<sup>2</sup> The use of translog cost function in banking industry production economies has become more common after the two major study by Benston et al. (1982) and Hunter and Timme (1986).

<sup>3</sup> McAllister and McManus (1993), correctly caution the use of translog cost function when the banking sample consists of very small or very large banks. To remedy this problem, Mitchell and Onvural 1996 suggest using the Fourier functional form. This is not an issue in this study since our sample consists of 20 largest banks from each ownership categories.)

<sup>4</sup> The problem with this approach is that the translog cost function does not allow for the calculation of costs when output is zero. To remedy this problem, we follow Kolari and Zardkoohi (1986) suggestion by substituting the minimum quantity of output in the sample for the zero output.)

<sup>5</sup> There is disagreement in defining inputs and outputs of banks. There are three approaches used in the literature in defining outputs and inputs; intermediation, user cost and value added. See Berger and Humphrey (1992) for further detail.

<sup>6</sup> Other earning assets is defined any asset except loans and securities on which bank earn return.

# Purchasing Pirated Software: An Initial Examination of Chinese Consumers

## Abstract

China is one of the countries with the highest software piracy rates in the world. However, little research has been conducted to understand Chinese consumers of pirated software. This research extends a previously tested model by Ang et al. (2001), and redesigns measures based on an analysis on the Chinese market, to identify factors influencing attitude and purchasing intention of Chinese consumers toward pirated software. A survey study was carried out to empirically test the model. Four out of the seven tested social and personality factors were found to be influential in determining consumer attitude toward software piracy. These factors were normative susceptibility, value consciousness, collectivism, and novelty seeking. Attitudinal measures representing buyers' and non-buyers' difference and their influencing purchase intentions are identified. This research established three attributes of consumer attitude toward software piracy: attitude toward social consequences, attitude toward pirated software, and attitude toward piracy behavior, which can be used in future research. This research is one of the first to examine the Chinese market, which is a focus of piracy problems for the software industries.

## Introduction

Software piracy is a prevalent and serious problem in Mainland China (hereafter China). China is one of the countries with the highest software piracy rates in the world at 98% (Traphagan & Griffith, 1998). Estimates reveal that software piracy in China alone cost United States' businesses \$1.85 billion in 2002 (Joshphberg et al., 2003). From a national level, China has a low per capita GNP and a low individualistic/high collectivistic culture, to which software piracy correlates significantly (Husted, 2000; Marron & Steel, 2000). The weaknesses in Chinese law legislation and enforcement for copyright protection also leads to the high piracy rate (Yeh, 1999). With a continuous double-digit annual economic development ratio, China is embracing a fast-growing software market, indicating an even more severe software piracy problem in China for the future.

While software piracy in China is an increasingly serious problem, and the "Chinese" (or eastern/Asian) culture is blamed as one of the major causes for the high piracy rates in Asian countries (Husted, 2000; Marron & Steel, 2000; Swinyard, Rinne, & Kau, 1990), surprisingly, insufficient research has been dedicated to understanding the software piracy problem in China, especially from the consumers perspective. To the best of our knowledge, no research has been conducted to understand Chinese consumer attitudes and behavior toward software piracy.

Some research has been conducted in countries/areas with a Chinese cultural influence, such as Singapore and Hong Kong. Moores and Dhillon (2000) conducted research in Hong Kong, studying shoppers' intentions towards purchasing pirated software in various scenarios, and found that lowering the cost of legitimate software may effectively reduce purchases of pirated software. Thong and Yap (1998) tested an ethical decision-making theory through a study on entry-level IS (information systems) professionals in Singapore, and found that moral intentions to pursue "softlifting" (illegal copying of software for personal use) behavior is determined primarily by ethical judgments. Swinyard et al. (1990) conducted research to compare the software piracy morality of students in Singapore and the US, and discovered differences in moral values between the two groups, as the US group was more influenced by legality of the copying and the Singaporeans focused more on the impact of outcomes. They suggested that the cultural difference between the west and the east is a major reason.

While the results from this research may help to understand Chinese consumers' software piracy behavior, they cannot substitute for research on Chinese consumers. First, Singapore and Hong Kong are more developed countries/areas, while Mainland China is much less developed in economy and has a much lower per capita income. The impact of high software costs may be more significant in Mainland China. Second, the software protection laws are better established and enforced in Hong Kong and Singapore than in mainland China. Meanwhile, consumers in Hong Kong and Singapore were educated about copyright laws much earlier than in Mainland China. Furthermore, western culture has been popular longer and more deeply in Hong Kong and Singapore societies than in China. While Hong Kong and Singapore may represent a mix of western and eastern cultures, China is characterized more by a collectivist culture, which is a main cause for software piracy. Meanwhile, China has a much higher piracy rate (about 98%) compared to Singapore (averagely 57%) and Hong Kong (64%) (Marron & Steel, 2000), and a much larger market. Thus, conducting standalone research on Chinese consumers in software piracy is valuable.

To design software protection strategies, analyzing software piracy from the demand side is important (Bloch, Bush, & Campbell, 1993; McDonald & Roberts, 1994). Actually, the magnitude of the pirated software market provides the strong motivation for illegal suppliers (McDonald & Roberts, 1994). Anti-piracy institutions need to understand the rationale behind the demand to design software protection strategies. Previous studies identified that financial value is one of the most important reasons for software piracy (Cheng et al., 1997; Moores & Dhillon, 2000; Traphagan & Griffith, 1998; Wee et al., 1995). However, other factors, such as demographic factors, benefit-cost evaluation other than financial factors, situational factors, professionalism, and other gains for consumers, are identified also (Cheng et al., 1997; Logsdon et al., 1994; Moores & Dhillon, 2000).

Software piracy may include a number of related practices such as illegal copying of programs, selling/purchasing pirated software, and renting unauthorized software. This research focuses on consumer attitude and behavior in purchasing pirated software. Since selling pirated software is an institutional market behavior, it presents a serious threat to the legal distribution of software by competing with and blocking consumer access to legal marketers. Usually, consumers are aware during the shopping process that the product is pirated (McDonald & Roberts, 1994). Still, they purchase the pirated software for various reasons. Understanding the influencing factors, especially non-financial factors, in consumers' purchase decision-making process is an important factor in the design of anti-piracy education and strategies.

The study by Ang, Cheng, Lim and Tambyah (hereafter ACLT), entitled "Spot the Difference: Consumer Responses Towards Counterfeits", and published in *The Journal of Consumer Marketing* in 2001, contributed important research in the examination of non-financial factors in consumer purchase decisions on pirated products. ACLT constructed a model examining social and personality effects on consumer responses toward pirated products. As shown in Figure 1, social and personality factors include informative susceptibility, normative susceptibility, value consciousness, integrity, and personal gratification. Attitude toward piracy is the moderator construct, and purchase intention is the destination construct. The model was tested on Singaporeans through a survey on pirated music CDs. ACLT found that among five social and personality factors, normative susceptibility, value consciousness, and integrity influenced the attitude of Singaporeans toward pirated music CDs, and informative susceptibility and personal gratification did not. Singaporeans who previously had bought pirated CDs had more favorable views about pirated CDs than those who had not bought such products; attitudes toward pirated music CDs was a significant predictor of purchase intention of Singaporeans, accounting for 44% of the variance.

This study, therefore, has three purposes. First, the ACLT model is submitted to a test in a different market context to understand consumer purchasing pirated software in Mainland China. While Chinese consumers are different from Singaporeans, purchasing pirated CDs may also differ from purchasing pirated software. Music CDs are for entertainment purposes, and a major portion of software is for business and study use. Music CDs are usually much cheaper than software. In fact, software has a higher piracy rate than music CDs (98% vs. 88% in Mainland China (Traphagan & Griffith, 1998)). Understanding consumers' social and personality factors, their attitudes, and purchase intentions in purchasing pirated software is important in designing an effective prevention strategy in Mainland China. Second, the ACLT model and study will be extended and refined by adding two more constructs: re-structuring and re-designing attitude measures, and using stepwise regression to analyze the data. Third, we intend to establish multi-attributes for the construct of consumer attitudes toward software piracy in this research, which can help build a foundation for future in-depth studies on Chinese consumer attitudes concerning software

piracy.

This paper is organized as follows: Section II discusses the extended model and hypotheses; Section III describes the research method; Section IV analyzes survey results; And Section V concludes the paper.

## **A Model and Hypotheses**

The model, shown in Figure 1, is adapted and extended from ACLT. The ACLT model examined five social and personality factors by, including informative susceptibility, normative susceptibility, value consciousness, integrity, and personal gratification. Informative susceptibility and normative susceptibility are two forms of consumer susceptibility to social influence (Bearden et al., 1989). Informative susceptibility concerns purchase decisions, which are based on the expert opinions of others, and normative susceptibility concerns purchase decisions, which are based on the expectations of what would impress others (ACLT, 2001). As software piracy is not legal/ethical and does not have a positive social image, consumers with higher susceptibility to social influence may present negative attitudes toward software piracy. Value consciousness is defined as a concern for paying lower prices, subject to some quality constraints (ACLT, 2001; Lichtenstein et al., 1990). As pirated software usually provides similar functions to the legal version of software but with a lower price, consumers who are value-conscious may have positive attitude towards software piracy. Integrity represents the level of consumers' ethical standards and obedience to the law. The More important integrity is to a consumer, the more negative s/he will feel about software piracy. Personal gratification concerns the need for a sense of accomplishment, social recognition, and to enjoy the finer things in life (ACLT, 2001). Consumers with high personal gratification will value the legal version of software, thus have a negative attitude towards piracy.

Two new constructs, collectivism and novelty seeking, are added to the model in our study as social and personality factors influencing consumer attitudes. The collectivist culture has been used extensively to explain the difference in piracy rates and in consumers' ethical decision-making between eastern and western countries. At the macro-level, the collectivist culture is associated strongly with piracy rates in regression studies (Husted, 2000; Marron & Steel, 2000). In micro-level studies, culture is used popularly as a reason to explain the different attitudes toward and decisions on software piracy among various groups (Swinyard et al., 1990). The Chinese proverb "He that shares is to be rewarded; he that does not, condemned." is cited widely to refer the impact of the collectivist culture on software piracy.

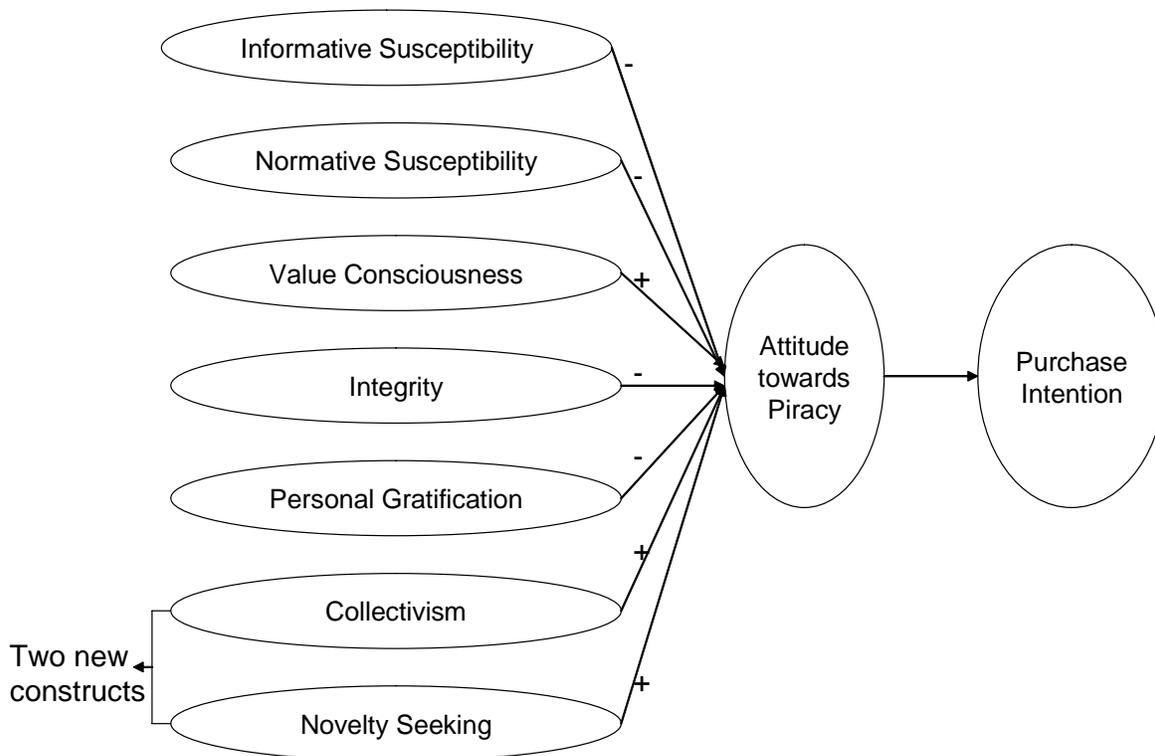

FIG. 1: A MODEL OF CONSUMER RESPONSES ON PURCHASING PIRATED SOFTWARE (ADAPTED AND EXTENDED FROM ACLT)

(Swinyard et al., 1990). However to the best of our knowledge, no research has directly examined the effects of the collectivist culture on individual consumer attitudes and decisions. Without this direct test, the leading relationship from the cultural factor to consumer responses to software piracy cannot be established appropriately. Meanwhile, if the cultural factor is a powerful explanation for software piracy, it has to be considered in the model. While at the national level, the Chinese as a group present a higher degree of collectivism, individual consumers may have different degrees of acceptance for the culture of software piracy. For example, some consumers may think that certain collectivist elements such as sharing and groups are more acceptable or desirable than others. The individual differences in agreeing to the collectivism will directly affect the consumer's attitude toward software piracy and his/her purchasing intention.

Another important factor is novelty seeking. Novelty seeking is curiosity of human to seek variety and difference (Hawkins et al., 1980). In an empirical study on consumer motivations for purchasing pirated software versus legal versions, Cheng et al. (1997) found that novelty (wanting to try out the software) is the second most important reason only behind cost consideration (software too expensive) out of the nine main reasons. Wee et al. (1995) found that novelty seeking is an influential factor for purchasing pirated software in student groups, but did not find it as an important influential factor in working adult samples. Novelty seekers may be more likely to purchase the legal version of software when satisfied with the product than consumers who are intensively value conscious. As software piracy can help promote the diffusion of legal copies (Givon, Mahajan, & Muller, 1995), the

novelty-seeking factor is an important factor to understand.

Marketing literature has firmly established that attitudes influence behavioral intentions (Ajzen & Fishbein, 1977). ACLT concluded in their study that attitude toward piracy was significant in influencing purchase intention. The attitude to behavioral intention links are tested also in our study.

To test the model in Figure 1, Hypotheses 1 and 2 are proposed in Table 1. In testing Hypothesis 2, we intend to identify the most important attitude measures influencing consumer purchase intention.

<b>Hypotheses in this research</b>	
<b>H1:</b> Relationships between social and personality factors and consumer attitudes toward software piracy	
H <sub>1a</sub>	Information susceptibility has a negative effect on consumer attitudes toward software piracy.
H <sub>1b</sub>	Normative susceptibility has a negative effect on consumer attitudes toward software piracy.
H <sub>1c</sub>	Value consciousness has a positive effect on consumer attitudes toward software piracy.
H <sub>1d</sub>	Integrity has a negative effect on consumer attitudes toward software piracy.
H <sub>1e</sub>	Personal gratification has a negative effect on consumer attitudes toward software piracy.
H <sub>1f</sub>	Novelty seeking has a positive effect on consumer attitudes toward software piracy.
H <sub>1g</sub>	Collectivism has a positive effect on consumer attitudes toward software piracy.
<b>H2:</b> Consumer attitudes toward software piracy leads to their purchase intention.	
<b>H3:</b> Attitude differences between buyers and non-buyers	

TABLE 1: HYPOTHESES

In analyzing consumer attitude, ACLT (2001) employed unstructured questions on: the risks in buying pirated CDs, trust in the stores that sell pirated CDs, worthy purchase, fairness to singers and music industry, the morality of buying pirated CDs, and the benefits to society, and found attitude differences between buyers and non-buyers of pirated CDs in terms of social fairness and benefits. In Hypothesis 3 (Table 1), the attitude differences between Chinese buyers and non-buyers of pirated software are proposed. However, the attitude components for Chinese in software piracy and for Singaporeans in CD piracy may not be the same. This research intends to identify important attitudinal aspects for Chinese consumers and the most important attitudinal aspects influencing consumer behavior in software piracy.

## Method

A survey was conducted on students of two universities in Beijing. Student samples have been used widely in research on software piracy (e.g., Cheng et al., 1997; Glass & Wood, 1996; Logsdon et al., 1994; Moores & Dhillon, 2000; Sims et al., 1996; Simpson, 1994; Swingyard et al. 1990; Wagner & Sanders, 2001; Wee et al, 1995). Due to the average low income, students are an important user group for pirated software. Research suggested that software piracy is prevalent in academia (Cheng et al., 1997). Meanwhile, as university students will dominate future management positions, their attitudes are important for understanding the future prevalence of software piracy (Oz, 1990).

### Measure Development

The questionnaire used in this research was in Chinese and consisted of five parts. Part I measured respondents' attitude toward software piracy; Part II measured their social and personality factors; Part III measured their purchasing intention; Part IV asked whether they had purchased pirated software before; and Part V collected demographic information. Seven-point Likert-scales were employed in Parts I – III of the questionnaire, with 1 representing “disagree or not important,” and 7 representing “agree or important.” Appendix 1 provides the construct measures used in the questionnaire in English.

Measures of the five social and personality constructs, tested by ACLT, are adapted from ACLT (2001) and other literature (Bearden et al., 1989). Novelty seeking is a relatively new construct for piracy research, and was tested by Wee et al. (1995) as a variable. Measures of cultural factors exist in literature, including cultural values

scale (Donthu & Yoo, 1998), Asian Values Scale (Kim et al., 1999), and universal structure of values (Schwartz & Sagiv, 1995). To identify good measures in novelty seeking and in individual responses to collectivism to reflect Chinese consumers in software piracy, a list of measures for novelty seeking and collectivism, was developed according to the meaning of the constructs and literatures. Two focus groups examined this list of measures, one with twelve Chinese students and another with ten Chinese industrial experts. According to their feedback and suggestions, four measures for each construct were selected. Four questions were asked to evaluate novelty seeking, including: “I am always one of the firsts to try new products”; “I am excited to purchase some interesting products”; “I own a lot of popular products”; “I keep up with fashion”. Instead of focusing on the relationship between an individual and others as used in some previous cultural values scales (such as Asian Values Scale (Kim et al., 1999)), the focus groups suggested that the specific aspect of sharing between an individual and others is more direct in reflecting the collective culture relevant to the Chinese response to software piracy. Thus, four questions to evaluate collectivism directly address the concept of sharing, including “he that shares is to be rewarded and he that does not, condemned”; “I like to share with others”; “I wish others can share with me”; “the more people share a product, the more valuable the product is”.

Measures of the attitude construct were developed based on responses from two focus groups on what are the important attitudes of Chinese consumers to software piracy. Four measures, of which two were adapted from ACLT, were developed on consumer purchase intention.

### Samples

A total of 340 questionnaires were distributed randomly to students on university campuses; 314 responses were received, with a response rate of 92.4%. Twelve responses were not completed appropriately, thus were excluded in the data analysis. A total of 302 responses were retained for data analysis through EXCEL and SPSS software.

Table 2 shows the sample distribution on gender and buying behavior. 52.3% responses are male and 47.7% are females. The rate of buyers (75.2%) is higher than non-buyers (24.8%), which reflected the high piracy rate in China (Traphagan & Griffith, 1998). Since the response rate of this survey is high (92.4%), this buyer/non-buyer distribution represents the real buyer/non-buyer distribution in university students in Beijing.

	Non-Buyers	Buyers	Total	Percentage
Male	11	147	158	52.3%
Female	64	80	144	47.7%
Total	75	227	302	100.0%
Percentage	24.8%	75.2%	100.0%	

TABLE 2: THE SAMPLE DISTRIBUTION

The Z-test is performed to test whether the percentages of buyers in different gender groups are the same under the assumption of the Binomial distribution. The results show that the Z-test statistics is -7.53, and the test significance level represented by p-value is much smaller than 0.001. This statistic confirms that the buying decision is biased by gender and that the percentage of buyers in the male group is larger than that in the female group (Moores & Dhillon, 2000; Rahim et al., 2000; Simpson et al., 1994; Sims et al., 1996; Solomon & O’Brien, 1990; Wong, 1985).

## Results

To validate the model in Figure 1 and test Hypotheses 1 and 2, regression analyses are carried out and discussed in sections 4.1 and 4.2. Section 4.3 examines hypothesis 3, and also provides an exploratory test to analyze the attitude construct.

### Relationships between Social and Personality Factors and Attitude

Following previous studies on piracy, such as ACLT, Logsdon et al. (1994), Tan (2002), and Wee et al. (1995), this study uses the method of regression to analyze relationships proposed in Figure 1. Since we would like to identify the most important factors influencing consumer attitude toward piracy, stepwise regression is used to analyze the relationships between the social and personality factors and the attitude construct. Stepwise regression is a hybrid

forward selection and backward elimination procedure (Jennrich, 1995). Stepwise regression is a good computer assisted model building method. It selects subsets of variables for researchers to consider and a good deal of insight can be obtained by watching the entry process (Jennrich, 1995). It is a suitable analysis tool as this study is one of the first to investigate software piracy in China and any detailed/underlying information can be useful. The independent variables are informative susceptibility, normative susceptibility, value consciousness, personal gratification, integrity, novelty seeking, and collectivism, and the dependent variable is consumer attitude toward software piracy.

First, reliability of the constructs is tested through Cronbach  $\alpha$  to evaluate the extent of consistency among construct measures. The value of Cronbach  $\alpha$  is 0.72 for the ten measures of the consumer attitude construct. The values of Cronbach  $\alpha$  for social and personality constructs are 0.71, 0.73, 0.80, 0.74, 0.80, 0.78, and 0.74, for informative susceptibility, normative susceptibility, value consciousness, personal gratification, integrity, novelty seeking, and collectivism, respectively. These values are all higher than 0.7, which demonstrates sound reliability of measures in these constructs (Nunnally, 1978; Rivard & Huff, 1988). Thus, the averages of measures of each construct are used as variables in regression analysis.

As shown in Table 3, four variables (value consciousness, normality susceptibility, novelty seeking, collectivism) are found important in influencing consumer attitudes toward software piracy, and is included in the final regression equation. Thus,  $H_{1b}$ ,  $H_{1c}$ ,  $H_{1f}$ , and  $H_{1g}$  are supported, and  $H_{1a}$ ,  $H_{1d}$ , and  $H_{1e}$  are not supported. The results from this study are consistent with the ACLT study in finding that normative susceptibility and value consciousness influence consumer attitudes toward software piracy ( $H_{1b}$  and  $H_{1c}$ ), and informative susceptibility and personal gratification do not ( $H_{1a}$  and  $H_{1e}$ ). Different from the ACLT study, integrity is not found as an important factor in influencing consumer attitudes ( $H_{1d}$ ). This finding is consistent with other studies (i.e., Logsdon et al., 1994; Simpson et al., 1994), which also found a weak relationship between consumer moral judgment and their response to software piracy. An explanation used in previous studies (Logsdon et al., 1994; Simpson et al., 1994) is that consumers do not consider software piracy as an ethical issue. Both of the two new constructs developed in this study are found to be important in influencing consumer attitudes, which indicates that the model proposed in this research is a valuable and important extension of the ACLT's. Especially, since culture is used widely as an explanation to consumer low moral intensity or ethical insensitivity of software piracy in ethics research (Logsdon et al., 1994; Swinyard et al., 1990), inclusion of the cultural factor (collectivism in this study) is important. Culture may be the reason for the different results of this study and ACLT's in evaluating the importance of integrity in influencing consumer attitudes toward software piracy.

Final Stepwise Regression Equation	B-values	Standard Error	Standardized Regression Coefficients	t-value	Significance Level
Value Consciousness	0.33	0.05	0.28	6.45	0.00
Normality Susceptibility	-0.04	0.01	-0.17	-4.17	0.00
Novelty Seeking	0.22	0.06	0.15	3.69	0.00
Collectivism	0.20	0.07	0.13	2.96	0.01
Constant Item	2.15	0.59		3.68	0.00
$R^2=0.22$ $F=12.18^{**}$					

TABLE 3: FINAL STEPWISE REGRESSION RESULTS ON FACTORS INFLUENCING ATTITUDE

#### Relationship between Attitude and Purchase Behavior

A stepwise regression also is used to test the influencing effects of attitude measures on purchasing intention. As the measures of the attitude construct may represent different, though related, aspects of attitude, and we intended to identify the most important measures, ten measures of the attitude construct are used as independent variables in regression. The Cronbach  $\alpha$  of the four measures of purchasing intention is 0.86, which demonstrates a consistency of construct measures. Thus, the average of the four measures of purchasing intention is used as the dependent variable in the regression analysis.

Table 4 shows the final stepwise regression results. For the overall sample, five independent variables

accounted for a  $R^2$  of 0.324 of the purchasing intention of pirated software. Five measures influencing purchase decision are product reliability (0.24), product functionality (0.15), social welfare (0.14), risks (0.10), and legal judgment (-0.09).

Final Stepwise Regression Equation	B-value	Standard Error	Standardized Regression Coefficients	t-value	Significance Level
Pirated software is as reliable as the legal software.	0.239	0.048	0.313	4.976	0.000
Without pirated software, many people will not be able to enjoy the benefits of using software.	0.142	0.049	0.181	2.873	0.004
Pirated software provides similar functions as the legal version.	0.146	0.058	0.170	2.524	0.012
There is little chance of being caught when purchasing pirated software.	0.103	0.046	0.137	2.256	0.025
Purchasing pirated software is illegal.	-0.0863	0.040	-0.128	-2.182	0.030
Constant	2.004	.384		5.217	0.000
$R^2=0.324$ $F=14.017^{**}$					

TABLE 4: FINAL STEPWISE REGRESSION RESULTS ON ATTITUDINAL MEASURES INFLUENCING PURCHASING INTENTION

#### Attitudes toward Software Piracy

In testing Singaporeans' attitudes toward pirated CDs, ACLT found that buyers and non-buyers had different attitudes toward software piracy. Compared to non-buyers, buyers of counterfeits perceive that the purchase of such products is less risky, worthier of purchase, will benefit society and entertainers more, as less unethical, and that stores selling counterfeits can be trusted.

To identify attitudinal differences to software piracy between Chinese buyers and non-buyers, ten measures were developed by the focus groups. Table 5 compares the attitudes toward software piracy of Chinese buyers and non-buyers. As the ACLT result, this study found the significant differences between buyers and non-buyer attitudes. Except for three measures (e.g., "Software piracy damages interests and rights of software manufacturers"; "Software piracy damages the software industry"; "Without pirated software, many people will not be able to enjoy listening to music"), attitudinal differences between buyers and non-buyers to the other seven measures were significant. Generally buyers showed more acceptable attitudes to software piracy than non-buyers. Thus,  $H_3$  was supported.

#### An Exploratory Study on Chinese Multi-attribute Attitude to Software Piracy

Given that ten measures were used in testing Chinese consumer attitude toward software piracy, an exploratory study was carried out to identify embedding attitude structure and developing multi-attributes for Chinese consumer attitudes toward software piracy. The multi-attribute attitude model (Bettman et al., 1975) is an important theoretical tool to evaluate consumer attitudes. Ten measures used in this study may represent certain attitude attributes, which form the basic and simpler attitudinal structure and help researchers to understand consumers.

Measures	Sample Average	Non-buyers	Buyers	t-value
<b>Attitude toward social consequences</b>				
Software piracy infringes intellectual property.	5.94	6.38	5.80	2.10**
Software piracy damages interests and rights of software manufacturers.	5.99	6.22	5.92	1.66
Software piracy damages the software industry.	5.38	5.59	5.31	1.58
Without pirated software, many people will not be able to enjoy listening to music.	5.30	5.24	5.32	-0.37
<b>Attitude toward pirated software</b>				
Pirated software has similar quality as the legal version.	3.74	3.30	3.88	-2.13**
Pirated software provides similar functions as the legal version.	4.50	4.04	4.65	-2.25**
Pirated software is as reliable as the legal software.	3.82	3.38	3.96	-2.56**
<b>Attitude toward piracy behavior</b>				
Purchasing pirated software is illegal.	3.73	4.23	3.56	2.73**
Purchasing pirated software is unethical.	3.85	4.41	3.66	2.84**
There is little chance of being caught when purchasing pirated software.	4.17	3.85	4.27	-1.88*

\*\* p<0.05, \* p<0.1

TABLE 5: COMPARISON OF BUYERS AND NON-BUYERS ATTITUDES

Consumer attitude attributes have not been investigated thoroughly by previous researchers on piracy studies. For example, while ACLT used twelve measures for Singaporean's attitudes to CD piracy, and subjectively grouped the twelve measures to seven sub-titles, ACLT used no quantitative method to verify the existence or appropriateness of these seven sub-titles. In a study on non-price determinants of intention to purchase counterfeit goods, Wee et al. (1995) also subjectively classified measures, which individually were found as purchase influencers, to the categories of psychographic, demographic, product-attribute variables in their discussions without further factor analysis. Without appropriate data analysis, these groupings cannot be used by researchers as a reference on attitude structure with confidence.

To test attributes of Chinese consumer attitudes on software piracy, an exploratory factor analysis was done. The significance level of Bartlett's test on attitude measures is 0.000 and the KMO measure is 0.072. Both show that it is appropriate to use factor analysis to uncover the underlying dimensions of the attitude measures. The principle component extraction method with varimax rotation is employed. Table 6 shows the factor loadings with the absolute value larger than 0.3, which is a threshold in factor analysis. Factor loadings below 0.3 can be ignored.

The resulting factor loadings in Table 6 clearly support the existence of three attributes of the attitude construct. An attitude attribute was named *attitude toward social consequences*, including measures, "Software piracy infringes intellectual property"; "Software piracy damages interests and rights of software manufacturers"; "Software piracy damages the software industry"; "Without pirated software, many people will not be able to enjoy listening to music". An attitude attribute, focusing on consumer attitude towards pirated products (e.g., "Pirated software has similar quality as the legal version."; "Pirated software provides similar functions as the legal version."; "Pirated software is as reliable as the legal software".), was named *attitude toward pirated software*. Another attitude attribute focused on consumer judgments toward piracy behavior, and thus was named *attitude toward piracy behavior*, with measures "Purchasing pirated software is illegal"; "Purchasing pirated software is unethical"; and "There is little chance of being caught when purchasing pirated software".

Attitude Measures	Factor Loadings		
	F1	F2	F3
<b>Attitude toward social consequences (F1)</b>			
Software piracy infringes intellectual property.	0.88		
Software piracy damages interests and rights of software manufacturers.	0.88		
Software piracy damages the software industry.	0.78		
Without pirated software, many people will not be able to enjoy listening to music.	0.67	0.46	
<b>Attitude toward pirated software (F2)</b>			
Pirated software has similar quality as the legal version.		0.80	
Pirated software provides similar functions as the legal version.		0.79	
Pirated software is as reliable as the legal software.		0.70	
<b>Attitude toward piracy behavior (F3)</b>

TABLE 6: FACTOR ANALYSIS OF ATTITUDE MEASURES

Two measures, each from the attitude toward piracy behavior and the attitude toward social consequences, load on attitude toward pirated software. However, the loadings are rather low (less than 0.5). If a threshold of 0.5, which represents “high” in factor loadings, instead of 0.3, is used, these two loadings will be eliminated. The three attributes and their measures can be used in future research on consumer attitude toward software piracy. The three attributes explain 62.92% of total variance.

**Re-examine Findings from Hypothesis Testing by Multi-Attribute Attitude Structure**

As three attitude attributes were established in an exploratory factor analysis, we found it interesting to apply this attitudinal scheme to earlier data analysis results for hypothesis testing. First, the three attitude attributes were applied to the attitude comparison of buyers and non-buyers, shown in Table 5. Clearly, under the scheme of three attitudes, the differences between buyers and non-buyers were reflected intensely by their attitudes toward pirated software (product), and toward piracy behavior. Buyers had more positive views on pirated software and piracy behavior than non-buyers. This result is consistent with previous findings on buyer and non-buyer differences in evaluating related attitude measures on pirated product and piracy behavior (ACLT, 2001; Nia & Zaichkowsky, 2000; Wee et al., 1995). Except for one measure (software piracy infringes intellectual property), buyers and non-buyers did not show significant differences in evaluating social consequences. While buyers recognize the damage of software piracy to intellectual property, their recognition of the damage is significantly less than non-buyers. Generally, the group means for both buyers and non-buyers were above 5, which means that both buyers and non-buyers recognized the benefit and damages of software piracy to society.

Also interesting is the application of the three attitudinal attributes to results in Table 4 when analyzing important attitude attributes in influencing consumer purchasing intention. In the five measures listed in Table 4, two measures, “pirated software is as reliable as the legal software” (the first one in Table 4) and “pirated software provides similar functions as the legal version” (the third one in Table 4), are for the attitude attribute toward pirated software. Two measures, “purchasing pirated software is illegal” (the fifth one in Table 4) and “there is little chance of being caught when purchasing pirated software” (the fourth one in Table 4) are for the attitude attribute toward piracy behavior. One measure, “without pirated software, many people will not be able to enjoy listening to music”, is from the attitude attribute toward social consequences. This may suggest that different attitude attributes have different influencing power in the consumer’s purchasing intention, and the consumer’s attitudes toward pirated software and piracy behavior are more important when compared to the social consequences. This needs to be tested further in future research.

## Discussion

This research is one of the first to understand Chinese consumer attitudes in software piracy. In addition, this research extended a previously tested model by ACLT (2001) by adding two social and personality factors, collectivism and novelty seeking. These two factors were found important in influencing consumer attitudes. Different from ACLT results, integrity was not found to be an important influencer in consumer attitudes. This finding supported a conclusion provided by many other studies (Logsdon et al., 1994; Simpson et al., 1994) that there was a weak relationship between consumers' moral judgment and their response to software piracy. Confirming ACLT results, this research found normative susceptibility and value consciousness important, and informative susceptibility and personal gratification not important in determining consumer attitude.

This research redesigned measures based on an analysis of the Chinese markets. To further analyze the attitudinal structure of the Chinese for software piracy, this research conducted an exploratory factor analysis, which was rarely attempted in previous studies and needed to be researched further. Three attributes of consumer attitudes toward software piracy (attitude toward social consequences, attitude toward pirated software, and attitude toward piracy behavior) were established. Attitude toward pirated software (product) concerns the consumer's evaluation of pirated products compared to legal software. Consumer attitudes on product attribute were found to be relevant in previous research. Wee et al. (1995) found that product attribute variables were important in explaining purchase intention toward counterfeit products. Nia and Zaichkowsky (2000) found that those consumers who owned only original goods and no counterfeits believed that counterfeits were inferior products; those who owned counterfeits had a positive image of them and did not believe these products were inferior. Attitudes toward piracy behavior concerns the consumers' legal and ethical judgments and their risk evaluation of the piracy behavior. These factors are important in consumer decision making (Tan, 2002; Wang, Zhang, & Ouyang, 2003). Attitudes toward social consequences concerns the consumer evaluation of the benefits/damages of the software piracy to society.

In applying the three attitude attributes to examine data analysis results in this research, we found that the different attitudes toward piracy between buyers and non-buyers reflected mainly on attitude measures toward pirated software and piracy behavior. Attitudes toward pirated software and social consequences were found important in determining future purchase intention.

The research has the following limitations: first, the survey was conducted in a university setting, using a student population sample. Researchers have raised concerns about the generalizability of student-based findings across the consumer population (Burnett & Dunne, 1986; Park & Lessig, 1977; Szymanski & Henard, 2001). In general, responses of college student subjects tend to be slightly more homogeneous than those of non-student subjects (Peterson, 2001). These sampling issues may influence how students evaluate each construct, and the relationships among constructs. In particular, students may not be a good representative for the Chinese population. However, our research is not only "effects application research" (Calder et al., 1981) at the descriptive level (Farber, 1952) for analyzing Chinese markets, but also "theory application research" (Calder et al., 1981) at a "conceptual level" (Farber, 1952) in establishing and validating a research model for Chinese consumers. As research with a theoretical nature, the use of college students is supported (Calder et al., 1981; Peterson, 2001). However, caution must be exercised when generalizing findings from this study.

Following many previous studies in this area including the ACLT, this research employs the regression method to analyze relationships among the three layers of constructs in the model. As the most important factors influencing consumer attitude and purchase intention can be easily identified through regression, and as constructs and measures were under development in this study for the Chinese software piracy research, the model is not tested as a whole. Based on the findings of this research, future studies may possess a more mature theoretical foundation in analyzing Chinese markets, and thus employ a model-testing method, such as the structural equation modeling (SEM), to validate a consumer attitude model as a whole.

Summarizing the findings and limitations of this research, we suggest a new model, shown in Figure 2, to be tested in future research. This model eliminates the unimportant social and personality factors (namely, informative susceptibility, integrity, and personal gratification), and focuses on four important factors (namely, normative susceptibility, value consciousness, collectivism, and novelty seeking). It incorporates three consumer

attitude constructs, which are established in this research.

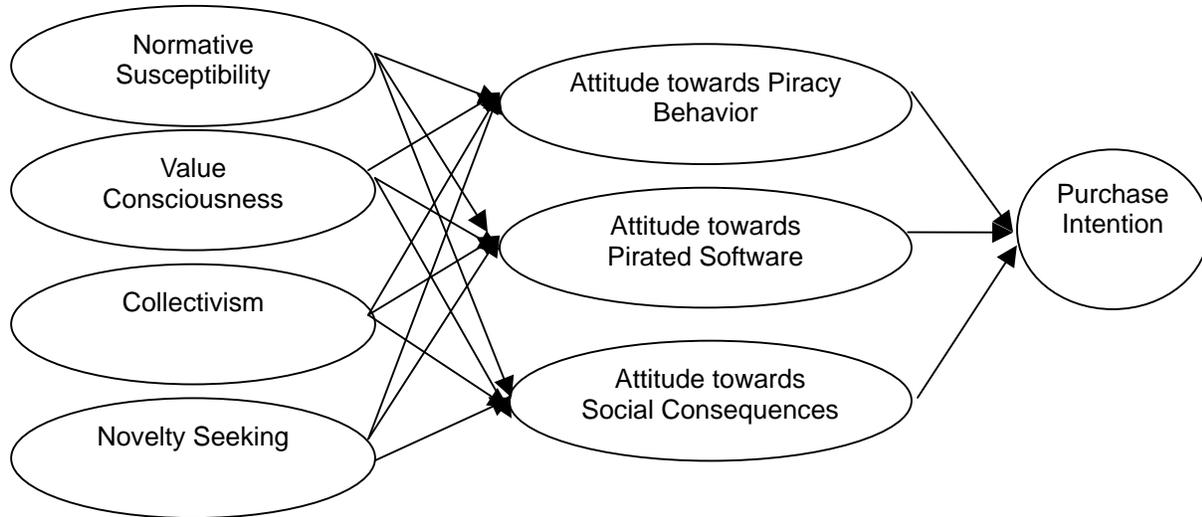

FIG. 2: A SUGGESTED MODEL FOR FUTURE RESEARCH

This research contributes to both theory development and industrial practice. In theory development, we re-designed the model and research, analyzed Chinese consumers in software piracy, established three attitude attributes, and suggested a new model. For industry practitioners, this research provides an in-depth understanding of Chinese consumers, which can be used in designing anti-piracy education strategies in China. This research suggests that product differentiation between legal and pirated software is a key to prevent piracy. Vendors can educate consumers or reinforce consumer perceptions that legal software is more functional and reliable than the pirated one. Vendors can provide superior services, such as technical support, warranties, or updates, to differentiate from pirated software. Finally, offering education on the legality of purchasing pirated software may be an essential tool in reducing piracy rates in China.

## Appendix 1: Measures in the Questionnaire

1. Informative susceptibility
  - To make sure I buy the right product or brand, I often observe what others are buying and using.
  - If I have little experience with a product, I often ask my friends about the product.
  - I often consult other people to help choose the best alternative available from a product class.
  - I frequently gather information from friends or family about a product before I buy.
2. Normative susceptibility
  - It is important that others like the products and brands I buy.
  - If other people can see me using a product, I often purchase the brand they expect me to buy.
  - I like to know what brands and products make good impressions on others.
  - If I want to be like someone, I often try to buy the same brands that they buy.

3. Value consciousness
  - I am concerned about price and product quality.
  - I compare prices for the best value for money.
  - I like to be sure that I get my money worth.
  - I try to maximize the quality for the money spent.
4. Integrity
  - I value honesty.
  - I value politeness.
  - I value responsibility.
  - I value self control.
5. Personal gratification
  - A comfortable life is important to me.
  - An exciting life is important to me.
  - A sense of accomplishment is important to me.
  - I value pleasure.
  - I value social recognition.
6. Collectivism
  - He that shares is to be rewarded and he that does not, condemned.
  - I like to share with others.
  - I wish others can share with me.
  - More people share a product, the more valuable the product is.
7. Novelty seeking
  - I am always one of the firsts to try new products.
  - I am excited to purchase some interesting products.
  - I own a lot of popular products.
  - I keep up with fashion.
8. Attitude toward piracy
  - 8.1 Attitude toward social consequences
    - Software piracy infringes intellectual property.
    - Software piracy damages interests and rights of software manufacturers.
    - Software piracy damages the software industry.
    - Without pirated software, many people will not be able to enjoy listening to music.
  - 8.2 Attitude toward pirated software
    - Pirated software has similar quality as the legal version.
    - Pirated software provides similar functions as the legal version.
    - Pirated software is as reliable as the legal software.
  - 8.3 Attitude toward piracy behavior
    - Purchasing pirated software is illegal.
    - Purchasing pirated software is unethical.
    - There is little chance of being caught when purchasing pirated software.
9. Purchase Intention
  - I would recommend pirated software to a friend.
  - Upon request, I will consider purchasing pirated software for a friend.
  - I will buy pirated software.
  - I will buy pirated software from peddlers.

## Social Responsibility of Public Transport Undertakings

*Ramanayya TV*

*Nagadevara V*

*Shyamal Roy*

*Indian Institute of Management, India*

### Abstract

In India, the investment in transport sector has immensely benefited the economy. There has been a shift towards road transport, both in passenger and goods segments. While the passenger transport sector was dominated by private operators before independence, post independence era has seen a major shift towards nationalization of road transport services. The major objective of nationalization was to provide high quality, reliable service to the public and fulfill the social responsibility towards all the stakeholders. While many nationalized transport organizations strived to fulfill this social responsibility, they failed to become commercially profitable. As a consequence, many state governments started allowing private transport operators in the sector. The coexistence of both the nationalized and private operators is expected to generate competition and result in better quality service to the passengers. This paper analyzes the extent of fulfilling the social responsibility by the nationalized and private transport operators from the point of view of quality of service, level of employee welfare, special concessions to disadvantaged sections of the society etc.

### Introduction

Transport sector bears a close and complex relationship with all other sectors of country's economy. Rapid growth of urban population, large scale manufacturing activities spread across the country, modern living habits have contributed to the development of various modes of transport across the world.

In India, planning and investment in transport sector has immensely benefited in achieving rapid growth in the economy, employment and access to rural settlements. During the last five decades there is a shift from Railways to Road transport in respect of passenger movement. Currently road transport accounts for 80% of total passenger flows across the country.

Prior to the promulgation of Road Transport Corporations Act 1950, a number of small operators owning 1 or 2 buses were providing the service. The government felt the need for improved and reliable services in this sector for overall economic development.

In India, as in many other parts of the world, investment in road transport is treated as a part of Public provision of services whereby one of the key objectives of this provision has been to meet the social obligations of an affordable, safe and reliable bus service to the people. Accordingly, the Road Transport Act 1950 enabled States and Central Governments to take initiative to form the Road Transport Corporations. Similarly, the Motor Vehicles Act 1950 was subsequently amended to make special provision for State Transport Undertakings (STUs). This Act was further amended in 1969 for promoting State monopoly in passenger road transport services. Despite its (Public bus operations) prime position in the movement of people especially in remote rural areas, these Public undertakings are subjected to criticism due to heavy losses incurred by them every year. Consequently, many states amended the legislation allowing private operators to provide transport services in the state. Thus, in many states, private as well as nationalized operators operate the road transport services simultaneously. Currently private operators account for 80 per cent of passenger transport services in India. The private operators own a fleet strength of 4,38,000 buses compared to 99,000 in the Public sector [4]. While the Public sector RTCs are geared towards Public good the private sector's primary aim is profit. There were cases in Rajasthan, Orissa and Bhopal where the private operators resorted to non-payment of taxes, exploitation of the traveling Public and high incidence of accidents [1]. Similarly, in Visakhapatnam, Vijayawada and Srikakulam in the state of Andhra Pradesh, the private operators failed to discharge their social obligation, which forced the State Governments to intervene and direct the state, owned APSRTC to introduce bus services in these districts [2].

In the state of Karnataka road transport services are provided by both Public sector by four corporations

- (i) Bangalore Metropolitan Transport Corporation (BMTC),
- (ii) Karnataka State Road Transport Corporation (KSRTC),
- (iii) North West Karnataka Road Transport Corporation (NWKRTC)
- (iv) North East Karnataka Road Transport Corporation (NEKRTC).

However, there is no competition among the Public undertakings as the districts of operation in the State are divided among them. BMTC caters exclusively in Bangalore Metropolitan Region.

The Private operators are registered with Regional Transport Authority in every district. Their number runs into hundreds in the study region. The districts of Karnataka can be clearly delineated into three categories: those where only the Nationalized services are allowed to operate (Category I); those where only private operators are allowed to operate (Category II), and those where both private and Nationalized services are allowed to operate simultaneously (Category III). The competition between the private and nationalized services is expected to improve the efficiency and generally work in favor of the passengers. It is expected that the passengers get better service, lower fares and higher reliability because of the competition. This paper attempts to compare the service levels provided and social responsibility undertaken by the private and nationalized operators. Since Karnataka state has delineated the services geographically, it provided an ideal setting for such a comparison.

Karnataka is one of the major states in India and situated on the western edge of the Deccan plateau. It has for its neighbors Maharashtra and Goa on the north, Andhra Pradesh on the east, Tamil Nadu and Kerala on the south, and on the west it opens out to the Arabian Sea. It has an area of 191,791 sq km. Bangalore, nicknamed as the Silicon Valley of India, is the Capital of this southern state. Fig. 1 provides the location of the state of Karnataka in India. The map of Karnataka with the administrative details is shown in Fig. 2.

FIG. 1: MAP OF INDIA SHOWING THE STATE OF KARNATAKA

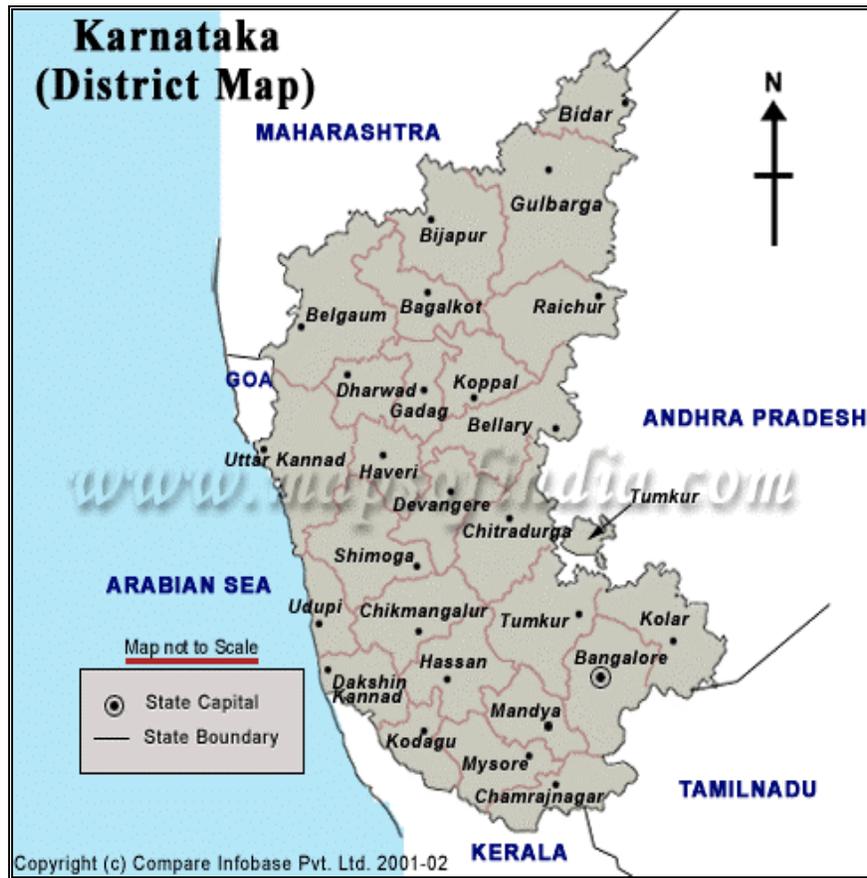

FIG. 2: MAP OF THE STATE OF KARNATAKA

The state is divided into 27 districts and is well connected by Roads, Railways, Airways and Waterways. Motorable roads are 150,000 km in length while rail network is about 3500 km. Karnataka is predominantly an agrarian state with about 65% of its working force engaged in agricultural and allied activities, which generate 42% of the state income.

### Objectives of the Study

Against the above background, the objectives of this study are as follows:

- To understand the functioning of passenger transport services in the state by different operators, in nationalized, non-nationalized and semi-nationalized transport service districts of the state.
- To measure, based on certain parameters, the current level of customer satisfaction, with the transport services provided.
- To compare services offered by Public with those offered by the private operators with respect to quality, cost, equity and other parameters.
- To assess the coverage of rural settlements
- To measure, the quantifiable concessions provided by the operators.

## Methodology

To provide a proper representation, a two-stage sample design was adopted. First, districts were selected in each category of operations: These are: Hassan, Dharwad and Gulbarga under Category I; Mangalore and Davanagere under Category II; and Mandya and Kolar in Category III. The second stage included the selection of routes in each district. The routes that were in operation within the district only were considered for the study. A random sample of 10% of the total schedules operated, with a minimum of five operators (in the districts where private operators are allowed) in each district was selected. The sample was selected in such a way that both moffusil and city services were included. For this purpose, certain amount of stratification was done in the sampling procedure. Finally, The sample includes a minimum of ten commuters on each schedule and two opinion makers from the villages covered in each schedule.

The primary focus of the study was to assess the perception of different stakeholders regarding the operations of different services by PUBLIC and private operators. Thus various stakeholders such as operators, commuter and travelers, opinion makers and intelligentsia were covered. Data with respect to the extent of services provided by the operators as well as various quality indicators were collected through a structured questionnaire.

**Employees of the Operators** – Data from the employees of the operators including, the drivers, conductors, etc. were collected through a structured questionnaire. In addition, focus group discussions were carried out. A suitable sample of the employees was selected for this purpose. The information thus, collected included career progression, remuneration, incentive schemes, if any, and training provided, etc.

## Sample Profile

### Route Characteristics

The distribution of sample routes based on route length is provided in Table 1.

TABLE 1: DISTRIBUTION OF THE SAMPLE ROUTES BASED ON ROUTE LENGTH

District	Upto 10 kms	Over 10 - 25 kms	Over 25 - 50 kms	Over 50 kms	Total
Mandya	7.14%	28.57%	53.57%	10.71%	100%
Kolar	2.44%	24.39%	53.66%	19.51%	100%
Hassan	3.57%	50.00%	35.71%	10.71%	100%
Gulbarga	8.33%	37.50%	50.00%	4.17%	100%
Davanagere	10.71%	14.29%	46.43%	28.57%	100%
Dharwad	18.18%	31.82%	40.91%	9.09%	100%
Mangalore	6.67%	30.00%	43.33%	20.00%	100%
Total	7.46%	30.35%	46.77%	15.42%	100%

The data indicates that the information is collected across different route lengths in a district operation. Table 2 provides the sample routes based on route length and operator.

TABLE 2: DISTRIBUTION OF SAMPLE ROUTES BASED ON ROUTE LENGTH AND OPERATOR

District	Upto 10 kms	Over 10 - 25 kms	Over 25 - 50 kms	Over 50 kms	Total
Nationalised					
Mandya	15.38	23.08	53.85	7.69	100
Kolar	3.85	26.92	53.85	15.38	100
Hassan	3.57	50.00	35.71	10.71	100
Gulbarga	8.33	37.50	50.00	4.17	100
Dharwad	18.18	31.82	40.91	9.09	100
Total	8.85	35.40	46.02	9.73	100
Private					
Mandya		33.33	53.33	13.33	100
Kolar		20.00	53.33	26.67	100
Davangere	10.71	14.29	46.43	28.57	100
Mangalore	6.67	30.00	43.33	20.00	100
Total	5.68	23.86	47.73	22.73	100

It may be noted that both types of operations are adequately covered to draw meaningful conclusions.

**Characteristics of Commuters and Opinion Makers**

The characteristics of the commuters and the opinion makers with respect to their age, educational qualifications occupation and income range are presented in Table 3.

TABLE 3: SAMPLE PROFILE OF THE COMMUTERS

Characteristic	Commuters	Opinion Makers
<b>Age</b>		
<20 Yrs	166	4
20-35 Yrs	1012	153
35-50 Yrs	576	152
50-65 Yrs	173	76
> 65 Yrs	17	5
No Response	56	9
<b>Residence</b>

Primary School	398	49
High School	653	153
Graduate	506	146
PUC/12th Std.	46	15
Diploma/UG	21	1
PG-Professional	2	1
PG-General	1	1
Others	14	6
No Response	18	4
<b>Annual Income</b>		
< Rs.5000	186	12
Rs.5000-12000	867	95
Rs.12000-25000	370	75
Rs.25000	513	212
No Response	64	5
<b>Occupation</b>		
Student	317	0
Agricultural Labour	618	0
Worker	413	0
Business	287	175
Housewife	151	0
Govt. Servant	144	56
Others	52	19
No Response	14	1
Unemployed	4	0
Teacher	0	29
Elected representative	0	40
Village elder	0	79

Data was collected from 2000 commuters and 399 opinion makers. The sample covered all selected routes. Of the 2000 commuters in the sample, 1119 were drawn from the routes operated by Nationalized operators and the remaining 881 were drawn from the routes operated by private operators. Similarly, 148 of the 399 opinion makers

were drawn from Category I districts, another 116 from Category II districts and the remaining 135 were drawn from Category III districts. The sample profiles of the commuters and opinion makers are presented below.

The profile of the commuters with respect to their place of residence, age, education, occupation and income are presented in Table 1. Most of the respondents were from the rural areas accounting for 76.2 per cent of the total. Only 11 per cent of the sample respondents belonged to the illiterate category. Those with high school education accounted for almost one-third of the total respondents. Most of the respondents belonged to the age group of 20 – 35 years, accounting for about 50 per cent. The next largest group was between 35 – 50 years of age. These two categories together (i.e., 20 – 50 years of age) accounted for almost 80 per cent of the sample.

The most predominant occupation across all the districts was agriculture. Out of a total of 2000 respondents, 618 belonged to the category of agriculture laborers. The unemployed accounted for less than 1 per cent of the total respondents. Considerable number of respondents comes from business.

The predominant income group consisted of those earning between Rs. 5,000 and 12,000 per annum, accounting for almost 44 per cent. At the same time there was fairly large number of respondents belonging to the income group of more than Rs. 25,000. Very few were in the category of less than Rs. 5,000 per annum.

Thus the typical respondent was from rural region in the age group of young or middle age with primary or high school education and having an income level of less than Rs. 5,000 – 12,000, the predominant occupation being agriculture labour or worker.

In addition to the commuters, some of the opinion makers such as village elders, elected representatives, teachers, businessmen etc. were also covered in the study. A total of 399 such persons were surveyed. Most of these persons were in the age group of 20 to 50 years. About 53 percent of those sampled lived in villages. More than 38 percent of them had completed high school and another 36 percent were graduates. There were also few postgraduates. Only 11 out of the 399 were illiterates. The predominant occupation was business. The village elders constituted the second largest group. There were 40 elected representatives and another 56 government servants. More than 50 percent of the respondents had an annual income of above Rs. 25,000 per annum. Another 25 percent had annual income of between Rs. 5,000 and 12,000. Only 12 persons had an annual income less than Rs. 5,000. In summary the sample of the opinion makers consisted of persons who are middle aged and well educated predominantly businessmen or elected representatives or village elders. They have a fairly high level of average annual income. They are distributed more or less evenly between the rural and urban areas. The composition of the group was such that they could be considered as the opinion makers in the area.

#### **Characteristics of Employees**

A total of 467 employees were interviewed from the 7 sample districts. Of these, 223 were from the Nationalized service and the remaining were from private operators. The district wise distribution of these 467 employees is presented in Table 4.

TABLE 4: DISTRICT-WISE DISTRIBUTION OF THE SAMPLE EMPLOYEES

District	Nationalized	Private	Total
Mandya	24	45	69
Kolar	52	43	95
Hassan	56		56
Gulbarga	48		48
Dharwad	43		43
Davangere		78	78
Mangalore		78	78
Total	223	244	467

The employees in the sample were primarily the drivers, conductors and cleaners. In addition to these categories of employees, the sample included 9 others, consisting of clerks and agents. The distribution of these employees is presented in Table 5.

TABLE 5 DISTRIBUTION OF SAMPLE EMPLOYEES BY DESIGNATION

Designation	Nationalized	Private
Driver	112	88
Conductor	110	78
Cleaner		70
Others	1	8
Total	223	244

The employees in the sample consisted of almost equal number of drivers and conductors. The cleaners in the sample are exclusively from the private operators. The sample employees from the private operators were more or less evenly divided between the three groups namely, drivers, conductors and cleaners.

There was a marked difference between the employees of Public and private operators in terms of the age group. The predominant age group (55%) was 35 to 50 years among Nationalized service employees sampled, while among private operators, majority (70%) of the employees belonged to the age group of 20 to 35 years. In general, the sample employees of private operators were younger as compared to the Nationalized service. The age-wise distribution of the sample employees is presented in Table 6.

TABLE 6 AGE-WISE DISTRIBUTION OF SAMPLE EMPLOYEES

Age Group	Nationalized	Private
Less than 20 Yrs		9
20-35 Yrs	73	171
35-50 Yrs	122	55
50-65 Yrs	28	7
No Response		2
Total	223	244

## Analysis

The analysis of the data collected from the commuters' employees of Nationalized and private operators and discussions with individuals in different villages is presented in the following paras. The analysis is broadly divided into the following heads.

- Quality of service provided as per the perception of commuters and individuals (opinion makers).
- Employee perceptions
- Frequency of services maintained during peak and off-peak period especially in urban areas.
- Linkages to rural settlements as perceived by commuters and opinion makers.
- Concession extended to different sections of consumers.

### Quality of Service

Quality is an abstract entity and subjective in character. It is simply an expression of the extent to which the service provided by an operator fulfils the expectations of the customer concerned. As such, there will be variations in perception of quality of service enjoyed by different customers for the same operation. Most of the commuters filled up the schedules during the course of their journey. As such they might be influenced by the service enjoyed in that trip. The discussions with opinion makers took place at their residences, as such; their perceptions could reflect the overall service provided by the operators in their respective districts.

The term quality may include many components such as

- Comfort and convenience
- Schedule details
- Crew behavior aspects
- Cost and other miscellaneous factors

The stakeholders on the basis of perception on a number of measurable attributes of that component perceive each component. Table 7 provides the possible attributes for different components listed above.

TABLE 7: ATTRIBUTES CONSIDERED FOR SERVICE QUALITY

Comfort and Convenience	Schedule and Operations	Crew Behavior	Cost & Others Aspects
Overloading	Notification of schedules	Courteousness with passengers	Notification of fares
Boarding and alighting	Following the schedule	Helping children and old age people	Returning small change
Seating arrangement	Prompt service during break down	Appearance of the crew	Adequacy of fares
Movement within the bus	Maintenance of vehicles	Neatness and professionalism	Reasons for break down
Driving comfort	Cancellation of schedules	Attitude of the crew in general	Charges for luggage
Travel time	Arrival / Departure timings		
First-aid service			
Luggage allowance			
Stopping at the bus stops			

#### Total Quality and Overall Perception

Data was collected from each of commuters and the opinion makers in terms of their perceptions on the attributes listed above. The respondents were asked to answer “yes or no” with respect to each of the attributes listed above for the nationalized as well as private service operators. The responses are summarized in terms of the proportion of persons who responded positively to each of the attributes. Thus, in the case of the attribute “Quick and prompt service during breakdowns”, 93 percent of commuters felt that the Nationalized operators are able provide immediate service, where as the only 62 percent of the respondents felt that such prompt relief service provided by private operators. These proportions are considered as scores representing then quality of service with respect to that particular attribute. These scores for all the attributes for the component “Schedules and Operations” are presented in Table 8. The overall score for this component is arrived at by simple arithmetic addition of the scores of each of the attributes. Thus, the overall score on this component for the Nationalized service (category I districts) is 5.74 and for the private operators (Category II districts) is 3.57. This procedure assumes that each of the attributes in that component is given equal weightage in the calculation of overall score for that component.

TABLE 8: OVERALL SCORE FOR SCHEDULE AND OPERATIONS

Attribute	Nationalized	Private	Nationalized/ Private
Perception of commuters			
Quick and prompt service during breakdowns	0.93	0.62	0.68
Better maintenance	0.89	0.49	0.77
Less prone to accidents	0.9	0.24	0.85
Less breakdowns	0.54	0.46	0.6
On-time arrival and departure	0.85	0.86	0.76
Notification of the schedules	0.78	0.45	0.65
First Aid in case of accidents	0.85	0.45	0.72
Overall score	5.74	3.57	5.03

Table 9 presents the combined picture, taking into account all the four major dimensions discussed above. The procedure followed is indicated below for the attributes of the component concerning schedule and operations.

TABLE 9: COMBINED TOTAL QUALITY AND OVERALL PERCEPTION

Item	Nationalized	Private	Nationalized/ Private
Perception of commuters			
Comfort and convenience	5.59	2.97	4.24
Scheduling and operation	5.74	3.57	5.03
Crew behaviour aspects	2.44	1.69	2.18
Fares and other issues	1.76	1.74	1.9
Total score	15.53	9.97	13.35
Perception of opinion makers			
Comfort and convenience	3.34	1.99	2.95
Schedules and operation	2.292	1.25	1.99
Crew behavior aspects	1.63	1.15	1.45
Fares and other issues	0.75	1.25	1.2
Total score	8.012	5.64	7.59
<i>Overall satisfaction of service (%)</i>			
Commuters' perception	0.65	0.34	0.49
Opinion makers' perception	0.6	0.41	0.58

The combined total score is calculated by simple addition of the scores for each of the major items. This assumes that equal weightages for each of the four major heads under which the quality is assessed. The overall score of combined quality of service provided as per the perception of commuters traveling both in Nationalized and private buses is in favor of Nationalized service, followed by combined operations. The overall score of the opinion makers is also similar indicating that the Nationalized bus operations are superior to private operators. The opinion makers are also of the view that combined operations (both Nationalized and private) is next best rather than exclusive private operations.

**Employee Perception**

Employee opinion is summarized under the following heads –

- Average Working hours / day
- Number of continuous hours at a stretch
- Remuneration and other privileges
- Promotional opportunities
- Cooperation from superiors
- Views about privatization

Their opinions are summarized in Table 10.

TABLE 10: EMPLOYEE OPINION

Item	Nationalized	Private
Working hours/day	10.30	11.32
Continuous work at a stretch (Hrs)	3.74	5.84
Kilometers run/day	306.62	269.96
Remuneration (Rs/Month)	4071	2888
Other privileges (LTC, Medical aid etc)	Available	Very rarely given
Promotional opportunities	Seniority basis	No promotion
Cooperation from superiors	Rarely	Rarely
View of privatization	Not required	Not always required

Most of the private operators do not paying minimum wages as stipulated by the law. Instead, they pay only on a daily basis. Most of these employees are not covered by Provident Fund act and they are not provided with rest places at the end of their journey. There are very few promotional opportunities even after serving with a private operator for more then 20 years. The situation is totally different in the case of nationalized operations. Their employees are provided with all the statutory benefits that accrue to the Government employees and there is no exploitation. Thus, nationalized services are able to take care of all the social obligations to a large extent whereas their counter parts in the private domain are mostly guided by their profitability rather than social objectives. The average number of persons employed by Nationalised operators works out to 5.89 per bus compared to 2.20 by private operators. From the point of view of employees perception privatization is not beneficial either to the workers or to the commuters.

#### **Frequency of Services**

Most of the private operators do not maintain detailed database about their operations. However, Nationalized service operators are always maintaining complete database on all aspects of their operations. A perusal of the data maintained by Bangalore Metropolitan Transport Corporation (BMTc), in one of their depots indicate that out of 400 schedules operated, 240 are operated during non-peak hours. The load factor during non-peak hour varies from mere 10% to 48%. BMTc is operating schedules from early morning around 4.00 a.m. to night 10.30 p.m. In the perception of the public, private operators mostly (85 to 90%) run their schedules during peak hours. Their non-peak hour operations are always delayed or cancelled.

#### **Coverage of Rural Settlements:**

As per the perception of commuters, the coverage of the Rural settlements the private sector is slightly better in providing the rural coverage. Data was collected on the extent of coverage in rural areas, as per the perception of the commuters. These percentages as perceived by them are averaged and printed below.

- Regions where only Nationalized services are available 59.84%
- Regions where only private services are available 65.41%
- Both Nationalized /private operations are computing 54.87%

The above percentages are only perceptions and the actual coverage could be accurately estimated after the publication of the recent census data.

#### **Concessions Extended**

In India, it is common practice to extend some concessions to needy sections of society. Different concessions extended include:

- Student passes
- Senior citizen passes
- Disabled person passes (for the physically challenged persons)
- Worker passes

For example, the number of student passes issued by Nationalized operators in Karnataka during the year 2002; as per “TN stores mode study” [3] is about 6,38,456. It is also estimated that the value of the revenue loss to the operators is about Rs.1035.58 million per year.

The student passes account for about 90% of the total concessions provided by the operators. The private operators are on record about extending a number of concessions to the commuters. However, discussions with stakeholders indicate that the concessions are provided only to students and that too in a very nominal way. The private operators do not maintain any record, to assess the quantum of revenue loss.

## **Conclusions**

The categorization of the districts of Karnataka into three different categories with respect to the operation of passenger transport offers an ideal setting for analyzing the social responsibility of various players involved. The social responsibility is evaluated from the point of view of quality of service as perceived by the passengers and opinion makers, employee welfare as perceived by the employees, frequency and reliability of services, extent of coverage in rural areas and special concessions extended to the disadvantaged sections of the society.

It was found that the quality of service provided by the nationalized service providers as perceived by the passengers as well as opinion makers is better compared to that of the private operators. The Nationalized service providers have consistently scored better on all the aspects of quality considered in this study. Similarly, the extent of employee welfare activities undertaken by the nationalized transport operators is much higher as compared to that of the private operators. This perception is evident even among the employees of the private operators. The frequency of services offered by the Nationalized transport operators is much better compared to the private operators. On the other hand, the private transport operators appear to provide a larger coverage in the rural areas as compared to the Nationalized transport operators. This is based on the perception of the passengers as well as the opinion makers. At the same time, the Nationalized transport operators extend a large number of concessions to the students and workers, senior citizens and physically challenged persons. Thus, the Nationalized transport operators appear to be fulfilling their social responsibility better than the private operators. In that sense, they have fulfilled the major objective of the nationalization of the transport services.

## Abstract

Based on a case study of two major stakeholder groups in a healthcare setting, the authors present findings using the views and perspectives of those stakeholders involved in the purchasing and delivery of public healthcare and identify and group relevant variables into four major themes or 'core categories' that characterise purchaser-provider stakeholder cooperation. The authors integrate a broad literature search with the exploratory research results, to present a descriptive framework for understanding stakeholder cooperation. We suggest that extending practitioners' understanding of the nature of these inter-related factors may lead to better insights of how interorganizational relations and partnerships might be managed more proactively throughout the healthcare value chain.

## Introduction

The healthcare environment has been described as 'turbulent' and even 'hyperturbulent' [35] [36][38] as most developed nations are struggling with the supply and demand issues of optimising their publicly-funded health systems using private sector mechanisms to pursue public sector goals [34]. In the UK, one of the most radical reforms of the National Health Service (NHS) occurred with the National Health Service and Community Care Act in 1990, which implemented with effect from 1<sup>st</sup> April, 1991 the principles of an internal or quasi-market. The prevailing view of the Government was that public health care service provision was becoming increasingly fragmented, outdated, inefficient, and driven by professional interests rather than the interests of the customer - the patient [24]. The reorganization of the NHS along a market system "would induce positive behaviour (by managers and professionals) which would work in the interests of patients, and that it would bring accountability and value for money within a proper management framework" [4, p. 23]. It also allowed the purchaser more choice regarding from whom they could purchase services. It was believed that this freedom of choice on the part of the purchaser would encourage the provider to be more efficient and offer a better quality of service to secure contracts, [27]. The new structure was all about managed competition...allowing limited competition for business between the providers - hospitals, community health services, ambulance services, and so on' [33].

Despite its shortcomings the incoming Labour government preserved the purchaser/provider split although with a new emphasis, 'co-operation not competition' between healthcare providers and purchasers [22][16]. The Government produced a White Paper entitled "The New NHS: Modern, Dependable" [Secretary of State, 1997] which outlined the Government's ten-year vision for the modernisation of the health service. The White Paper had a number of far reaching proposals to review and improve the NHS using 'evolutionary change rather than organizational upheaval' [7]. The eradication of the internal market with integrated care based on partnership and co-operation took place. Surprisingly however, the White Paper did not define either cooperation or partnership in non-clinical terms.

In light of these policy changes, our research examines the bases of positive relations between suppliers and purchasers of healthcare services and identifies a range of factors that characterize the relationships stakeholders have with each other. Specifically, we seek to explore the perceptions of the two main stakeholders in the supply chain. In doing so, we examine the nature of cooperation between the providers of healthcare services (hospitals) and those who commission and purchase healthcare on behalf of patients (regional health authorities).

“Stakeholders are those individuals, groups, or organizations who have a contractual, ethical, financial, or political interest (i.e., a stake) in the decisions and actions of a particular organization” [37, p. 20]. In the extant literature, there is a paucity of research that has illustrated multi-stakeholder perspectives in the public sector. Our research seeks to address this gap.

It should be noted that a third group of stakeholders, the consumers (patients) were studied as part of the wider research programme from which this research is taken. The researchers acknowledge that patients are key stakeholders but their perspectives were not included because their view of the relationship between purchasers and providers is very much over-shadowed by their own personal experience of the hospital. The patient does come into contact with a number of smaller internal stakeholder groups which may include the receptionist on the desk, nurses, doctors, rehabilitation staff and management, all of which colour the patient experience but is not the focus of this research paper.

The development of successful partnerships requires that an organization view its dealings with clients as a committed, long-term relationship, which cannot be secured only on the basis of superiority of the technical aspects of a service. For the purposes of this paper, we use the terms partnership, and cooperation somewhat synonymously in that we view each of them as denoting a more relationship marketing-like orientation towards interorganizational relations. Following Bull, we define partnership and cooperation to mean purchaser provider relationships based not on competition for short-term gains but on a long-term basis, which seeks to set and work towards common goals for mutual benefit [3]. Such relationships should be based on trust, on a clear recognition of needs and on a commitment to strive continually for higher standards of efficiency and service. Each of them embodies an interorganizational perspective based on the establishment and ongoing management of mutually-beneficial, long term relations that satisfy individual as well as shared organizational objectives [29][32][45], and in the case of the two major stakeholders under investigation, between the purchaser and provider of public healthcare services.

We begin by first reviewing elements of the stakeholder and relationship marketing literatures. We then describe the method of investigation, a single case-study approach, and compare and contrast the empirical findings from the field interviews with those findings already described in the stakeholder literature. From such comparisons, we identify and illustrate a number of factors that are important in the management of successful stakeholder relationships in a public healthcare setting. These factors are grouped into four major themes or 'core categories'. Finally, we present the theoretical and managerial implications of our findings for a future research agenda.

## **Background**

Interorganizational cooperation is now a way of working that is becoming more attractive to the public sector and public services. In the UK, public policy has decreed that those organizations involved in the supply chain of services must deliver “integrated care, based on partnership, rather than competition through a shared vision of those who both provide and purchase services [7]. This emphasis has taken interorganizational interaction in the supply chain beyond simple transactional exchange and into the realm of relational exchange, cooperation and partnership.

Crosby, Evans and Cowles demonstrate that opportunities in service partnerships depend mostly on trust and satisfaction, which comprise partnership quality [6]. There have been attempts to quantify the economic benefits of cooperation between purchasers and providers. For example Larson found that higher levels of cooperation between purchasers and providers led to lower total costs [26]. Additional benefits of positive partnerships include long-term loyalty and customer retention [21]. The received view has been that integration, through the consolidation of hospitals, support services, and health care professionals, can strengthen market position and lead to greater efficiencies [41][3]. Healthcare organizations typically face a diverse set of stakeholders with varied and frequently conflicting interests and goals. Healthcare managers face the challenge of greater accountability, to more stakeholders who are increasingly ardent in their requirement for information. Very few health care organizations have a clearly articulated and fully developed strategic approach to managing their key stakeholder relationships [2] and in the UK, strategic partnering and stakeholder management is not particularly evident. Having made reference to various stakeholders involved in healthcare service provision, we will now turn to the stakeholder literature.

Interorganizational arrangements are suggested as being vital to meeting public health goals, which necessitates actors involved in these arrangements having a stakeholder orientation [30]. All healthcare organizations have stakeholders. Stakeholder theory views cooperation as exemplifying the mutual acceptance among all stakeholders of each other's right to participate in the problem domain as well as the capacity to participate [14][15]. At the heart of stakeholder research is the basic premise that organizations have relationships with many constituent groups or "stakeholders" that have the ability to influence and that are themselves influenced by organizational decisions [25], citing [11], thus stakeholder theory attempts to classify these stakeholders into useful categories that help to explain how they influence firms' operations [39]. In addition, stakeholder theory is concerned with the nature of these relationships from both 'process' and 'outcomes' perspectives and assumes that the interests of all *legitimate* stakeholders have value [25].

Stakeholder theory also attempts to explain and predict organizational behaviour under stakeholder pressure [11][39], and can be positioned as a four step strategic planning process:

1. Identify all relevant stakeholder groups in relation to the issue being addressed;
2. Determine the stake and importance of each stakeholder group;
3. Determine how effectively the needs and expectations of each group are being met; and
4. Modify corporate policies and priorities to take into consideration those stakeholder interests not currently being met [11].

Polonsky, Suchard, and Scott have suggested an additional step whereby firms implement the planned strategy and make whatever adjustments are necessary if the desired outcomes are not being realized [31]. They argue that incorporating a stakeholder theoretical approach into modelling interorganizational marketing relationships makes strategies more realistic and better able to adapt and influence changes in the external marketing environment.

Freeman and Liedtka have refined this theory of management by describing four normative principles that can lead to success for a focal organization and its stakeholders [12]:

1. *Stakeholder cooperation* – in which value is created because stakeholders can jointly satisfy their wants/needs;
2. *Complexity* – in which the individuals belonging to various stakeholder groups are complex and act from different values, many of which are jointly determined and shared. This diversity in personal and professional values can lead to innovation (products and services) that benefit society;
3. *Continuous creation* – in which the institution is a source of value creation. Stakeholder cooperation while being motivated by values leads to new sources of benefit to stakeholders and allows for the emergence of creativity and innovation (see above);
4. *Emergent competition* – in which competition arises because stakeholders have options but this form of competition is based on the ability to manage the tension between simultaneous cooperation and competition amongst stakeholder groups.

We suggest that this stakeholder management model is applicable within the context of this research since the focal interorganizational relationship between service purchaser and service provider exists within a broader network of interorganizational stakeholder relationships. In addition, these findings support other published work that calls for more overt utilisation of stakeholder theoretical perspectives in managing stakeholders in the health sector [30].

## **Research Methodology**

### **The Case Site**

The data collection method utilized a single-case study approach using a subsidiary of a UK hospital (cardiac services). The researchers selected the research site because the hospital offered a number of interesting opportunities for study. A Trust was formed from the merger of two hospitals with very different cultures and management structures in the late 1990's, the aim being to develop a separate identity to promote the hospital as a 'centre of excellence' for the provision of cardiac services.. The purchasers had invested substantially in the creation of the new centre and wanted to see the hospital become the regional cardiac centre with centralized facilities

offering more extensive and accessible services for patients. With the additional resources provided by the merger, the purchasers foresaw that the increased capacity would attract more business from outlying areas.

#### **Research Method and Procedure**

We employed a qualitative interview approach for gathering and analysing major stakeholder (provider and purchaser) perceptions of their interorganizational relations and how these interactions impact on the quest of the healthcare provider to meet the needs of the community they serve. The interviews focused on the nature of their relations and how stakeholders in the supply chain can work together in delivering healthcare.

We began by collecting "grounded events" or actual incidents describing the operation and working of stakeholder relationships within the healthcare value chain [13]. These events or incidents were then analysed to reveal broader patterns. Our concerns, in examining the perceptions of stakeholder relationships, relate to the actors' construction of 'reality', and are 'interpretivist' in nature, our aim being to better describe, understand and explain the nature of the relations between the two major stakeholders. Others would recognize its contribution as being functionalist in nature in as much as its findings may suggest how practitioners may begin to ascertain how stakeholder relationships might be managed more effectively.

We promoted data reliability firstly, by using a case study protocol in which all the informants were subjected to the same sequence of entry and exit procedures and interview questions; secondly, by creating similarly organized case databases for each stakeholder. Construct validity was enhanced by using multiple sources of evidence and by establishing a chain of evidence as each interview was concluded. External validity was promoted by the research design itself, whereby all stakeholders belonged to the same industry. Finally, the authors addressed internal validity by the 'pattern matching' data analysis described by Yin [42].

#### **Data Collection**

In keeping with the chosen case-study method, multiple sources of data collection were used. Data was collected from hospital staff comprising the director, consultants (2), managers (4), technical staff (2), nursing staff (4) and healthcare purchasers representing local healthcare authorities (5). Each interview lasted between two and four hours and the interview results were then combined with other documentary evidence provided by the healthcare provider and purchaser to produce a detailed case study report on each stakeholder. A total of eighteen respondents were interviewed over a 3-month period - May-July 2001 (the full interview protocol is available from the authors). Immediately after the interviews, the researchers recorded and crosschecked facts, as well as their own personal perceptions and impressions. We followed a particular protocol for "within-case" analysis (Yin, 1984). The '24 hour rule' required that detailed interview notes and impressions were completed within one day of the interview. The interview results were then combined with other primary sources of documentary evidence provided by the stakeholders to produce a detailed case study report on each one. The reports were then returned to the interviewees to be checked for accuracy. When accuracy was confirmed, the case study evidence was deemed suitable for analysis.

#### **Content Analysis**

The analysis followed the sequence of steps described in Miles and Huberman [28, p. 10], who "define analysis as consisting of three concurrent flows of activity: data reduction, data display, and conclusion drawing/verification". Data reduction was undertaken for each of the 18 interviews; mainly using literature-based codes grounded in the relationship marketing and stakeholder relationships literatures. Codes were organized with the NUDIST software (version 4). The codes were arranged in the form of 18 within-case displays which took the form of a matrix or a network according to which was most appropriate to the interview being analysed [28]. The 18 displays were then integrated and synthesized into fewer cross-case displays capturing stakeholder experiences of strategic partnerships.

Each interview was taped and then transcribed in full. The analysis phase employed a three-step content analysis procedure [13][28]. In a first "unitising phase", the transcripts were broken down into "thought units" or first-order themes that ranged from a phrase to several sentences. Second, in the categorising phase, the thought units were organized into emergent categories or second-order themes. The assignment of labels to each category reflected attempts to capture the perceived communality or shared message amongst the thought units. An additional researcher was utilized to complete an independent content analysis and mediate disagreements. Independently derived findings were then compared and contrasted. Finally, in this classifying phase, the categories

emerged or metamorphosed into four final themes or 'core categories' that provide a summary of "what is going on" in the data [40].

## **Research Findings**

Analysis of the transcribed interviews yielded twenty-seven first-order themes, eleven second-order themes and four final themes. These themes represent provider and purchaser views on those factors characterising stakeholder relationships within the purchaser-provider dyad. Table I illustrates the themes derived from the three-step content analysis procedure. The reader is encouraged to use this table as a guide to the commentary that follows. Refer to Table I.

### **Theme 1: Relationship Dynamics**

Interviewees from the hospital and purchasing authority made statements regarding the relative strength of partners, the cooperation versus competition dilemma, and trust. We organized these second-order themes into the final theme "Relationship Dynamics". The hospital did not perceive losing the purchaser as a possibility. However, the majority of purchasers referred to a lack of confidence in the management of the hospital but recognized that they were more or less 'stuck' with it. They also expressed concern investing a considerable amount of money in the service and were now (two years on) still waiting for the hospital to show a return on that investment in terms of outcomes, volume of work and a drop in in-patient waiting lists. For example, one purchaser stated: "I think we look at them and say they're a disorganized crew, they need to get some of their internal act together first before there are opportunities for us to work closely together".

Perceptions of mistrust were also evident. For example, one purchaser stated: "There is a lot of work needed at the hospital to overcome a feeling of distrust and unhappiness about the way that the centre works. It's not about creating a centre of excellence it's about forging the link with the public". Theme 1 also incorporates the extent to which stakeholders perceive cooperation and competition. The director of the health centre stated: "The internal health market has gone somewhat . . . we don't compete anymore. We are working well as a partnership. We've now got to reinterpret the context and translate that into a meaningful feature for the heart centre". The director of the heart centre also stated: "The future has to be about a great deal of sign-up. Given that we have an epidemic of coronary heart disease and that it is a priority for the government, we've got to think hard about working with other people, partnerships outside the hospital, prevention, primary rehabilitation, secondary rehabilitation and pathways of care, that's the direction that we have to be moving forward".

### **Theme 2: People/Organizations**

The second-order themes that emerged from the case data included (see Table I): cultural fit and compatibility, managing personalities and open communication. We organized these categories into the final theme "People/Organizations". Both purchasers and providers identified the lack of a shared culture, where individuals are essentially doing as they pleased. One purchaser stated: "They are badly organized, poorly managed with no shared clinical culture. They make poor use of the best facilities in the UK which quite frankly is a scandal". The director of the heart unit stated: "Providing an excellent service must be built around clinical networks that operate in the interests of the patients who are sick and need the expertise of the specialist hospital". The centre's managers also identified culture compatibility. One manager stated: "There has not been a resolution about merging the two cultures and those cultures have not been overcome by a generation of people who feel like they are working as part of a team. They can't get the systems to work and provide information, they can't retain nurses".

Purchasers were very aware that individuals within the unit were working in ways that suited themselves rather than their colleagues. Both groups agreed that managing personalities, usually those of the consultants, was a problem. One of the heart centre managers noted: "Deflating some egos would be helpful along with building properly managed clinical networks across the wider community to ensure better flows of patients into the system and out again". One technical staff member stated: "They've got to get themselves organized and managed whereby the surgeon is not king, that the staff have confidence in the management structure to deliver".

Open communication was another problem for both groups. One purchaser stated: "We have little or no idea of how patients are selected for surgery. We have never been provided at the health authority with that

information. We try to find out how patients are referred in. There is a perception in this part of the world that our patients wait longer. So we don't feel that we are being dealt with fairly". Similarly, one of the unit's managers asserted: "We don't meet the needs of some of our stakeholders well enough or often enough. I don't think we're focused on standards sufficiently. We are not focussed enough on what it is those people who are supporting us as commissioners, purchasers, GP's, district cardiologists whoever (want). We are more focused on exploring the personal and professional interests of the people who work within the organization".

### **Theme 3: Propensity and Capacity to Cooperate**

Provider and purchaser respondents also identified both the willingness and the means to cooperate. This theme was characterized by three second-order themes (see Table I): first, compatible objectives; second, complementary skills and resources; third, a support climate for cooperation.

Both groups agreed that the resources are in place to make a dramatic difference to the treatment of coronary heart disease. But, what was holding them back was a lack of any organizational skills and a common culture moving the unit forward. Thus, there were problems with integrating different corporate cultures and creating an environment that would facilitate cooperation. Regarding the issue of resources, frustration was evident on both sides as one senior provider stated: "Why have we run for almost eighteen months with a brand new theatre that hasn't been utilized", while purchasers held the view that, "We see it as a centre with the physical resources but the inability to utilize those resources". One purchaser noted: "What they are looking for is a degree of stability in terms of commissioning the contract, which takes them a long way into the future that allows them to invest in services. But from our point of view we have been incredibly patient keeping the business there when everything tells us we ought to get out of this". Bridging the resource and systems issue, one purchaser commented: "You can't go shopping around, you have to have a system that is stable and provides continuity. But it does doesn't matter what we put in agreements, if they can't even provide the volume with all the resources that are available".

Compatible objectives, or lack thereof, were identified as being particularly problematic. Provider perspectives included one nurse noting: "Its got to look towards drawing different departments together, for example cardiac surgery works as cardiac surgery, cardiology works as cardiology. The holistic experience, the non-clinical aspects should be looked at as well, they make up the patient experience. Ultimately at the end of the day there's the patient sat in the bed and we are not looking at things holistically for that person sometimes". The issue of how to actually realize shared agendas was evident in comments made by one of the consultants: "Well my patients are on a waiting list and I want them off it. My agenda is to get more work done. The management's agenda is the same but how do we balance the books and get more work done when nobody's got anymore money and there are more people to be put through the system". The notion of problematic agendas was raised by one of the purchasers who complained that "The other agenda is pressure about artificially created targets, patients charter standards which they have to worry about. If it says thou shalt not have patients more than eighteen months on your waiting list they have somehow got to meet that target and they sometimes ask about ways that we can deal with that. Those sort of nagging issues only come along every now and then when the politicians decide to focus on one issue and then it sits in the headlines for a while and then it dies a death and nobody bothers".

The environment created by the existence or otherwise, of a support climate for cooperation, was also identified by purchasers and providers. As one manager noted: "There are a large number of individuals all working in isolation and they are not connected up which prevents the hospital from moving forward". This theme of stakeholders working in isolation is echoed in the perspective of one of the consultants who commented: "We want to do away with some of the barriers, how can you create excellence in a vacuum or in a desert. It should seek to influence and be influenced by its constituent parts. It's not in isolation". Somewhat more direct, one purchaser described the situation as: "I would describe the hospital as a failing dysfunctional organization. Each surgeon has a different system of managing and organising the patients". Additionally, one purchaser stated: "We don't actually know which groups of patients are given the preference regarding being put forward for surgery at the moment and we would like to know. I would like to commission for equality of access which then means you've got to have surgeons working as teams not as individuals".

### **Theme 4: Systems and Procedures**

Two second-order themes emerged from the case data to describe this final theme (see Table I): first, monitoring customer responses and second, the need to measure, monitor and review outcome measures. Hospital managers

were all too aware of the need to justify to their purchasers the cost and clinical benefit of the procedures that they perform. From the purchaser's point of view, it is not only the technical aspects of the service that are seen as important in evaluation. All of the purchasers agreed that they did not receive enough information about the service they were paying for. One purchaser stated: "I am led to understand their outcomes measures are up there with the best but I have never seen any evidence of this". This purchaser had invested a significant amount of money setting up the centre to be regarded as the primary centre for healthcare but they found themselves increasingly frustrated with the performance of the centre whom they regarded as complacent. One of the criticisms, which was voiced regularly by the purchaser, was the lack of information provided by the centre. They also believed that the outcome measures they used were limited and did not provide the variety of information needed to understand how well the centre was functioning. One purchaser commented: "They've got a clear outcome that they can measure 'death' because there are some specialities where people die, its not necessarily anybody's fault but they can measure it. This is absolutely scratching the surface in a very superficial way". Another purchaser stated: "They have not even thought about how they are going to measure outcomes in other areas where the outcome is not so clear cut, where there is a fair amount of greyness between a good outcome and a bad outcome. They have absolutely no idea how to do it. Measuring cardiac outcomes is the easiest possible specialism and they are finding out how difficult it is".

The management at the centre were also acutely aware that they were not satisfying the purchasers with respect to the type and amount of information they were providing. The director stated: "We don't meet the needs of some of our stakeholders well enough or often enough. I don't think we're focussed on standards sufficiently". Management were also aware that the communication problems were also causing difficulties amongst the staff themselves. Staff groups were identified who did not share information with their colleagues even detailed information such as their surgery selection process. One manager commented: "How do you measure the quality, the wisdom of a surgeon who decides he'll operate on one patient and not another?" Management also expressed the view that the lack of communication between staff groups was impeding their performance as a unit. The director stated: "In terms of these performance indicators that will be coming up, from our point of view we've got to pre-empt them by knowing what's happening everywhere else in the country. Are they undertaking best practice, whether it's length of stay or the treatment process?"

## **Discussion**

The final themes that emerged from this research include such interdependent factors as relationship dynamics, people and organizations, propensity and capacity to cooperate, and systems and procedures. Reference to Table I illustrates that many of the resulting themes identified by the major stakeholders interviewed in this research support the extant literature on relationship marketing. For example, Polonsky, Schuppisser, and Beldona cite a number of relational factors that can influence how stakeholder relationships evolve, including relationship orientation, trust, communication, learning, power, reciprocity and commitment [32]. These relational factors fall predominantly within the People/Organizations and Systems and Procedures themes where there is an emphasis on establishing, developing and maintaining successful relationship exchanges.

However, a number of our resulting themes are also evident in the stakeholder literature. The more obvious factors illustrated in Table I that have links to the stakeholder literature fall within the 'Relationship Dynamics' and 'Propensity/Capacity to Cooperate' final themes This encompasses such second-order themes as the perception of power in the relationship, the competition dilemma, and having complimentary skills and resources. We suggest that by framing these results using a stakeholder theoretical perspective, this presupposes the interdependence among the identified relational factors as opposed to seeing them solely as independent and dependent variables.

Our further analysis and synthesis of the findings contributed to the development of an illustrative framework (see Table II) for mapping the state of relationships using the final themes that emerged from our analysis plotted against a continuum of cooperation/partnership. Our illustrative framework draws on and brings together the views and perspectives of the major stakeholders involved in the provision and delivery of healthcare, and factors identified in the relationship marketing and stakeholder literatures. We suggest that this framework

enables the application of stakeholder theory to the analysis of interorganizational relations between purchaser and provider within a public healthcare context. Refer to Table II.

What becomes apparent from Table II is the appearance of the purchaser-provider stakeholder relationship dealing with the reality of transitioning from the competitive Conservative quasi-market to the New Labour cooperative approach to healthcare provision and delivery. It clearly demonstrates a marked difference between a 'propensity to cooperate' mindset and a 'capacity to cooperate' reality. We suggest that both provider and purchaser share a cooperative relationship mindset in that they understand that their own success is tied to the success of the other. They have common objectives in terms of relevant health outcomes and both parties are highly committed to the relationship. This interpretation is supported by the propensity/capacity to cooperate theme. However, our findings indicate that the purchaser-provider stakeholder relationship has elements of both cooperation and non-cooperation. Specifically, the remaining three final themes in Table II illustrate elements of both cooperative and non-cooperative orientations, suggesting a dichotomy between propensity and capacity to cooperate. These findings are not surprising given that many post-merger integration problems can be attributed to poor stakeholder management [23].

There are a number of implications of framing our research findings using this illustrative framework. We suggest that in this public healthcare setting, both purchasers and providers should carefully consider those organizational and management issues pertaining to the four themes that emerged from our analysis that are necessary to move stakeholder relationships from a non-cooperative orientation to one of cooperation. This could involve embracing the normative principles of stakeholder management suggested by Freeman and Liedtka [12]. A fundamental question for both stakeholders is to establish what measures in each stakeholder's context are necessary to facilitate changes in relationship orientation. The emergent themes provide some starting points for each purchaser/provider stakeholder to signal to the other that it seeks to improve the relationship. For example, recall that the provider stakeholder is comprised of a number of smaller stakeholder groups, thus achieving overall consensus (with respect to trust, communications, standards, information, etc.) amongst these internal stakeholders would signal to the purchaser stakeholder a desire to take the relationship to one that embodies both a capacity as well as a propensity to cooperate. As evidenced by the nature of relations among internal stakeholders within the provider side of the purchaser-provider dyad, a major implication of the findings is that healthy interorganizational relations depend upon good relations *within* each organization, thus successful interorganizational cooperation requires internal marketing and a receptive internal organizational culture [18][20][17][5][10].

## Conclusions

Our research explores the use of a more pronounced stakeholder theoretical perspective in analysing purchaser-provider relationships in a UK public healthcare context in an effort to assist stakeholders in managing cooperation and optimising a partnership mentality. Specifically, the case site investigation presented in this paper was carried out with the purpose of examining stakeholder relationships in a public healthcare setting. The emergent themes helping to describe perceptions of the various stakeholders are consistent with theoretical and empirical research cited in the wider stakeholder and relationship marketing literatures. Although the factors identified from the research were not validated quantitatively, we propose that they have face validity for managing and evaluating interorganizational relations. Quantified validation of these factors is suggested in future research.

We did not set out with a pre-determined construct of successful cooperation to test in this case study. Rather, from our findings, we looked for themes and presented an illustrative framework for mapping the state of stakeholder relationships. In the case of the UK, Government policy of 'joined up thinking' between providers and across purchasers and providers is intended to improve service encounter experience and efficiency of provision. We believe the stakeholder cooperation approach advocated in this paper can make a legitimate contribution to this improvement. Specifically, when evaluating interorganizational relationships, it is essential that managers in the supply chain of public healthcare purchasing and provision adopt a stakeholder approach in identifying and evaluating those factors that characterize the relationships that stakeholders have with each other. In addition, we suggest that the results of our analysis (illustrated in Table I) can be incorporated into a illustrative framework (see Table II) that

assists managers in identifying the current state of their stakeholder relations. This should encourage managers to then think strategically about how to maintain or enhance the nature of their interorganizational relationships i.e., remaining in a cooperative stakeholder relationship versus seeking to move the relationship from a non-cooperative orientation to one of cooperation. Although the US healthcare environment is much more competitive, and has a more pronounced for-profit, private sector involvement, recent studies have shown that where there is evidence of more cooperative interorganizational relations resulting in fully integrated delivery systems, positive outcomes are achieved in such areas as clinical quality, organizational survival and fulfilment of stakeholder needs [38].

The public sector is now characterized by cooperation and partnerships in the supply chain of public services. The policy and public pressures that have led to this have emphasized the need for public sector organizations to consider how they work together to form cooperative partnerships leading to more efficient services, which deliver enhanced user satisfaction. This research shows that both parties are very aware of this, though purchasers of healthcare have higher expectations and greater disappointment than their suppliers who are internally focused. They see this lack of focus arising out of their failure to fully understand and meet the needs of their stakeholders, confirming the need for the application of a framework that describes the organizational and management issues that influence the current and desired state of stakeholder relationships. In our research, these organizational and management issues were encapsulated by four emergent themes.

The case study method used in this study has limitations recognized by several of its proponents. As with any qualitative study, risk may be associated with recall bias and selective reporting [1], and the nature of data may lead to findings with limited validity, reliability or generalizability. However, authors such as Yin, Eisenhardt and Gummesson have long advocated theory building grounded in case study research [43][44][9][19]. Here, in order to enhance the reliability and generalizability of our findings specific to a public healthcare value chain setting; the two major stakeholders were selected and researched. Additionally, confirming the veracity and accuracy of the information and findings with interview subjects assessed data validity.

The use of retrospective accounts and perceptions of stakeholders can also present limitations. Although the use of recall and retrospective accounting was inevitable in some sense, it was nevertheless appropriate given the desire to explore the thoughts and thinking of different groups in the healthcare value chain. Such measures of perception are potentially subject to various forms of response bias, for example, the confirmation bias reported by Bazerman and others [1]. A suggestion as to how this might best be dealt with in future research would be to adopt more of a longitudinal perspective such that repeated access to key informants might be possible. In this way, earlier findings can be validated against subsequent findings through the ability to have key informants clarify, confirm or even disconfirm earlier data. In this manner, there is an additional measure of triangulation; not so much from multiple sources of data but through more long-term access to the source of data.

Future research should attempt to analyse more examples of this sort of interorganizational cooperation; either qualitatively through the accumulation and comparison of in-depth case studies, or through large-scale quantitative surveys whereby some of the themes and categories identified could be refined into more specific hypotheses that could be tested in an array of cooperative interorganizational relations scenarios. In addition, whereas we have suggested that the incorporation of a stakeholder approach to managing interorganizational relations is desirable, future research might attempt to actually guide the development of specific management strategies for achieving optimal interorganizational relations. Lastly, although patients are acknowledged to be stakeholders, future research might explicitly include their perspectives, since they will provide a very different stakeholder viewpoint.

# The Performance Effects of Bank Mergers: A Malaysian Case

*Faoziah Idris.*

*Norafifah Ahmad*

*Marwan Noraini Ismail*

*Universiti Utara Malaysia, Malaysia*

## Abstract

This paper investigates and compares pre and post-merger operating performance of acquiring banks of the recent banks mega mergers in Malaysia. Using a sample of 37 banks for period beginning 1988 through 2002, a period characterized by major changes in the banking sector. The merger exercises provide an opportunity to Malaysian banks to improve their efficiency and to enhance their competitiveness in view of ongoing financial liberalization. The findings reveal that bank characteristics such as bank growth and market growth are found to be significant and played a role in explaining the differences in pre- and post-merger performance. Capital asset is found to be significant in explaining the impact of the post-merger of the acquiring banks.

## Introduction

A variety of reasons have been advanced as to why banks merge. The rationales behind the increase in merger activities are being constantly analyzed to identify or provide answers to the frequently asked question about merger exercise: can merger affect bank post performance? Merger suggests a non-value-maximizing effort for the firms involved, although in most cases, mergers are justified on the basis that the new enlarged entity will be able to be more efficient in its use of resources, and thus operate at lower cost, or achieve greater revenue from cost base. In either case, the merged institutions should be able to increase returns to shareholders (Berger, Demsetz and Strahan, 1999).

Another important reason for the merger is the international consolidation trend in financial service issue. Since the mid- to late 1980s, many bank analysts as well as academic researchers have argued that bank mergers resulted in efficiency gains. The mergers also provide an important experiment in which to examine the public policy tradeoff between potential cost efficiency gains from consolidation and potential social efficiency losses from greater exercise of market power. On the other hand, some researchers have reservation on the findings on efficiency gains of merger exercises. A number of empirical studies show that there is no evidence of efficiency effect of horizontal mergers, and that such mergers did not, on average, yield efficiency gains. Empirical studies reported a disappointing operating performance results from merger activities in many industries (Rhodes, 1993)

A review of past literature indicates that there is no consensus for explaining the apparent popularity of mergers. However, conceptual theory and strategic management theories suggest that merger may improve the performance of the acquiring firm and merging should be to improve overall performance and to yield benefits in the form of increased efficiency (Lubatkin, 2001). To date, empirical studies have not supported the conclusions of the above suggestions. In the field of finance and banking, the studies generally find that mergers do not benefit the acquiring firm with a return greater than it would receive from other investment – production activities with similar level of risk. In spite of the mushrooming knowledge on the *causes* and *consequences* of bank mergers, particularly in the United States, few conclusions from this growing body of research seem “safe” today as contradictory and conflicting evidence continues to unfold along both the private and public dimensions of the bank merger process.

Results from well-documented empirical studies on mergers and acquisition of banking institutions suggest that only large and diversified banks can compete effectively and efficiently, not only in the domestic market, but more so in the international bank and capital market environment. As a result, the banking system has entered an era of restructuring and reorientation of activities in order to intensify competition among banking institutions and paved the way for the introduction of new financial instruments and practices.

Similar developments were also observed in the Malaysian banking system, as Malaysian banks had to adjust to the new conditions that resulted from gradual liberalization of the domestic financial market to increase

competitive environment in recent years. Merger in Malaysian banking sector has reached a record level since the government initiated liberalization in the banking sector in response to the 1997 Asian financial crisis, a period where a number of banks in the region had to close down. Rapid globalization has necessitated bank to merge in order to survive the onslaught of greater competition. The experience of United Kingdom, Australia and Singapore has proved that consolidation in the financial sector is both viable and desirable.

However, there are scant studies in the banking literature about the impact of bank operating performance on mergers in Malaysia firstly because of the country's small market and bank size and secondly because most merger studies, here and elsewhere, eliminate financial services and other regulated industries because of the impacts of changes in regulations.

In line with the limited studies carried out on Malaysian bank mergers and the ongoing debate on the effect of mergers on firm performance, our study is undertaken to fulfill three key objectives by providing empirical evidence on performance of Malaysian banks during the regulated period. The first objective is to investigate whether mergers generally improve the operating performance of acquiring banks. Relative indicators for acquiring and acquired banks will be compared to allow an assessment of the impact of merger on operating performance, and shed some light on the extent that operating performance influence mega-merger. The evidence on the effects of operating performance will be examined by measuring the overall bank profitability. The second objective is to investigate some of the possible factors that could influence performance of acquired banks. This study will present results of whether acquired firms are poor performers (due to bad management or other reasons that influence operating performance). The last objective is to investigate whether banks benefited from the so-called forced merger, by examining the differences of the performance of both (acquiring and acquired banks) during the pre-merger period.

## **Historical Background of the Merger Movement in the Malaysian Banking Industry**

The process of getting the banks to merge in Malaysia started in earnest in mid-1980s as a result of economic recession. The policy however, had always been to allow market forces to dictate the merger pace. The banking crisis in the mid-80's propelled a number of weak commercial banks and finance companies into insolvency and financial distress. These institutions were badly hit by the 1985-86 recession as they were saddled with huge levels of non-performing loans (NPLs). Given the severity of the losses, the Malaysian central bank (Bank Negara Malaysia) has advocated and recognized that a financial system with numerous small-sized banks are less efficient and unstable, and the banks must merge if they were to survive in the face of greater and stiffer competition. The issue becomes more urgent with the increasing pace of globalization and financial liberalization. With the need of countries to open up their financial markets to further entry of foreign banks, consolidation was inevitable for banks to be more competitive in the global market.

The need to merge was even more imperative in the face of the 1997 Asian Financial crisis where the viability of the financial sectors of the Southeast Asian countries was threatened. Malaysian regulatory authority responded proactively by embarking on a program of strengthening the banking sector. This consolidation was in line with the government's policy not to bail out weak banks but to rationalize business towards higher productivity.

Given the severity of the weak banks and the need to maintain integrity of public saving and the stability of the financial system, Bank Negara Malaysia had to implement a rescue scheme by initiating a merger program. The announcement on the merger exercise was called on 31<sup>st</sup> August 2000 and banks were required to complete their merger exercise by 31<sup>st</sup> December 2000. The whole consolidation exercise was to merge the perceived smaller financial institutions with the bigger ones (the "anchor" banks).

## **Research Design**

### **Methodology**

This study examines the operating performance of the acquiring commercial banks in Malaysia mega merger over the period 1988 – 2002. The analysis compares the performance profile of pre-merger to post-merger period.

Following the methodology in (Rhodes, Stephen 1986) acquiring and acquired banks were treated as a combined entity before merger. To measure the pre-merger performance, the study combines the ratio (accounting data) of acquiring and acquired banks to obtain pro forma performance for the merged firms. A comparison of the post-merger value with this pre-merger benchmark allowed us to measure the impact of the merger on the performance of the combined entity. T-test was employed on some key accounting profitability ratios. The profitability was measured as net income after taxes and securities gains and losses before extraordinary items as a percentage of total assets.

The sample consists of all 37 acquired and acquiring commercial banks. Data were extracted from financial statements of the sample banks obtained from the Bank Negara Malaysia (BNM), *Persatuan Bank Malaysia*, Association Bank Malaysia, the library of Universiti Utara Malaysia and the headquarters and branches of respective banks. The data covered a four year period prior to, and two years after the merger year (Healy et al., 1992) In this study the examination of financial profiles of the acquirer and acquired bank for two years after the merger would allow a time period that was sufficient for any potential economic gain to be realized. The sample periods were selected and focused on recent acquisitions so that there would be sufficient pre- and post- merger operating performance. In analyzing individual mergers, this study excluded the year in which the merger or acquisition occurred since the accounting data could often be unhelpful. For example, some mergers and acquisitions of banks occurred before the end of the relative financial year. As such data obtained include both the acquiring and target bank, while other mergers occurred after the financial year-end, with data available for the acquiring bank only.

In measuring the performance of the acquisitions, most of the studies on pre- and post-merger utilized industry performance indicators as the benchmark. Following Rhodes and Stephen (1990), observed post-merger differences in performance between non-acquired and acquired banks are used as benchmarks for comparison of efficiency. However, such performance indicators and benchmarks are not available in Malaysia, especially for all the mergers (considered mega mergers) taken as samples in this study.

Both profitability and operating cost ratios were computed for every bank up to four years prior and two year after the merger event. This study uses operating cost as the primary measure of performance efficiency (Rhodes, 1990) to indicate whether the acquired banks perform differently, in term of profitability and costs before they are acquired. Such difference would be apparent if, for example, acquiring firms generally sought out poorly managed firms to acquire. Presumably such firms would tend to have relatively low profit and high cost. In any case, these tests should indicate whether any observed post acquisition differences in profit and cost performance might be a result of the acquisitions rather than simply a reflection of long-run performance difference that existed before the acquisition.

## Results and Conclusion

In this section, we present the empirical test results based on two sets of profile. The comparison of the relative performance indicators for acquiring banks allows an assessment of the impact of the merger. The test of the hypothesis on merger involves the acquiring bank taking over an under-performing bank. The performance indicators consist of variables of bank profitability and operating cost. Using independent t-tests and multiple regression analysis, the tests are intended to determine whether acquiring financial institutions performed differently before and after merger:

$$P_i = f(S, MS, L/A, C/A, BG, MG)$$

Where

$P_i$	=	Performance measures
$P_1$	=	NI/TA = Net income/Total assets
$P_2$	=	OE/TA = Operating expenses/Total assets
S	=	Assets size of bank
MS	=	Bank's share of market deposits
L/A	=	Loan -asset ratio
C/A	=	Capital-asset ratio

BG = Growth of total bank deposits  
 MG = Growth of total market deposits

The specific measures of performance used to represent these factors are defined in Table 1. We examine these two indicators of bank performance in an attempt to identify specific areas within the merged banks where improvement occurs.

The measurement of profitability is return on assets (ROA). Profit variables are calculated both before and after taxes. Tax liabilities in banks can be influenced mainly by international activities and loan loss accounting, which may be unrelated to the merger. Due to the unavailability of market data, we used book values of assets.

TABLE 1: PERFORMANCE MEASUREMENT

Variables	Measurements
Profitability	Return on asset (ROA)
Efficiency (operating costs)	Total operating costs (excludes interest expenses) as a percentage of total assets
Firm size	Total assets during the study period
Market share	Percentage of total commercial bank deposits in a market held by a bank over the study period
Loan-asset ratio	Average of total loans as a percentage of total assets over the period study
Capital-asset ratio	Average total capital as a percentage of total assets over the period study
Bank growth	Annual percentage change in deposits over a period study
Market growth	Percentage change in commercial bank and finance companies deposits in the market during the period study

The analysis covers a period starting 1988 until 2002. For each of the years surrounding the merger, we calculate the mean value of different ratios for the banks involved. There are three profiles involved in the calculation. The first profile represents acquiring banks of which ratios prior-merger and to and post merger are calculated. The second profile established to investigate what factors influencing the acquisitions and thirdly profile of both the (acquiring and acquired) bank compares the value of the operating performance before acquisitions.

TABLE 2: DESCRIPTIVE STATISTICS

	Range	Mean	Std. Deviation	Variance
Roa	.0786	.005609	.0113323	.000
opcost	.0543	.024850	.0100185	.000
fsize	9.1169	23.630206	1.2553630	1.576
mktshare	.2447	.065759	.0615657	.004
loanaset	.3957	.613727	.0851571	.007
capasset	.1349	.049935	.0276032	.001
bankgrwt	2.0774	.231593	.3892845	.152
mktgrwth	1.7896	.131658	.3152482	.099
Valid N (listwise)				

Table 2 shows that the mean percentage for ROA is 0.01%, operating cost is 0.02%, firm size is 23.63%, market share is 0.07%, loan asset is 0.61%, capital asset is 0.05%, bank growth is 0.23% and for market growth is 0.13%. The mean for the eight variables range are from 0.005609 to 23.677705.

TABLE 3: CORRELATIONS

		roa	opecost	fsize	mktshare	loanaset	capasset	bankgrwt	mktgrwth
Roa	Pearson Correlation	1							
opecost	Pearson Correlation	-.794**	1						
fsize	Pearson Correlation	.097	-.103	1					
mktshare	Pearson Correlation	.110	-.085	.657**	1				
loanaset	Pearson Correlation	-.221	.308*	-.296*	-.160	1			
capasset	Pearson Correlation	-.015	-.002	.417**	-.379**	.057	1		
bankgrwt	Pearson Correlation	.040	-.281*	-.038	-.050	-.105	.091	1	
mktgrwth	Pearson Correlation	-.052	-.192	.036	-.017	-.099	.118	.955**	1

\*\* significant at the 0.01 level (2-tailed).

\* significant at the 0.05 level (2-tailed).

Table 3 shows that firm size, market share, loan assets, capital assets, bank growth and market growth have weak correlations with ROA. Loan asset has the highest correlation (-0.221), market share is the next largest (0.110) but the capital assets is the lowest correlation (-0.015). The firm size, market share and bank growth have positive relationship with ROA and this figure shows that one percent increase in firm size, market share and bank growth will increase ROA by 0.221, 0.015 and 0.052 percent. Instead, all independent variables have weak correlations with ROA. Loan assets has the highest correlation (0.308), bank growth is the next largest (-0.281) but the capital assets is the lowest correlation (-0.002). All these independent variables have negative relationship with operating cost except for loan asset. This figure shows that one percent increase in firm size, market share, capital assets, bank growth and market growth will decrease operating cost by 1.03%, 0.85%, 2%, 2.81% and 1.92%. However, the result is different for loan assets because this variable has positive with operating cost. The positive sign indicates that as loan asset increase one percent, operating costs tends to increase by 3.08%.

About 17% of the ROA variation in acquiring banks' performance is explained by firm size, market share, loan asset, capital asset, bank growth and market growth. This shows that the relationship between these variables and acquiring banks performance in Malaysia is weak. The operating costs result show that approximately 28% of the variation in operating cost is explained by firm size, market share, loan asset, capital asset, bank growth and also market growth. Therefore, the result indicates that the influence of independent variable on acquiring banks performance in Malaysia's is less rather than other factors.

TABLE 4: COEFFICIENTS

Model		Standardized Coefficients (Beta)	t	Sig.
1	(Constant)		-.482	.632
	fsize	.244	.596	.554
	mktshare	-.046	-.124	.902
	loanaset	-.165	-1.111	.272
	capasset	.128	.836	.407
	bankgrwt	1.233	2.430	.019**
	mktgrwth	-1.273	-2.480	.017**

**a** Dependent Variable: Return on asset

\*\* P < 0.05

The estimated model is:

$$\begin{aligned} \text{ROA performance} = & - 0.061 + 0.244 \text{ fsize} - 0.046 \text{ mktshare} \\ & - 0.165 \text{ loanaset} + 0.128 \text{ capasset} \\ & - + 1.233 \text{ bankgrwt} - 1.273 \text{ mktgrwth} \end{aligned}$$

Table 4 indicates that the significant value for all variables is greater than 0.05 except for bank growth and market growth. Therefore, there is no significant relationship between ROA and firm size, market n share, loan asset and capital assets. On the other hand, we can conclude that the relationship between ROA and these independent variables is statistically not significant. However, the result is different for bank growth and market growth because their significant value is less than 0.05. Therefore, we can conclude that a significant linear relationship exists between ROA and bank growth and market growth.

TABLE 5: COEFFICIENTS

Model		Standardized Coefficients (Beta)	t	Sig.
1	(Constant)		1.223	.227
	fsize	-.430	-1.129	.265
	mktshare	.211	.617	.540
	loanaset	.230	1.668	.102
	capasset	-.162	-1.139	.260
	bankgrwt	-1.423	-3.014	.004**
	mktgrwth	1.230	2.575	.013**

a Dependent Variable: Operating cost

\*\*P<0.05

The estimated model is:

$$\begin{aligned} \text{Operating cost performance} = & 0.142 - 0.430 \text{ fsize} + 0.211 \text{ mktshare} \\ & + 0.230 \text{ loanaset} - 0.162 \text{ capasset} \\ & - 1.423 \text{ bankgrwt} + 1.230 \text{ mktgrwth} \end{aligned}$$

Table 5 also similar with ROA coefficient result, which is the significant value for all variables are greater than 0.05, except for bank growth and market growth. Therefore, there is no significant relationship between operating cost and firm size, market share, loan asset and capital asset. However, the result is different for bank growth and market growth because their significant value is less than 0.05. Therefore, we can conclude that a significant linear relationship exists between ROA and bank growth and market growth.

TABLE 6: GROUP STATISTICS

	Mean before merger	Mean after merger	Std. Dev before merger	Std. Dev after merger	t-value	P-value
roa	.006097	.005350	.0109841	.0108550	0.495	0.521
opcost	.024608	.025066	.0098116	.0096189	-0.278	0.776
fsize	23.565265	23.832795	.8208855	1.6058994	-0.563	0.277
mktshare	.057998	.079606	.0570289	.0674764	-1.392	0.368
loanaset	.613493	.608863	.0871447	.0850016	-0.030	0.831
capasset	.050242	.051203	.0322233	.0219711	0.158	0.022
bankgrwt	.284147	.098082	.4481527	.2941268	1.456	0.085
mktgrwth	.137472	.124571	.3556242	.2163700	0.200	0.247

The acquiring financial institutions performance and efficiency after and before merger are shown in Table 6. According to the above result, the significant t-value for all variables are not significant ( $>0.05$ ) except for capital asset. Therefore, we can conclude that there is no significant difference in all variable measurement for acquiring financial institutions performance before and after merger except for capital asset. For capital asset, the significant value is less than 0.05. Thus, we conclude that there are significant differences in capital asset measurement for acquiring banks performance before and after merger. The finding is consistent with Rose (1987), which also found that profitability of acquiring firms does not improve after merger. Cornett and Tehranian (1992) also found the same result; which is no improvement in return on asset or cost efficiency (operating cost). However, Spong and Shoenhair (1992) found an evidence of an improvement in overhead cost efficiency (operating cost) as a result of merger but still no significant improvement in return on assets.

TABLE 7: T-TEST

Performance measure	Acquired means	Acquiring means	t-value	P-value
Roa	0.016923	0.007919	0.473	0.260
Opocost	0.026200	0.023466	1.034	0.136
Fsize	21.892091	23.719390	-8.141	0.002
mktshare	0.130838	0.066776	1.186	0.044
Loanaset	0.624659	0.596480	1.529	0.823
Capasset	0.054621	0.055321	-0.082	0.468
Bankgrwt	0.207433	0.318049	-1.252	0.006
Mktgrwth	0.035187	0.159688	-1.763	0.001

According to the Table 7, the P-value for ROA, operating cost, loan assets and capital assets are not significant ( $>0.05$ ). Therefore, we can conclude that there is not significant different in ROA, operating cost, loan assets and capital asset measurement between acquiring and acquired banks performance before merger. However, the P-value for firm size, market share, bank growth and market growth are significant ( $<0.05$ ). Therefore, we conclude that there is significant difference in firm size, market share, and bank growth and market growth measurement between acquiring and acquired banks performance before merger.

## Conclusion

This study is aims to investigate and compare pre-merger and post-merger operating performance of the acquiring banks of the banks merger in Malaysia. The study concluded that the ROA and operating cost performance do explain a weak correlation in the process of banks during pre and post-merger in the recent merger. Both ROA and operating cost are not significantly improved by the independent variables chosen except for bank growth and market growth does affect the performance of the bank merger. There is consistent with almost of the studies that find no gain in performance and also find no improvement in profitability. However, other studies show at least some indication of a performance improvement in some cases. In this study, the merger exercise is rather call forced merger due to the financial crisis rather than by the market competitiveness. Therefore, the results of the acquiring bank's performance were influenced by a condition of bank merger exercise and not due to bank choices and preference of the acquiring banks.

# A Strategic View of Responsiveness

*Duangpun Kritchanchai  
Mahidol University, Thailand*

## Abstract

Nowadays market and customer demands and pressures have increased and the customer has become a core focus in manufacturing. Manufacturing competition has shifted from cost to quality to time and to ability to respond. Responsiveness is a new emerging competitive performance aiming at competitive advantage on time and ability to respond. The authors' previous work has clarified the meaning of this key performance. Responsiveness components have been identified as a means to develop appropriate responsiveness approach in industries at operational level – order fulfillment process. However with respect to the fieldwork from the authors' previous work (Kritchanchai and MacCarthy, 1999) [10], it is noticed that not every company is aiming at achieving responsiveness. Rather an appropriate level of responsiveness for their firm is what they are looking for. This has added a strategic view to the responsiveness concept. It is a performance that needs to be strategically managed. This also influences its approach at the operational level. In this paper, firstly, the previous work and responsiveness background are given. Then responsiveness is discussed with respect to other relevant paradigms e.g. time-based competition, agility and flexibility. Definition and framework are presented. Then a strategic view of responsiveness regarding how responsiveness is managed is investigated. This also includes its relationship with other existing strategic performance objectives – quality, speed, dependability, flexibility and cost. Their relationships should enable us to allocate the appropriate role of responsiveness with respect to the other desired performances in the same organisation. Furthermore, responsiveness analysis and auditing process in developing responsiveness approach and checking responsiveness aspects in a firm is presented. A company can then apply this process as a guideline in developing appropriate tactics to achieve this performance.

## Background on Responsiveness

Responsiveness has been mentioned in a number of literatures and research. Although it is referred to as a key competitive performance in this century, its meaning and application are still ambiguous. Stalk (1988) [13] views responsiveness as being the same as the cycle time in Toyota manufacturing. Stalk and Hout (1990) [12] also appreciate the advantage of responsiveness but suggest the practices for responsiveness aim only at time compression. Again Azzone and Masella (1991) [1] do not distinguish between time and responsiveness. They exploit both concepts together in the context. Bozarth and Chapman (1995) [4] refer that responsiveness and flexibility are the key performances in achieving time-based competition. Sin and Hoon (1998) [15] note that time-based competition can improve responsiveness in a firm but only the term 'quick/fast response' is used for representing responsiveness. Yousseff (1992) [23] emphasises that responsiveness is a capability to achieve speed in the agility concept. Willis (1998) [22] also recognises the importance of responsiveness as one of the keys to future survival in agile manufacturing and view responsiveness as ability to serve the customer, response time or service to customer. Zairi and Sinclair (1995) [24] discuss responsiveness together with flexibility but never clarify the terms.

It can be seen from the literature that in the time-based competition context, responsiveness is viewed only in the time dimension – response time. In the agility context, responsiveness can be viewed as one of the key performance objectives but the role has never been clarified. Furthermore responsiveness and flexibility have been discussed together and may seem synonymous. Against this ambiguous, the authors' previous work has attempted to clarify the meaning and identify responsiveness aspects. It is found that responsiveness cannot only be represented by time, agility or flexibility. More precised and comprehensive view was proposed.

Here we review the investigation of responsiveness in the previous work focusing on order fulfillment process. Literature, field and case studies were employed in investigating this subject. Firstly, literature related to responsiveness – time-based competition, business process re-engineering, flexibility, agility and quick response manufacturing- were surveyed and analysed. It is found four common themes of responsiveness. These are: the factors that drive a system to be responsive or responsiveness drivers – *stimuli*; the need to be aware of these drivers

and what is needed to respond – *awareness*; the ability to respond to different drivers – *capabilities*; the targets or objective of each firm in its environment – *goals*. These four themes provide a basis for understanding of responsiveness, emerging from the literature, and will be referred to as “the four responsiveness components”. However it was realized that a more understanding and a more practicable view are still needed. A view is needed that accords more with reality. Hence empirical study was considered as the next step. The four responsiveness components were then investigated in the real world by using field and case studies (Kritchanchai and MacCarthy, 1999) [10] and survey (Nantiwannakul, 1999)[12].

The empirical data has pointed out that responsiveness is viewed differently in different types of industry. The interpretation of the four responsiveness components is also different in different types of industries. Ultimately, the data enabled us to classify four different types of industry with respect to responsiveness. These are (Kritchanchai and MacCarthy, 1999) [10]:

- Class I: Off-the-shelf – typical consumer products industry,
- Class II: Safety stock – typical oil and gas industry,
- Class III: Assembler – typical automobile, textile, steel industry,
- Class IV: Customiser – typical specialized machinery industry.

Furthermore, the four responsiveness components can be explained more precisely as follows.

- Stimuli – responsiveness driver- refers to the factors, events and issues that have, or could have an impact on system activities and expected or desired goals.
- Awareness refers to a firm’s knowledge and recognition of stimuli that occur or may occur and the preparation and responses necessary to address them.
- Capabilities refer to the activities and processes that enable a company to respond appropriately to stimuli.
- Goals refer to targets or objectives of each firm in its environment. Responsiveness is goal driven. Not all firms will be driven to respond to every stimulus at a similar level and the same goal may not be appropriate in different environment.

A generic framework for responsiveness has been presented in the previous work. We view responsiveness in two levels – strategic and operation. In the strategic level, any firm’s goals are set by their nature of the firm and business environment. These two factors also influence directions and constraints for responsiveness. Each responsiveness component is bounded within this direction and constraint. Stimuli, awareness, capabilities and goals can be different if they are within different boundary. This strategic issue will be investigated in detail in the next section. Furthermore, according to this responsiveness understanding, a practical definition for responsiveness with particular reference to the order fulfillment process can be provided as follows.

**Responsiveness is the ability of a system to identify significant stimuli, to be aware of their impact and the need to provide appropriate capabilities to respond, and to deploy those capabilities effectively whilst achieving set business goals.**

Although responsiveness can be explained more precisely, it is realized that some overlaps and relationships still occur between responsiveness and other paradigms - time-based competition, agility or flexibility. Hence it is necessary to clarify the term with respect to these concepts. Here we review the role of responsiveness, based on responsiveness components, framework and definition with these relevant paradigms.

## **Responsiveness and the Relevant Paradigms**

### **Responsiveness and Time-based Competition**

It is noticed that most papers on time-based competition use time as the strategic parameter and discuss about responsiveness only in the time dimension. This includes response time, ability to meet demand quickly and ability to respond to change faster. However, beyond the issue of response time, the four responsiveness components have clarified the term, more than just response time or ability to do things quickly. Aiming at shortening response time in time-based competition environment alone cannot bring responsiveness. The route to responsiveness also includes the issue of identifying stimuli that might lengthen the response time, acknowledging the system to be aware and

provide appropriate capabilities to respond in shortening the response time, and setting the system goals in targeting the desired response time. The desired response time, offered by responsiveness, should also be considered in achieving time-based competition. Youssef (1992) [23] mentions that, although speed is desired in market competition, it needs to be planned carefully depending on the willingness of customer. Moreover Carter, Melnyk and Handfield (1995) [5] argue that time-based strategy is not only shortening response time, it needs to take into account those lead time areas which are most important to the customer.

The wider approach of responsiveness, beyond the narrow perspective of response time seen in time-based competition strategies can provide an operational structure for the time-based competition approach in identifying critical areas and implementing the appropriate techniques. As a result, time can be compressed appropriately in the most significant areas and time-based advantage is obtained. Hence, responsiveness can be viewed as a significant route to win over time-based competitors, if it is interpreted and utilised beyond the issue of response time.

#### **Responsiveness and Agility**

Agility has been an emerging concept over the last few years focusing on rapid response to changes in manufacturing environments. Moskal (1995) [11] describes that agile manufacturing is a producer's ability to thrive in a continually and unpredictably changing environment while operating profitably in competitive climate. Barclay, Poolton and Dann (1996) [3] gave a definition of agility as the ability of a company to effect changes in its systems, structure and organisation. The book by Kidd (1994) [9] on Agile Manufacturing stated that agile manufacturing is driven by:

- Driving force for change in manufacturing,
- Competitive advantage that develops the capability to rapidly respond to the demand for high quality, highly customised products,
- To achieve the agility that is required to respond to these driving forces and to develop the required capabilities.

Kidd (1994) [9] also state agile manufacturing enterprises will be capable of responding rapidly to changes in customer demand. They will be able to take advantage of the windows of opportunity that, from time to time, appear in the market place. Considering the core concepts of agile manufacturing that are shared across these authors, the driving forces and the targets in responsiveness and agility tend to be in the same direction. However it is realised that agile manufacturing presents a bigger and wider approach in an organisation. While responsiveness is to respond to something that occurs or might occur, agility also considers self-development of the opportunity to respond. Therefore in theory, responsive manufacturing is rapid in responding to stimuli that occur or might occur but agile manufacturing is also rapid in responding to not only stimuli but the opportunities.

However in practice, agility does not particularly take into account the stimuli that directly affect the firm. Unlike the responsiveness concept, the typical or particular stimuli for the company should be identified and highlighted since it is the major factor that drives a company to respond. Moreover the organisation preparation for responding to changes in agile manufacturing come from three resources (Kidd, 1994) [9]: innovation management structures and organisation, a skill base of knowledgeable and empowered people, and flexible and intelligent technologies. This can be noticed that in being agile, the core principles are presented but the required system capabilities are not specified. Suri (1998) [18] also supports this view that the agile concept is full of theory but lacks implementation. However, the concept of responsiveness is to apply appropriate ability to respond to the particular known stimuli and aims at achieving particular set goals. It requires to specify only the appropriate ability to respond.

In summary, it is shown that agile concept covers wider theoretical principles with higher level and longer term strategy which are set beyond the idea of responsiveness. However, it can be said that responsiveness can target agility and develop the concept of agility to become more practical.

#### **Responsiveness vs Flexibility**

Unlike responsiveness, flexibility has long been discussed in both research and industry. In time-based competition, since flexibility and responsiveness are discussed together, they both may seem synonymous in this context. Some papers have given similar definitions of flexibility and responsiveness. Barclay, Poolton and Dann (1996) [3] defined responsiveness, which at its core, is an ability to *react and respond* to events. Slack (1990) considered flexibility as the ability to *respond* to changes. Upton (1994) [21] gave a definition of flexibility as the ability to change or *react*. However it is noticed in the flexibility literature that there seems to be another system ability

hidden in the context, which covers a larger area and has more potential than flexibility. Slack (1990) [18] stated that flexibility itself cannot be sold directly and is desirable not as an end in itself but as a means to other ends. Slack and Correa (1996) [17] suggested that manufacturing systems can utilise flexibility as an adaptive response to unpredictable situations. Barclay, Poolton and Dann (1996) [3] mentioned that a company must have the ability to analyse the potential impact of changes on its internal systems and organisation. They implied that an important aspect of a company's responsiveness capability is the way in which it manages and accesses internal and external resources.

From these points of view, flexibility can be identified as the capability which must be utilised and managed in order to respond to appropriate situations. Responsiveness – the concept of identifying stimuli, being aware and providing appropriate capabilities in responding to particular stimuli in achieving the set goals – is then the system ability that can manage the system capabilities in responding in appropriate situations. Therefore it can be viewed that flexibility is a capability within the system and essentially an attribute inside a responsive system.

According to this view and the study of responsiveness in this research, three factors can distinguish between responsiveness and flexibility.

- Drivers: there is no driver for flexibility. It is the capability which the system should have internally. Responsiveness on the other hand is driven by stimuli or potential stimuli. When stimuli occur or might occur, the system must be driven to be responsive to the stimuli.
- Assessment: the assessment of flexibility covers the system ability while responsiveness assessment must take into account the goal achievement.
- Action: responsiveness is the ability to take action to stimuli whereas flexibility is a capability inside the system.

Responsiveness also means to be aware of where and when flexibility is needed in manufacturing. Awareness is an important component of responsiveness and should be developed in order not to simply be flexible without concern for monitoring system stimuli and system goals. In short, being responsive does not mean that flexibility is a must. It needs to be considered and utilised appropriately as a *means to* responsiveness.

