to 8 between 1990 and 2003. Meanwhile, the aggregate world shares of the listed Asian leading synthetic fibers exporting-nations soared significantly from 29.6 % in 1990 to 48.9 % in 2003. Fig. 2 and 3 illustrate the export values and world share of the listed synthetic fiber exporters from 1990 to 2003. The graphs depicts that Asia was the only region which shows substantial increases in both synthetic fibers export values and shares during the prescribed period.

For Chinese Taipei: Compiled from Bureau of Foreign Trade [3]

Other 2<sup>nd</sup>-tier Developing Nations include China PRC, Indonesia, Malaysia and Thailand

### Japan

Japan used to be the world leading synthetic fibers exporter in the 1970s and was regarded as the initiator in the synthetic fiber exports in Asia. Faced with rising labor cost and growing competition from low wage developing Asian economies, the performance of Japan's synthetic fiber exports during the 1990's has been inferior to other emerging exporters. Japan was always the number one exporter in the early 1990s, with an average world share of 13 % during 1990 to 1994. However it was slightly dropped to the second position when South Korea took the place during 1995 to 1999. In 2003, Japan was the 3<sup>rd</sup> largest exporter in the world synthetic fiber trade. In general, the synthetic fiber exports of Japan has witnessed a steady pattern, with a mere annual increase of 0.43 % from 1990 to 2003, whereas her export value increased by about one-third, from US\$ 485 million to US\$ 661 million during the same observed period (Fig. 5).

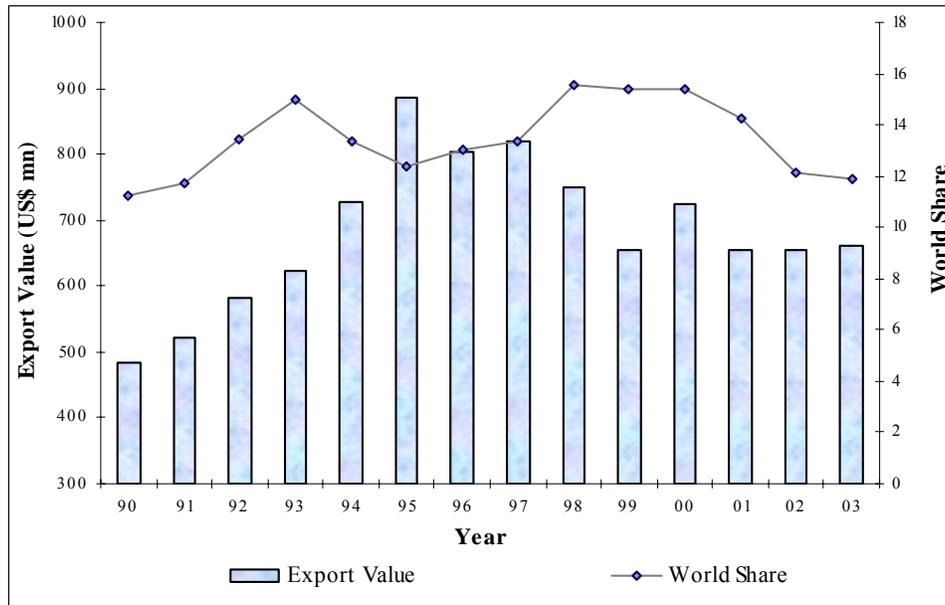

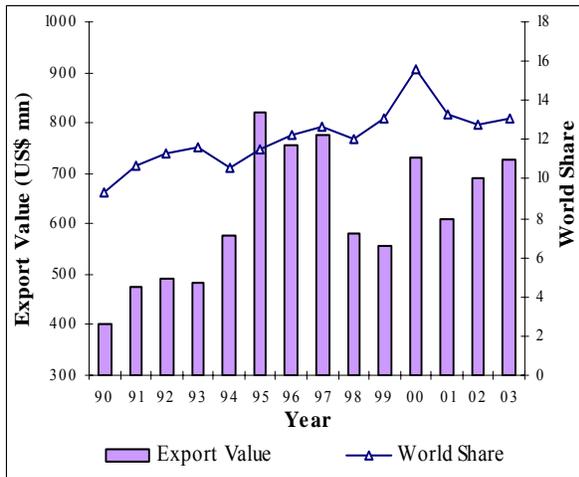

FIG. 5: SYNTHETIC FIBER EXPORTS FROM JAPAN  
 Sources: Compiled from International Trade Statistics Yearbook, *various issues* [15]

### Chinese Taipei and South Korea

There are substantial increases in the synthetic fiber exports for Chinese Taipei and South Korea during the prescribe period of study, both in values and world shares. This is due to that the two nations have already acquired the technology know-how through FDI from Japan and other industrialized countries, their production capabilities and capacity have greatly expanded. Today, the two economies play a significant role in the global synthetic fiber exports and have a remarkable export performance in the last decade. Fig. 6 and 7 depict the export performances of synthetic fibers for the two economies.

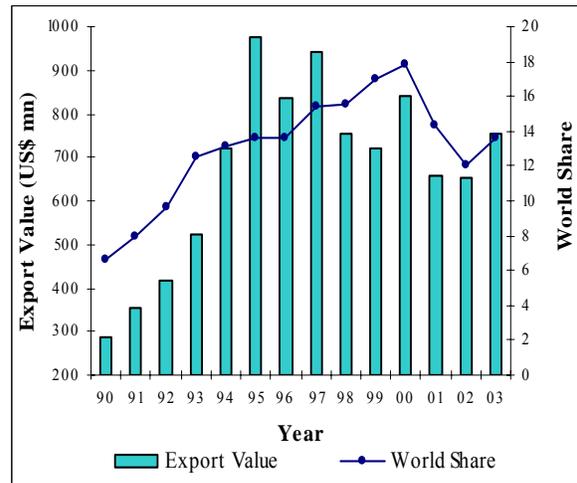

The synthetic fiber exports of Chinese Taipei had experienced a rapid growth during 1990 to 2003, with annual growth rates of 4.3 % in export values and 2.5 % in world shares respectively. In 1990, the country's export in synthetic fibers was valued about US\$400 million, accounting for 9.3 % of world share. During this period, Chinese Taipei was also included within the top-3 exporter in the world synthetic fiber trade. In 2002, her export share was 12.8%, and was regarded as the number one player in the world synthetic fiber export market.

Similar to Chinese Taipei, South Korea also registered an amazing growth in her synthetic fiber exports over the last decade. In 1990, her export value of synthetic fibers was US\$ 286 million and accounted for about 6.7% of the world's total exports. In addition, South Korea also ranked the first position in the world's leading synthetic fiber exporters during 1995 to 2001, with an average world share of 15.3 %. In 2003, South Korea resumed the number 1 exporting position, with US\$ 756.3 million, up 16 % from previous year and constituted about 13.7 % of the world's total synthetic fiber exports.

**Other 2nd-tier Developing Asian Countries**

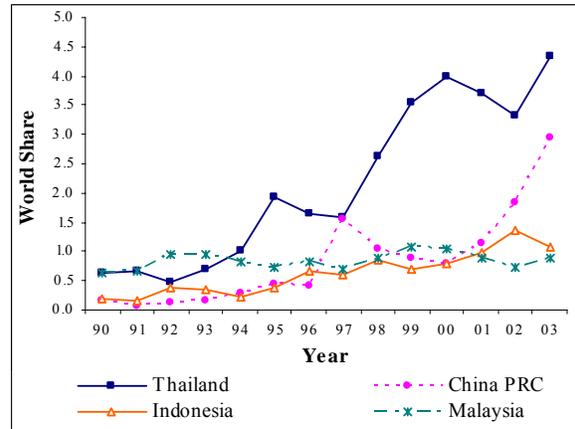

Other 2<sup>nd</sup>-tier developing Asian countries, including China PRC, Indonesia, Malaysia and Thailand, also demonstrated good performance in synthetic fiber exports in the 1990s and their growing trends also extended beyond the new millennium (Fig. 8). The synthetic fiber exports of the selected 2<sup>nd</sup>-tier developing Asian countries valued at about US\$ 70 million in 1990, representing about 1.6% world share. During the 1990s, these countries had actively involved in the world synthetic fiber trade, and registered sharp increases to US\$ 513 million in 2003, which accounted for 9 % of the world’s total.

Fig. 9 depicts the world share of synthetic fibers export of Thailand showing the greatest increase, from 0.64 % in 1990 to 4.3 % in 2003. In the same year, the country assumed the 5<sup>th</sup> position in the global synthetic fiber exports, after South Korea, Chinese Taipei, Japan and the United States.

### Modeling Trend for selected Asian Synthetic Fiber Exporters

The data in the previous section has pointed out that the Asian countries have gained their competitiveness in the world's synthetic fiber exports. Time series regressions were employed to test the trend of the world shares of the selected Asian synthetic fiber exporters from 1990 to 2003, and hence provide a statistical and mathematical model to describe the observed trends. After the analysis, it was found that the synthetic fiber exports trends of the selected Asian countries all showed an overall *increasing* pattern. The trends are modelled with a linear equation  $Y = \beta_0 + \beta_1 T$  and quadratic equation  $Y' = \beta_0 + \beta_1 T + \beta_2 T^2$  respectively. In the equation, Y is the indication for 'World Share' whereas T represents 'Time' and  $T^2$  is 'Square of Time'.

Table 2 lists the selected Asian countries with an overall *increasing* trend for their world shares of synthetic fiber exports, which consist of China PRC, Chinese Taipei, Indonesia, Japan, South Korea and Thailand.

TABLE 2: SELECTED ASIAN SYNTHETIC FIBER EXPORTERS WITH AN OVERALL INCREASING TREND

Country	Model	Adjusted R <sup>2</sup>	Constant	Coefficient
China PRC	$Y = \beta_0 + \beta_1 T$	0.6824	-0.0039	$\beta_1 = 0.0016$
Chinese Taipei		0.6222	0.0994	$\beta_1 = 0.0029$
Indonesia		0.8636	0.0000	$\beta_1 = 0.0029$
Thailand		0.8863	-0.0022	$\beta_1 = 0.0032$
Japan	$Y' = \beta_0 + \beta_1 T + \beta_2 T^2$	0.3448	0.1035	$\beta_1 = 0.0099$ $\beta_2 = -0.0006$
South Korea		0.8602	0.0369	$\beta_1 = 0.0255$ $\beta_2 = -0.0013$

Remarks: Y = world share, T = time

For China PRC, Chinese Taipei, Indonesia and Thailand, their increases can be described with a linear function (i.e. with positive  $\beta_1$  value). The regression models of these countries show reasonably good fitting which adjusted R<sup>2</sup> values ranging from 0.62 to 0.89. On the other hand, the increasing export trends of Japan and South Korea are modelled using a polynomial equation with linear ( $\beta_1$ ) plus quadratic ( $\beta_2$ ) function. In addition, their

coefficients of the linear components ( $\beta_1$ ) are positive, while the quadratic components ( $\beta_2$ ) are negative. The trend for these models can be described as increasing with a diminishing rate of increase.

## **Discussion**

From the above analysis, the world shares of synthetic fiber exports for the selected Asian countries, irrespective of their classifications into developed nation or 1<sup>st</sup>-, 2<sup>nd</sup>- tier developing nations, have shown significant statistical increases during 1990 to 2003. The trading philosophies as suggested by Posner's technology gap model, Vernon's IPLC and FDI reasons are justified for explaining the changing patterns of the world synthetic fiber exports.

### **Developed Nation: Japan**

Japan used to be the world leading synthetic fiber innovator and exporter over the past few decades. Its world share of synthetic fiber exports has increased steadily during 1990 to 2003. Although the country is now facing an intense competition due to the increasing number of developing countries engaged into the global synthetic fiber exports, Japan's leading position in synthetic fibers exporting was not easily be taken away. The key factors for the success of Japan's synthetic fiber industry are her advanced technological level and innovative development [13]. Following the technology-gap theory originated by Posner, innovative products are first initiated in industrial-advanced countries, as they are endowed with highly-educated scientists and abundant capital resources. From the statistics compiled from the Main Science and Technology Indicators of OECD Statistical Database, Japan used to have a comparatively higher R&D/GDP ratio when compared with other industrialized countries, implying that the country has input greater resources in innovative investment and results in strong competitive advantages in the development of new functional synthetic fibers. Nowadays, Japan has started to re-engine her local synthetic fiber industry from mass-produced commodity types into high-end specialty synthetic fibers production. Examples are Sporttech, Homotech and Clothtech [19]. The production technique of the hi-tech synthetic fibers was not easily imitated by other less-developing countries and hence Japan is still able to enjoy her technological advantage in exporting the high value added functional synthetic fibers.

### **1<sup>st</sup>-tier Developing Nations: Chinese Taipei and South Korea**

The sharp increases in synthetic fiber exports for the 1<sup>st</sup>-tier developing countries including Chinese Taipei and South Korea since the mid of 1980s can be explained by Vernon's IPLC model. Since they are the first-wave economies that have already acquired the technology know-how from the industrial-advanced countries coupled with their relatively low labor costs, they have gradually become significant exporters in synthetic fiber exports.

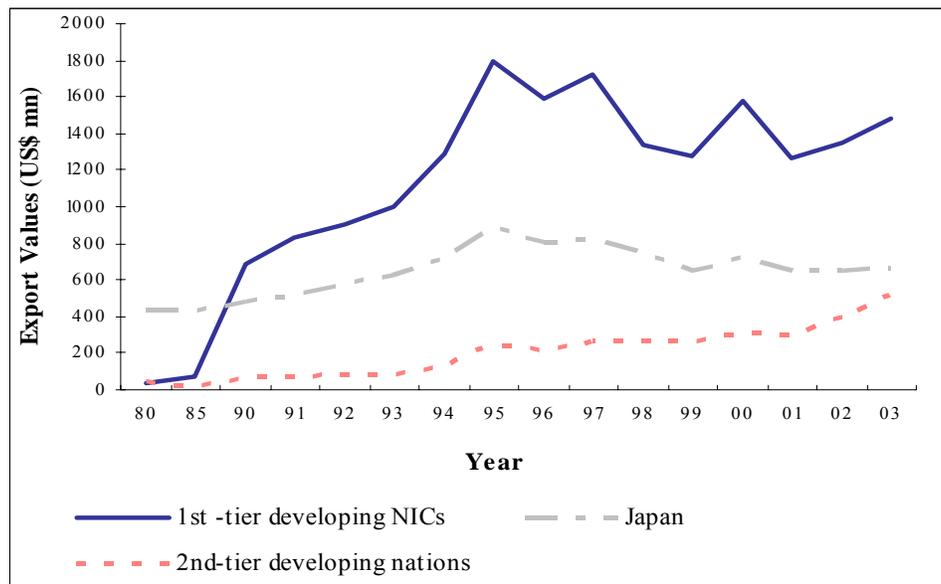

FIG. 11: SYNTHETIC FIBER EXPORTS OF SELECTED ASIAN COUNTRY GROUPINGS, 1980-2003  
 Source: Compiled from Bureau of Foreign Trade [3] and International Trade Statistics Yearbook, various issues [15]

Fig. 11 illustrates the pattern of IPLC for synthetic fiber export trade. At the early stage, the innovating country enjoyed the technology ownership advantage in exporting synthetic fibers. However, this advantage has lost when the technological know-how of producing synthetic fibers is taken up by other 1<sup>st</sup>-tier developing nations, such as Chinese Taipei and South Korea. They played an increasing vital role in the world synthetic fiber export trading and even outperformed the performance of Japan's synthetic fiber export. At a later stage, when the synthetic fibers became standardized products and the production techniques were acquired by lesser developed countries, the 2<sup>nd</sup>-tier developing countries with the advantage of lower labor cost would engage actively in the global synthetic fiber trading.

**2<sup>nd</sup>-tier Developing Nations: China PRC, Malaysia, Indonesia and Thailand**

When the common synthetic fibers become a more standardized product, it is necessary to lower its production costs by shifting the production plants to less-developing countries. In recent years, many MNCs in developed countries have set up offshore subsidiaries in the 2<sup>nd</sup>-tier developing nations through FDI in order to exploit locational, ownership and internalization advantages. The less-developing countries would be benefited through FDI as the technological-advanced home countries have brought the technological know-how and management expertise to the developing host countries. As a result, the production output of the 2<sup>nd</sup>-tier developing countries have enhanced and leading to increases in synthetic fiber exports.

**Conclusion**

In this paper, the synthetic fiber exports of the leading Asian countries have been analysed, using the export data at three-digit SITC level. Results show that the selected Asian countries have experienced significant increases in their world shares of synthetic fiber exports from 1990 to 2003. In addition, some developing Asian economies also have the potential to become leading global synthetic fiber exporters. It is anticipated that the Asian region would become an increasing engaged in synthetic fiber exporting and this trend will continue in the longer-term future.

The analysis also indicated that the potential of synthetic fiber exports in Asia is still great, including the well-developed economy (such as Japan), the 1<sup>st</sup>-tier developing nations (Chinese Taipei and South Korea) and further to the 2<sup>nd</sup>-tier developing countries (China PRC, Indonesia, Thailand etc). These country groupings play

distinct roles in the world's synthetic fiber exporting. The strategy for these Asian countries is to export the *right-type* of synthetic fibers based on their technological levels.

Japan, with a more sophisticated and advanced technological background, has carved out a niche market position by producing and exporting high value added functional synthetic fibers. As indicated by the technology gap model, the country can sustain her technological advantage over the developing fiber producers, and owns the competitive edge in the capital intense synthetic fiber production and export. Similar to the IPLC, the 1<sup>st</sup>-tier Asian developing nations hold the comparative advantages in synthetic fiber exports and have moved up to become leading fiber exporters in the world. In general, the less-developing Asian synthetic fiber producers, enjoying their low cost advantages, have obtained substantially increases in the world shares of synthetic fiber exports over the past decades. The phenomenon was facilitated by the fact that many industrialized countries have made direct investments and established manufacturing plants in the developing countries in order to exploit the advantages of the host countries. Through technology transfer, the developing Asian countries are able to secure new manufacturing technology to improve their productivity and culminated in increases of synthetic fibers exporting.

# The "Impossible Trinity" Cannot Serve as the Theoretical Foundation for China to Choose the Exchange Rate Regime

Huayu Sun

University of International Business and Economics, People's Republic of China

## Abstract

At present, some Chinese and foreign scholars discuss the reform of China's exchange rate regime on the basis of the "impossible trinity" hypothesis that there are not simultaneously perfect capital flows, fixed exchange rate, and monetary independence in an economy. This paper concludes that there is not this "trilemma" but "dilemma" in an open economy, supported by the Mundell-Flemming model and Dornbusch's model of the exchange rate overshooting. Therefore the independence of the monetary policy cannot be the reference for the choice of Chinese exchange rate regime. The author emphasizes that the choice of exchange rate regime can not be decided on the short-run policies performances. As a long-run arrangement, it must be considered that which exchange regime is good for the sustainable economic growth.

## The Study Background of the Relationship between the Proposition of "Impossible Trinity" and the Choice of China's Exchange Rate Regime

China has been maintaining double surpluses in the current account and capital account since 1999. The Official Reserve increased greatly in the last two years and amounted to USD 403.3 billion<sup>1</sup> in the end of 2003, 40.7% up on a year by year basis, or USD 116.8 billion (State Administration of Foreign Exchange of China, 2003), and set a new record in our history. At the same time, the western economy in downturn leads to the rise of trade protectionism with the gradually growing pressure on the appreciation of RMB. Currently, China has broken away from the deflation in domestic economy, with increasing economic growth and some trend of over-heating. The central bank is forced to take measures to sterilize the expansion of base money caused by the increase of foreign exchange reserves in order to prevent over-heating and inflation. The revaluation pressures on RMB are from home and abroad and it has become a hot topic to discuss whether RMB should be appreciated and the RMB exchange rate regime should be adjusted. In the discussion, some believe that China's monetary policy cannot be autonomy with fixed exchange rate and full convertibility of the capital account according to the "Impossible Trinity", namely, the full capital mobility, stable exchange rate and monetary policy autonomy cannot be hold at same time (Hu Zuli, 2003), and draw conclusions as following: In the short run, if RMB exchange rate cannot adjusted, more rigorous capital control would have to be exercised to reduce the sterilization pressure of the central bank, i.e., to maintain the independence of monetary policy at the price of capital mobility; In the long run, China is destined to get integrated into the global economic system thus has no choice but to give up the *de facto* fixed exchange rate regime and turn to the floating one (Eichengreen, 2003) so as to fully solve the revaluation pressure on the RMB.

Just as John Snow, the US Treasury Secretary, says in the meeting with Wen Jiabao on September 3, 2003, "the choice of exchange rate regime is a matter of a nation's internal affairs" which should not be determined by giving in to external political pressures. So, the monetary policy autonomy seems to be a determinant in the choice of exchange rate regime, just in economic consideration. The paper will analyze Mundell-Flemming model (herein after "M-F model") and Dornbusch's Exchange Rate Overshooting model, through which it is revealed that we are not only faced by the trilemma of monetary policy autonomy, stable exchange rate and perfect capital mobility, but also "dilemma in open economy" of missing monetary policy autonomy so long as the economy is opened, thus the monetary policy autonomy cannot serve as the theoretical foundation for choosing exchange rate regime. The "Impossible Trinity" is so simplified with several crucial factors ignored that it will be misleading so long as we are limited to the "Impossible Trinity" in choosing the long-term regime. The author emphasizes that the choice of either fixed or floating exchange rate regime should be a long-term arrangement and could not be determined by short-term policy performance. In stead, consideration should be given to whether the fixed exchange rate regime or the

floating one is more favorable for the continuing economic growth.

The following is an introduction of what the "Impossible Trinity" means, after which the extended M-F model will be used to prove that even the absolute capital immobility cannot ensure the independence of monetary policy in fixed exchange rate regime. Then, Dornbusch's Exchange Rate Overshooting model will be used to discuss that the monetary authorities will be forced to give up the independence of monetary policy by the exchange rate overshoot in the floating exchange rate regime. In the end, the other criteria of choice will be given together with the suggestions for China to choose exchange rate regime in the long run.

### The Meanings of the "Impossible Trinity"

The M-F model is publicly accepted as the theoretical basis for the "Impossible Trinity". The model takes the assumption of full capital mobility and reveals that the quantity of currency is an endogenous variant of the economic system in fixed exchange rate regime and subject to the balance of payments, thus cannot be considered as an anti-economic-cycle tool, while the same is an external one in floating exchange rate regime and can be considered as an anti-economic-cycle tool, and the foreign economy related sectors, however, will have to bear the risk of exchange rate fluctuation. The conclusion is symbolized by an "impossible trinity" as illustrated by Fig.1.

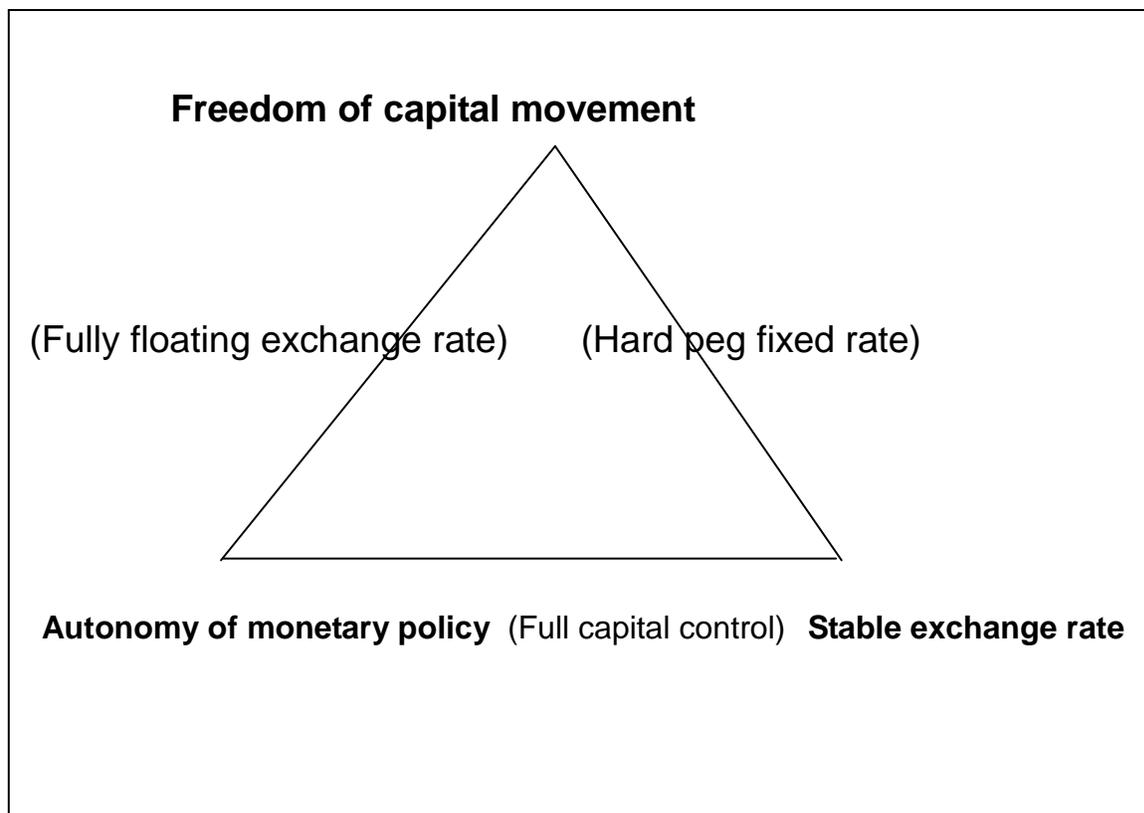

FIG.1: THE "IMPOSSIBLE TRINITY"

The three corners of the trinity above represent the freedom of capital movement, the autonomy of monetary policy and the stability of exchange rate, respectively, which are three positive macro-economic

objectives: The realization of the freedom of capital movement can lead to the integration into the global financial system and improve the efficiency of international capital allocation; The realization of the autonomy of monetary policy means the independence of monetary policy from foreign factors and the free adjustment against the fluctuation of domestic output and price indicators; The realization of the stability of exchange rate can help to stabilize the relative price at home and abroad, which is favorable for international trade and investment. The three sides represent the regimes of capital control, floating exchange rate and hard peg fixed exchange rate<sup>2</sup>, respectively. The proposition of "Impossible Trinity" means that one of the three objectives, namely, the currency policy independence, exchange rate stability and perfect capital mobility, has to be given up, due to the impossibility of realizing them all at the same time.

There some economists explains their idea of the international arrangement of currency and finance regimes on the basis of the "Impossible Trinity". Krugman discusses according to the "Impossible Trinity" that perfect capital mobility has to be abandoned to maintain the stability of exchange rate and the independence of currency policy, providing theoretical support to the post financial countries such as Malaysia to exercise the financial policy of strengthening the capital control. As to the discussion over whether RMB should be appreciated and the related exchange rate regime should be adjusted, Morris Goldstein, the well-known "Mr. Financial Crisis", also uses the "Impossible Trinity" as the basis for his suggestions to China, i.e., to take two strategical steps, of which the first is to turn from directly pegging to the US dollar to a basket of currencies (US dollar, euro, and Japanese Yen) and appreciate RMB by 15-20%, the second is to exit from the peg regime in the long term (about 10 years) and resort to the managed floating exchange rate system with a fluctuating margin of 5-7% (Goldstein and Lardy, 2003). The intuitionistic explanation ability of the "Impossible Trinity" makes it extremely popular in the analysis of exchange rate regime and the related policies and even considered as the fundamental doctrine by some economists.

Theoretically, if there're perfect replaceability between domestic and foreign capital, freedom of capital movement and reliable fixed exchange rate regime, domestic interest rate cannot be autonomously adjusted independent of foreign interest rate due to the arbitraging activities of arbitraging funds which can be seen as indefinite in amount. Therefore, the monetary policy cannot be freely and smoothly applied independent from the external factors and centered around the domestic economic conditions. This is the direct conclusion of uncovered interest rate parity as well as the basic logic of the "Impossible Trinity". The logic, however, can only exclude the simultaneity of the three corners on the "Impossible Trinity" and cannot ensure the coexistence of any two of the corners: e.g., we have no way to draw from the "Impossible Trinity" whether the autonomy of monetary policy will be definitely ensured under the fixed exchange rate regime if we give up the freedom of capital movement, or, whether the independence of monetary policy will be definitely ensured with the perfect capital mobility if we abandon the fixed exchange rate regime. The analysis framework of M-F model on the balance both in the monetary market and commodity market is overturned when Obstfeld, among others, change the valuation criteria on the efficiency of monetary policy from its impact on the output, the prices and the employment to the difference between the interest rate at home and abroad, with nothing but the partial-equilibrium analysis remained. Then, let's return to the basic framework of the M-F model and thoroughly examine performance of the monetary policy in the bottom edge solution<sup>3</sup> of the "Impossible Trinity", we will find that the complete capital control cannot guarantee the long-term efficiency of monetary policy in the fixed exchange rate regime, although the domestic interest rate is shielded from the foreign one.

## The Bottom Edge Solution of the "Impossible Trinity"

The algebraic form of the M-F model is as follows:

$$y = \delta(s+p^*-p)+\gamma y - \theta i + g \quad (1)$$

$$m = \phi y - \lambda i \quad (2)$$

$$\delta(s+p^*-p) - \alpha y = 0 \quad (3)$$

Where

$y$  – The national income;

$s$  – The spot exchange rate, a constant if in the fixed exchange rate regime;

$p^*-p$  – The spread between prices at home and abroad, usually assumed to be constant because the M-F model is a price stickiness one;

$\delta$  - The sensitivity of the current account balance to the real exchange rate,  $\delta$  is positive number with the assumption of Marshall-Lerner conditions;

$\gamma$  – The marginal propensity to spend;

$\theta$  - The sensitivity of investment to the interest rate;

$g$  – The government expenditure;

$m$  – The real money supply, co-determined by the domestic credit and the official reserve;

$\phi$  - The ratio of money demand to the national income;

$\lambda$  - The sensitivity of money demand to the interest rate;

$\alpha$  - The marginal propensity to import.

Equation (1) reveals the relationship between the interest rate and the national income with the equilibrium of commodity market maintained; Equation (2) reveals the relationship between the interest rate and the national income with the equilibrium of money market maintained; Equation (3) reveals the equilibrium of balance of payments with zero current account balance, namely, completely immobile capital.

Equation (3) shows that, with given  $p^*-p$  and  $\delta$ ,  $\alpha$ , there would be a unique national income under the equilibrium of balance of payments, called  $y_0(=\delta(s+p^*-p)/\alpha)$ .  $y_0$  also represents the national income under the automatic economic equilibrium. The reason is that, when  $y > y_0$ ,  $\delta(s+p^*-p)-\alpha y < 0$ , the balance of payments gets in deficit and the official reserve decreases, leading to the decline in the money supply and increase in the interest rate with accordance with equation (2), and then leads to the down turn of national income, until  $y = y_0$ . On the other hand,  $y < y_0$ ,  $\delta(s+p^*-p)-\alpha y > 0$ , the balance of payments gets in surplus and the official reserve decreases, leading to the increase in the money supply the up turn of national income, until  $y = y_0$ .

The target of the monetary policy is the national income under full employment,  $y_f$ , which may be higher or lower than  $y_0$ . When  $y_f > y_0$ , the monetary policy has to be expansionary in order to push the national income from  $y_0$  to  $y_f$ . Once  $y > y_0$ , however, there will be a deficit in the balance of payments, leading the decline in the money supply. Similarly, when  $y_f < y_0$ , the contractionary monetary policy is needed to push  $y$  from  $y_0$  back to  $y_f$ . Once  $y < y_0$ , however, there will be a surplus in the balance of payments, leading the increase in the money supply. The monetary policy is considered as ineffective from the long run because the policy-related money supply cannot be determined or exercised freely toward domestic targets, due to the offsetting effect by the reverse response of the money supply caused by the inequilibrium in the balance of payments.

In the M-F model, the dependence of monetary policy is actually impossible in the fixed exchange rate regime, regardless of the mobility of capital. which means it's from the beginning to open the economy and adopt the fixed exchange rate regime that the central bank cannot fully control its money quantity which become an endogenous variant and subject to the change in the official reserve(sun, 2000). According to the current laws, regulations and policies as well as the actual implementation, partial convertibility of RMB has been realized in the capital account, but the capital movement in the theories such as the M-F model and the "Impossible Trinity" refers only to the short-term financial capital movement caused by the spread between home and foreign interest rates. It's such financial capital that consists the main target of China's foreign exchange control. According to the "Impossible Trinity", the stability of fixed exchange rate and the independence of monetary policy coexist if such financial capital is in absolute control, while the M-F model tells us that the coexistence between the stability of fixed exchange rate and the independence of monetary policy is not ensured even if such financial capital is in absolute control. The practice and experience of our monetary policy supports the conclusion of the M-F model (Ping Xie and Xiao Pu Zhang, 2002). With Krugman making suggestions for the post-crisis East Asian countries to control capital and advocating "the study from China", the People's Bank of China was afflicted at the increase in the money supply hardly effective to defeat the deflation due to the contraction of trade surplus and the decline in the official increase. In 1998 and 1999, deflation emerged in the Chinese economy with CPI declined by 0.8% and 1.4%, respectively, while the increase of the official reserve amounted to only USD6426 and 8505 million, rather low in the history. This margin was lower than the expectation and made it difficult to successfully implement the plan to increase the money supply.

## The Left Edge Solution of the "Impossible Trinity"

Just as illustrated in the left edge of the "Impossible Trinity", the independence of the monetary policy may be realized if the stability of exchange rate is sacrificed. While the M-F model tells us that the independence of the monetary policy may be realized under the floating exchange regime, regardless the mobility of capital. Therefore, the left edge solution is only a special case of the M-F model. Taking full capital movement as an example, when the central bank tighten up money supply and increase the interest rate to control the aggregate demand, foreign capital will be attracted and home currency appreciated, while the official reserve undergoes no change for the lack of foreign exchange interference of from the central bank; In addition to the appreciation of the home currency causing the net export to decrease in the end, the increase in the interest rate will leads to the down turn of investment, thus the aggregate demand will be contracted and the monetary policy takes effect. So, it seems that the left edge solution of the "Impossible Trinity" does exist. In the case study, however, Frankel, among others, none of the countries enjoys the independence of monetary policy with the exception of the largest 4 or 5 ones, no matter they adopt fixed or floating exchange rate regime (Frankel, Schmukler and Servén, 2002); Surprisingly, some sample analysis even shows that certain countries which adopt floating exchange rate regime are not as independent as the ones which adopt fixed exchange rate regime. Why most of the countries with the floating regime "enjoys" no independence of monetary policy?

Dornbusch drew a conclusion that exchange rate overshooting arises from the change of monetary policy under floating exchange rate regime, on the basis of the M-F model and several assumptions such as the rational expectation, the stagnant response of the production sector to the price change and the quick response of the monetary sector the price change. Such overshooting can lead to instability which may cause the improper allocation of home and foreign resources as well as the excess speculation in the foreign exchange market, thus disordering the impact mechanism of exchange rate fluctuation on the aggregate demand and the central bank will have to interfere the excessive exchange rate fluctuation with the independence of monetary policy gained at the price of exchange rate stability. For example, Japan, our neighbor, is a publicly accepted country under floating exchange rate regime, but it's central bank bought US Dollars as much as 150 billion just in the period from January to November in 2003 in order to prevent the excessive appreciation of Japanese yen against US dollar. Therefore, the countries practicing floating exchange rate regime cannot "enjoy" the theoretical independence of monetary policy without consideration of the external factors.

The following part introduces the exchange rate overshooting with the help of the said M-F model:

$$y = \delta(s+p^*-p) + \gamma y - \theta i + g \quad (4)$$

$$m = \phi y - \lambda i \quad (5)$$

$$\delta(s+p^*-p) - \alpha y + k(i-i^*) = 0 \quad (6)$$

$k(i-i^*)$  in equation (6) represents the balance of the capital account, where  $i-i^*$  is the spread between the home and foreign interest rates,  $k$  is the sensitivity of the balance of the capital account to the spread between the home and foreign interest rate, which infinite under the condition of full capital mobility.

The national income undergoes no change at the beginning of the increase in the money supply the whole of which is absorbed by the decline in home interest rate. Equation (6) reveals that the large scale of capital outflow and the sharp depreciation of home currency is caused by the decline in home interest rate. From equation (4) we can see the decrease of home interest rate and the depreciation of home currency are sure to cause the increase of the national income, while from equation (5) we can see the recovery of interest rate will occur as the national income increases. The exchange rate will decrease according to the interest rate parity. The market participants are rational in Dornbusch's model and exactly predict the ultimate result of the exchange rate change at the beginning of the monetary policy execution, thus the expected exchange rate is adjusted to the ultimate level instantly with the sharp devaluation of the spot rate followed by a gradual appreciation, i.e., the exchange rate overshooting refers to the phenomenon that the instant adjustment of the spot rate exceeds the long-term equilibrium level. Such a theory is considered to have reflected the facts of the repeated fluctuation in the foreign exchange market, providing the basis for the floating regime countries to interfere with the market.

The positive role that the stability of exchange rate plays on international trade and investment makes the developing countries as well as the emerging market ones try every means of management even if they publicly declare the exercise of floating exchange rate, with the behavior of "the fear of floating" and the monetary policy not dedicated to the home economic cycle. Therefore, the floating exchange rate regime is not a sufficient condition for the independence of the monetary policy. The monetary policy not independent in open economy is very common in the real world, which is called "the open economy dilemma". Since the change of independence of the monetary policy is not subject to the exchange rate regime (floating or fixed) in the open economy, the independence of monetary policy cannot serve as the basis for choosing the exchange rate regime.

### **Outside the "Impossible Trinity"**

If we accept the conclusion of common dependence of the monetary policy in the open economy, the anti-economic cycle measures should not rely too much on monetary policy in the world economy which actually is closed economy, and the independence of monetary policy cannot serve as the choice of exchange rate regime. We have to take into account the effect of the fiscal policy if we still want to use the performance of anti-economic measures under different exchange rate regimes as the key criteria for choosing a proper regime.

According to the M-F model, if fixed exchange rate regime is adopted, the stronger capital mobility will mean the better effect of the fiscal policy; The fiscal policy will be fully effective under full mobility of capital mobility, and absolutely ineffective under entire capital immobility. If floating exchange rate regime is adopted, the stronger capital mobility will mean the worse effect of the fiscal policy; The fiscal policy will be absolutely ineffective under full mobility of capital mobility, and fully effective under entire capital immobility. We tend to choose the fixed regime if we use the effect of the fiscal policy as the criterion. A wrong conclusion may arise from the choice of exchange rate regime on the basis of the "Impossible Trinity" which just deals with the relationship between the fixed exchange rate regime and the independence of the monetary policy and does not cover all the other elements necessary for the choice of the exchange rate regime.

Besides the policy effects of the anti-economic measures, the merits and demerits of the floating and fixed exchange rate regime can be examined from several aspects. For example, the floating regime may help shielding from the external impact with the exchange rate determined by the market itself, featuring, among others, more transparency without the need to maintain a large sum of official reserve and providing "the incentives for hedging" to stimulate the development of the foreign exchange market and prevent the currency fluctuation, while such a regime is not favorable for the international trade and investment and the speculating and arbitraging activities may cause the exchange rate to depart from the economic fundamentals, thus the negative effects to the economic development may arise from the independent monetary policy without proper regulation. On the other hand, the fixed regime can reduce the uncertainty of the exchange rate fluctuation and cut down the trading cost and risk, favorable to the international trade and investment; The exchange rate can be seen as a nominal anchor enhancing the trust of the public toward the anti-inflation policy of the central bank. Such a regime, however, may be subject to some instability in face of continuing external impact, and certain costs have to be born to maintain the fixed exchange rate. The main reflections are the frequent interference from the central bank in the foreign exchange market, the financial costs arising from the sterilization and the efficiency loss possibly caused by the capital control.

The choice of exchange rate regime is a long-term regime arrangement, the most fundamental and important of which is to be suited to the long-term targets of the economic growth. Theoretically, it's the economic regime that exerts significant influence on the long-term trend of the economic growth, while the economic policy just serves to smooth the economic cycle with short-term effects. The following is a description of difference between the economic regime and policy in the long run, based on Fig.2:

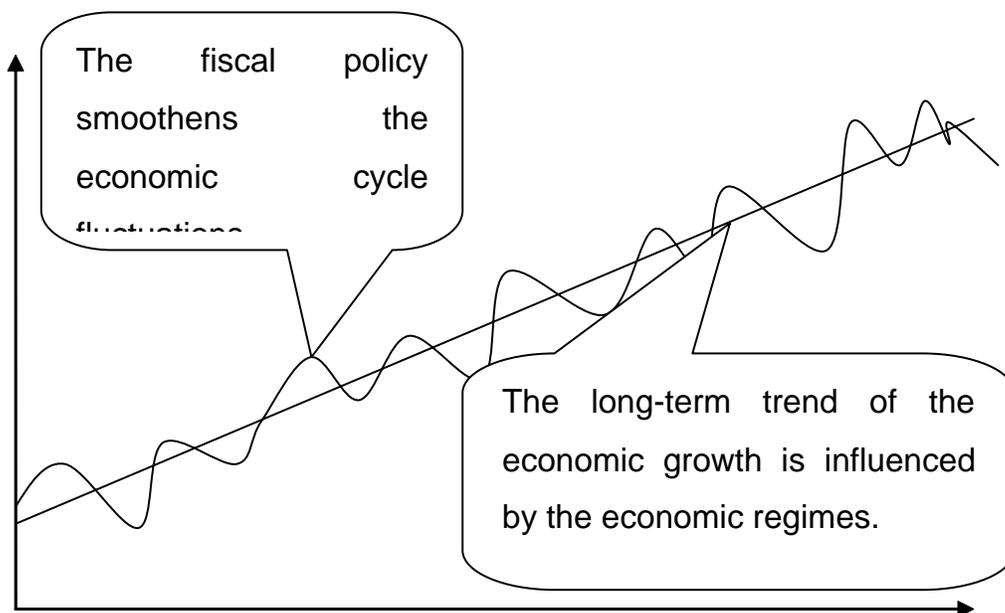

Fig.2 THE ROLE PLAYED BY THE ECONOMIC SYSTEM AND POLICIES IN THE LONG RUN

The exchange risk transferred from the private sector to the government under the fixed exchange rate regime reduces the market uncertainty and trade cost, favorable to the international trade and investment as well as the reasonable allocation of the economic resources, thus the trend of economic growth is enhanced in the long run. It's shown from the history that the high mobility of the global capital facilitated the reasonable allocation of the global capital and favored the economic growth under fixed exchange rate regimes such as the gold standard and the Bretton Woods system (Obstfeld and Taylor,2002). While according to the recent research data of 153 countries during the period of 1970-2001, the average level of the regions under limited floating and pegged exchange rate regimes<sup>4</sup> placed the first and second in the real per capita GDP growth and the ratio of the import and export to GDP; At the same time, the limited floating regime featured the lowest inflation followed by the pegged one. Generally, the limited and the pegged regimes performs the best (Reinhart and Rogoff,2002). The end of the gold standard system was followed by the establishment of the Bretton Woods system and the collapse of the Bretton Woods system was then followed by the European currency mechanism developing to the present unified currency of euro. The evolution of the international currency system reflects the perseverant pursuit of the countries to the fixed exchange rate regime. Such a preference should not be explained with the psychological needs for stability, but the facilitating role of such a regime to the economic base.

## Conclusion

Based on the M-F model and Dornbusch's exchange rate overshooting model, the paper discusses the relationship between the monetary policy independence and the exchange rate regime and concludes that the "Impossible Trinity" cannot serve as the basis for China to choose the exchange rate regime because the independence of the

monetary policy is ensured by neither the floating exchange rate regime nor the full capital control. With the irreversibility of China's economic opening, our monetary policy is destined to be influenced and limited by the foreign economy, which means that the policy makers have to try every means to solve the problem rather than rely on certain exchange rate regime to avoid such a difficulty.

The "single, managed floating exchange rate regime" established in 1994 was compliant with the characteristics of our current economic system, the capacity of the our enterprises and the standards of our financial supervision. China's monetary policy has undergone the target conversion from anti-inflation to anti-deflation in the past 10 years and becomes increasingly mature and visible effects as a whole, although limited by the exchange rate regime. It's true that we have to improve the imperfect aspects of the RMB exchange rate mechanism such as the lack of healthiness in the exchange rate mechanism, the poor exchange rate risk consciousness of the enterprises and the residents, the lack of tools to avoid the market risks, which does not mean, however, the need to radically overturn the RMB exchange rate mechanism. With the further market orientation of China' economy, the exchange rate management skills of the policy makers are believed to be increasingly perfect.

## End Notes

<sup>1</sup>It does not include the USD 45 billion of asset injection into the Bank of China and the China Construction Bank.

<sup>2</sup>The currency board regime, dollarization regime and the single currency regime can be called hard peg fixed exchange rate regime.

<sup>3</sup>As illustrated by the bottom edge of the "Impossible Trinity", the monetary policy should be an independent one in the fixed exchange rate regime if capital control is exercised completely, while the M-F model tells us that the freedom is still not ensured. Please see the following analysis for more details.

<sup>4</sup>It's classified according to the IMF standard.

# The Uncertain Factors in Weakening the Trade Effects on China of China-ASEAN FTA

*Tang Yihong*

*Wang Weiwei*

*University of International Business and Economics (UIBE), China*

## Abstract

The Association of South-East Asian Nations (ASEAN) and China endeavor to speed up trade liberalization by making Free Trade Arrangements. Generally, the economic integration will promote trade and investment in the integrated market. In fact, there are several uncertain factors for the trade effects on China of the China-ASEAN Free Trade Area (CAFTA). Firstly, it is inevitable that countries involved will encounter a certain amount of barriers except tariff, for government have to take many kinds of measures to protect themselves in order to balance the relationship between FTA and the benefit of the country. Secondly, there is competition in the substitutes of goods between China and ASEAN members in the ASEAN market. Thirdly, there is competition in ASEAN market with other countries, which signed FTA with ASEAN, such as Korea, Japan, India and USA. These countries are ASEAN's major trading partners and are seeking further cooperation with ASEAN.

## Introduction

The Association of South-East Asian Nations (ASEAN) and China endeavor to speed up trade liberalization by making Free Trade Arrangements, apparently they have come to consensus that their joint development is to create greater benefits.

There are many viewpoints about the effects of trade liberalization. Some studies provide evidence that increasing openness of an economy has a favorable impact on economic growth (Grossman and Helpman, 1991; Romer, 1992, Frankel and Romer, 1999). A domestic economy that is more open to world trade may grow faster to have a positive impact on GDP growth (Jang C.Jin, 2004). Arivind Panagariya (2004) suggested that sustained growth cannot be achieved without rapid growth in trade, which requires either low or decline barriers to trade.

As one phase of trade liberalization, FTA has drawn lots of interests. In recent attempts to capture the effects of China-ASEAN FTA with gravity model, Yang Changzhi (2003) explored the trade potential in China-ASEAN FTA and pointed out that there is excess trade between China and ASEAN countries at present. It means that the FTA is deficient in trade potential and trade volume between China and ASEAN would not increase in future. So we should be cautious of building China-ASEAN FTA. Chen Wen (2003) indicated that the establishment of China-ASEAN FTA would put many of its members in more direct competition with China in export markets and in terms of attracting foreign investment.

In contrast, Benjamin A. Roberts (2004) used the results of the Gravity model explaining trade flows within China-ASEAN Free Trade Area (CAFTA), and exhibited that trading partners are likely to gain following formation of the FTA in 2010. Besides, convergence in China and ASEAN countries' income level would maximum their benefits. However, the model revealed a rather insignificant effect in terms of the potential trade creation that could result from the integration. Naohiro Yashiro and Kiyota Kozo (2002) used a computable general equilibrium (CGE) model, illustrating that there were likely to be net benefits for both China and ASEAN members from China-ASEAN FTA in 2010<sup>1</sup>.

What kind of standpoints is true about the trade effects on China of the China-ASEAN FTA? This paper aims to explain the uncertainty of trade effects in China-ASEAN integration. Section I is introduction. Section II gives a glance at the background of China and ASEAN integration. Section III analyzes the uncertain factors in weakening the trade effects on China of China-ASEAN FTA. Section IV concludes with an overall summary.

## **Background of China-ASEAN Integration**

### **The Process of China-ASEAN Integration**

ASEAN was founded in August 1967 with the signature of the Bangkok declaration by five original member nations (Indonesia, Malaysia, Philippines, Singapore and Thailand). In 1984, Brunei Darussalam was admitted as the sixth member. In 1995, Vietnam also joined ASEAN. Lao People's Democratic Republic and Burma became members in 1997. With Cambodia's admission in 1999 ASEAN expands to 10 countries. ASEAN has proved to be one of the most successful regional groupings in terms of regional cooperation (See Table 1).

Before the 1990s, there was no official relationship between the ASEAN as a grouping and China, although China had official relations with certain individual ASEAN member states on a bilateral basis. China pushed for official ties with the ASEAN grouping in 1990s. In 1991, China founded or recovered its diplomatic relations with all ASEAN members. In 1996, China was upgraded as a dialogue partner of ASEAN. In 2000, China initiated its will to establish a Free Trade Area (FTA) with ASEAN. In 2001, China formally put forward the proposal to establish FTA with ASEAN and got an active response. In November 2002, China and ASEAN signed Framework Agreement on China-ASEAN Comprehensive Economic Cooperation at the Sixth China-ASEAN Summit in Cambodia—it was a breakthrough in East Asia's regional economic co-operation as well as a milestone in China-ASEAN relations. In October 2003, China joined 'Treaty of Amity and Cooperation in Southeast Asia' (TAC), and bilateral relations are upgraded as 'a strategic partnership toward peace and prosperity'. China signed an agreement on Trading in Goods of the Framework Agreement on Comprehensive Economic Cooperation with ASEAN on 29 November 2004. The agreement is set to reduce and eliminate tariffs on trade in goods between the parties, and establish a mechanism to adjudicate ASEAN-China trade disputes. Tariff cuts started 1 July 2005, and will aim to axe duties on some 4000 types of goods to between zero and five percent by 2010 for the six most advanced ASEAN members, i.e., Brunei Darussalam and five original member nations. The four poorer member states—Laos, Vietnam, Cambodia, and Myanmar (Burma)—will have to comply until 2015. Notably, tariffs on several 'sensitive goods,' including important sectors such as sugar, iron, steel, and cars, will not be subject to the same steep tariff reductions. The objective of the China-ASEAN FTA agreement is to create a FTA by the year 2010. Thus the largest FTA in the world will be born. There are 1.8 billion people and GDP of USD 2 trillion in 2004 (See Table2 ). If plans work out, the integration will unleash tremendous economic energy, create business opportunities, promote trade, investment and development between China and ASEAN.

ASEAN-China trade has expanded rapidly since ASEAN accorded China Full Dialogue Partner status in 1996. Statistics from the Ministry of Commerce show that since 1990, ASEAN has become China's fifth largest trade partner, and China the sixth of the ASEAN. From 1978 to 2003, ASEAN's total trade with China increased by nearly 90 times with a bilateral trade amount of 78.2 billion dollars in 2003 (See Table 3), in which China exported US\$30.9 billion to ASEAN and imported US\$ 47.3 billion from ASEAN. Trade volumes in the first 10 months of 2004 hit US\$84.61 billion, up 35.2 per cent over the same period 2003.

### The Momentum of China-ASEAN Integration

China has enjoyed one of the highest rates of growth in the world over the past decades. WTO accession makes Chinese economic system more transparent accountable and also potential, thus more attractive to the investors. The experience of China's WTO accession shows that China has high capacity to meet the challenge from liberalization of the market. In recent years, China has been going up and up to the 3rd place in the world trade in 2004. China's sustained and fast economic growth maintains a vigorous momentum of interregional trade in Asia. However, China's foreign trade is still faced with challenges. There is an obvious gap between China and other strong trade countries. For instance, the way in the trade increase is rough and unrefined with quality and efficiency to be further improved; export at a relatively low level with quite a few products of no high added value. China is facing an increasing pressure from resources and environment. The economic integration is the channel of seeking resources.

ASEAN has abundant natural resources. Its members produce about 95 per cent of the world's abaca, 85 per cent of its natural rubber, 83 per cent of its palm oil, 67 per cent of its tin and copra, 60 per cent of its copper along with substantial quantities of sugar, coffee, timber, various fruits, rice and minerals.<sup>ii</sup> The region is a developing and free market with a strong potential demand for consumer goods, capital goods and technical skills. ASEAN's key position in the Asia-Pacific region and its important economic weight have made it an essential partner for China in Asia. China's trade with its Southeast neighbors has prospered since 1990, enjoying a 20 per cent annual average rise.

ASEAN countries are China's neighbors and most ASEAN countries are developing countries as well. Geographic closeness and similar culture backgrounds made the economic relations between China and ASEAN countries steadier. The great consumer market of the FTA will help ensure the fast growing momentum of the two economies.

China-ASEAN Free Trade Area reduced tariff rate. Table 4 indicates that the ASEAN average tariff rate was approximately 2.68 percent in 2003, quickly down from 3.25 percent in 2002 before the start of the tariff reduction program. And the decreasing trend of average tariff would keep on.

TABLE 4: AVERAGE TARIFF RATES OF ASEAN ECONOMIES\*

	Average AFTA Tariff Rates (%)					
	1998	1999	2000	2001	2002	2003
Brunei	1.35	1.29	1.00	0.97	0.94	0.87
Indonesia	7.04	5.85	4.97	4.63	4.20	3.71
Laos	5.00	5.00	5.00	5.00	5.00	5.00
Malaysia	3.58	3.17	2.73	2.54	2.38	2.06
Myanmar	4.47	4.45	4.38	3.32	3.31	3.19
Philippines	7.96	7.00	5.59	5.07	4.80	3.75
Singapore	0.00	0.00	0.00	0.00	0.00	0.00
Thailand	10.56	9.75	7.40	7.36	6.02	4.64
Vietnam	6.06	3.78	3.30	2.90	2.89	2.02
ASEAN	5.37	4.77	3.87	3.65	3.25	2.68

Note:

\* Under the framework agreement on economic cooperation (2002), China and ASEAN agreed to first carry out an 'early harvest package' over three years. According to the plan, over 500 kinds of commodities, mainly agricultural produces, will have reduced duties between zero percent and five percent by 2006.

Source: ASEAN Secretariat, available at <http://www.aseansec.org>

In the case of the FTA, the reductions in trade barriers increase the competitiveness of imports from the other parties. Consequently, any resulting rise in imports from parties of the agreement may displace either domestic production or imports from other countries. The displacement of domestic production is trade creation because it results in a net increase in trade. And the displacement of imports from other countries is trade diversion. The China-ASEAN FTA will allow all members to enjoy the benefits from trade effects, that is, enjoy more favorable trade and investment treatment than the World Trade Organization can offer. A figure released by the ASEAN Secretariat shows that both export and economic growth will see a positive growth. China's export to ASEAN will increase by 55.1% while ASEAN' export to China will increase by 48% if the FTA is established.

However, we should pay more attention to the uncertain factors influencing the trade effects on China of China-ASEAN FTA.

## Uncertain Factors

### **It is Inevitable that China will encounter a Certain Amount of other Barriers except for Tariff**

Financial crisis in late 1990s damaged ASEAN's economy, and accordingly, a large amount of outflow of foreign investments from ASEAN weakened its competitiveness. Meanwhile, China keeps a high economic growth and its product competitiveness is greatly enhanced. China's rising strength in competitiveness and export power is being felt the world over, with talks of China being the 'factory of the world', and a 'black-hole for FDI'. According to the Wall Street Journal, Southeast Asia receives only 10 percent of direct US investment, falling from nearly 75 percent just 10 years ago. Instead, China attracts 80 percent of resources from the US companies. The rising influence of the Chinese economy with its consequent short-term and long-term impact on the economies in ASEAN has caused great concern, and ASEAN members have a strong incentive to protect its disadvantageous products when they face competition from the fast growing markets in China. For example, Indonesian union groups, however, called China-ASEAN integration a 'disaster', warning that a flood of cheap Chinese goods into Indonesian markets would lead to hundreds of thousands of lost jobs. China takes obvious advantages in textiles, clothing, shoes, foods, corn, architectural materials, home electric appliances, and has a potential advantage in machinery-electric equipments, precision instruments, clock and watch, vehicle, metal products and chemical products. Malaysia has begun to impose high anti-dumping tariffs on China's bicycles. After each of the ten ASEAN members formally recognized China as a full market economy, it was far harder for them to impose anti-dumping duties against China's export products. So there must be other forms of trade barriers, which would affect the trade effect between China and ASEAN.

Plus, large economic disparities between the ASEAN members also caused various forms of trade protection. In order to survive, firms of ASEAN members will seek the best business environment, over which they have little control. Thus the search for the favorable business environment will prompt governments to make efforts to provide it. In this way, governments of ASEAN members will be drawn into competition. In the case free trade agreement brought keen competition and did not adapt to industry development strategy of one country, the government would play a role of harmonizer between FTA and the benefit of the country. There are divergences of ASEAN trade policies, for example, Singapore and Thailand is more open in terms of trade policy; Malaysia takes import-substitution and anti-dumping policies; Laos, Myanmar and Cambodia are still restricted by the traditional non-market systems and cannot bear the impact from trade liberalization. All these factors may lead to frictions between China and ASEAN.

It is believed that the liberal trade order and Multilateralism is strengthening, the respective countries' policies are being regularly reviewed, the dispute settlement arrangements have been strengthened, and the economic integration tends to weaken the autonomy of involved governments, especially their power to control at the border the in-and outflow of goods, services, factors of production, and so on. But involved governments face the dilemma of being torn between strengthening free trade policies and preserving national autonomy. Protectionism in major trading countries is rising and the regional market would become too complex to forecast.

**There is Competition in the Substitutes between China and ASEAN Members in the ASEAN Market**

In ASEAN market, export products of China and ASEAN 6<sup>iii</sup> are substitute or complementary.