## **Responsiveness Strategy**

In this section, a strategic view of responsiveness is discussed. It is not to argue the business and manufacturing strategy theories that exist. Nevertheless this view is to extend the understanding of responsiveness at operational level to strategic level. In fact, responsiveness application at operational level is influenced by the strategic decision. Hence, in this section, we investigated responsiveness at strategic level along with the strategy literature, based on some of the empirical results in the previous work.

From the empirical data, it is found that companies do not desire to create responsiveness in every direction. If they decide to create responsiveness in a particular direction, they also consider appropriate degree of effort that they should put in creating responsiveness. This emerges two strategic decision questions for responsiveness. These are – are we going to respond?, if so, at what level should we respond?. We refer to these two issues as 'Responsiveness direction' and 'Level of responsiveness'.

Noticeably, these two strategic decisions are influenced from two factors at the strategic level – Nature of the firm and business environment (Kritchanchai and MacCarthy, 1999) [10]. As seen in the framework, these two factors influence responsiveness at operational level by identifying the boundary, directions and constraints for responsiveness. Here we investigate what do nature of the firm and business environment refer to? And how they influence responsiveness direction and level of responsiveness respectively?

### **Responsiveness Direction**

Responsiveness direction refers to the domain or the boundary that companies choose to create responsiveness in. As mentioned, companies do not create responsiveness in every direction. The nature of the firm identifies the boundary which also sets constraints for responsiveness components. Different nature of the firm leads to different boundaries and responsiveness components as illustrated in the empirical evidence following.

It can be seen that different industries bound their responsiveness in different directions. In oil and gas companies, responsiveness tends to be directed and framed by their product market. They tend to respond to only standardised product market. They tend not to respond to other directions such as customer variety requirements or new product introductions. Unlike the consumer product companies, they tend to respond to more customer variety requirements. Their boundary of responsiveness tends to be in higher customized product market. However they still refuse to respond to customer specific needs on product specifications. On the other hand, the machinery companies tend to respond in different directions. Changes in product produced or customer specific needs are allowed in their boundary.

From these evidence, it shows that type of industry is one of the factors that influence the direction of responsiveness at operational level. It is also noticed that one of the primary concerns of industry is their market served. This supports a strategic view by Hill (1995) [8] which highlights the importance of the link between functional strategies and the markets the business serves or intends to serve. He also states that market and manufacturing must have a common understanding and agreement about company markets. Only then can the degree of fit between the proposed marketing strategy and manufacturing's ability to support it be known at the business level and objectively resolved within corporate perspectives and constraints. Slack (1991) [15] also convinces that it is market and customers who totally define what manufacturing should consider important. Their needs should be manufacturing's needs, their concerns should be manufacturing's concerns. Furthermore, Smith (1985) [20] believes that the type of industry determines the nature of the strategic problems facing a particular enterprise. He states that the type of industry refers to the type of product produced and the type of market served. He views that the type of market served can be classified as:

- Commodity market for standard products, which tend to be simple and product life cycle is usually long.
- Differentiated market for variety products. The industry tends to have different and distinguishable characteristics from their competitors. Decisions about product design and markets become an important element in strategy.
- Monopoly market, where the product in this market is provided by a few producers. The products are quite unique and mostly compete on price and reliability.

These market characteristics are also reflected in our evidence. For instance, the consumer product companies which produce standard products tend to serve the commodity market. The machinery companies which offer customers the variety product tend to have the differentiated market. The oil and gas companies which have quite unique product tend to be in the monopoly market. Thus it can be seen that companies in different types of market served tend to have different responsiveness directions at the operational level. It can be said that nature of the firm in terms of type of market served influences the first responsiveness strategic decision – are we going to respond? This means that firms tend to create or improve responsiveness within the boundary of market served. They can refuse to respond to stimuli beyond the boundary. Only the stimuli, awareness, capabilities and goals within this boundary are considered. However, after responsiveness direction is defined, the appropriate area for creating responsiveness is constrained, the next question is – what appropriate level of responsiveness is required?

#### **Level of Responsiveness**

Level of responsiveness refers to the appropriate degree of effort that companies put in creating responsiveness within that boundary. Here we analyse how business environment affects level of response in a firm. In the field and case studies, we can see that companies do not respond to stimuli at the same level. A machinery company, which supposes to produce product as customer specifies, might not respond to every customised order. They may offer customers the product specification limited options from their range. In a garment industry, changes in product design is common, however, the company might not respond to every change customer requires. The product modification is allowed at a certain level. The company might refuse or the cost of change can be placed to customer. A machine part manufacturer tends to adjust production plan by also considering the rush order from the most important customer. They do not apply the same level of response to every rush orders.

Ball and Lorange (1979) [2] studied business strategy under the topic 'Managing your strategic responsiveness to the environment'. They recommend two key environmental factors that usually affect a division's plan –competitive strength and business attractiveness. Competitive strength refers to the potential of a firm in the market. This is not only represented by a company's competitive position of market share, but also of product

quality, distribution arrangements, plant capacity and ability to develop new products (Smith, 1985) [20]. Business attractiveness can be viewed as growth rate of sales of product, the future profitability of the sector, the financial results of companies in this field, etc. These two key factors are also reflected in the responsiveness case studies. Those competitive strengths affect the impact of stimuli. For instance, companies with adequate plant capacity are able to respond to volume fluctuation demand better than those with less capacity plant. The stimulus has less impact on the former than the latter. Thus, level of response and the degree of effort in responding to this stimulus in these two companies are provided differently. Furthermore, it can be seen in the case studies that rush orders by different customers are treated differently. This supports a view by Daugherty and Pittman (1995) [6] that a company cannot respond to special requests indiscriminately. Instead they prioritise such requests and develop tiered or differentiated service programs to ensure that preferred customers receive premier service. This confirms the fact that the preferred market influences the level of response in a firm and this preferred market can represent the attractiveness of a business.

After knowing that these two factors – competitive strength and business attractiveness – influence level of response, then, how these factors affect the level of response should be analysed. If the first part of responsiveness strategy is to set the constraint for responsiveness direction by the market served, the second part is to set the operational goal for level of response by business environment. Slack (1991) [16] states that one should consider customers and competitors for setting manufacturing objectives. Two manufacturing objectives are mentioned. These are order-winning objectives and qualifying objectives. He refers to the order-winning objectives as those which directly and significantly contribute to winning business. Raising performance in an order-winning objective will either result in more business or improve the chances of gaining more business. On the other hand, he refers to the qualifying objectives as those aspects of competitiveness where the operations performance has to be above a particular level even to be considered by the customer. Any further improvement in qualifying factors above the qualifying level is unlikely to gain much competitive benefit. Hill (1995) [8] distinguishes these two objectives by stating that “to provide qualifiers, companies need only to be as good as competitors, to provide order-winners, they need to be better than competitors”. In responsiveness perspective, it is viewed that business environment – competitive strength and business attractiveness- influences the decision in being order-winners or order qualifiers and guide appropriate level of response in achieving these set goals. According to this view and the field and case studies, the level of response with respect to the manufacturing objectives (the set goals) and business environment can be summarised in the matrix in fig. 1 as follows:

A – when the company has a strong competitive advantage, stimuli may have lower impact on the firm and when business attractiveness is high, the objective might be driven to order-winners. Although the company may not need so much effort in responding to stimuli, the level of response should be adequately high for ensuring profitability in the business.

B - when the company is quite weak in its competitive position, stimuli may have high impact on the firm and business attractiveness is high, the company may set the objective as qualifiers and may need to put high effort on improving their performance in responding to stimuli and gaining profitability.

C - when the company has a strong competitive advantage, stimuli may have lower impact on the firm but business attractiveness is low, the company may set the objective as order-winners but need to analyse the return on response and make a decision as to which degree of effort should be created for responding in this case.

D - when the company is quite weak in its competitive position, stimuli may have a high impact on the firm and when business attractiveness is low, the company may set the objective as qualifiers and may need to respond just to maintain its status in the market or business.

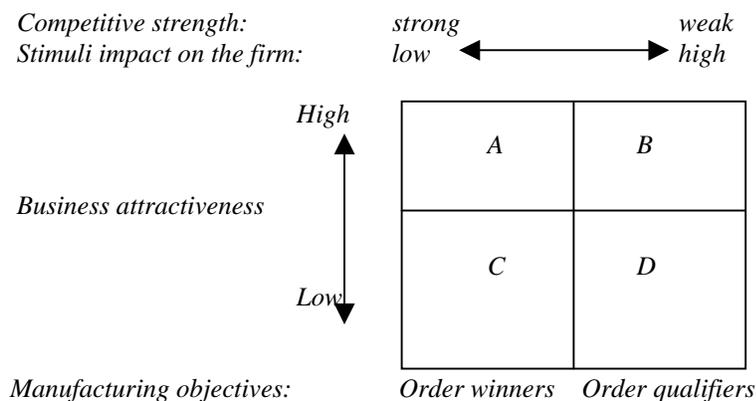

FIG. 1: LEVEL OF STRATEGIC RESPONSE MATRIX

### Responsiveness and the Strategic Performance Objectives

Performance objectives are the key factors in manufacturing strategy which are used as the weapon in business competition. Therefore, to have responsiveness in a firm, it is necessary to analyse the relationship, effect, impacts of responsiveness on other performance objectives. The existing set of performance objectives, used as the reference here, were proposed by Slack (1991) [16] – quality, speed, dependability, flexibility and cost. Based on the responsiveness view in this study, the relationships are analysed as follows.

#### Quality

From Slack’s point of view, in which quality is regarded as ‘to do the right things’, defined by the need of customers, responsiveness can be viewed as a supporter of quality. To be aware of the appropriate response capability enables us to assist the ability to do the right things. From another view in which quality is regarded as ‘doing things right’, quality can be considered as a factor to support responsiveness in terms of quality performance (conformance to specification). When everyone or every section does things right, this supports response capabilities in conducting any activities responding to stimuli.

#### Speed, Dependability, Flexibility

Similar to the relationships between flexibility and responsiveness discussed previously, it is viewed that speed and dependability are the capabilities in responsive manufacturing. The external effects of speed, dependability and flexibility are short delivery lead times, dependable delivery and wide product ranges respectively. With respect to this study, these effects can be viewed as the goals in responsive manufacturing depending upon different situations. On the other hand the internal effects of these three performances include fast throughput, reliable and stable operation and ability to change respectively. Again these effects can also be viewed as the capabilities that may be required in responding to stimuli in responsive manufacturing.

Therefore it can be seen that in responsive manufacturing, these three performances play an important role in tackling the stimuli and can be set as a means to achieve the goals. Willis (1998) [22] also supports this view that speed and flexibility are required in the production processes, product development and supply network activities. In turn, the capabilities in these integrative functions can support activities of customer orders and delivery process and lead to responsiveness. However being responsive is beyond these performances’ effects. Stimuli and awareness need to be identified and developed in order to utilise appropriate capabilities – how fast the throughput should be, where and how to create reliability and stability in operations and how much ability to change the system should have. When responsiveness is created in a firm, it must include the management and appropriate utilisation of the objective provided by these performances.

#### Cost

Price and cost are the most familiar competitive weapons (Hayes and Wheelwright, 1984) [7]. Although it is realised that being responsive may be costly, lower prices to customer may be possible. In responding to volume fluctuations

in demand, costs could be incurred from changing labour force levels or keeping high inventories. In responding to variety fluctuations in demand, cost could be incurred from keeping standard component inventory, customised processes or adapting standard components and holding excess machine capacity. However faster response, more accurate response, more reliable response, etc. may bring customer satisfaction. In turn high profitability and lower prices to customer may be obtained, although cost of production may not reduce. Responsiveness, as a result, can indirectly lead to cost performance improvement. Nevertheless, under this relationship, further in-depth analysis is still needed.

### Responsiveness Analysing and Auditing Process

After a company has identified and allocated their strategic direction and position for responsiveness, a number of aspects in developing appropriate tactics for achieving desired responsiveness at operational level are to consider. Based on four responsiveness components and the strategic factors, here, we present responsiveness analysing and auditing process. Fig. 2 shows the responsiveness analysing and auditing process. Strategic level

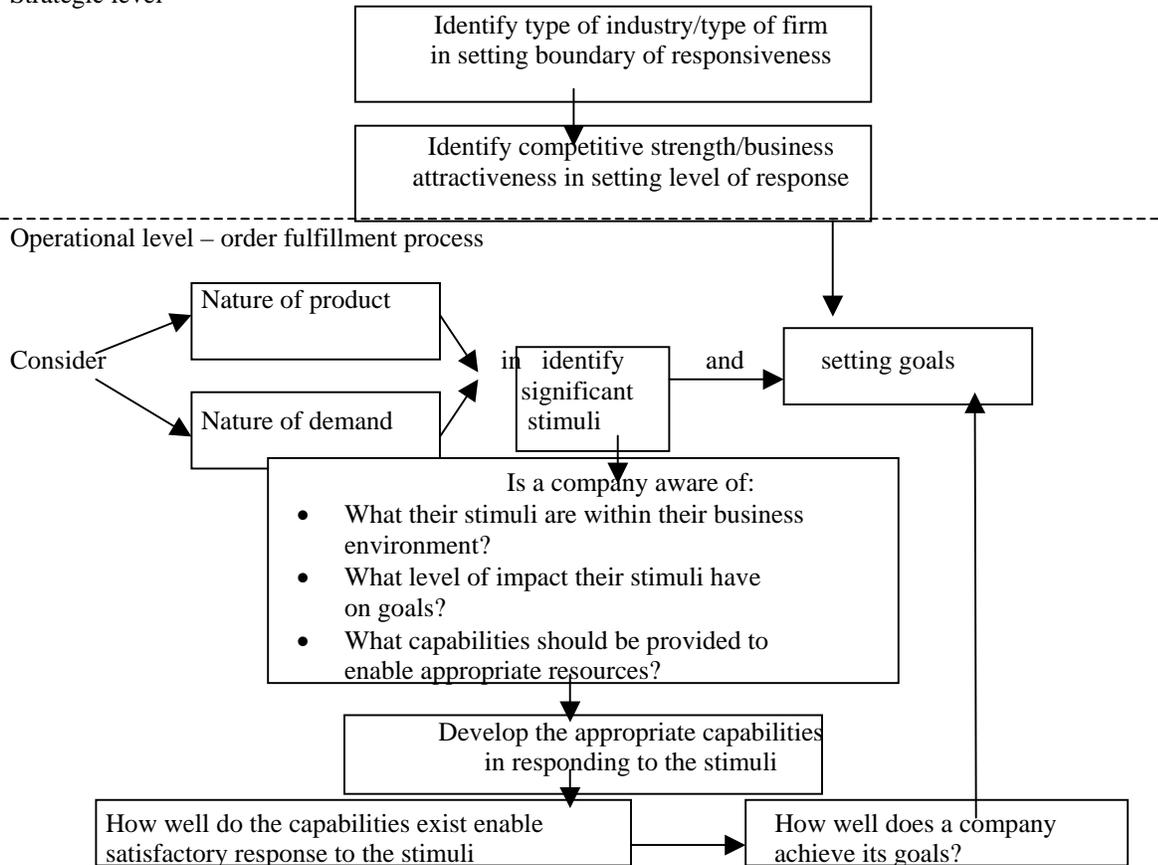

FIG. 2: RESPONSIVENESS ANALYSING AND AUDITING PROCESS

From Fig. 2, after identifying all responsiveness direction and constraint strategically, a company should consider their nature of product and nature of demand in identifying the significant stimuli and setting goals which are also determined strategically. Apart from the stimuli within their business environment, the company must also

check if they are aware of level of impact their stimuli have on goals and the capability that should be provided to enable appropriate responses. In other words, awareness in a firm can be assessed through the capability that they provided or intend to develop, reflecting recognition of the impact of particular stimuli. Then the company should develop the appropriate capability in responding to the stimuli. After that two questions are raised in the auditing process –how well do the capabilities exist enable satisfactory response to the stimuli, and how well does a company achieve its goals set earlier?

The important aspects in this process that one should take into account in achieving responsiveness are:

- Company's strategic direction which was described earlier
- Nature of product and nature of customer demand

Nature of product refers to volume, variety and degree of standardisation or customisation of the company's product. Nature of customer demand refers to the nature of variation of customer demand which can be volume fluctuation, variety fluctuation or customised demand, forecast reliably demand, non-repeatable demand, etc. These factors enable us to derive and identify the system's stimuli. For instances, customised specification product with non repeatable demand may lead to fluctuation of raw material requirement and workload on machine. This leads to difficulty in resources planning. Hence resource (material and machine) availability can be one of the stimuli that drive the system to respond.

- Four components of responsiveness analysis

This is to analyze what the company's stimuli and goals are, and assess the awareness and capabilities that they have or should have.

- Goal achievement assessment.

## Conclusion

This paper is based on the findings in the previous research which shows that companies are not to respond to every stimuli. The paper investigated how the companies strategically manage to create responsiveness. Responsiveness strategic decisions were raised. These are Responsiveness direction and Level of responsiveness. It is found from the evidence that responsiveness direction is defined by nature of the firm. This refers to type of industry and type of market served. The appropriate level of response is influenced by business environment which refers to competitive strength and business attractiveness. It is also found that responsiveness goals at operational level is related to the existing manufacturing objectives – order winners and qualifiers. This affects the level of response. In fact, from the overall strategic view of responsiveness, it can be seen that responsiveness at the strategic level is influenced and directed by business and manufacturing strategy. It is a performance which is still under the firm's strategy and policy. However at the operational level, responsiveness is quite a unique performance which develops its own response mechanisms. This is by identifying stimuli, being aware of stimuli, developing capabilities in order to achieve set goals. Furthermore, in giving a clear view of strategic and operational responsiveness, the paper also presented responsiveness analysing and auditing process. The process identifies the key aspects that a firm should take into account in considering responsive. It is hopeful that the process should enable a firm to create or improve their responsiveness with respect to their strategic policy.

Issham Isa  
University Utara Malaysia, Malaysia*

## Abstract

Redesign of business processes is currently attracting a lot of interest. Although many tools and technique have been used to model such processes, less attention is given to the analytical aspect to support or optimize the redesign process. In other application areas in where a network of server systems are concerned such as computer and communication systems, telecommunication systems and manufacturing systems, many analytical techniques have been developed to analyze the temporal aspect of the systems. The similarities exist between these kinds of system and business processes. In this paper, an analytic approach is presented that considers the performance of business process designs.

## Introduction

Recently business process redesigns have been given a lot of attention. Since then many modeling techniques and tools have been used to support the redesign process. However most of the currently available tools use static model such as diagram to model process. Some are quite dynamic where the functional aspects of the process have been modeled using simulation. However hardly any studies are found in the literature that used analytical model to study the quantitative behavior and optimization of business process.

Generally for business processes, the cost of the process depends on its time behavior. Customer satisfactions also often depend on time-based performance measure such as response time or turnaround time. For these reason, it is important to optimize the quantitative performance of business process. An important advantage of analytical modeling is that they allow for the off-line analysis of the effect of process redesign, without disturbing actual processes. To obtain the effective design model, feedback to the designer concerning process functional and alternative design option should be done at early process design. At this stage, analytical modeling provide quantitative properties, whereby these will provide the global indication of the expected performance. In the final stage, more accurate predictions may be required to fine-tune the design. Therefore, the analytical modeling proposed here is at the highest abstraction level of process design, i.e. to get the first idea on how the process should behave.

In this paper, we stress on the quantitative measures of business processes to those of concurrent discrete-event system. Based on this, we show that by using quantitative modeling, arrival to resource center can be reallocated to get the optimal performance measure. We focus on the issue of job allocation in a network of service centers where different service center has different job processing time. The optimization criterion studied here is to minimize the expected job response time in the systems to which jobs are allocated. Jobs arrive at a scheduler that allocate jobs to the service center according to a calculated arrival rate computed using Lagrange multiplier theorem. The paper is organized as follows. Next section shows the related work in this area followed by the proposed queueing and optimization model. Later numerical results and models verification are presented. Finally concluding remarks and directions for further research are described.

## Related Work

The problem of workload allocation is common to a variety of business system especially when it involves a network of service centers. Workload allocation seeks o allocate job arrival among service centers as evenly as possible. In a parallel setting, and particularly for multi service center systems where jobs may have many possible path at the job's scheduler, jobs allocation problem is of interest, each job entering the scheduler , a path is assigned to optimize the allocation of workload [25, 26, 28]. The workload allocation problem is of

particular interest for networks of service centers, since there are several ways to affect the distribution of workload among the centers[12].

Queueing network models have been recognized as powerful tools for evaluating performance of computer systems [1, 7] and communication network [2, 8, 9, 13, 27]. This analytical model has become a very important tool for predicting the behaviour of new designs or proposed changes to existing systems [10, 11, 17, 19, 22, 29]. Most queueing network models are used either by making assumptions to assure exact numerical solution or by employing approximate method [5, 9, 14]. [21, 23, 24], considered the control of arrivals to a network of queues with the objective of maximizing throughput subject to a response time constraint. He developed a throughput time delay function based on an optimality criterion where the arrival that maximize the throughput under the constraint of the average response time will not exceed a preassigned value. Then [19] continued with the problem of random routing. All these literature have been devoted to the probabilistic analysis of queueing system, their optimization is somewhat lagging behind. Network of queues in parallel are a natural way to model problems of resource and traffic allocation and many optimization problems based on them have been studied for instance in [3, 4, 6, 13, 15, 28, 15]. Most of the studies focus on reducing the amount of waiting time in a system with several servers either parallel or serial. However none of the studies consider the impact of jobs inter arrival and service time variation in modeling the systems performance. Although analytical workload allocation models are widely applied in area of computer and communication network, they are also applicable in the case of business processes especially by the increasing application of workflow management systems.

### Queueing System Model

When several users request for job (e.g customer request for product or service) at the same time, competition for the use of a common resource and the limited capacity of the resource can give rise to congestion, hence queueing is a common phenomena. Queueing occurs normally when the demand exceeds the service capacity of the resource and even when the otherwise occur. This is due to the fact that the inter arrival times of the request, and their required service times, are generally not fixed, therefore a mathematical model of congestion represents inter arrival and service times of users by random variables. Queueing Theory is devoted to the description, analysis and optimization of such queueing system [3]. It focus on a few key performance measures, like queue lengths and waiting times. Due to the stochastic nature of the arrival and service processes, and of the allocation process of jobs through a network of queues, the main performance measures are also random variables. With this in mind, we use multiple queue multiple server model to represent a central job allocation system and is shown in Fig. 1.

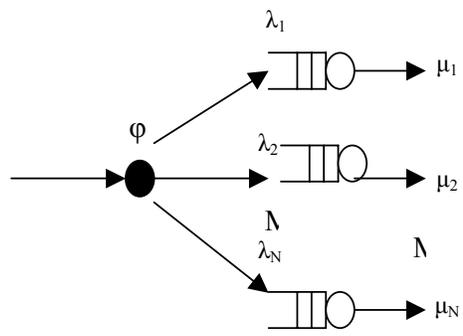

FIG. 1: MULTIPLE QUEUE MULTIPLE SERVER MODEL

In using this model, resources that provide services are represented by service centers at which jobs queue and compete for service. The workload is modeled as a single stream of job. A common example of workload is order request. Total workload rate arrived is given by  $\phi$ . Each newly arrived job, it is assigned to a node or server  $i$  with rate  $\lambda_i$ , according to the scheduling policy used. We consider the set of service centers to be heterogeneous which is common cases in real systems and also it can be generalized to homogeneous servers. In

the context of general queueing network models, the generalized exponential (*GE*) distributional model of the form [18] and [19].

$$f_s(t) = \left[ \frac{C^2 - 1}{C^2 + 1} \right] u_0(t) + \frac{4\mu}{(C^2 + 1)^2} \exp\left[ \frac{-2\mu t}{C^2 + 1} \right], \quad t \geq 0$$

Where  $\mu$  is the mean service rate,  $C$  is the coefficient of variation and  $u_0(t)$  is the unit impulse function, has been used to represent the inter arrival and service time distribution. This model is robust and versatile due to its memoryless properties and has been shown to maximize the entropy function subject to mean value constraints. Furthermore it can be shown [16, 20] the exact mean number of jobs in the GE/GE/1 queue is given by

$$L = \frac{\rho}{2} \left( 1 + \frac{C_a^2 + \rho C_s^2}{1 - \rho} \right), \quad \text{for } \frac{1 - C_a^2}{1 - C_s^2} \leq \rho < 1$$

Where  $C_a^2, C_s^2$  are the squared coefficients of variation of the inter arrival and service time distributions respectively. This mean number of jobs function will be used as the objective function in the optimization method.

### Optimization Model Using Generalized Exponential (*GE*) Distribution

In this section, the use of Lagrange method to *GE* type distributional model is proposed. In this case an optimization problem of queueing system can be generalized to a number of arrival and service distribution by configuring the value of coefficient of variation for inter arrival and service time. We formulated an optimization problem of  $N$ -GE/GE/1 queueing system as below;

P1 Min

$$\sum_{i=1}^N L_i = \sum_{i=1}^N D_i \left( \frac{\lambda_i \beta_i}{1 - \lambda_i \beta_i} \right) \left( \lambda_i \beta_i \left( \frac{C_{si}^2 - 1}{2} \right) + \frac{C_{ai}^2 + 1}{2} \right) \quad (1)$$

$$\text{s.t } \sum_{i=1}^N \lambda_i = \phi \quad (2)$$

$$0 \leq \lambda_i \leq \frac{1}{\beta_i}, \quad i = 1, K, N. \quad (3)$$

$$\lambda_i \geq 0 \quad (4)$$

$$\beta_i \geq 0 \quad (5)$$

where  $\rho_i = \frac{\lambda_i}{\mu_i}$  and  $\beta_i = \frac{1}{\mu_i}$

Problem P1 allows an analytical solution. Using Lagrange multiplier theorem we obtain with  $\delta$  the Lagrange multiplier, the following first order Kuhn-Tucker constraints:

$$\frac{d}{d\lambda_i} \left\{ D_i \left( \frac{\lambda_i \beta_i}{1 - \lambda_i \beta_i} \right) \left( \lambda_i \beta_i \left( \frac{C_{si}^2 - 1}{2} \right) + \frac{C_{ai}^2 + 1}{2} \right) \right\} = \delta \quad i = 1, K, N. \quad (6)$$

$$\sum_{i=1}^N \lambda_i - \phi = 0 \quad (7)$$

$$\text{From (6) and (7) we find the unique optimal values } \lambda_i^* = \frac{1}{\beta_i} \left( 1 - \left( \frac{C_{si}^2 + C_{ai}^2}{C_{si}^2 - 1 + 2\mu\delta} \right)^{1/2} \right) \quad (8)$$

and Lagrange multiplier is derived by solving the constraint equation below

$$\sum_{i=1}^N \frac{1}{\beta_i} \left( 1 - \left( \frac{C_{si}^2 + C_{ai}^2}{C_{si}^2 - 1 + 2\mu\delta} \right)^{1/2} \right) = \phi \quad (9)$$

When  $C_{ai} = 1$  and  $C_{si} = 1$ , the *GE* traffic optimal expression is reduced to exponential optimal expression.  $D_i$  is the cost associated with having one job in queue and for simplicity, we assign the value of 1.

## Computational Result

In this section, numerical results are presented to assess the credibility of the *GE* distribution used. Two configurations will be shown. For the first configuration, service rate of the tasks are assumed to be  $\mu_1 = 3, \mu_2 = 4$ ,  $C_{a_1} = 0.5, C_{a_2} = 0.3, C_{s_1} = 0.2, C_{s_2} = 0.4$ . The improvement of the performance measures is presented in Fig. 2 and 4. To verify the results, we use simulation and the comparative results are presented in Fig. 3 and 5.

TABLE 1: RESULT OF CLASSICAL AND PROPOSED APPROACHES OF 2-GE/GE/1 QUEUEING SYSTEM, L: MEAN QUEUE LENGTH, W: MEAN RESPONSE TIME.

Classical		Proposed		Classical		Proposed	
$\lambda_1$	$\lambda_2$	$\lambda_1$	$\lambda_2$	$L$	$W$	$L$	$W$

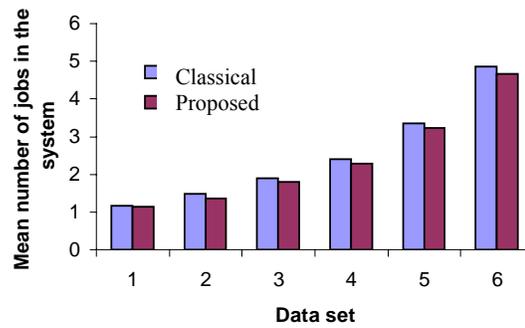

FIG 6: PERFORMANCE IMPROVEMENT OF MEAN QUEUE LENGTH FOR A DUAL GE/GE/1 QUEUEING SYSTEM

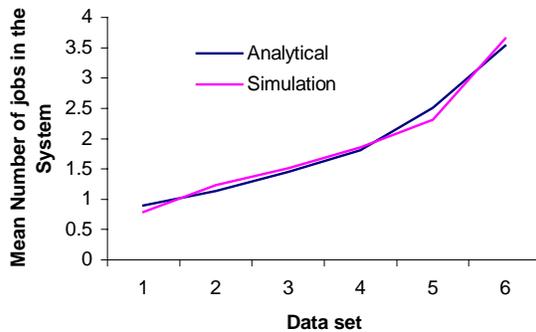

FIG. 7: ANALYTICAL VERSUS SIMULATION RESULT

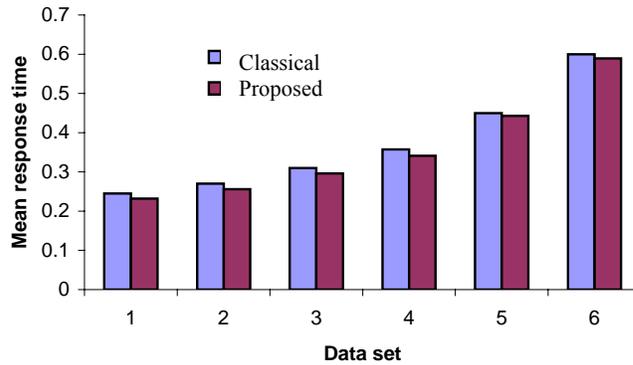

FIG. 8: PERFORMANCE IMPROVEMENT OF MEAN RESPONSE TIME FOR A DUAL GE/GE/1 QUEUEING SYSTEM

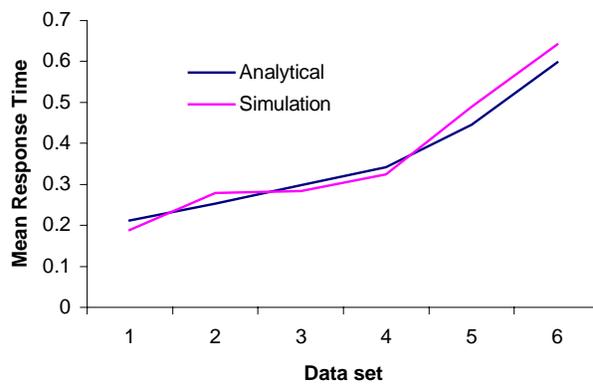

FIG. 9: ANALYTICAL VERSUS SIMULATION RESULT

Further analysis for sample cases of number of servers  $N = \{3,4,5,6\}$ , are shown below.

Numerical Result for Three Queueing Systems

$$\mu_i = (3,2,1) \quad C_{ai} = (0.1,0.2,0.3) \quad C_{si} = (0.2,0.3,0.1)$$

Numerical Result for Four Queueing Systems

$$\mu_i = (4,3,2,1) \quad C_{ai} = (0.1,0.2,0.3,0.4) \quad C_{si} = (0.2,0.4,0.3,0.1)$$

Numerical Result for Five Queueing Systems

$$\mu_i = (5,4,3,2,1) \quad C_{ai} = (0.1,0.2,0.5,0.4,0.3) \quad C_{si} = (0.3,0.4,0.1,0.2,0.5)$$

Numerical Result for Six Queueing Systems

$$\mu_i = (6,5,4,3,2,1) \quad C_{ai} = (0.1,0.2,0.5,0.4,0.3,0.6) \quad C_{si} = (0.6,0.3,0.4,0.1,0.2,0.5)$$

The analysis shows that a larger range for the service rates results in greater percentage improvements of our aggregate objectives. The result of the analysis for the queueing systems is summarized in Fig. 10 below.

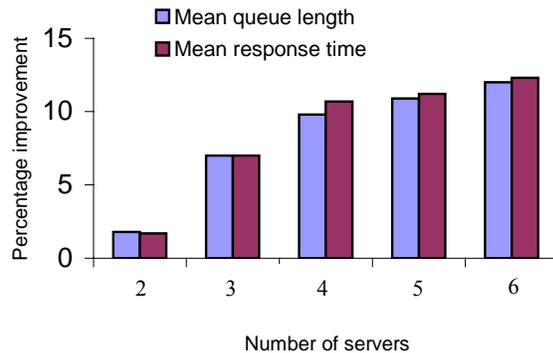

FIG. 10: PERFORMANCE IMPROVEMENT FOR A SAMPLE NUMBER OF SERVERS WHERE  $P = 0.9$ .

## Conclusion

In this paper, a new optimization model of allocating job arrivals to a network of service centers based on Generalized Exponential arrival and service time distribution has been proposed. A closed-loop expression to obtain the routing rate was described. Analytical model and simulation approaches were used to show that the classical allocation of total arrivals between two service centers with the same utilization rate does not provide an efficient performance result for the queueing systems. The result for a number of service centers was shown to portray the improvement. The *GE* distribution has been employed because it could represent exponential and other general distribution. The analytical modeling proposed can be used to guide the business process redesign in some part where networks of service centers are concerned. There are several directions to extend the applicability of this allocation algorithm such as different performance objective function, other arrival and service distribution and arrival with different type of jobs. These examples would involve interesting mathematical problem and could be the subject of future research.

# Capturing Winning Business Strategies: An Examination of Fit Concept in Firm Export Performance Model

*Phongsak Leartharanon  
Chulalongkorn University, Thailand*

## Abstract

The paper describes the importance of fit concept and its performance implication. In simple words, the fit concept suggests that, to be successful, there must be a fit between the strategies that firms pursue and the challenges from business environment. Given the importance of export trade in world economy, the paper explains how export performance research might be further enriched by incorporating fit concept that plays a key role in organization research. Conceptualizing fit as profile deviation, the author believes that the pattern analysis described will enable researchers to make specific recommendations to business practitioners to improve their firm export performance. This will reduce the gap between academic research results and real business implementation.

## Introduction

Strategic management is crucial to the success of any company. According to Wheelen and Hunger (1998), strategy is a comprehensive master plan stating how the corporation will achieve its mission and objective. It maximizes competitive advantage and minimizes competitive disadvantage. To operate effectively, firms must have an appropriate fit between their strategies and what their environment calls for. The concept of fit or contingency is an important concept in organizational research (Aldrich, 1979; Fry and Smith, 1987; Venkatraman, & Prescott, 1990). The fundamental assumption of contingency theory is that there is no one best way to organize, and that any one way of organizing is not equally effective under all conditions (Ginsberg, & Venkatraman, 1985). The theory suggests that firms operating in different environmental settings will have different strategy profiles<sup>2</sup> in order to have good strategic environment-strategy fit.

The emergence of contingent theory is related to the failure of the classical, and behavioral management/organization theorists to bring about consistently high performance for organizations over the long run (Griffin, 1996; Lemak, & Arunthanes, 1997). According to Griffin (1996), both classical and behavioral approaches are considered universal perspectives because they tried to identify the “one best way” to manage organizations. In contrast to this belief, the contingency approach suggests that there is no one best way to manage the organization. The appropriate way to manage a firm in a situation depends on or is contingent on unique elements in that situation. In short, an organization ability to achieve its goals depends on the congruence between various components of the organization. If the components fit well, then the organization functions effectively. If they fit poorly, the performance will deteriorate.

Although the concept of fit has been applied in management literature for some time, the concept is never explicitly discussed in export setting. Specifically, rarely is the fit concept discussed rigorously in connection with firm export performance, this paper therefore conceptually discusses how the concept of environment-strategy fit might enrich export performance stream of research.

Influenced by environmental forces, firms need to choose appropriate strategies accordingly. This is especially necessary when firm operate in hypercompetitive world market. Firms have to co-align its strategic moves environmental challenge. It is important to recognize that any one way of managing is not equally effective under all conditions (Ginsberg, & Venkatraman, 1985). An ideal strategy profile in one environmental setting may yield much poorer result if adopted in another environment setting. Miller (1988), for example, argued that the generic strategies (i.e. cost leadership or differentiation strategies as put forward by Porter) couldn't be used successfully across all environmental settings. Miller's findings revealed that the cost leadership strategy would be more powerful in stable rather than in unstable environments, while differentiation strategy would be appropriate in

dynamic and unpredictable environments. Therefore, the obvious implication here is that the choice of appropriate strategy (e.g. adopting either one or both) is contingent on a number of elements in the industrial environment in which firms compete. Carrying out strategies that are compatible with the needs of environment will substantially increase the chance of the firms to succeed.

As aforementioned, the contribution of fit concept to the understanding of firm performance is rarely rigorously discussed in export performance literature. Realizing this gap, this paper argues that firms as well as nation can benefit from knowledge gained from extending the study of fit concept to exporting firms. This is especially beneficial for developing nations whose economic health is significantly driven by export revenue. Applying and conceptualizing fit concept as profile deviation, researchers can substantially learn from top performers (i.e. learn from the derived ideal strategy profile). Namely, researchers will gain an understanding of how top exporting firms configure their resource allocation to bring about business success.

The performance differential among top performers and mediocre firms can be attributed to the difference between their strategy profiles. Realizing this deviation of strategy profiles, researchers can make a specific recommendation to low performing firms on the area that many need improvement, investment or merely more attention from managers in order to improve firm export performance. Because of this strong practical implication, the conceptual and methodological issue of this kind deserves more research attention to enrich our knowledge in export marketing literature.

Before being able to meaningfully discuss and delineate the procedure for testing the fit concept, it is important to first identify the relevant strategic variables that influence the performance of exporting firms. Therefore, a conceptual model of firm export performance needs to be developed. The importance of export can't be overemphasized. According to WTO international trade statistics ([www.wto.org](http://www.wto.org)), the value of world merchandise export trade is about \$7,294 billion in 2003 (WTO, 2003). Rapid internationalization, liberal trade policies of many developing countries and FTA has made cross-border trade an integral part of today world economy (Balabanis, Theodosiou, & Katsikea, 2004). An increasing number of firms see this as opportunity to expand their operations internationally to achieve firms' business goals. With low resource requirement and low financial risks, many firms have chosen to participate in world market through export (Balabanis, Theodosiou, & Katsikea, 2004). An understanding of how successful exporters manage their business would not only be useful to business firms but also to the nation economy.

The remaining of this paper will be organized as follows. First, relevant literature will be discussed to rigorously develop firm export performance model. Second, after the constructs affecting performance are identified in the model, I will move on to the discussion of how the ideal strategy profiles of successful firms can be identified and how fit concept conceptualized as profile deviation is tested. In short, this paper consists of two main parts. The first part focuses on conceptual model of export performance, and the second part on the discussion of how fit concept is tested.

## **Model Development**

Recognizing that firm performance is determined by a number of factors, an interdisciplinary approach is adopted to theoretically develop the model. Insights from several fields of study should substantially enhance our understanding of various factors determining firm performance better than an insights based on a single field of study. Specifically, this paper proposes a model that draws upon three distinct but complementary disciplines. Namely, they are strategic management, purchasing and marketing disciplines. Central to each of these disciplines is the question of how firms can achieves its business objectives successfully or have high performance. Based on conceptual linkage found in management literature, the impact of three strategic constructs, namely, business strategy, purchasing capability, and export market\_orientation, on export business performance is proposed in Fig. 1. However, since firm performance is a function of both controllable factors (or strategy variables) and noncontrollable factors (or environmental variables) (Kotha, & Nair, 1995). The fourth construct, namely environmental turbulence is introduced into the model. Each of these strategic and environmental determinants as well as its respective proposition is briefly explained in the following sections.

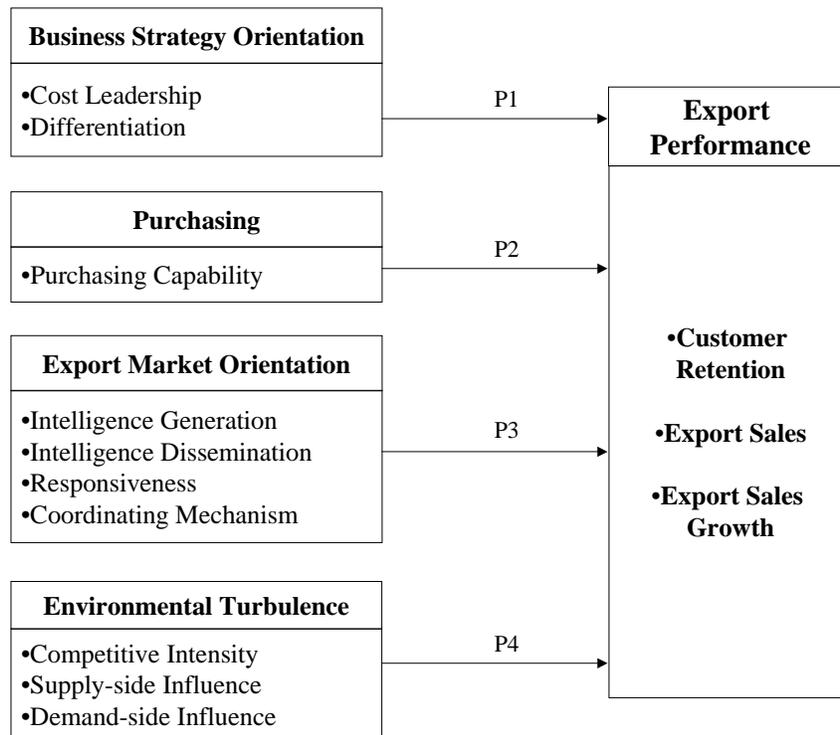

FIG. 1: CONCEPTUAL MODEL OF FIRM EXPORT PERFORMANCE

### Business Strategy

Strategy is a comprehensive plan for accomplishing an organization's goal (Griffin, 1996). It tells how firm go about achieving competitive advantage (Slater, & Olson, 2001). In essence, the concept of fit between strategy and environment suggests that, to be successful, a firm's strategy needs to be in tune with its environment. There must be a strategic fit between what the environment wants and what the firm has to offer (Wheelen, & Hunger, 1998). This implies that firms must constantly monitor the environmental changes and adapt firms' strategy accordingly. Past research has rendered support to this notion. For example, empirical findings revealed that there are positive relationship between environmental scanning and profitability of the firm (Thomas, Clark, & Gioia, 1993).

A notable contributor who is influential to the study of strategic behavior in organizations is undoubtedly Michael E. Porter. He proposes generic competitive strategy (Porter, 1990) that has been referred to widely in business literature and text. The popularity of Porter's typology of generic strategy might be due to the fact Porter's strategy type seem to integrate concepts of other typologies (Kumar, Subramanian, & Strandholm, 2001; Miller, 1989). Simply put, firms can derive its competitive advantage by pursuing cost leadership or differentiation strategy. Traditionally, it has been argued that firms have to choose to excel in either of these two. Firms trying to pursue both will "get struck in the middle". In contrast, later researchers show that it is possible to simultaneously pursue both strategies successfully (e.g. Kim, Nam, & Stimpert, 2004). Implementing one strategy doesn't necessarily preclude the firm from pursuing another strategy. For example, Hill (1988) put forward an interesting proposition that resolves the puzzle and debate over differentiation-cost leadership dichotomy. Applying contingency theory, Hill's main thrust is that in some environments both cost and differentiation strategy can be used, and this can possibly lead to sustainable competitive advantage. Hill argued that the simultaneous pursue of low cost and differentiation strategy in the right contexts (as he identified in his article) will bring about high profitability. This suggests that firms can pursue not only either strategy but also both strategies simultaneously to

gain competitive advantage. Both strategies are instrumental to achieve business success since they enable firms to deliver goods that are of value to customers. Thus, proposition 1 is put forward as follow.

P1: Business-level strategy (cost leadership and differentiation) is positively related to firm export performance.

#### **Purchasing Capability**

Purchasing undoubtedly plays key role in providing necessary inputs for firms. These inputs are then transformed or assembled into final products with attributes that satisfy customers' requirements or needs. The role of purchasing plays an integral part in helping the business to run smoothly. However, the academic research development is not commensurate with its heightened strategic importance in business. In addition, existing research in purchasing is still largely exploratory (Das, & Handfield, 1997).

According to Das and Handfield (1997), the purchasing discipline has not received as much share of research interest as many other research fields have. The issue seems not to be in the main stream of business research. Similarly, Chen, Paulraj and Lado (2004) have also addressed this theoretical void. They note that the claims of the strategic role of purchasing have not been fully subjected to rigorous theoretical and empirical scrutiny. Researchers tend to downplay their role by simply viewing the purchasing simply as a subset of manufacturing strategy.

However, in recent decades, the importance of purchasing has been improved from simply an operational one to a strategic one (Carter, & Narasimhan, 1996). The underlying belief of this shift in its recognized status is that effective management of purchasing will equip firms with competitive advantages (Narasimhan, Jayaram, & Carter, 2001). Similarly, Freeman and Cavinato (1990) argue that purchasing has a strategic influence on firm performance. However, the claimed link of purchasing and performance in past research has been descriptive in nature and few empirical studies have quantified the actual impact of purchasing on firm performance (Narasimhan, Jayaram, & Carter, 2001)

According to resource-based theory, firm capability can explain performance differential among firms. Barney (1991) argued that firm capability can create sustained competitive advantage if it is not tradable in strategic factor market and are historically based. Purchasing capability exactly possesses these two characteristics. It is not available in any factor market. Firm must develop and build its own network of supply and maintain good working relationship with suppliers. Developing a superior purchasing capability enables firms to maintain low waste rate, be cost efficient, meet required product quality standard and be more customer responsive. Purchasing capability is thus a firm-specific intangible resource that is likely to be a source of sustainable competitive advantage. Thus, proposition 2 is stated as follows.

P2: Purchasing capability is positively related to firm export performance.

#### **Export Market Orientation**

Fundamental to marketing discipline is marketing orientation concept. It enables firms to create sustainable competitive advantage by offering products that are of value to customer, that is, perceived value is greater than total acquisition cost (Narver, & Slater, 1990). Market orientation helps firms to have outstanding performance through the commitment to creating superior value for customers (Slater, & Narver, 2000). The emphasis on delivering superior quality offering to customer has long been an important issue for helping business to operate successfully. According to Jaworski and Kohli (1993), since customer needs and expectation continually evolves over time, being able to deliver consistently customer value necessitates firm's ongoing tracking and responsiveness to changing marketplace needs. That is, to deliver customer value, firms must try to understand customer needs by being market oriented to create strategic fit between what customers want and what firms offer.

Given its significance in business, a number of researchers have tried to analyze the potential impact of market orientation on such organizational issues as new product success, product quality, customer service, and sales-force commitment (Cadogan, Diamantopoulos, Mortanges, 1990). It is claimed that a link between market orientation and performance exists (Greenley, 1995; Cadogan, Cui, & Li, 2003; Akyol, & Akehurst, 2003). In addition, Dobni and Luffman (2000) note that the ability to be market oriented helps firm to coalign its key behaviors with the competitive context, which ultimately determines firm performance. Therefore, proposition 3 is stated as follows.

P3: Export market orientation is positively related to export performance.

### **Environmental Turbulence**

Selecting appropriate level of environment is crucial for researchers, since it is impossible to examine every aspects of environment (Castrogiovanni, 1991). Because the focus of this paper is related to firm-level variables, environment at task environment level is appropriate to understand the phenomenon occurring at organizational level (Castrogiovanni, 1991).

Firms in the same industry in a nation are usually exposed to the same set of general environmental factors. In particular, they are facing with the same rate of technological development, the same inflation rate, the same growth rate in GDP or the same economic depression, and the likes. However, unlike these macroeconomic forces, task environment in the same industry can be different among firms. Each firm has its own contacts with different set of economic players. Namely, firms are exposed to forces stemming from their unique set of competitors, customers, and suppliers.

Environmental forces undoubtedly affect firm operation. They are persistent source of business uncertainty that requires managerial attention. From an industrial organization perspective, firms' profitability is affected by the forces of various parties operating in the boundary of firm business environment. The notable forces come from three economic players in firm task environment, namely, competitors, suppliers, and customers. The pressure these three players exert on firm is environmental turbulence that firms have to encounter and manage because of their substantial performance implication. For example, if fierce competition, price or promotion war is the dominant characteristics of the business environment, resources spent to implement proactive or reactive responses to such competitive pressure inevitably erode firm's profitability. Similarly, if a firm is over-influenced by its suppliers (e.g., firms may have contact with only a few dominant suppliers) or customers (e.g. customers can switch to buy from others with minimal effort), firm performance is likely to be negatively affected. Therefore, proposition 4 is stated as follows.

P4: Environmental turbulence is negatively related to export performance.

### **Export Performance**

Scholars have examined a number of variables as various dimensions of export performance. These can be broadly categorized into two groups: financial and nonfinancial dimensions. However, when studying export performance, past research has unproportionately favored the study of economic or financial dimension of export performance. That is, past studies simply view or study export performance only from financial aspect (e.g. export sales or sales growth rate). Non-financial aspect like customer retention is rarely examined in export performance literature. Extending the argument of Cavusgil, & Zou (1994) and given the importance of customer retention to firm performance (e.g. attracting new export customers normally is much more costly than attracting new domestic customers), export performance literature would be further enhanced if this non-economic aspect of firm (namely, customer retention) is incorporated and studied in the export performance research.

Based on the above export performance model, in the next section, the propositions related to performance impact of the coalignment between strategy and environment will be presented and the testing procedure explained.

## **Fit Concept as Profile Deviation**

The underlying belief of fit concept is that there is an appropriate pattern of strategic variables in an environment that brings about high export performance. Allocating too little or too much resources to excel in a particular area or to build a firm-specific resource or capability will not be good for firm performance. The earlier section has already pinpointed the firm-specific capability or strategic variables for further discussion in this section. Firms have to decide to build the right profile composing of these variables, which are under direct control of firm's management to achieve firm objective.

In this section, there are two primary objectives. First, propositions related to fit concept are developed and presented. Second, analytical procedure for testing fit concept is delineated.

### **Environment-Strategy Fit Propositions**

The contingency theory, which is the central tenet in the organization theory literature, is based on the open system paradigm and on the notion of fit between the organization and its environment (Lemak, & Arunthanes, 1997; Katz, & Kahn, 1966; Lawrence & Lorsch, 1967). "Fit" is a desirable property because of its significant performance

implications (Venkatraman, 1990). Specifically, strategic management theorists assert that firm's performance is a function of the fit between its strategy and challenges from the environment. If firm pursue the right strategic posture, substantial performance improvement will result (Jauch, Osborn, & Glueck, 1980). Based on this, managers and scholars believe that choice of strategy should be made by referring to the specific environment of the firms (Murray, 1988). This is especially true for exporting firms whose environment is more dynamic than those of domestic firms. Given the significant impact of having the right strategy in the environment, this paper proposes research model illustrating the concept of fit between strategy and environment to enhance the understanding in this area. A framework is depicted in Fig. 2 to facilitate explanation. The figure postulates that in a given environmental setting where a number of firms operate, firms can be classified into two broad groups according to their performance. The first group is firms with high performance. This is the group of firm where "ideal (or good) strategy profiles", are derived. The remaining firms constitute the second group, the not-high performing firms. As evidenced from past studies, firms with high performance are conceived of as having a strategic fit between their strategy and environmental context, whereas firms with low performance adopt the strategy that doesn't respond to the need of the environment (e.g. Miller, 1988; Hill, 1988).

Given the different level of performance between these two groups of firms, two propositions can be derived. First, by inferring from previous researches about the strategy-environment fit, it suggests that ideal strategy profiles should not be similar to not-ideal strategy profiles. Second, the misfit score or deviation from the ideal strategy profile should lead to poor performance (Venkatraman, 1989; Venkatraman, & Prescott, 1990). These two propositions are restated below.

*P5: Ideal strategy profiles and not-ideal strategy profiles are statistically different from one another.*

*P6: Deviation from ideal strategy profile should be negatively related to performance.*

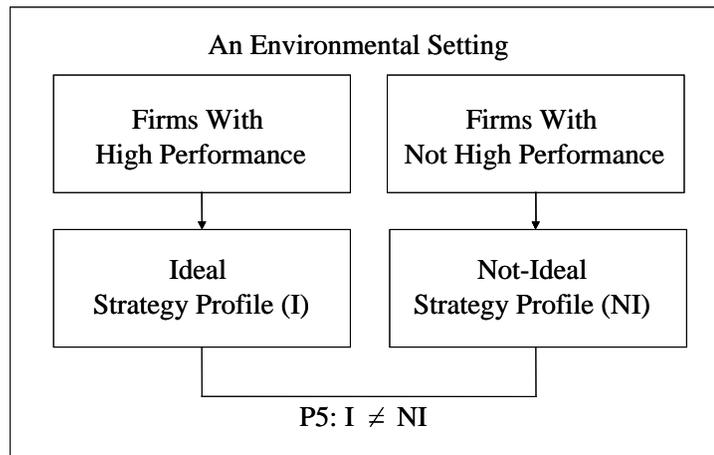

FIG. 2 : COMPARISON OF IDEAL AND NOT-IDEAL STRATEG PROFILE

#### Analytical Procedure

In this section, testing procedure is presented. Shown in Fig. 3 is the overview of the analytical procedure for this research paper. After the data are gathered, the research will proceed by following the procedure that is described step-by-step below.

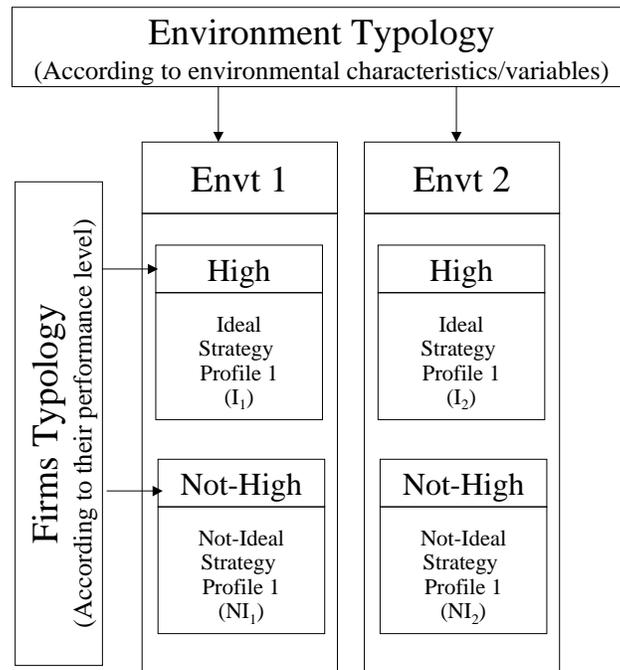

FIG. 3: RESEARCH DIAGRAM ILLUSTRATING ANALYTICAL PROCEDURE

1. All the *environmental variables* of all responding firms will be plugged into cluster analysis. Firms facing similar environmental forces will therefore be classified into the same groups/clusters of environment. For explanation purpose, say K-mean method with  $K=2$  might be used to categorized firms into two homogeneous environmental clusters.
2. In each environment/cluster, firms are further classified into two groups according to their composite export performance score. Many researchers use the composite measure when several measures of performance are employed (e.g. see Leonidou, Katsikeas, & Samiee, 2002). Firms with high composite performance score in each environment (e.g. above 4 on 7-point performance scale) will be categorized as “high performing firms” or “High”, while the remaining firms constitute the second group, namely, “the not-high performing firms” or “Not-High”. The practice of dichotomizing measurement scale into high and not-high is consistent with past researchers (e.g. Miller, & Friesen, 2001).
3. Ideal strategy profiles and non-ideal strategy profiles can now be derived. In environment 1, ideal strategy profile is the centroid (or mean values of the vector of *strategy variables*) of high performing firms, while non-ideal strategy profile is the centroid of not-high performing firms. The same procedure applies for environmental cluster 2.
4. In order to test the fit-related propositions, two testing procedures are carried out.
  - 4.1. First, the ideal strategy profile is compared with the non-ideal strategy profile in each environment. MANOVA will be used in this step to test proposition 5. MANOVA are used to assess the statistical significance of differences between groups. According to Hair, Anderson, Tatham, and Black (1995), a series of univariate ANOVA tests ignores the possibility that some linear combination (composite)

of the dependent variables may provide evidence of an overall group difference that may go undetected by examining each dependent variable separately. MANOVA may be able to detect combined differences not found in the univariate tests. By conducting two separate MANOVA tests (please see table 1), it is expected that the centroid or vector of the mean of *ideal* strategy variables will be statistically different from the centroid of *non-ideal* strategy profile in both environment. If the results turn out to be as expected, this confirms the notion that in a particular environment, there are distinctive set of strategy profiles that fit with the environmental needs and that differ significantly from non-ideal strategy profile. That is, using the right or ideal strategy profile in the right environment will enable firms to have high performance. However, pursuing strategy that is statistically different from the ideal strategy profiles is linked to the deterioration of organization performance (because firm pursuing such strategy is categorized in “Not-high” group). To confirm this notion, such linkage can be further tested in step 4.2.

TABLE 1: MANOVA TESTS

Tasks	Expected Results
1. Comparing $I_1$ with $NI_1$ (i.e. $H_0$ : vector of $M_{I1}$ = vector of $M_{NI1}$ )	1. $I_1$ is significantly different from $NI_1$ .
2. Comparing $I_2$ with $NI_2$	2. $I_2$ is significantly different from $NI_2$ .

- 4.2. Second, as a further analysis to explore more about strategy-environment congruence of firms, another testing procedure is performed to test proposition 6. This procedure is consistent with that of past research (e.g. Van de Ven, & Drazin, 1985; Venkatraman, and Prescott, 1990; and Roth, Schweiger, and Morrison, 1991. The “pattern approach to fit/pattern analysis” (Van de Ven, & Drazin, 1985) or the “holistic perspective of coalignment” (Venkatraman, and Prescott, 1990) is based on the belief of system theorists who conceive firms as holistic entities. So it is important to retain the holistic nature when testing performance effect of environment-strategy fit. The testing procedure calls for the computation of the correlation coefficient ( $r$ ) between misfit score and composite performance score. Although the explanation here will describe the steps to compute  $r_1$  only (i.e. the correlation coefficient for environment 1) for the first ideal strategy profile, the steps must also be repeated for the second ideal strategy profile to compute  $r_2$  (correlation coefficient for environment 2). First, misfit score will be computed by calculating the Euclidean distance between the ideal strategy profile 1 ( $I_1$ ) and each firm’s vector of strategy variables in “Not-High” group in environment 1. (In computer terminology, each record or firm will therefore have an additional column of variable, called misfit score.) Misfit score will be computed only for the firms that are in the low performing or “Not-High” group. Second, misfit scores of these firms will be correlated with their respective composite performance score. The negative and significant correlation coefficients (e.g.  $r_1$  and  $r_2$ ) will signify that as firm’s strategy deviate from the ideal strategy profile, its performance will be negatively affected. Based on this pattern analysis, researchers may be able to cautiously make specific recommendation for firms to fine-tune some of its strategy variables to improve firms’ export performance.

## Conclusion

As conceivably, business environment poses both threat and opportunity to firms. The environmental force brings about uncertainty that calls for close managerial attention. Firms that fail to align their firm strategy to build necessary capabilities to match business environmental challenges will undoubtedly be left far behind by fierce competition.

Even realizing that fit between strategy and environment will bring about not only business survival but also success; only a few research papers explicitly discuss how fit concept should be conceptualized and tested. The concept of fit is riddled with problems of conceptualizing and testing (Venkatraman, & Prescott, 1990). Despite the recognized importance of export as a growth engine for economic prosperity, not many management literatures theoretically discuss fit concept in connection with firm export performance. As an attempt to increase research momentum in this area, this paper conceptually combines and addresses both issues simultaneously. More study on exporting firms with strategic posture that fit with environmental challenge would add to our pool of knowledge in both export and strategic management literature.

Overall, this kind of research will further tighten the linkage and reduce the gap between academic research results and implication for real business practices. For example, researcher may use the results from cluster analysis and feed into discriminant analysis to formulate discriminating functions (i.e. linear combinations of environmental variables), which can be used to identify which type of environment a non-sample firm might fall into. When environmental type is known, the derived ideal strategy profile in that particular environment can serve as a broad guideline for that particular firm. More or less, the firm will learn some business lessons from the practices of high performing as well as those of not-high performing firms. Where appropriate, such firm may cautiously adopt and modify an ideal strategy profile that is appropriate for its own use to improve the firm export performance.

## **End Notes**

The term strategy profile refers to a set of strategy variables. Different combinations of strategy variables (each variable can take different value) constitute different strategy profiles.

# Concepts of Change Management from Central European Perspective – A Case of Slovakia

*Hana Potocká*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

**Identifying the need for organization-wide change and leading organizations through that change is widely recognized as one of the most critical and challenging responsibilities of organizational leadership. I argue that these responsibilities have become even more important also in Central and Eastern Europe in recent years as organizations are living through a time of tremendous changes (significant change of the political and legal system, transition from a centrally planned to market economy etc.). Change management has been a perennially popular topic in the organizational effectiveness. This article focuses on approaches and models useful for Slovak managers to lead their companies through organizational changes.**

## Introduction

In a world of continuous growth and powerful competition, the capability to predictably manage change will likely separate those organizations which will have long sequences of business success from those with one or two bright spots that then disappear. The notion that we can get control of things once they calm down is a formula for disaster. The winners will be those who are skilled at continuous change punctuated by periods of radical change.

In thinking about what is meant by change management at least three basic definitions according to Nickols (2004) come to mind: the task of managing change, an area of professional practice and a body of knowledge. The first and most obvious definition of “change management” is that the term refers to the task of managing change. The obvious is not necessarily unambiguous. Managing change is itself a term that has at least two meanings. One meaning of “managing change” refers to the making of changes in a planned and managed or systematic fashion. The aim is to more effectively implement new methods and systems in an ongoing organization. The changes to be managed lie within and are controlled by the organization. However, these internal changes might have been triggered by events originating outside the organization, in what is usually termed “the environment.” Hence, the second meaning of managing change, namely, the response to changes over which the organization exercises little or no control (e.g., legislation, social and political upheaval, the actions of competitors, shifting economic tides and currents, and so on). Researchers and practitioners alike typically distinguish between a knee-jerk or reactive response and an anticipative or proactive response.

The second definition of change management is “an area of professional practice.” There are dozens, if not hundreds, of independent consultants who will quickly and proudly proclaim that they are engaged in planned change, that they are change agents, that they manage change for their clients, and that their practices are change management practices. There are numerous small consulting firms whose principals would make these same statements about their firms. And, of course, most of the major management consulting firms have a change management practice area. Some of these change management experts claim to help clients manage the changes they face – the changes happening to them. Others claim to help clients make changes. Still others offer to help by taking on the task of managing changes that must be made. In almost all cases, the process of change is treated separately from the specifics of the situation. It is expertise in this task of managing the general process of change that is laid claim to by professional change agents.

Stemming from the view of change management as an area of professional practice there arises yet a third definition of change management: the content or subject matter of change management. This consists chiefly of the models, methods and techniques, tools, skills and other forms of knowledge that go into making up any practice. The content or subject matter of change management is drawn from psychology, sociology, business administration, economics, industrial engineering, systems engineering and the study of human and organizational behavior. It is not

clear whether this area of professional practice should be termed a profession, a discipline, an art, a set of techniques or a technology. For now, suffice it to say that there is a large, reasonably cohesive albeit somewhat eclectic body of knowledge underlying the practice and on which most practitioners would agree — even if their application of it does exhibit a high degree of variance.

#### **Purpose of this Paper**

Globalization, the disruptive influence of new technologies, the emergence of e-business, the exploration of new scientific discoveries and growing electronic connectivity among financial markets are all accelerating the pace of commerce throughout the world today.

From the central European perspective, the globalization has been intensified by radical change in a political system at the end of the ninth decade of the last century, deregulations, privatizations of state owned property, creation of a private bank and financial sector, definition of new laws and regulations. It is obvious that a tremendous turbulent market was created, where the organizations should set up and conduct their businesses and increase their economic values.

Firstly, the purpose of this paper is to present recent relevant approaches and concepts on change management which have been developed in schools of management, psychology, sociology, economics and other fields, briefly describe some of the tools and provide a selective review of key change models that have been developed to assist the management of change and are or should be used also in Central and Eastern European countries.

Main focus is placed on the schools, concepts and techniques useful in Slovak conditions and environment, because of an increasing need to deal with challenges of intentional organization-wide change resulting from the current reforms in Slovakia. The document addresses not just private sector business organizations but also state owned companies in this country.

Second goal is to provide a theoretical approach to lead Slovak organizations through organization-wide change process by using basic change management strategies and underline necessary skills for a successful change. A key element – people involvement is especially emphasized.

Finally, the main goal is to characterize changes and introduce such a Slovak organization, where transformational changes happen and some of the above-mentioned theoretical approaches were used.

#### **Approach and Method**

In order to explore this large and complex field a multi-method approach was used. First, a list of key theories and concepts was defined after reference to general management texts and review articles addressing change management, as well as through consultation and discussion with academics, management consultants and managers from Slovak republic. Desk research was accompanied by further discussions with practitioners over which tools, models and approaches they deemed most and least important, and which concepts were most commonly discussed by practitioners.

These tools, models and approaches were then subject to a systematic literature review, carried out by identifying key books and reports by seeking advice from academics and practitioners, and by reviewing published articles looking for influences and references. Criteria used for assessing the rigour of empirical studies were: clarity of methodology, use of multiple case studies, and external evaluation.

### **Approaches, Concepts, Tools and Models of Change Management**

Reflecting the sustained interest in organizational change and change management, a wide variety of approaches, concepts and tools have been developed to both initiate and manage organizational change and to control and direct change caused by unplanned disruptions. Many of the most popular tools are focused on achieving quality improvements; addressing worker concerns; and enhancing flexibility by changing organizational structure, processes, people, and/or culture. Nadler and Tushman (1997), Lawler et al. (1992, 1998, 2001) and others emphasize that the choice of approach, concept or tool depends upon the organization's nature, resources, and problems, and must be tailored to the specific contest and organization.

Mc Namara (1999) compiled an overview of the tools, concepts and approaches for organizational change and improvement that are used in change management (for example: Weisbord's Six-Box Organizational Model; 7S

Model; PESTELI; Five Ways; Content, Context and Process Model; Soft Systems Methodology; Process Modeling; SWOT Analysis; Force Field Analysis; Sources and Potency of Forces; Readiness and Capability; Commitment, Enrolment and Compliance; Organization-level Change; TQM; Business Process Reengineering; Parallel Learning Structures; Self-managed Teams; Innovation Research; Securing Individual Behavior Change; Organizational Development; Learning Organization; Action Research; Project Management etc.). I identified the following as candidate tools and approaches which I recommend to use in Central and Eastern European countries (esp. in Slovakia):

- Balanced Scorecard (ensure well-rounded performance, especially from managers, by designing an evaluation that takes into account the perspective of clients-customers, manager, peer, and subordinate on four dimensions: customer service, internal business processes, learning and growth, and financials)
- Business Process Reengineering (increase performance by radically redesigning the organization's structures and processes, including starting over from the ground up)
- Cultural Change (accomplish radical and fundamental change by changing the basic values, norms, beliefs, etc., among members of the organization)
- Employee Involvement (engaging personnel from throughout the organization to identify issues, purpose solutions, and become partners in implementing the changes needed to succeed in present and future environments).
- ISO 9000 (implement internationally recognized standards of performance and quality using guidelines especially focused on environmental performance).
- Management by Objectives (align goals and subordinate objectives throughout the organization – a form of planning)
- Learning Organization (enhance organization systems (including people) to increase capacity for performance - impact demands upon how well the enhanced ability is applied in the organization).

Although contemporary Slovak management practice remains deeply in the mechanistic and an autocratic model of management, it is increasingly influenced by an organic construct of the organization that emphasizes organization-external environment interactions, participation and worker motivation. Indeed, a substantial focus in the change management literature is helping also Slovak organizations, and top management, change their management model and their managers' behaviors.

Kurt Lewin's (1958) three-phase model of change – unfreeze, move or change, and refreeze – provides the framework for much of the literature that deals with intentional change in organizations (Goodstein and Burke 1995; Sapienza 1995; Kotter 1998). An important aspect of this framework is the centrality of changing the individuals who comprise the organization and the explicit recognition that change will be resisted, and that overcoming this resistance requires leadership (and hence the involvement of top management) and creates costs, which in the case of individuals include substantial emotional work. These aspects are especially relevant for the Slovak conditions and not just for private sector businesses but as well as for state owned companies. Lewin identified three ways that organizational change could be accomplished:

- Changing the individuals who work in the organization (their skills, values, attitudes and eventually behavior) – with an eye to instrumental organizational change
- Changing various organizational structures and systems - reward systems, reporting relationships, work designs
- Directly changing the organizational climate or interpersonal style - how often people are with each other, how conflict is managed, how decisions are made.

## Four Basic Change Management Strategies

I chose a concept of basic strategies, according to Bennis, Benne&Chin (1989), which can be used in Slovak conditions:

**Empirical-Rational Strategy:** People are rational and will follow their self-interest — once it is revealed to them. Change is based on the communication of information and the proffering of incentives.

**Normative-Reeducative Strategy:** People are social beings and will adhere to cultural norms and values. Change is based on redefining and reinterpreting existing norms and values, and developing commitments to new ones.

**Power-Coercive Strategy:** People are basically compliant and will generally do what they are told or can be made to do. Change is based on the exercise of authority and the imposition of sanctions.

**Environmental-Adaptive Strategy:** People oppose loss and disruption but they adapt readily to new circumstances. Change is based on building a new organization and gradually transferring people from the old one to the new one.

Generally speaking, there is no single change strategy. It can be adopted a general or what is called a "grand strategy" but, for any given initiative, the best is some mix of strategies. Which of the preceding strategies to use in mix of strategies is a decision affected by a number of factors. Some of the more important ones follow.

- **Degree of Resistance.** Strong resistance argues for a coupling of power-coercive and environmental-adaptive strategies. Weak resistance or concurrence argues for a combination of Empirical-Rational and normative-reeducative strategies.
- **Target Population.** Large populations argue for a mix of all four strategies, something for everyone so to speak.
- **The Stakes.** High stakes argue for a mix of all four strategies. When the stakes are high, nothing can be left to chance.
- **The Time Frame.** Short time frames argue for a power-coercive strategy. Longer time frames argue for a mix of empirical-rational, normative-reeducative, and environmental-adaptive strategies.
- **Expertise.** Having available adequate expertise at making change argues for some mix of the strategies outlined above. Not having it available argues for reliance on the power-coercive strategy.
- **Dependency.** This is a classic double-edged sword. If the organization is dependent on its people, management's ability to command or demand is limited. Conversely, if people are dependent upon the organization, their ability to oppose or resist is limited. (Mutual dependency almost always signals a requirement for some level of negotiation.)

### Necessary Skills by Managing Change

Managing the kinds of changes encountered by and instituted within organizations requires an unusually broad and finely honed set of skills, chief among which are the following.

#### Political Skills

Organizations are first and foremost social systems. Without people there can be no organization. Slovak managers should especially be aware of this fact! Lose sight of this fact and any would-be change agent will likely lose his or her head. Organizations are hotly and intensely political. And, as one wag pointed out, the lower the stakes, the more intense the politics. Change agents dare not join in this game but they had better understand it. This is one area where it is necessary to make own judgments and keep own counsel; no one can do it for another.

#### Analytical Skills

Make no mistake about it, those who would be change agents had better be very good at something, and that something better be analysis. Guessing won't do. Insight is nice, even useful, and sometimes shines with brilliance, but it is darned difficult to sell and almost impossible to defend. A lucid, rational, well-argued analysis can be ignored and even suppressed, but not successfully contested and, in most cases, will carry the day. If not, then the political issues haven't been adequately addressed.

#### People Skills

As stated earlier, people are the sine qua non of organization. Moreover, they come characterized by all manner of sizes, shapes, intelligence and ability levels, gender, sexual preferences, first and second languages, religious beliefs,

attitudes toward life and work, personalities, and priorities — and these are just a few of the dimensions along which people vary. We have to deal with them all.

The skills most needed in this area are those that typically fall under the heading of communication or interpersonal skills. To be effective, we must be able to listen and listen actively, to restate, to reflect, to clarify without interrogating, to draw out the speaker, to lead or channel a discussion, to plant ideas, and to develop them. All these and more are needed. Not everybody will have to learn Russian, French, or Spanish, but everybody will have to learn to speak Systems, Marketing, Manufacturing, Finance, Personnel, Legal, and a host of other organizational dialects. More important, everybody has to learn to see things through the eyes of these other inhabitants of the organizational world. A situation viewed from a marketing frame of reference is an entirely different situation when seen through the eyes of a systems person. Part of the job of a change agent is to reconcile and resolve the conflict between and among disparate (and sometimes desperate) points of view.

#### System Skills

There's much more to this than learning about computers, although most people employed in today's world of work do need to learn about computer-based information systems. For now, let's just say that a system is an arrangement of resources and routines intended to produce specified results. To organize is to arrange. A system reflects organization and, by the same token, an organization is a system.

A word processing operator and the word processing equipment operated form a system. So do computers and the larger, information processing systems in which computers are so often embedded. These are generally known as "hard" systems. There are "soft" systems as well: compensation systems, appraisal systems, promotion systems, and reward and incentive systems.

There are two sets of systems skills to be mastered. Many people associate the first set with computers and it is exemplified by "systems analysis." For the most part, the kind of system with which this skill set concerns itself is a "closed" system which, for now, we can say is simply a mechanistic or contrived system with no purpose of its own and incapable of altering its own structure. The second set of system skills associated with a body of knowledge and it deals with people, organizations, industries, economies, and even nations as socio-technical systems — as "open," purposive systems, carrying out transactions with other systems and bent on survival, continuance, prosperity, dominance, plus a host of other goals and objectives.

#### Business Skills

This entails an understanding of money — where it comes from, where it goes, how to get it, and how to keep it. It also calls into play knowledge of markets and marketing, products and product development, customers, sales, selling, buying, hiring, firing, etc.

#### **Managing People Involvement – A Necessary Competence of Slovak Managers**

Where a change must be implemented from the outside, so to speak, that is, when it has not been defined as necessary by the people involved, then it is unlikely to succeed (yield the full results of which people have ambitions) unless some of those involved are in favour of it. Several observers have suggested however that not everyone needs to support a change, and that not everybody needs to support it to the same extent.

Senge in *The Fifth Discipline* (1990) talks of the difference between commitment, enrolment and compliance, suggesting that while it is more pleasant (and reassuring) to have considerable commitment, it is not necessary for everyone to be as fully signed-up as this. There exist a number of positions along a continuum, along which players may position themselves in response to proposed action and change as illustrated below.

Commitment: Want change to happen and will work to make it happen. Willing to create whatever structures, systems and frameworks are necessary for it to work.

Enrolment: Want change to happen and will devote time and energy to making it happen within given frameworks. Act within the spirit of the frameworks.

Genuine compliance: See the virtue in what is proposed, do what is asked of them and think proactively about what is needed. Act within the letter of the frameworks.

Formal compliance: Can describe the benefits of what is proposed and are not hostile to them. They do what they are asked but no more. Stick to the letter of the framework.

Grudging compliance: Do not accept that there are benefits to what is proposed and do not go along with it. They do enough of what is asked of them not to jeopardize position. They voice opposition and hopes for failure. Interpret the letter of the framework.

Non-compliance: Do not accept that there are benefits to what is proposed and have nothing to lose by opposing the proposition. Will not do what is asked of them. Work outside the framework.

Apathy: Neither in support of nor in opposition to the proposal, just serving time. Don't care about framework.

Senge suggests analyzing what level of support is required from each of the players and directing energy to achieve that, rather than trying to persuade everybody to commit.

## **Case of Slovakia**

The transformation of economic and social life after 1989 was much harder for the economy of the Slovak part of former Czechoslovak Federation. This was true especially for engineering production. There were structural deformations from the period of centrally planned economy. The process of transformation from state ownership into other forms of ownership has been a sensitive economic and social problem. It includes restitutions, transfer of a part of state property into ownership by towns, liquidation of non-effective state enterprises and privatization itself. The biggest foreign investors and owners of successful companies in Slovakia include Volkswagen, KIA, Peugeot-Citroen, Whirlpool, Alcatel, Siemens, Assi Doman, Coca Cola, Neusiedler, Deutsche Telekom, U.S. Steel, Degussa, Aventis, Continental, INA and Nestle. The Slovak power distance index value is close to the values of countries such as the USA, the Netherlands, the UK or Germany that form the majority of countries establishing their businesses in Slovakia. Similarity of the power distance index values (Luptakova, Vargic and Kincel, 2004) suggests that the concepts commonly used by companies entering Slovakia are flexibly adapted in Slovakia and foreign companies do not witness major problems managing local workforce and implementing human resource management procedures.

The amount of national investments started growing in 1994. According to analyses the dynamics of the growth of investments in industry is insufficient. This is because of the lack of national resources especially in enterprises without foreign capital investment.

Progress in the area of restructuralization and change processes in enterprises in the Slovak Republic is not completely satisfactory. Together with a group of highly profitable enterprises there are still many loss-making companies, which need restructuralization to survive. The main reasons for insufficient restructuralization were weak bank sector, insufficient procedures within the framework of bankruptcy and a lack of foreign capital. Relatively low overhead expenses, a cheap and educated labor force, EU membership resulting in advantages of access to European markets, and last but not least the much more transparent domestic and foreign policies of the new government cabinet, still constitute advantages for Slovakia. Slovak managers have to face a difficult task to lead companies through complex change processes.

### **Change Management in the Slovak Railways**

Železničná spoločnosť, a.s. (ZSSK) – a new entity in the railway transport sector – has completed three years of its independent existence since the split-up of the unitary Railways of Slovak Republic (ŽSR). In January 2002 the former Railways were divided into two companies, which meant practical splitting-up of infrastructure and services of passenger and freight transport. The domain of the newly established ZSSK is to carry out the railway transport and business activities, while ŽSR retained the infrastructure management in its competencies.

The year 2004 was the year of reforms in the Slovak republic. Beside the tax reforms, social system, education system, health service and public administration reforms, that year was of crucial importance also for the continuing transformation of the railway companies in Slovakia. The state, being the ZSSK shareholder, faces a demanding task to prepare the company for entering of the private capital that will enable a prompt funding of necessary changes and investments. Without such changes of the technical base and supporting of the company business orientation the successful existence of ZSSK on the globalized transport market is not possible. The

shareholder, employees and practically the whole society expects from ZSSK the improvement of quality of services, effectiveness of management and finally also the larger independence on the state budget.

Transformation of railways is a complex process and the foundation of ZSSK was just its first stage. The whole process aims at gaining economic efficiency of railways, objectifying the volume of financial means drawn on the state budget, supporting the competitiveness within the sector, as well as adapting the railway industry to the requirements of the European Union.

The company has undertaken various changes in the company management to improve its performance, competitiveness and to maintain its position on the market. One of the possibilities to improve and change the company management is process analysis. The project of analysis was divided into three phases, of which the preparation phase and the first one have been carried out. The first phase came with a so-called process map as its result, showing various interconnected relations within the company, and dividing all the processes in the company into three categories – managing, main and supporting ones. At the same time the analysis specified several areas needing improvement. The outputs of the second phase of the project should show steps to bring the improvement potentials into practice, various variations of organisational structure and the implementation plan for the introduction of the changes. The following period should demonstrate whether the effort made to change the business orientation of the company, launch new products and new system of business will have impact on better position of ZSSK on the freight market, as well as revenues of the company. The customer orientation together with implementation of a new quality management system of selected products according to ISO standards will eventuate in increase in added value of the services provided by ZSSK to its customers. Certification of selected products in the freight transport represents only the first step towards the total change of the working processes, increase in efficiency of work, an along with introducing the process management, this shall contribute to rationalization of processes and anticipated reduction of workforce.

Subsequently, the possibility to sell a certain part of shares to an investor is considered. The first step is the division of the passenger transport from the freight transport (this step was made on the 1<sup>st</sup> January 2005). Both would be covered under an independent joint-stock company and later some shares of the freight joint-stock company would be sold. The decision on the shares being sold is upon the company shareholder, i.e. the State. The valid law momentarily allows for 49% of shares to be sold. The international tender shall be anticipated in this year.

#### **Discussion and Limitations**

The document aims to provide a very selection of key change approaches, models and associated evidence rather than a comprehensive introduction to change management, its many schools, concepts and techniques, for which alternative resources are readily available. For reasons of length, I also touch only briefly on some important factors bearing on change, such as necessary skills and possible strategies. I offered also a brief introduction of a company where some of the above mentioned theoretical approaches were used. Following periods should therefore demonstrate whether the effort made to change business processes and business orientation of the company will have impact on better position of ZSSK.

## **Conclusions**

A large proportion of the generic change management literature attempts to define concepts, describe how they should be implemented, and detail the benefits of implementation. Empirically based publications are relatively rare and, of those that are available, many describe research that is poorly conducted, or lacking a conceptual framework, appropriate research design, analytical rigour, or independent investigators. However, formalized research evidence is not the only source of knowledge about 'what works'. Slovak managers argue that much of the knowledge about the effectiveness of change management techniques is tacit in nature, yet to be codified and rigorously studied. This suggests that the evidence most practitioners currently use is driven from their own and colleagues' experience.

The successful adoption of a powerful concept, process, method, and/or tool often holds promise of dramatic benefit to an organization. Efforts to realize these benefits, however, often result in frustration and anger from precisely those who should benefit from the adoption.

# Controlling Function in Strategic Management

*Jozef Papula*

*Jan Papula*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

**In recent conditions of turbulent changing environment, strategic management is a key tool leading to sustainable success of the organization. Theory of strategic management offers managerial praxis many techniques and methods. Basically, they are focused in strategy formulation (analytical-syntactical techniques) and strategy implementation. The weakest part of strategic management process is control and this article is devoted to controlling in strategic management.**

## Introduction

In order to be successful, organizations must be strategically aware. They must understand how changes in their competitive environment are unfolding. Organizations have to deal with dynamic and uncertain environments. They should actively look for opportunities to exploit their strategic abilities, adapt and seek improvements in every area of the business, building on awareness and understanding of current strategies and successes. Organizations must be able to act quickly in response to opportunities and barriers.

Strategic management is in this way a highly important element of organizational success. The need to know what the business is about, what it is trying to achieve and which way it is headed, is a very basic requirement determining the effectiveness of every member's contribution. Every successful entrepreneur has this business self-awareness and every successful business seems to have this clarity of vision, even though it does not arise from a formal planning process.[9]

Effective strategic management involves more than just a few easy steps. It requires managers to think strategically, to develop the ability to see things in motion, and to make sense out of a cloudy and uncertain future by seeing the interdependency of key factors. This ability requires more than a passing awareness of significant social, political, legal, economic and technological trends. Managers who think strategically are able to envision their organizations in the context of world trends and events and to spot important interdependencies. They focus on how their organization should act and react to emerging opportunities and barriers.

The distinguishing characteristic of strategic management is its emphasis on strategic decision-making. [6]

*"A strategy is only as good as its ability to provide decision making guidance in a chaotic competitive environment."* [13]

New strategic initiatives often take several years to execute fully and relatively few succeed. Unfortunately, classical control processes have contributed to this situation because they have been designed as feedback systems that detect problems and deviations from planned results only after they have already occurred, and because the standards to which measurements are compared are assumed to be correct or good. Recent conceptual contributors to the strategic control literature have argued for anticipatory feedforward controls that recognize a rapidly changing and uncertain external environment. These new systems are designed to operate on a continuous basis, checking and critically evaluating assumptions, strategies, and results.

### **Strategic Control as a Part of Strategic Management**

Strategic management is the ongoing process of ensuring a competitively superior fit between the organization and its ever-changing environment. Strategic management is the process that defines the organization's mission, scans the environment to ascertain opportunities, then merges this assessment with an evaluation of the organization's strengths and weaknesses to identify an exploitable niche in which the organization will have a competitive advantage. [7]

Thomas L. WHEELLEN, and David J. HUNGER [12] defines strategic management as that set of managerial decisions and actions that determines the long-run performance of a corporation.

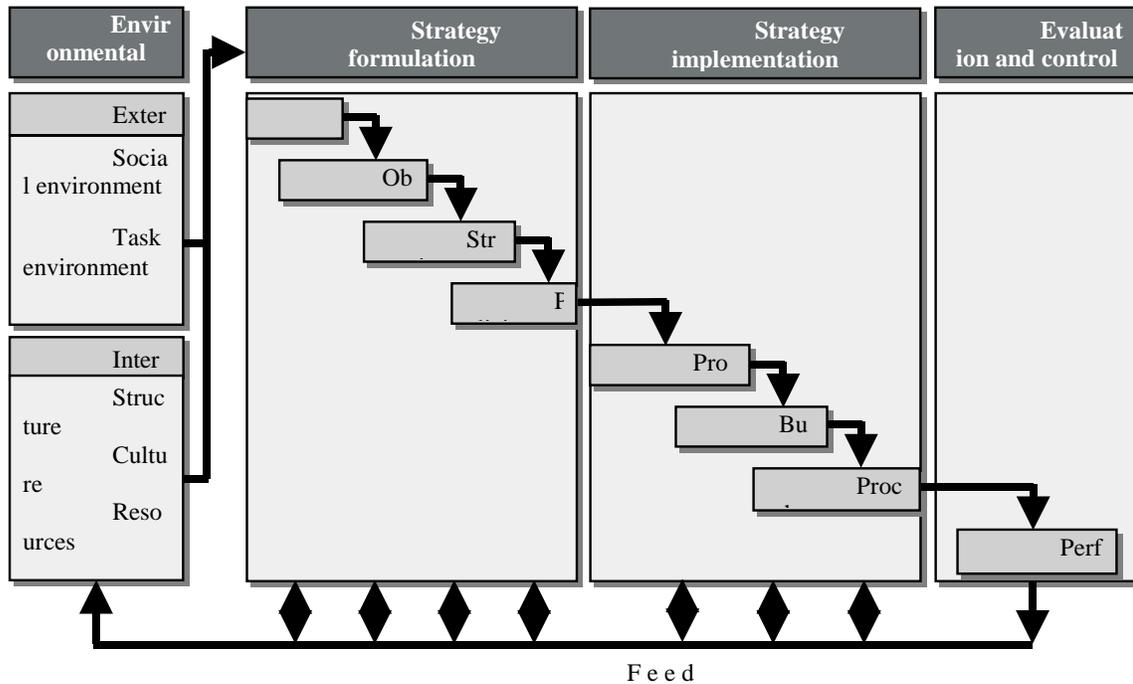

FIG. 1: MODEL OF STRATEGIC MANAGEMENT

Their model includes four basic elements:

1. **Environmental scanning,**
2. **Strategy formulation** (strategic or long-range planning),
3. **Strategy implementation,** and
4. **Evaluation and control.**

Figure 1 shows how these four elements interact. At the corporate level, the strategic management process includes activities that range from environmental scanning to performance evaluation. Management scans both the external environment for opportunities and threats and the internal environment for strengths and weaknesses. The factors that are most important to the corporation's future are referred to as strategic factors and are summarized with the acronym S.W.O.T., standing for Strengths, Weaknesses, Opportunities, and Threats. After identifying these strategic factors, management evaluates their interaction and determines the appropriateness of the corporate mission. The first step in the formulation of strategy is a statement of mission, which leads to a determination of corporate objectives, strategies, and policies. Corporations implement these strategies and policies through programs, budgets, and procedures. Finally, performance evaluation and feedback ensure adequate control of organizational activities.

Control, in the business administration sense, is most often discussed in the context of budgeting. In the control of budgeted expenditures, the focus is usually for a time span of a year or less; quantitative measurements are used to determine whether actual expenditures are exceeding planned spending, the emphasis is on internal operations; and corrective action is often taken after the budget period has elapsed.

But in strategic control, the focal time period usually ranges anywhere from few years to over a decade, qualitative and quantitative measurements are taken, management assesses both internal operations and the external environment; and the process is ongoing, because top management cannot wait for several years to evaluate results.

Strategic control consists of determining the extent to which organization's strategies are successful in attaining its goals and objectives. If the goals and objectives are not being reached as planned, then the intent of control is to modify the organization's strategies and implementation so that the organization's ability to accomplish its goals will be improved.

While the differentiation between operational and strategic planning is customary in theory and practice, the differentiation between strategic and operational control is largely uncommon.[3]

Lorange, Morton, and Ghoshal, in their book on strategic control, identified three types of control. [5]

- *Strategic control* deals with the basic strategic direction of the corporation in terms of its relationship with its environment. It focuses on the organization as a whole and might emphasize long-term measures (one year or more), such as return on investment and changes in shareholder value.
- *Tactical control*, in contrast, deals primarily with carrying out the strategic plan. It emphasizes the implementation of programs and might use medium-range measures (considering six months to a year), such as market share in particular product categories.
- *Operational control* deals with near-term (considering today to six months) corporate activities and focuses on what might be going on now to achieve near- and long-term success.

Strategic controls are intended to steer the company toward its long-term strategic goals. Strategic controls to meet top management's needs to track the strategy as it is being implemented, to detect underlying problems, and to make necessary adjustments. These strategic controls are linked to the assumptions and the key operating requirements necessary for successful strategy implementations. Ever-present forces of change fuel the need for a focus of strategic control.

Strategic control consists of determining the extent to which organization's strategies are successful in attaining its goals and objectives. If the goals and objectives are not being reached as planned, then the intent of control is to modify the organization's strategies and implementation so that the organization's ability to accomplish its goals will be improved.

According to John A. Pearce II. [8] The control of strategy can be characterized as a form of "steering control". Ordinarily, a good deal of time elapses between the initial implementation of a strategy and achievement of its intended results. During that time, investments are made and numerous projects and actions are undertaken to implement strategy. Also during that time, changes are taking place in both the environmental situation and the company's internal situation. Strategic controls are necessary to steer the firm through these events. They must provide the basis for adapting the firm's actions and directions in implementing its strategy to these developments and changes.

The four basic types of strategic control are (Figure 2):

- Premise control – is assumption testing
- Strategic surveillance - is the open-minded monitoring of the internal and external environments to see if any assumptions you made about your strengths, weaknesses, opportunities, and threats have been violated.
- Implementation control - depends upon your willingness to admit that your assumptions may be inaccurate when subjected to the day-to-day meat grinder test.
- Special alert control - is simply a system designed to monitor your key assumptions that are critical to the success of your strategic plan ..., which assumes that you have identified those key assumptions.

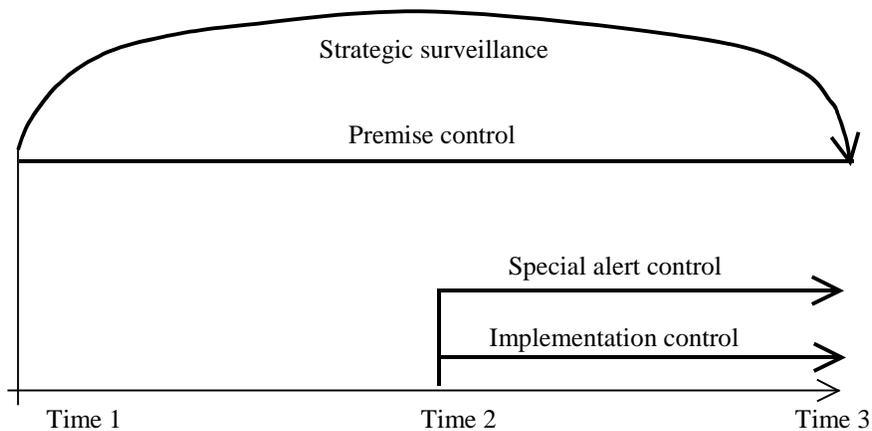

FIG. 2: FOUR BASIC TYPES OF STRATEGIC CONTROLS [8]

**a) Premise Control**

Every strategy is based on certain planning premises – assumption or predictions. Premise control is designed to check systematically and continuously whether the premises on which the strategy is based are still valid. If a vital premise is no longer valid, the strategy may have to be changed. The sooner an invalid premise can be recognized and rejected, the better are the chances that an acceptable shift in the strategy can be devised.

Strategies are often based on numerous premises, some major and some minor, about environmental and industry variables. Tracking all of these premises unnecessarily expensive and time consuming. Therefore, managers must select for tracking premises whose change is likely and would have a major impact on the firm and its strategy.

**b) Implementation Control**

Strategy implementation takes place as series of steps, programs, investments, and moves that cover over an extended period of time. Special programs are undertaken. Functional areas initiate strategy – related activities. Key people are added or reassigned. Recourses are mobilized. In other words, managers implement strategy by converting broad plans into the concrete, incremental actions and results of specific units and individuals.

Implementation control is the type of strategic control that must be exercised as those events unfold. Implementation control is designed to assess whether the overall strategy should be changed in light of the results associated with the incremental actions that implement the overall strategy. Prudential’s updating of cost and revenue projections based on early experiences with regional home offices is an example of implementation control.

Two basic types of implementation control are:

- Monitoring strategic thrusts
- Milestone reviews

**Monitoring strategic thrusts**

As a means of implementing broad strategies, narrow strategic projects are often undertaken – projects that represent part of what needs to be done if the overall strategy is to be accomplished. These strategic thrusts provide managers with information that helps them determine whether the overall strategy is progressing as planned or needs to be adjusted.

Although the utility of strategy thrusts seems readily apparent, it is not always easy to use them for control purposes. It may be difficult to interpret early experience or to evaluate the overall strategy in light of such experience.

One approach is to agree early in the planning process on which thrusts or which phase of thrusts are critical factors in the success of the strategy. Managers responsible for these implementation controls single them out from other activities and observe them frequently. Another approach is to use stop / go assessments that are linked to

a series of meaningful thresholds (time, costs, research and development, success, etc.) associated with particular thrusts.

**Milestone reviews**

Managers often attempt to identify significant milestones that will be reached during the time a strategy is being implemented. These milestones may be critical events, major resource allocations, or simply the passage of a certain amount of time. The milestone reviews that then take place usually involve a full-scale reassessment of the strategy and of the advisability of continuing or refocusing the firm’s direction.

**c) Strategic Surveillance**

By their nature, premise control and implementation control are focused controls; strategic surveillance, however, is unfocused. Strategic surveillance is designed to monitor a broad range of events inside and outside the firm that are likely to affect the course of its strategy. The basic idea behind strategic surveillance is that important yet unanticipated information may be uncovered by a general monitoring of multiple information sources.

**d) Special Alert Control**

Another type of strategic control, really a subset of the other three, is special alert control. A special alert control is the thorough, and often rapid, reconsideration of the firm’s strategy because of a sudden, unexpected event.

All four types of strategic control share common purpose: to assess whether the strategic direction should be altered in light of unfolding events. Strategic controls are designed to continuously and proactively question the basic direction of the strategy. Strategic controls are needed to manage the strategic process effectively.

**Controlling Way of the Control Function**

Controlling is a sub-system of the management, which deliberately puts processed information for preparation of the decision derivation at disposal.

The term “Controlling” underwent a continuous change in its evolution. First, it was only understood in the sense of control, implying a past-oriented view of controlling. This is a consequence of referring to it in its narrowest sense related to the last stage of the co-ordination, planning and control process which is the stage of control. [1]

Although this rather narrow delimitation of the term “Controlling” has been enlarged step by step, the relation to decision and information was missing for a long time. Progress was overdue, especially in connection with the decision-related condensing of information. However, the stage of planning was finally included so it was now possible to integrate deviations from plans into the decision process.[2]

Controlling system contains the information which type of problem in which area of the company must be analyzed and, moreover, which managerial tools and part of information technology are used.

System of controlling regulations doesn’t serve only for control, but much more for prediction. Thereby traditional management control mechanism “feed back” should be developed to mechanism “feed forward“.

TABLE 1: “FEED BACK” AND “FEED FORWARD” ORIENTATION.

Criteria	Managing before occasion	Managing after occasion
<b>Function</b>	Feed forward control	Feed back control
<b>Verification</b>	Input orientation = relation to the future	Output orientation = relation to the past
<b>Execution</b>	Before problem occurrences	After problem occurrences
<b>Influence</b>	Defense against the problem	Liquidation of the problem

Horvath [4] summarizes the functions and the targets of the controlling as follows:

- Controlling function in the co-ordination consists of planning and control as well as the information supply
- The controlling targets consist of the securing and maintenance of the co-ordination, reaction and adoption ability of management, so that these can realize the targets of the enterprise

Strategic controlling supports strategic management in carrying through *strategic planning* and *control*. [10] Therefore, in the framework of the strategic planning process it has got planning, co-ordination, information supply and control tasks which cover the process from the establishing of targets to realization and control. Thus,

Controlling has to provide the adequate instruments, which means that planning and control instruments are evaluated fixed regarding their advantages and disadvantages and are allocated according to their possibilities of employment and to the necessary additions. The task of information supply refers to securing the decision-relevant information supply for the planners. This covers as well the guarantee of the efficient employment of adequate instruments for analysis and prognosis of strategic chances and risks by the controller.

*Strategic planning* is the key link between strategic management and the organization's external environment.[11] Therefore, the main task of the strategic planning process is a careful strategic analysis of the market and the position of the company within that market. Strategic planning is to be understood as a repetitive process, i.e. the determination of singles phases (see Figure 3) only serves the representation of the necessary steps in a meaningful sequence.

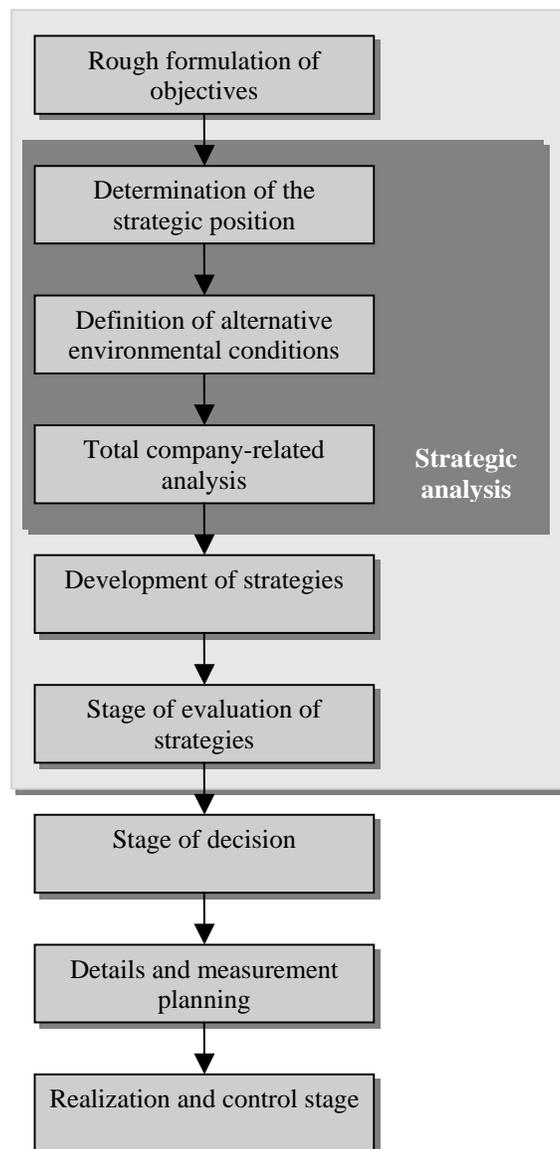

FIG. 3: PHASES OF STRATEGIC PLANNING [10]

Planning strategically means to first roughly formulate the targets giving the principal orientation and afterwards, beginning with the actual planning process, to carefully analyze the external influence factors, i.e. chances and risks, which are to be expected. Such an environment analysis does not only have to orientate towards a total economic growth analysis and, if necessary, the branch- and company-related possibilities of development, but has as well to take into consideration political and social developments. This environmental analysis enables the determination of global/critical success factors as well as profitability limiting key factors. The analysis of external factors must be succeeded by an analysis of internal factors. That means, the analysis of the company-related present and future strength and weaknesses in relation to the competitors on the market. Doing this renders an evaluation of the (relative) internal potential of resources possible.

*Strategic control* is related to the implementation of a strategy. This factor links strategic management to the organization's internal environment because it involves evaluating how well the organization is implementing the strategy. Strategic control has two components, one internal and one external. The internal component involves monitoring resource allocation and organizational operations and suggesting changes needed to implement the strategy better. The external component involves measuring the strategy's success.[11] Therefore, strategic control can be regarded as an instrument for the adaptation of strategic planning to changing environmental conditions.

The control process ensures that the company is achieving what it set out to accomplish. It compares performance with desired results and provides the feedback necessary for management to evaluate results and take corrective action as needed. This process can be viewed as a several steps feedback model, as depicted in Figure 4.

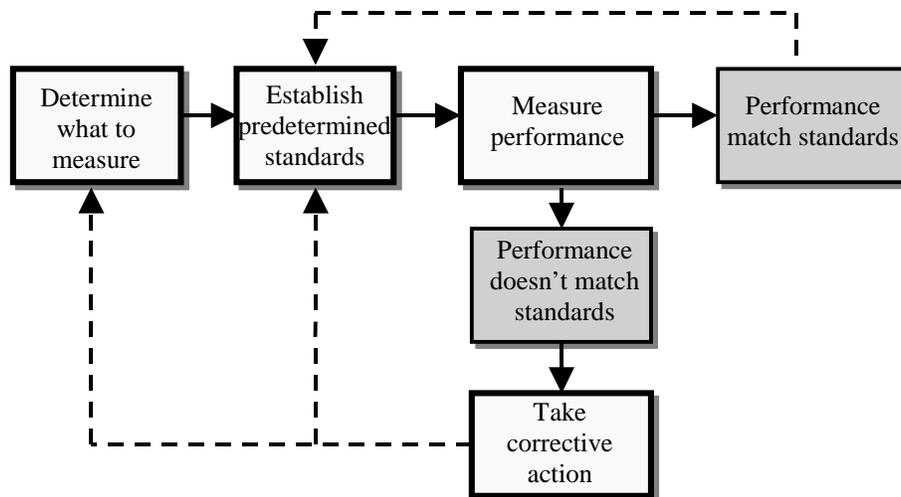

FIG. 4: EVALUATION AND CONTROL PROCESS

First, top management must decide what elements of the environment and of the organization need to be monitored, evaluated and controlled. Then standards must be established with which the actual performance of the organization can be compared. These first two steps will be strongly influenced by the organization's mission, goals, and objectives, which direct management's attention to certain organizational and environmental elements and to the relative importance of particular standards.

Next, management must evaluate the company's actual performance. These evaluations will generally be both qualitative and quantitative.

The performance evaluations will be later compared with the previously established standards.

If performance is in line with the standards or exceed them, then no corrective actions are necessary. However, if performance falls below the standards then management must take corrective action.

## Conclusion

The corporate world is becoming a very different place. Mergers and acquisitions have transformed the landscape. International boundaries are fading in importance as businesses take on a more global perspective. Knowledge of strategic management is essential to effective business performance in a changing environment.

To be able to recognize long-term success-potentials, it is necessary to have prognoses about the future development of specific environmental facts. In order to survive and be efficient firms have to predict their cost, price, and profit in the long run and then formulate their market strategies. The central task of controlling is to critically analyze and evaluate the relevance of its instruments from time to time regarding competition. Such an analysis has to take into consideration the most important internal and external influencing factors according to the company.

# Empirical Study on Strategic Choices of China Logistics Companies

Xiaodong Wang

Huaiqin Jia

Qiang Wang

University of International Business & Economics, China

## Abstract

The past decade has witnessed rapid development in the logistic industry in China. *Third-Party Logistics (3PL)* service suppliers or logistic companies are playing an increasingly important role in the global economy. This research is an empirical study on strategic choices of the logistics companies in China. Based on a nation-wide survey, it uses Porter's framework to analyze competitive strategy and outsourcing strategies of logistics companies. Also, a comparison is made to find out the difference between local 3PLs and foreign invested service providers. Managerial insights and implications have been generated from this research.

## Introduction

China's logistics sector has undergone four stages of development since 1949 (Luk, 1998). Since the Chinese system "still lies somewhere between socialism and free market capitalism"<sup>i</sup>, factors like unbalanced economy and regional protectionism still stand in the way for rapid development (Jiang 2002a, 2002b).

However with China's huge market and booming economy, local logistics market still enjoys a high growth rate (Mercer, 2002) in the past decade. Against the exponential potential growth (Morgan Stanley, 2001), the trend for outsourcing logistics services (Hong, 2004) will surely make logistics companies plays an ever-important role in the market.

China's WTO accession marks a turning point in the development of China's logistics sector (Powers 2001). By the end of 2004, restrictions for foreign investment on logistics sector including distribution and trucking services have been abolished<sup>ii</sup>. As more foreign firms take bolder strategy to penetrate the local market, competition is bound to be more severe. This research is an empirical study on logistics companies in China. It analyzes logistics company's strategic choices in terms of cost & service. Companies' outsourcing strategy is also reviewed to find out whether non asset-based companies have more privilege over asset-based companies. Finally, results it provide insights and implications for logistics managers and practitioners.

## Literature Review

Third Party Logistics (3PL) or contracting logistics originated in the 1980s. The term is used to refer to those companies that undertake logistics activities outsourced by manufacturing or commercial companies. In 1990s, a ".....3PL services are important trend in logistical management. Estimates vary concerning the magnitude of 3PL, but there is little question that opportunities for these services will continue to grow"<sup>iii</sup>. A 3PL service provider or logistics company is a logistics service provider that carries out activities "on behalf of a shipper and consisting at least management and execution of transportation and warehousing if warehousing is part of process"<sup>iv</sup>. In recent years, 4PL is also named referring companies that integrate and assemble "the resources, capabilities and technology of its own organization and other organizations to design, build and run comprehensive supply-chain solutions."<sup>v</sup> In a word, a 4PL is an integrator that may take advantage of its management skills or technological advancement to win contracts from manufacturers or commercial companies. While the 4PL provider may offer some operational services, the main characteristic is its limited asset provision (Morgan Stanley, 2001; Liu 2001, Zeng2002, Ran2004), which is more like non-asset service providers (Sheriff 1990).

It is not clear when the term 3PL was introduced in China. However, it is well accepted that in the late 1990s, the term becomes a lot of people's concern<sup>vi</sup>. Morgan Stanley (2001) suggested that logistics market in China is in the primitive stage with a very promising future. Jiang (2002) concluded that China is undertaking an evolution in distribution and logistics area. Both foreign firms and domestic firms face similar difficulties like overburdened and underdeveloped physical infrastructure and so on. Li (2002) analyzed the characteristic and current status of Chinese logistics companies. Mercer (2002) found that 3PLs are eager to improve their services. Zhang (2002) indicated that multinational manufacturers and commercial companies prefer to use foreign invested logistics companies. Hong (2004) found out that the great market potential have attracted many foreign logistics companies into the market, thus expanding market share especially on "high-level" services. Findings based on a series of surveys conducted by China Warehousing Association in 1999, 2000, 2001, 2003 seem more convincing. They found out that services provided by 3PLs are not satisfactory in terms of quality and relationship between customers and logistics companies is rather fragile.

However, the above-mentioned studies paid more attention on the demand side, i.e. logistics service users. They failed to provide valuable insights on the characteristics of 3PL service providers or logistics companies. Even less was provided on their competitive behavior. Leahay (1995) "Customer Orientation" and "Dependability" are two most important factors for logistics companies success. Sum and Toe (1999)'s empirical study on competitive advantage of 3PLs surveyed logistics companies in Singapore and concluded that companies that have both service and cost advantages perform best in market. Still we need to find out if those rules apply in China, the world's biggest transitional economy. Furthermore, China's geographic size, complicated business environment and rapid development make it common that logistics companies sub-contract some of their business to locally operated companies (sometimes such companies run only in specific cities or provinces). Together with the development of 4PL, some analysts predicted that companies, which take full advantage of outsourcing strategy, might achieve competitiveness in market (Liu 2001, Zeng2002, Ran2004). Therefore, this research is aimed to find out the relationship between logistics companies' strategic choices and their market performance.

## **Methodology**

To understand logistics companies' business practice in China, a survey was conducted in 2003 to get first hand information. Researchers visited or called managers or chief executives of logistics companies around the country. Samples were chosen on convenient basis. Participants were given a 9-page questionnaire.

Altogether 105 companies responded. Study shows respondents are from 15 provinces and the majority is registered in the coastal areas. Among them, 23 companies (22%) are registered in Beijing, and 20 companies registered in Shanghai (20%). See Figure 1 for the geographic distribution.

In terms of ownership, 69 companies (about 65.7%) are local companies. The rest (34.3%) are foreign companies or joint ventures in China. In 2003, due to the market entry restrictions in logistics sector, foreign firms could only set up offices to handle coordination tasks. As the restriction for market entry is relieved in 2005, branches or subsidiaries will take their place. Evidence shows that many foreign investors of joint ventures prefer to set up wholly owned companies after 2005<sup>vii</sup>. Therefore, this paper will not differentiate joint ventures and foreign owned companies instead they will be referred to as foreign invested companies (FIC).

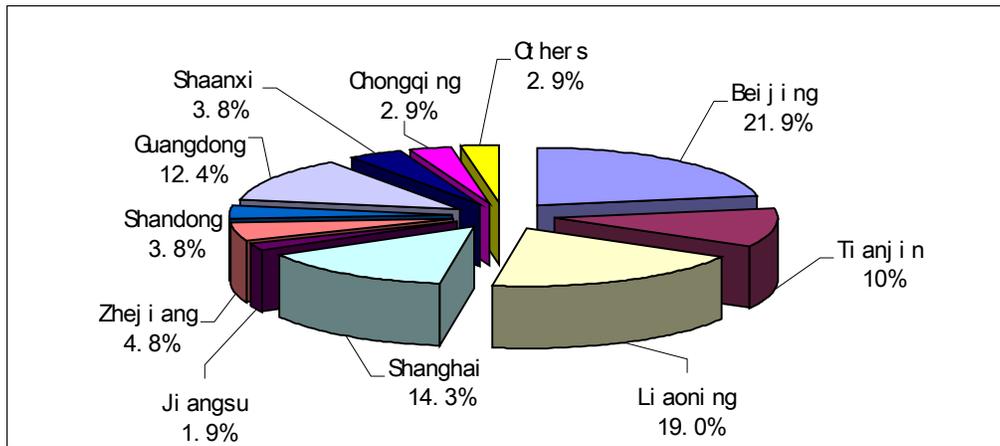

FIG. 1: GEOGRAPHIC DISTRIBUTION OF SAMPLES

Data show that small and medium sized companies are main players of the market. As many foreign firms are waiting for 2005 to expand their work force, this paper considers only local firms. Among them, about 50.7% are small companies with less than 200 employees. Less than 16% are large companies with more than 1,000 employees. This makes the market rather competitive.

## Results and Analysis

### Current Market Status

The survey shows that “logistics” or “third party logistics services” is not clearly understood among practitioners. A lot of logistics companies still provide traditional logistics services, either characterized by functional transportation and warehousing services or transaction-based services.

About 40% of the companies surveyed claimed to provide function-based warehousing and transportation service. About 9% of the companies mentioned that they might offer warehousing and related value-added services. Only 46% of the companies claimed to provide “Integrated Logistics Services” which involved transportation, warehousing and packing services. Even for the Integrated Service providers, the service might not be a one-stop service. However, the trend towards outsourcing is obvious. “Compared to the data collected in Survey 2001, the proportion of manufacturers and commercial companies which outsourced logistics services increased distinctly.”<sup>viii</sup>

In terms of relationship with customers, data show that only about 10% of the companies have a 3-year or longer contracting term with the customers. More than 53% of logistics companies have short-term (less than 1 year) relationship with their clients. Not only that, Figure 2 shows that about half of foreign-invested companies have 70% or more sales accomplished with Term-Contract while only 35% local companies fall in this group. On the other hand, 17% of local firms that have 30% or less sales achieved by Term-Contract while the figure for foreign invested firms is only 6%. It implies that local firms are more likely to rely on transaction-based services. Reasons behind this might be:

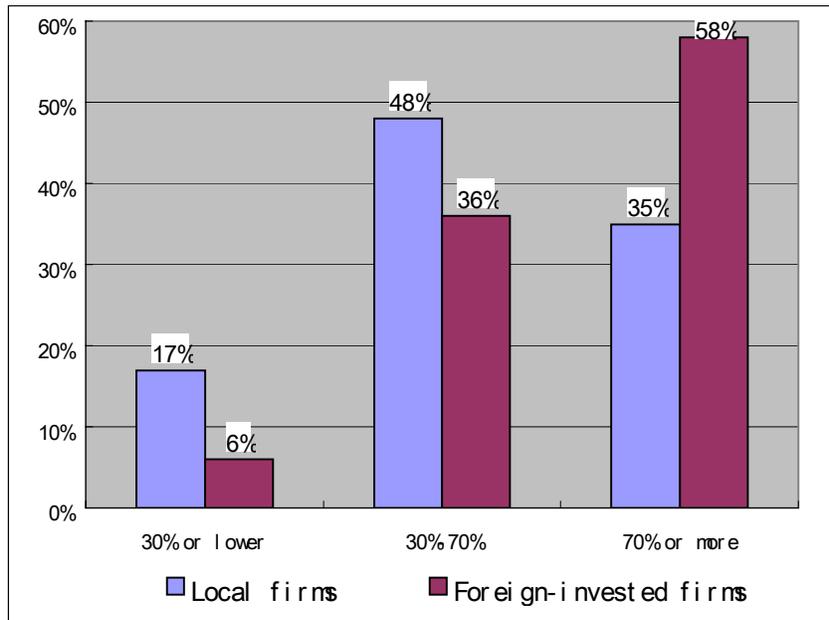

FIG. 2: SALES PROPORTION ACCOMPLISHED WITH TERM CONTRACT

- Local logistic companies provide more traditional logistics services or basic logistics service, i.e. warehousing or point-to-point transportation services. Those services are more like “normal goods” that can be easily bought from the market. Then, manufacturers or commercial companies prefer to keep multiple suppliers for more competitive prices and efficient service. In order to provide more value-added logistic services, local logistic companies need to expand their functions (or services). Maintaining established partner relationship will also improve service level.
- Services offered by local firms seem less differentiated. This is due to homogeneous suppliers and low substitution cost. Then customers will take advantage of short contracting term to pressure the logistic companies to lower prices.
- Competitive local market. As mentioned before, the market is congested with small and medium sized players. This leads to the most perfect competitive environment. 41% of the respondents claim to have more than 10 main competitors. About 29% of firms have more than 20 main competitors. Foreign invested companies which provide global service packages tend to be more competitive penetrate the market by extending overseas services, they are more likely to cover local service with global service packages.
- Since 1980s, more and more companies are entering China to leverage the country’s cheap labor costs and establish long-term competitive advantages in the world’s largest potential market. To cope with supply chain issues, they usually use cluster approach or use non-Chinese 3PLs (Jiang 2002a). Multinational companies prefer to use logistics companies from the same country because of similar cultures and close relationship developed in their home country (Zhang, 2002). Local companies originally are used to offer services on transaction-basis. However, recently most local logistics firms have been gradually transformed from function specific transportation or warehousing companies to logistics service providers. However, both the companies and their customers need time to develop a new relationship, from transaction based relationship to partnership based relationship. Therefore, foreign invested logistics companies have an edge over local firms to serve the market on relationship-basis.

### Customers' Attitude Towards Good Logistics Companies

When asked what are important for manufacturers or commercial companies to choose 3PL service suppliers, respondents come with rather consistent notion. Table 1 shows that good reputation, rich experiences and sound quality control system are listed as customers' prime concerns. Though logistic market in China is still in its primitive stage, the ability to develop new service or provide more value-added service is not quite important in the eyes of customers. It implies that customers in China are quite cautious about outsourcing logistic activities to outside suppliers. Logistic companies have to prove that they are trustworthy before they could get any businesses. Thus, established companies especially those big giants, mainly government-owned companies and multi-nation companies, which have been in business for decades, have more chance to expand the market share. It may also helps to explain why established shipping companies like COSCO or freight forwarders like SINOTRANS may easily become top logistic service providers around China. Meanwhile new incomers in particularly the private companies are facing natural barriers.

TABLE 1: FACTORS FOR CHOOSING LOGISTICS SERVICE PROVIDERS

Focus of customers' need	Mean**	Std Deviation	Sig. (2-tailed)
Have high prestige	6.27	1.05	.000
Be rich in operating experiences	6.07	1.16	.000
Have sound quality control system	6.06	1.02	.000
Provide a wide range of products/services	5.62	1.43	.000
Be flexible to adapt to customers' needs	5.51	1.26	.000
Have good relationship with government	5.47	1.42	.000
Provide more value-added services	5.38	1.48	.000
Be able to develop customized product/service	5.23	1.48	.000
Introduce new products/services rapidly	4.84	1.58	.000

\*: The data is processed by SPSS 10.0

\*\* : Measure on 7-point Likert scale. "7" for very important.

Customized service and the ability to provide more value added service are not regarded as the very important factors, which shows that the demand side is also at the primary stage. The demand for basic logistics service is still dominating the market.

Come to the logistics customer service, companies listed Be Accurate in Filling Orders, Respond Quickly to Customers' Inquiry, Meet With Promised Due Date, and Provide Tracking Service as the most important measurement for customer services.

### Logistics Companies' Operating Focus

In terms operation focus, respondents again show unanimously opinions. They all try to focus on providing more reliable, efficient service with the help of updated IT system (See Table 2). One thing interesting is though no one regards developing new service are customers' top concern, it is still listed as one of operation focus. One reason is more and more logistic companies try to stand out competition by differentiating services. Therefore, they are eager to improve the ability to develop new services and customized offerings. But because experiences are more persuasive than attractive promotional message, 3PL service providers are reluctant to increase payment on advertising. Meanwhile, responding to China's immature market, few 3PLs got the chance to be involved in more complicated services like inventory control. Then, they pay little attention on reducing inventories. Experts predicted that market would expand rapidly in the near future still incumbents are not willing to increase capacity. In times of fierce competition and oversupplied basic service market a lot of companies choose to outsource to sub-contractors to earn flexibility (see Outsourcing Strategy). Form strategic alliances and improve the capability to provide customized services are not top operational emphasis for logistics companies implies that market competition is still focus on operational efficiency. Partnership or long-term relationship is not valued too high. It confirms the conclusion that logistics companies compete against each other on transaction-basis rather than relationship focused.

TABLE 2: OPERATION FOCUS OF LOGISTICS COMPANIES

Operation focus of logistic companies	Mean**	Std Deviation	Sig. (2-tailed)
Increase ability to deliver orders on time	5.86	1.21	.000
Increase operational efficiency	5.75	1.26	.000
Improve information technology	5.49	1.27	.000
Develop new service	5.45	1.48	.000
Upgrade skills/training of workers	5.37	1.46	.000
Using better transportation vehicles	5.24	1.39	.000
Keep price competitive	5.11	1.38	.000
Improve capability to customized services/products	5.06	1.62	.000
Form strategic alliances	5.05	1.39	.000
Obtain ISO9000 certification	4.95	1.95	.000
Increase automation and mechanization	4.74	1.47	.000
Increase ability to reduce delivery lead time	4.67	1.49	.000
Introduce new services quickly	4.56	1.56	.000
Increase capacity	4.30	1.67	.000
Reduce inventory levels	4.18	1.73	.000
Increase promotion/advertising	3.90	1.89	.000

\*: The data is processed by SPSS 10.0

\*\* : Measure on 7-point Likert scale. "7" for very important.

#### Prospective of Future Market

Thanks to the confidence on China economic development, almost all respondents show strongly positive attitudes toward China logistics market. Foreign invested companies, in particular, expected to get more market share once Chinese government grant them full access to local market. Local firms are expecting that as more and more manufactures and commercial companies outsource their logistics activities the overall market size will increase significantly. Some local firms on the other hand are expecting market environment will improve as the government improve legal and physical infrastructure. Only a few local firms worried that with more foreign invested companies enter Chinese market, competition will become even more fury. Small companies with small fleet and poor management skills would hardly survive.

Except economic development, which is obviously the most important factors, data also shows that 3PL service providers regard Higher Expectation from Customers, Lack of Qualified Personnel and Increased Globalization will have important impact on market development (See Figure 3). It is disappointing that logistics companies regard Increased Environmental Concerns is the least import factor affecting the market. Evidence shows that less attention on environmental issues and lack of stern control on illegal activities have resulted in dangerous goods leakages or other environmental damaging cases. Some improvement has to be done in this regard.

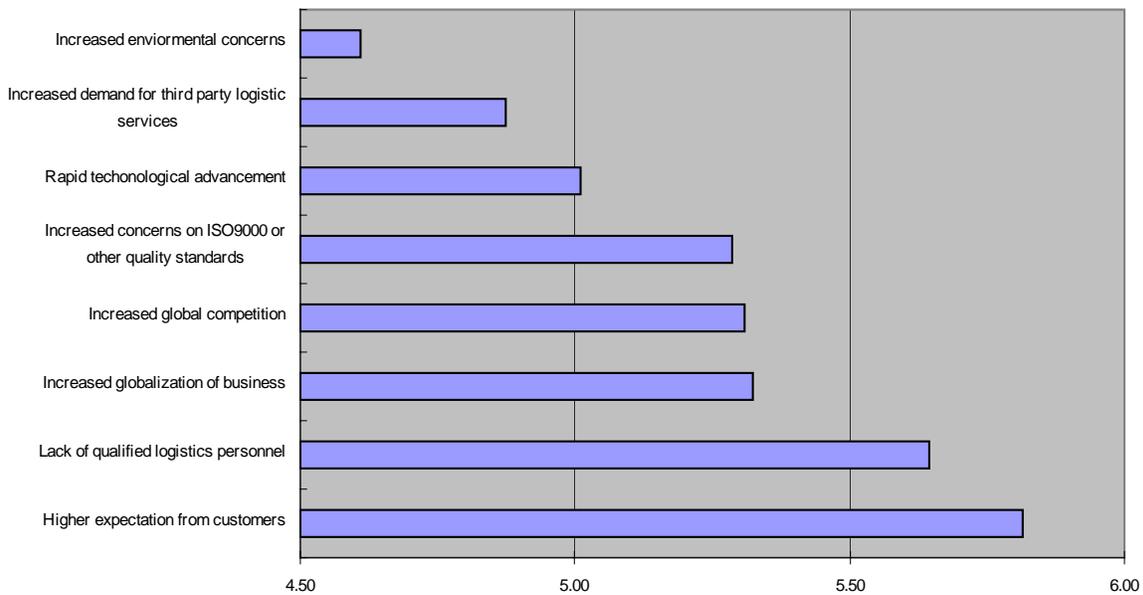

FIG. 3: FACTORS TO IMPACT FUTURE LOGISTICS MARKET

### Competitive Strategy of Logistics Companies

It is known that three basic competitive strategies are used to update a firm's competitive status. They are cost leadership, differentiation and focus strategy (Porter, 1980). Following the method in White (1986) and other empirical studies, Sum(1999) used Porter's typology and classified the respondents into four generic strategic types, named pure cost leadership strategy, pure differentiation strategy, simultaneous cost and differentiation strategy and no clear strategy. This research applied the same methodology. In the survey respondents are required to evaluate its advantage over its main competitors in terms of costs and services (7-distance Likert Scale). Based on the factors on choosing 3PL service provider, the research averaged service reliability, accuracy of invoices, respond speed to customers' inquire as service advantages. Then the respondents are classified into four groups, i.e. Group I (companies with cost advantage and service advantage or pursuing cost leadership strategy and differentiation strategy simultaneously), Group II (companies with service advantage or pursuing differentiation strategy), Group IV (companies with cost advantage or pursuing cost leadership strategy) and Group III (companies with no obvious advantages or no clear competitive strategy). Figure 4 shows the grouping results.

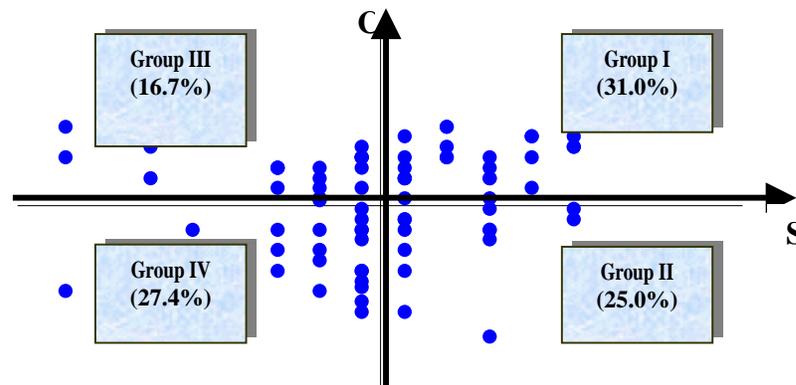

FIG. 4: GROUPING OF LOGISTICS COMPANIES' COMPETITIVE STRATEGY

The questionnaire also required respondents to evaluate its performance over its main competitors. To make the results more reliable, five indexes were used for measuring logistics companies' performance in the past two years. They are overall financial performance, average growth in annual sales, average growth in market shares, percentage in return of sales and percentage in return of assets. Further study shows that performance difference of different groups is significant (See Table 3). Companies apply both cost leadership and differentiation strategy (Group I) tends to win the completion followed by companies with differentiation strategy (Group 2). Performance of the rest two groups is not quite clear. Companies pursue pure cost leadership strategy (Group III) performs even worse than companies without clear competitive strategy (Group IV) in terms of Overall Financial Performance, Average Growth in Annual Sales. However, Group III seems work better in increasing market share, return of sales and return of assets.

TABLE 3: BUSINESS PERFORMANCES AND LOGISTICS COMPANIES' COMPETITIVE STRATEGY

Performance	Mean (Std Deviation)				K-W Test Sig.
	Group I	Group II	Group III	Group IV	
Overall financial performance	5.69(0.97)	5.26(1.15)	4.08(1.24)	4.14(1.56)	.000
Average growth in annual sales	5.58(1.10)	4.95(1.07)	4.29(1.07)	4.70(1.40)	.006
Average growth in market share	5.46(1.03)	4.76(1.09)	4.29(0.99)	4.26(1.68)	.005
% growth in return of sales	5.76(1.09)	4.70(0.92)	4.29(1.14)	4.13(1.39)	.000
% growth in return of assets	5.68(1.03)	4.70(1.03)	4.29(1.07)	4.09(1.41)	.000

	Competitive Strategy				Total
	Group I	Group II	Group III	Group IV	
Local Firms	20	15	9	24	68
Foreign invested companies	12	11	8	5	36
Total	32	26	17	29	104

Pearson Chi Square=5.16, p>0.05

Furthermore, data shows that no significant difference exists between local companies and foreign invested ones in pursuing competitive strategies.

#### Outsourcing Strategy of Logistics Companies

The survey results also show that 72 (about 69%) respondents have outsourced operations to the outside suppliers including 44 local firms (about 64%) and 28 foreign invested companies (about 78). Those subcontractors may act as contract carriers hiring real carriers to deliver goods or contract warehouses to provide extra warehousing or

distribution services at the rush season. Among them 11% have subcontractors achieved more than 70% of total sales; 27% companies have subcontractors achieved 30-70% total sales.

As to the reasons most companies find that subcontractors may provide same service at a lower cost. About one fourth companies use outside suppliers to supplement inadequate capacity. 7% local firms, 25% foreign invested companies offer a wider variety of services with the help of outside suppliers. Another 17% local firms and 20% foreign invested ones use sub-contractor to extend their service to cover more geographic areas (See Figure 5). Besides some practitioner suggested that another reason for foreign firms applying outsourcing strategy is they are not legally allowed to operate China in year 2003 due to market entry restrictions.

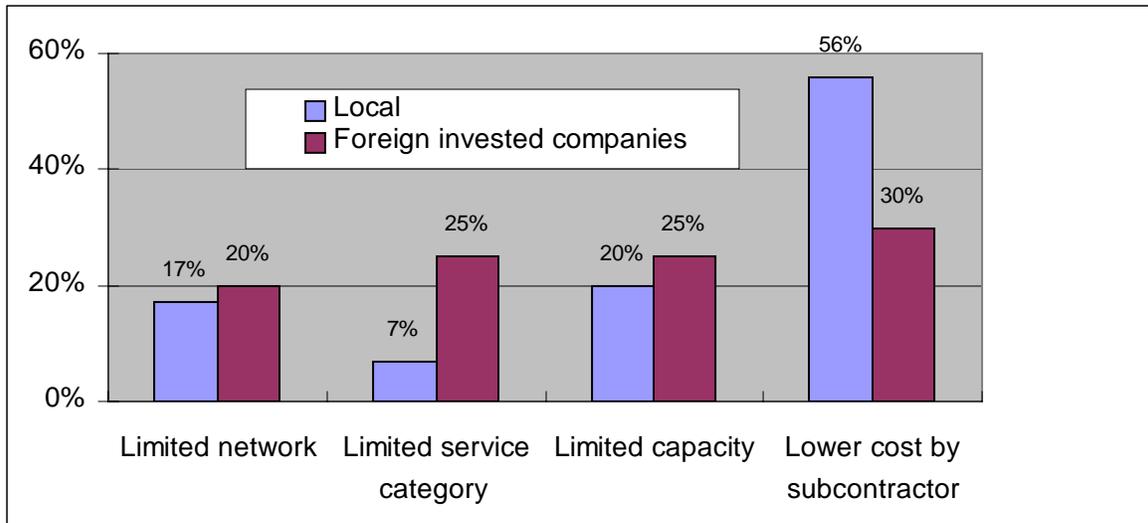

FIG. 5: REASONS FOR SUBCONTRACT LOGISTICS OPERATIONS

Obviously Fig. 5 shows that most companies outsource logistics operations to subcontractors to achieve cost advantages. To find relationship between outsourcing strategy and business performance we classified companies that sub-contracted 30% or less annual sales as Group A, while companies that sub-contracted 30-70% annual sales and 70% annual sales or more as Group B and C respectively. Those three groups correspond to companies that compete on assets-basis, mixed-basis and non-assets basis. Table 4 shows that K-W test implies that business performance between various groups are not significantly different or there is no significant relation between logistics companies' outsourcing strategy and their market performance. More than that, companies with non-assets basis even suffered from worst average market performance in terms of Percentage Growth in Return of Sales. Outsourcing strategy may help companies to focus on core business and reduce investment and cost (Crum and Allen, 1997; Leb and Miller, 2002). In logistics sector, outsourcing strategy may result in operational flexibility and high efficiency because logistics companies need not be limited to their own capacity and network coverage. However, high coordination costs, unstable operation performance are hard to be avoided. Therefore, in the long run customers will be satisfied.

TABLE 4: BUSINESS PERFORMANCES AND LOGISTICS COMPANIES' OUTSOURCING STRATEGY

Performance	Mean (Std Deviation)			K-W Test Sig.
	Less than 30%	30-70%	More than 70%	
Overall financial performance	5.67(0.58)	5.19(1.08)	5.06(1.39)	.619
Average growth in annual sales	5.50(0.58)	5.23(1.02)	5.17(1.04)	.803
Average growth in market share	5.50(1.29)	5.00(0.98)	4.72(1.41)	.593
% growth in return of sales	4.75(0.96)	5.00(1.07)	5.00(1.54)	.867
% growth in return of assets	5.25(1.26)	4.77(1.07)	4.94(1.48)	.678

	Outsourcing Strategy			Total
	30% or under	30-70%	70% or more	
Local Firms	4	22	18	44
FIC	1	12	15	28
Total	5	34	33	72

Pearson Chi Square=1.534, p>0.05

Finally, this research tried to find out if local logistic companies have different outsourcing strategy over the foreign invested companies. Cross-Tab analysis shows that the difference is not significant.

## Conclusions and Implications

In the last decade, 3PL has become trend both in global and China market. Logistics companies have been played an ever-important role in economy. Based on a nation-wide survey this research is attempting to investigate logistics market from a supplier's perspective. Right now China logistics market are congested with small and medium sized players. Fierce competition is the primary characteristic of the market. As market entry restrictions on foreign firms will be abolished in Year 2005, more foreign investment will be doomed in. The competition will surely become more severe.

Logistics market in China is of its primary stage. Positive perspective on future development offers a good market potential. However, a lot of logistics companies still compete on transaction basis instead of relationship basis. In future, basic logistics services are substituted by integrated one-stop modern 3PL services. Logistics companies especially local companies need to differentiate service package and improve quality of service to meet customer's requirements.

Because of geographic coverage, inadequate capacity and inefficiency, majority firms outsourced its operation to subcontractors. Outsourcing strategy helps companies break through its own capacity restrictions, enrich its offerings. At the mean time, coordination cost and lack of control also results in some uncertainties. Then, companies with outsourcing strategy are not believed to end with competitive advantages.

# Evaluating the Practicality of a Crisis Management Plan

*John K.S. Chong*

*University of Wisconsin – Parkside, U.S.A.*

*Terry Wu*

*University of Ontario Institute of Technology, Canada*

## Abstract

**This paper presents a discussion of six criteria for assessing the practical usefulness of a Crisis Management Plan (CMP). It suggests that confirming the practical value of a CMP through a systematic approach can aid in reinforcing the legitimacy of crisis planning and improving the chance of implementation success.**

## Introduction

The world is becoming an increasingly uncertain and dangerous place. With the occurrence of natural disasters and human-induced tragedies on the rise, organizations are paying more attention to crisis management than ever before. A growing number of managers have started to implement a formal process of crisis planning to deal with possible negative events that could threaten the survival and future development of their companies. The time and effort invested in this process typically lead to the formulation of a Crisis Management Plan (CMP), which is a written document detailing a series of steps to be taken in response to a crisis. Admittedly, from the standpoint of organizational crisis-preparedness, having a CMP in place is better than none at all. However, there is no guarantee that the mere existence of a CMP will make a company 100-percent safe from crisis. The bottom line is that any crisis planning should be pursued for a practical purpose, which is to enable a company to cope with, avert, or better still, prevent a crisis. For a CMP to perform its intended function, it must actually serve such a practical purpose, or at least be judged to be potentially capable of producing the benefits of crisis detection, diffusion, reduction, and avoidance. Thus the practicality issue is of critical importance in assessing the usefulness of organizational crisis planning. In this paper, six criteria are proposed for evaluating the practicality of a CMP. The essence of these six criteria is best understood by focusing on six key questions, which will be discussed in the following sections.

## Question # 1: Is the CMP Actionably Executable?

Planning is a fundamental managerial function that determines in advance what course of action to take if and when a significant event occurs. Organizational crisis planning is no exception. A CMP is not a symbolic piece of document, and should never be regarded as such. It must have true functional value to be worth its while. In other words, a practically useful CMP is expected to provide concrete, specific, and clear-cut steps for managers to follow within the framework of a carefully and rigorously selected number of crisis scenarios. It is important to remember that no CMPs can account for all crises. Although it has been suggested that organizations must prepare for at least one crisis in each crisis type (i.e., economic, informational, physical, human resource, reputational, psychopathic acts, and natural disasters) according to one school of thought [5, pp.60-61], in reality managers may find it necessary to plan for only those crises that are more likely to hit their organizations, depending on the particular nature of the business activities involved and the results of sufficient vulnerability analysis. A CMP that is excessive in its coverage of different crises suffers from a lack of focus, and may prove to be less helpful in giving managers the kind of policy guidelines that they genuinely need in the face of a crisis. What is most important is that these guidelines are stated in clear, unambiguous terms regarding what emergency response action should be taken and what alternative resources can be utilized. Group reviews, table-top exercises, and simulation exercises are, in general, excellent tools for testing whether a CMP is actionably executable. Action always speaks louder than

words. A CMP that fails to allow swift and appropriate action to be carried out to deal with a crisis will not help any organization. Organizational crisis planning must be geared toward resolving real crisis problems and avoid creating cosmetic documents that give no impetus to managerial action.

### **Question # 2: Is the CMP Productively Verifiable?**

Practical crisis planning is a purposeful activity aimed at generating verifiable results. The implementation of a CMP is expected to produce a desired level of performance consistent with the corporate objectives of crisis prevention, mitigation, and recovery. A productively verifiable CMP must provide a system of measuring the success or failure in the accomplishment of these three objectives. Whatever the system, the meaning of success or failure needs to be clearly delineated. Measuring the success or failure of crisis prevention is often more straightforward compared to crisis mitigation and recovery. A firm either succeeds or fails in preventing a crisis. The result is dichotomous. However, performance in crisis mitigation and recovery can be achieved in varying degrees. For example, as observed by Pearson and Clair [6, p.68] three possible performance outcomes may be associated with business resumption as part of crisis recovery: (1) failure outcomes – all organization operations are shutdown/downtime is lost in bringing organization back into operation; (2) midground outcomes – areas of operation most affected by crisis are closed temporarily/functional downtime is minimal with little effect on product or service; and (3) success outcomes – business is maintained as usual during and after the crisis/there is no loss of product or service delivery.

When formulating a CMP, a firm can certainly follow this three-outcome approach in devising a measure of the success or failure of each critical activity in relation to a given crisis management goal. It is of course up to the firm to widen the range of possible outcomes (e.g., five instead of three possible levels of outcomes) for a more comprehensive measurement. Generally speaking, other things being equal, the more comprehensive the measurement of success/failure outcomes is the more productively verifiable and therefore more practically useful is the CMP.

### **Question # 3: Is the CMP Economically Feasible?**

No effective CMP can be implemented without a sufficient amount of resource support. Physical, financial, human, and technological resources are all needed to carry out a firm's planned response actions in the event of a crisis. Dealing with a crisis is in many ways like fighting a war. A war cannot be won unless the war plan is supported with the necessary equipment, manpower, and other essential resources. Likewise, a crisis cannot be overcome unless enough resources are made available to facilitate the implementation of the CMP. Hence, to be practically useful, all CMPs must meet the test of economic feasibility, which can be assessed through a review of [3, p.25]:

1. Known resources available at each site;
2. Equipment and other resource needs, and lists of where the resources can be obtained;
3. Emergency systems for procurement, delivery, and replacement of supplies and material;
4. Other available personnel, equipment, or materials provided through mutual aid agreements and contractor agreements established prior to an incident.

Availability of financial resources is especially important when a firm prepares for certain types of crisis such as a product recall that may ultimately necessitate making compensatory payments to customers who are victims of the product defect. The firm's CMP must provide a designated source of contingent reserve funds to address possible product liability issues. Back-up resources, whether they be machines, tools, personnel, facilities, money, or computer software's, are required if a firm relies heavily on a redundancy approach in crisis planning. This approach often proves to be quite expensive, which explains why the economic feasibility criterion must not be overlooked.

#### **Question # 4: Is the CMP Intra-socio-culturally Acceptable?**

Within every company, there is an organizational culture that functions as sort of a glue that bonds organizational members together. In an organizational setting, culture means the totality of shared beliefs and assumptions. It gives meaning to and guides work behavior. Cultural norms refer to “the way we do things here” and often act as a powerful force that defines the direction and influences the performance of team efforts, including those of a Crisis Management Team (CMT). Clearly, successful implementation of a CMP hinges on the formation of an effective CMT. In companies that practice a more participative management approach, there may be an organization-wide effort to involve most or all employees in the process of crisis management. Managers in charge of these companies will need to pay special attention to making sure that the policy guidelines and response action steps provided in the CMP do not contain elements that either directly or indirectly works against organizational values, or more specifically cultural norms. Most importantly, care should be exercised in selecting CMT members who not only have the knowledge and skills to do their jobs but also hold positive attitudes toward the risk management philosophy behind the CMP.

Pearson and Mitroff [7] have identified thirty-two faulty cultural rationalizations that can have a negative impact on the effectiveness of a CMT. One example of faulty cultural rationalizations is the belief that “crisis management or crisis prevention is a luxury” [7, p.86]. A firm characterized by a prevailing belief such as this among its employees is unlikely to succeed in developing an implementable or enforceable CMP until its organizational culture becomes more aligned with the notion that “crisis management or crisis prevention is a not a luxury, but a necessity to secure the future of a company.”

#### **Question # 5: Is the CMP Legally Defensible?**

One reality faced by managers in running their companies in a rule-of-law society is the regulatory environment and the legal bounds within which management policies are implemented. It is true that a CMP is largely an internal management tool. Nevertheless, like any other management tool, it may have legal consequences as long as there is a people-related factor involved. Customers and employees are people and their human rights as individuals must be respected and taken into account when introducing a new set of crisis management policies.

Privacy rights issues can plunge a company into legal trouble if not handled properly. Since the 9-11 terrorist attacks and in light of an increasing incidence rate of workplace violence in recent years, more companies have begun to include additional security measures in their CMPs. Apart from using the more conventional methods of security enhancement like reference checks and drug testing on employees, some companies have now turned to biometric technologies in an attempt to boost security. Both customers and employees can be affected by this type of emerging technologies. According to one expert, biometrics consists of seven categories: fingerprint verification, hand geometry, voice verification, retinal scanning, iris scanning, signature verification, and facial recognition. He points out the intrusive nature of biometrics and cautions that even the International Biometric Industry Association (IBIA) “advocates the adoption of appropriate managerial and technical controls to protect the confidentiality and integrity of databases containing biometric data” [4, pp.28-30]. Fitzpatrick [2], a legal scholar, believes that crisis planning is not just about formulating a written plan of response action. Companies must seek the assistance of their legal counsels to institute a compliance program to keep them from getting caught in legal traps.

#### **Question # 6: Is the CMP Morally Justifiable?**

Good ethics is good business. Besides being law-abiding corporate citizens, morally responsible companies take the matter of business ethics seriously. They try to earn the trust of their employees and customers by treating them with honesty, even-handedness, and openness. They compete with their competitors without resorting to dirty tricks or deception. Every company has the legitimate right to construct a CMP to protect its assets, tangible or intangible. But from the moral point of view, it is not an unconditional (albeit legal) right that gives the company complete

freedom to do anything in any way it wants. A morally justifiable CMP is always built on the basis of sound principles of ethical conduct. Three codes of ethics, proposed by Barton [1, p.92], may be considered for judging the moral justifiability of a given CMP. They are stated as follows:

1. Management will honestly convey pertinent facts in a timely manner to key shareholders, including customers, employees and the news media, even when the news is not favorable.
2. The confidentiality of key persons will be protected when that is both appropriate and needed. However, pertinent names will be released after local authorities and victims' families have been notified.
3. Shareholders have a right to know whether the company is insured against losses from the incident or whether the company may have to use internal reserves to cover major expenses.

In times of crisis, a company needs all the help it can get from both its internal and external stakeholders. A morally justifiable CMP has the added advantage of projecting good corporate image, which can serve as a practically useful means of gaining wider support from customers, suppliers, employees, investors, and trade associations.

## Final Remarks

The primary purpose of this paper is to suggest six criteria against which the practical usefulness of a CMP can be gauged. For the sake of conciseness and easy understanding, the six criteria are summarized in six key questions. The first three questions pertain to administrative efficiency, performance measurability, and resource adequacy. The fourth question is concerned with the assessment of compatibility with organizational culture while the last two questions address the significance of legal and ethical compliance. Answers to these six key questions can go a long way toward helping a company determine the practical value of its CMP. Confirming the practical value of a CMP through a systematic approach aids in reinforcing the legitimacy of crisis planning and improving the chance of implementation success.

# Global Mindset Development for Chinese Managers: An Exploratory Study of Competency Linkages

*Subramaniam Anantham  
Cecil Pearson  
Curtin Business School, Western Australia*

## Abstract

The pressures of economic globalization are compelling Chinese organizations to rethink their strategies and reshape their structures, systems and processes, especially after China's joining the World Trade Organization. As Chinese organizations strive to gain a competitive advantage in global markets, there is a growing emphasis on human resource development and the importance on the cultivation of a global mindset. A number of studies have emphasised on micro level global reform and competency building through global mindset development which enable managers to function effectively in the complex global economic environment. This exploratory study with 27 Chinese managers empirically tests a conceptual framework and provides support for some of the competencies and values believed to be associated with the evolution of a managerial global mindset.

## Introduction

Globalization is compelling entities to intensify investment in participant mental capacity. In spite of the traditionally acknowledged importance of the desirability of skill acquisition through investment in education and training, the romanticism of leadership, effective management of resources, and other relevant work related attributes (Dougherty, 1999) there is also considerable evidence that remarkable economic achievements have been underpinned by engaging the disadvantaged (i.e., low paid, low skilled, socially marginalized) in what has been termed as a low cost strategy (Gregory 2000). Nevertheless, in contemporary industrial society, which enjoys developing communication technologies, knowledge is regarded as one of the major company assets for increasing competitiveness and improving overall efficiency of labor. Moreover, the sharing of global opportunities, such as membership to the World Trade Organization (WTO), now enjoyed by almost 150 countries; General Agreement of Tariffs and Trade (GATT), which promotes free and fair trade; or receiving financial assistance from the International Monetary Fund (IMF) or the World Bank (WB), is challenging nations and consortiums to combine economic efficiency with social equity. This prominent focus is mitigated by membership to these eminent bodies, that in turn not only provides access to growing world markets and an insurance against unilateralism, but obliges participants to engage in acceptable, sustainable business practices. For instance, reducing levels of inequalities (i.e., income gap, differences in national GDP), improving levels of transparency in business engagements, promoting anti dumping to avoid injury to local industry, or progressing economic and social development without compromising sustainability are within a range of actions that can have far reaching impacts on global trade. Clearly, these are neither traditional not well known tasks, and consequently, will call for new arrangements between capital, technology and work cadres. The newer strategic orientations will focus an emphasis on different competencies in innovation, risk taking and problem solving, and addressing these formidable challenges will require a renaissance in managerial mindsets.

Identification of the constituent elements of a managerial global mindset has attracted considerable attention. For example, Kao, Sinha and Wilpert (1999) have rejected a notion economic and industrial development is achievable by endorsement of Western management, but rather by work practices and institutional frameworks that blend traditional social values with emergent technologies. This is the divergent viewpoint that argues managerial values will be substantially different between countries despite pervading homogenizing economic ideology. This premise is partially supported by Wong (1985), Hofstede (1991), and Redding (1995) when they claim the successful form of overseas Chinese capitalism in the Asia Pacific is grounded in societal culture, and particularly Confucianism. Indeed, Confucian values are frequently exhibited as levels of paternalism and familism as well as the structure and operations of Chinese family businesses. Nevertheless, a paradox, and especially for Chinese organizations, is that since the Asian financial meltdown of 1997 arguments about the causes for the crisis have embraced claims that bad governance was underscored by

ideals of centralized decision making, a paternalistic organizational climate, priority to relatives or fellow villages, or preferential recruitment and promotion to kinsmen (nepotism). Yet these were the cornerstone of Chinese entrepreneurship before the monetary crisis. Others (Dirlik, 1996; Kosaka, 1990; Seagrave, 1997) have proposed the recent economic relationships of the east and south east Asian communities has roots in globalization. The general contention is that Chinese diaspora created the opportunity for Chinese entrepreneurial dominance in the Asia Pacific by inherent networking processes, the subcontracting of cheap labor and centralized structures for flexibility advantages in crisis or opportunity. These arguments are more aligned with the convergence perspective that promotes a basic premise that prevailing political and economic forces will systematically influence the adoption of a relatively common set of managerial attitudes and behaviors. There is also a third perspective, that cultural values can be assimilated. Ralston and colleagues (1993) suggested, together with some evidence that included a sample of mainland Chinese managers that blending of salient cultural and indigenous values could lead to a hybrid condition which they termed crossvergence. Understandably, the extent of convergence or divergence of managerial mindsets in the contemporary global village will continue to foster debate.

This debate has been fuelled by a perceived need to understand the mental orientation of managers. Central to the debate is a notion that the changing professional contexts of managers are reshaping their mental states, such as values of work goals, which are believed to influence cognitions, decision making and business interactions (Dowling and Nigel, 1986; England, Dhingra and Agarwal, 1974; Rokeach, 1973; Westwood and Posner, 1997). Consequently, the emerging markets of the south east Asian nations have attracted the attention of a number of research endeavours, by employing an enormous range of methodologies and measures with the aim of identifying drivers that are developing or modifying organizational structures, management practices and business strategies. For instance, Shaw and colleagues (1995) examined the influence of political forces and imitation processes of human resource practices (i.e., pay systems, training and developing activities) in local and foreign firms in Singapore and Hong Kong. And although a great number of investigations (Gopalan and Rivera, 1997; Kakar, Kets de Vries, Kakar and Vrignaud, 2002; Ralston, Thang and Napier, 1999) have been undertaken to assess the proposition cultural traditions and values, and social practices can strongly affect behaviors and lead to a diversity of management globally, Lundberg and Peterson (1994), and Harpaz and Fu (1997), mindful of changes in cadre participation rates, attempted to explain how similarity and dissimilarity of managerial mindsets are influenced by some demographic properties. In spite of the vast amount of investigation that has analyzed the personal disposition of managers in endeavors to generate a better understanding of Asian managerial trends seldom has a paradigm for creating culture specific expectations, or mental and social lines of distinction been employed.

The purpose of this paper is to report in five parts, an evaluation of a conceptual paradigm that contains a cluster of three constructs that are believed to be associated with the evolution of a managerial global mindset. In the first part is presented a review of the relevant literature, which provides the theoretical underpinnings for a conceptual model that expresses the three variables of 1) knowledge and information, 2) risk tolerance, and 3) international experience, that are predicted to contribute to the development of a managerial global mindset. In the second section, the conceptual model and the definition of the constructs is presented. How the conceptual model was evaluated is succinctly described in the third section of the paper, and the results are given in the fourth section of the paper. A concluding discussion summarizing the ramifications of the results is presented last.

## **The Logic of Globalization**

Figure 1 highlights the causal driven logic of globalization. it is depicted in Figure 1 that change process is initiated at the macro/national level, and that the forces percolate through the meso and finally the micro levels of society. For example, when China joined the WTO in November 2001, protection of domestic industries (by inspections and tariffs) had to be phased out, companies were restructured and labour reforms were implemented (Smyth and Zhai 2001). Nevertheless, apart from *government forces*, which enable the extension of the industry's legal and regulatory scope beyond national boundaries, being one of the driving forces towards globalization at the macro level in general, industrial organization theory has identified three other forces impacting global orientation. These have been nominated as 1) market, 2) cost and 3) competition (Yip, Johansson and Roos 1997; Yip 1989). *Market forces* enable the extension of the industry's market-scope beyond national boundaries and are indicated by new customers from global markets, use of global channels and

adoption of techniques and processes from global sources. *Cost forces* enable the extension of the industry's operation-scope beyond national boundaries, indicated by global economies of scale, favourable logistics, differences in country costs (including exchange rates), and outsourcing. *Competition forces* enable the extension of the industry's competitive-scope beyond national boundaries by creating well-established benchmarks indicated by the matching of structures, processes, systems and strategies employed by competitors. Collectively, these elements, together with government policy are the macro context.

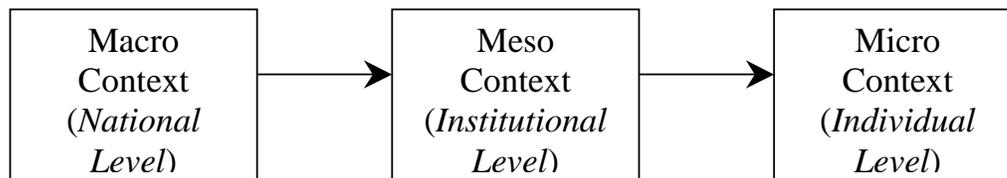

FIG. 1: CONTEXT DRIVEN LOGIC OF GLOBALIZATION  
Source: Ananthram and Chatterjee, 2004

The macro level forces of government, market, cost and competition pressure organizations (at the meso level). Indeed corporations are able to take advantage of the favorable macro environment, and consequently, shape their structures, processes and strategies to develop a competitive advantage. In practice these new organizational paradigms shape the way the companies relate to the operational environment. For instance, decisions made by organizations on the possibility of moving into overseas economies are strongly influenced by appropriate organizational paradigms (Burpitt and Rondinelli, 1998). Earlier, Dutton (1993) defined an organizational paradigm as a *theory of action* whereby organizations with a commitment to entrepreneurship perceive external possibilities (supplemented by the macro level forces enabling globalization) as opportunities. This contention (Dutton, 1993) highlights the importance of contextual conditions, institutional conditions and overall competitive orientation at the meso level as the important support builders for organizations to attain global reach. However, global opportunities do not necessarily translate into improved per capita incomes (Mehta, 2001).

Some of the key organizational factors which have enabled global linkages at the meso level include *organizational strategy* (Bartlett and Ghoshal, 1989; McDugall 1989); *technology intensity* (Cavusgil and Knight, 1997; Kohn, 1988) and *entrepreneurial orientation* (Burpitt and Rondinelli, 1998; Covin and Slevin, 1989). Clearly, these are salient features of corporations that are vital for mitigating further change. However, an important caveat the meso level contextual pressures of organizational strategy, technology intensity and entrepreneurial orientation operate simultaneously and compel managers to develop values, skills, competencies and a culture favorable to compete in the global environment. Recent studies have emphasized micro-level global reform and the cultivation of a global mindset to create an intelligent global organization (Gupta and Govinarajan, 2002; Jeanett, 2000; Rhinesmith, 1995). A critical success factor for any organization is the level of global mindset orientation amongst its managers (Harveston, 2000; Murtha, Lenway and Bagozzi, 1998). This provides a rationale for a deeper level understanding of the societal, psychological, cultural, economic and individual level parameters shaping the mindsets of managers (Begley and Boyd, 2003; Gupta and Govindarajan 2002; Jeanett, 2000; Beechler, Taylor, Boyacigiller, and Levy, 1999; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993, 1992; Bartlett and Ghoshal, 1989).

A number of studies have linked managerial global mindset orientation with certain competencies. Three competencies have been identified as *knowledge and information* about different cultures and contexts (Kedia and Mukherji, 1999; Rhinesmith, 1995; 1993; 1992), *levels of risk tolerance*, which is defined as the extent to which managers are willing to make risky decisions about international activities (Roth, 1992; Covin and Slevin, 1989), and *levels of international experience*, which is defined as the amount of experience that a manager has accumulated in an international context which includes foreign assignments, education and vacations (Harveston, 2000; Tung and Miller, 1990; Christensen, da Rocha and Gertner, 1987).

## Concept of Global Mindset

The concept of global mindset has received a growing interest amongst researchers over the past decade. Global mindset has been conceptualized in the international management literature as cognitive structure, a set of observable behaviors, individual competencies, leadership traits and strategic maturity (Gupta and Govindarajan, 2002; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993, 1992). The concept assumes that human beings and organizations are limited in their ability to absorb and process information. The constant challenge of complexity, ambiguity and dynamism of this information environment is responded by individuals through a process of cognitive filtration which involves the selection of what they absorb and the unique way in how they interpret the information (Gupta and Govindarajan, 2002). An integrated view of the concept can be summarised as *'the ability and willingness of managers to think, act and transcend boundaries of goals, values and competencies on a global scale'* (Ananthram and Chatterjee, 2004: 2).

### Competencies/Values

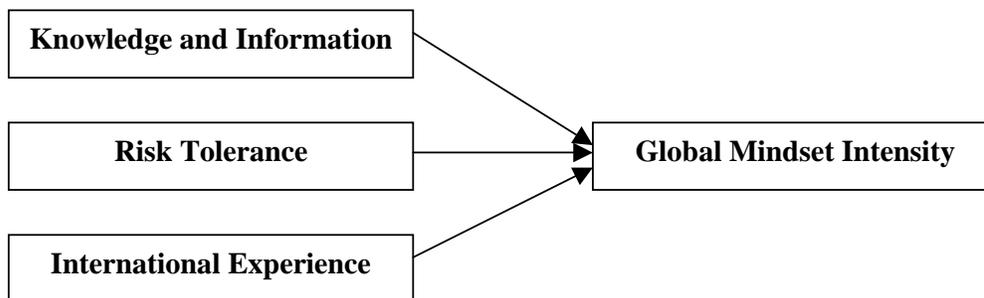

FIG. 2: GLOBAL MINDSET DEVELOPMENT MODEL  
Source: Adapted from Ananthram and Chatterjee, 2004

Fig. 2 highlights the global mindset development model for Chinese managers. This conceptual model provides a generic conceptual framework of the context of global mindset development underpinned by the theory of the logic of globalization. The macro-level forces impinge on organizations to rethink their strategies and processes and focus on converting their local presence into a global advantage which in turn puts the onus on executives and managers to cultivate a global mindset by developing values, skills, competencies and a culture favorable to compete in the global environment. The conceptual model (as shown in Figure 2) was empirically tested with a sample of executive managers who were employed in Chinese organizations and the procedure that was employed is outlined next.

## Methods

### Sample

The study respondents were 27 executives, supervisor and middle level managers of Chinese organizations. Specifically, 44 percent of the respondents were executives and senior managers, while the remainder ranged from supervisor and middle level managers to specialists. Few of these respondents were female. Other respondent attributes are reflected by the high levels of professional training and formal education. Almost 85 percent of the respondents had a professional qualification ranging from certificates to diplomas to executive development programs. A profile of the study participants is presented as Table 1.

TABLE 1: DEMOGRAPHICS % (N = 27)

<b>Managerial Level</b>		<b>Gender</b>	
Executive	44.4	Male	96.3
Supervisory and Middle	55.6	Female	3.7
<b>Age (Years)</b>		<b>Educational Background</b>	
Less than 39	25.9	University Degree	40.7
40 – 49	70.4	Professional Degree	85.2
50 and above	3.7		

### Procedure

Data were obtained with the support of the Central Consulting Ltd, a management consulting company in China, in July 2004. The Central Consulting Ltd. offers a number of executive training and management development programmes for executives and managers in organizations across China. The 27 respondents of this study were sponsored by the respective organizations to attend a management development program offered by the Central Consulting Ltd and were during the course their program invited to complete a questionnaire.

A Mandarin version of the questionnaire was administered. The questionnaire was translated into Mandarin (from English) and back translated to English by independent bilingual professional translators employed by the Central Consulting Ltd in China. A third different group of researchers compared the original and final versions of the questionnaire for nomenclature correspondence. The data collected from this study was input onto Statistical Package for the Social Sciences (SPSS) software Version 11.5. Data were then subjected to exploratory factor analyses with varimax rotation option to assess the psychometric properties of the instruments and to assess the internal consistency of the constructs. Reliability analysis to assess the internal validity of the constructs was also conducted. In this study is presented some of the results of the assessments of some of the variables that were measured by the questionnaire.

### Measures

The survey instrument was designed to capture demographic and perceptual data. Some of the demographic data is reported in Table 1. The perceptual responses were in terms of the three independent variables of knowledge and information, risk tolerance and international experience; and the dependent variable of global mindset.

#### *Knowledge and Information*

This construct is defined as the deep understanding of different aspects of the interdependent world and mastery over technology. In the absence of an instrument, knowledge and information was measured using a scale developed by this study from underpinning theory, feedback from scholars in international management in Australia, India, China and Singapore and managers in India and China. Three dimensions of knowledge and information have been identified in the literature, namely, *mastery over technology*, *socio-political factors of different countries* and *culture and cross-cultural issues that impact management* (Kedia and Mukherji, 1999; Rhinesmith, 1995, 1993, 1992). Three items were developed for each of the three dimensions from the available literature. Participants were asked to respond on a seven point Likert scale (1 = extremely unimportant to 7 = extremely important) to indicate the level of importance each item had in working in the global marketplace. Exploratory factor analysis resulted in the items loading onto three factors with eigen values of 2.9, 2.2 and 1.5. The reliability alpha's of the three constructs *mastery over technology*, *socio-political factors of different countries* and *culture and cross-cultural issues that impact management* were 0.56, 0.82 and 0.75 respectively.

#### *Risk Tolerance*

This construct has been defined as the extent to which managers are willing to make risky decisions about global activities. The measure assesses the extent to which respondents perceive risk and costs associated with the global expansion of their organization. This study employed a measure from Roth (1992) that was adapted from Covin and Slevin (1989), and later employed by Harveston, Kedia and Davis (1999) in their seminal work on the internationalization of born global and gradual globalizing firms. Managerial risk tolerance was assessed through five questions dealing with the riskiness involved with global activities. Respondents were asked to respond on a seven point Likert scale (1 = extremely unimportant to 7 = extremely important). All the items loaded onto one factor with an eigen value and alpha reliability assessment of 1.94 and 0.54 respectively.

#### *International Experience*

This construct has been defined as the amount of experience that a manager has accumulated in an international context. A number of studies have used the amount of time spent overseas in the form of foreign assignments, education or vacations as a proxy for international experience (Harveston, 2000; Harveston, Kedia and Davis,

1999; Christensen, Da Rocha and Gertner, 1997; Tung and Miller, 1990). This study adapted a measure by Harveston (2000) which was adapted from Harveston, Kedia and Davis (1999). Level of international experience was assessed through four questions. Participants were asked to respond on a seven point Likert scale (1 = very rarely and 7 = very extensively) to their level of involvement with each activity. All the items loaded onto one factor with an eigen value and alpha reliability assessment of 2.44 and 0.78 respectively.

**Global Mindset**

This construct is defined as the ability and willingness of managers to think, act and transcend boundaries of goals, values and competencies on a global scale. Global mindset has been conceptualized in international management literature as cognitive structure, a set of observable behaviours, individual competencies, leadership traits and strategic maturity (Gupta and Govindarajan, 2002; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993, 1992). Following the work of Kedia and Chhokar (1985), global mindset was assessed by asking managers a series of questions about their attitude towards globalization. Questions were adapted from Burpitt and Rondinelli (1998). Responses were coded on a seven point Likert scale (where 1 = Strongly Disagree to 7 = Strongly Agree. The responses were subjected to principal component factor analysis using varimax rotation in order to reduce the number of variables. One factor emerged with an eigen value of 2.54 and a reliability alpha of 0.79.

**Results**

Table 2 shows the multiple regression analysis results when the conceptual model (Figure 2) was assessed. At the top of table 2 is shown overall statistics and the Analysis of Variance output that depicts the conceptual arrangement was significant. Also included in Table 2, is the mean scores of the evaluated variables as well as the parameter estimates, beta scores and probability statistics. Except for social political factors, all relationships were significant. The significant inverse relationships were a feature of the respondents who were predominantly indigenous Chinese managers who had scant international business experience.

TABLE 2: MULTIPLE REGRESSION ANALYSIS FOR THE MICRO-LEVEL ENABLERS AND GLOBAL MINDSET INTENSITY

Multiple R	0.739		
R Square	0.546		
Adjusted R Square	0.438		
Standard Error	0.590		
<b>ANALYSIS OF VARIANCE</b>			
	<b>Df</b>	<b>Sum of Squares</b>	<b>Mean Square</b>
Regression	5	8.809	1.762
Residual	21	7.320	0.349
<b>F = 5.055</b>			
<b>Signif F = 0.003*</b>			

Notes: a. Predictors: (Constant), Mastery over Technology, Socio-Political Factors about Different Countries, Culture and Cross-cultural issues that Impact Management, Risk Tolerance, International Experience.

b. Dependent Variable: Global Mindset Intensity.

c. \* p < 0.01.

Variable	Mean Scores	B	Std Error	Beta	t	Sig t
Mastery Over Technology	5.57	.398	.190	.377	2.097	.048*
Socio-Political Factors of Different Countries	5.10	.219	.144	.256	1.519	.144
Culture and Cross-Cultural Issues that Impact Management	5.36	-.284	.122	-.368	-2.335	.030*
Risk Tolerance	5.01	.513	.234	.391	2.189	.040*
International Experience	2.28	-.363	.162	-.405	-2.238	.036*
(Constant)	1.489	1.257		1.184	.250	

Notes: a. Dependent Variable: Global Mindset Intensity

b. \* p < 0.05

c. Overall mean score for Knowledge and Information was 5.34

Table 2 provides the multiple regression analysis results when the conceptual model of Figure 2 was assessed. The three constructs of the variable *Knowledge and Information*: Mastery over technology, socio-political factors of different countries and culture and cross-cultural issues that impact management were regressed onto the dependent variable to highlight specific significant attributes of the variable. The analysis indicates a significant relationship between the micro-level enablers as a whole and the mindset variable. Independently, it can be noted that all the constructs except knowledge about *Socio-Political Factors of Different Countries* have a significant relationship with the dependent variable consistent with the existing literature. This further reinforces the importance of mindset as an outcome of the development of the micro-level enablers or competencies. A detailed analysis of the results is presented in the concluding discussion.

## Concluding Discussion

Globalization has become one of the most widely debated and controversial topic of contemporary times. Societies, organizations and individuals are undergoing unprecedented upheavals as global linkages in economic interdependence are responded to, differently, at different levels. The macro-level converging forces of economic globalization permeate onto the meso and micro level frames which makes it imperative to understand the symbiotic relationships of the macro-meso-micro interaction. Given China's embrace of the intensification of globalization, this macro-meso-micro interaction is of foremost importance in numerous industries (Ananthram 2004) providing a rationale for a deeper level understanding of the societal, psychological, cultural, economic and individual level parameters shaping the mindsets of managers and executives in Chinese organizations (Begley and Boyd, 2003; Gupta and Govindarajan 2002; Jeanett 2000; Beechler, Taylor, Boyacigiller, and Levy, 1999; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993, 1992; Bartlett and Ghoshal, 1989). The dominant quality of this paper is the presentation and evaluation of a conceptual model of competency linkages which are believed to be associated with the development of a managerial global mindset.

The study had two salient findings. A first important observation is the strong consensus for the independent values which assessed on seven point scales. It was shown in Table 2 that four of the independent constructs attracted means greater than 5.0 to reveal a strong endorsement for the questionnaire items. In contrast, the variable of international experience had a mean score of 2.28, which reflects the study sample was essentially a cohort of local managers with little exposure to the global market arena. A second important feature of the results is relatively strong support for the investigative paradigm expressed in Figure 2. Indeed, the overall analyses revealed nearly 44 percent of the variance the mindset was accounted for by the independent variables, a value that may be considered high in social science research. Despite a relatively small sample the results provide substantial support for the hypothesized relationships expressed in the global mindset development model.

The results indicate that the three mindset variables of *knowledge and information*, *risk tolerance* and *international experience* had a significant impact on the dependent global mindset variable. With a growing emphasis on the impact of technology on business dealings, it has become imperative for managers at all levels to be conversant with computer skills and e-commerce. A number of companies now offer services online, where there is no physical interaction between the buyer and seller, especially in the services sector. Chinese

organizations are now being coerced into developing software that is compatible with the English language, which is the common language in cross-border dealings. The respondents also noted the importance of culture in business dealings and the impact culture has on cross border assignments, negotiations, mergers and alliances on the development of a global mindset. In contemporary competitive market landscapes where managers frequently undertake business encounters both domestically and internationally, it is predicted better engagements are likely to be enjoyed by those who better understand cultural nuances and exigencies. Also, the increased uncertainty in the political, economic and socio-cultural environment in the contemporary complex global era makes it imperative for managers to act and react within the shortest time span available. The respondents indicated the importance of a high level of risk tolerance in clinching business deals before competitors do, especially given the increased amount of competition from bidding countries as economies open up to foreign competition. Though risk tolerance is to a large extent an inherent attribute, the respondents indicated a positive nexus between high risk tolerance levels and increasing levels of international experience gained through overseas postings, negotiations, alliances, education and travel. The responses also indicate that the development of a global mindset is largely impacted by high degrees of international experience supplemented with a high risk tolerance level.

The study design had limitations and strengths. As the investigation was undertaken within a narrow section of the Chinese managerial population, the results are likely to reflect common method variance. Also, the small sample size gave encouraging results, but assessments with larger cohort groups across other business domains would have greater predictive power and generalizability. Although the conceptual model, shown as Figure 2, may well be saturated (as evidenced by some degree of multi co-linearity) it does assimilate a number of important constructs that have been identified in the relevant literature as determinants of a global mindset. The information provided in this paper may encourage others to explore similar paradigms in more expansive studies in the quest to better understand the dynamics of global mindset orientation.

Mariyam Shakeela  
SIMDI*

## **Abstract**

**The dramatic emergence of global business has shaped new managerial priorities. A distinct feature of a marketplace that stimulates and facilitates the flow of investment, trade and services is the importance of skill acquisition in terms of transactions in education and vocational training. This paper, which reports the work goal preferences of 409 managers from the Maldives and Mauritius provides empirical evidence of the importance of learning as a result of the penetration of global economic, political, technological and social forces. The results are discussed to present implications for HRM policies and practices on business operating in inter and intra national contexts.**

## **Introduction**

Globalisation is an integral component of contemporary industrial society. Historically, minimal investment was given to the impact of globalisation on information acquisition, technology, education, tourism and terrorism, but today it is increasingly recognised major infrastructures, such a health services, transportation, communication networks, energy providers as well as water, sewerage and drainage utilities are being challenged to engage in broad based partnerships (Kingman-Beundage, George & Bowen, 1994; Weiner, Alexander & Zuckerman, 2000). Moreover, financial, industrial, manufacturing, welfare and legal agencies, and a host of other institutions engaged in activities, which underpin the fabric of a comprehensive range of societal needs, fosters integration with consumers through governing service systems at the local, regional and international levels (Congram & Epelman, 1995; Holmund & Strandvik, 1999, Silvestro, 1999). Consequently, strategic service management has become a central feature of leading corporations, whether they are manufacturing tangible or intangible products, to market their service capabilities. Over a decade ago Roscitt and Parket (1990) argued the highest level of service management was being demonstrated in “alert” (p. 28) companies, which inculcated synergistic company wide service cultures to engage both internal (employees) and external (clients, customers, providers) consumers in comprehensive business initiatives. Chan (2002) contends this position has been exacerbated in companies, which currently face formidable competitive pressures in new contours of economic order.

Creation of organisational architectures responsive to customer preferences requires a considerable resource investment. A holistic cultivation of internal and external constituent mindsets is likely to be encouraged by collaborative engagements as complex, dynamic and voracious customer needs and expectations are delineated and refined (Kingman-Brundage et al. 1995; Weiner et al. 2000). These concepts have spawned the social quality movement of the modern industrial society (Chin, Sun, Xu & Hua, 2002; Deming, 1986; Ishikawa, 1985; Juran, 1988; Grant, Shani & Krishnan, 1994), and the promulgation of a great deal of service quality literature (Carman, 1990; Orwig, Pearson & Cochran, 1997; Parasuraman, Berry & Zeithaml, 1985). A clear demonstration of the recognised importance of these concepts is revealed in the adoption of company wide strategic services management to embrace a customer service culture at all levels of engagement. Such spectacular reform initiatives have been exhibited in a number of South East Asian institutions (Bu & Xu, 1999; Li, 2003) subsequent to the currency crisis of 1997.

Rejuvenation in worker expectations, attitudes, values and practices is an expensive journey. The attainment of service quality oriented initiatives, that profoundly influence work structures and processes, obliges all involved participants to undertake considerable long term investment in learning (Marquardt & Berger, 2003). This

is because in traditional organisations, human resource management developmental programmes are frequently confined to reactive skill enhancement. In contrast, quality service management of the modern, competitive, global business domain encompasses softer, proactive competencies of team building, trust and loyalty development as well as creating vital provider and customer relationships knowledge (Chan & Pearson, 2002, Kingman-Brundage et al. 1993; Weiner et al. 2000). Hence, today's managers (compared to traditional managers) have expanded roles which challenge them to cultivate cross functional, integrative knowledge (people and technology) systems that will be responsive to customer preferences and expectations.

In this paper is advanced the notion globalisation has significantly impacted organisations, and specifically, workplace learning. As noted by Marquardt and Berger (2003) "... creating and sustaining meaningful and long-term change for global, national and community development." is equally important in manufacturing companies or service providers. The paper content presents a perspective the development of a seamless service culture, which is diffused throughout the organisation so activities demonstrate responsiveness to customer preferences, is a learning experience likely to be embraced by more progressive firms. These concepts are explored in the context of two island states in the Indian Ocean, the Maldives and Mauritius that are reinventing themselves in the aftermath of the 1997 financial crisis. Considerable foreign investment has driven a veritable tidal wave of economic and social reform, and consequently, the development of workforce skills and intellectual capital as the institutions of these two societies embrace multiculturalism and globalisation. Data from 409 managers reveal a strong preference for learning compared to other work relevant values. The findings are discussed in terms of the implications of expanding business interests with strong linkages abroad.

## **Organisational Learning**

In the aftermath of the 1997 south east Asian financial crisis the intensity of business competition has not abated (Das, 1999; Wan & Ong, 2000). Indeed, in the afterglow of meltdown the importance of the integration of elements of the internal organisation with external constituents was recognised. This was emphasised by strong calls to install reform initiatives to contain dysfunction effects on global markets and to reduce vulnerability to future business transactions (Aggarwall 1999; Tan 1999; Lim, 1997). One observable outcome has been fervent change in business environments (Halal & Taylor, 2002). Collectively, numerous pressures have heightened a compulsion for organisations to continually seek out those practices that will provide competitive advantage. One practice that has received considerable attention is the notion of organisational learning.

The concept of organisational learning has a long lineage in the social sciences literature. Notable contributions were provided in the 1960s (Cangelosi & Dill, 1965; Cyert & March, 1963) who advanced the earlier foundations of scientific management which was an environment in which employees learned to perform their jobs better by using principles of specialisation, repetition, observation and feedback (Taylor, 1911). More recently the notion of organisational learning has been promoted among academics and practitioners because of its potential to positively impact competitive advantage. Thus organisational learning is frequently perceived to be a crucial strategy for institutional survival.

Despite the considerable body of literature there is a lack of conceptual congruence about organisational learning. This is demonstrated by a variety of definitions, as well as disagreement as to whether it is a process or an outcome. In this paper the focus will not be in terms of conceptualisation, or what constitutes organisational learning with facets of how learning is undertaken, systems for storing and retrieving knowledge or relationships between individuals or groups. In this paper, the focus will be upon the perceptual value of learning in comparison to the preference extent of other work place relevant dimensions.

## **Service and Learning**

Interest in customer service is vital for the sustainability of industrial entities. Indeed, service requirements are becoming a major element in the development of product and service strategies (Eaton, 2000; Cross & Smith, 1995). In earlier times when manufacturing was the dominant base of an industrial society the norm was to improve service

effectiveness by cultivating a functional division of the organisation, such as sales operations, or the service department. Today, the manufacturing sector has been displaced by a burgeoning service sector, which has led to an inseparability of production and consumption in many operational settings. The more progressive managers (of today) are increasingly acknowledging service as a multidimensional property, often with some intangibility, and that customers can have an active role in the service product. This has compelled a strategic realignment in dealing with customers. Although managers have always sought to attain a level of customer loyalty and satisfaction, contemporary managers have to better articulate “dynamics of recalcitrant service problems” (Kingman-Brundage et al. 1995: p. 36) with customers who are likely to have an active role in the production process. Consequently, better service delivery is characterised by important relationships between provider and customers, which are necessary for achieving high levels of customer satisfaction and loyalty. Understanding the significance of these relationships compels organisations to develop sophisticated human resource management (HRM) policies and practices to instill a culture for facilitating customer loyalty and corporate profitability.

A vital cog in the delivery of quality services is structural coordination and alliances. The importance of coordination in work settings has been widely acknowledged as concepts of job standardisation and rule observation (Hage & Aitken, 1967), task vulnerability (Perrow, 1967), and work flow interdependence (Thompson, 1967; Van de Ven, Delbecq & Koenig, 1976), for diagnosing work routines, task scheduling and standardisation of job processes. In spite of these properties providing underpinning for establishing formal patterns of interaction and coordination to link tasks of individuals and groups (to achieve desirable outcomes) the arrangements allow for minimal interaction between service providers and customers. Nevertheless, the competitive climate of today’s market place demands work processes become characterised by iterative interactions between service providers within companies and frequently with customers (Gittell, 2002, Weiner et al., 2000). This is equally true for manufacturing corporations as well as service providers as well as outlets which blend tangible and intangible output (e.g., fast food outlets). Deepening commitment to involvement in partnerships with customers, that “go beyond isolated episodic interactions” (Gittell, 2002: p. 299) is likely to be facilitated by developing social capital (shared goals, knowledge, mutual respect) with tailored HRM policies and practices. Ultimately, such endeavours have potential to foster a managerial rationality towards a service logic.

Developing a service logic requires investment in learning. This is because a service logic is integrative, collaborative, and often the phenomena is complex as team members engage in synergistic interactions (Kingman-Brundage et al., 1995), within and outside the work place. Traditionally, sales, bureaucracy or legal logics have driven organisations in competitive, decisive arrangements (Rossett & Parket, 1990). In practice, the traditional functional services division had a primary role of after sales support for the company core product. This role is expanded in the contemporary competitive service logic corporation to a point where servicing is now a core function of the organisation (Cohen & Levinthal, 1990; Schultz, 2001). The sustainability of a service culture is reliant on employees who are knowledgeable not only of their own domain (e.g., engineering, production), but they must have access to vital information from other points in the organisation. Moreover, the provided service must be responsive to customer preferences. Transition from traditional work place cultures to a contemporary service logic environment will be associated with mindset change that captures congruity of the service concept of fundamental customer, technical and employee needs and expectations. Cumulatively, these theoretical contentions lead to the following prediction. *A reorientation of thinking will intensify pressures of employees to continually expand their portfolio of work relevant skills, competencies, talents and knowledge.*

## **Methodology**

### **Respondents and Site**

The study respondents were 409 managers who were working in the Maldives and Mauritius. Key respondent demographics and the size of the country samples are shown in Table 1. It is revealed in Table 1 nearly one third of the managers were female, which underscores the emerging role of women in these nations. The data, and particularly for the Mauritius sample, demonstrate a high percentage of the respondents were executive managers, who are the ‘change masters’ in the context of global change. Consequently, there is relativity with age (and

managerial level) in the two cadres. In addition, the prominence of formal education is shown. Overall, the profile of Table 1 reveals pertinent features for partitioning the work goal preferences.

TABLE 1: DEMOGRAPHICS (%)

Respondents	Overall 2057	Maldives 208	Mauritius 201
<b>Gender:</b>			
Female	31.8	43.3	25.9
Male	68.2	56.7	74.1
<b>Managerial Level:</b>			
Executive	34.7	44.2	78.1
Middle	36.9	38.5	16.4
Supervisory	28.4	17.3	5.5
<b>Age (years):</b>			
20-29	22.7	33.7	8.8
30-39	32.2	35.6	24.6
40-49	24.4	26.4	32.3
Above 49	20.7	4.3	34.3
<b>Education Level:</b>			
Senior High School	15.1	19.7	10.0
Trade or Vocational	18.8	34.6	17.4
University	66.1	45.7	72.6

The study managers were employed in a variety of organisations delineated by industry, size, structure and ownership. For example, these organisations were active in tourism, construction and industry, transportation, agriculture, manufacturing, finance and a plethora of service entities. Both the public and the private sectors were represented. Consequently, organisational size varied from large corporations to small family firms. Moreover, the organisational dimensions varied from company to company. Hence, it was less than meaningful to assess the data across these attributes. Indeed, this contention has precedence in earlier studies that have assessed managerial work goal preferences (Harpaz & Fu, 1997; Lundberg & Peterson, 1994).

The Maldives and Mauritius are island sovereign nations. More specifically, the Maldives is an archipelago (300 square km) in the Indian Ocean, southwest of India, while Mauritius, also an independent democracy, is a considerably larger island (2040 square km) east of Madagascar. Notably, these two countries are strategically located on major sea lanes in the Indian Ocean, and are well poised to take advantage of growth in Africa, India and the Asia Pacific Region. The Maldives has a population of about one quarter of Mauritius that was estimated at 1.2 million in May 2004. Initiation of economic reform programmes during 1989 has liberalised foreign investment, and today tourism in the Maldives accounts for some 20 percent of GDP and 60 percent of foreign exchange receipts. Within the Maldives economy agriculture and manufacturing continue to have a lesser role. Mauritius has also been impacted by global forces. Initially, based on an agricultural economy (fishing, sugar cane), which have been considerably expanded, the country has a new order of industrial, financial and tourism sectors, which continue to develop at a remarkable rate of some six percent. Clearly, being enmeshed in a globalised world these two countries have undergone substantial structural reorientations as they have accelerated the search for new markets, advanced techniques of production/service, and greater capacity human resource management business practices.

#### **Procedure**

The procedure for conducting the study had three main elements. The first element was the capturing of data from all respondents by the administration of a questionnaire. This approach was undertaken despite being mindful that in workplaces of developing and transitional economies it is unusual for employees to complete questionnaires. Thus, a second feature of the study was to establish a *quanxi* with the participants through sponsorship by the employer

organisation. The third feature of the study was to employ focus groups in each country to elucidate the meaning of the results of analyses from data obtained by the questionnaire.

### Measures

The questionnaire was prepared to obtain two main types of data. In the first section of the questionnaire, demographic data were sought (e.g., gender, age, managerial level). The second type of data was the ranked preferences of a set of 11 work goals. The instrument is attached in Appendix 1. In practice, managers were required to rank their perceived importance of the 11 work goals. This notion was first employed by the Meaning of Working study (MOW, 1987), led by George England, which was seminal cross study of the leading industrialised nations of 1981 to 1983. Their study with 8192 managers in eight countries was to considerably shape HRM policies and practices of the Western World (McGaughey, Iverson & DeCieri, 1997).

### Analysis

The relative importance of the 11 work goals was examined by determining item mean scores. This process has been employed in earlier studies. The data were further evaluated by testing for the significance of different rank scores within a country or between countries. For relative simplicity only rank scores of the 11 work goals, partitioned by country or demographic attributes are presented in this paper.

## Results

### Work Goal Rankings

Table 2 shows the work goal rankings across countries as well as the overall ranks reported by the MOW study. Inspection of the ranks of our study reveals the respondents expressed a high level of consensus for the work goal of *the opportunity to learn new things*. At lower levels of preference considerable agreement was given for the work goal of *interesting work*, and *matching of job requirements with incumbent ability and experience*. Generally, the two comfort goals of *convenient work hours*, and *work conditions*, and *the work goal of job security* were the least preferred. Arguably, there was greater divergence in work goal rankings for the remaining five work goals of 1) *good opportunity for promotion*, 2) *good salary*, 3) *a lot of autonomy*, and to a lesser extent 4) *interpersonal relations*, while 5) *task variety* had equal rank scores. Explanations for these variations were provided during focus group discussions.

TABLE 2: WORK GOAL MEANS AND RELATIVE IMPORTANCE

Work Goal	Maldives	Mauritius	MOW
Opportunity to learn	3.75 <sup>1</sup>	3.89 <sup>2</sup>	7
Promotion	5.52 <sup>5</sup>	6.13 <sup>7</sup>	11
Interesting work	4.07 <sup>2</sup>	3.27 <sup>1</sup>	1
Salary	7.69 <sup>10</sup>	6.91 <sup>8</sup>	2
Good match skills/tasks	4.45 <sup>3</sup>	4.31 <sup>3</sup>	5
Autonomy	6.46 <sup>7</sup>	4.35 <sup>4</sup>	6
Inter personal skills	4.48 <sup>4</sup>	5.55 <sup>5</sup>	3
Security	7.65 <sup>9</sup>	8.22 <sup>10</sup>	4
Variety of tasks	6.25 <sup>6</sup>	5.96 <sup>6</sup>	8
Convenient work hours	8.28 <sup>11</sup>	9.44 <sup>11</sup>	9
Conditions of workplace	7.30 <sup>8</sup>	7.95 <sup>9</sup>	10

Notes: a. The superscripts denote the ranking of the work goals.

b. MOW = The work goal rankings of the Meaning of Working Study (Harpaz, 1990; MOW, 1987)

Table 2 also shows variations between the country work goal rankings and the overall rankings of the MOW study. Notably, the work goal of *opportunity to learn new things* is considerably elevated as is the *opportunity for promotion*, while the work goal of *matching of job requirements with incumbent competencies* is marginally more important. It is also revealed in Table 2 the work goals of *interesting work*, *autonomy* and the two comfort goals of *convenient work hours*, and *good physical work conditions* have over time retained their respective preference levels. In contrast the work goals of *good salary* and *good job security* were considerably less preferred

in our study than the values reported in the MOW study. Table 2 also show there were some differences between the two studies for the work goals of *interpersonal relations* and *job variety*. The differences and similarities in work goal preferences were inspected across the assessed demographic variables.

Table 3 shows the work goal ranks across countries for gender. In addition, at the foot of Table 3, is presented the ranks for the MOW data. A salient feature of Table 3 is the degree of consensus expressed by the male and female respondents of our study for the relative importance of the 11 work goals. There were few instances when the male and female preferences were substantially different. A second prominent feature of Table 3 is the pattern of relative importance of work goals. Specifically, the work goal of *opportunity to learn new things* frequently attracted high preferences, while *interesting work* was often also reported to be reasonably important to the study managers. The work goal of *matching job requirements with incumbent ability and experience* was perceived to be of intermediate importance. The least preferred work goals of the male and female managers were the two comfort goals and the work goal of *job security*. A third feature of Table 3 is the extent of consensus and divergence between the work goal rankings of this study and the ranks as reported in the MOW study. Refer to Table 3.

Table 4 shows work goal ranks across the three managerial levels for the study countries. These data reveal there was a reasonable extent of agreement for the relative importance of the work goals. *The opportunity to learn new things* was often the most preferred work goal compared to *interesting work* which was perceived to be more important than *matching job requirements with incumbent ability and experience*, while the work goal of *opportunity for promotion* was also relatively attractive. Lower preferences for the work goal of *good interpersonal relations* was recorded across managerial levels. The lowest ranked work goals were often the two comfort goals and the work goal of *job security*. Comments from the focus groups enhanced understanding for the patterns of ranking, as well as the extent of consensus and divergences. Refer to Table 4.

Table 5 shows the profile of work goal rankings for the study countries across age categories. At the base of Table 5 is presented the rankings for these work goals as reported in the MOW study. In spite of substantial variations in the number of respondents in each examined group (country and age) the data of Table 5 show a high preference for the work goal of *the opportunity to learn new things* and the work goal of *interesting work*. Comparisons with the overall MOW data show a substantial difference with the work goal of *learning*. Refer to Table 5.

### **Focus Groups**

Focus groups enriched understanding of the findings in two main areas. The first major contribution of the focus groups was to elucidate underpinning for the relevant preferences of work goals. Unusually, groups in both countries acknowledged the importance of learning new things. Focus group members contended managers were required to continually upgrade their skills, knowledge, competencies and talents. These imperatives were the consequences of today's work settings which were impacted by continuous changes in technology, ever escalating customer expectancies and an incessant drive for company sustainability. On several occasions it was remarked "*A good job today is of little value if you do not know how to do tomorrow's job*". Despite other work goals such as salary, interesting work, and autonomy being important they were, in the overall scheme, relatively less important than the opportunity to learn new things.

A most interesting finding was the relatively low importance attached to salary. Two decades earlier the work goal of salary had been ranked second in the MOW study. It is important to acknowledge the MOW study was undertaken prior to the massive job losses worldwide and the extensive institutional downsizing of the manufacturing industries, which occurred in the late 1980s. In addition, the MOW data were obtained prior to the emergence of the complex global market economy, and a focus on service quality which grew out of the quality social movement. Although comparison of work goal preferences (between MOW and our findings) is cautioned there were salient differences in the perceived levels of importance. Specifically, attention is drawn to the work goals of *opportunity to learn new things*, *promotion*, *salary*, *internal personal relationships* and *job security*, which are shown in Table 2.

Comments from the focus groups also assisted in clarifying the likely causes for consensus within the two countries across demographics. For example, the focus groups expressed foundation for the relative importance of the work goal of *autonomy* across managerial levels. They explained executive managers reported a higher

preference as it afforded them institutional control, face and opportunity to further enhance their *guanxi* in business engagements, whereas supervisory managers had less opportunity in these activities, and thus, had higher preferences for work goal of *interpersonal relationships*. Representatives of the focus groups suggested the relative consensus of work goal preferences is a reflection of the facilitation of shared knowledge and innovation in systems that are designed to meet continuous improvement and global customer expectations. Nevertheless, there are some variations in work goal preferences across demographics as the respondent managers are at a stage of balancing traditional core beliefs with the realities of the competitive market arena. These differences in work goal priorities across demographics flag some choices and priorities of managers in a contemporary globalised world.

## Discussion

This study examined the work goal preferences of 409 managers from the Maldives and Mauritius where there is increasing attention on how to embrace global issues. The study findings reveal the exigencies of these work settings such as responsiveness to customer expectations, the delivery of servicing management company wide, and facilitation of business sustainability are reflected in the respondents' work goal preferences. Indeed, there was a substantial convergence on the perceived importance of a number of work goals. The most preferred work goal was *learning new things*, an expected outcome given the onus on managers to acquire a plethora of skills, talents, competencies as well as vital knowledge necessary for activities that govern day-to-day servicing operations.

Finding the work goals of *interesting work* and *matching of job requirements with incumbent ability and experience* were ranked relatively high is indicative of attributes of a customer service culture. Work places that are challenging and require managers to come to terms with new techniques, processes and approaches place considerable demands on job holders, but such contexts are also likely to be interesting. Moreover, service excellence is grounded in managerial competence in a variety of specialised functions (cultural diversity, task, technology). Understandably, the respondents acknowledged the importance of features of the job and the skill competence of the job incumbent.

A major skill and competency required of those who participate in systems of economic development is collaborative engagements. These are essential attributes for sustaining partnerships between managers and customers for facilitating core servicing relationships to promote and maintain corporate health. An observation of the relatively low ranking of the work goal of interpersonal relations, which scholars have contended is a distinctive dimensions of service settings is to be appreciated in terms of respondent ethnicity. All the managers were working in high context cultures. Arguably, the ubiquity of networking diluted the perceptual importance for processes that were relatively common place in the daily work activities of the surveyed managers.

In addition to the extent of consensus for the relative importance of work goals there were also substantial divergences. There were significant variances in importance between the findings of this investigation and those reported in the seminal MOW study. It has been suggested these contrasts were often the congruencies of the different servicing regimes of traditional and contemporary companies. Furthermore, the extent of consensus for work goal preferences across demographics was examined. Explanations given by the focus groups to account for variations in perceptual preferences inferred economic issues (and inherently global issues) received higher importance than the traditional organisational ambitions in terms of local priorities.

## Conclusion

The primary purpose of this investigation was to establish the relative preference of 11 work goals as perceived by Maldives and Mauritius managers. These respondents were engaged in work settings impacted by global trends. In such landscapes managers are increasingly being compelled to confront and cope with task uncertainty, unpredictability of consequences, crises and a range of closely related global issues. Today managerial work has become more complex, abstract, and knowledge based as an outcome of change in global market dynamics, and a reshaping of political, social, economic and cultural dimensions of industrial society. Dealing with these challenges demands both holistic and systematic approaches in ever changing contexts. The evidence of this study that the

managers, irrespective of country, gender, age or managerial level held a high priority for access to educational opportunities and life long learning is not to be unexpected. Moreover, that learning was of considerably higher preference, while salary was significantly less relevant than was reported some two decades earlier by the seminal Meaning of Working study, might arguably, be contended are inevitable and irreversible feature of globalisation. A salient inference of the findings of this study is that as nations intensify engagement in the global economy new orders of HRM policies and practices that address lifestyle and workplace preferences will be required.

The evidence of this study suggests a major challenge for global organisations will be how to develop strategies for sharing learning across international sites. Indeed, facilitation of knowledge, leadership and vocational training at intra and inter organisational levels is likely to be a prominent feature of successful global corporations. For instance, HRM practices are likely to include preparation of employees for overseas assignments (prior to departure and after return), the building of international teams as well as developing cultural competencies. As the phenomena of globalisation is both inevitable and irreversible HRM will continue to have a significant continuing presence as corporations embrace social, political, economic and cultural perspectives that are closely related to global issues.

## End Notes

Respondents are required to rank in order (1 = first to 11 = least) the importance of each work goal for their work life.

- A. A lot of opportunity to learn new things.
- B. Good interpersonal relations (supervisors, co-workers).
- C. Good opportunity for promotion.
- D. Convenient work hours
- E. A lot of variety
- F. Interesting work
- G. Good job security
- H. A good match between your job requirements and your abilities and experience.
- I. Good pay/salary.
- J. Good physical working conditions (such as light, temperature, cleanliness, low noise level).
- K. A lot of autonomy (you decide how to do your work).

# **Developing Measurements of Intellectual Capital in Venture Capital Industry in Taiwan by the Analytic Hierarchy Process**

*Chung-Chu Liu*  
*National Taipei University, Taiwan*

## **Abstract**

Taiwan venture capital industry has played a critical role in the rapid development of Taiwan's IT industry. The purpose of this research is to construct the intellectual capital indicators of venture capital industry in Taiwan. In-depth interviewed was used to collect data. Content analysis and analytical hierarchy process were used to analyze data. According to the results, the study divides the intellectual capital into three dimensions: Human Capital, Relational Capital, and Process Capital. The research also develops 12 indicators for business intellectual capital assessment. Measuring intellectual capital also can be used to help formulate business strategy of strategic map.

## **Introduction**

Taiwan venture capital industry has played an important role in the fast development of Taiwan's IT industry. Many of the most successful high-tech companies are applying management models used by venture capitalists to find and fund good ideas quickly (Chen, Chen & Liu, 2003). The role of venture capital has increased strongly in the world of business. Venture capital funds, which invest money solely on the basis of an entrepreneur's promising idea and its potential return on investment, provide a critical capital source for small and growing enterprise (Harris & Boverid, 1996). Empirical studies show that the so-called knowledge-intensive companies have a market value that is significantly higher than their book value of equity (Hansson, 1997). Some generative intangibles, which include human capital, internal and external structures, are called intellectual capital (Bontis, 2002). The growth in the topic of intellectual capital has arisen commensurate with the ascendance of the information age and the virtual economy (Litan & Willison, 2000; Blair & Wallman, 2000). As many authors point out, a major proportion of growth companies are valued beyond book value. The market value of a firm consists of its financial capital and "something else". The first term is the firm's book value and is formed by organizational financial and physical assets. The "something else" term represents the firm's intellectual capital, defined as resource created from internal learning and development of valuable relationships (Pablos, 2002). Stewart (1997) defines intellectual capital as "the intellectual material- knowledge, information, intellectual property, experience-that can be put to use create wealth." Intellectual capital provides firms with a huge diversity of organizational values such as profit generation, strategic positioning (market share, leadership, name recognition, etc.), acquisition of innovations from other firms, customer loyalty, cost reductions, improved productivity and more. Successful firms are those that routinely maximize the value from their intellectual capital (Pablos, 2002). To sum up, the purpose of this research is to construct the intellectual capital indicators of venture capital industry in Taiwan.

## **Literature Review**

### **Venture Capital**

Based on a survey of Singapore venture capital firms, Wang & Ang (2004) find that environment, resource-based capabilities, strategy, and venture capital firms' involvement affect the venture performance significantly. Liu, Chen & Chen (2004) used a process perspective to identify the uncertainty the risks facing are emerging at a number of levels and areas. According to the result, in the funding raising stage, the risk management policy emphasis on clear funding goals, trusts build. In the deal generation stage, the risk management focused on guanxi set up, carefully recruit and select good partners. Using account audit and internal audit to help evaluate related proposal plays an important roles in screening/analyzing. Choosing the making money industry is essential for investment stage. At

last, negotiation, management buy-out is good methods for risk management is the process of venture capital.

### **Intellectual Capital**

Stewart (1997) defines intellectual capital as “the intellectual material- knowledge, information, intellectual property, experience-that can be put to use create wealth..” Nahapiet & Ghoshal (1998) defined intellectual capital as “the knowledge and knowing capability of a social collectivity, such as an organization, intellectual community, or professional practice.” Intellectual capital represents a valuable resource and a capability for action based in knowledge and knowing. The importance of managing intellectual capital is highlighted by empirical observations from 11 Swedish firms with a long experience of successfully measuring and managing intangibles These firms demonstrate that a number of managerial processes have gradually evolved to secure the transformation of the measurement results into necessary action (Guthrie, Petty & Johanson, 2001). Intellectual capital will be key in determining organization value and performance. Generally the literature has identified three sub-phenomena that constitute the concept of intellectual capital: human capital, relationship capital, and organizational capital (Bontis, 2002). Human capital represents the individual knowledge stock of an organization as represented by its employees (Bontis, Crossan & Hulland, 2002). Relational capital represents the relationships with internal and external stakeholder (Roos, Roos, Edvisson & Dragonetti, 1998). Organizational capital is defined as the knowledge that stays within the company at the end of the working day. According to Bontis, Chong & Richardson (2000), it includes the databases, organizational charts, process manuals, strategies, routines and anything whose values to the company is higher than its material value. On the other hand, organizational capital can be broken down into innovation capital and process capital. Innovation capital refers to the explicit, packaged result of innovation in the form of protected commercial rights, intellectual capital and other intangible resources and values. Process capital is the combined value of value- creating and non-value-creating processes (Skandia,1996). Stovel & Bontis (2002) suggested that intellectual capital is divided three component categories: human capital, structure capital, and customer capital. Human capital is the cumulative tacit knowledge of employees within a firm. It is a combination of four factors: genetic inheritance, education, experience, and attitudes about life and business (Choo & Bontis, 2002; Hudson,1993). Structural capital is the support mechanism for employees to achieve optimum job performance and overall organizational performance (Bontis,1998). Customer capital is the tangible rapport and synergies created interpersonally both within the organization and externally (Stovel & Bontis, 2002). As Roos, Roos, Evisson & Dragonetti (1998) mentioned intellectual capital is the latest development in the line of research. The theoretical roots of intellectual capital come from two different streams of research: strategy & measurement. While the first stream studies are knowledge creation, acquisition, diffusion, capitalization, conversion, transfer and storage; and the second stream of research focuses on the measuring of intellectual capital. The second stream has advanced towards the elaboration of intellectual capital reports and the building of international standards on intellectual capital measuring and reporting (Pablos, 2003). By the purpose of this research, it focuses on the second steam of research: measuring and reporting the sequence of intellectual in venture capital industry in Taiwan.

### **Methods**

For getting the content of intellectual capital, this study gathered data from seven venture capital companies. In-depth interviewed, content analysis, and analytical hierarchy process were used to collect and analyze data.

### **Sample**

The research uses convenience sampling to collect data. Seven responsive companies are selected. General Open-ended questionnaire was interviewed and asking interviewees about the competitive advantages of their companies in the long term. The research reported here found that research participants’ perceptions of their own and other’ behaviors can be represented under broadly the same headings. A total of 8 persons ranged in age from 30 to 45 with a mean of 38. 62.5% of the respondents are male. 37.5% of the respondents are female.

### **Data Analysis**

Data analysis of this qualitative study used the content analysis method (Berelson,1952). Content analysis techniques may be applied to study the content of any book, magazine, newspaper, individual story or articles, motion picture, news-broadcast, photograph, cartoon, comic strip, or a series of combination of any of these. Holsti (1969) defined content analysis is any technique for making inference by objectively and systematically identifying specified characteristics of messages. Berelson (1952) defined content analysis as “a research technique for the systematic, objective, and quantitative description of the manifest content of communication” (P.18). The goal of

content analysis research is to present a systematic and objective description of the attributes of communication. These data may be used to make inferences about communicators. April, Bosma & Deglon (2003) also used a content analysis in accordance with a selected intellectual capital framework consisting of 24 indicators across the three categories of internal, external and human capital.

### **Categories of Analysis**

The researchers used some concepts of literatures (theory of reasoned action, economic exchange theory ...etc) and check the content of 8 persons form in-depth interview records. This study developed three major factors by above a conceptual framework: 1. **Human capital:** Human capital is the cumulative tacit knowledge of employees within a firm. It is a combination of four factors: genetic inheritance, education, experience, and attitudes about life and business (Choo & Bontis, 2002), the elements of human capital of this study are including group's tacit understanding, expertise of leading, partnership, and professional knowledge; 2. **Process Capital:** Process capital is the combined value of value- creating and non-value-creating processes (Skandia,1996); 3. **Relational Capital:** Relational capital is the knowledge that is linked with external relationships of the firm, such as government (Chaminade & Johanson, 2003), the elements of structural capital of this study are including internal standard operation procedure, and external operation process .

### **Unit of Measurement**

This study is used theme as unit of measurement. According to categories as mention above, we have 60 themes. Random sampling 20 themes from 60 themes is to do pretest. By researcher, two venture capital managers, and a university college teacher, the result shows the common consensus. Furthermore, we discuss the reliability of our study.

### **Degree of Mutual Agreement and Reliability**

Sampling 20 themes from 60 themes to count the degree of mutual agree by three coders. Using the result of coding to a formula.  $[2M/(N+O)]$ , M: all agree numbers , N : coder 1 agree; O : coder 2 agree] to get the degree of mutual agree. The average mutual degree of this study by three coders is 0.8. So, We get the acceptable reliability of this study is 0.923. Later, this study used 60 themes to calculate the average mutual degree is 0.82. The reliability (0.93) of 60 themes in this study is acceptable. According to the content of coding, we use the results to run analytical hierarchy process.

### **Analytical Hierarchy Process**

The data in this study were analyzed using a multi-criteria decision making approach called the analytical process (AHP). The Analytical Hierarchy Process, developed by Thomas L. Satty (1977), addresses many of the problems mentioned above. Expert Choice, Inc, one of the vendors of AHP software, reports thousands of installations of its namesake product on PCs around the globe. Satty (1994), the founder of AHP, claims that AHP is, "... natural to our intuition and general think," which combines logic and intuition, and take advantage of our ability to rank choices. Many articles have been written on the successful implementation of AHP in various environments that involve a selection or decision (Liberatore & Miller, 1995). Software implementation of the AHP, such as Expert Choice (1995), provides a variety of verbal, numeric, and graphical comparison method. The judgment inconsistency coefficient should be under 0.1.

### **Results**

This paper is intended to identify what are the content of intellectual capital of venture capital companies in Taiwan. According to these purposes, this study will show the results as follows.

TABLE 1 PRIORITY AND SEQUENCE FOR LEVEL 1 AND LEVEL 2 CRITERIA FOR INTELLECTUAL CAPITAL

Criterion	Items	Priority weight	Sequence	
Intellectual Capital	Human capital		3	
	Process Capital		2	
	Relational Capital		1	
		Inconsistency index: 0.00		
	Human Capital	Group's tacit understanding	0.064	4
		Expertise of leading	0.161	3
		Employees' professional knowledge	0.209	2
		Work teams	0.571	1
		Inconsistency index: 0.04		
	Process Capital	Law & regulatory	0.076	4
		Risk assessment	0.285	2
		Internal decision-making quality	0.384	1
External control system		0.254	3	
	Inconsistency index: 0.04			
Relationship Capital	Market sensitivity	0.211	2	
	Targeting right objectivities	0.510	1	
	Involving managerial activities	0.147	3	
	Good relationship between government and business	0.132	4	
		Inconsistency index: 0.07		

According to the results, the priority of frequency in first level is human capital (including group's tacit understanding, expertise of leading, employees' professional knowledge, and work team), process capital (including law & regulatory, risk assessment, internal decision-making quality, and external control system), relationship capital (including market sensitivity, targeting right objectivities, involving managerial activities, and good relationship between government and business). With regard to the indicators, first, the human element has grown in importance because knowledge has become a critical ingredient for gaining a competitive advantage, particularly in the new economy landscape (Grant,1996). Firm performance can be enhanced by the way in which firms use human resources in the development and implementation of their strategies (Wright, Smart & McMahan,1995); second, venture capital companies should pay attention to their customer's complaint and satisfy their needs; third, structural capital, venture capital companies should set up their internal and external standard operation procedure to improve their efficiency; fourth, service capital, venture capital companies should schedule their project management execution and provide customized service. Finally, innovation capita, due to external challenges necessitating high degree of innovation and customization without sacrificing cost and quality, many industrial firms need to transform their entire approach to product development (Drejer, 2003). Yang (2004) suggests that the speed of knowledge acquisition and the availability of knowledge dissemination facilities affect the cycle time and new product development and, thus, contribute to the improvement of financial performance. Innovation- technology significantly moderates the negative impact of speed on performance.

## Conclusion and Suggestions

This study is exploring to the value of venture capital industry by management perspective. "Intellectual Capital" was a popular issues and discussed at everywhere of the world nowadays. There are many discourses published from abroad, but it's just on the beginning at Taiwan. The purpose is to explore the construction of intellectual capital indicators of venture capital industry .In order to construct relevant measurement indicators; this study collected data from top managers of venture capital companies. In-depth interviewed, content analysis, and analytical hierarchy process were used to collect and analyze data. According to the results, the study divides the intellectual capital into three dimensions: human capital, process capital, and relational capital. It also developed 12 indicators for business intellectual capital assessment. The study refines and constructs the intellectual capital assessment model by cases

study of venture capital industry in Taiwan. The result shows the current situation about intellectual capital of the case and provides a reference to improve competitive advantages. However, intellectual capital is a complex, intangible subject and there can be no doubt that some errors by researcher's subjective and venture capital companies. This study is still exploratory in nature, as it is the first attempts to investigate intellectual capital reporting practice of venture capital industry in Taiwan, and further work needs to be done in several ways. As the sample used is quite small, the first step is would be use a larger sample in order to allow the inclusion in the analytical hierarchy process model. A second step would be to extend the analysis on a longitudinal basis aiming to monitor the progress and development of intellectual capital reporting practices. Measuring intellectual capital also can be used to help formulate business strategy of strategic map (Marr, Gray & Neely, 2003). These indicators also provide some evaluation base for venture capitalists for another country and allocate some resources for venture capital companies.

# Local Business Development by Global Management Standards: A Content Analysis of Mission Statements from Selected Malaysian Plantation-Based Companies

Haim Hilman Abdullah

AA Rahman

Universiti Utara Malaysia, Malaysia

Zainal Abidin Mohamed

Universiti Pertanian Malaysia, Malaysia

## Abstract

This paper studies one such practice in the area of management, on the micro-level of plantation-based companies in Malaysia. It is widely recognized by managers and academics as the first step in strategic planning because business is not defined by its name, statutes or articles of companies - but by its mission. Only a clear definition of the mission and purpose will make companies able to develop clear and realistic business objectives. This study found, thirty-one (31) or (79.5%) of thirty-nine (39) companies listed under the plantation sector of the Malaysia Bourse's main board have no mission statements. The eight (8) companies with mission statements want "to be a responsible corporate citizen" (18.8%), "to exceed customer expectation" (12.5%), "to enhance shareholders value" (12.5%), and "to provide opportunity for career advancement" (9.4%). These issues were identified as the most popular issues of the nineteen (19) being studied. Overall, the findings clearly indicate a lack of strategic management practices among companies in the plantation sector in Malaysia. This suggests, despite an image of rapid development, Malaysia is likely to lag behind - at least in the plantation-based company sector. If this is any generalisable indication for Malaysia management practices across the board, implications will be grave for long-term Malaysian development prospects. Further studies will be required to see if that indeed is the case - or the plantation sector studied here is only an aberration.

## Introduction

In these times of rapid globalization, economic development in any one country is invariably linked with development maximization practices across the globe. This is because, businesses in any one country increasingly will have to compete globally, and standards for success or failure also will be global. This is true both at the macro- and the micro- levels. This paper studies one such practice in the area of management, on the micro-level of plantation-based companies in Malaysia. The practice we like focus on here, is the formulation, and pursuance of business-firms' mission statements.

On the global level, in the practice of the most advanced businesses in most advanced economies, mission statements are seen as inseparable part of companies' strategy because they have an impact on performance. In fact, in a research by Bain *et al* (1996) suggests that mission statements are one of the most important and popular management tools these days. It defines the purpose of the organization, and acts as the medium that guide people within the organization so that they can work independently and collectively to achieve desired levels of companies' performance (Kotler *et al.* 1996). Organizations programs must be defined broadly enough to provide performance targets, and direct resources to achieve synergy, providing realistic frameworks for forecasting strategic planning and objective setting (Abell *et al.*, 1980).

The available literature on the subject also strongly indicates that mission statements are important to the development of corporate strategy, culture, believe, and values, the integration of employees, and the performance outcomes of companies. It also regarded as the most critical starting point for almost every major strategic initiative in modern management like re-engineering, TQM, and self directed works team (Bart, 1997). Well-defined mission statements are supposed to answer questions such as: why do we exist; what is our business; what do we want to become? When these questions clearly answered, then only a mission statement managed to distinguish a company's unique, enduring and dynamic purpose (Bart, 1999, 1996; Ireland and Hitt, 1992; Klemm *et al.*, 1991; Want, 1986).

However, many companies even in advanced economies like that of the US do not have mission statements. In a research by Jill et al. based *Business Week* found that 59 percent of the 1,000 companies did not have mission statements (1996). If such is the scenario even with substantial number of firms in the US, it certainly indicates a need for research into the situation with mission statements in companies in Malaysia – on whom there is hardly any information available to give any idea at all.

It is view of considerations such as above, that the research for the present paper was conducted, with companies listed under the plantation sector of the Malaysia Bourse's main board were used as samples. The main reason for us choosing firms from this particular sector was this sector's long relationship with the rise and fall of the Malaysian economy. It indeed is the sector that was known as the backbone for the country's economy for many years, before the rather recent shift of the focus of the economy to the manufacturing sector.

Like all dynamic companies, Malaysian companies also have to prepare and strive in today's business environment that is no doubt is competitive in nature. Globalization has definitely "shifted" today's business context to a new paradigm. Survival, growth, and prosperity seems belong to those who are proactive and dynamic. Failure to do so, or reluctance to change, will lead to a greater degree of risk of being eliminated from the market. Constructing and using a mission statement can generate and foster a focus on common objectives, a shared value system and culture, teamwork, behavioral guidelines, emotional commitment and resources allocation of a company. More and more companies have changed their management practices concept from ad-hoc based, or emergent planning based management - to one of strategic management. The main advantage of this strategic management concept is its capability to combine arts and sciences - facts with experience and intuitions - of management together into one whole. This involves including a mission statement in this total whole.

As we see that, existing literature on the subject strongly indicates that development of suitable and concrete mission statements is an essential part of globally succeeding management practice. Such mission statements are important for the development of corporate strategy, culture, beliefs, and values, the integration of employees, and the performance outcomes of companies. It is widely recognized by managers and academics as the first step in strategic planning because business is not defined by its name, statutes or articles of companies - but by its mission. Only a clear definition of the mission and purpose will make companies able to develop clear and realistic business objectives. To go by the existing the literature on the subject, both academic experts and hands-on practitioners very much agree that mission statements are critical to companies' survival, growth, and prosperity. Good mission statement holds a very crucial role in companies' planning processes - especially in the companies that believe in the effectiveness of the strategic planning as a useful management style to enhance their performance. Top management has the full responsibility to develop and bridge them with the company's other strategic tools, such as its vision statement. (Haim, 2005; Greengarten-Jackson, J. *et al.* 2002; Dymowski *et al.*, 1992; Lammers, 1992; Calfee, 1993).

A research by Bain and Company survey (1999) of Management Tools and Techniques has ranked mission statement as the first important factor for their business performance, for the period between 1993 and 1997. While in a research conducted by Rigby (1994) on 500 US managers found the mission statement was the most used tool out of 25 tools reported by respondents. Bart *et al.* (2001) also found that mission statements could influence companies' financial performance.

Failure to provide adequate thought to business purpose and mission statements was perhaps the most important reason in both managerial frustration and business failure (Drucker, 1974). Researchers like Abell (1980), McGinnis (1981), Pearce (1986), Ackoff (1986), Want (1986), Campbell and Tawadey (1992), Fred (1996) – all of them - have strongly emphasizes of mission statement in guiding company.

#### **Purpose**

In terms of strategies for strengthening companies' competitiveness, this research focuses on one aspect of the strategic planning tool - company's mission statement, in case of any given company. A mission statement is one of the most crucial strategic tools for better management practices. It is widely recognized by both academics and managers as the first step in strategic planning (Haim, 2005; David, 2004).

The importance of a mission statement for business is great. A business is not defined by its name, statutes or articles – rather, it is defined by its mission. Only a clear definition of the mission and purpose will make the organization able to achieve clear and realistic business objectives (Drucker, 1973). Research has indicated that

characteristics of mission statements have been related to companies' performance (Pearce and David, 1987). However, most of the previous empirical studies of mission statements have focused mainly on companies in western countries only. Despite the awareness on the contribution of the mission statements to companies' performance, very little empirical studies have been conducted to examine companies from this aspect in Malaysia particularly. To alleviate this lacking in the existing literature, we undertook to conduct and follow through this particular this research. For this, all companies listed under the plantation-based sector of the Malaysia Bourse's main board. As such, this research initiates an attempt to discover the characteristics of mission statements of the plantation-based companies that are listed in the main board of the Malaysia Bourse. In particular, this research attempts:

1. To identify the distribution of companies with and without mission statements from amongst the companies those are listed under the plantation sector of the Malaysia Bourse's main board.
2. To determine the issues addressed by the mission statement of each company that does have a mission statement – from amongst the companies that are listed under the plantation sector of the Malaysia Bourse's main board.
3. To determine the most popular issues addressed in their mission statements by the companies, which do have mission statements – from amongst the companies that are listed under the plantation sector of the Malaysia Bourse's main board.
4. To derive some generalizable tentative conclusions from the above three steps.

#### **Significance**

It is hoped that, proceeding from the purposes such as noted above, the finding from this research would be useful for all companies in the plantation sector, as well other sectors, in Malaysia. Extrapolations therefore might be relevant and useful for similar sectors elsewhere as well. Specifically, this study will generate the following benefits:

1. The findings are believed to be useful in providing an insight into the nature of the mission statements of plantation-based companies.
2. The outcomes are expected to be useful in helping companies in making better strategic planning.
3. The research could provide information concerning the current state of the art of mission statements among plantation-based companies listed in the Malaysia Bourse.

#### **Scope**

As noted, the research here focuses on plantation-based companies listed in the main board of the Malaysia Bourse. Altogether, thirty-nine (39) companies are listed under the sector, and were used for this study. Thematically, it focuses on mission statements only.

#### **What is a Mission Statement?**

We did mention a few times the term mission statement, while talking about its importance. One assumes, the broad meaning of the phrase is generally understood by experts and lay alike. But let us now see the various technically narrowed down definitions of mission statements made by both academic experts and hands-on practitioners of business performance. Information in this part of this paper is important in explaining and enhancing the important need to research mission statements and its contribution to companies' performance.

There are many technical definitions of mission statement in strategic management school of thought available in existing literature, but no one definition has been universally accepted. There are many prescriptions, which can be fundamental to companies' strategic planning. A mission statement might be seen as one such kind of prescription. Theoretically, the research on mission statements began in the early 1970s, and Drucker (1971) define them as a tool for "clear and realistic business objectives". A mission statement explains a company's present business scopes and purposes, while the vision statement is chiefly about the company's future (Haim, 2005; Strickland *et al.*, 2004, Zainal, 1998).

David (2004) has advocated nine essential component of mission statement such as customer, product or service, markets, technology, concern for survival, growth, and prosperity, philosophy, self-concept, concern for public image, and concern for employees.

Tahir and Howard (2003) research, based on Lynch (2000), suggests that - since no two companies are the same, so the mission statement for each to each company is unique to itself. Yet, there are some common features for mission statements of all companies. For example, a good mission statement is the one that has one or more

SMART criteria. SMART means S: Specific, M: Measurable, A: Achievable, R: Realistic, and T: Timely. Want (1986) indicates that a mission statement is one, which tells the purpose, principal business aims, corporate identity, policies and corporate values of any given company. Pearce (1982) also says that the contents of mission statement would include company philosophy, target customers, principal, geographical domain, core technology, product/services, commitment to survival, public image, self-concept, growth, profitability, and core technology. Furthermore, Abell (1980) suggests that a mission statement answers the question “What is our business?” – and the answer could be through three different perspectives:

1. “What are the customer groups that are being satisfied by the company?”
2. “What needs are being satisfied?” and
3. “How are the needs being satisfied?”

Carolyn (1997)’s research, based Ackoff (1986) and Campbell and Yeung (1991), suggests a mission statement should contain goals, differentiation factors, the companies’ aspirations, role of all stakeholders, and behavior standards.

Hitt *et al.* (2005) describe mission statement, as a company’s unique purpose and the scope of its operations in terms of products it intends to produce and markets it will serve using its core competencies. A good mission can become as an effective tool in inspiring stakeholders.

Wheelen and Hunger (2004) describe mission statement as the very reason for the company’s existence. It tells the types of products a company offers to the society. An effective mission statement defines the fundamental, unique purpose that sets the company apart from other companies of its type clearly. Charles *et al.* (2004) noted mission statement as a key indicator of how a company views the claim of its stakeholders and makes formal commitment to them. Fred (2003) indicates that that practitioners agreed that an effective mission statement to have the following:

1. Who are the firm’s customers?
2. What are the firm’s major products or services?
3. Where does the firm compete?
4. Is technology a primary concern of the firm?
5. Is the firm committed to economic objectives of survival, growth, and profitability?
6. What are the basic beliefs, values, aspirations, and philosophical priorities of the firm?
7. What is the firm’s distinctive competence or major competitive advantage?
8. Are the firm responsive to social, community, and environmental concerns?
9. Are employees, considered to be a valuable asset for the firm?

Table 1 shows the list of components thought and suggested by several researchers to be important as components of a mission statement.

TABLE 1: COMPONENTS OF MISSION STATEMENTS

Abell (1980)	Satisfied customer group, satisfied needs, how the needs are satisfied.
McGinnis (1981)	Define organization, organizational aims, flexible, should evaluate current and prospective activities, clearly interpreted.
Pearce (1986)	Target customer, market, products and services, geographical domain, core technology, survival, growth, profitability, company philosophy, self-concept, public image, employees.
Ackoff (1986)	Goals, differentiation factors, organizational aspirations, role of all the stakeholder groups.
Want (1986)	Purpose, business aims, corporate identity, company policies, and values.
Campbell and Tawadey (1992)	Customers, products/service, location, technology, survival, philosophy, self-concept, public image, employees.
Fred (1996)	Customers, products, markets, technology, survival, growth, profitability, philosophy.
Total Research, Service (1999)	Customer care/focus, products and service quality, leadership competitiveness, Strategic Marketing innovations, staff focus, social responsibility and shareholder value.
Lynch (2000)	Specific, distinctive, realistic/attainable, and flexible.
Frequent attributes	Customers, product/service, technology, market, survival, growth, profitability, company philosophy, differentiation factors, image, values, leadership, stakeholders, clarity, and social responsibility.

#### The Role of Mission Statements in Strategic Planning

We noted earlier that forward looking companies succeeding on the global level have shifted from ad-hoc based planning to strategic planning for their businesses. Mission statement is the foundation of strategic planning, and business strategies cannot be developed until fundamental decisions are made – and articulated in mission statements - about the business the company is in (McTavish, 1995). Mission statements provide the foundation for strategic planning which is important in ensuring planning is to be successful (Lipton, 1996). They are the basis for setting companies objectives (Bart et al., 2003). They drive companies’ priorities and intellectual capital development and enhancement (Bontis, 1996, 1999, 2001, 2002, 2003).

Since 1980s, the mission statements have been used heavily as to communicate the kind of relationships with a company’s major stakeholder groups (Campbell, 1997). However, not all mission statements created positive contributions, in other words, it is possible to have “good” and “bad” mission statements (Bart and Bontis, 2003).

As one of the most important strategic management tools in setting the overall direction for companies, mission statements are crucial for the field of corporate governance. Corporate governance is the system used to navigate and control business companies (OECD, 1999). As such, corporate governance has become fundamental to activities conducted in the companies. Within this system, the board is responsible in monitoring the company’s mission, vision, and strategy. Failure to do so will jeopardize any effort towards achieving the companies’ targeted objectives.

Logical deduction suggests that mission statements would have great impact on the performance of firms. However, on the level of empirical research, as Bart et al. (2001) acknowledge, very little empirically conclusive information is available about the relationship among various mission constructs. However, basing on whatever information is available, Pearce and David (1987) successfully demonstrate a strong relationship between three mission components (i.e. organizational philosophy, self –concept, and public image) on the one hand, and firm performance on the other. However, Bart (1997) found weak relationship between missions content to five performance outcomes (ROA, ROS, percentage change in sales, percentage change in profits, and influence of mission on employees’ behavior). The main reason for the fact that not much empirically conclusive information is available on mission statements’ contribution to companies’ financial performance is that, researchers focused too much on identifying mission statements’ content only (Pearce, 1982, Pearce and David, 1987; David, 1989, 1993; Klemm et al., 1991, Ireland and Hitt, 1992, Bart et al., 2001).

When Bart (1999) examined 103 Canadian Hospitals, he found a strong relationship between the contents of the mission statements on the one hand, and the “degree of satisfaction with the mission”. Same was found to be true between the contents of the mission statements and the “degree of satisfaction with financial performance”. However, a clear understanding of the relationship between critical mission variables, their interactions with one another, and the their overall relationship to financial performance does not yet exist. This is because their various interactions have not been modeled yet (Bart et al., 2001).

#### **Methodology and Sample-Focus**

Now we might pause a little, to discuss the research methodology followed in this, present research - the procedure, sample selection, data collection method and the statistical method used.

As noted earlier, this research focuses on companies listed in the main board of the Malaysia Bourse for 2004. All companies under plantation-based sector in the Bourse specifically were used as samples for Malaysian-based companies in general as a “population” whose condition regarding mission statements is sought to be understood. Most of the samples are conglomerate companies, but have strong root in plantation sector. This is the sector that has a long enough history with Malaysia to give some idea about the Malaysian business performance scenario over a considerable period of time. Until recently, this was the sector that used to be the backbone of Malaysian economy. It was the main agenda for Malaysian economy under Malaysia’s first, second, and third Prime Ministers.

However, the nation’s fourth Prime Minister, Dr. Mahathir Mohamed shifted the focus to heavy industries, when he took over the Prime Minister’s office in 1982. Since then, the plantation-based industrial sector has received relatively lesser attention. Latest development, however, is that the sector seems to get back its prime position. This is so, because the present Prime Minister, Datuk Seri Abdullah Ahmad Badawi wants more agricultural based activities to be explored and used as the nation’s economic backbone again. In particular Tan Sri Muhyiddin Yassin, one of the most senior ministers have been appointed to head the ministry of Agriculture as to ensure the agenda will work as planned.

So, this research tried to identify the issues addressed in companies listed in this sector. In lieu to that, all companies in the sector either with or without mission statements were taken as samples. Telephone interviews, website surfing, and annual report analyses were used as mediums to identify those companies’ mission statements. However, mission statements that are formally written only were counted in the research.

Telephone interviews were used when the mission statements were not available in a company website or annual report. All communication was done through communication department, human resource department, public relations, or corporate planning department of the contacted companies. They were asked to fax the statement to the researcher.

A Word by word analyses was conducted on all mission statements. Every possible bias or making assumption on the meanings of the words were strictly monitored and avoided and coding procedure analysis was used too. Each company mission statement consisted several issues, so separate index card were created for each issue with the name of the company at the bottom of the card.

The above mentioned data collection and analysis method were carefully selected and conducted as to minimize any potential bias. The method was selected because the mission statements literature indicates most of them have been widely adopted in the previous studies. Furthermore, by using the same method, the findings of this research can be compared with previous studies.

#### **Findings**

Now we present the result of this research. The data gathered are tabulated and analyzed in the various graphical forms. The results will be presented in terms of several major issues addressed in mission statements.

This research had three objectives. Firstly, to identify the distribution of companies with and without mission statements those are listed under the plantation sector of the Malaysia Bourse’s main board. Secondly, to determine the issues addressed by mission statements of each company that listed under the plantation sector of the Malaysia Bourse’s main board, and finally to determine the most popular issues addressed by companies in their mission statements. Proceeding on to achieve those objectives, we conducted the research, and reached the following conclusion. Following are the findings of this research.

The list of the companies participated in this research is shown in Table 2. The results shows most of companies listed under the sector have no mission statements. Out of thirty-nine (39) companies, only (8) companies or 20.5% have mission statements. This finding shows the lack of strategic management practices among plantation-based companies in Malaysia that were known as the backbone to the Malaysia economy.

TABLE 2: LIST OF COMPANIES IN THE PLANTATION SECTOR

1. Guthrie Ropel Bhd	2. Batu Kawan Berhad	3. Kim Loong Resources Bhd	4. NPC Resources Bhd
5. Highlands & Lowlands Bhd	6. BLD Plantation Bhd	7. Kluang Rubber Co (M) Bhd	8. PPB Oil Palms Bhd
9. IJM Plantations Bhd	10. Boustead Holdings Bhd	11. Kretam Holdings Bhd	12. Riverview Rubber Estates Bhd
13. Johore Tenggara Oil Palm Bhd	14. Bukit Katil Resources Bhd	15. Kulim (M) Bhd	16. Sarawak Oil Palm Bhd
17. Kuala Lumpur Kepong Bhd	18. Chin Teck Plantations Bhd	19. Kurnia Setia Bhd	20. Sungei Bagan Rubber Co (M) Bhd
21. Kumpulan Guthrie Bhd	22. Far East Holdings Bhd	23. Kwantas Companies Bhd	24. TDM Bhd
25. Ladang Perbadanan – Fima Bhd	26. Glenealy Plantations (M) Bhd	27. Mentakab Rubber Co (M) Bhd	28. Unico Desa Plantations Bhd
29. TH Group Bhd	30. Golden Hope Plantations Bhd	31. MHC Plantations Bhd	32. United Malacca Rubber Estates Bhd
33. Asiatic Development Bhd	34. Inch Kenneth Kajang Rubber Bhd	35. Multinvest Resources Bhd	36. United Plantation Bhd
37. Ayer Molek Rubber Co Bhd	38. IOI Companies Bhd	39. Negri Sembilan Oil Palms Bhd	

Two (2) of the companies use the same mission statements as they are subsidiaries to another company. In other words, their parent companies' mission statements are broad enough to represent their activities. The issues addressed by the eight (8) companies that have mission statements were grouped together as to bring out its latent structure. This research has identified nineteen (19) issues. Table 3 below is the list of the issues.

TABLE 3: ISSUES OF MISSION STATEMENTS

1. to exceed customer expectation	11. to enhance knowledge through effective training
2. to provide opportunity for career advancement	12. to ensure operational excellence
3. to enhance shareholders value	13. to fully utilize technological innovation and mechanization advancement
4. to maximize stakeholders benefits	14. to be a responsible corporate citizen
5. to be a cost effective producer	15. to be the best company to work for
6. to develop teamwork based working environment	16. to provide superior quality at competitive price
7. to become an excellence oriented management	17. to provide conducive working environment
8. to partner justly with subsidiaries and associates	18. to provide and maintain beneficial relationship with business associates
9. to provide superior quality and speed	19. to enhance growth and profitability
10. to grow through long term planning	

Nineteen (19) issues addressed by just eight (8) companies clearly shows the wide spread of issues being addressed by the companies. Several issues were identified as popular issues and those are factors such as “to be a good corporate citizen”, “to exceed customer expectation”, and “to enhance shareholders value”.

Among the nineteen (19) issues identified, issues such as “to be a responsible corporate citizen” (18.8%), “to exceed customer expectation” (12.5%), “to enhance shareholders value” (12.5%), and “to provide opportunity for career advancement” (9.4%) were identified as the most popular issues. (See Table 4)

TABLE 4: THE ISSUES ADDRESSED BY SAMPLE COMPANIES

Mission statement Number	Frequency	Percent
1. to be responsible corporate citizen	6	18.8
2. to exceed customer expectation	4	12.5
3. to enhance shareholders value	4	12.5
4. to provide opportunity for career advancement	3	9.4

Other issues were chosen once only or (3.13%) each by the companies. They are: to maximize stakeholders benefits, to be a cost effective producer, to develop teamwork based working environment, to become an excellence oriented management, to partner justly with subsidiaries and associates, to provide superior quality, to grow through long term planning, to enhance knowledge through effective training, to ensure operational excellence, to fully utilize technological innovations and mechanization advancement, to be the best company to work for, to provide superior quality at competitive price, to provide conducive working environment, to provide and maintain beneficial relationship with business associates, and to enhance growth and profitability.

## Conclusion

Let us now discuss guarding the major findings of the research, and draw tentative conclusions to provide basis for further research in the area. The objectives were to identify the distribution of companies with and without mission statements listed under the plantation sector of the Malaysia Bourse’s main board, to determine the issues addressed by mission statements of each company, and to determine the most popular issues addressed by in mission statements of the sample companies.

Overall, the findings clearly indicate a lack of strategic management practices among companies in the plantation sector in Malaysia. This suggests, despite an image of rapid development, Malaysia is likely to lag behind – at least in the plantation-based company sector. If this is any generalisable indication for Malaysia management practices across the board, implications will be grave for long-term Malaysian development prospects. Further studies will be required to see if that indeed is the case – or the plantation sector studied here is only an aberration.

This study found, thirty-one (31) or (79.5%) of thirty- nine (39) companies listed under the plantation sector of the Malaysia Bourse’s main board have no mission statements. The eight (8) companies with mission statements want “to be a responsible corporate citizen” (18.8%), “to exceed customer expectation” (12.5%), “to enhance shareholders value” (12.5%), and “to provide opportunity for career advancement” (9.4%). These issues were identified as the most popular issues of the nineteen (19) being studied.

Based on the findings, the empirical information suggests most of the companies have no mission statements (75.5%) or thirty-one (31) out of thirty-nine (39) companies. This findings is consistent with the earlier observation Jill *et al.* (1996) based *Business Week* that found 59 percent of the 1,000 companies did not have mission statements (1996).

While, the issues addressed by the eight (8) companies that have mission statements were very wide spread. The issues were “to exceed customer expectation, to provide opportunity for career advancement, to enhance shareholders value, to be a responsible corporate citizen, to maximize stakeholders benefits, to be a cost effective producer, to develop teamwork based working environment, to become an excellence oriented management, to partner justly with subsidiaries and associates, to provide superior quality and speed, to grow through long term planning, to enhance knowledge through effective training, to ensure operational excellence, to fully utilize technological innovation and mechanization advancement, to be the best company to work for, to provide superior quality at competitive price, to provide conducive working environment, to provide and maintain beneficial relationship with business associates, to enhance growth and profitability.” These issues addressed are consistent

with earlier studies by Pearce (1986), Campbell and Yeung (1991), Carolyn (1997), Tahir and Howard (2003), Thompson *et al* (2004), Charles *et al.* (2004) and Hitt *et al.* (2005).

On the basis of the findings of this research, mission statements appear to be very important strategic planning tool companies that exercising strategic management concept. The findings suggest most of the issues mentioned in mission statements of the Malaysia companies studied are similar to those mentioned most mission statements found discussed in the pre-existing literature, given the small sample, the drawing of any conclusion from this research should be done with caution. In view of this, future research could replicate this research with larger samples. Such commitment would further our understanding on companies approach to initiate their basis of activities.

In general, the findings of this research clearly highlight the lack of strategic management element among companies listed under the plantation sector of the Malaysia Bourse's main board. However, to the companies with their mission issues "to be a good corporate citizen" clearly show a very strong relationship between them and the Malaysia government whom always encourage private sector to take part in nation building programs.

We must mention something about the limitations of this research. The sample may be small to claim most of the plantation-based sector has no mission statement because many of them in the industry are not listed in the bourse. To locate them has emerged as this research's major problem because they are scattered all over the country.

Despite the above-mentioned limitations, the findings from this research are important. They create an opportunity for other researchers who might be interested in exploring issues addressed by mission statements in other sector and its relationship to companies' financial performances. Findings from this research can be used as a starting point for discovering the similarities in terms of issues of missions between sectors. Furthermore, it will be very useful to those who are interested in knowing the business management practices of Malaysian based companies in their efforts in mapping their future direction in contemporary, increasingly globalize – and hence, competitive - business world.

# Performance Management and Performance Measures

*Emilia Papulova*

*University of Economics in Bratislava, Slovak Republic*

*Zuzana Papulova*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

For every organization is important to achieve the best possible level of its performance. Securing performance is based on understanding business strategy, specifying performance goals and used management systems. Whole process of securing performance is called performance management. There are many techniques how to manage and measure performance. The most commonly used technique is the traditional performance management, which is based on financial indicators. There are also techniques that are using non-financial indicators like the balance scorecard. Performance management through processes is the latest and the least known. In comparison with previous techniques, this is focused more on behaviour of processes than their outcomes.

## Introduction

The challenges of continuously changing world stimulate the theory of management to generate new frameworks and techniques. Exerted frameworks and techniques in business management are losing their successfulness and forcing business to create new ones. E.g.:

- Quality Management
- Activity based costing
- Benchmarking
- Reengineering
- and more

Each of these generated vast interest, activity, consulting revenues but not always success. Why they can still exist? The answer is quite simply. They can exist because they all add value. Each framework purports to be unique and has its own protagonists. They all provide unique perspectives on performance.

## Performance Management

How we mention above, these frameworks and techniques provide unique perspectives on performance. It means, these views are one-dimensional and performance is multi-dimensional concept. Often they are not even linked to firm's strategy. That's the reason of their unsuccessfulness.

The more fundamental problem is that we are stuck with an archaic conception of the firm and where to look for performance. We think of firms mainly as black boxes. Investment flows into the box, activities take place inside but out of sight, products are made and sold to customers as results of these activities, and an income statement, balance sheet, and market valuation of the firm follow. Since financial results – the income statement, balance sheet, and market valuation – are reported for the firm as a whole or, internally, for large chunks of the firm called business units, we try to find measures describing the internal processes, products, and customers of the firm or large chunks of it. These aggregate measures conceal important sources of variation within the firm. The things a firm does well are lumped together with the things it does poorly. Critical information about performance is obscured. Performance is not an easy subject. There is clearly a need to study and rethink what is meant by the performance of the firm and how to measure it. Many firms claim to be running for performance and seek to measure their performance, improve performance, and compensate their people for performance. [8]

The field of performance measurement has evolved rapidly in the last few years with the development of new measurement frameworks and methodologies, such as the balanced scorecard, economic value added, economic profit, activity-based costing, and self-assessment techniques. What does the term “performance management” mean? We might say that performance refers simultaneously to the action, the result of the action, and to the success of the result compared to some benchmark. Viewing performance as a comparative judgment captures some of this complexity. If there is a judgment, a judge must be selected and criteria for the judgment need to exist. The criteria for the judgment are likely to focus on results, since the purpose of management is to create a continuous flow of value.

The organization is from a long-term view performer, if in advance specified goals are reached, and these goals are in compliance with organization strategy. The strategy should be proper and suitable and well-understood and strategic goals should be clearly defined. Then it is only up to organization how to reach these goals. [9] The whole process, which influenced performance carried out by organization, is called performance management.

There is not only one view of performance management and there are still many managers who feel dissatisfaction how performance is measured, designed and managed in their organization. Some of the measurement seems to be very inflexible and time demanding and they don't connect measures with strategy. Securing performance is based on understanding business strategy, specifying performance goals and used performance measurement systems. As the management has evolved, we recognize three streams how to manage and measure performance:

- Performance management based on financial indicators
- Performance management based on various perspectives
- Performance management based on processes

#### **Performance Management based on Financial Measures**

Traditional concept of evaluating firm's performance is using financial metrics – like revenue, profit growth, return on investment. Accounting measures of performance have been the traditional mainstay of quantitative approaches to organizational performance measurement. Firm is considered as performer, if it reaches planned financial outcome. According to a recent observation of organization performance, the high level of dissatisfaction is sometimes attributed to the dearth of non-financial predictors of performance. Financial measures of performance do not reflect the importance of current resource decisions for future financial performance. Past accounting results say nothing about the factors that actually help grow market share and profits – things like customer service innovation, R&D effectiveness, the percent of first-time quality, and employee development.

Financial indicators present the exact feedback about organization performance, what is the biggest negative of this concept. They are evaluating already carried operations. [1] Besides that, financial outcomes picture something already happened, the past period and they never tell us how our strategy is fulfilled.

Choosing performance measures is a challenge. Performance measurement systems play a key role in developing strategy, evaluating the achievement of organizational objectives and compensating managers. Yet many managers feel traditional financially oriented systems no longer work adequately. There is too much emphasis on financial measures such as earnings and accounting returns and little emphasis on drivers of value such as customer and employee satisfaction, innovation and quality. There are also non-financial indicators, which are important, e.g.: sustaining existing customers, obtaining new customers, introducing innovating products, customers' satisfaction, employees' motivation etc.

However, over the past two decades, a great deal of attention has been paid to the development and use of non-financial measures of performance, which can be used both to motivate and report on the performance of business (and other) organizations. The impetus for such developments has come from both the bottom and the top of the organization. Much performance management at the operational level is carried out using specific indicators of performance, which are usually not measured in financial terms. At the most senior levels, although financial performance is inevitably a major consideration, there has been increasing recognition that other important factors in the effective running of the organization cannot be well captured by such measures. Thus, non-financial performance measures have undergone significant development, to the relative neglect of the development of improved financial measures. However, the recent publicity surrounding the marketing of economic value added

(EVA) as an overall measure of company performance by management consultants Stern Stewart can be seen as a sign of a new emphasis on the financial aspects of performance. [8]

The purpose of this contribution is to review the roles and functions of financial measures of organizational performance, and to outline the major features of their development, particularly in the latter half of the last century. It will be argued that there are three different major functions for financial performance measures, and that, although these functions overlap to some extent, major confusion can be caused by applying measures developed for one function to a different one. The three main functions involved are:

1. Financial measures of performance as tools of financial management. Here the focus is on the functional specials of finance and financial management. This is concerned with the efficient provision and use of financial resources to support the wider aims of the organization, and to manage the effective and efficient operation of the finance function.
2. Financial performance as a major objective of a business organization. Here an overarching financial performance measure, such as profit, return on investment, or EVA, is used to signify the achievement of an important (perhaps the most important) organizational objective.
3. Financial measures of performance as mechanisms for motivation and control within the organization. Here the financial information provides a 'window' into the organization by which specific operations are managed through the codification of their inputs and outputs in financial terms.

Clearly, there is some overlap between these different functions. Efficient financial management is a component of efficient overall management, but it does not subsume the latter. Performance may be managed, in part, by the transmission of corporate objectives (in financial form) downwards as part of the process of strategy implementation, and financial measures may provide substantial insight into the overall impact of operational activities, but other, more specific, measures are generally needed to fully understand and manage the "drivers" of performance. This contribution will therefore first consider each of the major functions independently, and then examine the linkages between them. [8]

What follows is by no means a comprehensive review of how functions of financial performance measures have been used over the past 50 years. Rather, it is a brief report on the highlights, which attempts to draw out the lessons that have been learned and to limit the confusion that can be caused by not recognizing the different functions involved. Any organization, whether public or private, has to live within financial constraints and to deliver perceived value for money to its stakeholders. The role of the finance function is to manage the financial resources of the organization, and to ensure that the financial constraints it faces are not breached. Failure to do this will lead to financial distress, and ultimately, for many organizations, to financial failure or bankruptcy.

Thus, financial planning and control is an essential part of the overall management process. Establishment of precisely what the financial constraints are and how the proposed operating plans will impact upon them are a central part of the finance function. This is generally undertaken by the development of financial plans that outline the financial outcomes that are necessary for the organization to meet its commitments. Financial control can be seen as the process by which such plans are monitored and necessary corrective action proposed where significant deviations are detected. [8]

#### **Performance Management based on Various Perspectives**

To stay competitive in today's business environment, we need to manage and control a wide array of factors that drive the success of our company. To succeed, companies have to adopt a holistic and multidimensional view of problem solving and analysis. This creates a need for a performance management system that allows us to view the business processes from many different perspectives. A modern performance measurement system, thus, has to allow for a multitude of business perspectives. Executives, managers and workers all have their specific needs for information that will help them make the right decisions and take the right action. As a consequence, a performance management system has to incorporate measurement models that support strategic and operative processes, short-term and long-term perspectives, financial and non-financial perspectives and so on.

Modern performance measurement joins the dictionary definitions of performance and the prevailing definition of economic performance. The dictionary definition of performance, again, is the act of performing; what people, machines, or, for that matter, firms do. The economic definition of performance is future revenues discounted to present value. Modern performance measurement searches for what firms do that generates revenues

in excess of costs. But, having bridged the dictionary and economic definitions of performance, modern performance measurement has gone awry because it remains firm centric. Firm-centric measurement treats the firm as a single entity and attempts to measure both the financial and non- financial performance at the level of the firm. It starts, in other words, with the firm and its financial results, asks how the functioning of the firm affects these results, and then searches for the right measures of the functioning of the firm, that is, the right non- financial measures. [8]

Performance management systems directly influence five critical organizational outcomes: financial performance, productivity, product or service quality, customer satisfaction, and employee job satisfaction. When performance management systems are flexible and linked to strategic goals, organizations are more likely to see improvement in the five critical areas. Team objectives, non-manager training, appraiser accountability, and links to quality management are the specific practices most strongly associated with positive outcomes. The research examined performance in six strategic performance areas deemed crucial to long-term success:

- Financial performance
- Operating efficiency
- Customer satisfaction
- Employee performance
- Innovation/Change
- Community/Environment

The performance management can be based on more than one perspective how it was before. More than 75 percent of the average firm's market value is derived from intangible assets that traditional financial metrics don't capture. Arguing that firms can't manage what they can't measure, Robert S. Kaplan and David P. Norton introduced a revolutionary performance measurement system called Balance Scorecard/ BSC. BSC enables companies to quantify critical intangibles such as people, information, and culture.[5]

An organization's strategy describes how it proposes to create value for a shareholder and customers. If an organization's intangible assets represent more than 75 percent of its value, than its strategy formulation and execution need to explicitly address the mobilization and alignment of intangible assets. An origination must measure the critical few parameters that represent its strategy for long-term value creation.

#### **The Balance Scorecard**

The Balance Scorecard offers framework for describing strategies for creating value. It is using four perspectives:

- Financial perspective,
- Customer perspective,
- Internal business process perspective,
- Learning and growth perspective.

Fig. 1.1 illustrates the architecture of BSC. The scorecard defines the set of the near-term objectives and activities, the drivers that will differentiate a company from its competitors and create long-term customer and shareholder value, the outcome.

*Financial performance*, provide the ultimate definition of an organization's success. Strategy describes how and organization intends to create sustainable growth in shareholder value.

Success with targeted customers provides a principal component for improved financial performance. *Customer perspective* defines the value proposition for targeted customer segments. Choosing the customer value proposition is the central element of strategy.

*Internal processes* create and deliver the value proposition for customers. The performance of internal processes is a leading indicator of subsequent improvements in customer and financial outcomes.

Intangible assets are the ultimate source of sustainable value creation. *Learning and growth* objectives describe how the people, technology, and organization climate combine to support the strategy. Improvements in learning and growth measures are lead indicator for indicator for internal process, customer, and financial performance. [7]

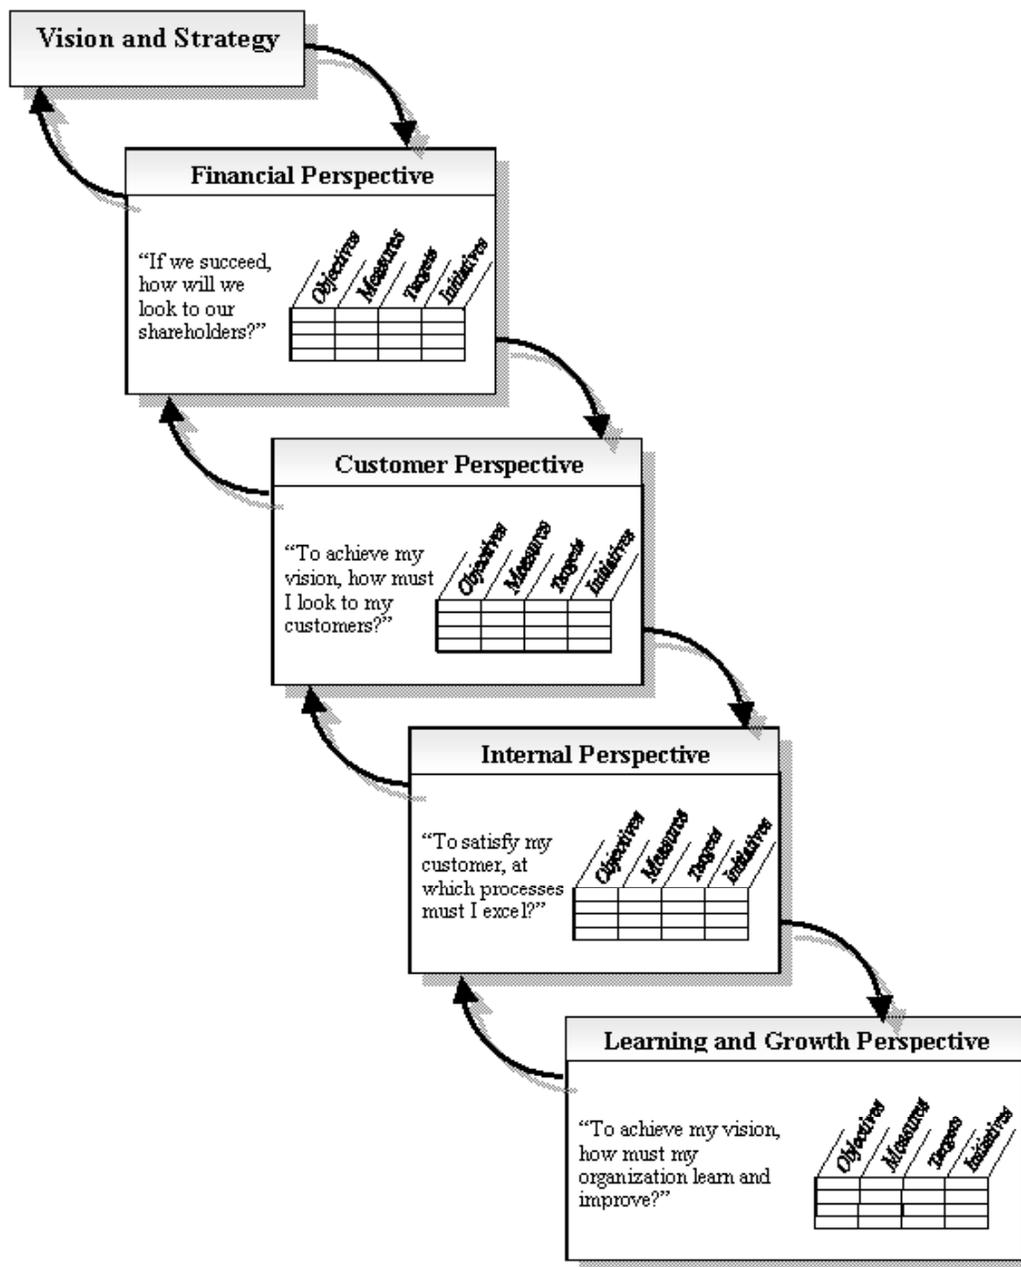

FIG. 1.1 CAUSE-AND-EFFECT RELATIONSHIPS OF THE STRATEGY [6]

In these four perspectives are objectives link together in a chain of cause-and-effect relationships (Figure 1-1). .BSC has a top-down logic, starting with desired financial and customers outcomes and then moving to the value proposition, business processes, and infrastructure that are the drivers of change. The relationships between the drivers and the desired outcomes constitute the hypotheses that define strategy. [6]

The Balanced Scorecard approach is used in establishing the right performance measures for business performance gains. Scorecards systematically report past financial performance while providing sketchy details of clients served quality, and value-added achievements. Public and private organizations worldwide have struggled to develop a 'scorecard', which portrays performance in a balanced fashion. Public and private sectors have tended to place heavy quantitative emphasis on financial resource results - and this in turn has skewed management attention towards internal financial control, at the expense of other areas.

#### **Performance Management based on Processes**

In recent years, interest in performance measurement connected to process management has rocketed. Much has been written about how performance measures should be process based. It is also the contention of this part, that processes should provide the foundation of a performance management system. Process orientation is a big benefit. Resulting framework would incorporate balanced scorecard and strategic performance measurement concepts. Even more importantly, a process-based framework can integrate a wide range of other management initiatives such as ABC, six sigma and total quality control.

What is a business process? A business process is a collection of activities designed to produce a specific output for a particular customer or market. It implies a strong emphasis on how the work is done within an organization, in contrast to a product's focus on what. A process is thus a specific ordering of work activities across time and place, with a beginning, an end, and clearly defined inputs and outputs: a structure for action.

Processes provide an excellent foundation for settling a performance measurement system. Processes that are in control deliver good performance. Equally, processes that are out of control or have negative relationships with other processes deliver unequal or poor performance. This is the basis of process performance measurement system. It is focused more on behaviour of processes rather than performance results. Measurement of performance results is characteristic for function-oriented organization.

We can illustrate the difference. Consider that we are introducing a new product to the market. How can we measure performance of this introduction process? The measure can be number of new products introduced versus plan. Or what else should we measure? Should we measure the number of new products that were introduced on time? Or should we measure if the number of new products was on the cost? There are many other dimensions that need to be measure. Alternatively, processes approach measure whether the activities of the new product introduction process are in control. This involves setting up a control chart for the product introduction process and each of its major activities. The goal of the control chart approach to performance measurement is to ensure each activity and the overall process is in control and operating properly. If these conditions are met then we know that the targeted number of new products is being achieved and that they are on cost and on schedule. [2] Thus we do not need to directly measure the results. If the process is out of control, the goal of introducing new products will not be achieved and we do not have to measure the results to determine this consequence. If we don't control processes, we don't know anything about goal achievement until we will make the measures of the results. [10]

#### **Process-based Performance Measures**

The principles of process management are very simple. Performance results are directly related to the stability of a process. Process stability is directly related to the amount and distribution of process variation. Control charts should be used to detect changes to process equilibrium. (Fig. 1.2) The factors that cause process variation must be identified and constantly minimized. Once a process is in control, it must be brought to higher levels of performance. And finally, key events that will significantly disrupt process performance must be detected and proactive action taken to minimize their impact. [2]

A control chart is a simple and effective tool to define process variation. Process variation is due to external and internal factors that influence a process in a chain of cause and effects. These factors must be constantly identified and, where possible, minimized or eliminated. Many of these environmental factors are controllable. The control chart defines the effectiveness of the process and characterizes the behavior of the time series. Some time series are consistent and thus predictable and stable over time. More commonly, time series are inconsistent-they are unpredictable and changing over time. The lines on the control chart provide reference points in deciding which type of behavior is displayed by any given time series. The control chart is used to characterize the behavior of the data-it is predictable or not. Second, the control chart allows the manager to predict what to expect in the future-the behavior of the process. [3]

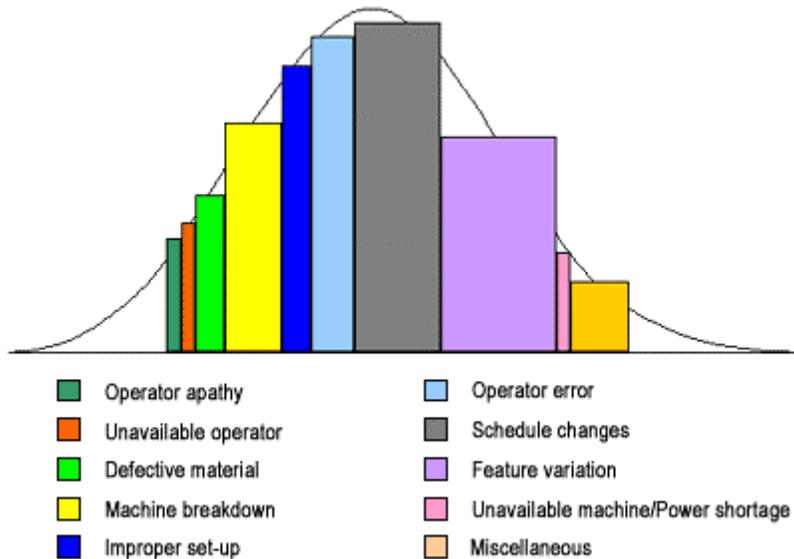

FIG. 1.2 CAUSES OF PROCESS VARIATION [3]

One of today's organizational problems is the disconnection and absence of alignment between local measurements of things a manager, team, or employee can control or influence and the subsequent organizational results. [4] Performance measures that evaluate performance give the management team confidence that satisfactory results are being achieved. Through processes measurement problems can be identified immediately and it enables immediate correction to assure better performance. Performance measures identify how well a process is performed. It measures the process efficiency and effectiveness. A process that is efficient and effective will deliver predictable results. Inefficient and ineffective process delivers unpredictable results.

Performance management based on processes measures is based on understanding strategy, specifying performance goals, and identifying all processes, which have impact on reaching these goals. For these processes we have to set key performance indicators according to which we measure and evaluate processes. Measures give us information about how well processes work, which also means how well is all organization operating and performing. Performance measures should be defined that are linked to business strategies, process capabilities and individual performance capacities. Feedback also should be provided on the performance of operations, help is given to assess the operations experience to continuously improve performance, and setting targets are guided for improvements that are specific and attainable.

## Conclusion

The performance management and performance measures have developed rapidly last few years. Many management teams are still not satisfied with the performance of their firms. Performance management depends on understanding business strategy, specifying performance goals and used performance measurement systems.

Traditionally, performance management was based on financial indicators, but this concept under current conditions of changing world, is not that successful how it used to be. The performance management can be based on more than one perspective. There are new frameworks and methodologies, such as the balanced scorecard, which help with strategy implementation and secure better performance using various perspectives.

Performance is something what we do today and what will lead to measured outcome tomorrow. If we want to manage performance is not enough just measure the outcome or the results of past performance. In that case, there is no room for managing something that already happened. We need to take appropriate actions immediately to ensure satisfying future results.

Performance management based on process is focused more on behaviour of processes rather than performance results. Through processes measurement, problems can be identified immediately and it enables immediate correction. Also, process-based framework can integrate a wide range of other management frameworks and methodologies.

# Reducing Resistance to Change Through Knowledge Management: A Conceptual Approach

*Martin Rahe,  
Laureano Berasategui  
EADA, Spain*

## Abstract

The research is based on two hypothesis: 1. Corporate change produces resistance from those who feel negatively affected by that. This can be due to a loss of responsibility, status, power or income. 2. Knowledge Management is a tool to reduce resistance by evaluating individual competence, motivation and responsibility. The subject of analysis is the individual. While change management literature focuses on individual behaviour, knowledge management refers to human assets, like tacit and explicit knowledge. If knowledge management is considered to be a tool in order to manage corporate change processes, then it must be extended to the issue of human behaviour. The freedom of choice is limited by rules of behaviour, which influences directly in individual cost-benefit situations. Therefore, rules as element of the individual environment should be taken into account when analysing people's behaviour. The purpose of this research is to develop a new model of knowledge management, which improves the management of change in corporate organisations.

## Introduction

Since intangible resources are considered to be a major source of sustainable competitive advantage, knowledge has emerged into a primary topic in strategic management.<sup>1</sup> The importance of knowledge becomes evident if we look at corporate change processes, i.e. process innovations. Knowledge is a factor which pushes innovation and either drives the company or instead, puts a halt on progress if people do not follow and they reject co-operation. Employees themselves become personal barriers of change.

An overview of research on knowledge shows that most studies emphasize, on the one hand, the process of knowledge creation and on the other hand, the organizational prerequisites needed for the knowledge creation process.<sup>2</sup> Different theoretical streams back up this research and can be classified into three groups: a) organizational learning theory<sup>3</sup>, b) resource based theory of the firm<sup>4</sup>, and c) knowledge creation theory<sup>5</sup>.

All these theories analyze knowledge from the organizational perspective focussing on the creation, administration and dissemination of knowledge. Management and organizational theory has developed knowledge management tools, based on the different approaches mentioned above and enriched by technical details of knowledge management implementation. Ever since then, human resource and information technology experts have dominated the academic discussion by polarizing between personalization and codification strategy.

So far, as the discussion has dealt mainly with organizational and technical details, management problems resulting from individual behaviour have not been considered. The objective of knowledge management (KM) has been to create organizational knowledge so as to increase, on the one hand, the effectiveness of human capital through knowledge sharing and knowledge synergies and, on the other hand, to improve organizational flexibility concerning change and innovation. Within this framework, the individual is expected to be cooperative in his/her attitude concerning his/her participation in knowledge management as well as in processes of change. But what happens in the case of uncooperative behaviour? Literature on change management shows that new organizational processes may cause resistance to change from single persons or groups, when it comes to the moment of implementation. Conceptually well-defined process innovations can fail because of a reserved or negative individual attitude towards innovation. A frequently proposed solution in change management literature is to change people's attitude so as to change behaviour through detecting change agents. If a critical mass of employees changes its attitude, the entire organization will change. In this way, change is an experience of conversion of minds.