According to statistics, 20 major export commodities accounted for 61.7 percent of China's export volume to ASEAN 6, and 20 major import commodities accounted for 67.9 percent of China's import from ASEAN 6 in 2003. Among the twenty major commodities, 15 kinds of products were different and accounted for 32.3 and 31.7 percent of China's total export and import volume to and from ASEAN 6 respectively.<sup>iv</sup> It means that although China and some ASEAN members have similar resource endowment, similar foreign trade strategy, similar export pattern and economy development strategy, they are complementary in export products to some extent.

Especially, we pay close attention to the competition in substitutes between China and ASEAN members in the ASEAN market.

According to the classification of World Bank, Cambodia, Laos, Myanmar and Vietnam are Low Income Economies; Indonesia, Thailand and Philippines are Low Middle Income Economies; Malaysia is a Middle Income Economy; and Singapore and Brunei are High Income Economies (Benjamin A. Roberts, 2004). Basing on the H-O factor endowments model, a country shall specialize in and export products, which uses intensively abundant factors of production. The less developed ASEAN members should specialize in unskilled labor-intensive, natural resource-intensive products, such as textiles, footwear, agricultural and mineral products. China's industry structure is similar to that of Indonesia, Thailand, Malaysia and Philippines. As a result there would exist drastic competition and substitute between export of China and ASEAN members, especially in horizontal intra-industry trade.

In China-ASEAN trade, ASEAN is running a large bilateral trade surplus with China (4.85 billion USD in 2001) and the amount of the surplus keeps increasing in recent years. China's export of agricultural goods to ASEAN has the downward trend recently, and China's deficits are increasing in the agricultural trade. Except for its abundant agricultural produces, China has been an important exporter of machinery and electrical equipment, garments and accessories, high-tech products, textile raw materials and products in world. As a result of FTA, Chinese products entered ASEAN market in a large scale while some ASEAN's advantageous products enter into Chinese market.

Differences in trade specialization between China and ASEAN are illustrated by the index of revealed comparative advantage (RCA)<sup>v</sup>:

$$RCA = \left( \frac{X_{ij}}{X_i} \right) - \left( \frac{M_{ij}}{M_i} \right)$$

where

$X_{ij}$  is the amount of export to ASEAN of products j of country i;

$M_{ij}$  is the amount of imports from ASEAN of products  $j$  of country  $i$ ;

$X_i$  is total volume of exports to ASEAN of country  $i$ ;

$M_i$  is total volume of imports from ASEAN of country  $i$ ;

The export structures of China and ASEAN 6 are similar to some extent, especially in ASEAN market. ASEAN 6's biggest gains are textiles and apparel, electrical appliances and machinery, and other manufactures. In 2003, ASEAN 6's top 20 export products to ASEAN account for 61.2 percent of its total export to ASEAN, and China's top 20 export products to ASEAN market account for 61.7 percent of its total export to ASEAN (See Table 5). In the leading 20 products of China and ASEAN 6 exporting to ASEAN, 11 kinds of the products are the same, such as office machines, Petroleum oils, electrical equipments, and telecommunications equipments, etc. The 11 kinds of products account for 51 percent of China's total export and 52.3 percent of ASEAN 6's total export to ASEAN market. The figures indicate that ASEAN 6 is an important competitor in ASEAN market for China especially in the products China and ASEAN 6 both export to ASEAN in large quantity. The RCA analysis indicates China's strength in the office machinery, telecommunication equipments and weakness in crude oil and some labor-intensive products, which had been the absolute advantages of China (see Table 6). China's exports to ASEAN are dominated by low-tech goods (including toys, furniture, plastics, steel, textiles, garments, and footwear), although engineering and electronics have grown rapidly recently. China would lose market share compared to ASEAN members' exports in ASEAN if its export structure remains the same as it is at present.

TABLE 5: TWENTY MAJOR EXPORT COMMODITIES OF CHINA AND ASEAN TO ASEAN MARKET BY 3 Digits-SITC CODE (2003)

China				ASEAN 6

### There is Competition in ASEAN Market with other Countries which Sign Free Trade Agreements with ASEAN

ASEAN has negotiated on FTA not only with China, but also with Japan, India and USA respectively (See Table 7). It means Chinese export products are facing competition with foreign products drastically in the ASEAN market. In fact, ASEAN's major trading partners (See Table 8) are seeking further cooperation with it and struggling to have better access to ASEAN market, for they knew the value of the ASEAN market well. It will weaken the advantages of China in ASEAN market.

TABLE 7: SOME BILATERAL AND SUB-REGIONAL FTA OF ECONOMIES IN ASIA-PACIFIC AND EAST ASIA

Source: Lu Jianren (2004)

Japan, India and ASEAN announced trade deals of their own. Japan, ASEAN's largest trading partner and investor, announced that it will start tariff-cutting talks with ASEAN in April 2005, with the objective of liberalizing trade in goods by 2012. India signed a comprehensive agreement with ASEAN called the 'ASEAN-India Partnership for Peace, Progress and Shared Prosperity', which plans to establish an ASEAN-India free trade area by 2011 for five of the six advanced ASEAN members and by 2016 for the Philippines and the four less advanced member states. The United States has been the largest export market and major source of foreign investment of ASEAN 6 (Brunei, Indonesia, Malaysia, Philippines, Singapore and Thailand). The significant US-ASEAN 6 bilateral trade is largely due to a substantial inter-industry trade owing to strong economic complementarities. ASEAN 6 countries are major exporters of such goods as petroleum, rubber, tin, textiles, garments and other labor-intensive products, and those items are imported by the US. The US in turn exports capital-intensive and technology-intensive goods such as chemicals, electrical and non-electrical goods. Although a recent study by the Asia-Pacific Economic Cooperation (APEC) business advisory group concluded that the US stands to be the biggest loser if the ASEAN+3 free trade area<sup>vi</sup> is successfully established, the US-ASEAN Business Council has long supported the ASEAN Free Trade Area and other initiatives to promote regional economic integration. The Council knew well that with ten integrated markets with a population exceeding half a billion people, ASEAN will be much more attractive than it would as a collection of relatively small, segmented markets.

Just as mentioned in table 7, the countries having signed FTA agreements with ASEAN economies or in the process of establishing FTA with ASEAN economies, such as Korea, Japan, India and USA, would be competitive rivals in ASEAN market with China. The trade effects of China-ASEAN FTA not only depend heavily on whether an ASEAN member is in a complementary or competitive relationship with China, but also depend on competition of China and ASEAN's other trading partners. If the composition of their export and import items is similar to that of China, the relationship is substitute and competitive in the ASEAN market. Until now it seems that China is not in a competitive position with the advanced countries such as USA, Japan and EU in ASEAN market, because export products of the advanced countries to ASEAN are mostly capital-intensive and technology-intensive, and the leading export products of China are labor-intensive and land-intensive. But competition is coming. If China countries want to sustain its economic development, it must make adjustments to the industrial structure. Thus with the upgrading and optimizing of China's industry structure, the export products pattern of China is changing accordingly. China has experienced ceaseless optimization of the export product structure with the products of highly added value and high-techs to become the new growth point in pushing forward the foreign trade and economy. The share of Capital-intensive and technology-intensive products is also rising. New competition with advanced countries arises.

TABLE 8: ASEAN IMPORTS BY COUNTRY OF ORIGIN

Country of Origin	1995		1999		2003	
	Value	Share (%)	Value	Share (%)	Value	Share (%)
South Korea	11,345.6	3.56	12,277.9	4.36	15,036.6	4.18

## Conclusion

The objective of this paper is to analyze uncertain factors in weakening the trade effects on China of China-ASEAN FTA. There are three important uncertain factors: other barriers except for tariff; competition in the substitutes between China and ASEAN members in the ASEAN market; competition from other countries signing FTA

agreements with ASEAN members. It is well known that it is possible to benefit, but it doesn't guarantee that each party involved will benefit as expected and enjoy the same benefit. The uncertain factors should not be ignored.

<sup>iii</sup> ASEAN 6 are Brunei, Indonesia, Malaysia, Philippines, Singapore and Thailand. The trade volume of the other four countries (Cambodia, Darussalam, Lao People's Democratic Republic and Vietnam ) with China is too small to calculate.

<sup>iv</sup> Source: ASEAN Statistical Yearbook, 2004

<sup>v</sup> There are other forms of RCA index such as  $RCA_{ij} = (X_{ij}/X_i)/(X_{wj}/X_w)$  where  $X_{ij}$  is the amount of export to world of products j of country i;  $X_i$  is total volume of exports to world of country i;  $X_{wj}$  is the amount of exports of products j of world;  $M_i$  is total volume of exports of world. It indicates that products j of country i is of stronger comparative advantage when  $RCA_{ij} > 1$  and of comparative disadvantage when  $RCA_{ij} < 1$ .

<sup>vi</sup> A free trade zone to be established among the ASEAN countries with China, Japan and Korea.

# Understanding Competitive Advantage in the EDA Industry: The Role of Indian Subsidiaries of MNCs

*S Raghunath*  
*Indian Institute of Management, India*  
*C Shankar*  
*Ernst & Young, India*

## Abstract

This study examines the drivers of competitive advantage within the EDA industry. Specifically, the authors examine the industry structure and find that three firms controlled more than eighty per cent of the industry. The findings from the field exploratory study of the Indian subsidiaries of these three firms reveal that their roles related to the following: developing tools with emphasis on lean production; developing “yet-to-be-commercialized” tools; developing support centres for tools with focus on cost-cutting. Through their strategic actions relating to the capabilities and customer relationships that the subsidiaries of MNCs developed and deployed, they could establish advantageous competitive positions utilizing low cost locational advantage and local talent aiming to achieve economies of scope.

## Introduction

The service sector's share of international investment has grown rapidly. With the increasing importance of services firms there is a need to develop an understanding of the competitive advantage as well as the role of foreign subsidiaries in the internationalization of such firms. This paper focuses on services firms in a technology-intensive industry known as the Electronic Design Automation or EDA industry. EDA is an acronym coined for Electronic Design Automation and refers to the category of tools used for designing and producing electronic systems ranging from printed circuit boards (PCBs) to integrated circuits (ICs). It is a complex and highly leveraged technology that enables the electronics industry to handle design complexity; enabling faster time-to-market; higher productivity, accuracy & efficiency. The term EDA is also used as an umbrella term for computer-aided engineering, computer-aided design and computer-aided manufacturing of electronics in the discipline of electrical engineering.

The EDA industry is essentially a service industry in the sense that its manner of growth depends on the direction and strength of the industry it serves, viz. the semiconductor manufacturing industry. The semiconductor industry has always been and will always be the primary motivator of growth in the EDA industry. The semiconductor industry impacts the EDA industry by providing new capabilities that support the fabrication of increasingly smaller geometries of transistors in accordance with Moore's law. Please refer Figure 1 for a diagrammatic representation of the value chain of the electronic industry.

It is the semiconductor industry that appropriates most value in the value chain, which is in accordance with the theory that generally, in any innovation, the customer appropriates most value (please see Figure 2), followed by the innovator and the imitators.

## Why This Study on the EDA Industry?

The global EDA industry has been performing exceedingly well in terms of profit margins and has managed to sustain a phenomenal pace of growth. The EDA industry has been one of the few industries that have been generating tremendous returns for its small size. EDA companies in U.S generated revenues of more than \$3.7 billion in 2003-2004, and the acquisitive nature of the industry keeps both investors and bankers interested in its growth. Indeed, venture capital firms invested \$132 million in EDA companies in 2003 and more than \$100 million in 2005.

Industry leaders like Synopsys and Cadence have also set up design outsource centers or tool providers in countries like India, China and Russia to exploit the low cost advantage. As the financial data of top ten EDA companies reveals (see Table 1 and 2), the performance of the Big Three is quite impressive compared to that of the EDA industry.

TABLE 1: FINANCIALS OF TOP 10 EDA COMPANIES, 2001

Company	Total 2002 Revenue	% of 2001	Total 2002 Net Income	Total 2001 Net Income
Cadence	1293	90 %	72	141
Mentor Graphics	596	99 %	(14)	31
Synopsys	999	143 %	(180)	61
Altium <sup>1</sup>	26	91 %	0+	7
Ansoft	48	92 %	(4)	2

Market Capitalization	\$3.9 bn	\$ 3.3 bn	\$0.75 bn	

## Questions We Asked

### What is the Basis of Competitive Advantage-Future Outlook of Industry?

In the industry value chain, there is constant pressure on chip makers to come up with something better and even cheaper than what re-defined state-of-the-art only a few months before. Chips makers must constantly go back to the drawing board to come up with superior goods. Even in a down market, weak sales are seen as no excuse for not coming up with better products to whet the appetites of customers who will eventually need to upgrade their computing and electronic devices. The EDA industry in a state of flux as of now, with a number of changes occurring in traditional methodologies, on both front and back end, trying to keep up with the increasing design complexity.

### Why Internationalization? - Sector Growth

There were double digit growth return bookings in 2003 while service revenues bottomed out. At the same time, major players were weighed down by legacy or mature products and semiconductor recovery is expected to be anemic or profitless. Strengths were the earnings predictability and the pricing power enjoyed by the sector. We wished to examine the role of foreign subsidiaries, specifically Indian subsidiaries of EDA firms.

### **Methodology**

The data for the study was initially culled out of all secondary sources of information through an extensive search of the worldwide web, as well as from technical and management books, journals and magazine articles. With a comprehensive database of the EDA industry on hand, structural analysis was carried out to understand the structure of the industry. Then key success factors in the industry were short-listed based on the study of core competence of the global majors in EDA - Synopsys, Cadence and Mentor Graphics, as these were more or less representative of the industry as a whole (three-firm concentration ratio of 80%). Many other insights (for example, on value appropriation) on the industry were gained through using models for technology-intensive markets based on Robert Grant's work on Contemporary Strategic Analysis (1998).

The sample used for primary research basically consisted of the Indian subsidiary of the global leader Synopsys, as well as Cadence and Mentor Graphics. Field visits were undertaken to understand how software development takes place and the functioning of these organizations. Interviews were also conducted with key management personnel to obtain practitioners' views on the industry.

### **Theoretical and Conceptual Discussion of Competitive Advantage and Internationalization of Design Services Firms**

#### **Theoretical Models**

The basic framework used in the study was an application of Porter's five forces model of industry analysis. Models from Grant's (1998) Contemporary Strategic Analysis were useful in tailoring the understanding to a technology-intensive industry. Other frameworks like C.K.Prahalad's (2004) model on co-creation of value were used wherever applicable. We referred to Saloner Shepard and Podolny (2001)'s work in analyzing the impact of the external environment on a firm in an industry. In addition inputs were taken from articles and papers in different technical and management journals and magazines, such as the Journal of Business and Industrial Marketing (Don.A.Dunn, Thomas Claude, 1994).

## Theoretical Models and Design-Services Firms

### **Economic Drivers**

There are huge economies of scale to be gained in R&D, which is one of the reasons why the industry has globalize. There is also a lot of horizontal integration that is taking place, mainly through mergers and acquisitions. On the other hand, economies of vertical integration are virtually non-existent. This is on account of the power of semiconductor manufacturers and the entry barriers prevalent in the industry, which we examine in detail below.

### **Entry (and exit) barriers**

There are no specific economies of scale though an investment of at least \$10 million is required to set up a new company. Brand recognition plays an important part (which especially favors the Big Three). However the switching costs are typically low, especially for a new product. Access to technology is quite restricted as well as availability of quality engineers. There is some amount of favorable government regulation. There is not much of asset specialization and the cost of exit (laying off employees and selling off computers) is also low. The main cost of exit relates to laying off employees, but with quite a favorable IT scenario, this is not much of a problem.

### **Suppliers**

The prime supply of value in this industry is typically in the form of qualified high quality engineers. In the Indian scenario there is huge demand for engineers which has to be met in the coming years. Their contribution to quality is substantive. In fact the quality and utilization of tools and consulting services is directly proportional to the quality of employees. Employees also form a major cost component in the form of salaries. The EDA industry is also not very important source of employment to potential graduates, due to its small size. Quality engineers can directly join semiconductor companies instead.

### **Co-creation of Value**

Even though there are a number of semiconductor companies a few account for a huge part of revenues. Hence EDA companies maintain close relationships with buyers through regular meetings and interactions.

With the exception of the fledgling SOC (System on a Chip), all of the buyer industry's key segments are dominated by a small number of large players. In microprocessors, for instance, Intel possesses a virtual monopoly and has huge bargaining power. However, with design getting increasingly complex, many smaller chip makers are becoming increasingly dependent on a handful of large EDA companies. There are few substitutes available and switching cost is low, especially for a new product.

The concept of Co-creation of Value developed by C.K.Prahalad and Venkat Ramaswamy is extremely relevant in the context of the EDA companies. Companies can no longer unilaterally decide what value is – instead they must co-create it with customers. With industry boundaries becoming increasingly unclear, it becomes difficult to identify the nature of competitive advantage. Industry has to adapt to the changing role of the customer and the new frame of reference for value creation.

### **Competitive Scenario in Design Services**

To understand the competitive advantage enjoyed by successful firms in the EDA industry we first examine the competitive scenario existing in the industry and then identify the key value drivers in the industry.

### **Key Players**

There are almost 75 (both big and small) players in the industry in spite of acquisitions and consolidation happening. A number of start-ups were seen proliferating during the days of the technology boom. Now the number has been reducing. But even this trend only occurs in the U.S. The Big Three – Synopsys, Cadence and Mentor Graphics account for almost 70%-80% of the market share (three firm concentration ratio), making the industry quite profitable.

There is always pressure on the buyers, semiconductor companies to come up with something better, faster and cheaper than what re-defined the state-of-the-art only a few months before. That pressure extends to chip makers, foundries, design labs and EDA companies – everyone connected to the business of bringing chips from R&D into high-tech equipment. The result is an industry that continually produces cutting-edge technology while riding volatile business conditions.

There are different product categories and differentiation on the basis of quality among them. The industry growth rate is high, but there is low switching cost. The terms of sales are not very open and are in the form of

contracts between the industry and buyers. In the case of products, bidding system might be followed, but again quality is an issue rather than price.

The demand for EDA tools is rising at a fantastic rate as shown by the astronomical growth rates of the industry in the past couple of years. This is mainly due to the semiconductor industry growth which in turn is driven by the cellular industry.

There are many small players in the EDA industry, but the top ten players (on the basis of revenue) are Synopsys, Cadence, Mentor Graphics, Magma, Altium, Ansoft, Nassda, Synplicity, TransEDA and Verisity. Of these, the Big Three account for nearly 80% of the industry revenues. See Figure 3 for valuation of public EDA companies.

## **Key Value Drivers**

### **Role of Technology**

The semiconductor industry lives and dies by a simple creed: smaller, faster, and cheaper. The newest chips have circuits with lines less than 0.13 microns across – less than one-thousandth the width of a human hair. The benefit of being tiny is pretty simple: finer lines mean more transistors can be packed onto the same chip. The more transistors on a chip, the faster it can do its work. Please see Figure 5 for an illustration of the design productivity gap. The main customer for the EDA industry is the semiconductor (IC) industry. To make things easier for users, technologies must become more complex. Consider the latest advances in mobile phones. On the outside, handsets are increasingly functional and reliable; on the inside they are a tangle of chips and processors that grows increasingly complex with each new functionality added. That complexity comes from companies in the semiconductor industry. From microprocessors to integrated circuits, the tiny products of the semiconductor industry are the engines that drive technology. In turn it is the tools provided by the EDA industry, which drive this growth. The disruptive effects of technology are clearly reviled by the McKinsey S-curve. The industry has to definitely gear itself to face the challenges of technology.

## **Research and Development**

Software represents quite a significant portion of the value (and development costs) of an EDA tool. The initial development costs for a tool are quite heavy, and continuing. Companies require considerable financial resources as well as technical personnel. Consequently we see a number of start-ups mushrooming in the Silicon Valley backed by VC funding. The ratio of R&D to sales is about 25% for the Big Three – Synopsys, Cadence and Mentor Graphics. To give an idea of how significant R&D is, a typically low technology industry like textiles, R&D to sales is around 10%. In an EDA industry, they spend is two-and-half times the figure.

## **The Establishment Chain and Entry Strategies of Design Services Firms**

### **Consolidation through Acquisitions**

This is an industry that has a spate of consolidations over the years. Top players in the industry are actively deploying financial strategies of consolidation through acquisition and major expansions. Lawsuits, acquisitions of outside public and private companies, acquisitions of intellectual property, purchases of other assets, strategic changes in pricing and software license/lease practices, integration costs, in-process R & D, amortization of intangible assets and deferred comp, interest income, pro or con income tax effects and other similar events frequently affect both the reported revenues and GAAP net income of all companies. Many of these “non-operating” activities lead to entries “below the operating income line”. 2002 was a year of frenzied activity on the acquisitions front with Synopsys acquiring Avant!, and Mentor Graphics completing a hostile takeover bid of IKOS Corp and Innoveda Inc, and Cadence acquiring Simplex Solutions and half-dozen smaller entities.

Nevertheless, these impacts, positive or negative, are almost always the result of explicit employee actions and management decisions designed to supplement organic revenue growth in revenues, earnings or both. Thus,

both pain and gain must be borne in one accounting period or the other. Accordingly, total revenues, GAAP net income and GAAP Earnings Per Share (EPS) are universally accepted measures of analyzing the relative and absolute performance of most private as well as public companies.

The industry has a stable structure with just a few players offering complete end-to-end solutions. But there is increasing product overlap with the R & D of main players proving to be ineffective. There is also the risk of overpayment or integration. Please refer Table 3 for a list of probable acquisition targets.

TABLE 3: POSSIBLE CANDIDATES FOR ACQUISITION<sup>i</sup>

Company	Core Assets	Possible Buyer(s)
Prolific	Better approach to cell library creation	Synopsys
Get2Chip	Architectural synthesis	Cadence
Verplex	Formal, assertion-based verification	Magma
Denali Software	Memory compilation	Synopsys, Cadence
Verisity	Functional verification language, alliances	Magma
Celestry	Cell characterization	Synopsys, Magma
Atrenta	RTL virtual prototype	Synopsys, Magma
LogicVision	Design for test	Synopsys, Magma, Mentor Graphics

#### Life-cycle of Start-ups

There is a great proliferation of start-ups in the EDA industry. Very few of them go on to scale up to transform themselves into sizeable corporations like Synopsys. This is mainly due to a number of factors that typically differentiate a start-up from a corporation. Start-ups have a very strong core of technological know-how in innovation. What they lack is a host of competencies in finance, marketing and manufacturing required to produce tools on a global scale. So, the easier route for them is to find a technological niche, and design a tool which could be sold, alongwith the start-up to one of the bigger companies, for a hefty premium. So the EDA industry teems with small start-ups who after reaching a certain stage in the growth cycle, merge with the larger entities.

#### Increasing the Bottom Line

EDA vendors have always been having proven design expertise and domain knowledge, as well as a world class tools expertise backed by access to IP. But the traditional area of weakness has been their high operating costs, and lack of system integration skills. Therefore, the cost advantage must be exploited by locating R&D and design facilities in India, Russia or China.

Design services companies cannot continue to play a game based on price alone, and must look at acquiring competence in innovation, if they are to sustain their profit margins. The aim should be to emerge as a contributor rather than just being an implementor.

#### The Big Three

The EDA industry is doing well compared to the rest of the high-tech industry (see Figures 3,4 and 5 for a comparison of earnings of EDA sector with the IT sector, and stock price performance of EDA sector against market indices, and EDA sector relative valuations (Price/Earnings ratio) vis-à-vis IT industry, S&P Information Technology, NASDAQ Composite Index and S&P Index.

#### Synopsys

Synopsys is currently the #1 player in the EDA industry. It has tie-ups with the top semiconductor manufacturers of the world, and maintains close relationship with them. During the past 17 years, Synopsys has grown from a small one-product start-up to a diverse company that is the technology leader in IC design tools, offering a complete solution from concept to silicon. The company was founded in 1986 by Dr. Aart J. de Geus and a team of engineers from General Electric's Microelectronics Center in Research Triangle Park, North Carolina. First established as

"Optimal Solutions," Synopsys was chartered to develop and market the synthesis technology developed by the team at General Electric.

Synopsys proceeded to pioneer the commercial application of logic synthesis that has since been adopted by every major electronics company in the world. The company has followed a practice of growth through acquisitions and is the leading provider of electronic design automation (EDA) software and services used to design complex integrated circuits (ICs), field-programmable gate arrays (FPGAs) and systems-on-chips (SoCs) for the global semiconductor and electronics industries.

Synopsys solutions include pre-designed and pre-verified blocks of intellectual property (IP) that can be easily inserted into design flows, as well as technology to address yield and manufacturing issues early in the design process. Compute power, multi-media, graphics and communications features are converging in consumer products, putting additional pressure on engineers to create designs that are especially sensitive to cost, power consumption and size. From high-level synthesis to silicon, Synopsys provides a wide variety of solutions. Synopsys products span the entire design flow, allowing its customers to use integrated best-in-class technology from design specification to silicon fabrication. Synopsys primarily develops and supports products based on two major platforms, the Galaxy™ Design Platform and the Discovery™ Verification Platform. These platforms provide customers with an integrated suite of tools for advanced IC design and verification. Please refer Table 4 for financial details.

TABLE 4: KEY FINANCIALS: SYNOPSYS, 2004

#### **Cadence Design Systems Ltd**

Cadence Design Systems is one of the leaders in Electronic Design Automation (EDA) software and provides end-to-end EDA solutions. Through innovative product development, strategic partnerships, and business mergers, the company has become the industry's leading supplier of EDA software technology and services. IEEE, the world's largest technical professional society, honored it with its 2002 Corporate Innovation Recognition award. It is world's largest supplier of electronic design technologies, methodology services, and design services. The company offers a comprehensive product line, including end-to-end solutions for system, digital, analog, and printed circuit board (PCB) design. It therefore helps electronics companies develop the new products that fuel their business. In the year 2001, 41 percent of its \$1.43 billion in revenues was generated by international customers - nearly \$333 million from Europe and the United Kingdom, almost \$181 million from Japan, and more than \$94 million from the Asia Pacific region.

It has R&D centres all over the world ranging from Dublin to Noida. Cadence India is playing a pioneering role in promoting the development of electronics industry in India. Cadence is also creating partnership programs with premier engineering institutes in India including software grants, joint product development programs and fellowship programs. Cadence India has evolved to be a leader in technology at the international level, through representations through forums like the VITAL TAG, the IEEE Timing subcommittee, which is responsible for defining the VITAL standard (VHDL Initiative Towards ASIC Libraries) and in the synthesis Inter-operability Working Group (SIWG) set up under the auspices of VHDL International. Cadence India plays a key role in promoting the annual VLSI Design Conference and VLSI Design and Test (VDAT) conference. Please refer Table 5 for financial details.

### Mentor Graphics Ltd

Mentor Graphics is a publicly held company founded in 1981, and headquartered in Wilsonville, Oregon. The company offers innovative products and solutions for design challenges in the complex worlds of board and chip design. Mentor Graphics has a quite a broad portfolio of products including embedded software solution.

The company has close to 3,700 employees as of now spread over 28 engineering sites worldwide involved in R&D. It also has a global distribution channel with 48 sales offices around the world. Its revenue in last reported 12 months is approximately \$675 million.

The company's global customer support organization offers leading customer support solutions online, by phone and in-person, to ensure good customer service. It has achieved Support Center Practices (SCP) certification and is a five-time winner of the Software Technical Assistance Recognition (STAR) Award from the Service and Support Professionals Association.

The company also invests in the transfer of knowledge to its customers. Their solutions are used worldwide by forward-looking electronics companies to optimize design productivity and advance adoption of the latest industry design best practices.

The company believes in strategic partnerships with leading electronics manufacturers, semiconductor and electronic design suppliers for development of new design solutions and methodologies. Please refer Table 6 for financial details.

## **Conclusion**

Considering the key findings and challenges given in the above section it is evident that the EDA industry is poised for greater success in the coming years, offering phenomenal returns to investors. There are some key conclusions with respect to the industry that are as follows:

### **Competitive Advantage in EDA Industry**

#### **Developing Better Customer Relationships**

As far as customer relationships are concerned, there are different levels at which companies operate in servicing the customer. In the initial stages of the EDA industry history, firms were essentially involved in transaction selling with emphasis on product features, function, price and performance. The next stage was an evolution to a product solution, where the product was offered along with application services. In the current scenario there are companies like Cadence and Mentor Graphics offering a business solution, which is essentially a multi-product solution that can address a business problem. But a firm like Synopsys goes a bit further offering a “partnership” solution, that is essentially multiple business solutions linked across the corporation. Partnerships with customers involve strategic relationships to solve complex problems. The industry is highly dependent on its suppliers for revenue as well as technology. At the same time, value creation occurs when the suppliers actively involve themselves with the EDA vendors so as to partner together in solving complex design problems. In fact, the future of the industry lies in strengthening this mutually beneficial bond.

In the face of the threat from a challenger like IBM, strategic relationships are the only way EDA tool vendors can save their skin. It is therefore imperative that definite efforts are taken to maintain and if possible, strengthen the relationship. There is a crying need for design services companies to enter into alliances with EDA companies who are suppliers so as to strengthen the supply chain. Another possibility would be to increase collaboration between industry and academia which would greatly benefit from the R&D point of view.

#### **Developing Human Capital**

The most important asset for the EDA industry is its human capital. There is a two-pronged strategy that the industry must follow to keep pace with technology – asset acquisition and deployment. These refer to accessing and effectively using knowledge assets in the form of the latest developments in the industry, as well as attracting the best talent for work. Other modes of asset acquisitions could be R&D work performed through tie-ups with universities and academia.

Keeping pace with technology is possible through constant and consistent efforts in R&D capabilities. It is necessary to attract the best talent available and use them in a judicious manner. Brand image is also important as sometimes semiconductor manufacturers themselves approach EDA vendors with some specific tool design. But it is in reality quite difficult for EDA companies to focus their efforts on branding. Co-branding options are also limited due to the relatively small size of the industry.

### **Internationalization in the EDA Industry**

#### **Main Consideration during Initiation**

The initiation of internationalization is a phase highly influenced by network contacts and one’s own abilities to go international. Technology-intensive industries, in the introductory or growth phases of their life-cycle, have a number of distinguishing characteristics like the emergence of standards, network effects, or just the innovation-focused environment. Subsidiaries that have a definite source of competitive advantage manage to steal a march over the rest of the industry and earn phenomenal returns.

#### **Main Consideration during Expansion**

The second phase of internationalization is that of expansion and influenced by new experience, knowledge and confidence gained through the initial establishment of international operations through subsidiaries. New relationships yield additional opportunities but also lead to vicious circles. Initial success paves the way for increased desire and ability to expand. But there

must also be simultaneously established a system of elements that control growth along with the engines of growth themselves. The classic example is the problem of maintaining high quality standard of provided services. This was evident in the interviews we had with the Vice-President, R&D of Synopsys India Ltd.

One way to overcome the quality problem is to ensure that the entire service-providing concept is systematic. Such a well-developed system for service production is likely to result in a uniform production of high-quality service, than if the service production operations are based entirely on an individual's performance. Further, newly recruited employees would need some amount of time cushion to develop the skills necessary to match the quality standard that the firm currently maintains.

**Main Consideration during Consolidation**

The implication for EDA firms offering design services is to operate in several spheres offering economies of scope, so that complementary activities are performed together. Further, customization has become an important ingredient in the service delivery model of such firms. This is actually an opportunity to increase the customer's switching costs of going to a new supplier by ensuring successful customization. Besides, there is an element of learning from customers that in turn enhances opportunities to pursue continuous change.

The main consideration when it comes to the choice of country in which to establish subsidiary is either cost or value-add. The Indian subsidiaries of global EDA firms have been found to be aligned with the business strategies of their parents, while the implementation of these strategies is based on the key strength derived by the subsidiary. The table below summarizes the role and the predominant intent of the Indian subsidiaries of the three EDA firms that were studied:

<b>Indian subsidiary</b>	<b>Role</b>	<b>Predominant Intent</b>
<b>Synopsys</b>	<b>Established as cost centres and developing tools with emphasis on lean production</b>	<b>Low cost</b>
<b>Cadence</b>	<b>Established as R&amp;D centres and developing "yet-to-be-commercialized" tools</b>	<b>Low cost + Talent</b>
<b>Mentor Graphics</b>	<b>Established as support centres and developing tools with focus on cost-cutting</b>	<b>Low cost</b>

# What Make M&As Successful in China?

*Hong Liu*

*Jie Dong*

*Manchester Business School, England*

## Abstract

China's M&A activities have become a significant economic phenomenon, and have been rapidly growing. However, to date research on M&As in China has been extremely limited. Based on a single case study, this paper examines the effect of 'strategic fit' and 'organizational fit' on performance in China. It has been found that an M&A is more likely to be successful if both 'fit' conditions are met, and implementation is successful. In China, the government plays a major role in M&As as both a majority shareholder and policy maker. The implementation of organizational fit appears to be more difficult due to the mentality associated with the planned economic system. The process of the post-acquisition integration is also a process of 'modernization' or installation of scientific management systems and infusion of market-driven concepts. Implications for both research and managerial practices have been discussed.

## Introduction

Issues on mergers and acquisitions (M&As) have been at the heart of research on strategic management. Although acquiring companies have frequently experienced deteriorated post-acquisition performance that has reduced shareholders' wealth [1], M&As have remained to be a major strategic approach to expansion.

In the last few years, M&A deals have grown at a double-digit rate in China. It is notable that the economic environment in China is different from that in the West, with the legacy of economic planning and limitation of intervention from the government. In addition, M&A activities in China are still at an initial stage, and thus expected to differ from those in the West. Although an extensive body of literature can be found on M&As in the West, to date, research on M&As in China has been extremely limited.

As an initial step to fill the void in the area, this study is aimed at identifying factors that influence M&A performance in China. Specifically the study addresses the following questions: (a). What are the environmental factors that affect M&A activities and outcomes both positively and negatively? (b). What are the strategic and behavioral factors that impact M&A's performance? (c). What are the appropriate performance evaluation criteria that can be used to determine a successful acquisition transaction?

## Literature Review

M&As are still poorly understood and managed resulting in disappointing performance, and about 50% or more M&A deals have been unsuccessful [2][3]. Understanding the sources and/or determinants of value creation or loss is vital to comprehending the causes of success and failure of corporate acquisitions [1]. Two bodies of literature have addressed sources of shareholders' wealth in acquisition activities: strategic management and financial economics literature [4].

Since Kitching's [5] initial notion that the post-acquisition integration process is one of the most important factors for success, it has been identified that value creation from M&As is gained not only from those strategic factors that cause realization of synergies as reflected in capital market expectations [6] [7], but also the processes that lead to the realization of anticipated synergistic benefits to be realized [8].

Traditionally either a choice perspective or a rational decision model is adopted in M&A research. Many previous studies based upon a perspective of rational choice have focused on two key points: strategic fit [9] [10] and organizational fit [11] [12]. It has been argued the rational choice perspective may not provide a thorough view of acquisition processes and outcomes [13] [14]. Subsequently, it has been suggested that the conventional choice

perspective should be supplemented with a process perspective, and the process perspective is an alternative model that may replace the traditional and popular choice perspective [15].

To maximize acquiring firm’s strategic gains, three general phases in the acquisition process must be planned as integral to one another [16].

TABLE 1: SUMMARY OF SOME MAJOR STUDIES ON M&AS

Author(s)	Studies and Conclusions
[17]	Contextual and Buyer Behavior impact acquisition success
[18]	Pre-acquisition planning is a grossly undervalued yet fundamental element of acquisition success
[19]	Post-merger integration is critical to long-term merger success.
[20]	Success factors: a. Degree of diversification, b. Choice of industry, c. Choice of country, d. Market share to purchase, e. Relative size of the acquisition, f. Profitability of the acquisition, g. Financial architecture of the purchase
[21]	A strategic approach to acquisition
[22]	Examined Drucker’s five rules for successful acquisition

## Research Framework and Methodology

Research on M&As in the West has been going on for decades, and been quite advanced in terms of various issues covered. Recently research emphasis has been shifted from the conventional choice perspective (strategic fit and organizational fit) to a process perspective [15]. However, given the fact that limited research on M&As in China can be found, it would appear appropriate to start from basics. Thus, this study has used a simple model, i.e. the effect of strategic fit [9][10] and organizational fit [11][12] on performance, as shown in Figure 1. The model suggest that an M&A project would be successful if it has achieved both strategic fit and organizational fit.

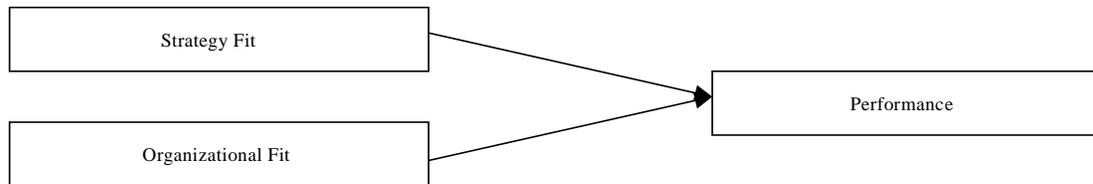

Fig 1. A FRAMEWORK FOR RESEARCH ON M&A IN CHINA

Since the study intends to find out why and how strategy and organizational factors influence M&A performance in China, the case study method is deemed proper [22]. A case in which a privately owned firm has acquired a state-owned enterprise (SOE) has purposefully been chosen for the following reasons: (1) privately owned firms represent a growing force and presently account for over one third of China’s GDP and (2) it is the government intention to encourage privately owned firms to merge with state-owned enterprises in order to achieve the objective of diversifying ownership in the hope that SOEs can be revitalized.

## Supor’s Acquisition of Kinisy: The Case Study

### Development of the Supor Group

The predecessor of the “Supor” group is the Zhejiang Yuhuan Pressure Cooker Plant, a small township firm that evolved from a spare parts manufacturer to becoming a ‘franchisee’ for Shenyang Shuangxi pressure cooker, a large reputable state-owned enterprise, (using its brand name ‘Shuangxi’ while paying handsome royalties). However, the pressure cookers manufactured by Yuhuan turned out to be better than those by Shenyang Shuangxi itself in terms of

quality and design, and this resulted in a rapid increase in market shares at the expense of Shengyang Suangxi. As a result, Shengyang Shuangxi suddenly stopped the 'franchising agreement', and forced Supor into a difficult market position. Without choice, Supor started to launch its own brand 'Supor'. Initially, it could only sell about 30,000 units monthly while with the franchise, the monthly sales were over 100,000. Gradually, Supor penetrated the market based on its super quality and design, and has become the market leader in the kitchen equipment sector. In 1996, Supor took 40% of the market share.

After 1996, Supor diversified from the single pressure cooker to a full range of cooking utensil manufacturer, and to electrical appliance for kitchen, and also expanded into international markets. In 1997, Supor acquired a Pharmaceutical company (Kinisy), and set up a plastic company. In 1998, an R&D center was set up, with over 10 million RMB poured into the development of specialized production of cooking utensils. In 2002, Supor was awarded the "China's Best-Known Trademark" by the State Industry and Commerce Bureau, and in 2004, its sales reached 1.2 billion RMB taking around 60% of the market share. Today, about 35 million families use "Supor" kitchen utensils, and "Supor" is almost the name or a symbol of kitchen utensils.

#### **Background of Kinisy**

The Zhejinag Kinisy Pharmaceutical Co. Ltd, a stated-owned company, was established in August 1970, with an area of 27,000 m<sup>2</sup> and 318 employees. Its main products consisted of traditional Chinese medicine and Western medical preparation, chemical raw materials and chemical semi-finished products etc. It has had over 40 licenses for manufacturing various drugs, including capsules, tablets, granules, instant medications and drinking medications etc. In 2002 with a sales of 70 million RMB, the company owns a trademark "Kinisy" that has enjoyed an excellent reputation both province and nation-wide in China.

#### **Strategic Fit**

##### **Supor's Perspective**

Following a successful diversification into other industrial sectors such as kitchen appliances and expansion into international markets, in 1997, Supor acquired 95% equity of Kinisy at the price of 5.13 million RMB. What were the strategic factors that led to Supor, a privately-owned and predominantly kitchen-product firm to acquire a well-established and reputable state-owned pharmaceutical company?

In the early 1990s, Supor gradually shaped, through an extensive consultation process within the firm, a strategy consisting of three key points: (1) firm's strategic objective is to attain No. 1 position in China and create a world-renowned brand. To achieve this, it would develop from the single kitchen utensils product line to extend into other related and downstream product lines, and build up an advanced manufacturing base with kitchen products at the core. (2) Making full use of its financial strengths and geographic (coastal based) location advantage, Supor would diversify into other industries such as ocean transportation, tourism, real estate and pharmaceuticals as well as possible infrastructure constructions. (3) Putting the development of new technology as a top priority, the firm would endeavor to compete based on its own intellectual properties and develop world-class new products.

In the mid 1990s, Supor recognized that its market share of cooking utensils would soon reach its limit and profit growth would be under pressure. Therefore, Supor began to embark on transformation and diversification to become a multiple business (including services) enterprise. Sales volume from its cooking utensils would expect to account only for 40-50% of its total revenue in the future. The chairman believed that acquisition across industry would be a natural choice for expansion. Supor acquired 15 enterprises in the sectors of aluminum and home appliances within 6 years, and later further diversified into businesses such as plastics, packing, medicine, tourism and real estate etc.

The acquisition of Kinisy has given Supor a platform to enter the pharmaceutical industry, and reflected its strategic intention: "focusing on traditional Chinese medicine, simultaneously developing both Chinese and Western medicines". Supor has seen the synergy of the two companies in terms of marketing, manufacturing, technology, management and capitals, and planned to strive for entering both domestic and international medicine markets. Employees within Supor have unanimously supported the management decision.

##### **Kinisy's Perspective**

Before the acquisition, Kinisy's development was heavily restrained by the traditional planned system, out of date business concepts, inflexible control mechanism, and ineffective and demotivating remuneration policy. Having

undergone through a financial hardship, with many year losses and heavy debts, the firm suffered from incompetent management and inefficient operations.

As the largest shareholder of Kinisy, the local (Yuhuan County) government played a key part in the acquisition process since it was keen in finding a solution to help Kinisy get out its difficult position. Supor has been one of the largest firms in the region, and thus the government saw the acquisition as an ideal way of helping Kinisy. In particular, through the involvement of a privately-owned firm, it would greatly assist in the process of transforming shareholding structure and thus stimulate productivity and motivation on the part of management and employees.

As far as the top management of Kinisy was concerned, they came to an impasse as they could not work as a united team, and their attempt to push the reform and turnaround of the company could not see any light. Therefore, the involvement of a third party seemed to be a hope to save the company. At the time, as a senior director put it “at the beginning of the acquisition, Kinisy’s shareholders including government authorities basically didn’t think much about the future prospect of the enterprise, but just wanted to get rid of this troubled burning fire to pay back money owed to banks and get back what they deserve.”

In addition, Kinisy also has its own strengths. For example, it has owned a number of production lines for packaged Chinese medicine (pills, tablets, capsules, sachets etc) and some very popular types of medicine and a team of competent employees (engineers and technicians as well as some good managers). Its extensive distribution channels and advanced or first-class technology and equipments also made the combination seem to be attractive and synergistic. For instance, Kinisy has had the production capacity for 80,000 kg Kelish capsules, with the technology and equipment imported from Europe and first-class technology and facilities for compressing, disinfections and packing, especially water treatment.

Therefore, after acquisition, it would only need to carry out some house cleaning work and replace or improve a small part of facilities and equipments before the company could fully function again. If adding more varieties of drugs and increasing production capacity, it would be possible to seize a large piece of regional market share. Moreover, Kinisy’s technology for Chinese medicine injection has represented an important new direction for Chinese medicine development, and such injections would have a high added value and great marketing potential.

#### **Integration Strategy and Organizational Fit**

Upon the completion of the acquisition deal at the end of 1998, the Chairman of the Supor group spoke at a conference with Kinisy’s employees to announce the post-acquisition goal and integration plan: the sales in the first half year of 1999 would be maintained at the same level as previous year but losses would be eliminated. In 2000 the company would start to make profits. The current main tasks would be to restructure the company, tap potentials and improve productivity, and increase turnover from then on.

Supor has adopted “four” general principles to pursue post-acquisition integration within Kinisy:

Principle 1: Changing business concepts. The concept of a manager being an ‘official’ must be abandoned. In a state-owned enterprise, managers would expend a lot of energy on non-business related things to seek promotion for a higher position, whilst now they must focus on their work and become a good ‘business’ manager. In the past, if their business operations had financial difficulties, they would wait for being rescued by the government while now they must rely on themselves to turn it around. Employees now must accept the fact that salaries and bonus could go up as well as go down while in the past they never came down. Some seemingly basic business concepts have been put forwarded to the employees: “if you don’t love your work today, you may lose it tomorrow”, “if you don’t work hard on your job today, you may lose your post tomorrow”, and “company’s success is the success of all of us.”

Principle 2: Transforming the management system. This has mainly included two aspects: firstly, employment and promotion based on competition to best utilize human resources. This is aimed at select qualified talents and competent managers. Secondly, the remuneration system must reflect the effort and performance proportionally.

Principle 3: Enhancing management effectiveness. The new organization must have a simple and practical system allowing effective decision-making, execution, control and feedback, and it must be flexible, responsive, reliable and efficient and knowledge generation.

Principle 4: Tapping and penetrating markets. The firm must be market driven and actively engage in

market competition and continuously develop high-graded and new traditional Chinese medicine.

#### **People Integration**

In the new organization, senior management would be selected through competition, and each director would be responsible for one area (while in the past, he/she would normally have a responsibility for a subsidiary) to build up an efficient management team. Middle managerial positions would have a tenure period, and would be assumed in turn. At the end of each year, directors/managers would perform a self-assessment as well as be evaluated by employees. If someone is under performed, he/she would either go through a training process or be replaced. Incompetent employees would be laid-off.

Before the acquisition, Kinisy had 9 directors, and they were either appointed by the government or joined the company from another one. After the acquisition, 4 people from the previous senior and middle management team have been selected based on a stringent evaluation process to be part of the new senior management team, including the general manager, who was an ex-deputy general manager of Kinisy. Supor has sent three people from Supor to join the team, two being deputy general managers in charge of marketing and personnel and one chief accountant. The general manager commented: "I would never dreamed of being put into such a position," and expressed his aspiration to excel in transforming the management system and leading all the employees to work hard and improve performance.

The new personnel policy has now truly reflected the principle that competent and capable people would have the priority for employment, and be promoted, and once appointed, they would be empowered. The number of managers has been cut from 89 before acquisition to 36, a reduction of 40%. As a result of integration, Kinisy has cut 80 part-time workers, and transferred 280 former full-time employees into the new company, with no job losses. Such a measure has saved monthly salary payment of 200,000 RMB for Kinisy.

#### **Cultural Integration**

Supor has had the belief that it could not force its own culture into Kinisy but two cultures would need to be integrated. After the takeover of Kinisy, the government and trade union have worked closely to build up a new corporate culture with Supor characteristics. Selfishness and commitment to the company has been advocated and promoted. The culture is reflected in the slogans: "I am here for you, you are here for me, everyone is here for Kinisy, and Kinisy is for the country"; "we need pressure, will overcome pressure, and will scare no pressure" etc.

Initially the cultural integration came across some serious problems. At the beginning of integration, the work team from Supor to takeover Kinisy was blocked at the entrance of the company. This is because the former employees of Kinisy were concerned about becoming part of a 'private enterprise' and felt insecurity of their jobs. Such an incident has greatly affected Kinisy's normal operations for a short period of time. The problem was resolved through the intervention from the local government.

The former employees of Kinisy had the old concept that they were the 'masters' of the company, and how the 'master' would be hired and fired? Many employees reluctantly accepted Supor's new management practices but refused to sign a one-year contract, and they wanted an 8-year or 10 year contract to make their life secure. In addition, the company has implemented a new rule that employees would need to register attendance using a punch machine, 4 times a day, arriving at work 10 minutes earlier. Other 'rules' have included such as "no smoking, no chatting, no sleeping, or no eating is allowed during working hours". All these have been common in Supor, but proved difficult in Kinisy. Many employees left the company because they could not adapt themselves to the new management system. However, an integrated Kinisy has become hugely successful, and this has suggested that the short-time inadaptability on part of Kinisy employees is just "birth pangs" in the process of post-acquisition integration.

The practices of Supor's 'culture' in Kinisy, the employees have become aware of Supor's system: employment and promotion based on competence and capability. Supor has set 22 salary levels in which performance-related bonuses have accounted for 60% of the total pay, and there have also been some other incomes and allowances for employees. It would be uncommon for normal hardworking employees to earn a monthly salary higher than the general manager. Such an environment has brought dynamism and vigor into Kinisy. This "Supor model" has become widespread known in the provincial region, and been used by the government to encourage state-owned enterprises to follow suit.

#### **Integration of Management System**

In order to fundamentally change the old Kinisy management practices and transplant scientific management systems, over 20 new administrative 'rules' and systems have been enforced in areas of personnel, finance, vehicles scheduling, internal auditing and procurement as well as external service contracts etc. This has been intended to put an end to the past popular phenomenon of "everybody taking from the enterprise", or loose control. The company has carried out the reform and simplification of organization to make it lean, and enhanced management training and education to changed their concepts and to enable employees to accept Supor's management philosophy and quality consciousness.

#### **Performance Appraisal**

Kinisy sales has increased 26% compared with that before acquisition, and the market share from 10% to 19% in the Zhejiang province. Kinisy has paid back both the previous Kinisy debts (about 30 million RMB) and the loans owed to the bank before acquisition (30 million RMB), provided settlement fees for both laid-off and disabled employees and comprehensive funds for social security of 19 retired employees.

Starting from 1999, Kinisy started making good profits with net cash flow-in of 86 million RMB and its turnover has grown at an annual rate of 35%.

It is notable that it has taken only four months for Supor's team to put Kinisy back into normal operations. Supor has also ploughed a large percentage of sales into R&D on biological medicine. For example, it has invested 43million RMB in Wuhan research project and 50 million RMB to construct a Shenzhen Kinisy drugs research center and 32 million RMB for Kinisy medical network.

#### **Major Difficulties Encountered**

##### **Transitional Mentality**

The local government has been seen by some managers and employees as a 'traitor', who has offered a state-owned enterprise with good assets to a privately owned firm. As a result of changing the ownership, the employees would no longer enjoy state retirement pensions, allowances and subsidies. The average age of employees has been over 40 years, and most of them would have little hope for re-employment. Retirees accounting for one-third of the total employees had not received their pensions or retirement benefits for a long time. Though Supor has promised them for job security or satisfactory settlement, they would still worry about their basic living expenses. Considering the lose of the secured or guaranteed social benefits from the state-owned enterprise, many employees would naturally suffer from stressful emotions, and some managers would also be very concerned about giving up the 'official' status from the enterprise, with the loss of related benefits. All these have resulted in resistance or difficulties in the acquisition process and integration and thus an increase in Supor's acquiring costs.

##### **Agency Issue**

It is notable that there has been the absence of intermediates such as professional investment bankers, strategy consultants and accountants. Generally speaking, due to the limitations in management professionalism and talents, Supor's management and acquisition approach has tended to be speculative. Supor would benefit a great deal from professional intermediates on its development of strategy, products, markets, and management system etc.

##### **Inconsistent Government Support**

As one of Kinisy's major shareholders, the local government has strongly supported the acquisition initiation and planning. But at a later phase of post-acquisition integration, the government became somewhat a passive 'observer'. It would let problems be resolved between the two parties while distancing itself from any problems unless they would involve social stability.

## **Conclusion**

As China's influence on the global economy increases, its M&A activities have also become significantly notable. However, little research can be found in this area partially due the difficulty in undertaking research in China and partially to the fact that it is only recently that M&As in China has started to draw attention from the academic community. As an initial attempt to understand M&As in China, this paper provides some preliminarily findings through an in-depth case study.

Despite rapid growth, M&A activities are relatively new and still at an early stage, and thus there have been limited sophistication (strategic selection and evaluation of targets) and involvement of various intermediates

(investment banks, consultants, and accountants). M&As tend to occur between SOEs, between foreign-funded firms and Chinese enterprises, and between non-state-owned firms and SOEs. This study has centered a non-state-owned (private) firm and an SOE. However, some of potential problems or implications may apply to those between foreign-funded firms and SOEs.

The study has mainly focused on two dimensions that potentially influence M&A outcome: strategic fit and organizational fit. Within each dimension, there are two factors: fit conditions and implementation. It is evident that strategic fit conditions are not sufficient, although vitally important, for a successful M&A. At the pre acquisition stage, apart from factors such as industry, market, technology, and motive, the government, as a majority shareholder of SOEs and industrial policy maker, is an important factor that can determine whether an intended project would take place and how, and thus affect the implementation of strategic fit. There are some constraints on the development of a successful M&A project: enterprises seeking for acquisition targets are often reluctant to use professional help such as investment banks, consultants or accountants, and such quality resources are either unavailable or too expensive to be helpful. Therefore, a due diligence exercise is either absent or poorly carried out.

At the post-acquisition stage, the realization of organizational fit appears to be more difficult and crucial for success. Firstly, the mentality of employees from SOEs has deeply rooted in the planned economic system, and thus is a serious obstacle to administrative, cultural, people and management system integration. Secondly, the process of integration is also a process of 'modernization' or installation of 'scientific' management systems and market-driven business concepts. Thirdly, once a M&A deal is completed, the government is less willing to be involved (or supportive), and the acquiring firm has to find all the help it can get on its own.

In order for an M&A project to have more chance to be successful, an acquiring firm must:

1. Identify the target that meets 'strategic fit' conditions, and get government support is a necessary condition for success;
2. Plan and prepare for post-acquisition integration before the project takes place are of paramount importance, and be aware of the difficulty in changing employees' old mentality. In many cases, the acquired firms are poorly managed, and badly need a strong team to install an effective management system
3. Engage professionals such as investment bankers, consultants or accountants to help planning and due diligence.

Since this study is based on a single case between a privately owned firm and an SOE, it is desirable to continue research on M&As between other types of companies. The scope of research should also be extended to cover factors such as environment and process, and if possible, a survey study should be carried out.

## **Abstract**

This study focuses on the operation of international business within Myanmar, a nation that has been under US trade sanctions since April 1997. International perceptions of Myanmar (formerly known as Burma) have been dominated by the poor human rights record and the country's notoriety as a major producer of narcotics. International state actors have adopted divergent responses in relation to the decision to engage, or not to engage, with repressive regimes such as the government of Myanmar. The US and the European Union (EU), have, to some extent, adopted a policy of 'isolation' with regard to Myanmar, while other governments and business communities, many of them located within Asia; have suggested an alternate 'constructive' institutional and economic engagement with Myanmar. This 'unfavourable' impression in the international community, in addition to the threat of possible international consumer boycott actions, means that unique challenges and operational and ethical dilemmas have confronted international businesses which have chosen to operate in Myanmar.

## **Myanmar: Background Information**

Myanmar, with a population of close to fifty million people, is often considered to be the 'crossroads' of Asia and shares borders with Thailand, India, China and Bangladesh (*About Burma* 2003). Myanmar is 262, 000 square miles, an area equivalent to that of the U.S state of Texas (Maung 1998, p. 4). Myanmar has been represented as an attractive investment destination because of its multi-varied economic potential including ample natural resources and future development prospects in the areas of infrastructure, tourism and consumer markets ('Infrastructure, Economic statistics' 2002). For example, Myanmar's vast teak forests and deposits of precious gemstones have yet to be fully commercialised. While the sustainability of development may be an open question, Myanmar's unspoilt and idyllic natural splendours and architectural heritage offer huge potential in the area of tourism ('Myanmar: Ripe for rape' 1994). After Myanmar ended decades of economic isolation in 1989, its gross domestic product (GDP) increased to 4.2% in 1994 and to 6.8% in 1995, as estimated by the Myanmar Government and the World Bank (Jones 1996). However, since a peak period of economic growth in 1995/96, Myanmar's GDP has fallen and for the year 2003/04 and 2004/05, GDP growth has been forecasted to dip below 4% ('Business outlook: Myanmar' 2003). Table 1 shows general facts concerning Myanmar's country profiles.

TABLE 1: GENERAL FACTS ON MYANMAR

<b>Location:</b>	South-eastern Asia, bordering the Andaman Sea and the Bay of Bengal, between Bangladesh and Thailand  Strategic location near major Indian Ocean shipping lanes
<b>Natural resources:</b>	Petroleum, timber, tin, antimony, zinc, copper, tungsten, lead, coal, some marble, limestone, precious stones, natural gas, hydropower
<b>Population:</b>	42,510,537
<b>Life expectancy</b>	55.79 years
<b>Ethnic groups:</b>	Burman 68%, Shan 9%, Karen 7%, Rakhine 4%, Chinese 3%, Indian 2%, Mon 2%, other 5%
<b>Government type:</b>	Military regime
<b>Capital:</b>	Rangoon (regime refers to the capital as Yangon)
<b>GDP - real growth rate:</b>	3.3% (2002 est.)
<b>GDP - per capita:</b>	Purchasing power parity - \$1,660 (2002 est.)
<b>Population below poverty line:</b>	25% (2000 est.)
<b>Inflation rate (consumer prices):</b>	53.7% (2002 est.)
<b>Exports:</b>	\$2.7 billion f.o.b. (2002)
<b>Exports - commodities:</b>	Gas, wood products, pulses, beans, fish, rice
<b>Exports - partners:</b>	Thailand 31.8%, U.S. 13.2%, India 7.4%, China 5.0%, Japan 3.7% ( <i>note: official trade statistics do not include trade in illicit goods - such as narcotics, teak, and gems (2002)</i> )
<b>Imports:</b>	\$2.5 billion f.o.b. (2002)
<b>Imports - commodities:</b>	Machinery, transport equipment, construction materials, crude oil; food products
<b>Imports - partners:</b>	China 21.8, Singapore 20.1%, Thailand 12.4%, South Korea 9.7%, Malaysia 7.6%, Taiwan 6.5% (2002)
<b>Currency:</b>	kyat (MMK)
<b>Exchange rates:</b>	kyats per U.S. dollar - 6.6421 (2002), 6.7489 (2001), 6.5167 (2000), 6.2858 (1999), 6.3432 (1998)

Source: Adapted from "Burma", CIA - the World Factbook, retrieved: September 29, 2003, from <http://www.cia.gov/cia/publications/factbook/geos/bm.html>.