But reality shows that attitudes change very slowly and arise from the individual assessment of situations. In fact, individual behaviour is shaped by motivation and organizational roles which people play and which have an influence on evaluation through perception and experience. Instead of emphasizing directly on attitude, the focus must be on people's roles. An effective way to change behaviour is to put the employee into a new organizational context with formally defined tasks, responsibilities and relationships. If the new role matches individual expectations and preferences, he/she is motivated to change his/her attitude. But once again, what happens if the employee does not see this match? Often, new situations in fast changing environments can cause some wicked problems, where the percentage of unknown or uncertain variables and relationships are difficult to define, and are highly subjective.<sup>6</sup> Such a situation can result in inefficiency and may lead to missed opportunities.

The objective of this study is to develop an instrument which helps business decision makers to improve the management of change by reducing individual resistance to change. The core component of such an instrument is the traditional concept of knowledge management, because it manages the key parameter for innovation and change - knowledge. But as mentioned above, traditional KM is mainly focussed on organizational issues and refers to the establishment of organizational parameters to stimulate knowledge creation and sharing. The assumption is that parameters which influence individual behaviour should be integrated into a modified extended model of KM in order to discover personal barriers of change. This new tool helps decision makers to improve efficiency in managing human capital and as a result, maintain or increase the competitive advantage of the company. "A firm can increase its flexibility and adaptability in a rapidly changing business environment by focussing on the efficiency of KM activities."<sup>7</sup>

## **The Conceptual Approach**

The conceptual starting point of this research is the economic theory of human behaviour. According to this theory, individuals are rationally maximizing beings within an institutional framework of norms and rules, which determine the individual activity scope.<sup>8</sup> Rational choice theory makes the point on three issues: Rationality, evaluation and maximization. Within the theoretical context, individual rationality is the ability to learn from mistakes and to avoid repeating the same error consistently. "Rationality [...] means the mistakes that people make are random and not consistent over time."<sup>9</sup> A second point is that individuals weigh the pros and cons of alternatives and choose those alternatives that make them better off. "... people do not act capriciously and reflexively."<sup>10</sup> Finally, maximisation is the decision rule that brings the decision process to an end. The rule is result oriented and its purpose is to increase the individual's welfare. Maximisation is the most exclusive rule in individual behaviour, because the only authority on this decision is the individual him or herself and his/her understanding of personal welfare.

Due to the underlying assumption of rationality, this approach provides some clear decision rules and contributes to identifying cooperative or uncooperative behaviour. Modifications of this approach by Simon or Thibaut/Kelley underline the need to understand behaviour within a social context. Bounded rationality or rank happiness deal with the limits of individual maximization capacity.<sup>11</sup> Utility maximization is relative instead of absolute. It is the individual benchmark compared to others, which defines the degree of personal satisfaction.

The individual environment consists, on the one hand, of people surrounding the individual and, on the other hand, of rules, standards and norms, which co-ordinate the interaction between the members of a group, organization or society. These institutions limit the individual activity scope, but also provide security and stability for individual decision-making.

The research model focuses on the individual, whose behaviour is driven by rational calculations of their own self-interest (see fig. 1).<sup>12</sup> In this sense, individuals behave like investors, who spend their scarce resources on the economically most attractive alternative. Individual decision-making follows the economic philosophy of utility maximization under the restrictions of limited resources and the social conditions of the environment.

Changes in the work environment initiate a process of individual reflection concerning expected costs and benefits. Depending on the result, the individual accepts or resists change. From this moment, the individual decision shifts to the organizational level and the process affects the organizational dimension. The company, which consists of a personnel, technological and organizational structure, has to manage individual reaction to change. In

the case of a negative attitude towards change, reasons can be found by applying the conceptual logic of economic theory of human behaviour to the specific situation. This received information can be used to improve the matching of individual preferences and work environment. Knowing individual parameters of behaviour within the work environment allows us to discover uncooperative behaviour already in advance. In contrast to the traditional KM, the modified, extended KM-model also responds to unco-operative behaviour, which arises when the individual's preference function is not in line with organizational objectives.

The first assumption of this research is that corporate change raises a conflict if it damages the agreed equilibrium between company and employee. Kubr points out that on the one hand, people are prepared to cope with organisational change if they see the benefit and purpose.<sup>13</sup> But this means, on the other hand, that people are not prepared and perhaps not willing to change if they do not see the benefit. The aim of this paper is to discuss the issue of resistance to corporate change by focussing on parameters of behaviour.

The second assumption is that an individualized concept of KM is a tool for reducing resistance through identifying and analyzing tangible and intangible parameters of individual behaviour. In doing so, KM becomes a management tool with a broad scope of application. The integration of parameters of individual behaviour extends the concept from the organizational knowledge perspective to the broader view of individual decision-making. KM evolves into a holistic strategy tool which helps to identify cooperative and uncooperative behaviour.

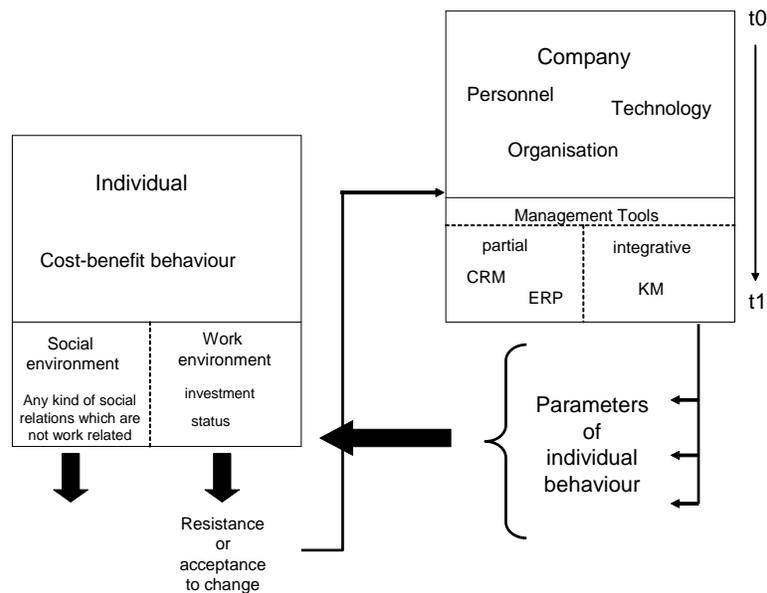

FIG. 1: RESEARCH MODEL

The study is based on a literature survey, including in a first step, the economic theories of human behaviour. This helps to define parameters of behaviour and to explain in which direction – against or in favour of change – they influence behaviour. The disadvantage that economic theory of individual behaviour reduces the complexity of behaviour, must be contrasted with the fact that the homo oeconomicus is a construct to measure decision behaviour. Therefore, the theory enables us to draw some clear conclusions concerning behaviour in changing environments.

In a second step, the results from the former analysis will be integrated in a model of KM. In contrast to traditional models, the new one is focussed on decision behaviour. The different parameters of behaviour will not

only be identified, but also put into a conceptual structure in order to assure the logical coherence of the new descriptive model.

## **Economic Human Behaviour and Change**

Within the change process, a crucial element of success is the commitment of all involved.<sup>14</sup> The willingness to support change is the first predictor of every organizational change process and depends on whether the utility of change is perceived favourable or unfavourable. The perception of change is related to the performance of a number of determinants the individual considers relevant to achieve his/her goals. Following the conceptual approach of this study, these determinants affect the economic calculus positive or negative. The individual attitude towards change reflects the expected performance after change.<sup>15</sup>

But apart from personal outcomes, people care also about processes. This approach follows Hayek's theory of mind, which explains behaviour as a consequence of perception. According to Hayek, the way something is perceived depends on a process of cognitive reflection. Essential components of this process are interpretation, which is based on personal interests, and categorization, which puts the decision object into a contextual framework.<sup>16</sup> The important point is that decisions are not only defined by the result of rational choice behaviour but also by procedural rule behaviour. Rule behaviour means identifying the context in which something happens and connecting the actual event with the environmental configuration. In this sense, decision-making is a holistic process of perception, interpretation and evaluation within a framework of rules.

### **Tangible Costs of Change**

In line with with Rational Choice Theory, individuals evaluate alternatives before taking decisions to reach a satisfying utility level. Having made the correct decision, providing the individual with tangible (financial reward) or intangible benefits (prestige). Looking at tangible income, the way people behave in processes of change, depends on realized current and expected future income. If the individual objective is to reach a satisfying level of annual or lifetime income, then the conclusion is that every change which puts this objective at peril, will be rejected. Following the logic of rationality, employees are open to change if they see what is in it for them and if they can be sure that they are going to benefit from change.

In contrast, change is considered negative when disadvantages pre-dominate the individual perception. Within the context of cost-benefit, disadvantages determine the cost-side of change. Two types of costs can be identified:

- Tangible costs, which affects directly the level of tangible income, and
- Intangible costs, which refer to the negative outcome on the cognitive or emotional level and which may have an indirect impact on the tangible income level.

Two determinants of income, specialization and experience, need to be considered, due to the fact that corporate change may influence the importance of both. Knowledge specialization is an investment in specific human capital which is difficult to use outside the company, if the specialization is highly firm-oriented. Only the company, for which the knowledge investment was made, can guarantee the return on knowledge investment, therefore, every change which puts the future use of firm-specific knowledge in danger, is rejected. The extreme situation is human capital, which cannot be used in activities outside the company, and, therefore, has no market price, because there is no market. The employee is in a monopolistic position, but then so is the company. According to Williamson, the income of a specialist is entirely rent income, if the specialisation is only valuable for the company but not for the market in general.<sup>17</sup> For the employee it is impossible to recover his salary in another company. If the share of rent income on total income compared to market income is high, a negative individual attitude towards change, which puts the level and stability of income in danger, can be expected. The conclusion is that, firstly, organisational change has a negative effect on those employees whose human capital becomes devaluated through change and, secondly, it threatens the expert more than the generalist.

Expertise results from explicit and tacit knowledge generation. The main characteristic of the latter is that it is a knowledge asset which grows over time. Tacit knowledge, generally called experience, cannot be learned by theory, but is positively related to age. The fact that companies place emphasis on experience and are willing to pay

for it, demonstrates the importance of this type of knowledge. This means that if experience becomes useless because of change, the employee loses a strong asset and needs some time to build up new experience. Older people particularly are not in the situation to do this, due to their limited potential of work years. As a consequence, these employees often remain unemployed once they lose their job. It can be expected that employees who are threatened by the devaluation of experience, will be in a strong opposition towards change and that opposition is positively correlated with age.

Following economic theory, the income of the production factor “labour” is linked to its productivity which is a function of knowledge specialisation and experience. Organizational change which depreciates knowledge specialisation or experience reduces the labour productivity of the employee and, according to theory, has a negative impact on income. The marginal productivity shrinks over time. If

$$P = f\{SK, E\}$$

then

$$dP/dT < 0$$

with:

P = productivity

SK = Special Knowledge

E = Experience

T = Time

Graphically, the marginal productivity of an employee whose specialist knowledge and experience is depreciated, turns downward. The slope of the curve depends on whether the organizational change is radical or incremental. Due to contract conditions, the employer is not free to reduce wages. Therefore, income will hardly follow the marginal productivity curve. This creates a gap between the level of income and labour productivity. This gap grows over time and increases the risk of dismissal for the employee. In this situation, the employee can choose between two alternatives: a) cooperative or b) uncooperative behaviour. In the case of uncooperative behaviour, the change process can be damaged if the employee is still in a powerful position. He/she can use this power in order to slow down the change process and to diminish the income-labour productivity gap. Mathematically, this means that the second deduction of marginal productivity is positive:

$$d^2P/d^2T > 0$$

Often, change in the company requires management or staff training in order to familiarize employees with the new external (regional markets) and/or internal (process innovation) environment. These costs are tangible and directly related to the change process. Provided the company assumes these costs, the risk of uncooperative behaviour is low, because costs are externalized to the company.

#### **Intangible Cost of Change**

Beyond tangible costs there are individual adjustment costs, which result from changes in responsibilities, habits and routines and are internalized by the employee. Some typical reasons for this type of costs are mentioned by Kanter.<sup>18</sup> Most of these costs are intangible and are related to a) a misfit between actual perceptions and expectations concerning status and prestige, and b) the personal status compared to others.

The first impact of organisational change is emotionally, negatively or positively, and is characterized by stress and anxiety or happiness and satisfaction. The principal reason for a misfit between perception and expectation result from a *lack of involvement* of the employees in the change process. A top-down change management leads to the perception that change is made to the employees instead of made by them. From the employees' perspective, an authoritarian style of change management includes an unpredictable component. The employees are informed later about decisions that have already been taken, without really knowing the context which influenced decision-making. This raises *uncertainty* and generates a lack of security.

The personal status within the organization is affected, if a change in process or organisation is perceived as a *loss of face* by those who were responsible for the situation before the change. Especially in static organisations without a culture of continuous innovation, changes may appear as a correction of policies, which are later considered to be wrong. A further point is related to the aspect of *responsibility*. In a change process an employee can get more or less responsibility. A typical case is that of an organisation that plans to flatten its organisational

structure and eliminate one hierarchy level. The question rises, what happens to the employees, who worked on this level? Do they ascend or descend in hierarchy?

Apart from intangible direct costs, intangible indirect costs of change arise, when the employee is tied to an activity which results from the change process and hinders him/her from pursuing another one. The cost of not being able to follow an alternative because of being involved in the change process, describes the opportunity costs of change. An example of private opportunity cost is the cost of not being with the family, because of management training that takes place over the weekend. Even in the case that direct tangible costs of change are paid by the company (training), the individual is charged with indirect costs, which are the opportunity costs of change.

To conclude, intangible costs result from processes which move the individual in absolute or relatively new positions in comparison to others and, therefore, have their impact on individual wellbeing because of interindividual effects. According to Kim/Mauborgne these costs produce resistance if the individual has not been involved in the decision making process. Not only the result of change, but also the process of change is perceived unsatisfying. Kim/Mauborgne call negative impacts resulting from processes procedural injustice.<sup>19</sup>

#### **Rules and Change**

The impact of rules is on the organizational and individual level. On the organizational level, rules specify the norms of behaviour that must be adhered to in interaction with others. Any ignorance of norms bears the cost of non-observance. Institutional economics define this type of regulation (rules, norms, standards, habits) such as formal or informal institutions which standardize processes, create routines, reduce insecurity and increase organizational stability.<sup>20</sup>

The economic game theory, and in particular the prisoner's dilemma, underline this issue by analyzing opportunistic behaviour.<sup>21</sup> Opportunism means that in an interactive situation between two people, at least one of them behaves different to the way formerly agreed, if defecting behaviour generates higher benefits than costs. With no rules, there is no possibility to sanction defecting behaviour and mutual trust would become the main driver of any transaction. But according to Jönsson/Christensen, trusting somebody means to expose oneself to the risk of betrayal.<sup>22</sup> Obviously, under these circumstances, some transactions would never be carried out. The conclusion is that regulation increases organizational efficiency, because it generates an institutional framework in which transactions take place at lower costs. Frameworks define the individual activity scope and must be taken into account when analyzing individual behaviour. In this sense, the individual activity scope is limited by the environment and every rational decision-making takes place within the limits of rules.

On the individual level, institutions help to create cognitive schemes, which are used to classify situations. How a new situation is evaluated by the individual depends on how far the situation matches the existing cognitive and affective schemes.<sup>23</sup> March and Simon argue that individuals respond to new situations (stimuli) with an elaborated set of routine activities and only when a stimulus is truly innovative, will a more appropriate response to the specific issue be developed. According to Hayek, individuals are looking for recurring patterns in separate situations. Innovations which do not require a change of habitual behaviour will be less probable to cause aversion, because of joint elements in both situations, before and after change which the individual is familiar with. What people's minds are trying to figure out when faced with a new situation "are elements that show some resemblance to those that we have experience of".<sup>24</sup> The fact that behaviour is a symbiosis of individual action and the related environmental context, in which action takes place, shows that experience is a construct of both. This means that recurring patterns which are used to classify different situations, can be found in the similarity of actions and/or the similarity of rules and norms. Therefore, individuals do not respond to separate situations such as unique events, but look for similarities between the elements of the situations. There is no activity within a vacuum. "If sensory perception must be regarded as an act of classification, what we perceive can never be unique properties of individual objects but always only properties which the objects have in common with other objects".<sup>25</sup> Drastic changes which affect action as well as rules and norms, reduce the probability of perceiving their impact on the employee and raising uncertainty. In contrast, smooth changes can avoid uncertainty by maintaining elements of the old situation, which makes it easier to interpret the new one. Within this context, rules are of special importance due to the fact that they come into existence because of their durable character. Individual choice within a set of rules means within a framework of stable elements, which helps to classify events.

## Categories of Decision Parameters

Individual decision-making contains the three steps perception, interpretation and evaluation. Changing environments have an impact on decision parameters, which can be classified into three categories:

- Parameters referring to the individual himself/herself (individual level),
- Parameters referring to the relation between people (inter-individual level) and,
- Parameters describing the institutional environment (environmental level).

The category of individual parameters consists of elements which describe the personal characteristic of the individual knowledge asset. Knowledge specialization and experience are components of the human capital which determines the value within the corporate value chain. According to the employee's marginal productivity, he/she is a strong or weak asset for the company. Although there is a huge discussion on the subject of knowledge company and knowledge economy, KM-literature refers basically to organizational aspects, without putting emphasis on the integration of the smallest and decisive unit concerning knowledge - the individual.

Apart from the importance of knowledge specialisation and experience, age is a factor which needs to be considered, when investment in human capital is expected. Following the economic approach, the age of an employee defines the remaining period necessary to calculate the return on knowledge investment.

A further element, belonging to the individual category, is opportunity costs. To take a decision means to chose between different opportunities. Following maximisation behaviour the benefit from the chosen alternative should be higher then the cost of the second best opportunity. Any commitment which hinders the selection of first best alternatives, reduces motivation and personal involvement in processes.

The second category refers to the relationship between individuals and contains elements which are related to management styles or personal benchmarks. While the management aspect focuses on the issue of uncertainty due to a lack of involvement in corporate decision-making, personal benchmarks deal with the issue of responsibility and image and how somebody is socially and economically ranked compared to others. Increasing uncertainty or a descent in ranking, raises intangible costs, which once may have had a direct impact on individual income and, therefore, may turn into tangible costs.

The third category refers to the environment which surrounds the employee and which is determined by formal and informal institutions. In change processes, organizational institutions which regulate the relationships between employee and company can be affected. Typical areas are internal communication, training standards, job evaluation, selection criteria of personnel, financial remuneration system, planning of staff, leadership, career plans and the organization of work. Changing or disappearing rules in these areas contribute to individual uncertainty and make it difficult to interpret and evaluate the new situation after change.

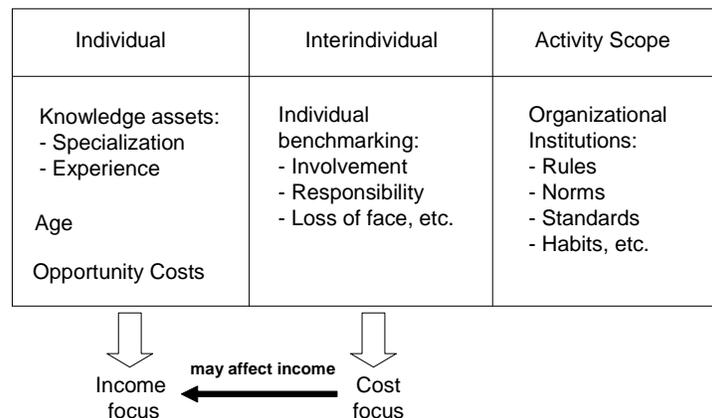

FIG. 2: INFLUENCING PARAMETERS IN CHANGE BEHAVIOR

The identified elements of the three categories influence individual decision-making in change processes and need to be integrated in the KM-model in order to identify cooperative or uncooperative behaviour. In doing so, KM turns into a broad management tool, not only for knowledge generation and dissemination, but also for the management of change and innovation.

## Developing the New Model

### Traditional KM-Models

Previous models of KM differ on one hand in their practical approach and on the other hand, on the bandwidth of distinguished perspectives on the topic. A practitioner focus, however, with a narrow perspective on the evaluation of intellectual capital, is the Skandia navigator. The Swedish company became an example of how to identify the value of knowledge in relation to five key areas of success: Finance, customers, process, innovation and human resources.<sup>26</sup> Similar to the Skandia Navigator, the Balanced Scorecard follows the idea of analyzing corporate vision and strategy from the different perspectives of finance, customer relations, internal processes and learning and growth.<sup>27</sup> Concentrated on human resource management, communities of practice put emphasis on the creation of focus groups for problem solving. The purpose of these groups is to deepen knowledge and gain expertise in concrete fields.<sup>28</sup> A practical but more holistic model of KM is developed by CIDEM, the Centre of Corporate Innovation and Development in Catalonia, Spain. The model integrates the different elements of organizational culture and strategic vision, people, technology and knowledge processes and recognizes them as fundamental for the implementation of KM.<sup>29</sup> The “Two Cycle Paradigm” of Riverola and Muñoz Seca combines the corporate learning process with the process of problem solving, stating that people learn when working on specific problems.<sup>30</sup> A stronger academic focus looks at the knowledge conversion model of Nonaka, which describes the process of knowledge creation by passing through the different types of knowledge.<sup>31</sup> Finally, Zahra and George emphasize the importance of knowledge for the potential capacity of a company and they have developed the absorptive capacity

model. The central point is that due to frequent changes in the corporate environment, knowledge potentials maintain the organization's strategic flexibility and, in doing so, support the competitive advantage.<sup>32</sup>

Despite their different focus, the above mentioned models do not include individual behaviour as a particular element. This raises the problem that the application of KM-techniques itself can fail due to unco-operative behaviour of employees and that the KM-tool cannot be used for the management of staff in the innovation processes. This seems to be contradictory, considering knowledge as a key element of innovation and having KM-tools available. The conclusion is that, conceptually, the existing KM must go beyond current concepts in order to extend its applicability for management.

#### **The Individualized KM-Model**

To meet the challenges of change processes with KM, the traditional KM perspective has to be broken down from the organizational to the individual level. This means integrating individual behaviour and decision-making, the asset aspect and the meaning of individual roles in organizations into an individualized concept of KM. The basis of the new model is given by Chandler, who indicates knowledge and motivation as the central figures of individual competence.<sup>33</sup> The point is that knowledge has to be managed in such a way that the employee can achieve his/her own objectives and that the company can benefit from this synergy. The art of management is not to motivate people but to awaken their individual motivation by creating an environment in which people identify themselves with the company. This is an ambitious goal, especially in changing organizations, and requires information about what drives people and in which direction. Within the economic reasoning of this study, the individual income-cost-balance is the key issue of motivation. As shown above, the quality of knowledge, defined by knowledge specialization and experience, is a direct influence on income and, therefore, also on motivation. The conclusion is that the core element of an individualized KM-model is the quality of individual knowledge, its use in organizational processes and the income it produces for the knowledge owner.

On the individual level, the task of KM is to define the individual knowledge performance through an analysis of specialization and work experience. Measuring indicators refer to professional and social competence as well as to observed abilities and incorporate all aspects which provide speciality in the employee. Some typical examples of indicators are a university degree, management training, participation in conferences, integration into networks, membership of associations, communicative and social capacity, sensibility and creativity. Concerning the individual motivation, income, resulting from the knowledge performance, age, which is not an individual competence, but affects human capital investments and experience, and the existence of opportunity costs are important factors to consider. The latter shows to what extent professional alternatives or private constellations influence the individual commitment to a company. The combined performance of knowledge and motivation indicates whether the employee is a special knowledge owner or not and whether he/she is willing to offer his/her knowledge to the company.

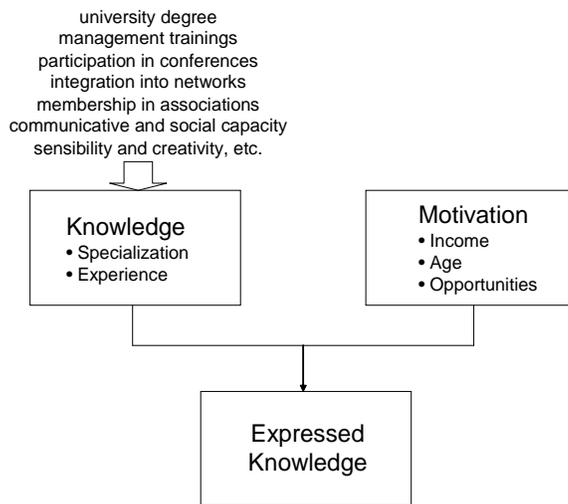

FIG. 3: INDIVIDUAL LEVEL OF THE INDIVIDUALIZED KM-MODEL

Whether the employee is willing to express his knowledge and then is also encouraged to do so, depends on his role in the company. The employee's formal or informal role is defined by responsibility, involvement in decision processes, image, etc. Roles are important in inter-individual behaviour and influence intangible assets such as prestige, reputation and social acceptance. They arise from formal and informal processes and limit the individual scope of activity within the company. A positive configuration of knowledge, motivation and role encourages the activation of knowledge in the company. Any change of roles which reduces the scope of activity is considered negative, creates aversion and reduces the employee's willingness to cooperate.

Change management has to take into account that depending on the individual evaluation of the above-mentioned factors, employees will either follow or resist change. In order to complete the whole picture, the organizational context of rules, norms, standards, habits, etc. must be observed concerning changes, due to their importance on the evaluation of situations.

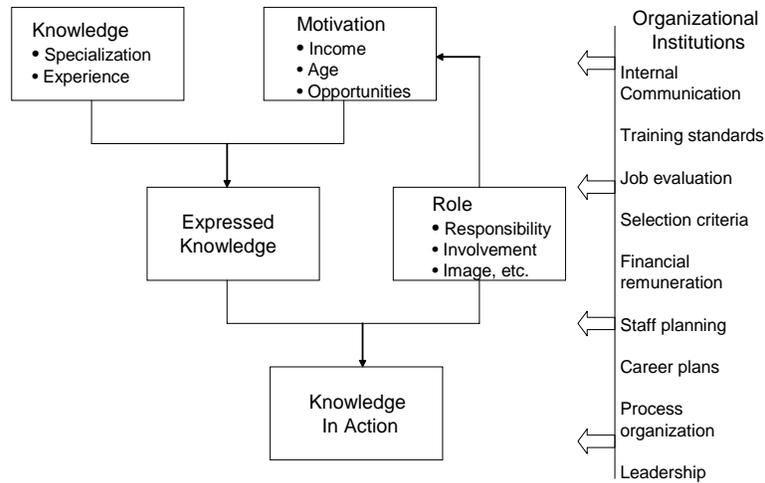

FIG. 4: INDIVIDUALIZED KM-MODEL

#### The Extended KM-Model

Traditional KM-models such as the organizational component oriented model proposed by CIDEM make their point on the importance of culture, personnel, technology and processes for knowledge creation and knowledge sharing. Frequently asked questions are: Is the organization prepared to share knowledge? Does knowledge acquisition benefit the organization?<sup>34</sup> Confidence and trust are recurring answers to the question of how to stimulate knowledge sharing. To create the right atmosphere, individual willingness to collaborate in KM is expected, which, additionally, can be awarded so as to motivate people. Although motivation is considered, there is no analytical view on individual decision behaviour. In this sense, the individualized KM-model contributes with a new perspective to the discussion and also opens the way for applications in change management and turns the focus from the organization to the individual.

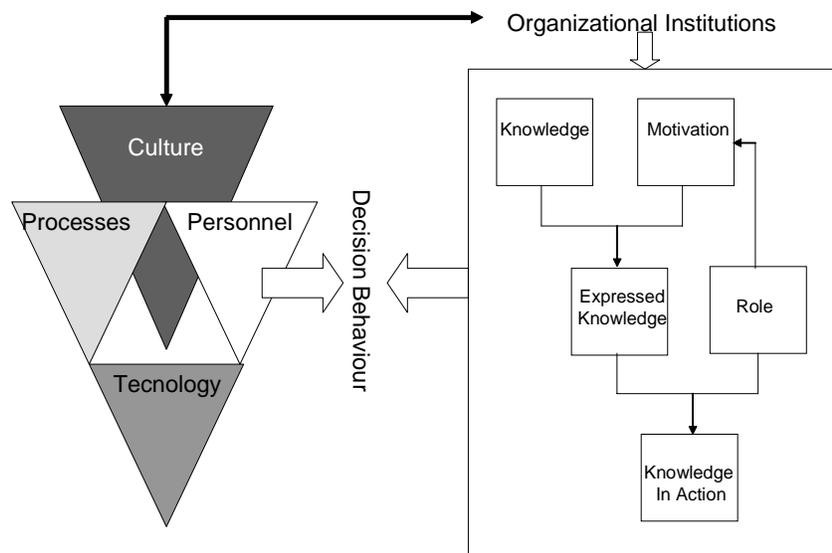

FIGURE 5: EXTENDED KM-MODEL

The innovative approach of the extended KM-model arises from the importance given to the individual. If management success is considered to be a dependent variable on workforce behaviour, then it would appear problematic to develop management tools on the organizational level without taking into account individual behaviour. This is even more problematic if the company focus is on pro-active management, such as Change Management or Innovation Management. The extended KM-model helps a) to organize knowledge (traditional approach) and b) to identify resistance to pro-active management (new approach). A further advantage is the possibility of discovering resistance in advance, if a process simulation, including the expected procedural, organizational and individual impact, can be made.

## Conclusion

If changing environments become a habit and knowledge turns into a critical success factor for companies, then corporate change and corporate knowledge need to be combined in a holistic view in order to develop KM as an adequate tool to manage both. Holism means to open traditional KM to decision theory and integrates components of this theory into KM. In doing so, the limited view of KM as an organizational knowledge generating concept shifts to a broader perspective of the utilization of knowledge in changing environments. This is an important aspect, when thinking that behaviour is driven by individual motivation and organizational circumstances. Changing circumstances may change motivation and, therefore, may influence in behaviour.

KM or innovation management are necessary in order to stand global competition, but need to be planned on the organizational and individual level. The research delivers an extended model of KM which combines both levels and allows to draw conclusions concerning cooperative or uncooperative behaviour. According to the first assumption of this paper, parameters were identified which affect motivation. Due to economic theory, the decision in choosing an alternative depends on the expected results. Although simple, this approach provides a clear decision

framework and helps interpreting behaviour. Influencing key parameters of behaviour exist on the individual and inter-individual level. A negative parameter value affect tangible income through asset devaluation.

Extending KM onto the individual perspective by integrating decision behaviour into the concept requires the analysis of the employee as a firm asset. Acknowledging the criticism to the economic approach, it treats the employee from the resource based view as this what he is – an asset. The important point is that the individual is the most important asset in the company and she/he behaves according to their motives. The extended KM-model takes into account the meaning of the human asset and delivers a concept of managing it.

# **Squeezing the Pips: International Pressures on Managers' Affective Well-being and Performance**

*Peter Hosie*

*Peter Sevastos*

*Curtin University of Technology, Australia*

*Nick Forster*

*The University of Western Australia, Australia*

## **Abstract**

Implicit in the drive for international competitiveness is the recognition that high-performing managers are essential for organisations to achieve and sustain competitive advantage. A critique is undertaken of the global economic pressures impacting on Western managers' jobs. The emphasis was on investigating an aspect of human behaviour with the potential to enhance managerial performance. Despite mixed empirical evidence from decades of research, there is support in the literature for the notion the 'happy-productive worker thesis.' A study is presented to establish which indicators of Australian managers' affective well-being and intrinsic job satisfaction predict dimensions of their contextual and task performance. A contribution of this study was to provide qualified support for the 'happy-productive worker thesis' by linking these conceptual bases and theories to managers' affective well-being, intrinsic job satisfaction and performance.

## **Introduction**

### **Globalisation and Western Economies**

International pressures to manage the increasingly complex and varied contingencies impacting on organisational performance are greater than ever (Patterson, West, Lawthom & Nickell, 1998). In this environment, managers' performance is central to the success of organisations. Achieving and sustaining high individual performance and organisational productivity in this intensely competitive economic environment has the potential to impact on the affective wellbeing of managers' worldwide (Kinicki, McKee & Wade, 1996). In dynamic, competitive markets, successful organisations are likely to be staffed with managers capable of adapting to constantly evolving roles, and with the capacity to achieve and sustain optimal levels of performance. Individual and collective affective wellbeing and the level of intrinsic job satisfaction are aspects of managers' performance that are critical to organisational survival and prosperity.

During the last four decades globalisation and market deregulation has dramatically altered the competitive landscape facing Western managers who were thrust into the turbulent economic environment of the mid 1970s, as a result of intense competition for domestic and international markets from North American, European, and emerging East Asian rivals. From the mid 1980s onwards, many Western economies began experiencing adverse terms-of-trade accompanied by an unprecedented growth in the current account deficits. In the 1980s and 1990s most Western societies experienced a significant decline in their international competitiveness (Ohmae, 1995; Guehenno, 1995). Consequently, managers were forced to adopt more sophisticated cost management approaches. For instance, the necessity for cash flow replaced short-term debt funding for asset management in the late 1980s, often resulting in a marked increase in accumulated foreign debt and associated interest payments.

Competition from countries with lower labour costs has forced companies in most industrialised countries to become more efficient and to reduce labour costs (Jones, 1995). In particular, many Asian nation-states have developed a distinct comparative advantage over many Western nations, primarily resulting from a ready supply of cheap labour, which was complemented by a willingness and capacity to adopt new technologies, competitive marketing and business strategies (Ohmae, 1995; Guehenno, 1995). Western economies are likely to remain under pressure to reduce the cost of labour. In contrast, many competitively strong countries, such as the USA, Japan,

Germany, and Switzerland have relatively high wage rates and innovation is a critical differentiator of national competitiveness.

These events were preceded by the reduction in prominence of the nation-state and deregulation of the global economy (Porter, 1990; Ohmae, 1995; Guhenno, 1995). Enterprises have faced rapid technological advances, coupled with globalisation, resulting in dramatic changes to organisational structures. Since the 1980s, downsizing and delayering has emerged as a pervasive international trend (Palmer & Dunford, 1996; Cascio, 1993). Flatter organisational structures have emerged from significant downsizing and the uptake of new technologies. These changes have compelled a shift in the pace and direction of managerial practices (Quinn, Faerman, Thompson & McGrath, 1996; Hammer & Champy, 1993, Limerick & Cunningham, 1993).

## **Globalisation and Western Managers**

With increased global competition, Western managers are being required to adapt to the liberalisation of world trade and investment regimes, such as the deregulation of financial markets (Brooks & Faff, 1997). Managers are in an era that demands competencies with global relevance, and where managers are expected to efficiently perform a wider range of complex functions. These changes have increased the strain on managers with consequent increases in the incidence of stress, and burnout and subsequent impact on performance (Forster & Still, 2001). These economic dynamics have at times provided a strong impetus for employers and governments to pursue ways of improving efficiency and global competitiveness (Kramar, 1991). Structural micro and macro economic reforms implemented by the government in the 1990s were intended to make the firms more internationally competitive (Hilmer, 1993). These developments have had considerable impact on managers who must now operate within these global dynamics. As a consequence, the roles and performance expectations of managers have changed substantially. For organisations with international responsibilities and aspirations, some managers are now required to perform highly complex tasks, such as coaching employees for overseas assignments and developing skills that are transferable to international settings.

Managers were formerly required to achieve results directly through people, using a centralised and narrow span of control. Several levels have been eliminated from organisational hierarchies, resulting in managers having a more dispersed span of control (Beittenhausen & Fedor, 1997). Relinquishing this direct supervisory role has necessitated that managers perform different roles, such as empowering employees and facilitating team-based work. At the same time, some managers' jobs require that specialised tasks be performed to increasingly higher levels of efficiency. These changes to the workplace require more sophisticated and comparable measures of managers' performance in order to ascertain individual contributions to organisational effectiveness. Managers' jobs are likely to become more complex and, as a consequence more demanding in the future. As the marketplace becomes further deregulated, outsourcing is likely to increase. In this scenario, managers' roles are evolving more into managing the outsourcing of an organisation's needs rather than just managing human resources. Technological developments will exacerbate this trend. These global trends are likely to continue to have a significant impact on all aspects of managers' jobs.

Enterprises are under increasing pressure to improve productivity, while simultaneously reducing costs, resulting in an epidemic of 'corporate anorexia' (Hamel, 1996). A new enterprise formula is emerging - '1/2 x 2 x 3' - whereby half as many people are being paid twice as much, to produce three times more (Handy, 1996). This trend to 'squeezing the pips' is particularly evident for managers, where the incidence of stress and burnout is increasingly common (Reinhold, 1997; Quinn, et al; 1996). Organisational dynamics experienced by Australian managers are indicative of those facing most nation states and economies. Australian managers are under increasing pressure to produce superior results in shorter time frames, with fewer resources (Forster & Still, 2001; Coles, 1999). Handy (1996) considered the '1/2 x 2 x 3' formula 'about right' for Australia, New Zealand, the United Kingdom and North America. This formulae may well apply to a wide range of Western managers.

## **Human Resource Management and Business Performance**

An empirically compelling argument supporting the relationship between human resource management (HRM) and commercial performance is made by Patterson, West, Lawthom, & Nickell (1998). Compared to other management practices (e.g., strategy, quality focus, investment in research and development), HRM practices explained 18 per cent of the variation in productivity and 19 per cent in profitability of companies in the United Kingdom. Two clusters of skills - the acquisition and development of employee skills (including the use of appraisals), and job design - were shown to be particularly important. A strong causal link has been established between HRM practices and business performance by Patterson et al. (1998).

A central point in the debate over the significance of managers to firms competitiveness is the assertion that "good managers are the key to a more competitive economy and higher performing enterprises" (Karpin 1995: 1). Ascertaining the factors that determine managers' performance has the potential to assist in initiatives to improve firms competitiveness. Managers are pivotal to an organisation's productivity and effectiveness, since they have ultimate responsibility for maximising the resources available for organisations to create value (Jones, 1995). As Sanchez and Heene (1996: 13) assert, "managers' cognitive processes are at the head of a chain of causality that can eventually reshape the nature of competition in an industry"; a proposition extended here by determining the contribution of managers' affective wellbeing and intrinsic job satisfaction to this process.

The resource-based view of the enterprise recognised the value added by human capital (Wernefelt, 1984; Hamel & Prahalad, 1994). Regardless of the industry or country concerned, managers represent the human capital that is critical to an organisation's success (Williams, 1991). Any decline in managers' performance inevitably results in revenue foregone, opportunities lost, and increased costs. In turn, this outcome is likely to hamper the capacity of organisations, and ultimately national economies, to create wealth. Findings from a study by Hosie, Forster & Sevastos (2003) into managers affective wellbeing, intrinsic job satisfaction and performance are applicable to managers in other international working situations because they are critical to the success, or failure, of a range of enterprises (Carlopio, Andrewartha & Armstrong, 1997).

To reach and sustain heightened levels of performance, and to avoid burnout in this environment, it is desirable that organisations develop strategies for maintaining managers' affective wellbeing and intrinsic job satisfaction. Of the three psychological aspects of burnout (emotional exhaustion, depersonalisation, diminished sense of personal accomplishment), Lee and Ashforth (1996) found emotional exhaustion is increasingly prevalent in Western workplaces. By establishing how affective wellbeing and intrinsic job satisfaction influences behaviour, it will be possible to predict how deterioration, or an improvement, in affective wellbeing and intrinsic job satisfaction impacts on managers' performance (Hosie et al. 2003). Similarly, management practices that increase managers' affective wellbeing and intrinsic job satisfaction may result in corresponding reductions in workplace tension and improved efficiency. Such information may be used to develop recommendations about changes that are likely to promote a healthier and more supportive work environment for managers.

## **'Hard' and 'Soft' Contributions to Managers' Performance**

An important aspect of organisational behavioural research, concerns optimising an organisation's less tangible assets. Individual task performance only captures a portion of what managers contribute to organisations. This portion is mainly attributed to the knowledge, skills, abilities and experiences of managers. Contributions beyond task performance may be more accurately termed discretionary behaviour. These behaviours contribute to organisational effectiveness and go beyond 'soft' psychology, or 'humanistic' concerns to become a critical part of the managers' contribution. As Barnard observed, "successful cooperation in, or by formal organizations, is the abnormal, not normal condition" (1938: 5), as:

*perhaps the reason for the dearth of explanatory power of the 'softer' side of I/O psychology in the study of performance has not been because it is too soft, but that our dependent variable, 'performance', has been too hard.* (Organ & Paine 1999: 338)

Such an approach has the potential to improve the interconnections between management disciplines, as well as providing useful insights for related fields (Staw, 1986). The mutual contribution of 'soft' (people-driven human resource features, such as motivation and leadership), and 'hard' (market-driven forces such as strategy formulation and program evaluation), aspects of management have yet to be established (Nankervis, Compton & McCarthy, 1996). Hence, the soft aspects of managers' performance may be associated with hard organisational outcomes, such that these:

*two apparently disparate approaches are not necessarily mutually exclusive. They can be reconciled through a contingency framework, which provides guidance on the positioning of an organisation's human resource strategies as part of the organisation's overall change strategy and ultimately its business strategy.* (Dunphy & Stace, 1990: 87)

Many studies have confirmed that the so-called 'soft skills' are critical for a vital economy (Boyatzis, Goleman, & Rhee, 2000; Spencer, McClelland & Kelner, 1997; Carnevale, Gainer, Meltzer, 1988). Integrating 'soft' (affective wellbeing and intrinsic job satisfaction), or less tangible aspects of managers' performance, with 'hard' (performance) aspects of management is relevant to the attainment of organisational performance outcomes. When human potential is expertly integrated with organisational strategies, it has the potential to liberate a powerful additive force. Information about the relationships between managers' affective wellbeing and their performance may assist in identifying those managers who are likely to sustain heightened levels of performance, and thereby, to survive and prosper in global competitive environments. This will potentially contribute to optimising managers' capacity to create value for organisations (Bommer, Johnson, Rich, Podsakoff & McKenzie, 1995).

## **Research into the 'Happy-Productive Worker' Thesis**

There has long been an adherence to the intuitively appealing notion that happy employees perform better. Decades of research have been unable to establish a strong link between intrinsic job satisfaction and performance. Belief in the 'happy-productive worker' thesis has its roots in the Human Behaviour School of the 1950s. Similarly, the 1970s Human Relations Movement had a significant influence on job redesign and quality-of-life initiatives and was credited with specifying the original satisfaction-performance relationship (Strauss, 1968).

Reasoning and research into the construct of happiness preceded research into affective wellbeing. Emotions and happiness are first order conceptual bases of affective wellbeing. Affective wellbeing refers to feelings about either life in general (i.e., 'context-free'), or in relation to a specific domain (i.e., 'job-related'). In relation to affective wellbeing, the term 'job' refers to the specific tasks undertaken by individuals in a particular setting (Warr, Cook & Wall 1979: 1179). Intrinsic job satisfaction refers to the internal state associated with characteristics inherent in a job, such as utilisation of skills, amount of job complexity and opportunities for control, amount of responsibility, and challenges (Clegg, Wall & Kemp, 1987; Brayfield & Rothe, 1951).

Hosie et al. (2003) have progressed the debate over 'happy-productive worker' thesis by determining which aspects of managers' affective wellbeing, intrinsic job satisfaction indicate managers' contextual task performance. Managers' performance is defined by Hosie (2004: 63) as "the recent net contribution value to organisational effectiveness and goals, attained in conjunction with people, determined by events under managers' control, in a particular environment." Two types of performance are distinguished in the literature: contextual and task (Borman & Motowidlo, 1993; Motowidlo, Borman & Schmit, 1997). Both domains of performance contribute to accomplishing organisational goals, but through different mechanisms. Managers' performance mainly constitutes task performance, which is defined as the "effectiveness with which job incumbents perform activities that contribute to its technical core either by directly implementing a part of its technological process, or by providing it with needed materials or services" (Borman & Motowidlo, 1997: 99). Contextual performance deals with the psychological linkages between people and is represented by discretionary forms of contributions to the organisation that have uncertain or indirect rewards compared to task performance (Organ & Paine, 1999).

## Methodology

A number of research questions and hypotheses were investigated in the study by Hosie et al. that were derived from the literature. An empirical methodology was used to test the hypotheses to enable the research questions to be answered. A questionnaire of 19 Western Australian organisations was undertaken during 1998/99 to collect cross-sectional data to answer the research question, test the hypotheses and model. Data was collected using self-report measures of affective wellbeing and intrinsic job satisfaction, and downward appraisal of managers' performance (by the person to whom managers reported). A composite selection of private, public and 'third sector' organisations was surveyed, representing managers from a range of occupational groups. A total of 400 useable questionnaires were returned from the 1,552 distributed, representing a 26% useable response rate.

Self-report data was used to measure managers' affective wellbeing and intrinsic job satisfaction. Self and superior appraisals were used to gauge managers' performance. Job-related affective wellbeing (Sevastos, 1996a) and intrinsic job satisfaction (Sevastos, 1996; Cook, Hepworth, Wall & Warr, 1981a) items were obtained from published scales. These instruments were acceptable for measuring state and trait affective wellbeing and managers' performance. Using two independent sources of information, one for the DVs (i.e., one to one supervisory ratings of managers' performance) and the other for the IVs (i.e. managers' self-report measures of affective wellbeing and intrinsic job satisfaction) eliminated unnecessary noise in the data caused by common method variance.

Answering the research questions required the development of an instrument to measure the structure of managers' contextual and task performance. Managers' contextual and task performance items were devised from Borman and Brush's (1993) and Borman and Motowidlo's (1997) taxonomies of managers' performance. An eight-dimensional construct of performance was tested through confirmatory factor analysis. The performance construct was operationalised in terms of four contextual performance dimensions (*Endorsing, Helping, Persisting, Following*) and four task performance dimensions (*Monitoring, Technical, Influencing, Delegating*). These dimensions were confirmed through multi-sample analysis and cross-validation techniques of managers' and superiors' ratings on performance ( $n = 200$  and  $n = 125$ , respectively). Canonical correlation standard multiple regression were used to analyse the linear combination ( $n = 125$ ) of managers' self-reported affective wellbeing and job satisfaction with superiors' rating of managers performance for contextual and task performance.

## Partial Model of Managers' Affective Wellbeing, Intrinsic Job Satisfaction and Performance

The model was refined into two orthogonal dimensions of affective wellbeing, intrinsic job satisfaction and performance as illustrated in Fig. 1.

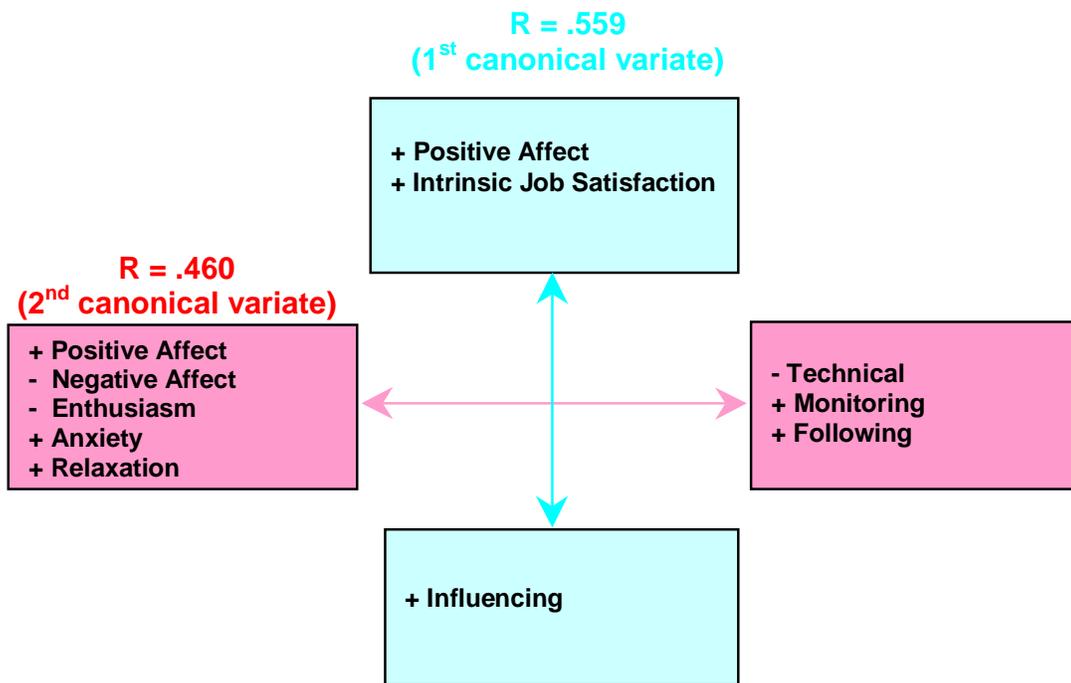

FIG 1: A MODEL OF MANAGERS' AFFECTIVE WELLBEING, INTRINSIC JOB SATISFACTION AND PERFORMANCE (N = 125)

Affective wellbeing and intrinsic job satisfaction was found to predict different dimensions of managers' contextual and task performance. As predicted, positive affective wellbeing was associated with enhanced managerial performance, whereas poor affective wellbeing indicated diminished performance. Certain aspects of managers' affective wellbeing and intrinsic job satisfaction (Enthusiasm, Positive Affect, Intrinsic Job Satisfaction and to a lesser extent Anxiety) were found to be most influential for managers' contextual performance (Following) and task performance (Monitoring, Influencing, Technical). A large amount of this variance of performance was explained by affective wellbeing and intrinsic job satisfaction that enhanced the predictive power of the Model. The first canonical variate explained 31.25% of the variance of performance and the second canonical variate explained 21.16% of the variance of performance. Thus, each of the canonical variates separately accounted for substantial amounts of managers' performance in relation to affective wellbeing and intrinsic job satisfaction.

In the first canonical variate, Positive Affect (PA) and Intrinsic Job Satisfaction were strongly associated with Influencing is shown as Figure 1. Positive Affectivity is a trait personality characteristic associated with extroversion, a personality characteristic that is central to managerial jobs in dealing with peers, superiors, subordinates and external constituents. Possibly, an engaging personality is the reason that individuals are promoted, or self-select into managerial positions. PA may enable managers to influence decisions from which they derive considerable Intrinsic Job Satisfaction, which has a substantial cognitive component. Alternatively, the opportunity to Influence decisions within an organisation may result in enhanced Intrinsic Job Satisfaction and heightened PA.

## Conclusions about the Data

The canonical variate showed a complex set of relationships between aspects of affective wellbeing, intrinsic job satisfaction and performance. PA, Anxiety and Relaxation were positively associated with the contextual performance variable, Following, and the task performance variables Monitoring and Technical, while Negative Affectivity (NA), or Neuroticism) and Enthusiasm were negatively associated with performance variables (Technical, Monitoring and Following). This indicated that high arousal (positive PA with negative NA) was present, but job dimensions were not particularly motivating (as indicated by negative Enthusiasm but positive Relaxation). This finding indicates that managers will experience arousal but low distress when undertaking transactional roles.

Another explanation for the second canonical variate may be that aspects of managers job requiring essentially transactional or administrative roles (negative Technical, with positive Monitoring and Following) may lead to high arousal with positive PA and Anxiety, but provide opportunities for Relaxation in conjunction with negative Enthusiasm and NA. A positive association with Monitoring and Following indicated that these performance characteristics require vigilance and consequently high arousal (Anxiety and PA with the attendant NA), but do not lead to a motivating environment (negative Enthusiasm). Monitoring and Following provide opportunities for Relaxation that leads to acceptable levels of affective wellbeing. Managers reported PA, a personality trait, to be the only variable common to both dimensions of contextual and task performance, indicating that it may be a prerequisite for managerial jobs. From this finding it could be inferred that managers will have a positive disposition to work.

An association was found between affective wellbeing, intrinsic job satisfaction and managers' contextual and task performance. Contextual and task performance was found to be significant predictor for PA. As anticipated by Judge et al. (2001), Intrinsic Job Satisfaction was found to be associated with performance. Affective wellbeing self-report (PA, Intrinsic Job Satisfaction) was positively associated with a dimension of superiors' report on task performance (Influencing). Positive associations for dimensions of affective wellbeing self-report (PA, Anxiety and Relaxation) were negatively associated with dimensions of superiors' report on task performance (Monitoring) and contextual performance (Following). PA, Anxiety and Relaxation were also negatively associated with a task performance dimension (Technical).

As predicted, positive affective wellbeing was found to result in enhanced managers' performance, and poor affective wellbeing to be detrimental to managers' performance. Consistent with Warr's (1992) *Vitamin Model*, a link between managers' affective wellbeing, intrinsic job satisfaction and performance was evident. Also consistent with Warr's (1992) findings, those in higher-level jobs (e.g., managers) reported less job-related depression, but significantly more job-related anxiety. PA was found to be a significant predictor of task and contextual performance, supporting George and Brief's (1996) argument that PA (one of the indicators of extraversion) is related to distal and proximal measures of motivation.

PA, Anxiety and Relaxation were positively associated with the task performance variable Monitoring, and the contextual performance variable Following, but negatively associated with the task performance variable Technical. This result is consistent with the Hay Group (1999) finding that less than 10% of FORTUNE 500 companies attributed technical ability to result in high potential managers and leaders careers becoming 'derailed'. NA and Enthusiasm were negatively associated with Technical, Monitoring and Following, indicating a level of 'disengagement'. PA is an 'activation-based' affect that was positively associated with the task performance variable, Influencing. Thus, managers' who have high PA and intrinsic job satisfaction are more likely to influence decisions. Technical expertise was not considered to be an important aspect of manager' task repertoire. As Goleman noted "outstanding supervisors in technical fields are not technical but rather relate to handling people" (1998: 21). Managers with PA are likely to experience elevated anxiety, but have opportunities for relaxation when undertaking Monitoring and Following work.

## **Conclusions about the 'Happy-Productive Worker' Thesis**

Despite mixed empirical evidence, there is support in the literature to suggest that a relationship exists between managers' affective wellbeing and their performance. Wright and Staw (1999a,b) claimed that a person's disposition towards happiness, not organisational conditions, was associated with performance. Ledford (1999) extended this reasoning by concluding that if "only trait-based happiness leads to performance, it was pointless to try to make employees happier as a way of improving performance" (1999: 30). This position assumes that employees are either born happy or unhappy, and that such a demeanour would not change, notwithstanding the design of a job. However, a vast literature exists to indicate that trait affect is not solely determined by hereditary (Hesketh 1993; Ilgen & Hollenbrook, 1991; Gardner & Cummings, 1988; Gerhart, 1987; Broadbent, 1985; Hackman & Oldham, 1980, 1975).

PA was the only variable to be significantly associated with both task and performance dimensions. This indicated that managers with high PA were likely to perform well when Influencing, and when undertaking Monitoring and Following roles, supporting the argument that managers' with dispositional PA will outperform those who are unhappy (negative PA). This study supports Wright and Staw's (1999a,b) claim that a person's disposition is associated with performance. However, this position should not be taken as evidence to support the Wright and Staw's contention that organisational conditions do not influence the happiness of managers. A person's genetic makeup, socialisation and life experiences all contribute to happiness.

As predicted, positive affective wellbeing and intrinsic job satisfaction was related to enhanced managerial performance and poor affective wellbeing indicated reduced performance. Affective wellbeing self-report (PA, Intrinsic Job Satisfaction) was found to be positively associated with a dimension of superiors' report on task performance (Influencing). Positive associations for dimensions of affective wellbeing self-report (PA, Anxiety and Relaxation) were found to be negatively associated with dimensions of superiors' report on task performance (Monitoring) and contextual performance (Following).

The direction of the relationship is between the variables reported in the literature is from affective wellbeing, intrinsic job satisfaction to performance (Warr 1999). These findings do not provide evidence of causation. As Ashkanasy, Hartel, Fischer and Ashforth stated, "[p]erformance is another likely concomitant of affect at work, though whether it is a cause or a consequence is unclear" (1998: 4). The analysis does provide for certain inferences to be made about the relationships between aspects of managers' affective wellbeing, intrinsic job satisfaction and performance. Hosie et al. (2003) has empirically examined the 'happy-productive worker' thesis, by establishing the impact of job-related affective wellbeing and intrinsic job satisfaction on Australian managers' performance.

## **Implications for Human Resource Development**

Since behaviour is something that can be changed and developed, the emphasis in this investigation was on developing an aspect of human potential to enhance managerial performance. Training and development efforts have not always distinguished between cognitive learning and emotional learning, but such a distinction is important. A shift in attitude and emphasis is needed for this to occur, beginning with recognition of the importance of affective well-being and the contribution of intrinsic job satisfaction to managers' performance. Creating ingrained patterns of thoughts, feeling and behaviour may require an extensive development effort over several months, and may require three to five years to be fully developed (Cherniss & Goleman 2001, Boyatzis 2000). Developing emotional intelligence takes time and, most of all, commitment from organisations and individuals. Benefits that flow from a well-developed emotional intelligence, for both the individual and the organisation, make the effort and cost worthwhile. Emotional competence requires emotional learning to be recognised and given the similar prominence as cognitive learning.

A growing body of research on emotional learning and behaviour change suggests that it is possible to help people of any age to become more emotionally intelligent at work. However, many programs designed to do so fail to recognise the difference between two types of learning. An "emotional competence is a learned capability based

on emotional intelligence that results in improved job performance" (Goleman, 1999: 25). According to Goleman. "[C]ompanies are naive in how they spend their development dollars in training for people skills - they can get a far better return on their investment if they do it right ... The rules of work are changing. We're being judged by a new yardstick: not just how smart we are, or our expertise, but also how well we handle ourselves and each other" (Goleman, 1998: 317). Emotional intelligence may be a core competency of prospective managers. As Rozell; Pettijohn; & Parker (2002) concluded "... potential manager's understanding of management techniques dealing with interpersonal interaction and intrapersonal emotions may have a fundamental place in the overall success of that individual in the workplace." (p.287). Hosie's et al study reinforces the need to rethink how we approach developing soft skills in the workplace.

Cognitive learning involves fitting new data and insights into existing frameworks of association and understanding, extending and enriching the corresponding neural circuitry. But emotional learning involves more – it requires that we also engage the neural circuitry where our social and emotional habit repertoire is stored. Changing habits, such as learning to approach people positively instead of avoiding them, to listen better, or to give feedback skilfully, is a more challenging task than simply adding new information to old. Motivational factors also make social and emotional learning more difficult and complex than purely cognitive learning.

Emotional learning often involves ways of thinking and acting that are more central to a person's identity. Goleman (1998) has specifically linked the ability to *influence* to emotional intelligence. However the importance of emotional intelligence needs to be kept in perspective, "[e]motional intelligence skills are synergistic with cognitive ones: top performers have both" (Goleman, 1998: 21). Developing managers' emotional competencies requires a broad and sophisticated array of development tools. Traditional training needs to be blended with a variety of ongoing planned development, such as career assignments and individual coaching. A period of months involving ongoing coaching, encouragement, peer support, modelling and on-the-job practice is necessary (Hay Group, 1999). Such initiatives have do have important resource implications for organisations.

## Conclusion

Certain indicators of affective wellbeing and intrinsic job satisfaction are argued to predict dimensions of managers' job performance. The impact of affective wellbeing and intrinsic job satisfaction on managers' performance was established. As global market forces become more pervasive, optimising so-called hard and soft HRM strategies is likely to become more important to enhancing managerial health, performance, and organisational prosperity. This position has been predicated on the assumption that improved affective wellbeing and intrinsic job satisfaction may result in improved managerial performance, which will eventually result in increased organisational productivity. Enhanced individual performance may also result in increased benefits and reduced an enterprises costs, and ultimately more effective organisational outcomes. A considerable amount of the variance of performance was shown to be predicted by affective wellbeing and intrinsic job satisfaction, and vice versa. Explaining this variance made it possible to develop a model of managerial affective wellbeing, intrinsic job satisfaction and performance with enhanced predictive power.

Elements of affective wellbeing and intrinsic job satisfaction were identified that indicate how managers gain and sustain heightened levels of performance. Hosie's et al. study investigated the impact of individual affective wellbeing and intrinsic job satisfaction on managers' performance. Managers' jobs might be improved to enhance, or avoid decline in, managers' affective wellbeing, intrinsic job satisfaction and performance. In turn, this helps to explain the process of upward and downward spirals of managerial effectiveness, whereby positive or negative affective wellbeing and intrinsic job satisfaction leads to increased or reduced performance, which in turn either enhances positive, or exacerbates negative affective wellbeing and intrinsic job satisfaction. These issues need to be addressed if enterprises are to operate effectively, in an integrative manner.

This research established which indicators of the managers' affective wellbeing and intrinsic job satisfaction predict dimensions of their contextual and task performance. An empirical methodology to predict which indicators of managers' affective wellbeing and intrinsic job satisfaction predict dimensions of their performance. Components of managers' affective wellbeing and intrinsic job satisfaction were identified that predict

dimensions of their performance. Happiness was found to contribute to self-motivation, and that this facilitates organisational effectiveness, or that performance is a barometric of the feeling that managers are effective. This study lends qualified support for the proposition that happy managers perform better but the 'happy-productive' worker thesis is yet to receive unequivocal empirical support. Well-performing managers could also be happy as a consequence of their effective performance and the resulting rewards.

# **The Impact of Total Quality Management (TQM) Practices on Business Performance in Service Sector: Does Service Quality Mediates the Relationship**

*Norizan M. Saad*

*Ishak Ismail*

*Nusrah Samat*

*Universiti Sains Malaysia, Malaysia*

## **Abstract**

**It is observed that organizations, both manufacturing and service have realized the importance of quality. However, there is still a dearth of TQM study in the service sector. This research attempts to investigate the impact of TQM practices on service quality in service organizations. The intention of this study was to examine the relationship between TQM practices and service quality. Questionnaires were distributed to the managers of 175 service organizations in northern region of Malaysia. The results show that there is some support for the claim.**

## **Introduction**

The emergence of the service industry nowadays has increased the researchers' interest in service quality. In relations, the main objective of TQM is to establish a management system and corporate culture to ensure that customer satisfaction is enhanced, which involves a systematic method for continuous improvement of organizational processes, resulting in high quality products and services (Waldman, 1994). Quality system like TQM could lead to a better service quality and organizational performance (Cook & Verma, 2002).

However, most of what has been written on TQM is usually related to manufacturing related organizations (Agus & Abdullah, 2000; Agus, 2000; Ljungstrom & Klefsjo, 2002) even though it is widely believed that concepts and principles under TQM are equally relevant to service organizations. There is a shortage of TQM study in the service sector in general (Brah, Wong, & Rao, 2000). Therefore this research tries to investigate the impact of TQM practices on service quality in service organizations.

### **TQM and Service Quality**

Quality programs are designed to boost the organization's potential revenue and reduce the cost of quality (Banks, 1992). Previous empirical studies regarding the linkages between TQM and organizational performance as well as quality have shown strong and positive results. This is agreed by Ahire et al. (1996), Flynn et al. (1994), and Samson and Terziovski (1999). This is true since the main focus of TQM as suggested by Deming (1982), Juran (1988), Crosby (1979), and Ishikawa (1972) is to improve quality. A research on the relationship between TQM practices, quality performance, and innovation performance conducted by Prajogo and Sohal (2003) concluded that TQM is significantly and positively related to quality performance as well as innovation performance.

According to Antony et al. (2002), successful TQM implementation will give benefits in improving quality and reducing rework as well as reduction in costs of poor quality such as scrap, rework, late deliveries, warranty, replacement, etc.

Furthermore, Brah et al. (2002) supported the proposition that TQM implementation correlates with quality conformance. Behavioral factors such as role of top management leadership, customer focus, human resource focus, and quality focus as well as TQM tools and techniques like corporate planning, process focus, and information and analysis contribute to the successful TQM implementation.

Other TQM elements also give a better result to an organization. When organizations provide supportive structures and processes like TQM for their employees, these employees are more able to provide top quality products and services to their external customers (Gilbert & Parhizgari, 2000).

Cook and Verma (2002) in their study on linkages between quality system, service quality and performance excellence found that according to the perceptions of the bank's employees, quality systems affects service quality that in turn relates to organizational performance.

Litton (2001) also said that TQM process improves quality and service. He concluded in his paper on TQM – Concept Articulation that effective TQM processes can generate marked improvements in both product and service quality which then resulted in increased customer satisfaction and organization's profitability.

As cited by Geralis and Terziovski (2000), Roth and Jackson (1995) found that by establishing a motivated, customer oriented management philosophy and practice; internal service quality levels will be more favorable. They also found that employees' processing organizational knowledge and skills are important in delivering service quality in which high levels of employee morale and satisfaction were found dependent on the empowerment and involvement of employees. All the customer focus, employees' skills and knowledge as well as their empowerment and involvement are some of the practices under TQM. Therefore TQM can lead to a better level of service quality in organization.

## **Literature Review**

### **TQM Practices**

A distinction can be made between the TQM content, elements, processes or practices. It is so-called elements (Waldman, 1994) practices and principles (Dean & Bowen, 1994), values and techniques (Hellsten & Klefsjo, 2000), processes and contents (Reed, Lemak, & Mero, 2000), interventions (Hackman & Wageman, 1995), principles and precepts (Sitkin, Sutcliffe, & Schroeder, 1994), etc. Although definitions do not coincide in full, all of them still refer to those fundamentals that make up TQM theoretical frame without which the management system implemented in the organization or the philosophy on which it is based could not be called TQM (Javier, Antonio, & Mignel, 2003).

Saraph, Benson, and Schroeder (1989) argues that there are eight critical success factors (CSFs) for TQM implementation such as: top management leadership, role of the quality department, training, product design, supplier quality management, process management, quality data reporting, and employee relations.

Meanwhile, Black and Porter (1996) reveals ten major TQM practices. They are people and customer management, supplier partnerships, communication of improvement information, customer satisfaction orientation, external interface management, teamwork structures for improvement, operational quality planning, quality improvement measurement systems, and corporate quality culture.

Even so, Antony et al. (2002) describes eleven TQM practices: management commitment, role of the quality department, training and education, employee involvement, continuous improvement, supplier partnership, product/service design, quality policies, quality data and reporting, communication to improve quality, and customer satisfaction orientation.

Sureshchandar, Rajendran, and Anantharaman (2002) expands the practices even further and come out with twelve major practices comprise of top management commitment and visionary leadership, human resource management, technical system, information and analysis system, benchmarking, continuous improvement, customer focus, employee satisfaction, union intervention, social responsibility, servicescapes, and service culture.

Brah et al. (2000) in their study on TQM and business performance in Singapore service sector has come out with eleven constructs of TQM implementation, which are the top management support, customer focus, employee involvement, employee training, employee empowerment, supplier quality management, process improvement, service design, quality improvement rewards, benchmarking, and cleanliness and organization.

Based upon the above literature, the researcher has selected the following list of seven main practices of TQM implementation for this study. All practices are selected due to their relation and mostly support in service organization and market oriented behavior: management support and commitment, employee involvement, employee empowerment, information and communication, training and education, customer focus, and continuous improvement. All these seven practices are among 25 TQM practices listed to be the most common extracted across 76 studies on TQM (Sila & Ebrahimpour, 2002).

### **Management Support and Commitment**

To be successful TQM must be top-management driven and focus on maximizing efficiency and effectiveness, and promoting market dominance through improving systems and processes, error prevention, and aligning business objectives and customer needs (Agus et al., 2000). It was found by Ahire, Golhar, and Waller (1996), Flynn, Schroeder, and Sakakibara (1994), Grandzol (1998), and Powell (1995) that top management commitment was positively correlated with many performance measures such as financial and operational results and customer satisfaction.

### **Employee Involvement**

Since the philosophy of TQM is to prevent defects of goods or services early in the production process rather than fix it at a later stage, employee commitment is a necessary element for successful TQM implementation (Lee & Howard, 1994). Quality is everybody's responsibility (Gunasekaran & Goyal, 1998) involving each employees which results to better service quality and market oriented behavior that in turn relates to high organizational performance.

### **Employee Empowerment**

Another key focus area in the TQM implementation is the empowerment of employees like work groups, task teams, functional teams and self-management teams. To be succeeding, both employees and managers must be committed enough and trusteeship must be developed among them (Dean & Helms, 1996). Empowerment practices when simultaneously implemented have a favourable effect on employee well being, productivity, performance and service quality (Geralis & Terziowski, 2003).

### **Information and Communication**

Organization should have correct information to ensure all employees understand with the organization and its process. Therefore, to make sure the information is accurately and effectively disseminated to the right person at the right time, organization need to have a good communication system. Anjard (1998) mentioned that a better communication could be accomplished if an organization implements the TQM effectively. This is because in TQM, people will communicate more open and frequent among them.

### **Training and Education**

In order for employees to be committed and actively participate and contribute their ideas to the successful of TQM, they need to be trained and educated. According to Juran (1989), training must be provided to all employees from all levels. The employees' level of knowledge can be reinforced depending on the attention paid to training and education by the system.

### **Customer Focus**

According to Brah, Serene, and Rao (2002), customer focus refers to organization's effectiveness in recognizing its customers' needs, wants and expectations. It is believed that the focus on their needs is important in serving better quality of service (Patel, 1995). Issues related to customer focus and satisfaction received the biggest coverage in the TQM survey literatures analyzed here given the major push toward a customer satisfaction orientation in virtually all types of businesses (Sila & Ebrahimpour, 2002).

### **Continuous Improvement**

Continuous improvement is always refer to better and better quality, less and less variation, which results from process management practices that bring improvements and innovating in products, services, and processes (Zairi, 2002). Work process and improvements are very much focused in TQM implementation (Antony et al., 2002) in which employees will contribute more on the elimination of root causes instead of problem corrections. All of these are to ensure increase in quality and reduce rework and wasting of time.

### **Service Quality**

A service is a process that leads to an outcome during partly simultaneous production and consumption processes (Gronroos, 2001). Service quality is the great differentiator; it gets and keeps the customer's attention (Berry, Parasuraman, & Zeithaml, 1988). According to Gronroos (1984) and Parasuraman, Zeithaml, and Berry (1985, 1991), the traditional approach for defining service quality emphasizes that service quality perception is a comparison of consumer expectations with actual performance. Chia et al. (2002) simplified the definition of service quality as a comparison between consumers' expectations and their perceptions of the service they actually receive.

Many studies on the TQM implementation and its effect on performance have been published, but the sample of companies targeted showed that manufacturing companies have been surveyed to a greater extent compared to service sector (Sila & Ebrahimpour, 2002). This may be because of TQM has its origin in manufacturing related organizations (Brah et al., 2000) as well as the assessment and measurement of quality management in services may seem more difficult because of the intangible nature of services (Parasuraman et al., 1985).

Juran (1979) classified the measurement of quality in a service organization along 2 dimensions: internal and external. Internal measurement is to measure the internal process, while external measurement is to measure the quality of products or services based on customer satisfaction. The main yardstick of performance in quality for service organizations is external customer satisfaction. According to Lee and Howard (1994), in providing preliminary feedback of an organization's quality improvement an internal climate survey could be utilized, which refers to employees' and managers' perceptions, about their organization and work units along several dimensions.

## The Framework

Based on the literature review, a research framework has been developed in order to study the linkages between TQM practices and service quality. The framework is adopted from Cook and Verma (2002), but for the purpose of this research, we eliminated the variable organizational performance. The framework is presented in Fig. 1.

Referring the framework, it was illustrated that the study investigates the relationship between the TQM practices and service quality. The TQM practices act as the independent variable, which is said to positively relate to the service quality as the dependent variable. This relationship was used to develop hypotheses for this study.

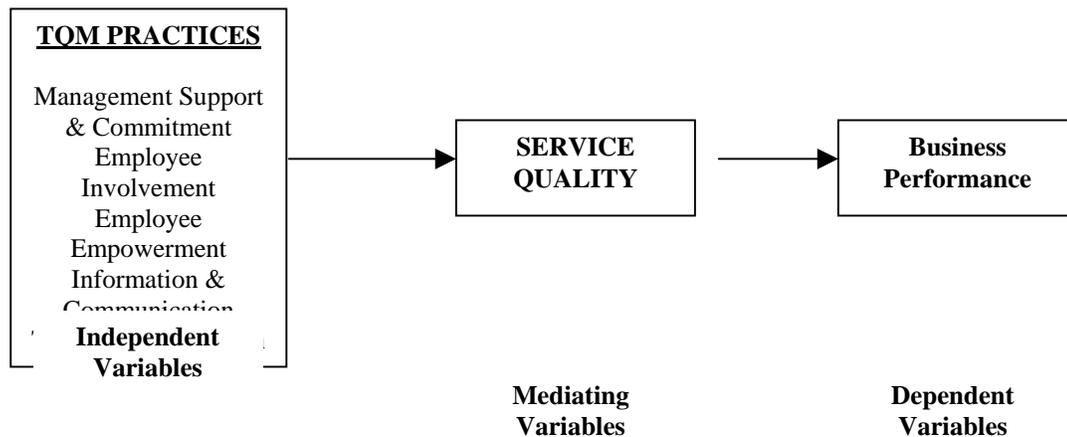

FIG. 1: SCHEMATIC DIAGRAM FOR THEORETICAL FRAMEWORK

As suggested by TQM gurus: Deming (1982), Juran (1988), Crosby (1979) and Ishikawa (1972), the crucial thing in TQM is to improve both products and service quality. Litton (2001) found that TQM processes improved quality and service. This is also agreed by Antony et al. (2002) in which they found that successful implementation of TQM will improve quality. Thus, the researcher hypothesized that:

H1: The level of TQM practices is positively related to service quality.

This main hypothesis leads us into specifying seven sub-hypotheses:

H1a	The level of management support and commitment is positively related to service quality.
H1b	The level of employee involvement is positively related to service quality.
H1c	The level of employee empowerment is positively related to service quality.
H1d	The level of information and communication is positively related to service quality.
H1e	The level of training and education is positively related to service quality.
H1f	The level of customer focus is positively related to service quality.
H1g	The level of continuous improvement is positively related to service quality.

Literature on service quality indicated that better service quality gives better organizational performance. Further, a large number of studies have found that better products and service quality have a relationship with organizational performance. For that reason, the researcher hypothesized that:

H2: Service quality mediates the relationship between TQM practices and organizational performance.

Also, the researcher expanded it into seven sub-hypotheses, which are:

H2a	Service quality mediates the relationship between management support and commitment and organizational performance.
H2b	Service quality mediates the relationship between employee involvement and organizational performance.
H2c	Service quality mediates the relationship between employee empowerment and organizational performance.
H2d	Service quality mediates the relationship between information and communication and organizational performance.
H2e	Service quality mediates the relationship between training and education and organizational performance.
H2f	Service quality mediates the relationship between customer focus and organizational performance.
H2g	Service quality mediates the relationship between continuous improvement and organizational performance.

## Research Methodology

The population of this study includes the service organizations in northern region of Malaysia (Kedah, Perak, Penang, and Perlis States) that do practices TQM in their operations. Banking industry, finance companies, insurance companies, private and public utility service organizations, higher learning organizations, consulting service companies and other related service organizations were purposively chosen in this study.

In order to purposively select the service organizations to be the sample in this study, the researcher has reviewed the yellow pages directories to find out the service organizations that practice particularly the seven practices of TQM listed in this study (management support and commitment, employee involvement, employee empowerment, information and communication, training and education, customer focus, and continuous improvement) to be chosen to participate in answering the questionnaire.

Primary data was used by distributing questionnaires to the respondents. For this study, 200 service organizations have been contacted and only 175 of them do practice TQM in their business routine. Questionnaires were sent by post and e-mail directly to the manager of each selected service organizations. The researcher keep on contacted the respondents through e-mail and phone asking for their responses after the questionnaire has been distributed to them. A total of 175 sets of questionnaires were distributed to the respondents and 57.71% of it, which is 101, were responded.

This study used the judgement or purposive sampling method in collecting data in which questionnaires were distributed to the managers of service organizations in the northern region that practice TQM. This judgement or purposive sampling method was used since it is justified to fulfill the objectives of this study. In determining the linkages between TQM practices, service quality, market orientation and their impact on organizational performance in service organizations, the researcher need to get the data from service organizations that practice TQM in their operations. Therefore, among various sampling method we have, judgement or purposive sampling was used in this study.

Data and information gathered were treated using the Statistical Package for the Social Science (SPSS) software Version 11.0. The data was analyzed using various methods: Cronbach's alpha, which is a reliability coefficient that indicates how well the items in a set are positively correlated to one another, used to measure the goodness of data. It ranges from 0 to 1 with values of .60 to .70 deemed the lower limit of acceptability (Hair, Anderson, Thatam, & Black, 1998). Generally in most studies the agreed lower limit cronbach's alpha is .70. For this study, we chose .60 as the lower limit of acceptability.

Furthermore, in order to examine how much is the variables affect each other, the researcher used the Regression analysis. Descriptive statistics like frequencies, mean and standard deviation were used to analyze the demographic information of the organization.

## **Measurement**

The TQM practices construct tries to measure the level of TQM practices in the organization. The 33 questions being asked were modified from Sureshchandar et al. (2002), Antony et al. (2002) and Brah et al. (2000) in which respondents were asked to respond to the statement using 5-point Likert scale ranging from strongly disagree, which is weighted as 1, to strongly agree, weighted as 5.

Service quality constructs attempts to capture the respondents' perceived service quality in their organization. It was divided into two categories: functional quality, and technical quality. Basically all the 12 questions in this section are modified from Gronroos (1983) which is adopted from Lassar et al. (2000). Respondents were asked to respond to the statement using 5-point Likert scale ranging from 1 for very low to 5 for very high for each statement.

Under the demographic information, it is wanted to gain some background information on the organization as well as the profile of the respondents themselves. Among questions being asked are: respondent's position in the organization, their age, gender, education level, type, nature, and size of the service organization, certification of ISO 9000 and number of years TQM being implemented in the organization.

## **Results**

### **Demographic Information**

Table 1 presents the demographic information of the organization including nature, type, size, ISO certification and number of years TQM being implemented in the service organizations.

In terms of nature of service organization, 47.5% were from others category of service organization such as public service department, government authority, government agencies, healthcare industry and hotels. Meanwhile, 11.9% comes from higher learning organizations, 9.9% from consulting service companies, 8.9% from banking industry, 7.9% from financing companies, 7.9% from insurance companies, and only 5.9% out of 101 organizations comes from utility service companies. From all service organizations that have participated, 61.4% comes from private sector and the remaining 38.6% comes from public sector. 58.4% are the small size organizations that have below 500 employees, 6.9% are medium size organizations with the range of 501 to 1000 employees, and 34.7% of them are the large size organizations with more than 1000 employees. Only 50.5% of 101 service organizations involved have received the ISO 9000 (or similar) certification. The mean average of number of years TQM being implemented was 4.83 years with a standard deviation of 2.84 years.

	Total	101	100

## Hypotheses Testing

H1: The level of TQM practices is positively related to service quality.

In this model, regression analysis on TQM practices and service quality was performed in which service quality acts as the dependent variable and TQM practices with the 7 elements: management support and commitment, employee involvement, employee empowerment, information and communication, training and education, customer focus and continuous improvement, as the independent variable.

From the result as shown on Table 2, R Square is 0.616, which means 61.6% of the variance in service quality can be predicted from management support and commitment, employee involvement, employee empowerment, information and communication, training and education, customer focus and continuous improvement. The suggested model is fit with 61.6%.

Table 2 revealed that only information and communication ( $\beta=0.374$ ,  $p<0.01$ ), customer focus ( $\beta=0.299$ ,  $p<0.05$ ), continuous improvement ( $\beta=0.255$ ,  $p<0.05$ ), and employee empowerment ( $\beta=0.152$ ,  $p<0.05$ ), had a significant and positive effect on service quality. This provided evidence to support H1c, H1d, H1f and H1g. Based on the  $\beta$  values, information and communication has the highest impact on service quality followed by customer focus, continuous improvement and subsequently employee empowerment.

**Testing for Mediation**

In this study, service quality implies a causal hypothesis whereby an independent variable (TQM practices) causes a mediator, which causes a dependent variable (organizational performance). The researcher used the Baron and Kenny (1986) procedures to test the effects of mediation. Figure 2 depicts the test for mediation.

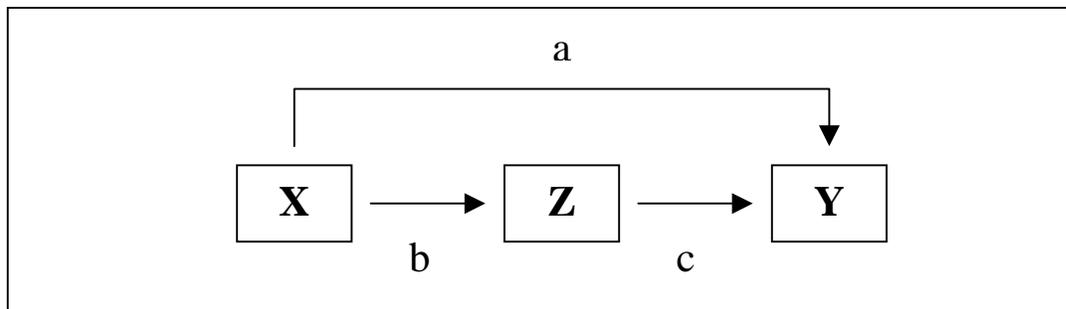

FIG. 2: TEST FOR MEDIATION

Baron and Kenny (1986) proposed the 4-step approach in which several regression analyses are conducted. Further, at each step, the significance of the coefficients is examined. The test should follow this procedure (Newsom, 2001):

- Step 1: Regress the dependent variable (Y) on the independent variable (X) to establish that there is an effect that may be mediated.
- Step 2: Regress the mediator (M) on the independent variable (X), which involves treating mediator as if it were an outcome variable.
- Step 3: Regress the dependent variable (Y) on the mediator (M) to test the significance of path b, and finally,
- Step 4: Regress the dependent variable (Y) on both the independent variable (X) and mediating variable (M).

According to Baron and Kenny (1986), mediation is supported if the partial direct effect for path a, is non-significantly different from zero, results are consistent with a full mediation model. If path b is significant after controlling for the direct effect of X (path c), but path c is still significant, the model is consistent with partial mediation.

It is hypothesized that service quality mediates the relationship between TQM practices and organizational performance. This hypothesis was sub-hypothesized into seven according to seven elements in TQM practices.

To test for mediation effect, first of all the dependent variable (organizational performance) was regressed on independent variable (TQM practices). The result shows that only management support and commitment

( $\beta=0.271$ ,  $p<0.05$ ) had a significant effect on organizational performance. Secondly, the mediator (service quality) was regressed on independent variable (TQM practices). The result shows that only four variables had significant effect on service quality. They are information and communication ( $\beta=0.374$ ,  $p<0.01$ ), customer focus ( $\beta=0.299$ ,  $p<0.05$ ), continuous improvement ( $\beta=0.255$ ,  $p<0.05$ ), and employee empowerment ( $\beta=0.152$ ,  $p<0.05$ ).

Further, the dependent variable (organizational performance) was regressed on service quality and market orientation as the mediator. Both service quality ( $\beta=0.489$ ,  $p<0.01$ ) and market orientation ( $\beta=0.278$ ,  $p<0.01$ ) were significant. However, since the significant variables that effect organizational performance are not common with the significant variables that effect service quality, therefore we cannot proceed with Step 4 to establish that service quality mediates the relationship between TQM practices and organizational performance. Therefore, there is enough evidence to reject the hypothesized relationship. Hence, it is established that service quality did not mediate the relationship between TQM practices and organizational performance. Table 3 shows the results of regression analysis.

TABLE 3: RESULTS OF REGRESSION ANALYSIS

## Discussion

### The Relationship between TQM Practices and Service Quality

Results from regression analysis shows that only four out of seven variables under TQM practices have a significant and positive effect on service quality: information and communication, customer focus, continuous improvement, and employee empowerment.

Information and communication ( $\beta=0.374$ ,  $p<0.01$ ) has a greatest impact on service quality. This may be because of to maintain the focus on customers' needs and keep track of service quality performance, a quality information and communication like reporting system is required. For customer focus ( $\beta=0.299$ ,  $p<0.05$ ), it was significant with service quality because it is important in serving better quality of service. This supports the argument by Patel (1995). So do the continuous improvement ( $\beta=0.255$ ,  $p<0.05$ ) in which it always refer to better quality both in service and manufacturing industry. Thus, it has a great impact on service quality. In terms of employee empowerment ( $\beta=0.152$ ,  $p<0.05$ ), it has been indicated by literature that it has a favorable effect on service quality. This supports the argument by Gerals and Terziovski (2003) as well as study made by Litton (2001) and Gilbert and Parhizgari (2000) in which they found that effective TQM practices improve quality and service.

From seven practices, employee involvement and training and education give a negative relationship with the service quality. The measurement for employee involvement refers to teamwork, too much focus on team make the individuals less responsive to their job because they always depend on the team. This could lead to low performance, which in turn lead to low service quality. For the training and education, this happened because of the measurement used to measure the level of training and education practice in the service organizations are more focus on the skills but not on the delivery of service itself.

### Summary of the Results

From all seven hypotheses that have been developed, only four of them were accepted since three of them have enough evidence to be rejected. This study focused on various service organizations' nature. Various kinds of service operational settings tend to be different in terms of their implementation of TQM practices. This might affect the results of this study. The result could be different in which more hypotheses could be accepted if we concentrate only on one nature of service such as banking industry, financing companies, and insurance companies.

It can be concluded that in some cases TQM fails to deliver better service quality. This is parallel with what has been found by Shin, Kalinowski, and El-Enein (1998) in the literature that TQM gives high failure rates of 60% - 67%. This has made many organizations believe that TQM has not been delivering on its promises.

In the study developed by Cook and Verma (2002), the proposed relationship between quality management, service quality and organization's performance seem to hold true for a large service organization operating in turbulent business environment. Despite in this study, the major organizations involved come from the small size service organizations (58.4%). Therefore the results were different.

## Conclusion and Implications of the Study

This study explores the relationship between TQM practices and service quality using seven variables under TQM practices. Only some of TQM practices have significant effect on service quality.

TQM is not easy to implement in which it demands a full commitment from various parties in the organization and requires some changes and restructures that involve time consuming. However, in this study, the mean average of number of years TQM being implemented was only 4.83 years. This may be one of the reasons why the implementation of TQM does not much deliver positive results in this study. According to Chin and Pun (2002), TQM stresses the mutual cooperation of everyone in an organization and associated business processes to produce services that meet the needs and expectations of customers.

Also, quality is generally corporate-driven. Sometimes quality is sacrificed in meeting the bottom line output or immediate customer requirements. In some circumstances, organizations will never sacrifice quality. All these are very much dependent on the management style and organizational culture.

The sample size of this study was relatively small in which it focused on service organizations in the northern region only. Consequently, the results might not generalize to overall service organizations in Malaysia.

This study also faced the self-reporting bias, which is a common problem since it involves collecting data from managers about their organizations. This cannot be avoided because it is difficult to recognize respondents with knowledge about the TQM practices and their organizational performance.

Apart from that this study focused only on seven TQM practices whereas there are lot more practices that can be included.

It is suggested that a wider sample can be used for any future study, which can be generalized to the service industry. The same study can be conducted with a bigger sample.

The self-reporting bias perhaps can be reduced with multiple responses from different individuals and management levels.

# **The Role of Relationships Management in Anglo-Sino Partnerships Are We Speaking the Same Language?**

*Kathryn Ringwald  
University of Wales, Newport, UK*

## **Abstract**

The dynamic economy of China, its low cost manufacturing capability and the strategic significance of Hong Kong as the gateway to China has resulted in a proliferation of inter-organisational relationships between Western and Chinese businesses. These relationships take a variety of forms, all dependent on the interaction between individuals and groups to achieve the declared strategic objectives. This paper examines the nature of relationships formed by UK and Chinese partners. Using focus groups in China and UK it explores both parties' understanding of relationships and the characteristics for success. The paper considers the concept of *guanxi* and compares its complex system of favour and obligation with the traditional transaction-based, highly regulated relationships of Western cultures. The paper concludes that attitudes to relationships are both culturally derived and "learned" from experience of personal and work relationships and suggests ways in which UK and Chinese partners can minimise risk and achieve mutual understanding.

## **Background**

The liberalisation of the Chinese economy since 1979 and in particular China's accession to the World Trade Organisation in 2001 has resulted in a proliferation of inter-organisational relationships between Western and Chinese businesses. At their simplest these may be supply-chain relationships established between buyers and suppliers, ranging through various degrees of partnership and collaboration to complex strategic alliances and joint ventures. All will be dependent on the interaction between individuals and groups to achieve the declared strategic objectives i.e.: success is dependent on the degree to which the inter and intra organisational relationships can be successfully managed. How then can this be achieved?

This paper represents the second phase of a three stage study into Anglo-Chinese Partnerships in Higher Education. The first phase [15] studied the extent to which strategic congruence exists between partners and the implications for the development of successful relationships. The first study highlighted the fundamentally differing understanding of the nature and characteristics of "relationships" between Chinese and Western cultures. This paper therefore attempts to identify Chinese and UK perceptions of the essential dimensions of a relationship and seeks to understand how these culturally embedded differences can be reconciled in practice. The primary research for this paper was undertaken in UK and China using focus made up of people from all walks of life in an attempt to achieve broad cultural representation. The findings from this paper may therefore have wider application than the Higher Education sector and may be relevant to any Anglo-Sino business relationship.

## **Modern China and Hong Kong**

The economy of the post-Mao era in China continues to attract foreign direct investment from around the world. The People's Republic of China is now the world number one recipient of foreign direct investment (FDI), receiving 10% of the global total in 2003. This level of investment results in the creation of countless strategic alliances, joint ventures and acquisitions. The Pearl River Delta in Guangdong Province in the South East of the country produces 5% of the world's manufactured goods and with less than 1% of the land area and just 4% of the population is responsible for 8% of China's GDP, 38% of total trade and 29% of FDI. The region is home to more than 7,500 multi-national companies and tens of thousands of smaller enterprises, many of which are engaging in collaborations with UK companies.

Hong Kong has a long history of “collaboration” with Britain and was handed back to P.R.China in 1997. Hong Kong is described as a Special Administrative Region (SAR) of the People’s Republic Its position as a gateway to China has guaranteed its strategic significance since the days of the Silk Road when traders passed through en route to eastern destinations. It remains a gateway to this day – more than half of the world’s population is within five hours of Hong Kong – and following the implementation of the CEPA agreements liberalising trade between Hong Kong and China, exports through its port increased by 19% in 2004. Foreign investors are keen to take advantage of CEPA and Hong Kong has become the second largest recipient of inward investment in Asia.

The current growth in the economy of China and Hong Kong, access to a huge emerging market and access to a large pool of low cost labour has resulted in UK organisations developing collaborative arrangements with partners in Greater China. The Higher Education Sector in UK has also been quick to identify and exploit potential partnerships where demand for education significantly exceeds the local ability to supply, and where the British education system is held in high regard.

Anglo-Sino relationships are formed in a modern and dynamic economic environment, yet they exist within deeply embedded and very different cultural contexts. The success of these relationships will be dependent upon an organisation’s ability to understand and satisfy the expectations of both parties.

## **Attitudes to Collaboration**

In recent year the concept of social capital has received attention from academics in the social sciences, and Western practitioners seeking to lever benefits from personal and inter organisational relationships. As the concept has been embraced by several disciplines, so various definitions of social capital have emerged. For the purposes of this study the definition adopted by Hitt Lee & Yucel [10] has been adopted, which is “the relationships between individuals and organisations that facilitate action and thereby create value. The web of social relationships that develops entails norms, values and obligations for members”. This interest in social capital is in contrast to the traditional transaction-based business dealings which have prevailed in Europe and North America, where reliance on orders and contracts implemented by regulation and legislation are the norm. The advantages of developing social capital through networking is now seen as sufficiently important to be engineered, particularly in the SME sector, and a proliferation of business clubs, trade associations and networking initiatives have been established throughout the UK.

The development of social capital is seen as an iterative process which is “by its nature dependent upon history. In other words, the current relations of a firm are products of its prior relational activities as well as the basis upon which it establishes future social relations” [3]. The real benefits of the development of social capital vary considerably according to the nature of the collaboration, but research suggests that social capital can

- Develop trust and create norms and sanctions which reduce transaction costs [5]
- Improve access to resources within the network group [6]
- Shift the perceptions of individuals within a network, making them more willing to pool resources and create synergies [6]

However, Falk and Kilpatrick also caution that the development of social capital does not necessarily result in the realisation of potential, and that the quality and quantity of positive interactions are vital to the realisation of synergies. Hitt, Ahlstrom, Dacin and Levitas (2001a) [11] observe that Western firms tend not to be sensitive to their partners needs in collaboration and therefore may not be capable of choosing the best possible partners.

Despite this move towards notions of sharing and reciprocity, Western managers still find the Chinese concept of guanxi difficult to embrace, often believing it to be related to unethical practice [1]. In their article “Is guanxi ethical? A normative analysis of doing business in China” Thomas Dunfee and Danielle Warren (2001) [4] ask the question “Should (Western) corporations use guanxi? In this study they found that 63% of European firms doing business in China considered guanxi to be a personal asset rather than a corporate asset in that if the person leaves the organisation, the guanxi is lost. They conclude that guanxi involves a variety of practices which might be used to achieve a variety of objectives in widely differing contexts and whilst they concede that some may have

positive outcomes, they suggest that corporations should avoid forms of guanxi which are contrary to emerging business norms or which might disadvantage ordinary Chinese people.

Guanxi has been part of Chinese culture and business for centuries and has its origins in Confucianism, a social philosophy seeking to establish harmony in a complex human society. It is deeply embedded in family, work and business and taken as a “given” in everyday life. Chinese people cultivate guanxi in a variety of subtle and imaginative ways and its existence governs their attitudes to relationships. Chinese firms use guanxi to “manage organisational interdependence and to mitigate institutional disadvantages, structural weaknesses and other environmental threats” [13] For the purpose of this study guanxi will be defined as “a special type of relationship which contains trust, favour, dependence and adaptation [17]. However it is impossible to understand guanxi without understanding “Mianzi” i.e.: the importance of “face” particularly the avoidance of “loss of face” which is traditionally compared to physical mutilation, and “Renqing”, the notional of obligation and reciprocity which is at the heart of guanxi. Not to honour “Renqing” causes loss of face, offends partners and damages the guanxi network [13]. Guanxi is therefore based on an exchange of favours and is not formed from an emotional attachment. Fan (2002) [7] suggests that “guanxi” and “relationship” should not be confused, for while a relationship may exist, guanxi will only happen when something needs to be done.

Attitudes to collaboration and partnership between UK and China are clearly based on different notions of social capital. These differences are highlighted in their respective measures of success. A British executive’s success might be measured by the accumulation of personal wealth, whereas a Chinese executive might be measured on the strength of his/her connections (guanxi) [2].

The problem is therefore that whilst both UK and Chinese partners in a relationship may earnestly want the relationship to succeed, their deeply embedded understanding and expectations may be considerably at odds. This paper seeks to explore the understanding and expectations to mitigate the negative effect they may have on collaboration.

## Research Methodology

From the initial study in this series [15] it appeared that the Chinese and UK partners in the set of relationships under investigation had quite different expectations of the relationship. More significantly, their expectations were not associated with the strategic objectives of the partnership but more concerned with the interaction between individuals within the relationship. The second phase would therefore need to analyse the differences in attitudes at a micro-level.

The methodology developed from significant conversations with UK and Chinese academics, which centred on the extent to which an individual’s attitudes to relationships were culturally derived or “learned” from personal life experiences of relationships e.g.: with parents, siblings, friends etc. These conversations revealed key differences in the language used to describe critical incidents. UK colleagues tended to relate incidents of partnership failure, a breakdown in communication, a betrayal of trust. Chinese colleagues tended to relate the mutual advantage arising from the obligation and reciprocity associated with guanxi. It appeared that the words used to define and explain relationships were critical to an appreciation of the cultural and personal factors affecting the management of relationships and thus the methodology emerged.

Initially two pilot focus groups were arranged, one for UK participants and one for Chinese participants. Both groups were made up of six members from a variety of work and social backgrounds. The groups were asked to come up with a list of twelve to fifteen words which they associated with “relationships” in a generic sense. They were then asked to shortlist six to eight of the words, then to prioritise the words according to the following relationship categories

- Personal Relationships: Relationships with parents, siblings, spouse, close friends
- Work Relationships: Relationships with work colleagues, superiors, subordinates within the same organisations
- Business Relationships: Relationships which are inter-organisational i.e.: between buyers and suppliers, partners in collaboration etc

These categories are based on a comparison of three types of guanxi by Ying Fan (2002) [7]. In this case the term “Work Relationships” has been substituted for Fan’s “Helper” category, as the meanings are very similar i.e.: colleague, associate and the term “Work Relationships” would be more easily understood by the participants. Table 1 illustrates Fan’s comparisons of the three types of guanxi

TABLE 1: A COMPARISON OF THREE TYPES OF GUANXI

<b>Guanxi Type</b>	<b>Personal</b>	<b>Work</b>	<b>Business</b>
Definition	Special relationship, the expressive tie	Process of exchange, favours	Process of finding business solutions through business connections
Nature	Emotional and instrumental	Instrumental, utilitarian	Purely utilitarian
Cultural / Social Root	Chinese cultural values	Cultural values and contemporary socio-economic factors	Current political / economic structures
Exchange	Love, affection, support	Favour	“Money and power” deal
Ethic	General ethical, even desirable	Depends	Widely regarded as evil and unacceptable
Time	Long term or permanent	Temporary or long term	Varies

Source: Adapted by the author from Fan (2002)

The use of word association without reference to any specific incident examples allowed participants to associate more freely and to offer their own examples which enriched the results. The groups were facilitated by the author and a Chinese speaking colleague to ensure that the subtlety of meaning was recorded. After minor revisions to the format, a further eight focus groups were held in Newport and a further eight groups were held in China (Haikou, Shanghai and Hong Kong). In each case it was deemed important to record key elements of the discussions leading to the selection and prioritisation of words. As “language” was fundamental to the exercise, all participants were allowed to use their first language. The group discussions were recorded and translated by one Chinese colleague with a specific interest in networking and social capital. All groups consisted of between five and seven people, selected from part time post graduate student groups to give broad gender balance and a range of ages between twenty five and fifty five. In total one hundred and nine people participated in the study. The pilot studies were undertaken in October 2003. The other groups took place between May 2004 and January 2005.

Initially the intention was to map the results of the focus groups against Mandell’s five characteristics for relationships in collaboration [12]. These are:

- Commitment of members.
- Perceptions and values of members
- Imposition of rules and regulations
- Relative power of members
- Impact of political and cultural context

However this proved to be of limited value, therefore the results have also been analysed by relationship type to identify the extent to which evidence supports the contention that attitudes are culturally derived (by nationality) or learned from personal and / or work experiences.

## Findings

### General Comparisons UK / Chinese

It was interesting to note that from the pilot study that the Chinese group found the tasks easy to understand and complete, while the UK group seemed to look for a “catch” or a non-existent complication. This trend continued in most of the focus groups. However, the UK groups discussed the responses for longer with more debate. Most Chinese groups had broad agreement on the list but debated priorities. From the total data collected it was possible to make some general comparisons between the groups. Table 1 illustrates these comparisons.

TABLE 2: GROUP COMPARISON – OVERALL DATA

	UK Focus Groups	Chinese Focus Groups
Total number of words identified by the groups	90	75
Percentage of words unique to each national set	65%	55%
Words related to Mandell’s Five Characteristics		
• Commitment of members	24%	35%
• Perceptions and values of members	34%	41%
• Imposition of rules and regulations	20%	3%
• Relative power of members	9%	16%
• Political and cultural contexts	12%	6%
Incidence of negative words	13	4
Percentage of negative words	14.4%	5.3%
Negative words	Abuse Anger Betrayal, Confrontation, Disappointment Distrust Enemy Envy Fear Frustration Hard (difficult) Intimidation Volatile	Complicated Cruelty Hate Jealousy

Source: Author

The UK focus groups identified a total of 90 words, the Chinese group identified 75. This confirms that there was more commonality among the Chinese than the UK groups. The number of unique words in each list indicates the extent of the difference between the sets. Unique words in the UK list included Assertiveness, Boundaries, Enjoyment, Suspicion and Vision. Unique words in the Chinese list included Beliefs, Ethics, Honour, Leadership and Reputation.

The UK set listed thirteen negative words within the overall list. However, when discussing words like trust, the discussion tended to focus on negative aspects e.g.: relating incidents of betrayal of trust or absence of trust, when discussing honesty the groups would frequently refer to dishonesty and relate incidents of dishonesty in work or business relationships. The Chinese set included four negative words, including “complicated” which has been identified as “negative” because the group discussed at some length the problems of relationships “complicated” by contract, rules and regulations.

The imposition of rules and regulations was of much more importance to the UK group (20%) than the Chinese group (3%). This is consistent with the traditional Western reliance on regulation and legislation. The UK set were more concerned with the relative power of the members than the Chinese set, which could be attributed to differing views of “power” – for UK legitimised by position / hierarchy, for the Chinese vested in the strength of guanxi [2].

#### Analysis by Relationship Type

Table 3 below summarises the responses of the UK set in relation to Personal Relationships. Direct quotes from focus group participants appear in italics.

TABLE 3: PERSONAL RELATIONSHIPS – UK SET

Group	Ranking		
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
1	Trust	Commitment	Honesty
2	Trust	Respect	Loyalty
3	Trust	Honesty	Loyalty
4	Trust	Respect	Communication
5	Trust	Respect	Communication
6	Honesty	Friendship	Collaboration
7	Trust	Honesty	Respect
8	Trust	Respect	Communication
UKPilot	Integrity	Sustainability	Compatibility

Source: Author

The results show the extent to which trust dominated the attitudes to personal relationships – the UK pilot group had decided that the word “Integrity” covered trust and honesty. The group discussions repeatedly raised issues of betrayal of trust and / or distrust. The groups felt that trust needed to be established at the beginning of a relationship - *“Do you have an instinctive rapport – I know I can trust this person. Therefore we can be compatible.”* All discussions focused on “Can I trust this person?” and not “Can this person trust me?” There was no assumption trust and honesty exists between family members and close friends. Most of the words were about “regulating” the relationship – trust, respect, loyalty.

Table 4 below summarises the responses of the Chinese set. Chinese people are not normally outwardly affection nor do they talk openly about personal feelings, but there was no reluctance to express their view through words and it was surprising to see the dominance of “love” in this set together with words like caring and friendship, which might be regarded as “given” by the UK set. Trust was not discussed to any great extent and could be assumed as part of the obligation of personal / family guanxi –

*“Guanxi is also relationship within the family. Guanxi is a resource as well as a responsibility – legal responsibility, defined by law, wife and children. Whoever has made achievements; these will contribute to family honour shared by everyone”.*

This demonstrates the very serious nature of guanxi, even in the informal setting of the family. The appearance of the word forgiveness suggests a degree of tolerance. The word “forgiveness” was unique to the Chinese list. The majority of the words suggest mutuality and the discussions were around both sides of a partnership, so the words chosen had to exist on both sides.

TABLE 4: PERSONAL RELATIONSHIPS – CHINESE SET

Group	Ranking		
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
1	Reliability	Honesty	Respect
2	Love	Help (one another)	Forgiveness
3	Respect	Friendship	Trust

Table 5 below summarises the UK set’s priorities in work relationships.

**TABLE 5: WORK RELATIONSHIPS – UK SET**

Group	Ranking		
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
1	Cooperation	Commitment	Communication
2	Attitude	Understanding	Respect
3	Communication	Expectation	Trust
4	Communication	Responsibility	Trust
5	Communication	Partnership	Compromise
6	Collaboration	Synergy	Honesty
7	Communication	Respect	Professionalism
8	Trust	Communication	Empathy
UKPilot	Integrity	Partnership	Sustainability

Source: Author

These findings suggest that communication between colleagues is the key to successful relationships for the UK set. Commitment, collaboration and compromise all feature in the list and suggest that mutuality is more to the fore. Certainly the discussions were more “two-sided” – considering both sides of the relationship. Trust was seen of much less importance than in personal relationships. The words here suggest a will to “get on” to achieve objectives. The Chinese set offered more mixed responses as summarised in Table 6 below.

Here trust and mutual trust are given priority in working relationships, but not with the same understanding of trust as expressed by the UK set (see above) –

*“Trust is based on knowing and understanding the person”*

*“I may understand someone, but I don’t trust them. I may still do business with them, but I take care”.*

*“Working relationship doesn’t involve trust. Individual responsibility is what can do the job. You are responsible for what you do, so is he / she. Trust is not involved here”*

*“Trust in work relationships is ambiguous. In Chinese trust is a heavy word, and involves more than just knowing, understanding and familiarity. Years of experience of contact and doing things together, also kinship relationships can contribute to trust”*

Help, support and encouragement suggest a spirit of collegiality, which relates to mianzi, the concept of face. It would be considered serious to lose face with colleagues.

**TABLE 6: WORKING RELATIONSHIPS – CHINESE SET**

Group	Ranking		
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
1	Respect	Concern	Encourage(ment)
2	Trust	Help (one another)	Honesty
3	Trust	Help (one another)	Interests (in common)
4	Honesty	Understanding	Patience
5	Trust	Team Spirit	Commitment
6	Trust	Communication	Loyalty
7	Communication	Understanding	Supportive

The UK set’s responses regarding business relationships are summarised in Table 7 below.

TABLE 7: BUSINESS RELATIONSHIPS – UK SET

Group	Ranking		
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
1	Honesty	Respect	Communication
2	Trust	Compatibility	Attitude
3	Communication	Expectation	Respect
4	Communication	Trust	Responsibility
5	Communication	Vision	Partnership
6	Collaboration	Familiarity	Honesty
7	Professionalism	Communication	Respect
8	Communication	Negotiation	Cooperation
UKPilot	Integrity	Personal Link	Sustainability

Source: Author

Once again communication features significantly in the priorities of the UK set. Trust appears in only one. From the discussions within groups this would appear to be because trust is not expected. Trust did not feature largely in the group discussions. Apart from the importance of communication, there was no real correlation between the nine groups. In discussion the groups were uncertain how to manage business relationships and struggled to find any real significance –

*“Power is not important. You may not have any power”*

*“Personality, partnership, sustainability, they are all linked”*

*“Integrity has a positive effect on perceptions of compatibility”*

*“How do you assess integrity within a person, a close relationship?”*

Most of the words chosen suggest a desire to regularise or formalise the relationship – Respect, Negotiation, and Partnership. In the absence of any evidence of generalisation, it is assumed that each collaboration is taken on its own merits and the relationship developed without any iteration.

The Chinese set of responses summarised in Table 8 below reveals far more agreement and understanding across all groups in the set.

TABLE 8: BUSINESS RELATIONSHIPS – CHINESE SET

Group	Ranking		
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
1	Win-Win	Competitive	Honesty
2	Cooperation	Forgiveness	Honesty
3	Equality	Communication	Friendship
4	Trust	Confidence	Honesty
5	Loyalty	Ethics	Win-Win
6	Trust	Communication	Ethics
7	Beneficial	Trust	Respect
8	Honesty	Equality	Support
CP	Reputation	Trust	Guanxi

Source: Author

The range of words all resonate with the mutuality – the reciprocity and obligation that it synonymous with guanxi – Win-Win, Equality, Forgiveness, Friendship, Support exemplify the common understanding of relationships for mutual benefit. It is interesting that “ethics” appears three times, however this is ethics as defined in guanxi, which is to deliver on the obligations and expectations, to do otherwise would result in loss of face. The comments from the groups provide interesting insights

*“Trust based on how well you know the other person. This is vital in business relationships – how familiar you are with each other; otherwise it will just be one way trust.”*

*“I don’t trust a company simply because it has reputation. Reputation itself is not enough for trust”*

*“Mutuality, balance, win-win. Relationships should not be for one side, both sides are satisfied – like bosses and employees – satisfaction in all aspects”*

In contrast to the UK set, the words here do not seek to regularise or formalise the relationship, but instead reinforce the desire for harmony, balance and mutual benefit.

## **Discussion and Conclusions**

### **Are Attitudes to Relationships Culturally Driven?**

Western attitudes to business relationships have traditionally been based on transactions, regulated by legislation and regulation. Business has been driven by the desire for profit and wealth accumulation. Neither individuals nor organisations explicitly espouse “British” cultural values in the way that Chinese understand and express their culture. The findings within the UK group indicate that the responses are not affected by a single pervasive culture. However, the Chinese responses clearly indicate an understanding of and commitment to the culturally derived principles of guanxi. The Chinese set responses to personal, work and business relationships are consistent with the guanxi types characterised in Fan [7] which suggests that where a clear culture exists it can drive attitudes to relationships.

### **Are Attitudes to Relationships “Learned” from Life Experience?**

The UK set indicated overwhelmingly that trust is essential to the success of personal relationships and that trust, together with honesty, loyalty and respect, cannot be assumed. It is possible that many of the participants have experienced breakdowns in family relationships through, separation, divorce and/or the breakdown of the extended family. Work experiences may have involved redundancy, uncertainty and poor corporate governance. In such circumstances it is quite possible that trust, loyalty and honesty would be seen as significant to successful relationships. The Chinese group emphasised the importance of love, caring and understanding. In China divorce is still relatively uncommon and re-marriage, even after the death of a partner is unusual. The bonds of extended family are still very strong, with families of three generations often living together for extended periods. Outward expressions of affection, even within families are very rare. Children defer to their parents well into adulthood. It is possible that these circumstances, coupled with an understanding of guanxi, may suggest that participants would want evidence of love, affection and understanding. In other words, there is an inverse relationship between life experience and attitudes to relationships – each wants what they have not got!

### **How can we Reconcile the Differences?**

The evidence suggests that the key differences in attitudes to business relationships between UK and Chinese partners are likely to be:

- The emphasis on mutuality and social capital on the Chinese side
- The emphasis on trust and communication on the UK side
- The existence of a complex and culturally specific shared code that is guanxi
- The UK need to have comprehensive and explicit communication between partners
- The negative attitude to relationships which prevails in the UK
- The risk of guanxi descending into unethical territory
- The risk of over-policing relationships resulting in loss of face and damage to the relationship

In order to overcome these differences Anglo-Sino partners will need to put measures in place pre and post the establishment of partnership. In the pre-agreement phase both partners should undertake a training programme which explains in detail the culturally derived attitudes on both sides. Many organisations enter into partnerships with no more preparation than a brief lesson on the etiquette associated with the exchange of business cards and the appropriate table manners in their respective countries. This simple measure would better prepare key personnel to enter into the partnership negotiations without infringing the limits of mianzi.

Before a partnership begins both sides should explicitly state their objectives and their capacity to deliver in order to instil trust and encourage open communication. Caution is required as Chinese are prone to exaggerate their abilities in an attempt to impress potential partners [16]. UK partners should use incentives rather than penalties in performance measurement as a further demonstration of trust.

Post agreement, parties should be encouraged to facilitate face-to-face meetings between key personnel in the partnership at an early stage. This builds personal relationships, which in turn leads to trust and respect, easing the way for future long-distance communication. Prusak and Cohen (2001) [14] suggest that “Relationships can only happen and trust can only flourish when people know each other...Social capital grows when team members meet face-to-face and work side-by-side”. Both parties should also make signal allocations of resources and create an identity for the partnership within their respective organisations. Significant milestones in the partnership should be identified and jointly celebrated, conferring status and appreciation for the efforts of all concerned. Someone in the UK partner organisation should be made responsible for managing the “relationship”, which should be regarded as a valuable asset requiring constant care and attention.

#### **Are we Speaking the Same Language?**

Trust and communication are central to Anglo-Sino partnerships, though the language used to define them varies considerably. The difference is not between English and Putonghua, but in the subtlety of understanding developed through culture and experience. Hart (1988 p.191) [9] refers to trust as “the negotiation of risk occasioned by the freedom of others” which appears akin to the UK understanding. However, Harris (2003) [8] describes Fukuyama’s notion of trust as “the expectation of regular, honest and cooperative behaviour based on commonly shared norms” which seems to reflect the Chinese understanding. The UK understanding of communication is explicit, written and / or verbal information shared through established channels and by accepted means. The Chinese understanding of communication is much broader, to include everything we do (and don’t do) and the way in which we do it. Every action is of significance – the order participants speak at a meeting, the seating arrangements, and the exchange of gifts – all these things say something about the value and status conferred on the relationship and are therefore a means of communication.

The term “cultural fluency” has entered into the general lexicon of management-speak. However, more work is to be done if we are to achieve fluency in the language of partnership and collaboration.

# Understanding Management in South Korea: Utilising a Comparative Management Framework

*Richard Grainger  
Subramaniam Ananthram  
Curtin University of Technology, Western Australia*

## Abstract

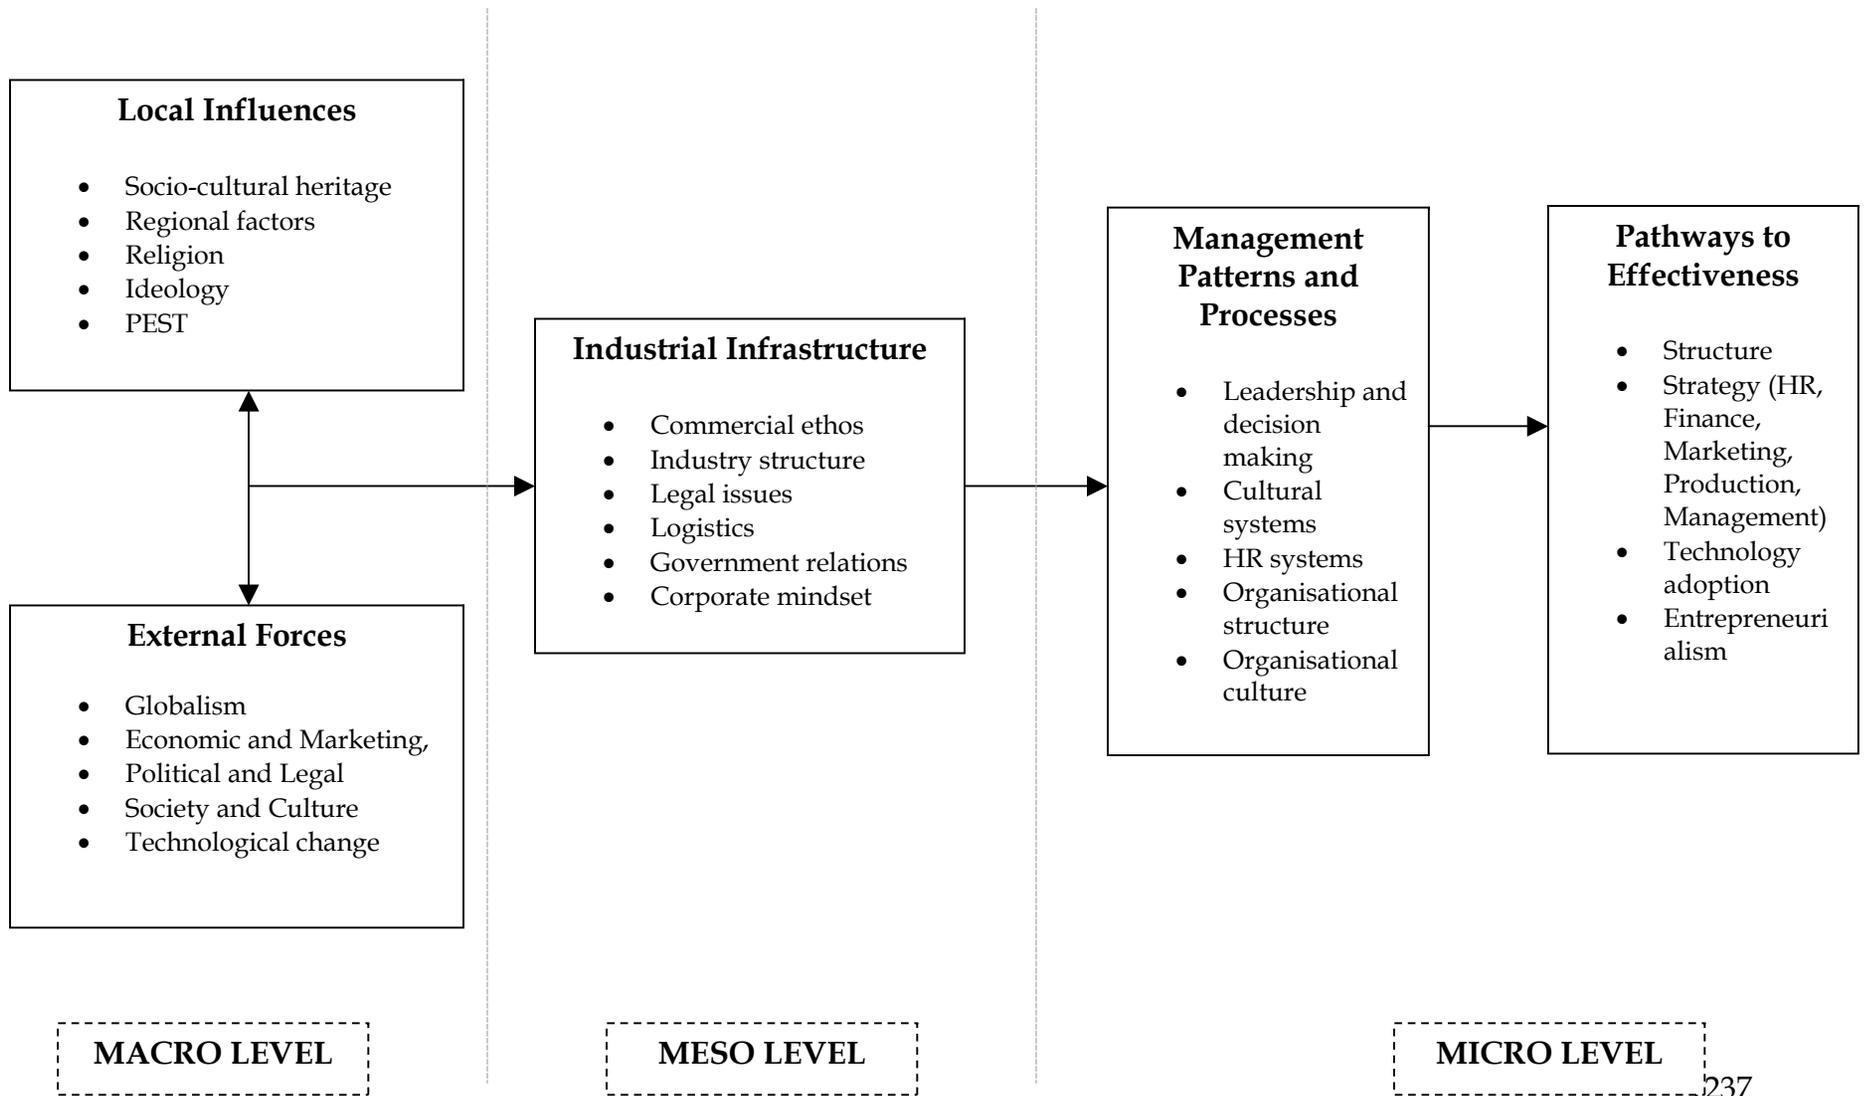

This paper introduces a comparative management framework as a means of better understanding the establishment Korean Management System. Whilst not specifically seeking to make comparisons with other management systems in this paper, the authors utilise a "Comparative Management Model for the Global Era" (Grainger, Nankervis and Chatterjee, 2005) to broadly describe the context and application of management systems in the industrial conglomerates, the Chaebol, which dominate the external and domestic economies of the Republic of Korea. After a very brief outline of the history and cultural origins of the Korean people, industrialization in the post Korean War era, the major elements of the modern industrial structure, the management approaches which prevail amongst the enormously powerful family dominated industrial conglomerates, the Chaebol, are discussed. The competitive strategies upon which the competitiveness of these industry groups is based are also outlined.

## Introduction

Understanding and providing advice in relation to management systems or components of management systems is really primary task for management scholars. And within this key mission, as economic activity globalizes, the need to understand and interpret different national management systems is really a priority. This paper provides a working application of a theoretically constructed comparative management model to a national management system - the management of the Korean Chaebols. The model utilized here was adapted from Chen's (1995) comparative management model, which was itself an extension of earlier work by Harbison and Myers (1959), Farmer and Richman (1965), Davis (1971), Neghandi and Prasad (1971). The current model operates at three distinct levels, macro, meso and micro. This device enables a useful re-interpretation of Chen's work by considering the global and local business environments (macro level), by highlighting national level industry features (meso level), and utilising this information as a background for considerations of particular approaches to management and managerial effectiveness (micro level). This approach was significantly inspired by the influential work of Bartlett and Ghoshal (1990), who have drawn our attention to the importance of considering the effectiveness of global corporations in local contexts, albeit that their principal focus has been on the business strategies of transnational corporations, and not specifically on management systems.

**COMPARATIVE MANAGEMENT MODEL FOR THE GLOBAL ERA (Grainger, Nankervis and Chatterjee 2005)**

The following sections utilise the re-interpreted model to describe the management systems of the key Chaebol groups in the Republic of Korea.

## **Macro Level: Local Influences and External Forces**

### *Republic of Korea - Country Profile*

Korea is the English version of *Koryo*, a kingdom established in the central Korean peninsula in AD 918. Korea has been subject to repeated Chinese invasions and intermittent Chinese occupations for centuries. And relatively recently, Japan annexed Korea as a colony in 1910 and following the defeat of Japan in the Pacific War in 1945, Korea's northern half fell under the influence of the USSR, while the southern half was a sphere of American influence. As the cold war between these two super powers developed, identification with radically different ideologies strengthened in the northern and southern halves of the country. In 1948, the south attained independence as the Republic of Korea while the Soviets simultaneously established the Communist Democratic People's Republic of Korea (DPRK) in the north. Two years later the DPRK attacked the Republic of Korea the first act in the devastating Korean War which lasted for three devastating years. United Nations forces led by the US eventually drove the DPRK out of the south and an armistice was signed, however the legacy has been an ongoing low level hostility between the two Korea's, with both sides maintaining large standing armies. Recent nuclear threats have from Pyongyang have retarded conciliation efforts towards the formation of a unified Korea.

In political terms, North Korea is a communist dictatorship with a dynastic, iconoclastic leadership. Politically isolated, it retains one of the world's last centrally planned economies, and currently faces desperate economic conditions - without aid from the developed world; millions of its citizens would certainly die from starvation. Much of the nation's industrial capital stock is beyond repair resulting from years of under investment and neglect. Industrial and power output has declined in parallel (CIA World Factbook 2005). In contrast, the Republic of Korea, commonly known as South Korea, has a powerful economy and is a major industrial and trading nation. As one of the Four Dragons of East Asia, South Korea has one of the fastest growing economies in the Asia Pacific region, with an average annual growth rate of more than eight percent over three decades. Just three decades ago, Gross Domestic Product (GDP) per capita was comparable with levels in the poorer countries of Africa and Asia. Even after the setback posed by the Asian Financial Crisis of 1997, its GDP per capita is sixteen times North Korea's, seven times India's, and is currently comparable to the smaller nations of the European Union (CIA World Factbook 2005).

### *National Culture: Religion and Ideology*

Although the precise origin of the Korean people are obscure, it is generally understood that Korea was first populated by migrants from the north-western and central parts of Asia, the Lake Baikal region, Mongolia, and the coastal areas of the Yellow Sea. Currently, South Korea has an estimated population of 48.5 million (CIA World Factbook, 2005) with a radically and linguistically homogenous population, with no sizeable indigenous minorities, except for some Chinese (approximately 20,000). However, the number of foreigners is steadily increasing with an influx of American soldiers associated with active US military support since the end of the Korean War, Chinese and other foreign national business immigrants, and thousands of workers from Southeast Asia attracted by the high rates of economic growth over the past three decades.

Korea's traditional religions are Buddhism and Shamanism, but the majority of the modern population are Christians (49 percent). Christian missionaries arrived in Korea as early as the 16th century, but it was not until the 19th century that they founded schools, hospital and other modern institutions throughout the country and Christianity has now become Korea's largest religion. Buddhism has lost influence over the years but is still practiced by 47 percent of the Korean population (CIA World Factbook, 2005). Shamanism – characterized by the worship of natural spirits, is still practised in certain pockets. The general influence of Korea's proximity to China, and the legacy of historical Chinese intervention in Korean affairs, means that Confucianism remains a dominant cultural influence. Since the Japanese occupation of 1910 - 1945, it has existed more as a living social philosophy, or a way of life, than as a separate philosophical or religious School. Chondogyo (Religion of the Heavenly Way) –

a native religion founded in the mid 19th century that fuses elements of Confucianism and Christianity is practised by a small percentage of the population.

In spite of invasion and occupation by China, Mongolia, Manchuria and Japan throughout its ancient and modern history, Koreans have succeeded in maintaining their distinctive identity, remaining one of the most ethnically homogenous countries in the world. All Koreans speak the distinctive Korean language which is classified as an Altaic language. It has affinities to Japanese language, contains many Chinese loanwords and written characters, and has a unique phonetic script, known as *Hangul*. With the intensification to globalization and the pervasive American influence, English is now widely taught in junior high and high schools.

#### *Economic Background*

The South Korean economy has undergone an extraordinarily rapid industrialization. In the aftermath of the Korean War, economic aid from the United States and Japan has been instrumental towards its economic development from one of the world's poorest nations to a contemporary industrial power. The country's GDP has expanded on average by more than nine percent annually since the mid-1960s when the military-dominated government established economic development as its primary goal and mobilized the nation's resources to achieve this goal (Chung, Lee and Jung 1997). A series of five-year economic plans began in 1962, concentrating on the development of export-oriented manufacturing fostered by strong government support in terms of sweeping economic, currency and financial reforms. During this growth era, economists branded South Korea as one of Asia's "Four Tigers", joining Singapore, Hong Kong and Taiwan, and in 1996 Korea gained membership of the OECD. By 1997, annual national budget figures showed revenues of US \$ 94.5 billion and expenditures of \$ 83 billion.

However, Korea was not immune to the rigours of the Asian Financial Crisis. In November 1997, Korea followed Thailand and Indonesia in suffering a loss of international investor confidence, resulting in a severe foreign exchange liquidity crisis. The Korean currency (the *won*) lost over fifty percent of its value against the US dollar by the end of 1997, and foreign currency reserves dropped to dangerously low levels. In December of the same year, Korea signed an enhanced US\$58 billion aid package, including loans from IMF, World Bank and the Asian Development Bank (Morden and Bowles, 1998).

In recovery from the Asian financial crisis, South Korea has begun an economic reform program designed to address some of the fundamental conditions which had destabilized its economy. Since that time, the South Korean government has begun a program to reduce the general economic influence of the *Chaebols* (large, multi-industry conglomerates), especially in relation to the financial sectors which has been weakened by a large number of non-performing loans. During the growth era, observers had characterized the close business-government relationship between the Chaebols and the Korean Government as 'Korea Inc.', where the national government set the policy frameworks in which the conglomerates operated and prospered (El Kahal 2001). In this system, government traditionally controlled firms' access to capital and thereby dictated the strategy and operations of the Chaebols (Ungson et al, 1997: 43). More recently, the Chaebols have been pressed to spin off their non-core businesses, and to rationalize their corporate structures. In other economic measures aimed at stimulating domestic demand, the South Korean government enacted a package of tax cuts directed at lower and middle income workers. The government also has plans to privatize several large state-owned enterprises, including the State Electric Utility, Korean Electric Power Corporation (KEPCO) and natural gas monopoly Korea Gas Company (KOGAS).

Services industries make up approximately 60 percent of the Korean GDP followed by industry (36.4 percent), and agriculture (3.6 percent) (CIA World Factbook, 2005). Korea is currently the world's largest ship builder, second biggest steel producer and home to the world's leading semi-conductor manufacturers. South Korean exports in 2003 earned US\$201 billion with semiconductors, wireless telecommunications equipment, motor vehicles, computers, steel, ships, and petrochemicals being the major export commodities. Major export partners were the China (18.2 percent), US (17.8 percent), Japan (9 percent) and Hong Kong (7.6 percent). Imports in 2003 totalled US \$175 billion estimates with machinery, electronics and electronic equipment, oil, steel, transport equipment, organic chemicals, plastics being the major commodities. Korea's major import partners were Japan (20.3 percent), US (13.9 percent), China (12.3 percent) and Saudi Arabia (5.2 percent) (CIA World Factbook, 2005).

*External Factors: Drivers of Globalisation and Foreign Investment Policy*

The major forces driving Korea as a leading world economy of the world have been supportive government policies on foreign investment, and efficiencies derived from increased competition in a variety of industries within the Asia-Pacific region, technological advancements and infrastructure building, low cost production offering economies of scale and scope and increases in disposable income and market size in the Korean economy (Kim and Campbell, 1995; Sohal and Ritter, 1995).

#### *Government Enablers*

Since the 1960s, South Korean government intervention towards the establishment of an export oriented and relatively protected domestic economy has been a highly successful formula for growth. However, as part of the recovery process from the Asian Financial Crisis, the government is steadily changing its longstanding discouragement of foreign participation in the indigenous economy (Whiteley and England, 1977). “Liberalisation and deregulation is slowly opening the economy to foreign investors, especially in the areas of construction, telecommunications, distribution and finance” (Yip, 2000: 70). The basic policy direction of the Korean government on foreign investment has been to facilitate market access and provide domestic status to foreign firms after their establishment through a number of initiatives (El Kahal 2001). Some of the initiatives that have brought about a positive climate for investment in Korea include granting domestic status to foreign investors to encourage free and fair competition between indigenous and foreign companies; replacement of the Foreign Capital Inducement Act of the 1960s with the new Foreign Investment Promotion Act to attract foreign investment; and implementation of the High Tech Industry Cooperation Act of 1995 to provide financing and taxation benefits for Foreign Direct Investment (FDI).

The government has also directed initiatives towards reducing and eventually dismantling the restrictive trade barriers which have protected the indigenous economy against foreign influence. The government has also promoted the use of market mechanisms to improve the competitiveness of Korean firms by lowering tariffs and loosening regulations. For example, one of the major trade barriers against Japanese imports was the import diversification regulation which was intended to block Japanese imports that might have had a direct negative impact on Korean products such as consumer electronics and automobiles. This regulation disallowed Japanese-made Toyotas or Hondas from being imported into Korea, while American and German cars were allowed to be freely imported.

Recently, the government has proposed a series of laws related to the protection of intellectual property rights and patent laws which would be a critical in encouraging American, Japanese and German Multinational Companies (MNCs) to invest capital or transfer technology to South Korea. The government hopes to attract foreign investment and acquire the latest technology by implementing these laws governing intellectual property and patents.

#### *Market Enablers*

With a per capita GDP of US\$17,800 (2003 estimates), the level of disposable income in the hands of South Korean consumers has provided a general rise in the standard of living and has altered consumer tastes and preferences. South Koreans are being exposed to foreign cultures as opportunities for higher education, international travel; cross-border business networks and alliances have increased (Morden and Bowles, 1998). Research on changing consumer preferences indicates that younger Koreans are being influenced accordingly, and demand for Western style goods is increasing. A recent Electronics Industry of South Korea study indicated that 29.6 percent of Korean respondents preferred South Korean products whereas 6.6 percent purchased foreign products. However, 63.8 percent of the respondents indicated that they were undecided, suggesting that there were favourable market opportunities for foreign goods to enter the South Korean markets.

Over the past ten years, several foreign MNCs have made inroads into the South Korean economy. Some of them include fast food giants KFC and Pizza Hut and home appliance MNCs including Phillips, General Electric, Siemens, Whirlpool, Westinghouse and Moulinex. With the Korean government’s initiatives to deregulate distribution channels since July 1993, more than one hundred distribution-related foreign businesses have commenced operation in South Korea, particularly in areas of retail, wholesale and services. These include Amway and Nuskin in multilayered distribution, Tower Records and Museum Company in speciality distribution, and Sharper Image in catalogue retailing (Jun and Yip 2000). French hypermarket chain Carrefours, Dutch Makro

distribution chain, and American warehouse shopping giant Price Club have all made inroads into the Korean economy. The opening up of the distribution networks has also provided opportunities for Japanese companies to enter the Korean economy.

It is clear that South Korean Government policy will provide significant competition in the domestic market place for the indigenous industrial conglomerates, the Chaebols, which have been responsible for so much of Korea's export led growth in the post Korean War era, and have dominated much of the home market. The next section will provide a micro level description of the business management structures and systems of these behemoths, since their central place in the economy means that an understanding of them is integral to an understanding of Korean Management.

#### *Demand Side Enablers*

A number of observers have noted South Korea's growing importance as an economic powerhouse not only in the Asian region, but also across the globe as a global player. A wide variety of Korean MNCs across the automobile, semiconductor, consumer electronics, steel and shipbuilding industries are now world leaders in their respective fields. For example, Hyundai, Samsung and LG together account for approximately twenty six percent of the global memory chip industry (Jun and Yip 2000). Daewoo, Hyundai and Kia have made strong inroads into a number of countries in Asia-Pacific and across the globe. Further, the information revolution supplemented by a burgeoning middle class and a rapid expansion of per capita income has led to an enormous increase in demand for new appliances in the domestic market. The cellular phone market evolved during 1993-94 and by 1996, the demand had reached 2.4 million units and latest estimates show a demand in the range of 33 million units in 2003 (CIA World Factbook). With 29.33 million internet users connecting to the information gateway, the demand for personal computers is rapidly increasing.

#### *Supply Side Enablers*

South Korea is no longer attractive as a low labour cost production site owing to increased manufacturing wage rates, higher inflation rates and interest rates when compared to Japan, Singapore, France, U.S. and Germany (Jun and Yip, 2000). However, South Korea with its well-educated, highly trained workforce provides operational efficiencies and production improvements for high value-added products as an offset to high labour costs. The unfavourable increase in labour costs is also being offset by the rapid expansion of its domestic market which makes it easier for companies to achieve economies of scale and scope in production and marketing. This has led to a radical change from labour-intensive to capital and technology-intensive mechanisms whereby production has shifted from multistage assembly-type handling with large number of workers involved to a high degree of automation, electronically controlled testing and inspection and the development of new parts and components. Technology adoption and deployment has given South Korean firms especially in DRAMs, LCDs, satellite receivers, ultrasound diagnosis technologies, semiconductors, memory chips and wireless telecommunications equipment including pagers and mobile phones a healthy competitive advantage (Kim, Nam and Stimpert, 2004).

The South Korean government has been continuously upgrading its infrastructure to promote the country as an attractive business location as well as to assist indigenous industries to compete in the global arena. The government has initiated a number of large-scale public works to remove bottlenecks and improve transportation and logistics through South Korea (Kim, 1996). Government initiatives aimed at improving logistical networks include construction of Yongjong-do New International Airport, the expansion of port capacity at Kadok-do and Kwangyang, completion of the West Coast Freeway and the Seoul Pusan High Speed Railway. The government is also considering initiatives to strengthen international trade, banking, finance and transportation regulations and generally reduce bureaucratic restrictions to business initiatives.

## **Meso Level: Industrial Infrastructure**

#### *Korean Chaebols: Business Organizational Characteristics*

A *Chaebol* can be defined as a Korean business group comprising of large companies that are owned and managed by family members and relatives in many diversified business areas (Chen 2004). The term *Chaebol* means a

financial faction linked to various corporate enterprises engaged in diverse businesses producing and offering a wide variety of products and services. Normally, such a conglomerate is owned, controlled and managed by family group, or perhaps two inter-related family groups (Ungson et al., 1997).

#### *Rise and Growth of Korean Chaebols*

The first Chaebols were formed in South Korea in the 1920s and 30s when Korea was under Japanese colonial rule. To a large extent, Japanese interests planned and shaped Korea's economic development to satisfy its markets and set up a series of companies that were privately owned and managed but under strict control of the central government – through credit, licensing approvals and other measures (El Kahal, 2001). This system installed by the Japanese was later extensively revamped and developed during the tenure of President Park Chung Hee from the 1950s to the 1970s. The regime selected a few companies which received preferential treatment and a range of subsidies to grow and prosper, which became known later as Korean *Chaebols*.

Chaebols can be classified into three groups: the late 1950s Chaebols such as Hyundai, Samsung and LG which were created by self-made founders who benefited from the sale of government owned properties, preference in taxation and the preferential allotment of grants. Chaebols of the 1960s such as Hanjin, Korea Explosive, Hyosung, Sangyong, and Dong-A were formed with the help of foreign loans during the institutionalisation of the five-year plans proposed by the government. The last group are the Chaebols of the 70s and include Daewoo, Lotte, Doosan, Kolon and Sunkyung which were the offspring of the rapid growth in exports and local demand (Chen 2004). These conglomerates have become the pride of the Korean economy and have enjoyed monopolistic profits as a result of the strong government backing in the form of tax concessions, tariff barriers and wage and labour movement controls in a wide variety of industries. They have employed over a million employees and have acquired a massive, and some would argue, excessive, concentration of economic power.

#### *Features of Korean Chaebols*

The major difference between Korean Chaebols and the Japanese Keiretsus is that generally, Chaebols do not have financial institutions (banks) as part of the group, hence making them more dependent on government approval, especially after the nationalisation of South Korean banks in the mid-1970s (El Kahal 2001). Also, unlike Japanese Keiretsus which are vertically integrated within the same industry, Chaebols are commonly spread across numerous industries. Further, they tend to have a more formalised organisational structure and more centralised control than their Japanese counterparts. And in contrast to the Keiretsus, the Chaebols are family dominated, highlighting a fundamental difference in the concept of 'family members' which exists between the two cultures (Lee and Yoo, 1987a). That is, the Japanese concept of 'family' consists of two distinct meanings – one is the concept of family based strictly on blood relationship and the other is the concept of household which is not only based on blood relationship but also on adoption. The Korean concept is strictly based on blood relationship. This inherent difference in concept has important implications for family inheritance and ownership structure. In Korea, inheritance is strictly an outcome of blood relationship, with the eldest son enjoying priority over other family members (Lie, 1990).

According to Hattori (1989: 87 – 88), the family ownership of Chaebols can be classified into three types. The first is direct and sole ownership, where the founder or his family members owned all the Chaebol affiliated companies. An example of this type is the Hanjin group. The second was the domination of a holding company, which in turn owned the affiliated companies. The Daewoo group fits into such a structure. The third was interlocking mutual ownership, where the founder of his family members owns the holding company and/or some kind of foundation, which in turn owns the affiliated companies. The Samsung group represented this type. Chen (2004) notes that the common trend seems to be a progression from the first type to the third as the Chaebols grow in size, though it may be a long and difficult process.

Another distinguishing factor of the Korean Chaebols is their commitment to entrepreneurship. The strong entrepreneurial orientation which has encouraged risk-taking has largely contributed to the rapid growth of the Chaebols during the 'Asian Miracle' and also to their sudden collapse during the Asian Financial Crisis (Morden and Bowles, 1998). Chaebols can move more quickly and decisively than their Japanese counterparts as they are much smaller and because their family dominated management structures mean they have to devote much less time to consensus-building among different managerial levels (Ungson et al., 1997). "This characteristic has proved

valuable in riding the Asian crisis through the introduction of swift measures of restructuring and reforms” (El Kahal 2001: 168).

## **Micro Level: Approaches to Management and Effectiveness**

### *Management Patterns and Processes*

Understanding Korean management style, patterns and processes is important for overseas companies, business partners and managers liaising with Korean companies and managers. Observers have noted that Korean management is at present undergoing a radical change owing to a massive corporate restructuring process. Despite these changes and the increasing Western cultural and management influences, Korean management remains unique. A brief description of the characteristics of this unique management style is presented next.

### *Organisational Culture*

Korean companies have developed their own management style often referred to as K-type management. This unique management style is underpinned by Chinese Confucianism ideas, as well as Japanese and American management influences. The resultant outcome is said to represent a unique blend of Western and Eastern management philosophies and practices (Morden and Bowles, 1998; Fukuyama, 1995; England and Lee, 1971).

Koreans are traditionally hard working people. This trait can be traced back to the Confucian value system and is referred to as *eui-yok* which means ‘will’ or ‘ambition’ (Ungson et al., 1997: 170-01). An employee with *eui-yok* has an internal drive or motivation to succeed and to accomplish something important. While this internal achievement oriented drive exists in both Eastern and Western work ethic, the basis of focus of this drive is different in the two contexts. In Korean a ‘Confucian’ work ethic, an employee’s work effort is primarily group oriented. *Eui-yok* entails hard work so that the group or the company benefits. The Western Protestant work ethic however emphasises individual advancement and achievement. The employee generally puts himself first. Indeed Davis and Rasool note that “the goal of organisational growth is highly valued by Korean managers, relative to managers from other countries, and represents their strong desire for continued industrial development of Korea (1988: 16).

These values underpin the basic principles of K - type (Korean - type) management which include: top-down decision making, planning and coordination; authoritarian and paternalistic leadership; *inhwa* (harmony oriented cultural values); centralised management; flexible life-time employment; compensation based on seniority and merit; and high mobility of workers (Lee and Yoo, 1987b). Each of these features is discussed in the next section.

### *Leadership and Decision-Making Styles*

Given the strong influence of family traditions, there is a tendency for Korean business leaders, especially founders, to manage on the basis of principles governing the family or clan system. As Confucian dynamism favours regimentation and authoritarianism, authority in Korean firms is concentrated at senior levels of managerial hierarchies with the Chairman on top, followed by the president, vice-president, senior managing director, managing director, department manager, section manager to the foreman and blue-collar workers (Morden and Bowles, 1998). Thus, a top down decision making style is common among Korean companies. Approximately eighty per cent of the authority lies in the upper management levels, with middle and lower management having a very limited authority (Lee and Yoo 1987a). Authoritarian leadership has been a well accepted managerial norm under the centralized structure of Korean companies with the reins of management generally being held by one central paternalistic figure (Fukuyama, 1995). The chief executive or founder usually accepts personal responsibility for the performance of every aspect of the company. It is expected that a supervisor or manager will assume personal responsibility for the development of his subordinates who in turn will respond with respect and obedience. A manager or supervisor also takes an active interest in his subordinate’s family life, attending functions, and giving gifts on occasions. (This is in contrast to the Western norm that clearly separates work life from home life). However, the traditional decision making *pummi* (proposal submitted to deliberation) is still practised and used to predominantly diffuse responsibility (De Mente 1991).

This paternalistic authoritarian behaviour is heavily influenced by a key value of Korean behaviour *inhwa* which is defined as harmony, and is similar to the Japanese concept of *wa*. *Inhwa* emphasises harmony between

unequal in rank, power and prestige (Alston 1989). Korean managers cherish good inter-personal relationships with their subordinates and try to keep the needs and feelings of subordinates in mind. Another aspect of *inhwa* is that each party has responsibility to support the other. Managers tend to make decisions in consultation with their subordinates. The process of informal consensus formation or *sajeonhyupui*, is similar to the Japanese *nemawashi* but Korean subordinates are normally reluctant to express their opinions to their supervisors (Chen 2004). Managers are often expected to consider their subordinates feelings before making appropriate decisions. Managers maintain various interactions with subordinates informally to achieve harmony-oriented leadership based on mutual trust and benevolent authoritarianism.

#### *Centralised Planning, Co-ordination and Communication*

Most Chaebols have a planning group, known as the planning and co-ordination office, the central planning office, or the office of the chairman (Chen, 2004; El Kahal, 2001). The central planning group works closely with the group chairmen in major decision making including design, development and implementation of strategic plans for future corporate actions. The group office collects, analyses and prepares reports for dissemination to the chairmen and other core members for future decision making. The planning group also plays a major role in personnel decisions and is mainly responsible for screening, hiring and assigning newly recruited staff with a view to ensuring continuity and quality across various business units. The group also overlooks the transfer of personnel between functional units and companies and also the overall salary structure and bonus system.

Formal communication in Korean businesses is mainly achieved along vertical hierarchies which are an outstanding feature of organisational communication (Lee 1989). The organisational communication process depends largely on hierarchical relations, which are determined by a combination of factors, ranging from formal authority and informal social status to length of employment and age (Chen 2004, Morden and Bowles, 1998). In the vertical communication process, superiors are expected to give directives to their subordinates who in turn are expected to comprehend and implement those directives. The directives are oftentimes vague and general as opposed to being specific and detailed and subordinates prefer using their own judgement in interpreting the directives rather than asking their superiors for clarifications. A study across twenty seven Korean organisations concluded that lower levels of centralisation and conflict in Korean organisations were associated with positive employee perceptions of organisational climate (Sommer, Bae and Luthans, 1995). Another feature of communication in Korean companies is that Korean employees usually attach more importance to upward formal communication on hierarchical lines rather than to communication on horizontal interdependent lines which may have resulted from the high centralisation of authority. De Mente (1991) has noted that poor horizontal communication between vertically structured departments has become a major barrier to many large Korean companies to efficient organisational performance.

#### *Motivation*

Like the Japanese work force, Korean employees are highly motivated and known for their long working hours. Korean culture underpinned by Confucian influence has contributed to this conscientious work ethic. Confucian values of diligence and harmony combined with an instinct for survival are the driving forces that motivate Koreans to work hard. While specific motivations vary depending on the size and structure of the company and the level of seniority, high wages and job security tend to be the most important motivational factors (Chen 2004). According to a 1984 study conducted by the Korean Chamber of Commerce and Industry, executives of large companies cited 'environment for voluntary participation' as the most effective incentive, while CEOs of small companies regarded the management-by-objective (MBO) system as the best motivational technique. Further, it was also reported that older workers over sixty years of age cited wages as the most important incentive for hard work, while new management staff under thirty years of age viewed 'environment for voluntary participation' as the most effective means of motivation and increasing productivity (Kim and Kim 1989). Lee (1989) notes that Korean employees working as a group emphasize extrinsic factors including wages, working conditions and job security much heavily than on intrinsic factors like creativity (*changjo*), achievement and recognition for high enthusiasm and motivation. Given that harmony and a strong work ethic have become the most cherished values of Korean employees, the external factors are even more important as the employee's value group interpersonal relationships. Chen (2004) however notes that with Korea's embrace of the intensification of globalisation and increased complex environment

in which the Korean companies operate, more and more Korean companies are shifting their emphasis to intrinsic motivation factors in order to establish a worldwide status and brand name.

#### *Human Resource Management*

Korea has a large pool of well educated, skilled and highly motivated workforce. About ninety eight percent of the populace can read and write (CIA World Factbook 2005) and English is now widely taught in junior high and high schools. More than eighty percent of Korean teenagers finish high school studies and a majority of high school graduates attend university, vocational or professional training schools. This vast talented pool of fresh graduates provides a recruiting minefield for Korean companies whose human resource management priorities include recruiting the best candidates from this pool, designing and operating on-the-job training programs, instituting and reward and appraisal program, determining severance and retirement policies and defining industrial relations policies while dealing with trade and labour unions.

#### *Recruitment and Training*

Most large Korean companies classify employees into three distinct categories: core (top management), basic (permanent staff) and temporary. Most Korean companies hire employees through word of mouth or reference checks, a test for knowledge in specialised areas, tests for English proficiency, a personal interview and a physical/medical examination. Korean companies prefer fresh talented college graduates or experienced professionals (Chen 2004, Lee 1989). Recruitment in large Chaebols is very competitive and campus recruitments in June and November often attract the brightest graduates from prestigious Korean universities.

#### *Compensation and Promotion: Emphasis on Seniority and Merit*

Reward and promotion systems in Korean companies are traditionally based on seniority and merit. Increasingly, performance has become an important factor in reward and promotion-related decisions (Lee, 1989). Over time, Korean companies have gradually combined seniority with performance in their reward distribution rationale. Wages are generally based on seniority, but bonuses may be awarded based on performance in many Korean companies (Chen 2004). It is strongly believed that the seniority system contributes to the maintenance of group harmony and reduces competition between co-workers.

#### *Severance and Retirement*

Lay-offs are common in Korean companies. Moving with business cycles, Korean companies lay off staff during a general downturn in the economy when cost cutting initiatives are imperative. Korean employees are known to change jobs freely, though many of them work with one organisation until retirement. Job-hopping is quite common among skilled staff and although Korean employees attach great importance to their companies, they would not normally feel embarrassed to accept better position/pay offers from other companies. Song (1990) noted that because the concept of loyalty in Korea is based on individual relationships, the loyalty of Korean employees is often devoted to a specific superior and when a manager moves to another company on a better offer (position and or pay), often the manager may bring many of his loyal subordinates to the new company.

Most Korean companies do not have a uniform retirement age, though many require their staff to retire between 55 and 60 years of age (Chen 2004). Retirement age depends on rank and senior managers and executives usually have an extended retirement age. Korean companies do not normally make a distinction between resignation and retirement age in calculating severance or retirement pay. Chang (1989) noted that most Korean companies set aside one month's salary per year for severance or retirement whereas some companies put in an additional two or three months per year in calculating the total period of service.

#### *Competitive Strategies*

Many Korean companies achieved rapid economic growth and development by improving their manufacturing and service capabilities and diversifying their businesses before the Asian Financial Crisis of 1997. With radical reforms institutionalised by the government enabling foreign companies to directly invest in the Korean economy and supported by a well established infrastructure, Korea's economic progress was unstoppable (Morden and Bowles, 1998). Foreign multinational companies increasingly recognised Korea's potential as an emerging economic powerhouse and made Korea part of their regional and global strategies. Korean Chaebol corporate strategies were also aimed at expanding the profile of the Chaebols as world class conglomerates offering products and services worldwide. As competitive strategies have a significant impact over organisational structure, processes and

managerial efficiency, an analysis of the competitive strategies commonly adopted by Korean companies helps understand the positive turnaround and development of Korean businesses.

#### *Manufacturing Development and Product/Service Strategies*

In the pre-financial crisis era, many Korean companies took advantage of the trade liberalisation policies institutionalized by the government, especially the import-substitution policy and adopted a strategy of selecting growth/maturity stages of products (Hahn 1989, El Kahal 2001). As unskilled labour was inexpensive and in abundant supply, most companies concentrated on labour-intensive light manufacturing industries. A number of cement and fertilizer industries were also developed to assist the agricultural development initiatives. This development initiative was a win-win situation for both the government as it saved much needed foreign exchange by investing domestically and dramatically. This was also positive for individual companies, as they were strongly backed by the government and quickly developed into worthy competitors for labour intensive products in the global marketplace (Chen 2004, Lee, 1992).

As the government increased its investment in infrastructure and telecommunications in Korea, the government promoted technology transfer and duplication incentives (Cho, 1993; Gywnne, 1993). Kim and Kim (1989) note that large intermediate goods manufacturers of cement, fertilisers and chemicals adopted an apprenticeship strategy and relied heavily on support from foreign entities via turnkey plants, licensing and consultancy. Korean technicians and engineers received orientation, training and know-how which enabled them to use the expertise in maintenance and development of the initiatives. Smaller manufacturing companies on the other hand, did not have any financial resources to negotiate with the suppliers of foreign technology and hence resorted to alternative measures like upgrading their products/services and technologies through reverse engineering and imitating locally available foreign products. Chen (2004) notes that this approach was prevalent in the early period of the technology transfer initiatives. Korean Steel Pipe, for example, successfully duplicated and improved the Japanese model through imitation.

#### *Diversification and Market Participation Strategies*

Diversification strategies are crucial for gaining competitive advantage and are important for growth in any business. Large Korean Chaebols had pursued diversification strategies until the mid-1990s and these strategies had been well supported by the Korean government. The government supported its dream of developing world class conglomerates that could compete successfully in the global environment by encouraging Chaebols to implement 'octopus-arm' diversification strategies (Chen 2004). The encouragement provided by the government coupled with strong Korean entrepreneurial mindset propelled the major Chaebols like Samsung, Hyundai, LG and Daewoo from locally based organisations to global business houses in two – three decades and developed as the pillars of the Korean economy. Kang (1989) contends that the Korean attitude of 'get the order first and figure out how to do it later' helped this initiative.

Diversification strategies can be categorized as: single, vertical, dominant-constrained, dominant-linked, related-constrained, related-linked and unrelated. Large Chaebols like Samsung tended to follow the strategy of unrelated product diversification by entering into sugar and woollen textiles in the 1950s; electronics, fertiliser and paper production in the 1960s; shipbuilding in the 1970s and aircrafts, bio-engineering and semiconductors in the 1980s. Smaller companies generally pursued the strategy of pursuing a single or dominant and well established product structure. Medium-sized companies tended to adopt related product diversification, strategy that was in between what the large and small companies pursued (Cho 1989). Table 3 outlines the growth strategies of Chaebols. Diversification strategies also varied across industries with vertical diversification adopted by textile manufacturers owing to a continuous supply of raw materials and market outlets being critical for survival. Companies in the food and beverage industry generally adopted a related-constrained strategy whereby products closely related to each other in the use of raw material and distribution channels were manufactured. The dominant-constrained strategy was seen to be popular in the metallic and non-metallic industries as it enabled management to focus on a few dominant product lines using the same organisational resources (Chen 2004).

## **Conclusion**

This paper has utilized a comparative management model to describe the prevailing management approach for the Chaebol, large industrial conglomerates which dominate the South Korean economy. This model has enabled an examination of the Korean business environment and business management systems at macro (global and local environments), meso (industrial infrastructure) and micro (managerial and managerial effectiveness) levels.

Korea, always in the shadow of its powerful neighbours China and Japan, has had a remarkable political, economic and cultural history. Perhaps the most striking feature of this history is the fact that Korean culture, society and nation has survived in its precarious neighbourhood. Exemplifying this spirit, following the pervasive destruction of the Korean War between 1950 and 1953, the Korean Government utilized the Chaebol, clusters of family dominated companies with family dominated confucianist management hierarchies, as a vehicle for rapid industrialization and entry into international markets. This approach was spectacularly successful, apart from the temporary disruption of the Asian Financial Crisis of 1997. Contemporary Korea, is confidently expanding its industrial base, taking full advantage of globalizing trends, especially in terms of access to foreign markets and adoption of technology. Current Korean government policy, in contrast to the first phases of economic post Korean War expansion, continues to facilitate the international operations of the dominant Chaebol groups, is increasingly allowing foreign entry to the Korean domestic market enhancing competitiveness and efficiency in the deployment of human, capital and physical resources. The Korean management system, a unique hybrid of native and foreign influences, continues to adapt and evolve in the age of globalization. The mainstay of the management system, the highly educated and motivated Korean workforce, nurtured by government economic, education and ICT policies, remains a fundamental source of managerial effectiveness and competitive advantage.

# **Creativity, Innovation and Technology Transfer: Towards a New Strategic Management Paradigm**

*John Milton-Smith  
Curtin University of Technology, Western Australia*

## **Abstract**

This paper explores the fundamental limitations of the two-step technology transfer mindset by examining two major examples of its failed application. The first example is the notorious disconnect between university research and business performance. The second examines the unsuccessful attempt to establish a major aircraft factory in Indonesia as part of a rapid industrialization strategy. The failure of these examples is then set against the outstanding success of both long-established and relatively new enterprises such as Johnson & Johnson and Dell Computer. These success stories highlight the importance of tight customer focus and the strong branding of an integrated business model. They demonstrate also the importance of taking a broad view of innovation and of recognizing the power of intangible, aesthetic and emotional sources of customer value, which many traditional, technology-focused research institutes and innovation programs tend to ignore. Drawing upon the analysis of both successful and unsuccessful cases, the paper proposes a new strategic management paradigm which emphasizes the critical role of innovative, entrepreneurial leadership in designing business models, creating resource capabilities and converting these capabilities into new sources of customer-centered added value. The implications of this paradigm for organizational design, and especially for university research management and structures, are then outlined and depicted in an ideal model labeled INOVACC (Interactive Network of Value Adding Core Competencies). An elaboration of this model, including a detailed description of Hollywood film-making, demonstrates the central importance of creative ideas and innovative systems, such as knowledge and competency-based networks and multi-disciplinary project teams, as essential capabilities for building and implementing effective business models.

## **The Myth of Innovative University Research**

The power and pervasiveness of myths should not be underestimated and their cost is probably best left uncalculated. Mindsets develop roots, stakeholders become entrenched, assumptions turn into beliefs and so the capacity to learn is lost. Take the case of universities and their contribution to innovation, for example. Anybody stoic enough to make a comprehensive study of university mission statements would discover that most universities claim they give very high priority to being innovative and to having a world-class reputation for it. Linked to this boast, in most cases, is an extravagant commitment to partnership, especially research and development partnerships, and to working closely with business in creating new products, processes and technologies. In some cases companies have established campus-based research facilities. However, while a parallel study of corporate mission statements, annual reports and planning documents reveals a similar commitment to innovation and partnership, there is very little reference to the contributions of specific universities. Certainly it is extremely rare to find universities being given credit for commercial triumphs or business out-performance. From the corporate side, it would appear that university research collaboration is frequently at the margin, related to a highly localized requirement, or even simply just based upon philanthropic, broadly-defined sponsorship.

The myth of university innovation is clearly exposed by probing the reality of research funding and management. It is frequently the case that an individual academic's research status, recognition and rewards are determined more by traditional academic peer review processes than by his work's innovative impact in the external environment. It counts much more to give an esoteric paper at a local academic conference than to present an invited keynote address to a major international conference of business or professional practitioners. A competitive research grant awarded by a government research body would probably attract much more professional glory than a fee ten times that amount to conduct a major research project for Microsoft or Boeing. Similarly, a scientist responsible for creating a patent, which proves to be impractical and is never commercially implemented, will generally be given

more research credit by his university than the colleague whose advice leads to major changes in a bank's customer relations.

The absurdity of using crude quantitative measures to assess research quality is demonstrated by the debasement of the patent system. Originally devised to protect and facilitate innovation, it now has the opposite effect, as a quick Google search reveals. An exploration of headings such as 'patently absurd', 'patent madness' and 'patent stupidity' soon throws up a plethora of bizarre mutations, which are obviously more concerned with blocking competitors by partitioning off large markets or basic technical functions, than with creating and securing genuine, value-adding innovations. For example, Amazon has patented 'one-click ordering' and other leading companies such as Dell, Intel and Kodak have obtained patents which will allow them to monopolize significant market segments and functional capabilities. Given that there are patents for such banal so-called inventions as pet toilets, meditation bags and keeping calendars on the Web, it is remarkable that research reports continue to cite the number of patents applied for and granted to an organization, as though they are reliable indicators of research performance, often without even disclosing whether or not the patent was eventually implemented (see Shulman. 1999; Monbioy. 2002).

Universities seeking a research reputation generally encourage, even pressure academic staff to maximize their research output, which is frequently evaluated on an annual basis (National Survey of Research Commercialisation. Year 2000, 2002, pp.8-11). There are strong incentives to publish as much as possible in as short a space of time as possible. From an innovation perspective, this approach is highly dysfunctional because it motivates ambitious staff to publish numerous fragmented, trivial papers in relatively unread technical academic journals, rather than to write a more carefully-considered, wider-ranging article for a magazine with a larger, more influential readership base. The debasement of research quality is reinforced by the ever-increasing proliferation of mediocre specialist academic journals, which are launched in order to accommodate the flood of material seeking publication. Ironically, an article commissioned by the editor of an international paper such as the *Financial Times*, or a magazine such as *Fortune*, and read by senior executives and decision-makers all over the world, would not normally count as a research publication, or be taken into account in measuring the academic's research productivity, no matter how erudite and influential (Morris. 2005, p.68).

Commercial arms such as consulting companies and cooperative research centers, involving representatives from university faculties, government research organizations and corporate partners, are among the most commonly-used entities for transferring and commercializing academic research. However, there can be little doubt that universities are much more comfortable and successful in producing curiosity-driven research, as opposed to strategic or applied research. Despite indirect subsidies, and access to an extensive variety of resources and facilities, very few university-controlled technology transfer companies and 'spin-outs' have maintained a consistent record of commercial viability, with those operating at Stanford and Cambridge universities, for example, being very much in the minority (McLeod. 2004). Even when universities are active in contributing to, or developing science parks, there are very few examples of spin-offs or partnerships becoming successful new publicly-listed companies. Indeed, it is generally the case that the majority of enterprises located near university campuses have little or no regular contact with the neighbouring academics. Although there is a great deal of scope for linking staff and student research projects, professional secondments and work experience programs with the development of new entrepreneurial ventures, such initiatives are rare. Despite a great deal of rhetoric, and a profusion of high profile committees, there is a notable absence of innovation in creating the kinds of business models, management structures, integrative mechanisms and course curricula which would transform the knowledge-based, task-orientation and work skills of those involved in university/science park precincts.

What is the explanation for the persistent disconnect between university research and business performance? One reason stems from the entrenched university tradition favouring pure over applied research. This bias has been reinforced by the late development of business and management schools and the poor funding support which they have typically received. Research grants allocated to these areas remain a small fraction of funding directed towards science and technology projects. Another factor, related to the first, is the influence of political agendas, and especially iconic public policy programmes in fields such as defense, health and telecommunication. The love affair with technology, and research emphasizing discovery and invention, probably got out of control in the 1960s following President Kennedy's challenge to put a man on the moon and bring him back before the end of

the decade. As the delusion that technological invention is synonymous with human progress took hold, university research budgets became increasingly distorted and imbalanced. Not only did science and technology take priority over social, cultural, economic and management issues, but in some countries business-related research was not even accorded the status of a distinct funding category.

## **A Comparison of Two Technology Transfer Strategies**

A comparison of the very different technology transfer strategies pursued by Indonesia and Singapore in the early 1990s highlights the dilemma facing university research strategists. Singapore from the beginning set out to work closely with, and learn from, its carefully chosen technology transfer partners. It also took pains to ensure that technology transfer arrangements were always driven by business strategy, not the other way around, as was the case in Indonesia. The approaches adopted with respect to the aircraft industry illustrate the difference very clearly. Taking account of global trends in the industry, the Singaporeans designed a business model which positioned their country as a major regional hub, with the emphasis upon service-related activities. Accordingly, they developed close partnerships with the major aircraft manufacturers and airlines in order to acquire the tacit knowledge, as well as the technical skills, needed to meet the very specific requirements of their partners. In addition, the Singapore Government was both entrepreneurial and innovative in creating and branding a world-class airline, airport, aircraft maintenance center as well as a major and annual aerospace exhibition. This is an outstanding example of a value-adding cluster effect in which service quality is emphasized as heavily as technological excellence.

In contrast to the Singaporean approach, Indonesia set out to establish an aircraft manufacturing industry. Under the responsible minister, Dr.Habibie, an engineer, a company (IPTN) was established in order to achieve this objective, as part of a larger national strategy for rapid industrialization. It was assumed that, by acquiring technological capabilities in a variety of high technology industries, these skills would then be gradually diffused, transferred and re-applied throughout the economy. It was a false premise. Although IPTN was successful in learning from its foreign partners how to manufacture high quality aircraft, it neither succeeded in becoming a sustainable business enterprise nor did it achieve the aim of spawning related industrial activities based upon the capabilities acquired. It highlights the fallacy at the heart of the government-led technopreneurship campaigns of the 1990's.

The IPTN experience has two important lessons for university researchers engaged in commercializing intellectual property. The first lesson is that the technology-receiving organization will need to learn how to absorb and convert its new knowledge into a value-adding capability as part of an integrated business model. Often university researchers are only interested, and only involved in the technical aspects of the transfer. Connected to this point is the second lesson, which is that the effective translation of knowledge into practice is surrounded by a great deal of tacit understanding which is context specific. When the transfer takes place in a different environment, culture or industry, a new set of variables will come into play and impact upon the implementation process. Furthermore, because deep knowledge of the factors shaping commercial performance in a specific organizational context will often be an essential ingredient of the original technological concept, it is desirable that university researchers enter into long-term innovation partnerships rather than arms-length relationships. From the perspective of the technology-receiving organization, strong entrepreneurial leadership will be a critical ingredient, whereas the researcher will need, not only a good grasp of the principles of project management, but also considerable insight into the forces that shape management effectiveness and organizational behavior (Hansen. 2004, pp.26-27).

## **Innovation as Added Value for the Customer**

It is important to acknowledge that technology is the underpinning resource driving the integration and expansion of the global economy. In addition to providing information and communication linkages, technology is the catalyst for innovation in product development, service delivery and business efficiency. Furthermore, the new technological tools have made it possible for proactive firms to build international alliances and participate in networks as a means of accessing new markets, protecting core competences and achieving economies of scale. However, it is also

important to keep remembering that technology is nearly always a resource rather than the solution and that it requires highly creative managers to design and implement the business models which produce innovative added value (see Exhibit 1). Because the added value in technology is latent, the first challenge is to leverage its power in the service of customers. The second challenge is to sustain the resulting competitive advantage, given the rapid rate of technological change and the ability of competitors to match and nullify technological advances. It is the successful response to this challenge which represents the major source of business innovation, as the cases of Johnson and Johnson (J&J), Dell computer and Google clearly demonstrate.

J&J is one of the world's most successful and respected companies. Although it is one of the world's top three health care businesses, its success is due more to a portfolio of iconic products and a reputation for social responsibility than for cutting edge scientific research or pioneering inventions. In this respect J&J is not unlike Microsoft, which while maintaining a very large research budget, nevertheless concentrates upon serving a mass market. Although these two priorities may appear somewhat inconsistent, they contribute to a strategy which is both highly creative and innovative and market-driven *and* customer-centric. Furthermore, both companies recognize that successful innovation is not only accidental but essential and therefore heavy continuous investment is required (Tidd *et.al.* 2005, p.541).

At a time when its main competitors, especially Pfizer and Merck, are experiencing difficulties, J&J continues to set new performance records. Indeed, for seventy-two consecutive years it has increased sales, for forty-two years annual dividends have increased and for twenty successive years double-digit sales have been maintained (J&J Annual Report 2004, 2004-5). How is this remarkable record to be explained? Part of the answer lies in J&J's carefully-refined business model, which has evolved over more than a century of continuous operation, and which includes the following features:

- A significant and consistent, high-profit cash flow is provided by long-established mass market products such as Johnson's Baby Powder, Band-Aids and Tylenol
- One-third of all sales come from new products developed during the previous five years
- A strong belief in the advantages of being as broadly-based as possible and leveraging diversity both as a means of managing risk and as a platform for innovation
- Keeping a balance between the three major segments of the business: medical devices and diagnostics, pharmaceuticals and consumer products
- A highly decentralized management structure including subsidiaries for each market, to give managers maximum autonomy in relating to customers, seeking new opportunities and driving innovation processes

Dell Computer is another excellent example of the growing emphasis on customer-oriented innovation. By 2000 it had achieved top position in the PC market over established brands such as IBM, HP and Compaq. Dell's success resulted from a radical reinvention of the value chain and the creation of an unbeatable business model based upon lower costs and better service. Focussing on the mass market and specializing in a narrow range of products allows the company to tighten the value chain and outsource many functions to a series of well-integrated partners. The concept of dealing directly with customers on the Web gave Dell control over inventory, leverage over partners and a unique capacity to respond to, anticipate and learn from the needs, priorities and preferences of individual customers. As is often the case, Dell's corporate vision and business model originated in the foresight, passion and drive of its founder and CEO, Michael Dell. From a position of cost leadership, Dell has branded a formula which is almost unassailable. It includes an exceptional range of optional added value services for the customer, a lean and low-cost organization structure, just-in-time inventory system and a continuous market research database.

## **Resource Capability, Organizational Effectiveness and Added Value**

As the J&J and Dell examples demonstrated, the challenge for entrepreneurial business leaders and managers is to convert the organization's resource *capabilities* into *core competencies* (see Exhibit 1). The former is potential, the latter is reality. Converting capabilities into core competencies requires strong, disciplined leadership, unwavering

focus on customer's current and future, and an integrated approach to staff development, team-building and values reinforcement.

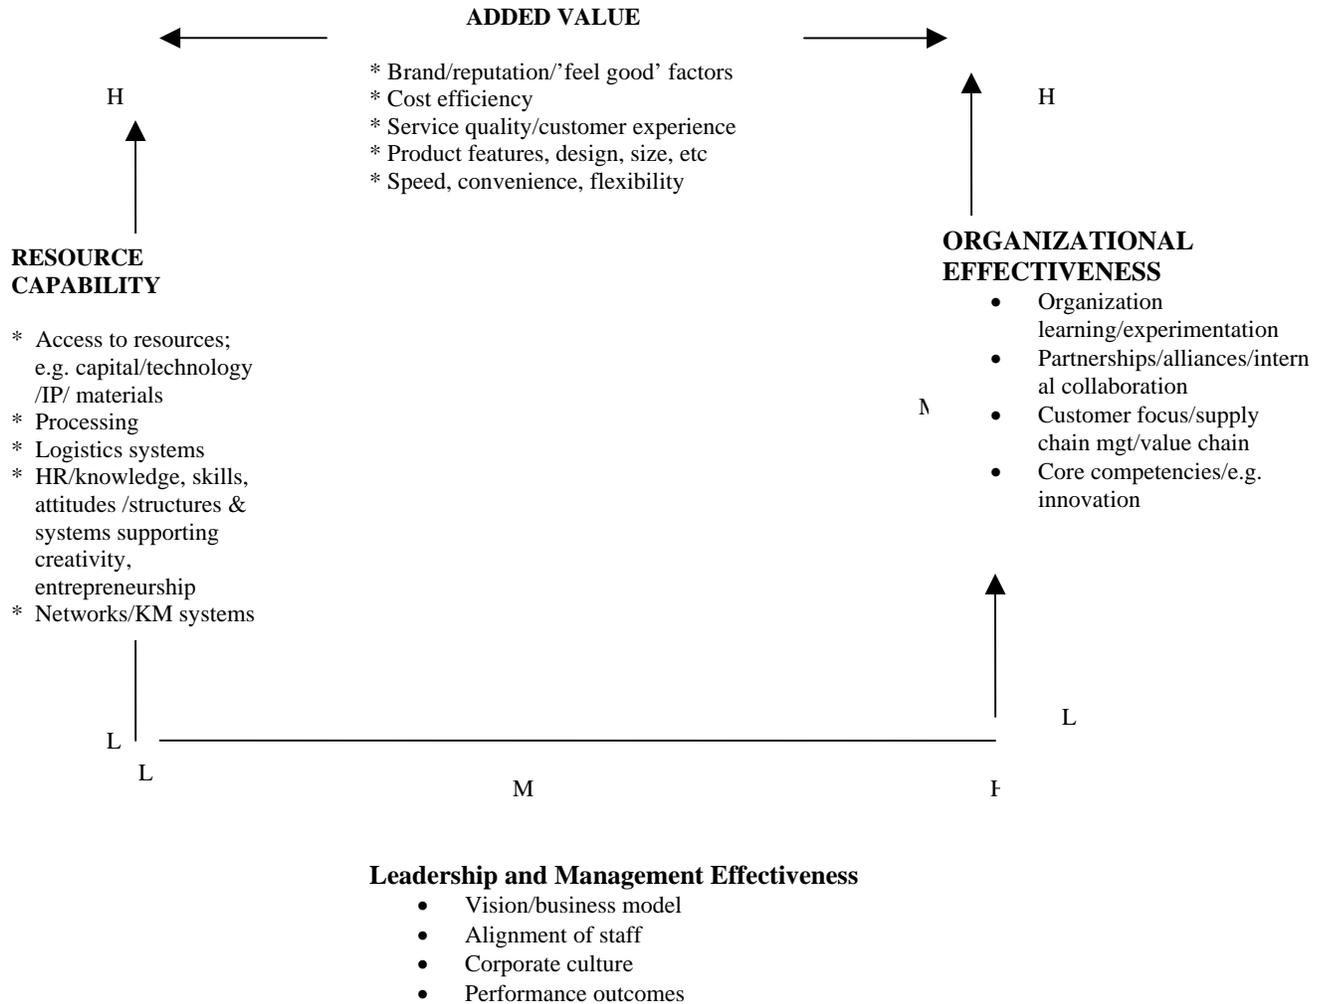

FIG. 1:CORPORATE INNOVATION AUDIT

Organizational capabilities and core competencies are the tools for implementing the business model and creating the added value which underpins the organization's success in the market place. They are indispensable assets for thriving and surviving in a highly turbulent, unpredictable and competitive environment. Products can easily be copied and are often superseded but competencies are more enduring. Without the ability to draw constantly upon a unique set of strategic resources and transform them quickly and distinctively into new and compelling value propositions for customers, the organization will be overtaken by its competitors or, more likely, in the case of Nokia and Motorola, by a company from an entirely different industry.

Even front-rank technology leaders such as IBM have problems converting advanced technology into effective customer value propositions, usually because they underestimate the management aspects of the task. Thus, for example, when IBM set out to improve its service delivery to some of its distributors, there were unexpected

pockets of internal resistance and fine-tuning delays in establishing an efficient business-to-business (B-to-B) system. The project turned out to be a classic example of the challenge of change management. Following a mounting barrage of customer complaints, it took the passion and persuasion of an influential crusader to get the B-to-B option on the management agenda. After creating a strong sense of urgency and commitment in principle to introduce a new system, it was still necessary to convince a number of senior managers to come on board and agree to the strategy. Considerable time elapsed before it was judged appropriate to communicate the new vision to staff. A number of experiments and trials were then conducted, staff training programs were designed and progress was widely communicated. It took several years of adjustment and learning to finally win full support and realize the projected benefits of the change (McAfee, 2005, pp.81-83).

Relating the audit framework to the B-to-B innovation under discussion (see Exhibit 1) clearly indicates that, despite IBM's very considerable resource capability, especially in technology and knowledge management, the major obstacles to change were in the negative attributes of some staff and the difficulty of winning the cooperation needed to design an integrated logistics system. It required determined and patient leadership to align staff to the new vision and put in place the culture of cooperation, teamwork and trust, which was the key to establishing an effective B-to-B process. It was only at this point that it was possible to polish, consolidate and realize the essential core competencies around service quality and speed in delivery as the means for achieving the desired performance outcomes. As this case demonstrates, a critical success factor in technology transfer is the closeness of the relationship, the depth of the mutual understanding and the strength of the commitment of the parties involved.

## **The Service Revolution and the Innovation Gap**

The imperative for stronger customer focus is matched by the extremely rapid growth of the service sector of the economy. Although services now account for well over 60% of the total economic activity, employment and value added of most developed countries, compared with manufacturing, which has fallen below 20%, manufacturing still tends to command much of the attention of policy-makers and university researchers (see *The Service Economy*, 2000, pp.3-4, 37-38). Globalization, deregulation and the IT revolution have done much to accelerate the growth of services by opening up new business opportunities and management challenges. However, traditional assumptions about the nature of innovation have lingered and therefore restricted the flow of creative effort and investment into the service sector. As early as the 1980s, some scholars foresaw the radical shift towards knowledge-based, service oriented economies and the need to broaden the definition of innovation beyond the realms of science and technology. There were also calls to open up the concepts of technology transfer which had grown out of the old research and development paradigm. An Australian Government report pointed out, towards the end of the decade, that the time had come for extending the transfer process to embrace all kinds of *knowledge* and not just technology. It was argued that 'innovation is centrally an organizational and managerial issue' and therefore 'organizational and managerial innovation are as vital as technical innovation (see Exhibit 1) (Centre for Technology and Social Change, 1988, pp.78-79).

From the mid-1970s onwards the so-called postmodern era has coincided with the impact of globalization, computer technology and mass education and has reflected increasingly the values of democratic freedom, cultural diversity and personal choice. During the preceding half century or so, industrial progress bred a high level of certainty about the ability of humans to control nature, unlock the secrets of the universe and solve virtually any problem through the application of scientific knowledge. Indeed, knowledge was equated with science and this was underlined by the priority given to scientific, medical and technological research by universities around the world. Universities are inherently conservative institutions and many traditional structures and assumptions have been refined and even reinforced by traditional patterns of funding and recruitment. This has certainly been the case with university research which continues to be both elitist in approach and poor in quality. Although the pressure of student demand has led to radical changes in university course profiles over the past thirty years, the research establishment has been much more rigid. The academic concept of what constitutes invention and innovation, for example, has adapted to the wider social and economic changes very slowly and with great reluctance. However, in the community, and especially in the market place, the triumph of postmodernism is everywhere. The transfer of

power from manufacturers to consumers is evident in the plethora of customized choices available in virtually all aspects of life from religion to sports shoes and from cable TV to toothbrushes. In a world where innovation is determined by the customer rather than the scientist, the creation of Barbie Dolls, Mars Bar ice creams, and business class air travel would rank among the more significant innovations of the postmodern era in terms of generating new added value, yet no university research institute would have an interest, let alone the capability, to play an active in reinventing ordinary products and services such as these.

The old technology transfer concept and the associated concept of technology diffusion perpetuated by government and university research establishments embody an assumption of an ideal two-step relationship between the 'pure' research conducted by research institutions and the commercialization role of business enterprises (see evidence of this in *Unlocking the Future*. 2000). They also tend to ignore the service dimension of innovation and the role of entrepreneurial management in the implementation process (Drucker. 1986, p.109). With the potential scope for innovation limited only by managerial creativity and organizational capability, this mechanical mindset is obviously an anachronism. The more innovation comes to be seen as an infinite potential for creating new or added value, from the *customer's* as opposed to the researcher's or manager's perspective, the more obvious it becomes that research institutions need to give more attention to value chain structures, processes and competencies. Of course, this is not to suggest that government and university research institutes will not continue to have a major responsibility for the sort of curiosity-led research that leads occasionally to great scientific, medical and technological breakthroughs. However, a good case can be made for conducting this research as part of a diversified network of collaborators rather than in the isolation of an ivory tower workshop or laboratory (Christensen. 2004, pp.311-314). Furthermore, in funding this research, much more qualitative selectivity is required, not only to prevent the proliferation of second rate, low impact publications and conference presentations, but also to allow greater priority for collaborative, value-adding applied research.

A recent investigation in Britain concluded that many areas of the business community are still reticent, if not reluctant, to initiate research partnerships with universities. As is the case in Australia, most business-university research partnerships are initiated by the universities and are heavily subsidized by government. In seeking to achieve a better balance between research push and market pull, the British review proposed a number of measures to bring about a deeper level of *institutional* engagement in joint innovation projects than is typically found in existing cooperative research centers. These included funding support for Knowledge Transfer Partnerships based on highly strategic projects and managed by high caliber graduates, and encouragement for a much more extensive flow of senior personnel between business and universities and vice versa (Lambert. 2003, see sections 2.48, 2.49, 6.2).

## **Innovative Entrepreneurs**

In the face of mounting government and community pressure to make research funding more accountable and to better demonstrate value-adding outcomes, some senior academics are resisting these demands and have revived the old debate about the appropriate balance between curiosity-driven and profit-driven research. For example, Professor Vicki Sara, the former chair of the Australian Research Council, has argued that 'the pressure on academics to turn a quick profit from research posed a serious threat to future innovation'. This statement is clearly an exaggeration. While it is true that profits generated by university research are disappointingly low, the most serious 'threat to future innovation' is not the issue of profit but quality and the blatant dissipation of research funding on a myriad of low-quality research projects, generated largely as self-defense against the 'publish or perish' culture which is rampant in many universities to-day. However, Professor Sara's most surprising comment was her reference to the bionic ear, which she cites as a classic example of curiosity-driven invention, which 'would not have been possible without innovative research' (Yaman. 2005).

Notwithstanding the fact that he is an academic, Professor Clark was, and remains, a classic entrepreneur. The two roles are not incompatible. Indeed, many distinguished professors, while not involved in commercial enterprise directly, still manage to operate entrepreneurially by virtue of the way in which they promote their disciplines, concepts and courses and attract resources for their various projects. In the case of Professor Clark, there

is little evidence that he was reclusive inventor, beavering away in splendid isolation, waiting for serendipity to occur. On the contrary, quite early in his career he developed the vision, or least a working hypothesis, of a bionic ear implant. For over a decade he persevered in the face of numerous financial and technological obstacles. Testing, experimenting, crusading, fund-raising, coalition-building and lobbying, like any other single-minded pioneering entrepreneur Clark survived many crises and set-backs. Even often the first bionic ear was implanted in 1978; it took another 20 years or so to actually get it into industrial production and for it to be distributed internationally. Very gradually he built upon the necessary resource capability and organizational effectiveness to realize his strategic vision and establish an innovative business enterprise with a potentially world-class image and reputation (see Exhibit 1). Today, the Bionic Ear Institute, based in Melbourne, is the central node in an extensive network of research institutes, hospitals, universities, companies and support groups, which include service organizations such as Lions, Rotary and Apex. In short, Clark is both an innovator and an entrepreneur.

Quite apart from increasing the social and economic value of university research, greater opportunities for regular interaction between academic researchers and senior members of business, government and community organizations are also likely to serve the cause of basic research, not simply by opening up unexpected avenues for additional funding, but also, and more importantly, by increasing the diversity of research stimuli and enhancing the prospects for random conceptual fusion. For Australia, this is an urgent priority. The case of Australia is unusual in that, although there is a relatively high level of entrepreneurial activity, it tends to be neither innovative nor research-based. Such a conclusion is consistent with the findings of a major international comparative survey 'describing and analyzing entrepreneurial processes within a range of countries' (ACS *et.al.* p.11).

According to the Global Entrepreneurship Monitor, on average only about 3 percent of all new business start-ups have the potential to be 'high potential' innovative enterprises generating new jobs, new products and new exports. Although Australia ranks above the average of the countries surveyed, much of its entrepreneurial activity appears to be 'driven more by high growth in market opportunities for existing services, and less so by the introduction of new services or innovative products' (ACS *et.al.*, pp.17, 23). An extremely high proportion of Australia's economic activity, employment profile and export growth is in the service sector, but this emphasis is not reflected in the research priorities of most universities. Australia's research establishment is dominated by academics with a science, medical or technology background. The fields of business, economics and the social sciences are very much under-represented by comparison. It will not be easy to reverse this pattern. The experience of Silicon Valley, Bangalore, Cambridge in England and Tsinchu in Taiwan, would seem to indicate that the intensive clustering of knowledge-based industries and research institutions is the most effective strategy for stimulating entrepreneurship that is both innovation-oriented and high value-adding and includes both advanced technology products and sophisticated professional services. The common characteristic of successful knowledge precincts, which distinguishes them from most science parts and research institutes, is that they are irresistible magnets for creative people, ideas and capital (Hamel. 2000, p.290).

Building on the findings of the Lambert Review, it is important that governments divert more of their research funding to strategic innovation projects that are initiated, or at least strongly supported, by the senior management of companies working with, or intending to work with, neighbouring universities. There is little point in directing more research funds to universities without increasing the 'absorptive capacity' of the firms they could potentially assist. An impressive body of research now exists to show that the level of a firm's internal research and development investment is a 'valid measure' of its ability to extract relevant knowledge from collaboration with university research institutes. Given that in Australia, the level of business expenditure on research and development is relatively low and certainly much lower than that extended by government (Maiden. 2005), there is a strong case for government to create incentives to reverse this anomaly, possibly adopting those recommended by Lambert in Britain (Yencken and Gillin. 2003, *passim*).

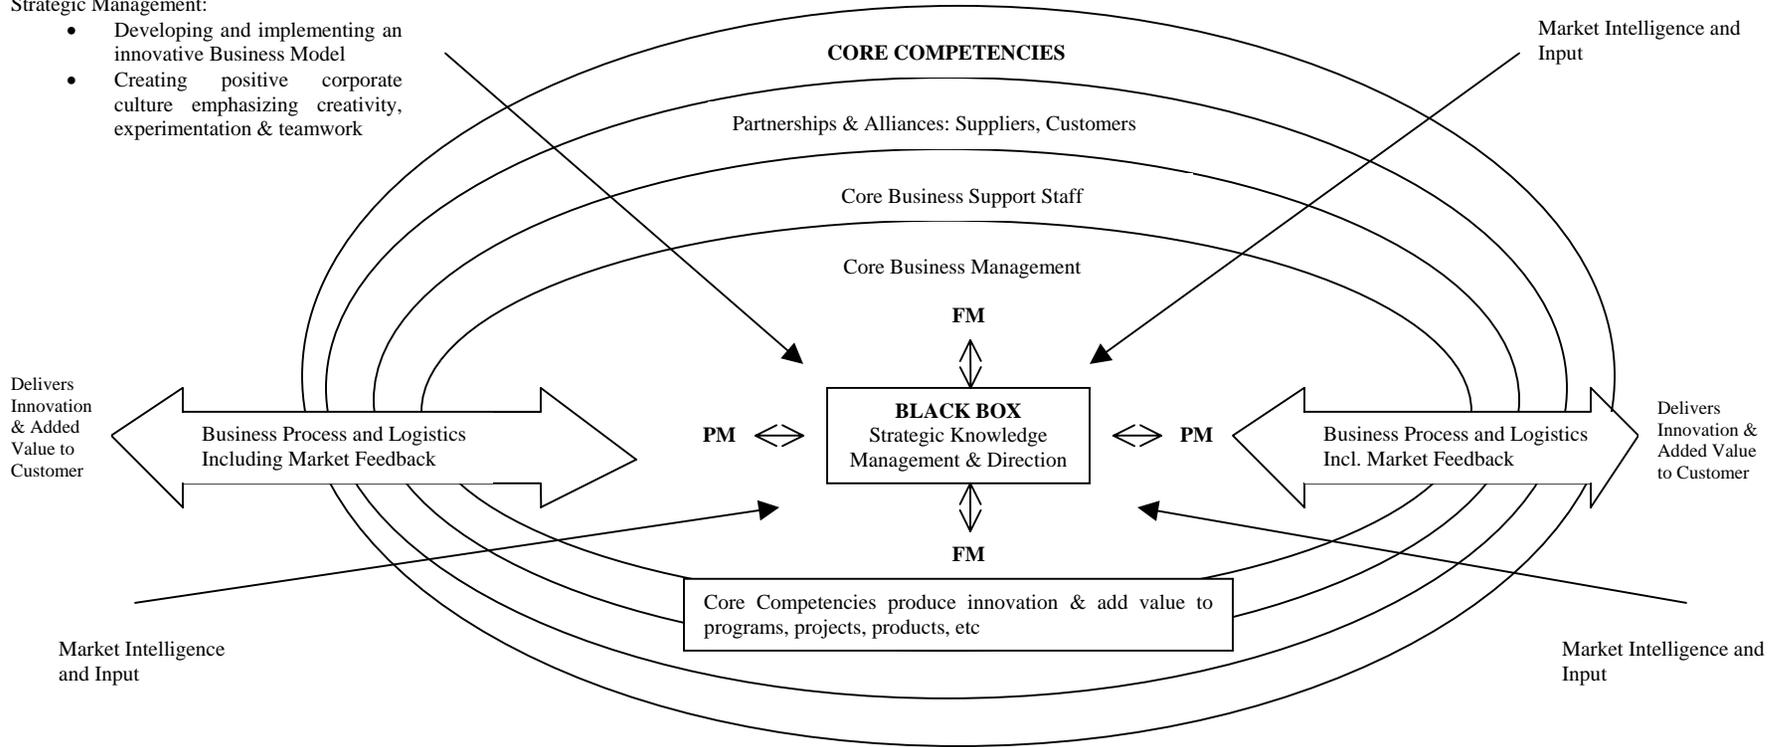

## **INOVACC: The Learning Organization**

Just as the environment has changed the strategic imperatives confronting organizations, it has also forced organizations to review their structural architecture in order to place much greater emphasis upon leveraging

networks, building partnerships, obtaining information creating knowledge and learning new competencies. Drawing on insights from the case studies previously discussed. INOVACC (See Exhibit 2) portrays the organization as an innovation engine rather than as a conventional pyramid of functional, geographic and product units. As an 'interactive network of value-adding core competencies', INOVACC is a dynamic amoeba, constantly transforming itself, open to the world, going *out* to the world, more resembling a series of integrated oval-shaped concentric 'circles' than any other form. Designed to optimize its relationship with the environment and connect with all its stakeholders, this new model is a value-adding machine in perpetual motion. Driven by an intelligent business brain (a kind of strategic 'black-box'), INOVACC is a new organizational model based upon unique core competencies, which drive customer-centered business processes and are coordinated by project/product teams. The project/product teams are multi-disciplinary, totally customer-focused and constantly drawing on wider networks of potential knowledge and organizational learning.

Strategic Management:

- Developing and implementing an innovative Business Model
- Creating positive corporate culture emphasizing creativity, experimentation & teamwork

The **Black Box** is the top management team operating as the centre of learning, the 'Intelligent Business core' or 'strategic apex' responsible for Strategy, Knowledge Management and Learning related to satisfying the needs of present *and* future customers (business concept innovation).

The **Core Business Management** includes both functional (FM) and project managers (PM).

The **Business Process** or 'value chain' converts strategies into core competencies and added value to the customer (= competitive advantage) and is led by a senior project manager

*Adapted from Knowledge Management to Learning Culture*

FIG. 2: THE NEW MODEL: INOVACC

The purpose of the Black-Box is to provide strategic leadership: conceptualizing, communicating, coordinating and developing. The most important roles of top management are to define the mission, align people to the vision and values inherent in the pursuit of this mission and to inspire and empower them to make it happen. In its essence it is an integrated process of teaching, learning and creating, which eventually becomes a pervasive culture, shared and practiced by all of the organization's stakeholders. Flexibility and adaptability are obvious distinguishing features of INOVACC. The project/product teams are constantly seeking to better align themselves with existing and potential customer bases. As part of the same process, they are also vigorously seeking out and forming new creative ideas and networks to increase their knowledge and ability to serve future markets better. It is a dynamic not a static exercise, based upon *action* rather than academic learning. Raw data, technical information and business knowledge are quickly absorbed into the organization's individual and collective learning experiences in a culture which is led by, and characterized by, people who are committed to competency-building, experimentation and living in the future. In all of this, the senior managers, in their Black Box capacity, illuminate and uncover the way forward. Although they could be described as teachers, they should not be thought of as traditional classroom teachers. Instead, their role is to stimulate, guide, mentor, influence and empower but, above all, to be tireless in their efforts to provide access to knowledge and new learning opportunities. It will not be easy to recruit managerial leaders like this from among the ranks of typical fast-track functional managers with degrees from traditional business schools. These are not jobs for people whose ambition exceeds their wisdom, whose immaturity preoccupies them with power, status and self-promotion and whose careers have been shaped by cleverly climbing the organizational hierarchy and who are primarily motivated by money. Finding the right people in the first place is the biggest challenge confronting organizations to-day; the second biggest challenge is to keep developing their leadership potential (Drucker. 1986, pp.105-109).

## **Towards a Learning Culture**

INOVACC is designed to facilitate the growth of a learning culture. A strong learning culture is characterized by four equally important and inter-dependent features:

- A top management team with highly developed leadership skills
- The strategic architecture for simultaneously thinking about the future, reflecting on the past, learning from the environment and nurturing creativity
- A highly-developed capability for locating and working with complementary value-adding partners
- Continuous investment in building core competencies by leveraging the organization's knowledge and competency base

(Milton-Smith. 2003, pp. 5-7)

Not surprisingly, life-long learning is a driving philosophy in learning organizations. It applies with equal force at every level. At the corporate level there is a deep understanding of the need for constant re-invention and transformation; even *Fortune 500* companies – the biggest and best in the world – only have a life expectancy of less than 40 years. At the corporate level there is a constant need to reinvent the business model and to build and leverage organizational competencies in order to keep creating innovative new sources of value and at the individual level, personal growth and mastery are seen as 'an essential cornerstone of the learning organization'. As Senge has pointed out, organizations acquire their institutional learning and core competencies through the accumulation and transfer of individual and team learning. It is therefore incumbent upon top managers in their mentoring capacity, to initiate developmental learning projects on a continuing basis to stimulate creative thinking and support innovation (Senge. 1992, p.141).

## **Putting Creativity into the Innovation Equation**

Like Silicon Valley, Cambridge, Bangalore and Hsinchu, Hollywood is another excellent example of a business model that is both entrepreneurial and innovative. It not only stimulates and sponsors an endless stream of original ideas, it has also developed successful processes for commercializing them. As in any market, some films succeed

and others fail; some successful films are variations on a theme, and just occasionally there is one which goes in new directions and represents a breakthrough. The novelist Amy Tan has given a penetrating insider's view of the period in the early 1990's when the Disney Studio made a film based on her novel *The Joy Luck Club*. Despite her deep reservations and concern for creative integrity she found the project to be a surprisingly positive experience.

Tan underlines the power of networks in Hollywood and the critical role of producers and directors in drawing upon their networks to obtain the resources needed for making a movie. She describes the gradual assembling of an extremely diverse, highly specialized group of people which eventually becomes a dedicated team, with a clear common vision and urgent sense of purpose. After the novel, the creative blueprint, had been converted (with the author's direct involvement) into a viable commercial script, and various creative and commercial tensions were resolved, contracts were signed and the film went into production. The project involved a screen-writer, producer, director, agents, lawyers, cinematographers, a large array of technical experts and, of course, the actors. Creativity and innovation were brought together in perfect harmony.

Tan was especially surprised by the 'enormous respect' with which she was treated and the 'creative control' she was given. She was also unprepared for the effective way in which the creative and commercial activities co-existed and harmonized:

.....There was never an organized agenda to meetings. People talked in broad imprecise terms. I thought it was code for something else, shorthand for all kinds of criteria. But now that I've been in the business for a while, I realize that people leave the precision points to the lawyers (Tan. 2003, p.184).

Throughout the making of the film, there was continuous cross-fertilization, crossing of boundaries and crossing of bridges. There was remarkable trust and goodwill. While the creative process may be slow and labored, novels often take many years to complete, once contracts are signed the innovation phase – the production of the film – is subject to very heavy time pressure. A film studio in action is a compelling demonstration of a well-managed knowledge cluster: constant dialogue, exploring ideas, seeking solutions, experimenting, negotiating and improvising, but always moving forward in order to meet deadlines, keep within budgets and achieve the common goal. In this innovation phase, the true test of the director's mettle is his skill in maintaining the delicate balance between the soft creative imperatives and the hard discipline of business reality and, in the case of *The Joy Luck Club*, it was a test Wayne Wang, 'the final arbiter on everything', passed with flying colors (Tan. 2003, p.188).

Creativity is the leadership challenge which most so-called leaders fail. Although managers and researchers alike relish the opportunity to sprinkle powerful words like 'creative' and 'innovative' in their speeches, mission statements, course outlines, public relations documents and reports, very few are prepared to expose themselves to the risk involved in *real* creativity and innovation. However, it must be conceded that very few managers know how to manage creativity in the first place. Search the content of business school offerings, check the indexes of text books – even those on entrepreneurship and innovation – and there is very little guidance, if any; plough through the avalanche of government reports aimed at making business more innovative and they scarcely touch on the subject of creativity and how to make it happen. Creativity is the missing ingredient in traditional strategic planning models. Although strategic plans will frequently make provision for creativity and innovation awards, conferences and festivals, they rarely propose the necessary changes in management ideas, roles, structures and accountabilities for building organizational capabilities in these areas (Johansson. 2004, pp.14-15, 67-69).

## **Concluding Remarks**

Overall, it must be concluded that the creative dimension in university research is much weaker than is generally acknowledged. Despite the fact that university research strategies are placing greater emphasis on increased staff participation and output, the main result seems to be an even greater flow of esoteric piecemeal knowledge seeking publication in an ever-expanding list of specialized academic journals. Piecemeal knowledge may be of interest to a limited number of people as knowledge for its own sake or as knowledge which, in combination, creates a new insight or better understanding. However, the true value of new knowledge is determined by society. Whether the customers are students of philosophy, consumers of packaged soup or mobile phone subscribers, the potential users and beneficiaries of the new knowledge are the final arbiters of how creative it is. This judgment is only possible

after the innovation process has been completed. Simply declaring an idea, concept or product to be ‘creative’ or ‘innovative’ in advance is not only premature but also misleading. That is why quantitative assessment of university research performance is dangerous, deceptive and self-defeating. Instead of perpetuating the old technology transfer mindset and counting the number of publications, patents, licences and spin-offs produced, a far more accurate measure of research quality would be an assessment of the value-adding knowledge, partnerships and mechanisms the researchers brought to bear in order to optimize the creative potential of their research, together with an evaluation of their roles in helping to manage the innovation process in order to realize this creative potential. While there will always be a place for curiosity-driven, self-directed – even self-indulgent – research, surely the time has come when universities need to give greater emphasis to increasing its direct social and economic impact.

It is also relevant to draw some conclusions on the broader issue of strategic planning. Traditional strategic planning techniques such as forecasting, scenario planning and SWOT analysis project the existing business model into the future, usually leading to plans for extending, adjusting and improving current operations. Incremental change, however, is no longer enough. Already it is a formula for standing still and increasingly it is a prescription for falling behind. Managers must be prepared to test and interrogate their business models to confirm their durability. When the boundaries of so-called ‘industries’ keep changing, who are the main competitors and what is the best competitive position? Is there really such a thing as sustainable advantage apart from an iconic brand or reputation? The real strategic challenge now is a creative one because the business environment is so fluid and unpredictable. In such a context there is no substitute for having deep insight into trends, patterns and uncertainties in the market and into the world that shapes it, combined with the necessary foresight to anticipate where these variables might lead and what opportunities they could open up. However, without the ability to imagine a future, drawing upon this analysis, where the enterprise, in the minds of customers, is in a class of its own, there will be no strategic focus for inspiring stakeholders, investing in resources, or building capabilities.

# Learning in International Strategic Alliances- Integration of Research Paradoxes

*Peter Knight  
Carleton University, Canada*

## Abstract

The “Learning Organization” is firmly in management lexicon. Rapid globalization makes cross-national strategic alliances between “learning” organizations increasingly important to understand as global acculturation is still a distant promise. Integration of contradictory research regarding the impact of national cultural distance on inter-organizational learning outcomes is suggested through a broad research framework.

## Organizational Learning

### The Importance of Organizational Learning

Over the past few decades the world economy has experienced an unprecedented transformation. The convergence of several trends, including global proliferation of technology, reorganization of economic boundaries, intensified global competition and competition and more knowledgeable, technologically-enabled consumers with higher expectations, have profoundly altered managers’ notions about the firm, markets, and competition. Product and process life cycles have become significantly shorter, eroding product-based advantages and forcing firms to develop continuous streams of innovation.

The concept of the ‘learning organization’ is gaining currency amongst large organizations as they attempt to develop structures and systems which are more adaptable and responsive to these changes. Learning is also increasingly seen to have broad analytical value as illustrated by the breadth of academic disciplines using it (Dodgson, 1993). Learning is a dynamic concept, and its use in theory emphasizes the continually changing nature of organizations and it is also an integrative concept that can unify various levels of analysis: individual, group, corporate, which is particularly helpful in reviewing the cooperative and community nature of organizations. (Dodgson, 1993)

Organizational learning is seen to allow for development of organizational design and renewal that provides durable and perhaps the most unimitatable type of competitive advantage (Almeida et al, 2002; Doz, 1996; Epple, Argote, and Devadas, 1991). The increasing need for organizational renewal is also seen to place additional demands on a theory of organizational learning (Crossan, Lane and White 1999).

### The Nature of Organizational Learning

Organizational learning has existed in our lexicon at least since Cangelosi and Dill (1965) discussed the topic nearly 40 years ago. Lately, its popularity has grown dramatically yet little convergence or consensus on what is meant by the term, or its basic nature, has emerged (Crossan, Lane and White, 1999).

The concept of organizational learning is complex. The first issue worth citing is that an organization can only learn through its members as “all learning takes place inside individual human heads” (Simon, 1991). Gardner et al (2002) and others in the cognitive learning school find the human brain has an internal structure that it continuously updates and alters as new information is received, processed, and stored. Everyone has a different way to handle the information they receive and process. Individual separate intelligences; linguistic, logical-mathematical, spatial, musical, bodily, interpersonal, intrapersonal and naturalistic are proposed by Gardner (2002) and organizational learning is then seen as capable only through people and the synergy of people and their separate intelligences in an organization. However, as Tsang (2002) muses, it would be simplistic to think that organizational learning is the sum of each member’s learning. When an orchestra learns to play a new symphony, every member has to learn his or her part. The performance of the symphony, which is the product of learning, is always a group activity and cannot be meaningfully reducible to the playing of the different parts by the members.

This independent character of organizational learning is elaborated by Hedberg (1981) in describing the concept of organizational memory:

*“Organizations do not have brains, but they have cognitive systems and memories. As individuals develop their personalities, personal habits, and beliefs over time, organizations develop world views and ideologies. Members come and go, and leadership changes, but organizations’ memories preserve certain behaviors, mental maps, norms, and values over time.”*

Shrivastava (1981) suggests that: “Organizational learning refers to the process by which the organizational knowledge base is developed and shaped.” The term “organizational knowledge base” is analogous to organizational memory referred to by Hedberg (1981) above. Considering that individuals are agents of organizational learning, a link between individual and organizational learning has to be established.

Crossan, Lane and White (1999) - (Table 1) aver that organizational learning is multilevel: individual, group, and organization and that 3 levels of organizational learning are linked by social and psychological processes: intuiting, interpreting, integrating, and institutionalizing (4 I’s).

**Learning/Renewal in Organizations: Four Processes Through Three Levels**

Level	Process	Inputs/Outcomes
Individual	Intuiting	Experiences Images Metaphors
	Interpreting	Language Cognitive map Conversation/dialogue
Group	Integrating	Shared understandings Mutual adjustment Interactive systems
Organization	Institutionalizing	Routines Diagnostic systems Rules and procedures

TABLE 1: CROSSAN, LANE AND WHITE (1999)

The 4 I’s are related in feed-forward and feedback processes across the levels. Throughout the processes, the interactive relationship between cognition and action is critical; one cannot be divorced from the other.

Based on the above definition, learning by a member of an organization has to be shared by other members and be institutionalized before the learning is part of the organizational knowledge base. An organizational knowledge base can be developed and shaped in a number of ways. An important way is to acquire knowledge from outside of the organization through a variety of inter-organizational structures including the strategic alliance.

## Inter-Organizational Learning

### The Importance of Inter-organizational Learning

Examining how learning occurs between organizations is important, not only because of the increased globalization of economic activities but also because the field of organizational learning (OL) itself demands that future research efforts concentrate on how learning processes cross boundaries and occur at inter-organizational or population levels (Easterby-Smith, Crossan and Nicolini,2000; Levinson and Asahi-1995).

### The Nature of Inter-organizational Learning

As with all learning, organizational learning has a down side. Just as with humans, learning structures boundaries and limitations – it “closes the box”. Managers recognize that it is increasingly difficult to generate enough

knowledge independently to compete successfully in the current knowledge-rich environment and therefore they increasingly look outside the organization.

Further support for the assertion that inter-organizational relationships provide an ideal platform for learning is found in the literature on biotechnology and inter-organizational networks. In a seminal piece on networks and learning, Powell, Koput, and Smith-Doerr (1996) wrote, "Knowledge creation occurs in the context of a community, one that is fluid and evolving rather than tightly bound or static. The canonical formal organization with its bureaucratic rigidities is a poor vehicle for learning. Sources of innovation do not reside exclusively inside firms; instead they are commonly found in the interstices between firms, universities, research laboratories, suppliers and customers.

Tsang (1999) finds that the processes through which organizations acquire information or knowledge that are also particularly relevant to understanding inter-organizational learning are experiential learning and vicarious learning. Vicarious learning is a pre-planned attempt to learn about strategies, management practices, and especially technologies of other organizations (Tsang, 1999). Badaracco (1991) classifies knowledge into two types, migratory and embedded. A major objective of vicarious learning in the context of strategic alliance is to absorb deeply embedded knowledge from a partner (Hamel, 1991).

Osland and Yaprak (1995) specify two oft used vicarious learning strategies: imitation and grafting. Traditionally, imitation has occurred through corporate intelligence and other forms of environmental scanning. "Follow the leader" strategies can be an imitative result. Grafting is used to explain how organizations increase their store of knowledge by formally acquiring another firm or by developing a long-term alliance with another organization that possesses information not previously available within the organization itself. Licensing products and processes would also fit into this type of learning. Learning through grafting is often more complete than learning through imitation though it does not necessarily create innovative new knowledge that will provide a durable competitive advantage.

Experiential learning (Tsang, 1999), on the other hand, refers to the case where organizations acquire their knowledge through direct experience. An important feature of experiential learning is that it may not be intentional. As a matter of fact, many of our habits are learned unconsciously. Similarly, the day-to-day adaptation of an organization to changes in the internal and external environments is a consequence of a gradual, but often unintentional, learning process.

## **International Strategic Alliances, Cultural Distance and Inter-Alliance Learning**

### **International Strategic Alliances**

A strategic alliance is defined as a long-term cooperative arrangement between two or more independent firms that engage in business activities for mutual economic gain. International alliances are cooperative arrangements, with cross-border flows and linkages that utilize resources from autonomous organizations headquartered in separate countries (Parkhe, 1991). As markets continue to become global and firms become more international, cross-border alliances, increasingly provide firms with opportunities to rapidly expand geographical market participation, create economies of scale and critical mass, reduce risks, learn new skills and technologies, and facilitate effective resource sharing (Bleeke & Ernst, 1995; Harrigan, 1988; Slocum & Lei, 1992; Yip, 2003).

Amazingly, 61 percent of international alliances have been outright failures, or are limping along in some state of poor performance (Parkhe, 2001). This is often triggered by the inability of many partners--relative newcomers to voluntary cooperative relationships with foreign firms--to surmount their differences. Problems with alliance governance and desired learning outcomes can be particularly related to trust issues, learning asymmetries and particularly cultural differences in international strategic alliances (Tsang, 1999; Lane, Lubatkin and Florin, 2001; Doz, 1996).

### **National Cultural Distance**

When benchmarking the level of cultural distance between alliance partners it is important to distinguish between organizational cultural distance and national cultural distance, though clearly organizational culture is often related to the national origins of alliance partners. Terpstra and Yu (1988) listed language, culture, political systems, level

of education, and degree of industrial development among the important factors comprising “psychic distance”

Psychic distance was defined by Nordstrom and Vahlnes (1994) as “factors preventing or disturbing the flow of information between potential or actual suppliers and customers” and thus their metric seems appropriate as a proxy for national cultural distance for the purpose of study of national cultural effects on inter-organizational learning.

National cultural distance in alliances also highlights an obvious paradox. If the benefit of knowledge integration is in meshing the different specialized experience of different organizations--if two organizations have very similar experience there is no gain from integration and yet, if the organizations have entirely separate experience bases, then integration cannot occur beyond the most primitive level (Grant, 1996). This paradox frames the central research theme of this paper.

### The Learning Perspective of Alliance Formation

Aside from the explicit strategic and operational motives, learning in order to sustain a competitive edge in the marketplace serves as a primary motivation for the formation of strategic alliances. The learning perspective of alliance formation is one of a number of perspectives in the literature. The learning perspective is viewed as being a primarily behaviorally based (as opposed to an economically based) perspective (Barringer and Harrison, 2000-Fig 1).

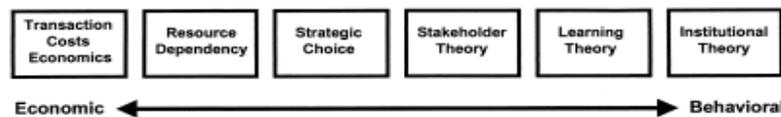

FIG. 1: THEORIES OF ALLIANCE FORMATION-BARRINGER AND HARRISON (2000)

In the inter-organizational relationship literature, one of the most widely cited motives for alliance formation is the acquisition of new technical skills or technological capabilities from partner firms (Hamel, 1991, Mody, 1993). As Hamel (1991) says, learning through internalization (acquiring skills to close the gap between partners) and sustainable learning help reapportion the value-creating core competencies in an alliance context, giving partners the ability to match or overtake their competition. Learning also reduces the prospect that firms may fall into “competency traps” or the inability to face novel competitive and market situations (Cohen and Levinthal, 1990; Levitt and March, 1988). Therefore, learning, be it related to technology transfer, acquiring skills, or for improving learning capability (“absorptive capability,” as Cohen and Levinthal coin it), is a critical consideration for firms.

Alliance partnerships grow over time, and learning occurs throughout the evolutionary process, however, the dynamics of learning and partner interactions are seen to continuously change over the course of time. Initial motivating conditions for exploring partnerships generate adaptive learning capacities in firms, and these lead to greater responsive abilities to meet new conditions encountered at each phase (Doz 1996, Lei, Slocum, and Pitts, 1997). Learning that takes place in strategic alliances occurs along several dimensions (environment, task, process, skills, goals) (Doz 1996). In fact, Iyer (2002) found that successful alliance projects were highly evolutionary and went through a sequence of interactive cycles of learning, reevaluation and readjustment. Failing projects, conversely, were highly inertial, with little learning, or divergent learning between cognitive understanding and behavioral adjustment, or frustrated expectations.

### National Cultural Distance and Learning in Alliances-The Transaction Cost/Knowledge Transfer View

Transaction costs theory (Williamson, 1991) focuses on how an organization should organize its boundary spanning activities so as to minimize the sum of its production and transaction costs. Transaction costs also vary, and include expenses associated with arranging, managing, and monitoring transactions across markets (Child & Faulkner, 1998; Kogut, 1988). An inter-organizational relationship, such as a strategic alliance is an alternative to a market or an organizational hierarchy.

In international strategic alliances, increased cultural distance is seen in the transaction cost view to create additional difficulties and challenges for managers who must spend more time on communication, design of compatible work routines, and development of common managerial approaches. Accordingly, a significant body of

conceptual research finds that the level of national cultural distance between alliance partners is negatively related to important facets of inter-organizational learning such as information flows (Lyles and Salk 1996), the process of knowledge management (Tiemessen et al. 1997), and knowledge transfer (Kogut and Singh 1988). Tiemessen et al. (1997) have warned that knowledge is not as mobile as it has often been assumed and Kogut and Singh (1988) also referred to the “inertness of knowledge.” Knowledge transfer has been seen to depend on how easily that knowledge can be transported, interpreted, and absorbed” (Hamel 1991). In this process, Simonin (1999, 2004) pointed to the need of considering the more subtle aspects of knowledge in this case marketing know-how - in particular its ambiguity, its resistance to clear communication, its embeddedness in context, and its idiosyncrasy.

All these studies are indicative of the existence of an important underlying latent construct, according to Simonin (1999, 2004), which he has termed “knowledge ambiguity”, averring that this construct needs to be explicitly recognized and integrated in research undertakings. Beyond the knowledge-holder’s desire to protect its know-how and the knowledge seeker’s prior experience with the knowledge base, cultural distance between partners is seen as an ambiguity raising impediment to the process of inter-organizational knowledge transfer. As the gap between the knowledge provider and seeker deepens, so does the level of “noise” surrounding the understanding and communication of valuable information (Simonin 1999, 2004)

#### **National Cultural Distance & Inter-organizational Learning- Double-Loop Learning View**

According to Osland and Yaprak (1995), however, the extant organizational learning literature appears to have failed to discover the synergistic learning potential of inter-organizational learning between partners of culturally distant national origins and the “research landscape” of this topic since 1995 does appear rather sparse. This is surprising since in cross-national collaboration one might expect better potential for synthesis of each of the partner’s skills, knowledge, and paradigms to create previously non-existent competencies, products, and strategies. Indeed, Ouchi and Bolton (1988) have demonstrated that international collaborative R&D has led to new product development that would not have been possible without such collaborations. As counterpoint to the resource dependence theory notion of national cultural distance having a negative impact on inter-organizational learning, due to greater inherent barriers in transferring knowledge, Parkhe (1991) and Kidd (1998) posit that cultural diversity between partners in international strategic alliances can potentially lead to higher levels of knowledge creation and knowledge based advantage. The NUMMI alliance (Phan and Peridis, 2000) for example, between GM and Toyota to create the Saturn Corporation is cited as one where unique methods and technologies were created through learning between two organizations from rather disparate national cultures. The learning applied to Saturn Corporation’s development was rather idiosyncratic in that it could not be applied to either partner’s core operations and yet it did create unique competitive advantages in the North American automobile market for a number of years. Clearly not all strategic alliances are designed to create a new business entity whose learning is not transferable to the alliance partners’ respective core businesses, but this example does illustrate well the competitive advantages that can be created through synergistic learning achieved between culturally diverse partners.

Tsang (1999) may provide some insight into the contradictions in this research topic through a preliminary typology of learning in international strategic alliances. He differentiates between tasks such as implementing technology transfer, managing the alliance per se and knowing about a new business environment which constitute what Tsang calls “learning from strategic alliance experience,” which he suggests requires an experiential learning process and “learning the other partner’s skills,” which he suggests entails a vicarious learning process. Therefore a venture that provides a novel and fruitful learning experience through cultural diversity may not, and need not, be an operation of great strategic importance to create a valuable knowledge resource. Though Tsang agrees with Parkhe (1991) and Kidd (1998) that cultural diversity in ISA’s can create higher levels of knowledge based advantage he also sees erosion of trust and development of competitive learning environments as being particularly negatively related to learning in highly culturally diverse strategic alliances.

Phan and Peridis (2000) extend the positive role of national diversity in knowledge creation by arguing that diversity and conflict need not be a negative influence on alliance success per se but can instead represent a key component in the learning process. They cite the generative or double loop learning process that is amplified in alliances between culturally diverse partners (Liedtka et al. 1997; Argyris and Schon 1996) , a process that does not necessarily create knowledge that already exists in each another’s knowledge base.

They further suggest that attempts to reduce partner conflict while beneficial to alliance stability in the short run, can block the double loop learning process triggered by such conflict. They also suggest a positive relationship between the level of partner diversity and double loop organizational learning to knowledge creation and that tension between cultural influences becomes a necessary condition for knowledge creation to occur.

## A Suggested Research Framework

### Resolution of the Paradox

Van De Ven and Poole (1989) suggest using action and structure framework in theory development to resolve research paradoxes that may be present in the extant literature. They suggest 4 possible approaches that were each assessed by the author as providing potential resolution of the paradox (Table 2).

**1. Accept the paradox and keep theories separable**

**2. Advance a new conception or paradigm**

*In both cases-possibly but no approach via structure and action apparent from literature-this deserves further study*

**3. Look at differences between organizational levels**

*Both perspectives clearly utilize inter-organizational learning rather than group or individual learning as unit of analysis*

**4. Look at temporal effects**

*Theory of Morphogenesis provides viable approach*

TABLE 2: RESOLUTION OF THE PARADOX USING VAN DE VEN AND POOLE (1989) FRAMEWORK

Parke (1991) and Shi (2000) among others have found that alliance duration is negatively related to national cultural distance and that there is a higher probability that culturally distant alliances will fail in the short to medium term. One possible reason is that at the early stage of a relationship, each alliance partner in a culturally distant alliance may experience a higher degree of ethnocentrism (Han, 1988) which may result initially in opportunistic behavior that precludes a long term relational commitment as well as a strong commitment to endure conflict which might support generative or double loop learning.

However, as the relationship matures, (if it survives initial conflict) exchange partners are likely to develop relational norms and have a better understanding of each other's competencies, goals and future expectations (Dwyer. et al., 1987). Lyles and Salk (1996) did not find significant main effects between cultural misunderstandings/differences and levels of knowledge acquisition in Hungarian joint ventures. These results are also consistent with Meschi et al's (1997) findings that: cultural differences in an international joint venture, regardless of their nature or intensity, will ultimately recede over time. Therefore the view of a "cultural learning curve" where knowledge ambiguity is seen as a pre-existing structural impediment that may initially relate negatively to inter-organizational learning seems plausible. Over time action can be viewed to influence structures and double-loop learning derived from inherent value conflict (Phan and Peridis, 2000) and may result in more idiosyncratic and valuable knowledge if the partners can survive the initial heightened levels of conflict. The process is illustrated in Table 3.

**Action and structure influence each other over time (i.e. I/O Learning in ISA's)**

1. **Pre-existing structures dominate**-*Inherent knowledge ambiguity and different values initially deter inter-organization learning(Simonin 1999)*

2. **Action articulates alternative arrangements.** -*Double Loop Learning Occurs? (or partnership more rapidly dissolves)*

3. **Structural Elaboration**-*Learning is institutionalized if alliance does not dissolve*

TABLE 3: THEORY OF MORPHOGENESIS, VAN DE VEN AND POOLE (1989) RE: LEARNING IN INTERNATIONAL STRATEGIC ALLIANCES

## Research Hypotheses

Simonin (1999) provides strong theoretical support for the construct of knowledge ambiguity being positively related to cultural distance and negatively to inter-organizational learning. This hypothesis remained unproven, however, as the 151 alliances studied averaged a seven-year life span. Simonin (1999) suggested that they may have passed a "threshold of cross-cultural myopia and belligerence prevalent in the early stage of collaboration." Therefore:

H1: Knowledge ambiguity will be positively related to national cultural distance but its valence and therefore its negative effect on inter-organizational learning will weaken over time if the strategic alliance does not dissolve in the short run.

Phan and Peridis (2000) suggest that double loop learning between alliance partners is a necessary but not sufficient condition for knowledge creation and that double loop learning is more likely when national cultural distance is high. They suggest that environments with values tension provide best opportunities for knowledge creation. The higher the values tension between partners the more likely new knowledge will be created. Therefore:

H2: Value conflict and thus double loop learning are positively related to national cultural distance.

A "mutual hostage" (Kogut and Singh 1988) or bilaterally dependent condition binds alliance partners to the relationship and increases the likelihood of mutual effort to attain shared alliance goals. Such mutual effort takes the form of actions that reduce the variances between partner expectations and objectives. For the purposes of knowledge, Phan and Peridis (2000) believe that mutual hostage situations are not conducive to double loop learning. For such contracts to be effective, the allowed variance in performance has to be relatively small because there is no monitoring provision for motives and values. Thus, mutual hostage contracts tend to 'pull the plug' prematurely when there is non-performance in the contract, leaving little room for the partners to mutually to explore the assumptions, organizational values and learning process. Therefore:

H3: Reciprocal dependencies are a moderating variable with a negative effect on double loop learning

Resource complementarity (Phan and Peridis, 2000) attenuates the difficulties inherent in managing a culturally disparate partnership because it reinforces the instrumentality, defined as the explicit goals, of the alliance. By focusing on the instrumentality the emotional dissonance generated by cultural and organizational conflict will be tempered by the promise of higher benefits from partnering. In effect, organizations can decide to be munificent in their assessment of partner non-performance and thus be prepared to engage in the kind of values exploration that leads to knowledge creation if the expected benefits are high. Therefore:

H4: Resource complementarity is a moderating variable with a positive effect on double loop learning

Meschi (1997) suggests that all cultural differences in an international joint venture, regardless of their nature or intensity, will ultimately recede over time and Ouchi and Bolton (1988) have demonstrated that international collaborative R&D has led to new product development that would not have been possible without such collaborations. Parkhe (1991) and Kidd (1998) posit that cultural diversity between partners in international strategic alliances can potentially lead to higher levels of knowledge creation and knowledge based advantage. Therefore:

H5: If no alliance dissolution occurs, national cultural distance (or psychic distance as a proxy) will in time be positively related to I/O learning.

The resultant theoretical model is depicted in Fig. 2.

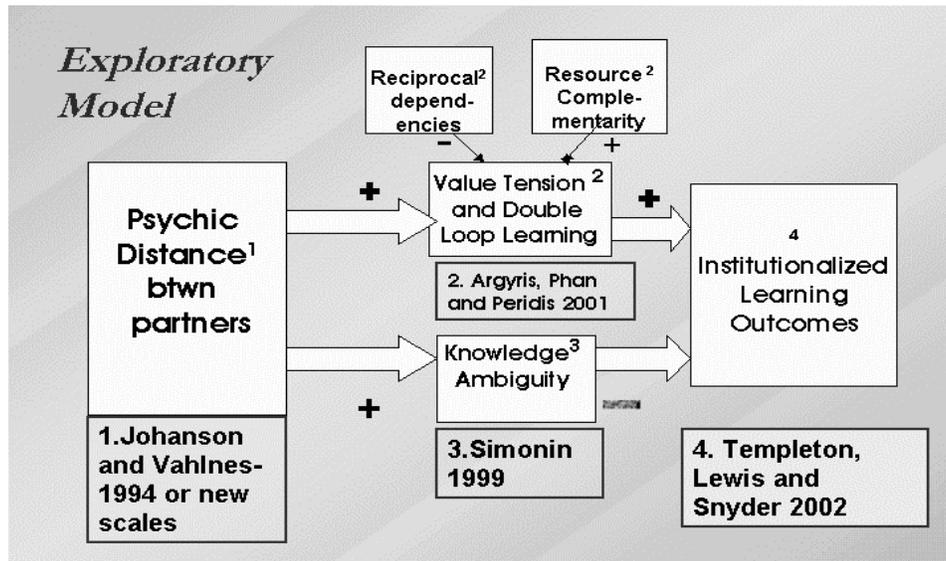

FIG. 2: EXPLORATORY MODEL

## Metrics

### Dependent Variable-Organizational Learning

According to Crossan, Lane and White (1999), as one moves from the individual level of intuiting/interpreting through group integrating to organizational institutionalizing, the process of learning is less fluid and incremental and becomes more staccato and disjointed. Generally, that which becomes institutionalized in organizations has received, at some point, a certain degree of consensus or shared understanding among the influential members of the organization. Changes in systems, structures, and routines occur relatively infrequently in organizations; as a result, although the underlying processes of intuiting, interpreting, and integrating are more fluid and continual, significant changes in the institutionalized organization typically are punctuated. However, even though the institutional changes may appear disjointed, the underlying learning processes of intuiting and interpreting at the individual and group levels that result in these changes may be more continuous. Accordingly although organization learning is by nature dynamic and characterized by feed forward and feed back loops it may be most appropriate to utilize institutionalized learning as a unit of analysis.

Olivera (2000), for example, relies upon the organizational level concept of institutionalized knowledge or memory to develop an empirical investigation of knowledge collection, storage and access in multi unit organizations and other researchers (Crossan, Lane and White 1999) have found this approach to be an acceptable one.

Based on a domain definition grounded in the literature, Templeton Lewis and Snyder (2002) attempted to develop an empirically reliable and valid measure of organizational learning. They integrate 2 methodological frame-works to develop an 8 factor, 28 item instruments for assessing OL derived from a sample of 119 firms. This scale is suggested as a metric to assess OL in the framework outlined to test the above mentioned research hypotheses. (Table 4)

- the extent to which organizational members are aware of the sources of key organizational information and its applicability to existing problem areas (*awareness*);
- the extent of communication and that exists between organizational members (*communication*);
- the comparison of process- and outcome-related performance to organizational goals (*performance assessment*);
- the development of experience, expertise, and skill among existing employees (*intellectual cultivation*);
- technology-related items pertaining to organizational responses to environmental change (*environmental adaptability*);
- the extent to which organizational members learn through social channels about organizational concerns (*social learning*);
- the extent to which the organization manages knowledge, skill, and other intellectual capital for long-term strategic gain (*intellectual capital management*); and
- the extent to which the organization capitalizes on the knowledge, practices, and internal capabilities of other organizations (*organizational grafting*).

TABLE 4: FACTORS WHICH MEASURE ORGANIZATIONAL LEARNING- TEMPLETON, LEWIS AND SNYDER (2002)

#### **Explanatory Variable-Value Conflict and Double Loop Learning**

Gardial, Woodruff and Flint (2002) results suggest that tension is related to organizational members desire to improve their situation by learning. Learning is a means of managing tension is similar to coping behaviors found in research on role stress (Keaveney and Nelson 1993). The learning described by participants in the Gardial, Woodruff and Flint (2002) study was often reflective of organizational learning as "generative learning," in which people in organizations question "long-held assumptions about [the organization's] mission, customers, capabilities, or strategies" (Slater and Narver 1995), This is analogous to the double loop learning created through values tension as described by Phan and Peridis (2000)

Gardial, Woodruff and Flint (2002) designed interviews to draw out autobiographical memories of personal experiences related to changes in what participants valued from suppliers including developing metrics of the incidence of value conflict and the resultant desire on the part of participants to learn. Although such memories may not depict a "true" representation of what actually happened, it is well established that they accurately represent the meaning of personal experiences (Brewer 1986; Conway 1990), are likely "representative of the underlying [memory] structure with respect to both content and organization" These interviews were supplemented, when possible, by observation of meetings with purchasing professionals inside participants' organizations, tours of facilities, and analyses of documents provided by participants to aid in construct development including a construct of double loop or generative learning. A similar ethnographic study is suggested to develop a construct of double loop or generative learning for the recommended research framework in this paper.

#### **Explanatory Variable-Cultural Distance**

Hofstede (1994) validated five independent dimensions of national culture differences. These ideas were first based on a large research project into national culture differences across subsidiaries of IBM in 64 countries in 1980. Hofstede or (Hofstede adjusted) measures are employed by most studies of cultural distance. Nordstrom and Vahlnes (1994) adjusted Hofstede measures via an expert panel to provide a more current measure and their measures of cultural distance could be employed pending the availability of more current measures shortly expected to be published in the Journal of Marketing (Laroche, 2003)

#### **Explanatory Variable-Knowledge Ambiguity**

Simonin's (1999) measures of knowledge ambiguity derived from national cultural differences included partner protectiveness, language differences, similarity of business practices and operational mechanisms and similarity of management style of partners. These validated scales could be used to measure knowledge ambiguity between alliance partners.

## **Proposed Sampling, Analysis and Validation**

### **Preliminary Stage**

Double loop learning, reciprocal dependencies and resource complementarity metrics could be validated through an ethnographic/ grounded theory approach via study of a single alliance between culturally diverse partners. Interviews would be supplemented by observation of meetings, tours of facilities, and analyses of documents provided by participants

### **Model Validation Stage**

The model could be potentially then validated through a survey of organizations involved in cross-national alliances of varying cultural distance via a longitudinal study (i.e. 12 -24 months) that would track organizational learning as per the metric described above supplemented with periodic survey research and interviews of key front line employees most involved in the alliance, from both organizations.

A sample of national origins of partners chosen to represent high, medium and low cultural distance based on adjusted Hofstede or newer measures might include respective national origins such as Canada-US, Canada-Sweden and Canada-China. The exploratory model could then be validated through multivariate and Structural Equation modeling techniques as well as such techniques as proportional hazard modeling to measure temporal effects.

### **Benefits of an Integrative Research Approach**

Benefits of an integrative research approach to address paradoxes of inter-organizational learning in the study of cross cultural alliances could include a better understand value of national culturally based conflict vs. stability in learning outcomes as well as guidance in partner selection based on gaining learning/ knowledge advantage. The research gaps remain numerous and important in this field as inter-organizational learning amongst alliance partners of different national origins is an increasingly important competitive advantage. Though we are in an era of rapid cultural convergence across the globe (Bird and Stevens, 2003), national cultural differences and how they can levered for competitive advantage in the learning organizations will likely remain important for many decades to come.

## **Limitations**

The limitations of this broad approach are numerous despite potential contributions to the extant literature. “Networked” alliances forms (Simonin 2003) between partners of more than two (often many) national origins are increasingly prevalent. Simonin (2003) for example explores how organizations learn from their networks of alliances and partners and proposes a model of alliances that constitutes an attempt to develop a meta-theory of collaborative learning, one that accounts for, and is meaningful to, all types of organization, all levels of learning and knowledge management, and for different collaborative foci. This framework does not address these different typologies.

Secondly, the model does not account for learning asymmetries (Tsang 2002, Lubatkin, Lane and Florin, 2001) which clearly are typically present between culturally distant alliance partners though this could be incorporated into further iterations of the model.

Thirdly, Hofstede’s cultural distance metrics are dated and need revalidating in an environment of globalization and convergence.(Shenkar, 2001) and in fact cultural distance may be a measure that is of less interest to researchers than that of acculturation (Tan Lin Boon, 2002), that is the phenomenon of emergent multinational or global cultures. New validated metrics will aid in better empiricism for all types of cross-cultural study, including this proposed framework.

Finally there is only recently been construct development of methods to measure double loop or generative learning in an organizational setting. This is clearly a critical piece of the puzzle in understanding cross-cultural learning between organizations.

## Conclusions

There is not consensus as to how national cultural distance between strategic alliance partners effects short and long term organizational learning outcomes. In fact the research is rather paradoxical. An integrative research frame work is suggested to attempt to resolve and rationalize conflicting views in the extant literature though a cross-disciplinary approach. There is a growing body of work, however, that suggests managers should consider the value of “loosely managed conflict” to generate unique and competitively advantageous learning from culturally distant alliance partners rather than focusing solely on the benefits of ease of knowledge transfer.

# R&D Game and Innovation Timing under Uncertainty in Pharmaceutical Industry: An Application of Real Option

*Yongshun Luo*

*Toyohashi University of Technology, Japan*

## Abstract

Nowadays pharmaceutical R&D has been considered as a mixture of strategy and luck with the increasing difficulty of drug discovery. Among the various attempts to clarify the decision-making mechanism to give birth to more drugs, real option theory is widely accepted for its attention to managerial flexibility.

In this study, we discuss the possibility of the integration between real option theory and game theory at pharmaceutical R&D. As a simple model, we consider two competing firms which are pursuing R&D innovation in continuous time in a two-player market. They both face uncertainty in expecting their R&D outcomes. This time for comparison, we discuss two cases; one is the two firms making R&D decisions simultaneously and the other is one firm moving first. Unlike the common belief of first-mover advantage, even in a high-tech competitive scene as pharmaceutical R&D of this model, there exists a second-mover advantage that can be valued by a real option. We found with the increase of uncertainty, the second-mover advantage can become bigger within certain conditions.

## Introduction

The pharmaceutical industry has been experiencing an exciting times during the last two decades. Despite the widely expressed negative sentiments regarding pharmaceutical productivity, the new signs that innovation could yet win the day and bring a fresh wave of breakthrough drugs have activated the main pharmaceutical companies of the world to put their resource into a new round of pharmaceutical R&D race. With the cause and effect relationships of innovative process separated by decades, pharmaceutical industry is defined as the 'ultra slow' industry where the likelihood of epoch-making drugs been developed is considered as a mixture of strategy and luck (see, Schmid and Smith [2004]). The existing literates have put great emphasis on the managerial ability in ingeniously rearranging the resource for multi-drug-effect development (e.g. portfolio of projects) which renders the possibility of application of real option theory, and factors that influence pharmaceutical R&D productivity or R&D incentive such as impact of mergers & acquisitions (see, Koenig and Mezick, 2004), impact of price regulation (see, John A. Vernon, 2003) and of market size (see, Acemoglu and Linn, 2004). However, considering the dominating monopoly power of the leading drugs in specific drug effects and the extremely protected developing information flow, pharmaceutical industry has been turned into a typical field where strategies could not be discussed without attention to a R&D competition game background.

Does strategy make a difference when the success rate of outcome of a new drug is out of control and at the same time the reaction of the rivals is difficult to predict? This study is trying to give an answer by constructing a simple model linking pharmaceutical R&D game and real option theory. We consider two competing firms which are pursuing R&D innovation in continuous time in a two-player market. They both face uncertainty in expecting their R&D outcomes. In contrast to the previous research, the study takes the real option value of a pharmaceutical into consideration, which will change the expected value of the strategies the firms take and give a big impact on the equilibrium of the game. Then we discuss two cases under this circumstance for comparison: One is the two firms making R&D decisions simultaneously and the other is one firm moving first. We will observe under the new definition of game, how the innovation timing influences the decision-making in R&D, especially in the strategy-intensive pharmaceutical industry.

This paper is arranged as follows, in section 2, we describe the model in consideration of real option value of the projects in comparison with the existing game equilibrium, and apply our approach to the two innovation timing games to analyze the effects of second-mover advantage on the equilibrium innovation dynamics. In section

3, we fit the model into pharmaceutical R&D race to obtain the characteristics of innovation activity in this industry. Finally, we draw the conclusion.

## Model

### Two Firms Moving Simultaneously

We consider a two-player game: there are only two firms in a industry,  $i = A, B$ . Both firms are facing two choices of projects: X, Y, where X stands for a high-risk-high-return project and Y stands for a low-risk-low-return one. They can only choose one of them because of the budget restraint. The payoff matrix of A,B under this condition is as follows,

A \	B	X	Y
X		$a_1, b_1$	$a_2, b_2$
Y		$a_3, b_3$	$a_4, b_4$

FIG. 1

We can find it's wrong to conclude  $a_1 > a_4, b_1 > b_4$  because neither of the firms can be sure of its success in developing the new products. Project X has a high return but the possibility of failure during the development is also high. Project Y has a considerably low return but it's safe. Also, there is no information of what strategy the rival will take. Now let's introduce the success rate for discussion.

Assume the success rate of project X is 5%, and the possible return (extracting the costs) is \$200 million; the success rate of project Y is 80%, and the possible return is \$10 million. The technologies developed are perfectly protected within patent period, which assures no spillover or imitation happen. Let's see what the matrix will be with the expected value. (For easier discussion, we omit the discount factor since the all the values are discounted at the same rate.)

A \	B	X	Y
X		5,5	10,8
Y		8,10	4,4

FIG. 2

On the occasion A and B choose project X or project Y simultaneously, the total markets are split into two halves ( $200 \cdot 5\%/2$ ). The Nash equilibrium are two: (X, Y) and (Y,X). Under mixed strategy, the equilibrium is (4/9,4/9). And the optimal expected payoff is (20/3, 20/3).

Now let's discuss the development in two stages. We assume there is an important stage in development of X, where the result is vital to the success rate of next stage and is determinative in making the go and no-go decision. We assume the result in stage 1 raises the success rate to 50%, for example. The project value  $v$  at the point can be calculated as  $100k$  ( $200 \cdot 50\% \cdot k$ ), where  $k = 1/(1+r)^{T-t}$  representing the time discount rate. The time span of stage 2 is  $t$ , and the full length of development is T.  $r$  is the risk-free interest rate.

Considering the additional value originated from the successful development, we can define a real option representing the future opportunity benefiting from the current result. We get,

$$C = \text{Max}(V - v/k, 0) = \text{Max}(V - 100, 0) \quad (1)$$

$v/k = 100$  is strike price and represents the return of licensing out the half-finished outcome in case the development fails in stage 2 or the project value falls below the strike price. The matrix of expected return in stage 1 can be expressed by,

A \ B	X	Y
X	50k, 50k	100k + Ck, 8k
Y	8k, 100k + Ck	4k, 4k

FIG. 3: MATRIX OF EXPECTED RETURN IN STAGE 1

Also, we eliminate the discount rate to get the following matrix.

A \ B	X	Y
X	50, 50	100+C, 8
Y	8, 100+C	4, 4

FIG. 4: MATRIX OF EXPECTED RETURN IN STAGE 1 (SIMPLIFIED)

Under mixed strategy, the possibility of A choosing project is  $p$ , while the possibility for B to choose X is expressed by  $q$ ,

$$\begin{aligned} \text{The expected return of A} &= 50pq + (100+C)p(1-q) + 8(1-p)q + 4(1-p)(1-q) \\ &= (-54-C)pq + (96+C)p + 4q + 4 \end{aligned}$$

the value  $p$  that maximizing the equation is  $p = 4/(54+C)$

The same,  $q = 4/(54+C)$

The condition of A and B is totally asymmetric, so they have the same expected return curve only concerned with project value in expiry ( $V$ ) despite of the move of the rival.

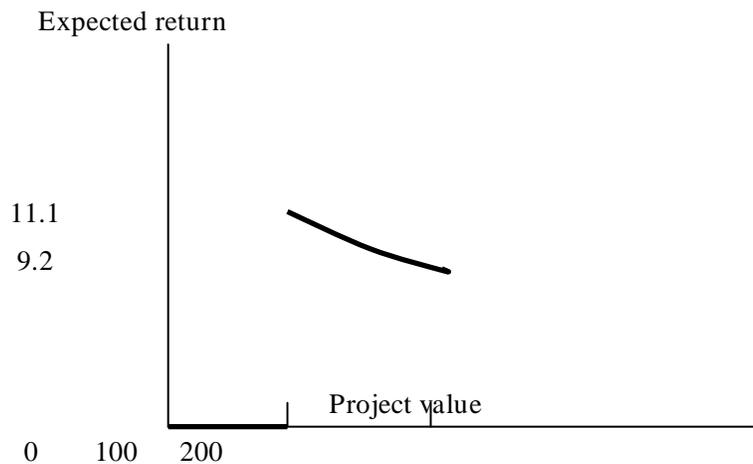

FIG. 5: THE EXPECTED RETURN CURVE UNDER SIMULTANEOUS GAME

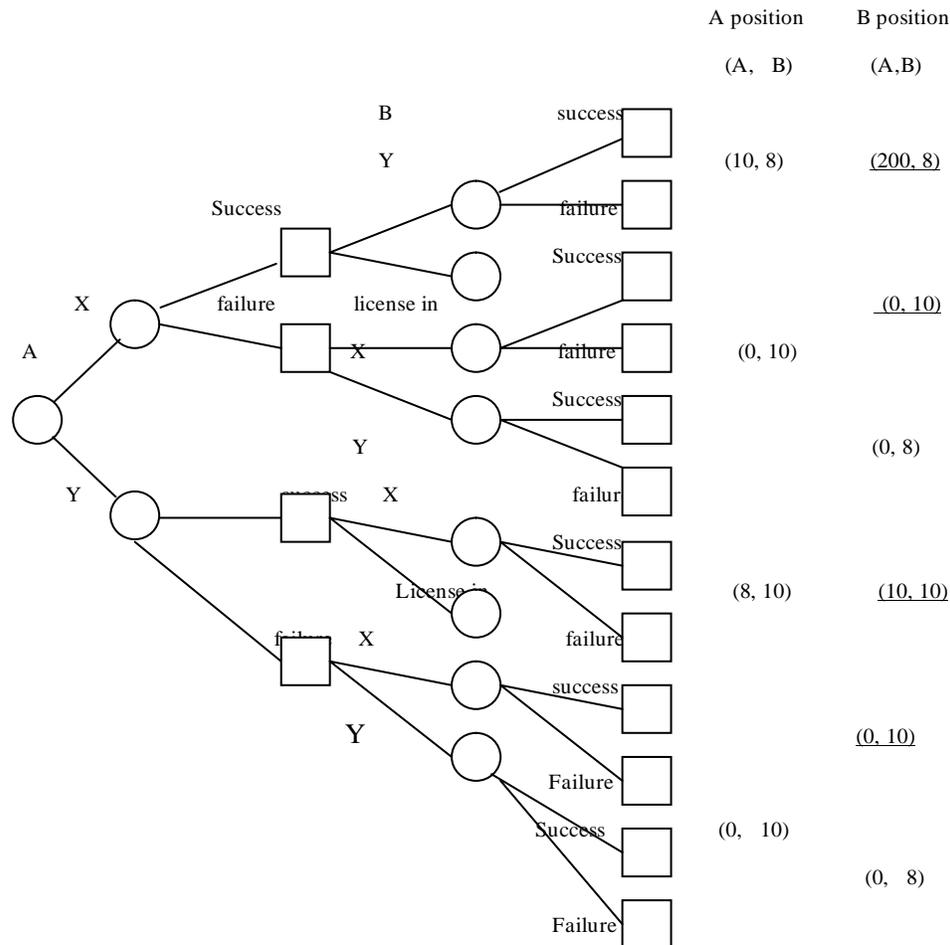

FIG. 6: THE EXTENSIVE GAME OF ONE FIRM MOVING FIRST

**One Firm Moving First**

Assuming firm A move first, then firm B makes decision after observing the result of A. Firm A start from nature, choosing project X or Y by random. When it succeeds in the development of one project, it can obtain monopoly profit with a strong protection of patent. Also as the leader, firm A can choose to license out the technology to avoid marketing risk. The right to license out is what we call license-out real option of R&D management, which is also used to demonstrate that the leader has the first-mover advantage. Firm B, being lagged as the follower, seems to be in a disadvantageous position.

Is this really the truth? As we've seen in 2.1, moving first cannot assure the success in development, while avoiding undertaking the same project can be more meaningful for product differentiation. This can also help the follower in concentration at its development plan. Another merit for being follower is to wait for new information about the development. Furthermore, in the case first mover licensing out its result, license-in strategy may give an addition to its future value by supplying the follower a real option. In the worst case, even when the follower can not share the result through licensing in, when the patent period is over, the follower B enters the market and gets a equilibrium duopoly profit with firm A.

Analyzing Figure 6 may help understand the second-moving advantage. At B position, where firm A has made its decision and the result has come out, what firm B has to decide is to pursue the maximum option. Here we assume the return of licensing in is near zero. When firm A chooses project X and succeeds in developing it, its

return is \$200 million, firm B chooses developing project Y which gives it an expected return of \$8 million. When firm A chooses project X but fails, there is an option facing firm B, project X, or Y,  $\max(Ex(X), Ex(Y))$ , in this case, project X is the better one. To supplement for this, we'd like to mention again that because of the budget restraint, firm A can not gather resource for the second round race after first selection, so there is no sharing of market, firm B can safely monopoly a product market. We can obtain the following payoff matrix,

	B	Y-L,Y	Y-L,L	X-Y,X	X-Y,Y	X-L,X	X-L,L
A							
	X	<b>200,8</b>	200,0	<b>0,10</b>	0,8	-	-
	Y	-	-	<b>0,10</b>	0,8	<b>10,10</b>	10,0

FIG. 7: PAYOFF MATRIX FROM B POSITION (ONE FIRM MOVING FIRST)

From firm A position, it should expect firm B's reactions to every occasion to decide the possibility of selecting project X or Y. See Fig. 8,

	B	A succeed	A fail
A			
	X	10,8	0,10
	Y	8,10	0,10

FIG. 8: PAYOFF MATRIX FROM A POSITION (ONE FIRM MOVING FIRST)

To maximize the expected return at A position, firm A should maximize  $10p+8(1-p)=2p+8$ ,  $p=1$ . At this time, the expected return of firm A will exceed that of firm B. The calculation is as follows,

$$Ex(A)=200 \cdot p \cdot 5\%+10 \cdot (1-p) \cdot 80\%=10$$

$$Ex(B)=8p \cdot 5\%+10p \cdot 95\%+10(1-p) \cdot 80\%+10(1-p) \cdot 20\%=9.9$$

Furthermore, the possibility to assure the leader's advantage is  $p>2/2.1$ , below which there is the value area of second-mover's advantage.

## The Pharmaceutical R&D Race

### The Characteristic of Pharmaceutical R&D

Compared with R&D in other industries, the development of a new drug is a time-consuming and costly process through a strict way from development to application until marketing. What makes it more difficult to handle is the high uncertainty in technological failure. The characteristics of pharmaceutical R&D can be roughly described by four facets: high risk, high cost, long time and easiness of imitation.

#### High Risk

1) Discovery in screening: an accidental event. As we've known, the research in screening stage is on the base of individual work. The technological uncertainty is so high that the possibility of finding effective compounds is almost unpredictable. Experience data have shown that almost by synthesizing 1000 compounds could one compound come to the surface. For more innovative discovery, the rate is even lower.

2) Uncertainty accompanies the whole process of clinical trial. Almost in every step of the trial, risks come up with the form of virulence, or serious side effect, which will possibly invalidate the whole project. Compared with the success rate in screening stage, the possibility of the new effective compound going through (pre)clinical stage is fairly high, almost reaching 1/3-1/2. However, since it's connectedly related to the effect on human body, even a few reports of virulence or serious side effect may sentence the end of the project. Unlike in the other stage, in most of the cases, there is little room for improvement during (pre)clinical stage, especially in clinical stage where human body is the direct object of tests. The defect during this stage is irreversible both technologically and economically. This requires that the management have a high level of capability of reacting to the possible negative information.

***High Cost***

Compared with other industries, pharmaceutical R&D spends a much higher amount in searching for a totally new compound in screening stage. However, it's only a small part of the total expenditure.

The later the stages come to, the higher does the R&D cost. The expenditure increases sharply with the unfolding of Phase I, II, and III. The candidates should be carefully selected on considering the balance of minimal cost and minimal opportunity cost. In such circumstance, the timing of fatal defect being found turns to be a critical problem when considering the possible wasteful use of resources.

***Long Time***

The average development cycle of pharmaceutical R&D is the longest among the mostly industries. There contains a considerable time value that no management can ignore. When comparing several projects with different development time, time value undoubtedly gives a great impact on the decision-making.

***Easiness of Imitation***

In contrast to the difficulty of drug development, the results of pharmaceutical R&D without patent can be easily imitated as long as the competitors buy the new drug from market and analyze its ingredient. With low cost, little time and almost no risk, imitators can easily have access to the technique achieved by great efforts of the developers. Pharmaceutical industry is said to be the industry most suitable for patent protection due to such fragility of technological monopoly.

***Pharmaceutical R&D Race***

According to the above-mentioned characteristics of pharmaceutical R&D, we can relate them with the discussion in section 2. The higher uncertainty and higher cost in drug development require the first mover to bear more risk and engage more resource inside firm. At the same time, the wait option should be valued with great importance with the changing information among pharmaceutical industry. Here we'd like to discuss it based on the previous talk.

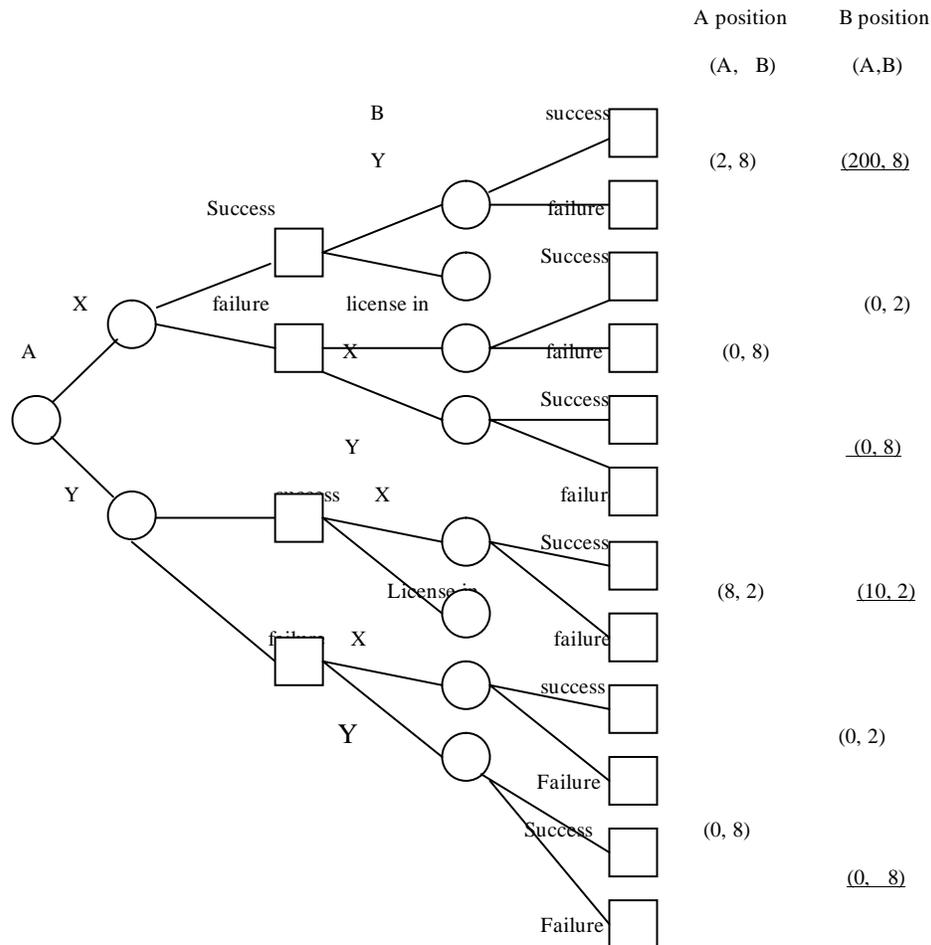

FIG. 9: THE EXTENSIVE GAME OF ONE FIRM MOVING FIRST

To adapt the figures to reflect the pharmaceutical R&D game, we make the following assumptions,

- 1) Project X refers to the breakthrough new drug development with a fairly low rate of success, here 1%, for example. While Y refers to drug improvement with the same possibility of success.
- 2) We assume firm A move first and firm B follows after waiting for a period of time.

The expected return at A position and B position are changed as showed in figure 9. We can see that with a lower success rate, both the first mover and second mover decreased in their expectation.

	B	Y-L,Y	Y-L,L	X-Y,X	X-Y,Y	X-L,X	X-L,L
A							
X		<b>200,8</b>	200,0	0,2	<b>0,8</b>	-	-
Y		-	-	0,2	<b>0,8</b>	<b>10,2</b>	10,0

FIG. 10: PAYOFF MATRIX FROM B POSITION (ONE FIRM MOVING FIRST)

From firm A position, it should expect firm B's reactions to every occasion to decide the possibility of selecting project X or Y. See Fig. 8,

	B	A succeed	A fail
A	X	2,8	0,8
	Y	8,2	0,8

FIG. 11: PAYOFF MATRIX FROM A POSITION (ONE FIRM MOVING FIRST)

To maximize the expected return at A position, firm A should maximize  $2p+8(1-p)=-6p+8$ ,  $p=3/4$ . This time, the expected return of firm B exceeds that of firm A. The calculation is as follows,

$$Ex(A)=200 p 1\%+10 (1-p) 80\%=7/2=3.5$$

$$Ex(B)=8p 1\%+8p 99\%+2(1-p) 80\%+8(1-p) 20\%=6.8$$

## Conclusion

In this paper, we discuss the possibility of the integration between real option theory and game theory at pharmaceutical R&D. As a simple model, we consider two competing firms which are pursuing R&D innovation in continuous time in a two-player market. They both face uncertainty in expecting their R&D outcomes. This time for comparison, we discuss two cases; one is the two firms making R&D decisions simultaneously and the other is one firm moving first. Unlike the common belief of first-mover advantage, even in a high-tech competitive scene as pharmaceutical R&D of this model, there exists a second-mover advantage that can be valued by a real option. We found with the increase of uncertainty, the second-mover advantage can become bigger within certain conditions.

# **A Study of Relationship between Job Satisfaction and Organizational Commitment among Employees of Academic Profession**

*Ibrahim Ali*

*Ida Irdawaty*

*Universiti Tenaga Nasional, Malaysia*

*Juhary Ali*

*Universiti Utara Malaysia, Malaysia*

## **Abstract**

**The purpose of this study is to gain a better understanding of the relationship between job satisfaction and organizational commitment among employees of academic profession working at two different work locations. Previous studies have shown that variations in levels of organizational commitment and job satisfaction were contributed by some of the demographic factors, but not much has been studied in terms of its relationships to work location and job profession factor. Using a survey instrument consisting of job satisfaction and organizational commitment questions adapted from the Job Description Index (JDI) and Organizational Commitment Questionnaires (OCQ), the study was conducted on 314 respondents working in different job classification and in two different work locations of a private institution of higher learning. Data were statistically analyzed and results are discussed.**

## **Introduction**

It is in the interest of the organization to understand its employees' level of job satisfaction and organizational commitment in order to assure of their stay with the organization. Realizing high turnover rate of employees causes high cost to the organization, efforts are made to retain employees and minimize turnover whenever possible. Employee turnover has become a very serious problem over the past decades, and to manage employees' retention and to keep employees turnover rate below target is the most challenging issues facing the organization. The impact of employees' turnover—costs of lower productivity due to poor contribution from dissatisfied employees, loss of productivity of experienced personnel, cost of hiring new employees, and also loss of competitive edge due to experienced employees joining new organizations that compete in the business—all these are contributing factors that impact organization performance.

While job satisfaction has been of broad interest to both people within the organization and researchers for many decades (Spector, 1997), organizational commitment has been studied focusing on its consequences to the organization such as performance, turnover, and attitudes (Hunt, Chonko, & Wood, 1986). Organization has to understand the commitment employees have to their operation, and to determine what affect the levels of commitment is one of the ways that organization addresses the issue of employees' turnover.

The issue of turnover and employees leaving the organization has become a central issue of labor in a competitive market environment. Thus, it demands for a continuous study and examination that is able to contribute its findings for changes and improvement for the organization to overcome. Among the issues that are related and deliberated by previous research of organizational study are issues of work attitudes that influence workers behavior—whether to stay or to leave the organization. Job satisfaction and organizational commitment are among the significant factors that have been examined from several approaches and facets.

Examining job satisfaction and organizational commitment will further contribute to organization for continuous improvement, besides that it contributes to enrich current academic literature, specifically the outcome deriving from various perspectives that have been less examined before. In addressing the issues, management of organization has to realize and understand the importance of commitment employees have on their organization and identify factors that are significantly related to their job satisfaction. A clear understanding on the definition and

concepts of both the variables—job satisfaction and organizational commitment is thus important in examining the relationship between the two and identifying factors that affect job satisfaction.

## **Literature Review**

### **Organizational Commitment**

Organizational commitment has been described as consisting two constructs—*affective* and *continuance* (Allen & Meyer, 1990). While affective commitment is defined as “a strong belief in and acceptance of organizations’ goals and values; a willingness to exert considerable effort on behalf of the organization; and a strong desire to maintaining membership with the organization’ (Mowday, Porter, & Steers, 1982, p. 27), continuance commitment considers the idea that individuals do not leave the company for fear of losing their benefits, taking a pay cut, and not being able to find another job (Murray, Gregoire, & Downey, 1991). Organizational commitment refers to an attitude that reflects the strength of linkage between an employee and the organization, and levels of commitment tend to implicate employees’ intention whether to stay or quit the organization. Organization commitment recognizes the identity of a person that is linked to the organization (Sheldon, 1971), thus developing emotional or psychological attachment with the employer.

Organizational commitment has been profoundly investigated by researchers because of its significance in affecting organizational performance. Organizational commitment influences organization performance when it is viewed as employees’ willingness to devote energy and loyalty to the organization. Salancik (1977), in support to this view appeared in the literature to define organizational commitment to include the three organizational functions—organizational identifications, job involvement, and organizational loyalty. In other words, organizational commitment can thus be seen as the extent to which employees show the willingness to exert effort, participate in decision-making, and internalize managerial values (O’Reilly & Chatman, 1986).

Most research seems to focus on the consequences of organizational commitment—organizational performance, turnover, and attitudes (Hunt, Chonko, & Wood, 1986). Nevertheless, an understanding of what predicts organizational commitment in the early state of employment is also beneficial to the organization, as it would help the management to adopt practices that would build up organizational commitment and reduce turnover rate.

### **Job Satisfaction**

Literature in organizational behavior shows job satisfaction as to have been widely studied on its relationship to organizational commitment because of their significant effects on organizational performance—to an extent that job satisfaction has been recognized as a component of organizational commitment (Kovach, 1977).

Job satisfaction has been defined in various ways, and the term was brought to limelight by Hoppock (1935). Hoppock reviewed 32 studies on job satisfaction conducted prior to 1933, and observed job satisfaction as a combination of psychological, physiological, and environmental circumstances that cause a person to say, “I am satisfied with my job”. Job satisfaction is also defined as a state of pleasure gained from applying one’s values to a job (Locke, 1969). Employees who perceived that their values have been realized would embrace a positive attitude towards their jobs, thus acquiring job satisfaction (McCormic & Tiffin, 1974). It is also believed that job satisfaction “can be considered as a global feeling about the job or as a related constellation of attitudes about various aspects of or facets of the job” (Spector, 1997, p.2).

The importance of job satisfaction for an organization is reflected through the interests of several researchers in studying the issue in its relation to organizational performance. Studies have shown how demographic factors—age, gender, race, and education have important effects on job satisfaction. Study by Kallerberg and Loscocco (1983) shows that older workers are more likely to be satisfied than younger workers, whereas a study by Shapiro and Stern (1975) found that professional women such as clinical psychologists, social workers, and medical workers experienced lower job satisfaction than their male counterparts. Several other researchers have also found that employees who report better interpersonal relationship reported higher job satisfaction (Everly & Falcione, 1976; Robinson, Roth, & Brown, 1993; Schneider & Locke, 1971).

In addition to the studies, Shinen and Wait (1996) conducted a study on the effects of socialization among subordinates and supervisors on job satisfaction and reported that employees who were more satisfied with their job in general, and with the nature of their work were also those who more frequently socialized with both their subordinates outside their work place. In fact, Maslow's hierarchical model of human needs can be used to identify the factors affecting job satisfaction. The model can be used to develop a sense of satisfaction in their jobs if they apply bottom-up perspective on job satisfaction.