A Tibeto-Burman race first entered Myanmar around the fifth century (Myint 1996). At the beginning of the 11<sup>th</sup> century, the first Burmese empire was formed (Andrews 1997). The country was then ruled by a series of kings throughout the pre-colonial era. Among the best-known kings were King Anawrahta (who became a king in A.D 1044 and first introduced Theravada Buddhism to the Burmese), Bayinnaung (who ruled from 1551 to 1581 and re-unified the entire country, making Myanmar "the largest empire in the Indochinese peninsula"), King Alaungpaya (who founded the Konboug dynasty in 1752) and King Mindon (1853-78) (Myint 1996). The history of ancient Burma (Pagan dynasty to Konboug dynasty) was littered with warfare among Burmese city states, and between the central Burmese kingdom and various ethnic minorities. Burma's pre-colonial history was also characterised by intermittent conflicts with Siam and China, and Burmese kings launched several famous invasions into Siam (Hall, cited in Maung 1998, p. 6-7).

The modern history of Myanmar can be divided into four stages (Kyi et al. 2000):

1. The Colonial Period (under the British) (1885 – 1948)
2. Independence and Parliamentary Democracy (1948 – 62)
3. The Burmese Way to Socialism (1962 – 88)
4. The SLORC/SPDC Regime (1988 – Present)

Myanmar was occupied by the British for over 60 years between 1885 until independence in 1948 (Kyi et al. 2000). Under British colonial rule, Burma was considered to be an administrative component of the Indian empire, and was governed as such until 1937 when the administration of the country was reconstituted as an independent colony (*The World Factbook: Burma* 2003). Under British colonialism, the Burmese economy was relatively open in terms of international and regional trade flows (Than 2000). After a prolonged nationalist struggle

led by General Aung San, Burma achieved independence in 1948. Over the next decade, in the context of relatively weak local institutions, a fragile parliamentary democracy was established. The AFPFL (the Anti-Fascist People's Freedom League) was the most significant political force during this period and was led by U Nu, who resigned as Prime Minister in 1962 (Kyi et al. 2000; Alamgir 1997).

In 1962, General Ne Win assumed power with a highly organised military coup, effectively terminating the country's experiment with parliamentary democracy. In 1974, Ne Win attempted to legitimise and solidify his regime by establishing the BSPP (the Burma Socialist Programme party) (Andrews 1997). After gaining power, Ne Win also moved to introduce a centrally-planned 'command' economy and to follow a self-sufficient path of national economic development through "the Burmese Way to Socialism", severing ties with the outside world (Than 2000). The country became known as "Socialist Republic of the Union of Burma" (*The World Factbook: Burma* 2003). Under Ne Win and the "Burmese way to socialism", Myanmar's economy declined dramatically, and the period has subsequently been characterised as "the most disastrous in the entire modern economic history of Burma" (Kyi et al. 2000).

Following political and economic upheaval and the brutal repression of dissidents in 1988, the State Law and Order Restoration Council (SLORC) took control of the nation, ending the Ne Win government's 24-year reign. SLORC abandoned the system of "the Burmese Way to Socialism" stating a public preference for moving the nation towards a market economy and international trade flows (Kyi et al. 2000). This change of policy on international trade by the SLORC government was a historic change in economic development strategy and marked "a symbolic end to self-imposed isolationism" (Sabesan 1996).

The SLORC military government renamed Burma in 1989, arguing that the new name "Myanmar" encompassed all ethnic groups of Myanmar, instead of referring to only the Burmans (the largest ethnic group in Myanmar) (Marcos 1997). The name "Myanmar" also derived from the actual term used in the Burmese language (*Myanma Naingngandaw*) (*The World Factbook: Burma* 2003). While many governments accepted and adopted the name change of Burma to Myanmar, some governments (especially from the West) refused to use the new name because it was the SLORC regime government who initiated the change (Marcos 1997). For example, the U.S. Government still refers to the country as "Burma", without adopting the name "Myanmar" (*The World Factbook: Burma* 2003). On 15 November 1997, the ruling SLORC also attempted to rejuvenate its tarnished international image by changing its name to the State Peace and Development Council (SPDC) (Guyot 1998; Callahan 2000).

Since gaining power, the regime government has been plagued by a series of economic and political problems. Although Myanmar is rich in natural resources and was once considered to be the 'rice bowl' of Asia in terms of agricultural productivity, economic mismanagement during the Ne Win government, followed by the successor SLORC/SPDC government, has severely damaged the country's economy, and has seen Myanmar ranked among the poorest countries in Southeast Asia (McCarthy 2000). The Myanmar economy has faced major macroeconomic imbalances including "a steep inflation rate and an official exchange rate that overvalues the Burmese kyat by more than 100 times the market rate" (*The World Factbook: Burma* 2003). Observers such as Maung (1998) continue to express scepticism about the prospects for sustained economic growth, blaming "the ineffective and repressive policies" of military governments that have ruled the country since 1962 and suggesting that policy settings and weaknesses in infrastructure have 'ruined' the nation's human capital. After the regime's crackdown on political dissidents in 1988 the Myanmar Government has ceased to receive funding through most overseas development assistance programs (*The World Factbook: Burma* 2003).

Aside from these severe economic problems, the regime's domestic and international legitimacy has eroded because of its refusal to implement political reforms. In particular, the regime has been opposed by the National League for Democracy (NLD), led by Daw Aung San Suu Kyi, the daughter of the legendary nationalist hero General Aung San. In 1991, SLORC suffered a major political humiliation when the NLD achieved a landslide election victory ('Background to reform' 1996). Since this election, the SLORC/SPDC has refused to transfer power or to recognise the NLD as the legitimate government of the country. Furthermore, the regime government of Myanmar has placed Suu Kyi under house arrest on several occasions since 1989 and has severely repressed the activities of pro-democracy activists in the country (*The World Factbook: Burma* 2003). As a result, the junta government of Myanmar has been represented as "the most brutal and oppressive in Asia...also the most corrupt"

(Ball 1999). Myanmar has remained under authoritarian government since the Ne Win regime gained power in 1962 (Alamgir 1997).

In July 1997, the regime government won a degree of international legitimacy when the Association of South East Asian Nations (ASEAN) accepted Myanmar as a full member (Than & Than 2001). In the same year, however, there was an important countervailing development when President Bill Clinton banned U.S. businesses from making new investments in Myanmar, justifying the investment restrictions on the grounds of the exceptionally poor human rights record of the regime government (Finch 1997).

### **‘Constructive Engagement’ Versus Isolation: the Case of the Myanmar Sanctions**

The Myanmar Government was implicated in the exploitation of forced labour and human rights abuses in the Report of the Commission of Inquiry appointed by the International Labour Organization (ILO) (Bolle 1998). In fact, Myanmar had long been tipped to take the place of South Africa as the next internationally outcast state ('Burma a pariah' 1995). In response to sustained pressure by various human rights and pro-democracy campaigners, the Clinton Administration imposed sanctions against Myanmar on April 22, 1997 (Finch 1997). Myanmar sanctions, however, only prohibited 'new investments' made by U.S. companies in Myanmar, and they only applied to U.S. citizens and companies registered in the U.S (Finch 1997). Myanmar sanctions have been considered unilateral because United States has been the only country which bans new investment in Myanmar, although a few European countries have imposed some restrictive measures on trading with Myanmar (Preeg 1999, p-3).

The sanctions on Myanmar were renewed in mid 2000 ('Myanmar's upstream sector hobbled' 2000). In July 2003, the United States government appeared to have stepped up its 'isolationist' policy stance on the Myanmar regime, when U.S. President George Bush "signed the Burma Freedom and Democracy Act of 2003 into law", following the crackdown on political dissidents and detention of Daw Aung San Suu Kyi, the leader of the National League for Democracy (NLD) (O'Connell 2003). The new sanctions law on Myanmar prohibited all Burmese imports to the US, suspended the U.S. assets controlled by the Myanmar Government and individual officials associated with the regime. The new measures also included disincentives for the provision of any major loans to Myanmar, and intensified existing restrictions on granting U.S. visas to Myanmar Government officials and their immediate family members. Similarly, the European Union reportedly warned of tough sanctions on the Myanmar Government, and called for the immediate release of Aung San Suu Kyi ('A Showdown Over Aung San Suu Kyi' 2003).

Calls to isolate Myanmar have been supported by international human rights activists and prominent Nobel laureates such as the Dalai Lama and Desmond Tutu, who have cited South Africa as an example whereby economic sanctions brought about significant measures towards democratisation ('Burma a pariah', 1995). In particular, Archbishop Desmond Tutu from South Africa has supported strongly economic sanctions against Myanmar. He commented, "Tough sanctions, not constructive engagement, finally brought the release of Nelson Mandela and the dawn of a new era in my country. This is the language that must be spoken with tyrants, for sadly, it is the only language they understand" (Tutu 1993).

Opinions, however, have been divided as to whether or not sanctions are effective in achieving their stated intentions, or whether they actually help to change the behaviour of the 'offending' government. As a result, debate has raged as to whether international business and the international 'community' should isolate, or engage with, Myanmar, often referred to as a South-east Asian 'pariah' state. In contrast to the U.S. position, other governments and regional groupings, particularly in Asia, have been much more reluctant to impose trade sanctions. Many of these Asian governments, along with a number of critics of unilateral trade sanctions, have often argued for a policy of 'constructive engagement' with repressive regimes that have contravened 'international' standards. The regional dimensions of this debate in South East Asia will be examined next.

Ironically, the term 'constructive engagement' was initially used by the U.S. and British governments in the 1980s to define their engagement with the then white minority apartheid government of South Africa. Again ironically the policy was adopted in the face of strong opposition from other nations including many Asian nations

(Mallet 2000, p. 43). A decade later, in the case of Myanmar, the situation has been reversed and the U.S. and the Western governments opted for 'isolation' while Asian governments supported 'constructive engagement.'

## **ASEAN and its Support for “Constructive Engagement” with Myanmar**

ASEAN was first founded in the 1960s by Asia's non-communist countries to protect the region against communist influence, and, accordingly, their development strategy centred on the market economy ('Expanding ASEAN', 1997). However, over the last two decades ideological divisions between non-communists and communists have slowly faded away. In 1995, Vietnam, still officially a communist state, became an ASEAN member ('Expanding ASEAN', 1997). With the new countries (Vietnam, Myanmar, Cambodia and Laos) joining the existing ASEAN member nations (Brunei, Indonesia, Malaysia, the Philippines, Singapore, Thailand, and Vietnam), the larger ASEAN group was made up of countries with different politico-economic systems. The core members have been strongly committed to market economies while the new comers were in the process of transition from a centrally-planned economic system to market-oriented economies (Yusoff 1997). In addition to major differences in political systems within ASEAN, there were also vast differences in terms of comparative levels of economic development. For example, ASEAN's poorest member, Vietnam, had a GDP per person of \$200-\$300 as compared to \$26, 000 for the richest member Singapore ('Never mind the quality', 1997).

While the U.S. and the European Union (EU), to some extent, have adopted a policy of “isolation” in regard to Myanmar, ASEAN governments and business communities have encouraged 'constructive engagement' with Myanmar ('Inexorably, the tide turns', 1996). ASEAN admitted Myanmar as a member nation in 1997 despite the policy of “isolation” adopted by the U.S. and EU governments (Masaki 1997). ASEAN took a different stance from the West because it considered “the West as posturing over Myanmar, trying to impose its own, inappropriate values on an Asian country” ('More repression in Myanmar', 1996). Asian leaders also questioned UN standards for assessing human rights. At a meeting in Bangkok before the UN World Conference on Human Rights, the governments of many Asian nations declared that they disagreed with the UN standards for human rights as they considered them to be 'prescribed' by the West. Instead, they stressed that an 'Asian' interpretation of human rights should be given 'due' consideration. According to these leaders, an 'Asian' interpretation of human rights focuses more on “economic growth and political stability for the benefit of whole communities more than individual freedom” (Mallet 2000, p. 41).

ASEAN was determined to engage with Myanmar, and it argued that an immediate change-over to democracy, the model proposed by the West, would create economic and social problems in Myanmar. Engaging with Myanmar, however, would be more appropriate in facilitating steady, stable, and gradual change ('More repression in Myanmar', 1996). In addition, Kruczek (1998) argued that instead of condemning ASEAN for admitting Myanmar, the West “should be celebrating” because, in his view, constructive engagement was the answer to dealing with international pariahs such as Myanmar.

Amidst these public disagreements between ASEAN and the Western nations over the Myanmar issue, it appeared that the governments of the South-East Asian nations were keen to develop business ties with Myanmar. Indonesian President Suharto's visit to Myanmar in 1997 was considered to be a gesture for his support for ASEAN's policy of 'constructive engagement' ('Country Watchlist', 1997). Similarly, Thai officials actively encouraged Thai companies to invest in neighbouring countries such as Myanmar, which were once political enemies ('From foes to financial friends', 1997). Hill (1995) reported that at a time when other nations were steering clear of dealing with the Myanmar junta, the Singapore government developed a close friendship with them, playing a role of a 'pathfinder' for Singapore's business sector. Singapore's Prime Minister, Goh Chok Tong, paid a visit to Myanmar in March 1994 and Myanmar's former Prime Minister, Than Shwe, returned the honour when he visited Singapore in June 1995, where he received red-carpet hospitality (Hill 1995). It was reported that Burmese pro-democracy supporters and liberals were displeased with Singapore investors who supplied the Myanmar military with weapons and who were collectively considered as “...a public defender of authoritarianism”. A senior opposition leader from National League for Democracy (NLD) was quoted as saying, “Singaporeans are all set to make money. They have no moral conscience at all” (Mallet 2000, p. 44).

Given the current situation, where despite the U.S. trade sanctions on Myanmar, foreign investments have still been trickling in, officially or unofficially, especially from neighbouring Asian countries, an important issue is how investors already operating in Myanmar could be encouraged to use their presence in an ethically constructive way. Schermerhorn (1997) was among those observers who have urged Asian investors in Myanmar “to add real meaning to constructive engagement.” Schermerhorn suggests that Asian businesses in Myanmar should be required to exhibit their real commitment to social as well as economic progress in Myanmar by, for example, financially contributing towards the welfare of the Myanmar people. To make this aim a reality, Schermerhorn placed the responsibility with Asian business leaders, who should develop a statement of principles in accordance with the April 16<sup>th</sup> resolution by the United Nations Commission on Human Rights, and these principles should guide their business practices in Myanmar.

While the Asian governments and Asian business community have agreed to engage with Myanmar as discussed above, the United States, and to some extent the countries of Europe, have continued to maintain their support for trade sanctions against Myanmar. Some critics have asserted that ASEAN's admittance of Myanmar demonstrated a lack of concern for the military regime's human rights violations, and was limiting the effectiveness of principled stance taken by Western governments (Humphreys 1996). For example, it has been claimed that “ASEAN is taking on not just one of the world's nastiest regimes, but an economy on the verge of collapse” (*Going for broke*, 1997).

Overall, there has been a widening gap between Asian and Western governments on the Myanmar ‘issue’ and ASEAN has been seen as risking its relationship with the West (*Expanding ASEAN*, 1997). Some European countries have gone so far as to introduce a ban on issue of visas to the Myanmar Government's officials (*Cook's orders*, 1997). Britain's former Foreign Secretary Robin Cook announced his intention not to invite the new ASEAN member Myanmar to the EU-ASEAN Joint Cooperation Committee meeting held in November 1997, and condemned the junta for having been highly repressive in stifling political dissidents, and also for being “irresponsible in that it is one of the few governments in the world whose member are prepared to profit out of the drugs trade rather than to seek to suppress the drug trade” (*Cook's orders*, 1997). Malaysia's Prime Minister, Dr Mahathir, responded to Mr Cook's intention not to invite Myanmar by urging ASEAN members to boycott the 1998 Asia-Europe Meeting held in London (*Cook's orders*, 1997). In addition, other ASEAN members refused to accept the objections made by the EU in regard to Myanmar's participation as an observer at the EU-ASEAN Joint Cooperation Committee meeting held in November 1997 (Than 1999, p. 221-22). Dr Mahathir also suggested that the financial woes of Southeast Asian nations were inflicted by George Soros, a multi-millionaire investor and a pro-democracy supporter, as a way of showing displeasure with ASEAN's admittance of Myanmar (*Going for broke*, 1997).

While the dispute raged on between ASEAN and Western governments, a key strategic issue for the ASEAN nations to consider was if the importance of holding meetings such as the Asia-Europe summit should be secondary to the inclusion of Myanmar (*Cook's orders*, 1997). Meanwhile, it appeared that the only “gain” for Myanmar from the public disagreement between the ASEAN and the West was that the country's international isolation has once again been brought to the fore (*Myanmar's seat at the back*, 1997).

While some critics have acknowledged that there were some real benefits associated with Myanmar's admittance into ASEAN, others have argued that the decision to admit Myanmar should not be rushed because the longer the regime had to wait for such international and regional recognition, the more likely it was that it would be gradually persuaded to improve its domestic record of governance (*Expanding ASEAN*, 1997). In addition, some analysts believed that the ASEAN should have made Myanmar's membership dependent on the degree of political freedom given to NLD and its leader, Aung San Suu Kyi, and until such a time, the regime should “be treated as polecats” (*More repression in Myanmar*, 1996). Despite the controversies discussed above, an important, if somewhat neglected, question was not so much why ASEAN eventually admitted Myanmar, but why the admission was fast-tracked.

## **Methodology**

The project was exploratory, and guided by the principles of the grounded theory approach (Glaser and Strauss, 1967) in that the methodological design of the study did not contain an a priori hypothesis. Such an approach, as opposed to engaging the participants with a pre-designed structured survey instrument, was appropriate given the exploratory and sensitive nature of the research. The data collection process involved semi-structured face-to-face interviews in Myanmar with executives handling international consumer brands. In total, over sixty interviews were conducted for the thesis. The transcripts were subsequently content-analysed using NUD\*IST (Non-numerical Unstructured Data\* Indexing Searching and Theorizing), a computer software program for qualitative data analysis.

## **Implications of Aspects of Market ‘Risk’ on Operational Strategies and Practices**

The interview findings on the operational difficulties experienced by businesses in Myanmar call for consideration of relevant theories on risk factors confronting foreign businesses in various ‘host’ country environments. The discussion will begin by examining extant literature in international management on various types of uncertainties surrounding foreign business operations in a host country. Two broad types of uncertainties have been identified and discussed in the literature: 1. political risk/uncertainties (Robock 1971; Simon 1982; Butler & Joaquin 1998), and 2. foreign exchange uncertainties (Dhanani 2004; Pantzalis, Simkins & Laux 2001; Jacque & Vaaler 2001; Aabo 2001).

In reality, it is not only the fact that such uncertainties do not exist in isolation from one another, there are also other forms of uncertainty that are not considered in any detail in the literature (i.e. uncertainties relating to government policy, social context, and patterns of competition). As an alternative method to existing approaches that mainly focus on considering individual uncertainties largely in isolation from one another, Miller (1992) has developed “A Framework for Integrated Risk Management in International Business.” Miller’s (1992) framework proposes consideration of “multidimensional uncertainty”, and argues that uncertainty variables are interrelated and should not be viewed in isolation from one another. For example, Miller’s (1992) framework extends the scope of corporate risk management approaches to consider a variety of business uncertainties, instead of restricting discussion and analysis to the question of possible financial losses. In this regard, the integrated framework was a significant contribution to international management literature in that previous analysis tended to concentrate on transaction costs theories in the international finance area. By considering a range of uncertainties, the integrated framework recognizes the complex nature of corporate decision making in that corporations weigh up various ‘trade-offs’ among a range of interrelated uncertainties, instead of concentrating on reducing or managing only one type of uncertainty at a time. In addition, the model expands the boundaries of corporate risk management approaches by giving thought to and linking both financial issues and management strategy formulations.

Miller’s (1992) framework contains two parts. As shown in Table 2, the first component of the model focuses on the categorization of uncertainties including three groups: 1) general environmental uncertainties, 2) industry uncertainties and 3) firm uncertainties. The second component, as shown in Table 3, focuses on corporations’ strategy formulations in response to uncertainties, including two types of strategy assessments: 1) financial risk management and 2) strategic management. In so doing, Miller’s framework offers potential for finding or testing relationships between uncertainty variables and corporate strategic responses.

TABLE 2: A CATEGORIZATION OF UNCERTAINTIES: APPLICATION TO THE MYANMAR MARKET

General Environmental Uncertainties	Industry Uncertainties	Firm Uncertainties
<b><i>POLITICAL UNCERTAINTIES</i></b>	<b><i>INPUT MARKET UNCERTAINTIES</i></b>	<b><i>OPERATING UNCERTAINTIES</i></b>

Adapted from: Miller, K. D. 1992, 'A Framework for integrated risk management in international business', *Journal of International Business Studies*, vol. 23, no. 2, pp. 311-32.

The integrated risk management model is suited to the current study because it is inclusive of uncertainties at three levels (general environment, industry and firm levels) and therefore comprehensive. In particular, the model's emphasis on linking uncertainty variables to strategy formulation is particularly suited to the current study in that it has examined the nature of both international and domestic factors influencing corporate strategies in the Myanmar market.

Application of Miller's (1992) framework to the current study's findings provides insights into the nature of various risk factors presented to foreign businesses in the Myanmar market. These relevant risk factors are indicated in Table 2 by a symbol "X" and are discussed below:

**General environmental uncertainties:** businesses in Myanmar undoubtedly were exposed to a high degree of "political uncertainty", given the current political impasse between the National League for Democracy, the opposition party led by Daw Aung Sun Suu Kyi, and the military government of Myanmar. While direct

concerns about political uncertainty or instability were expressed only infrequently during the interviews for this study, this is likely due to the topic's very high political sensitivity for businesses in the country. Regarding "policy uncertainties" and "macro economic uncertainties", businesses in Myanmar encountered numerous problems and this was a recurrent theme within the interview findings. In particular, they faced onerous trade restrictions, barriers to profit repatriation, infrastructural inadequacies (often exacerbated by prolonged rains in the monsoon season), high inflation and foreign currency exchange difficulties. In terms of "social uncertainties", the interviewees did not discuss this issue. In part, this seeming lack of concern in regard to dramatic social instability may be related to the authoritarian nature of the regime government and its apparent tight control of power, so much so that social unrest/riots would appear to be somewhat unlikely, at least in the short to medium term.

Despite a high degree of political uncertainty (as to which party would prevail and when this was likely to occur), it was apparent that most businesses felt confident that the broad thrust of current economic policies (greater openness to the global economy compared to the previous "Burmese Way to Socialism" pursued by the Ne Win government from 1962 to 1988) would continue regardless of whether a democratic transition was to occur in governance in Myanmar. For instance, the general sentiments of respondents who discussed this issue appeared to centre on a belief that there would not be any drastic changes in terms of trade policies, as any new or transitional government would require equivalent levels of foreign investment. As a result, there was a view that foreign participation in the country would not be reversed, or, given various existing trade restrictions imposed by the regime government, that the business environment would be no 'worse' under a new government. In a more negative connotation, there was an impression among several of the interviewees that there unlikely to be positive changes towards a more favourable and competitive local business environment regardless of the political character and composition of the government. This feeling of 'pessimism' derived from their apparent belief that the Myanmar business environment would not improve drastically because there were too many variables to deal with and structural problems to be 'fixed' before any significant changes to trade policies could be successfully introduced.

**Industry uncertainties:** uncertainties in the general business environment can result in significant uncertainties at the industry level. For instance, a severe shortage of supply in the market ("input market uncertainties") was caused by the Myanmar government's periodic bans on the import of most consumer goods. In addition, businesses in Myanmar also experienced high level of "product market uncertainties" whereby genuine brands constantly faced intense competition from smuggled goods and imitation brands, and also consumer demand changed frequently. Businesses in Myanmar also confront the problem of a shortage of complementary products. For instance, a scarcity of good quality petrol in the country has increased the level of need for after-sale service offered by new car dealers in Myanmar. Such industry uncertainties were also affected by government policy and macro economic uncertainties, and by the country's recent transition towards 'marketisation'.

**Firm uncertainties:** businesses in Myanmar faced numerous uncertainties at the firm level. Regarding labour issues, while labour was inexpensive and abundant in Myanmar, the quality of the workforce was considered to be low in terms of their exposure to international practices and standards. Individual enterprises in Myanmar also faced shortages of raw materials and other inputs due to the Myanmar government's bans on imports and the generally poor state of infrastructure in the country. In addition, "problems with collectibles" (account receivables) were also experienced by some wholesalers, and this problem has been exacerbated by the highly inflationary climate of the country.

**Strategic responses to uncertainties:** in terms of assessing "financial risk management strategy", brand principals who were exporting into Myanmar via distributors did not bear significant financial risk in that, in many cases, payment for goods were normally made outside Myanmar. For instance, it was common for some distributors to own a company outside Myanmar, and it was this company that completed tasks such as paying for goods bought for export into Myanmar. While this mode of payment applied for some principals, others had to wait until the goods were sold, and in such cases, there would be a degree of risk in terms of obtaining final payment for goods sold. In contrast, brand principals who had direct investment in Myanmar (in the consumer goods sector in the country, foreign investment went into areas such as human resources, distribution, sales and marketing) carried significant risks in terms of confronting government policy and macro economic uncertainties. However, either case involved some degree of financial risk because it was found that many principals were required to assist distributors

in terms of providing them with discounts, sales incentives, training, and budgets for advertising and promotions. In particular, they had to accommodate for losses incurred in Myanmar due to high inflation and also due to intense competition from border traders.

In terms of assessing “strategic management” strategy, as marked by “X” in Table 3, foreign businesses in Myanmar appeared to have made the following strategic decisions. A number of corporations made a strategic decision to divest from Myanmar responding to both international pressures and operational difficulties within the country. For those firms that remained, some (for instance, key players in the consumer electronics sector) endeavoured to achieve greater levels of “vertical integration” to enhance “control” by utilising their own sales force, distribution vehicles and establishing and managing their own warehouses and product showrooms, instead of relying on wholesalers and other “middlemen”. In relation to “cooperation” strategy, firms have extensively used “alliances and joint ventures”, and also in a select number of cases “voluntary restraint of competition” in order to keep their involvement in Myanmar comparatively undetected, so as not to aggravate pro-democracy campaigners. In relation to “imitation” strategy, it was found that key players in the Myanmar consumer goods sector exhibited a tendency to imitate one another in terms of company structure and marketing strategy. In particular, it was observed that market leaders appeared to have spent similar amounts of advertising money in the Myanmar market. In the area of “operational flexibility”, the fact that Myanmar operations were managed from Bangkok, Thailand, has given brand principals a relatively high degree of flexibility in the area of human resource management and product sourcing. Examples of this strategy were evident in cases whereby products made in Thailand or designed for that market were sent to Myanmar from the Bangkok office, and in the relatively common situation where personnel from the Thai office either temporarily resided or regularly visited the Myanmar branch operations.

While models such as Miller (1992) provide comprehensive coverage on uncertainty factors at industry or firm level, they are somewhat lacking in terms of examining external factors. In this regard, Alon and Martin’s (1998) “A normative model of macro political risk assessment” (shown in Table 4) provides a structured qualitative model to estimate the level of political risk imposed by a host country on multinational corporations, and is complementary to other models that concentrate on risk factors deriving from internal factors.

TABLE 4: MACRO POLITICAL RISK CONSTRUCT

	<b>Internal</b>	<b>External</b>
<b>Government</b>	<ul style="list-style-type: none"> <li>• Degree of elite repression</li> <li>• Degree of elite illegitimacy</li> <li>• Likelihood that regime change will affect policy</li> </ul>	<ul style="list-style-type: none"> <li>• Likelihood of political violence</li> <li>• Degree of involvement in international organizations</li> <li>• Possibility of restrictions on investment, capital, or trade</li> </ul>
<b>Society</b>	<ul style="list-style-type: none"> <li>• Degree of fragmentation</li> <li>• Potential for social conflict</li> <li>• Sense of nationalism, xenophobia, alienation or fundamentalism</li> </ul>	<ul style="list-style-type: none"> <li>• World public opinion</li> <li>• Disinvestment pressure</li> <li>• Regional diversity and incongruent interests</li> </ul>
<b>Economic</b>	<ul style="list-style-type: none"> <li>• GDP per capita growth</li> <li>• Income distribution</li> <li>• Likelihood that economic goal will be met</li> </ul>	<ul style="list-style-type: none"> <li>• Future economic policies regarding foreign direct investment</li> <li>• Likelihood of balance of payments problems</li> <li>• Likelihood of currency inconvertibility/instability</li> </ul>

Source: Alon, I. & Martin, M. A. 1998, 'A normative model of macro political risk assessment', *Multinational Business Review*, vol. 6, no. 2. Retrieved: April 16, 2004, from ProQuest database.

Alon and Martin’s (1998) macro political risk assessment model considers risk factors relating to government, society and economy both at ‘external’ and ‘internal’ levels. In particular, the macro political risk assessment model adds to Miller’s (1992) framework of integrated risk management in two ways as follows. Those are the “shaded” areas in Table 4.

- a. The inclusion of local economic-related factors (“per capita GDP growth, income distribution and the likelihood that economic goals will be met”);
- b. The consideration of government and society related factors at the external level (“the likelihood of political violence, the degree of the country’s involvement in international organizations, and the

possibility of regulatory restrictions on investment, capital, or trade flows, world public opinion, disinvestment pressure and regional diversity and incongruent interests”).

In relation to local economic-related factors, it is not only the case that Myanmar has been one of the poorest in the world ('A Tiger with a Trunk' 1996), but also that income is unequally distributed, resulting in an apparent lack of a developed middle class in Myanmar. Compared to other emerging markets in Asia, Myanmar is therefore lagging behind in terms of developing a thriving and dispersed population of middle class consumers to fuel economic growth. For instance, India's middle class has been estimated to number close to 300 million, according to India's National Council for Applied Economic Research, while the Economist Intelligence Unit has estimated that middle class demand for motor vehicles would reach 500,000 units during 1998 (in Moore 1998)). The expanding Indian middle class is giving rise to developed and sophisticated consumer product markets, and this growth has immense appeal for prospective foreign investors (Jacob 1994b). Similarly, countries in Central Europe and Latin America have also seen the growth of a viable middle class, and indeed, according to the U.S Department of Commerce, the biggest emerging markets in the world were “China, Indonesia, India, South Korea, Turkey, South Africa, Poland, Argentina, Brazil, and Mexico.” (Jacob 1994a).

## **Conclusion**

In relation to external government-related factors, in particular, “the possibility of regulatory restrictions on investment, capital, or trade flows”, as this study has detailed, Myanmar has been a prime example whereby an investment climate has been restricted by ‘external’ regulatory restrictions from Western governments and institutions. This factor has had a significant impact on corporations’ market entry and business development strategies, which were also similarly shaped by Myanmar’s internal weaknesses as discussed previously. In this regard, it is important to note that both external and internal factors have influenced strategy formulations on risk in the Myanmar market.

# Political Economy of Korea's New Globalization Strategy: Strategic Implications for Multinational Corporations

*You-il Lee*  
*Edith Cowan University, Australia*

## Abstract

One of the most revolutionary aspects of the Korean company since the 1997 Asian financial crisis is that Korea has emerged as a major recipient of foreign capital for both strategic and non-strategic industrial areas, ranging from consumer products to telecommunications. In particular, the Korean government has shown its ambition in recent years to level up the country's economic status by transforming the nation into an international business hub in the Asia-Pacific region. This is the backdrop of this paper, which takes a political economy and cultural approach to the Korea's new globalization strategy. By examining the seemingly changing role of the Korean state in the market and economy as well, this paper offers a cultural and institutional insight into the critical and often invisible issues to be considered for a successful realization of the vision and its strategic implications for multinational corporations.

## Introduction

Until the 1997 Asian financial crisis, Korea was one of few Asian countries that did not liberalize inflows of foreign direct investment (FDI). However, the '97 financial crisis to large extent *changed* the whole picture of the Korean FDI chapter (Park, 2003). The late 1990s saw the sudden emergence of Korea as a major recipient of foreign capital for both strategic and non-strategic industrial areas, ranging from consumer products (eg alcohol, tobacco, cosmetics, textiles, etc) to telecommunications. By 2001, on a cumulative basis, there were more than 11,500 foreign firms invested in Korea. Further investment de-restrictions coupled with a lower value of the currency (won), declining status of the *chaebol* (mostly family-owned large industrial conglomerates in Korea), and the government capacity which resulted from the '97 financial crisis made investments more attractive. In particular, during the four year period after the crisis (1998 to 2001), Korea has attracted around US\$52 billion in FDI, which is almost more than double the entire amount of the previous four decades. More strikingly, the Korea Times reported in late December 2004, foreign investors owned almost 42 percent of stocks listed on the Korean Stock Exchange by December 2004 (Cho, 2004). This implies that the Korean market is rapidly changing and open to outsiders offering opportunities to maximize market benefit in Korea. In particular, the Korean government has moved towards a new market-driven paradigm of economic growth based on FDI replacing the decades old state-driven and mercantilistic economic growth model. The IMF's proclamation made in 2000 well reflects the above, "over the past two years bold policies and a commitment to reform have made Korea a more open, competitive, and market driven economy" (Crotty and Lee, 2001a: 28). One of the attempts made by the government is its ambition to transform the nation into a business and economic hub of Northeast Asia. However, despite the growing concern on the topic among government agencies, industry, media and academia, the absence of a cohesive and realistic approach to the issue is a relative void in the literature.

## Korean Financial Crisis: A Triggering Factor for Korea's New Globalization Strategy

Under the guidance of the International Monetary Fund (IMF) since early 1998, the Korean economy rebounded from its late 1997 meltdown faster than expected. Korean macroeconomic indicators have shown significant improvements. After falling nearly 7% in 1998, real gross domestic product (GDP) was almost 11% in 1999 and nearly 9% in 2000. Many early neo-liberal supporters like international financial institutions described Korea's 'economic recovery and financial stabilisation' as remarkable (Crotty and Lee, 2001:183).

The Korean economic woes began when its trade deficit ballooned beginning in 1996 and the value of its currency slipped. At that time, Southeast Asian currency and financial shock waves reached the country. This happened at a time when the Korean market was saddled with billions of US dollars of bad loans (US\$145.2 billion or 30.3% of GDP). Then, various events that occurred since early 1997 indicated that the collapse of its economy (formerly the 11<sup>th</sup> largest economy and 14<sup>th</sup> largest trading power) was imminent. In January 1997 Hanbo Steel, formerly the nation's 14<sup>th</sup> largest business group, collapsed under US\$6 billion in debts and in March 1997 another leading conglomerate, Sammi Steel fell. Furthermore, in July Kia, Korea's third largest car manufacturer, suffered severe credit crunch and was nationalised in October after the Korean banks refused to provide more loans. By the end of 1997, seven, including the above groups, of the 30 largest *chaebol* went bankrupt as well as a large number of small and medium-scale companies. These in fact threatened the stability of the banking sectors and consequently provoked extreme concern among foreign bankers, which redirected their lending policies. As a consequence, the picture of the spectre of overseas loan defaults changed as the Korean foreign exchange rate diminished to a much lower level; *won* (Korean currency) dropped below 1000 to the US dollar since 17 November 1997.

Consequently, the Korean government officially requested from the IMF for emergency help on the 21<sup>st</sup> of November 1997 to restore overseas confidence. This marked the end of the country's long-hailed reputation as a newly industrialising country and even as an advanced industrial country. Korea is now going back to the stage of Asia's emerging economies like Thailand, Vietnam and Indonesia. 'The miracle on the Han' no longer exists or, applicable to the Korean economy in the IMF loan era. As of December 3, 1997, the Korean economy was officially under the IMF control like Indonesia.

Korea's financial crisis has brought various but serious economic problems for Korea (Moon, Lee and Yoo, 1999). The GDP growth rate in the first quarter (January-March) of 1998 was -3.8% year on year, which was the lowest since the -7.8% growth rate in 1980. Changes in unemployment and inflation rates since November 1997 are also remarkable. From 2.6% at the end of November 1997, the unemployment rate rose drastically to 6.8% by the end of 1998 and the number of unemployed has already exceeded 1.5 million (Moon *et al.*, 1999:14). The consumer price index rose from 4.3% in November 1997 to 7.5% in 1998, largely because of the exchange rate devaluation (Moon *et al.*, 1999:33). UNCTAD (the United Nations Conference on Trade and Development) in its annual report on trade and development estimated that Korea's unemployment rate would reach around 10% by the end of 1998. The most significant drop in terms of employees since the currency crisis is in manufacturing, particularly in sectors related to infrastructure and automobile.

Despite the negative figures for GDP growth rate and increasing inflation, Korea has experienced a large trade surplus since December 1997. However, this has not been caused by a rise in exports, but by the rise in Korean won/US Dollar exchange rate. Excluding gold exports, Korea's export growth rate was only 1.4% in January 1998 and it turned negative in May 1998. More important, the overall trade surplus was 35.9% decrease in imports. It seems clear that there are more difficult times ahead for the Korean economy and business as well. Simultaneously, this crisis offered foreign multinational corporations (MNCs) with a new market environment. As then President DJ Kim's statements well reflect this, "market reforms and foreign investment are the only solution to Korea's problems, and the crisis will be remembered as a blessing" (Crotty and Lee, 2001).

Ironically, the '97 financial and economic crisis needed an old tradition of neomercantilist intervention of the government, as was the case of the Park Chung-Hee regime in the 1970s. This has been proved in recent years. Top five *chaebol* groups (Hyundai, Samsung, Daewoo, LG and SK) agreed to cut their subsidiaries from 264 to around 130 by 1999. This agreement was made in a meeting on 6 December 1998 between the President and owners of the above top five groups. These groups set out a firm timetable for reducing debts (below 200% by the end of 1999) incurred by an opaque accounting system and ending inter-subsidiary cross payment guarantees.

This landmark agreement played a major part in attracting the nation's much needed foreign capital. This is because the lack of transparency and complicated debt payment system among those subsidiaries have been major hurdles for foreign investors doing business in Korea. For example, according to the FKI (Federation of Korean Industries), the top five *chaebol* groups by the end of October 1998 attracted US\$14.2 billion through sales of their business divisions and assets. Regarding the so-called the President-*Chaebol* Accord of December 6, Kim Dae Jung asserted, 'the accord ensures that no Korean *chaebol* will be able to hide anything about their operations as the accord stipulates the promotion of full corporate transparency'.

It should also be noted that President Kim asserted in his inauguration speech on the 25<sup>th</sup> of February 1998, 'no more authoritarianism dressed up in *Asian values*'. Asian values to President Kim also means that democracy can be sacrificed in an effort to achieve fast economic development. Therefore, this Asian crisis, especially for Korea, is the moment for the country to transform its previous autocratic, command-and-control societies into democratic, flexible, and market-driven economies. For example, the introduction of foreign capital in Korean banks means an end to overt and covert government influence on financial institutions.

It seems clear that the IMF era, which required a fundamental overhaul of the structure of Korean political economy, would play as a watershed for foreign investors with long-term implications with market opportunities. Among the Asian countries suffering from the post mid-1997 currency melt-down (Indonesia, Thailand, and Korea), Korea is perhaps in the best position to recover. Although the severe side effects of the IMF program such as social instability should not be underestimated, policy implementation adhering to the IMF conditions appeared to be the strongest and Korea still has rich market potential, a strong industrial base, an abundance of highly educated manpower, a high saving rate, a record of growth, and high market value as a strategic business location.

Recent performance of the Korean economy substantiated the above. Under the guidance of the IMF since early 1998, the Korean economy rebounded from its late 1997 meltdown faster than expected. Korean macroeconomic indicators have shown significant improvements. After falling near 7% in 1998, real GDP was almost 11% in 1999 and near 9% in 2000. Many neo-liberal supporters like international financial institutions described Korea's 'economic recovery and financial stabilisation' as remarkable (Crotty and Lee, 2001, p.183). Consequently, the IMF loans were paid off in the mid-2001. A vivid example of this changing picture is the FDI trends in Korea. During the four year period after the crisis (1998 to 2001), Korea has attracted around US\$52 billion in FDI, which is almost more than double the entire amount of the previous four decades (Kim and Choo, 2002, p.30); by 2000 more than 1,100 business sectors of Korea had been fully opened up to foreign investors (Economist Intelligence Unit, 2002, p.29). Korea's recent inward FDI trend implies that the Korean market is rapidly changing and open to outsiders offering opportunities to maximize market benefit in Korea. On the other hand, the Korean government has shown its ambition in recent years to level up the country's economic status by setting up the new national agenda. In April 2002, the Korean government, then the Kim Dae-jung administration, unveiled its grand ambition to turn the nation into an international business hub of Northeast Asia. This master plan included establishment of the so-called "special economic zones" that consist of 132 sq km (40 million pyeong) of land encompassing Youngjong Island, Songdo New Town of Incheon and Gimpo to promote international business. This new vision by radically liberizing market environment (covering foreign investment, finance, logistics, information technology, manufacturing and research and development) has emerged as one of the new government's (the Roh Moo-hyun administration, February 2003 – present) ten national agendas (Kim 2003: 17). In particular, Korea's new President Roh has established a special task force team to develop and implement the new vision, specializing in three main specific sectors including logistics, finance and industry. The logistics dimension is considered to be crucial given Korea's strategic and business location between Japan and China. The Roh administration has also promised to improve the business and operating environment for the multinational corporations (MNCs) through socioeconomic and institutional reforms such as labor market conditions, chaebol, liberalization of immigration policy and tax benefits at the national level. In other words, the attraction of MNCs has become one of the top priorities for the current Korean economy and the major component of the Korea's new globalization strategy (Sachwald 2003).

### **Hub Vision: New Paradigm?**

It seems obvious that Korea needs to establish a regional business center as its survival strategy in this rapidly changing and competitive age of globalization, especially with the geographical and technological advantages that Korea possesses. However, on the question of "hub" there seems to be a variety of opinions. Some refer to a logistical hub given Korea's geographical advantage (its close proximity to China and Japan) and its possession of a newly established airport and potential mega-hub ports (Lamers 2002; Kim 2002; Feller 2003). Others researchers

(Seitz 2002; Raubach 2002; Rooney 2002) focus on Korea as a regional financial center given that the nation is blessed with good infrastructure such as modern telecommunication facilities and high-speed internet network. Despite a sound and coherent strategic direction yet to emerge, Korea's new vision has seemingly been designed in an effort to create an image of Korea as a home for MNC's regional headquarters (RHQs), bringing foreign capital and technology as a consequence of Korea's becoming the logistical and financial center of Northeast Asia.

Despite the Korean government's and the media's effort in recent months, the majority of foreign companies in Korea do not seem to agree on what exactly is meant by "hub" (Lee and Hobday 2003). There seems to be two critical reasons that support this observation. First, to foreign companies and experts, Korea as a business hub, especially a regional financial center by any standards is unrealistic. As Kwon argues in his study on Korea's financial liberalization, although financial globalization is an inevitable force, the idea of financial hub vision seemed to come out of no consideration of experts' strategic advices (Kwon 2004). Unlike Hong Kong and Singapore who have successfully built a "foreign-friendly business environment" such as English-speaking domestic workforce, effective urban-planning for foreign professionals, and the overall global mind-set among government bureaucrats, business leaders and employees, etc. Equally important, Korea still lags Hong Kong and Singapore in infrastructure and internationalization and has a smaller domestic market than Japan and China (Feller 2003). Second, the market (48 million people) size and its potential of the Korean economy coupled with Korea's growing importance as a market in the global economy and their (MNCs) global strategies to expand to new markets turned out to be three most persuasive factors in MNCs' initial decision to invest in the Korean market.

Until very recently Korea has been among the least receptive to foreign direct investors in the Asian region, with the inflow of FDI accounting for just 1.1% of gross fixed capital formation in 1995. This contrasts with a regional average of 9%, and ratios of 25.7% in China, 24.6% in Singapore and 17.9% in Malaysia (Morgan 1997). Although FDI in Korea in 1996 increased sharply, a rise of 65% in amount (US\$3.2 billion) over the previous year, Korea still compares poorly in terms of FDI (2.2% of GDP) with countries like China (18.2%), Malaysia (28.5%) and Taiwan (7.3%) (European Union Chamber of Commerce 1997: 60; Sakong 1998: 105–106). Korea was one of the few Asian countries that did not liberalize inflows of foreign capital until the mid-1990s. Until 1993, non-residents were given very limited access to the Korean stock market while the types of securities that local firms could issue abroad were expanded.

The main reason for not having a larger business presence in Korea is due to its long history of economic nationalism stimulated by negative experiences as a result of earlier interactions with foreign regimes. A strong belief in self-sufficiency has inevitably resulted in a tough business climate, seemingly especially hostile to foreign companies. Korea has always been for foreign companies a difficult market to set up and invest in. It has also been difficult to form joint ventures so it has not been an easy market.

According to analysis by the Economist Intelligence Unit (EIU 2002) on FDI environment, Korea was ranked as the least favorable destination among 60 countries in which to invest, although Korea was ranked ahead of Japan and Thailand.

One of the major indications from the above study is that although there is a general skepticism among foreign business community on the variable quality of the tax regime and rigidities in the Korean labor market, the sheer scale of the market opportunity coupled with the ongoing and progressive process of deregulation and economic stability combine to create a major upside. In March 2002, the American Chamber of Commerce in Korea (AMCHAM) conducted a market environment survey with CEOs (approximately 1,700 individuals) of the Fortune 500 companies in the Asia-Pacific region on eight categories including Korea's macroeconomic and global business environment and perception of the Korean market in comparison with Hong Kong, Singapore, Shanghai and Tokyo (AMCHAM 2002). The survey echoes the EIU analysis (2002) in that while the CEOs believe the market potential is perceived to be bright, Korea's brand image and global business environment are far less competitive than other major cities of Asia.

#### **102 MNCs' Perception on the Feasibility of South Korea**

It has been taken for granted that Korea's economic policy over the last three decades has been strongly nationalistic. Prevailing perceptions are that there is chronic inefficiency and opaqueness in the Korean government and across society, difficulty in market access, unequal treatment in the domestic market, and relatively higher political and social instability than in other major Asian markets. Many (foreign companies in Korea) still believe that although

Korea's economic development over the last few decades and deregulation since the financial crisis of 1997 have been impressive, elements in the environment such as corruption, labor-management conflict, taxation and red tape are no better, and perhaps worse, than other Asian countries. A fundamental and obvious implication of this irony is that Korea is a tough market to invest in but the market and its potential overwhelm the obstacles and other issues that hinder their operation in Korea.

## **Hub Feasibility**

On the surface, there is no doubt among foreign business community that Korea has an enormous potential to be a business hub in the Northeast Asian region since the nation has already achieved internal and external requirements. Internally, Korea, according to Porter (1990) possesses a strong competitive advantage in factor conditions both in basic and advanced factors. Over the last four decades, Korea's lack of natural endowments has caused the nation to invest in the creation of advanced factors such as education, infrastructure and advanced communications systems to make its industries globally competitive. Korea's telecommunication infrastructure (utilization of internet) is already second in Northeast Asia. Korea is also investing very aggressively in the essential infrastructure for a business center such as construction of a high-speed railway between Seoul (capital city) and Busan (second largest city in Korea), upgrading of deep-sea ports in Busan and Gwangyang and the establishment of the new international airport in Incheon. Further, China's entry to the World Trade Organization (WTO) and the gradual shift of business activity from Southeast to Northeast Asia in accordance with the rapid but strong economic development of the region will accelerate Korea's role in the region. But Korea still considered among CEOs of MNCs, in general, to be an unattractive place for doing business. Thus, Korea's new vision for becoming Northeast Asia's business hub is nothing but a desk theory.

## **Government**

A crux of the International Monetary Fund (IMF) requests in 1997 was to uproot crony capitalism; non-transparent financial practices involving government, the chaebol and major banks; and the prolonged but rapid wage increase that outstripped the gains in labor productivity, which all contributed to the erosion of Korea's international competitiveness.

A critical point is that until the advent of President Kim Dae-jung administration (1998 – 2002), the government-chaebol alliance has been very active, using the control of finance (Bank of Korea) as a key policy tool. This enabled the government to have control over politics and led to the practice of favoring people and companies (chaebol) in regard to economic policies. A number of chaebol groups benefited from this tight alliance, especially when they needed financial help in expanding their industries overseas, including European countries. It is no wonder that most of the top 30 chaebol groups were found to have piled up debts averaging about 4.5 times more than their assets in 1997. The debt-to-equity ratio averaged 449.4% in 1997. The top 30 chaebol groups accumulated a total debt of 249.67 trillion won (US\$177 billion). This shows a sharp contrast with other countries like the US (160%), Japan (206%) and Taiwan (86%) (Gong 1999). Among the heaviest borrowers were the big five chaebol: Hyundai, LG, Daewoo, Sunkyung and Samsung. The Korean government is still regarded as a "god father", presiding over most aspects of economic affairs (Kim 1999). Korea's political and economic structures are still under government influence. Korean financial sectors, over the last four decades, have been under the government umbrella. Key figures in the major banks used to be appointed by the president himself and all financial matters were dealt with by the Ministry of Finance (now the Ministry of Finance and Economy). Although there has been some change in terms of the government and president's perception towards the role of banks since the IMF involvement in the Korean economy, the above tradition is still prevalent. This is why the role of the Korean government and bureaucrats still does not make sense to many foreign investors in Korea (Lee and Hobday 2003).

The Korean regulatory environment, difficult even for Korean firms, poses a particular challenge to the foreign investors (Office of the Investment Ombudsman (OIO) 2001). It is one of the most urgently needed areas to be corrected for Korea to become a regional business hub. Laws and regulations are often generally framed. In

particular, government's current policy of frequent working-level post rotation (1 to 2 years) decreases the degree of expertise. The meaning of the law in practice thus depends on discretionary interpretations by working-level officials, thus increasing the opportunities for inconsistent application, discrimination and corruption. Working-level officials, particularly in divisions like Immigration and Taxation Departments, often rely on unpublished internal ministerial guidelines and unwritten administrative guidance in interpreting and administering the law. But one thing that differentiates Korea from the rest of the world is that the personal relationships are a little bit more effective in Korea. These networks incorporate school friends (secondary and tertiary) going back 40 to 50 years, the region from which people originate, particular universities and of course army friends. The following remarks made by a CEO of an MNC made at the interview with the author in Korea depicts the difficulty of doing business in Korea. "When we go the relevant government agency, you find most of the bureaucrats are from one of the top universities in Korea. Meanwhile, in filing for registration, it usually takes 2 or 3 years because it requires heaps of documents. But if an employee of a certain company and the bureaucrats are from the same university, they let the company know about the required materials before the review process is complete. So the company can prepare all required materials ahead of other companies and they can save a considerable amount of time. That is not possible for foreign companies. Now that we know this sort of practice, so we select a special person who does that kind of lobbying".

One key aspect of Korean working environment that foreign countries must come to grips with is that of the confrontational relations between labor unions and management (Sakong 2003). In fact, apart from more general deterrents to FDI, the Korean labor market is the single most consistent worry by foreign MNCs. Many foreign chambers of commerce like AMCHAM believe that the Korean labor law gives significant benefits to the Korean union members with weak protection for management (AMCHAM 2002). For example, Korean labor laws still discourage firms from dismissing staff by requiring companies recruiting new staff in two years following dismissals to try to rehire laid-off workers and, in cases involving large numbers of workers, to notify the Ministry of Labor in advance, providing the reasons for the dismissal and proof that they have consulted sufficiently with staff (Economist Intelligence Unit 2002: 18).

The Korean labor unions are militant and tend to pursue their aims in a merciless way. A failure to understand the nature and style of the process will be, at the very least, demoralizing for an expatriate manager. As Sakong claims that "Korea can become Northeast Asia's business hub – if only it can provide a business-friendly environment" (Sakong 2003).

Favorable FDI policies and laws (tax and labor) coupled with appropriate infrastructure for various hubs such as finance, logistics and other businesses may attract MNCs and eventually their RHQ2. But issues concerned with socio-political and business cultures should not be underestimated. In other words, human issues are as important as business matters. Paradoxically, international businesses are all about humans and their families. Despite much publicized propaganda (establishing a residential complex for foreigners in the special economic zones) on ongoing improvements in relation to the quality of life in Seoul, the reality is that none of the above meets global standards. Importantly, many foreign companies put a high priority on their children's education, weekends, food, convenience, double-standard renting systems and cost of living in Seoul as much as business concerns (Lee and Hobday 2003). If Korea has less to offer to potential foreign residents, it is hard to attract foreign companies as well. Although there have been a few special economic zones designated (one in near Incheon international airport for business hub and two in the areas of ports of Pusan and Kwangyang for logistics hubs) where foreigners can find more favorable business and living environments (e.g. income-tax exemptions, simplified visa requirements, financial support, international schools, hospitals, accommodations, etc.) (Feller 2003), the government should also need to offer a credible reason that there will be no disadvantage in terms of convenience for existing foreign companies to shift their business operations to outskirts of Seoul. Further, in order for Korea remain as a Northeast Asian business hub candidate, more transparent measures should be taken to improve the regulatory framework and supervisory process in implementing plans and initiatives. In other words, even the "special economic zone" concept is not persuasive yet, rather it only serves as a symbolic gesture.

## Conclusion

This paper has delivered an analysis of Korea's new globalization strategy initiated by the Korean government in early 2000s. In doing so, it has offered cultural and institutional insights into some of the most critical issues to be considered for a successful transformation of Korea into a business hub of Northeast Asia. Insights and critical evaluation have been produced especially on various different interpretations of the hub concept and socio-cultural and institutional barriers to becoming a hub. In relation to Korea becoming a business center of Northeast Asia, and the general problems in the business environment for MNCs (which would need to be overcome for most MNCs to choose Korea as a hub), there is also a lack of clarity over the concept of hub, the parameters of the region targeted, and the timetable for achieving hub status.

This study has also shown that while the foreign business community in Korea unanimously is in favor of Korea's great potential to be a business hub of Northeast Asia, many of MNCs operating in Korea perceive the new vision as "too ambitious" and "unrealistic" unless there is a stark change in the current form of Korea's internal and external market environment.

# Prospects of Monetary Integration in East Asia: The Role of an Asian Monetary Authority

*Wan Leong Fee  
Monash University Malaysia, Malaysia*

## Abstract

In extending liquidity support from the original ASEAN Swap Arrangement (ASA) to a network of bilateral swaps and repurchase agreements (BSA) to the thirteen ASEAN+3 (China, Korea, and Japan) countries, the Chiang Mai Initiative (CMI) gives a new lease of life to Japan's initial proposal of an Asian Monetary Fund shortly after the 1997 Asian financial crisis. Empirical evidence is not conclusive as to whether East Asia satisfies the criteria for an Optimum Currency Area (OCA). However major forces such as the growing intra-regional trade and financial integration; the need to insulate intra-regional exchange rate variability or averting future financial crisis contagion are driving the region toward some common currency arrangements. This paper argues in favor of the establishment of an Asian Monetary Authority (AMA) as the next logical step after the CMI. As a lender of last resort, AMA can provide liquidity support on a larger regional scale. AMA can play other strategic roles to unify the region's diverse economic and political interests such as mobilizing East Asia's vast foreign reserves or enhancing the development of East Asian bond markets.

## Introduction

Since the breakdown of the Bretton Woods exchange rate system in 1971, the international monetary system has departed from a rigid centralized administered framework to a more flexible exchange rate regime. Goodhart (2002) highlighted three distinct features of the international monetary system:

- The exchange rate regime of the 1970s as supported by agreed parities gave way under the combined pressures of divergent inflation and massive capital flows in 1971-73;
- A system of floating exchange rates and capital flows driven by market forces dictate the balance of payment adjustment process via macroeconomic policies;
- Liquidity arrangements as determined by international agreement under the Bretton Woods system has shifted to liquidity from private markets with the emergence of liquidity shortages in the 1950s and 1960s.

The current international monetary system is characterized by the absence of formal agreements or rules to regulate international trade and monetary relations in what is essentially a dollar exchange standard (Duncan, 2003) as the US Dollar has dominated the international currency system along with the Euro and the Yen. While the Group of 7 makes major decisions on exchange regimes and monetary rules, the Third World is left out of the policy decision making process of the international monetary system, bearing inevitably the brunt of monetary adjustments.

The Asian financial crisis in 1997 has led to new thinking in East Asia of the need for a new currency bloc to represent the economic interests of the East Asian community in future international monetary reform. With hindsight of the success of the European Monetary Union and the use of Euro as a single currency for EU, Japan's proposal of an Asian Monetary Fund shortly after the Asian financial crisis is given a new lease of life as financial and monetary cooperation assumes a new dimension under the new Chiang Mai Initiative (CMI) of an expanded ASEAN Swap arrangements for ASEAN+3.

This paper reviews the major economic justifications for monetary integration, and highlights the problems underlying the choice of an appropriate form of common exchange rate arrangements in relation to the diverse economic policy options that hamper the type of monetary integration achieved by the European Monetary Union. The prospects of long term monetary integration that may be brought about by the proposed Asian Monetary Authority are assessed in the context of current efforts to foster deeper financial and monetary integration in East Asia.

## Economic Rationale for Monetary Integration in East Asia

East Asia (EA) has emerged to develop into a newest regional block as ASEAN+3 embark on the Chiang Mai Initiative to enhance liquidity support for countries experiencing balance of payment difficulties in the aftermath of the 1997 Asian financial crisis. Table 1 shows the tremendous growth potential of EA (Akhtar, 2004):

- EA's one-quarter share of world trade grew at an annual growth rate of 9.2% between 1980-2003;
- Intra-regional trade increased from 33.4% (\$86 billion) in 1980 to 49.3% (\$970billion) in 2003 ;
- Annual GDP growth averaged 7% over the same period;
- A savings rate of 28.8% compared with 20.2% and 15% for the EU and NAFTA;
- EA has more than half of the world's foreign exchange reserves;
- A population of over 2 billion compared with 453 million in EU and 420 million in NAFTA.