#### **Job Satisfaction and Organizational Commitment**

The relationship between job satisfaction and organizational commitment has been argued and debated by previous researchers, and several studies have shown job satisfaction to predict organizational commitment (Porter, Steers, Mowday, & Boulian, 1974; Price, 1977). Previous research (Breaugh, 1983; Cullen, Parboteeah, & Victor, 2003; Mowday, Porter, & Steers, 1982) shows consistent results of the positive relationship between job satisfaction and organizational commitment. In the context, it is argued that employees that are satisfied with their jobs are likely to have greater attachment to the organization and to develop stronger commitment.

Although both job satisfaction and organizational commitment are said to be related, they are distinguishable attitudes. Job satisfaction is more an immediate reaction to the job, while organizational commitment is a reaction to the overall organization (Mowday et al., 1982). Thus, employees who may have dissatisfaction over the job, may remain committed to the organization. In general, employees tend to be satisfied and committed if they are contented with the nature of work, satisfied with supervisors and co-workers, and if they perceive current pay policies and opportunities for promotion within the organization are adequate.

Previous research indicates a fairly positive correlation between job satisfaction and organizational commitment (Arnold & Feldman, 1982; O'Driscoll, Ilgen, & Hildreth, 1992). Some of the positive correlation indicated may be contributed by employees' positive response bias, or employees that tend to have a positive response to both measures. It may also be due to workers trying to avoid *cognitive dissonance*—i.e., an unpleasant state of self-inconsistency (Festinger, 1957). In the context, workers seem to convince themselves that they are satisfied because they are loyal to the organization. While it can be argued that a worker can be satisfied with the job but he or she may have low feelings of commitment to the organization—feelings that tend to be positively related.

Both job satisfaction and organizational commitment are affected by several factors. This includes type of work, responsibility associated to the work, social relationships, compensation, promotional policies and practices, and career advancement in the organization. Studies have shown mixed results as to the direction of influence between the two. O'Driscoll et al. (1992) found that job satisfaction may affect organizational commitment, whereby other studies indicate organizational commitment leads to job satisfaction (Becker & Billings, 1993; Vandenberg & Lance, 1992).

It is apparent therefore that maintaining job satisfaction and organizational commitment are challenges encountered by both the employers and employees of the organization—challenges of concerns in order to maintain a high quality and loyal workforce. Studies in this area of research have to remain important for further contributions for organizations and literature as well.

## **Methodology**

### **Research Questions and Instrument**

For the purpose of analyzing the relationship between job satisfaction and organizational commitment and determine which job satisfaction specific indicator significantly affect organizational commitment, three research questions were formulated as guidance to the study. The three research questions are:

1. Is job satisfaction and organizational commitment positively related?
2. Is there any particular job satisfaction indicator that is significant to affect the organizational commitment?
3. Does work location and job profession affect employees' level of satisfaction and commitment?

A survey instrument was designed to measure the levels of job satisfaction and organizational commitment among employees of an academic institution—a private institution of higher learning operating at two different work locations, i.e., Bangi, in the state of Selangor, and Bandar Muadzam Shah, in the state of Pahang—both are located in

the Peninsular Malaysia. The study classified the campus in Bandar Muadzam as located in the rural area, while campus in Bangi as location in the urban area.

Survey questions for the instrument was adapted from the Job Description Index (JDI) capturing 5 facets of job satisfaction—job, pay, rewards, co-workers, and supervisors, and the Organizational Commitment Questionnaires (OCQ). However, pay and rewards items were combined as rewards item. An additional item was included in the job satisfaction measure and identified as overall satisfaction—two questions capturing respondents feelings in general. The questionnaire also includes employee demographic data such as age, education level, job tenure, position, and marital status.

The OCQ which was adopted from Porter and Smith (1970) consists of 15 questions to capture factors pertaining to the acceptance of organization’s values and goals; willingness to put effort on behalf of the organization, and; desire to maintain membership with the organization. The respondents rated on a 7-point Likert-type scale ranging from “Strongly Disagree” weighted (1) to “Strongly Agree” (weighted 7). A general score is determined by acquiring the mean score of all the 15 responses after reverse-coding several negatively phrased questions.

## Results

### Demographic Data

A total of 314 academic and non-academic staff participated in the study that forms about 72 percent of the total number of affected respondents at the two work locations—both are in different states within the peninsular Malaysia. The commonest age group of respondents was 25-29 years old (35.4%). 51.3 percent of the respondents were male and 48.7 percent female. Lecturers constitute 57.6 percent of the sample with the remainder (42.4%) being the non-academic staff working in various categories of job classifications. Respondents from Bangi campus, located in the state of Selangor, and Bandar Muadzam Shah campus, located in the state of Pahang accounted for 84.4% and 15.6% respectively. The majority of the respondents (59.9%) worked for the private institution for less than 5 years, 26.1% worked for 6-15 years, while the remainder (14%) worked for more than 15 years.

### Reliability Analysis and Inter-correlation Analysis

The questionnaire responses were analyzed statistically to assess job satisfaction and organizational commitment of employees toward job and the entire work organization. Mean scores were calculated for each of the job satisfaction items. Mean scores were similarly computed for organizational commitment.

The means, standard deviations, Cronbach’s alpha, and zero-order correlation are presented in Table 1. Mean values for all job satisfaction items and one organizational commitment item are reported to be in the range of 4.11 to 5.39, while their standard deviations ranged from 0.96 to 1.40. The results of reliability analysis are shown in italic and bold on the diagonal. The results showed that all dimensions attained reliability coefficients of 0.78 to 0.95. Thus the internal consistency reliability of the measures used in the study is considered good.

The correlation between all job satisfaction items and organizational commitment shows that all are significantly correlated at  $p=0.00$  where the coefficient was  $r=0.47$  for satisfaction to job,  $r=0.52$  for satisfaction to rewards,  $r=0.32$  for satisfaction to co-workers and supervisors, and  $r=0.53$  for overall satisfaction.

TABLE 1: CORRELATION OF ALL JOB SATISFACTION VARIABLES AND ORGANIZATIONAL COMMITMENT

	1	2	3	4	5	6
1. Job	<b>.85</b>					
2. Rewards & Recognition	.65**	<b>.87</b>				
3. Co-workers	.41**	.56**	<b>.92</b>			
4. Supervisors	.57**	.61**	.62**	<b>.95</b>		
5. Overall Satisfaction	.54**	.47**	.45**	.43**	<b>.78</b>	
6. Org. Commitment	.47**	.52**	.32**	.32**	.53**	<b>.81</b>
Mean	4.94	4.11	4.75	4.68	5.39	4.83
SD	1.09	1.21	1.21	1.40	1.20	.96
N	314	314	314	314	314	314

\*\* $p = .00$ , \* $p < .05$ .

The multiple regression coefficients between organizational commitment as dependent variable and JDI facets as the independent variable are presented in Table 2. In the model, three of the job satisfaction items were found significant to affect organizational commitment. Satisfaction toward rewards and overall satisfaction were revealed significant at  $p=0.00$ , while satisfaction toward job was found significant at  $p<0.05$ . The regression model thus explained 38% of variation in organizational commitment.

TABLE 2: REGRESSION ANALYSIS

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std.Error	Beta		
Job	.12	.06	.13	2.04	.04*
Rewards	.27	.05	.34	5.07	.00**
Co-workers	-.01	.05	-.01	-2.22	.83
Supervisors	-.07	.04	-.10	-1.57	.12
Overall satisfaction	.27	.04	.34	6.17	.00**
R					.62
R <sup>2</sup>					.38
Sig. F					.00

\*\* $p = .00$ , \* $p < .05$ .

### Analysis of Variance (ANOVA)

Analysis of variance (ANOVA) was performed to reveal the significance of job satisfaction and organizational commitment examined from the job profession and work location factors. Results found no significant effect for both job satisfaction and organizational commitment when examined by the work location factor, while examination from the job profession factor revealed job satisfaction as significant ( $p < 0.05$ ). Table 3a and Table 3b respectively show the results of the analysis.

TABLE 3A: ANALYSIS OF VARIANCE BY WORK LOCATION

		Sum of Squares	df	Mean Square	F	Sig.
Org. Commitment	Between Groups	.647	1	.647	.702	.403
	Within Groups	287.369	312	.921		
	Total	288.016	313			
Job Satisfaction	Between Groups	.080	1	.080	.073	.788
	Within Groups	344.774	312	1.105		
	Total	344.855	313			

\*\* $p = .00$ , \* $p < .05$ .

TABLE 3B. ANALYSIS OF VARIANCE BY JOB PROFESSION

		Sum of Squares	df	Mean Square	F	Sig.
Org. Commitment	Between Groups	5.109	5	1.022	1.113	.354
	Within Groups	282.907	308	.919		
	Total	288.016	313			
Job Satisfaction	Between Groups	12.204	5	2.441	2.260	.048*
	Within Groups	332.651	308	1.080		
	Total	344.855	313			

\*\* $p = .00$ , \* $p < .05$ .

Responses from the questionnaire were also analyzed to reveal the rate of percentage for respondents from both the location and job profession. Rating 6 and 7 were classified as high, 3, 4, and 5 as moderate, and 1 and 2 as least satisfaction or dissatisfaction.

Table 4 shows the percentage rated by respondents in both the work locations, while Table 5 shows the percentage rated by respondents of different work professions. The work professions were divided into academic staff (professional lecturers) and non-academic staff (clerical and administration) Results shows that respondents in Muadzam Shah, Pahang rated higher percentage of high job satisfaction on job (59.2%) and rewards (38.8%) compared to respondents in Bangi, Selangor. Conversely, higher percentage of high satisfaction was rated by respondents in Bangi, Selangor on items of satisfaction with co-workers (52.1%) and supervisors (51.7%). Respondents in Muadzam also rated higher percentage of dissatisfaction over respondents in Bangi on job, whereas respondents in Bangi rated higher degree of dissatisfaction over respondents in Muadzam on the other three satisfaction items—rewards, co-workers, and supervisors.

TABLE 4: EMPLOYEES LEVELS OF JOB SATISFACTION BY WORK LOCATION

	Very Satisfied		Moderately Satisfied		Dissatisfied	
	Muadzam	Bangi	Muadzam	Bangi	Muadzam	Bangi
Job	59.2	54.6	38.4	27.7	22.4	17.7
Rewards	38.8	27.4	28.5	29.1	32.7	43.5
Co-workers	40.8	52.1	28.6	27.1	30.6	20.8
Supervisors	44.9	51.7	26.5	21.8	28.6	26.5

Note. Based on a 7-point scale.

Rating 6 or 7 = Very satisfied

Rating 3, 4, 5 = Moderately satisfied

Rating 1, 2 = Dissatisfied

TABLE 5: EMPLOYEES LEVELS OF JOB SATISFACTION BY JOB PROFESSION

	Very Satisfied		Moderately Satisfied		Dissatisfied	
	Academic	Non-Academic	Academic	Non-Academic	Academic	Non-Academic
Job	52.5	60.9	30.4	21.1	17.1	18.0
Rewards	14.4	42.1	33.7	23.3	48.1	34.6
Co-workers	47.0	57.1	30.3	19.6	22.7	23.3
Supervisors	48.1	53.4	23.2	2.5	28.7	24.1

Note. Based on a 7-point scale.

Rating 6 or 7 = Very satisfied

Rating 3, 4, 5 = Moderately satisfied

Rating 1, 2 = Dissatisfied

## Discussion

The purpose of the study was three-pronged. Firstly to examine the relationship between job satisfaction and organizational commitment. Second was to examine whether work location and job profession were significant in affecting job satisfaction and organizational commitment, and thirdly was to examine which specific job satisfaction facets were significant in affecting organizational commitment.

The result of the study that shows positive correlation between all facets of job satisfaction and organizational commitment indicate the significance of the two variables in affecting organizational performance. Rewards and recognition registered significance in relation to organizational commitment ( $r=0.52$ ,  $p=0.00$ ) suffice to relatively show that the higher the rewards and recognition received the higher would the commitment to the organization be. Similarly, the overall satisfaction - which sought respondents to indicate whether they looked forward to go to work every day - showed high significance ( $r=0.53$ ,  $p=0.00$ ). The study thus is consistent with previous studies asserting that job satisfaction and organizational commitment are noticeably related (e.g., Breaugh, 1983; Culen, Parboteeah, & Victor, 2003).

In examining job satisfaction and organizational commitment by employees of different work locations, despite the difference in amenities and infrastructure between the urban and rural setups, no significant result was found. This means that employees were not really concerned in which locations they were placed or posted to.

That it was limited to one particular organization only may have attributed to the generalizability of study. However, the significant results found in the analysis by job profession showed that different job profession—academician by profession and non-academician—do affect job satisfaction.

Job and Rewards were two of the job satisfaction attributes or facets that were found significant to affect organizational commitment. In other words, higher organizational commitment derived from higher satisfaction employees have on their job and more rewards they received.

Previous studies showed that there were some positive relationships between job satisfaction and job performance. Studies have also shown job satisfaction as having positive correlation with organization commitment. The study found significant relationship between job satisfaction and organizational commitment, thus consistent with the most recent study by Addae, Parboteeah, and Charley (2004) who found a positive relationship between the two variables.

The results of the study that examined job satisfaction and commitment from two types of respondents group—i.e., group by different work location, and group by different job profession could pose a question of generality within this limitation as the study was confined to one particular organization. Therefore, to further consolidate the findings, it is suggested for future research on similar study to be carried out in other localities and organizations in order to explore further contributing results that could help develop new findings and theories and henceforth add value to the academic literature.

## Conclusion

The results of this study show that job satisfaction and organizational commitment are positively related. The study also indicates that differences in job satisfaction between job professions exist. This provides an improved guideline—e.g., between job professions for the decision-making process. The study provides valuable information about how employees feel on their job and work organization while working in different work environments and locations. Specific job satisfaction facets were found to significantly affect organizational commitment, suggesting to the management to consider those factors in assuring higher productivity and organizational performance. The findings may be relevant and of value to employees, researchers, and human resource planners for their future planning.

# **An Exploratory Study on Intermediation Trend in the Recruiting Industry: Focused on the Korean Job Market**

*Kiho Park  
Hoseo University, Korea*

## **Abstract**

Under the internet age, the competition among recruiting intermediaries including online and offline players has been intensified for several years. Therefore, their business processes or business models have also been transformed to be able to earn the competitive advantages. For these reasons, the traditional players like offline-based recruiting companies have willingly or unwillingly experienced the competitive disadvantages on the recruit battle ground. The online recruiting intermediaries, who newly participated in this industry and based on the internet environment, however, seized on the competitive advantages with the richness and the reach traits of online media. Under this context, the offline traditional intermediaries, who have been threatened by new online entries, must make a replacement of traditional trading mechanisms with alternate trading mechanisms like IT-enabled intermediaries. In this study with the exploratory approach, we investigate the phases of transformation of the traditional recruiting intermediaries, changes in business strategies of offline-based firms, and impacts of online media in e-recruiting industry.

## **Introduction**

With the emergence of online-based recruiting intermediaries, so called e-recruiting service providers, the traditional recruiting intermediaries like headhunters based on the offline business should change the business strategies (NCA, 2004). For instance, the representative firms such as Korearecruit, KK Consulting, Top management consulting, and Unicosearch etc. showed like that the competitive power seemed to be weak for a while when the e-recruiting firms such as Jobkorea, Incruit, Joblink, and so forth emerged in the market. And some headhunters share the recruiting database through strategic alliance with on-line recruiting companies (HR Conference, 2002). The offline recruiting firms, however, have tried to improve competitive power in internet environment. In this study, we hope to investigate the following research questions:

- How does the emergence of information technology affect intermediary market in recruiting industry?
- How do traditional recruiting firms cope with change of managerial challenges?
- How does intermediation trend and competitive position be changed and transformed?

By exploratory study, we observed how the intermediation trend in recruiting industry is changing the industrial structure between new internet-based firms and traditional recruiting firms. We believe the result of this research can suggest the implications in promoting the competitive advantage of firms who wish to newly enter into the online market and understandings the trend of changes in recruit industry in digital age.

## **Theoretical Background**

### **Information Technology and Intermediary**

In the ex-electronic transaction age, the traditional intermediaries existed in almost markets. However, the information technology has made an influence to the existing intermediary industry. Namely, the competitive context between the pure electronic-based (e-based) commerce and the traditional intermediaries dynamically changed the market structure and the rule of competition. In addition, the electronic markets enable direct connections between buyers and suppliers (Pralhad, 1998; Tapscott, 1996).

Gradually, the e-based firms has grasped the more portion of market share, meanwhile, the traditional players hesitantly seems to shrink backward (Chircu & Kauffman, 2000). The traditional brokers, however, who shrank for a while backward and transformed their business model into the e-based intermediary, actively reentered

into the market and try to recapture their lost market share (Easterwood & Morgan, 1991; Chircu & Kauffman, 2000; Gellman, 1996). In addition, the electronic markets offered new types of intermediaries called cybermediaries (Sarkar et al., 1995). Here the traditional middlemen might be defined into the middle man who has provided the brokerage services between suppliers and buyers in existing traditional market structure. And the e-based firm means the middle man who has equipped with electronic media and made a relationship with customers via internet communication (Chircu & Kauffman, 2000).

Also, the traditional intermediaries, equipped with digital media, convey on and offline brokerage services in parallel to electronic markets. In Korea, e-commerce-only recruiting middlemen are, such as JobKorea (www.jobkorea.co.kr) and Incruit (www.incruit.com), representative firms. Meanwhile, Korearecruit (www.recruit.co.kr), as reintermediated brokerage service provider, started offline recruiting service in 1981 and launched web recruiting service in 1987.

#### Intermediaries in Electronic Market

The firms, who want to enter into the electronic market on the basis of IT, occasionally experience three strategic stages such as intermediation, disintermediation, and reintermediation (Chircu & Kauffman, 2000). By emerging new type of intermediaries based on the digital technology, the traditional firms with the strong ruling power in the market start to develop and implement their own strategic plan in order to deal with new managerial environment.

And some e-based intermediaries, who had the competence of information technology, supportively provided the IT-based solutions to non-IT-enabled companies in order to make them recapture the competitive advantage in electronic market. As a result, they could seize new opportunities to get high profitability by developing IT-related standards and providing solutions to market. Yet, in some cases, not almost e-based intermediaries are technology providers to market. For example, new entrants like JobKorea or Incruit in Korea recruiting industry were the late runners, however, they, as pure e-based intermediaries, have continuously grown up and became the powerful market leader.

With the emergence of the internet web-based intermediaries, some traditional companies tend to be slower in identifying the new opportunities on the Internet (Bower & Christensen, 1995). Therefore, in some circumstances, e-based intermediaries disintermediated the existing brokers. But, in this situation, the traditional firms begin to reequip with IT-enabled business activities and try to enter into the new market structure. This situation should be recognized as reintermediation phase.

When the disintermediation and the reintermediation occur in the marketplace, the structure of market share might be rearranged; and then, some traditional firms can seize the strategic and competitive opportunities to be reintermediated. On the other hand, some of these firms occasionally vanish in the market like bubble due to being unable to recover their previous position in the industry. Moreover, it brings about the changes of industrial structure and competitive span (Chircu & Kauffman, 2000).

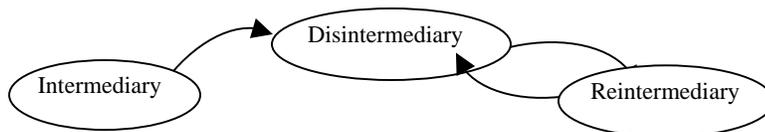

FIG. 1: E-TRAVEL INTERMEDIARIES (CHIRCU & KAUFFMAN, 2000)

## Business Transformation of E-Recruiting Industry

### Korean e-Recruiting Market

Since 1997 under IMF, Korean e-recruiting market is rapidly growing. Because of the economic crisis in Korea, recently, high growth rate of unemployment and difficult job taking might be the crucial motivation of growth of e-recruiting industry. Under this context, the developing trend of recruiting industry reflects the economical situation and managerial environment in firms sensitively. In addition, the growth of unemployment became social and political concern now (NCA, 2004; JobKorea Performance Report, 2004).

Broadly speaking, the recruiting market, as human resource market, usually deliver services to job offers and job seekers like online recruit posting, head hunting, human capital dispatching, outsourcing, and recruitment service and so forth.

The online recruiting market launched the services since 1998 has been based on expansion of the online network technologies and IT infrastructures. Also, according to the expansion of e-recruiting industry, online recruiting firms have partly acquired and merged traditional recruiting intermediaries. And some of existing firms have relationship with online players through strategic alliances. In initial stage, IT-related firms like JobKorea who can easily understand and acquire the cutting-edge technologies began the online recruiting business and then this trend has expanded into broad arena like non-IT based firms. In 2005, the total market size of online recruiting forecasted by JobKorea will be 180BKRW.

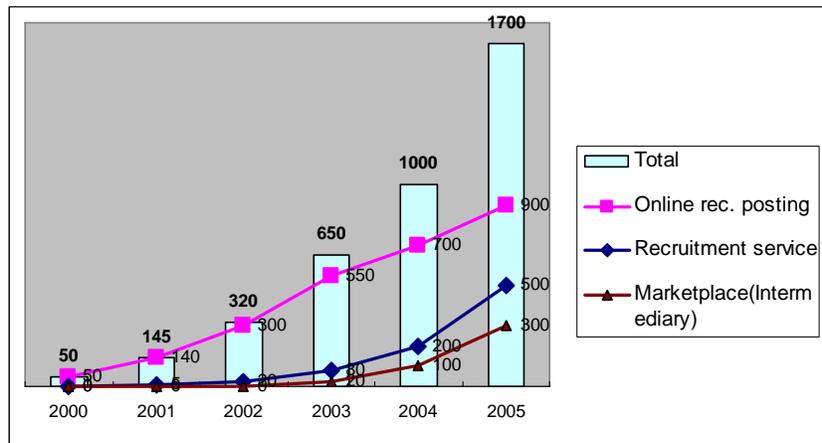

FIG. 2: MARKET GROWTH OF E-RECRUIT POSTING SERVICE(JOBKOREA, 2004)

### Traits of e-Recruiting Industry

#### Digitalized Recruiting

In contrast with offline-based services, the recruiting services on the internet web site can provide much more differentiated services on the basis of digitized data. And, compared with the existing job offering and seeking focused on the general persons, the e-recruiting service can targeted one person or firm who seeks a job or offers a position. By using digital technologies, the sequential phases of e-recruiting evolution are progressing toward e-transformation for much better services such as real time response, personalized service, and high interactivity as shown in figure 3.

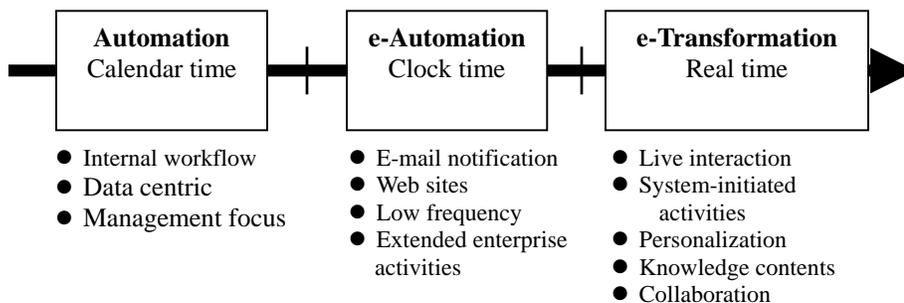

Figure 3. e-Recruiting evolution(Adapted from Gartner Research)

FIG. 3: E-RECRUITING EVOLUTION(ADAPTED FROM GARTNER RESEARCH)

**Public Business**

The traits of recruiting industry may be both public and profit-making business. Because the high growth rate of unemployment, as a barometer for the economy and social issue, can affect the trust level of that country and firms. In addition, in order to decrease the unemployment ratio, there should be prepared lots of idea and the direction of governmental policies by government, firms, and labor-related agencies.

**Competitive Market**

In 2002, the competitive structure had been rearranged the big three players such as JobKorea, Incruit, and Scout as JobKorea, Daumrecruit, and Incruit in Korea recruiting industry. Also, the following firms and new entrants are in pursuit of the leading group. According to the report from Financial Supervisory Service (dart.fss.or.kr) in early 2004, however, the leading firms recorded the revenues of e-recruit posting service as shown below table.

TABLE 1. ESTIMATED REVENUE IN 2<sup>ND</sup> Q, 2004

Company name	Revenue(Billion KRW)	Market share (%)
JobKorea	4.8	46.6
Incruit	2.3	22.3
Daumrecruit	1.7	16.5
Scout	1.5	14.6
Total	10.3	100

(Adapted from [www.dart.fss.or.kr](http://www.dart.fss.or.kr), 2004)

**Active Market**

By endeavor of firms for finding high quality human resource and increment of the job seekers, the volume of recruit market has expanded every year. Therefore the big domestic portals such as Daum recruit center, Nate hello job, and Naver recruit and firms like Korea Recruit Information, or Two Job Korea entered into the online recruit market (NCA, 2004). Also, the recruiting intermediaries focused on the specific industry actively participate in each industry. For example, there are Media Job for media industry, Game Job for game industry, and Medical Job for medical industry and so forth.

**Recruiting Method Change**

In general, the traditional offline media-based recruiting has depended upon such printing materials as newspapers, magazines, or periodical publications. Some of headhunting companies regularly provided brokerage service through the transactional relationship to members as job seekers and job offering companies. Yet IT enables them to personalize the service and deliver one-to-one recruiting services. In addition, the emergence of internet enables firms and applicants to reduce the cost needed in recruiting process.

**Research Methodology**

During the exploratory study, we collected and analyzed the secondary data from internet web pages, the periodical publications, and daily newspapers and had an interview with key informants of online and offline companies.

Major case sites selected for study were two online companies (A and B company) based on pure IT-based recruiting (e-recruiting) and one offline company(C company). Company C established in early 1980 started to publish the periodical magazines and held working exhibition related to recruit. And they launched the recruit

posting service on the basis of internet web in 1997.

We concluded that the company C was representative firm reintermediated with online-based intermediary from the offline-based recruit business. So, we decided that this company was the proper site for study. And two IT-based companies starting with pure online recruit posting service in late 1990 sustain the leading group in Korean e-recruiting market. Both offline and online companies, as case sites, have gap in establishment point, however, the launching points in late 1990s were similar with each other.

Regarding the selection criteria, company A and B have sustained the e-recruiting service for more than 7 years and maintained leading position in this industry. And company C started their business in recruit-related publications, offline posting services, and lots of offline events and launched the online recruiting services. As a consequence, these three companies might be proper sites to our exploratory study.

## E-Recruiting Intermediation

### Case Companies(A and B): Online Recruiting Firms

The company 'A' that actively started meta searching service of recruit information in September 1998 launched the recruit posting service in April 1999 (JobKorea, 2005). At the second quarter of 2004, they took more than 40 percent of domestic recruit market share. In initial stage of business, they developed and offered the differentiated profit model for price structures, for example, item-based prices and daily/weekly/monthly fixed prices, etc. Major offerings consist of recruiting portal, recruit posting, headhunting search firm consulting, headhunting e-marketplace, and ASP(Application Service Providing) service, and so on. In May 2004, about 235 members including 630 thousand firms and 1,720 thousand résumés of personal members have site membership (NCA, 2004; JobKorea, 2004).

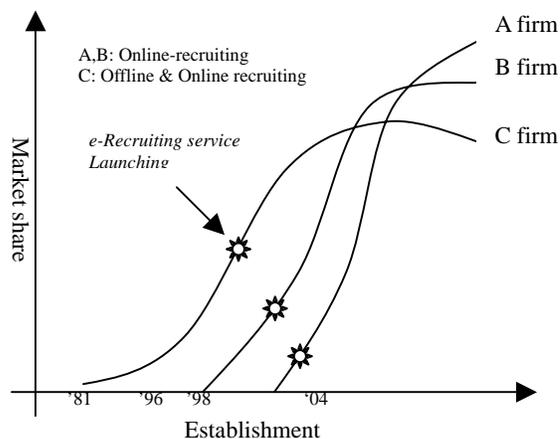

FIG. 4. E-RECRUITING SERVICE STARTING POINT OF CASE SITES

The company 'B' established in 1996 had launched the e-recruiting posting service based on internet web in June 1998. They target businesses such as human capital management (HRM & HRD), HR media service provider, and global standard media group as future vision. Their major offerings are online recruit posting, online advertisement, on/offline headhunting service, and IT solution media business, etc. At the end of the second quarter of 2004, they have sustained about 20 percent in domestic market and conducted in parallel the online posting and offline headhunting services (FSS, 2004).

The company 'C' aiming total recruit information provider had been established in 1981 and started to publish the monthly recruit magazine. In 1992, via PC communication and Hitel network, company provided the recruit information based on text data. After two years, in 1994, they prepared the initial online stage in order to enter the online recruit market by networking with Nowcom, a kind of PC communication service, and launching the Recruit-Net service. Further, the web-based recruit posting service had been launched in 1997. Although company 'C' was first-mover, they did not have any first-mover advantage. Comparing with A and B companies in 2005, in e-recruiting market, they do not come to the front yet but show us high recognition rate. Their major services consist of online recruiting information providing, headhunting, recruitment agency, publishing, and offline-based exhibition or conferences.

TABLE 2: COMPARISON OF RECRUITING CASE SITES

Case site	Established	Major service	Competitive advantage	Differentiation	
IT-based	A	1998	<ul style="list-style-type: none"> <li>Recruit-posting service</li> <li>Personal aptitude test</li> <li>Recruiting ASP service</li> </ul>	●	<ul style="list-style-type: none"> <li>Rich contents</li> <li>Meta-search Technology</li> <li>Three-tier services</li> </ul>
	B	1986	<ul style="list-style-type: none"> <li>Posting service</li> <li>Albeit information</li> <li>Education information</li> </ul>	◐	<ul style="list-style-type: none"> <li>Rich contents</li> <li>Earlier online recruiting firm</li> <li>Media solution technology</li> </ul>
Offline-initiated	C	1981	<ul style="list-style-type: none"> <li>On/Offline posting service</li> <li>Internship posting-service</li> <li>Recruiting magazine</li> </ul>	◑	<ul style="list-style-type: none"> <li>Offline customer loyalty</li> <li>On/Offline customers</li> <li>Publication business</li> </ul>

### Recruiting Intermediary Trends

Traditionally, the information related to the human capital searching has been distributed the recruiting advertisement to the potential applicants by newspaper, magazine and periodical publications. But the advent of internet technologies transferred from the traditional media channels to the web-based.

Some of the offline-based headhunters like company 'C' rapidly entered into the online-based recruiting market. On the other hand, small and foreign companies did not try to expand business into the IT-based market but endeavor to establish the strategic alliance relationship and share the human resource database and get membership as recruit agencies. The reintermediated firms like company 'C' make an effort to maintain the competitive position with its own differentiated competences such as the personal and firm customer network, recruit contents, know-how regarding market traits.

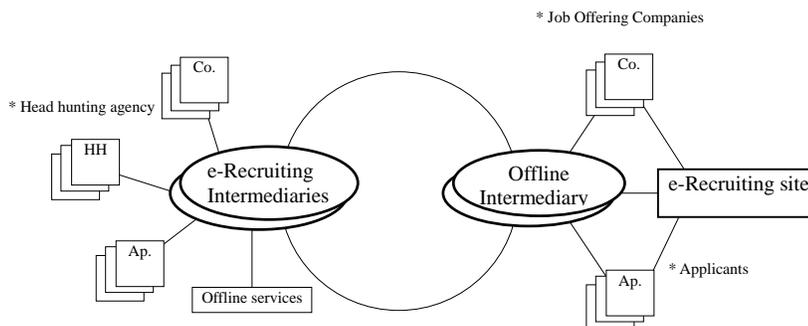

FIG. 5: BUSINESS RELATIONSHIP IN RECRUITING INDUSTRY (HR CONFERENCE, 2003)  
\* PARTLY MODIFIED BY RESEARCHER

But the IT-enabled e-recruiting firms deliver brokerage service between job seekers and job offers as well as infomediary, abbreviation of information and intermediary, service sharing the recruiting database and

information with offline headhunting agencies. Moreover, they gradually provide the offline headhunting business derived from online business. The progress of IT prompted the advent of portal site sharing recruit information. These sites dealt with the online banner advertisement, searching service of human resource, affluent and rich contents, and information distribution and so forth. Also, the portal sites enable to form the recruiting communities. In recent days, they rapidly provide the IT-based one-to-one services applied the CRM technologies via the electronic mail or mobile messages. The internet technologies made possible increase the richness and reach of services to customers (HR Conference, 2000; Evans & Wurster, 2000).

Therefore, by the emergence of IT-based recruiting service providers, some of the traditional recruiting intermediaries seem to shrink up in competitive situation. Yet, by the strategic alliances with online partners, they maintain their own position based on non-IT-based intermediary. Also, the specific recruiting firms that focus on not total recruiting service but targeting on the specific industries appear recently.

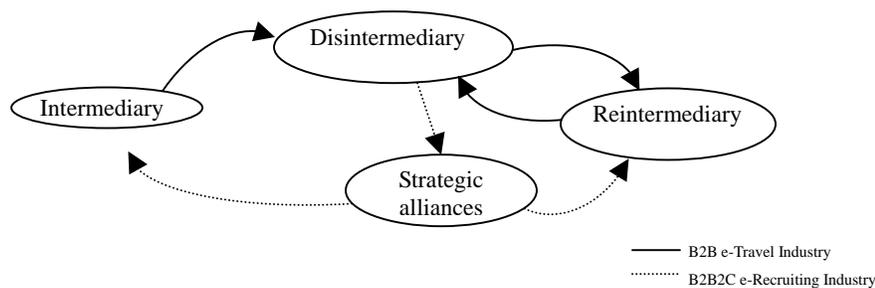

FIG. 6: COMPARISON OF E-TRAVEL & E-RECRUITING INDUSTRY

## Implications

By exploratory study, we investigated how information technology like the Internet affected changes of intermediation phenomena in recruiting industry. We found out the following implications:

First, both the rapid information technology development and the increase of the Internet users enable the traditional intermediaries to reestablish the business strategy for adapting themselves to new circumstances.

Second, the pure e-based recruiting intermediaries should seamlessly make an effort to improve the strategic and competitive advantages against reintermediation phenomenon of offline-based intermediaries.

Third, despite the advent of electronic market, some offline-based intermediaries aggressively seek to survive in recruiting industry with the personalized and differentiated service instead of reintermediation equipped with information technology.

Fourth, in order to expand the business scope and deliver better and personalized recruiting services, e-based intermediaries need to focus on the offline-based core businesses including traditional firms.

We believe that this study can give implications to the traditional offline-based intermediaries who should prepare the new business strategy for survival in electronic market. Additionally, to the online-based intermediary firms, there can be some implications in order to maintain competitive advantage in which the structures of marketplace dynamically change.

## Discussion and Conclusion

With the emergence of internet age and the rapid development of information technologies, there are lots of changes in human capital recruiting industry. The offline-based firms have been fatally influenced by e-recruiting firms providing IT-based recruiting services. Meanwhile, the online-based recruiting service providers disintermediated them from the market or industry for a while (Chircu & Kauffman, 2000). But some offline intermediaries in recruiting industry, who seemed to be disintermediated, reequipped themselves with IT-based service and reentered

into the market in order to recapture their lost market share. As a result, some reintermediaries in the market got back their competitive advantage.

On the other hand, by analyzing case sites in this study, the recruiting industry has shown different trend with online and offline travel industry that was shown in the previous research by Chircu and Kauffman. There are some of traditional intermediary firms modify business strategy by strategic alliance with pure online players such as human resource database sharing, offline human capital pool sharing and so forth.

For starting research area, we determined that the exploratory case research approach seemed proper. However, the case study focused on the single industry and used the secondary data has limitations in confidence about implications. In addition, the outlined conclusions might not be applicable to other industries. So, we have a plan to do further study for generalizing this result by more extensive in-depth interview and empirical survey research.

Focusing on the intermediation trend in human resource recruiting industry, we investigated the change of business strategy of traditional intermediaries. Through this research, there must be some clues in the Internet age that offline-based firms have to develop appropriate business strategies for the digitized managerial environment and to improve their competitive advantages.

# **Business Strategy and Human Resource Management links in the Emerging Markets: Case Study Evidence from the Five Leading Japanese Manufacturing Units in the People's Republic of China**

*Norihiko Takeuchi  
Tokyo University of Science, Japan*

## **Abstract**

**This paper attempted to document how the PRC-based Japanese affiliates can align their human resource management (HRM) policies and practices with their competitive strategies based on in-depth interview surveys over the five leading Japanese manufacturers operating in and around Guangzhou city, the capital of Guangdong province in Mainland China. My interviews with general managers (or vice general managers, in some cases) for each sample firm revealed three types of a firm's strategic orientations, including product differentiation, cost reduction, and quality enhancement for gaining competitive advantage in the Chinese market. Also, interviews with human resource and production managers further clarified firms' HRM efforts to be aligned with their competitive strategy each firm is pursuing. Findings are used to offer several hypothesized relationships between the particular strategies pursued and HRM policies and practices adopted in the PRC market. Limitations of the study and the directions of future research were also discussed.**

## **Introduction**

More and more people now believe that the People's Republic of China (PRC) will become an economic "super power" (Goodall & Warner, 1997). The population of China reaches 1.3 billion people in 2005, or about one in five persons in the world. Most people live in the crowded river valleys and costal areas and there are twenty-five cities with more than a million inhabitants, forming a rapidly growing and increasingly wealthy urban population. Since the introduction of the "Open Door" policy, China has undergone enormous social and economic transformations, which accelerated the speed of industrialization and modernization especially around the Eastern costal areas.

China's success is not only due to her enormous number of human resources, but also to other parts of the world. Findings consistently show that China is one of the most preferred places for foreign investment (e.g., National Bureau of Statistics of China, 2004). Over the last decade, the PRC has attracted 259,000 foreign direct investment projects, with committed investment of more than US\$ 395 billion (Han's Chinese Cultural Development Co., 1996). Further, China's entry into the WTO in 2001 has further increased opportunities for foreign manufacturers, including Japanese firms, to expand their business activities into Mainland China.

Despite the impressive inflows of foreign investment, some observations cast the doubt on whether the economic achievements are sustainable in China. According to the extant research on strategic management that advocates the importance of "fit" in organizations, the performance of an organization is contingent on the degree of the organizational alignment between the organizational systems and business environment (Dotty, Glick, & Huber, 1993). Previous findings in the Western research contexts have confirmed a positive relationship between organizational systems and firm performance (Ketchen et al., 1997). Extending this view to the PRC context, the sustainability of the economic success in the PRC will hinge on how effectively these firms can continue to restructure and reorganize to align with the emerging socialist market economy after the reform in 1976, and to survive the foreign competition when barriers are lifted as China becomes a member of the WTO.

It must be noted that corporate strategy itself was defined and governed by the State in the pre-reform era of the PRC (McComb, 1999). Under such a static environment surrounding the State-owned corporations (SOCs) in the past, the links between strategy, structure, organization, and HRM were of no concerns, and thus Chinese domestic corporations in general have little been able to develop capabilities in formulating competitive market strategy and its responsive HRM policies and practices. The lack of such an organizational knowledge among Chinese domestic corporations has strongly frustrated the establishment of their competitive positions in the market.

Many foreign firms in the PRC, on the other hand, enjoy superior economic performance by exploiting their knowledge and know how to formulate organizational and human resource strategies in ways that can cope with and compete in the dynamic competitive market environment emerging in the PRC. Thus, the ways in which PRC-based foreign firms align their HRM policies and practices with the China's market environment would be taken as a model when the Chinese domestic corporations, including SOCs, took to building their organizational strategies, structures, and systems. Given that a large number of Japanese manufacturers have invested in the PRC and established their competitive positions, the pattern of strategic fit initiated in the PRC by Japanese firms would provide a strategic benchmark for constituting a potent source of competitive strengths among Chinese domestic firms in the future. This motivated the author to examine how in fact Japanese manufacturers in the PRC implement HRM policies and practices in ways that can cope with the China's emerging market competitions.

Despite theoretical assertions of "contingency fit" made by many researchers on strategic human resource management (SHRM) that the adoption of HRM practices should be aligned with the firm's upper-level strategic goals and objectives, little empirical evidence has been reported to date to support such a contingency fit proposition, particularly in the Asian research contexts (e.g., Bratton, 2001; Li, 2003; Takeuchi, Wakabayashi, & Chen, 2003). In other words, an attempt to examining the strategy-HRM fit of Asian firms is at a preliminary stage in the SHRM research field. Given such a preliminary nature of empirical tests for this theory-based proposition, it is deemed appropriate, at this stage, to take a qualitative approach to exploring the firm's strategic archetypes in the PRC, based on the detailed case analyses of some representative firms in the PRC. It is also quite important to identify the specific HRM activities followed by the firm's particular strategic orientations. The present study, therefore, attempts to document how the PRC-based Japanese manufacturing units align their human resource activities with their business strategies for gaining competitive success in the emerging markets in the PRC, using the case study data of the five leading Japanese firms in China. It is expected that this work will help clarify the strategic prototype and its corresponding human resource activities from the practical point of view in the PRC, and serve as a foundation to formulate more testable hypotheses to be examined by using the quantitative survey data for future studies of this field.

## **Methodology**

The case study by using an interview method was carried out to explore the strategic human resource activities in Mainland China. This interview survey was conducted in 2003, with a sample of five leading Japanese manufacturing firms in and around Guangzhou city, the capital of Guangdong province in China. Guangzhou city is well-known as a financial center of Southern part of Mainland China as well as a manufacturing heartland alongside the three other active cities in Guangdong province; Shenzhen, Zhuhai, and Shantou. It is also known that the city is developed through intensive foreign direct investments by Japanese, Hong Kong, US, and UK multinationals with particularly strong influences of Hong Kong economy and trading systems.

One-day interviews with two to three managers for each sample firm were undertaken using the open-ended interview method. For the interview survey, I requested, for each sample firm, one top manager (a general or a vice-general manager in some cases) and two functional managers (the heads of human resource and production departments) to be interviewed. Given that the research tries not only to explore firm's entire business and market strategy, but also to obtain the detailed information on the human resource and production management practices, interviewing with a top manager as well as a functional manager is necessary. Evidently, information associated with firm's strategic activities needs to be collected from the top management executives who are expected to have much information on the firm's strategic plans and objectives, whereas information relating to functional and divisional activities, involving HRM and production management, can be best obtained from the respective department heads: i.e., human resource and production directors. Thus, the multi-informants interview design was applied to examine the strategy-HRM links in the present study.

After my interviews of each sample firm, I asked each top manager to answer the structured questionnaires that contain items of firms' strategic orientations and background information of firms. Filled questionnaires by the top managers were asked to return to the author's affiliation by using the stamped envelopes that were passed along

with questionnaires. The reason why I distributed to the structured questionnaires to top managers is to ensure the compatibility of my open-ended interview findings using different survey methodologies. Also, the complementary use of structured questionnaires with open-ended interviews helps the author to effectively collect the basic information of firms without spending much time on hearing firms' demographic information during the interview time.

Table 1 displays the summary of background information for the five PRC-based Japanese affiliates investigated. The target samples consisted of three electronics and two automobile industries. The major reason why these industries are chosen as cases of this interview survey is my desire to control the technology-level across firms. Prior research asserted that the level of technology possessed by a firm is considered to significantly and directly influence the strategic process of firm's human resource management practices (e.g., Delaney & Huselid, 1996). It is reported that in the PRC, the major industries of Japanese investors are the *textile, electronics, food processing*, and so forth. However, the prior study advocates that the technology level of electronics industry is not necessarily comparable to those of the textile and food processing industries (Yuan & Kee, 1991). Moreover, some SHRM studies recommended that firms' strategic activities and their response to internal management including HRM policies and practices should be observed from the careful sampling of some leading and progressive industries (Becker & Huselid, 1999). The speed and the nature of environmental changes and its reaction to HRM are different across industries with different levels of technology. For these reasons, I focused on choosing the sample firms categorized as high technology-based industries (Yuan & Kee, 1991), and thus did not include the textile or food processing firms.

TABLE 1. BACKGROUND INFORMATION OF THE FIVE PRC-BASED JAPANESE AFFILIATES INTERVIEWED

	Company A	Company B	Company C	Company D	Company E
Industry Type	<i>Electronics</i>	<i>Electronics</i>	<i>Electronics</i>	<i>Auto industry</i>	<i>Auto industry</i>
Interviewees	1 vice general manager, 1 prod. manager, and 2 HR managers	1 vice general manager, 1 prod. manager, and 1 HR manager	1 general manager (double as the prod. director) and 1 HR manager	1 general manager, 1 prod. manager, and 1 HR manager	1 vice general manager and 1 HR manager
Main Products	Electric iron	Electric shaver, hair drier, etc.	Micro-motors for electric devices (CD-ROM/ VTR)	Motorcycle	Car
Establishment year	1992	1993	1993	1992	1998
Number of employees	606	860	855	2100	2436
Number of Japanese expatriate	2	6	7	5	26
Total Assets (US\$)	10.6 million	40 million	6 million	50 million	139.9 million
% of investment by Japanese parent	60%	80%	70%	50%	50%
% of local procurement	75%	30%	65%	95%	60%
% of sales in domestic market	10%	30%	2%	97%	100%

The firm size is another important variable that should be carefully controlled for the qualitative research of this type (Colins & Cordon, 1997). The three electronic firms hold very close number of employees ranging from 606 to 860. Also, two firms that are classified as auto industries (Companies D and E) have 2,100 and 2,436 employees respectively, indicating the similar number of employees between two samples. Thus, the possible extraneous effect caused by the different number of employees within the same industry was controlled for the present case study.

Except for Company E, the establishment year of each company in Mainland China is around 1992 and 1993, indicating that most of the companies interviewed have operated in Mainland China for 10 years or more. All the target Japanese affiliates took the joint venture form with ownership capitals shared with Chinese counterparts. For Companies A, B, and C, 60 to 80% of total assets are owned by their respective Japanese parent firms, while the rest of them are by Chinese domestic electric corporations. For Companies D and E of automobile industries, they

choose equity ownership structure to form 50 to 50 capital investment ratios between Japanese and Chinese corporations. The percentages of sales in China's domestic market to worldwide are much lower in three electric companies (10%, 30%, and 2% for Companies A, B, and C, respectively) than in two automobiles (97% and 100% for Companies D and E, respectively). This is due partially to the differences in international strategies that are generally pursued between electric and automobile industries. Automobile industries tend to adopt multi-domestic strategies whereas electric industries tend to choose global strategies, which can reflect the degree of local market orientations and penetrations of overseas affiliates. Nonetheless, my interviews with top managers at Companies A, B, and C revealed that these electric affiliates in the PRC are shifting export orientations to domestic market orientations, given the rapid growth and importance of the PRC market in their businesses. Moreover, the managers interviewed at Company C, who reported only a two percent of China's domestic market share to total sales, added that a number of products are sold in Mainland China via Hong Kong, and these products are treated as export products. The sales of these products in China are said to be counted as export sales, which deflate the China's domestic share in their accounting data. Thus, the actual percentage of sales in China to total sales volume in Company C must be higher than they reported.

## Results

### Strategy Types of the PRC-based Japanese Affiliates

For the purpose of collecting information necessary to understand how each company attempts to establish their competitive positions in the PRC market, I performed interviews with top management of each target company. Specifically, the following information was collected from affiliates' top managers to classify the firms' competitive strategies in the PRC; namely, (1) the top management perceptions on the firms' competitive strength, (2) time-series changes of the main product prices, (3) the amount of annual product rollout, (4) target clientele for each affiliate, (5) the degree of technology transfer from their Japanese parents, and so forth. Findings of a series of the interviews have enabled the author to classify the competitive strategies of the five Japanese affiliates into three generic strategy types; namely, (1) *cost reduction strategy* (Companies A and D), (2) *differentiation strategy* (Company B), and (3) *quality enhancement strategy* (Companies C and E).

### Strategies of Companies A and D (Cost Reduction Strategy)

Company A specializes in producing electric irons in China towards distributing both inside and outside China's markets. Out of the total assets of 10.6 million US dollars, 60% of it was invested by a Japanese parent firm of Company A and 40% by a local partner of it. The Japanese parent of Company A manages more than 200 overseas affiliates in almost all continents (including 46 units in the PRC), and is well-known as one of the most comprehensive worldwide electric and electronic manufacturers in the world. According to the vice general manager of Company A, the extensive cost reduction is the major sources of competitive advantage of this company, especially in the recent years of fierce competitions in the PRC iron market. As in the cases of other Japanese electric and electronic MNCs in the PRC, high quality production based on the firm-specific, high technologies served as foundation to meet the market requirements from customers, which led to an increased economic performance of Company A in the past. Furthermore, with its highly reputed, strong name brand that had been established for long by its Japanese parent in the global market, Company A could establish, from the outset, its competitive position in the PRC to a considerable extent. In particular, at the beginning of its operations in the PRC, the products with its name brand attracted considerable attentions of the upper income consumer groups in the PRC, and thus Company A chose a focused strategy to offer its high quality products for such a selective consumer segment.

However, the price competition has increasingly got heated among multinationals from Europe and Asia, which blocks an expansion of the Company A's market share in Mainland China. According to the marketing research conducted by Company A, the potential demands of the PRC's electric iron market amount to about 4 million iron sets per a year. Against the total of 4 million demands, Company A could currently sell 230,000 sets annually (6% of the total demands), the number of which is the third of all the iron makers in the PRC, following a European MNC (25%) and a Taiwanese MNC (22%). Under such a harshly competitive environment surrounding electric iron manufacturers, Company A now places an overwhelming emphasis on the cost reduction by

restructuring the entire business processes.

The strategic changes of this Company A to cope with the emerging market competition can be observed from how it has succeeded in reducing the cost of their products. In 1998, an anchor iron product of Company A was sold at the price of 295 RMB for one set, whereas the similar model is sold currently at 138 RMB. Surprisingly, the price of the iron produced by Company A has dropped by more than 50% for the last four years, despite the fact that commodity price estimated by the retail price index (RPI) in the PRC shows just a slight decline from 1999 to 2002 (National Bureau of Statistics of China, 2003). According to a vice President of Company A, such a strategic shift from the focused strategy to the cost reduction one has enabled this Japanese company to cut into the mass market of the PRC, and to compete with other competitors on costs and prices.

The very similar scenario was also found in Company D, which started its motorcycle manufacturing and sales operations in 1992 in Guangzhou. The Japanese parent company of this equity joint venture is well-known as a worldwide automaker that offers a range of automobiles, motorcycles, and other power equipments to the global markets. In particular, over around 50 years since its establishment, this MNC has manufactured a cumulative total of over a hundred million units in 25 countries. Company D attempted to compete in the market based on maximally exploiting the reputational and technological advantages inherited from its Japanese parent. At the beginning of its PRC operation, producing quality motorcycles and appealing to selective customers with the high-income bracket were the basic strategy that had been adopted by this PRC-based Japanese affiliate.

However, as Company D penetrates into the PRC market, some of its competitors (mostly SOCs) grew as strong competitors, having their product quality higher than they used to offer. They eventually started to offer the middle-to-high quality products at the very low prices, becoming the threats to this PRC-based Japanese manufacturer. Then, the market share of Company D's motorcycles hit its ceiling after the 7 years of its establishment in the PRC. In the year of 1999, the production volume and net sales for this company achieved its peak with 330,000 sets produced per year. After reaching maximum sales outcomes in 1999, the Company D's market share gradually got shrinking due to the growing competitions among motorcycle manufacturers in the PRC. In an attempt to increase the motorcycle share in the China's market, Company D made a strategic decision to enter into the downmarket by remarkably slashing the prices of mainstream product models. A 125 cc. motorcycle was offered at the price of RMB 15,000 in 1992. However, the similar model with the same air volume displacement was sold at around RMB 5,000 to 6,000 in 2002. Surprisingly, Company D cut the price down to the one-third of the original price set at the beginning of its PRC operation. According to the general manager of this company, the market share of Company D's motorcycle had recovered for the last two years, due largely to the success in this strategic change and its corresponding efforts in reorganization. As such, the major strategic shift this company aims to accomplish at present is to expand their market share by switching their target from the high-end to the mass market segmentation. Thus, Company D currently adopts the cost reduction strategy to cope with the emerging market competitions in the PRC's motorcycle market.

#### **Strategies of Company B (Differentiation)**

Company B produces various home electric appliances for both overseas and domestic (Chinese) markets, including electric shavers, hair dryers, electric toothbrushes, and air purifiers. Of these products, electric shavers are produced the most with total 10 million sets during 2002, which accounts for 60% of the total production volume in Company B. Following the multi-domestic strategy pursued by the recent business planning of its Japanese parent company and the increased demands of home electric appliances among Chinese consumers, Company B has lifted the percentage of domestic sales in China to the export ones from 5% to 30% only for the last few years. Now, the situation is that in order to establish the potential competitive advantage for long in the PRC market, Company B places a massive emphasis on attracting the Chinese customers through the on-site development of a wide range of product lines that no competitors had ever challenged. In reality, the core R&D function resides in the head office of Company B in Japan, but currently some of the new products, especially most of the electric shaver models, can be designed and engineered independently by the Company B's R&D department in Guangzhou. The vice general manager mentioned that this on-site R&D function inside this PRC-based affiliate plays a significant role in offering a number of new products that fit in well with Chinese customers taste in a timely manner.

Regarding the shaver products including those for men and ladies, Company B annually enter around 40 models of new product into the PRC market, the number of which is much larger than the products offered by any

other competitors, especially those from Europe including Phillips and Braun. With its wide varieties of product models, according to the vice general manager, Company B has achieved top sales in the China's domestic market along with Phillips. Surprisingly, the sales volume of Company B has become doubled for the last five years, which makes the firm ahead of its competitors. The vice general manager narrated that this PRC-based Japanese affiliate was, at that time, making concerted efforts to outdistance the Phillips market share in the PRC for the upcoming three years. Thus, such a product differentiation and innovation strategy contributes significantly to an establishment of the Company B's competitive position in the PRC market.

#### **Strategies of Companies C and E (Quality Enhancement)**

Company C was established in 1993 with a capital of US\$ 6 million invested jointly by a leading Japanese electronic producer (Parent C) and a local partner, for the purpose of producing and supplying high technology-based electric parts in Mainland China, including various electric motors that can be equipped with computer storage of high rotation speed, camcorder, VCR, and audio products. When Company C was established, the 70% of the total assets was capitalized by its Japanese parent side and the 30% by the Chinese local investor. With the total number of 855 employees, Company C earned the net sales of US\$ 36million in 2002. These indicators are comparable to two other electronic firms (Companies A and B) sampled for the present study.

The Japanese parent of Company C is also a well-known Japanese MNC in the world, and emphasizes the development of "miniaturization technologies" based on high-density mounting and other new technologies stemming from its own unique perspective and know-how. The Company C's strategic mission is to supply the high technology-based, high quality IT components and devices not only to the overseas business units under this MNC, but also to other high-tech ventures operating in the PRC, especially those invested from Taiwan and Korea. According to the general manager of Company C, the micro-electric motors that are produced with an exploitation of miniaturization technologies by Company C show considerably high demands from the Korean and Taiwanese manufacturers who do not possess appropriate technologies or know-how to manufacture such types of mini motors. By taking advantage of firm-specific technologies that Parent C has developed and accumulated over time, Company C, the parts plant of Parent C, extends its business to other manufacturers beyond Parent C's production units. Thus, it can be said that Company C started to move beyond the boundary of this MNC's global value chain network, and to exploit the local markets in China with its manufacturing and technological strengths.

As in the cases of other firms with strong technological orientations, maintaining and continuously improving the supreme level of a product quality is the major strategic goal of Company C for the pursuit of financial performance in the PRC. The general manager of Company C said that neither the cost reduction nor differentiation is the issue for this components plant, as the product (micro electric motor) offered by Company C itself is based on its firm-specific technology. He continued that in order to keep its technological advantage, the continuous quality enhancement and improvement is the enduring theme of the company. Moreover, Company C specializes in the production of value added products that can allow the firm to increase profitability in the PRC. Hence, how to establish the dominant producer position in the niche and to expand micro-motor market in the PRC through quality enhancement strategy is the major concern for Company C.

Company E is another PRC-based Japanese affiliate that can be classified into the quality enhancement company. This automobile manufacturer is an equity joint venture between leading Japanese and Chinese carmakers, which started its PRC operation in 1998. Company E, in particular, focuses on manufacturing and marketing only the following two car models in the PRC: one is a 5-seat middle-sized sedan with three variations that equip different sizes of engines (i.e., 2000 cc and 2300 cc) and the other is a 7-seat multifunction car that equips a 2300 cc one. The choice of the product lines to be offered in the PRC reflected the several of marketing research conducted by this company prior to starting its PRC operation. The vice general manager narrated; "our marketing surveys showed that the Chinese customers prefer to own more luxury model than we had expected before. They seemed to drive the models that are sold and driven in North America." Taking seriously into account this marketing research results, Company E made a decision to focus only on the above two executive car models that had already been well received in the US market.

Surprisingly, the price setting of the cars sold at Company E was much higher than most of other car manufacturers in the PRC; Company E sold its main car model at around RMB 298,000 (US\$ 38,000) despite the fact that the dominant price of the car product among European and other Japanese automobile makers was below

RMB 150,000 (US\$ 19,000). Even with such a higher price setting, this company outperforms in the PRC car market based on its product quality. Thus, establishing and maintaining the high quality production of the luxury-typed cars in the PRC forms a basis for Company E's success in the PRC market. The vice general manager narrated that in terms of quality, Company E had already met the expectations of its Japanese parent. According to him, the car quality inspection conducted by its Japanese parent showed that this PRC-based affiliate outranked, in its car quality, other 16 manufacturing sites managed by the Japanese parent all over the world.

## **Human Resource Management Practices under Three Strategy Types**

My interviews with top management of the five PRC-based Japanese manufacturers revealed the way they adapted themselves to the China's emerging market competitions, which can be classified into the following three strategic types; *cost reduction, differentiation, quality enhancement strategies*. In the following section, I will document the findings of my interview surveys with HRM and production managers, which will help to understand the links between HRM practices and the three strategic archetypes in the PRC. Table 2 displays the summary of the interview surveys on HRM practices and business strategy links.

### **HRM Practices under Cost Reduction Strategy (Companies A and D)**

As shown in Table 2, I found that both Companies A and D, which adopted cost reduction strategy, had the following distinctive characteristics in terms of recruitment and employment policies; (1) recruitment of employees mainly from provincial areas, (2) high reliance on contingent workers, (3) short-term employment policy, and (4) the reduction of the Japanese expatriates within the affiliate. All these practices are considered directly reducing the personnel expenses within the firm. For example, Company A was found to prepare three employment contract options that are differentiated depending on the period of employment that ranges from 1 month, 9 months, to 1 year. The period of an employment contract for each employee is determined based primarily on the results of screening tests of recruits as well as the work attitudes and skills they show on their probation period. High performers are able to make a one-year contract with options of contract renewal, while those who don't perform well are forced to choose either the nine-months or one-month contracts. Since electric irons are, in nature, the seasonal commodity; they are sold well during spring to fall and not during winter, a nine-month contract was prepared to reduce unnecessary employment costs during winter season. As such, Company A pursues the flexible management of human resources with its emphasis of an effective use of contingent workers that enables Company A to balance the human resource and production inputs and outcomes. Company D also pursued the flexible employment policy by offering one-month, three-months, and one-year contracts for employees. Out of the 2,100 employees, 1,400 workers were involved in the operational jobs at the shop floor of Company D. Of the 1,400 direct workers, 300 staffs were classified as temporary workers whose labor contracts are relatively short; i.e., on a monthly basis for part-time workers and on a seasonal (three months) basis for other temporary workers. These contingent workers are called "assistant" in the organization and normally assigned to the operation jobs, which do not require skillful tasks. In such a situation, they are treated differently from full-time employees in terms of the wage level, welfare scheme, and some other incentive systems. Thus, the use of contingent workforce helps the firm to reduce personnel expenses, and fit well into the corporate-level cost reduction strategy that Company D is currently pursuing.

Another important characteristics in employment policy Companies A and D took to align their overall cost reduction strategy was that both companies had reduced the number of Japanese expatriates, and staffed only a small number of them in these PRC-based affiliates. For Company A, only two Japanese expatriates were dispatched out of 606 total employees in the PRC operations, having decreased half the number of Japanese expatriates for the last 3 years. In a similar vein, only five expatriates out of the 2,100 total employees in the PRC were assigned from Japanese parent to Company D. As in the cases of other Japanese overseas affiliates, the personnel cost allocated for Japanese expatriate assignment was prohibitively high, and it became an inordinate burden to affiliates' cost management. Thus, reducing the number of Japanese expatriates by replacing them with competent local managers seems to be consistent with the cost reduction strategy these companies are pursuing.

TABLE 2. SUMMARY RESULTS OF THE STRATEGY-HRM LINKS AMONG FIVE PRC-BASED JAPANESE AFFILIATES INTERVIEWED

	Company A	Company B	Company C	Company D	Company E
<i>Strategic focus</i>	<i>Cost reduction</i>	<i>Differentiation</i>	<i>Quality enhancement</i>	<i>Cost reduction</i>	<i>Quality enhancement</i>
<b>HRM Characteristics</b>					
- Core Philosophy	<i>Buy</i>	<i>Buy &amp; Make</i>	<i>Make</i>	<i>Buy</i>	<i>Make</i>
- Basic Policy	<i>Flexibility focus</i>	<i>Results orientation</i>	<i>Long-term orientation</i>	<i>Flexibility focus</i>	<i>Long-term orientation</i>
	Recruitment of employees mainly from provincial areas	Emphasis on the recruitment of R&D personnel	Emphasis on the recruitment of administrative personnel	Recruitment of employees partly from provincial areas	Recruitment of employees within Guangzhou city
	High reliance on contingent workers	Low reliance of contingent workers	Low reliance of contingent workers	High reliance on contingent workers	No reliance of contingent workers
- Recruitment and Staffing	Short-term focus (Contract term: 1 month, 9 months, & 1 year)	Long-term focus (Contract term: 1 year, but almost all employees renew contracts)	Long-term focus (Contract term: 1 year, but almost all employees renew contracts)	Multiple focus (Contract term: 1 month, 3 months & 1 year)	Long-term focus (Contract term: 1, 3, 5, & 9 year(s))
	Small number of Japanese expats	Medium number of Japanese expats	Large number of Japanese expats	Small number of Japanese expats	Very large number of Japanese expats
	Person-Job fit principle	Person-Position fit principle	Person-Organization fit principle	Person-Position fit principle	Person-Organization fit principle
- Performance Appraisal and Compensation	Short-term, performance-based (Monthly bonus system)	Team performance-based (for shop-floor); Performance & Market-based (for R&D)	Seniority (length of service, experiences, etc.) considered	Seniority (length of service, experiences, etc.) considered	Seniority (length of service, experiences, etc.) considered
	Technical most	Both managerial and technical	Technical most; language (Japanese) & disciplinary education emphasized; Incorporating strong corporate philosophy	Technical most	Both managerial and technical; Incorporating strong corporate philosophy
- Training and Development	Short-term focus	Long-term focus	Long-term focus	Multiple focus	Long-term focus
Belief That the Parent Company's HRM Is Competent	Low	Moderate	Very high	Moderate	Very high

Furthermore, appraisal and compensation practices of Company A were found well designed to match the cost reduction strategy this company was striving to follow. In particular, the HR department of Company A has increased the portion of the special cash payment (bonus) in ways that can reflect the short-term performance results of an employee in the compensation package. As in the cases of other Japanese companies, individual differences in terms of work achievements and performance are reflected in the amount of bonus each employee receives in Company A. As of the interview survey, around 21% out of the total amount of pay for each employee was made up by the bonus. In order to further compensate for an employee's work performance, the HR department of Company A set the objective to increase the portion of employee bonus up to 40% in his/her total amount of salary. It should be noted that Company A modified the bonus practices of its Japanese parent company which normally pays the bonus twice a year. In Company A, however, this special cash earning was changed to be paid on a *monthly* basis. With such a modification, the short-term work performance of employees is immediately compensated in the form of a monthly monetary reward. This modified short-term bonus system enabled this company to succeed in motivating the part-time and seasonal workers who are of little interest in the upward career mobility in this organization.

### **HRM Practices under Differentiation Strategy (Company B)**

Company B has adopted the unique shop structure for producing wide varieties of electric shaver models that are continually developed by the Company B's on-site R&D office. Unlike the traditional assembly line production typically seen in this type of electric factories, Company B introduces the "module production system" in order to fit in well with differentiation strategy this PRC-based affiliate is pursuing. In Company B, the belt conveyor production lines were replaced by a number of module work units on the shop floor. Each work unit is composed of 5 to 6 production workers in which they assemble all the shaver parts and make the finished products. The main advantage of this system is that every work unit can independently assemble the different types of finished products at the same time, and thus the system does fit in well with the production of various models and products. According to the production manager of Company B, the system can also cope with the necessary adjustment of the production methods which is accompanied by the continuous development of new product lines; i.e., more than 40 models annually developed in the Company B's local R&D office.

Such a unique work system followed by the company B's differentiation strategy was found to significantly affect the management of human resources at the shop floor. Perhaps, the most significant aspects that characterize human resource management under the differentiation strategy can be seen in the Company B's compensation policy and practice. My interviews with human resource and production managers of this company revealed essentially the two compensation characteristics that distinguish the Company B's HRM practices from others. The first is the policy that emphasizes the reward for team-based performance mostly among employees at the shop floor level. Replicating the compensation practice exists in the Japanese parent company (Parent B), the basic policy of Company B's compensation is to link an employee's regular cash payment closely with his/her position rank. However, for the purpose of reflecting the employee's work performance in his/her monetary reward to a large extent, Company B increases the portion of a special cash payment (bonus) in the total compensation scheme. In this sense, Company B develops a strong tendency to embody a performance-based compensation policy to fit with the differentiation strategy. More interestingly, this special cash payment is given for employees on a team basis; namely, Company B adopts a team bonus system. "This is a unique compensation system developed in this affiliate without any transfers or influences from our Japanese parent company," said the production manager. An introduction of the team bonus program in Company B is followed by the prevailing way of Company A's module production system in which strong co-operation among employees within each work unit is highly encouraged. The amount of a bonus paid for each employee is determined based on the team-based performance evaluation results. The evaluation results depend on the degree to which each module unit can attain the production goals and objectives set by team leaders staffed in each unit. In addition, some of the high performing and/or promising employees are individually rewarded, and become the strong candidates to be promoted into the career track of Company B. It must be noted that the team-based bonus program and the corresponding appraisal methods are developed independently by this PRC-based affiliate, accompanied by the corporate-level differentiation strategy and its supporting shop structure of Company B.

Another key HRM policy that characterizes the differentiation-focused company can be observed from the management of R&D personnel in Company B. With the increased strategic importance of the R&D section under the differentiation and innovation strategy, Company B places a strong emphasis on motivating the professional R&D employees so that they can continuously bring out the new product models that may stimulate the customers' buying willingness. In reality, the incentive system for the R&D professionals is fairly independent in this company. First, Company B provides relatively a higher level of incentives (basic wages) with designers and engineers in the R&D section. Second, the ratio of special cash payment including a bonus to the total compensation is higher for R&D employees than for other staffs in Company B. This indicates that more performance-based pay is practiced in the R&D section compared to other functions in Company B. Third, a part of special cash payment is closely tied to the market success of the Company B's products. In other words, to the extent that the newly developed shaver model has caught the customers' attention in the market, the particular R&D staffs who joined the project can receive high evaluation results which reflect the amount of special cash earnings.

All these aspects of Company B's HRM policies are considered to be aligned vertically with the differentiation strategy that Company B is pursuing. Basically, Company B focuses on rewarding employees based on their performance. The tendency is much clearer in the R&D section where new products are created and brought

into the market. The policy of a result-orientation is consistent with the very nature of differentiation-focused firms whose success is determined by how they can offer a new line of products that can stimulate the consumers' buying behavior.

#### **HRM Practices under Quality Enhancement Strategy (Companies C and E)**

I observed from the qualitative analyses of five companies that there was a certain degree of compatibility in HRM practices between two quality-enhancing firms; i.e., Companies C and E. It is notable that these two PRC-based affiliates with quality enhancing strategy were found to have strong tendency to train and develop their human resources from the long-term perspective, which is typically seen in many of the Japanese firms in Japan. For example, both companies took a similar recruitment policy of hiring potentially high quality human resources rather than hiring low cost workforce. At the time of my interview, Company C placed an emphasis on hiring administrative staffs, and conducted very careful screenings for hiring types of employees who can be easily trained and educated into the company's organizational culture of high quality. Honesty, faithfulness, and the sense of loyalty were valued in the screening process of this company. The HRM manager narrated; "The major reason why we seek to hire this kind of employees is our desire to nurture employees with strong quality consciousness in the firm." Thus, the HR department of Company C carefully screens the potential workers whose personality is acceptable to this Japanese organization that has strong quality orientations. In reality, this PRC-based affiliate pursued quality enhancement through the uncompromising efforts on practicing its parent company's way of management, which is initiated by the general manager from Japan. He was also responsible for the production manager of this company, and has exercised a strong leadership in this PRC-based affiliate.

Contrary to the cost reduction firms that extensively hire recruits from provincial areas, Company E practiced annual recruitment of fresh graduates only from within the Guangzhou city where the wage standards of employees are relatively high. The company's intension of hiring employees merely from the urban area is that the company prefers to employ potential workers with a certain level of technical and academic backgrounds necessary to complete quality jobs within the organization. Another policy related to the employment in Company E is that the company adopts relatively a long-term employment. Four different options in the labor contract are prepared in this organization depending on the period of worker's employment: i.e., the 1-, 3-, 5-, and 9-year(s) labor contracts, which are quite long and rare in the PRC. According to the HR manager of Company E, however, the contracts are automatically renewed for almost all employees, and thus at the present stage, the employment here becomes quite long-term.

Both Companies C and E invested a large volume of capitals in employee training and development within the company. Company E conducted the formal training programs 10,000 times a year. Company C had provided not only the technical training but also the language (Japanese) and disciplinary trainings in order for employees to fit in well with the climate of this quality-centered, Japanese organization. Evaluation and reward systems are closely linked with employees' participation in the quality control (QC) activities and trainings and other development programs. As such, evaluation and reward systems of these companies are said to be more process-orientated than those of other companies. Interestingly, HRM managers of these two quality companies showed similar reactions to my question as to whether or not the parent company's HRM is competent in the PRC-based affiliates. They provided very affirmative responses to this question, and added that localization would be of little importance in the PRC operations as it might involve the loss of quality in production and management. It appears from the findings that long-term development policy which is traced back from their Japanese parent companies would play an important role in adopting the quality enhancement strategy in their PRC operations.

## **Discussion**

With an emerging but increased market competitions in the PRC, how firms can outperform competitors through the management of China's abundant and quality human resources constitutes major challenges for firms establishing competitive advantages in the PRC. Following the resource-based view in the strategic management research (e.g., Barney, 1991), the prior work on SHRM field had suggested that the pursuance of a vertical fit between business strategy and its supporting organizational policies and practices would constitute the potent sources of competitive

advantages in the market. Using this framework, this study has attempted to document the ways in which the five leading PRC-based Japanese manufacturers align their HRM policies and practices with their business strategies in the PRC market. Findings and implications of the study can be summarized as follows.

My interviews with general managers (or vice general managers, in some cases) for each sample company revealed that their strategic orientations in the PRC market can be classified into the three types; i.e., cost reduction, differentiation, and quality enhancement strategies. This finding is partially consistent with the Porter's (1986) framework of competitive strategies that categorized MNCs' strategies into the cost leadership and differentiation. The finding showed that adding to the Porter's work, there was an independent strategic dimension of quality enhancement on which some PRC-based Japanese affiliates compete with other competitors in the emerging PRC market. Some recent studies have tended to treat quality enhancement or high quality strategies as being a distinctive competitive strategy that can be used as a lens in analyzing strategy-HRM alignment (Schular & Jackson, 1987; Sanz-Valle, Sabater-Sanchez, & Aragon-Sanchez, 1999; Zhara & George, 2000). In this respect, the study provided additional evidence that the three strategic typologies of quality enhancement, cost reduction, and differentiation were valid operationalizations among Japanese manufactures in order to cope with the fierce competitions in the emerging market economies in the PRC. With the PRC market being increasingly complex, global, and competitive, future studies are highly recommended to explore some other strategic dimensions specific to the PRC-based firms, with which notable findings can be generated regarding a set of HRM policies and practices to be aligned.

Moreover, my interviews with human resource and production managers of each sample firm clarified companies' HRM policies and practices that can be aligned with their competitive strategies in the PRC. It was found that in support of the contingency notion of SHRM, HRM policies and practices are greatly contingent on the affiliates' upper level business strategies. Specifically, companies under cost reduction strategy (Companies A and D) exclusively adopt the short-term, flexible human resource policies in order to reduce the personnel expenses to a large extent. Other HRM practices including compensation and training are also aligned with this flexible policy as well as corporate-level cost reduction strategy. The core HRM philosophy would be to "buy" or "acquire" the human resources where firms rely on external labor markets surrounding them. On the other hand, the company with differentiation strategy (Company B) emphasizes human resource management for the R&D section. Performance-based compensation is extensively practiced in such an innovative company. The basic HRM policy of this differentiation firm is not process-oriented, but results-oriented where employees' enrollment in the market success of each product is highly evaluated. The mixed approaches of "buy" and "make" are adopted in this companies' HRM philosophy. In addition, firms with quality enhancement strategy (Companies C and E) place a massive emphasis on replicating the HRM policies and practices originated in their Japanese parent firms. They engaged in standardizing the corporate HRM procedures with a high similarity to those of the Japanese head offices. Long standing employment and human resource development are salient among these manufacturers in the PRC. It appeared that strong commitment to quality may require a Japanese HRM model which is considered as quality-enhancing human resource management. The core HRM philosophy of these quality companies is to clearly "make" human resources within the firm who can contribute to the upgrading and maintaining unparalleled product quality.

The above findings of HRM policies and business strategy links replicated some empirical studies that have been reported to date in the Western research contexts. For example, Schular and Jackson (1987) point out that firms pursuing such a strategy have the following organizational and operational characteristics: tight controls (centralization), overhead minimization, and the tendency to pursue economies of scale. Therefore, it is argued that a reduction in the number of employees and/or a reduction in wage levels might constitute the basic human resource policies of this type of organization (e.g., Schular & Jackson, 1987; Sanz-Valle et al., 1999). In their study of a US manufacturing plant, Youndt et al. (1996) report that the low-cost strategy fitted in well with what they describe as an administrative HRM policy including hourly pay, individual incentives, results-based performance appraisals, and so forth. Moreover, Miles & Snow (1984) and Khatri (2000) pointed out that HRM policies among differentiation firms tend to have a strong results orientation with the intention of developing a large number of innovative and creative employees. For instance, in his study of 194 Singaporean firms, Khatri (2000) found that innovative firms tended to introduce a more performance-based compensation system than did those with strong cost orientations. Sanz-Valle et al. (1999) conclude that firms using the differentiation strategy will compensate employees in relation to their competencies. Finally, Schular and Jackson (1987) took a US-based Japanese automobile manufacturer as an

example of pursuing quality enhancement strategy, and showed that long-standing policy in human resource management and development could be a major source of competitive success in the US.

As such, these findings reported in some prior SHRM studies are considered highly comparable to those of this study that used five leading Japanese manufacturers as a source of information in the PRC setting. This suggests that the findings and evidence related to the strategy-HRM links in Western or other market economies can be practically applied, to some extent, to the ways firms in the PRC align their HRM policies and practices with the China's emerging market environment. Therefore, the study provided a possibility that researchers of this field may find some generalizability in the manner by which types of HRM policies and practices fit into particular strategic orientations without cultural and/or geographical constraints.

Furthermore, the findings of the study also offer a partial but significant insight into the modification processes of HRM policies and practices in a cross-cultural setting of MNCs, which has been mainly discussed in the area of international HRM (IHRM) field. Some prior research of this field (Bird et al., 1999; Beechler & Bird, 1995; Taylor et al., 1996) explained the modification processes of HRM practices in Japanese MNCs' subsidiaries, and identified several determining factors that may affect the local adjustment of the parent company's HRM practices. One key consistent finding in the stream of literature is that the belief shared by the top management team of subsidiaries strongly affects the choice of HRM practices in the local setting. To be more specific, if the subsidiary's top management team has the shared belief that the parent company's HRM practices are context generalizable and competent, then the original management template transferred from its Japanese parent firm can be sustained and reinforced. On the other hand, if the subsidiary's executives believe that the parent company's HRM practices are context specific and incompetent (mismatched), then the HRM template is subject to some or significant modifications in the local environment. Adding to such findings, the present case analyses of some leading Japanese manufacturers in the Guangdong area further clarified the processes in which the HRM template adopted by the Japanese manufacturers in the PRC can be maintained or modified. In particular, the study found that the firm's strategic choice of competitive strategy for the survival in the PRC market determines the extent to which the affiliate firms in China adjust their HRM template used in the Japanese parents.

Finally, the present study has attempted to document how the PRC-based Japanese affiliates with different strategic approaches adopted and emphasized different sets of HRM policies and practices in the manner by which an HRM is vertically aligned with their competitive strategies in the emerging market competitions of the Chinese market. This is an initial attempt, and thereby further investigation is needed to empirically test the strategy-HRM links by taking not only a qualitative but also a quantitative approach. Substantial accumulation of empirical research that tests the contingency fit between strategy and HRM in relation to performance consequences of firms in the PRC would help generalize the findings of the study and provide better understandings of this relationship.

### End Notes

This research was funded by the Grant-in-Aid for Scientific Research from the Ministry of Education, Culture, Sports, Science, and Technology (MEXT), Japan, which is related to the JSPS (Japan Society for the Promotion of Science) Research Fellowship Program (# 9348). I wish to express my great appreciation for the cooperation of the five Japanese affiliates in China who participated in this research and so made the study possible.

# **Comparative Study of Strategic Human Resource Practices of Five Personal Care Companies in Malaysia for Enhancing Employee Motivation and Retention**

*Yin Teng Chew*  
*Nagoya University, Japan*

## **Abstract**

This comparative study aims to compare and contrast strategic activities of designing HRM systems across five leading companies with different country-origins and cultural values in Malaysia. The study, in particular, examines how HRM practices of these companies are implemented so as to secure and retain talented HRs as well as to inflate their in-role and extra-role behaviors from the comparative perspective. Findings showed that, while Western HRM practices are widely adopted to a varying degree in Malaysia, significant differences in the HR practices across the five companies exist to attain strong organizational effectiveness. This paper demonstrated that a focus on competitive pay packages to attract, motivate, and retain talented HRs is clearly effective in most of the Malaysian employees as they highly desire monetary rewards. Adding to this finding, however, combined and complementary uses of other strategic HR practices with competitive pay practices are found to be very important in order to further increase employee retention and organizational effectiveness of firms. Findings are used to discuss the application aspects of well-integrated strategic HR practices – not just “what,” but also “how” to achieve closely integrated complementary HR practices that create synergies for firms.

## **Introduction**

Much had been said about the importance of human resources (HRs) in achieving organizational effectiveness of firms (Gerhart & Milkovich, 1990). While HRs are the backbone of an organization, hiring capable people alone is not enough as employee attitudes, intentions and commitment are critically affected by human resource management (HRM) practices. In other words, HRM practices can be strategically designed and implemented in order to promote desirable employee outcomes, including the enhancement of employees' in-role and extra-role behaviors and intentions to stay.

In the age of globalization, where the accumulation of both individual and organizational knowledge becomes rapidly of great necessity in firms, employees are increasingly required to enhance and renew their knowledge bases so as to meet their organizational requirements. People are likely to job hop not only to obtain better monetary rewards, but also to enlarge their career development opportunities. The overall turnover rate in Malaysia was 14.8 percent for 2002 and was predicted to increase up to 17.7 percent for 2004 - the highest among 11 Asia-Pacific areas/countries (Hewitt, Nov, 2003). Past survey research reported that Malaysian respondents showed their willingness to stay with their current organizations only for less than three years (Lim, 2001). Given the ongoing loss of talented HRs that may result in high operational costs of many firms in Malaysia, the issue of attracting, retaining and motivating talented people is ever challenging for HR specialists in Malaysia.

Considering that talented people are the scarce strategic resources of the 21<sup>st</sup> century and that multinational corporations (MNCs) tend to introduce different home-country practices to managing employees' motivation and retention at their local operations, this comparative study aims to compare and contrast strategic activities of designing HRM systems (hereafter referred to as SHRMSs) among five companies. Specifically, the study is designed to examine how HRM practices are implemented so as to secure and retain talented HRs as well as to inflate their in-role and extra-role behaviors from the comparative perspective of the five leading firms in Malaysia. It also aims at offering the several of case study evidence to understand the underlying purposes of human resource strategies to achieve success in the market. A literature review revealed that numerous case studies evolve general comparisons that lack in-depth comparative study in Malaysia. Further, this study that uses the sample of Malaysian-based Japanese and Western MNCs, in addition to Malaysian local firms, is deemed important due to the magnitudes

of these MNCs' impacts on Malaysian economy. Also, these MNCs have been creating huge employment and skill enhancement opportunities in Malaysia. Thus, this study is expected to become, in part, a meaningful guideline to management practitioners in attracting, retaining and motivating talented HRs in a Malaysian context.

### **Brief Backgrounds of HRM in Host Countries**

Compared with MNCs from other countries, Japanese MNCs have a strong tendency to transfer their parent country's HRM practices, which are called "Japanese-style HRM", and to control their local subsidiaries through overseas assignment of parent country expatriates (Peterson, Napier, & Shim, 1996). It is generally known that Japanese MNCs are largely group-oriented, and emphasize harmonious work relationship and teamwork. They also tend to adopt culturally distinctive HRM practices such as seniority wage and promotion system, lifetime employment, extensive training programs, and group-oriented approaches (Gomez-Mejia & Welbourne, 1996) to elicit employee's sense of loyalty and commitment to their organizations.

On the other hand, the performance-reward tie of Western MNCs is strong and mainly individual-based, reflecting HRM practices that are close to their individualistic national values in motivating employees for superior performance (Hofstede, 1980). High performers are identified and given extra attention for succession planning. However, Western MNCs tend not to hesitate terminating poor-performing employees owing to the contractual nature of employment relationship. In short, the Western, particularly U.S., management systems are characterized by high individualism, impersonality in relationships, emphasis on pay as a main motivator (money-oriented), and high inter-firm mobility (Zhuang, 1992).

As for Malaysia, its HR practices, systems, and regulations are largely influenced by British colonization experience. It is commonly seen that HRM practices of Malaysia are the artifacts of an integration of Western and indigenous HRM practices. Malaysian have been described as money-oriented and inclined to job-hop for better financial offers with little hesitation (Kawabe, 1991). This tendency is traced back to the proactive introduction of Western management and education systems in the past as well as the increased convergence of work-related values and expectations across culture in the present. Although the role of HR department and its importance are gradually changing in many of Malaysian firms, the general notion is that it still plays merely an administrative role, not a revenue-generating one. However, some progressive Malaysian firms that adopt Western HRM practices have recognized the strategic importance of an HR department. Whichever role the HR department would play in organizations, Malaysian national survey showed that 90.5 percent of 304 companies in a survey practiced performance-based reward systems, although seniority still minimally counts in salary decision to a varying degree (MEF, 2003).

### **Strategic HRM Systems (SHRMSs) of Five Companies in the Personal Care Industry**

Much has been said about the convergence of HRM practices. While MNCs may utilize similar strategic planning to manage organizational effectiveness, the degree of effectiveness may differ since the way MNCs implement their planning tend to be strongly affected by their parent company. This article is based on in-depth case studies of five personal care companies operating in Malaysia (Table 1). The companies investigated include A (a Japanese MNC), B (a British-Dutch joint venture (JV)), C (a U.S. MNC), D and E (two Malaysian domestic firms). Approximately three managers in one firm were interviewed at Companies B, C, and D and one top manager at Companies A and E in 2003. In order to explain in detail each company's strategies to retain talented employees and to promote in-role and extra-role individual performance among them, I investigated firms' efforts in doing so in the following HR functions: namely, recruitment, compensation and benefits, training and development, promotion and succession planning, performance appraisal (PA) system, and organizational culture of firms. Considering the depth and the sensitive topics covered in this study, all companies are represented with alternate names for the purpose of confidentiality.

### **Strategic Retention Strategies**

In general, popular reasons for turnover include unfavorable work environments, unsatisfactory compensation, better offers elsewhere and personal reasons. Distinctive reasons for staff turnover in each firm were identified across the five companies. First, Company A, a Japanese MNC, tends to lose employees due largely to less competitive pay packages relative to its competitors and less attractive pay practices which is referred to as “seniority-based pay systems,” whereas Company B, an European MNC, and Company C, an US MNC, tend to lose a number of talented HRs in groups at the same time when employees resign to follow their boss who is poached by a new firm. These companies also attribute their high turnover rates to the failure in hiring practices that may induce the lack of person-organization fit among new entrants happen. Another reason for their high turnover rates is a poor competency of employees that leads to their resignation or termination of employment. Two Malaysian domestic firms (Companies D and E) often lose talented HRs due largely to their less competitive pay packages and the lack of matured training facilities. There were the cases in Company D where some key middle management staffs resigned to set up their own business.

### **Recruitment and Selection**

Selecting the right people who fit in well with organizational and task requirements for each firm constitutes one of the most critical ways to retain employees. The recruitment strategies of two Western MNCs in Malaysia, i.e., Companies B and C, try to address the challenges of sourcing the best potential HRs and of retaining them in these companies as well. In order for these Western companies to facilitate employees’ retention through firms’ selection activities, Companies B and C placed a greater emphasis on using a person-organization fit assessment as an effective selection tool. As facilitators of using this selection tool, HR departments of both Companies B and C work closely with their functional managers in setting selection criteria (trainability, required skills and competency) coupled with their organizational values (qualities and work attitudes). For instance, Company B, a British-Dutch JV, that places more emphasis on employees’ competency and attitudes (80%) than on the skills they have (20%) preferred fresh graduates who had less working experiences in the past. For this European MNC, a priority is given to the recruits’ personality and characteristics that may fit in well with its organizational policy and climate. For instance, this company first screened job candidates over the phone to gauge their enthusiasm about working at Company B. Then, the company checks how desirable they are for the company’s reward system (especially, the pay for performance system that Company B is implementing). This example demonstrates that, HR department of this European MNC try to identify the degree of correspondence between each applicant’s needs and organizational reward systems, and then to assess how compatible an applicant’s work motivation, satisfaction, and organizational commitment are with the company’s expectation and culture.

Such great emphasis on pursuing P-O fit in the recruitment process stems from Company B’s corporate belief that changing attitudes is far more difficult than training people in a skill. The better the new recruits fit with the organization, the less likely they are to leave the organization since screening provides clues as to how well job candidates would work and behave in the company in ways that are more in tune with the corporate culture. In contrast, new recruits who go through their behavioral change exercise may get frustrated and may eventually increase their intentions to leave. This will, therefore, induce high turnover rate and inefficient operational cost. Both of these companies are particularly careful towards selecting job candidates who secure employment at Malaysian local firms due to high failure rate (75%) in hiring them.

Not believing in poaching HRs, the Japanese MNC (Company A) previously practiced the same hiring policies as the ones practiced by its headquarter in Japan. Following the hiring policies in the headquarter in Japan, Company A used to hire only fresh graduates with no practices of mid-career hiring. Just as other Japanese MNCs that practice conventional Japanese HRM systems, Company A was careful to avoid raiding talent as commonly practiced in highly individualistic nations. However, this approach brought about high recruitment and training cost in Malaysia-based subsidiary, in that, Company A was targeted as a free training center by rival firms and its star trainees left after completion of three-year training for more lucrative positions elsewhere. In response to such inefficiency, Company A started to ease its hiring strategy to consider re-entry of experienced middle-aged HRs. Apart from internal sourcing, Company A that gained improved reputation after introduction of SHRMSs rarely advertised for hiring in that, news of job openings or vacancies tend to be passed through word-of-mouth from employees of Company A to their acquaintance.

Compared to the aforementioned three foreign companies in Malaysia, two Malaysian local companies, Companies D and E, place somewhat less attention to the hiring practices of attracting, retaining, motivating talented HRs. This is due to the tendency that the talented job applicants generally select foreign-owned firms that have more attractive employment packages than local firms. In the case of Companies D and E, they often took a reactive stance in hiring talented HRs through counter-offering rivals' pay packages. One distinctive difference in these local companies is that they have less concern on how well applicants fit with organizational culture than foreign-owned firms, particularly Western firms in Malaysia (Companies B and C).

#### Salary and Compensation

Pay-for-performance system (PFPS) is the most widely used approach to reward employees' individual performance as it is used to motivate their willingness to work hard and to retain resourceful employees within the firms (Gerhart & Milkovich, 1992). It was found that all five companies interviewed believed that the primary motives of rewarding employees were to motivate and retain desirable HRs. Foreign MNCs generally can afford to have deep pockets enough to attract, retain, and motivate the best talents. They also tend to be more aggressive in poaching talented HRs. Further interviews for three foreign-owned companies (Companies A, B, and C) revealed that many employees who participated in foreign-owned companies continued to serve their employer. This tendency is particularly clear among two Western MNCs (Companies B and C) where other firms could not counter-offer talented employees working for these Western firms due to the less attractive pay packages for them. In short, influence of parent company values is very noticeable when observing salary structure and incentive distribution among the five companies interviewed.

In offering relatively high and comprehensive compensation which is based primarily on an employee's individual performance, the two Western MNCs (Companies B and C) tried to attract, retain, and motivate talented HRs by strongly differentiating employees' monetary reward depending on their individual performance. In the case of Malaysian locals (Companies D and E), they often take a reactive stance in counter-offering rivals' pay packages owing to budget constraint and concern for economies of scale. This is because there is a tendency that talented HRs in Malaysia seem to gravitate to foreign-owned firms including Japanese (Companies A), European (Company B), and US MNCs (Company C). According to the interview findings, most of the participating companies assumed that Companies B (at 75<sup>th</sup> percentile) and C (at 50<sup>th</sup> percentile) offer the best pay packages (basic salary, bonus and other forms of incentives) in ARM valuable staff, followed by Company A, Company D and E respectively. In terms of the formal salary increase structure, Company C pays the highest, followed by Company A (Table 3). Those of Companies B and D are below the first two companies. While Company E's seems to be the least attractive, it rewards excellent performers at 10-15 percent that is off the record. Comparing the average salary increase of five participating companies with those in Table 2 (Table 3), most of the companies offered median range (Companies A, B and D). Company C offered upper quartile range at 8 percent while Company E offered lower quartile range at 3.5 percent.

TABLE 1: SALARY INCREASE OF 2002 AND 2003 (FORECAST) IN MALAYSIA

Industry	Average Salary Increase (in percentage)		Quartile Analysis (in percentage)					
			Lower Quartile		Median		Upper Quartile	
Year	2002	2003	2002	2003	2002	2003	2002	2003
Manufacturing	4.87	5.24	3.50	4.00	5.00	5.00	6.00	6.00
Non Manufacturing	5.87	5.74	4.58	5.00	5.00	5.00	8.00	7.00
Overall	5.38	5.52	4.00	5.00	5.00	5.00	7.00	7.00

Source: MEF, 2003, pp. 331 and pp. 369

TABLE 2: COMPARISON OF FORMAL SALARY INCREASE STRUCTURE ACROSS COMPANIES

PA Category	Comparison of Percentage of Salary Increase as per PA Results									
	Company A		Company B		Company C		Company D		Company E	
	Rank*	Degree**	Rank	Degree	Rank	Degree	Rank	Degree	Rank	Degree
Average increment	2	5%	2	5%	1	8%	2	5%	5	3.5%
Excellent	2	high	4	high	1	high	3	low	5	low
Good	2	high	3	medium	1	medium	4	high	5	low
Average	4	medium	3	high	1	high	2	medium	5	low
Poor	3	low	3	low	2	medium	1	low	5	low
Non-performer		0		0		0				0

Note: \* Ranking of the salary increase (in percentage) is compared across all five companies within the same PA category.

\*\* Degree of salary increase is determined by comparing the percentage between the PA categories of the same company. For instance, it is determined by comparing the salary increase of poor performer to the salary increase of average performer (i.e., 2% and below: low; 3%: medium; and 4% and above: high).

TABLE 3: ANNUAL BONUS OF COMPANY B

PA Category	Spread of HR Competency	Annual Bonus	
		Executive level	Managerial level
Outstanding	Less than 10%	2 months contractual bonus	2 – 4 months
Stretching	About 75%	-	1 – 2 months
Minimum	Less than 15%	-	0 month

TABLE 4: ANNUAL BONUS OF COMPANY A

Appraisal Rank	PA Category	Gap of Bonus across PA Category*	
		Organization	Individual
6, 7 and 8	Excellent	substantially large	unrevealed
4 and 5	Good	large	small
3	Average	substantially large	small
1 and 2	Poor		

Note \* Gap of bonus is determined by comparing the difference between the PA categories.

To strongly tie pay packages to individual performance, Company B differentiates the three levels of salary increase with medium to high degree of salary increase between different performers. Judging from the distribution of salary increase, Company B highly rewards outstanding performers, putting in more effort to retain this group of HRs (Table 3). It did not practice automatic increase (Table 4). Only those outstanding executives in Company B may enjoy contractual bonus.

The US MNC (Company C) does not rely compensation strategy for staff retention as heavily as the British-Dutch JV (Company B). This is because Company C considers avoiding a constantly spiraling outlay on compensation packages. Furthermore, Company C does not intend to be the best paymaster in attracting, retaining, and motivating talented HRs although it still pay competitively and readjusts its remuneration based on salary survey every two years. It creatively formed employment packages (training, job enrichment, organizational culture, fairness and transparency) that compensate for the monetary difference. While salary increase scheme at Company C is generous at eight percent on average, it is also designed to substantially differentiate each of the nine performance rankings in order to clearly distinguish five levels of performers (Table 3 and Table 9). Unlike Company B, Company C's retention strategy spread to cover from average to excellent performers. Poor performers who are ranked at the bottom three would not receive any salary increase. Neither can such employees receive contractual bonus even though it is based on organizational performance.

Like its parent firm, Company A, the Japanese MNC, used to implement conventional Japanese HRM systems that emphasized greatly on seniority in reward systems. This has resulted in below-market salary, perceived unfairness, and demoralized employees in Malaysia that further complicated intended motivation and crippled retention strategies. Faced with such difficulties, Company A started revamping its HRM practices in 2001, and was in full force for three-year gradual pay readjustment so as to offer market-competitive pay packages. Company A redesigned its poorly defined 23-grade structure to one of eight grades that are more precise in terms of (1) the size of accountability, (2) job design, (3) individual achievement, and (4) his/her contribution to department and organization. This Japanese MNC in Malaysia also introduced a salary increase system that makes large differentiation among employees in order to better retain good and excellent performers. This effort not only fruitfully promoted greater trust among employees but also was motivational to them. To further maintain offering competitive pay, Company A adjusts compensation levels every three years according to salary survey. Its new sales incentive scheme was effective in continually motivating sales team on monthly and quarterly basis. Company A does not practice automatic salary increment for non-performers. Unlike some other companies investigated in this study, Company A extends organizational performance-based bonus to non-performers, aiming at motivating and appreciating less or non-performing employees. The bonus differentials based on organizational performance are quite large, while differentials based on individual performance are relatively small. This tendency reflects the collective nature of Company A's greater emphasis on appraising team and well-concerted efforts within work units and their contributions to better organizational performance (Table 5). Opportunities to join the company's oversea tour (especially to Japan where the home office of Company A exists) are provided for excellent sales performers as a motivational incentive.

Company D, a Malaysian local, has simple compensation practices in which performance slightly counted more than seniority (60:40) in salary decisions. Amount of salary increase was narrowly fixed in accordance with appraisal grades except for grade A (Table 3). Company D did not carry out pay freeze except for some least performing employees as a means to provide stable work environment and job security for all employees in Company D.

TABLE 6: SALARY INCREASE AND INCENTIVE SCHEMES OF COMPANY E

Appraisal Rank	Annual Incentives	Monthly Incentives
	Bonus (month)	Sales Commission
Excellent	2.00	oversea tour
Good	1.50	RM800
Average	1.00	RM500
Poor	0.50	none

Another Malaysian local company, Company E, is cost-sensitive and family-managed. It mainly extends attractive pay package to revenue-generating unit such as sales teams (Table 6). For instance, offering monthly incentives and competitive commissions for new and existing products. Although most of the companies interviewed in this study mainly used individual performance as a yardstick for salary increase, Company E principally refers to organizational performance with an average of three and a half percent increment while still taking into account some degree of individual performance and traits as per PA form. However, higher salary increase may deviate from written policies and reach as high as 15 percent on a quiet affair. In spite of tying bonus to individual performance, poor performers at Company E could still enjoy half month bonus, which is higher than that of Company A (Japanese MNC), showing the paternalistic side of local management that accommodates with less competent employees. Based on the even incremental spread of bonus across different level of performers, it shows even importance is given to all performers. In the case of staffs being poached, Company E tends to take less proactive approach to retain them through counter-offer.

**Fringe Benefits**

My interviews revealed that there were no huge differences in the fringe benefits among foreign MNCs, offering equally attractive perks. More interestingly, I could observe, through a series of interviews, that these participating foreign MNCs had responded to changing social values. For instance, both Companies B and C, the Western MNCs,

in recent times have decided to reduce its fringe benefit for cost control as they were less effective in attract, motivate, and retain employees as a result of complacency among seasoned employees. Moreover, traditional fringe benefits that had promoted loyalty in the past were becoming less feasible with the increased tendency of younger workforce to job-hop as well as to opt for real-time monetary rewards. These social changes have prompted these two Western MNCs to reconsider the role of fringe benefits such as housing subsidy, retirement scheme and insurance coverage in creating flexible benefit scheme (cafeteria-style benefit system) to better meet specific needs of employees. As for Malaysian companies, Company E mainly provides basic fringe benefits as per statutory requirement while offering more indigenous perks that are traditionally popular. The fringe benefit of Company D is somewhere in-between of the foreign MNCs and Company E.

Besides retaining HRs through competitive compensation, Companies A (Japanese MNC) and B (British-Dutch JV) offer very generous fringe benefits (higher medical coverage, housing subsidy and longer seniority-based annual leave, and attractive retirement gratuity) than that of other three companies to demonstrate organizational care for employee welfare. Fringe benefit in Company A also provides better health maintenance for senior staff. Recognizing that ineligibility of latecomers to receive housing subsidy represents unfairness, Company B compensates new recruits who join after 2001 with higher salary.

Company C, (US MNC) also provides attractive fringe benefits but also tries to keep it cost-manageable since its employees perceive these benefits as some form of entitlement, and hence defeating its motivating purpose. Company C allows full reimbursement of education within a certain expense without any contractual binding – something rare and very appealing to Malaysian society that greatly emphasized on education. MBA course is fully sponsored to retain potential HRs and senior employees. Further, rank-related benefit like partial subsidization of car loan at five percent is equipped in order to retain top and middle management personnel. To retain talented young HRs, Company C designed another form of retirement allowance to encourage younger employees to continue their service there. This attempt is to transfer the retirement allowance into additional of three percent of payroll onto employee provident fund or into real-time monetary incentives of which can be enjoyed after five years of service. Company C did not put any cap on medical benefits and extended this benefit to immediate family of its employees to show organizational care.

At a first glance, the fringe benefits of Company D (a Malaysian local) seemed too simplistic and less attractive than the three MNCs investigated. However, given the interpersonal orientation of Malaysian firms that put less attention on elaborative written rules, less formalization can also be interpreted as more room for flexibility in negotiation of fringe benefit. For instance, Company D is less stringent in extending car and housing subsidy to employees. Although some fringe benefits lacked the detailed elaboration, they are decided case by case hence no maximum cap was placed. Another Malaysian domestic firm (Company E) that manages its organization in rather indigenous way offers most of its fringe benefits by adhering to the minimal legislative requirement. However, there is employee dissatisfaction towards the current provision.

#### **Training and Development**

Simply paying high-performing HRs more monetary incentives is not sufficient in retention strategy. The more the executives feel a company values them, the less likely they are to leave. In essence, training equips employees with the necessary skills and knowledge to meet job expectation as well as to reinforce desirable attitudes. However, training can also be strategically positioned for attract, motivate, and retain talented HRs. Past research (Rioux, Bernthal, & Wellins, 2002) revealed that Malaysian workforce eagerly sought to receive training, and primarily engaged in developmental activities for personal and practical reasons (Table 7). Given its importance, it is obvious that training can contribute significantly to attract, motivate, and retain talented HRs. Being well-recognized for excellent training programs, training and development is one of the main strategies to staff retention for Companies A, B, and C. In line with their emphasis on continual learning and upgrading of skills, these three companies extend development programs conducted by professional institutions to employees so as to equip them with skills required in future. Such orientation reflects that these companies have long-term career plans for employees that may possibly enable their career advancement.

TABLE 7: REASONS FOR ENGAGING IN DEVELOPMENT ACTIVITIES (N=871)

Reasons	Percentage
It helps me grow as a person (not just in terms of my job)	94
It gives me the skills I need to perform my job	93
It makes me more marketable for other (future) jobs	75
It helps me receive special rewards or benefits (e.g., salary increase)	45
I am required to participate	33

Source: Rioux, Bernthal, & Wellins (2002)

Despite of its flat organizational structure that implies limited upward promotion opportunities, Company B strategically designed its training programs to retain HRs. Before introducing training programs in this European MNC, training need analysis is carried out to properly identify only the necessary training or re-skilling required to better aligned with future plans and other critical systems. Company B is widely recognized for its comprehensive training and efficient coaching. It allows steep learning curve and creates high performing HRs equipped with five-year practical hands on experience only in three years. Because of these excellent learning opportunities and futuristic development, Malaysian workforce is generally attracted to their continuous employment at Company B. About 20 percent of the talented HRs are sent to high quality personal development programs, some conducted abroad that are relevant to their future job assignment. This is much to their delight considering the popularity and hefty cost of such high-quality training. As for retention of senior staff, Company B that places great importance on continuous learning designed six-month or one-year oversea posting-cum-training programs that not only broaden one's international exposure but also help to get senior employees refreshed. Interestingly, these programs are connected with other foreign subsidiaries of this European MNC. Therefore, the longer the talented HRs continue to work for Company B, the more they could learn and thus, the better their marketability become.

Compared to other four participating rivals, one unique feature of training strategy of Company C is its cost-effective and self-directed cross-sectional training in which ambitious and potential employees volunteer their participation to gain more exposure, even though there is no monetary incentive involved. Apart from these benefits, voluntary participation gives employees the chance to demonstrate their talents to the management. Job rotation and change of work content are carried out with new product developments. Avoiding overemphasis of compensation in retaining senior employees, Company C sends high-performing senior employees for oversea posting or foreign assignment that may immeasurably enhance their competency. In addition, Company C provides senior employees with training on development of soft skills and long-range skills (strategic decision making, global understanding) pertinent to its long-term goals. It even sponsors high-performing HRs and senior employees with full educational scholarship (MBA course) with two-year contract. In cases whereby reimbursement is below a fixed value, it is without any legal binding.

Training at two local companies (Companies D and E) mainly covered job-specific training program although Company D occasionally send employees to local training institution for personal development such as leadership and time management. While training effort is improving in these two companies, insufficient investment for long-term requirement apparently made them less attractive to HRs. This is partly attributable to the general notion among Malaysian firms that training beyond contractual scope of work should be shouldered by employees. To encourage Malaysian firms to better-equip their employees and thereby creating a competitive workforce, Malaysian government introduced HR Development Fund Act in 1992 whereby employer contribution of one percent monthly payroll could be reimbursed for 70 percent of the training cost. However, Malaysian government later increased the claimable to full reimbursement owing to the poor initial response of Malaysian firms in HR investment. There may be reluctance on the part of Malaysian companies to extensively train HRs, knowing that training improves market value of employees and may lead to high tendency of job-hopping that necessitates offering of better pay packages to retain employees. Generally, both the better home-grown Malaysian firms and foreign MNCs take training seriously while firms with less proactive attitude towards HR development approach training on a need-to basis (Yong, 2003).

While excellent training programs are effective in attract, motivate, and retain talented HRs, inherent issue such as poaching is unavoidable. As mentioned earlier, Company A was viewed at a free training center, and rival

firms just waited to poach its trainees. Company B is famous for its comprehensive and efficient training. This has attracted serious poaching and employees, at times, left in groups. The loss of valuable HRs owing to drastic poaching has forced Company B to contractually bind its employees especially when investing in expensive training programs conducted by famous overseas trainers. In contrast, a US MNC of Company C that chose not to contractually bind employees preferred to trust its employees. More surprisingly, Company C did not experience loss of talented HRs as severe as Company B (European MNC) despite its stance. The closest logic behind this difference could be due to successful assimilation of strong organizational culture in Company B. According to the statements of two personnel at Company B, there were many cases whereby former employees of Company B who left for better offers elsewhere returned later to request for reemployment.

#### **Performance Appraisal**

Performance appraisal (PA) is the process of identifying, measuring, and developing human performance that serve three major organizational purposes: administration, development, and communication (Butler, Ferris & Napier, 1991). Data collected in on-site interviews showed pertinent differences are analyzed and summarized in Table 8. While PA is used for similar purposes to varying degrees at all five companies, more importantly is the way PA is integrated in design and practice with other HR measures to effectively serve organizational priorities. The data point to the existence of some cultural differences in the perception of performance management and the organizational role of PA.

Practicing PFPS may attract high achievers; however, PFPS can be a risky proposition if not done properly. For reward programs to be as successful as possible, employees must understand what is expected of them and how performance is measuring up to goals. Recognizing this, Companies A, B, and C strategically designed and implemented their sophisticated PA to be an integral part of SHRMSs to support organizational effectiveness. PA is used extensively for communication (performance management and review frequency), administration (salary and promotion decisions), and development (training and re-skilling). For instance, these three companies used PA for performance management more extensively than the remaining two companies by providing ongoing feedback and taking immediate remedy for work improvement as well as updating employees with corporate directions. In addition, given the strong performance-reward tie and its inherent sensitiveness on distribution of rewards, these former companies designed PA systems with detailed descriptions and quantitative measures to facilitate fair salary decision.

Conversely, domestic firms are comparatively more relationship-oriented. Thus, Companies D and E tend to handle their basic PA systems less formally, and implement less objective PA that are less clearly articulated than the three MNCs. These companies utilize mainly qualitative-oriented PA measure to arrive at salary decisions. This variance is further supported by the distinctive difference observed in their neither standardized nor precise measurement criteria. In spite of using PA primarily for feedback, Companies D and E tend to handle feedback indirectly and less formally considering the cultural significance of keeping harmonious relationships and traditional concept of face-saving (Abdullah, 2001).

Following the parent company's HRM practices in Japan, Company A pursued PA systems that used to have subjective appraisal, unclear, and unrealistic targets that were set by superiors without mutual discussion or agreement. In its effort to be organizationally effective as well as to design a global corporate standard, Company A did away with top-down decision-making, and started to involve employees in operational and performance-related decisions. PA was transformed into one that is fair, transparent, objective, and measurable. It is also closely integrated with the new performance management system so as to provide accurate and reliable PA results.

Another interesting finding is that management priorities are reflected in the usage of PA. My interviews revealed that the three foreign companies that are more willing to invest extensively in HR development tend to use PA extensively for their identification of future training needs. The two Malaysian companies, however, are relatively more concerned with production outcomes, and tend to use PA more for the purpose of performance management than for identification of training needs.

TABLE 8: STRATEGIC PRACTICES AND APPLICATIONS OF PA SYSTEMS

Policies and Procedures	Companies of Personal Care Industry				
	Company A	Company B	Company C	Company D	Company E
<i>Purpose and Applications of PA</i>					
Performance management	Extensively; Formally	Extensively; Formally	Extensively; Formally	Moderately; Less formally	Moderately; Less formally
Salary decision	Objective; Detailed; Quantitative	Objective; Detailed; Quantitative	Objective; Detailed; Quantitative	Subjective; Qualitative	Subjective; Qualitative
Promotion decisions	Extensively	Extensively	Extensively	Rarely	Moderately
Development	Moderately	Extensively	Extensively	Rare-Moderately	Rarely
<i>Measurement Criteria</i>					
Orientation	Performance-driven; seniority at minimum	Highly performance-driven	Highly performance-driven	60: 40 ratio of performance-seniority	Performance-driven
Measurement criteria	Detailed; Standardized criteria are job-specific; Comprehensive	Detailed; Standardized criteria are job-specific; Comprehensive; Recently put more focus to global result	Detailed; Standardized criteria are job-specific; Comprehensive	Simple; No standardized criteria for job nor skills; Mainly narrative essay; Emphasis on the "hows".	Simple; No standardized criteria for job – only for overall skills. Mainly narrative essay.
<i>Participation</i>					
Goal-setting, KPI (subordinate or superior)	Set by both parties	Set by both parties	Set by both parties	Set by both parties	Set by firm.
Appraisal parties (subordinate or superior)	Both parties; Twice of the self-appraisal		Both parties	Both parties	Superior
<i>Transparency</i>					
Measurement criteria	Disclosed	Disclosed	Disclosed	Disclosed	Disclosed
Appraisal result	Disclosed	Disclosed	Disclosed	Disclosed	Disclosed
Avenue for negotiation	Available	Available	Available	Available	Not formally available
<i>Monitoring and Control for Accuracy</i>					
Review of goals, KPI and redefinition	Twice a year	Twice a year	Twice a year	Once a year	None
Frequency of performance review	Twice a year	Twice a year but on quarterly basis for talented HR	Twice a year but more for talented HR	Once a year	Once a year
Trained assessors	Trained	Trained	Trained	Not trained	Not trained
Parties involved	Department Head	HRD	HRD	None	Three directors
HR Monitoring	Not in practice	In practice Close supervision	In practice Close supervision	Not in practice	Not in practice

Except for Company E (a Malaysian local), participation in goal-setting are somewhat similar across all companies in this case study. Company E decides the goals and delegates the key performance index (KPI) to superior. Company A encourages employees to set their own KPI twice a year of which are later discussed with superior for agreement. Concerning the degree of transparency, all five companies reflected high degree of

transparency although Company E prefer not to formalize avenue for grievance and negotiation since it concerned that formalization may proliferate complaints.

As part of the attempt to uphold the validity, reliability, and credibility of PA systems, Companies A, B, and C seem to put more serious efforts on monitoring and control: assessors are trained, and goals and KPI are reviewed and readjusted twice a year in response to external and internal forces. PA at Companies B and C are performed under close supervision of HR department, in particular the latter, taking proactive approach to screen appraisal results for irregularity, unfairness or favoritism even when no complaints are raised. Table 9 explains the management of different performers as well as the backward learning of Company C as an attempt to avoid repeated selection mistakes.

TABLE 9: STRATEGIC ACTIONS OF COMPANY C

Appraisal	Categorization	Strategic Action
9	Excellent performer	Good and excellent performers are given extra attention in coaching, training and widening job specification that may be value-added for succession planning.
7 and 8	Good performer	
4, 5 and 6	Average performer	Provide constructive feedback on the areas that average performers need to improve. Revision of work content and measurement criteria to create fairness in the system though there is no fixed revision period: <ul style="list-style-type: none"> <li>1) Revision depends on source of poor performance in particular, those that tend to significantly affect business such as skills, priority management and others.</li> <li>2) Provide opportunity for improvement to average performers</li> </ul> Monitoring is also practiced to track and note details of average performers with the purpose of improving selection skills during staff recruitment as part of the attempt to avoid employing average performers.
3	Low performer	Non-performers may have a high tendency to leave Company C in a year. This could be due to inability to deliver contractual job requirement; mismatch between organizational and personal values; and poor selection.
1 and 2	Non performer	

### Promotion and Career Advancement

Promotion and career advancement play crucial roles in retaining and motivating talented HRs. In general, all five participating companies practice performance-based promotion to varying degrees. Excellent performance and consistent proven track records are necessary recipes for promotion considerations in Companies A, B, and C. In general, PA is utilized to enable sound promotion decisions. Another formal approach to facilitate promotion decisions at Companies A and B is their formal performance management, with two and four reviews a year, respectively. Despite Company B's flat organizational structure that generally implies limited upward promotion opportunities, this European MNC managed to retain many valuable HRs through its successful attempt in minimizing discouragement. To overcome this structural shortcomings so as to meet the needs of its highly achievement-oriented HRs, Company B offers long-term career plan by sending high performing senior for oversea posting or top designation previously occupied by expatriates through its localization effort. In addition to offering lucrative pay and extensive training to retain HRs, Company B also exposes talented HRs to challenging projects as a substitution to limited promotion opportunities since this strategy helps to satisfy the need for self-actualization of its employees.

Company C supports internal talent mobility and makes extensive use of internal candidates when filling vacancies at leadership level. Advancement opportunities available in Company C are such as oversea posting, upward and lateral promotion. This US MNC makes serious efforts in embarking on succession planning, an ongoing activity to identify and develop tomorrow's HRs from current pool of talents. Under this program, Company C reviews the competencies deemed critical for managerial positions and assessed current skill levels of talented HRs in these competencies in order to determine the appropriate extra training that could best maximize their potentials. The performance of talented HRs is closely monitored with four reviews a year. Such serious effort

gives a sense of comfort to them in that, they may have a promising future in Company C since their career advancement are taken care which further reinforces their organizational commitment.

Before doing away with the parent company's HRM system in Japan in 2001, Company A previously practiced guaranteed seniority promotion system that promoted HR in lock-step, time-consuming fashion. This conventional practice considered employee's age and years of service. However, given that fresh graduates who perform well tend to get their first promotion after three years of service in Malaysia as well as the changing social values of workforce, the conventional promotion practice became a threat to organizational effectiveness and performance. High performers left for firms that reward rapid advancement, whereas less competitive HRs continued to stay. According to top personnel of Company A, most of those excellent HRs that left Company A for better career development elsewhere are currently directors of well-established companies, an fast-track upward advancement that could hardly happen in the conventional system. With the adoption of new HRM systems, Company A takes an active role in identifying talented HRs and tracking performance for promotion decisions. Moreover, performance management system that was introduced to effectively manage performance process (short-term and mid-term objectives with clear descriptions on the "what", "when" and "how") also assisted in performance tracking exercise.

While foreign companies in this study proactively and creatively use promotion to retain talented HRs, Companies D and E (Malaysians) adopt the traditional concept of career management with relatively more element of seniority influencing promotion decisions whereby promotion takes place as some form of progression through a vertical ladder of positions but with somewhat similar responsibilities. Aligned with its high emphasis for seniority-performance wage system (40:60), Company D that favors internal promotion mainly promotes from within. Top management positions at Company E are mainly held by family members.

Other forms of strategies besides those mentioned above should also be considered for staff retention. In the case of Company C, it created job enrichment program for senior employees that includes job rotation, cross-functional moves and sanctioning more diverse career paths. Other related interventions are such as succession planning, problem solving task force, delegating challenging yet enjoyable assignments to help keep their work meaningful and interesting.

## **SHRMSs to Fostering In-Role and Extra-Role Behaviors**

While having strong retention strategy is considered important for organizational effectiveness of firms, it is also vital to have appropriate HRM strategy to elicit both in-role and extra-role behaviors among employees. In-role behavior points to the one in line with and within the range of contractual requirement for each employee. Extra-role behavior is said to be exerted voluntarily beyond contractual requirement (Organ, 1988). Recent studies tend to see organizational citizenship behavior (OCB) as a typical extra-role behavior. OCB is considered as part of work-related activities performed by employees that contribute to organizational effectiveness, and yet are beyond the regular scope of job descriptions and contractual sanctions or incentives. Moreover, although many organizations desire employees to exhibit OCB, they cannot force or punish those who do not show such behaviors since these behaviors are neither legally binding nor in-role behaviors.

Past research (Yong, 1996) revealed that in general, Malaysian firms whose HR department is more administrative-oriented are less concerned with OCB as they simply focused on productivity and sales revenue that are more visible and on short-term bases. Consistent with this general finding, most of the HRM strategies in Companies D and E are designed more for aiming at attaining some other purposes (especially, lowering personnel expenses) than for enhancing employees' sense of OCB. Even though HRM practices in these companies reflect resemblance to some basic Western HRM, their HRM practices are not developed to maximize on its benefits owing to their administrative nature. Their efforts to promote OCB are less sophisticated and less concerted than those of other three companies. In particular, their approaches are neither clearly defined nor articulated even though they recognize much importance of employee motivation in firms' productivity increase.

Despite the lack of formality commonly found in Western HRM, Companies D and E attempted to promote employees' OCB to a lesser extent by mainly adopting the indigenous way; that is, increasing relational exchanges

among employees. Perhaps, the adoption of such strategy by Malaysian local companies could be closely related to accommodative Malaysian societal values that tend to keep written rules to the minimum extent in order to maintain the flexibility for special arrangement that are beyond written corporate regulations. Malaysian is a people-oriented society that tends to be less formal in carrying out task. It is common for top management to treat employees amenable and to create a family-like workplace. These two Malaysian companies hold the similar values, and thus tended to recognize employee efforts more informally and more personally.

Here are a few examples of lax practices that are appreciated by employees of Company D. For instance, while employees of Western companies are expected to perform beyond set expectation to be perceived as acceptable, employees in Companies D are comfortable working there since they shall perform only according to expectation set. Moreover, employees in Company D do not have to go through layers of formal upward channels to get approval for personal time off and during work hours. Further, work environment is family-oriented and status is least emphasized. Since rules are not strictly enforced, Company D does not take disciplinary actions on rule breakers unless those employees' behavior seriously jeopardizes their moral.

Offering competitive compensation packages is considered important for enhancing employees' OCB. Equally important is, however, to offer compensation packages that are fairly perceived by employees. This requires careful management of both distributive and procedural fairness as perceived by employees. To achieve distributive fairness, it is vital to ensure fairly distributed incentive system by continually crafting compensation packages that reflect precise and accurate market data. As for managing procedural fairness, it is important for firms to ensure clearly defined roadmap in performance management process with ongoing reviews as well as fair and transparent PA in which performance is measurable and acceptably link to reward systems. By doing so, firms may significantly increase hiring and retention rates as well as fostering OCB. Most of the firms in this case study attempt to fulfill these requirements.

To achieve retention through, employee development, Company B shows serious commitment to develop HRs by integrating training throughout the organization and by allocating incentives to superiors who proactively provide close mentoring that helps subordinates to develop the right competencies. Company B also provides recognition to talented HRs by enlisting them in presentation team at board committee meetings. Such efforts may further encourage employees to display in-role and extra-role behaviors. Company B, an European MNC, also tries to promote employee commitment and OCB by recognizing the need to balance work and family life of each employee. Employees of all levels are not encouraged to spend long hours at the office after official hours. Such practice is particularly appreciated by talented female employees who are career-minded, since it makes it possible for them to play dual roles effectively.

Self-directed cross-sectional training in Company C that enhances employee participation and that promotes sense of achievement can further help to strengthen their sense of affiliation with company, given the high degree of empowerment and solicitation of ideas. Because of the ability of such training to meet intrinsic needs of talented HRs, it is attractive even in the absence of monetary incentives. Most notably, Company C, a US MNC, takes proactive stance to monitoring appraisal results for any irregularity or possible favoritism even when no complaints are filed. In the event of suspicious results, respective departments would be investigated, and failing to receive a satisfactory explanation from appraisers requires readjustment of appraisal result. Such extra and genuine efforts made by Company C may not only give its employees a sense of fairness but also help to promote OCB. The efforts of Company B and C in creating flexible benefit scheme that customizes rewards and benefits (cafeteria-style benefit system) to better meet specific needs of employees that may further boost their motivation and intentions to stay.

Trust has the potential to inspire employees to go beyond what is required of them to best promote the welfare of the whole organization. All five companies attempt to promote distributive and procedural fairness among employees to help generate organizational trust in employees. In their efforts to promote organizational trust, Companies A, B, and C (Japanese, European, and US MNCs, respectively) strive to create an open culture where financial and performance information is accessible. Salary decisions and PA results are highly transparent, and management action at the top and middle levels could be questioned by employees for clarification and understanding of organizational goals and purposes. Salary decisions are highly objective and quantitative-oriented in the three foreign companies. Companies A (Japanese) and D (Malaysian) did away with punch card system to

exhibit trust in their employees. Certain benefits that were once only eligible for upper management at Companies A, C, and D were extended to executives. All these efforts are also made to reduce status distinctions. Company D also extends financial and performance information to production workers once a month to create organizational awareness and to promote OCB among employees.

Organizational culture is also important in achieving organizational effectiveness. Coupled with other strategic HR practices, Company C, a US MNC, tries to create informal work environment and atmosphere for the purpose of delegating more empowerment and authority to young employees. Company C also put less emphasis on structural status. By extending the hospitalization benefits that were once only eligible to rank-and-file employees to all employees, Company C not only aligned with its credo to promote and demonstrate fairness but also responded to the changing work values of younger workforce that do not prefer repetitive reminders and instructions. According to the statements of two personnel at Company C, there were many cases in which former employees who left for better offers requested reemployment at Company C as a result of deep attachment to its organizational culture. In fact, its former employees often hold social gathering to keep the networking. Both Companies B and C put in efforts to balance the pay and job satisfaction (concern for level of job fulfillment) of employees to ensure that the people they hire are a good match for the job and the work culture.

Besides making information access easy and transparent, Company B that recognizes and formally deals with the importance of cooperative and trusting work environment also fosters open communication. This open culture helps employees to maintain friendly working relationship by facilitating a truly open environment to solve work conflict as well as to clear up misunderstandings without fear for subsequent retaliation.

As for Company A (a Japanese MNC), various meetings are held at Company A to elicit input from employees to improve organizational effectiveness. Meetings are frequently held to address or resolve issues. This form of employee participation considers views from all angles, and further strengthens employer-employee relationship. Company A also implicitly practices lifetime employment practices. Company A attributes poor performance to insufficient training, incompetence, or poor person-job fit. In the first two cases, poor performers are given retraining and ample chances to prove their work ability. In the case of poor person-job fit, Company A reallocates more suitable jobs to poor performers in its effort to avoid layoff. Therefore, Company A does not take as strict a stance as western practitioners on terminating employment of poor-performing employees. However, in the event of unavoidable layoff, it adopts 'last-in-first-out' policy to ensure long-serving employees are given more priorities in securing employment within Company A. Further, Company A places great importance on orientation for new recruits to foster family-like atmosphere and helping spirit, which eventually serve as enhancing OCB among employees in this Japanese MNC.

## Summary

While Western HRM practices are widely adopted to a varying degree in Malaysia, the country-origin of MNC is still an important factor which shaped the platforms as to how a firm can strategically manage their human resources to foster staff retention and in-role and extra role behaviors of employees. Although to a minimum extent, Company A, a Japanese MNC, still maintained certain practices of parent company after redesigning its home-made HRM system to the one that resembles Western management styles. Malaysian companies implement Western HRM practices under strong indigenous influence and somewhat lax practices.

This comparative investigation shows that, while a competitive compensation package is able to attract, motivate, and retain employees in a short period of time, it is not a silver bullet. Heavy reliance on it will only result in constantly spiraling outlay that is costly with limited success. Nevertheless, along with close integration of other complementary HR practices, outstanding companies tried to use a combination of interventional strategies to capture the full essence of their HRs to the greatest advantage. This comparative study notes that foreign companies holistically integrated their strategic HR practices to attract, motivate, and retain employees. Great emphases each firm made on managing Malaysian people could be observed in their serious attention on introducing complementary practices such as strategic hiring, simulation of organizational culture, extensive training, and succession planning.

As shown in Table 10, Malaysian-owned companies were one of those that scored the highest turnover rate of executives for 2002 (16.68%), followed by companies with ownership from US., UK/ Europe, and Japan. This result may imply that, along with other Asian countries, Malaysian companies are not as effectively as other Malaysian-based foreign firms in securing and retaining HRs. Findings in the current study supported this notion, showing that while Malaysian firms tend to adopt Western HRM style, they greatly lack the concrete action plans as well as the critical integrations for staff retention and effective increase of in-role and extra-role behaviors.

TABLE 10: EMPLOYEE TURNOVER RATE FOR EXECUTIVES 2002.

Source of Capital Ownership	Yearly Employee Turnover Rate for Executives (2002) (in percentage)				
	No. of Companies.	Average	Lower Quartile	Median	Upper Quartile

Source: MEF, 2003, pp. 35

It can be concluded that, despite the wide adoption of Western HRM practices, the retention and motivation strategies of Malaysian firms in this case study are still lagging behind the strategic HR practices used by foreign MNCs. This is partly due to their little recognition for close integration of business and HRM in attract, motivate, and retain a considerable number of high-performing HRs. On the other hand, it can also be argued that, while recognizing the long run benefit of strategic HR practices of those foreign firms, Malaysian firms in this study still chose to operate within their firm affordability. They also did follow cost reduction strategies that inhibit them from adapting more effectively to cope with societal changes in Malaysia. After all, most of its functional strategies in each department are nothing but protecting losses and lowering costs, which can simply improve some accounting data in these companies.

Based on the comparisons of the collected data, I found that the HRM practices in these Malaysian firms are less sophisticated or competitive that other counterparts from US, Europe, and Japan. However, it is never the intention of this study to imply that traditional work practices of these Malaysian firms are, in any way, less sound in organizational effectiveness, since types of such administrative HR practices used in Malaysian locals are still considered appropriate under their strategic contexts. In particular, the administrative HRM practices used in these local firms would be fitting into the overall business strategy of cost reduction pursued by them. In this sense, the links between HRM strategy and competitive strategy are maintained to a certain extent, and they have some advantages in competitions in Malaysian markets. Further, introduction of organizational changes that require careful design may disrupt their greatly emphasized economies of scale and profitability. Indigenous ways to attract, motivate, and retain talented HRs may have been highly effective several decades ago. The question is how Malaysian domestic firms respond well to the changing work values and competitive environments surrounding them, when Western and Japanese MNCs come to take leading initiatives in the market competitions in Malaysia.

Nevertheless, it is also necessary to keep abreast with the rapid social and economic changes by replacing outdated practices or more importantly, developing better practices. Offering fringe benefits that mainly adhere to legislation is no longer sufficient to attract, motivate, and retain talented HRs. It is particular true when unsatisfied parties exist. Even Company A, a Japanese MNC, had to go through massive changes to create congruent motivational effects after realizing its initial introduction of seniority practices from Japan that were then pertinent and effective in staff retention which eventually became a source of competitive disadvantages to them. Company A re-examined the role, focus, and function of seniority systems within the Malaysian subsidiary, and redefined its HR mission to shift from an administrative role to a strategic one that focused on business needs.

If they intend to create competitive advantage through its workforce, they need to refocus on training and recognize that well-directed investment in recruiting and training will yield far better long-term results than short-term job-specific training. These firms need to take more responsibility for enhancing talents within their own organization. It is a mere suggestion that these firms need to become more holistically responsive to the pace of change, if they intend to compete aggressively with rival firms to attract, motivate, and retain talented HRs in an increasingly turbulent environment. The first step could be the redefinition of staffing roles and required competencies in order to free up internal HR personnel from day-to-day administration activities and to utilize their talents for more value-added purposes. In order to stay competitive, Malaysian companies may want to reconsider the roles of their HR department within the organization.

## Conclusion

In an effort to exploring the distinctive features of HRM across companies with different country origins and cultural values, this paper has analyzed and compared SHRMSs used by five personal care companies that can attract, motivate, and retain talented HRs. Findings showed that significant differences in the HR practices across the five companies exist to attain strong organizational effectiveness. This paper also demonstrated that while a focus on competitive pay packages to attract, motivate, and retain talented HRs is clearly effective in the Malaysian workforce that highly desire monetary rewards, it is also important to combine with other strategic HR practices to further enhance retention strategy and organizational effectiveness as well as to meet various needs of potential talented HRs in Malaysian labor markets. Above all, this article showed the application aspect of well-integrated strategic HR practices – not just “what,” but also “how” to achieve closely integrated complementary HR practices that create synergies for firms.

### **End Notes**

The fieldwork is based on research and multiple interviews carried out in Kuala Lumpur, Malaysia from mid 2003 to early 2004. I would like to take this opportunity to acknowledge the contribution and generous support of all five companies that made the comparative study across MNCs of different country-origin possible and meaningful in the personal care industry.