TABLE 1: ECONOMIC INDICATORS OF REGIONAL GROUPINGS: EAST ASIA, EUROPEAN UNION AND NAFTA

Economic Indicators *	East Asia	European Union	NAFTA
Population (million)	2,014.5	453.3	420.6
GDP (\$trillion), 2003	7.5	11.0	12.3
Average GDP growth (%), 1980-2003	7.0	5.0	6.0
Domestic savings (% of GDP)	28.8	20.2	15.0
Investment (% of GDP)	26.5	18.7	37.5
FDI Flows (\$ billion)			
Inflows	105.5	295.5	36.4
Outflows	57.7	337.0	173.4
Foreign Exchange Reserves (\$ billion)	1177.0	304.4	116.4
Current Account Balance (% of GDP)	3.2	0.3	(4.1)

Source: Akhtar, 2004, *Economic Integration of East Asia, Trends, Challenges and Opportunities*, ADB.

The major issue in the future development of East Asia revolves around the key question: Does East Asia qualifies as an optimum currency area (OCA)? This question is of relevance in the light of:

- global trend towards the shrinking of independent currencies with the advent of the European Monetary Union (EMU) or the creation new currency unions. Barro (2001) estimates that 60 countries out of 200 independent countries have joined new currencies unions with growing trade and financial integration;
- the failure of monetary policy in the inflation-unemployment trade-off;
- the inability of emerging economies to use their own currencies to borrow abroad in what is known as the "original sin" or incompleteness in financial markets

An OCA is defined as the optimal geographic domain of `a single currency, or of several currencies with pegged or unified exchange rates such that the single currency or pegged currencies can fluctuate only in unison against the rest of the world (Mongelli, 2002). A vast literature has emerged on the traditional criteria for East Asian currency union, based on Mundell's theory (1961) on the benefits and costs of monetary integration. The important factors include the relative share of intra-regional trade, the nature of demand and supply shocks, flexibility of markets, and the economic size of members of monetary union. Frankel (1999) identifies two OCA properties as crucial in assessing the net benefits from currency union: the degree of openness as reflected in the extent of reciprocal trade and their correlation of income. Countries sharing a high level of either openness or income correlation, preferably both properties will benefit from a single currency. Statistics on bilateral trade shows that EU members increase trade by over 60 percent.

Recent studies on OCA put forward two contrasting paradigms –specialization versus “endogeneity of OCA”. It is argued that national specialization may lead to a decline in diversification and in income correlation such that the cost from losing direct control over national monetary policy in a single currency union may become

higher. In the “endogeneity of OCA” paradigm, trade integration and income correlation will augment in the creation of a currency union.

Some of the most notable works are summarized in Table 2.

TABLE 2: EMPIRICAL STUDIES ON EAST ASIA AS AN OPTIMUM CURRENCY AREA (OCA)

Author/Year/Model	Empirical findings
Eichengreen & Bayoumi/1999/ Exchange rate variability	Supports OCA theory - small open economies - Hong Kong/Singapore benefit from pegging to other East Asian currencies
Eichengreen & Bayoumi / 1999/Structural VAR model	Aggregate demand shocks is less than half in East Asia compared to Europe. Demand and supply shocks in East Asia are smaller and more symmetric than in Europe.
Beck & Song/2002/Extend E-B model	15 East Asian countries do not share the degree of similarity in the economic structure comparable to EU, but are closer in the share of intra-regional trade, manufactures in exports and openness.
Goto /2002/Principal component analysis	Measures the degree of synchronization of real disturbances. Real disturbances of Indonesia, Korea, Malaysia, Philippines, Singapore and Thailand are much synchronized.

Source: Bergsten and Yung, 2002, Toward Creating a Regional Monetary Arrangement in East Asia, ADB.

Although empirical studies are not conclusive as to whether East Asia satisfies the criteria for a CAC, the tremendous growth in intra-regional trade in East Asia exceeding more than 50 percent of the region’s total trade in 1998 and financial integration have driven home the need to stabilise the exchange rates of East Asian currencies. East Asian experience of contagion in financial crisis and the slow progress of global reform in international financial architecture are behind some of the most powerful forces for the East Asian community to get together for some kind of regional defence arrangement against future financial crisis in the move towards the development of liquidity support as provided under the CMI. The increased accumulation of foreign reserves of East Asian countries after the 1997 financial crisis has become increasingly costly with the continual depreciation of the US Dollar (Mongelli, op. cit.). A regional arrangement may provide a better alternative to reserve accumulation for the mobilization of the vast saving resources in East Asia to provide liquidity support for countries experiencing balance of payment difficulties

### Some Issues on East Asian Exchange Rate Arrangements

East Asia has taken a significant step toward the vision of long-term monetary integration when it embarked on a program of short-term liquidity support under the CMI:

- The ASEAN swap arrangement (ASA) was agreed among the five ASEAN countries – Indonesia, Malaysia, Philippines, Thailand and Singapore in 1997. The currencies available under ASA are the US dollar, the yen and euro. ASA allows each member to draw a maximum of twice of its committed amount for a period up to six months, subject to a further extension not exceeding six months.
- ASA was extended to a network of bilateral swaps and repurchase agreements (BSA) to the thirteen ASEAN+3 countries (China, Korea and Japan) in May 2000. The short-term liquidity support was increased from the initial US\$200 million to US\$ 1 billion. BSA is a swap of US dollar with the domestic currencies of the thirteen member countries. The maximum amount of drawing under BSA is to be determined by bilateral negotiations, with an automatic disbursement of up to 10% of the maximum amount of drawing. Any drawing exceeding 10 percent is subject to IMF conditioning of macroeconomic and structural adjustments. The current amount of BSAs for the 13 member countries is estimated at US\$20 billion. This amount is too meagre to avert any future financial crisis, considering the total sum of US\$118.2 billion provided jointly by IMF, the

World Bank, ADB, and Japan to restore financial stability in Indonesia, Korea and Thailand during the 1997 Asian financial crisis (Bergsten and Park, 2002).

To transform the CMI into a region-wide defense mechanism against future financial crisis, and eventually into a single currency union for monetary integration, Bergsten and Yung (2002) has proposed:

- The creation of a network of bilateral swap arrangements (NBSA) for the provision and disbursements of swaps, monitoring and surveillance in supporting swap operations;
- Establishment of the Asian arrangement to borrow (AAB) by merging NBSA and ASA. Liquidity support in the range of 7% of GDP at the end of 2000 amounting to US\$72 billion in the event of speculative attacks against all eleven countries is estimated;
- The creation of an Asian Monetary Fund in the final stage of financial integration.

The creation of an effective institution for policy coordination, economic surveillance and management of liquidity supports is largely political, as reflected in the European experience. The choice of a common currency and a collective exchange rate regime during the transition period is governed very much by the macroeconomic and monetary framework in the region. Monetary framework, based on announced basic principles and institutional rules guiding the execution of monetary policy, can be distinguished by the degree of discretion – whether the monetary authority (Central Bank) in charge of monetary policy has the possibility of:

- Setting short-term interest rates independently from monetary conditions abroad; and
- Surprising the private sector through unanticipated inflation without repudiating the announcements, in both the short run and in the long run.

Of the nine basic monetary frameworks identified (Table 3), currency union and exchange rate peg without capital controls are among the four frameworks that provide no independent monetary policy, either in the short run or in the long run.

TABLE 3: RULE-BASED VERSUS DISCRETION-BASED MONETARY FRAMEWORKS

	Can Monetary Authorities:			
	Set short-term interest rates independently from monetary conditions abroad?		Adjust their inflation target in response to country specific shocks?	
	Short –run	Long-Run	Short –run	Long-Run

Currency union	N	N	N	N
Currency board	N	N	N	N
Exchange rate peg without capital controls	N	N	N	N
Exchange rate peg with Capital controls	Y	Y	N	N
Exchange rate peg with capital controls and a short-term intermediate target	Y	N	N	N
Inflation targeting	Y	Y	N	N
Short-term intermediate target	Y	N	N	N
Discretion	Y	Y	Y	Y

*Source: Carlo Cottarelli and Curizo Giannini, Credibility Without Rules? Monetary Frameworks in the Post-Bretton Woods Era, IMF.*

Cottarelli and Giannini's (1997) study on monetary frameworks in 100 countries between 1970 and 1994 has identified the apparent trend in the shift towards discretion in the use of monetary policy instruments in the post Bretton Woods era. To enhance credibility in monetary policy, increasing diffusion of four strategies is observed:

- Delegation of monetary policy to an independent central bank;
- Increased transparency of the monetary policy process and inflation targeting;
- Greater reliance on an outsource of credibility (acceptance of IMF conditionality);
- Heavy front-loaded in anti-inflationary reputation of monetary authorities.

This trend was dominated by the gradual abandonment of exchange rates target. In the rule-based frameworks, exchange rate anchors are more popular than domestic anchors (monetary aggregates), especially in developing countries.

In East Asia, many economies have shifted from the *de facto* US dollar-pegged regime to flexible exchange rate regimes. Kawai (2004) has advocated a tri-polar currency basket system, to stabilize rates to a basket of currencies consisting of the US dollar, the yen and the euro in a trade-off between exchange rate stability for the promotion of trade, investment and economic growth and the need for flexibility for international competitiveness. The variety of 'official' exchange rate arrangements in East Asia ranges from a currency board system (Hong Kong) to independent float (the Philippines). In between are the conventional fixed pegs to the US dollar (China and post-crisis Malaysia) and managed floating (pre-crisis Korea, Indonesia and Singapore).

Growing trade and financial integration in East Asia are reflected in the rise of ASEAN intra-regional trade as a share of regional trade similar to that of the euro area (Bayoumi and Mauro, 1999). Goto and Kawai (2001) show considerable growth in East Asian trade interdependence, leading to the correlation of business cycles in East Asia, especially in demand and supply disturbances. Indonesia, Malaysia and Thailand have highly correlated demand shocks (Eichengreen and Bayoumi (1999), while correlations of supply shocks are evident in Japan and South Korea as a group, as against Indonesia, Malaysia and Thailand in another group. Such increasing interdependencies lead to rising intra-regional fluctuations in exchange rates. This raises the issue of stability in intra-regional exchange rates among the region's diverse exchange rate regimes in two aspects:

- Movements in G3 currencies affect the bilateral exchange rates among regional currencies and consequently the competitiveness of regional economies;
- East Asian exports are heavily dependent on the United States, Japan and Europe. Any movement in G3 currencies affects the competitiveness of the dollar peg countries.

To stabilize overall trade competitiveness and to insulate the countries from intra-regional exchange rate variability from currency fluctuations of major trading partners, a common-basket exchange rate peg for East Asia has been advocated by Williamson (1999), Dornbusch and Park (1999) and Murase (2000). The debate on whether a common-basket exchange rate peg would be appropriate for East Asia depends significantly on firstly the degree to which trade patterns vary between countries and secondly the similarity of exports (Gordon, 2003).

Common currency arrangements can take two forms:

1. The formation of a currency area, with countries in the region pegging their currencies to a basket of the yen, dollar and euro, using weights based on their trade shares with Japan, the United States and the European Union, or on a regional average of trade shares with these three regions (Dornbusch and Park, 1999; Williamson 1999; Murase 2000)

Some of the issues raised in the literature can be briefly summarized as follows:

- In the common basket peg, the exchange rate could be fixed to the peg or move within a specific band (say 7-10%), Williamson, 1999) or 15% (Murase, 2000);
- A regional fund could also be used to support currencies within the band (Kuroa,2000; Murase, 2000);
- Dornbusch and Park view a common basket as the end of regional currency cooperation;
- Murase (2000) sees it only as a first step and proposes a common currency arrangement in the form of an Asian Currency Unit (ACU), using perhaps the yen as the anchor, like the European Monetary Union;
- Moon, et al. (2000) and Moon and Rhee (2001) argue for a regional currency unit as an alternative to basket peg for regional liquidity support and currency arrangements;

- Williamson (1999), Dornbusch and Park (1999) and Murase (2000) argue that as an alternative to floating the exchange rate or pegging it to one major currency, East Asia could collectively peg their currencies to a basket using common trade weights.

This view is based on two observations:

- (a) Over 40% of East Asia's trade is with itself. This supports the argument that inter-regional exchange rate stability is important for regional economic stability;
- (b) Non-Japan East Asia trade is linked heavily to Japan (14%), the United States (14%) and the European Union (12%). This supports the argument that East Asian currencies should be linked to a basket of currencies: yen, dollar and euro.

In response to these proposals, Gordon (2002) has made several useful comments:

- It is not clear that using trade weight in a peg are preferable to using exchange rate elasticities of imports and exports;
- Is establishing trade balance the best choice for policy planners instead of output stabilization?
- A common peg assumes that reducing intra-regional exchange rate variability between East Asia is more important than reducing exchange rate variability between East Asia and its major trading export markets of Japan, the United States and the European Union.
- A country targeting a basket of currencies may be better off using its own rather than common trade weights
- In the absence of strong credibility and economic convergence or strong commitment among participating members to observe strictly the rules of the games, a pegged exchange rate system is liable to speculative attacks under free capital mobility;

To be viable, a common-basket has to be robust to shocks and speculative attacks. The ultimate impact of a common-basket peg for East Asia is unclear unless it can be shown to be superior to the current regime--floating exchange rates which many East Asian economies have shifted to when they abandoned the implicit dollar pegs during the Asian financial crisis. The adoption of common currency arrangements, in the writer's view, may move economies closer together. The robustness of a regional exchange rate system depends on the similarity of economic structures, macroeconomic policies, internal and external shocks, which are empirically demonstrated in many studies to be heterogeneous. It also depends on political commitment which is currently lacking.

2. Adopting a common currency for the region. This option, as reflected in the European experience of monetary unification, eliminates the risks inherent in pegged exchange rates. As pointed out by Adams and Semblat (2004), it is superior to pegged exchange rates for various reasons:

- A single currency removes impediments to intra-regional trade and investment;
- It avoids the risks of speculative attacks under currency pegs with high capital mobility;
- It lowers transaction costs thus boosting economic integration of the region;
- It raises potential output of regional economies from increased competition, reduced transaction costs in market integration;
- A single currency increases efficiency in resource allocation, capital mobility and savings reallocation.

The emergence of currency union is the outcome of what is known as the 'hollowing out' of the intermediate regimes after two decades of pegged but adjustable exchange rate regimes (Williamson, 1996) in the aftermath of the 1992-93 European monetary system and the Asian financial crisis in 1997. Free flows of capital force many small economies to opt either for free floating or fixed exchange rate regimes in the form of a currency board arrangement or dollarisation, or the formation of currency union.

Coere' (2004) has pointed out that currency unions are not necessarily monetary unions as countries might fix their currencies without transferring monetary policy to a supranational institution like the European Central Bank (ECB). Alternatively, we may have an asymmetric currency union if the participating countries fix their exchange rate to an anchor country, leaving it to decide on a common monetary policy as in dollarisation. According to Coere', several important issues on Asian monetary union are of relevance:

- Asian economies satisfy the McKinnon OCA criterion in being much more open than European economies on average;
- Asia is much larger than Europe as it spans across 900 km between Jakarta and Singapore to 5,768 km between Jakarta and Tokyo. Comparable geographical spread between the capitals of EU countries is between 190 km between Luxembourg and Brussels to 3,362 km between Helsinki and Lisbon. As longer distances are obstacles to trade, Asia may be more integrated than Europe.
- Asian economies are more diverse than Europe, thereby providing greater scope for asymmetric shocks;
- Most studies based on the Bayoumi-Eichengreen methodology view Asia not as good an OCA as Europe.
- No single country in Asia can become an anchor rivaling that of Germany in Europe, as shown in the trade relationship (Table 4).

TABLE 4: EMERGING ECONOMIES'S TRADE WITH DEVELOPED ECONOMIES  
(UNWEIGHTED AVERAGE, AS PER CENT OF GDP)

Region	With USA	With euro area	With Japan

## The Role of an Asian Monetary Authority

East Asia is seeking exchange rate coordination and monetary integration to stabilize the exchange rates of regional currencies after the 1997 Asian financial crisis (ADB, 2002).

- Most countries in East Asia have abandoned the fixed or dollar-pegged exchange rates in favor of floating exchange rates regime. The fear of floating has driven them to look for the optimal exchange rate;
- Limiting excessive movements of exchange rates will reduce the scope of contagion;
- Monetary union in East Asia may be a better alternative to competitive devaluation of regional currencies;
- Exchange rate stability arising from common currency in a monetary union reduces exchange risks, facilitating exports and foreign borrowings.

Is East Asia ready for regional monetary integration? What institutional support is needed to bring together diverse economic, political structures into a cohesive, economically integrated and political harmonious region like the European Union? Should East Asia implement monetary integration ahead of trade integration, reversing the sequence between trade and monetary integration as was done in Europe?

At the peak of the Asian financial crisis, Japan proposed an Asian Monetary Fund (AMF) to assist the afflicted Asian economies. The idea was opposed by the United States, EU and IMF, despite the support it received from Asian countries including Malaysia and South Korea. Japan did not consult China at that time, according to Japan's former vice-finance minister Eisuka Sakakibara, in the first East Asian Congress in Kuala Lumpur in August 2003. With China's recent strong support and the softened stand of the US and IMF to regional financial arrangements, and the growing regional cooperation in trade, finance and investment, the revival of the proposed AMF has provided a new vision to East Asian monetary integration.

In assessing the roles of an Asian Monetary Authority to implement AMF, it is useful to understand the economics of monetary institutions (Bernhard, 2003) in relation to several crucial issues:

1. The benefits and costs from the perspectives of a benevolent social planner;
2. The inconsistency of monetary policy;
3. The delegation of monetary policy to an independent central bank or a conservative foreign central bank via pegged exchange rates to enhance credibility; and
4. The trade-offs between credibility and flexibility.
5. For trade-oriented nations, fixed exchange rate regime reduces exchange rate variability and transaction costs, the major advantage in favor of OCA approach to exchange rate regime choice;
6. Currency pegging implies the loss of domestic monetary flexibility;

Major roles that may be perceived for the establishment of an Asian Monetary Authority:

1. As a lender of last resort – an immediate objective of providing liquidity support on a larger scale than the current ASA and BSA under CMI. Ultimately it will assume the leading position of an independent East Asian Central Bank (EACB), much like the European Central Bank (ECB).
2. Facilitating reserve pooling as part of monetary integration in East Asia so that the regional economies can derive the benefits of scale economies. East Asia is estimated to own the world's largest holdings of foreign reserves, about 38% of the global international reserves (minus gold) amounting to US\$2,223 billion in May 2002 (Rajan, Siregar and Bird, 2003)

The Asian financial crisis has brought the realization of the underdevelopment of Asia's capital markets which in a way contributed to the severity of the crisis as the corporate sector was trapped in the currency and maturity mismatch. Asian savings were channeled to global financial centers in the United States and Europe and relent back to Asian investors. The development of an Asian Bond Fund at US\$1 billion by the 11 central banks in East Asia and Pacific countries - Australia, China, Hong Kong, Indonesia, Japan, the Republic of Korea, Malaysia, New Zealand, the Philippines, Singapore and Thailand on 2 June 2003 is designed to develop the Asian bond market to facilitate long-term and sustainable private sector development. The current bond markets in Asia face the constraints of small market size, low liquidity, and other regulatory problems on settlement standards and international acceptability. Global bond markets are predominantly US dollar-denominated or foreign currency rather than local currency bonds.

An Asian Monetary Authority will have an important role in the development of East Asian bond markets, to avoid the problems of reliance on foreign-currency bonds and the associated currency mismatch and downward spiral of self-fulfilling crisis (Krugman, 1999, Schneider and Tornell, 2001). Burger and Warnock' study (2004), on the development and foreign participation in 49 local bond markets shows that local bond markets are better developed in countries with stable inflation rates and strong credit rights, relying less on foreign-currency denominated bonds. Of the global bond market estimated at \$31.1 trillion in 2001, emerging market issuance made up only 7% of the global bond market, the bulk of outstanding bonds were issued by developed countries (93%), in particular the United States (46%), Euro area (22%), and Japan (16%), (Table 5).

TABLE 5: GLOBAL BOND MARKET PORTFOLIO

	Total Bonds Outstanding		Local Currency Bonds Outstanding	
	\$billion	% in world Bond portfolio	\$billion	% in world Bond portfolio

3. As an institution facilitating monetary integration in East Asia, enhancing macroeconomic stability against adverse balance of payment difficulties and future currency attacks-- an intermediate role; and
4. Leading East Asia to the final long-run monetary union using a single currency, and assuming the position of a new currency grouping with the dollar, yen and euro.

Although it is neither feasible nor desirable to duplicate the model of Economic and Monetary Union (EMU), much can be learned from the EU experience. Eichengreen in his presentation to the Asian Development Bank High-Level Conference on Asia's Economic Cooperation and Integration in Manila, 2004, has pointed out some of the key differences:

- A single currency for Asia requires an institutional framework to provide the legal basis for decision making much like the Treaty that established the European Community for the establishment of the European Central Bank (ECB) and the European System of Central Banks (ESCB) effective from 1 June 1998.
- The two decision-making bodies of the ECB for the implementation of a single monetary policy are the Governing Council of the ECB and the Executive Board of the ECB. Six members of the Executive Board and the governors of the euro area National Central Banks (NCBs) make up the Governing Council for the formulation of the monetary policy of the euro area and the provision of guidelines for the performance of the Eurosystem.
- ESCB is responsible for maintaining price stability - the primary objective of the single monetary policy. Price stability is defined as a year-on-year increase in the Harmonised Index of Consumer Prices (HICP) for the euro area of below 2%.
- Of significance is the Stability and Growth Pact as a means of safeguarding sound government finances for price stability and strong sustained growth , keeping government deficit below the reference value of 3% of GDP.
- Unlike Europe, Asia does not have political counterpart to a regional central bank, nor an equivalent of European Parliament.
- Asia is more politically fragmented than to-day's Europe (Wall Street Journal, 8 June), with skepticism toward Japan, and an economically fast catching up China. The decision making rules and the type of country representation if a regional central bank is created, and the delegation of policy making may appear to become some of the major issues to be resolved.

According to Eichengreen, three prerequisites for monetary union should be noted:

1. A degree of political solidarity for the delegation of monetary policy to an international institution for strict adherence to representativeness, accountability, and policy effectiveness.
2. A commitment to transparency and openness for the efficient formulation and conduct of policy;
3. Measures to strengthen, develop and harmonize the structure of financial systems.

Although the Euro area has pursued trade integration first, Shin and Wang (2003) argued that from a theoretical point of view, there is no clear reason for introducing trade integration ahead of monetary integration. First, monetary integration can increase intra-regional trade. Rose's study (2000) shows that bilateral trade in a currency union increase significantly than similar pair of countries using their own currencies by as much as 100%. Second, the introduction of monetary union can accelerate financial integration in East Asia under free capital mobility. However, on account of the close link of East Asia's capital markets to the global financial centers in U.S. and U.K., large benefits may not result from financial integration via monetary integration (Lee, Park and Shin, 2002).

Wyplosz (2002) has also pointed out that Europe's sequencing –from trade agreement to the exchange rate system and to monetary union- is not necessarily the only possible way. East Asia could proceed first with a collective exchange rate arrangement or even a monetary union, provided that the importance of building institutions along the way is duly recognized.

## Concluding Remarks

The preconditions for monetary union in Asia, from the EU experience, have to be both political and economic, as pointed out by Eichengreen. Asia may be as close as Europe in the late 1980s and early 1990s to satisfy the classic optimum currency area criteria (Goto and Hamada, 1994), but Asia is slow in political integration. The CMI is a momentous step to bring the ASEAN+3 closer in economic and political integration.

The next logical step is to establish the Asian Monetary Authority to chart the next course of monetary integration. Significant convergence of the diverse economic structure in East Asia, the strengthening of banking and capital markets for financial integration, the development of East Asian bond market initiatives, and the adoption of a workable common basket currency peg prior to the full establishment of a single currency, and the enhancement of liquidity support to avert future financial crisis are some of the major issues that need to be addressed. ASEAN+3 countries must spearhead the setting up of an Asian Monetary Authority to implement the various stages of monetary integration that EMU has achieved.

The achievement of Economic and Monetary Union in the European Union has travelled through 3 stages (ECB, 001):

- The dismantling of all internal barriers on the free movement of capital within the European Union, between July 1990 and 31 December 1993;
- The establishment of the European Monetary Institute (EMI) beginning 1 January 1994;
- The transfer of monetary competence to the European Central Bank (ECB) and the introduction of euro on 1 January 1999.

If a single currency union in East Asia is to be achieved in the next two to three decades, a timeframe should begin for the establishment of an Asian Monetary Authority.

It is important to know that real exchange rates are unlikely to remain stable within a monetary union (Wyplosz, 2002). Short run variability for asymmetric shocks and long-run variability for different stages and speeds of development require wage and price adjustments. Flexibility in goods and labor markets is required to permit adjustment while large variability of price changes is needed where large disparity exists among union members to achieve real convergence. Asia may not benefit from Europe's approach in the choice of a union-wide inflation objective to achieve nominal rather than the emerging issue of real convergence, given the diverse economic structure, the regional disparity in income levels and the political reality that each country must devise its monetary and fiscal policies and strategies to overcome domestic economic problems and global uncertainties.

TRADE IN SERVICE INDUSTRY

2005

# A Simulation Study on the Entrance of Banks into the Insurance Industries in China

*Hu Zaiyong*

*Lin Guijun*

*University of International Business and Economics, China*

## Abstract

We use hypothetical mergers between banks and insurance companies to analyze the potential risks and returns of bancassurance in China. The mergers using the industry data show that the insurance business would have increased the returns of banks, and decreased the bank risks as a whole. Furthermore, appropriate portion of insurance business is indispensable to achieve the optimal integration. The results using company's accounting data also show that the business of insurance, especially the property insurance, would have decreased the probability of bankruptcy of banks.

## Preface

With the severe competition of the international finance and the deepening financial integration, the trend of cooperative agreement and interpenetration among the bank, insurance, securities and fund becomes obvious day by day. The financial industries in most countries have transformed from the separated operation to the mixed operation, especially the consolidation between the banking and insurance industries. In western countries, the so-called bancassurance has become more and more prevail.

The premium income obtained through the bancassurance has played an important part in the European life insurance market.<sup>1</sup> In America, for instance, the consolidation between Citicorp and Travelers Group in 1998 had paved the road for the bancassurance business. While in Asia, the insurance policy sold among banking networks have become prevailed, in 1995, the total premium income of Asian countries except Japan have reached \$119 billion, among which the proportion of insurance policy sold by banks directly and indirectly is from 25% to 35%. Therefore, it is obvious that the development of bancassurance will become a global phenomenon.

In China, the development of bancassurance has experienced several phases. Before 1999, the cooperation between banks and insurance only includes the simple relevant businesses such as agreement deposit business, house mortgage loan insurance, export remit insurance business, etc. After 1999, more cooperation has appeared between the banks and the insurance companies. It covers the business that bank acts as an agent for intermediary's business of the insurance, life insurance company can use the bank service network, and specially introduces the insurance products sold through the bank counters. In 2002, the bancassurance industry had a tremendous progress, the scale of the banking agent business of the life insurance is up to 388.4 million yuan, accounts for 17.1% of the personal premium income, and the annual growth rate of bancassurance reached a record high of 600%. On January 1st 2003, the insurance law was emended, it abolished the policy restriction which allows only one bank to deputize for one insurance company; the new policy allows for a multiply model, which means banks can service for several clients without limitation. Furthermore, three new banking laws enacted in late 2003 have obligated the mixed operation in the policy level. In this way, the bancassurance will have a bright future.

Before the determination whether allows the bank to enter the insurance industries, the supervisor should have a comprehensive understanding of the expansion consequence, especially the impact on risk of the banking system. The investment portfolio theory is the most powerful academic weapon of those advocators. According to the investment portfolio theory, as long as the revenue of the bank and insurance is incomplete association, the consolidation can obtain a diversification benefits, thus reduce the risk of the bank directly. In the other way, the bank can also reduce the probability of bankruptcy by the multiple operation of insurance business. By contrast, the protesters consider more about the moral hazard, and they thought that the bank will prefer high risk business in order to seek high return on investment. It will offset the effect of diversification of risk, and damage the bank's own interests and interests of investors with incomplete information. What's more, the protesters insist on that the close dependence between the financial systems will make the risk contagion possible, and lead to the systemic risk.

At present, there are so many documents analyzing the risk of the bancassurance, but no unanimous conclusion exists, it is mainly because the data used are different, the research approaches and the measures of risk and profitability differ from each other. Moreover, the data in these documents are with regard to the situation of Europe and America, it may not be suitable to the Chinese situation.

Therefore, in this paper, on the basis of our own banking and insurance statistics, we use hypothetical mergers between banks and insurance companies, and evaluate the risks and returns of bancassurance in order to provide reference for further discussing the financial integration in China.

The paper proceeds as follows. Section 2 discusses the literature. Section 3 presents methodology: the risk and return measures employed, the sample, and the simulation procedure. Section 4 presents the demonstration analysis. Section 5 concludes and suggests.

## **Review of the Literature**

At present, the research about the potential risks and returns of bancassurance varies from each other. There are mainly three kinds of methods on the whole. The first method is to directly observe the effect of bancassurance, it mainly directly analyze the difference of risks and returns between the universal banks and the specialized banks in Europe and other countries or assess the effect of the nonbanking business on the bank holding companies in American. By contrast, the others two methods based on empirical analysis: the second one is measuring the risks and returns by analyzing the relativity of returns among the financial industries. The academic basis is the asset portfolio theory; and the third one is using the method of hypothetical merger to simulate consolidation between the banks and insurance companies, and then analyze the effect of the integration on the risks and returns.

As to the first method, the most influential literatures nowadays are two books written by Saunder and Walter (1994,1996), and other articles written by Sul (1998), Kwast(1989), Apilado, Gallo & Lockwood(1993), Vennet (2002) and so on<sup>ii</sup>. However, either their keystone of researches are different from these papers, or fail to adopt the precise quantitative methods, furthermore, as we are characteristic of separated operation system, and have great differences with other countries' financial system, so the experience from other countries may not be suitable to our country.

As far as the second method is concerned, it usually observes the characteristics of the risks and returns of banks and insurance companies and the relevant degree between each other, so as to preliminarily estimate the potential risk and diversification benefits of the bancassurance, then it will compose investment portfolios with different proportions among the banks and life insurance companies or property insurance companies, and calculate the risks and returns of these portfolios, finally estimate the impact of the bancassurance. In addition, it can also divide the insurance business into property insurance & life insurance business. Then according to analyzing the efficient portfolios among the banks, life insurance and property insurance businesses, it can further analyze the impact of these insurance business on risks and returns of the banks. The most influential literatures are Stover (1982), Rose (1989), Litan (1985), Saunder & Smirlock (1987), Wall, Reichert, and Mohanty (1993), Brewer, Fortier, and Pavel (1988) and so on.

However, no unanimous conclusion exists, it is mainly because the data (market data or accounting data) used are different, and the measures of risk and profitability (such as standard deviation, Coefficient of variation, Probability of Bankruptcy, Return on equity, The profit rate per unit risk and so on) differ from each other too.

In the portfolio approach, it assumes the existence of homogeneous industries with return distributions, which are time-stationary and joint-normal. But the market data and the accounting data may not satisfy these assumptions, so the asset portfolio approach may bring some deviation of the study. So the portfolio approach is not suitable to study the potential risk and profitability of banks entrance into the insurance industries in china.

In this case, it is required to seek new method. Boyd and Graham (1988) initiate the third method, which is hypothetical merger. In this way, banks and insurance companies are taken out at random and hypothetically merged, then we can account the returns and risks of the consolidated firms. After numerous random hypothetical mergers, we can use the medians or the mean values to analyze the impact of financial integration on the returns and risks.

Boyd et al. use accounting data and market data during 1974-1984 to simulate the mergers among the bank holding companies and other financial enterprises. The result shows that both the fluctuation of return and the probability of bankruptcy will be reduced when the bank is integrated with the life insurance company, but when the bank is consolidated with the brokerage or agent companies, the result will be different. As to the accounting data, the risk and return will all increase a lot, but in the case of market data, the predicted risk and return will be reduced.

The shortcoming of the above-mentioned simulation method lie in being unable to analyze the consolidation between the bank and insurance company with different proportions, nor can it be able to figure out the investment portfolios with minimum risks. Boyd, Graham and Hewitt (1993) design another factor to blow up or shrink the nonbanking financial companies. Their findings about the mergers between bank and life insurance company are the same with the result of Boyd et al., but the assessment on entering insurance marketing business have some differences, and the conclusion of entering property insurance industry is totally opposite to the previous result.

Allen and Jagtiani (2000) also simulate the mergers among the bank holding companies and other financial enterprises. The results show that the merger among bank holding companies, security and insurance firms will devote to reduce the bankruptcy risk. However, if banks only merger with security firms, the diversification benefit can not be achieved.

Santomero (1993) makes use of quarterly data and figures out the implied asset return volatility on the basis of option pricing theory, and then he gets out the probability of bankruptcy. He finds that after the hypothetical merger, although the implying risk of the bank rises, the profitability of bankruptcy has been reduced remarkably.

## **Methodology**

From the above analysis, it is known that different research data and risk measurement method may lead to different conclusions. Therefore, in order to completely reflect the risks and returns of bancassurance in china, this paper plans to adopt four indexes of return on equity, standard deviation, coefficient of variation and bankruptcy probability to measure the risk and profitability; in addition, it will use the latest industrial data, fiscal year data and accounting quarterly data to make an all-round comparing and analyzing.

### **The Data**

In this paper, we mainly use the annual data, quarterly data and industrial data because the samples must be existent and having open account data during the time period. For the annual data, the time period lasts for 17 years, from 1987 to 2003, while the time period of the quarterly data lasts for 5 years, from January 1999 to December 2003. As to the industrial data, we use annual data, from 1996 to 2003; the calculation method is to sum up the samples so as to get the industrial data.<sup>iii</sup> The data mainly come from the Periodical of Almanac of China Finance, Almanac of China Insurance, website of the companies, CBRC (China Banking Regulatory Commission), CIRC (China Insurance Regulatory Commission) and the Panorama. The time period is from 1985 to 2004.

Hereby, the banks considered are as follow: Bank of China, Industrial and Commercial Bank of China, Chinese Construction Bank, Agricultural Bank of China, Bank of Communications, Shenzhen, China Merchants Bank, Shanghai Pudong Development Bank, China Minsheng Banking Limited company, Hua'xia Bank, Guangdong Development Bank, Fujian Industrial Bank, CITIC Industrial Bank, China Ever bright bank, Ever-growing bank; All-risks Insurance companies include People's Insurance Company of China, China Pacific Insurance (group) Co. Ltd, China Ping An insurance(group) Co. Ltd, Tian'an insurance Limited Company of China, Da Zhong insurance Limited Company; the life Insurance companies include Chinese life insurance company, Xinhua life insurance Limited Company, Taikang life insurance Limited Company; Property insurance Companies include Huatai property insurance Limited Company, Sinosafe general property insurance Limited Company, Yong An property insurance Limited Company, China united property insurance company.

### **The Models**

The methods employed in this paper are all referenced to the Measurement methods in the above literatures, especially the evaluation method of the probability of bankruptcy citing from the study of Boyd, Graham, and Hewitt.

### Measures of Profitability

We use average return on equity to measure profitability. The average return on equity of every company is calculated by the following formula:

$$\bar{R} = \left\{ \sum_{j=2}^n [2\pi_j / (E_j + E_{j-1})] \right\} / (n-1) \quad (1)$$

In the above formula,  $\Pi$  is the net profit after taxes; E is the stockholder's equity

### Measures of Risk

In this paper, we mainly adopt three methods to evaluate the risk:

The first method is standard deviation; it represents the variability of the return.<sup>iv</sup>

$$S = \left\{ \sum_{j=2}^n (R_j - \bar{R})^2 / (n-2) \right\}^{1/2} \quad (2)$$

$$R_j = 2\pi_j / (E_j + E_{j-1}) \quad (3)$$

The second method is Reciprocal of the coefficient of variation; it represents the profit rate per unit risk.

$$ICOV = \bar{R} / S \quad (4)$$

High value of *ICOV* represents high profit performance. On the contrary, it also stands for a low level of risk per unit of return, so it can be used as an indirect measuring index of risk.

The third index is the probability of bankruptcy; it is used to measure the probability when the debt is greater than the stockholder's equity.<sup>v</sup>

Suppose A is the total assets, E is the stockholder's equity, and  $\pi$  is net profit after taxes. When the stockholder's equity is not enough to pay off the debt of the firm, that is to say  $\pi < -E$ , this company goes bankrupt. Suppose  $r = \pi/A$ ,  $k = -E/A$ , then the probability of bankruptcy of the bank can be expressed as follow:

$$P(\pi < -E) = P(r < k) = \int_{-\infty}^k \phi(r) dr \quad (5)$$

In the above formula,  $P(\ )$  represents the probability,  $\phi(r)$  is the Function of density of probability of r. Suppose that the variable r presents normal distribution, then  $P(r < k) = N(z)$ ,  $N(z)$  stands for an accumulative probability distribution function with standardized normal distribution.

So we can deduce the following formula:

$$z = \frac{k - \rho}{\sigma} \quad (6)$$

Among which  $\rho$  is the true mean value of r distribution, while  $\sigma$  is the true standard deviation of r distribution. Since  $k$  is smaller than zero, so  $z$  is usually negative. For convenience, we use  $Z$  to represent  $-z$ . If the yield rate is lower than the average yield rate by  $Z$  unit of standard deviation, the stockholder's equity of the firm is not sufficient to cover the deficit, so the firm will be bankrupt. Therefore, the higher value of  $Z$  it is, the lower bankruptcy probability will be. Even if the variable  $r$  is not normal distributing, as long as  $\rho$  and  $\sigma$  exists,  $Z$  can also represents the upper limit of the probability of bankruptcy, because we can establish the estimated value of  $Z$  with

the estimated sample value of the  $\rho$  and  $\sigma$  according to the Bienayme-Tchebycheff Inequality:

$$P(r \leq k) \leq \{\delta / (\rho - k)\}^2 = 1/Z^2 \quad (7)$$

As to the formula below, when calculated by the accounting data,  $\pi$  is net profit after taxes,  $A$  is total assets,  $n$  is the total time periods,  $E$  is the stockholder's equity,  $j$  is the time period, and  $S_r$  is the estimated standard deviation of  $r$ .

$$Z = \left\{ \sum_{j=2}^n [2\pi_j / (A_j + A_{j-1})] / (n-1) + \sum_{j=2}^n [(E_j + E_{j-1}) / (A_j + A_{j-1})] / (n-1) \right\} / S_r \quad (8)$$

### Merger Simulations

This study employs the method of Boyd et al. to compose simulating mergers between the commercial banks and insurance companies in china, because their method avoids the unsuitable hypothesis of the portfolio diversification method, and permits the simulated firm having various nonbank businesses with different proportion at the very beginning. We use the factor  $s$  to blow up or shrink the insurance company, in equation (9),  $N$  is an initial portfolio weight for a particular simulation, and  $A_b$  stands for the total assets of a bank before the mergers, while  $A_n$

$$s = \frac{N}{1-N} \frac{A_b}{A_n}, \quad 0 \leq N < 1 \quad (9)$$

is the total assets of nonbanking firms before the mergers.

In this paper, we will employ the following three methods to compose the simulations: a. bank mergers with all-risks insurance firms; b. bank mergers with property insurance firms; c. bank mergers with life insurance firms. The simulation proceeds as follows: we firstly multiply the net profit after taxes ( $\pi$ ), stockholder's equity ( $E$ ), total assets ( $A$ ) of all-risks insurance, life insurance and property insurance by  $s$ , then sum up with those of the bank, and we can get the net profit after taxes, stockholder's equity and total assets of the simulated firms (bank vs. all-risks insurance; bank vs. property insurance and bank vs. life insurance). After that, we can calculate the  $\bar{R}$ ,  $S$ ,  $ICOV$  and  $Z$  of the above simulated firms.

When simulating by quarterly data, there are 75 kinds of integration portfolios between bank and all-risks insurance, 60 kinds between bank and property insurance, and 45 kinds between bank and life insurance. With annual data, however, there are 12 kinds of integration portfolios between bank and all-risks insurance.

We use three figures to describe each of the simulation outcomes; the first figure describes the relationship between  $\bar{R}$  and  $S$ , and the predetermined weight  $N$  stands for the proportion of investment on the nonblank asset. The second figure describes the relationship between  $N$  and  $ICOV$ , and the third figure describes the relationship between  $N$  and  $Z$ .

## Empirical Result

### Empirical Result based on the Industrial Data

From Fig. 1-3 and Table 1, we can see that the rate of returns of the property insurance, life insurance and all-risks insurance are all higher than that of the banking industry, while the standard deviation and the probability of bankruptcy are all lower than that of the banks. Based on these statistics, it is revealed that the returns of the insurance industries are higher than that of the banking industry, but the risk is much lower. In addition, the coefficient of correlation between the banks and property insurance, life insurance and all-risks insurance firms are respectively 0.22, 0.15 and 0.56, as they are not high enough, so if the bank mergers with the property insurance, life insurance and all-risks insurance, a potential diversification benefit will be attained.

TABLE 1: COEFFICIENT OF CORRELATION RATIOS AMONG VARIOUS INDUSTRIES

	Industrial data	Accounting quarterly data	Accounting annual data
coefficient of correlation between the bank and all-risks insurance	0.56	0.61	0.92
coefficient of correlation between the bank and property insurance	0.22	-0.23	~
<i>coefficient of correlation between the bank and life insurance</i>	0.15	0.21	~

No matter how large asset proportion the life insurance is, there is a comparative potential diversification benefit, the rate of returns & the profit rate per unit risk can be promoted, the standard deviation and the probability of bankruptcy can be reduced. Moreover, the rate of returns have been increasing with the growth of the asset proportion of the life insurance all the time, the point where the asset proportion of the life insurance is 35% is a turning point of the standard deviation, before which, the standard deviation is basically in state of dropping (except one point which the weight is 30%), crossing the point, it will rise again, but they are still lower than the standard deviation of the bank. The rate of returns reach the toppest when the asset proportion of the life insurance is up to 40%, while the probability of bankruptcy is minimum when the weight is 35%. However, if the bank mergers with the property insurance, no matter what proportion of the property insurance is, they all have a comparative potential diversification benefit, the rate of returns & the profit rate per unit risk can be promoted, the standard deviation and the probability of bankruptcy can be reduced. Moreover, the rate of returns & the standard deviation have been increasing with the growth of the asset proportion of the property insurance all the time except the proportion varies from 0 to 5% (in that case, the standard deviation will reduce, but it is still lower than that of the bank). From the figure, we can also see that when the asset proportion of the property insurance is 10%, the profit rate per unit risk reaches the highest level, but the probability of bankruptcy has been decreasing with the growth of the asset proportion of the property insurance all the time (except one abnormal point where the weight is 30%)

As to all-risks insurance, the rate of returns has been increasing with the growth of the property insurance proportion all the time, while the standard deviation of all-risks insurance is smaller than that of the bank besides the weight of all-risks insurance is less than 10%, in addition, the standard deviation of the mixed operation falls when the asset proportion of all-risks insurance is smaller than 60%, but when the proportion is greater than 60%, it grows instead; only at the point of 60%, will the standard deviation be minimum. Furthermore, the entire profit rate per unit risk will increase a lot no matter how large proportion of all-risks insurance is. When the proportion is 90%, the profit rate per unit risk will reach the highest level and the probability of bankruptcy can also be reduced when the asset proportion of all-risks insurance rises.

On the whole, the result of the hypothetical merger with the industrial data quite supports the way of bancassurance in china. The conclusions in this paper are more supportive for the bancassurance than that of Stove, it is mainly because the coefficient of correlations between Chinese banking and insurance industry are much lower, and the potential diversification benefits are relatively greater than that of other countries. Moreover, as far as the life insurance and property insurance are concerned, our conclusions are also more supportive for bancassurance than that of Brewe et al. From their conclusions, it is considered that only the low asset proportion of the insurance business could reduce the risk of the bank, and increase the profit per unit risk, however, in our conclusion, no matter what proportion of the property insurance、 life insurance and all-risks insurance is, the mixed operation can reduce the risk of the bank and increase the profit per unit risk, but only at certain rate, can it get the highest profit per unit risk.

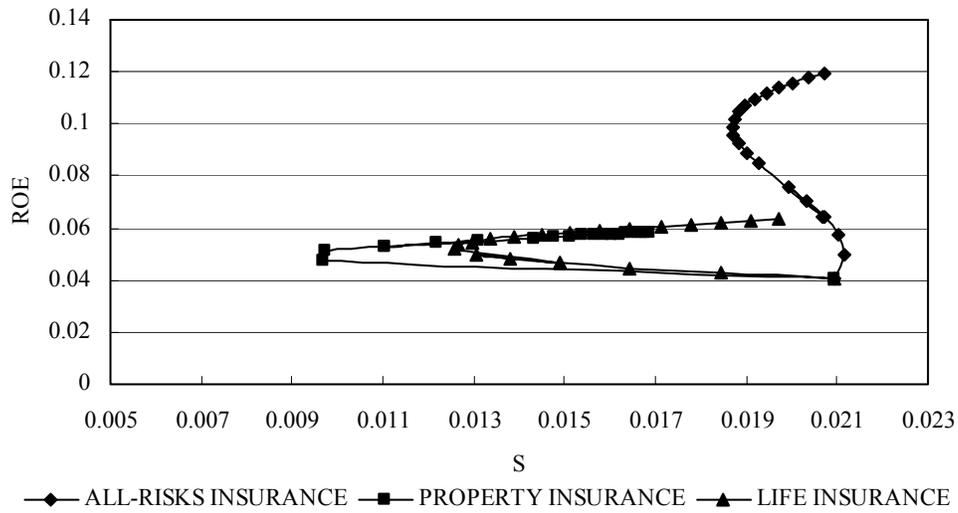

FIG.1: HYPOTHETICAL MERGERRING RESULT OF RETURNS (INDUSTRIAL DATA)

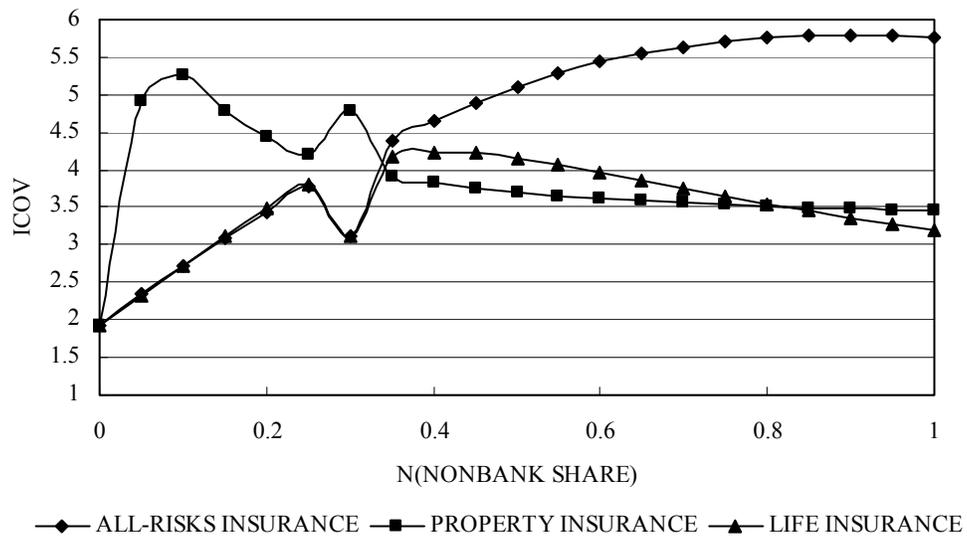

FIG.2: HYPOTHETICAL MERGERRING RESULT OF RISKS (INDUSTRIAL DATA)

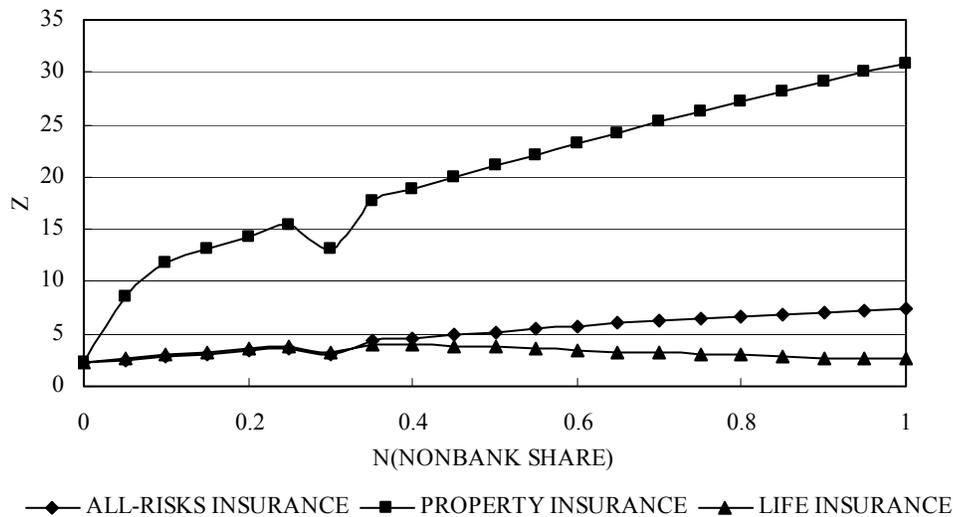

FIG.3: HYPOTHETICAL MERGERRING RESULT OF PROBABILITY

**Empirical Result based on Company's Accounting Data Quarterly Data**

According to Fig. 4-6, the rate of returns and profit rate per unit risk of the life insurance are all smaller than that of the bank, the standard deviation of the two is nearly the same, but the probability of bankruptcy of the life insurance is much lower than that of the bank. According to the data from table 1, however, as the coefficient of correlation between the bank and life insurance is just 0.21, thus the financial integration is really able to reduce the probability of bankruptcy, and the rate of returns of the simulated bank will drop with the rising of the asset proportion of the life insurance; in addition, when the proportion is lower than 40%, the standard deviation drops as the asset proportion of the life insurance rises, but when the proportion is higher than 40%, the standard deviation will rise instead, and the return per unit risk will increase while the asset proportion of the life insurance is lower than 10%. Furthermore, from Fig. 6, it is shown that the value of z grows, reflecting a reduction of bankruptcy probability. So in the case of the merger with the life insurer, the reduction of risk is at expense of the decrease of the bank's return.

As far as the property insurance is concerned, the result is not the same. The rate of returns, the standard deviation and the probability of bankruptcy of the property insurance are all lower than that of the bank, but as there are a negative relationship between them (the coefficient of correlation is -0.23), so the integration between bank and property insurance will achieve a considerable diversification effect. From the Fig. 4-6, we can see that the risk and return will all increase as the asset proportion of the property insurance is growing, in addition, as long as the proportion is no more than 30%, the profit rate per unit risk will be promoted and will reach the highest level when the proportion is 5%, in this case, the probability of bankruptcy can be reduced remarkably.

By contrast, the return of all-risks insurance is similar with that of the bank, but the standard deviation, the profit rate per unit risk and the probability of bankruptcy of all-risks insurance are much bigger than that of the bank. As their correlation coefficient is up to 0.61, so a certain diversification profit can also be attained. From the Fig. 4-6, it is shown that if the bank merges with all-risks insurance firms, the return and the standard deviation of the bank would drop first and then go up again. Therefore, no matter what asset proportion is, the consolidation between the bank and all-risks insurance will promote the unit risk premium, and when the asset proportion is 25%, the unit risk premium is the maximum and the probability of bankruptcy can be reduced obviously.

Generally speaking, the quarterly data strongly support the financial integration among the bank, property insurance and life insurance firms. As to the life insurance, although it can reduce the probability of bankruptcy and the standard deviation (when the proportion of life insurance is less than 40%), and promote the return of unit's risk (when the proportion of life insurance is less than 10%), still the integration between the bank and life insurance will lead to a reduction of the bank's return. The reason may lie in the fact that in recent years, property insurance industry has experienced a fast growing course, but the development of life insurance is not so optimistic. In addition, we should also notice that the proportion of property insurance business must be restricted at certain level so as to prevent the blind pursuit of high rate of returns regardless of risk.

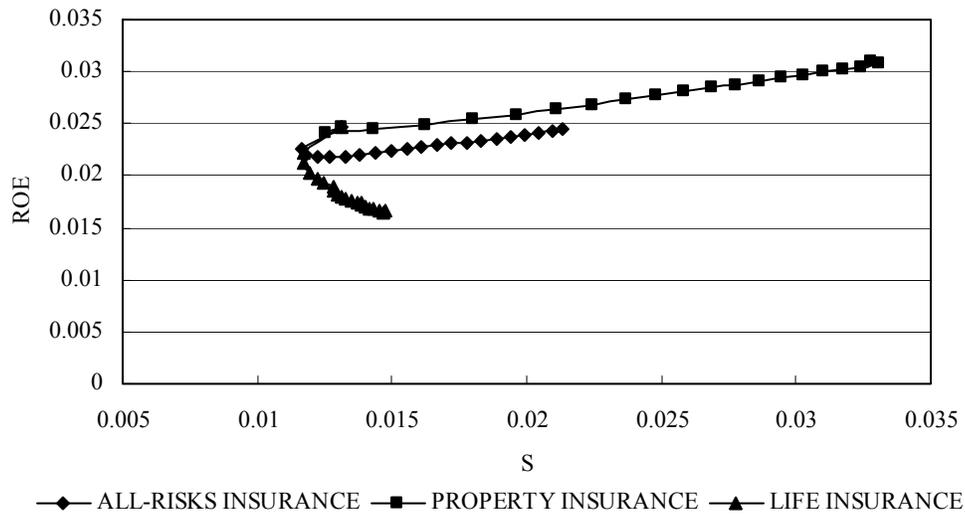

FIG.4: HYPOTHETICAL MERGERRING RESULT OF RETURNS (OUARTERLY)

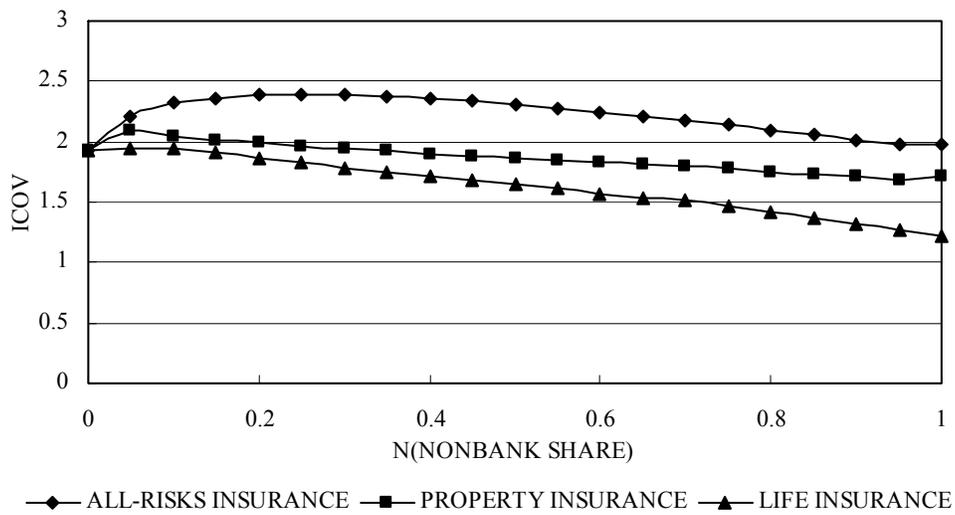

FIG.5: HYPOTHETICAL MERGERRING RESULT OF RISKS (OUARTERLY DATA)

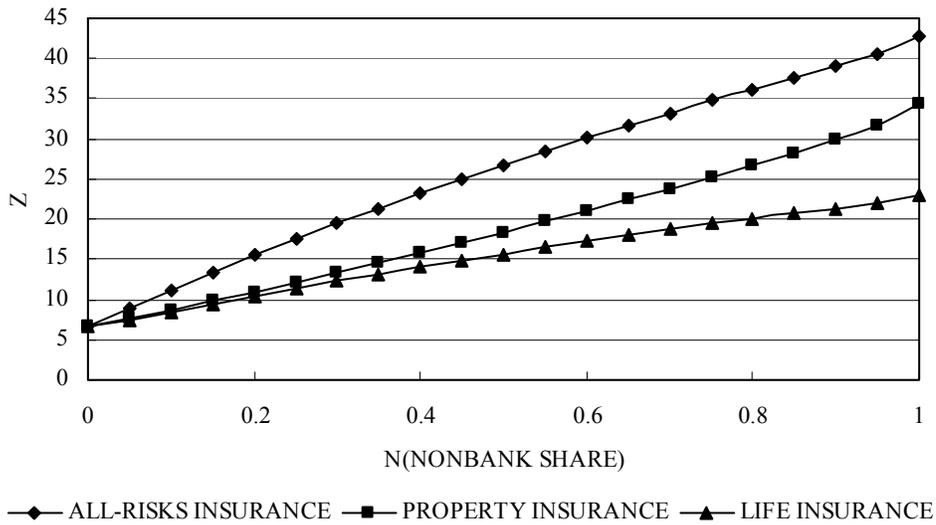

FIG.6: HYPOTHETICAL MERGERRING RESULT OF PROBABILITY OF BANKRUPTCY (QUARTERLY DATA)

**Annual Data**

As to the fiscal year data, we only analyze the risks and returns of the consolidation between the bank and all-risks insurance, it is found that the return and standard deviation of all-risks insurance firms are all bigger than that of the bank, but the profit rate per unit risk and the probability of bankruptcy are much lower than that of the bank. Form table 1, we can see that the coefficient of correlation between the bank and all-risks insurance is up to 0.92 which means the diversification benefit is limited. From the Fig. 7-9, it is shown that although the return of the company consolidated between the bank and all-risks insurance rises, the risk grows simultaneously; when the asset proportion of all-risks insurance is lower than 40%, the benefit per unit risk will increase, and when the proportion is 5%, the benefit per unit risk is the highest and the probability of bankruptcy drops obviously. The results above are similar with that of the Boyd et al.

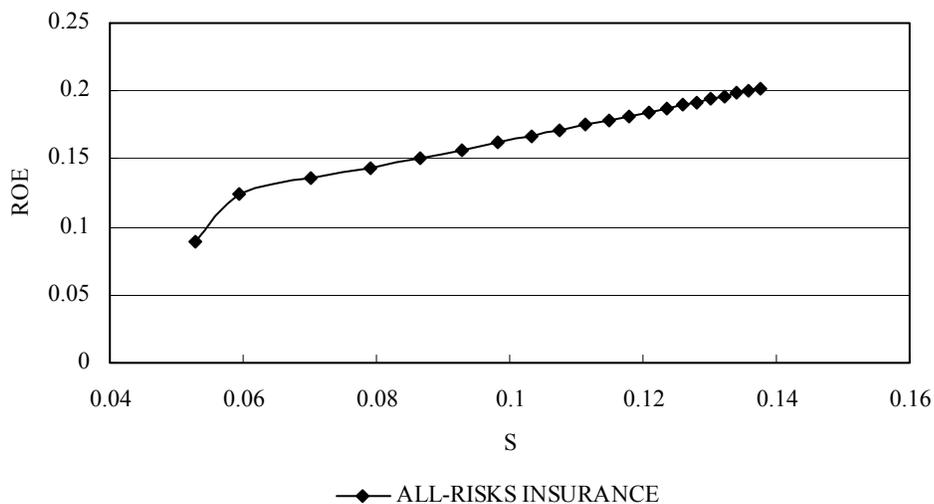

FIG.7: HYPOTHETICAL MERGERRING RESULT OF BRETURNS (ANNUAL

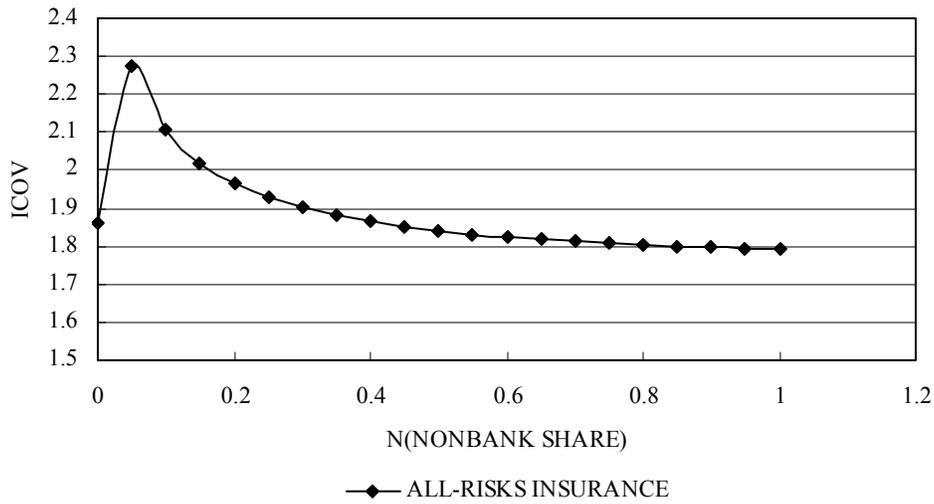

FIG.8: HYPOTHETICAL MERGERRING RESULT OF RISKS (ANNUAL DATA)

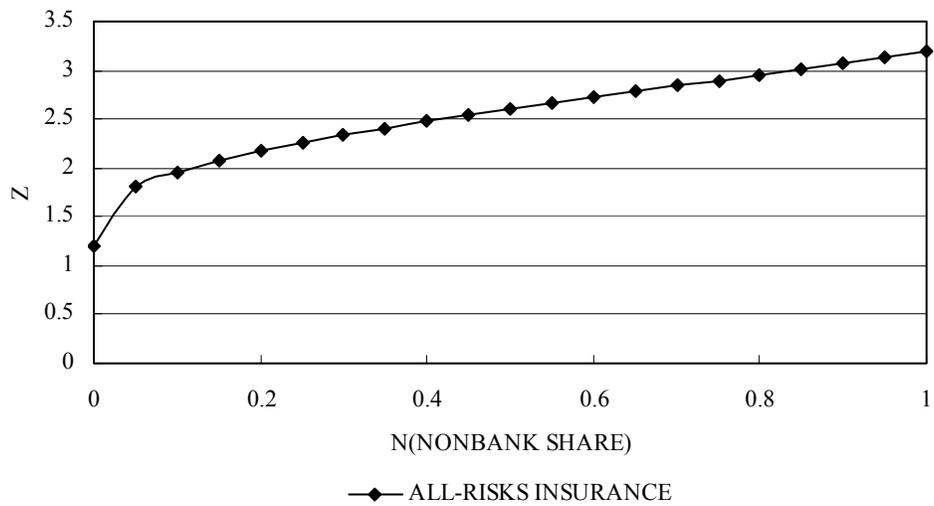

FIG.9: HYPOTHETICAL MERGERRING RESULT OF PROBABILITY OF BANKRUPTCY (ANNUAL DATA)

On the whole, the annual data supports the way of bancassurance, as long as the asset proportion of all-risks insurance is lower than 40%, the profit per unit risk will rise accordingly.

The empirical results with various data are sorted respectively in Table 2 and Table 3.

## Conclusion & Suggestion

At present, there is no unanimous view on the risk and profit of the bancassurance in western literatures. Therefore, this study will make use of the data of Chinese banking and insurance industries to empirically simulate the impact on the risk and profit of the bank if Chinese bank mergers with insurance firms, and to provide reference for the decision on the opening of bancassurance in the future.

Quarterly data	<i>Not support</i>	<i>Not support</i>	<i>support</i>	<i>support</i>	<i>support</i>	<i>support</i>	<i>support</i>	<i>support</i>	<i>support</i>
Annual data	—	—	—	—	—	—	<i>support</i>	<i>support</i>	<i>support</i>

*Note.* Support represents that the entrance of bank into insurance has diversification benefit, not support means there is no diversification benefit.

The finding of this paper is regarded as a positive backup of the bancassurance. The industrial data strongly support the financial integration among the bank, property insurance, life insurance and all-risks insurance industry. In this case, the rate of returns can be promoted and the standard deviation can be reduced. As to the life insurance industry, when the proportion of the life insurance is 40%, the return per unit risk is the highest; and when the proportion is 35%, the probability of bankruptcy is the minimum. By contrast, when the proportion of the property insurance accounts for 10%, it will get the maximum return per unit risk, and the result will be the same when the proportion of all-risks insurance is 90% instead. In addition, the probability of bankruptcy has been decreasing all the time with the growth of the proportion of the property insurance and all-risks insurance businesses.

Contrary to the industrial data, the findings with the quarterly data are not the same. Although it supports the merger among the bank, property insurance and all-risks insurance, the life insurance is got rid of the portfolio. As to the property insurance, once the weight of the property insurance is no more than 30%, the profit rate per unit risk will increase continuously, and reach the highest level when the weight is 5%. As far as all-risks insurance is concerned, the profit rate per unit risk can be promoted by any proportion of non-banking business, and it acquires the maximum when the asset proportion of all-risks insurance is up to 25%. Therefore, although the merger with life insurance can reduce the risk of the bank when the proportion of the life insurance is less than 40%, still it is at a expense of the reduction of the returns. Nevertheless, the probability of bankruptcy has been decreasing all the time with the growth of the proportion of the life insurance, property insurance and all-risks insurance. Meanwhile, based on the quarterly data, the rate of return of life insurance is not very high, so a reasonable proportion of property insurance is necessary to achieve the optimal portfolio effect.

As to the annual data, however, it shows that the bancassurance is effective, the profit rate per unit risk will rises when the proportion of all-risks insurance is less than 40%, and when the proportion is 5%, the profit rate per

unit risk will reach the toppest and the probability of bankruptcy can also be reduced while the asset proportion of all-risks insurance rises.

Therefore, as far as the diversification benefit is concerned, it is suggested that bancassurance should be permitted. Moreover, a reasonable proportion of property insurance is necessary to the optimal portfolio effect, and the proportion of non-banking business must be restricted at certain level so as to achieve the optimality and prevent the blind pursuit of high rate of returns regardless of risk.

Although this paper has adopted the latest data as much as possible, as the financial market changes very fast, so in order to accurately evaluate the effect of bancassurance, it is absolutely necessary for us to update the data continually. Furthermore, as the annual market data of Chinese bank and insurance is so limited, we can make further study on the basis of improved market data in the future.

### **End Notes**

- 
- <sup>i</sup> Among those countries with relatively developed bancassurance such as France, Spain, Portugal, the premium income obtained through the bancassurance accounts for 60% of total amount of life insurance market; while in other countries (such as Belgium, Italy, Norway, Holland, Germany and so on), the proportion varies form 20% to 35%. In the field of Property insurance, however, the bancassurance starts relatively late, the premium income accounts for only 10-20 percent of the total amount of business in the property insurance market. (the data come from website: <http://www.cnp.com.cn>.)
- <sup>ii</sup> The others are Fields & Fraser(1999), Mishkin(1999), Bhargava & Fraser(1998), Wall & Eisenbeis(1984).
- <sup>iii</sup> The time period of the industrial data sample is limited because most insurance firms established just from 1996, this may slightly affect the outcomes.
- <sup>iv</sup> The method of standard deviation is citing from Chenghsien Tsai, Wei-chien Wang(2001).
- <sup>v</sup> The probability of bankruptcy is the best index which comprehensively comprises other three indexes.

# **Analysis on the Development of Intermediate Business of Chinese Banks**

*Hongzhen Guo*

*Dong Sun*

*North China Electric Power University, China*

## **Abstract**

We provide a model to explain the impact of some factors, borrower's credit level, general interest margin, general fee rate of intermediate business and agency problem on the intermediate business development of Chinese banks. The assumption is that the amount of deposit, loan and intermediate business is the function of resources allocation, and the effect of resources allocated to balance-sheet business and intermediate business are not interdependent before 2002. Since 2002, many factors have promoted the development of intermediate business of Chinese banks. Firstly, China has promised to open its banking business in all places and all currencies to foreign banks by 2006. Balance-sheet business and intermediate business become interdependent in practice. Secondly, procedures governing the charging of intermediate business has promulgated in a bid to promote its development. Thirdly, China is pushing market-oriented reform strategy that includes coordinates government, SOCBs and SOEs reform to deal with agency problem.

## **Introduction**

The so-called intermediate business in China consists of off-balance-sheet business and fee collection business. In March 2002 the Nanjing-based Ericsson-Panda Mobile Telecommunication Equipment Co. Ltd. paid off loans to its Chinese creditors ahead of schedule and then borrowed the same sum, 1.99 billion yuan, from Citibank. Because Citibank can meet the factoring demand of Ericsson-Panda, while Chinese creditors cannot. This event represents a watershed in the competition of off-balance-sheet business between domestic and foreign banks since China joined WTO. China has promised to open its banking business in all places and all currencies to foreign banks by 2006. A fierce competition can be expected.

In general, large international banks get 40%-60% of their income from intermediate business. Most of them have robust financial strength, sound governance, strong ability of financial innovation and rich experiences. Statistics show that Citibank gets over 70% of its income from intermediate business--which include securities underwriting, risk mitigation, factoring, merger & acquisition, credit guarantees, credit commitments, hedge instruments, trading instruments (interest rate swap, forward rate agreements, cross currency swaps, Option, etc.). Until recent years, general interest margin still remain the major profit source of China's big four state-owned commercial banks (SOCBs), get about 10% of their income from intermediate business.

## **The Development of Intermediate Business during 1995-2002**

In this section, we provide a model to discuss the impact of some important factors on the intermediate business development of Chinese banks during 1995-2002. These factors include borrower's credit level, general interest margin, general fee rate of intermediate business and agency problem. We suppose that the amount of deposit, loan and intermediate business is the function of resources allocation, and the effect of resources which allocated to balance-sheet business and intermediate business are not interdependent before 2002.

According to our model, during 1995-2002, the decreasing of borrower's credit level and regulated interest margin had a positive impact on resources allocation to intermediate business. While the decreasing of general fee rate of intermediate business caused by bad competition as well as agency problem had a negative impact. As a result, Chinese banks hadn't allocated enough resources to intermediate business. Statistics show that the development of intermediate business of Chinese banks is very slowly during this term, that is to say, the negative factors had more effect on it.

**Basic Assumption**

The following assumption will be used throughout this paper to make the analysis as simple as possible.

(i) Here only consider bank's two types of balance-sheet business: deposit and bank loan. Assume the rate of deposit  $r_D$ , the rate of bank loan  $r_L$ , and the general fee rate of intermediate business  $p$  are all regulated by central bank within Chinese transition economy.

(ii) The bank's resources include business emphases, human resources and funds. For intermediate business, mainly make use of human resources owing to its little fund using. Suppose bank's total resources are 1,  $l$  is the resource proportion allocated to balance sheet business,  $1-l$  to intermediate business. Then the amount of deposit, loan and intermediate business are the function of resources allocation, which are not interdependent, denoted by

$$D(l), L(l) \text{ and } I(1-l).$$

$$\text{Where } L = kD, k \in [0,1] \quad D' = L' \text{ and } I'(1-l) > 0.$$

$$D'' = L'' \text{ and } I''(1-l) < 0, \quad I' = \frac{dI(1-l)}{dl} < 0, I'' = \frac{dI'(1-l)}{dl} > 0.$$

(iii) Assumed the operation cost function of deposit, loan and international business is linear, given by the following equation,

$$C = C(D, L, I) = a_1D + a_2L + a_3I \quad \text{where } a_1, a_2, a_3 \geq 0$$

(iv) Consider the credit status is asymmetry between bank and borrower. For SOCBs, so far they will not default on any deposit and interest payment owing to state's guarantee, whereas it is possible for borrower to default on bank loan repayment. So banks' expected interest income of loan is  $E(\theta)kr_L D(l)$ .  $E(\theta)$  is defined by borrower's expected credit level distribution, where  $\theta$  is on the interval  $[0, 1]$ .  $\theta$  equals to 1 if a borrower can repay the loan for a certainty. The real general interest margin of bank is denoted by  $(\tilde{r}_L - r_D)$  where  $\tilde{r}_L = E(\theta)kr_L$ .

(v) The bank will maximize its profit, which depends on resources allocation optimization between liabilities, assets and intermediate business.

**The Impact of 3 Parameters on  $I(1-l)$**

**The Equilibrium Resources Allocation of the Bank**

Because  $\theta$  is an uncertain value, the bank's expected return will be

$$E[\Pi(l)] = E[\theta r_L L(l)] - r_D D(l) + pI(1-l) - [a_1 D(l) + a_2 L(l) + a_3 I(1-l)] \tag{1}$$

The bank will try to maximize its expected return based on resources allocation optimization,

$$\max_l E[\Pi(l)] = E(\theta)r_L kD(l) - r_D D(l) + pI(1-l) - [a_1 D(l) + a_2 L(l) + a_3 I(1-l)] \tag{2}$$

Solve the first order conditions, we have

$$\frac{\partial E[\Pi(l)]}{\partial l} = E(\theta)r_L kD' - r_D D' + pI' - a_1 D' - a_2 kD' - a_3 I' = 0 \tag{3}$$

Then the equilibrium resources allocation will be

$$[E(\theta)kr_L - (r_D + a_1 + ka_2)]D' = (p - a_3)I'(1-l) \tag{4}$$

The left hand side of equation (4) is expected marginal return of balance sheet business, the right hand side of equation (4) is expected marginal return from intermediate business. The equilibrium resources allocation  $l^*$  is determined by comparing bank's expected marginal return from balance-sheet business and intermediate business. Solve equation (4), we can get  $l^*$  and  $1-l^*$ , then the corresponding  $D(l^*), L(l^*)$  and  $I(1-l^*)$ .

### The Impact of $E(\theta)$ on $I(1-l)$

Assume other parameters are all constant except for  $E(\theta)$ , resources proportion allocated to intermediate business is decreasing in  $E(\theta)$ . From equation (4), we can get the following differential equation,

$$kr_L D' dE(\theta) + E(\theta)kr_L D'' dl - (r_D + a_1 + ka_2)D'' dl = -(p - a_3)I''(1-l)dl \quad (5)$$

we can see that,

$$\frac{\partial l}{\partial E(\theta)} = -\frac{kr_L D'}{[E(\theta)kr_L - (r_D + a_1 + ka_2)]D'' + (p - a_3)I''(1-l)} \quad (6)$$

Being a rational bank, it will provide loan if  $E(\theta)kr_L - (r_D + a_1 + ka_2) > 0$  or engage in intermediate business if  $p - a_3 > 0$ .

$$\text{And } D' > 0, D'' < 0, I''(1-l) < 0, \text{ then } \frac{\partial l}{\partial E(\theta)} > 0 \quad \frac{\partial(1-l)}{\partial E(\theta)} < 0$$

During 1995-2002, Chinese SOCBs and state-owned enterprises (SOEs) were facing severe managerial problems with lack of sound corporate governance, local governments tend to intervene in bank loan, and law environment couldn't work as we wish. These factors as well as some historical factors resulted in high default frequency of SOEs and then a high ratio of bad assets of SOCBs. This decreasing of borrower's credit level had a positive impact on resources allocation to intermediate business.

### The Impact of $(\tilde{r}_L - r_D)$ on $I(1-l)$

Assume other parameters are all constant except for  $(\tilde{r}_L - r_D)$ , resources proportion allocated to intermediate business is decreasing in  $(\tilde{r}_L - r_D)$  or the average regulated interest margin  $(r_L - r_D)$ . From equation (4), we can get the following equation,

$$[(\tilde{r}_L - r_D) - (a_1 + ka_2)]D' = (p - a_3)I' \quad (7)$$

Then we can get the following differential equation,

$$\begin{aligned} \frac{\partial l}{\partial(\tilde{r}_L - r_D)} &= \frac{D'}{-(\tilde{r}_L - r_D - a_1 - ka_2)D'' - (p - a_3)I''(1-l)} \\ \frac{\partial(1-l)}{\partial(\tilde{r}_L - r_D)} &= -\frac{\partial l}{\partial(\tilde{r}_L - r_D)} < 0 \end{aligned} \quad (8)$$

Since 1995, the average regulated interest margin  $(r_L - r_D)$  has consecutively decreased, from 4.67% to 3.45% in 2002. This decreasing of regulated interest margin had a positive impact on resources allocation to intermediate business.

### The Impact of $p$ on $I(1-l)$

Assume other parameters are all constant except for  $p$ , resources proportion allocated to intermediate business is increasing in  $p$ .

From equation (7), we can get the following differential equation,

$$\frac{\partial(1-l)}{\partial p} = \frac{-I'(1-l)}{(\tilde{r}_L - r_D - a_1 - ka_2)D'' + (p - a_3)I''(1-l)} > 0 \quad (9)$$

During 1995-2002, the decreasing of general fee rate of intermediate business caused by bad competition hindered resources allocation to intermediate business. Until recent years, general interest margin still remain the major profit source of Chinese SOCBs. Firstly, they have long been encouraged to focus on issuing loans rather than off-balance-sheet business. Secondly, even for a variety of fee collection business, most of them only were treated as a mean of

competition in deposit market share, charge a little or no charge. Such as the inactive cards, also referred to hibernating cards, have cost banks a lot of money, but contributed little to revenues.

#### The Impact of Agency Problem on $I(1-l)$

SOCBs' unsound governance is characterized by having a huge filiation framework, too many levels and improper authorization, which makes banks in each level out of the control of general bank. SOCBs often orient to government official standard, make them bureaucracy in internal operation. The decision-makers in each level with short-term tenure are inclined to short-term target, rather than durative reform. The decision-maker's pursuing his private utility maximization rather than the institution's profit maximization is the so-called agency problem. The improper systems of manage responsibility in SOCBs result in misusing of authority, embezzlement or malpractices.

#### The Equilibrium Resources Allocation with Agency Problem

Due to agency problem, the decision-maker will pursue his private utility maximization rather than the institution's profit maximization. The utility function of decision-maker  $U(p)$  is defined as follows:

$$U(p) = \alpha L + \beta[(\theta r_L L - r_D D + pI - C(D, L, I)) - \gamma(1 - \theta)L] \quad (10)$$

Where  $\alpha L$  represents decision-maker's self-interest get from loan borrower,  $\gamma(1 - \theta)L$  is the penalty mechanism of NPLs' increasing,  $\beta[(\theta r_L L - r_D D + pI - C(D, L, I))]$  is the reward that decision-maker received from the bank.

Because  $\theta$  is an uncertain value, decision-maker try to maximize his expected self-interest through resources allocation arrangement. Here overlook  $C(D, L, I)$  for simplicity, then the equation (11) hold:

$$\max_l E[U(p)] = \alpha L(l) + \beta[E(\theta)r_L L(l) - r_D D(l) + pI(1-l)] - \gamma[1 - E(\theta)]L(l) \quad (11)$$

Solve the first order conditions, we have

$$\frac{\partial E[U(p)]}{\partial l} = \alpha L' + \beta[E(\theta)r_L L' - r_D D' - pI'(1-l)] - \gamma[1 - E(\theta)]L' = 0 \quad (12)$$

Then, the following equation (16) hold:

$$\alpha L' - \gamma[1 - E(\theta)]L' + \beta[E(\theta)r_L L' - r_D D'] = pI'(1-l) \quad (13)$$

The left hand side of equation (13) is the sum of expected marginal self-interest, marginal reward that decision-maker received from balance-sheet business and marginal penalty caused by increased NPLs. The right hand side of equation (13) is expected marginal reward that decision-maker received from intermediate business. The equilibrium resources allocation  $l^*$  is determined by comparing decision-maker's expected marginal utility from balance-sheet business and intermediate business. Solve equation (4), we can get  $l^*$  and  $1-l^*$ , then the corresponding  $D(l^*)$ ,  $L(l^*)$  and  $I(1-l^*)$ .

#### The Impact of $\alpha$ and $\gamma$ on Bank's Resources Allocation $I(1-l)$

Assume other parameters are all constant, from equation (13), we have

$$[\alpha + \beta E(\theta)r_L]L' - \beta r_D D' - \gamma[1 - E(\theta)]L' = \beta pI'(1-l) \quad (14)$$

From equation (14), we can get the following differential equation (15):

$$\{[\alpha + \beta E(\theta)r_L]L'' - \beta r_D D'' - \gamma[1 - E(\theta)]L''\}dl + L'd\alpha = -\beta pI''(1-l)dl \quad (15)$$

$$\frac{\partial l}{\partial \alpha} = \frac{L'}{-[\alpha + \beta E(\theta)r_L]L'' - \beta r_D D'' - \gamma[1 - E(\theta)]L'' - \beta pI''(1-l)} > 0 \quad (16)$$

$$\frac{\partial(1-l)}{\partial \alpha} < 0 \quad \text{similarly,} \quad \frac{\partial(1-l)}{\partial \gamma} > 0$$

If self-interest  $\alpha$  received from bank loan is high enough, decision-maker prefers to provide bank loan rather than intermediate business even facing a borrower with a very low level of credit. Although exist a penalty  $\gamma$ , because Chinese SOCBs were facing severe managerial problems with lack of sound corporate governance, we see that  $\gamma$  can't work as it supposed to be. Only the loss of bank caused by decision-maker's self-interest seeking can be identified and decision-maker be given a proper penalty, will the restrain mechanism  $\gamma$  do its work. During 1995-2002, the existence of agency problem had hindered resources allocation to intermediate business to a large extent.

## **An Expectation for the Development of Intermediate Business**

Despite of facing handicaps or difficulties, there are still many factors will benefit the development of intermediate business of Chinese banks in the future. Firstly, Chinese banks have all listed intermediate business as a key area for development. Secondly, procedures governing the charging of intermediate business has promulgated in a bid to promote its development. Thirdly, China is pushing market-oriented reform. Therefore we can expect that intermediate business of Chinese banks will get a real impetus and develop rapidly.

Since 2002, the foreign banks' arrival has exerted a significant impact on management and concept of Chinese banking. Chinese banks are conscious that balance-sheet business and intermediate business become interdependent in practice. That's to say, the good or bad performance of intermediate business will have an important impact on deposit or bank loan, they must enhance their financial service ability and make great efforts to tap and innovate intermediate business, or else they will lose good customers of balance-sheet business.

Now Chinese banks have all listed intermediate business as a key area for development, and so far recent years their income growth from intermediate business has mostly exceeded overall income growth. "Different services for different clients" is one of the ideas Chinese banks have learned from their foreign counterparts and most China's commercial banks have adopted the system of arranging managers for specific clients. ICBC posted 63.5 billion yuan (US\$7.65 billion) in revenues, 7 billion yuan (US\$845 million) of which came from intermediate business in 2003. ICBC expects its revenues in 2004 from intermediate business will exceed 10 billion yuan (US\$1.21 billion) and getting 30% of its income from intermediate business in 2010.

PBOC and the China Banking Regulatory Commission (CBRC), the industry's watchdog, decided early 2003 that Chinese banks should be allowed to impose fees from services, as the practice is common in other countries. Procedures governing the charging of intermediate business has promulgated in a bid to promote its development. Banking authorities have also allowed banks to collect account maintenance fees from depositors.

Since 2002, with the expansion of the new business cycle, it seems that China will enter an interest-rate-rising period, which benefits the ascending of general interest margin. This trend may have strengthened by two other factors: the market-oriented reform of interest rate and the raise of American interest rate. However, the increasing competition may weaken the rising trend of interest margin. Moreover, because balance-sheet business and intermediate business become interdependent, banks' good performance of intermediate business will bring them good bank loan customers, the increasing of borrower's credit level and regulated interest margin will not simply have a negative impact on resources allocation to intermediate business, may have a positive impact.

To deal with the agency problem, we should develop a comprehensive reform strategy that includes coordinates SOCBs and SOEs reform with the addition of government reform and law environment improving. Pursuing these four sectors reform simultaneously is particularly important in transition economy, they are large and highly interdependent.

For restructuring of the banking sector, the next-stage reform of SOCBs should put special focus on internal reform and establishment of effective corporate governance mechanism. SOCBs should continue to reform their institutional composition, institutional framework and ownership structure to achieve reform objectives including making duty and power arrangement symmetry, reducing operation risk and enhancing efficiency. The proposed listing of SOCBs on domestic and overseas stock markets is therefore seen as an integral step in, and vital to, the reform process. In December 2003, the country took its first major step towards preparing its large SOCBs

for listing on the Hong Kong and overseas stock markets by drawing on its massive foreign exchange reserves to inject \$45bn into two of its largest banks, ordering them to clean up their tattered loan books and improve lending practices to become internationally competitive banking firms. Once they are transformed into shareholding banks, a stiffer supervisory regime will take effect.

Today, China has become an important part of the world financial market with the rapid development of economic and financial globalization. In 2006, China's financial industry will open comprehensively to foreign competition and the financial market will, to a larger extent, be integrated with the global financial system. In China, banks have been accustomed to relying on growth to solve their problems. The improvement of China's financial regulation environment and the positive and steady development of Chinese economy as a whole, also provide a foundation for the sound development of the banking industry.

In a word, with the competition between domestic and foreign banks increasing and market-oriented reform pushed in China, intermediate business of Chinese banks will get a real impetus and develop rapidly.

## AVR (Audience Variation Rate) As a New Predictor of Film Performance

Chang Hyun Lee  
Sang Yong Kim  
Korea University, Korea

### Abstract

This study analyzes the relationship between 'AVR (audience variation rate)' and box office performance of film. We investigate the relationship between AVR and box office number (admissions). Further, we develop one index - 'APS' (audience per screen) as a variable of film performance efficiency (or box office return) - , and additionally analyze the relationship between APS and AVR. Our analyses of actual box office data suggest that 'AVR' is an important predictor as forecasting box office performance. Especially, it is more critical as forecasting box office returns than box office number (admissions). Taken together, the findings not only show that AVR is a useful predictor of box office performance and but also offer insight into how film studio can strategically manage 'AVR' to enhance box office performance, especially box office returns.

### Introduction

As the world shifts to service economy (Shugan 1994), we find enormous growth in the entertainment industry, including movies, theaters, music, cable television, home videos, and other recreational services. Especially the motion picture industry has experienced continuous growth although in the recent economic recession period. According to the Motion Picture Association of America (MPAA), Box Office has increased over \$6billion in the past 20years and 7 films released in 2003 grossed over \$50million on their opening weekend, with *The Matrix Reloaded* claiming the top spot (opening at \$92million). The total number of films released in 2003 increased 1.5% and MPAA new releases grossed an average of \$41.6million - an increase of 27% over the prior year. In that same year, the average production and marketing costs of a movie were \$64million and \$39million, respectively.

Despite of their profit potential, many films continue to fail to meet studio expectations at the box office (e.g., *Water world*). According to Vogel (1994), less than 70% of movies are profitable. Moreover, given the short life cycle of most films, the risk in new product development is high (Shugan 1995). Studios must seek ways to both enhance the likelihood of success and predict failure. However, demand for a new movie is highly uncertain, since movies are "experiential" products, and it is difficult for consumers to evaluate the quality of a movie until they have actually experienced it (Hirschman and Holbrook 1982, Holbrook and Hirschman 1982, Eliashberg and Sawhney 1994). Given the importance of new movies and the uncertainty in predicting the Box Office forecasts is extremely high in this industry (Sauhney and Eliashberg 1996).

Various research has focused on forecasting the commercial success of movies (Smith and Smith 1986, Austin and Gordon 1987, Dodds and Holbrook 1988, Sawhney and Eliashberg 1996, Eliashberg and Shugan 1997). Additionally, some research has begun to emerge addressing diffusion (Mahajan, Muller and Kerin 1984, Jones and Ritz 1991), seasonality (Radas and Shugan 1998), release timing (Krider and Weinberg 1998), clustering (Jedidi, Krider, and Vwinberg 1998), sequential products (Lehmann and Weinberg 1998, Prasad, Mahajan, and Bronnenberg 1998), contract design (Swami, Lee, and Weinberg 1998), and the impact of advertising (Zufryden 1996), all in the context of motion pictures. But, the predictive power of these variables could be poor and appears to be unstable over time (Eliashberg and Shugan 1997). Most of these research focused revenue and didn't deal with return as a box office performance variable. More over, even research dealing with box office return couldn't identify factors influencing it. Ravid(1999) and John, Ravid, and Sunder(2002) show that though big budget are correlated with higher revenue, they are not correlated with returns. If anything, low-budget films appear to have higher returns.

We consider one important factor - Audience Variation Rate(AVR) - as a new predictor of film performance. We investigate the relationship between AVR and box office number (admissions). Further, we develop one index - 'APS'(audience per screen) as a variable of film performance efficiency (or box office return) -, and additionally

analyzed the relationship between APS and AVR.

Our analyses of actual box office data suggest that AVR is an important predictor as forecasting box office performance. Especially, it is more critical as forecasting box office returns than box office number(admissions). Therefore film studio must strategically manage 'AVR' to enhance box office performance, especially box office returns.

## **Empirical Analysis**

### **Data and Variables**

Our data include 71 films that lasted in theaters at least two weeks during the period March 2003 to August 2004. It includes about 65% of the movies released by Korea productions. Because of data availability, we confine our analysis to films released in Seoul.

#### **Cumulative box office number**

Korea film council I(KOFIC) reports the total admissions(cumulative box office number) for each film. Because Korea has not produced box office revenue data officially, these figures serve as our first dependent variables showing box office performance.

#### **Audience per screen (APS)**

Because Korea has not produced box office return data, we develop this index for the purpose of showing it(or film performance efficiency). By definition, APS should be 'total cumulative admission / total screen'. But, we compute it at 'total cumulative admission / first-week screen' because of impossibility to obtain total number of screen data of Korea movies. These figures serve as our second dependent variables showing box office performance.

#### **Audience Variance Rate (AVR)**

This variable means 2nd week admissions per 1st week admissions in Seoul. In developing this index, we use the weekly box office number published by *CINE21* (Korean film magazine).

#### **Screens**

It means the first week number of screens in Seoul for each film.

#### **Film life in weeks**

*CINE21* (Korean film magazine) publishes a list of the Korea Box Office top 10 of the week. We define film life as the week which was among the top 10 movies.

#### **Summary Statistics**

In Table 1, we provide an illustrative sample of our motion pictures, their film life in weeks, first week screens, first week box office, audience variance, cumulative box office, audience per screen.

TABLE 1: SELECTED MOTION PICTURES

Film	Film Life in Weeks	First Week Screens	First Week Box Office	Audience Variance Rate	Cumulative Box Office	Audience Per Screen
The First Amendment	2	40	23,773	42.2%	71,646	1,791
My Teacher, Mr. Kim	8	60	111,144	94.9%	856,680	14,278
Save the Green Planet	2	27	11,000	18.2%	32,683	1,385
Oh! Happy Day	4	47	67,449	62.3%	280,523	5,969
Memories of Murder	10	54	120,763	101.1%	1,912,725	35,421
A Tale of Two Sisters	5	52	151,811	115.7%	1,017,027	19,558
Singles	5	58	148,231	67.5%	859,347	14,816
A Good Lawyer's Wife	6	32	74,600	99.5%	636,721	19,898
Untold Scandal	7	76	208,026	77.9%	1,292,951	17,013
Old Boy	9	45	132,000	106.1%	1,172,921	26,065
Silmido	12	83	192,000	102.1%	3,262,000	39,301
Spirit of Jeet Kune Do	6	67	165,617	79.9%	1,020,869	15,237
Taegukgi	12	110	299,900	104.2%	3,509,563	31,905
The Wolf Returns	2	378	18,124	31.8%	51,264	1,386
The Big Swindle	5	50	87,000	118.8%	776,928	17,532
Arahan	7	87	112,640	74.2%	756,000	8,690
Dance With the Wind	3	40	32,500	59.5%	112,463	2,812
The President's Barber	5	65	120,835	79.1%	661,957	10,184
Low Life	3	56	29,000	19.3%	196,000	3,500
Windstruck	4	75	163,000	59.5%	665,531	8,874
Love So Divine	3	56	86,234	43.7%	311,663	5,565
Fighter in the Wind	5	41	116,303	72.1%	579,027	14,123

In Table 2, we provide summary statistics for our motion pictures. The average number of first-week screens is 44, the average film life is 3.94 weeks, the average first-week admission is 80,177 persons, and the average total cumulative box office is 482,100 persons. The average audience variance rate is 63.73% and the average audience per screen is 9418. In our sample, *Taegukgi* had the highest total cumulative box office (3,509,563 persons) and *Silmido* had the highest audience per screen (39,301 persons per screen).

TABLE 2: MOTION PICTURES SUMMARY STATISTICS

Variable	Median	Mean	Standard Deviation
Film life in weeks	3.00	3.94	2.29
Screens (first week)	40.00	43.87	17.56
Box office (first week admission)	67,200.00	80,176.59	56,706.59
Cumulative box office	292,190.00	482,099.52	609,252.22
Audience variance rate	63.40%	63.73%	25.24%
Audience per screen	7096.00	9417.77	7482.26

Number of Observations = 71

**Findings**

To understand the impact of AVR on motion picture box office performance better, we add the number of screens known as a significant predictor of box office revenue (Eliashberg and Shugan 1997, Elberse and Eliashberg 2002) as a independent variable to the regressions. And we divide box office performance measure into two variables. One is cumulative box office number (total admission) and the other is audience per screen. Table 3, 4, and 5 contain our regression results for movies with lives at least two weeks.

In Table 3, we show the results of regressing the number of screens and AVR on the box office performance. The table shows that both the number of screens and AVR are statistically significant predictors of the box office and

APS. But, the size of the effect these variables on the box office and APS are different. Though the effect of the number of screens on the box office is greater than AVR (Screen .613 vs. AVR .304), AVR has a more effect on audience per screen than the number of screens (Screen .286 vs. AVR .563).

TABLE 3: EFFECT OF SCREENS AND AUDIENCE VARIATION RATE ON BOX OFFICE PERFORMANCE

Variable	Multiple R <sup>2</sup> (Adjusted Multiple R <sup>2</sup> )	Screens		Audience Variation Rate		F-Ratio (p-value)
		Standardized Coefficient	t-statistic (p-value)	Standardized Coefficient	t-statistic (p-value)	
Cumulative Box Office	.631 (.620)	.613	7.475 (.000)	.304	3.707 (.000)	58.047 (0.000)
Audience Per Screen	.539 (.526)	.286	3.120 (.003)	.563	6.150 (.000)	39.796 (.000)

Number of Observations = 71

In Table 4, we show that, for the movies with over 40 first-weeks screens, both the number of screens and AVR are also statistically significant predictors of the box office and APS. The box office is more influenced by the number of screens than AVR (Screen .658 vs. AVR .433), on the other hand, APS is more influenced by the AVR than the number of screens (Screen .372 vs. AVR .608).

In Table 5, we show that, for the movies with 40 and less than first-week screens, the number of screen is a statistically insignificant (i.e., .167) predictor, but the AVR is a statistically significant ( $p < .00$ ) predictor of the box office. In the effect on APS, the number of screen is a less significant (i.e., .058) predictor than the AVR (i.e., .000). at the .05 level). Moreover, the table shows that the effect of the number of screens on APS is negative (-.259), but AVR has not only a positive but also great (coefficient value .737) effect on APS.

TABLE 4: EFFECT OF SCREENS AND AUDIENCE VARIATION RATE ON BOX OFFICE PERFORMANCE (SCREENS > 40)

Variable	Multiple R <sup>2</sup> (Adjusted Multiple R <sup>2</sup> )	Screens		Audience Variation Rate		F-Ratio (p-value)
		Standardized Coefficient	t-statistic (p-value)	Standardized Coefficient	t-statistic (p-value)	
Cumulative Box Office	.710 (.692)	.658	6.825 (.000)	.433	4.489 (.000)	39.122 (.000)
Audience Per Screen	.579 (.553)	.372	3.208 (.003)	.608	5.239 (.000)	22.046 (.000)

Number of Observations = 35, film with over 40 screens

TABLE 5: EFFECT OF SCREENS AND AUDIENCE VARIATION RATE ON BOX OFFICE PERFORMANCE (SCREENS ≤ 40)

Variable	Multiple R <sup>2</sup> (Adjusted Multiple R <sup>2</sup> )	Screens		Audience Variation Rate		F-Ratio (p-value)
		Standardized Coefficient	t-statistic (p-value)	Standardized Coefficient	t-statistic (p-value)	
Cumulative Box Office	.520 (.491)	.180	1.414 (.167)	.642	5.038 (.000)	17.889 (0.000)
Audience Per Screen	.487 (.455)	-.259	-1.966 (.058)	.737	5.590 (.000)	15.636 (.000)

Number of Observations = 36 film with 40 and less screens

## Discussion and Managerial Implications

Previous researches related to the box office performance identify the antecedents of the box office revenue, but the predictive power of those variables appears to be unstable (Eliashberg and Shugan 1997) and they (i.e., big budgets) are not correlated with box office returns (Ravid 1999; John, Ravid, and Sunder 2002).

Our empirical findings suggest a statistically significant relationship between AVR and the box office performance. Especially, AVR is a very strong predictor of the box office return (i.e., audience per screen). The

number of screens is a statistically significant predictor of the box office such as previous researches (Eliashberg and Shugan 1997, Elberse and Eliashberg 2002), but it is insignificant for predicting the box office of the small and medium-sized movies with 40 and less than first-week screens. Moreover, the number of screens has not only a smaller effect on the box office return than AVR but also it has a negative effect on the box office return of the small and medium-sized movies with 40 and less than first-week screens. AVR, therefore, is a very important predictor of both the box office performance, especially box office return.

These results suggest that studios must strategically manage AVR to enhance box office performance. Especially, Studios with low budget (i.e., therefore with few screens) have to pay more attention to AVR for the success of the movie.

# **The Relationship of Industry Cluster and Performance: The Case of Financial Holding Industry**

*Shiou-Yu Chen*

*Chung-Yu Institute of Technology, Taiwan ROC*

## **Abstract**

**From the results of practical investigation, this research presents that there exists industry cluster in financial holding companies industry. According to cluster category, the industry divided into three clusters: Banking-dominant cluster, Insurance-dominant cluster and Security-dominant cluster basing on Grey Clustering Analysis. By deeply exploring the result, there exist significant differences among the three clusters in financial performance, however, not in non-financial performance. Therefore, the result of this research demonstrates that industry cluster is very important explanatory factors of the financial performance in financial holding industry. In the aspect of practical development, this study suggests every FHC should reduce the homogeneity by differentiating themselves, seek to cooperate with international finance group and merge with each other for realizing the synergy thoroughly.**

## **Introduction**

With the fast development of global market during the past decade, financial institutions are getting bigger and more conglomerate; Japan took the lead to revise its Anti-monopoly Law in 1997 allowing financial institutions to engage in cross-business activities in the form of financial holding company. In addition, in 1999 the U.S. passed the Modern Financial Laws, or the so-called Glass-Steagall Act, and lifted the ban on financial institutions from doing cross-business activities, which gives financial institutions the green light to establish financial holding companies to do a wider spectrum of finance-related businesses given that certain legal requirements are met. Similarly, globalization and joint of WTO have made Taiwan government to speed up the opening of financial market. Taiwan had carried the Merger Law of Financial Institution and Financial Holding Company in 1999 and 2001, respectively, giving the thumbs-up for merger between banks and establishment of financial holding company. It has been three years since the successive establishments of 14 financial holding companies in Dec. 2001. Owing to the deregulation and liberalization, the competition in financial sector is getting fiercer than ever within a different industry sector. The most experts and practitioners predict that some banks will forced to exit the markets, and even the larger scale financial holding companies, they facing the common problem that is “too many and too small” compared with the international financial group. Thus, for survival, the prior job for all financial holding companies is to identify their own niche market by appropriately strategic positioning and differentiate themselves from others to fight back with the evasion of foreign large financial group.

The financial industry is consolidating at an accelerating pace: the integration of financial markets has blurred distinctions between activities such as lending, investment banking, asset management, and insurance. Technological innovations and a thorough-going deregulation have prompted a wave of mergers in the banking industry throughout the world, starting in the United States in the eighties and reaching Europe in the nineties. To date most studies in this area have been conducted in western countries and in North America. Little has been done within Chinese communities, particularly in Taiwan. In order to make up the deficiency of past research, this study uses a new research design to highlight this phenomenon in fourteen Taiwan Financial Holding Companies (hereafter, FHC stand by Financial Holding Company) that are of crucial economic importance to the Taiwan economy. Thus, the main purpose of this study is to find out the unique financial strategic positioning of one strategic group and its relation to performance. According to the empirical results, we hope to offer some valuable suggestions to the managers in financial industry and all stakeholders.

This study will use the strategic group as unit of analysis and the wholes sample is fourteen FHCs. The research questions are:

1. Dose there exist different cluster within financial holding companies?

## 2. Do between-clusters profitability differences exist? Which one is the best and why?

This study is structured as follows. First, we briefly review the latest evolution of financial industry in Taiwan. Next we review extant literature with regard to industry cluster and then select the key dimensions for identifying different industry cluster. Third, hypotheses are proposed by using the aforementioned theories about performance differences across industry clusters. Fourth, we describe how we tested the hypotheses in a sample of fourteen FHCs. At last, we present the empirical results and some suggestions.

## Literature Review

### Brief Review of Financial Reform in Taiwan

Starting from 1991, Taiwan embarked on the policy of financial liberalization and internationalization by granting new banking licenses and encouraging foreign banks to join the local market. Over-competition in the financial market has led to deterioration in the profitability of banks and the qualities of their loan assets. After Taiwan's entry into the WTO in January 2002, financial institutions have encountered increasing competition and threat from foreign banks. To lay a solid foundation for the financial reform, the government has enacted or amended 13 financial laws and regulations since 2000. These include the Banking Law, Deposit Insurance Act, Financial Institutions Merger Law, Trust Enterprise Act, Financial Holding Company Law, Statute for the Establishment and Administration of the Financial Restructuring Fund, Financial Asset Securitization Act, and so on. The main purpose of the financial laws was to make financial institutions stronger and healthier through mergers and acquisitions, universal banking, diversification of financial services, financial innovation, development of new financial products, and asset securitization, thereby enhancing their international competitiveness.

After the concerted efforts of the government and financial institutions, significant progress has been made in the implementation of reform. Mergers and acquisitions between financial institutions have been sped up. Eight M & A events have occurred in the past three years. As of today, 14 financial holding companies have been established. A financial holding company may integrate clients of banking, securities, and insurance subsidiaries. Within the company, cross-selling of financial products is allowed and the mutual use of information, equipment and human resources becomes possible.

The financial industry of Taiwan did not have an integrated system for development; it also lacked credible institutions and indices for financial management and operating performance evaluation purposes. Since 1991, the Ministry of Finance (MOF) licensed the establishment of sixteen new banks, afterwards, the MOF allowed the conversion of credit cooperatives, trust investment companies, and small & medium business banks into commercial banks; hence the soaring increase in numbers of commercial banks. In the process, the nation saw an excessive number of similar banking products, thus diminishing the margin between bank profits. The stiff price competition resulted to the development of "too many banks with not enough businesses to handle"; as a result non-performing accounts began to pile up.

### Industry Cluster

What is an Industry Cluster? Professor Michael E. Porter of the Harvard Business School, whose 16 books and more than 100 articles have provided the basis for the analysis and use of industry clusters, has defined an industry cluster as "a geographically proximate group of interconnected companies and associated institutions in a particular field, linked by commonalities and complementarities." Another basic definition of an industry cluster is "geographical concentrations of industries that gain performance advantages through co-location (Doeringer and Terkla 1995, pg.225)." These definitions of clusters are similar to that of agglomeration economies, but in fact, it is within industry clusters that agglomeration economies are likely to be observed. Beyond the basic definition, however, there is little consensus on how to define an industry cluster. Porter provides a simple definition of two types of clusters: vertical clusters, and horizontal clusters. Vertical clusters are made up of industries that are linked through buyer-seller relationships. Horizontal clusters include industries which might share a common market for the end products, use a common technology or labor force skills, or require similar natural resources (Porter 1990). Jacobs and DeMan (1996) and Rosenfeld (1996,1997) present more in-depth discussions of the different definitions of industry clusters, although these authors also use the definitions of vertical and horizontal clusters as the basis for their definitions. Jacobs and DeMan (1996, pg.425) argue that "there is not one correct definition of

the cluster concept...different dimensions are of interest.” They expand from the definitions of the vertical and horizontal industry clusters to identify key dimensions that may be used to define clusters. These include the geographic or spatial clustering of economic activity, horizontal and vertical relationships between industry sectors, use of common technology, the presence of a central actor (i.e., a large firm, research center, etc.), and the quality of the firm network, or firm cooperation (Jacobs and DeMan 1996). Rosenfeld (1997) includes criteria for defining a cluster, including the size of the cluster, the economic or strategic importance of the cluster, the range of products produced or services used, and the use of common inputs. According to Rosenfeld’s definition an industry cluster is: “a geographically bounded concentration of similar, related or complementary businesses, with active channels for business transactions, communications and dialogue, that share specialized infrastructure, labor markets and services, and that are faced with common opportunities and threats.” Rosenfeld’s definition clearly emphasizes the importance he places on the role of social interaction and firm cooperation in determining the dynamic nature of a cluster.

Based on the literature cited above, there are several common themes in the definition of an industry cluster. First, it is generally agreed that clusters are a dynamic phenomenon. It is the interaction and functional relationships between firms and industries that characterize a cluster (Doeringer and Terkla 1995). Secondly, most of the definitions of industry clusters reference the geographic scope of the cluster, and the importance of spatial proximity. However, while geographic scope is important in defining clusters, every cluster has different geographic requirements, so there is no uniform definition of the appropriate geographic scope of a cluster (Rosenfeld 1996, Jacobs and DeMan 1996, Jacobs and DeJong 1992). A third common theme is the importance of looking beyond individual industries and recognizing that individual firms are part of a much larger industrial system. Lastly, the role of social infrastructure in defining industry clusters is a theme prevalent in the literature. Rosenfeld (1996), in particular, argues that information flow is critical in an effective industry cluster, and, in order to facilitate information exchange, a social infrastructure is required. He points out that while the characteristics of a cluster may be present, it is not necessarily an effective cluster; an effective cluster must also include social interaction, trust, and a shared vision in order to create the dynamic nature of a cluster. The importance of social interaction is supported by the cluster definition developed by Jacobs and DeMan (1996), as well as by Saxenian (1994) in her discussion of Silicon Valley. The role of social infrastructure is important in the discussion of identifying industry clusters presented in the following section.

#### **Identification of Industry Clusters**

The varying definitions of industry clusters help explain the differing arguments regarding the methodology to identify clusters. One of the common approaches to identifying clusters is based on quantitative techniques, including location quotients and input-output (I-O) analyses (Rosenfeld 1997). These tools help identify relative concentrations of industries in the region, as well as identify the buyer-seller linkages in different industry sectors. Michael Porter relied heavily on this type of analysis to form the basis of his international study of industry clusters. The quantitative approach towards identifying industry clusters is generally regarded as a critical component of a cluster analysis. This type of analysis will provide an initial tool for identifying potential clusters and will indicate the relative presence of different industries in the local region. An I-O analysis is especially useful in the analysis of a vertically-integrated cluster, when the buyer-seller linkages are more obvious. However, the quantitative analysis does not address whether relationships really exist between the individual firms, and it does not account for other factors beyond the product-market relationships, such as industry collaboration and information flow (Doeringer and Terkla 1995, Jacobs and DeMan 1996, Rosenfeld 1996, 1997). “Although inter-industry transactions incorporated within production channels can not sometimes be detected in input-output tables, neither the character nor relationships among firms nor can the benefits of clustering be discerned in this way (Doeringer and Terkla 1995, pg.228).

There is a general consensus in the literature that in order to truly identify industry clusters it is necessary to conduct a qualitative analysis in addition to the quantitative analysis. Surveys and interviews of key industry representatives will help expand an understanding of the buyer-supplier relationships, as well as further identifying commonalities between industries (i.e., workforce or infrastructure needs, or technologies used). The use of the qualitative analysis will both confirm the findings of the quantitative analysis, as well as help identify potential industry clusters that may have been overlooked by the conventional data analysis (Doeringer and Terkla 1995,

Jacobs and DeMan 1996, Sternberg 1991, State and Local Policy Program 1998). Synthesizing the points of view from different streams, this study adopts the qualitative analysis to identify the industry cluster by using depth interviews and market surveys. We identify key dimensions to define clusters, including: geographically bounded concentration, vertical corporation relationships, horizontal competition or substitution relationships, horizontal corporation relationships and sharing the common resources.

## Research Design

### Conceptual Framework

As stated earlier, the purpose of this study is to identify the industry clusters and explore their performance implications. More specifically, this study rests upon two major research questions pertaining to the effects of industry cluster. Therefore, the empirical framework is composed of three major parts: key dimensions of industry cluster, industry cluster of FHC and cluster's performance. This study uses some special research methods to link these three parts, including the grey clustering and ANOVA. And they are depicted as Fig. 1:

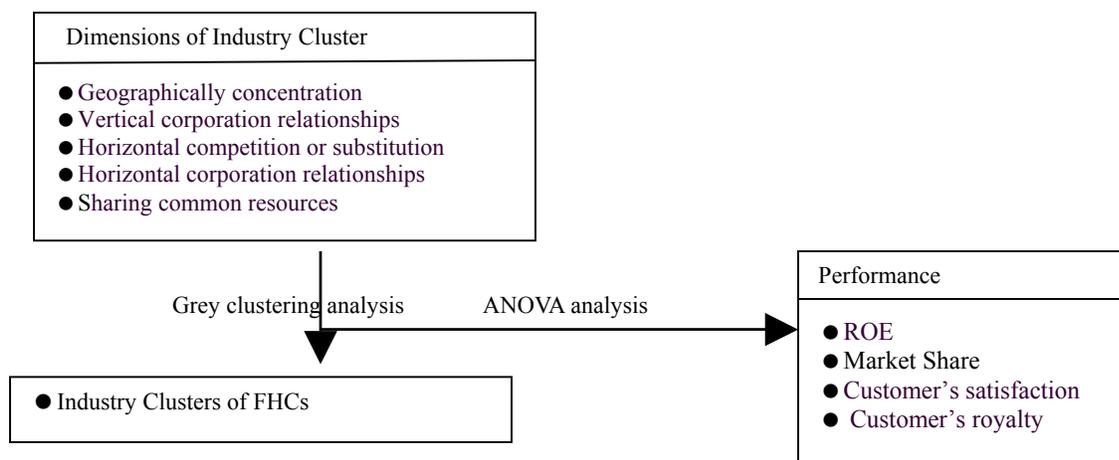

FIG. 1: EMPIRICAL FRAMEWORK

### Research Hypotheses

According to the purposes of this study and the empirical framework in Fig. 1, this study has offered some relevant research hypotheses to explore the performance implications of different clusters.

Industry clustering refers to some firms within the same industry pursue the same or similar goals, or composition of firms which got similar industry features. Thus, some firms in the same industry, in order to reach the specific goal, will present different clustering phenomena. Therefore, by observing the key dimensions will identify the existence of different industry clusters within the same industry. According the discussion above, we can offer the first hypothesis:

*Hypothesis 1: According the different persuasion of industry dimension, there really exist different industry clusters within financial holding industry.*

Pointed out by extant research, different kinds of industry cluster exist differences in the performance (including subjective and objective performance measures), hence, this study develop the second hypotheses:

*Hypothesis 2-1: Between different industry clusters, there exists significant difference with regard to ROA.*

*Hypothesis 2-2: Between different industry clusters, there exists significant difference with regard to market share.*

*Hypothesis 2-3: Between different industry clusters, there exists significant difference with regard to customer satisfaction.*

*Hypothesis 2-4:* Between different industry clusters, there exists significant difference with regard to customer royalty.

#### **Data Collection and Sampling**

To test the hypotheses developed above, the procedures for collection the empirical data and the sampling frame is postulated as follows.

Two data collection methods are to be used in this research: field interviews, and questionnaire. Yet, this study mainly employs a mail questionnaire survey to collect data from FHC managers and their customers.

According to interviews and previous study (Heide and John, 1990) it is important to find the right informant given the non-uniform distribution of knowledge among potential informants. The key informant should be the focal person in the firm who play the role as a focal point for relations with a given customer. In most cases he or she would be the leader of a team taking care of the whole business activities. To formally assess informant competency through survey items, the question measuring the respondent's knowledge of the relationship between FHCs and customers that was reported in the beginning of questionnaire. The respondent indicated insufficient knowledge, reporting a four or less scale, will be eliminated after the questionnaires were returned. However, their knowledge and involvement will be assessed via self-reports, which could be a limitation of this sample. Interviews with managers of FHCs and filed visits to their branches are made before the questionnaire is designed.

According to the data reported by Taiwan Institute of Economic Research on their web site, the total number of FHCs in Taiwan was 14 in 2003; the detailed is shown as Table 1.

TABLE 1: BASIC DATA OF 14 FINANCIAL HOLDING COMPANIES

	<b>Company name</b>	Funded	Asset (in hundred million NT\$)
1	HUA NAN FINANCIAL HOLDING CO., LTD.	12/19/2001	472.85

#### **Analytical Methods**

This study chose to adopt the grey relation analysis of the grey system theory to identify the industry clusters. The grey relation analysis and the grey system theory are briefly described below.

Deng, Julong, a professor of Hua Chung Science and Engineering University, proposed the grey system theory in 1982. The grey system theory in the last 20 years of development has become the basic analysis system for "grey relation area" with grey model becoming the principal model system expanding its use into other related research areas. Generally speaking, systematic behavior data series are random ones without a regular pattern and probability statistical methods are generally used in studying the random variables and processes. The grey system theory treats all random processes as a grey process within a scope. As long as the original data have three or four, it can be converted into grey model (Shen et al., 1998). Grey system's special characteristics are for systems containing incomplete message: 1) the system factors (parameters) are unclear; 2) the factors relationships are unclear; 3) the structure of a system is not clearly known; and 4) the theorem for the system's operation is not clear.

Conversely, white systems are those systems in which factors, relationships, structures and operation

theorem are obvious (Hsiao, 2000). Grey relation means when there is an uncertain relationship between things or the system's factor, or when the factor's effect upon the main behavior is unclear. Grey relation analysis is based on the microcosmic or macrocosmic proximity of geometry between behavioral factor series. It analyzes and decides the degree of influence between factors or measures the contribution of the factors to the principal behavior (Hsiao, 2000) Grey relation analysis needs just a small amount of data and its computation method is quite simple (Deng, 1986;1987; Yuan, 1991). There are several steps to achieve the industry clustering by using grey system theory:

- (1) Normalizing the original data;
- (2) Using equation (1) to compute the grey relation coefficient for each related factor's behavioral data series with regard to characteristic behavioral data series.

$$\zeta_i(k) = \frac{\Delta_{\min} + \rho\Delta_{\max}}{\Delta_i(k) + \rho\Delta_{\max}} \quad \text{Equation (1)}$$

in which,  $\Delta_i(k) = |x_0(k) - x_i(k)|$  is the absolute difference of two data series at "k position;  $\Delta_{\min} = \min_{\forall j \in i} \min_{\forall k} |x_0(k) - x_i(k)|$  and  $\Delta_{\max} = \max_{\forall j \in i} \max_{\forall k} |x_0(k) - x_i(k)|$  determine the minimum and maximum differences;  $\rho \in [0,1]$  is the identification coefficient used to weaken the influence of too big  $\Delta_{\max}$  value upon the grey coefficient. Thus, to cause the significant difference of the grey relation coefficients, we use  $\rho \leq 0.5$ .

- (3) Using equation (2) to compute the grey relation degree for each related factor's behavioral data series with regard to characteristic behavioral data series.

$$r_i = \frac{1}{m} \sum_{k=1}^m \zeta_i(k) \quad \text{Equation (2)}$$

- (4) Using size comparison to permute the obtained grey relation degree into a grey relation order, which will explain the relative influence of each factor's behavioral data series on the characteristic behavioral data series.

Regarding to examining the effects of clustering in subjective and objective performance, this study uses the traditional statistical analytical method, ANOVA to capture the difference.