# **Embracing Kaizen: Towards Improving Management Performance and Manpower Competitiveness**

*Juhary Haji Ali  
Reynaldo Gacho Segumpan  
Mohamad Zainol Abidin B. Adam  
Universiti Utara Malaysia, Malaysia*

## **Abstract**

The impact of “kaizen” on organizational parameters cannot be underestimated. The voluminous literature on this “continuous improvement” philosophy expounds on its positive impact on various spheres of the organization, be it business, corporate, or otherwise. This paper explores the myriad applications of kaizen in the organizational milieu. Specifically, the discussion converges on the impact of kaizen on certain organizational outcomes and how the management can play proactive roles in its development and ultimately, imbibe among employees the culture of continuous improvement. The flow of discussion begins with a review of the concept of kaizen, how it emerged in the research and business environment, and introduces kaizen gurus and their principles. In the final part of the paper, the authors discuss what the management can do to cultivate the culture of kaizen and make it thrive in the organization, with the end that kaizen becomes a personal philosophy and practice.

## **Introduction**

If it were not for change, a manager’s job would be relatively easy. Planning could be so simple because it is based on historical events where tomorrow would be no different from today (Robbins et al., 1999). In addition, decision-making would be very streamlined because the result of every alternative taken in decision-making could be predicted with almost certain accuracy. However, this is not the way things work. Today’s environment is full of uncertainty; market changes, changing workforce demographics, political and also social pressures and mostly certainly advancement in technology make today’s organization one of constant changes (Savery et al., 2000).

Organization in the global market place will, therefore, need to have tremendous and continuous improvements. A growing number of businesses are going multinational to strategically position themselves in global market and worldwide manufacturing operation. These new markets demands for new products to match specific consumer needs requiring customization of products or even altering an entire product line (Kumar and Harms, 2004). Consequently organization need to identify improvement and change opportunities in the working systems. However, organizational leaders thought change and improvement were an event (Kanter, 1991). However, change and improvement is now viewed as an ongoing process triggered by multiple variables (Grieves, 2000). It has become so discontinuous and transformational that it is leading to a distinct shift in the nature of managerial work (Doyle, 2000). Managers at all levels, but more specifically those at the middle level, must be constantly being reminded of their role and their influence in respect to organizational performance. Leading organizations spend 20 per cent of effort on formulating and 80 per cent on the implementation of change and the benefits are accrued from the ability to embrace change more quickly and effectively than competitors (Samson et al, 2000).

With this scenario, we can say that today’s competitive environments require organizational to pursue continuous improvement in their work process; continuous improvement requires effective managerial performance; effective managerial performance requires appropriate skills and behavior. Appropriate skills and behavior development are facilitated through appropriate and effective management development activities.

## **The Concept of Kaizen**

Kaizen or continuous improvement (CI) as it is casually translated in English, is an important key element in

Japanese management. This principle is often cited as one of the underlying principles in achieving organization efficiency and quality management. Boer, Berger, Chapman and Gertsen (2000) defined as "the planned, organized and systematic process of ongoing, incremental and company-wide change of existing practices aimed at improving company performance. Bessant, Caffyn, Gilbert and Harding (1994) defined it as a company-wide process of focused and continuous incremental innovation sustained over a long period of time. Masaki Imai (1986), the first well-known proponent of *kaizen*, who wrote *KAIZEN - The Key to Japan's Competitive Success*, outlined this Kaizen concept, its core values and principles, its relation to other concepts and the practices used in the improvement process. The practice of Kaizen is simple and straight forward, whereby, every member in an organization should improve their performance by continuously looking and implementing small changes in their everyday work processes. It also encourage individuals at all levels in the organization to identify problems and proposing solutions for a particular problem. In short, Imai claims that the ability to motivate employees to undertake small, incremental improvement to shop-floor activities constitutes to the gist of Japanese manufacturing excellence.

But Kaizen did not gain popularity in the United States until 1986 (Henricks, 1996), with the publication from Imai. Imai contended that by constantly seeking out small opportunities for improvement, Japanese companies were becoming much more superior than their American counterparts. The idea of this Japanese secret caught many American businessman by surprise. Hence, a closely related concept to Kaizen – Total Quality Management (TQM)-gained its popularity. In this relation, continues improvement is also one of the goals of TQM. However, TQM is quite technical, stressing on all kinds of tools and techniques ranging from array of charts to graphs (Henricks, 1996). However, Kaizen is more philosophical.

As Hendricks (1996) mentioned, Kaizen focuses on improving processes instead of results. In this case, a kaizen practitioner aim to improve the organization's decision making tools without necessarily trying to make a better decision on a matter encountered that day. He continued by saying that kaizen aims to improve systems and not people. In a Kaizen company, making a mistake is not an occasion to blame the person who made it. Instead, it is considered a chance to find out what is wrong with the process

Skymark (2005) suggested that Kaizen can be implemented in corporations by improving every aspect of a business process in a step by step approach, while gradually developing employee skills through training education and increased involvement. The principle in Kaizen implementation are:

- i. human resources are the most important company asset,
- ii. processes must evolve by gradual improvement rather than radical changes,
- iii. improvement must be based on statistical/quantitative evaluation of process performance.

Skymark (2005) concluded that Support throughout the entire structure is necessary to become successful at developing a strong Kaizen approach. Management as well as workers need to believe in the Kaizen idea and strive toward obtaining the small goals in order to reach overall success. Therefore, all members of an organization need to be trained in a manner to support this idea structure. Resources, measurements, rewards, and incentives all need to be aligned to and working with the Kaizen structure of ideas.

Brunet and New (2003) found that the form taken by *kaizen* within an organization may adapt over time, and reflects the changing environmental conditions. They also argued that *kaizen* allows for the management of complexity in the management of target-oriented operations. They illustrates their argument through the schematic model in Fig 1. The figure shows a system of four adjustment cycles in the planning and realization of strategic goals. Individual members perform their routine tasks under individual control (continuous) against production plans, internal team control (usually weekly) and external control by middle management (usually monthly) and being reinforced by team capabilities

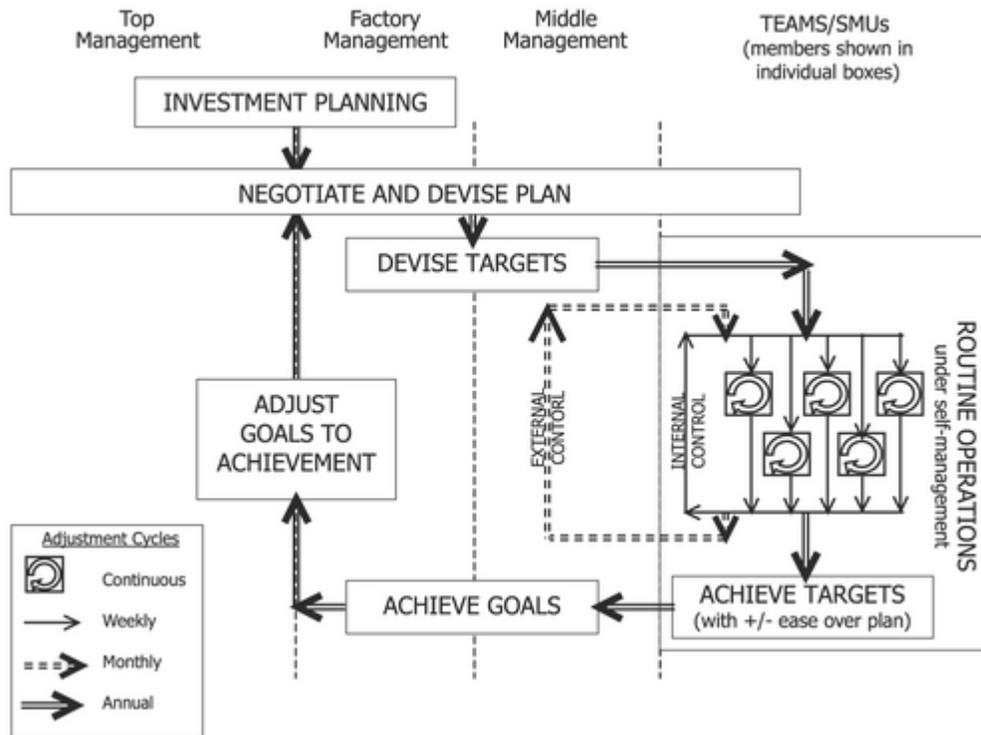

FIG. 1: KAIZEN FACILITATED ADJUSTMENT SYSTEM TO MAINTAIN OPERATIONS ON TARGET (ADAPTED FROM BRUNET AND NEW, 2003)

Brunet and New (2003) also cited that the concept of Kaizen is regularly being misinterpreted as either an endless improvements which emerge from the workers or as the mundane application of suggestion schemes and quality circles. They suggest that the concept of Kaizen focuses on three main points:

- i. Kaizen is continuous - which is used to signify both the embedded nature of the practice and also its place in a never-ending journey towards quality and efficiency
- ii. Kaizen is incremental in nature, in contrast to major management initiated reorganizations or technological innovation
- iii. Kaizen is participative, entailing the involvement and intelligence of the work force, generating intrinsic psychological and quality of work-life benefits for employees

Based on Japanese experiences, Berger (1997) described the characteristics of kaizen at two different levels. The first level he said, is concerned with the management improvement concepts that indicate a mind-set for the required management behavior, whereas the second level describes the practical outcomes for the workforce. In this relation, he also cited that the characteristics of an ideal kaizen lies on three main principles as follows:

- i. Principle 1. Kaizen is process-oriented. Before results can be improved, processes must be improved. Kaizen does *not* state that results are of minor importance, but rather that management attention should be directed towards creating sound processes since it is assumed that good results will follow automatically. The principle has at least two practical consequences for the improvement process. First, management's main responsibility is to stimulate and support the effort of organizational members to improve processes. Second, process-orientation calls for evaluating criteria which can monitor and bring attention to the improvement process itself, while simultaneously acknowledging its outcome

- ii. Principle 2. Kaizen is distinctive in its focus on small improvements of work standards as a result of an ongoing effort. The standard should be binding on everyone, and it is management's job to see that everyone works in accordance with the established standards
- iii. Principle 3. Kaizen *is* people-oriented and should involve everyone in the organization from top management to workers at the shop floor. In order for everyone to be involved, there needs to be a form and a content for ongoing improvements that make use of everyone's contribution.

Gondhalekar , Babu and Godrej (1995) conducted a study in India and uncovered a number of interesting features about factors to be considered for steering Kaizen mission in the company. They summarized these factors as follows:

- i. People with a strong and positive self-image are likely to make more and better continuous improvements in their working environment
- ii. Age is found to influence only stability and reach of benefit. The middle age phase of maturity appears to be giving confidence to experiment more heavily and find kaizen with wider reach of benefits.
- iii. People receiving recognition from management are found to bring up more original ideas and invite participation of more people. They are also seeking more self-development type of *kaizen*. This indicates that the need for recognition drives a search for originality and wider contribution in self-development oriented kaizen.
- iv. Those employees who are desk-bound have a better kaizen record due to the nature of their work
- v. Education is found to be a factor that enhance improvement orientation. They strongly recommend that organizations devote time and energy to provide for lifelong formal education for all employees in the organization.
- vi. Good communication ability is found to be essential in implementing kaizen. This is essential especially when they communicate for instructional purposes (Elsey and Fujiwara, 2000)
- vii. People with good reading habits are found to be more inclined to self-development and improvement.

They also suggested that, although employees are encourage to participate continuously in making improvements, restrictions, however, should be imposed during the process of making improvements. They outline two types of restriction as follows;

- i. The financial investment for making any improvement should not exceed US\$40.
- ii. Substantial financial rewards should not be extended to any employee for making an improvement, however much the monetary saving accruing from the improvements may be.

Gondhalekar and Karamchandani (1994) too agreed that the freedom for implementing improvement should also be check and monitored. This is to ensure that the empowerment given for making such improvement is not misused. They listed the conditions as follows:

- i. All changes and improvements made must be reported after implementation.
- ii. All existing rules and regulations must be followed while implementing improvements. If existing regulations require prior sanctions to be taken, then such sanctions must be taken in advance.
- iii. The improvements should be made with zero investment.
- iv. Monetary rewards are not given for the improvements. Non-monetary awards, like token gifts, and all kinds of recognition, are welcome and provided to those reporting good improvements. This is because monetary rewards stimulate jealousy and destructive competition.

The ultimate aim of any Kaizen implementation is to strive for customer satisfaction and involvement. Customers are the reasons why organizations exist. They bring revenue and profits to organizations. In this relation any improvements either in the product offered or in the service provide that does not meet their overall needs and expectations will be a total waste of time. In other words customer satisfaction (Jabnoun, 2001) and loyalty should therefore be the ultimate objective of any improvements made in the organization. In this respect, Jabnoun (2001) listed several driving values that impel people to be committed to customer satisfaction and hence, continuous improvement. These factors are as follows:

- i. **Respect:** Respect for individuals as a foundation for total quality improvement (Mehta, 1999). Respecting customers means listening to them, communicating with them kindly and making sure that our products or services offered match their levels expectations. As a result employees will be committed to improving their levels services to meet customers' varying needs and wants.
- ii. **Responsibility:** Highly responsible people are innovative and committed to the performance of their assigned jobs, comply with orders and directives of superiors, and do not swerve away from doing what they are supposed to do by any distraction. People with self-instilled responsibility are worthy of being empowered by their superiors. Their commitment to their jobs and to their customers enables them to effectively pursue continuous improvement
- iii. **Empathy:** Empathetic people strive to satisfy their customers. They will have a sense of guilt and outrage for any failure to meet expectations of their customers; external or internal. To delight customers, continuous improvement efforts should be carried out by empathetic people. These type of employees will go beyond what is within their responsibility to delight their customers.

## **Kaizen In Action**

Bodek (2002) cited some examples of Kaizen at work which he considered as an amazing results generated when employees think the kaizen way

- i. At the Haneda Airport in Tokyo, an employee painted a bright yellow arrow on the floor to show travelers which direction the luggage carousel moves. This was a helpful aid for travelers using the airport and save time in searching for luggage.
- ii. At Canon in Tokyo, a worker put wheels on a bucket so that employees could pass parts without having to go back and forth between workstations.
- iii. At Nippon Steel, in Kimitsu, Japan, steel moves along a conveyer belt. When the steel leaves an oven, a door opens, tons of hot air are lost, and a great deal of energy is needed to reheat the oven. A worker shopping off duty noticed that when he entered a department store there was no door, only a curtain of hot air. He told his supervisor about it and got permission to install a curtain of hot air in the plant.
- iv. In Wolverton, England, a number of employees at British Rail Maintenance Ltd. weren't using protective screens while working with arc welds. Two employees noticed that workers who neglected to use the screens were getting flash eye, that is, a temporary blindness caused by looking at the arc welding. Those employees developed a small portable screen that was more comfortable for welders to use.
- v. In Dartford, South London, employees at British Rail are issued a new uniform and new leather belt each year. One employee suggested that the belt should be issued every other year and this action will saved the company £10,000 (US\$15,000).

Kaizen is very evident at Toyota Motor Manufacturing Kentucky (TMMK) in Georgetown, Kentucky. Kaizen implementation has helped Toyota become one of the world's premier automobile companies (Metalworking Digest, 2002). It is a corporate-wide operating philosophy that Toyota Motor Corporation has adopted, especially in its global production facilities. It enables Toyota to decreased labor costs, increased productivity, and enhanced product quality. In their quest for continuous improvement, the company installed a new shelf converter drawer system that can be easily inserted into existing standard shelving. This new system provides improved organization, space utilization, ease of access, and improved aesthetics. Because of the increased organization and efficiency, employees can quickly retrieve items, thereby reducing foot traffic in the production area and increasing overall safety. The Shelf Converter Drawer System has greatly improved the company's ability to meet overall production schedules.

Hara (2002) found that at Suzuki Motor Company, the new No. 3 assembly plant in Kosai which was newly installed, had reduced work stations on its No. 1 line from 150 to 115 by such measures as combining window washing, brake fluid, steering fluid and long-life coolant injection into a single process. He also found that

an Honda company, in overhauling its No. 1 and No. 3 Suzuka lines in the summer of 2000, cut manpower requirements and utility costs by one-third and one-fourth respectively. It made these gains through the introduction of lighter, more versatile manufacturing equipment along with new labor-saving processes including expanded usage of modules.

Brunet and New (2003), in their observations made in six Japanese companies namely Suzuki, Toyota Motor Kyushu, Honda, Sumitomo Metal Industries, Somic Ishikawa and Japan Casting and Forging Company, found out that Kaizen implementation are widely practiced in these companies but various important differences were noted such as:

- i. the work team make up was similar, but the focus of kaizen varied from the individual to much larger groups.
- ii. several companies claimed that kaizen was voluntary while others enforced mandatory participation.
- iii. the split was different when it came to payment for time spent doing *kaizen*; some companies offered no compensation, while others paid for the time spent on *kaizen* outside working hours
- iv. Some companies placed more emphasis on suggestion systems while other companies looked towards small group activities.
- v. the reward and incentive systems for *kaizen* varied from direct rewards to nominal prizes in some companies.
- vi. involvement of team members in negotiation in all the six companies of the annual targets ranges from high to nil.

Kaizen can work in companies of all sizes, in functions from sale to finance. On an average, a Japanese company receives 24 improvement ideas in writing per employee each year while in the United States, companies received on an average less than one idea per employee per year (Bodek (2002). This concept holds that small improvements, made continuously over a long period of time, can radically reshape and improve processes. In Paine & Associates, a public relations firm in Costa Mesa, California, USA, with a series of minor changes over a period of time, it built a much improved process and the agency was rated one of the country's 10 most creative by an industry journal (Hendricks, 1996).

At this company, the first change was to invite more people in a brainstorming session. Next, the company expanded its roster to include people from unrelated departments. Paine also began to hold meeting off-site to obtain different approaches. In this relation, the company, instead of trying one thing and discarding it when it proved not to be the perfect solution, the company kept using everything that showed it had some worth.. In other words, the company does not replace one technique with another.

Alexander Doll Company in New York City, achieved dramatic results by applying kaizen principles to the company ailing line of collectible dolls. Beginning with its small production line for baby dolls, the company set up cross functional team to evaluate problems with the line. They found out that operations were spread over three floors, causing extra handling that wasted time and damage the dolls. The batch process being used caused hundreds of dolls in various stages of completion to collect at each operation. They then physically moved the operation and combined everything in one location on one floor.

The flow of the product was designed so that each operation was carried out as each doll moved through the process. As a result of the improvements made, the distance each doll traveled from the beginning to the end of the process was reduced from 630 feet to 40 feet. The time required to complete a doll went from 90 days to 90 minutes. The number of unfinished doll pieces was reduced from 29,000 to 34. The square footage used for the line was reduced from 2,010 to 980. And productivity increased from eight dolls per person per day to 25 (Maynard, 1996).

## **Managing Continuous Improvements in Organizations**

To become more competitive, organizations and the people that operate them must break old habits and develop new

behaviors and processes that make them more effective and efficient (Hill, 2000). Thus, the name of the new game is not only improvement but continuous and sustainable improvement and change, in the search of competitive advantage. To this end, most modern organizations are presently engaged in various organizational improvement efforts aimed at improving performance. New strategies are being considered which require different organizational skill sets or behaviors. The complexity involved in implementing new strategies has increased and the time available to managers to respond to competitive threats and implement changes has shortened. They must not only be fast but most important is be first.

Though we see that change and improvement is taking place around us, the catalysts that set it in motion often remain unclear (Longenecker and Fink., 2001). Improvement can be broadly defined as "making or becoming different" or "a transition from one state, condition, or phase to another" (The Oxford Compact Dictionary & Thesaurus, 1997). However, in the context of organizational improvement, others have noted that any definition of improvement is potentially problematic (Kemelgor, Johnson and Srinivisam 2000).

It can therefore be suggested that organizational improvement encompass ongoing initiatives that are directed from the top to the bottom of the organization and has a profound effect on the depth of the change effort (Appelbaum, Pierre and Glavas 1998). Improvement can also be understood in a temporal context. Rapid change might occur in response to dramatic or urgent situations. As Fishman (1997) pointed out, "in a world that is changing with incredible speed, ambiguity is a constant."

Robbins and Coulter (1999) identified that change and improvement essentially falls into 3 categories as shown in Fig 2. These categories are structure, technology and people. Changing structures include any alteration in authority relations, coordination mechanisms, degree of centralization, job redesign or similar structural variables. Changes in structures of the organization ordinarily follow changes in strategy (Clardy, 2001). Logically, the organizing function follows the planning function since structure is a means for achieving the goals established through planning. Structural change attempts to improve performance by altering the formal structure of task and authority relationship. At the same time, the structure of an organization creates human and social relationships, which will become ends for the members of the organization. These relationships, when they have been defined and made legitimate by management, introduce the element of stability.

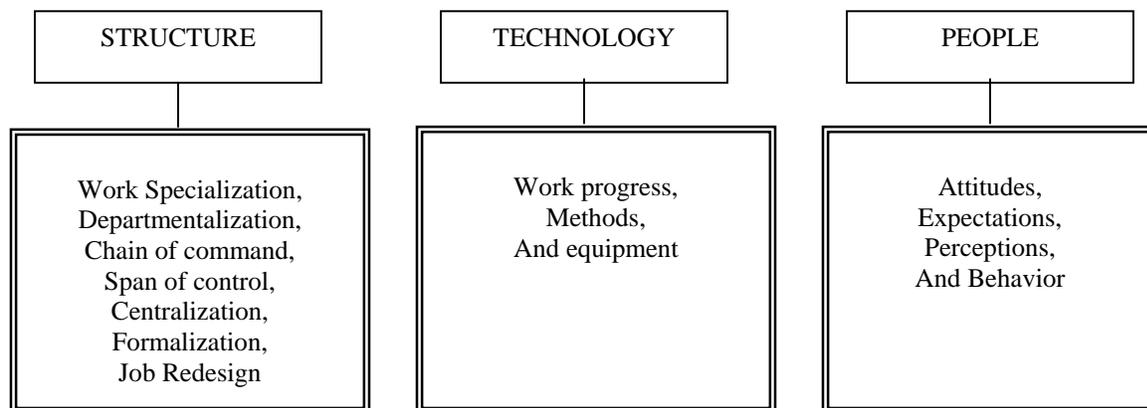

FIG. 2: THREE CATEGORIES OF IMPROVEMENT AND CHANGE  
 ADAPTED FROM: Robbins, S.P., & Coulter, M. (1999)

Changing technology includes any application of new ways to transform resources into the product or services. It encompasses modifications in the way the work is performed or the methods and equipment that are used. In the usual sense of the word, technology means new machines but we should expand the concept to include new techniques with or without new machines. Therefore, from this perspective, the work improvement methods of

scientific management such as automation and computerization can be considered as technological breakthrough (Lavin, 1997).

Lastly, changing people refers to the changes in employee's attitudes, expectations, perceptions and behavior. The major objective is to enhance the capacity of individuals to perform assigned tasks in coordination with others. In this relation, change could also be perceived in terms of individuals as agents who facilitate organizational transformation. It must be recognized that individuals are the critical catalysts for organizational change where real change occurs through the initiative and creativity of people, not hardware or systems.

Therefore, in organizational improvements, the "dynamics (content and format) of management development" must change (Longenecker and Fink., 2001) to help managers recognize their changing and revolving roles. Managers must also be assisted to acquire the skills needed to get their jobs completed but also to function more effectively and efficiently (Robbins and Coulter, 1999).

In addition, the paradigm for management development is also evolving in rapidly changing organizational. This evolution is being driven by the changing needs of both organizations and managers alike (Kemlelgor, Johnson and Srinivisam 2000). It is becoming apparent that organizations need managers who are capable of adapting themselves to change in terms of their skill and capability and modus operandi for leading others to achieve organization's goal.

## **Managerial Roles in Implementing Continuous Improvements**

Besides the function of planning and implementing, integrating and coordinating, leading and controlling as the main functions in managerial roles, rapidly changing organizations require:

- i. *New and different ways of thinking*: Makers of change or change masters are not necessarily creative than other people but they are more willing to approach problems from new angles. Managers in a rapidly changing organization should step outside traditional thinking, move across fields and bypass what everybody else is looking at to find possibilities for change.
- ii. *The acquisition of new business skills* (Longenecker and Fink, 2001): Determining the organization success is the key factor for all managers. At the very least managers need to understand the organization's situation well enough to know what is more important to competitive success and what is less important (Thompson and Strickland., 1998) and then acquire the skills needed to accomplish the task. This thinking is based on the premise that customer satisfaction, employee satisfaction and impact on the society are achieved through leadership driving policy and strategy, people management, resources and processes, leading ultimately to excellence in business results (Shergold and Reed., 1996).
- iii. *The development of different management skills and leadership styles*. Managers are people who do things right while leaders are people who do the right things. The difference may be summarized as activities of vision and judgment, which facilitate effectiveness as a leader, versus activities of mastering routines, which facilitate efficiency as a manager. A successful leader in the organization is a person who inspires, by appropriate means, sufficient competence to influence a group of individuals to become willing followers in the achievement of organizational goals. These leaders are creating new ideas, new policies or new procedures and have the reputation for bringing change to the basic operational foundations of their organizations. They are viewed as "creative change agents" and not simply as masters of basic routines (Darling, 1999).

Thus, the degree to which managers are also leaders relates to how they perform their roles. Those who are successful will be viewed as leaders, not just managers. This is to say that they are concerned with their organization's success dimensions in all respects. A real test of successful leadership in management lies in giving, to the greatest extent as possible, opportunities to others (Darling, 1999) act as resource allocators, coaches, mediators, controllers and negotiators (Chapman, 2001) within the situational context of the organization.

The competitive environment - societal, economic, global and technological - are changing and requires organization to change as well. When organization changes it requires effective managerial performance; effective managerial performance requires appropriate skills and behavior. Appropriate skills and behavior development is

facilitated through appropriate and effective management development activities (Longenecker and Fink, 2001). And different management development activities that is planning and implementing, integrating and coordinating, leading and controlling, may be required depending on which skills and behaviors are in most demand of development by the organization at a particular time.

## **Expectations Of Employees: Are They Getting What They Need To Make Improvements?**

In rapidly changing organizations, work and production processes change, reporting relationships are modified, job responsibilities are enriched, usage of technology increases resulting in a more self-managing and team-oriented employees. This led us to ask few questions about management development in rapidly changing organizations:

- What types of skills do managers need to handle change and how do they manage them?
- Are managers obtaining the experiences they need to be effective and efficient in rapidly changing organizations?
- What specific management practices are useful to improving management performance in rapidly changing organizations?

In their study on ten different, large US organizations experiencing significant levels of organizational change, Longenecker and Fink (2001), obtained top ten management development methods that managers considered to be most important to improving their performance in times of rapid change. The ranking of these management development methods is shown in Table 1.

In the top tier (cited by more than 75% of the managers) were three management development methods for improving performance which managers considered critical and top priority: *help them clarify their roles, goals and performance expectations* (85%) in their changing organizations, *give ongoing performance measurement and feedback* (77%) and *being mentored by senior managers* (75%). The importance placed on these three items suggest that in times of rapid organizational change, managers need better and clear direction, guidance and positive feedbacks to improve their effectiveness and efficiency.

Four methods appear in the second tier of importance (cited by more than 60% of the managers) for improving management performance. These methods included: formal career planning discussion (64%); challenging job assignments (62%); purposeful cross-training experiences (61%); and formal performance appraisal and review (60%). Each of these methods provide opportunities to improve their problem-solving and conceptual skills, improve their understanding of the organization as a total system, and highlight areas they need to improve or become more proficient.

Other top ten rankings methods were visiting other facilities and departments (56%); increased contact with external/internal customers (54%); special assignments like problem-solving teams or task forces (49%); and 360 degrees feedback systems (49%). The second half of the rankings are mentoring junior managers (46%) and using computer technology and networks (42%) as tools to improve performance. Managers also believed that involvement with professional associations (40%); pursuing additional college education (39%); attending outside seminars and workshops (35%); and, being part of a career development system (29%) also do have substantial benefits. Finally, near the bottom of these rankings are in-house seminars and workshops (27%); serving as an internal trainer/facilitator (26%); and outside readings assignments (17%).

TABLE 1: RANKING OF MANAGEMENT DEVELOPMENT METHODS FOR IMPROVING MANAGEMENT PERFORMANCE

Management Development Methods	What Managers Want (%)	What Managers Get (%)	The Difference (%)
Clarify Roles, Goals and Performance Expectations	85	41.6	43.4
Ongoing Performance Measurement And Feedback	77	35.7	41.3
Being Mentored By Senior Managers	75	16.6	58.4
Formal Career Planning Discussion	64	22.3	41.7
Challenging Job Assignments	62	46.2	15.8
Purposeful Cross Training Experiences	61	16.9	44.1
Formal Performance Appraisals and Reviews	60	41.1	18.9
Visiting Other Facilities	56	28.2	27.8
Increased Contact With External/internal Customers	54	34.9	19.1
360 Degrees Feedback Systems	49	18.1	30.9
Special Assignments	49	36.3	12.7
Mentoring Junior Managers/Supervisors	46	23.2	22.8
Computer Technology and Networks	42	39.7	2.3
Involvement with Professionals Associations	40	21.9	18.1
Pursuing Additional Educations	39	27.3	11.7
Outside Seminars and Workshops	35	44.8	-9.8
Career Development Systems	29	13.2	15.8
In-house Seminars and Workshops	27	41.1	-14.1
Serving As an Internal Trainer/Facilitator	26	17.3	8.7
Outside Reading Assignments	16	19.9	-3.9

NOTES: Statistical significant differences at the 0.05 level. N=433 managers

Adapted from: Longenecker et al. (2001)

It is interesting to note that all of the methods which included "formal" management development education such as formal college courses, in-house seminars and workshops, outside assignments; or involvement with professional were considered the least effective methods in improving management performance in rapidly changing organizations. Longenecker and Fink (2001) also pointed out that needs of these managers were not adequately addressed in order for them to improve their performance. For example, of the 20 management development methods identified, managers are receiving less than they desire in 17 cases. The other remaining three cases, the data revealed that organizations are investing resources in providing management development practices that managers in rapidly changing organizations do not necessarily find helpful for improving their performance.

On an overall basis, it is also noted that of the top ten development practices that managers have cited as most important in helping them improve their performance, all ten are being offered on average at levels. This suggest that managers are not well exposed to those management practices they most feel they need to improve their

performance. In other words, manager's needs are not being adequately addressed. They are not given what they desire to improve their performance. This might be the explanation why managers frequently having trouble in improving their performance in rapidly changing organizations.

The findings of the study made by Longenecker and Fink (2001) point toward the dynamic and complex nature of management development. In rapidly changing organizations, work and production processes change, reporting relationships are altered, job responsibilities expand, technology use increases, and people are called to become more self-managing and team-oriented. These changes place significant pressure on managers who must get results in this environment in shorter time periods, with less formal authority and fewer resources.

## Conclusion

The competitive pressure received by today's business environment is causing many organizations to make fundamental improvements not only in their operations but also in the way they interact with their customers. This means that continuous improvement effort, re-engineering, downsizing, working with a diverse workforce, culture change, team building and implementation of new technology is a critical respond to the above issue. Managers who are facing and implementing these programs require a much more diverse range of technical, interpersonal/communication, conceptual, diagnostic and political skills than ever before to successfully cope with the demands and expectations placed on them. As a consequence, extensive training and retraining of managers is vital if these changes are to be effectively implemented.

Improvements in strategy, structure, and work processes often leave managers unsure of their roles and related responsibilities. It can also lead to confusion about the roles and responsibilities of others within the organization. Bringing employees aboard the changing organization, assigning them a new job and expecting them to perform up to new standards, when they have no idea what those standards are or what their roles are, is unfair, unrealistic and counterproductive (Ziglar,1998). If employees are to serve as the drivers of improvement efforts, they must understand where the organization wants to go and how to achieve that vision. Only with a clear understanding of their role can employees develop strategies for implementing a new business project or change effort. Employees cannot be effective if they experience roles ambiguity. Perhaps this is why clarifying roles, goals, and performance expectations was the most frequently cited among those management development methods seen as important in improving manager performance in rapidly changing organizations.

In organizations experiencing intense competition, employees' effectiveness at anticipating, responding to, and implementing improvements in organizations can determine an organization's ability to compete. Organizational success is almost always a function of the effectiveness of an organization's employees. Thus, improving the effectiveness of organization's management development practices can be a distinctive source of competitive advantage in the years to come. The most encouraging aspect is that this competitive advantage can be expanded without a huge capital and technology but what is really needed is to help managers improve and a commitment to improve current management development efforts within the organization.

Yes, it takes everyone involved to make an organization successful; from CEO down to managers to the cleaning crew. Each person's job is important and each person has the power to make a positive or negative difference. Whether you are in the top management or you fill in part time for temporary service, you have a choice to make everyday of the week. Then choose to do good things that nurture your organization.

# Employee Stress: The Case of Malaysian Workforce in Health Care Service

*Reynaldo G. Segumpan  
Juhary Haji Ali  
Universiti Utara Malaysia, Malaysia*

## Abstract

Stress has been studied extensively in the business industry. In Malaysia, especially in the academic milieu, though, the need for more exploratory researches seems to be not fully explored. Being a pandemic concern, the necessity for casting attention on stress is as important in the educational setting as it is in the business environment. This paper looked into the work stress among the health personnel of Universiti Utara Malaysia, Sintok, Kedah. It also examined work stress across (a) gender, (b) age, (c) marital status, (d) educational attainment, and (e) length of service. The paper also explored on the implications of work stress on employee welfare development. Data were gathered using a Work Stress Questionnaire, and were analyzed employing the SPSS computer software. All analyses were set at 0.05 significance level. Findings revealed that as a whole group, the respondents experienced a “moderate” level of work stress. Potential sources of stress were Terms of Employment, Supervisor and Co-Worker Support, Job Demands, Decision Authority, and Skill Discretion. Work stress levels did not significantly vary according to gender, age, marital status, educational attainment, and length of service. Implications of findings are elucidated.

## Introduction

Stress may have been talked about in a myriad of discussions and in a string of researches. Despite the abundant investigations on stress and stress-related concerns, researches continue to explore its correlates and consequences as well as develop programs that reduce its health-related impact.

Whether one likes it or not, stress is an occupational or industrial reality and job issue that has permeated in management literature, especially in the context of work. It has become a major focus of organizations across types and cultures, owing to its negative and debilitating impact on employees' efficiency and productivity. For instance, in the UK, Cooper and Cartwright (in Rodham and Bell, 2002) pointed out that stress-related absences were 10 times more costly than other industrial relations disputes put together; in terms of sickness, absences, premature death or retirement, stress costs the UK economy a staggering 2 billion pounds per year. Likewise, Visser, Smets, Oort, and de Haes (2003) also cited a case in point of illnesses among Dutch physicians which prompted disability insurance companies to increase premiums by up to 30%.

According to Kivimaki and colleagues (2002), attention should be paid to the prevention of work stress because of its adverse effects on health, particularly the risk of cardiovascular disease such as hypertension, high concentrations of low density lipoprotein cholesterol, lowered vagal tone, and impaired fibrinolytic capacity. Johnson and Indvik (1996) said that approximately 100 million working days are lost each year because employees cannot face going to work. Bailey (in Stevenson, 2000) asserts that stress now accounts for more lost working days in the UK than industrial action. These examples may suffice the statement that stress affects appallingly personal health and job efficiency, among others. Stevenson (2000: 1) clearly states:

It is certainly conceivable that many stress-related absences – especially those of only a few days' duration – may be attributed to other, more mundane, causes. This is because stress does not usually manifest itself as a single easily identifiable set of symptoms; indeed many victims may not even realize that they are suffering stress at all.

The above assertion implies that stress consequences can sometimes be subtle. It can manifest itself by certain physiological problems like nausea, headache, irregular sleep patterns, and the like. In a business culture which puts more pressure on the personnel to succeed, says Grout (1994), it is vital to control and manage stress, like maintaining a balanced diet, cutting down on smoking, having exercise routines, and on the general scale, taking

good care of personal health. For Rojas and Kleiner (2000), positive thinking is an important tool to keep stress away.

Undeniably, the issue of stress in the work environment still creeps into the managerial agenda of employee development. It is obvious that if the workers are not given adequate attention, their safety and health in the organization will be at stake. As Ben-Bakr, Al-Shammari, and Jefri (1995) noted, stress is a major factor for absenteeism, poor morale, high accident and turnover rates, dwindling productivity, and increased company medical expenses.

The level of work stress among health workers of Universiti Utara Malaysia (UUM) was looked into in this paper. The health personnel of UUM, just like any other workers, are also worthy of research attention with regard to stress studies such as the present one. These personnel are undoubtedly playing roles in the university, with special mention to their contribution towards the health development of the university's workforce and students.

Through the findings of this study, the administrators and policy-makers would have baseline information on the level of work stress of personnel who are involved in the health care services in the university. These bits of information might lead to some restructuring of jobs or terms and conditions to cater to employees' suitability in performing the work vis-à-vis the possible amount of stress associated with the job. Stress-reduction programs may also be carried out depending on the extent of the work stress experienced by the respondents.

The benefits of the research may also be extended to the participants, whose awareness of their personal or individual stress level might be of great use for them for coping purposes.

## **Objectives of the Study**

The main purpose of this study was to determine the level of work stress among the staff at the Health Center of Universiti Utara Malaysia, Sintok, Kedah, Malaysia. It also examined work stress of respondents when grouped by (a) gender, (b) age, (c) marital status, (d) educational attainment, and (e) length of service. Finally, the study looked at how work stress would have implications to employee welfare development.

## **Methodology**

### **Research Design and Instrument**

This research was descriptive-correlation in nature utilizing all the staff at the Health Center of Universiti Utara Malaysia (UUM), Sintok, Kedah, Malaysia as the target population. Of the questionnaires distributed, only 68 percent were usable for analysis.

In assessing work stress, a Work Stress Questionnaire (WSQ) devised by several independent researchers namely, Karasek, Smulders, de Winter, Grundemann, Dhondt, Houtman, Bloemhoff, Dhondt, and Terwee (in Kompier and Levi, 1994) was used in the study. This questionnaire was also utilized in the study of Yeap, Bathmavathy, and Ifa (2002) of government hospital employees in the state of Kedah, Malaysia. To facilitate better understanding of the items, a Malay translation was provided. Three experts on language and on translation did the Malay version of WSQ.

WSQ consists of 38 items, answerable by "yes" (1 point) or "no" (0 point). Of this number, six (6) items were negatively stated, and the rest, positively stated. Due to the bipolar items, a reverse in scoring was done; that is, a positive statement with a "yes" response would be given 1 point while a "no" response, no point. On the other hand, a negative item with a "yes" response would not be given a point while a "no" response would receive 1 point. The higher the mean score (minimum = 0, maximum = 38), the higher would be the level of work stress.

In this study, however, WSQ was modified into a 5-five point Likert scale, with responses ranging from "always" to "never". Scoring was similar to the original format, where "always" received 5 points for a positively stated item and 1 point for a negatively stated item; "never" received 1 point for a positively stated item and 5 points for a negatively stated item.

WSQ has a total of five (5) sub-dimensions with the following number of items: (a) Job Demands – 9 items (max. score = 45), (b) Decision Authority – 8 items (max. score = 40), (c) Skill Discretion – 6 items (max. score =

30), (d) Terms of Employment – 7 items (max. score = 35), and (e) Supervisor and Co-Worker Support – 8 items (max. score = 40).

The WSQ was also pilot-tested to determine its suitability in the local setting. The overall Cronbach alpha was 0.893, and each sub-dimension generated the following Cronbach alpha coefficients:

- (a) Job Demands – 0.845
- (b) Decision Authority – 0.791
- (c) Skill Discretion – 0.805
- (d) Terms of Employment – 0.901
- (e) Supervisor and Co-Worker Support – 0.925

To determine the level of work stress for each sub-dimension, the researchers devised arbitrarily the following scale based on the minimum and maximum scores, as presented in Table 1.

TABLE 1: MEAN SCORES AND VERBAL DESCRIPTION FOR EACH SUB-DIMENSION OF WORK STRESS

Sub-Dimension	Range of Mean Scores	Verbal Description
(1) Job Demands (nature and volume of expected work)	33.00 & above	High
	21.00 – 32.99	Moderate
	20.99 & below	Low
(2) Decision Authority (freedom to determine what, when, and how to perform a task)	29.35 & above	High
	18.67 – 29.34	Moderate
	18.66 & below	Low
(3) Skill Discretion (personal discretion required on a task)	23.00 & above	High
	15.00 – 22.99	Moderate
	14.99 & below	Low
(4) Terms of Employment (conditions on employment like vacation arrangement, job security, career development, promotion)	18.67 & above	High
	9.33 – 18.66	Moderate
	9.32 & below	Low
(5) Supervisor and Co-Worker Support (workplace atmosphere and relationship between supervisors and co-workers)	23.00 & above	High
	15.00 – 22.99	Moderate
	14.99 & below	Low
OVERALL WORK STRESS LEVEL	139.34 & above	High
	88.67 – 139.33	Moderate
	88.66 & below	Low

### Data Collection and Analysis

Permission was first obtained from the Director of the Health Center of the university. The Director examined the WSQ and assessed its suitability to the target respondents. After about a week, the researchers were granted approval to gather the data.

Assistance was solicited and the questionnaires were distributed and collated by staff assigned by the Director. Gathering of data took about two weeks. The information obtained were then tallied, tabulated, and analyzed using the SPSS computer software, set at 0.05 significance level.

## Findings

### Profile of Respondents

There were more female respondents (52.20%), but their proportion with the males (47.80%) was almost similar. The respondents were almost in their forties, their mean age being 38.69 years (median = 36.50). The youngest respondent was 21 years and the oldest was 55 years.

Two-thirds (65.20%) of them were married; almost half (47.80%) possessed Sijil Pelajaran Malaysia or SPM/Sijil Tinggi Pelajaran Malaysia or STPM (Malaysian Certificate of Education/Malaysian Certificate of Higher

Education), and about one-fourth (21.70%) had Diploma/Certificate qualifications. A few of them had other qualifications (13.00%) and Bachelor's degrees (8.70%).

On the average, the respondents had a working experience of 9.79 years, with a median of 8.00 years. The shortest length of work was 1 year, and the most senior of them had 30 years of working experience.

#### Level of Work Stress

Table 2 shows the work stress of respondents as a whole and when grouped by sub-dimensions of work stress. As shown in the Table, the respondents obtained an overall mean score of 119.65, which fell in the "moderate" work stress category.

TABLE 2: WORK STRESS LEVELS OF RESPONDENTS

Work Stress Sub-Dimension	Mean Score	Verbal Description	Standard Deviation	Min. Score	Max. Score
(1) Job Demands	29.15	Moderate	4.77	23.00	41.00
(2) Decision Authority	24.84	Moderate	6.20	14.00	36.00
(3) Skill Discretion	18.10	Moderate	4.17	12.00	26.00
(4) Terms of Employment	19.05	High	8.37	7.00	35.00
(5) Supervisor and Co-Worker Support	29.59	High	4.58	22.00	36.00
Overall Work Stress Level	119.65	Moderate	20.52	92.00	166.00

Looking at the spread of overall mean scores, the lowest mean score generated was 92.00 ("moderate") while the highest mean score was 166.00 ("high"). The overall standard deviation was 20.52, suggesting that the respondents were heterogeneous in their views on the work stress they experienced in their workplace.

Across the sub-dimensions of work stress, the findings revealed that the respondents had "moderate" work stress in terms of Job Demands (mean = 29.15), Decision Authority (mean = 24.84), and Skill Discretion (mean = 18.10). However, they expressed "high" work stress with regard to Terms of Employment (mean = 19.05) and Supervisory and Co-Worker Support (mean = 29.59).

In order to identify specific components of the job that contributed to high work stress, individual items of WSQ were examined. As found, those that indicated relatively "high" work stress levels were as follow:

- (a) Job Demands:
  - "My job requires working very hard." (mean = 4.57)
  - "My job requires working very fast." (mean = 4.41)
  - "My job is very hectic." (mean = 3.78)
- (b) Decision Authority
  - "I can determine the order in which my work is to be done." (mean = 3.59)
  - "I can determine when a task is to be done." (mean = 3.50)
- (c) Skill Discretion
  - "My job requires a high level of skill." (mean = 4.04)
  - "My job requires that I learn new things." (mean = 3.74)
  - "My job requires me to be creative." (mean = 3.35)
- (d) Terms of Employment
  - "In five years, my skills will still be valuable." (mean = 3.35)
- (e) Supervisor and Co-Worker Support
  - "The daily management under which I work is good." (mean = 4.26)
  - "The atmosphere at the workplace is good." (mean = 4.13)
  - "The daily management gives me enough support in my work." (mean = 4.09)

### Work Stress Level by Demographics

In terms of gender, the data in Table 3 show that on the overall work stress, the female respondents experienced a “high” (mean = 128.83) level of work stress while the males had “moderate” (mean = 117.11) level of work stress. The difference, however, was not statistically significant when analyzed using a t-test ( $p = 0.294$ ).

TABLE 3: WORK STRESS AMONG RESPONDENTS BY DEMOGRAPHIC VARIABLES

Demographics	Job Demands	Decision Authority	Skill Discretion	Terms of Employment	Supervisor and Co-Worker Support	Overall Work Stress Level
(1) Gender						
Male	30.00(M)	23.00(M)	16.78(M)	18.44(M)	29.50(H)	117.11(M)
Female	28.44(M)	28.00(M)	19.67(M)	21.50(M)	30.50(H)	128.83(H)
(2) Age						
Younger (<36)	30.86(M)	24.71(M)	18.00(M)	18.57(M)	31.25(H)	122.83(M)
Older (36&>)	28.17(M)	27.50(M)	20.00(M)	24.67(H)	29.71(H)	129.17(M)
(3) Marital Status						
Single	27.67(M)	28.50(M)	19.67(M)	22.50(H)	30.00(H)	131.00(M)
Married	28.54(M)	26.08(M)	19.31(M)	21.77(H)	30.67(H)	125.92(M)
(4) Educational Attainment

Legend: M = Moderate; H = High

Note: The t-test and ANOVA analyses were not statistically significant at 0.05 alpha ( $p > 0.05$ ).

Across various sub-dimensions of work stress, both the male and female respondents had “moderate” work stress in terms of Job Demands, Decision Authority, Skill Discretion, and Terms of Employment. However, both groups expressed “high” work stress with regard to Supervisor and Co-Worker Support. When the differences in mean scores across the sub-dimensions of work stress were analyzed, it was found that all the t-values were not significant at 0.05 significance level ( $p > 0.05$ ).

For comparison purposes with regard to age, the respondents were arbitrarily grouped into two: the younger and the older groups. The median age (36.00) was used as the point for categorizing respondents: those that were in the median level and above were considered “old” while those lower than the median were deemed “younger”. Based on the analyses, it was revealed that on the overall, both the younger and the older groups had a “moderate” level of work stress. Except for Supervisor and Co-Worker Support (“high”), both age groups had a “moderate” level of work stress in Job Demands, Decision Authority, and Skill Discretion. As regards Terms of Employment, the older group had a “high” (mean = 24.67) work stress level and those in the younger group had a “moderate” (mean = 18.57) work stress. When all the mean scores were tested statistically, it was noted that there were no statistically significant differences in the differences observed ( $p > 0.05$ ).

With regard to work stress of respondents grouped by marital status, both the single and married respondents expressed “moderate” work stress in terms of Job Demands, Decision Authority, and Skill Discretion. On the other hand, both groups revealed a “high” level of work stress with regard to Terms of Employment and Supervisor and Co-Worker Support. As a whole group, the single and married respondents experienced “moderate” work stress. The t-test was employed to determine if the differences in mean scores were significant at 0.05

significance level. The findings showed that regardless of marital status, no statistically significant differences were noted in the respondents' levels of work stress ( $p > 0.05$ ).

Across educational attainment, the overall work stress level of respondents was found to be "moderate," a trend which was also shown by all groups of respondents grouped by educational attainment with regard to Job Demands and Skill Discretion. In terms of Decision Authority, only those with Bachelor's degrees (mean = 30.00) experienced "high" work stress level while the other groups had "moderate" work stress. With respect to Terms of Employment, those with SPM/STPM expressed "moderate" work stress while the other groups had "high" work stress level. In terms of Supervisor and Co-Worker Support, all groups of respondents having various educational attainment had a "high" work stress level. Contrary to expectations, the ANOVA did not indicate any statistically significant differences in the mean scores across educational attainment groups at 0.05 significance level ( $p > 0.05$ ).

In terms of length of service, "moderate" levels of work stress were observed among those with shorter (less than 8 years) work experience and those with longer (8 years and above) years in work as regards Job Demands, Decision Authority, and Skill Discretion. Both groups, however, experienced "high" work stress in terms of Supervisor and Co-Worker Support. With regard to Terms of Employment, the "shorter" group had "moderate" (mean = 17.13) work stress while the "longer" group had "high" (mean = 23.57) work stress. The overall work stress level was "moderate" for both groups of respondents classified by length of service. To determine if the differences in mean scores varied significantly according to length of service of respondents, the t-test was employed. Based on the analyses, the findings revealed that there were no statistically significant differences in the work stress levels of respondents when grouped by length of service ( $p > 0.05$ ).

## **Discussion and Conclusion**

The health personnel of Universiti Utara Malaysia (UUM) experienced some degree of work stress. Based on the scale arbitrarily devised for the purpose of this research, the levels of work stress among the respondents ranged from "moderate" to "high." This finding is also similar with that of Yeap, Bathmavathy, and Ifa (2002), whose study examined work stress among employees of a government hospital in the state of Kedah, Malaysia. These researchers found that employees assigned at the Radiology and Pathology departments encountered "above average" work stress in terms of job demands.

In the present study, job demands, decision authority, skill discretion, terms of employment, and supervisor and co-worker support came out to be sources of work stress. Of these factors, the health personnel of UUM had relatively high work stress in employment matters and supervisor and co-worker support, and moderate amount of work stress in the other preceding sub-dimensions.

Terms of employment surfaced as a strong work stressor among the respondents. For instance, in the work of Ben-Bakr, Al-Shammari, and Jefri (1995), they highlighted an aspect of employment, which dealt with performance evaluation. Their research indicated that a lack of knowledge about performance evaluation ranked much higher as a source of stress in private and semi-private organizations than it did in public organizations. Rojas and Kleiner (2000) clearly stated that competing in the workplace for performance is a very stressful condition. These statements may well apply in the present study but when the individual items of the Work Stress Questionnaire (WSQ) were examined, the item "In five years, my skills will still be valuable" had the highest mean score. This implies that it is the most dominant source of work stress in terms of employment matters among the university's health personnel. It might be argued that work stress among the health personnel of UUM surged with this factor because of the feeling of "job insecurity" or inability to pursue valuable contribution to the university. This feeling may be more prevalent among the older respondents than the younger ones, especially those nearing retirement.

Moreover, the findings of the present research disclosed that supervisor and co-worker support was another major job stress among UUM's health personnel, where the respondents experienced a high level of work stress. This outcome, however, does not corroborate with the work of Lai and Chan (2000), who found that relations with superiors and colleagues constituted sources of least stress. These researchers explained that the low level of stress associated with interpersonal relationships might be due to the emphasis on social cohesion. In the context of the

present study at UUM, the individual items on this sub-dimension pointed out that work stress was high in terms of the atmosphere at the workplace, the daily management, and support in work. In other words, these are the areas in the management at Health Center that need to be looked into so that the personnel would be more eased in their work and in dealing or interacting with their colleagues and supervisor in the work environment. In the investigation of Cottrell (2001), “relationships” also turned out to be a source of occupational stress among community mental health nurses in a semi-rural area of North Wales.

Job demands, decision authority, and skill discretion were also other potential sources of work stress among the health personnel of UUM. The work of Rusli, Huda, Rampal, Naing, and Winn (2003) also cited job demand, psychological stressors, created skill, and working in clinical-based departments as significantly related to high job strain among medical lecturers at Universiti Sains Malaysia in Penang, Malaysia. Azzat, T. Ramayah, and S. Kumaresan (2003) also found that blocked career, alienation, conflict, and unfavorable work environment had significant positive effects on job stress among electronic firm managers in Penang.

In the present research, it was identified that work stress was relatively high if jobs were viewed as demanding, specifically those that “require working very fast, very hard, and very hectic.” This is understandable for those who cannot cope with the physical requirements of the tasks assigned. Alternatively, it might be explained that work stress could be attributed to the nature of work of the health personnel of UUM. Being into a “caring,” service-oriented job, a lot of demands could be expected and as such, people may not be able to cope easily with the pressure involved. The situation may have been induced by the “decision authority” viewed by the respondents, where they felt that they had limited opportunities to determine the order and period (time-related) of doing their work. Moreover, the conditions may have been perceived to be more stressful because the respondents had to “learn new things, be creative, and acquire high level of skills.” The findings may suggest that on top of the demands of the job, the respondents had to possess additional experiences or competencies so that they could perform their work efficiently.

The finding that there were no significant differences in the work stress levels of respondents when grouped by demographic characteristics implies that work stress would not be statistically and significantly different regardless of whether respondents were male or female, younger or older, single or married, had degrees or not, and had shorter or longer length of service. Some studies have also focused on these variables, such as that of Golec (2002), who found that nurses who felt older than their actual age reported mental and physical tiredness and feeling tense after a workday more so than the other nurses. Lai and Chan (2000) disclosed that gender, education, age, and work experience were not related to stressors. Humpel and Caputi (2001) found that years of experience was not related to work stress.

## **Implications**

The findings of this research have led to certain implications, with special emphasis on employee welfare management. Along with these implications go some recommendations for future action.

Over the past 20 years, there has been growing recognition of job stress as an important occupational health problem. In industry, there is an increasing awareness that occupational stress contributes to a significant portion of employee compensation claims, health care costs, disability, absenteeism, and productivity losses (Sauter, Murphy, and Hurrell, 1990, in Murphy, 1995). If work stress is not diagnosed or attended to at its early stage in the workplace, it might pose a substantial damage to the medical and health conditions of employees as well as strike a huge financial liability on the part of the management. Obviously, there is a need to initiate stress management and stress-coping programs for the employees. As global competition increases, corporations that can teach their employees how to manage and channel stress in positive directions may well have discovered a strategic advantage (Donovan and Kleiner, 1994). However, the task of selecting and implementing stress management interventions is not a simple one, said Bradley and Sutherland (1994). These authors pointed out that stress management programs might include a heterogeneous range of activities, which extend from training an individual in relaxation techniques to the redesign of a job. In other words, there should be initiatives from the top management to ensure that

employees work with a tolerable level of work stress. It is argued that some amount of stress is also necessary to motivate individuals to push ahead and work with a certain amount of urgency.

Apart from training and management commitment, another implication of the research is to provide more financial incentives to the health personnel of UUM. These incentives may come in the form of, say, bonus, which can be performance-based or as determined by the management. As these personnel may be prone to any contagious diseases or illnesses, the management may wish to provide sort of risk allowances to qualified employees, such as those in the x-ray department, among others. Another incentive may come in the form of a reward package for employees, which will serve as a motivation for employees to maintain a satisfactory level of performance despite the elements of work stress.

Moreover, employees need to be educated of the evolving and progressive nature of work stress. Specifically, the management should emphasize the importance of developing a positive outlook and wholesome mindset regarding the approaches of dealing with work stress. Citing the National Institute of Occupational Safety and Health of the U.S., Segumpan (2003: 38) clearly advances:

Jobs should be designed to provide meaning, stimulation, and opportunities for workers to use their skills. Roles and responsibilities should be clearly defined, giving workers opportunities to participate in decisions and actions affecting their jobs. Communications should be improved by reducing uncertainty about career development and future employment prospects. Social interaction needs to be provided, and work schedules that are compatible with demands and responsibilities outside the job should be established.

Special emphasis needs to focus on supervisor and co-worker support as well as terms of employment because these were the two sub-dimensions of work stress in the study where the respondents had high work stress. The implication, therefore, is to establish a social or interpersonal support network in the workplace and encourage active socialization process and programs. Proactive, not reactive, measures should also be explored on which or what specific terms of employment should be modified or changed to cater to the growing needs of the health personnel.

Finally, it may be worthwhile to point out that to a large extent, work stress is attitudinal or perceptual in nature. It is self-imposed. Hence, efforts should be done to encourage employees to view work stress in a positive or constructive perspective.

# **Examining the Relationship between HRM Practices and Firm Performance in Malaysian Manufacturing Firms: The Moderating Role of Environmental Uncertainty**

*Normala Daud*

University Technology MARA, Malaysia

*Zainal Ariffin Ahmad*

University Sains Malaysia, Malaysia

## **Abstract**

An increasing interest in improving the management of people or utilizing human resources better as a means of achieving competitive advantage has resulted in an extensive literature in this area of human resource management. Whilst a good number of empirical studies have examined the human resource management (HRM) practices in the West, there is insufficient research that has focused on the role of environmental uncertainty in moderating the relationship between HRM practices and firm performance. This study initiates an attempt to address this issue. Data were collected using mail questionnaires to human resource managers of manufacturing firms in Malaysia. This study finds there is a relationship between HRM practices and firm performance. Furthermore environmental uncertainty is found to significantly moderate the relationship between HRM practices and firm performance.

## **Introduction**

Over the past decade there has been high interest and much research in the area of HRM or people management practices and their link to performance. For many companies, employees or human resources constitute an important source of competitive advantage (Barney, 1991; Pfeffer, 1994). For these companies maintaining a competitive advantage requires a management of human resources that makes sure these human resources stay competitive, difficult to imitate and substitute. As a result, it is important for a company to adapt HRM practices that make the best use of its human resource. The above realization has prompted an increasing interest to study the importance of HRM practices on organizational performance, and a number of studies have found a positive relationship between HRM practices and firm performance (Huselid, 1995; MacDuffie, 1995; Delery & Doty, 1996; Huselid & Becker, 1997; Fey & Bjorkman, 2001; Rondeau & Wagar, 2001, Daud & Ahmad, 2003).

## **Defining HRM**

HRM means different things to different people. Armstrong (1995) defined HRM as 'a strategic and coherent approaches to the management of organization's most valued assets - the employees' whereas Storey (1995) applies a more specific definition, stating that HRM 'is a distinctive approach to employment management which seeks to achieve competitive advantage through strategic deployment of a highly committed and capable workforce, using an integrated array of cultural, structural and personnel techniques.' Storey's definition specifies the characterization of HRM as one particular approach to managing people which yields competent and committed workforce which positively affects competitive advantage or performance; because of that many researchers (Schuler & MacMillan, 1984; Schuler & Jackson, 1987; Wright & Snell, 1991) consider HRM practices as organizational activities that are directed at managing the pool of human resources and ensuring that the resources is employed toward the fulfillment of organizational goals.

## Literature Review

### HRM Practices and Firm Performance

Since early 1990s, HRM practices have become an increasingly important topic for research (Arthur, 1994; Pfeffer, 1994; Huselid, 1995; MacDuffie, 1995; Delery & Doty, 1996; Ichniowski, Shaw & Prennushi, 1997; Fey & Bjorkman, 2001; Mayrhofer, Muller-Camen, Ledotler, Strunk and Erten, 2002; Hartog & Verbug, 2004). One of the earlier attempts was undertaken by Arthur (1994) where he identified two types of HRM systems (i.e. control and commitment) to test the extent to which the specific combination of practices utilized by organizations could predict differences in organizational performance.

Similarly, Huselid (1995) using a national sample found that HRM practices had an economically and statistically significant effect on turnover, productivity, and corporate financial performance. Hoque (1999) explored HRM practices and a range of outcome variables from a sample of 200 hotels. He found that, amongst the quality enhancers, commitment, job satisfaction, quality of work, quality of service and financial performance as perceived by the respondent, were all strongly related to the use of HRM practices. On the other hand, Khatri (2000) using a sample of 200 of the largest companies in Singapore, found that HRM practices have a stronger direct effect on profitability than sales growth and non-financial measures. In fact, the significant relationship between HRM practices and profits is in agreement with the findings from other studies (Gerhart & Milkovich, 1990; Huselid, 1995).

### HRM Practices – Environmental Uncertainty – Performance Relationship

Researchers have for decades been concerned with the effects of the environment on the organization's effectiveness and efficiency. Much work has suggested that environmental forces combined with internal organizational conditions have degree of impact on firm performance (Lenz, 1980; Rumelt, 1982; Hambrick, 1983; Prescott, 1986). Environmental uncertainty has been viewed as the amount of change and predictability in the economic, technological and political dimensions of the industry environment. A majority of earlier studies on external environment have basically concentrated on the relationship between environment and organizational performance. However, there are a few researches that have studied external environment as a moderating variable.

Although a number of studies have tried to investigate the HRM practices – firm performance relationship, no clear pattern of the relationship between HRM practices and its environment has been found. Though prior studies have found that external environment is one of the moderating variables that can influence the performance of large firms, the influence of external environment on HRM practices has not receive much attention. Based on the above review, the present study considers environmental uncertainty will positively affect the relationship between HRM practices and firm performance.

### The Present Study

Based on the above discussion, the theoretical framework for the present study is depicted in figure 1 below.

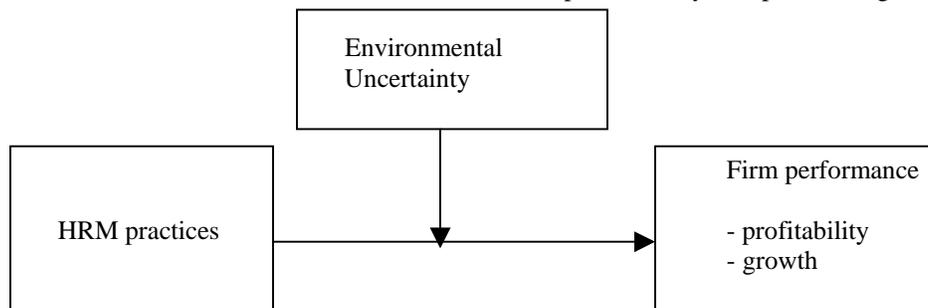

FIG. 1: RESEARCH FRAMEWORK

Within this framework two hypotheses are proposed:

- H1a: There is a significant positive relationship between HRM practices and profitability.

- H1b: There is a significant positive relationship between HRM practices and growth.  
H2a: The relationship of HRM practices and profitability is moderated by environmental uncertainty.  
H2b: The relationship of HRM practices and growth is moderated by environmental uncertainty.

## Methodology

### Sample and Response Rate

For this study, a list of medium and large-sized firms was obtained from the Directory of the Federation of Malaysian Manufacturers (FMM) 2001. Data was collected through mail questionnaires, which were addressed to the Human Resource Directors/Managers. The unit of analysis is organization and the samples were randomly selected from the directory. The sample selected were the manufacturing firms with a minimum number of fifty fulltime employees.

A total of 800 questionnaires were mailed, of which 170 firms responded. Out of the 170 questionnaires received, a total of eight questionnaires were unusable due to incomplete response. This represents an overall response rate of 20.25%. Considering that mailed surveys generally have a low response rate, this level of response is considered satisfactory.

### Variables and Measures

The variables of this study were measured using instruments derived from various sources. Many researchers have included various HRM practices to be tested. In this research we identified seven practices that should contribute to high growth and profitability of the firm which include staffing, training and development, performance appraisal, compensation and benefits, employee participation and involvement, job security and human resource planning. The extents of these HRM practices were expected to increase growth and profitability of the firm. A five-point Likert scale (1 = not at all to 5 = to a very great extent) was used in order to measure the extent of HRM practices.

Environmental Uncertainty measures the predictability of impact of changes in environment on performance.

Performance. The performance measures used in this study include profitability and growth. Profitability is measured in terms of market share, profit, return on investment, sales, return on sales and size of market for the last three years. Growth is measured in terms of percentage of growth in sales and percentage of growth in profit in the last three years (Khatri, 2000).

These measures were subjected to factor analyses to identify the structure of interrelationship (correlation) among a large number of variables. Factor analyses were conducted on all the items measuring HRM practices. Four main factors emerge factor loading ranging from .52 to .88. On the basis of factor loading, the four factors were named accordingly. The factor analysis was conducted separately for extent of environmental unpredictability. The result of factor analysis on the five questions provides a single factor (Cronbach's alpha, .74). The result of factor analysis on profitability also yields a single factor, thus the name profitability was retained (Cronbach's alpha, .95).

Past research have shown that HRM practices can be influenced by demographic variables. The demographic factors that may have potential effect on HRM practices are size of the firm; life cycle stage and length of operation. Hence, these demographic variables were controlled in the statistical analysis. In the current study, the third and fourth hypotheses were tested using hierarchical regression (Cohen and Cohen, 1975). Control variables were entered first, followed by in step 2 regression with the independent variables of HRM practices, step 3 refers to regression with the independent variables and the moderator environmental uncertainty, whilst instep 4 refers to regression with the independent variables, moderator and the interaction terms. Categorical variables such as size of the firm, life cycle stage and length of operation were initially dummy-coded.

## Findings

### Organizational Profile

The profile of the respondent firms is given in Table 1. From a total of 162 firms that responded, 53 firms (32.7%) were from the electrical and electronics, while 22 (13.6%) firms from fabricated metal products, machinery, transport equipment tied with chemical, petroleum and plastics products responded to the survey. Seventeen firms (10.5%) were from basic metal/nonmetallic mineral products, and thirteen (8%) and twelve (7.4%) firms came from wood, wood-based products, and furniture and food, beverage and tobacco respectively. A total of ten (6.2%) were from rubber-based products, seven (4.3%) were from textile, wearing apparel and leather firms and six (3.7%) firms grouped under others, which comprise of jewelry, watch and ammunition manufacturing. Majority of the firms (73.5%) have been in business for more than 10 years. Slightly more than half of the firms responded were Malaysian owned (51.9%), while the remainders were foreign-owned. Approximately 57% of the firms surveyed were in the maturity or decline stage, with 43% were in the introduction and growth stage. More than half of the responding firms (61.7%) have 500 fulltime employees or less while thirty-eight percent are large firms with more than 500 employees

TABLE 1: ORGANIZATION PROFILE

	No. of firms	Percentage
Manufacturing sectors		
Food, beverage and tobacco	12	7.4
Textile, wearing apparel and leather	7	4.3
Electrical and electronics	53	32.7
Fabricated metal products, machinery, transport equipment	22	13.6
Wood, wood-based products, furniture	13	8.0
Chemicals, petroleum, plastic products	22	13.6
Basic metal/non-metallic mineral products	17	10.5
Rubber-based products	10	6.2
Others	6	3.7
Length of operation in Malaysia		
10 years and below	43	26.5
11 to 15 years	46	28.4
16 to 20 years	15	9.3
More than 20 years	58	35.8
Ownership status		
Malaysian	84	51.9
Japanese	26	16.0

Introduction & growth stage	70	43.2
Maturity stage	84	51.9
Decline stage	8	4.9
Size		
500 employees or less	100	61.7
501 to 1000 employees	31	19.1
More than 1000 employees	31	19.1
Formal HR department		
Yes	146	90.1
No	16	9.9

### Respondents' Profile

Table 2 presents detailed figures concerning the respondents' profile. More than eighty percent of the respondents were HR or Personnel Managers or Assistant HR Managers. The other respondents (19.1%) were senior Administration or Senior HR executives. The highest number of respondents is Malays (62.3%) followed by

Chinese (27.8%). Indian and others make up 9.9 percent of the total. More than two third of the respondents in the sample were male (71.0%), female make up less than a third (29.0%) of the people responded to the survey. The table also indicate the majority of the respondents were below 45 years of age (72.3%). Most of the respondents (72.9%) have at least a bachelor's degree.

TABLE 2: RESPONDENTS' PROFILE

	No. of firms	Percentage
Position of respondents		
Director/Director of HR/General Manager		
General Manager of HR/Deputy General Manager – HR	11	6.8
Administration & HR/Personnel/HR Manager	99	61.1
Assistant HR Manager/Office Manager/Personnel Officer	21	13.0
Senior Administration/HR Executive	31	19.1
Race		
Malay	101	62.3
Chinese	45	27.8
Indian and others	16	9.9
Gender		
Male	115	71.0
Female	47	29.0
Age (years)		
Less than 36	39	24.1
36 – 40	44	27.2
41 – 45	34	21.0
46 – 50	31	19.1
51 – 55	10	6.2
More than 55	4	2.5
Education level

Table 3 presents the results of multiple regression analyses, which analyses the relationship between HRM practices and profitability. Human resource planning and performance-based pay practices were found to be significant at .05 level. The results of the analyses also indicate that performance-based pay significantly influencing the profitability of the firm. The greater the extent of firms practicing human resource planning and performance-based pay the higher the profit of the firm. This result is consistent with Khatri (2000). There is no significant relationship between HRM practices of skills development and group-based incentives on profitability. Thus, hypothesis 1a is partially supported.

Similarly, hypothesis 1b states that there is a significant positive relationship between HRM practices and growth. Table 3 also shows that human resource planning, performance-based pay and group-based incentives practices were found to be significant at .01 level. The results of the analyses indicate that human resource planning; performance-based pay and group-based incentives significantly influence the growth of the firm. The

greater the extent of the firms practice human resource planning, performance-based pay and group-based incentives the greater the growth of the firm. Thus, hypothesis 1b is partially supported.

#### The Moderating Effect of Environmental Uncertainty

As can be seen from Table 4, size of the firm and life cycle stage of the firm both have a significant effect on profitability of the firm. The results of the regression show that both human resource planning and performance-based pay have a significant effect on profitability. Environmental uncertainty moderates the relationship between human resource planning and profitability. On the other hand performance-based pay will have a greater impact on profitability in firms where the environment is more stable. Thus, hypothesis 2a is partially accepted.

Table 5 displays the moderating roles of environmental uncertainty on the relationship between HRM practices and growth. In step 1 it was discovered that control variable, length of operation has an effect on growth of the firm. The results show that environmental uncertainty does not moderate the relationship between HRM practices and growth. Thus, hypothesis 2b is rejected.

## Discussion and Conclusion

With regard to the impact of HRM practices on profitability, we found that human resource planning and performance-based pay have a significant positive effect on profitability. These findings indicate that firms can improve their performance by practicing a greater extent of human resource planning and performance-based pay. This result is supported by many previous studies done by Huselid (1995), Khatri (2000). Likewise, this finding also shows that human resource planning; performance-based pay and group-based incentives have a significant positive effect on growth. These findings imply that firms that practice a greater extent of human resource planning, performance-based pay and group-based incentives seem to experience better growth than firms that do not.

Environmental uncertainty reflects the extent of predictability in the environment. The uncertainty of the environment refers to factors such as economic, technology, and political that are likely to influence a business organization. We postulate that the more unpredictable the environment, the greater the impact of HRM practices on profitability. This is because firms in an uncertain environment are able to differentiate themselves from competitors and because of that they have a competitive advantage over their competitors, which would translate into better profits for these firms.

We also postulated that the more unpredictable the environment, the greater the impact of HRM practices on growth. However, our findings show that environmental uncertainty does not moderate the HRM practices – growth relationship. This can be attributed to the overall situation whereby Malaysia was actually experiencing slow growth as a result of the Asian financial crisis that struck the country in late 1997. Some firms are still struggling to recover from that situation.

The findings of this study imply that the impact of HRM practices on profitability of the firm depended on the predictability of the environment. Firms that are able to differentiate themselves from others will be in a better position in terms of profit. The first limitation of this study is that this study is limited to the manufacturing sector only, thus generalization to other sectors is not possible. Secondly, requests for financial information limit the voluntary participation of respondents and thirdly, the survey on HRM practices is limited to non-managerial employees only, as such the results of this study could not be generalized to other levels of management. Future research could be extended to the service sector and financial sector as well. Future studies may consider using other non-financial dependent variables such as quality of work life, organizational citizenship behavior or organizational learning.

# **Exploring the Antecedents of Needs and Job Satisfaction among Employees of a Leading Bank in Malaysia: Implications for Managing Bank Employees in Malaysia.**

*Tek Yew, Lew*

*Mei Yin, Liew*

*Curtin University of Technology, Malaysia*

## **Abstract**

In view of the rising competition as a result of globalization, managers have placed great importance on the construct of job satisfaction. This paper investigated the perceptions of need satisfaction and job satisfaction for the employees of a leading bank in Malaysia. This study utilizes the Cornell Job Descriptive Index and the Porter Need Satisfaction Questionnaire. The findings indicated that salary, self-actualization and autonomy needs were regarded as the least fulfilled needs and the most important needs perceived by the employees were salary, self-actualization and job security needs. Results showed that respondents from the supervisory category generally perceived less need satisfaction compared to respondents from the clerical category. All five job facets of the Cornell JDI had strong significant relationships with overall job satisfaction and the partial correlation coefficients were above 0.70. Meanwhile, almost 36% of employees are not satisfied with promotion opportunities which is the most important job facet influencing the level of job satisfaction.

## **Introduction**

There has been a convergence of interest by organizations to examine the facets that contribute to greater job satisfaction. This may be due to the perception that job satisfaction will lead to better quality work performance and employees will be more committed towards their organizations (Carroll and Tosi, 1977). While the concern for employee satisfaction in Malaysia is high, there are very few research done on job satisfaction amongst employees in the financial institutions. Most knowledge of job satisfaction comes from journal articles, individual experiences, opinions of scholars and corridor conversation (Saiyadain, 1996).

Job satisfaction as a construct has been defined differently by various scholars. The term was first defined by Hoppock (1935) as a combination of psychological, physical and environmental circumstances that cause a person to say, "I am satisfied with my job". Among the most accepted definition of job satisfaction is by Locke (1969) who defines job satisfaction as an positive emotional feeling as a result of one's evaluation towards his job or his job experience by comparing between what he expected from his job and what he actually gets. Job satisfaction is the result of the interaction of the employees' values and his perception towards his job and environment. This definition is in line with Smith et al.(1969) that job satisfaction is the feeling or emotional reaction of an individual towards certain aspects of the working environment.

Nasurdin and Ramayah (2003) cited the work of O'Reilly and Caldwell (1980) that both task and organizational rewards contribute to job satisfaction. Task rewards are intrinsic rewards directly associated with the job such as interesting and challenging work, variety and opportunities to use one's skills. Organizational rewards are the tangible rewards that are visible to others such as pay, promotions and comfortable working conditions.

There are many ways to measure this construct. However, the Cornell Descriptive Index (Cornell JDI) has been well accepted by many employees as a measurement tool which has been well formulated to measure job satisfaction (Smith, Kendall, and Hulin, 1969). It measures job satisfaction in terms of 5 aspects ie. salary, promotion opportunities, relationship amongst co-workers, supervision and the nature of work itself. Besides, Poon and Ainuddin (1990) has cited the work of Muchinsky (1977) that the JDI has been shown by extensive research to be a reliable and valid measure of job satisfaction.

This is in line with Dessler (1985) opinion that job satisfaction can be measured by measuring the degree of satisfaction of an employee towards salary, promotion opportunities, recognition etc. Locke (1969) mentioned that a job satisfaction index can be obtained by summing up the employee's evaluation towards all aspects of the job and it

is not necessary to allocate importance to each of the job facets as it has been reflected in the employee's satisfaction towards each of the job facet. This conclusion is supported by Mobley and Locke (1970) that there is a correlation between the importance of the employees' values and his satisfaction towards that value and the researchers also highlighted several other studies that weighted scores do not predict job satisfaction better compared to unweighted scores such as Decker (1955); Ewen (1967); and Schaffer (1953).

Meanwhile, Saane, Sluiter, Verbeek, and Frings-Dresen (2003) found out that seven job satisfaction instruments met the defined reliability and validity criteria ie. the Job in General Scale(JIG), the Andrew and Withey Job Satisfaction Questionnaire, the Job Satisfaction Survey(JSS),the Emergency Physician Job Satisfaction Instrument(EPJS),the McCloskey/Muller Satisfaction Scale(MMSS), the Measure of Job Satisfaction(MJS) and the Nurse Satisfaction Scale(NSS). Only the Measure of Job Satisfaction(MJS) has an adequate content validity.

Besides, Chu, Hsu, Price, and Lee (2003) cited the model proposed by Price, Mueller and colleagues that hypothesized 11 exogenous variables to have direct influence on job satisfaction. The variables are job involvement(one's willingness to exert effort on the job); positive affectivity versus negative affectivity(the degree to which an individual feels enthusiastic over time and across situations); autonomy(the degree of power that an employee can exercise over his/her job and work environment); distributive justice( the degree to which rewards are related to performance inputs; procedural justice(the degree to which rights are applied universally to all members of an organization; job stress(the extent to which job duties are difficult to fulfil); pay; promotional chances; routinization (the degree to a job is repetitive) and social support(assistance with job-related problems provided by co-workers, supervisors and family members). It was discovered in the study on non-supervisory nurses in Taiwan that six of the variables namely involvement, positive and negative affectivity, job stress, routinization and co-worker support are significantly influencing job satisfaction and explains 45% of the variance of job satisfaction. This findings suggest that the Price and Mueller model work fairly well in explaining job satisfaction in a non-western country.

Besides, employees are motivated to satisfy various types of needs including physiological, job security and self-esteem and needs fulfillment will have a significant impact on employee behavioral responses such as job satisfaction, job performance, intention to quit etc. Hence, it is important to identify the needs satisfaction levels of the employees in banks to avoid losing many experienced and well trained employees (Maslow, 1943; Pinder, 1984 and Steers & Porter, 1987).

## **Problem Statement**

The banking scenario in Malaysia has changed completely since the Asian economic crisis. The banks are witnessing fundamental shift in working attitude and work style due to the impact of globalization and increased competition. Many banks have adopted the new customer-centric work environment and this has changed dramatically the roles and job requirement for bank employees. Additionally, the existing expertise of the employees is constantly being challenged by new requirements and expectations of the authorities and management.

Hence, the rapid change in the banking business environment and the demanding working environment will definitely influence the level of needs and job satisfaction of bank employees. In this instance, it is important for the management of Bank X to identify the important factors influencing the level of needs and job satisfaction since human resources is the most important capital asset in the banking industry. The findings of the study will reflect the desired needs of the employees in the banking industry.

## **Objectives of the Study**

The main objectives of this study were to identify the factors influencing the level of needs and job satisfaction among employees of Bank X.

Specifically, the objectives were:-

- a) To measure the level of perceived needs satisfaction of the employees of Bank X utilizing the Porters' Needs Satisfaction Questionnaire (1961) based on the Maslow's Hierarchy of Needs

- b) To identify the level of perceived importance of the various categories of needs based on the Porters' Needs Satisfaction Questionnaire (1961)
- c) To examine whether there are any significant differences in the level of needs satisfaction between employees from different category of work, namely supervisory and clerical employees
- d) To measure the level of job satisfaction of employees working in Bank X using the Cornell Job Descriptive Index(Cornell JDI).
- e) To examine whether there is significant relationship between each of the facets in the Cornell JDI and overall job satisfaction
- f) To examine whether there is any relationship between age, gender, job category, experience and level of education and level of job satisfaction.

## **Job Satisfaction**

There has been many past studies conducted on the construct of job satisfaction. The importance of job satisfaction towards productivity was first highlighted by the Hawthorne studies in the 1920s where it was concluded that when workers receive special attention, their productivity is likely to improve whether or not working conditions actually change.

Hoppock (1935) forwarded a traditional approach to job satisfaction where job satisfaction is a result of various factors in the working environment and if these factors are present, job satisfaction will arise otherwise job dissatisfaction will arise. In other words, the same factors influence job satisfaction and job dissatisfaction. Hoppock's preposition is supported by Khaleque and Rahman (1987) who also highlighted the importance of good relationship between co-workers towards job satisfaction. Vroom (1964) also cited many past studies which confirmed the importance of good relationship between co-workers towards job satisfaction of employees. Herzberg, Mausner, and Snyderman (1959) on the other hand distinguished the factors like the working environment, pay, company policies etc that eliminates job dissatisfaction as the hygiene factors while the factors creating job satisfaction like challenging work, responsibility, recognition and achievement as motivators.

Mumford (1991) have categorized the various thoughts of job satisfaction into several categories which include the psychologists such as Maslow, Herzberg, Likert etc who viewed motivational development as the primary factor influencing job satisfaction; the psychologists such as Blake & Mouton and Fiedler who viewed that the supervisors' behavior and they studied the relationship between leadership styles and job satisfaction; the Manchester Business School studies which emphasizes the importance of rewards system towards job satisfaction; Crozier (1964) and Gouldner (1955) studies which emphasize the importance of organizational values such as punishment, delegation of power and bureaucracy; and finally the behavioral scientists who emphasizes on the importance of job content and the process of developing the jobs.

## **Needs Satisfaction**

There are many definitions and interpretations about the concept of needs. Several categories of needs are examined by the motivational theories such as Maslow Hierarchy of Needs (1954), Herzberg Two Factor Theory (1959) and the existence, relatedness and growth theory(ERG theory) by Alderfer (1969) and Locke (1976) value theory. Employees satisfy their needs through activities and outcomes from their work experiences. Common categories of employees' needs identified in the studies were physiological, job security, social, salary, autonomy, self-esteem and self-actualization. Pinder (1984) defines needs satisfaction as the feeling of a person when the tension felt by him as a result of unfulfilled needs are removed.

## **Needs Satisfaction and Job Satisfaction**

Job Satisfaction is often defined as a function of the extent of perceived needs satisfaction by the employees through their work experiences (Pinder, 1984; McCormick & Tiffin, 1974; Locke, 1969). Hence, this paper attempts to explore the relationship between needs satisfaction and job satisfaction among bank employees.

## **Theoretical Frameworks For Job Satisfaction**

There are 2 categories of job satisfaction theories ie. the content and process theories (Gruneberg, 1979). The content theories examines factors influencing job satisfaction such as Maslow Hierarchy of Needs (1954), Herzberg Two Factor Theory (1959) and the existence, relatedness and growth theory (ERG theory) by Alderfer (1969). The process theories examines the process of interaction between variables such as expectation, needs and values and the job characteristics to create job satisfaction. Examples of process theories are the equity theory by Adams (1963) which is concerned with individuals' beliefs about how fairly they are treated compared with their peers; Vroom (1964) expectancy theory which states that people choose among alternative behaviours according to their expectation that a particular behaviour will lead to one or more desired outcomes; and Locke (1976) value theory which states that the employees' values are influential factors of job satisfaction and the values consist of job related values such as achievement and sense of success towards the job as well as non-job related factors such as increase in salary, promotion opportunities and recognition.

Maslow (1954) identified two levels of needs ie. lower order needs such as physiological needs and security needs and higher order needs such as affiliation, esteem and self-actualization needs. He assumes that lower order needs must be satisfied before higher level needs become strong to stimulate behaviour. However, Onedo and Ojuka (1991) found out that cultural differences and differing stages of economic development affect the degree of importance attached to the 5 needs categories. On the other hand, Alderfer (1969) who proposed the ERG theory said that people strive to meet a hierarchy of existence, relatedness and growth needs and if efforts to reach one level of needs are frustrated, the individual will regress to a lower level of needs.

Herzberg et al.(1959) categorized the hygiene factors as factors that can eliminate job dissatisfaction and motivators as factors that can create job satisfaction. Herzberg's emphasis on the importance of motivators compared to the hygiene factors as factors that contribute to job satisfaction is true and generally accepted (Locke, 1976; Lok and Crawford, 1999). However, there were many studies and reports which did not support Herzberg's model and also questioned the methodology adopted by Herzberg such as Gruneberg (1979); McCormick and Tiffin (1974); Dunnette, Campbell, and Hakel (1967); Armstrong (1971); Hulin and Smith (1967); and Hinton (1968).

Witt and Nye (1992) reported that there were many studies which supported the predictions of the equity theory (Adams, 1963) that people will be more dissatisfied and motivated to change when they are in disequilibrium compared to when they are in equilibrium with others in terms of the input-output ratio and the relationship between equity and satisfaction is stronger for men compared to women implying that women do not place much importance on salary and promotion compared to men.

## **Organizational Factors Influencing Job Satisfaction**

Robbins (2004) concluded that there are five categories of factors influencing job satisfaction ie. challenging job; equitable reward system which include salary and promotion opportunities; conducive working environment and good relationship between co-workers. Ronan and Organt (1973) have reported many studies that salary is one of the main factors influencing job satisfaction. One recent study by Egbule (2003) suggest that salary, working conditions and status of universities affect job satisfaction of academic staff in Nigerian universities. Comparison salary was found to be an important influence on academics' overall job satisfaction of Scottish academics (Ward and Sloane, 2000).

Meanwhile, Korman (1977) listed both working environment factors and personal factors to explain job satisfaction. Among the working environment factors are the level of job category, job variety, caring leadership

style by the supervisors, promotion opportunities and reward system as well as social interaction and teamwork. On the other hand, Hui and Yee (1999) found out that positive workgroup atmosphere resulted in higher job satisfaction among collectivists than individualists.

Among the personal factors there are positive relationships between age and job satisfaction by controlling factors such as level of job category (Saleh and Otis, 1964); there are negative relationships between the level of education and job satisfaction by controlling the level of job category and there is no conclusive evidence that women are more satisfied than men though other factors such as category and level are held constant. Korman (1977)'s comments that the working environment and personal factors are influencing job satisfaction are in line with Vroom (1964)'s opinion that job satisfaction can best be explained using both working environment and personal factors.

Hackman and Oldman (1976) has highlighted in their Job Characteristics Model that job characteristics such as skills variety, task identity, task significance, autonomy and feedback are important determinants of job satisfaction. For employees who would want to satisfy their higher needs from their job, those jobs that are high on task variety, autonomy, task identity and feedback will generate high job satisfaction (Hackman and Lawler, 1971; Stone, 1976; Gerhart, 1987). Prichard and Peters (1974) found out that intrinsic factors such as achievement and autonomy explains nine times the variances in job satisfaction and also has higher correlation with overall job satisfaction compared to extrinsic factors such as salary, promotion opportunities and recognition.

Supervisory practices is perhaps one of the most thoroughly explored variables contributing to job satisfaction. Since the publication of Michigan Leadership Studies by Katz, Mccoby, and Morse (1950), a large number of studies have been conducted to identify supervisory styles leading to satisfaction and there is overwhelming evidence that the participative and involving style of supervisors has a more positive effect on the job satisfaction of the employees (Saiyadain, 1996; Lunjew et al., 1994; Kim, 2002). Meanwhile, Burns (1978) describes transformational leadership as followers and their leaders inspiring each other to achieve "higher levels of morality and motivation" while transactional leadership refers to exchange relationships between the leaders and their followers to fulfill self-interests. Transformational leadership was often demonstrated to have stronger relationship with job satisfaction (Haji Busari and Chang, 2003; Chiok, 2001; Bogler, 2001).

## **Personal Characteristics Influencing Job Satisfaction**

Review of the literature on the relationship between personal characteristics and job satisfaction suggests that the former contributes in varied and complex ways to the attitudes employees have towards their jobs (Saiyadain, 1996). While generally women have been found to be more satisfied with their job than men (Dunham and Herman, 1975; Liou, et al., 1990), few studies suggest no differences in the satisfaction scores between male and female employees (Ghazali, 1979; Furnham and Schacffer, 1984; Hashim, 1985; Weaver, 1977; Witt and Nye, 1992; Saiyadain, 1996; Ward and Sloane, 2000; 2001).

Sauser and York (1978) found out that differences in job satisfaction between men and women are due to several other factors which changes along with gender and gender is not the single factor influencing job satisfaction. This is in line with the research findings and opinions by Herzberg et al.(1959) that there were no studies which showed consistent job satisfaction differences among men and women. Hulin and Smith (1967) also share the same opinion that once the effect of the other factors are controlled, differences of job satisfaction between men and women becomes not significant. However, Varca, Shaffer, and McCauley (1983) found out that job category moderates job satisfaction levels between men and women towards salary and promotion opportunities while Ward & Sloane (2001) suggest that age cohort moderates the influence of age towards job satisfaction.

Mottaz (1986) tested Locke (1969) value theory whether there is any differences in the perception of the rewards system offered by their jobs in relation with their work values among men and women. Results showed that men and women have significant differences in their perception of the rewards system. This may be explained by men who perceived more intrinsic reward, better working environment, salary and better opportunities while women perceive better supervision and support from their co-workers.

Most studies have found positive relationship between age and job satisfaction (Kong, Chye, and Hian, 1993; Weaver, 1977; Hulin and Smith, 1967;). However, some recent evidence suggests that the assumed direct relationship between age and job satisfaction may be questionable. Older employee may experience a downturn in job satisfaction, suggesting a curvilinear relationship between age and job satisfaction (Luthans and Thomas, 1989; Zeitz, 1990; Kacmar and Ferris, 1989;). Meanwhile, there are some other past studies suggesting that job satisfaction may be independent of age (Wright, 1987) or may be inversely related to age (Ghazali, 1979). Synder and Dietrich II (1992) and Zeitz (1990) suggested that there are moderating variables affecting the relationship between age and job satisfaction and these factors may explain the inconsistencies of research findings. Some of the moderating variables suggested by the researchers are job category, job characteristics, non job related social roles, attitudes, values, communication abilities etc.

Highly educated employees have generally been found to be not satisfied with their jobs (McDonald and Gunderson, 1974; Ghazali, 1979; Saiyadain, 1985). It is generally accepted that the more educated feel more frustrated in routine jobs (Saiyadain, 1996). However, one study reported no relationship between education and job satisfaction (Hashim, 1985). As far as length of service is concerned, its correlation with job satisfaction is not conclusive. Some studies found no relationship (Rao, 1970; Saiyadain, 1985), some found a linear relationship (Hashim, 1985; Salleh, 1988) and some others found a U-shape relationship (McDonald and Gunderson, 1974).

## **Past Studies on Needs Satisfaction**

There were many studies conducted on the construct of needs satisfaction since the work of Porter (1961). The studies were conducted in various industries including manufacturing, financial, hospitals and also on professionals such as accountants, students etc. The most often cited study was Porter (1961) study of needs satisfaction on the perceived needs satisfaction among the middle and lower level managers utilizing the needs satisfaction deficiency method whereby the higher the perceived deficiency in terms of needs satisfaction, the employees will experience higher needs dissatisfaction. In the study, the lower level managers experienced higher needs satisfaction deficiency and the middle level managers were more satisfied in terms of their job security, autonomy and self-esteem needs. In addition, both groups of managers perceived that they were not satisfied with the job security and self-actualization needs which were their most important needs. Similar findings were reported in Porter (1962) utilizing larger sample size of about 2000 respondents. Hence, this study investigates whether there are any significant differences in the level of needs satisfaction between employees from different category of work, namely supervisory and clerical employees

Meanwhile, Porter(1963) reported interesting findings that the employees' position in the organization influenced the perceived importance of the categories of employees' needs. In this respect, managers in higher managerial position perceived the autonomy and self-actualization needs as more important compared to lower level managers.

Studies conducted in the over the last four decades had explored the antecedents of needs satisfaction and found that demographic, culture, environment, job level, job category and the size of the organization influenced the level of needs satisfaction among the employees (Rhinehart, Barrell, Dewolfe, Griffin, and Spaner, 1969; Strawser et al., 1969; Slocum, 1971; Root & Tosi, 1973; Stephens et al., 1980; Onedo, 1991; Khojasteh, 1993; Karl & Sutton, 1998).

## **Methodology**

The objectives of this study are summarized by Figure 1 below. It attempts to measure the level of needs satisfaction based on Porter's Need Satisfaction Model (1961). The findings of the level of needs satisfaction formed the basis of discussion for the level of job satisfaction of the employees.

The independent variables of this study are all the five facets of job satisfaction according to the Cornell Job Descriptive Index (JDI) ie. the nature of work, supervision, salary, promotion opportunities and relationship between co-workers as well as some of the selected demographic variables such as age, gender, years of work,

academic qualification and category of work. The dependent variable of this study is overall job satisfaction and also satisfaction of the worker towards each of the facets of job satisfaction namely satisfaction towards the nature of work, supervision, salary, promotion opportunities and relationship between co-workers.

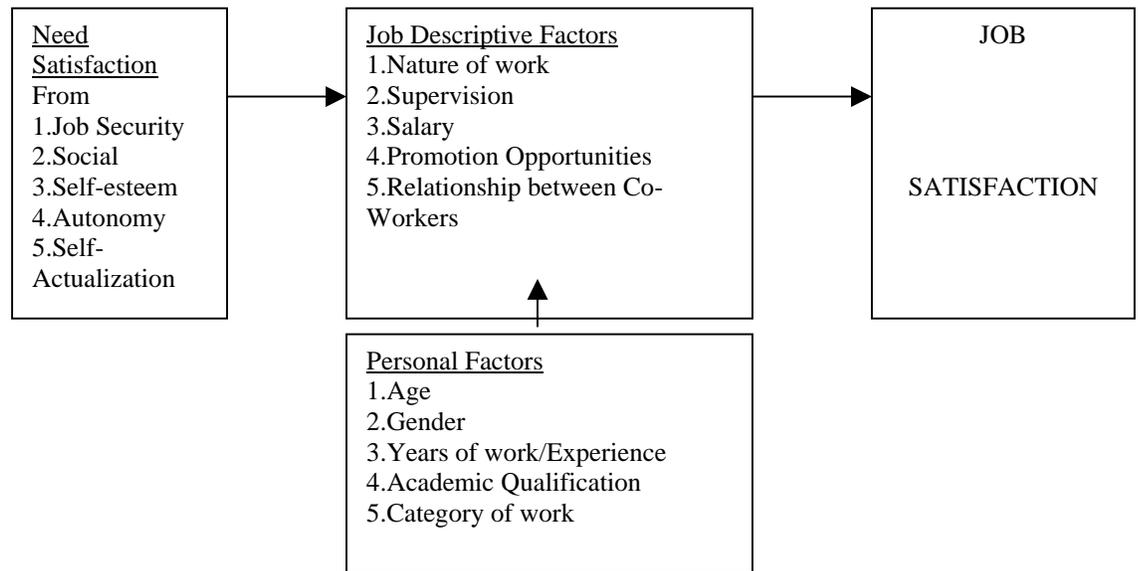

FIG. 1: THE THEREOTICAL FRAMEWORK

## Sample

Data for this study was collected through self-administered questionnaire sent to employees attending training at the Bank's training centre. This approach was chosen as employees attending training at the center are selected from the bank's branches throughout Malaysia. Hence, the random sample taken will be representative of the bank's employees in Malaysia. The sampling frame is all the bank's employees working in Malaysia. A total of 200 questionnaires were mailed along with self-addressed envelopes to the respective employees. Of these, 121 were completed and returned, amounting to a 61% response rate. In order to encourage the participants to respond, they are given an option to indicate whether they are interested to know their job satisfaction scores and confidentiality is also assured.

## Measurement Instrument

The Porter (1961) Needs Satisfaction Questionnaire (NSQ) which is the most popular instrument used by researchers to measure the level of needs satisfaction was adopted to gauge needs satisfaction in an organizational context. The NSQ was used to assess the level of organizational resources relevant to the needs experienced by the employee, the level of employee needs that are pursued on the job and the congruence between a person's needs and organizational resources, with greater congruence reflecting increased need fulfillment by the organization. Four need categories, including seven needs based on Maslow's hierarchy were covered by the NSQ measure. These are:

- Survival needs:
- Security needs (1 item), and
- Pay (1 item)
- Social needs:

- Need of interpersonal interactions and friendships(2 items), and
- Need for membership and being-in-the-know in a significant social group(1 item)
- Ego needs:
  - Need for self-esteem(3 items), and
  - Need for autonomy(4 items)
- Self-actualization needs(3 items)

Using security needs as an example, respondents were asked: “The feeling of security in my job: (a) How much feeling of security is there now in your job?; (b) How much feeling of security do you feel should be in your job? and (c) How important is the feeling of security to you in your job? The response scale is a 7-point scale varying from “minimum” (1) to “maximum” (7). Need satisfaction (an index of congruence between organizational resources and personal needs) is derived by taking the absolute difference between “is” (organizational resources) and “should” (need) scores. Hall et al., 1970; Cohen et al., 1997; Golembiewski and Sun, 1989, 1989, 1990 (as cited in Sirgy, Efraty, Siegel, and Lee, 2001, p.244) established the nomological (predictive) validity of this measure. Meanwhile, the face validity and discriminant validity of this instrument was established by Mitchell & Moudgill (1976) and Porter & Lawler (1968) respectively.

The instrument to measure job satisfaction is the questionnaire based on the Cornell Job Descriptive Index(Cornell JDI). It measures job satisfaction according to five dimensions ie. nature of work, supervision, salary, promotion opportunities and relationship among co-workers. The study has also adopted the Cornell JDI translated into the Malay language by Ariffin (1981). The instrument is worded in both English and Malay languages to facilitate understanding of the items of the instrument. Jaafar (1996) has also reported that the Cornell JDI has been used in several local studies in Malaysia (Ariffin, 1981; Jacob, 1980; Narander Singh, 1987; Othman, 1986; Selwendran, 1989; Zaiton, 1982) and the instrument is widely used because it is simple and hence does not require the respondents to be highly proficient in the English language; easily understood and proven suitable in several researches. Zaiton (1982) reported that Cornell JDI has high content validity. The different facets of job satisfaction were designed after extensive review of the literature and the correlation between the job satisfaction scores of the Cornell JDI and job satisfaction scores from other job satisfaction instruments is at least 0.70 (Smith et al. 1969). Meanwhile, Smith et al.(1969) reported high internal consistency with Cronbach alpha coefficient of between 0.80 and 0.88. Kacmar and Ferris (1989) supported the findings of Smith et al., (1969). In addition, Feratt(1981) has reported several studies which supported the hypotheses that overall job satisfaction is a linear function of satisfaction towards a few facets of job and a linear job satisfaction model will generate job satisfaction scores which are as effective as other non-linear job satisfaction models.

There are three parts to the questionnaire. The first part attempts to get the respondents’ background in terms of gender, race, religion, academic qualification, marriage status, age, salary, working experience and job category.

The second part consists of the Porter’s Need Satisfaction Questionnaire to measure the level of needs satisfaction and the importance of the various categories of employee needs.

The third part consists of the Cornell JDI which will require the respondents to describe their satisfaction towards each of the five facets of job satisfaction, namely satisfaction towards the nature of work, supervision, relationship between co-workers, salary and promotional opportunities.

If the respondents’ response to a particular item corresponds with the required answer as per the Cornell JDI, three points will be allocated, otherwise no marks will be given. However, if the respondents are not sure whether the particular item describes his job satisfaction level, then one point will be given. This process will be repeated until the satisfaction scores towards each of the facets of job satisfaction are computed. The respondents’ overall job satisfaction scores will be obtained by summing up all the satisfaction scores towards each of the dimensions of the Cornell JDI.

## Analysis of Data

The SPSS statistical package was used to analyze the data and generate research findings. Descriptive statistics such as percentages, frequency, mean and correlation were presented to report the background of the respondents such as gender, age, marital status, education level, working experience and job category as well as the level of perceived needs satisfaction, level of perceived importance of the various categories of needs and the level of job satisfaction. Independent samples t tests were used to test significant differences in the level of needs satisfaction between employees from different category of work, namely supervisory and clerical employees.

Significant relationships between each of the facets in the Cornell JDI and overall job satisfaction were tested by using the Pearson r zero-order. Next, the partial regression coefficient will be used to test the predictive power of each of the facets of the Cornell JDI towards overall job satisfaction when the effects of the other facets are being controlled.

The Pearson r correlation coefficient, t tests and ANOVA were used to test whether there is any significant relationship between age, gender, job category, experience and level of education and level of job satisfaction.

## Findings

The demographic profile of the respondents are presented in Table 1 below:-

TABLE 1: DEMOGRAPHIC PROFILE

Background	Frequency	Percentages (%)
<b>Gender</b>		
1.Male	54	44.6
2.Female	67	55.4
<b>Academic Qualification</b>		
1.SRP	2	1.7
2.SPM	62	51.2
3.STPM	20	16.5
4.Diploma	12	9.9
5.Degree	25	20.7
<b>Age Groups</b>		
Less than 21 age	3	2.5
21-29++ years	73	60.3
30-39++ years	27	22.3
Above 40 years	18	14.9
<b>Working Experience</b>		
Less than 1 year	1	0.8
1-5 years	57	47.1
6-10 years	32	26.4
More than 10 years	31	25.6
<b>Job Category</b>		
<b>Executives</b>	67	55.4
<b>Clerks</b>	54	44.3

Table 2 shows that the employees are very dissatisfied with salary (mean =1.73), the opportunity for participating in the determination of methods and procedures (mean =1.73) and the feeling of self-fulfillment (mean

= 1.70). In terms of needs category, the employees are very dissatisfied with the need for self-actualization (mean= 1.58) and the need for autonomy (mean=1.41). Meanwhile, the employees are most satisfied with the social needs (mean =0.78).

TABLE 2: NEEDS SATISFACTION MEAN SCORES DEFICIENCY FOR EACH ITEM OF THE NSQ AND CATEGORIES OF EMPLOYEE NEEDS

Items and needs category	Mean Scores
1. Feeling of security in the job	1.33
2. Social	
a.The opportunity to give help to other people	0.80
b.The opportunity to develop close association and friendship	0.76
Mean for category	0.78
3. Self-esteem	
a. The feeling of self-esteem obtained	1.26
b The prestige of the position within the company	1.21
c The prestige of the position outside the company	1.10
Mean for category	1.19
4. Autonomy	
a.The opportunity for independent thought and action	1.16
b.The opportunity for participation in the setting of goals	1.59
c.The authority given by the company	1.11
d.The opportunity for participating in the determination of methods and procedures	1.73
Mean for category	1.41
5. Self-Actualization	
a.The opportunity for personal growth and development	1.43
b.The feeling of worthwhile accomplishment	1.60
c.The feeling of self-fulfillment	1.70
Mean for category	1.58
6. Salary	1.73
7. The feeling of being informed	1.55
Note: The higher the mean scores deficiency, the lower the level of needs satisfaction	

Table 2 showed that the employees are very dissatisfied with salary (mean = 1.73), the opportunity for participating in the determination of methods and procedures (mean = 1.73) and the feeling of self-fulfillment (mean = 1.70). In terms of needs category, the employees are very dissatisfied with the need for self-actualization(mean=1.58) and need for autonomy (mean = 1.41). Meanwhile, the employees are most satisfied with the social needs(mean = 0.78).

Table 3 below showed the three most important perceived needs are job security (mean = 6.23), salary (mean = 6.17) and self-actualization (mean = 6.09).

TABLE 3: THE MEAN SCORES FOR THE PERCEIVED IMPORTANCE OF THE VARIOUS CATEGORIES OF NEEDS

Items and needs category	Mean Scores
1. Feeling of security in the job	6.23
2. Social	
a.The opportunity to give help to other people	6.02
b.The opportunity to develop close association and friendship	5.90
Mean for category	5.95
3. Self-esteem	
a. The feeling of self-esteem obtained	6.06
b The prestige of the position within the company	5.64
c The prestige of the position outside the company	5.61
Mean for category	5.76
4. Autonomy	
a.The opportunity for independent thought and action	5.92
b.The opportunity for participation in the setting of goals	5.62
c.The authority given by the company	5.39
d.The opportunity for participating in the determination of methods and procedures	5.46
Mean for category	5.60
5. Self-Actualization	
a.The opportunity for personal growth and development	6.12
b.The feeling of worthwhile accomplishment	6.01
c.The feeling of self-fulfillment	6.16
Mean for category	6.09
6. Salary	6.17
7. The feeling of being informed	6.06
Note: The higher the mean scores, the higher the perceived importance for the particular need category (min=1 & max = 7)	

From Table 3, the three most important perceived needs are job security (mean = 6.23), salary (mean =6.17) and self-actualization (mean = 6.09). Table 4 below showed significant differences were found in the mean scores deficiency for the overall needs satisfaction between the supervisory and clerical employees. This may be due to the significant differences of the two needs category ie. autonomy and self-actualization as well as the needs items of the opportunity to develop close association and friendship, the opportunity for participation in the setting of goals, the opportunity for participating in the determination of methods and procedures and the feeling of worthwhile accomplishment. The supervisors were less satisfied than the clericals in all the above mentioned categories and items of needs.

TABLE 4: MEAN SCORES FOR NEEDS SATISFACTION DEFICIENCY ACCORDING TO JOB CATEGORY

Items and needs category	Scores (Supervisor)	Scores (Clerical)	t value
1. Feeling of security in the job	1.32	1.35	-0.15
2. Social			
a.The opportunity to give help to other people	0.83	0.76	0.47
b.The opportunity to develop close association and friendship	0.96	0.57	2.73*
Mean category	0.89	0.67	1.78
3. Self-esteem			
a.The feeling of self-esteem obtained	1.16	1.35	-1.07
b.The prestige of the position within the company	1.16	1.26	-0.54
c.The prestige of the position outside the company	1.24	0.97	1.60
Mean category	1.19	1.19	-0.06
4. Autonomy			
a.The opportunity for independent thought and action	1.29	1.04	1.63
b.The opportunity for participation in the setting of goals	1.87	1.33	2.36*
c.The authority given by the company	1.20	1.02	1.06
d.The opportunity for participating in the determination of methods and procedures	2.00	1.50	2.34*
Mean category	1.61	1.22	2.56*
5. Self-Actualization			
a.The opportunity for personal growth and development	1.61	1.27	1.92
b.The feeling of worthwhile accomplishment	1.87	1.36	2.79*
c.The feeling of self-fulfillment	1.88	1.54	1.83
Mean category	1.80	1.39	2.92*
Overall needs satisfaction	18.33	15.36	2.18*
6. Salary	1.87	1.61	1.12
7. The feeling of being informed	1.70	1.41	1.36

Note: The higher the needs satisfaction mean scores deficiency, the lower the level of needs satisfaction

\* significant t tests (2 tails) at the  $p < 0.05$  level.

### Satisfaction Levels

The overall job satisfaction levels findings revealed that about 65.3% and 33.1% of the respondents are moderately satisfied and very satisfied respectively. Meanwhile, satisfaction towards the nature of work, salary, promotional opportunities, supervision and relationship between co-workers are presented in Table 5 below.

TABLE 5: PERCENTAGES OF THE JOB SATISFACTION LEVELS TOWARDS EACH ASPECTS OF WORK

Types of satisfaction	Not Satisfied	Moderately Satisfied	Very Satisfied
Satisfaction towards the Nature of Work	6.6	66.1	27.3
Satisfaction towards Salary	35.5	51.2	13.2
Satisfaction towards Promotional Opportunities	35.5	36.4	28.1
Satisfaction towards Supervision	4.1	43	52.9
Satisfaction towards Relationship between Co-Workers	1.7	33.9	64.5

Findings in Table 5 indicated that 65.3% of the employees who are moderately satisfied in terms of overall job satisfaction may be due to the majority of the employees are moderately satisfied towards the nature of work, salary and promotional opportunities while 52.9% and 64.5% of the employees are very satisfied towards supervision and relationship between co-workers. On the other hand, about 65% of both men and women employees are moderately satisfied towards their overall job satisfaction.

Table 6 below showed that all the aspects of work as per the Cornell JDI have significant relationship with overall job satisfaction. Meanwhile, satisfaction towards promotion opportunities demonstrated the strongest linear relationship with overall job satisfaction, followed by satisfaction towards supervision, salary, nature of work and co-workers respectively. It is observed each facets of job satisfaction in the Cornell JDI are important in measuring job satisfaction as the partial correlations coefficients which measure the main effects of each of the facets towards overall job satisfaction is above 0.70.

TABLE 6: BIVARIATE AND PARTIAL CORRELATIONS BETWEEN SATISFACTION TOWARDS THE NATURE OF WORK, SALARY, PROMOTIONAL OPPORTUNITIES, SUPERVISION AND CO-WORKERS WITH OVERALL JOB SATISFACTION

Types of Satisfaction	Bivariate Correlation between Satisfaction towards each aspect of Cornell JDI and Overall Job Satisfaction	Partial Correlation between Satisfaction towards each aspect of work and Overall Job Satisfaction
Satisfaction towards the Nature of Work	0.631**	0.750**
Satisfaction towards Salary	0.532**	0.8002**
Satisfaction towards Promotional Opportunities	0.783**	0.8218**
Satisfaction towards Supervision	0.503**	0.810**
Satisfaction towards Co-Workers	0.416**	0.709**

\*\* correlations are significant at  $\alpha= 0.01$  level(2-ends)  
where  $p=0.000$  for all correlations

Meanwhile, there is no significant relationship between the demographic variables of this study and job satisfaction except for age and length of service which demonstrated significant relationships with satisfaction towards the nature of work.

## Discussion

Almost 65% of the employees are moderately satisfied and this finding can be explained by the Herzberg Two Factor Theory (1959) that employees will only be satisfied when their basic needs ie. hygiene factors such as annual leave, annual increase in salary, allowances, equipment and housing, EPF contribution and conducive working environment provided by the Bank are satisfied. In these aspects, the Bank has provided almost all the hygiene factors to its employees. However, promotion opportunities in the Bank is rather limited and based more on seniority rather than performance, though changes are on the way whereby promotion opportunities are more performance based rather than seniority based. There is evidence that almost 35% of the employees are not satisfied towards salary and promotion opportunities, though these are important factors influencing job satisfaction.

Generally, all the aspects of work in the Cornell JDI ie. satisfaction towards the nature of work, salary, promotion opportunities, supervision and co-workers are significant in influencing the job satisfaction of employees of Bank X. The hierarchy of relationship strength between each dimension of the Cornell JDI and overall job satisfaction in descending order is opportunities for promotion, supervision, salary, nature of work and co-workers. The findings are consistent with the findings of several studies such as Smith et al.(1969); Kacmar and Ferris(1989) and Zaiton (1982) that Cornell JDI has been well accepted by employees as a measurement tool with high validity and reliability which has been formulated thoroughly and it is also a good measurement tool of the construct of job satisfaction which is defined by Locke (1969) as an emotional reaction by employees as a result of his evaluation whether his job can satisfy his important values or not.

The relationship between satisfaction towards the nature of work and overall job satisfaction is strong and significant as evident by the Pearson r coefficient of 0.750. This may be explained by the perception and aspiration of the employees towards their work. Those employees who have high aspirations towards their work will

experience high job satisfaction. This is explained by Vroom's (1964) expectancy theory of measuring job satisfaction whereby an individual will only be committed to his job if he is aware that there is a strong relationship between his effort and achievement and also rewards which are important to him. Hackman and Oldman (1975) also mentioned that the characteristics and nature of work is an important determinant of job satisfaction. The importance of the nature of work in influencing job satisfaction is also highlighted by Locke (1969) that job satisfaction is the result of relationship between what is expected from the job and what is actually experienced by the employee.

Meanwhile, the need for job security emerged as the most important perceived employee need mainly due to the current employment scenario in the Malaysian banking industry whereby job security is more performance driven rather than seniority driven. Moreover, the many voluntary separation schemes (VSS) offered during the Asian regional economic crisis in 1998 and the banking industry merger exercise in 1999-2001 may have affected the sentiment of the employees.

This study revealed that employees are dissatisfied with their need for self-actualization which was the third most important perceived need and the need for autonomy as they are not given the opportunity to participate in the determination of methods and procedures and their jobs did not give them the feeling of self-fulfillment. This findings support the earlier findings by Porter (1962), Rhinehart et al., (1969) and Root and Tosi (1973).

The relationship between satisfaction towards salary and overall job satisfaction may be due to the fact that salary can eliminate job dissatisfaction and it can be a motivating factor if salary increment is linked with performance track record. This is in line with the opinion of Herzberg et al.(1959). In the Bank, salary scales are fixed according to the job grades and also terms and conditions specified in the collective agreement negotiated between the Bank's management and the employees' union every three years. Employees will normally get fixed annual increment whether they are performing or not. Even the bonuses component declared every year are dependent on the Bank's financial performance. This may perhaps explained why 35% of the employees are not satisfied towards their salary and the employees were most dissatisfied with the need for salary. This finding is consistent with the findings of Porter (1961) that salary is one of the most difficult aspects of employees' needs to be satisfied by employers. Since salary is the second most important perceived need identified in this study, the Bank is currently introducing a performance based salary system based on the respective Key Performance Index (KPIs) for various job grades.

The relationship between promotion opportunities and overall job satisfaction has the highest partial correlation. However, about 35% of the Bank's employees are not satisfied with promotion opportunities in the Bank and only 28% are very satisfied with it. This showed that promotion opportunities are limited in the Bank and it cannot satisfy those employees who have needs for advancement and self-improvement. Promotions are normally based on seniority rather than performance and it will normally take 3-5 years before an employee will be recommended for further promotion. This is line with the research findings of Patchens (1960) that individuals who are not promoted but feel that they are qualified for promotion, will experience job dissatisfaction, leading to deterioration in the individual's and organization's productivity. The importance of promotion opportunities may be due to the higher order needs of employees such as the need for achievement and self-esteem which are important to satisfy employees especially when their lower order needs have been satisfied (Maslow, 1954).

Meanwhile, the supervision aspect is the second most important facet of job satisfaction and the Bank should ensure that all employees are properly supervised in their work as highlighted by Locke (1976) and Vroom (1964). Effective supervision by supervisors is of paramount importance for bank employees as the banking industry is a highly regulated industry governed by the respective banks' standard practice of instructions, the Banking and Financial Institutions Act (BAFIA) and others. Last but not least, satisfaction towards co-workers is also an important determinant of job satisfaction and the employees are most satisfied with their social needs.

There is significant differences in the mean scores of satisfaction towards the nature of work between employees of different age groups. Hence, age is an important determinant of satisfaction towards the nature of work.

The findings contrasted with the findings of Kong, Chye, and Hian (1993) who reported several studies that there is positive linear relationship between age and job satisfaction. This may be due to the non-linear relationship between age and job satisfaction which was discovered by Luthans and Thomas (1989) who found curvilinear

relationship between age and job satisfaction. However, the findings of this study are consistent with the findings of Kong et al.(1993) and Lee and Wilbur (1985) that older employees are more satisfied than younger employees. This may be explained by the fact that younger employees who are more inexperienced are assigned more routine and simple jobs compared to senior employees who are more experienced and assigned non-routine jobs, engaged in complex decision making and undertaking challenging analysis. Kacmar and Ferris(1989) and Zeitz (1990) also reported that the U curvilinear is the most appropriate relationship between age and satisfaction towards salary, promotion opportunities, supervision and co-workers and the inconsistencies of past studies suggest that there are other factors such as length of service, educational level and salary which may influence the relationship between age and job satisfaction.

It is important to note that there is relationship between age and satisfaction towards the nature of work whereby older employees will be more satisfied than younger employees. This suggest that the senior employees perceive their job as more enjoyable, non-routine, interesting, creative, respectful, more challenging and satisfy the need for achievement. However, when other aspects of job satisfaction such as salary, promotion opportunities, supervision and co-workers are taken into account, the main effect of age towards overall job satisfaction becomes not significant.

There is also no significant relationship between gender and job satisfaction. This findings contrasted with the findings of Sauser and York (1978) who found significant differences of satisfaction towards promotion opportunities and the nature of work whereby men are more satisfied than women employees. However, the findings of this study are consistent with the findings of Herzberg et al.(1959) that there is no consistent conclusion of differences in job satisfaction between men and women employees and Hulin and Smith (1967) that gender is not an important factor influencing job satisfaction compared with other factors which change along with gender such as salary, job category, promotion opportunities, values of the society etc. There is also no significant relationship between job category and job satisfaction.

Other findings of this study is that there is no relationship between academic qualification and satisfaction towards salary which contrasted with the findings of Ronan and Organt (1973) and several other studies in the western literature that academic qualification has a weak positive relationship with satisfaction towards salary for all levels of employees. The implication is that the management of the Bank does not have to worry that its highly educated executives will be dissatisfied with their job.

Another important discovery of this study was that there is significant relationship between length of service and satisfaction towards the nature of work. This finding can be explained by referring to the report by Gruneberg (1979) who reported the work of Wild and Dawson (1972) that job satisfaction is related to both age and length of service and the longer the employee served the organization, the importance of factors such as self-esteem and nature of work will diminish while the importance of salary will increase. In this respect, the more senior employees will not pay attention to the nature of work when evaluating their satisfaction towards their job. However, they will emphasize the importance of salary and this is where the Bank's reward system which is often based on seniority will assist to satisfy the more senior employees. Meanwhile, when the effects of the other facets of job such as promotion opportunities, supervision and co-workers are taken into account, the effect of the length of service towards overall job satisfaction becomes not significant. The implication is that there are other factors such as the types of sampling units and types of satisfaction moderating the relationship between the length of service and job satisfaction.

There are also significant differences in the overall needs satisfaction, the need for autonomy and the need for self-actualization between the supervisory and clerical level of employees. The supervisory category which comprises the non-managerial level employees were less satisfied with the need for autonomy and the need for self-actualization compared to the clerical level employees. This may be explained by the fact that supervisors in the Bank are not given the opportunity to participate in the setting of goals as their job responsibilities and performance targets are set by the Management with little consultation/discussion with them. Moreover, the methods and procedures for work are determined by the management of the Bank and relevant Malaysian banking acts such as the Banking and Financial Institutions Act 1969 etc. As a result, the nature of work did not generate the feeling of worthwhile accomplishment needed to satisfied the need for self-actualization. The findings were not consistent with the findings of Porter (1961) and Porter and Mitchell (1967) that higher ranking employees tend to be more

satisfied with their higher order needs. However, both the supervisors and the clerical employees were dissatisfied with their higher order need for autonomy and need for self-actualization. This is due to the slow promotion process in the Bank that compared to the individual employee's performance.

## Conclusion

The study identified that the need for adequate salary and the need for self-actualization were important perceived needs for both supervisory and clerical level employees. However, these needs were regarded as the least fulfilled needs. Hence, the Bank needs to provide the opportunity for personal growth, the feeling of worthwhile accomplishment and performance and create pay for performance systems to promote the excellence driven culture in the Bank. Meanwhile, the Bank needs to be aware that the supervisors were generally less satisfied in all the employee needs' category compared to the clerical level employees. The Bank needs to create more opportunities for the supervisors to satisfy their need for social, self-esteem, autonomy, self-actualization and salary. Besides, their expectations of the perceived employment benefits must be managed to reflect the norm of the industry and the economy. It is important to satisfy the needs of the supervisors as they formed the majority of the workforce of the Bank and most of them are front liners delivering quality services to the ever demanding customers.

This study implies that the management of the Bank should be aware that the majority of its employees are only moderately satisfied and almost 36% of its employees are not satisfied towards promotion opportunities which is the most important aspect of the Cornell JDI influencing overall job satisfaction. In addition, the significant contribution of the five dimensions of job satisfaction in the Cornell JDI i.e., the nature of work, supervision, salary, promotion opportunities and co-workers have to been taken into account when designing effective human resource strategies in the future. This is important in view of the challenging Malaysian banking environment beyond 2007 when the full effects of financial liberalization is evident and the fact that motivated employees play important roles in creating and sustaining the resilience of the banking industry characterized by many challenges and opportunities in the new millennium.

# Human Capital Development in a Complex Learning System: The Virtuous Interaction between Individuals, Organizations and Communities

*Luciano Pilotti*  
*University of Milan, Italy*  
*Silvia Rita Sedita*  
*University of Padova, Italy*

## Abstract

The aim of the paper is to find a framework for understanding dynamics of the learning process at different levels, occurring through different forms of education. The purpose is to consider the impact of formal, informal, non-formal learning on firms' performance. For sure R&D expenses and market are really important to foster innovation and drive firms towards better performances, but they need to take place in a learning oriented environment.

Our target of analysis are micro and small firms learning processes, which we look at using secondary data from different sources. The paper proceeds as follow. Firstly, the main aim of the work and research questions are presented, secondly, we focus on the relationships between human capital and innovation in SME. Thirdly, we illustrate what we mean for learning, paying particular attention to the differences between education and learning. Fourthly, we propose our interpretative framework, analysing in details its components.

## Introduction

The aim of this paper is to find a framework for understanding dynamics of the learning process (changes in the stock of owned knowledge), at different levels (individuals, organization, community), occurring through different forms of education. The purpose is to consider the impact of formal, informal, non-formal learning, as they are defined in the 2001 Communication from the Commission of the European Communities, on firms' performance. For sure R&D expenses and market are really important to foster innovation and drive firms towards better performances, but not only. The wide spread of innovation by large scale of adoption and redesign (best practices, meta-standard) in multiple context, in fact, is enormously relevant overall in Europe, where systems of SMEs are dominant (20.415.000 SMEs vs. 40.000 large firms in Europe<sup>1</sup>). It is in this environment that the virtuous paradox of European industrial experiences takes place. We look at the innovation process as an ecological process (Shrivastava 1998), where the focus is the relational ability of individuals and the high quality of human resources, building a dynamic bridge between individual learning, organizational learning and network learning, sustaining the creativity of individuals in general and human capital in the specific. Three main categories determine an ecology system to build up a shared value between different actors:

- a) Internal/external interdependences (multidimensional identity – individual and network)
- b) Compatibilities as standards sharing (communication);
- c) Connectivity (developing interactions towards the creation of a super-identity).

This multidimensional network of interdependences shape a peculiar ecosystem of both actors and network interactions, able to foster competition and cooperation on the basis of their specific competencies and inclinations towards a process of knowledge and value creation [23][31]. From this perspective, we relay mainly on the work of Morin [41] [42], who defines an ecosystem as a complex system of interactions characterized by two subsystems: an interactive system and the environment.<sup>2</sup> None of these subsystems plays a dominant role in the generation of the ecosystem. The ecosystem is the dynamic and emergent outcome of the combinatorial interaction between these two parts, that we could defines as a sort of *genetic* mechanism of emergent ecology. A generative integration between systems - or system of systems - and complex environment (material culture, traditions, habits and mental habits, intangibles or specific coupling of tangibles and intangibles and so forth, building a flexible bridge between local and global resources to enlarge learning capacities by varieties [3][45][23].

The paradigm of the knowledge economy (K-Economy) is definitely shifting to a new paradigm: the learning economy (L-Economy) [35][22]. The key factor of this new “Paradigm” is the power of generating knowledge by knowledge. Inputs of productive process are technology and knowledge, and outputs are technology and knowledge as well, deriving by learning capacity of the agents of the value chain. New needs of innovative networks in a new industrial space are:

- a) Connecting richness of learning organizations by interacting in evolutionary contexts (through tacit knowledge sharing) and developing absorptive capacity as acquisition of codified knowledge;
- b) Connecting networks of firms, new cores of infrastructure (ICT, ADSL, new media, etc.), R&D institutions, High Education institutions (University, Business, School, middle School, etc. ).
- c) Connecting identity value of firms and identity value of network oriented to renew and upgrade multiple levels of an identity core tree.
- d) Connecting private and public interests to the same channels for multiple values of sustainable overall growth of non-scarce resources by creating meta-organizer .

We assume the innovation process as an ecology process where human resource needs are:

- a) Continuing education as long-life mobility intra-firms and inter-firms, intra-industry and inter-industry up to trans-national education system for managers, technicians or specialists, etc.
- b) Developing Innovation Support Organizations preferably oriented to SMEs network for focalised filiere or industry, or Local Production Systems for new management skills as “network manager” or “district manager”;
- c) Enlarged application of benchmarking methods for diffusing best practices (as prospected for example in “European Trend Chart of Innovation” )

The paper addresses the crucial issue of the creation of new skills and the re-invention of learning processes in Italian industrial districts or local production systems, through an emergent intensification in the use and development of new customised information and communication technology supporting new learning organization. This evolution implies the availability of trained workers who can maximise the opportunity offered by new technologies as a basic support to diffuse learning *in action*, to reinforce mobility, flexibility, adaptability and innovation of knowledge local resources by coupling global ones.

## **From “Knowledge Economy” to “Learning Economy”**

The paradigm of the knowledge economy (K-Economy) is definitely shifting to a new paradigm: the learning economy (L-Economy) [22][35]. The competitive advantage of firms doesn't reside in the amount of owned “scarce” knowledge, but in their capability to learn. How do firms learn? Do they learn through their employees? What is the relative impact of formal and informal education on their learning capabilities? Is it a matter of cross-learning actions between individuals and organizations? What are the principal types of learning? Those are the questions that can be raised for facing competitive issues in a learning economy. Henceforward we will try to provide some answers after giving some definitions and useful specifications.

Education is prevalently oriented to programmed knowledge meanwhile learning needs both programmed and non-programmed knowledge (as we can define made by “structure and semi-structure knowledge”), for facing the complexity of a not stable (internal/external) organizational climate (see: environment). Learning presumes diffuse interactions and an orientation to a system creativity of firms, where the engine is connecting human agents' minds through relationships of organizations, probably sustained by technology interfaces communities: learning fuelling (micro/macro) ecosystem.

The process of interaction changes nature and structure of the environment, but structure and nature of the environment themselves shape the structure and nature of the interaction: we assist to a complex process of co-evolutive mechanism by interaction of the two semi-autonomous levels of artificial life. The main resource of this interaction between two levels (system and environment) is a communication normally mediated by technology as a distance communication among both persons and systems creating a new social “virtual” space. We are referring here to a space that differs from the traditional space of action or work, because agents are not isolated but become

active and creative parts of virtual communities. In a virtual community emotions, tastes and preferences create glue to reproduce relationships within four main leverages that operate towards an integrated ecology of value involving single and networked systems:

- a) Instant relationships,
- b) No sense of place or absence of space;
- c) Relevance of contents as emotional value;
- d) Competence passion as a sharing mission in a chain of learning games [23].

It is quite well known that traditional teaching/learning approaches of highly structured and polished lessons in pre-programmed classes suffer of flexibility shortage [39]. They are too much stuck into fixed scheduling, offering a standardised form of education, which often doesn't fit the real needs of individuals and firms (mostly SMEs). Education systems fail to foster self-motivated learning, and the attitudes of openness, curiosity and responsibility needed to live and prosper in a permanently changing world. As Shrivastava [55] underlines, carefully pre-packaged knowledge resources (such as books, articles, case study analyses) sometimes become obsolete even as they are under preparation. That is why new knowledge societies need *ad hoc* education systems, where the past static classrooms have to be plugged into permanent and continually updating knowledge instruments and networks. The classic hierarchical relation between teacher and learner is moving towards the building of a knowledge ecosystem, which can extend over the entire working life of the learner. The ambitious objective of a knowledge ecosystem is to create and maintain strategic human resources, capable of enhancing the competitive advantage of companies where they are employed, through different kinds of knowledge applications (such as lifelong learning). In a static world, in fact, learning is not so important, the accumulation of knowledge needed to perform reasonably well the tasks occurs during the first ages of human life, through formal education. In an uncertain world, instead, where changes are becoming day-by-day routine and the demand for flexibility is swelling, the need to learn increases. Training is necessary throughout life. If theoretically this assumption can meet an almost general agreement, practically it meets some difficulties, particularly in the case of SMEs. The limited available time of managers and employees is a relevant obstacle to the adoption of a lifelong learning point of view. New educational forms and channels are needed, possibly involving distance learning and multimedia techniques [19], pushing the diffusion of adult education, in an action learning perspective.

It appears as if Reg Revans [48] is the first to introduce the concept of action learning for describing a type of learning that comes from concrete experience and critical reflection on it, basically through group discussions that allow learning from each components experience<sup>3</sup>. Particularly interesting is his "equation for learning" [49] that is:  $L = P + Q$ . Learning (L) occurs through a combination of programmed knowledge (P) and the ability to ask insightful questions (Q).

We can see at this type of learning as a three (at least) dimensions process, which involves together different spheres of the worker life: individual, social and job-related one.

Considering the complexity of human interactions, we can speak about learning in action as an overlapping layers learning system, where the single worker assumes a central position. Learning and training authorities actually largely recognize this "learner centrality" point of view, all over the world, as we can infer by reading several ILO (International Labour Office) documents.

*"The individual is becoming the architect and builder responsible for developing his or her own skills, supported by public and enterprise investment in lifelong learning."*

With this exhaustive sentence the 2002 Report IV [27] of the ILO underlines the emergent role of the learner in the emergent knowledge society. It is clear that the focus of international policies is moving from traditional formal education to informal processes of learning, where workers are been encouraged to be innovative and creative, where they learn to learn, and not to absorb passively new knowledge. They become learning agents in dynamic communities of learning.