## Empirical Results and Analysis

### Grey Clustering Analysis

After computing the Total decision matrix, this study identify three industry clusters by using grey clustering described in Table 2:

TABLE 2: INDUSTRY CLUSTERS

Company Name	Grey Clustering
HUA NAN FINANCIAL HOLDING CO., LTD.	Grey clustering 1
FUBON FINANCIAL HOLDING CO., LTD.	Grey clustering 3
CATHAY FINANCIAL HOLDING CO., LTD.	Grey clustering 3
CHINA DEVELOPMENT FINANCIAL HOLDING CORP.	Grey clustering 2
E. SUN FINANCIAL HOLDING CO., LTD.	Grey clustering 1
FUHWA FINANCIAL HOLDING CO., LTD.	Grey clustering 2
MEGA FINANCIAL HOLDING CO., LTD.	Grey clustering 1
TAISHIN FINANCIAL HOLDING CO., LTD.	Grey clustering 1
SHIN KONG FINANCIAL HOLDING CO., LTD.	Grey clustering 3
WATERLAND FINANCIAL HOLDING CO., LTD.	Grey clustering 2
SINOPAC FINANCIAL HOLDING CO., LTD.	Grey clustering 1
CHINATRUST FINANCIAL HOLDING CO., LTD.	Grey clustering 1
FIRST FINANCIAL HOLDING CO., LTD.	Grey clustering 1

According to the grey clustering processes, this study identified three industry clusters possessing different weights in key dimensions respectively; these results verify the hypothesis 1.

The ANOVA models (one for each variable) were constructed using cross-section data (2003) for the four variables. The F-Test at a 1% level of significance was used to determine the statistical significance of the differences. The result of the ANOVA test is summarized and reported in Table 3. As shown in Table 3, the p-values obtained from the ANOVA analysis on the four major performance measures, namely, ROA, market share, customer satisfaction, and customer royalty, are mixed at one percent level of significance ( $[\alpha] = 0.01$ ). The empirical result of ANOVA tests reveals that there are significant differences among the three industry clusters in objective performance; however, the differences in subjective performance – customer's satisfaction and royalty - are statistically insignificant.

TABLE 3: ANOVA RESULTS,  $\alpha=0.01$ 

Variables	P-Value	Estimation Results	Difference among the three clusters
ROA	0.000	support	Significant
Market share	0.000	support	Significant
Customer's satisfaction	0.408	Not support	Insignificant
Customer's royalty	0.554	Not support	Insignificant

## Conclusion

Basing on industry cluster theory, this study applies Grey Clustering Analysis, and ANOVA to discuss the relationship among cluster effect and performance in financial holding industry.

From the results of practical investigation, this research presents that there indeed exists the industry cluster in financial holding companies industry.

Through the grey clustering processes, the industry divided into three clusters: Banking-dominant cluster, Insurance-dominant cluster and Security-dominant cluster. By deeply exploring the differences in objective and subjective performance, we find the significant differences only exist in objective aspects. Therefore, the result of this research demonstrates that industry cluster is very important explanatory factors of the financial performance in financial holding industry. However, this study can not provide enough evidences to prove there exist significant differences between three industry clusters in subjective performance. And the subjective performance sometimes is more important than objective performance, since the former represent long-run and the later just a short-run phenomenon.

After reviewing the practical development of this industry, this study offer some suggests:

- (1) Every FHC should reduce the homogeneity and seek to differentiate by positioning themselves. A lot of FHCs took all efforts on the amalgamation in the past two years, and neglected the importance of products innovation, has caused the serious homogeneity.
- (2) Financial industry are relative closed compared with other industry in Taiwan, thus for competing globally, FHCs should cooperate with the international finance group to increasing the competitive advantages.
- (3) For achieving the 3C (Capital efficiency, Cross selling and Cost saving), the FHCs should merge with each other for realize the synergy thoroughly. That is, according to this study's finding: the all three industry clusters should consider enhancing networking relationships with other clusters.

# Major Theories of Retail Institutional Change and Application to the Hong Kong Department Store Industry

*Lai-ngun Sun*

*The Hong Kong Polytechnic University, Hong Kong*

*Robert Kay*

*University of Technology, Sydney*

## Abstract

This paper evaluates theoretical models of retail institutional change, examines the history of the department store industry through the life cycle model, and explores how it can be applied to the case of the department store industry in Hong Kong. In this paper, section 2 surveys the current theoretical models of retail institutional change, and Section 3 argues that the retail life cycle theory is the most appropriate model to explain and predict retail institutional change among the current theories. The retail life cycle model is developed from the concept of product life cycle in marketing studies and it conceptualizes retail institutional change in four stages: introduction, growth, maturity and decline. Section 4 associates the scholarship on the development of the department store in the West with reference to the life cycle model. Section 5 applies the life cycle model to the case of department stores in Hong Kong. In conclusion, three research questions are formulated regarding department store industry in Hong Kong, and are deserved for further investigation.

## Introduction

A range of disparate approaches is adopted in the academic research on retailing (McGoldrick, 1999). An earlier classification of the approaches demarcates among: 1/ the economic theoretical understanding of the management of the retail store, 2/ the functional study of retail firms, 3/ the institutional approach, and 4/ the study of management decisions in a retail firms (Rachman, 1975). As the scholarship of retailing continues to growth, a more complex classification was suggested (Rosebloom and Schiffman, 1981). It identifies five groups of theories: 1/ retail entrepreneurial theory, 2/ retail institutional change theory, 3/ macro-retailing theory, 4/ retail operations theory, and 5/ retail shopping behavior theory.

Among them, theories of retail institutional change is the most important and prolific one for examining the types of retail formats — department stores, supermarkets, specialty stores, and discount stores — that have brought about the modern form of retailing. Retailing has become more complex with the historical increase of population, urbanization, and industrialization in the past few centuries (Shaffer, 1973). Retail institutional formats became more varied and individual companies in each format could develop slightly different institutional directions. In order to make sense of the contemporary reality of retailing, theories of retail institutional change are indispensable.

Theories of retail institutional change provide the most appropriate framework for studying the historical and diachronic dimension of retailing. They deal with the evolutionary processes, cycles, and the rise and fall of retail formats. Why did the structure of retailing change over the past two centuries? How would and should a particular retail firm change as time goes on? Why and how does a particular retail institutional format change? These theoretically and practically important questions cannot be examined without a thorough understanding of theories of retail institutional change. The first half of this study outlines and reviews the major theories of retail institutional change. The second half selects the most appropriate model amongst these theories for a subsequent analysis of department stores in Hong Kong.

The department store is a good test case for theories of retail institutional change. By surveying the relevant studies on department stores in the United States (Davidson, Bates et al., 1976; Moregenstein and Strongin, 1992) and Europe (Eurostat, 1993; McGoldrick 2002), the rise and fall of the department store industry in the West can be accurately understood with the retail life cycle model. The model is useful to analyze the history of the department

store industry in Hong Kong. Such an exercise will be worthwhile for showing the global generalization of the model as well as exploring a completely overlooked area in the study of retailing in Hong Kong.

## **Theories of Retail Institutional Change**

### **Historical Development of Theories of Retail Institutional Change**

There were already numerous working hypotheses in the field of retail institutional change in the 1950s. Most of them were constructed on the basis of the historical evolution of individual retail formats. Both the quality and quantity of publications on the topic marched a step forward in the 1960s as scholars began to formulate more explicit and general theories of retail institutional change.

In this early stage of the field, the dominating theoretical models were the natural selection model and the theory of dialectic process. Both theories were constructed out of and heavily influenced by concepts borrowed externally from scholarly fields that are remote from retailing. ‘Natural selection’ comes from Darwinian biology and ‘dialectics’ from Hegelian-Marxist philosophy of history.

Other models were the wheel of retailing model and the general-specific-general cycle model. Although they were less well accepted than natural selection and dialectic process models in the 1960s, they have become regarded as more significant as time went on. As cyclical theories gained increasing interest towards the end of the eighties, the theories of retailing have been applied to numerous cases of institutional structural change in American retailing (Davidson, Sweeny et al., 1987, Lewison, 1994).

Another major theory of retail institutional change, the retail life cycle model, was developed in the early 1970s out of the concept of product life cycle in the field of marketing. Contemporary scholarship on retail institutional change is dominated by the retail life cycle model and the wheel of retailing theory. Textbooks on retailing emphasize the wheel of retailing and retail life cycle (Morgenstein and Strongin 1992). Most of the popular discourses on change in retailing institutions are of the wheel of retailing or the life cycle varieties (Markin and Duncan, 1981). No new theories of retail institutional change are suggested in recent decades. Recent studies focus on evaluating the available models with empirical evidence and calibrating the models to the practical needs of retail businesses.

It would be ideal to have a single, universal theory of retail institutional change that allows management to forecast changes of any given retail institution. However, it is generally acknowledged among retail scholars that such a model is not obtainable. The most useful theoretical exercises are instead comprehensive and synthetic analyses of existing theories. Stephen Brown’s works are the most accurate and useful among them. He identifies three basic groups of theories out of the numerous schools of thought in the study of retail institutional change — environmental theories, cyclical theories, and conflict theories (Brown, 1987). Given the shortcomings of each of the approaches, he proposes a combination of the three approaches into a more general theory of institution evolution. Other researchers also suggest creating combination models that incorporate elements of environmental, cyclical and conflict theories (Agergard, Olsen et al., 1970; Brown, 1991; McGoldrick, 2002; Sampson and Tigert, 1994).

### **Major Varieties of Retail Institutional Theories**

Among the numerous theories of retail institutional change, five of them are recognized as the most practically useful and theoretically important.<sup>i</sup> They are the natural selection model, the dialectic process perspective, the retail accordion model, the wheel of retailing model, and the retail life cycle model (Lewison, 1994; McGoldrick, 2002). In the following, identify their theoretical background and rationale, highlight their key features, and briefly discuss how they may or may not be applied to the analysis of institutional changes in the department store industry in the West.

#### **Natural Selection**

The natural selection theory represents one of the most important environmental theories of institutional evolution. The concept of natural selection derives from Charles Darwin’s biological theory of life evolution (Hannan and Freeman, 1989). ‘Survival of the fittest’ is the central theme in the Darwinian theory of natural selection. It represents Darwin’s early view that organisms evolve and change on the basis of survival and that only those organisms that evolve in ways that are most fit with the environment survive. The natural selection theory sees

retail institutions as economic life forms that must adapt to environmental change. The retailing institutions that can most effectively adapt to environmental changes are the ones most likely to prosper or survive (Dreesmann, 1968; Etgar, 1984). Lewison (1994) describes the general environments of retailing in terms of social, cultural, political, legal, technological, economical, and competitive structure of the marketplace. Other theorists see the major environmental factors that affect retailers in terms of changes in consumer character (including demographic, social, economic factors), changes in technology, and changes in the competition (Cox and Brittain, 2000; Gist, 1968). The environmental approach takes account of changes in economic, demographic, social, political, cultural, legal, and technological conditions of the market are reflected in the retail system (Duncan, 1965; Meloche, Benedetto et al., 1988). Levy and Weitz (1998) find that retailing institutions that adapt to changes in customer, technology, competition, and legal environments have the greatest chance of success. The potential list of environmental conditions that might require adaptive behavior on the part of the retailer is almost endless. All theorists concur, though, that environmental suitability and adaptive behavior are necessary traits for the long-term survival of an institutional format.

In the beginning of the 1970s, it was widely believed that the environmental models would enable marketers to predict retail trends in different nations (Cundiff, 1965; Wadinambiaratchi, 1972). Nonetheless, the wide disparity of social, political, cultural, legal and historical forces at work among individual countries entailed greater diversity rather than uniformity in retail institutional evolution (Dawson, 1979). The retail environment is less useful for predicting what will occur than explaining past phenomena— it helps us to understand why an institution of retailing has changed in a certain way over time by specifying which environmental parameters affected it. It is useful for explaining known cases of success of some institutional species and the failure of others.

The natural selection model can be used to explain the rise and decline of department stores. It accounts for the general contours of their evolution but does not provide many insights about its details or practical advice for retail management. The environmental factors that allowed the department store to prosper include “the growth of cities, improvement in their transportation systems, a rise in the standard of living, increased capital, the coming of the electrical age, and the development of plate glass and retail advertising” (Mayfield, 1949: 28). More recently, department stores tried to battle specialty stores’ competition by creating small specialty stores or boutiques within themselves (Levy and Weitz, 1998). The department store is, at the same time, often cited as an example of a retail format that fails to adapt quickly to changes in external condition such as suburban growth of out-of-town stores and congestion in town centers. The department store industry in the US has declined because of its inability and unwillingness to adapt to the changing environment. For example, it continued with the traditional merchandise lines even when it was clear to many observers that other lines would come to occupy positions of greater importance in the budget of American households (Entenberg, 1957).

#### **Dialectic Process**

The dialectic process is a ‘melting pot’ theory of retail institutional change in which two different competitive forms of retailing interact to generate a new retailing institution. The dialectic process consists of a thesis, an antithesis, and a synthesis (Gist, 1968). Thesis refers to the original, antithesis to its opposite, and synthesis to the result (Lewison, 1994; Pioch and Schmidt, 2000).

The dialectics theory of Hegel and Marx asserts that the world transforms through complex processes. They force old and new modes to adapt to each other and then generate something that is different from a simple summation of the two modes. The dialectic process perspective in institutional change similarly claims that the thesis institutional mode spawns its own antithesis that in turn must also adapt to the thesis institutional mode. Through this mutual adaptation, the institution is changed into something beyond a simple summation of the thesis and antithesis institutional modes (Davidson, Sweeny, and Stampfl, 1987).

When challenged by a competitor with a differential advantage, an established institution will adopt strategies and tactics in the direction of that advantage, thereby negating some of the innovators’ attraction. The innovator, meanwhile, does not remain unchanged. The innovator over time tends to upgrade or otherwise modify products and institutions. In doing so, he moves toward the ‘negated’ institution. As a result of these mutual adaptations, the two retailers gradually move together in terms of offerings, facilities, supplementary service, and prices. They thus become indistinguishable or at least quite

similar and constitute a new retail institution, termed the synthesis. This new institution is then vulnerable to 'negation' by new competitors as the dialectic process begins anew (Maronick and Walker, 1974).

The dialectic model recognizes that retailers often mutually adapt in the face of competition and that new retail institutions result from stores borrowing characteristics from their competitors in a way that resembles how children are created by a combination of the genes of their parents (Levy and Weitz, 1998). The dialectic process becomes the early conceptual development of the conflict-evolution model that emphasizes the evolving nature of innovation and the interaction between responses of established retailers and actions and innovators (Dickinson, 1981).

The dialectical process may be employed to describe one of the aspects of institutional change in American department stores. The department store was originally developed as an institution offering hard goods, soft goods, a wide array of services, and attractive surroundings (the thesis). The challenging retail institution in the American context (the antithesis), the discount store, offered similar merchandise. But they were located in unattractive, low-cost surroundings and lacked customer services such as credit or delivery. The promotional department store (the synthesis) then emerged as a blend of the strengths of both the department store and discount store. K mart is an example of a promotional department store (Mason and Mayer, 1987). The 'thesis' institution was known for relatively high margins, low turnover, and plush facilities. The antithesis one had low-margin and high turnover. Over time, characteristics from both department stores and discount stores were synthesized in the form of discount department stores. The traditional department store format in the immediate post-World War II era emphasized downtown location, hierarchical management structures, personal service, fixed margins regardless of stock turnover, and such 'free services' as delivery and credit. The discount store of the early 1950s emphasized outlying locations, flat management structures, customer self-service, flexible margins, and low prices leading to high stock turnover. The early discount store was an innovative challenge to the traditional department store. The traditional department store was competitively challenged by its antithesis. The synthesis institution to emerge in the 1960s was the stable, chain-owned discount department store (Davidson, Sweeney et al., 1987).

#### **The Retail Accordion**

The accordion theory proposes that retail institutions fluctuate between the strategy of offering many merchandise categories with a narrow assortment and the strategy of offering a wide assortment with a limited number of categories. Hower (1943) was the first to notice this cyclical pattern in merchandising assortments. Hollander (1966) then extended this principle to individual institutions in order to describe their widening and narrowing of inventories over time. He finds merchandise assortment to be a significant aspect of retail institutional change. His important paper suggests that the history of retail development demonstrates a general-specific-general cycle, which is also known as the accordion pattern. The notion of accordion aptly describes the contraction and expansion of merchandise lines; market domination by general line, wide-assortment retailers often alternates with domination by specialized, narrow-line ones. Manson and Mayer (1987) similarly argue that retail institutions evolve over time from broad-based outlets with wide assortments to outlets offering specialized, narrow lines. Cox and Brittain (2000) also describe the tendency for retail business structure to be dominated by generalists and then by specialists. The specialized outlets would begin to offer a wide assortment over time and thus round out general-specific-general pattern. Lewison (1994) further explains that the changing character of retail competition stems from strategies that alter the width of the merchandise mix.

The accordion theory sheds light on the early development of the American retail structure (Hollander, 1966). But it is apparently too one-dimensional in its explanatory parameters to adequately handle the complex changes of the department store and the retail structure as a whole in a modern retail market. The early American retail system has undergone a general-specific-general cycle. In the middle of the nineteenth century, retail institutions that offered a wide variety of merchandise dominated the retail system (Gist, 1968). Examples include the department store and the mail-order dry goods store (Nystrom, 1932). Towards the end of the nineteenth century, the American retail system was characterized by a high degree of specialization. There were less than twenty different kinds of specialty stores in the United States at the opening of the nineteenth century, but over a hundred by the end (Jones, 1936). The retail structure switched back to general merchandise lines during the first half of the twentieth century (Oxenfeldt, 1960; 1961).

### **The Wheel of Retailing**

The pioneering study of Malcolm McNair (1958) argues that a retail structure always revolves in a circular fashion. It revolves slowly sometimes and rapidly at others, but does not stand still. A wheel of retailing begins with a conceptual innovation that generates a new type of retail institutional format. This entry phase is a stage during which new types of retailers enter the market as low-margin, low-priced, low-status merchants. They gradually increase their operating costs by providing new services and improving their facilities and market share in the trading-up phase. Over time, they enter the vulnerable phase to become high-cost merchants, experience gross margin reductions, and turn increasingly vulnerable to new competitors entering the marketplace. The wheel continues to turn and revolves to yet another retail institutional innovator (Hollander, 1960; McNair, 1958).

A more structured wheel model and a more updated and comprehensive analyses of the concept are recently provided (Brown, 1988; 1990). In these versions, the wheel of retailing resembles a circular pattern and the cycle contains three phases in a wavelike pattern. The cycle begins with a bold new concept in the entry stage and ends with the vulnerability stage with the original innovation giving way to another institutional innovation. The entry level has three distinct characteristics: offering minimal customer services; providing a modest shopping atmosphere in terms of exterior and interior facilities; and occupying low-rent locations and offering limited product mixes. The trading-up phase usually takes shape through acquiring more elaborate facilities that offer expected, exotic, as well as essential services and that are located in high-rent neighborhoods. By the end of the trading-up phase, the original innovative institution matures into a higher-status, higher-price operation with a required operating gross margin comparable to that of many established competitors. In other words, the innovative institution matures into a conservative retail institution. It enters a vulnerability phase because of its top-heaviness, conservatism, and a decline in the rate of return on investments.

The wheel of retailing consists of four hypotheses (Goldman, 1978). First, institutional innovations in retailing penetrate the system on the basis of price appeal. Second, the lower prices characterizing the new institution are achieved through a reduction in operating costs made possible by the elimination of store services and the lowering of store standing and quality. Third, after establishing itself in the retailing system, the new retailing institution engages in a progress of trading up. Fourth, trading up leads to new institutional innovation in retailing. The wheel of retailing is based on four basic premises. First, there are many price-sensitive shoppers willing to trade customer services, wide selections, and convenient locations for lower prices. Second, price-sensitive shoppers are often not store-loyal and are willing to switch to retailers offering lower prices. Other prestige-sensitive customers like to shop at stores with high-end strategies. Third, new institutions are frequently able to implement lower operating costs than existing institutions. Fourth, when retailers move up the wheel, they typically do so to increase sales, broaden the target market, and improve store image (Berman and Evans, 2001). The wheel of retailing suggests that established retailers should be cautious in adding services or in converting their strategy from low end to high end. Because price-conscious shoppers are not usually store-loyal, they are likely to switch to lower-priced firms. Furthermore, retailers may be eliminating the competitive advantages that have led them to profitability.

The wheel of retailing does not explain the emergence of all forms of retail institutions equally well (Hollander, 1981). Most commentators point out that the entry and trading up phase of the wheel model may not be universally applicable. However, there is conclusive evidence that the concept is generally applicable to retail development in economically developed and growing countries. The wheel of retailing theory is especially useful for showing how new retail institutional forms challenge existing retail formats. It graphically alerts the management to the real possibility that numerous short-term decisions, each of which increases expense only slightly, may add up collectively to fundamental long-term changes in merchandising strategy and a new competitive threat at the bottom as former marketplace niches are abandoned without serious forethought. Experienced strategic planners in retailing have taken a lesson from the wheel hypothesis and have either slowed down the cycle or found ways to take advantage of it.

The theory of the wheel of retailing has been used to explain particular aspects of change in the United States retail structure (Brand, 1967; Hollander, 1960; Lord, 1984; Oxenfeldt, 1960) as well as to conceptualize the general evolutionary process of American retailers (Goldman, 1978). The evolution of the American department store can be understood in terms of the wheel of retailing (Entenberg, 1957; Hollander, 1960). The entry phase started with the first American department stores in the middle of the nineteenth century as an innovative retailer

with low status, low price, minimal service, poor facilities, and limited product offerings. The trading-up phase describes the established department stores in the middle of the twentieth century with elaborate facilities, essential services, higher-rent locations, higher prices and extended product offerings. Department stores already entered the vulnerability phase by the present. They are vulnerable because of their top-heaviness, large overhead, and declining return on investment. However, this model is inadequate to explain department stores that never traded up (Brown, 1990; 1991; 1995).

#### **The Retail Life Cycle**

The retail life cycle theory is developed on the basis of the concept of the product life cycle in the field of marketing (Benett and Cooper, 1984; Levitt, 1965). A new retail institutional format resembles a new product in the innovation stage. It has few competitors, rapid growth in sales but low profitability due to start-up costs (Dhalla and Yuspeh, 1976). Sales and profits rise sharply but long-run success is not yet assured. In the stage of accelerated development, both sales and profits of a retail institution exhibit rapid growth because of the economies of scale. However, competitors are likely to spot the niche and begin to encroach on this market. Overall sales may continue to go up but it rises at a much lower rate than the first two stages. Toward the end of accelerated development, cost pressures may begin to affect profits. Profit margins may have to be reduced to stimulate purchases. At the maturity stage, there are many competitors, sales growth has declined, and profitability moderates. This stage is characterized by a slowdown in total sales growth. In the decline phase, sales and profits fall, and new innovative products emerge. Maturity is brought about by saturation of the market, which in turn is caused by the high number of firms in an institutional format, competition from newer institutions, changing societal interest, and the management's inadequacies in adapting to leading larger firms. Once maturity is reached, the goal is to sustain it as long as possible and not to fall into decline. The final stage in the retail life cycle is decline, whereby industry wide sales and profits for the retail format fall off, many firms abandon the format, and newer formats attract consumers previously committed to that retailer type.

These theoretical ideas of the retail life cycle have been applied to both the level of retail institutional formats and that of individual retail firms. All of the other four models of retail institutional change perform well only at one of the two levels, whereas the life cycle model deals with both levels equally well. This contrast has received little attention in the literature, perhaps because the two levels of application have not been made explicit by retail life cycle theorists.

In the very beginning, the theory was developed to examine the level of retail institutional change. The historical institutional life cycle of five types of retail formats, including the downtown in department stores, variety stores, supermarkets, discount department stores and home improvement centers, have been charted (Davidson, Bates et al., 1976). The life cycle trend line of a retail institutional format is charted with market dominance and profitability. Market dominance can be substituted by a range of measures, e.g. sales turnover, selling space, or market share percentage of the retail formats in question (Bartels, 1981; Gist, 1971; Knee and Walters, 1985).

The life cycle of an individual retail firm, however, is charted with the variables of sales turnover volume and profitability. One of the first to extend the original concept of retail life cycle in this way was Tom Heffner's study in *Management Horizons* (Morgenstein and Strongin, 1992), which is shown in a diagram (in appendix 1.4). Conceptualized in this way, the life cycle represents a predictable series of stages that can explain, describe, and forecast the development of a retail firm. Although it may be difficult to pinpoint the exact year in which a retail firm reaches maturity, the model provides valuable help in understanding its market characteristics.

The basic version of the retail life cycle suggests that all retail institutions pass through four stages and eventually die. McGoldrick (2002) has presented a diagram of retail life cycle for many retail formats of Euro market. But a few theorists argue for the more positive view that some institutions may resurge under the right circumstances (Davidson, Sweeney et al., 1987). This view seems plausible in theory. It is possible for products to avoid the fourth stage of product life cycle and gain reincarnation? For example, some brands went from the maturity stage to a fresh period of rapid growth. However, in the reality of the business world, retail institutional formats are seldom able to raise their sales turnover, profitability, and market share again after they decline. Only individual retail firms are able to resurge. With the right management and marketing strategies, individual firms could prolong or reverse their decline even if the retail institutional format to which they belong is in general decline.

## **Advantages of the Retail Life Cycle Model**

After outlining the major theories of retail institutional change in the last section, section 3 assesses and evaluates them; and also identifies the best model for explaining and predicting institutional changes of the department store industry. The argument supports that the retail life cycle model stands out among them as the most theoretically powerful and practically useful perspective.

### **Major Weaknesses of Current Theories of Retail Institutional Change**

The first major weakness of theories of retail institutional change is that not all of them are equally good at capturing the diachronic dimension of retail institutions. The environmental approach, of which the natural selection model is a variant, focuses on the changing retail environment (Board, 1980; Hensel, 1973; Liversey and Hall, 1981), an industry's responses to opportunities and threats (May and McNair, 1977), and emergence of future retail formats (McNair and May, 1978). Both the birth and development of retailing change are explained in terms of environmental conditions. While we may grant that environmental factors are the main determinants of retail institutional changes, the model does not at all construct a sequence of stages of change that helps retail managers to monitor trends. The conflict approach to retail institutional change, of which the dialectic process model is a variant, also falls short in this aspect. It provides insights into how inter-institutional conflicts give rise to institutional innovations, but doesn't construct a stage-like theory that models the evolution of retail institutions.

The cyclical approach is most appropriate for investigating the macro and long run diachronic dimension of retail institutions. Brown (1987) states that the retail accordion, the wheel of retailing, and the retail life cycle models all belong to a category of cyclical approaches. All of them theorize on the introduction, development, maturation, and demise of retail institutions (Davidson and Smallwood, 1980; Dawson, 1979).

Cyclical theory begins with the premise that, a rhythm of change is evident in some phenomenon, and if the rhythmic nature of that change can be measured, then (a) factors underlying the change may be identified and (b) the future direction of the cycle can be anticipated or predicted (Gist, 1971).

Among the three cyclical models, the retail accordion is regarded as decidedly less powerful than the other two in modeling macro diachronic processes. By modeling the trend line exclusively with the width of merchandise assortment, the theory is too simple and narrowly focused to capture the richness and complexity of general retail structural changes.

The second and partly related major weakness of many theories of retail institutional change is their focus on explaining known past cases rather than predicting the future of all theoretically possible cases. The natural selection, dialectic process, retail accordion, and most of the other theories of retail institutional change are constructed and empirically tested primarily with historical data on retail institutions. It is seldom noticed that this is a serious handicap. They are good at explaining past phenomena, but is unproven in the forecasting of retail institutional trends. They are useful as tools of historical summary, but they do not tell us when or where the next wave of the cycle will appear. The natural selection accounts for institutional evolution as a response to random fluctuations in the environment. The dialectic process simply implies that retailers mutually adapt and develop new formats in the face of competition. Questions such as how institutional change will look like or when it will occur are not investigated at all. The accordion theory offers a very simplistic view of institutional evolution. It is essentially descriptive. It does not explicitly identify the causes of cyclical change; it simply points out symptoms in the cycle.

### **Weaknesses of the Wheel of Retailing Model**

The wheel of retailing and the retail life cycle model dominate the current scholarship on retail institutional change. We find the wheel of retailing models less attractive because it has a number of serious weaknesses. It is more equipped to deal with an individual retail firm than a retail institutional format. In contrast to the model's description, not all retail institutional formats begin as low-margin outlets with few services. For example, department stores, suburban shopping centers, and vending machines do not follow this pattern. Moreover, some types of retailers never trade up. These counter-examples suggest that the model does not describe the most common retail institutional change patterns in industrialized economies (Hollander, 1960). The model's focus on changing cost and gross margin relationships as the key to understanding evolutionary retail behavior also seriously limits the model

and renders it inapplicable to the evolutionary behavior of newer, less price-oriented retail innovations (Markin and Duncan, 1981).

Savitt (1984; 1988) is not convinced that the wheel theories are as important as current marketing scholars render it. He thinks that no current studies provide strong historical evidence to support the elements of the model. Brown (1990) contends that the model may be salvageable but needs to be tested more often with empirical evidence. However, the lack of historic empirical data is a great obstacle to his proposal.

The wheel of retailing model is exposed to especially harsh criticisms since the concept's uses for practical business decisions are limited and undeveloped. Similarly, Markin and Duncan (1981) states that the wheel of retailing, and life cycle frameworks are lacking empirical evidence to support them. They even conclude that it is 'a questionable theory of institutional change'. The wheel of retailing theory is especially critical since it has not undertaken an analysis of concept validity for its use in the circumstance (Zaltman, LeMaster et al., 1982). The wheel of retailing theory fails to meet the criteria as a formal theory (Hirschman and Stampfl, 1980). There is a general criticism of the wheel that some types of retailers never trade up. Some institutions don't begin as low-price and low-service entrants, for example a high fashion boutique. The model tells us nothing about profitability and market share. The changing character of retail innovation and the acceleration of innovative retail activities pressure us to learn about the pace with which retail innovations rise and fall. But the theory is never equipped to explain the rise and fall of particular retail formats. The theory introduces the concept of a cycle, but then shifts its focus to pricing, merchandising, services, and operations. These are abstract qualitative elements that are hard to measure. In contrast, the retail life cycle measures sales turnover and profitability, data that are measurable, easily obtainable, and quantitative.

#### **Practical Benefits of the Retail Life Cycle Model**

The Retail Life Cycle model is the most powerful tool for understanding the rise and fall of retail institutions. It provides a useful perspective to predict the business performance of retail institutions because it specifies the series of stages that every major retail format has to go through. It specifies a series of stages that explain, describe, and forecast the life cycle of an institution (Davidson, Doody et al., 1975). In contrast to other theories of retail institutional change, it squarely addresses the question of the pace at which change occurs. Other theories have no basis for appraising and forecasting potential future developments. Only the retail life cycle theory is sensitive to the acceleration of innovative retail activities in recent decades.

The main criticism of the retail life cycle model is that the dating of the life cycle of a particular institution is extremely difficult (Markin and Duncan, 1981). It is difficult to specify the exact year that a stage ends and another begins (Hollander, 1981). However, the argument is that if we have adequate time series market data, we may be able to identify the trend line. Relevant market data are usually confusing: different firms belonging to the same institutional classification reach maturity at different times, trends in geographic regions differ significantly, and many individual firms run counter to the predominant trend.

Despite this difficulty, the explanatory power of the retail life cycle theory is demonstrated in its application to the historical evolution of the department store industry. This example suggests that if we have adequate historical data, dating of the life cycle can be carried out. Davidson, Bates et al. (1976) has also identified the institutional life cycle for five types of retail formats on the basis of data from the National Bureau of Economic Research, US Department of Commerce. The problem of dating the stages is in fact a problem with data rather than an inherent problem in the model.

The life cycle model does not only represent an alternative way to theoretically conceptualize retail changes, it is also practically valuable for enabling retail managers to anticipate the stage of life cycle their institutions are in and to implement appropriate strategies accordingly. The management should emphasize research, stay flexible, analyze risks and profits, and attempt to extend the maturity stage. The institutional life cycle is a natural evolutionary process that is very difficult to control or counteract. What the management can do is to plan more effectively and continuously revise their operations.

This is particularly important for periods such as the volatile 1980s, during which the decline stage can no longer be readily avoided. The decline stage may be avoided in some cases (Knee and Walters, 1985). A possible route to postponing institutional death is to have enough insight and courage to transform their dying retail institutions into a new effective synthesis format rather than waiting to be outperformed by a new competitor

(Davidson, Sweeney et al., 1987). The concept of retail life cycle was usually applied to a macro interpretation of retail institutional formats, but it can be and is increasingly applied to study individual retail companies. The life cycle concepts can be extremely useful for rationalizing an otherwise unfocused set of conditions being experienced by a type of retail institution, a firm, a product, or a merchandise classification. The life cycle concept is helpful in formulating growth, renewal, and repositioning strategies, in market analysis, in sales forecasting, in capital allocation, in store location decisions, in consumer communications, and in all elements of the retail marketing mix (Davidson and Smallwood, 1980).

## **The Department Store and its Historical Development in Terms of the Retail Life Cycle Model**

The understanding of the department store is surely important in itself. It emerged in the nineteenth century and has established itself as the major retail institution over the middle decades of the twentieth century. It played a crucial role in propelling retailing from its traditional forms into its modern phase. At the same time, because of its ability to generate employment as well as its significance to overall economic development, its evolution is recognized as an important indicator of the dynamics of the economy. For instance, the Economic Development Administration of the United States Department of Commerce sponsored a large project to study the American department store industry (Bluestone, Hanna, et al., 1981).

### **The Department Store as a Retail Institutional Format**

The concept and definition of retailing has evolved over the years. Retailing was defined as the activities involved in the sale of goods to ultimate consumers (Duncan and Hollander, 1977). A more contemporary definition is that “retailing consists of the business activities involved in selling goods and services to consumers for their personal, family, or household use” (Berman and Evan, 2001).

Retailing can be approached from a variety of perspectives and a major one among them is to classify different types of retail institutional formats. The concept ‘institution’ is only loosely defined in the scholarship on retailing. What it refers to ranges from individual firms or groups of companies to forms of retail organization, and even national retail systems. The most common references of the concept are distinctive retail formats, however. Several types of retail formats are recognized in the literature. They include department stores, supermarkets, specialty stores, discount stores, hypermarket, mail-order companies, kiosks, and flea market stalls (Diamond and Pintel, 1996). Classifying retailers by their retail formats is useful though it is mainly descriptive.

### **Decline of the Department Store Industry**

In recent decades the department store industry has experienced a decline in the West. It has been shown that the discount department store and the downtown department store of the United States have reached their maturity (Davidson, Bates et al., 1976). Although some of them are still prospering, studies show that the overall trend is toward decline and replacement by other retail formats (Rogers, 1991). In England, department stores suffered a slow but steady decline from 1933 to 1988, closure exceeding new entrants (Willians, 1996). In Germany, department stores have traditionally been the front-runners in the retail industry. But the department store groups suffered setbacks and failed to produce successful strategy to cope with the changing social circumstance (Coles, 1999; Dickson, 1979). The Statistical Office in the European Communities provides comprehensive secondary data of retail industries to show that the department store industry in these countries has reached its maturity (Eurostat, 1993). In Singapore, department stores intensely competed against one another during the last decade and this competition resulted in declining performance (Chong, 1996).

## **Application of the Retail Life Cycle Model to the Department Store Industry in Hong Kong**

The department store seems to be reaching its maturity and decline stage all over the world. Is the department store industry in Hong Kong following a similar pattern of decline? To date this question has received little attention in the retail literature (Sun, 2002; 2003). Below has sketched the historical and economic conditions of Hong Kong to provide a backdrop to the evolution of its department store industry (Sun, 2000; 2001). Originally a traditional Chinese fishing village, Hong Kong became a British colony in 1898. There were only a few department stores at the time. Lane Crawford was established at 1850. The two earliest department stores founded by the Chinese, Sincere and Wing On, were established in 1900 and 1907 respectively. They had store outlets in Shanghai and Guangzhou respectively during the 1910s. Chan explores the beginnings of Hong Kong's department stores, documenting the activities of Sincere and Wing On in Shanghai and Hong Kong between 1900 and 1941 (Chan, 1996).

Since Hong Kong did not start to industrialize until the 1950s, most of the retail businesses before the recent decades were small-scale family-run operations. Retailers set up their store in the front of a building and lived behind the stores. Retail businesses began to develop with the rapidly growing population in Hong Kong and their increasing demand for consumer goods (Simmons and Chan, 1992; Sun, 2000). Daimaru opened the first Japanese department store in Causeway Bay on Hong Kong Island in 1960. Another local department store, Shui Hing, started its business in 1961. Hong Kong experienced rapid economic growth from the 1970s to the 1990s and this period further fueled the emergence of new retail formats. At the same time, Hong Kong became a global city and attracted the investment of many Japanese department store companies. Isetan entered Hong Kong in 1973 and Matsuzakaya followed in 1974 (Veitch, 1990). The Ocean Terminal shopping center was the first major mall to be built in Hong Kong and became very successful. Supermarket retailers also emerged. As foreign investment poured into the Hong Kong retail industry, retail ownership shifted from family run businesses to large-scale enterprises in the 1980s. Additional Japanese department store companies landed in Hong Kong in the decade, including Mitsukoshi, Sogo, UNY, Seibu, Jusco and Yaohan (Sun, 2000). Joint ventures such as that between Wing On and Seiyu also arise (Wong, 1998). The rise of department stores in Hong Kong was discussed (Ho, 1990; Phillips, Sternquist, et al., 1992). They list the major fifteen department store groups in Hong Kong from 1850 to the early 1990s, and summarize their market information in Hong Kong.

But the decline of the industry has not been as well understood as its rise. Sun (2001) shows that Hong Kong has less than twenty department store chains in the city's history. Two department store groups (Shui Hing and Yaohan) are closed down in the late 1990s. Many Japanese department stores (Isetan of Japan Ltd., Yaohan International Group, Daimaru Department Store Co. Ltd., Matsuzakaya Enterprises Co. Ltd., and Tokyu Department Store Co. Ltd.) retreated out of Hong Kong. Four Japanese department stores (Daimaru, Isetan, Matsuzakaya, and Tokyu) retreated out of Hong Kong in the economic downturn following 1997. The general retail consumption indicators for both tourists and locals kept falling throughout the past several years. An overall fall in demand softened retail sales and department stores suffered reduced sales turnover. Many retailers were forced to cut prices in order to reduce their inventory. The French hypermarket Carrefour opened its store in 1997 but had to leave Hong Kong in 2000. One of the winners in these years are supermarkets, which took the opportunity of others' decline to open more outlets and expand their business (Sun, 2001).

It can tentatively conclude that the department store industry developed rapidly in Hong Kong between the 1970s and 1990s, and have been declining since the late 1990s. The claim of their decline is based on a crucial observation: the number of department stores that were closing down exceeds those that were entering the market. The situation indicates a mature market condition. It is not satisfactory to simply infer this from a general narrative however, and an analysis of the empirical indicators described above is required.

## Conclusion

This study has reviewed and evaluated five major theories of retail institutional change. We argue that the retail life cycle model is the most powerful one for explaining and predicting institutional evolution. The retail life cycle model explains retail institutional change through specifying four stages of evolution that retail formats tend to go through. It avoids many of the theoretical shortcomings that are evident in other major models of retail institutional change. Because of its specification of stages and capacity to predict, it also has great practical value for business strategy formation.

The model has been corroborated by data on the historical evolution of the department store industry. Besides helping to evaluate theories of retail institutional change, the analysis of the evolution of the department store suggests that general economic conditions are highly relevant to retail formats. Rapid economic growth creates a favorable environment for the department store, while economic stagnation negatively affects it. An explanation is that the department store is a relatively inflexible retail format. It requires bigger investment than specialty stores, for example. More research needs to be done before we can decide whether this hypothesis is true.

Following from the previous analyses, three important research questions regarding Hong Kong's department store industry may be formulated for further investigation.

1. Previous studies suggest the department store industry has in many countries reached the maturity and decline stages. Are Hong Kong department stores following the same pattern?
2. If so, what kinds of factors brought about this state of the department store industry Hong Kong?
3. Are there any actions that retail management in Hong Kong can carry out to ameliorate the decline or to make use of it for new developments?

The above three research questions are investigated in further research work (Sun, 2004).

## End Notes

---

<sup>i</sup> It is possible to argue that the theories of retail institutional change do not really meet the formal criteria for 'theory' (Hunt, 1976). Indeed, these theories have been variously described as models, hypotheses, conceptualizations, paradigms and generalizations. Nonetheless, this problem is moot for the purposes of this study. Moreover, the 'theory' descriptor seems to be staying in the scholarship of retailing (Berman and Evans, 2001; Brown, 1987; Brown, 1988; Levy and Weitz, 1998).

# Management of Uncertainty in Tourism Development

*Štefan Bojnec*  
*University of Primorska, Slovenia*

## Abstract

**This paper investigates the dependency of tourism development on institutional, policy, economic, and other factors of development and uncertainties within the historical time-series perspective for Slovenia as a case study. We analyze determinants of tourist supply and tourist demands, patterns in the structure of tourist demands for a tourist destination places and in the average number of overnight stays, and the seasonality in the structure of tourist arrivals. The long term stability and economic growth and thus long term increasing tourist demand induces incentives for tourism supply to respond to more favorable market signals by investment activities to increase capacities and/or to improve the quality of accommodation and services. The most recent developments in tourist markets suggest opportunities for greater cooperation in regional tourism marketing and in cross-border development of tourist resorts, products, and destinations.**

## Introduction

The literature on the role of tourism in economic development considers different economic benefits associated with tourism development. Tourism as a part of the economy is one of important sources of income growth and employment creation, positive induced externalities or external multiplicative effects, foreign exchange earnings, investments activities, government revenues and greater integration into the global economy (Gray, 1970; Lea, 1988; Bull, 1995). On the other side, tourism is a fragile business, which may vary seasonally in response to a combination of demand and supply factors, particular climatic conditions, and internal and external factors of uncertainty. Among a range of uncertainties in tourism development, besides seasonal character of tourists demands and climatic conditions hindering tourist supply, there are those factors associated with the international political and economic factors, historical economic and political relations. Relatively high capital intensity of the tourist economy and its seasonal character in capacity utilization and employment induce costs burdens reducing business efficiency. In several countries the demand and the supply structure of tourism are unsustainable over the year. To reduce the negative externalities deriving from seasonality and uncertainties in tourism, the most recent approaches emphasize the importance of segmentation, changes and diversification in tourist types and innovative approaches in tourist products development over time as important factors for sustainable tourism and regional development (Brohman, 1996; Clarke, 1997).

The economic recession in the world leading economies (e.g. Germany), animal and human diseases, security, political and some other influences have been the key factors that have determined development patterns in tourism during the post-2000 (Cabrini, 2004). The downward deviations in the number of tourist arrivals and in the tourism receipts have been largely associated with global, regional and local economy factors; political, social and safety factors; diseases and other unpredicted factors.

The role of the state with the globalization process is diminishing, while firms and tourist destinations competitiveness gain in importance. With multinational corporations and foreign direct investments (FDIs) outward-oriented development strategies considering both domestic and international tourism development are gaining in importance towards future-oriented comparative advantage and tourism destination competitiveness (Crouch and Ritchie, 1999; Dwyer et al., 2000; Enright and Newton, 2004).

Seasonal variations in tourism demand and seasonal variations in the performance of tourism supply are reflected in relatively high fixed costs, seasonal tourism jobs and an insecure income for the employees (Butler, 1994; Frechtling, 1996). The tourism accommodation sector is particularly burdened with relatively high fixed costs, which in association with pronounced seasonality is regarded as an important economic issue influencing efficiency in this sector. Low variability in occupancy performance, an extended main season, and a higher occupancy level are

often regarded as desirable goals and as a major strategic economic issue challenging the structure of the supply-side factors providing an innovative perspective on sector performance-based segmentation improving patterns in occupancy rates (Koenig and Bischoff, 2004).

Of course, there are several examples and case studies of country's specific factors that suddenly caused uncertainty and the impact on the travel and tourism industry of this specific country as well as broadly on regional tourist destinations. For example, Goodrich (2002) analyzed the September 11, 2001 attack on America to evaluate the impacts and reactions in the USA travel and tourism industry, while Okumus et al. (2005) analyzed the impact of Turkey's economic crisis of February 2001 on the tourism industry in Northern Cyprus.

Slovenia similar as most other former communist countries has experienced political, institutional and economic changes, restructuring and transition to a market economy. While the nature, processes, restructuring and impacts of political, institutional and economic transition have been widely analyzed, the uncertainties and changing patterns in tourism as an element these wider processes of restructuring and transition have taken much less attention and academic interests. Tourism is an element of the overall economic development, which is also influenced by economic, political, institutional and social restructuring (Hall, 1995). The specific threats to tourism development represented institutional and policy limitations for tourism development during the central planning in the post second World-War period, while more recently the political instability and the wars in the region after the collapsed of the former Yugoslavia with the implications for tourism development during the privatization and restructuring of hotel accommodations and other tourist infrastructure.

We focus on the evolution and structural changes in tourist markets in Slovenia, emerging trends in arrivals of foreign tourists and receipts, and on the main characteristics and challenges for tourism development. More specifically, in this paper we investigate main uncertainties and associated risks in tourism development in Slovenia. Besides seasonality in tourism demands and supplies, our focus is on medium- and long-term developments in association with political, institutional and some other factors, which caused considerable demand shifts and the supply responses in diversification of tourist markets and tourist products in Slovenia. Similar as for other ex-socialist countries, political and institutional factors and their radical changes over time are important as they were enforcing considerable changes in macro- and micro-economic environments. Yet, political and institutional factors were evening in certain periods preventing or limiting the tourist sector development, particularly international tourism. To tackle this medium- and long-term developments and structural changes in it, we analyze both domestic and foreign tourism development as potentially their might be some similar, but also diverging development patterns as different driving forces of the tourist demand associated with different policy and institutional constraints and their changes in different time periods. It is expected that during political instabilities, domestic tourist arrivals and overnight stays might have prevailed, while foreign tourists may regain under political and institutional deregulation and economic and political stability. Therefore, the tourism growth is dependent on the economic, sociopolitical, institutional, and other restructuring and transitional factors. The long term economic and political stability is likely to encourage increasing tourist demands, which induce incentives for tourism supply to respond on favorable market signals by investment activities to increase capacities, but also to improve quality and price competitiveness.

In the next section, we present an institutional appraisal of tourism development in Slovenia and the significance of factors of risks and uncertainty during different stages of tourism development in Slovenia. In the third section we present the empirical evidence on tourist supply developments, patterns and the structure of tourist demands for tourist destination places, and the seasonality as an important challenge to reduce it in the Slovenian tourist markets. The final section concludes with management of uncertainty in tourism development and policy implications.

## **An Institutional Background on Tourism Development in Slovenia**

The tourism economy in Slovenia has relatively a long tradition. Due to geographical and historical proximity to most developed parts in Europe, particularly the northern part of Italy and Austria, some similar trends in tourism development at the end of the 19<sup>th</sup> century and prior the Second World War were being observed on the present territory of Slovenia as in some other most developed European tourist destinations (Planina and Mihalic, 2002).

Similar to most other European countries, the progress in tourism development was halted by the Second World War. However, immediately after the Second World War, with the iron curtains, which divided Europe on two parts, most Central and Eastern European (CEE) countries faced considerable negative implications for the private sector and tourism development associated with enforced institutional and policy changes by the Communist governments. Several strict institutional and legal constraints on tourism development were later being gradually relaxed within the previous economic system. With transition to a market economy since 1989 and with the membership in EU, Slovenia as well as other CEE countries have been largely adjusted and harmonized their institutional basis with the EU countries. Therefore, considering the institutional background on tourism development in Slovenia, we can distinguish more stages in tourism development.

During the pre-Second World War period, similar as in other economy sectors and similar to developments in Central Europe, tourism economy was emerging as private family business. Besides inns, there were set-up family run hotels and overnight accommodations. This was also a period of emerging of the first tourist destinations, which were at that time focusing on natural attractions of Bled's lake, the sea resorts of Portorož, the spa resorts of Rogaška Slatina and Laško, several cultural and historical attractions of towns and rural areas.

The nature and evolution of the tourist sector during the immediate state socialist post-Second World War period was influenced by the communist ideology. Similar to other socialist countries (e.g. Light and Dumbrăveanu, 1999, for Romania), there was little interest in developing tourism, particularly international one. The importance of tourism in the economy in terms of the number of tourists and the number of overnight stays considerably declined immediately after the Second World War. The changed political ideology and of the political system, the introduction of the centrally planned economy, and the post Second World War political and military division of Europe are among the crucial factors, which negatively influenced on tourism development. The foreign tourist arrivals and international tourist overnight stays almost disappeared. In 1948, in Slovenia were registered only 228.000 tourists and tourist receipts amounted to 150.000 US\$, which was around one-tenth of that before the war (Planina and Mihalic, 2002). Consistently with the forced centrally planned economy, the tourism sector during that time played so called "non-economic functions" providing some tourism activities, which were largely covered by common or social funds.

The first initial relaxation of the centrally planned rules began in the 1950s when some tourist organizations in Slovenia are reestablished. Among them was the Slovenian Tourist Board in 1952. At the same time these more open policy changes for that time positively contributed to tourism growth. With a shift in foreign policy of the former Yugoslavia towards a West-ward-looking policy, openness with cultural and academic life, and a shift in internal policy measures to allow small-scale private craft enterprise development, these changes in foreign policy, macroeconomic, institutional and policy environment were reflected in tourism development also towards foreign tourists. In 1958 the number of foreign tourist overnight stays for the first time exceeded the level before the Second World War. Slovenia within the former Yugoslavia was an accessible and relatively inexpensive tourist destination for Western Europeans from the neighboring countries (e.g. Italy and Austria) and from the region (e.g. Western Germany) as border formalities were relaxed and visas easily obtainable.

The most considerable liberalization shift from non-economic tourism functions towards encouragement of economic tourism functions within the previous socialist system occurred in the mid-1960s with the economic and political reform of 1965. The induced economic and political deregulations within the socialist self-managed system, the former Yugoslavia at that time opened the borders towards the West. Among considerable changes, this offered incentives to encourage arrivals of Western European tourists to Slovenia as well as to the other former Yugoslav tourist destinations (particularly in Croatia) during the main season as well as out of the main season. During the approximately the same time, unlike to any other ex-socialist country, the former Yugoslavia permitted own labor force employment in the Western Europe. While the labor migration flows were being particularly directed towards the German speaking countries such as the Western Germany, Austria and Switzerland, among tourist arrivals to the former Yugoslavia, including to Slovenia at that time, were tourists also from some other Western European countries, particularly from the neighboring Italy. During the 1960s and 1970s Slovenia as well as some other parts in the former Yugoslavia made substantial investments in hotel accommodations and other tourism infrastructure, mostly on the Adriatic coast and in spa tourism around the former Yugoslavia. During this an intensive investment period in tourist destination development, the hotel and similar basic tourist capacities increased considerably.

These deregulation policies contributed to the changing structures in tourist demands, which become driven by both domestic and international tourists. Domestic tourists were encouraged to travel on holidays to the Adriatic coasts during the former Yugoslavia. The socially owned enterprises and other state organizations, and the state budget itself supported social tourism. Similar to some other socialist countries (e.g. Light and Dumbrăveanu, 1999, for Romania), trade unions within enterprises and other organizations arranged for families of their employees' low-cost holidays to the Adriatic Sea, then to spa and mountain resorts. Educational trips were also promoted for school children. Since the introduction of the deregulation policies for foreign tourists up to 1988, the year in which the tourist markets achieved the peak within the former Yugoslavia, the former Yugoslavia, became a popular tourist destination particular for tourists from the Western Europe. The role of international tourism for economic growth and development was strengthened with the balance of payments problems and associated large foreign debt of the former Yugoslavia. The shortage of foreign exchange for the necessary imports and the black market of foreign exchange provided a specific situation in the country. The tourism sector was foreseen as an economic opportunity for non-merchandise inflow of foreign exchange, particularly from international tourism. In this regards, investment activities in development of secondary tourist infrastructure and superstructure have been intensified particularly since 1967. Since then, the tourist economy has become an important service activity in the economy that positively contributed to overall economic and regional development. The foreign tourists were largely accommodated in hotels, camps and similar organized tourist accommodation facilities, which were largely in socially owned ownership. Both for domestic and even foreign tourists there existed also the opportunities for independent tourists to be accommodated in private tourist accommodations. This practice at that time was different from most other ex-socialist countries where were contacts between residents and foreign tourists largely forbidden or rather limited and controlled (see for example Light and Dumbrăveanu, 1999, for Romania during the mid 1970s). More an open ideology rather than an isolationist ideology and measures continued in order to comply with requirements set by international institutions regarding the foreign debt management. These more open policies towards the West brought some advantages from joint ventures with Western enterprises, then was important for remittances from workers abroad, and particularly was important for inflow of foreign exchange from international tourist arrivals and the receipts from their overnight stays and spending during their holidays and other trips.

After the Tito's death in 1980, the president of the former communist Yugoslavia between 1945 and 1980, the economic difficulties of the country arising from a previous inefficient development policy based on import substitution strategy of development with a large foreign debt of the former Yugoslavia became suddenly openly visible. Due to the faced external liquidity problems, investment activities were reduced substantially. The open sign of the shortage of foreign exchange and an inability to pay off Yugoslav's foreign debt was possible to notice in rationing of households consumption for fuel and some other detergents, coffee and some other consumer goods. In spite of this economic difficulties and associated uncertainties in the tourist markets in the former Yugoslavia, the tourism economy during the 1980s, unlike to Romania, but similar to Bulgaria and Hungary, was still booming. The peaks in the tourist markets in Slovenia were achieved in 1988. The positive results in Slovenian tourism were particularly achieved through rather efficient management uncertainty thanks also to the geographical proximity to the Western Europe, where most tourists were coming from (Italy, Germany and Austria). Standards of accommodation and service continued to be at the level expected by Western tourists.

The rapid decline in foreign tourist arrivals occurred at the end of the 1980s and the early 1990s when the former Yugoslavia experienced macroeconomic instabilities with output and employment declines associated with high inflation, which accelerated into hyperinflation, an increased open unemployment, political and nationalistic movements in the multi ethnic former Yugoslav republics. Prior to and immediately after the collapsed of the former Yugoslavia, most of the territory of the former Yugoslavia experienced deep economic and severe political crisis, which in some parts accelerated into the civil war. While the war in Slovenia at the end of June and beginning of July 1991 did not have considerable direct destruction impacts, the bad image occurred at that time for the former Yugoslav tourist destinations. International tourism arrivals and overnight stays in Slovenia and even more in the rest of the former Yugoslavia were in decline at the end of the 1980s and the early 1990s. Among major determinants, which negatively influenced foreign tourist arrivals and overnight stays are the political and economic instabilities in the former Yugoslavia. The last former Yugoslav government tried to resolve difficult political and economic situation with the big bang macro-economic stabilization program introduced, similar as in Poland, on 1

January 1990. After initial institutional and macroeconomic reform successes, the macroeconomic stabilization program in the second half of 1990 failed, and the former Yugoslavia again experienced macroeconomic and even more severe political instabilities that accelerated in national movements and hostilities.

After the successful exit from the former Yugoslavia in 1991, Slovenia was rather successful in stabilizing its economy, which also contributed to an increase in political stability. However, the recovery in international tourist arrivals, overnight stays, and receipts have arrived with time lag suggesting that tourism is a business, which is very sensitive on different difficulties, and erratic situations, which are facing tourist destinations. The process of the Slovenian independence was also marked with transition from socialist self-managed system to a market economy. In spite of economic and political stability in Slovenia during the post-independence period, Slovenia as the new independent country and tourist destination was still largely unknown internationally and often mixed with some other countries such as Slovakia. Geographical proximity to the unstable Balkan region and a lack of international image of safe and a nice tourist destination negatively caused particularly the international tourist arrivals in the first post-independence years.

During the second half of the 1990s, Slovenia was in a process of adjustments its economy towards the EU membership. This has induced new challenges, including for the Slovenian tourist economy in promoting its natural, cultural and other tourist attraction. The country's successes in the economic, political, cultural, sport and other activities established an image of a stable and successful country that is worth to visit, which since the end of the 1990s contributed to the recovery in international tourist arrivals and their overnight stays with also improved inflows of international tourist receipts.

On 1 May 2005 Slovenia became the member of the EU. The Slovenian membership in the EU is expected to be beneficial for the tourist economy. The image of Slovenia as the EU member with adjusted and harmonized economy with the EU principles has improved. The deregulation of service markets is also to have positive impacts on the recovery in foreign tourist arrivals as the first low-cost carrier "EasyJet" has started with operation bringing several new tourists to Slovenia since the end of April 2004. Besides demand gains, there are also expected tourist supply gains from greater entrepreneurial spirits and new investments with sources of finance. Domestic investors and/or foreign direct investments can finance this. Yet, tourist projects as well as other economic business projects can be co-financed (particularly in less developed areas) by EU structural, regional, rural and cohesion funds. Since May 2005, three important tourist projects in the spa tourism and natural cave tourism and destination development have already been included as successful. Tourism should play also more important role in tourism-environment and sustainable-tourism development.

Finally, it is worth to mention, that Slovenia records greater receipts from international tourism than expenses (Bank of Slovenia, 2005). The surplus from tourism services is recorded for each of the Slovenian post-independence year, when the receipts from the international tourism increased particularly with the recovery in the foreign tourist arrivals and overnight stays after 1997. On the other hand, the increases in Slovenian tourist expenses abroad have also increased, but they have amounted a bit more than half of international tourist receipts. During the most recent years, the surplus from international tourist receipts amounted more than a half billion US\$. The most recent evidence indicates both the increases in international tourism receipts caused by the recovery of international tourist arrivals to Slovenia and an increase in Slovenian international tourist expenses abroad as there are now several new opportunities to travel abroad.

## **What Does the Empirical Evidence Tell Us?**

As already indicated, the multidisciplinary theoretical and methodological approaches are combined in this empirical part of the paper. We combine the previously explained institutional and policy developments in the historical perspective with the time-series statistical data analysis. Slovenia similar to most other CEE countries has experienced the changing patterns in tourist markets caused by the changes in institutional and political factors inducing adjustments in demands and supply factors (Bojnec, 2004). The economic and political instabilities within the former Yugoslavia led to instabilities in the tourist markets, which experienced considerable decline in foreign tourist arrivals and overnight stays before and immediately after the Slovenian independence 1991. Since 1997 the

Slovenian international tourist arrivals has recovered thanks to political and economic stability in Slovenia as well as in the broader Central and Southeastern European region. Similar to other countries, which entered into the EU on 1 May 2004, Slovenia expects growth in inbound and outbound tourist flows. Yet, tourist development may gain from EU structural policies and business activities including FDI and cross-border cooperation and partnerships in the tourist economy. This empirical part is divided in four subheadings to address development patterns based on the empirical evidence in more detail. First, we analyze the evidence on the Slovenian tourist supply developments using the available evidence on tourist rooms and tourist beds since the end of the 1950s. Second, we analyze Slovenian tourist demands using empirical evidence on tourist arrivals and overnight stays. Third, we analyze the structure and patterns in development of tourist demands according to the statistical division of tourist places in Slovenia: the capital of Slovenia, health resorts, seaside resorts, mountain resorts, others tourist places. Fourth, we analyze the seasonality in the Slovenian tourist markets as an uncertainty in tourist markets within a certain year. Therefore, besides annual and potential cyclical changes in the Slovenian tourists markets (tourism supply and tourism demands), we analyze main trend lines, which allows us to derive conclusions on the long-term patterns or average annual rates of growths and the disturbances from the main trend line over individual years, which are associated with policy, institutional and some other radical changes in environment for development in tourist markets. Yet, with analyze also seasonal oscillations within a year, a fact, which may reduce economic efficiency of tourist enterprises.

#### **Empirical Evidence on Tourist Supply Developments in Slovenia**

Tourist supply around the world is applying different diversification and innovative approaches to become more flexible to adapt towards demands, and to generate new products and induce multiplicative effects. This holds also for CEE countries (e.g. Hall, 1995). The tourist economy in several CEE countries have been restructured and adjusted towards emerging new tourist markets (e.g. Bachvarov, 1997, for Bulgaria; Light and Dumbraveanu, 1999, for Romania; Johnson, 1995, for the Czech and Slovak Republics; Baláz, 1995, for Slovakia; and Johnson, 1997, for Hungary). Our focus is on shifts in tourist supply developments in Slovenia.

As Fig. 1 indicates, during the period 1960-2003 tourist beds and tourist rooms in Slovenia explored upward long term tendency of an increase with cyclical oscillations. The number of tourist beds has increased a bit faster. Their rapid increase is observed at the end of the 1960s, the fact, which is consistent with institutional and policy changes, which induced investments in development of tourist destinations. The second peak in the number of tourist beds is observed in the second half of the 1980, which is again consistent with the efforts to restructure tourist supplies towards demands for different niche markets. Finally, at the beginning of the 1990s, with institutional changes, which introduced transformation, restructuring and privatization of socially owned enterprises some former tourist capacities are excluded and not anymore used for tourism, which is reflected in the decline in the number of tourist rooms and tourist beds.

The environmentally sensitive mass tourism during the 1970s has led to tourism concentration and dispersal. Tourism concentration into integrated resort and destination development aims to minimize the harmful environmental impacts and the negative externalities of tourism development. Tourism dispersal aims to develop new tourist destinations in different recreational areas, but at the same time trying to minimize the negative environmental and cultural impacts of mass tourism in both urban and rural areas.

#### Empirical Evidence on Patterns in Tourist Demands in Slovenia

Traditional tourism demand functions include real income, price of product, prices of complementary goods and/or substitutes, and other economic and non-economic determinants (e.g. Gunadhi and Boey, 1986; Witt and Martin, 1987; Crouch, 1994). Tourism demand is positively associated with real income growth and real prices of substitutive tourist destinations, while negatively with real price of the tourist product and real price of complementary products. Main consumer profiles and preferences may differ over time, across household income clusters and countries, and tourist products (e.g. Durbarry and Sinclair, 2003). Among most recent changes in consumer preferences are greater associations of tourist demands with low-cost airlines towards diversified and new locations, Internet booking, and associated travel benefits.

As Fig. 2 presents, tourist demands in Slovenia in terms of tourist arrivals and overnight stays increased. During the analyzed period 1949-2003, there are clearly shown four significant sub-periods, which are consistent with institutional and policy changes and associated uncertainties in tourist demands. First, immediately after the Second World War up to 1956, tourist demands were at absolutely low level, the level less than prior to the Second World War. After 1956 up to 1986, there is a rapid, but a slightly cyclical increase in both in tourist arrivals and particularly overnight stays, suggesting that the average overnight stay per tourist increased (see also Fig. 4). The number of tourists explored a rapid growth particularly during the 1970s and with some instability during the 1980s it picked in 1986. This is consistent with the rapid increase in a massive, holiday's tourism. With the economic and political crisis in the former Yugoslavia during the second half of the 1980s and at the beginning of the 1990s, tourist demands rapidly declined. The evidence indicate a considerable decline in Slovenian tourist overnight stays, which declined from more than 9.2 million overnight stays in 1986 to less than 4.9 million overnight stays in 1991. This reduction in overnight stays is particularly determined by the implication of the collapsed of the former Yugoslavia, when Slovenia occurred as an independent state, then a lack of knowledge and information about Slovenian as an independent state and as the tourist destinations, and particularly due to the instabilities in the Balkan region caused by the Yugoslav wars in Croatia, Bosnia and Herzegovina and Kosovo.

The most recent bottom in the tourist overnight stays is clearly illustrated in 1991, when it amounted a bit more than a half of that in 1986. In 1991 Slovenia declared independence from the former Yugoslavia. Due to a short military intervention by the former Yugoslav army, during the time when the summer tourist's season began,

this short war caused negative consequences both on international tourist arrivals and their overnight stays. The decline in tourist arrivals continued in 1992, while since then overnight tourist stays have recovered. The recovery in tourist demands has continued during the post-Slovenian independence since 1991, and since 1997, the recovery is recorded for international tourists arrivals and their overnight stays. In 2004, they are further speed up by the liberalization of civil aviation transport and entering low-cost carriers into the Slovenian market making traveling by plains to Slovenia much cheaply (Bojnec, 2004).

The domestic tourist arrivals represented the majority in the structure of tourist arrivals in Slovenia during the times of greater political and economic instabilities. Two main such periods are clarified. First, it was during the post-second World War period between 1945 and 1968, and second, after the Slovenian independence between 1991 and 1997. While during the former period the presence of foreign tourists was institutionally and politically limited, during the latter period it was constraint by lack of information or even wrong information regarding the safety and security in the Slovenian tourist markets. During both periods of uncertainties, domestic tourists were those who mitigating decline of foreign tourist participation in the Slovenian tourist markets. The foreign tourist arrivals and overnight stays have recovered since 1998. This is consistent with an increase in image of Slovenian tourist destinations.

In 2002, in Slovenia are recorded 2.2 million tourist arrivals and 7.3 million overnight stays: 45.1 per cent tourists from Slovenia and 54.9 per cent foreign tourists (e.g., Bojnec, 2004). More than 55 per cent of overnight stays of foreign tourists in Slovenia are from Germany, Italy and Austria. The remaining overnight stays are dispersed among larger number of countries, particularly from Croatia, the United Kingdom (UK), the Netherlands and to a lesser extent from Belgium, Russian Federation, Hungary, Bosnia and Herzegovina, the United States of America (USA), France, Israel, the Czech Republic and some other countries. Since April 2004, new demand opportunities for Slovenian tourist destinations occurred in the EU countries for new visitors. With the Slovenian membership in the EU, the rapid growth of tourists is recorded from the UK, the Benelux countries and other countries outside the close region, which is caused by a substantial reduction airline tickets. Similar to some other CEE countries, such as in Poland, Hungary and the Czech Republic, the number of inbound and outbound tourists between the UK and Slovenia increased rapidly. The single Slovenian airline company, the “Adria Airways”, is also adjusting its operation with rationalization and costs reductions to the increasing competitive pressures by some other foreign airline companies, which are more actively entering in the previously rather closed Slovenian travel and tourist markets.

Source: Own chart on the basis of data from the Statistical Office of the Republic of Slovenia (2004).

### **Patterns in the Structure of Tourist Demands for a Tourist Destination Places in Slovenia**

The Slovenian tourism is depended on domestic tourist arrivals and tourists from the neighboring countries. Among main reasons of foreign tourists for coming to Slovenia are holidays, then business and education. The statistical surveys with foreign tourists visited Slovenia showed that majority of the tourists are from the region coming to Slovenia by cars on holidays due to natural beauties, calmness and possibilities to rest and climate as the crucial determinants encouraging foreign tourist arrivals to Slovenia (Bojnec, 2004). Among motives with the increasing importance are prices, cultural sights and performances, recreational activities, medical and non-medical services in health resorts, the vicinity of tourist's resorts, and gambling. These new changes in the nature of tourist markets are reflection of growing demands for new tourist products. After the Slovenian accession to the EU on 1 May 2004, the importance of tourists coming by plains is increasing because the civil aviation transport is liberalized and the first low-cost carriers, the EasyJet, entered into the Slovenian market. As a result, there are the increasing arrivals of foreign tourists by plains from longer distances looking for broader European and world-class tourist destinations.

The Statistical Office of the Republic of Slovenia distinguishes five group of tourist places in Slovenia: Ljubljana (the capital of Slovenia), health resorts, seaside resorts, mountain resorts, others tourist places. In Fig. 3, the capital of Slovenia (Ljubljana) is included among other tourist resorts. During the last four decades, the mountain resorts have experienced the most stable structure in Slovenian tourist arrivals. The seaside resorts and particularly the health resorts have experienced a significant increase confirmed by an upward shift in the structure of tourist arrivals. On the other side, the other tourist places and since the mid-1980s other tourist resorts with the capital Ljubljana, have experienced a significant decline in the structure of tourist arrivals in Slovenia. These shifts in the structure of tourist demands are a reflection of both the tourist preferences towards a specific tourist places, and the innovative approaches in tourist supply. Therefore, the long-term preference in the structure of tourist demands in Slovenia is towards the spa and health resorts, and the tourist resorts at the Slovenian coast, which besides summer holidays are specializing in congress and wellness tourism.

Most tourist arrivals and tourist overnight stays are recorded in hotels, and domestic tourists on average stayed longer than foreign tourists. During the prevailed domestic tourism up to 1966, the average number of overnight stays in tourist resorts was relatively at high level. Immediately after then it declined, but increased during the 1970s and the beginning of the 1980s (Fig. 4). Up to 1986/1987 it is observed the increasing duration in overnight stays per tourist. After then this development pattern is reversed. Again increased during the prevalence of domestic tourists during the years 1992-1995. Since then, as already observed, the number of overnight stays increased less than the tourist arrivals confirming the reduction in the average length of overnight tourist stays in Slovenia. Across tourist destination places, the mountain resorts experienced rather stable developments close to the country average in the length of tourist stays. There are, however, diverging patterns for other tourist destination places. The overnight stays tend to decline for health resorts and seaside resorts, but the average length of stay remains greater than average. On the other side, less than the average length of overnight tourist stays is recorded for other tourist resorts and for other tourist places. A slight increase for other tourist resorts seems to be a consequence of the political independence of Slovenia, where Ljubljana, the capital of Slovenia is gaining in tourist importance as a tourist attraction as the administrative and cultural center of Slovenia.

### Seasonality in the Slovenian Tourist Markets

The seasonality in tourist demands and the seasonal variation of quality in natural attractions are one of the most constraining factors reducing the utilization of the accommodation capacities particularly in massive seasonal holiday's tourist activities. Hotels in Slovenia are dominant in the structure of tourist accommodations for tourist arrivals and overnight stays with the greatest occupancy rates of beds. Among the new EU members, the net

occupancy rate of beds in hotels and similar establishments in Slovenia is less than 50 per cent. It is less than in Cyprus, but greater than in any other new EU members (Bojnec, 2004). The tourist beds occupation rates are associated with tourist arrivals. The climatically induced tourism seasonality is partly eliminated by new offers of a high value added tourism products substituting deterioration of natural attractions out of the main season and thus increasing competitiveness. As Table 1 shows, there are indeed variations in Slovenian tourist markets within a certain year as during the last two decades the tourist demands and arrivals are more concentrated on the summer months, when natural attractions are also in the best conditions. However, these uncertainties are already somehow predictable as they are occurring rather regularly over time. It is clearly illustrated that within a certain year, the number of tourist arrivals is increasing from January and completed with August. During September, there is approximately one-third less tourist arrivals than in August, but the number of tourist arrivals also in September is a bit less than in June, the third most important month according to tourist arrivals after August and July. The number of tourist arrivals in October is more comparable with its arrivals in April and May. During November and December is again low season in tourist arrivals, except for the Christmas and the New Years' holidays something similar as it is then at the beginning of the year in January and February. Of course, there are differences between the occupancy rates of tourist accommodations within a certain tourist destinations and even more across tourist destination places. The annual gross occupancy rate of tourist accommodations is the highest for the health resorts, where it is approaching two-third of beds being occupied on an annual basis. The seaside resorts are particularly well occupied during the summer holiday's season, but they are increasing their annual occupancy rate, too. Less than average on an annual basis are occupied mountain resorts (around one-third) and other tourist places. In the capital of Ljubljana, there is less turbulence tourist demands within a year by months.

TABLE 1: STRUCTURE OF TOURIST ARRIVALS IN SLOVENIA BY MONTHS, 1985-2003 (IN PERCENT).

	1985	1990	1995	2000	2003
January	5.2	5.2	5.7	5.3	5.2
February	5.1	5.1	6.0	6.2	5.6

## Management of Uncertainty in Tourism Development and Policy Implications

We have analyzed the changing patterns in the demands shifts and supply responses in the Slovenian tourism economy, which are connected with institutional and policy changes in the Slovenian economy, and the institutional, historical and policy changes in the broader Central and Southeastern European territory during different historical times. It has been clearly states and empirically illustrated that tourism is a sensitive economic activity, which is rapidly responding to different economic, political, social, natural environment, ecological and some other substantial changes. More specifically we have analyzed the Slovenian tourist supply and demand developments using available tourist accommodation capacities, tourist arrivals, and their overnight stays. Additionally, we have

analyzed the structures and patterns of tourist arrivals to Slovenian main statistically defined tourist destination places. The specific attention has been devoted to seasonality in the Slovenian tourist markets indicating potential risks and uncertainties within which the tourist markets are operating. Besides these short-term uncertainties within a certain year, our main attention has been devoted to long-term developments. The main structural breaks in tourist supplies and demands have been associated with crucial institutional, policy and some other changes, which induced shocks and uncertainty for participants in these long-term growing markets. Due to political, institutional and economic factors in the former Yugoslavia, tourism in Slovenia as well as in most other former Yugoslav republics and ex-socialist CEE countries faced difficulties immediately after the Second World War. Particularly after the mid 1960s, the tourism economy in the former Yugoslavia was liberalized within the communist system, which induced dynamic demand and supply processes. The dynamic growth of the Slovenian as well as other former Yugoslav destination was stopped by the economic and serious political crisis at the end of the 1980s and the first half of the 1990s. Unlike to some other CEE countries (e.g., Poland, the Czech and Slovak Republics, and Hungary), where after the collapse of the communist regime the tourist economy was booming by increasing numbers of foreign tourist arrivals, the former Yugoslav destinations, including in the first half of 1990s also the Slovenian ones, went in a decline. During these years the international tourist arrivals and overnight stays declined substantially, which was partly offset by domestic tourists as they reduced travels abroad, particularly to the neighboring Croatian tourist destinations, which were closer to the Balkans' wars during that times. With the economic and political stability since the mid 1990s the tourist economy in Slovenia has recovered with the increasing number of tourist arrivals and overnight stays by foreign tourists coming to Slovenia. Most foreign tourists are from the region (Germany, Italy, Austria and Croatia) coming by cars, but the importance of tourist coming by planes is increasing by entering low-cost carriers into the travel markets. The membership of Slovenia in the enlarged EU since 1 May 2004 increases opportunities for tourism development. Slovenia is attracting new holidaymakers from EU and the rest of the world.

As has been empirically illustrated, the Slovenian tourist markets are biased to seasonal fluctuations within a year. The most important strategy for management with seasonality is to extend or to disperse the season. This of course requires innovative approaches of diversification towards new tourist products and new niche markets, which is also associated with investments. Hotels play the crucial role in tourist arrivals and overnight stays, but some other tourist supply is emerging thus creating diversification offers to different niche markets also in non-traditional tourist destinations. Tourism is therefore foreseen as a good opportunity also for areas, which is lacking in behind in development, particularly rural ones. Some domestic investors in expectation of tourism growth already invested in some hotel based tourist supply focusing on post-privatization restructuring, diversification of tourist offerings and quality improvements to keep and attract new tourists in Slovenian tourist destinations. The important synergies are expected from the EU membership and political stability in the region, which are expected to reflect in a considerable increase in foreign tourist arrivals and international tourism receipts. So far the FDIs in the Slovenian tourist economy have been less important. It is known that they have played an important role in tourism and tourist destination developments in some EU members such as Spain, Portugal and Greece. With the membership of Slovenia in the EU, factor markets are deregulated, which may induce the entry of FDIs in the Slovenian tourist economy. The membership of Slovenia in the EU provides also new opportunities for domestic private investors and entrepreneurs in diversification of tourist supply using the EU programs and initiatives for investments in tourist projects and in development of tourist destinations. There are also greater opportunities for investments and tourist destination developments from mutual cooperation between diversified private and public resources, including structural, cohesion, cross-border, rural development policies and investment initiatives from the EU with the crucial role of entrepreneurial spirits and incentives.

# Managing and Sustaining Tourism Products: A Case of Island Promotion

*Rosmimah Mohd Roslin*  
*Universiti Teknologi MARA, Malaysia*  
*Mohd Akbal Setia*  
*Tourism Malaysia*

## Abstract

In line with the challenges facing global markets, the tourism industry is pressured to look into innovative marketing strategies to lure international tourists who are kept away by uncertainties brought about by terrorism and numerous health scares. Various tourism products become marketing tools as tourism agencies strive to attain profitable tourist entries into the country. A case study of *Perhentian* Island, an island off the coast of Terengganu, a state in the east coast of Peninsular Malaysia, revealed some interesting findings which could be transcended into the development of tourism promotion. Using the qualitative technique as an approach to data collection, focus group interviews were conducted with two groups of stakeholders who play vital roles in the development of tourist products. The main aim of the focus group is to elicit responses from the groups about their views on the development of tourism in *Perhentian* Island. The findings of the study is meant to evoke further thoughts into management issues that may be translated into means of sustaining long term resources in the island.

## Introduction

The tourism industry is big business in Malaysia generating some 10 percent to the country's gross domestic product (The Star, 2004). In 2004, tourists' arrivals generated almost RM30 billion (US\$7.8 billion) income for local businesses and hotels in the country and just between January and November of 2004, 14.4 million tourists' arrival (Tourism Malaysia, 2004) was noted despite current environmental crisis in the region such as the outbreak of SARS, Bird Flu and the ever looming threat of terrorism in nearby countries.

Although Malaysia is still the destination of choice among its neighboring countries such as Singapore, Thailand and Indonesia, its appeal to other tourists from countries such as China, Japan, United Kingdom and Australia is still relatively high as highlighted by Table 1 below.

TABLE 1: NUMBER OF TOURISTS' ARRIVALS TO MALAYSIA 2003/2004

ASEAN	2003	Jan-Nov. 2004	OTHER REGIONS	2003	Jan.-Nov. 2004
Singapore	5,141,831	8,689,997	China	304,138	504,609
Thailand	1,026,172	1,389,947	Japan	188,272	279,234
Indonesia	537,968	737,033	United Kingdom	110,101	185,510
Brunei	192,638	414,689	Australia	128,267	183,514

Source: Immigration Department of Malaysia, 2004

One tourism product that has stood out as a popular destination in Malaysia, especially among European tourists, is the many islands around Malaysia. Malaysia is bestowed with beautiful islands which to a large extent have not been fully tapped as a tourism product. However, island as a tourism product have been a subject of debate by both environmentalist groups as well as policy makers. On one hand, environmentalist groups see island resources as scare and therefore need to be preserved and protected. The policy makers on the other hand, look at islands as natural resources full of lucrative potential for boosting tourism. This is a dilemma that is faced by many islands in the world and islands in Southeast Asia are no exception as the lure of tourists beckons the need to enhance promotional strategies. This study therefore seeks to assess the views of the stakeholders, namely, the island

residents and the hotel and resort operators on the likely impact of aggressive island promotion by tourism agencies in the country. Despite, the lucrative outlook, there is a need to assess the opinions of both parties whose livelihood is very much dependent on such natural resources.

Perhentian Island is one distinctive island off the east coast of Peninsular Malaysia where marine lives thrive and beautiful corals are still available widely. An approximately one hour boat ride from Besut, a coastal town on the mainland, will take visitors to the scenic Perhentian Island where island resorts and numerous chalets are available to meet the needs of both local and international tourists. Tourism Malaysia (2003) finds in their departure study of international tourists that more than 27 percent of tourists visiting Malaysia prefer the beach as their main destinations whilst more than 20 percent feel that the beach and island resorts are attractive destinations that should be used to promote Malaysia. The underlying implication of these findings is the importance of islands with their beaches, open seas and exotic marine lives as attractive products for promoting tourism in the country. Yet, to what extent can tourism bodies responsible for marketing such products aggressively promote and market them? The question of controlled tourism is often posed for such scarce resources where sustainability is an issue linked to its marketing strategies.

## Literature Review

Tourism has grown tremendously in the last century and become the world's largest 'industry' and as a result, tourism demands have now become more complex and challenging (Buhalis, 1999). It is therefore not a surprise that pertinent parties involved in tourism development and those who are passionate about conservation may have different views on tourism management. Whilst tourism promises lucrative income for a country, this may also spell disaster to natural resources and environment when there are loopholes in the regulations and lax of resource management. As such, both the environmentalists and policy makers often differ in their views on how tourism resources should be manipulated and managed.

Marketing of tourism products have taken center stage among tourism bodies responsible for enhancing tourists' revenue for a country. In Malaysia, Tourism Malaysia, the agency in charge of overseeing tourism marketing in the country is keen to promote tourism products that are both lucrative and could be sustained for a long period of time. But this is quite difficult to attain when most attractive tourism products are linked to natural resources that are often scarce and irreplaceable. Cooper and Ozdil (1992) suggest that the realization of the negative impacts of tourism on host environments and societies has prompted a search for alternative forms of tourism and a move away from 'mass' tourism. Although this may seem viable from a marketing perspective but the long run implementation can be both difficult and cumbersome.

In line with this discussion is the need to select tourism products that could be highlighted by agencies such as Tourism Malaysia that is managing and marketing such offerings. Indeed, the competitiveness of tourist organizations in luring potential tourists to their destinations depended on their ability to differentiate their product and serve individual consumer needs. Kotler, Swee, Siew and Chin (2003) suggest that each customer is potentially a separate market because of unique wants and needs and therefore should be treated accordingly. This essentially increases the difficulty of planning proper marketing strategies or more specifically promotional strategies that meet the wants and needs of target markets whose sophistication is matched only by their ever increasing palette for new offerings. Plog (2001) believes that the life cycle of particular tourists' attraction will influence the level of appeal among target market. At each stage of the life cycle, destinations appeal to a different psychographic group of travelers who determine the destination's character and success. This essentially adds to the complexity of developing effective marketing strategies. For Tourism Malaysia, the way to ensure that they reach target markets is through a deep understanding of each specific market whilst managing effectively existing tourism products in order to ensure sustainability.

Swarbrooke and Horner (1999) identified a rise in the number of tourists keen in preserving the environment as they are referred to as 'green' or 'eco tourists'. This is supported by the study by Middleton and Hawkins (1998) where tourists are keener to select destinations that promise environmental attractions. Islands offering natural attractions such as corals and marine life are more likely to be selected and will be placed high in

the list of attractive tourists' destinations. However, Buhalis (1999) noted that such destinations are more open to exploitations as natural resources make way for personal gains. Ultimately, these islands may give way to development and as development proceeds, natural resources recede. The outcome of this is the diminishing attraction of such islands as tourists move to other alternative attractions.

This is indeed a reality, which tourism bodies cannot deny and neither can relevant policy makers ignore. As such, the extent of development and promotion of island destinations as lucrative tourism products need careful analysis as a balance between profit and long term environmental gains become critical consideration. This study seeks to explore the level of promotion which tourism bodies and relevant government agencies should consider when sustaining the natural attractions of islands become a vital issue in ensuring long term economic survival of the islands. The findings may well help in providing inputs into strategic promotional development where controlled markets become necessary. Indeed, it would be impossible to plan mass promotion of tourism products such as islands when such products are often categorized as scarce and in need of protection from the depletion of natural resources found only in or surrounding the islands.

The preservation and conservation of islands has become a subject of interest among numerous agencies and conservationist groups in Malaysia when island developments are linked to increased tourism revenue. In Malaysia, island tourism is associated with European tourists as the lure of the islands' natural beauty brings many foreign tourists into the country (Tourism Malaysia, 2003). As such, island developments are considered inevitable, as facilities need to be built and upgraded to keep pace with increasing tourists' arrivals. Yet, questions as to the extent of development often arise and policy makers and conservationists are in constant battle to uphold their views and opinions.

## **Research Objectives**

The study aims to achieve the following objectives:

1. To identify key elements influencing the development of tourism products arising from the views of local residents,
2. To assess the views of local residents on the likely implications of tourism development in Perhentian island,
3. To develop a framework of main issues pertaining to the development of tourism in Perhentian Island critical to policy formulation by relevant agencies.

## **Research Questions**

1. What are the views of local residents on the development of tourism in Pulau Perhentian?
2. What are the main issues influencing tourism development from the perspectives of residents of Pulau Perhentian?
3. What implications would tourism development have on Perhentian Island?

## **Methodology**

The study opted to utilize a qualitative method of data collection where focus group interviews were the main mode of data collection. The main reason for selecting a qualitative method is the need to generate as much first hand views and opinions from selected respondents who represented the subject of interest and who are likely to provide an unobtrusive view of the subject. The richness of data is elicited through qualitative method such as this and this is considered critical to the research findings.

Two groups of focus group respondents were selected. The first group represented the resort and hotel operators whose main livelihood is dependent on the arrival of tourists to the island. Their views are pertinent as this may serve to highlight the importance of tourism development on the island. The second group comprised of local residents and community leaders whose views may be mixed as some were dependent on tourism development for

their family well-being whilst some may see tourism as intrusive and a hindrance to a relatively peaceful living environment. Essentially, the views of these two groups of respondents may be similar or it may contradict each other and the differences in opinions are likely to provide a rich array of data concerning the subject.

Perhentian Island is generally divided into two main islands, *Big Perhentian* and *Small Perhentian*, where *Big Perhentian* is where the tourists' attractions are located whilst *Small Perhentian* is the residential island where locals lived. Apart from the hotel and chalet operators, there are very few locals living in *Big Perhentian* where infrastructure development is linked to the needs of the hotels and chalets in the island. *Small Perhentian*, on the other hand, offers most of the infrastructural requirements and facilities of communities living in the island. The selection of respondents from each of this island is purposive in order to meet the need of the study. The two focus groups represented each of the two main subjects, the resort and hotel operators at *Big Perhentian* and local residents at *Small Perhentian*. The two focus groups comprised of the following:

TABLE 2.: FOCUS GROUP 1 AT BIG PERHENTIAN ISLAND

<b>*Respondent</b>	<b>Ethnicity</b>	<b>Gender</b>	<b>Occupation</b>
Mr A	Malay	Male	Resident Manager, Perhentian Island Resort
Mr. OD	Malay	Male	Human Resource Manager Perhentian Island Resort
Mr. Dan	Chinese	Male	F&B Manager, Coral View Resort
Mr. NZ	Malay	Male	Manager, Coral View Resort
Mr. MS	Chinese	Male	Managing Director ,Watercolors Resort
Mr .AMN	Malay	Male	Marketing Executive, Perhentian Island Resort

Mr. OM	Malay	Male	Village Head
Mr. MT	Malay	Male	Boat and Chalet Operator
Mr. K	Malay	Male	Teacher Perhentian Island Primary school
Mrs. R	Malay	Female	Chairperson, Parent-Teacher Association Perhentian Island Primary School
Mr YH	Malay	Male	Gardener Perhentian Island Primary School
Mr. NA	Malay	Male	Fisherman

\* Names of respondents have been disguised

In line with the requirements of conducting focus group discussions, the selection of respondents who are relatively homogenous is pertinent to the success of the session. The group must share similar backgrounds whilst maintaining sufficient variations to allow for contrasting opinions. This was essentially achieved where respondents in the first group comprised of those hotel and chalet managers and operators who understood their roles and the importance of tourism in their line of work. The second group however, comprised of respondents who shared one distinctive similar characteristic in that they were all local residents who have lived on the island almost all their lives and knew one another relatively well but were dissimilar in vocation and their source of livelihood. As such, this is deemed relevant to the needs of the focus group where homogeneity is still maintained whilst addressing the need for variations of opinions (Cavana, Delahaye and Sekaran, 2001).

The size of focus groups of between 6 to 10 people are considered adequate as too small a group is not likely to generate enough views and opinions whilst too large a group may lead to unequal participation among respondents, hence bias responses may be generated. Two moderators or facilitators were employed at each focus group session to ensure a smooth flow of questioning and probing. Each focus group sessions lasted between 1½

hours to 2 hours and the sessions were videotaped and tape recorded to assist in the transcribing process. Although the interview sessions were conducted in the Malay language, this did not interfere with the analytical process as the moderators and the researchers were bilingual and were well-versed in both the Malay language and the English language to ensure correct translation for the purpose of this report. Responses were immediately transcribed and the completed transcripts went through the process of qualitative analysis by means of open coding, axial coding and selective coding procedures (Glaser and Strauss, 1967; Strauss and Corbin, 1998; Denzin and Lincoln, 1998). The grounded theory method of analysis (Glaser and Strauss, 1967) was adopted for the purpose of analyzing the qualitative responses as this method has proven to be more thorough and scientifically robust. At the same time, interpretive analysis by means of constant comparative method and a detailed content analysis were continuously maintained to ensure that responses were thoroughly analyzed.

Open coding refers to the naming and categorizing of phenomena through a close and detailed examination of the data. A total of 15 categories were identified through open coding in the study and these were written as code notes or memos where each category underwent further scrutiny by asking questions and making comparisons about the content of the interviews. Basic questions of who? when? where? what? how? how much? and why? were examples of the types of questions posed to ascertain the attributes and the dimensions of the categories. The process of axial coding comes next where data generated from open coding process is put back together in new ways by making connections between categories and subcategories. The resulting model provides a more detailed description of causal and intervening conditions as well as the consequences of the conditions of the findings. The last process of selective coding involves the process of integrating all the data accumulated in axial coding and identifying core categories, systematically relating these to other categories, validating relationships and filling in categories that need further refinement and development (Neuman 1997). Evidences that justify and validate themes are collected to ensure that an overall description of the underlying theory emerges. Findings from three coding processes are integrated to allow for the development of propositions relating to the research questions posed at the on-set of the study.

The credibility of a qualitative study such as this is judged by both the adequacy of the research process and the adequacy of the empirical grounding of the research findings (Strauss and Corbin, 1990). The research process was guided by detailed procedures especially in the selection of respondents and when identifying categories as well as detailed procedures of conceptualizing relationships among categories. As outlined earlier, constant comparative and thorough content analyses guided the whole process of data analysis, which should satisfy the requirement of credibility and adequacy of empirical grounding. Although this justification addresses issues of credibility and adequacy of the empirical grounding from a qualitative perspective, some clarification for those more familiar with quantitative analysis may be necessary. Firstly, grounded theory as a qualitative enquiry is generalizable to the specific actions and interactions that pertain to a phenomenon and resulting consequences. This particular study is representative of the theoretical perspectives of thirteen participants who were deemed relevant as they represented the views of key people relating to the subject matter. Secondly, reproducibility of the study may be questioned by those more familiar with quantitative research. Theory that deals with a social or psychological phenomenon is probably not reproducible because conditions cannot be exactly matched to the original study though many major conditions may be similar. However, given the same theoretical perspective of the original researcher and following the same general rules for data gathering and analysis in a similar set of conditions, another investigator is likely to 'reproduce' the same theoretical explanation about the give phenomenon. Should discrepancies arise, these could generally be explained by reexamination of the data and identification of different conditions that may be operating in each case (Brott and Myers, 1999).

The results of open, axial, and selective coding procedures reflect the emergence of theoretical categories that explained the likely impact of tourism development in the island. Three theoretical categories emerged through the process of axial coding that explained how respondents view the impact of tourism development in the island. The three theoretical categories included, 1) attitude, 2) shared understanding, and 3) acceptance. These are then grounded in the data to induce the theoretical implications leading to the impact of tourism development in Perhentian Island.

## Findings

The problem grounded in the data of this research was to identify the likely impact of tourism development on the island that could provide possible inputs for developing guidelines toward sustainable management of resources and appropriate promotional strategies. The theoretical categories that emerged are explained as follows:

### Attitude

The feelings of the participants toward the presence of tourists on their island are best reflected by their underlying beliefs that human attitude influenced the reaction of people. Their outlook towards the presence of tourists on the island indicates the extent of tolerance and understanding these people have towards foreigners. Despite the general perception that the people of the islands are rather backward and very conservative and are not used to the ways of the world, the responses given indicated otherwise. These people who are by now used to the ways of the westerners or foreign tourists regarded their presence as adding colors of their lives where a lot could be learned about human behavior. As indicated by the following response:

*“It’s really up to us. The way they (foreign tourists) live, they dress, that’s their way. But everyday I see them reading, the way they eat – their etiquette. If they are eating a banana (and cannot find a bin), they will not throw away the banana skin, they will keep it in their pockets and then when they find a bin, they will throw it.”*

- Teacher, Small Perhentian Island

Clearly the locals’ perception of the foreign tourists is not all bad as they marveled at the attitudes of the foreigners whom they see as full of wisdom in many respect. Their physical outlook or the way they dress may be different from the locals who are predominantly Muslims whose code of dressing is dictated by Islamic requirements. Yet, they are tolerant and accept the positive values exuded by foreigners on the island.

Undeniably, there are those whose lack of exposure of the ‘ways of the world’ have succumbed to negative temptations but some are clever enough to take advantage of the presence of foreigners on the island as indicated by the following response:

*“There are some youths who are influenced by the ‘yellow culture’ but they are others who take advantage of the tourism industry. For example, for water sports, scuba diving..... if we look at their academic achievement, they have not even passed their SRP (basic educational certificate), but when conversing in English, if we switch off the lights, we would think they come from England.”*

- Resort Operator, Big Perhentian Island

Essentially, the presence of tourists on the island need not necessarily lead to negative outcomes, as there are positive consequences enjoyed by the people of the island. Their knowledge is clearly richer and their understanding of human behaviors is more open than before. In essence, they believe that people’s attitudes influence how they perceive a particular situation. A lot could be learned if people are more opened and view new experiences as life’s way of increasing their knowledge. As the following response indicates:

*“To me, it’s up to the family. If the family is responsible, negative effects will not occur. But if the family is irresponsible, meaning that they could not care less, the children can do what they want.....”*

- Parent-Teacher Association Chairperson, Small Perhentian Island

The close-knit family of Malaysian communities are reflected in the above response when the participant feels that the children’s upbringing has a lot to do with the way they accept new experience. Guidance from parents or other extended family unit is crucial in ensuring that positive values are developed and adhered to. The ‘Asian values’ as reflected by the eastern cultural influence of many Malaysians dictate the importance of the family unit as a support system in ensuring family well-being. Thus, family influence is key in molding the children into resourceful and well-balanced individuals.

The people on the island believe that human attitude is key in influencing one’s perception towards others. The general believes of many Malaysians that the people of Perhentian Island are rather backward and conservative is not justified when these people are already exposed to the many ways of the foreign tourists. As lamented by one of the participant:

*“In my opinion, the ‘land people’ (people on the mainland) still do not know that this is an international island where there are outside tourists. So the land people still have low perception of the island people...”*

- Head Master, Small Perhentian Island

This is how the locals regarded the general Malaysians whom they feel have very low perception of them as people who are well exposed to the ways of the world since tourists from various nations are indeed their best teachers. The policy makers and tourism authorities that are mainly located on the mainland are essentially the target of criticism among the locals where development is concerned. Their welfare is sometimes neglected because of the lack of understanding of higher authorities in managing them and their island resources. The connotations of the ‘land people’ and the ‘island people’ are proof of how the locals perceived their standing. The land people are seen as controlling the development of the island without internalizing the needs of the locals. There are still inadequate infra structural development as basic commodities such as water supply, health facilities and security measures are not developed abreast with tourism development. As indicated by the following responses:

*“There is only one maternity clinic in Perhentian Island, there is no hospital or anything. If there is any emergency among the tourists or local residents there is no immediate medical attention, we have to bring them to Besut (nearest town on the mainland). That is if the weather permits, that’s okay we can bring them in the boat. But if the weather is bad, there are problems”*

- Chalet Operator, Big Perhentian Island

*“Earlier, there was adequate water supply because we have our water resource in the big island. But when the chalet people also request for water, it has to be distributed to the chalet people also. Then there is not enough water but only now on the first of June, the water for the chalet people was stopped and all was given back to the village people.....the pipes. Maybe in 2006 or 2007 water from the mainland will come to Perhentian Island. This is all in the planning stage.”*

- The Village Head, Small Perhentian Island

*“The electric here for now operates for 24 hours except when the engine is faulty...the generator is disrupted.....Water supply is not consistent everyday, its here for a while usually for half an hour, then we have to keep them. Its only the next morning it (the water) will come again. That is why we need water from the mainland.”*

- Parent-Teacher Association Chairperson, Small Perhentian Island

The imbalance of the development of basic facilities such as those cited by the participants are slowing ebbing the patience of both the local residents and the chalet operators who are very much dependent on the availability of basic amenities. Definitely development is required on the island but it has to be prioritized according to the needs of both residents and tourists and equally distributed. The locals have already indicated their ability to handle the presence of tourists on the island but there are still things that need to be addressed urgently. There is a need to increase the understanding between the island people and those who are managing their resources. This brings back the point on attitude and shared understanding on the needs of the island and the island people. It is how people perceived one another that could expand one’s understanding of their needs. This relates to how the locals’ attitudes influenced their reception towards foreign tourists whilst at the same time the administrators are urged to develop positive attitudes towards the people of the islands who are no longer backward nor unknowledgeable of the needs of tourism. As much as exposure among the islanders on the ways of the foreigners has indeed increased over the years, there is still the question of to what extent these can be translated into strategies of productive management of existing resources. Scarce island and marine resources need to be managed effectively to ensure sustainability. Are the islanders ready or do they understand the likely impact of unregulated tourism development on their scarce resources? This is addressed in the next findings.

#### **Shared Understanding**

The people of Perhentian Island have essentially displayed a strong opinion of what they think of tourism development. To a large extent, tourism is regarded positively as it allows them to enhance their economic well-being. It has certainly enabled them to learn more about the foreigners whose ways are totally different from them but are still laden with good values if one takes the time to analyze and understand their behaviors. Yet, what is greatly lacking at present is a shared understanding between the ‘land people’ and the ‘island people’ on how

tourism should be handled. Indeed, tourism has changed the lives of the people on the island as indicated by the following responses:

*“If we were to compare 10 years ago, the women of the island work together with their husbands on their vegetable plot or as fishermen, but not anymore....It used to be the island’s produce, the bananas, the fruits from the island to the mainland. Sent to the mainland to be sold. Now, we have to get from Besut and bring them here. The costs of things are very expensive because we have to calculate transportation cost, wages to those people who handles our things at the jetty.”*

- Parent-Teacher Association Chairperson, Small Perhentian Island

*“Now the residents here.....very obvious differences. .... They used to be fishermen but now they are boat drivers. It is very difficult to find fishes here. The people here get their fishes from the mainland..... What is very obvious, those aged 35 and above will work on the resorts .....Some work on their own and will buy small boats and will take advantage of the opportunities to increase their income”*

- Front Office Manager, Big Perhentian Island

Tourism has become the lifeline of many of the people of Perhentian Island. They are no longer solely dependent on their natural livelihood of fishing as the waters around the island has become a protected area and a sanctuary for marine lives. They now look at tourism as their main means of income generation and some could not visualize their lives without tourism. They have now become dependent on goods from the mainland as their lifestyles changed and their living standard increased. Indeed, this revelation changed one’s outlook towards the islanders who are now more susceptible to the impact of tourism. Should tourism in Perhentian Island failed to ensure sustainability, it would be difficult for the islanders to shift their lifestyles to their original ways. Life has become too good where their standard of living is now comparable to people on the mainland. It has now become more pertinent for tourism agencies to manage the island products as effectively as possible. This realization however, enhances the need for both the islanders and the managers of the tourism products to understand each other’s needs. Shared understanding comes from the realization that each party has something to offer the other whilst at the same time each is dependent on one another to ensure the success of any tourism undertakings. The following responses highlight this need:

*“Just that we hope that the locals will manage tourism on this island. If tourism is here, big agencies will come to this island, there is no need for this. .... I see that the islanders themselves can develop this island.....”*

- Headmaster, Small Perhentian Island

*“We just hope that the authorities will play their roles from the social aspect. As for now it is quite effective...what they’re doing. For the chalet operators everyone got the approval from the authorities. That is for now. ...Because the government has dictated that everyone must have licence (to operate chalets)*

- Village Head, Small Perhentian Island

Shared understanding also goes to describe the need to accept and uphold the importance of conserving and protecting the island’s natural resources. The distinct depletion of some of its beautiful marine resources has prompted the authorities to increase conservation efforts by imposing fines and increasing monitoring procedures much to the chagrin of the locals who are dependent on marine lives for their livelihood. They have however, accepted the need to conserve when scenario of complete depletion of their beautiful island’s resources are conveyed to them by the authorities. Yet, much needs to be done in this respect if sustainable tourism development is to be realized.

#### **Acceptance**

Changes on current tourism measures are inevitable on the island if long-term sustenance of resources is to be achieved. In this respect, the islanders appear to display a high level of acceptance on the ways of managing and operating their tourism resources although this realization has not been translated well in practice. To some, it is the tourists who have taught them the need to uphold conservation as suggested by the following response:

*“Normally, the village people will sweep the leaves and burn them under the trees.... I do the same thing...I got scolded by the tourists. Their awareness of conservation is very high but our locals do not appreciate this. They don’t appreciate what we have because the minute they opened their eyes (in the morning) they see greeneries and they see the blue skies, so there is nothing left to appreciate.”*

-Chalet Operator, Big Perhentian Island

*"....I agree with the other chalet operators of the importance of conservation. If we look at the tourists who come here with their high awareness of conserving nature... and I, as a diver, I have traveled all over the world, up till Papua New Guinea, even in places where there are cannibals, I have gone to dive.....and in terms of the corals there and Perhentian Island, I think Perhentian Island is the last frontier...."*

-Diving Instructor, Big Perhentian Island

There is indeed a high realization of the importance of conservation and the need to ensure sustainability of existing resources on the island. However, extending this realization to the masses is not an easy task and one which appears daunting. As reflected by this response:

*"Actually, this must start at the school level. About cleanliness and things like that because once we leave schools and we come to islands like these.....we are sometimes embarrassed when we look at the foreigners, how they value cleanliness and we as Malaysians if we want to promote to the people outside our country and we do not keep our cleanliness, how do we expect people to come?"*

- Resort Operator, Big Perhentian Island

If the people of Perhentian Island and the tourism authorities agree on tourism development of the island, a lot needs to be done to ensure that natural resources are sustainable. What the analysis has managed to highlight are a few subjective revelations of the islanders' view on tourism. They are ready to undertake the challenge of managing and running their own island and they expect the authorities to understand their needs as much as the authorities would like them to understand the long-term impact of tourism development on the island. The possibility of the islanders adapting to the needs of the tourists and the requirements of the authorities are possible although this may appear to be quite a long affair as the islanders need to understand and accept the reality that tourism development has its price.

## **Discussion**

The purpose of this study was to generate a grounded theory of the people of Perhentian Island's perception towards tourism development. The aims of the study were to identify key elements influencing the development of tourism products and the assessment of views on the implications of tourism development as well as relate these to possible marketing strategies of similar island products. The grounded theory has resulted in identifying key human elements that are vital ingredients when planning strategic ventures. Be it business or non-business ventures, it is still human needs and human values that need to be considered. The propositions emerging from this study indicates that:

P1: Attitudes of the people of Perhentian Island is important in conveying acceptance to tourism development.

P2: Shared understanding is a vital element in ensuring that tourism development meets the needs of all relevant parties.

P3: Acceptance of vital elements critical to long-term sustenance of island resources is indicative of support given by the islanders.

It appears that tourism development is generally viewed positively by the islanders although much has been said about possible negative impacts brought about by the 'yellow culture' of foreign tourists. What can be established at this point is the local residents' view that it is essentially one's attitudes that will influence one's perception and acceptance of new values. Indeed, there are problems brought about by new culture such as the foreigner's way of dressing and the way of life that is considered 'unislamic' but these are by no means the sole perils of tourism. There are still some good values to be learned from the foreigners such as their strong values on conservation and environmentalism, their dependable work ethics and their unassuming acceptance of new ideas. Influences on local youths on the free lifestyles of the foreigners have been noted but these have been attributed to personal values and need not necessarily be generalized to the masses. Indeed, there is likely to be both pros and cons in the development of tourism.

What is perhaps essential at this point is a thorough analysis of how to sustain the attractions of the islands. The marine lives, the beach, the seas, and the corals are resources that are irreplaceable and measures need to be undertaken to ensure their continued existence. This is where the authorities play a vital role in developing

appropriate marketing and conservation strategies. The need for a well managed or controlled tourism may well be the answer to this. Islands like Perhentian should be listed as protected environment and therefore tourism activities should be drawn carefully to reflect the need for conservation. It is not proper therefore to lump island promotion into the big promotional or marketing strategies common of tourism bodies or marketing agencies. These are for selected markets who understand the need to protect and to conserve. Indeed, in this era of borderless world, a whole range of changes in society and the global economy will need to be taken into consideration in planning and managing tourism destinations (Parker, 1998; Go, 1996; Smeral, 1998).

Promoting island products would entail a niche or specialized promotional tactics. The target market should be clearly defined and carefully segregated. Marketing strategies aimed at this group is likely to provide richer and effective impact. Islands as a tourism product appeal only to certain group of people and this should be made clear to all relevant marketing authorities. If long-term survival is to be ensured, both for the island and the islanders, specialized campaigns may well be the answer for effective island promotion. It is critical that tourism agencies responsible for marketing such scarce resources understand the need to attain full support of the locals as they are the stakeholders and ultimately the island belongs to them.

## Conclusion

What this study has established is the need for a well planned and controlled island promotion where opinions and view of the stakeholders or people of the island must be given proper consideration. Island as a tourism product is still a lucrative product for the tourism industry but an essential element in ensuring its sustainability is the realization by all relevant parties of its fragility and the need to implement effective strategies to ensure long-term survival. Island promotion can still be implemented successfully with a profound realization that this product is both unique and scarce and therefore must be managed with extra care. Thus, support from the locals is vital to ensure that planned strategies are effectively implemented and monitored and proper infra-structural development eventually brings a win-win situation to all involved.

# **Market Performance and Regulation: A Case Study on China Airline Industry**

*Ruijuan Hu*

*University of International Business and Economics, China*

## **Abstract**

**Firstly, the study will present a big picture on the evolution and background of China airlines industry regulation reform. Secondly, some comparisons are made to show the market structure change induced by the regulation policy evolution. Thirdly, using both rout-level cross-section data and time series country level data of China airline industry, some relationship between the regulation policies and market performance indicators are explored.**

## **Review on Airline Regulation Literatures**

In the past few decades, the airline industry has been one of the most frequently discussed industries in industrial economics literatures. As Borenstain (1992) said, “there was no other industry has experienced the process of dramatic change from strictly regulatory regime to the competitive market.” Before the 1980s, it was the case that extremely strict regulation exists in civil aviation in most countries. As more and more researches have shown, regulation could induce inefficiency. Keeler (1972) showed that the regulated routes tended to have much higher fares and markups. Both De Vany (1975) and Graham (1983) argued that CAB regulation tended to cause the excess capacity employed by airlines. Hendricks etc. (1997) have shown that the fixed price regulation could deter the entry of regional carrier on the spoke line hence impede the natural development in the hub-and-spoke system. Furthermore, Levine (1965) demonstrated that deregulation reform enhanced air service productivity and decreased local fares without affecting national markets in some deregulated experiments such as Texas and California in US.

With the passage of the 1978 Airline Deregulation Act in U.S., however, the commercial air transportation system was dramatically deregulated. By 1984, the number of airlines competing in national or regional markets had nearly doubled from the nineteen that had been in operation immediately prior to deregulation (Scharpenseel (2001), etc.). Studies after the 1978 reform revealed that efficiency and fare gains were concentrated on routes where true competition and network optimization unfolded, free from operational obstacles such as infrastructure congestion, hub domination by incumbent carriers, and mergers foreclosing low-to-medium density ends of the networks to competition (Hurdle et al., 1989; Kim and Singal, 1993; Liu and Lynk, 1999).

In contrast to the U.S., the EU countries have more difficulties in liberalization since the widely varied geographic and legislative differences across the EU countries. After the European Union completed its transformation into a single market in 1993, however, the large demand of this market has created an enormous challenge for the EU airline industry. The European Community took a fairly gradual way through three air transport liberalization packages and finally completed the liberalization only after the wholesome implementation of the third European air transport liberalization package of 1993 in 1997 (Morrell (1998)), which at last replaced the bilateral agreement system with a multilateral system within the EU. Scharpenseel (2001) pointed out that Europeans have been benefited from many discount fares and a network of additional routes within the E.U. However, a single aviation market across the E.U. has not yet been accomplished.

In conclusion, most economists have agreed that the deregulation lowered fares in some market hence increased the welfare of public and optimized flight distribution system in some areas. At the same time, however, some depressions of the air transport performance, such as airport congestion, flight delays, increased concerns with safety, and rising fares in less competitive markets, has been attributed to the deregulation (Morrison and Winston (1989)). In recent decades, a more intensive discussion on the optimal market structure of airline industry incurred. Findlay (1985) discussed four different approaches to regulation and corresponding effectiveness. Button (1996) mentioned that, without appropriate institutional safeguards, the technical features of the aviation market might

make it unstable. Should regulation be reintroduced? Or in what degree should the industry be regulated? Some economists began to cast suspicions on the deregulation move occurred in the end of last century (Borenstain (1992)).

In China, deregulation or liberalization of air transport has been a hot topic of the public during the last decade; however, most of the discussions were superficial newspaper and webpage articles. Among the few academic papers on China's airline regulation, Le (1997) took a deep exploration on the reform in China's airline industry, Zhang and Chen (2003) focused on the international liberalization aspect. In a report for OECD, Gonenc & Nicoletti (2000) used route-level indicators to analyze the relationship between regulation policy, market structure and infrastructure access. However, the relationships between the regulations policies and market performance of China's airline industry are remained an open problem. To fill the gap, this study attempts to create some market indicators, such as HHI on route market, Flight Frequency Concentration, Yield on specific route, and to show the relationship between regulatory policies and market performance by comparison analysis and numerical analysis. At the same time, it highlights the characteristics of airline industry that are unique to China.

## **The Evolution of Regulation Policies on China Airlines Industry**

### **State-owned Monopoly**

Before 1984, there was a monopoly state-owned carrier directly operated by the Civil Aviation Administration of China (CAAC) provide the air service to very limited clients<sup>1</sup>. Because of the capacity constraints, the CAAC had to take a censor institution. Only those qualified "applicants" can get air ticket. Meanwhile, the whole industry has suffered loss for many years. During the period of 1953 to 1978, there are 14 years in which the industry suffered loss (Shen, 1992). In 1978, the total passenger traffic was 2.31 million, among them, only 0.11 are international passengers.

### **Functional Separation and Marketization**

With 1978's economic reforms and open policy embarked, the CAAC saw prospective profit from the huge potential market. To disencumber the heavy loss and subsidy burden of civil aviation system and enforce the capability of the air industry, the CAAC submitted the *Report on Reforming the Management Structure of Civil Aviation* to the State Council (SC) in December 1984. The State Council approved the original version of the Report in January 1985. After some reviews and discussions, the SC approved the final version of the Report in January 1987. According the Report, the CAAC's administrative function are separated form its enterprising function. It was to become primarily an administrative agency responsible for formulating aviation policy and development plans, negotiating international air transport agreements, instituting technical standards for airline and airport operations, managing civilian air traffic control, issuing air operator licenses, monitoring safety and airworthiness, regulating air fares, coordinating aircraft acquisitions, setting rules on airlines' financial accounting and reporting, and supervising aviation training schools.

To frost a competitive market in the airline industry, the CAAC and central governments encourage the regional government and enterprises to invest in airlines. Several airlines invested by the regional government and companies were established (Xiamen Airlines in 1984, China Xinjiang Airlines and Shanghai Airlines in 1985, China United Airlines, Zhongyuan Airlines, Wuhan Airlines and Sichuan Airlines in 1986). According to the arrangement presented in the *Report*, six major airlines were spun off from the old CAAC between 1987 and 1991. Three of them---Air China, China Eastern and China Southern---are known as China's big three airlines. By the year of 1994, the number of airlines operating on the scheduled passenger mushroomed to 23 (see table 1a).

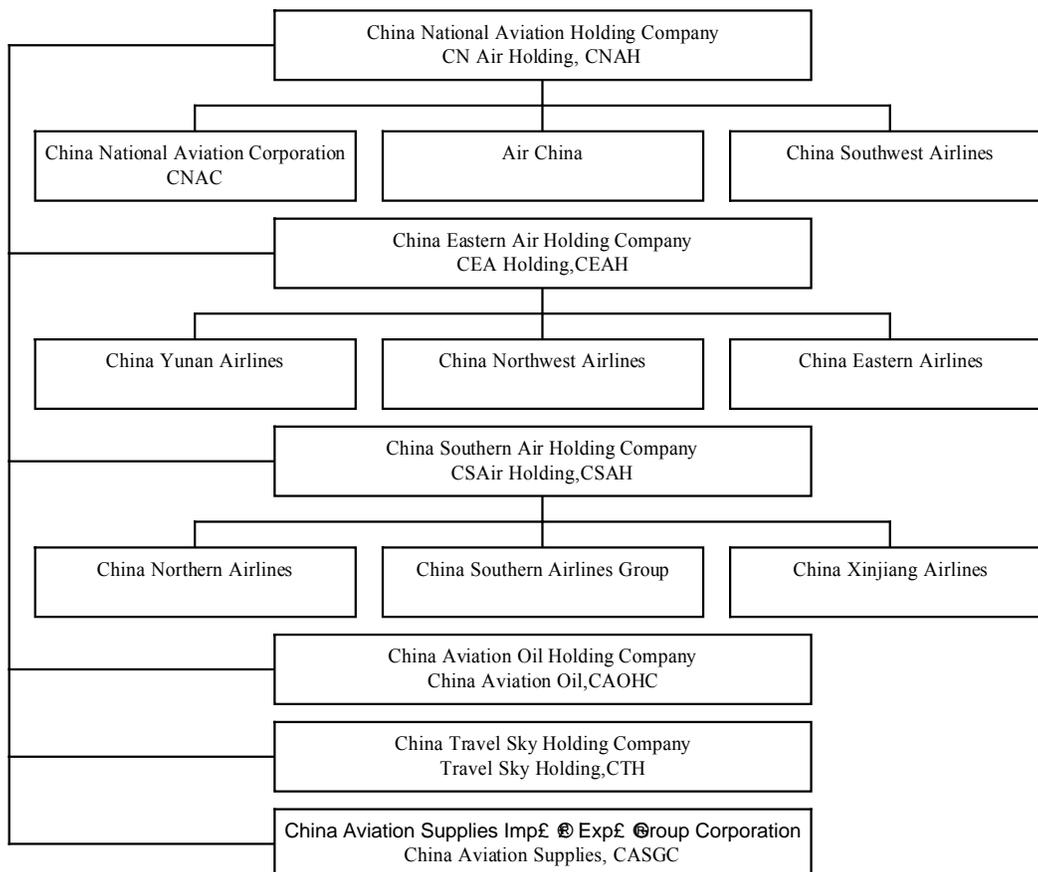

### **Consolidations and Reorganizations**

The rapidly growing number of airlines put intolerable strains on aviation infrastructures and raised concerns about the airline safety. The CAAC concerned the small size of airline as one of the major cause of loss. It began to encourage mergers and takeovers among the small airlines (e.g., Swan Airlines was take over by China Northern and Fujian Airlines by Xiamen Airlines). Six independent airlines (Hainan, Shandong, Shenzhen, Sichuan, Wuhan and Zhongyuan Airlines) were approved to pool their staff, aircrafts and ground facilities into the Xinxing Alliance

and started in 1998. By the end of 1998, there are 10 airlines under direct organization of the CAAC and 24 under the regional bureau.

However, the number of airlines is still higher than the optimal level in the CAAC's point of view. The CAAC believes that a more intensified consolidation will help the airlines develop a reasonable hub-and-spoke route system and reinforce the competitive capability of Chinese airlines hence be beneficial to growth of the whole industry. In January 2002, it issued the *Scheme on Civil Aviation System Reform* to conduct a move of reorganization and consolidation among the airlines and aviation companies under its direct organization. The reorganization was finished in October 2002. As Figure 1 shows, six big aviation groups are formed to replace the former civil aviation companies under the direct organization of the CAAC. At the same time, the CAAC also welcome the regional airlines attending the move. Among the six big civil aviation holding companies, the three big holding companies (CN Air Holding, CEA Holding and CS Air Holding) are integrated airlines of the nine former airlines under direct organization of the CAAC and some regional airlines (see Table 2 in Appendix 1). According to the Scheme, individual airlines in the three big Air Holdings will pool their staff, aircraft and ground facilities together, operat all their transportation service under a single sign (of the core airline of each Air Holdings). However, the name of former airlines can remain unchanged.

Figure 1 China's big 6 aviation groups after the 2002 consolidation and reorganization

### Price Regulations

As shown in the following table, the CAAC has been taking a gradual liberalization policy on China's domestic scheduled passenger air transportation. It experiments then reviews the aftermaths, but make actions continuously. Before 1992, air fare was under strictly regulations of the governments (the State Development Planning Commission (SCPC) and the CAAC). Every a few year, the government adjusted the fare level slightly, and airlines just applied them into the operation.

In 1992, the CAAC released the pricing regulation<sup>ii</sup> for the first time by setting a flexible range ( $\pm 10\%$ ) around the baseline fare. With the capacity and number of airlines growing more quickly than the growth of demand<sup>iii</sup>, price-cutting competition broke out and depressed airlines profits. According to a Statistics on the Managerial Level of the Air Carriers in 1995, 15 out of 24 airlines suffered loss. Some small airlines suffered continuous loss. At the same time, the illegal ticket agency and kickback was becoming a more and more serious problem. In 1996, the CAAC abolished the 20% fare change zone. But it did not stop its step to liberation. In 1997, a more flexible "Multiply discount based on the single fare" policy was issued. Airlines are allowed to use different discounts to different clients depending on the route and season within the 60% maximum discount zone. However, the kickback problems came again. Concerning the difficulties in practice for customers to distinguish the permitted discount and the illegal discount, the CAAC abolished the 1997 price regulation policy in 1999.

On the other hand, with the economic and tourism activities growing vividly, people are more and more likely to use air transportation. However, the comparative fare level of China air service is considered as much higher than that of the rest part of the world. As Table 1 show, the comparative air fare of China is almost higher than that of all the rest countries (apart from Africa). On the contrary, the ratio of maximum fare and minimum fare is quite low. This means that the price range is quite narrow. As a rule of thumb, the differentiated price system is a powerful means for airlines to win the market. With the date of China's entry into WTO coming closer, the CAAC felt pressure to enhance Chinese airlines' competitive capability. It began to take some policy experiments. The discount ticket policies were allowed to give to tour groups on Hainan consolidated routes (operated by members of XinXing Alliance). Then the experiment was spread to the tour groups on all the rest routes 2 years later.

The most recent Scheme was issued by the SCPC and the CAAC in March 2004. It redefined the discount zones. Airlines are allowed to discount 45% of the baseline fare or overcharge 25% of the baseline fare (0.75 per RPKm). And monopolist airlines are only subject to the upper limitation.

TABLE 1: THE COMPARATIVE AIR FARE LEVEL

Country /Region	Fare** (dollar/rpk)	GDP per capita (dollar)	Minimum Fare/ GDP per capita(%)	Maximum Fare/ GDP per capita(%)	Maximum Fare / Minimum Fare
China	0.04-0.12	1000	4.00	12.00	3.00
US	0.10-0.84	30000	0.33	2.80	7.50
Europe	0.14-0.78	20000	0.70	3.90	5.57
Oceania	0.10-0.50	15000	0.67	3.33	4.71
South America	0.08-0.56	7000	1.14	8.00	7.27
Africa	0.05-0.12	400	12.5	30.00	3.00
Japan	0.20-1.60	35000	0.57	4.57	8.00
Korea	0.12-0.80	8000	1.50	10.00	6.67
India	0.04-0.15	800	5.00	18.75	3.73
China (PPP*)	0.12-0.40	3320	4.00	12.00	3.00

Note: \* PPP data is based on that of IMF in 2001.

\*\* Fare here refer to the fare level apply to the 1000 km route.

TABLE 2: THE EVOLUTION OF FARE LEVEL AND PRICE REGULATION POLICIES IN CHINA AIR TRANSPORTATION

Year	Nominal Fare		on 1978 Fixed Price		Regulation Policies
	Non-peak	Peak	Non-Peak	Peak	
early 1950's	0.2	0.3			Before 1992, air fare was set by the former National Price Administration and the CAAC. Airlines were absolute price takers.
1974	0.05	0.07			
1985	0.084	0.144	0.07	0.11	
1986		0.19		0.14	
1987	0.11	0.24	0.08	0.16	
1988		0.24		0.14	
1989	0.2	0.32	0.1	0.16	
1990		0.32		0.15	
1991	0.308	0.354	0.14	0.17	
1992		0.41		0.18	
1994	0.49	1.01	0.16	0.33	
1996		1.01			The CAAC began to set air fare with the coordination of the former State Planning Commission (i.e. the current State Develop Planning Commission) instead of the former National Price Administration. The 20% allowable discount range was abolished. Average fare increased by 20% on 1 <sup>st</sup> February, and by 6% on 28 <sup>th</sup> July.
1997		1.01			The CAAC issued a "multiple discount based on one fare" policy. Airlines were allowed to sell ticket on different discounts.
1999		1.01			The CAAC abolished the ticket discount policy again
2000		1.01			The CAAC started ticket discount experiment to tour groups on consolidated Hainan routes on 15 <sup>th</sup> May. Since 1 <sup>st</sup> October, the carriers on spoke routes were permitted to set their own fare level subject to a fare ceiling of 10% higher than the baseline fare and submit their fare data to the CAAC.
2001		1.01			An extra oil charge up to 15% of the fare or no more than 150 yuan per trip was enacted since 5 <sup>th</sup> November. At the same time, airlines were allowed to increase their fare by up to 3% as the domestic oil price increased by more than 10%.
2002		1.01			The CAAC started another ticket discount experiment to tour groups on all domestic routes on 10 <sup>th</sup> June.
2004	0.3	1.01			<i>MinHangGuoNeiHangKongYunShuJiaGeGaiGeFangAn</i> (the Scheme on the Price Reform of Domestic Air Transportation) was issued by the State Develop Planning Commission and the CAAC on 17 <sup>th</sup> March and was enacted on 20 <sup>th</sup> April.

Source: Fare data of 1950 to 1994 are selected from Zhang (1998), other fare data are selected from Li & Deng (2004).

## Comparison Analyses on the Scheduled Passenger Market

### Radical Increase of Market Concentration

Table 1 and 2 in Appendix 1 show the change of passenger airlines market structure in China during the last decade (1994 to 2003). The total number of independent operators in the market has increased only by one, from 23 to 24. However, the structure has changed a lot. Some airlines disappeared, having been taken over (e.g., China Great Wall, Zhongyuan, Fujian) or stopped by the CAAC (e.g., China United Airlines was required to stop operation by CAAC in 1998 because of its Army Force background. It actually stopped operation in 2003 and was taken over by

Shanghai Airlines in the next year). Also, there are new started airlines (e.g., Zhuhai Airlines, which was held equity by China Southern and Greene Group, a electronic appliance manufacturer).

In this decade, the concentration degree of the market has increased rapidly. Under the encouragement of government, many small airlines have been taken over by larger ones. Especially, the recent consolidation and reorganization move among the CAAC directly organized airlines has squeezed the number of airlines directly organized by the CAAC by 1 to 3 ratio (from 9 in 1994 to 3 in 2003). As the table 1 shown, the big 3 airlines (Air China, China Southern, China Eastern) has increased their market share by more than 20 percentage (from 53.89 in 1994 to 75.60 in 2003). It is worth to note that, this percentage is slightly lower than the big 6 market share in 1994 though the number of airlines incorporated into the big 3 actually more than 6. This might do things with the even more rapid growth of regional airlines, such as Hainan Airlines and Shandong Airlines. Hainan Airlines, the first Sino-US joint airlines in China, has increased its market share by 6 times (from 1.25 in 1994 to 8.11 in 2003), and been called “the Fourth Polar” in China’s airlines industry. Meanwhile, Shandong Airlines, a small regional airline has increased its share from almost null to 2.01%.

During empirical analysis of market concentration, a more formal index about the market concentration degree is Herfindahl-Hirschman Index (HHI), which is obtained by squaring each airlines’ market share (in percentage terms) and adding the squared values. Without concerning the consolidations and takeovers among airlines, i.e., calculate the HHI using the market share of each individual airlines, the HHI of 2003 (1234.85) was even 73.39 lower than that of 1994 (1308.24). This means that, without the conduction of consolidation, the market were actually taking a de-concentration tend. However, under the vivid arrangements and incentives of the CAAC and other government sectors, a move of consolidations and mergers has largely increased the concentration degree. The HHI of 2003 (2044.85) increased 736.61 comparing to that of 1994. The total merger and consolidation related HHI equals to 809.99. Both the post-merger HHI index and the merger-related HHI are much higher than the maximum limitation<sup>iv</sup> that likely to incur an antitrust sue in some west countries.

Another comparison based on route level data illustrates the increase trend of market concentration degree in a more detailed way. It is shown in Table 3 in Appendix 1. During the period of 1992 to 1997, it shows that, the number of airlines operating on each route has taken a trend of increase. But the number declined during the consequent six years (1997 to 2003). Whereas, the weekly flight frequency maintained a trend of increase during the two consequent periods. From 1992 to 1997, the weekly flight on each route has increased by at least twice. And it has increased even more times during 1997 to 2003. On the route from Shanghai to Xiamen, the weekly flight has increased by more than 20 times in the last 11 years (1992 to 2003). The last three columns in table 3 show us the weekly flight frequency of each airline on the route. We can see that, apart from those airlines who has exited the market, almost all incumbent airlines input more flights on each route than past. Obviously, the capacity of airlines has increased rapidly.

#### **Concentration Degree And Fare Level**

Combining the change of HHI and concentration degree with the fare level data displayed in table 2 and the yield (fare per km) displayed in the table of Appendix 3, we can see that, fare level didn’t go up with increase of the concentration degree. The floor fare of 2003 (0.30) is even lower than that of 1994 (0.49). And the yield in 1994 was 5.54 while it declined to 4.82 in 2003. This extraordinary feature in China’s air service market might largely due to the strictly price regulation of the CAAC. Besides, concerning that airlines might sell discounted ticket to passengers, the fare level displayed in table 2 might not equal to the real fare used in price calculation. However, as the former section has mentioned, the discounted ticket was under the strict regulation of the CAAC. Thus the actual impact of discounted ticket can be considered as ignorable.

A reasonable guess about the China airline industry can be drawn from this comparison, airlines actually are not able to control the market price even with the concentration degree getting quite high. This means that the competition in China’s airline industry under price regulation might be similar to a Cournot competition. However, to prove this point, more studies on the pricing action of airlines have to be done. This goes beyond the extent of this paper.

There are two probable reasons. One might be that the CAAC has put strict constraints on the price level (note that the maximum limitation is tighter than the minimum limitation) could charged by airlines. I would like to call it “regulation element”. However, the “regulation element” is far from enough to interpret the problem. As you

might notice that, the CAAC actually has been trying to control the discount level of ticket since 1992's price regulation release. There must be another more significant element that is impacting the airlines' pricing action. This is related to the characteristics of the demand of air service. As a rule of thumb, transport demand can be a continuously random variable, while the capacity of airlines is comparatively fixed (at least in short term). To satisfy the demand at a high ratio, airlines usually tend to invest excess capacity to handle the peak-time demand. Thus, excess capacity is actually quite popular in airlines industry. Success airlines are those who have highly ability to manage their excess capacity. In China, with the marketization and corporatization getting deep, the investment on airlines, aircrafts and ground facilities has multiplied. Thus, with the flight capacity growing rapidly, it has overstep the demand under the strictly price policy of CAAC.

Actually, as the data in Appendix 3 shown, the increase rate of capacity is higher than that of demand in the same period. This is also reflected by the continuously decreased (with very few exceptions) average load factor on domestic passenger routes.

## Numerical Analysis

To explore more relationships between the market structure and the performance, I did some simple regressions using both route-level and country level time series data. However, due to the limitation of the data, many result are not significant enough. I choose two here to help identify some interactions between the market elements and regulation elements.

### Regression Result 1: Relationship between Fare Level and Concentration Degree (Based on Route Level Data)

Using the route level data, take natural logarithm on each variable. Then run a regression (ln(fare) on a constant, ln(distance) and ln(concen)). The data set used can be seen in Appendix 2.

The result is shown as below.

Source	SS	df	MS	Number of obs = 26
Model	.374647037	2	.187323519	F( 2, 23) = 53.24 Prob > F = 0.0000
Residual	.080920397	23	.003518278	R-squared = 0.8224 Adj R-squared = 0.8069
Total	.455567434	25	.018222697	Root MSE = .05932

lnfare	Coef.	Std. Err.	t	P> t	[95% Conf. Interval]
lnadis	-.2315547	.0266873	-8.68	0.000	-.2867617 -.1763477
lnconcen	.0646946	.0394666	1.64	0.115	-.0169483 .1463374
_cons	.8774962	.4290881	2.05	0.052	-.0101401 1.765132

Note: lnadis denotes ln(distance), lnconcen denotes ln(flight concentration index), cons denotes the constant.

Flight Concentration Index (FCI) are calculated by the following formulation:

$$\text{Flight concentration Index} = \sum (\text{flight frequency of each airlines} / \text{total no. of flight per week on the route})^2$$

From the regression result, we can see:

- Fare is highly dependent on the distance of the route, the negative sign of coefficient means that the fare will decline with the increase of distance. This is coincided with the rule of "taper with distance". That is, there are significant economies of distance in air transportation.
- Because the HHI on route level is unavailable, I use this Flight Concentration Index, which is similar to the HHI, but replace the market share by the share of total flight per week. Usually the airlines with larger flight supply on a route will have higher output. The regression of traffic on flight frequency and capacity also support this. Thus the FCI can be used as a representative of the HHI.
- The variable of Flight Concentration Index is not very significant. However, it is still reasonable to say that the fare level has some positive relation with the concentration degree of the route market. However, given

that the FCI is sufficient to represent the concentration degree, the contribution from concentration index to the change of fare is quite slight.

**Regression Result 2: Relationships between Load Factor and Output, Income (Based on the Time Series Data)**

Using country level data. Take natural logarithm on all the observations. Run regression on passenger load factor, GDP per capita, revenue passenger tonnage and yield. (where, yield = fare / distance). The dataset see Appendix 2. The result of regression is shown as below:

Source	SS	df	MS	Number of obs = 18		
Model	.349240103	3	.116413368	F(3, 14) =	35.06	
Residual	.046487736	14	.003320553	Prob > F =	0.0000	
				R-squared =	0.8825	
				Adj R-squared =	0.8574	
Total	.395727839	17	.023278108	Root MSE =	.05762	
lgplf	Coef.	Std. Err.	t	P> t	[95% Conf. Interval]	
lngdpperca~t	-.6473751	.1569057	-4.13	0.001	-.9839042	-.3108459
lnrpts	.4240025	.142936	2.97	0.010	.1174352	.7305698
lnyield	.0808959	.089889	0.90	0.383	-.1118967	.2736886
_cons	3.038599	1.003512	3.03	0.009	.8862793	5.190919

Note: lngdpperca~t denotes ln(gdp per capita), lnrpts denotes ln(revenue passenger tonnages), lnyield denotes ln(yield), where, yield = fare / distance, and cons denotes the constant.

From the result, we can find out that,

- Passenger load factor is negatively related to GDP per capita, and the relationship between this two variables are quite significant. This in certain degree reflects the fact that flight capacity is growing more quickly than air demand. Thus support the conclusion that airlines consolidation didn't raise fare level mostly because of excess supply rather than price regulation.
- When load factor be considered as an indicator of service quality (the lower the load factor, the higher the availability of the service), this means that the requirements for higher quality service will increase with the growth of people's income.
- Passenger load factor is positively related to the total revenue passenger tonnages. This is easy to be justified. When more and more people take airplane, given the capacity fixed in short term, the load factor will go up.
- Yield is not significant.

**Conclusions**

The regulation regime in China's airline industry has witnessed a continuous and gradual process of reform to liberalization. During this gradual process, the reform displays quite a few features that are unique to China. It is very difficult to directly borrow west principles to fit the Chinese practice. This paper did some analysis based on the available facts and data.

The primary finding is that, the CAAC's incentive policies to takeovers and consolidation, especially the 2002 Reform Scheme, has contributed largely to the increase of concentration degree in China's schedule passenger market. The extraordinary result is that, because there is comparative excess supply/capacity (under the current regulated price level), airlines cannot impact the market price. The results of two regressions also support this argument. (The numerical study did not see significant relationship between fare and concentration index. The load factor is declining with the increase of income, which implies that there is excess supply.)

By the end of 2004, it is said that China's airline industry finally recovered from its continuous loss and enjoyed an 8.69 billion RMB profit. This profit equals to the sum of the industry's profits in the last ten years. Because of enact of the 2004 Scheme on Price Regulation Reform, airlines were able to attract more passengers by more flexible price mixture. This has increased the average passenger load factor to 71%, about 5 percentages higher

than that of 2003. This might be considered as a fact support the finding of this paper. However, the effect of the 2004 Scheme of price regulation reform remains as a topic of another paper.

## Appendix

APPENDIX 1: TABLES OF THE COMPARISON ANALYSIS  
TABLE 1: MARKET STRUCTURE IN 1994

Airlines	RPKs(10,000pkm)	Market Share*(%)
Under direct organization of CAAC		
Air China	1179200	21.58
China Southern Airlines	1073663	19.65
China Eastern Airlines	691463	12.66
Big 3 Concentration		53.89
China Southwest Airlines	584809	10.70
China Northwest Airlines	273825	5.01
China Northern Airlines	540717	9.90
Big 6 Concentration		79.51
China Xinjiang Airlines	251443	4.60
China Yunnan Airlines	167120	3.06
China Great Wall Airlines (was taken over by China Eastern in 2001)	14778	0.27
under organization of Regional Bureau		
Xiamen Airlines	210614	3.86
Shanghai Airlines	131085	2.40
Sichuan Airlines	98987	1.81
Hainan Airlines	68111	1.25
China United Airlines (Stopped operation in 2003, was taken over by Shanghai Airlines in 2004)	50285	0.92
Shenzhen Airlines	41308	0.76
Wuhan Airlines	38504	0.70
Xinhua Airlines	30590	0.56
Zhongyuan Airlines (was taken over by China Southern in 2000)	7353	0.13
Changan Airlines	1313	0.02
Fujian Airlines (was taken over by Xiamen Airlines)	3555	0.07
Guizhou Airlines	3915	0.07
Nanjing Airlines	687	0.01
Shangdong Airlines	2	0.00
Total RPKs	5463327	
HHI*		1308.24

TABLE 2: MARKET STRUCTURE IN 2003

Airlines	RPKs(10000pkm)	Market Share*(%)
Air China (CN Air Holding)	3347703.3	26.50
China Eastern Airlines	1610422.3	12.75
China Eastern Xibei Airlines (was taken over by China Eastern in 2002)	382439.2	3.03
Nanjian Airlines(was taken over by Northwest in 1997)	15481.6	0.12
China Eastern Yunnan Airlines(consolidated with China Eastern in 2002)	396346.8	3.14
China Eastern Airlines Jiangsu(was held equity by China Eastern)	189848.8	1.50
China Eastern Airlines Wuhan (was held equity by China Eastern)	179342.8	1.42
CEA Holding Total	2773881.5	21.96
China Southern Airlines	1836750	14.54
China Northern Airlines(consolidated with China Sourthernin 2002)	817921.3	6.48
Northern Air Sanya(consolidated with China Southern in 2002)	88889.9	0.70
China Southern-Xinjiang Airlines(consolidate with China Southern in 2002)	409477	3.24
Southern Air Shantou(hold equity by China Southern)	65875.4	0.52
Guizhou Airlines(consolidated with China Southern in 1998)	77800.9	0.62
Guangxi Airlines(was held equity by China Southern)	55485.4	0.44
Zhuhai Airlines(was held partial equity by China Southern, start in 1995)	76059.5	0.60
CS Air Holding Total	3428259.4	27.14
Big 3 Total		75.60
Hainan Airlines	425515.1	3.37
Shanxi Airlines(was held majority equity by Hainan in 2001)	105734.8	0.84
Changan Airlines(was held partial equity by Hainan)	80728.3	0.64
Xinhua Airlines(was consolidated with Hainan in 2001)	411912.8	3.26
Hainan Total	1023891	8.11
Big 4 Total		83.71
Xiamen Airlines	526763.6	4.17
Shanghai Airlines	549113.8	4.35
Shenzhen Airlines	455793.3	3.61
Sichuan Airlines	273006.5	2.16
Shangdong Airlines	253440.7	2.01
Total	12631853.1	
HHI without Takeovers and Consolidation		1234.85
HHI After Takeovers and Consolidation		2044.85
Merger and Consolidation Related HHI		809.99

Note:

\* Market Share is obtained by dividing each airlines' RPKs by total RPKs.

\*\* HHI, "Herfindahl-Hirschman Index", is obtained by squaring each airlines' market share (in percentage terms) and adding the squared values.

## End Notes

---

<sup>i</sup> From 1950 to 1953, there were two airlines in China and was operated by the Civil Aviation Bureau (CAB, the predecessor of the CAAC). In 1954, the two airlines were combined into a state-owned monopoly and the CAB was replaced by the CAAC (Le, 1997).

<sup>ii</sup> The price of air ticket in China is calculated by the general formula: Price = minimum price + fare\*distance. Current minimum price is 80 yuan for all scheduled routes. Thus the real ticket price will be decided by the fare and discount applied. For example, the economic class ticket price from Beijing to Shanghai can be calculated from:  $1178(\text{distance}) * 0.76(\text{fare}) + 80(\text{minimum price})$ , that is 975.28. When passenger go to the ticket office, he/she will get a ticket at discounted price plus tax and oil adjust charge.

<sup>iii</sup> Note that the demand in this paper should be considered as the demand level under specific price level, i.e., the regulated fare level. This might be unique to China. However, the state can be quite different without the price regulation.

<sup>iv</sup> In US, under the 1984 DoJ merger Guidelines, for markets with post-merger HHI indices above 1800 and a merger-related increase in the HHI exceeding 100, an antitrust challenge was deemed likely, and only in “extraordinary cases” would it be concluded “that the merger is not likely substantially to lessen competition.”

# **Media Transition in Post-Soviet Kazakhstan: Privatisation, Regulation & Oligopoly**

*Amos Owen Thomas  
Maastricht School of Management, Netherlands*

## **Abstract**

**In tracing how the television industry has developed in a transitional economy within Central Asia this paper addresses the general lack of knowledge on its media scene. Through face-to-face interviews with industry executives and utilising secondary data obtained in-country and beyond, this paper documents the evolution of Kazakhstan's media policy in the post-Soviet era. It analyses the creation of a media oligopoly through interlocking ownerships and reinstatement of authoritarian controls after short-lived media freedoms. The author examines also the interplay of political influence and economic imperatives in cultural production and distribution. As with many other transitional economies, the media industry has not contributed to political freedoms, plural ownership, civil society and democratisation in relatively moderate Kazakhstan.**

## **Introduction**

Much has been written and researched about media in the former Soviet Union states and satellites in Eastern and Central Europe, yet little attention has been paid to its former Central Asian states. Doubtless this is because they are seen as smaller markets and more distant and impenetrable, both geographically and culturally. Given the dearth of published material on this long-closed and thus neglected region, at least in the developed world, any contribution to knowledge of it would prove valuable, and an understanding of its media should provide some insight into the dynamics of its culture, society, politics and economics. Kazakhstan is the largest of the Central Asian countries, possibly the wealthiest, most Russian/European and politically moderate, and thus a good starting point for understanding the developments and trends in the region.

## **Comparative Media Systems**

In analysing the media of post-communist Eastern Europe, Downing [1] adopted a political science perspective to understanding the parallel political and cultural changes. Television had the distinct advantage to the communist leadership, he argued, of being a one-way medium from top-down, which could carry a standardised message throughout the nation and that intruded into the homes of the masses. Thus it was self-published 'small media' of typed sheets and audio-cassettes, and informal media of graffiti, tee-shirts and student theatre that helped maintain dissenting alternative perspectives. However in the period of transition to democracy and independence, it was television once again that politicians turned clumsily to, though analysis of consequent media laws and news content does not yield the full story of the new politics and economics involved.

In Russia, the first private station was established in 1993 on an 'experimental basis', namely NTV which became a major broadcaster known for accurate news. In the absence of an organised opposition in pre-1989 Bulgaria, the fall of totalitarian regimes in other parts of Central and Eastern Europe stimulated street protest. This slowly led the media to deviate from their past ways of reporting and instead play a new role as stimulator of political reform [2]. However liberalisation of the television began only in 1994 with both local commercial television and unregulated satellite/cable channels becoming accessible. Unlike other transitional economies in Europe, public television in Estonia maintained its dominant market position after the arrival of commercial stations because of its commitment to original local programming [3]. Free-to-air retransmission of Russian television was gradually replaced by Estonian domestic channels, though these also broadcast partly in Russian including news, breakfast television and prime-time serials. Meanwhile satellite and cable television mainly from Russia was accessible via four local providers to 41 percent of the Estonian population by 1997.

Believing that a free-market in broadcasting allows all opinions is naïve, given differential consumer access and profit-maximisation by owners, says Splichal [4]. He argued that the media need regulation to perform their role as public fora in democratic societies, balancing civil society and public service interests against capital and political power. Although re-regulated nominally in line with 'Western' norms, the privatised, transnationalised media in the transitional economies of Eastern Europe are not necessarily instrumental to democracy but subject to political and economic manipulation. Given the different history of takeover by communists of many Eastern European and ex-Soviet states in the early 20th century and paths to independence in the early 1990s, there is considerable variation in the development of their media industries. Drawing on first-hand interviews and secondary data collected in-country and abroad, this paper will document the experience of Kazakhstan over its first decade and a half since the demise of communism.

## **Historical Background**

### **Past Geo-Politics**

Geographically the region of Central Asia roughly demarcated by the Caspian Sea in the west, Iran and Afghanistan in the south and Russian in the north, and China in the east. From the early 18th century the Russian Empire had extended its control over the Asia steppes, used by the largely nomadic Turkic tribes, through diplomatic and trade means [5]. When there were periodic uprisings, successive Tsars resorted to military conquest and colonisation of the region, with due respect afforded to cultural and religious traditions. The Islamic faith was a unifying factor among all the Central Asian peoples and the launch-pad for various movements for autonomy and independence in the 18th and 19th century. However, intellectuals leading the political movements were in favour of a pan-Turkism as an alternative to westernisation and pan-Islamism, some of them flirting with socialism.

The abdication of the Tsar raised hopes of independence and following their later take-over the Bolsheviks had initially pledged equal sovereignty and self-determination for all nations of the former empire. Lenin had argued that nationalisms as a reaction to capitalism would be replaced by internationalism as socialism gained ascendancy. But Stalin, who came to power in 1924, advocated the establishment of nations with a shared official language and territory. Consequently, the region that had once held such names as Turkestan, Bukhara and Khorezm underwent radical territorial reorganisation that was to result in Kazakh, Uzbek, Kyrgyz, Tajik and Turkmen Soviet republics that are the predecessors of the current nation-states. Soon after the redistribution of lands previously owned by Russian colonisers to the landless was superseded by collectivisation and settling of nomadic peoples [6]). Khrushchev who succeeded Stalin, was determined to make the USSR self-sufficient in grain and meat, and Kazakhstan was selected to have millions of hectares of grazing land converted to this task. To create this 'miracle' came settlers from Russian, Ukraine and Germans, who were resented by the native Kazakhs and this fuelled further calls for cultural autonomy.

### **Recent Polity and Economy**

The agitation came to a head under 'perestroika' era of Gorbachev when a repressive Russian apparachik was appointed as party head in Kazakhstan. Subsequent riots and their putting down led to the appointment of a Kazakh national Nazabayev as party leader, who was to push for the formation of the Commonwealth of Independent States to replace the Soviet Union [7]. Despite claiming to advocate democratic reforms, Nazabayev was to extend his tenure, first via a referendum in 1995, then legislative amendments to the constitution and finally through an election in 1999. In that election the key opposition candidate was banned and, upon his self-imposed exile, sentenced to 10 years imprisonment. Subsequent attempts to mount serious political opposition have also been subject to similar harassment. Still, supporters of Nazabayev claim that he has been instrumental in preserving inter-ethnic peace and political stability through the difficult years of economic reform [8].

Economically, the country continues to cope with declining high unemployment, poverty, inflation, prostitution, drug addiction and aids. Infrastructure is declining while pollution remains a tragic consequence of the Soviet Union's nuclear testing, space exploration, draining of the Aral Sea for irrigation and toxic dumping on its soil. Nonetheless the country is rich in mineral resources, particularly oil in its west bordering the inland Caspian Sea, though until recent years the lack of export pipelines from this largely land-locked country have been an

impediment to its export. Culturally, the country comprises largely Kazakhs who make up 53 percent of the population, and Russians totalling about 30 percent and declining through migration due to discrimination since the collapse of the Soviet Union. Independence has seen the renaissance of Kazakh language and culture through government policy, although Islamisation has been resisted in favour of secularism and freedom of religion. The Kazakhstan government has in recent years had a successful track record at negotiating long-standing disputed borders with neighbouring Russia, China, Uzbekistan and Kyrgyzstan [9].

## Post-Soviet Media Development

### Short-lived Freedoms

In the immediate post-independence period, the many new commercial television stations and newspapers competing with state-owned media gave their journalists and opposition politicians freedom of expression. Given the ideological vacuum prevalent then, these media were critical to the formation of public opinion but this was threatening to government officials unaccustomed to criticism and dissent. The government responded by forming a new television station called Khabar (meaning 'News') in addition to two existing state channels. It then compelled the cessation of free-to-air broadcasting by Russia's public broadcaster ORT and a Russian commercial broadcaster RTR, which had reported on cases of state corruption [10]. By 1997, all Russian channels were available solely via cable subscription, and by 1998 major domestic channels were being drawn into a network of corporations associated with the political elite in Kazakhstan.

A decree in 1996 required that the private channels that had been started since independence tender for a license but the high prices charged compelled about 20 of those channels to shut down, among them a number that had been critical of the government. By 1999, the government had ceased to conduct tenders, despite promises to the contrary [11]. When the state media were converted by government decree into a joint-stock company in 1996, the president's daughter, Dariga Nazabaeva, purchased its shares. Thus she came to control the state news agency Khabar as well as three television and two radio stations. Meanwhile her husband Rhakhat Aliev has gained control of the Karavan media group which owns the largest private newspaper of the same name, KTK television station, radio stations and a major publishing house [12]. However according to law enacted, criticism of the president and his family were deemed seditious and forbidden.

The 1999 Media Law required that by 1 January 2002 the broadcast of foreign mass media was not to exceed 50 percent of the total volume on television and radio, and by 1 January 2003 the limit would be 20 percent [13]. While this stipulation was justified as part of the promotion of Kazakh language and culture, it was allegedly arbitrarily applied to harass stations into complying with censorship guidelines or face closure [14]. In 2001 the Kazakhstan government enacted new laws that treated Internet sites as mass media. The rationale given in parliament was the development of the quality of local journalism and the reduction of dependence on foreign sources. But it was believed to be really in response to local journalists the reprinting of articles found on-line published by Western press, alleging corruption in government [15].

## Industry Structure

### National Television Networks

A number of stations, both public and commercial, enjoyed near nationwide penetration (Table 1) while others were centred on the commercial capital Almaty or other provincial capitals. Most channels were of domestic origin while a few were of Russian pedigree but adapted for Kazakhstan:

*KhabarTV:* The leading television broadcaster, commercial or otherwise, in Kazakhstan is Khabar TV which sold the programming it produced to other stations [16]. It was part state-owned and run by the daughter of the president of Kazakhstan, Nazabyeva. The president's daughter had inaugurated Khabar as something novel but government control was extended over it, though not formally but indirectly. For instance, it taught Kazakh and English languages in support of the government policy, and included programmes about museums and theatre in addition to light entertainment (Interview Kaz09). Khabar TV was classified as 'social television' by one respondent

who believed it was wholly government-owned, just as Kazakhstan-1 was [17]. In fact it was reported to be a closed joint-stock company but that its stocks belonged to the committee for state property [18].

*Kazakhstan One:* Of the terrestrial national broadcasters, Kaz One had a 98 percent audience reach in Kazakhstan, ORT 89 percent and Khabar TV 85 percent in 2002 according to the social research firm of Concom Eurasia. This figure differed somewhat from that reported by the media research firm Gallup [19]. Kaz One, the public broadcaster had technically the highest penetration in the country but in reality had low viewership because most of its programming was considered dull.

*ORT Kaz:* ORT-1 was the leading Russian-language channel in Kazakhstan by ratings and was also believed to be controlled by Khabar Agency. Many of its talk-shows, game-shows and interview programmes are cloned from western formats. While copyright laws existed in Kazakhstan, they were deemed ineffective [20]. ORT Kaz was produced in Russia but was not broadcast 'live'. Instead it was re-broadcast after a two-hour delay which allowed for the insertion of Kazakhstan advertising, news, weather and so on. Though ORT was not state-owned, it came under strong political influence in both Russia and Kazakhstan [21]. Since ORT was careful with its programming and news, it was granted a license to broadcast free-to-air in Kazakhstan unlike its rival channel, the private commercial RTR [22].

*Other channels:* Arna television station, formerly Khabar's second channel, broadcast only in Kazak although less than half of ethnic Kazaks (or 16 percent of the total national population) speak the language. Another television broadcaster dominating the Kazakhstan market was KTK or Kazakhstan Commercial Television. Together, all the national channels in Kazakhstan raised US\$25-30 million from advertising annually, which was considered sufficient to survive financially but to not be very profitable. Strictly speaking, these channels were not competitors as they had overlapping ownerships. Besides their advertising rate rises were done in quick succession raising questions of price-fixing [23].

TABLE 1: TERRESTRIAL TELEVISION STATIONS IN KAZAKHSTAN

<i>Channel</i>	<i>Broadcast language</i>	<i>Ownership</i>
Kazakhstan 1	Kazak and Russian	Government
Khabar TV	Kazak and Russian	Government/ Private
KTK	Kazak and Russian	Private
EurasiaTV	Russian	Government
Channel 31	Russian	Private

Source: BBC (2004), Internews (2004)

### Satellite & Cable Television

Less than 2 percent of households in Kazakhstan have access to satellite television and only 16 percent of the 345,000 television households in Almaty have cable access [24]. Private dishes were permitted officially but could be afforded only the wealthy and so were not considered a threat to the political elite. A number of foreign and local channels (Table 2) are provided via two major service providers in the capital city.

*Katelco:* This service was linked to the Russian broadcaster NTV Plus owned by Media Most and charged \$10 for 20 satellite channels. Katelco was part of Kaz Telecom and so government-owned which probably supplied channels to Alma TV [25]. Katelco was relatively newer and smaller than AlmaTV, broadcasting only 32-36 channels, though it was digital

*Alma TV:* This station was started in 1994 by a US company Metro Media Group in Almaty and then 3 other cities: Oskemen, Karaganda and Aktau. It reached half a million households in the whole country, about 240,000 of them in Almaty and about 70,000 each in the regional centres. Only 3 other cities in Kazakhstan had local cable networks [26]. It relayed 56 channels primarily from StarTV, ESPN, National Geographic and others using the AsiaSat3 platform, usually analogue arguing that Kazakhstan homes were not ready for digital transmission. A senior executive in Alma TV stated that Metro Media was no longer a shareholder in it, nor was it owned by any local conglomerate, though he conceded that some of its owners might 'overlap' [27]. But another respondent believed that the cable channel had been independent till 2001 and was then brought into the Kazakhstan media oligopoly [28].

TABLE 2: TELEVISION CHANNELS AVAILABLE VIA CABLE IN KAZAKHSTAN

Channel	Origin	Programming observations
K	Russia	Childrens programming, including Italian cartoons
1	Russia	Childrens programming, music programmes
ACT	Russia	Comedies and documentaries in Russian
THT	Russia	US movies in Russian
'dd'	Kazak?	Music programming in Russian
'**'	Kazak?	US movies dubbed into Kazak
'O'	Kazak?	Old movies from around the world
Ajara TV	Usbekistan	Programming in Uzbek language

## Commentary

Unlike Eastern Europe, most Central Asian nations retained the leadership of former regimes despite democratic elections triggered by ardent nationalism following the dismantling of the Soviet Union. Many of these enduring leaders converted rapidly from totalitarian communism to authoritarian capitalism, thereby benefiting themselves, family and friends from the privatisation of state-owned corporations and monopolies. Often, as in Kazakhstan, media establishments were owned by these nouveau-riche oligarchs and/or their not-so-transparent conglomerates which have thus influenced public opinion and political policy in favour of their business enterprises. There has been little evident development of and support for civil society officially, and hence no related access by such groups and the wider community to autonomous media and communications. Given the fact that all media is now dependent on advertising revenue, they are constrained to uphold the ascendant free-market ideology and its politically powerful proponents. Where occasionally some new commercial media have attempted to play their role as the fourth estate, as highly publicised in Russia, governments have sought to rein them in.

As the most westernised, Kazakhstan may be an exemplar for media industry development for the other Central Asian nations. In turn it could learn from the experience of other post-Soviet states and satellite countries such as in the Baltic and Central Europe, which have progressed considerably further in the commercialisation of their media and adoption of 'Western' quasi-liberal norms concerning the media freedoms. The transitional economies in Asia such as China and Vietnam where the ruling communist parties have retained stringent political control over their media despite marketisation might provide alternative models. Yet another model for Kazakhstan might be culturally-closer Turkish television operating within a secular state with moderate Islamic values, though other Central Asia states might find cultural if not political affinities with Iran, even if the role of Islam in society diverges.

*Northeastern Illinois University, USA*

## **Abstract**

**In this study we examine the economies of scale and scope of the three ownership groups of banks; privately-Owned Domestic banks (PROBs), Publicly-Owned Domestic banks (PUODs), and foreign-Owned banks (FOBs) operating in India using the most recent available data, 1998-2003. Using the translog cost function specification, we found that there exist economies of scale and scope for the three ownership categories. We conclude that banks operating in India have opportunity to save costs by increasing their scale of operation and by diversifying their outputs.**

## **Introduction**

Since the 1980s, there has been an increasing trend towards global economic integration. The reduction in trade barriers and the significant advances in computer and communication technology are two main factors responsible for this trend. This has resulted in an upsurge in the demand for international financial services. In fact, the move towards the “supermarket” concept in the banking industry in many developed countries can be attributed to this trend. These countries have passed laws deregulating their banking industry as these laws were seen as being crucial to improve the effectiveness of their domestic banking industry in coping with the increasingly competitive landscape in this era of globalization. The same trend can be observed in developing countries starting in the middle 1980s or early 1990s. During this period, a large number of developing economies implemented a massive liberalization policy on their banking system to make them more productive and competitive like their foreign counterparts.

From the time of independence in 1947 until 1991, India followed an economic policy known as “the middle path.” This combined some features of socialism and capitalism. However, the banking sector was mired in excessive regulation and was subject to pervasive bureaucratic interference. The decades of socialism did incalculable harm to the Indian economy. In 1991, a new government took office. Led by a visionary prime minister, it decided to liberalize the economy and embrace a market-driven economy. This liberalization process has been continued by subsequent governments too regardless of political affiliation. Due to these measures, India has now joined China as the two fastest growing economies in the world. Although public sector banks still dominate the Indian banking environment, there has been a sharp increase in the number of private sector and foreign banks.

The issue of public versus private ownership of banks Hawtrey [23], Gerschenkron [22], Myrdal [40], Caprio and Martinez-Peria [10], Barth [3], La Porta [30], whether foreign banks should be allowed to expand freely in the domestic market DeYoung and Nolle [14], Chang [13], and production economies of foreign versus domestic banks Elyasiani and Rezvanian [17] and Rezvanian, Rasheed and Mehdian [53] has received a lot of attention in the banking literature. However, despite the empirical studies that have been done in this area, these issues remain controversial. Examining the production economies of banks will provide greater insight into this area. Therefore, in this paper, we examine the production economies of the three ownership groups of banks operating in India using the most recent available data, 1998 - 2003. We categorize banks based on their ownership structure as; Privately-Owned Domestic banks (PROBs), Publicly-Owned Domestic banks (PUOBs), and Foreign-Owned banks (FOBs).

This study contributes to the two following related questions. First, what are the scale economies of the three different ownership groups of banks operating in India? Second, which type of banking ownership has larger

scope economies? Understanding the degree of scale and scope economies of the three types of banking ownership will allow us to refer to possible cost saving opportunities through expansion of scale of production and diversification of outputs. The rest of this paper is organized as follows: In section 2, we describe the banking environment in India. Section 3 provides a brief review of the recent relevant literature in banking industry. Section 4 explains methodology, data and definition of inputs and outputs used in the paper. Section 5 discusses the empirical results and finally Section 6 concludes the paper.

## **Bank Environment in India**

### **The 1947-1991 Period**

In the early years after independence from Britain in 1947, there were a large number of private sector banks in India. In 1955, the Imperial Bank of India and its seven associate banks were nationalized. This was followed by the nationalization acts of 1969 and 1980 which brought the largest private sector banks were brought under government control. According to a 1992 report by the Indian credit rating agency ICRA, as a result of the nationalization acts of 1969 and 1980, the government's share of bank assets increased from 31% to 92 %. The Indian Government viewed banks primarily as instruments for bringing about social change and decided how the banks raised money, to whom they loaned money, and how much they loaned. Other policies included administered interest rates, pre-emption of resources by the government and extensive micro-regulations directing the major portion of the flow of funds to and from financial intermediaries. The stifling government control over the banking sector resulted in a decline in the productivity and efficiency of banks as well as an increase in their non-performing assets. These factors, combined with a sharp increase in personnel costs, negatively impacted the profitability of the banks. The public sector banks were viewed as vehicles for providing employment and advancing the government's social goals, regardless of the detrimental impact on their profitability. The primacy of the social goals resulted in the Government not being too concerned with the low levels of competition, efficiency, productivity, and profitability in the banking sector. Thus, during the socialism era from 1947-1991, the banking sector was characterized by inefficiency, poor customer service, very low usage of technology and inadequate transparency of accounting information. The market was not allowed by the government to exert a disciplining influence on the banks and other market participants.

Paradoxically, this policy of the Government towards the banking sector resulted in a significant increase in the number of branches in the rural sector and thereby brought banking services to the millions of people living in that sector. These people were earlier at the mercy of money lenders. The net result of the spread of banking in the rural areas was acceleration in the pace of economic development in those areas. It also gave an impetus to agriculture and small-scale industries.

### **Economic Liberalization and Deregulation of the Banking Sector**

In 1991, the Government of India decided to liberalize the economy and remove the impediments to growth. Among the sectors whose liberalization was seen as the key to India's economic revival was the banking sector. There was a realization among the reform-minded policy makers that the market's disciplining mechanism and greater transparency in accounting disclosure would actually strengthen the process of supervising the banks. It was felt that greater market discipline in bank management and greater transparency through improved disclosure norms would help in the early identification of problems and avoid erosion of the public's faith in the banking system. Unlike the policy adopted by many developing countries around the world, India decided not to adopt a policy of large-scale privatization of government-owned banks. Instead, the Government of India decided to increase the capitalization of banks through diversification of ownership to private investors up to a limit of 49 percent. This also ensured that majority ownership and control remained with the government. The eventual goal was to help them attain standards of international best practices. Consistent with this objective, the Government of India constituted a Standing Committee on International Financial Standards and Codes in December 1999. The objectives of the first generation of financial sector reforms were to create an efficient, productive and profitable financial service industry operating within the environment of operating flexibility and functional autonomy Mohan [38]. The Government of India established two important committees (Committee on the Financial System (CFS) in

1991 and Committee on Banking Sector Reforms (CBSR) in 1998) and charged them with coming up with specific recommendations for reforming the banking sector. The CFS advocated a more market-oriented banking system that operated in an environment of prudent regulation and transparency of accounting information. The market was viewed as the main mechanism for bringing about discipline in the banking sector, while the role of the Reserve Bank of India (RBI), the nation's central bank, was to provide an environment that would foster a level-playing field and facilitate the operation of the market forces. The RBI was viewed as a market-friendly supervisor of the banking sector and not as a heavy-handed regulator. The CBSR recommended the dilution of government equity in nationalized banks to 33 percent. It also suggested that the RBI nominees on bank boards step down in order to give the banks real autonomy. The CBSR recommended the creation of an Asset Reconstruction Fund (ARF) which would take over the bad debts of banks from their balance sheet to enable them to restart on a clean slate. It also recommended increasing capital adequacy and tightening provisioning norms. It suggested that foreign banks seeking to set up business in India should have a minimum start-up capital of \$ 25 million and that they should be allowed to set up subsidiaries and joint ventures that should be treated on par with private banks. The recommendations of the CFS and the CBSR formed the basis of the reforms initiated in the 1990s and early 2000s.

#### **Banking Sector Reforms**

The deregulation of the Indian banking sector has been multi-faceted. There has been a relaxation of the requirement to lend to government-designated "priority sectors". There has also been a move towards international standards of capital adequacy, asset quality ranking, liquidity, and reserve requirements. Other reforms have included a liberalization of most deposit and lending rates by commercial banks. However, the interest rate on savings deposits continues to be dictated by the Reserve Bank of India and demand deposits continue to offer no interest. The Reserve Bank of India has also gradually lowered the reserve requirement for commercial banks. The average cash reserve requirement (CRR) has fallen from 15 percent before the onset of reforms to 4.5 percent currently. The statutory liquidity requirement (SLR) has dropped from 38.5 percent for domestic liabilities and 30 percent for non-resident liabilities to 25 percent currently, which is the minimum ratio of liquid assets to demand and time liabilities allowed under the existing law. Foreign banks have been allowed to expand operations. Banks have been allowed to set up Offshore Banking Units in Special Economic Zones. The limit on foreign direct investment in private banks has been increased from 49% to 74% and the 10% cap on voting rights has been removed. In addition, the limit on foreign institutional investment in private banks is currently 49%.

The Government has allowed the strong banks to raise funds in the capital markets and has reduced its equity in banks. It has also given banks greater freedom in choosing the location of branches as well in recruitment. Banks have been allowed to enter into new business areas such as infrastructure financing, leasing, insurance, investment banking, asset management, etc. Limits on overseas investments by banks have also been relaxed. New instruments such as interest rate swaps, forward rate agreements, cross currency forward contracts, forward cover to hedge inflows under foreign direct investment, liquidity adjustment facility for meeting day-to-day liquidity mismatch have been permitted. The Government is also encouraging the growth of universal banking.

The Reserve Bank of India has introduced Risk-Based Supervision of banks and taking measures to ensure that the best international practices in accounting systems, corporate governance, payment and settlement systems are being adopted by the banks in India. Consequently, Indian norms for capital adequacy, asset classification, income recognition, prudential, and supervision that are applied equally to all banks, irrespective of ownership, are now close to global standards. The Reserve Bank of India has issued guidelines for putting risk management systems in banks to address credit risk, market risk, and operational risk. Most banks in India now have specialized committees to measure and monitor various risks and have been upgrading their risk management skills.

As a result of these reforms, there has been increasing competition in the banking sector. The prudent measures put in place by the RBI have resulted in a significant decline in Non-performing Assets (NPAs). The enactment of the Securitization and Reconstruction of Financial Assets and Enforcement of Security Interest Act (SARFAESI) in 2002 has also helped banks to manage their NPAs better. Debt Recovery Tribunals have also been set up to assist banks in the recovery of loans.

Although the liberalization of the banking sector has resulted in the rapid growth of private banks and foreign banks, the public sector banks still account for nearly 90% of the branches and 73% of the credit in the Indian banking system. These private sector banks have become strong players and are challenging the dominance

of the public sector banks. The share of the private sector banks in the overall income of the banking sector has risen from 8.2 % in 1995-1996 to 18.5% in 2002-2003, while the share of the public sector banks has fallen from 82.5% to 74.5% during the same period. The private banks and foreign banks have been able to focus on improving their efficiency and profitability as they are not constrained by government mandates to lend money to certain “priority sectors.” . They have also invested in the latest banking technology. The public banks, however, have been slow in adopting modern banking technology. Consequently, the overall efficiency and profitability of public sector banks are believed to lag behind the efficiency and profitability of the private banks and the foreign banks.

## Literature Review

There has been an extensive study of economies of scale and scope of depository financial institution in recent years. However, these studies mostly have focused on the US banking industry. The most recent studies using the US banking data include Humphrey [25]; Noulas, Ray and Miller [42]., Noulas, Miller and Ray [41]; Hunter, Timme and Yang [26], Hunter and Hunter and Timme [27]; Shaffer [60]; Berger and Humphrey [7]; Mester [36]; McAllister and McManus [34]; Evanoff and Israilevich [20]; Rezvanian, Mehdian and Elyasiani [53]; Mahajan, Rangan and Zardkoohi [32]; Mitchell and Onvural [37]; Mehdian and Rezvanian, [35].

The scale and scope economies of banks operating outside the US also have been studied extensively. The recent studies include Zardkoohi and Kolari [62,63] for Finland; Dietsch [15], Martin and Sassenou [33] for France; Lang and Welzel [31] for Germany; Rodriguez, Alveraz and Gomez [59] for Spain; Drake and Weyman-Jones [16] for UK; Karafolas and Mantaka [28] for Greece; Fields, Murohy and Tirtiroglu [21] for Turkey; Simper [61] for Italy; Cavallo and Rossi [11] and Altunbas and Molyneux [2] for Europe; Rezvanian and Mehdian [54] for Singapore; Rezvanian, Rasheed and Mehdian [55] for Hong Kong; Allen and Liu [1] for Canada.

The results of these studies, although conflicting, mostly indicate presence of scale and scope economies for only smaller and medium size banks and not so for largest banks. Additionally, the result of these studies may not be applicable to the Indian banking system, given the differences in the regulatory and competitive environment as well as input prices. We noted that there has been only a few studies done on the economies of scale and scope of commercial banks in India, though few studies have studied the cost efficiency of the India’s banking system<sup>1</sup> This provides an impetus for our study into the India banking system, in particular the scale and scope economies. Three recent studies have analyzed scale economies of banks in India and found results similar to those for the US data. Ray and Sanyal [46] reported larger scale economies for small banks and smaller scale economies for larger banks. Chatterjee [12] found increasing return to scale for smaller banks and constant return to scale for larger bank. Pradeep [45], using 1995-1996 data reports that all banks in India are operating below their optimal size, and that unexploited economies are stronger for the largest banks in India

The information on the production economies of banks operating in India has an important public policy implication to Indian regulatory authorities who are responsible for a safe and efficient production of banking industry. The issue of productivity and efficiency of banking system is important to the policy makers, especially in the developing countries since banking sector is considered as the major vehicle for private capital formation as well as the major source of providing funds to the economy. In this study, we examine the production economies of three groups of banks in India, namely, domestic private banks, public banks as well as foreign banks. Specifically, we try to answer the following questions: What is the cost structure of the banking system in India? Are domestic banks operating with a different degree of economies of scale and scope as compared with their foreign banks counterparts? What about scale and scope economies of private versus public banks?

## Methodology and Model

In this study, we use translogarithmic cost function to study economies of scale and scope of banks operating in India<sup>2</sup>. For a cost minimizing multi-input and multi-output bank, the translog cost function is presented by the following equation<sup>3</sup>.

$$\ln C = \alpha_0 + \sum_{k=1} \alpha_k \ln Y_k + \sum_{l=1} \beta_l \ln P_l + \frac{1}{2} \left[ \sum_k \sum_z \delta_{kz} \ln Y_k \ln Y_z + \sum_l \sum_g \gamma_{lg} \ln P_l \ln P_g \right] + \sum_l \sum_k \rho_{lk} \ln P_l \ln Y_k. \quad (1)$$

Where  $C$  is total operating cost,  $Y_k$  denotes output quantities, the  $P_l$  are input prices,  $\alpha_0$ ,  $\alpha_k$ ,  $\beta_l$ ,  $\delta_{kz}$ ,  $\gamma_{lg}$ ,  $\rho_{lk}$  are parameters to be estimated. The derived demand for the three input factors can be obtained by partially differentiating the cost function with respect to the factor prices as:

$$\partial \ln C / \partial \ln P = S_l = \beta_l + \sum_l \gamma_{lg} \ln P_l + \sum_l \rho_{lk} \ln Y_k. \quad (2)$$

The translog cost function (1) and the two of the three share equations (2) are estimated using Zellner's [64] Seemingly Unrelated regression (SUR) after imposing the following linear homogeneity and symmetry condition defines in equations (3) and (4) respectively.

$$\sum_l \beta_l = 1; \quad \sum_l \gamma_{lg} = 0; \quad \sum_l \rho_{lk} = 0 \quad (3)$$

$$\gamma_{lg} = \gamma_{gl} \quad \text{and} \quad \delta_{kz} = \delta_{zk} \quad (4)$$

The estimated coefficients are used in calculation of the scale and scope economies.

A bank is considered as operating at increasing return to scale if a one percentage increase in all outputs lead to a less than one percentage increase in total costs, meaning that the banks has opportunity of reducing average cost if the bank increase its scale of operation. According to Hanoch [24] and Panzar and Willig [43], the degree of scale economies can be measured as the inverse of the sum of the cost elasticities of outputs as:

$$SE = 1 / \sum_k E_{Y_k} \quad (5)$$

Where,  $E_{Y_k} = \partial \ln C / \partial \ln Y_k$  is the cost elasticity of output  $k$ . If  $SE > 1$ ,  $SE < 1$ , or  $SE = 1$ , then the production technology exhibits increasing, decreasing, or constant return to scale.

Scope economies are said to exist if a joint production is less costly than producing the same outputs separately. Panzar and Willig [44] propose the following method to measure overall economies of scope for the case of two outputs:

$$SC = [C(y_1, 0) + C(0, y_2) - C(y_1, y_2)] / C(y_1, y_2).$$

If  $SC > 0$  ( $SC < 0$ ), then there is overall economies (diseconomies) of scope<sup>4</sup>.

#### Data

The data used in the estimation of the translog cost function and the measures of scale and scope economies are gathered from the Reserve Bank of India (RBI) website and from the Indian Banking Association for the years 1998-2003. We categorized banks based on their ownership structure as Privately-Owned domestic banks (PROBs), Publicly-Owned domestic Banks (PUOBs) and Foreign-Owned Banks (FOBs). We selected 20 largest banks from each group and those with complete data were retained. The retained banks consisted of 19 PROBs, 20 PUOBs and 16 FOBs for each of the years 1998-2003. Thus, our sample consisted of 114 PROBs, 120 PUOBs, and 96 FOBs.

In defining our input and outputs of banks, we used intermediation approach<sup>5</sup>. Based on this approach, we assume that banks are using three inputs, namely, deposits labor and fix assets to produce three outputs, namely, loans, securities and other earning assets<sup>6</sup>. Total cost is sum of interest and expenses on the three inputs. Three outputs are defined as: loans ( $Y_1$ ), securities ( $Y_2$ ), and other earning assets ( $Y_3$ ). Three inputs are defined as: borrowed funds ( $X_1$ ), labor ( $X_2$ ), and fixed assets ( $X_3$ ). The price of borrowed funds ( $P_1$ ) is obtained by dividing the annual interest expense on deposits and other borrowed funds by ( $X_1$ ), the unit price of labor ( $P_2$ ) is calculated by dividing the total salaries and benefits of employees by ( $X_2$ ), the price of capital is the ratio of total expense of premises and fixed assets to ( $X_3$ ). Table 1 presents the descriptive statistics of cost function variables for the three ownership categories for the sample period 1998-2003.

## Empirical Results

Each of the three samples representing each ownership group was fitted into the system of equation (1) and (2) separately. Table 2 reports the estimated coefficients, the  $R^2$  values, and the significance level. The results are obtained by using Zellner's [62] Seemingly Unrelated Regression (SUR) technique. For the three estimated set of coefficients the goodness of fit is good with high  $R^2$  ranging from 0.956 to 0.986. Most of coefficients carry proper sign and are statistically significant.

The estimated coefficients of translog system of equations along with equation (5) were used to estimate the economies of scale for each observation in each group. The mean of scale economies is presented in table (3). According to this table, the mean of scale economies of the three samples are greater than one and statistically significant, indicating that there is cost saving opportunities for all the three sample. However, this cost saving opportunity is more prevailing to the FOBs and PROBs that to the PUOBs. Table 4 provides information on the number of banks from each sample falling in each category of scale and scope economies. The figures show that over the sample period 84.8% (280) of the banks operated below their optimal size, 11.8% (39) operated at their optimal scale and 3.3% (11) operated above their optimal scale. This data confirms the statistics provided in table 3, indicating that majority of banks in India during 1998-2003 operated at smaller scale than the optimal size and they could increase their cost saving by increasing their size.

TABLE 2: PARAMETER ESTIMATES FOR THE FOBs PROBs AND PUOBs.

Variable	Coefficient	FOBs	PROBs	PUOBs
Intercept	$\alpha_0$	1.672*	2.283*	1.976*

Ln P <sub>3</sub> Ln Y <sub>3</sub>	$\rho_{33}$	0.007***	0.017**	0.107**
Number of Observation		96	114	120
Adj R-square		0.956	0.986	0.975

Significant at the 1% level, \*\* Significant at the 5% level, \*\*\* Significant at the 10% level.

TABLE 3: ESTIMATES OF SCALE AND SCOPE ECONOMIES FOR FOBs, PROBs, and PUOBs

	FOBs	PROBs	PUOBs	Overall**
Scale Economies	1.0893*	1.1029*	1.0022*	1.062
Scope Economies	0.8276*	1.2193*	0.6752*	1.026

\* Economies of scale (scope) different than unity (zero) at 1% level of significance.

\*\* Overall scale and scope economies are calculated as the weighted average SE and SC for each of the three groups estimated separately, rather than using the pooled sample.

TABLE 4: NUMBER OF BANKS IN DIFFERENT CATEGORIES OF SCALE ECONOMIES

	FOBs	PROBs	PUOBs	Total
Scale economies:				
Increasing returns to scale	83	95	102	280
Constant returns to scale	11	14	14	39
Decreasing returns to scale	2	5	4	11
Total	96	114	120	330

The estimated coefficients of translog system of equations along with equation (6) are used to estimate the economies of scope. Table 3 also provides the results of scope economies. According to the figures in this table, the mean score of scope economies are greater than zero and statistically significant. This indicates that there is cost saving opportunity for all three groups of banks through product diversification. The magnitude of scope economies for is greater for PROBs than PUOBs and FOBs.