Denmark, for example, is pioneering a learner centred approach to vocational education and training by interaction. This attitude enforces the potentiality and the performances of its enterprises [53]. In the Report IV<sup>4</sup>, in fact, it appears that Danish enterprises that introduced process or production innovations combined with targeted training are more likely than non-innovators to report output growth (11% vs. 4%), job growth (3% vs. 2%) and labour productivity growth (10% vs. 4%). The difference existing between knowledge and learning is not always

clear, misunderstandings may occur. Following the definitions given by Gavigan et al. [24], knowledge substantially describes a state or potential for action and decision in a person, organisation or group. Learning, instead, is a dynamic process, which indicates permanent changes in the state of knowledge, often manifested by a change in understanding, decision or action. Knowledge mostly derives from a process where the amount of information achieved is mediated by a context and by human beliefs. Two kinds of information can be identified: un-probable and probable. According to the Information Theory [54], it is the un-probability that defines the high value and usefulness of information, because un-probable information is mostly embedded (in individuals or organizations) and, by definition, hard to unforeseen. On the contrary, probable information is easily to forecast and therefore has a scarce or null value. Learning capacity of individuals and organizations signs a deep gap between the two types of information. The first one (un-probable) emerges by new contexts of interactions, the second one (probable), instead, is normally codified and it is non-context specific (or inter-context). Emergent innovation contexts need both types of knowledge: codified and non-codified. That is why we need to facilitate an education process where both formal/codified and informal/non-codified knowledge can coexist and interact, by fostering, for instance, a circular reproduction of contexts that enable the generation of individual and organisation creativity.

In other words, learning can be seen as the capacity to integrate different types of knowledge (both tacit and explicit) in an industrial or business activity. From the age of the industrialisation to date, explicit types of knowledge and consequently stereotyped forms of learning have been the only ones under the attention of policy action. In the emerging post-industrial world, soft-tacit forms of knowledge and learning have come to dominate, allowing the growth of a knowledge-based economy, characterised by high levels of adaptability, flexibility and creativity at individual and collective level.

## Types of Learning

The scale of current economic and social change, the rapid transition to a knowledge-based society and demographic pressures resulting from an ageing population in Europe are all challenges which demand a new approach to education and training, within the framework of lifelong learning<sup>5</sup>. Lifelong learning, in fact, is often encapsulated in the idea of the lifelong development of human potential to empower the learner to adapt to continuously changing circumstances. It is therefore generally agreed that lifelong learning marks a paradigm shift away from an emphasis on the supply of education and training opportunities provided by systems and institutions towards a demand for actual acquisition of learning in many different settings reflecting changing needs over the lifetime of the individual. Many conceptualisations of lifelong learning promote a multi-faceted aetiology consisting of active citizenship, personal fulfilment, employability and social inclusion, and embrace learning at primary, secondary, tertiary as well as continuing levels.

In the 2001 Communication from the Commission of the European Communities, lifelong learning is defined as:

*“all learning activity undertaken throughout life, with the aim of improving knowledge, skills and competence, within a personal, civic, social and/or employment-related perspective”*.<sup>6</sup>

The breadth of this definition draws attention to the full range of formal, non-formal and informal learning activity. In next paragraphs we are going to explain the conceptual contents of these three categories, according to definitions given in the Communication.

- Formal learning
  - *“Learning typically provided by an education or training institution, structured (in terms of learning objectives, learning time or learning support) and leading to certification. Formal learning is intentional from the learner’s perspective.”*<sup>7</sup>
    - Formal learning mainly takes place in education and training institutions and are leading to recognized diplomas and qualifications
- Non-formal learning

- *“Learning that is not provided by an education or training institution and typically does not lead to certification. It is, however, structured (in terms of learning objectives...). Non formal learning is intentional from the learner’s perspective.”*<sup>8</sup>
  - Non-formal learning mainly takes place outside education systems at the workplace and through learning activities provided by stakeholders, institutions etc. within the civic society. Situated learning [32], and instructive learning [13] belong to this category. They, in fact, are in practice a kind of efficient transfer of tacit knowledge through apprenticeship.
- Informal learning
  - *“Learning resulting from daily life activities related to work, family or leisure. It is not structured (in terms of learning objectives, learning time or learning support) and typically does not lead to certification. Informal learning may be intentional but in most cases it is non-intentional (or “incidental”/random).”*<sup>9</sup>
  - Informal learning is seen as the learning we experience through our daily life activities as human beings.

## **Locus of Learning (Providers of Education), Contents and Tools**

Learning oriented activities take place in different ways and following different channels. We distinguish among the locus of learning, i.e. the physical environment where knowledge is transferred and learning mechanisms are activated. Basically we identify three natural places: school, workplace and the Internet. As we can easily infer, each educational channel is characterised by a different type of audience, and shows both advantages and disadvantages, which we tried to summarise in the following.

### 1.1 Formal education → schooling

For formal education we mean the hierarchically structured, chronologically graded 'education system', running from primary school through the university and including, in addition to general academic studies, a variety of specialized programmes and institutions for full-time technical and professional training.

Among the advantages of this type of education:

- it provides a system of easily readable and comparable degrees;
- it guarantees an educational base where to build next specialization.

Among disadvantages:

- long-term and general;
- credential-based;
- contents are standardized and input centred;
- the delivery system is institution-based, isolated from environment, rigidly structured, teacher-centred and resource intensive;
- external / hierarchical control.

### 1.2 Training in line → workplace

Training in line includes every activities the enterprise develops for up-to-date the competencies of its employees. They can be shaped in the form of classroom lessons or conferences and seminars, as well as weekly/monthly meetings. This form of training is structured and is useful for the transfer of specific knowledge related to practical issues concerning the production system, as well as to technological issues concerning the enterprise communication and information system.

Advantages:

- possibility to deepen ad-hoc topics strictly related to firm core-activities;
- opportunity to create occasion of ideas exchange between employees employed at any level;
- reinforcing of the sense of belonging to the same work-community.

Disadvantages:

- very focused topics;
- scarce capacity to connect members outside the boundaries of the organisation.

### 1.3 On the job training → workplace

On the job training is an informal process of acquisition of professional skills, which is shaped through the direct observation (on the field) of the activities that a just-employed should carry out. By working next to an incumbent expert he has a great opportunity for absorbing gradually his/her competencies [18]. It's obviously a direct training tool (learning by doing), useful for transferring not only abilities and information, but also tacit behavioural codes, allowing a socialisation of competencies at an organisational level [43]. This form of learning can be assimilated to a kind of apprenticeship, where the temporal horizon is limited and declared, and the knowledge shared is mostly contextual.

Main advantages of the adoption of on the job training are:

- possibility to transfer knowledge (specific and tacit) regarding utilisation of specific production processes, which imply both the familiarisation with the technology and the specific behaviour typical of the productive context;
- orientation to workers employed at any level (from the lowest to the highest ones);
- increasing horizontal intra-firm mobility of workers and consequently elevate capacity to front complex problems related to interconnected areas of the company;
- quick and easy inclusion of young workers in the firm context and enforcement of the feeling of belonging to the new work community;
- perfect integration in the production activity, without breaking point.

Between the disadvantages we can consider:

- strong investment of the company in the process of training;
- subtraction of some of the most valid incumbent workers from their task during the on the job training activity;
- risk of replication of past best practices, in a static learning context, where a kind of path-dependency mechanism occurs.

### 1.4 Education on-line → society, community→ubiquification

Removing social, geographical, psychological barriers (by promoting, for instance, ICT) is a key point in the process of facilitating access to learning opportunities. Workplace learning and local learning centres are able to bring learning and learners together at times/paces and in places suited to other people's commitments. Education on-line is a technology-based category of training, which allows instructor and student being separated geographically. Main efficient vehicles for information exchange are multimedia tools, such as audio, video, and graphics. Both synchronous (real-time training) and asynchronous forms of interaction are possible. Anyway, the more is the reduction of temporal lag, the more we can assume the students can benefit from this educational form. Proximity advantages of instant feedback can be re-created in the virtual education environment, thanks to customised software for interactive individual and group communication (Internet Relay Chat (IRC), Multi-User Domain (MUD), and MUD-Object Oriented (MOO)). We are talking about a distance type of learning, which is build upon an interactive type of knowledge at the organisational level, and which can evolve towards a final empowerment of workers thanks to the benefit of the enlargement of the number and expertise of the learners involved. The shift from the organisational level to the community level implies a growing process of knowledge sharing from which individuals, organisation and society can benefit. ICT tools permit to go over the barriers of the single experience (both at the individual and at the organisational level), and to exploit a network effect, where the pluralities of actors and of their background joint together can be mutually empowered. Virtual communities of practices, as described by Wenger [58] are one of the means that can be surprisingly helpful for reaching the purpose.

Advantages in the implementation of distance learning for virtual office workers are basically:

- possibility to chose a convenient location for both student and instructor, reducing travel expenditures and wastes of time;
- availability of expert instructors independently from their geographic location;
- high interactivity due to the use of advanced communication technology, which allows also the shyest student to express doubts and solutions (it is well known how virtual interaction benefits from the sense of protection given by the web);
- global reduction of training costs, and consequently broader employee access.

Among disadvantages:

- absence of visual contact and connected difficulty to be concentrated, for the student, and to give equal attention to all the students, for the trainer;
- difficulties to adapt certain topics to the distance learning format;
- initial difficulty to feel the sense of belonging to the virtual learning-community;
- basic computer skills are a prerequisite for accessing this educational channel;
- infrastructure costs, related to the acquisition of computer equipment and communication services (specific software, fast connections and so on).

## The Pace of the Learning Activity: An Interpretative Framework

The number of the agents involved in the learning process determines the effectiveness of the knowledge transferred and created among networks of different sizes. **FIG. 1** shows the relationship between the two forces that regulate the learning process, geographical power (in terms of physical area covered), the relational power (in terms of number of agents involved) and the resultant force, fruit of their interplaying: the effectiveness (in terms of amount and quality of knowledge created and transferred) or knowledge intensity.

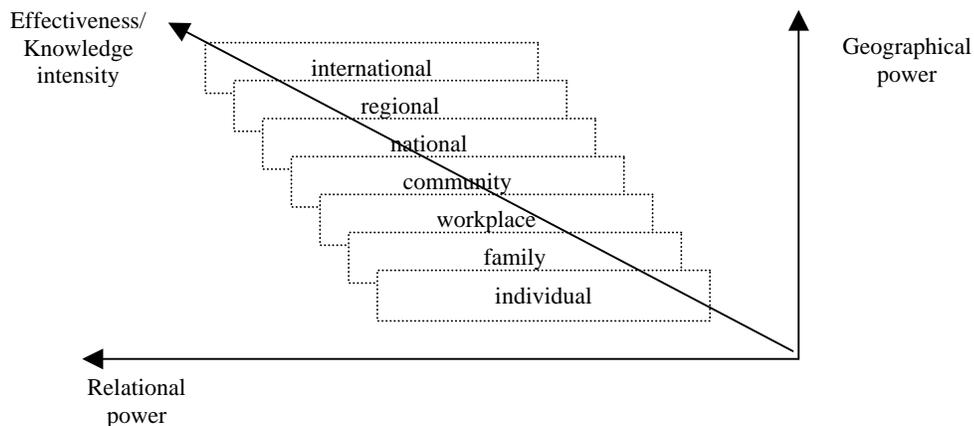

FIG. 1: SETTINGS OF LEARNING AND RELATED POWER.  
SOURCE: OUR ELABORATION

The potential agents involved in the educational process<sup>10</sup> can be grouped in three levels:

- The individual level orientates attention to the education and training of people;
- The organisational level refer to the co-operative and collective processes of knowledge generation, management and learning within organisations and between organisation in networks;
- The broader community or system level considers the overall coherence of individual and organisational knowledge and learning processes, plus the frameworks and incentives in place to further their development.

We propose firstly a tri-dimensional framework, where different types of education, from traditional (mono-directional and static) to technology-based (interactive and dynamic) ones, give life to plural types of learning, which involve the participation of different agents.

In **FIG. 2** there is a graphic representation of the framework. In x-axes we find the educational forms, in y-axes the learning types and in z-axes the agents involved. The best way to read the graph is to start from the x-axes, and individuate for each educational form what is the type of learning associated (y-axes). Finally, connecting the y-axes with the z-axes we can have an idea of the impact of informal, non-formal, formal learning on the agents involved in the process.

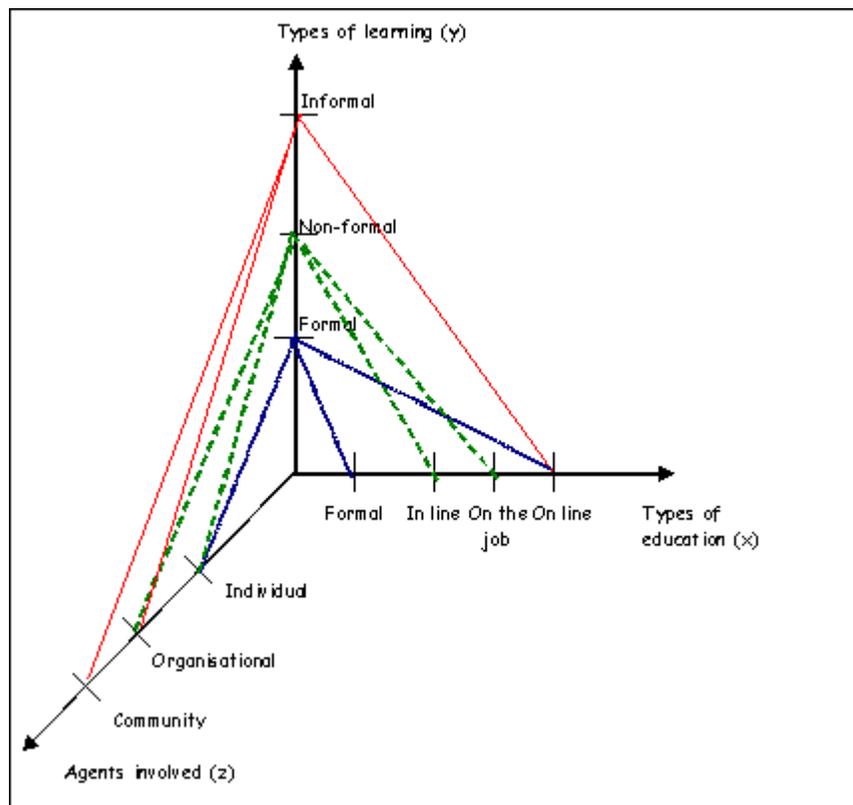

FIG. 2: THE FRAMEWORK (FIRST STEP).  
SOURCE: OUR ELABORATION

Let see what happens if we take in consideration the formal education: it implies a structured and standardised type of learning, which involves learners at an individual level. Scarce or null attention is given to interactions between the learner and the environment, in the shape, for instance, of sharing experiences with other learners or of meeting the local working demand. It's basically routed on an instructive process, where little room is reserved to follow and deepen individual proclivities, to foster personal involvement and to reinforce the engagement.

Looking at the in-line training, we shift to a non-formal learning, based on participation to internal courses or meetings, which are extremely focused in specific topics, which allow workers belonging to the same organisation engaging together a learning experience, even if the possibilities of mutual interaction are still low.

If we look at the on the job training, we assist to a non-formal learning process, which doesn't lead to a certification, which is deeply based on a strong peer-to-peer relationship between the individual and the organisation. The sphere of interest here is enlarged, the number of agents involved increases, and the goals of the training are in a way more reliable because they are declined on the basis of a company's needs.

Things completely change when we approach the on line education. Here, thanks to the availability of modern information and communication technology, able to connect distant location and to allow interactions between people both in an asynchronous and synchronous way, learning process evolve towards a formal plus informal model. We enter the domain of the virtual, which can be viewed as a place where employees meet together

and share their experience, but also a place where standard teachers and learners virtuously interact. The co-existence of the offer of pre-packed curricula, on one side, and high versatile sections firm-oriented or learner-oriented, on the other side, turns to be particularly useful to aid SMEs embracing new challenges (in terms of technological change, innovation adoption, network processes). In this case the standard becomes pushing flexible solutions that can broader involve a plurality of agents, stimulating learners' active participation and providing ad-hoc solutions.

By the way, this first framework can be extended including emergent issues in learning types and focusing on the nature of the knowledge exchanged by different channels (or education places). A representation of this enlarged framework can be found in FIG. 3.

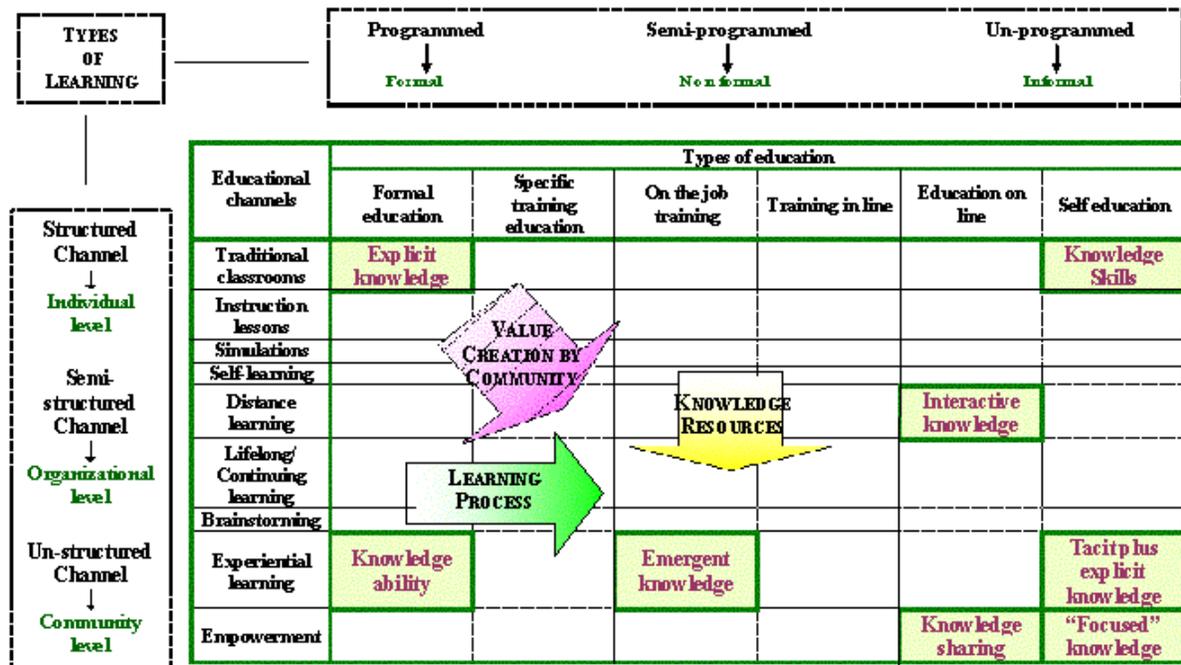

FIG. 3: THE FRAMEWORK (SECOND STEP).  
SOURCE: OUR ELABORATION

In the table presented in FIG. 3, out of the borders there are different types of learning with their main characteristics and their level of impact (on individuals, organisations, community), in columns there are educational forms, in rows there are educational channels. Matching together this information we are able to describe the complexity of the inter-relationships between the components of the learning system.

Here (FIG. 3) we can identify at least three strong forces that influences the dynamic of the education process:

- the learning process;
- the capability to create knowledge by community;
- the knowledge resources.

Moving from the left to the right of the table, learning appears to be more and more un-programmed, embracing the “informal” category, where explicit knowledge loses its weight and the tacit knowledge prevails.

Moving top-down we meet a type of learning un-structured, which is able to affect an enlarged number of actors and to build what can really be called a learning-ecosystem, based on knowledge sharing. Finally, if we follow the diagonal of the table, from the top-left corner to the bottom-right one, we can individuate a pattern where

value for the whole system is created. The knowledge transferred in this case is focused in terms both of the task and the user, it is the fruit of community interactions and it is mainly incorporated in individuals, as a mixture of tacit and codified knowledge (derived by formal learning and experience).

## Learning in SMEs and Local Production Systems

Spatial proximity has been elected by some scholars as one of the most important determinants for learning capability. They talk about economies of agglomeration, that is: net benefits of being in a location together with other firms increase with the number of firms in the location. Emblematic is the case of industrial districts, where non-market relations between firms, trust, conventions, cultural structures and non-codified knowledge are seen as factors of spatial binding, which promote innovation and entrepreneurship and help lowering transaction costs.

It is not the purpose of this work to recall all the types of local production systems, which sometimes take the shape of a cluster [47], sometimes of an industrial district [9], some others of a regional system of innovation [37]. The concept we want to take in account here as a reference one is the local development, which involves simultaneously local firms, institutions, social community, workers.

It is particularly relevant to give a careful look to the statistics concerning the pace of the training activities of SMEs, which dominate the economic Italian landscape. ISTAT collected in the second survey CVTS2 (Continuing Vocational Training Survey), performed in 1999, many useful information on the learning structure of SMEs and large firms by interviewing directly 2.665 large enterprises and mailing 11.000 firms with more than 10 employees. The situation of Italian enterprises can be compared at the international level with other countries (TABLE 1), revealing a clear time lag that imposes a penalty on Italian SMEs development and competitiveness.

TABLE 1: PERCENTAGE OF FIRMS THAT PERFORM TRAINING ACTIVITIES BY COUNTRY AND SIZE

Country	Total	10-49 employees	50-249 employees	>249 employees
Denmark	96	95	98	100
Netherlands	88	85	96	98
Ireland	79	75	98	100
Germany	75	71	86	98
Belgium	70	66	93	100
Spain	36	31	58	86
Italy	24	21	49	81
Portugal	22	17	46	78

SOURCE: ISTAT/EUROSTAT: CONTINUING VOCATIONAL TRAINING SURVEY - 1999

The characteristics of the Italian business structure, dominated by small firms that prevalently do not carry out any form of training activities pushes towards a serious reflection on type, time, and place where to organise the necessary employees update.

We propose to look not only at the single firm, but at the network of relations locally built and developed between public and private training institutions, trade associations and chambers of trade, organizations and individuals, in search for a useful training planning, organization and management (**FIG. 4**).

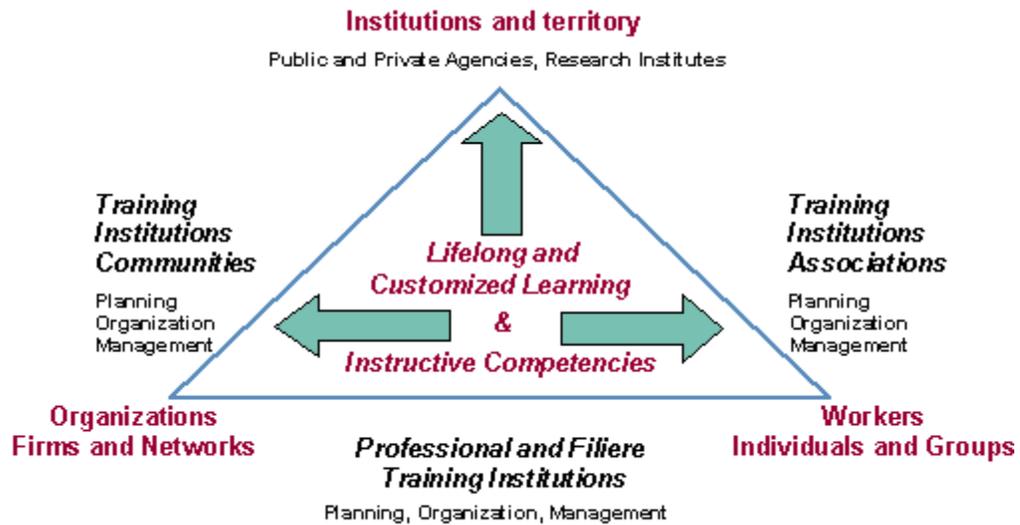

FIG. 4: THE TRAINING VALUE CHAIN.  
SOURCE: ALBERTINI AND PILOTTI [4]

Besides, we individuate in the territory the first and natural place where to share training investments, both between firms and workers. The specific local productive environment, with its social and work-based relationships, constitutes a powerful layer where to insert instructive initiatives, deploying the communication channels that already exist. We are referring to training activities that benefit not only the single individual or firm, but also the overall local production system, which is characterised by a lively local market for skill connected with a high level of inter-firm mobility. The existence of a district-specific and not firm-specific labour market is unluckily not linked to a local institutional engineering [14], able to plan customised training activities.

Despite the need of local learning policies [34][52], there is a lack of formal institutions (trade associations, service centres, universities, research institutes, chambers of trade) or informal institutional mechanisms developed between firms (inter-firm agreements, partnerships, communitarian rules).

A inter-firm and communitarian place, not completely public nor private (firm specific), should be created, where to access knowledge resources for labour force upgrading. We are talking about a new locus of learning, which is rooted on the social and economic relational tissue and whose benefit can be appropriated by all the agents of the local system, a meta-organiser operating at a meso-level, just between the macro (government) and the micro (firm) level. This new approach to the learning dynamics of local systems imply to shift the focus from a supply-push to a demand-pull model, where the instructive technology adapt to the specific needs of the system, to produce customised educational channels and contents, towards a context-specific instructive value chain.

The flexible model of production, which is typical of the local production systems, has to be coupled by an adequate learning structure, which is organised around the specific tasks to be performed.

Stemming from the assumption that learning is a social activity, and derives from social participation [32], we outline an environment that is marked out by the interplaying between different agents.

Under this vision, territory can't be no longer seen as a simple container of a lot of elements (such as morphologic, social, economic, political objects), but it must be seen as the locus of a fruitful interaction between them. ICT diffusion is one of the tools that can be exploited to create quick and deep linkages between all the stakeholders of what cannot be ever named a "territory", but which should be better defined as a "space system" (characterised by dominating governance) or an "ecology system" (characterised by interdependence governance).

One of the heaviest problem a SME is finding a way to meet effectively time to work and time to learn, that need to be viewed as different moments of a holistic process of growth. New tools from ICT (Information and

Communication Technology), which form the “knowledge local infrastructure”, could be very helpful in this field, allowing the creation of alternative educational channels, such as, for example, the distance education.

## Conclusions

The paper aimed to enlighten on the complex learning environment which is created by the interactions between different agents at different levels (individual, organization, community). Looking for an interpretative framework, we propose our view for a possible schematization of the places where learning occurs, the channels by which knowledge is transferred and the content of the knowledge transferred. We basically distinguish between schooling, workplace and on-line training. Our effort aims to produce a more policy-oriented contribution, able to overcome the limits given by the theoretical controversy developed around the attempt to establish the relative importance of tacit vs. codified knowledge and vice versa.

A particular attention is devoted to the analysis of learning activities occurring in local production systems, where the territory and its properties (physical, social, economic) play a fundamental role in planning training and instructive activities. The establishment or the individuation of instructive meta-organizers avoid to keep knowledge transfer and accumulation as an individual action.

The local production system behaves, in fact, as an ecology system, where the interactions among the agents and between the internal agents and the environment, constitute a natural field where to articulate modern education and training methods, that take in account of the pre-existent networks of relations.

We pinpoint the need to customise the training offer according to the specificity of the place and of the type of relations between firms, local institutions, labour market. Tools coming from ICT appear to be a good chance to realize an educational network that can be rather flexible in terms of time and space devoted to training activities.

Distance learning coupled with periodical encounters, such as fairs, meetings et al. could be a solution to the largely diffused attitude towards routines and mental models driven systems of running the business in micro and small firms.

The work is oriented towards the constitution of a complex learning system, which empowers itself thanks to the local relations and which takes advantage from the fruitful communication with global agents, in an evolving spiral of creation and conversion of both tacit and codified knowledge through new connected educational platform, generating a multiplicative effect of the learning efforts.

## End Notes

<sup>1</sup> Source: Osservatorio Europeo 2002 sulle PMI.

<sup>2</sup> Lanzara and Morner [31], referring to the work of Bateson [8], apply a similar definition. The ecology of open source, according to their perspective, is an interactive system. Part of the "rules" that "govern" the interaction in the ecology are in-scripted in the coordination technologies that parties use to coordinate their work.

<sup>3</sup> Action learning can be associated, in a way, with the type of learning occurring inside Communities of Practices (CoPs) [59]. Here learning is viewed as a social process, where each member benefits from the interactions with

---

other members, and where personal experiences and capabilities melt together with the experiences and capabilities of the whole community. Nevertheless, the main difference between the two types reside in the characteristics of the group (community, in the case of CoPs). CoP, in fact, constitutes a rather defined and fruitful environment, where to share knowledge and where to play action learning.

<sup>8</sup>See endnote 6

<sup>9</sup>See endnote 6

<sup>10</sup>The classification has been inspired by the considerations made by Gavigan et al.[24] in their Report on Knowledge and Learning prepared for the European Commission Directorate.

## Does Type A Behaviour at Work: A Taiwanese Case

*Amy Lai Yu Wong*

*The Hong Kong Polytechnic University, Hong Kong*

### Abstract

Bortner's Type A Behavior Questionnaires was used to explore the work behavior of Chinese managers and entrepreneurs in Taiwan and how that behavior was influenced by occupation, age and gender. 117 subjects participated in the study of which 45 were also interviewed. The mean score on the questionnaire was 74.68, the median (74) and the mode (76) within a scoring range of 0-140. 84 subjects registered scores of 80 or less (Type B behavior) and 33 came within the mid-range of 81-120. None of the subjects registered scores of 121-140 (Type A Behavior). The highest score of 113 was registered by a female bank vice-president and the lowest (47) by a male manager working in a charitable organization and about to retire. The results are discussed within the context of Chinese cultural traditional and parenting practices, the unique characteristics of Taiwan's recent history and the subjects' career experience.

### Introduction

It has become almost a commonplace to remark that we live in hectic times fraught with intractable pressure such as deadlines, role conflict and ambiguity, financial responsibilities, traffic congestion, noise and air pollution, family problems and work overload (Kreitner et al. 1999). Technological advancements make it harder for employees to disconnect completely from the office. Managers find that the dynamics of modern career life present them with real challenges in balancing the demands of work and non-work obligations. Studies of the impact of these pressures have also become common. Barley and Knight (1992) reported that the amount of published material on work and stress had doubled since 1980 and this rapid rise continues. More than two decades ago, Rosenman and Chesney (1982) argued that the modern work environment had stimulated competitiveness, aggression and hostility and created unique stressors not experienced by previous generations or non-industrialized societies. Cooper (1981) pointed out that managers are particularly vulnerable to these intensifying pressures and Cox and Cooper (1988), in a study of forty-five UK chief executives, commented on what they referred to as their 'frenetic' lifestyle. A major survey undertaken by the UK Institute of Management (1996) and involving almost 1100 managers showed that stress is common to all levels and types of manager with nearly 90% of the sample reporting adverse effects on their health, morale, work effectiveness and relationships.

Given the weighty responsibilities which managers are said typically to carry, often coupled with relentless time pressures and equally relentless pressure to deliver, it is reasonable to conjecture that these factors will carry significant implications for the way managers (and entrepreneurs) go about their work. However, studies of these implications to date have focused predominantly on managers in the West with a few exceptions such as the research of Siu et al (1999) comparing two managerial samples from Hong Kong and Taiwan. There is a paucity of studies of Chinese managers' work behaviour and particularly so as regards Taiwan.

Looking back over the last forty years, Taiwan has been gone through several stages of modernization and became one of the Asian Economic Tigers. The intention of the Taiwanese government has been to make the country a regional economic power by actively encouraging foreign direct investment, a policy which has spawned new managerial elite. Simultaneously, one of the Taiwan government's central economic policies has been to encourage the establishment of small and medium size businesses, the outcome of which has been the growth of a vibrant entrepreneur class. The success of the Taiwanese economy thus owes a great deal to its managers and entrepreneurs who have risen to the government's challenge through their strong work ethic, long hours and busy lives. On the face of it at least, Taiwanese managers and entrepreneurs are strong candidates for demonstrating the kind of behaviour denominated by Friedman et al. (1966) as Type A: behaviour characterized by aggression, impatience, time urgency and restlessness.

## Literature Review of Managerial Work Behaviour-Type A Behaviour

During the 1960s, Friedman and Rosenman made extensive studies of patients with coronary heart disease (CHD) (Rosenman et al. 1966). They found that these patients behaved similarly in many ways, being extremely competitive, high-achieving, aggressive, hostile, impatient and restless. They were also characterized by explosive speech patterns, tenseness of facial muscles and appeared to be under constant pressure of time. Friedman and Rosenman referred to these patients as having 'Type A' personality types as opposed to the more relaxed 'Type B' individuals who were 'completely free of all of the habits and exhibiting none of the traits of the Type A personality.' Type Bs, in contrast to Type As, have a low risk of coronary heart disease but Type A employees tend to be more productive than Type Bs. Kreitner et al. (1999) refer to three studies covering students, university professors and life assurance brokers, in each of which Type A Behaviour and performance showed a significant and positive correlation. But this high performance can bring with it negative consequences such as raised blood pressure and high cholesterol levels. Friedman and Rosenman contend that Type A Behaviour may not be due solely to personality attributes but rather that the cluster of particular behaviours as manifested by Type A Behaviour stems from the interaction of specific personality characteristics with the stressors of the environmental milieu (Rosenman, 1978). Cox and Cooper (1988) report a study of white-collar, middle class males in Buffalo, New York in which a link between high status jobs and Type A Behaviour was indicated. The men occupied a range of work settings including banking, healthcare, university academics and trade union officers. Type A Behaviour was found to relate to occupational status as measured by rank, level of occupational prestige and income. It was also significantly related to rapid career achievement as indicated by rank and income relative to age.

Chusmir and Hood (1986), examining the relationship between Type A Behaviour and motivation needs, argued that Type A individuals, both men and women, are characterized by high levels of job commitment, higher needs for power and achievement and a tendency to occupy high-ranking positions in profit-making organizations. They are also more prone to low job dissatisfaction and are younger compared to Type B subjects. Individuals identified as Type B are most characterized by reports of high job satisfaction, are older and work more often for non-profit making organizations than Type A subjects. Thoresen and Low (1991) and Moss et al. (1986) suggest that as age increases, Type A Behaviour decreases. Studies by Waldron et al. (1977) and by Davidson, Cooper and Chamberlain (1980) indicate that older professional women (over 60 years old) demonstrate virtually no Type A Behaviour. The reason for this may due to a sense of satisfaction and achievement with what life has brought. Byrne and Reinhart (1989) suggested that as individuals achieve their life goals, Type A Behaviours become less important. Greenglass (1991), in a study of female academics at a large Canadian university, found that those who were looking to be promoted to professor were more likely to display Type A Behaviour patterns. Type A scores also correlated positively with role-conflict: the higher the Type A, the higher the role conflict in areas involving work and family roles. Bedeian et al. (1990) examined the work exposure of accountants (men and women) and found that, on the whole, Type A correlated with the work experience of males but not of females. Job satisfaction and Type A status were only weakly related for males but highly related for the women in the study. The authors conjecture that this gender-based difference may be related to a relative ineffectiveness of males in managing such negative Type A characteristics as impatience, hostility and aggressiveness.

Cohen and Reed (1985) report on a cross-cultural study comparing Japanese and Caucasian men. The results of the study indicated that there was low prevalence of Type A Behaviour among the Japanese subjects (18.7% in comparison to 50% in the American white-collar male sample). The authors explained these findings in cultural terms: the Japanese culture encourages trust and cohesiveness at the expense of individual needs for achievement; similarly, it discourages the hard-driving and competitive behaviour which are reinforced by western cultures. In a study comparing managers in Hong Kong and Taiwan (men and women) for occupational stress, Siu et al. (1999) report little difference between the two samples. However in the Hong Kong group, Type A Behaviour was associated with strain symptoms: worse physical and mental well-being and higher absenteeism. In the Taiwan group, Type A Behaviour was only associated with worse physical well-being. The gender difference in Type A Behaviour was not significant in Hong Kong but in Taiwan, male managers indicated a higher tendency towards Type A Behaviour than their female counterparts.

## **Taiwan and Its Cultural Specific Characteristics**

Taiwan's economy before the 1960's was based primarily on low-skill labour-intensive industry such as assembly work and agricultural plantations. In 1949, when Chiang Kai Shek retreated to Taiwan, his one million followers brought with them much of the indigenous Chinese culture such as Confucian values and Mainland dialects, life styles and traditional religious practices. However, the Japanese who withdrew from Taiwan after their defeat in World War II left a legacy of their own culture and the Americans, who have aided and protected Taiwan since that time, have also left their mark.

From the-mid 1960s to the 1980s, Taiwan implemented a series of economic reforms which rapidly accelerated the country's economic growth and raised the people's living standard. Taipei is the capital city and has been developing fast over the past 30-40 years with a strong economic infrastructure whilst Taiwan, the second city gradually shifted to become an important commercial centre with a strong service base from its mainly industrial beginnings. Taiwan has also been the recipient of considerable foreign direct investment (FDI) during the process of its economic and social reforms and this has been accompanied by an influx of western business management values, ideas and practices. In other words, both of the country's major cities provide vibrant job markets and opportunities for individuals to enjoy high career mobility. Over the last ten years or so, the expansion of industries calling for high levels of technological know-how has raised the standard of managerial performance required in order to sustain continuing economic development. The determination of the Taiwanese government to make the country a regional economic power has had spectacular results. In addition to the government's determination to reform Taiwan's economy, other factors such as a strong Confucian work ethic engendering hard work and thrift (Westwood, 1992) may also be at work.

The economic transformation of the Asian Tigers, including Taiwan, within the space of a single generation has raised the question of whether there is something uniquely Asian at work here. Given the common Confucian heritage of these countries, is that something essentially bound up with Confucian values? Interestingly, Weber ([1926], 1964) took the view that Confucianism was anything but conducive to economic success. He argued that its emphasis on obedience to parental authority discouraged competition, risk-taking and innovation; in other words, it was hostile to capitalism. More recently however, commentators have focused on other aspects of Confucianism, explaining the success of the Tiger economies and China as well in terms of their encouragement of hard work, high rates of savings and investment, long-term vision and an emphasis on co-operation towards achieving shared goals. Not everyone is convinced about this explanation: for example, the celebration of Confucianism in South-East Asia has been said to spring from the central importance which it attaches to obedience, a feature which makes it attractive to authoritarian governments in the region (Naisbitt, 1997). Nevertheless, the debate about the nature and extent of the influence of Confucianism goes on and, to the extent that it has been deemed important in producing economic success, it seems a logical next step to me to enquire into how far elements within the Confucian work ethic are reflected in the behaviour of the managers and entrepreneurs who can reasonably claim much of the credit for delivering that success? Does hard work coupled with a strong desire to achieve manifest itself in the behaviour characteristics known as Type A? And are there any culture-specific factors operating in Taiwan which might additionally lead to Type A Behaviour patterns? In other words, is Type A Behaviour an inevitable outcome of leading a managerial and entrepreneurial career in present-day Taiwan? What role do Confucian values play in important decisions in the work and personal lives its managers and entrepreneurs?

## **Taiwanese Managers and Entrepreneurs and Type A Behaviour**

Research evidence has been presented above about links between the nature of managerial work, individual characteristics (age, gender, occupation, career aspirations etc) and Type A Behaviour. On the basis of this evidence, I conjectured that, in the context of present-day Taiwan with its own peculiar pressures on managers stemming from the voracious national appetite for economic growth, a high incidence of Type A Behaviour should be found among the subjects taking part in this study. Given also the links revealed by the research between Type A Behaviour and age, gender and occupation, I was also interested in exploring how far these factors were lead to significant in

influencing the work behaviour of the sample population. Research cited already in this paper, Byrne and Reinhart (1989), Thoresen and Low (1991), Moss et al. (1986) has demonstrated the effects of age on work behaviour and attitudes towards career achievement. Also, Greenglass (1991), Siu et al. (1999), Waldron et al. (1977), and Davidson et al. (1980) have shown how gender can have a differential impact on work behaviour. And turning to occupation, Rosenman et al. (1966), Cox and Cooper (1988), Chusmir and Hood (1986) and Kreitner et al. (1999) have produced findings which suggest that type of occupation, responsibilities and organizational ranking can all exert influence on work behaviour. But no research to date, as far as I am aware, has examined the variables of age, gender and occupation as they affect Type A Behaviour solely within the Taiwanese context. This led me to frame the following research question as the cornerstone of my research:

### **What are the Work Behaviour Characteristics of the Subjects (Using Type A as an Indicator)?**

It is contended that differences in scores on Type A Behaviour measures among the subjects according to age, gender and occupation represent prima facie evidence of the influence of these factors on the subjects' work behaviour. Three hypotheses were proposed relating to this research question:-

H1: Given the indicators from research that Type A Behaviour tends to decline with age, younger subjects taking part in the study are more likely than older subjects to exhibit Type A Behaviour.

H2: Given the indicators from research that Type A Behaviour is more associated with males than females, male subjects are more likely to exhibit Type A Behaviour than women subjects.

H3: Since the work of managers and entrepreneurs could be considered as equally demanding, there will be no differences between managers and entrepreneur subjects on Type A Behaviour.

### **Method and Research Techniques**

Two instruments were considered for gathering data to measure the managers' and entrepreneurs' behaviour. One was devised by Bortner (1969) consisting of 14 bipolar items (e.g. never late -casual about appointments, very competitive-never competitive). Bortner's questionnaire was derived from studies of coronary heart disease by Rosenman et al. (1966). The scoring range is 0-140. Scores of 121-140 are considered high (proneness to Type A Behaviour), scores of 81-120 average, and scores of 0-80 low (proneness to Type B behaviour) (Friedman and Rosenman, 1974). The questionnaire has been validated and is widely used (Robinson and Heller; 1980; Cox and Cooper, 1988; Thoresen and Low, 1991; Lam, 1996). The second instrument is the Jenkins Activity Survey (JAS) (1979) which consists of 52-items and is a modification of Bortner's instrument. (JAS) yields a total Type A score as well as a score for stress assessment which comprises three factors: a speed and impatience factor, a job involvement factor and a hard-driving and competitiveness factor. Bortner's was the preferred instrument for the present study as it is simple and clear as well as being easy to administer.

In order to enrich the data collected from the Type A Behaviour questionnaires, semi-structured interviews were carried out with 45 subjects to gain a deeper understanding of their perceptions of their career experience. An interview is a conversational exchange with the purpose of obtaining insight and knowledge by listening carefully and by questioning the interviewee and as such, it allowed the subjects to articulate and define their thoughts and feelings and what they perceived as important to them (Miles and Humberman, 1994; Wong and Slater, 2002). The subjects were also requested to complete a biographic data sheet indicating their age, gender, occupation and their work history. Its purpose was to provide background details to assist in analyzing the data collected from the Type A Behaviour questionnaires and interviews.

The Bortner Type A Behaviour questionnaires was first published in English but in this study, it was translated and administered in Chinese, the established convention of back-translation being used to verify that accuracy of meaning had not suffered through translation (Brislin, 1986). The semi-structured interviews were conducted in Chinese too. The reason for using Chinese was to ensure that the concepts were fully understood by the subjects. Although all of the interviewees were highly educated and spoke fairly good to fluent English, it seemed

wise to use Chinese as the medium for the study to ensure that there was no ambiguity in their understanding of some of the specific English terms used when translated into Chinese. A pilot study was carried out using a trial group of native Chinese speakers from Taiwan to ensure the acceptability of the Chinese version of the Type A Behaviour questionnaires. Discussion and revision meetings were also held on five occasions involving the same trial group to test the interview format and especially to ensure that it included appropriate words, tones, common expressions and phrases which are used colloquially in Taiwan. These discussions turned out to be very useful subsequently in enhancing the effectiveness of the interviews.

## Sampling and Data Collection

117 subjects were identified from Taipei and Taiwan. The reasons for choosing these two cities stem from their economic significance within Taiwan and their thriving managerial job markets, characteristics which I have previously referred to. In other words, they offered good potential for finding subjects who would meet the sample criteria. These were that they had to be ethnically Chinese, either born in Taiwan or living there for more than 20 years; aged 30 or above, university educated and in a managerial and or entrepreneurial role for at least 5 years.

The subjects taking part in the study turned out on average to have at least eight years working experience and at the time and were either employed as managers or self-employed as entrepreneurs. Some combined employment as managers with part-time entrepreneurial activities. Most of them had an MBA or were studying part-time for an MBA. Of the 117 subjects, there were 86 males and 31 females. Of the males, 54 were managers and 32 entrepreneurs (self-employed or in business partnerships). Of the females, 28 were managers and 3 entrepreneurs. In terms of age, there were 24 (20.5%) male subjects aged from 30-35, 19 (16.2%) from 36-40, 29 (24.8%) from 41-45, 7 (6%) from 46-50 and 7 (6%) above 50. Of the females, 18 (15.3%) subjects were aged from 30-35, 8 (6.8%) from 36-40 and 5 (4.4%) from 41-45. 84 subjects were married, 32 single and 1 divorced. 42 male subjects' wives were in full-time and 9 in part-time employment. 20 were full-time house-wives. Of the female subjects, 10 were married and one subject's husband was in part-time employment. 35 subjects did not indicate whether their spouses were in employment or not.

## Results

The mean score on the 117 validated Type A Behaviour questionnaires was 74.68, the median (74) and the mode (76) (Table 1). The highest score, 113 was registered by a female subject (a bank vice-president who was married and had two children) and the lowest (47) by a male (a manager working in a charitable organization and about to retire). Table (2) indicates that 84 subjects registered scores of 80 or less (Type B behaviour) and 33 came within the average range (81-120). None of the subjects registered scores of 121-140 (Type A Behaviour).

	113	1	0.90	0.90	100.00
	Total	117	100.00	100.00	

Turning to the interview sample, 14 subjects registered scores within the average range, their mean age being 42. (Subject 8), (JS), aged 44 and (Subject 26), (AT), aged 38 both said that they would like to get on further in their careers but both also admitted that they found their current life patterns comfortable and that they had no specific plans as to their next career move; what enthusiasm they had for 'getting on' tended to come and go. (JS) was married with two young children and wanted to spend more time with them. Case (46) (LGL) liked the idea of advancing his career but not if it meant promotion to a job in Taipei which would require him to leave Taiwan where he was living close to his parents.

### Age and Type A

Table 3 indicates that of the five age groups into which the main sample was divided, the age group 50+ registers the lowest mean score (66.25) and the age group 41-45 the highest (78.34).

TABLE 3: COMPARE MEANS-TYPE A BEHAVIOUR BY AGE GROUP

AGE	Mean	N	Std. Deviation
30-35	73.38	42	11.27
36-40	74.48	25	11.48
41-45	78.34	35	11.59
46-50	74.43	7	7
50+	66.25	8	14.84
Total	74.68	117	11.7

### Gender and Type A

The Independent Samples Test (Table 4) indicates that the difference in mean scores between male (73.40) and female subjects (78.23) is significant (0.08).

TABLE 4: INDEPENDENT SAMPLES T TEST: TYPE A BEHAVIOUR BY GENDER

	SEX	N	Mean	Std. Deviation	Std. Error Mean					
TYPE A	1 Male	86	73.40	10.63	1.15					
	2 Female	31	78.23	13.82	2.48					
		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	90% C.I.	
									Lower	Upper
TYPE A	Equal variances assumed	4.49	0.04	-2.00	115	0.05	-4.83	2.42	-8.84	-0.82
	Equal variances not assumed			-1.77	43.47	0.08	-4.83	2.73	-9.43	-0.23

Note: F – the F – statistic, Sig – level of significance, t – t-statistics, df- degree of freedom, C.I. – confidence interval of the difference

### Occupation and Type A

The Independent Samples Test (Table 5) indicates that there was no significant difference (0.86) in the mean scores of managers and entrepreneurs

TABLE 5: INDEPENDENT SAMPLES T-TEST: TYPE A BEHAVIOUR BY OCCUPATION (MANGERS AND ENTREPRENEURS).

	You are manager/ entrepreneur	N	Mean	Std. Deviation	Std. Error Mean					
TYPE A	Manager	82	74.80	12.39	1.37					
	Entrepreneur	35	74.37	10.05	1.70					
		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	90% C.I.	
									Lower	Upper
TYPE A	Equal variances assumed	1.79	0.18	0.18	115	0.86	0.43	2.37	-3.5	4.37
	Equal variances not assumed			0.20	78.55	0.84	0.43	2.18	-3.2	4.06

Note: F – the F – statistic, Sig – level of significance, t – t-statistics, df- degree of freedom, C.I. – confidence interval of the difference

## Discussion

The low to average Type A scores suggest that, despite the pressures stemming from rapid economic expansion in Taiwan, the subjects seemed to be well protected against its more unwelcome and health-endangering manifestations. The semi-structured interviews included that in their daily lives, they appeared to put a high value on work behaviours which avoided confrontation and conflict and on the maintenance of smooth relationships. If their behaviour on the surface seemed busy or even hectic, the subjects, according to their self-reporting, did not seem to suffer serious adverse consequences in terms of typical Type A Behaviour patterns.

Turning to Hypothesis 1, it was posited that the subjects' Type A Behaviour would decline with age based on research by Davidson et al. (1980), Moss et al. (1986), Thoresen and Low (1991) and others. This was not the case. Type A Behaviour actually increased with age, peaking within the age group 41-45 and only declining afterwards. Perhaps the pattern here reflects increasing work responsibilities as the subjects age up to a point where at around 45, the subjects take stock and determine to take things more easily. Hypothesis 1 is supported only to the extent that it applies to subjects aged 46+.

Hypothesis 2 was based on research evidence which suggests that Type A Behaviour is associated more with males than females. It was posited that the men taking part in the study would score higher than the women. This also turned out not to be the case in that the difference in mean scores was significant with women scoring higher than men. The interview program might shed useful light here. Several female subjects drew attention to the tensions which they experienced as a result of the conflicting roles of wife, daughter, mother and career woman. There is the intriguing possibility that the Type A Behaviour questionnaire in this case was measuring not so much work behaviour as role conflict. Hypothesis 2 is rejected.

Hypothesis 3 proposed that there would be no difference in the mean scores of managers and entrepreneurs subjects given that there is no research (as far as I am aware) to suggest that work behaviour, as measured by Type A, differs between these two occupational categories. Indeed, the data revealed no significant difference, so Hypothesis 3 is supported.

The research question 'What are the work behaviour characteristics of the subjects?' was based on the premise that, given the apparently frenetic pace of business activity in Taiwan stemming from its recent rapid pace of economic growth, the work behaviour of the subjects would exhibit strong evidence of the Type A pattern. This turned out not to be the case with 72% of the main sample falling into the Type B Behaviour pattern and the remainder into the average range. Whatever the factors which lie behind the subjects' career success, they do not appear to include the typical Type A Behaviour such as an insatiable desire to compete, to adopt an adversarial approach to relationships or to treat time as if it were an enemy.

Two subjects, Subject 8 (JS) referred to above and Subject 26 (AT) seemed to exemplify the attitudes of the 45 subjects who were interviewed in expressing a desire to strike a proper balance between the competing claims of work and non-work activities. Analysis of the biographic data sheets reflects this. 94 subjects (80%) said that they gained support from their families in pursuing their work and 91 subjects (78%) indicated that they tried to keep their work and home lives separate. The participants in the interview program frequently referred to their family and home as a haven from the pressures and deadlines that they had to grapple with daily in the workplace. Cohen, Syme, Jenkins, Dagan and Zyzanski (1970) and Cohen and Reed (1985) contend that national cultural characteristics might be an important factor affecting the incidence of Type A Behaviour. Could it be therefore be that cultural characteristics are at work here? Westwood (1992) and Wong and Slater (2001) found in many Chinese communities, the extended Chinese family provided a stronger bulwark against the pressures of the workplace than the nuclear family, more typical of western societies. Perhaps it is also worth noting that almost all the subjects had completed an MBA degree. That need to balance the commitments of working and studying successfully might have filtered out the Type As.

Although the Type A data reveals differences in mean scores by age and gender (but not by occupation), I take the view that those variances pose questions which are far less critical than the question of why scores overall are as low as they are. Some conjecturing on this has been made in the previous paragraph but conjecturing is no valid substitute for systematic research. A promising avenue for further research might lie in a comparative study in

which Taiwanese managers are matched with managerial samples from other Chinese (and non-Chinese) communities. The relationship between work behaviour and career experience also merits a more rigorous exploration than I was able to give within the constraints of the present study.

## Limitations of the Present Study and Indications for Future Research

The Bortner questionnaire was the instrument used in this study for measuring work behaviour. The justification I gave for using this questionnaire rather than alternatives was that it is 'simple and clear and as well as being easy to administer'. Practical considerations weighed heavily here: the Bortner questionnaire presented few translation difficulties and there was concern on my part about the burden being imposed on the subjects' time given that they had also been asked to complete a biographical data sheet and 45 of the subjects had also accepted the invitation to take part in the interview program. But practical considerations aside, the questionnaire is well validated and widely used in developmental settings.

However, my reservations about the Type A Behaviour questionnaire, having gained experience of using it in this research, relate first to the question of what was measured. Did it measure work behaviour or did it measure behaviour generally? This is not to imply that there is always a clear-cut distinction: but the question is important if only because a number of subjects in the interview sample pointed out a contrast between their extremely busy lives at work and the relaxed tranquillity of the home and family environment. A second reservation relates to whether Type A Behaviour should be considered healthy and Type B Behaviour unhealthy. Friedman and Rosenman (1974) distinguish between good (adaptive) and bad (maladaptive) Type A and B types. Thus, some Type A types, they suggest are talkative, in control and charismatic while others are tense, hostile and competitive; some B types are relaxed and quiet while others are over- controlled inhibitors. Chinese parenting practices are strong on control of children's behaviour. Wu (1996) and Ho (1996) commenting on Chinese child-rearing note that Chinese parents teach their children by their example not to indulge in horseplay, argue, quarrel, joke, slouch, speak in a vulgar manner, upset their parents and to obey without question. There is an intriguing possibility that the low Type B scores obtained in the present study might in part be a reflection of maladaptive Type B Behaviour: inhibition instilled in childhood finding expression in adulthood. Further research is needed.

# Human Resource Management Challenges in Times of Global Change and Uncertainty

Eduardo P. Garrovillas  
Jose Rizal University, Philippines

## Abstract

Human resource management is at a crossroad in its evolution. It has developed highly efficient programs, practices, and policies to serve industrial organizations of the 20<sup>th</sup> century, *specifically, the dynamic global labor market*. However, the demands of the 21<sup>st</sup> century knowledge economy present a new imperative for HRM more than an efficient employment bureaucracy bequeathed to us by the Industrial Revolution and management *giants* like Taylor, Weber, Fayol, and Mayo, et al. To become a viable contributor to organizations in the new economy, HRM must undergo self-examination and redirection. It must reinvent itself to preempt being consigned in the dustbin of obsolescence. It will require a *paradigm shift* or a new focus: 1) on building strategic capability; 2) on expanding the boundaries of HRM to include the entire value chain; and 3) on managing new roles – roles that contribute directly to the creation of organizational capabilities. Indeed, the challenges posed by the knowledge economy are formidable (Lengnick-Hall and Lengnick-Hall, 2003), let alone in its complexity. And yet the microchip era owes its existence from a simple, uncomplicated but ubiquitous office gadget, a bent paper clip!

## Introduction/Overview

The ubiquitous *paper clip*, commonly used in a typical human resource office (or any office for that matter), symbolizes quite anachronistically, the Industrial Revolution, in this age of digital revolution otherwise known also as the knowledge economy (courtesy of Peter Drucker, a world-renown management guru, and Fritz Machlup of Princeton University). In fact, the assembly line of the Industrial Revolution gave birth to the ubiquitous paper clip. Grab any book on human resource management, and you will find out that HRM has its roots from the Industrial Revolution (late 1800s to early 1900s). A montage symbolizing the Industrial Revolution, would include, other than the assembly line, the steam engine of James Watt, electricity, and some ideas in various fields whose currency has not been diminished by the ravages of time, such as, mass production, economies of scale, division of labor, the capitalism of Adam Smith, the comparative advantage of David Ricardo, and the socialism of Karl Marx. History, according to Andrew Steven Grove, CEO of Intel, has its “strategic inflection points”, which can cause global change and uncertainty, those moments when new circumstances alter the way the world works, as if the current of history goes through a transistor and our oscilloscopes blip. Such inflection points may be a *process*, like the assembly line of the Industrial Revolution; or an *invention* like the Gutenberg’s printing press of the 15<sup>th</sup> century; or an *idea* like the yearning for individual liberty during the 18<sup>th</sup> century, or a *technology* like electricity in the 19<sup>th</sup> century (“Man of the Year”, *Time*, Annual 1997 The Year in Review: p75).

Is there a connection between the paper clip and microchip? The development of HRM is similar to the metamorphosis of the paper clip to a microchip. The very first microchip, invented by the two scientists from Bell Laboratories in New Jersey on December 23 1947, the dynamo of the digital revolution or the knowledge economy (of the 21<sup>st</sup> century) made use of “...*some strips of gold foil, a chip of semiconducting material and a bent paper clip*” (“Man of the Year”, *Time* Annual 1997 The Year in Review:74). An ordinary paper clip can only hold about 3 to 5 pieces of paper; a Pentium II microchip is capable of processing 500,000,000 bits of information per second (Pentium IV, 1600 megahertz, has a much bigger capacity). By extrapolation, while the paper clip age has painted an exciting art and science of human resource management apropos to the past century just ended, expect no less that the microchip era of the 21<sup>st</sup> century would evolve a much more exciting HRM tapestry, vis a vis the *challenges in times of global change and uncertainty*, i.e., an HRM initiative going beyond the traditional box of managing people, but more than that --- *managing the human capital or the capabilities that people create and the relationships that people must develop*.

### **HRM, Defined**

Basically, human resource management (HRM) is the effective management of people at work, according to textbook definition. HRM examines what can or should be done to make working people more productive and satisfied (Ivancevich, 2004). It deals with the professional treatment and concern for people within the organization, its most important asset, to optimize their performance, bearing in mind the notion that to grow, prosper, and remain healthy, the organization must optimize the return on investment of all resources – physical, financial, and human. HRM is the function performed in organizations that facilitates the most effective use of people (employees) to achieve organizational and individual goals. Terms such as *personnel*, *human resource management*, *industrial relations*, and *employee development* are used to describe this unit, section or department within the organization. Currently, however, the term human resource management is widely used globally, although some people still refer to it as the personnel department. HRM is more reflective of the increased concern, respect, and recognition both society and organizations have for people.

### **Typical HRM**

A typical HRM “box” consists of numerous activities, such as --- 1) job analysis, 2) human resource planning, 3) employee recruitment, selection, motivation and orientation, 4) performance evaluation, compensation and benefits administration, 5) training and development, 6) labor relations, 7) safety, health, and wellness, and 8) community relations, otherwise known today as “corporate social responsibility”. Depending upon the nature, size, and structural complexity of the organization, the emphasis or focus on the aforementioned activities would vary. In companies for example with complex products like in a pharmaceutical company, training and development function is a high profile position, a knot or two higher than simple housekeeping functions such as wage and benefit administration or canteen supervision.

Under the paper clip milieu, with imprints of Taylor and Gantt, Weber, Fayol, et. al, this old HRM box has worked to the satisfaction of management with some modifications here and there (but modifications all within the context of the “rational man” theory, pointed towards efficiency and productivity of the assembly line, and serving well the self-interest of business). The “social man” theory embraced by the human relations theorists and behavioral scientists, espoused by Elton Mayo, et al., Maslow and company, have gained popularity in the later part of the 20<sup>th</sup> century up to the present digital age, but remains to be clothed under a heavy cloud of suspicion from the global community at large, fueled by the clamor for transparent corporate governance, corporate social responsibility, and rising education and vigilance of all stakeholders, specially the NGOs.

*Under the microchip milieu, most of the functions in the old box are either outsourced, digitalized, or shared by other departments within the organization; hence, there may be a need to think outside of the old box, or better still create an entirely new box?* But this may be easier said than done. A simple case in point is the name of the biggest aggrupation of HRM practitioners in the country, called the Personnel Management Association of the Philippines (PMAP); the association could not seem to discard its old name which is very clearly an anachronism!

### **Current HRM Thoughts, New Imperative**

The influence of behavioral science (e.g., the work of Elton Mayo, et al., the *Hawthorne Studies*) and the rapid changes in the macro-environment of the organization, e.g., globalization, technology, the economy, legal considerations, social and political changes, and the phenomenal growth of stakeholders’ vigilance, vis a vis the compelling challenge of sustainability, have resulted in a *humanistic orientation* of today’s HRM; a stark contrast to the *Weberian* tradition (the three Es of bureaucracy – effectiveness, efficiency, and economy) and the management science of Frederick Taylor and his associate, Henry Gantt, et al. The traditional housekeeping functions of the “old” personnel office, such as hiring, wage and benefits administration, and keeping of the 201-file in a steel-cabinet are still being performed. However, the portfolio has been expanded to include such strategic functions as career planning, training and development, organizational development (OD), and corporate social responsibility (CSR) functions, hence, the “qualitative leap into human resource management” (Sison, 1991: 2).

Today’s HRM is doing a strategic function relative to the achievement of organizational objectives and enhancement of employees’ development and satisfaction. Some contemporary HRM thoughts are, as follows:

1) It is action-oriented. Effective HRM focuses on action rather than on record-keeping, written procedure, or rules. Certainly, HRM uses rules, records, and policies, but it stresses action. HRM emphasizes the solution of employment problems to help achieve individual and organizational objectives.

- 2) It is people-oriented. HRM treats each employee as a human being, not as a tool of production, and offers services and programs to meet the individual's needs.
- 3) It is globally oriented. HRM is a globally oriented function or activity; it is being practiced efficiently and continuously in many organizations around the world, where employees are treated fairly, with respect, and with sensitivity, within the ambit of the Universal human rights declaration.
- 4) It is future-oriented. Effective HRM is concerned with helping an organization achieve its objectives in the future by providing for competent, well-motivated employees.

Lengnick-Hall and Lengnick-Hall (2003) have a more forward-looking view of HRM for the 21<sup>st</sup> century *knowledge economy* (please see Appendix B); for them, HRM is no longer simply focused on “managing people” in the conventional meaning of the phrase (e.g., staffing, training and development, performance management, and so on). Human resource management is now responsible for managing the capabilities that people create and relationships that people must develop. In Michael Porter's value chain analysis (please see Appendix A), the sustainable competitive advantage of an organization emanates from the combined talents, skills, and competencies of its human resources, otherwise known as the human capital.

#### **A Brief History**

To better appreciate this new imperative on human capital management, a review of history is in order. The history of HRM may be said to have its roots from --- 1) the Medieval guilds in Europe, which saw the beginning of employer-employee relations as these are known today (e.g., the merchants guilds composed of storekeepers, merchants; the craft guilds composed of masters, journeymen, and apprentices engaged in shoemaking, weaving, baking and similar trades, they used their unity to improve their work conditions); and 2) the Industrial Revolution in the latter part of the 19th and early 20th centuries which laid the basis for a new and complex industrial society (e.g., the introduction of the factory system of production). The radical changes brought about by the Industrial Revolution in terms of production and distribution created far-reaching effects on social organization (which saw the evolution of the middle class), economic relationships, and political philosophy.

At first, labor was regarded as a mere commodity that could be acquired or disposed of like any other chattel or property governed by the law of supply and demand. When machines were invented, the workers employed to operate them were considered parts of these machines; hence the idea arose that labor was a machine, an operating organism capable of a certain amount of output, as in the *time and motion* study of Taylor and Gantt.

#### **The Industrial Revolution**

In the transition from agricultural to industrial phase of the economy, a growing population looking for work in cities, coupled with abundant natural resources such as coal, iron, and water power, helped to ignite the Industrial Revolution in Great Britain, which eventually spread throughout the world. Its other preconditions are the advances in science and technology, incentive, and money capital to build machines; a labor force to run them; raw materials and markets to make the system profitable; and efficient farms to feed a new group of workers. At the start of the 1700s Great Britain possessed all these requirements. It is where industrialism first took root. Power-driven machinery took the place of handwork done in the home. As industry came to dominate economies, inventors developed technology for industrialists to increase and speed production. Expanding and increasingly complex industries led to a changing social order in the mid-1800s. As factory owners and managers prospered, a sizeable middle class grew. Many workers, however, endured crowded and unsanitary living quarters and poor working conditions. In the late 1800s some workers joined to form labor unions in the hope of improving their lives (Farah and Karls, 1999).

In simple terms, the Industrial Revolution saw the substitution of machines for time-consuming hand labor. It virtually transferred the skills of guild's craftsmen and journeymen to the machines. In contrast to the preceding era where economic power emanates from ownership of land, during the Industrial Revolution, economic power comes from ownership of machines; working conditions, social patterns, and the division of labor were significantly altered. A new kind of employee – a boss, who wasn't necessarily the owner, as had usually been the case in the past – became a power broker in the new factory system. With these changes also came a widening gap between workers and owners.

The establishment of factories led to the migration of workers from rural to urban areas and the concentration of workers around the factory sites, thereby giving rise to problems in psychological and social

relationships, and more industrial relations problems. By grouping workers together in large numbers and standardizing methods of production and distribution, management was able to cut down production costs radically and new markets were opened locally and overseas. In turn these expanded outlets necessitated the establishment of more factories, the increased production of goods, and the creation of new services. The resulting changes and development in the social, economic, and political structures of communities caused greater demands for new products and services.

The rise of industry changed the world forever; the way McDonald and Coke have changed people's behavior. So dramatic were the changes that historians have labeled the period the Industrial Revolution. Although the revolution began in Britain, it respected neither time nor place. The revolution traveled beyond Britain to touch every nation on earth.

#### **Adam Smith, David Ricardo and Karl Marx**

The Industrial Revolution saw the emergence of economists such as Adam Smith and David Ricardo who pointed out the basic principles of capitalism and held that businesses should operate without governmental interference. British philosopher John Stuart

Mill favored the concept of capitalism but called for government supervision and reforms to provide social justice. But the German philosopher Karl Marx opposed capitalism and supported socialism, believing that workers either by themselves or through the government should control industry.

#### **Darwin and Pasteur**

The Industrial Revolution also saw many exciting scientific advances. In the 1850s British naturalist Charles Darwin proposed a theory of evolution to explain the origins of life. About the same time, microbiologist, Louis Pasteur used new scientific knowledge to conquer diseases such as smallpox and rabies that had plagued humankind for thousands of years. Increased interest in education led to the spread of literacy as public schools and libraries were established throughout Europe and the United States.

## **Scientific Management**

The continuous search for ways to improve methods of production led Frederick Taylor (1856-1915) to spearhead the scientific management movement towards the beginning of the twentieth century. He is acknowledged as the "Father of Scientific Management".

Scientific management is a type of management, which is characterized and guided by the use of scientific approaches to the solution of managerial problems in business and industry. It aims to find out what particular management procedure is applicable in a given situation by conducting job analysis, determining what is to be accomplished and then designing the tools and methods to accomplish the task. Scientific management requires that both workers and management join in the search for the least waste in materials, working time, and efforts through systematic ordering of operations. In the final analysis, improvements in production could best be achieved through effective leadership by the supervisor and the manager.

Taylor's famous works are --- 1) a paper which he read before the American Society of Mechanical Engineers, entitled "A Piece Rate System"; and 2) his handbook on "Shop Management", published in 1903. This was the first attempt to apply cost analysis to jobs by splitting up a job into its constituent parts and determining the time required for each part. It also introduced job simplification programs aimed at greater productivity and the effective use of human resources and materials.

The principles of scientific management may be summarized as follows:

- 1) The application of science in the development of each job, thus replacing the old rule-of-thumb method;
- 2) The scientific selection, training, and development of workmen in order to achieve optimum efficiency;
- 3) Adequate compensation of the workman according to his accomplishment; and
- 4) The equitable division of work and responsibilities between management and workmen, giving to each man the functions for which he is best suited, and preserving his own individuality in the exercise of his initiative. In the past, the worker was given the responsibility to do certain jobs regardless of his qualifications and the requirements of the particular job.

Other advocates of the movement were Henry Gantt (the Father of the Gantt Chart), Frank and Lillian Gilbreth, (Stoner, et al., 1999).

Henry Gantt (1861-1919) worked with Taylor on several projects. An industrial engineer by profession, his Gantt Chart was translated into eight languages and used throughout the world. Starting in the 1920s, it was in use in Japan, Spain, and the Soviet Union. It also formed the basis for two charting devices which were developed to assist in planning, managing, and controlling complex organizations: the Critical Path Method (CPM), originated by Du Pont, and Program Evaluation and Review Technique (PERT), developed by the Navy. Lotus 1-2-3 is also a creative application of the Gantt Chart.

The Gilbreths. Frank B. and Lillian M. Gilbreth (1868-1924 and 1878-1972) made their contribution to the scientific management movement as a husband-and-wife team. Lillian and Frank collaborated on fatigue and motion studies and focused on ways of promoting the individual worker’s welfare. To them, the ultimate aim of scientific management was to help workers reach their full potential as human beings. Using motion picture cameras, they tried to find the most economical motions for each task in order to upgrade performance and reduce fatigue.

On the whole, the scientific management was concerned with increasing the productivity of the shop and the individual worker. The classical organization theory, which subsumes several schools of management thoughts (as shown in the table below), grew out of the need to find guidelines for managing such complex organizations as factories. Noted classical organization theorists are Henri Fayol (1841-1925) who pioneered in identifying the principles and skills that underlie effective management; and Max Weber (1864-1920), a German sociologist who developed a theory of bureaucratic management that stressed the need for a strictly defined hierarchy governed by clearly defined regulations and lines of authority. Before Fayol, it was generally believed that “managers are born, not made”. Fayol insisted, however, that management was a skill like any other – one that could be taught once its underlying principles were understood.

						Management Science				
						The Systems Approach				
						The Contingency Approach				
						Dynamic Engagement Approach				

## Human Relations Movement

The scientific management movement was followed by another group of researchers led by Elton Mayo (1880-1949), and his Harvard associates, Fritz J. Roethlisberger and William J. Dickson, whose works in the famous Hawthorne Studies, also known as the Hawthorne Experiments, influenced management thinking along the lines of human relations. To managers’ frustration, people did not always follow predicted or expected patterns of behavior, as postulated by Weber, Fayol, et al. Thus, there was increased interest in helping managers deal more effectively with the “people side” of their organizations, with the insights of sociology and psychology. *De facto*, Elton Mayo

and the human relations theorists challenged the rationalist ideas put forward by Max Weber, who defined the bureaucratic form of government, and Frederick Taylor and Henri Fayol, who implied that management really can be made into an exact science. Weber virtually pooh-pooed charismatic leadership and doted on bureaucracy; its rule-driven, impersonal form, he said, was the only way to assure long-term survival. Taylor, of course, is the source of the time and motion approach to efficiency: if only you can divide work up into enough discrete, wholly programmed pieces and then put the pieces back together in a truly optimum way, why then you'll have a truly top-performing unit (Peters and Waterman, 1982).

Human relations is frequently used as a general term to describe the ways in which managers interact with their employees. When "employee management" stimulates more and better work, the organization has effective human relations; when morale and efficiency deteriorate, its human relations are said to be ineffective. The human relations movement arose from early *attempts to systematically discover the social and psychological factors that would create effective human relations*.

### **The Hawthorne Experiments**

The human relations movement grew out of a famous series of studies conducted at the Western Electric Company from 1924 to 1933. These eventually became known as the "Hawthorne Studies" because many of them were performed at Western Electric's Hawthorne plant near Chicago. The Hawthorne Studies began as an attempt to investigate the relationship between the level of lighting in the workplace and worker productivity – the type of question Frederick Taylor and his colleagues might well have addressed.

In the Hawthorne Experiments, researchers divided the employees into test groups, who were subjected to deliberate changes in lighting, and control groups whose lighting remained constant throughout the experiments. The results of the experiments were ambiguous. When the test group's lighting was improved, productivity tended to increase, although erratically. But when lighting conditions were made worse, there was also a tendency for productivity to increase in the test group. To compound the mystery, the control group's output also rose over the course of the studies, even though it experienced no changes in illumination. Obviously, something besides lighting was influencing the workers performance. When other variables were introduced and altered, the same ambiguous results came out. Some interesting conclusions from the Hawthorne Experiments are, as follows: 1) a complex chain of attitudes other than lighting (or elements of the physical environment) affects the productivity of people; 2) that it is *attention to employees*, not work conditions per se, that has the dominant impact on productivity; this phenomenon is otherwise known as the *Hawthorne effect*; 3) that informal work groups – the social environment of employees – have a positive influence on productivity; and 4) that the concept of "social man" - motivated by social needs, wanting rewarding on-the-job relationships, and responding more to work-group pressures than to management control – is necessary to complement the old concept of "rational man" motivated by personal economic or physiological needs.

From the Hawthorne Studies, the leaders of the movement stressed greater attention to sociological changes that affect the attitudes and productivity of the workers. Elton Mayo argued that since industrialization removed the personal contacts between management and the workers, it became the manager's responsibility to repair the said damage that specialization and mechanization of work had done. He believed that the loss of the face-to-face contact between management and the workers was the source of frustration and psychological deterioration in the work situation. To offset this, he felt that management should either permit the spontaneous formation of voluntary small groups or organize small groups to provide the kind of face-to-face association that was needed (Sison, 1991: 6).

Likewise, the human relations movement emphasized the need for active participation of subordinates in decision-making and for treating them with dignity as an important partner in the organization. A more permissive type of control under which subordinates were encouraged to express themselves freely, to make suggestions, and to participate in decision-making replaced the old autocratic methods of supervision and control. Workers were to take a more active role in the production process by membership in committees, the suggestion system, and increased face-to-face dialogues on lower management levels. This is also aligned with the ILO Declaration of Principles, to wit: "All human beings, irrespective of race, creed, or sex, have the right to pursue both their material well-being and their spiritual development in conditions of freedom and dignity, of economic security and equal opportunity".

Other important offshoots of the human relations movement are --- 1) Kurt Lewin's *group dynamics* (he is the father of group dynamics) which holds that active member participation in decisions will result in more

production, deeper satisfaction, and greater attainment of group objectives; and 2) Roethlisberger's "case method" approach in the study of human relations, based on the complexity of human behavior and the "uniqueness" of each situation.

Mayo and his colleagues from Harvard, otherwise dubbed as *human relations theorists*, pioneered the use of the scientific method in their studies of people in the work environment. Later researchers, more rigorously trained in the social sciences (psychology, sociology, and anthropology), used more sophisticated research methods and became known as "behavioral scientists" rather than "human relations theorists".

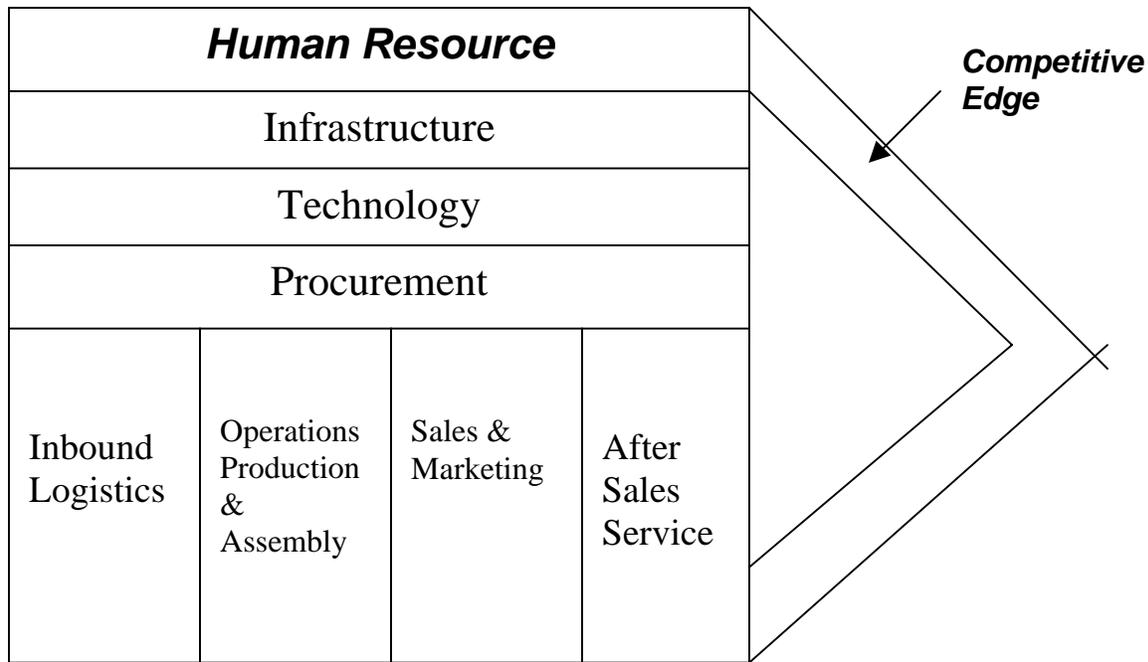

## Summary

By the end of the 20<sup>th</sup> century, some people questioned whether HRM made any value-added contributions to organizations. Many of the traditional administrative HR functions had become automated processes most efficiently outsourced to organizations with specialized expertise (e.g., payroll preparation, janitorial services, canteen services, record-keeping thru *PeopleSoft*, etc.). It is now a department whose employees spend 80% of their time on routine administrative tasks, which can be performed more expertly for less by others. Human resource management is at a crossroad in its evolution. It has developed highly efficient programs, practices, and policies to serve industrial organizations of the 20<sup>th</sup> century. However, the demands of the 21<sup>st</sup> century knowledge economy present a new imperative for HRM more than an efficient employment bureaucracy bequeathed to us by the Industrial Revolution and management *giants* like Taylor, Weber, Fayol, and Mayo, et al. To become a viable contributor to organizations in the new economy, HRM must undergo self-examination and redirection. It must reinvent itself to preempt being consigned in the dustbin of obsolescence. This will require a *paradigm shift* or a new focus: 1) on building strategic capability (a readiness for the present and an ability to adapt in the future), which consists of three components directly related to HR – human capital ("that which goes home with employees at night"), structural capital ("that which is left behind when the employee goes home at night") and relationship capital (networks of personal relationships that provide the basis for collaborative and cooperative actions); 2) on expanding the boundaries of HRM to include the entire value chain, e.g., including suppliers, distributors, and customers, as described by Michael Porter in his value-chain analysis (Hitt, 1999), well-beyond its traditional operational focus – hiring, firing, promoting, training, and so forth; and 3) on managing new roles – roles that contribute directly to the creation of organizational capabilities, e.g., *human capital steward* (managing the sum total of know-how, skills, and capabilities of individuals in the organization), *knowledge facilitator*, *relationship builder*, and *rapid deployment specialist* (please see Appendix C). Staying within the functional bureaucratic boxes that HRM has created for itself will only undervalue its impact on organizational effectiveness. Indeed, the challenges posed by the knowledge economy are formidable (Lengnick-Hall and Lengnick-Hall, 2003), let alone in its complexity. And yet the microchip era owes its existence from a simple, uncomplicated but ubiquitous office gadget, a bent paper clip!

## Appendix

APPENDIX A: MICHAEL PORTER'S VALUE CHAIN ANALYSIS

The sustainable competitive edge is characterized by VRIN, which is the acronym for Valuable, Rare, Inimitable, and Non-Substitutable. *Source:* (Hitt, et. al, 1999, see End Notes).

<b>Knowledge Economy Characteristics</b>	<b>Definition</b>
Symbolic goods/Digitization	Electronic symbols representing information about the physical goods that we need to know to conduct the transactions (for example, details of a banking transaction): human communication, delivery of government programs, execution of health care, business transactions all become based on ones and zeros.
Demassification	Reduced dependency on the need for physical concentration or massing (collocation) of labor, materials, and money.
Boundaryless enterprise/ Globalization	Knowledge transcends firm, industry, and national boundaries; organizations have time-and-space-independence; work can be performed from a variety of locations.
Virtualization	Physical things can become virtual, such as corporations, teams, auction sites, and so on.
Connectedness/Unprecedented partnering/integration-internetworking	Interconnections within and between organizations and institutions; interconnections between businesses and customers; no one organization can have all the knowledge needed, so partnering is essential.
Disintermediation	Elimination of the intermediaries in economic activity – anything that stands between producers and consumers.
Convergence	Bringing together different economic sectors to create new products and services (for example, telecommunications).
Personalization/Mass customization/Prosumption	Fitting products and services to the unique needs of individual customers; consumers become involved in the actual production process as their knowledge, information, and ideas become part of the product specification process.
Dynamic Pricing	Pricing decisions change based on time and place as products and services are constantly updated and shifted.
Immediacy	Business is transacted in real time; enterprises continuously and immediately adjust to changing business conditions; product life cycles become shorter.
Customer Communities	Customers talk with other customers on a local and global scale (e.g., Amazon.com)

APPENDIX B: ELEVEN CHARACTERISTICS OF THE KNOWLEDGE ECONOMY

# Inculcating Life Long Learning & Training in Human-Resource-Development (HRD) through Tripartite Educational Partnership between Higher Institutions, the Government and the Corporate Sectors in Malaysia

*Hisham Dzakiria*  
*Universiti Utara Malaysia, Malaysia*  
*Rozhan Mohd Idrus, Hanafi Atan*  
*Universiti Sains Malaysia, Malaysia*

## Abstract

The quest for continuous learning and training in human resource development (HRD) is the key to success for many organizations. In line with this vision, life long learning is an essential challenge for inventing the future of Malaysian society. Unlike developed countries, life-long-learning is a 'fairly' new concept in Malaysia introduced to engage the citizens with continuous learning and training in life. It represents a wide ranging concept which extends well beyond the boundaries of formal education. It affects a range of stakeholders including governments, business, industry, clubs societies and associations, providers of adult formal and non-formal education and community based learning, and increasingly every individual or organization who makes use of the Internet and technology. Life long learning needs to be inculcated and encouraged to the potential learners and citizen at large. This paper discusses the importance of inculcating the concept of long life learning and training to improve and sustain continuous staff development in Corporate and Government sectors in Malaysia through tripartite collaboration and partnership between higher institutions, the government and corporate sectors. Tripartite partnership will provide a win-win situation to all participating parties. With the potentialities and the availability of resources, the role of higher institutions and partnership between higher institutions, the government and corporate sectors will be discussed. With the emerging educational tools and technologies, and significant room for educational development and training for the work force life-long-learning only enhances more opportunities for learning and training. This paper advocates that with collaboration, together we can make the acquisition of knowledge a life-long activity in which institutions of learning becomes the centers for making individuals mature learners with an autonomous capacity to self learn outside the institutions walls throughout their lives.

## Introduction

Knowledge and training can enable workers to achieve higher productivity and innovation. The concept of learning, training, attaining new knowledge, re-training, and others along that line is embedded in what is known as **life long learning**. It does not imply that learning is an externally imposed requirement, but it refers to a society in which learning possibilities exist for those who want to learn (Coffield, 1999, Cappelli et al.1997). Life long learning is not a new concept to many countries like United Kingdom, America, Australia, and to many European countries, but, not the case for many developing countries including Malaysia. It is a concept that is grasping popularity and 'growing'. Internationally, according to Candy (2000) it is a concept that goes back at least to the year 1972 when the Final Report of Unesco's International Commission on the Development of Education was published which argues

...every citizen should have the means of learning, training and cultivating himself or herself freely available...under all circumstances, so that he or she will be in a fundamentally different position in relation to his or her education...(Faure et.al, 1972, p.163, in Candy, 2000)

Since then, life-long learning has spawned into a huge body of literature in all parts of the world. Such development is also evident in Malaysia. Today, it is a concept which goes beyond the boundaries of mainstream education, and affects various stakeholders which include federal government, Ministry of Education, Ministry of Higher Learning, business and industry, associations, society at large, institutions and increasingly every individual or organization.

A critical task that all Malaysians have to face like any other citizens in the developed countries at the start of the twenty-first century is to sustain economic growth in the global economy. This challenge has recently become even more complex and demanding. The world has change so much in the span of the last 20 years. Economic, social and technological change is gathering pace and calls for continuous policy and institutional adaptation in order to meet new needs and seize the opportunities that are opening up in a rapidly integrating world economy. It has been increasingly recognized that people's endowment of skills and capabilities, and investment in education and training, constitute the key to economic and social development. Skills and training increase productivity and incomes, and facilitates everybody's participation in economic and social life.

However, the intricacy in putting into place effective collaboration policy between various stakeholders (i.e public and private with higher institutions) gives high priority to education and training are appalling. It is taking place, and efforts are made to realize collaboration and partnerships. Nevertheless, such partnership is still slow in motion. In view of the rapidly growing economy, such partnership and collaboration need to be expedited to benefit all sectors and organizations.

Some countries are investing heavily in their human resources. But, other countries, particularly under developing countries have not been able to maintain investments at sufficiently high levels to meet their rapidly increasing needs. The overall goal of the global economy should be to provide opportunities for all people to obtain decent and productive work in conditions of freedom, equity, security and human dignity. This paper advocates educational partnership between higher institutions with government and corporate sectors to inculcate life-long learning and training for the benefit of the people, and workers, and ultimately the corporations, and the institutions themselves. This paper advocates that with collaboration, together we can make the acquisition of knowledge a life-long activity in which institutions of learning becomes the centers for making individuals mature learners with an autonomous capacity to self learn outside the institutions walls throughout their lives. This paper believes through such partnership, Malaysians, and in particular the government, corporate sectors could help to improve social progress. We believe that, life-long learning and training could help to attain the following objectives that are vital to social progress in Malaysia:

1. continuous improvement, learning and training
2. employment creation and career improvement
3. competitiveness, and growth
4. social inclusion

## **Incorporating Life-long Learning in Malaysia**

Malaysia is a fast developing nation. The country is transforming itself and moving aggressively towards building an effective and successful 'K' Economy. Our society according to Tan (2000: p.59) "... is information and knowledge hungry. We need greater speed, more efficiency and effectiveness in all our endeavours. For this, we need all the knowledge and information that we can get from all sources, and from around the world."

In the last 15 years, a market sensitive education system has evolved in Malaysia. Schools and higher institutions in the country are taking up the challenge of globalisation by changing not only the content of curriculum and programmes but also more importantly their delivery systems. IT-enhanced *teaching* and *learning* are already making computers, video conferencing and the use of the Internet a commonplace in Malaysia educational settings. The Malaysia Ministry of Education sees the need to bring about a significant transformation of the Malaysian educational infrastructure in order to meet the 21<sup>st</sup> century as a technologically competent and scientifically adept society in line with the aspiration laid down in Vision 2020 by Dr. Mahathir Mohamed in 1990.

In order to focus on K-Economy as a national strategy for the near future, the country realises the significant role of education and its impact on development. Education is important in achieving stability and continuous sustainable progress. In the annual government budget over the last 20 years, *education* has been a major item of public expenditure and this allocation is steadily increasing. In 1991 for example, education was allocated RM6642.1 million amounting to 17.3% of the national budget allocation. The following year, the allocation was increased to RM8239.2 million, constituting about 18.1% of the national budget allocation. In 1993, the amount

allocated for education was RM8923.5 million, constituting about 20.2% of total allocation. Ever since then, allocation for education has been sustained at between 17 to 20% of the country's budget (Malaysia,1998). In the recent 2002 budget announcement by the Prime Minister who is also the Minister of Finance, 20.52% was allocated for education planning and development in the country. The continuous and sustained allocation of a significant percentage of the country's wealth on education is evidence of Malaysia's commitment and aspiration to fulfil the country's obligation to provide better and accessible education for all her citizens.

Today, Malaysia has higher institutions than before. The establishment of higher learning institutions has flourished. More public and private universities and colleges are built to meet the demand for professional qualifications and a trained workforce. New programmes and courses are continuously being introduced.

Consequently, *distance education (DE)* which was first introduced and implemented by Universiti Sains Malaysia in 1971 has become an increasingly important mode of education to meet the rising demand for education. Such progress has now introduced life-long learning as a new educational vehicle to democratise education and training in Malaysia. Life-long-learning functions as an economically viable medium to provide continuous knowledge and skills to its learners. This, and many other advantages of life-long-learning as an educational alternative, has resulted in the birth of many public and private colleges and universities and DE and life-long learning programmes and courses throughout the country.

In view of recent development in the world economy, and globalization, Malaysia recognises that 'knowledge' is the passport to prosperity and social stability. With a market economy, Malaysia has a good communication infrastructure for life-long-learning in terms of printing, radio and television broadcasts, telephone, postal services and telecommunication. The Multimedia Super Corridor (MSC), which is the brainchild of the Prime Minister, could play a major role for the future development of distance education in Malaysia.

To survive and flourish as part of the 'global village', the government believes that Malaysia has to become a 'learning society'. As Brown & Lauder (1977: p.179) say, "...it is the knowledge, skills and insights of the population that is the key to future prosperity." This is a concept that needs to be inculcated into Malaysians' life, educational system, and society at large. Acknowledging the monumental importance of realising such a concept, many institutions have promoted lifelong learning as a key objective for an education provider.

*Vision 2020* is not new to Malaysians. It is not Dr. Mahathir Mohamed's view of the future but a carefully planned response by the government and the Malaysian people to global change and development. Malaysia's own development has reached a critical juncture. Having Singapore as a close neighbour and being located in a region of rapid development adds to the pressure to innovate. The structural transformations of its economy place the citizens of Malaysia at the threshold of a fundamental shift; first into an information-based society and then beyond to a knowledge based one.

In the government view, Education must build a pool of well-educated, highly skilled and strongly motivated professionals. The nation's human capital is its most important economic and development resource. Today, the nation is embarking on an educational journey that will deliver on the promises made to establish Malaysia as a fully industrialised country in this new century.

The Malaysian government is facilitating change and seeking innovative approaches to expand the education base. Strategies for growth and development of education in the 8th Malaysian Plan are a significant departure from the government-propelled initiatives of previous years. A Malaysia approach in education is making it possible for both the public and private sector to meet the needs for tertiary education by offering degree, diploma and certificate level courses either by the traditional method or distance and now through inculcating life-long-learning.

In the last 10 years, many developments have occurred in the Malaysian educational system; the stage for a major revolutionary change has been set. Since 1995, the Malaysia Ministry of Education has effectively passed six phases of legislation to position Malaysia as a regional education hub. The *Education Act 1996*; *The National Council on Higher Education Institutions Act 1996*; the *Private Higher Educational Institutions Act 1996*; *National Accreditation Board Act 1996*, the *Universities and University Colleges (Amendment) Act 1996*, the *National Higher Education Fund Board Act 1997* and *National Higher Education Fund Board Act (Amendment) 2000* has facilitated a more market centred education system (Gan & Azahari, 1998).

With the legal and policy framework almost complete, the education system is set for a quantum leap which will bring sweeping changes to Malaysian institutes of learning, enabling them to offer a wider range of courses, different options and approaches to learning, better management, new teaching methods and an overall increase in productivity and standards.

The development of the education system in Malaysia reflects the multi-faceted role it assumes in the creation of a united, democratic, just, liberal, and progressive society. The overriding national objectives of education are national unity and human resource development. Education is regarded as a vehicle for the workforce needs of the country. Educational policies are aimed at providing greater opportunities for those in the lower income groups and the deprived regions in the country.

Innovation in education has been continuous. Nevertheless, further changes will still be needed. In the context of the changing world and as a result of the advances in science and technology, Malaysia has no alternative but to remain competitive in global economic activities, whilst at the same time guaranteeing domestic growth and development. Operating within these parameters, issues pertaining to equity, access and democratization of education, education quality, efficiency, as well as values, education will continue to be geared towards enhancing the quality of life of our children and generations to come.

In the new economy, the structure of the economy will not be the same as before. In the global K-economy, wealth is measured not just by agricultural or industrial production, but also by the new values created through the resource-based application of knowledge (Cappelli et al. 1997, Brown & Lauder, 1997, Tan, 2000). It may not be enough to rely on traditional industries with tangible products. There is also a need to develop new industries to produce information and knowledge products. Nevertheless, the manufacturing sector, which accounts for more than one-third of the GDP of the country, will continue to play an important role in the K-Economy. However, in view of the gravitation of the economy from production-based to knowledge-based, the manufacturing sector will have to adjust to the rapid change in technological advancement by innovating its products through research and development (R&D) and enlarging the pool of knowledge workers. It is no less important to develop the services sector. It is generally known that the level of development of the service sector, particularly the knowledge intensive segments, has become a key determinant of competitiveness for many economies. There are many compelling reasons for Malaysia to develop its services sector. An expansion of this sector would help to create national wealth. The advancing economy has created a demand for skilled knowledge workers and professionals. Skilled labor is still in short supply, especially in the Information Communication Technology (ICT) sector and manufacturing industries. Therefore, several additional efforts have been made to increase ICT literacy. In surging towards a more globalized economy, Malaysia spearheads the information age through the aggressive promotion of Information Technology (IT). It has embarked on e-education, borderless marketing, electronic commerce and digital broadcast through the Multimedia Super Corridor (MSC) project. Currently, e-learning is sweeping across the training and education industry, creating a chain reaction that is revolutionizing the way people learn at work, in school and at home. Nevertheless, almost all universities in Malaysia have incorporated new skills such as information and knowledge management, as well as programming applications, into their education and training curriculum. With the rapid deployment of ICT, it will be necessary to accelerate the learning process and innovate through the effective application of the acquired knowledge.

## The Importance of Learning & Training

Human being is born with an innate ability to learn and it is a process than has no endings. Learning is part of everyday human activities that defines characteristics of what it means to be human. *Life long learning* is therefore a concept that only advances the idea that learning is a human preoccupation that is bind to human's life and activities. Learning will and should not cease till one departs from life. We believe that life long learning makes an invaluable contribution to the personal, social and economic development and society as depicted in Fig. 1.

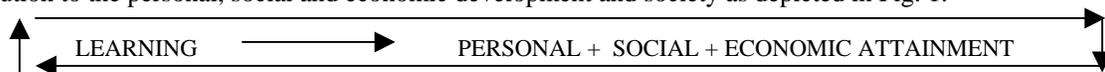

FIG. 1: LEARNING PRODUCES INVALUABLE CONTRIBUTION

This paper argues the need for workers to constantly update their skills to survive and profit in the global economy. Workers need to be continuously trained, and learn different skills to remain competitive, and such effort is made more plausible with collaboration, partnership with different organizations that has relevant interest and desire. One possibility, such collaboration as advocated in this paper could be in place between *public-private-educational institutions*.

The discussion of life-long-learning usually emphasizes progressive social objectives such as social cohesion, equal opportunities, social inclusion, active citizenship, and so on.

Public education systems particularly higher institutions have been seen as a means of securing social progress. But, dependency on higher institutions to campaign, and inculcate life long-learning and training among Malaysians is not sufficient and slow coming. Partnership is advocated and needed among different segmented entities or stakeholders to ensure its success. The incorporation and introduction of life long learning into educational opportunities within the human resource development is timely, and is parallel to its often stated aims.

As distance and life long learning educators, we are concerned with the role of corporate and private organizations in democratic redistribution of educational opportunities by way of education and other public services. The question therefore arises as to whether or not lifelong learning, together with related concepts such as the learning society, K-Economy, all constitute an element that can be fully advocated and realized among the public, private organizations with the higher institutions. The core argument that this paper brings forward are three folds. Life long learning must be made into a policy, a strategy and a cultural practice as shown in table 1

TABLE 1: LIFE LONG LEARNING MUST BE MADE INTO A POLICY, A STRATEGY AND A CULTURAL PRACTICE

<p><b>Life-long-learning</b></p>	<p><i>A policy for the expansion of the education and training system, addressed to competitiveness and employability</i></p> <p style="text-align: center;">↓</p>	<p>This concept has to be made into an on-going policy that focuses on strengthening human resource. Workers need to be –retrained and given an opportunity to be multi-skilled in order to become a better work force.</p>
	<p><i>A strategy for mutual partnership among higher institutions of learning with public/private organizations</i></p> <p style="text-align: center;">↓</p>	<p>It is timely that public-private organizations and institutions work together for the benefit of all stakeholders. Institutions of higher learning are primary providers of education, and training, and could only do its part in inculcating life-long learning if provisions are made in organizations to enable workers and employers to seek continuous learning and training.</p>
	<p><i>As a cultural practice</i></p>	<p>Last but not least, it is also timely that learning, and in particular continuous learning is encouraged and commanded. With such culture existing, Malaysians would be a learning society, and this would help to inculcate the culture of life-long-learning in the country.</p>

## **The Need to Inculcate Life long Learning & Training**

“Do we need to inculcate life-long-learning? Do we want to be world leaders, and be able to provide services and produce products with world distinctions? Do we have the skills and human resource that is able to judge, screen and select the best quality of information? Do we have the professionals to access and screen needed information?” ‘It’s a different world. The working environment has changed significantly, and that require a better work force’ a phrase that ideally answer this very question. Learning, re-learning and re-training have certainly receive utmost attention and has many implication in today’s world.

Learning in recent years has taken on a particular significance in terms of both individual and collective advancement and well-being (Coffield, 1997). In times of rapid and pervasive change, an existing or static body of knowledge does not equip people with the ability to cope, much less to thrive and advance.

Malaysians have to change. In particular, the current mindset about what constitute learning, teaching and education have to be transformed. Quite often, the view on teaching and learning is dominated by the view which is often fitted into a mold in which teacher is explicitly one who tells or shows presumably unknowing learners something they presumably know nothing about. A critical challenge is a reformulation and reconceptualization of this impoverished and misleading conception as it is inadequate in life-long-learning. Learning is more than being taught. Learning new skills and acquiring new knowledge cannot be restricted to formal education settings.

## **Dominant Changes that Made Life-Long-Learning Timely**

What, then are the dominant changes that are impacting on our lives as Malaysians and bringing about a requirement for continuing learning, re-training and adaptation?

### **Effects of New Technologies & Working Environment**

The first and most obvious is the pervasive effects of new technologies. Whether in the home, the community, the office, the library or on public transport, people have to cope with new and often intimidating technologies. Thus simply to go about one’s everyday life, there are always new introduction to recent applications, software, hardware and new concepts and terminologies to be mastered. Today’s modern working environment calls upon an impressive range of technologies to enable professionals who may be separated by distance to communicate with each other in real time (synchronous) and delayed time (asynchronous). It is virtually impossible to escape the implications of new technologies, which affect every aspect of our lives. This means that learners, workers and professionals can access education and learning opportunities at a time, place, and pace to suit their individual lifestyles, learning preferences and personal development plans. Such separation according to Idrus & Lateh (2000) give rise to “an impressive and innovative array of media mix resulting in the application of technology...” (p.197). Such development offers a radical new direction for not only distance educators, but life long learning enthusiasts, employees, teachers and learners alike, incorporating flexible and open learning and training methods as well as modified and specially created learning resources.

The main task of any life long learning provider is to design and offer educational experience that encourages learning and training. As such, life long learning providers need to understand that its educational products and services are to service the learners and provide an encouraging educational experience for the learners. In doing so, many factors need to be considered in developing and delivering life-long-learning courses to achieve effective and efficient implementation of the courses or programs.

### **Globalisation**

A second dominant source for new leaning is the phenomenon of ‘globalization’ which has triggered significant change on how business and companies, educational institutions, and organizations operate. The economy crisis late 97’/98’ for example forced mergers, downsizing, and retrenchment as part of normal activities to sustain survival. Globalization in itself embraces everything from the changing geo-political situation, to issues of mass migration, the displacement of large numbers of people, and the impacts of different cultures and religions on established ways of thinking and behaving. However, there is also a more alarming aspect of globalization which demands new learning, and that is the effect of changed economic circumstances, the emergence of multinational corporations and,

for many, the loss of jobs, necessitate the development of new skills in order to gain or retain employment. Globalization in some ways has forced people to re-train themselves, and coming back to institutions, and that has become a choice for individuals to remain skillful and competitive.

#### **Changing Work Patterns**

Globalization has indeed changed every aspect of human activities. Work patterns are drastically different and more demanding. Whether changing work patterns are precipitated by globalization, technology or simply by changes in organizational structures also provide a significant pressure for continuous learning (Coulson-Thomas, 1999). Clearly this imperative impacts most directly on those already in the workforce, but there are few if any people who escape the need for updating, learning about new markets products or services, adjusting to changing organizational structures and systems, or in other ways engaging in work-related learning. As mentioned above, some such learning takes place through short courses and other off-the-job interventions; some through mentoring or on-the-job training, some through the distribution of new specifications and organizational structures via bulletin boards, email or through the organization's intranet. Most of it occurs, however, incidentally and continuously through informal means including conversations with colleague, suppliers and customers, or through casual interactions with others in, or in relation to the workplace.

#### **Information Surplus**

Globalization and the change environment has also contributed to the excessive flow of information and knowledge to us. In some ways, the world has witnessed an unprecedented surplus of information. The total amount of information in our society is expanding at an unprecedented rate, and it is a challenge for everyone. This phenomenon, commonly dubbed 'information overload,' captures perfectly the extraordinary challenge in keeping up without feeling overwhelmed by the tidal wave of information; a challenge which commonly leads to a phenomenon called 'information anxiety' (Tan, 2000, Wurman, Leifer & Sume, 2000). With such a change in working environment, organizations of all kind need to be able to maximize the use of the unprecedented amount of knowledge effectively. This calls for re-training, and repositioning the work force so that the best results could be acquired.

### **Partnership Criteria to Inculcate Life Long Learning as a Practice**

From the perspective of partnership, the selection of the partner is of superior importance. Partnership selection distinguishes between criteria for partners associated with operational skills and resources which is vital for competitive success and criteria associated with efficiency and effectiveness of partner's cooperation. Partnership will be based on mutual interests, trust and the management of ongoing relationships. Alliances and joint ventures will focus executive behavior on working collaboratively, communicating and gaining consensus. A review of successful partnership has identified the following important criteria that higher institutions, public and private organizations could consider:

1. Partnership is effective when the driving forces are complementary
2. There should be complementary strengths-strategic synergy
3. Partners must have co-operative spirit, the importance of 'chemistry'
4. Partners are willing to address new risks, and committed to flexibility
5. Partners should have compatible styles of management and corporate cultures
6. Partners must practice effective communication between partners

Understanding partnership criteria helps in understanding what are expected to be pursued when embarking on cooperative venture or partnership on inculcating life long learning and training between public-private-higher institutions.

One needs to understand how each entity or organization complements each other. This 'win-win' situation would strengthen the 'alliance' and give benefits to its participants, namely the higher institutions as educational and training provider, the professionals representing the public and private organizations as 'potential learners'. There are indeed vast potential to be developed.

## **The Assembly of 3-Way Collaboration for Human-Resource Development (HRD)**

The assemble of this three-way collaboration or partnership is timely as countries affected by the Asian currency and economic crisis of 1997 begin to show signs of recovery. One of the consequences of the economic crisis was the restructuring of business sectors in the affected countries. This has affected millions of Asian workers and resulted in rising unemployment. Economic recovery means these displaced workers can now look forward to better employment prospects. However, in some cases, re-employment will come about only if workers possess the skill set and capabilities needed for the jobs which are being created. Hence, the importance of HRD cannot be overstated. Another reason why this is timely is the emergence of the knowledge-based economy (KBE) which has been adopted by Malaysia. The KBE is one in which intellectual capital will be the key source of competitive advantage instead of physical assets. Increased globalization and rapid advances in technology, communications and transportation has greatly removed the geographical barriers of time and space. This means that the importance of physical assets such as land, labor and infrastructure as key factors to sustain competitive advantage has been significantly eroded. Factors of production are now more mobile and portable, traveling freely across the globe unhindered by national boundaries. The ability of a workforce to absorb and apply knowledge to add value will instead be the key source of competitive advantage in the business environment of the future.

HRD or the continual development and investment in people has therefore become more important today than ever before to provide the skills and intellectual capital that is essential for businesses and nations to not only survive but to explore new business opportunities.

### **Partnership in Training**

The effectiveness of HR development and training efforts, however, hinges very much on partnership and shared commitment of employers, employees and the public and private sectors in general. It has to be a three-ways effort. Effective HRD programs would require employers to invest in training and skills upgrading that go beyond meeting the requirements of present jobs. Employers must prepare workers for changes in technology and the way in which a company does its business. Employers must also encourage and reward workers for their keenness to master new skills or upgrade old skills. For employees, their active participation in learning and re-learning would sharpen their competency and adaptability to new and higher-value added jobs in a rapidly changing business environment. Skill upgrading is the worker's guarantee of employability.

Likewise, higher institutions and providers of education in general have a social responsibility to invest and equip the workforce with basic education that are essential for the acquisition of new skills to keep pace with technological changes. Governments must promote the concept of life-long learning and constant refreshing of every worker's stock of skills and knowledge.

Shared commitment amongst the partners (public-private-educational institutions) is necessary to put in place a supportive infrastructure to build up a learning culture whereby workers are continuously motivated to train and upgrade themselves even as the labors market evolves to meet new demands.

In such spirit, the partnership between the public-private-educational organizations in the development of human resource is reflected in the formulation of Malaysia's strategic manpower strategy which is an attempt to prepare Malaysian workers with the necessary skills and capabilities to take on the challenges of a knowledge driven economy in the 21st century. There is still much room for expansion and development. A strategic thrust of manpower is the creation of a national system of lifelong learning for our workers so that their knowledge and skills will remain relevant and needed as job requirement changes.

In addition, the Ministry of Higher Education has set up a network of Community Colleges to provide workers with continuous education, job placement assistance, as well as assisting them in seeking out appropriate skills training and upgrading. The longer-term objective is to create a strong learning culture in Malaysia where every worker with the desire to upgrade himself or herself, will have the opportunity to acquire new knowledge and higher skills. For our workers, life-long learning translates into life-long employability and provide the following advantageous:

### **Economic and Social Benefits of Learning, Education and Training**

Education and training make individuals employable, help them gain access to decent work and escape poverty and marginalization. Education and training also improve individuals' productivity and income earning opportunities at work, their mobility in the labor market, and widen their choice of career opportunities. According to the World Bank, primary education is the single largest contributor to growth and development in developing countries.

Economic growth and social development of countries are invariably associated with large and sustained investments in education and training. Countries with the highest incomes are also those where workers are most educated. Witness enrollments of high income countries in primary education, which is universal, secondary education, which is almost universal, and tertiary education, which is approaching 50 per cent of the relevant age group. Some 98 per cent of the adult population in these countries is considered literate. By contrast, in the poorest (or least developed) countries, primary education enrollments were in 1997 around 71.5 per cent, secondary education enrollments 16.4 per cent, and tertiary education enrollments a mere 3.2 per cent of the respective age groups. That was 8 years ago, today this number could easily increase to a better statistics. Basic literacy, essential for learning and "trainability", and for employability and access to decent work in today's world, eludes a significant share of adults in Sub-Saharan Africa and Southern Asia. In 2005, it is believe that advanced and developed countries invest at least 30 times more per student in education and training than the least developed countries.

Human resources development and training contribute to improved productivity in the economy, reduce skills mismatches in the labor market, and promote a country's international competitiveness. A comparative study of Germany and the UK found that the greater willingness of German employers to offer apprenticeship training, as opposed to the regular youth employment and informal training which came to dominate in the UK, contributed to Germany's higher productivity and better trade performance.

Finally, and beyond any economic considerations, education and training bring benefits to society. Human resources development and training underpin the fundamental values of society - equity, justice, gender equality, non-discrimination, social responsibility and participation of all in economic and social life.

### **Empowering the Workers**

Every Malaysian has a right to education and training, as do many national constitutions, for example, in Argentina, Bolivia, Brazil, Chile, Germany, Guatemala, Italy, Mexico, Spain and other countries.

More than ever before, individuals want to master their own lives and expect to contribute to the economy and society. The development of individuals as active citizens of society is increasingly given a central place in statements of learning, education and training objectives. Active citizenship is about how people participate in all spheres of economic and social life, the chances and risks they face in trying to do so, and the extent to which they feel that they belong to, and have a fair say in, the society in which they live. Decent work underpins individuals' independence, self-respect and well-being, and, therefore, is a key to their overall quality of life. Many countries, both industrialized and developing, are putting the individual in the center of the education and training process, but trussed by financial means that help him/her access learning.

Denmark is pioneering a learner-centered approach to vocational education and training. Others, for example Tunisia, Egypt, Singapore, Argentina and many other Latin American countries, are introducing fundamental basic education reform that emphasize "essential", "basic", "key" etc. skills that are intended to promote the independence and initiative of the individual. In Sweden, the Adult Education Initiative (AEI) the largest adult education investment initiative ever undertaken in the country, explicitly puts the focus on the individual. All AEI programs are governed by his/her needs, wishes and capacity. Education should help to improve the individual's opportunities in the labor market and provide for further study opportunities; it must be demand-led, be it in terms of organization, planning or actual courses provided. Every individual is given ample scope to make a personal choice of the study he/she wants to undertake, its timing and location.

The individual is becoming the architect and builder responsible for developing his/her own skills, supported by public and enterprise investment in life-long learning. Democracy is about empowering the individual. Several factors - economic, social and technological - account for the growing emphasis on the individual. Firstly, in any modern economy today, the production of goods and services increasingly relies on human, rather than physical, capital, i.e. on its workers' individual and collective endowment of knowledge and skills.

Secondly, from a passive, and teacher oriented, approach to gaining knowledge and skills, there is a shift towards learning for life and work, centered around the individual. The process of formal education and training is becoming less one of passing on information - as there is too much of it in today's world - and more one of individuals learning to learn so that they can find out for themselves. The relevance of knowledge about facts is diminishing, while the need to learn how to access, analyze and exploit information and transform it into new knowledge is increasing. It is only by giving the individual the desire, and tools, including financial means, to take charge of her/his own learning that he or she will be able to live and work in the knowledge and information society.

Thirdly, modern communication and information technologies (ICT), in particular the Internet- based technologies, offer great opportunities. ICTs are used by increasing number of people as learning tools, since access to them is expanding rapidly in the advanced, as well as in many middle income, countries and free courses are becoming available on the Internet. These learning opportunities are not restricted to computer and ICT skills but cover now a vast, and rapidly expanding, range of learning opportunities for life and work in the knowledge economy and society. However, the "digital divide", i.e. unequal access to ICT and the Internet - between countries and within countries - runs the risk of growing even wider unless serious efforts are undertaken nationally and internationally to reverse the trend.

## Conclusion

The changes in the business environment as a result of rapid globalization and technological progress present new challenges in the area of human resource development. The tripartite collaboration effort could provide an excellent opportunity for Malaysia to share experiences and to formulate new strategies for human resource development and training. Successful implementation of human resource development and training programs will play an important part in helping the country to achieve sustainable economic growth. This will in turn bring about greater employment opportunities, social progress and a higher standard of living for workers in Malaysia. To survive the higher intensity of competition brought about by globalization, Malaysians will have to adapt themselves to the demands of the K-economy. It must be remembered that, other competing economies are also racing to transform their populations into knowledge societies, where people are constantly enriching themselves with knowledge to stay competitive. And inevitably, all these people will have to embrace the philosophy of life-long learning.

# **Individual Innovativeness and Organizational Citizenship Behavior: The Mediating Role of Leader-Member Exchange**

*Noormala Amir Ishak  
Universiti Teknologi MARA, Malaysia*

## **Abstract**

Little is known on whether individual innovativeness predicts organizational citizenship behavior. This study examined the relationship between individual innovativeness and organizational citizenship behavior and whether leader-member exchange mediated the relationship between these variables. Drawing on the social exchange theory, the results were consistent with these predictions. A sample of 385 non-supervisory bank employees was obtained from domestic commercial banks using survey questionnaires. Findings provided important evidence that the way supervisors treat their employees plays a very important role in getting innovative employees to perform organizational citizenship behavior. Research and practical implications are discussed.

## **Introduction**

It is now commonly accepted that an important condition of organizational effectiveness is a willingness of employees to “go above and beyond” the formal specifications of their prescribed roles (Barnard, 1938; Katz & Kahn, 1978; Organ, 1983). Discretionary organizational citizenship behavior (OCB) (Bateman & Organ, 1983; Smith, Organ, & Near, 1983) includes behaviors that are neither mandatory in-role behavior nor directly or contractually compensated for by formal organizational reward systems (Organ & Konovsky, 1989). OCB facilitate the accomplishments of organizational goals and enhance organizational performance (Podsakoff, Ahearne, & MacKenzie, 1997).

According to Organ (1988), the OCB construct comprises five key dimensions: altruism, civic virtue, conscientiousness, courtesy, and sportsmanship. Although some researchers have proposed variations of this framework, these five dimensions are the most commonly cited dimensions in the social sciences literature (Organ & Ryan, 1995). Altruism is defined as voluntary actions that help another person with work-related problems (Podsakoff, MacKenzie, Moorman, & Fetter 1990). It means taking time out of one’s own schedule to give help to someone who needs it. Civic virtue characterizes a person who participates in and is concerned about the life of the organization (Podsakoff, MacKenzie, Moorman, & Fetter, 1990). The activities include attending meetings or functions that are voluntary or optional in nature. Conscientiousness refers to placing priority on attendance, use of time and adherence to various rules (Organ, 1988). The employee takes extra responsibilities, is punctual, and places great importance on detail and quality of tasks. Courtesy involves engaging in actions that help prevent work-related problems with others from occurring (Podsakoff, MacKenzie, Moorman, & Fetter, 1990). Employees are thoughtful and considerate toward others. Sportsmanship involves a willingness to tolerate the inevitable inconveniences of work without complaining (Organ, 1988). Employees maintain a positive mindset and abstain from bad feelings when their suggestions are rejected.

Although there have been many studies of OCB in organizations, no known studies have examined the linkage of individual innovativeness with OCB where the effect of leader-member exchange (hereinafter, LMX) as a mediator, is included. Given this lack of information, attempts are made to answer two questions. Does individual innovativeness influence OCB? Does LMX mediate the relationship between individual innovativeness and OCB?

## **Theoretical Framework and Development of Hypotheses**

This study conceptualizes individual innovativeness has a positive relationship with five dimensions of OCB--altruism, courtesy, conscientiousness, sportsmanship, and civic virtue. Further, we believe that this relationship is mediated by LMX as depicted in Fig. 1 below.

FIG. 1: HYPOTHESIZED RELATIONSHIP BETWEEN INDIVIDUAL INNOVATIVENESS AND ORGANIZATIONAL CITIZENSHIP BEHAVIOR WITH LEADER-MEMBER EXCHANGE AS MEDIATOR.

## Organizational Citizenship Behavior

Organ (1988, p. 4) defines OCB as: "individual behavior that is discretionary, not directly or explicitly recognized by the formal reward system, and that in the aggregate promotes effective functioning of the organization." The behavior is not one that is enforceable by the organization; instead the behavior is more of a matter of personal choice. These behaviors when summing across time for a single person or summing across persons in the group, department or organization, will improve the effective functioning of the organization. Most OCB actions, taken singly, would not make a dent in the overall performance of the organization (Organ, 1988). The most critical element is that these behaviors are defined at face value. OCB are behaviors that are clearly observable by peers, supervisors, or researchers.

Williams and Anderson (1991) suggested that the interpretation of OCB has been troublesome because it has failed to clearly differentiate between OCB and in-role performance (Moorman, Niehoff, & Organ, 1993). In-role behaviors involve supporting the technical core of the business in the organizations whereas OCB does not. Similarly, Morrison (1994) argues that the boundaries between OCB and in-role behavior are often interpreted differently by different employees. A study conducted by Morrison (1994) sought to identify the boundary that views OCB and in-role behavior as distinct constructs. Morrison (1994) argues that OCB may be in-role from the employee's perspectives. An individual is more likely to engage in OCB when these behaviors are part of his or her job requirements. Thus, empirically it is not clear if the individual who engages in citizenship behaviors considers those behaviors to be extra-role or in-role (Morrison, 1994). Contrary to these confusions, this study will adopt the perspective taken from the voluminous theoretical and empirical work on OCB which gives the impression that the boundary between in-role and OCB is agreed upon and clearly defined and that OCB is the same for all employees (Niehoff & Moorman, 1993; Organ, 1988; Podsakoff, MacKenzie, Moorman, & Fetter, 1990). In this study, a measure on in-role behavior is included as a control variable so as to isolate variance in OCB measures that is not associated with performance of in-role behaviors.

## Individual Innovativeness and Organizational Citizenship Behavior

There is a lack of previous research that has investigated a link between individual innovativeness and OCB. However, there is some theoretical support for such a link. One source of theoretical support is the social exchange theory. Perceptions of innovativeness within an organization have been directly linked to employee satisfaction and their willingness to participate in the innovation processes (Hurt & Teigen, 1977; Johnson, Donohue, Atkin, & Johnson, 2001). Regardless of the extent of organizational rigidity, innovative employees would still be satisfied with their own work and would be more likely to find unusual and interesting ways of doing it (Hurt & Teigen, 1977). The assumption here is that the more innovative the employee, the tendency will be that he or she will perform OCB. An individual who is innovative forms an attitude to do things differently. Doing things differently may go beyond what has been prescribed in the individual's job description. If the individual does not expect to receive explicit rewards on what his or her actions, this behavior can be part of what is described as OCB.

Studies on individual innovativeness (Hurt & Teigen, 1977; Johnson, Donohue, Atkin, & Johnson, 2001; Oldham & Cummings, 1996) have mostly focused on its effect on behaviors and performance in general. George and Zhou (2001) found that individual innovativeness predicted behavior of employees in organizations. Therefore, this study seeks to examine whether individual innovativeness influences OCB, which is a type of behavior.

Employees who perceive themselves as innovative are more likely to have consistent attitudes and these will in turn lead them to perform beyond their daily responsibilities. Innovative behavior has been defined as the willingness to change (Hurt & Teigen, 1977). Thus, carrying out work differently from what is prescribed in the job description with the aim of enhancing effectiveness and efficiency, contributes to what we refer to as OCB. Since there has been no previous study done between individual innovativeness and OCB, the researcher hypothesizes the relationship as follows:

Hypothesis 1: Individual innovativeness has a positive relationship with the various OCB dimensions.

## **Individual Innovativeness and LMX**

In an era emphasizing the need for change, creativity, and innovation in organizations, particularly employees' initiation of organizational change efforts, one wonders if individual innovativeness can be a contributor for organizational effectiveness; especially through the support of LMX from their supervisors. That is, employees who are innovative in their work place are, in essence, satisfied with their jobs and this triggers them to come up with new ways to improve current conditions. Individual innovativeness contributes to organization's renewal, survival, and growth in today's turbulent and competitive business environment through the performance of OCB (Amabile, 1988). An examination is thus made on the relationship between individual innovativeness and LMX, thus the hypothesis:

Hypothesis 2: Individual innovativeness has a positive relationship with LMX.

## **Leader–Member Exchange and Organizational Citizenship Behavior**

LMX describes how leaders develop different exchange relationships over time with their various subordinates as they influence each other. LMX research shows that supervisors reporting high-quality SLMX not only assume greater job responsibilities but also express contributing to other units (Liden & Graen, 1980). Hence, the quality of the LMX influences levels of delegation, responsibility, and autonomy and in turn, employees perceive greater latitude, decision influence, and feelings of contribution (Gomez & Rosen, 2001). Liden and Maslyn (1998) found a four-dimensional LMX model comprising of contribution, loyalty, affect, and professional respect. We expect the higher the LMX on each of these dimensions, the higher the subordinates will be in performing OCB. Hence, the hypothesis:

Hypothesis 3: LMX has a significant positive relationship with OCB.

## **Mediating Effect of Leader–Member Exchange on Individual Innovativeness and Organizational Citizenship Behavior**

To date, there has been little effort made to study the potential mediating effect of LMX relating to individual innovativeness and OCB. The following hypothesis is thus conjectured:

Hypothesis 4: LMX mediates the relationship between individual innovativeness and OCB in such a way that the influence of individual innovativeness on OCB will be smaller (partial mediation) or non-significant (full mediation) in the presence of LMX.

This study employs social exchange theory to investigate the connection between individual innovativeness, LMX, and OCB. Social exchange theory has been the primary framework for understanding OCB (Konovsky & Pugh, 1994; Organ, 1988; Smith, Organ, & Near, 1983). People always seek to reciprocate those who benefit them (Adams, 1965; Blau, 1964). To reciprocate the support from the organization, the employee may do so via job performance, but such performance may be limited up to a certain extent only since organization has strict contracts. Thus, the exchange that takes place will be more of an ambiguity thus allowing discretionary acts to be carried out by employees. OCB, from a social exchange theory perspective, becomes an outlet for these positive feelings. When a supervisor engages in helping behavior toward an employee, the employee incurs obligations to

repay the supervisor so that the exchange is mutually beneficial. Social exchange relationships have an implicit understanding that a history of extra-role efforts will over time be recognized, appreciated, and rewarded.

## Method

A cross-sectional research design was used to examine the relationships between individual innovativeness, LMX, and OCB. Data were collected through printed questionnaires personally administered at various banks situated in Klang Valley, Malaysia.

## Sample and Procedure

The sample consisted of 400 non-executives from the banking industry in Malaysia. Data were collected through a written questionnaire distributed through the “drop-off and pick-up” method. The respondents were informed through the cover letters accompanying the questionnaires of the voluntary nature of their participation in the survey and were assured of anonymity. A total of 390 of the distributed questionnaires were returned, of which 385 were determined to be usable for purposes of this study (i.e., completed in full). This produced a usable response rate of 99%.

### Organizational Citizenship Behavior

This study examined OCB from the standpoint of the employees’ supervisors. The 24-item OCB scale developed by Podsakoff, MacKenzie, Moorman, and Fetter (1990) was utilized to assess five dimensions of OCB proposed by Organ (1988). The results from this research hope to draw inferences about OCB from the five dimensions, which may have different relationships with the predictors. Studies argued that because the five OCB dimensions represented distinct classes of citizenship behavior, they should be analyzed separately. In-role behavior scale was also included in the questionnaire as a control variable so as to isolate variance in OCB measures that was not associated with performance of in-role behaviors (Moorman, Niehoff, & Organ, 1993). This approach was used instead of including in-role behavior in the criterion set because the theory supporting OCB-predictor relationships was not applicable to in-role behaviors; thus in-role behaviors were not expected to be related to the predictors (Williams & Anderson, 1991).

On the basis of previous studies (Morrison, 1994; Williams & Anderson, 1991) both in-role behavior items and OCB items were together submitted to a principal components analysis with varimax rotation ( $N = 385$ ). By doing this, it will lead to a better measurement of OCB since such analysis would clarify whether the respondents differentiated in-role behavior and OCB. This recommendation was strongly supported in other studies (Diefendorff, Brown, Kamin, & Lord, 2002; Moorman, Niehoff, & Organ, 1993; Morrison, 1994; Motowidlo, Borman, & Schmit, 1997; Williams & Anderson, 1991) which found that the boundary between in-role behavior and OCB was ill-defined and varied from one employee to the next and between employees and supervisors (Morrison 1994). The OCB scale comprised of 24 items and in-role behavior scale comprised of seven items. The reliabilities (Cronbach’s alphas) for all the constructs met or exceeded Nunnally and Bernstein (1994) recommended level of 0.70 (refer Table 1). The item ratings were obtained from a 7-point Likert-type ranging from 1 = “Strongly Disagree” to 7 = “Strongly Agree”. The ratings indicated the extent that each of the behaviors was characteristic of the employee’s behavior.

### Individual Innovativeness

Measurement items for innovative behavior were adapted from the work of George and Zhou (2001). This variable was measured by summing the 13-item scale responses and divided the sum by 13 to give a summary indicator of individual innovativeness. Higher scores indicated a higher degree of innovativeness. The responses ranged from 1 = “To the lowest degree” to 7 = “To the highest degree”. The Kaiser-Meyer-Olkin value for the items was 0.96 and the Bartlett’s Test of Sphericity was significant. The results of a scree test supported a one-factor solution. Individual innovativeness yielded one clean factor with an eigenvalue greater than 1 (eigenvalue = 9.44). Principal components analysis conducted on the 13 items revealed a total of 72.64% of the variance. The name “Individual Innovativeness” was retained. The single scale used has a reliability of 0.97.

### **Leader–Member Exchange**

LMX was measured using the 12-item LMX questionnaire that was adapted from Liden and Maslyn (1998). Four dimensions made up LMX: contribution, loyalty, affect, and professional respect. Quality of LMX was looked at from the views of the employees' supervisors. Factor analysis was carried out on the LMX items and one factor emerged with eigenvalues greater than 1.00, explaining a total variance of 57.34%. All of the items were retained. We named this factor "LMX". This factor encompassed all the four dimensions of LMX found in past LMX literature. The coefficient alpha of the scale was 0.93. This is comparable to those reported by Liden and Maslyn (1988) that showed reliability coefficients ranging from 0.80 to 0.92.

### **Results**

A majority of the respondents comprised of 64% females and 36% males. This female bias in terms of percentage representation is indicative of normal gender distribution for these types of employees at the banks in Malaysia. The sample was diverse in terms of ethnicity. The highest number of respondents was Malays (75%), followed by Chinese (11%), Indians (10%), and the remainder (3%) was classified as "others". Most of the employees were married (54%), with 44% still single and 1% separated or divorced. Most employees were relatively young. Most of them were below 30 years old (80%). In terms of educational attainment, 65% received Malaysian Certificate of Education (MCE), 15% achieved their Higher Certificate of Education (HSC), 17% held Diploma certificates, and a very small percentage of them received Bachelor's degree (3%) and Master's degree (0.3%). For the most part, the employees had relatively low formal education. This was not surprising because the positions they held were non-supervisory positions. They did not supervise any employee at their workplace. 43% of the employees have worked in the banks between 1 year to 3 years and 38% have worked between 4 years to 7 years. Majority of the employees (38%) was supervised by their current supervisors for less than 2 years.

A supervisor rated each employee. The total number of supervisors who answered questionnaires on their subordinates was 258. There were several cases where one supervisor had to answer two, three, or four questionnaires about his/her subordinates. These happened because the subordinates chosen to answer the questionnaires were under the current supervision of these same supervisors. There were 29% males and 38% females. 42% of the supervisors were Malays, followed by Chinese (21%), and Indians (4%). Most of the supervisors were married (54%) and 13% still single. Most of them were between 31 years to 40 years old (33%), 16% less than 30 years old, and 17% between 41 years old to 50 years old. In terms of educational attainment, majority had at least a Bachelor's degree (18%), whilst the rest had Diploma (15%), Higher Certificate of Education (HSC) (11%), and Malaysian Certificate of Education (MCE) (21%). Most of the supervisors (48%) have worked in the banks for more than 7 years.

A principal components analysis (PCA), with varimax rotation, was performed separately for items indicating individual innovativeness, LMX, in-role behavior, and OCB variables. Factor analysis was used to summarize the structure of a set of variables. In this study, a sample of 385 more than enough met the desired cases-to-variables ratio for factor analysis (Hair, Anderson, Tatham, & Black, 1998). An examination of correlation matrix in Table 1 indicated a considerable number of correlations exceeding 0.30 and thus the matrix was suitable for factoring (Hair, Anderson, Tatham, & Black, 1998). The Bartlett's Test of Sphericity, measure of sampling adequacy (MSA), and the Kaiser-Meyer-Olkin (KMO) measure were also examined to determine the appropriateness for factor analysis. Assumptions of normality and linearity were satisfied prior to analysis. Variables were found to be normally distributed. No serious outlying cases were detected.

TABLE 1: DESCRIPTIVE STATISTICS, CRONBACH'S COEFFICIENT ALPHA AND ZERO-ORDER CORRELATIONS OF ALL STUDY VARIABLES

VARIABLES	<i>M</i>	<i>SD</i>	1	2	3	4	5	6	7
1. Individual Innovativeness	4.10	1.05	<b>0.97</b>						
2. Altruism	5.25	1.04	0.46**	<b>0.92</b>					
3. Courtesy	5.28	0.95	0.30**	0.54**	<b>0.82</b>				
4. Civic Virtue	5.16	0.89	0.38**	0.52**	0.59**	<b>0.71</b>			
5. Conscientiousness	5.0	1.11	0.41**	0.53**	0.47**	0.48**	<b>0.62</b>		
6. Sportsmanship	5.30	1.17	0.21**	0.37**	0.50**	0.40**	0.37**	<b>0.89</b>	
7. In-Role Behavior	5.46	0.85	0.44**	0.59**	0.57**	0.58**	0.54**	0.42**	<b>0.90</b>
8. LMX	4.92	0.91	0.58**	0.74**	0.60**	0.61**	0.60**	0.42**	0.66**

Note. *N* = 385; \* *p* < 0.05; \*\* *p* < 0.01; Diagonal entries indicate Cronbach's coefficients alpha ; LMX = Leader-member exchange.

In this research, based on the sample size of 385, the cut-off point for factor loadings of 0.30 and above are retained for further analysis. This is in line with Hair, Anderson, Tatham, and Black (1998) proposal that factor loadings greater than  $\pm 0.30$  are considered to meet the minimum level. Furthermore, Hair, Anderson, Tatham, and Black (1995) proposed that for a sample of 350, a minimum factor loading of 0.30 is required for significance at 5% significance level. When each variable has only one loading on one factor, the interpretation of the factor is considerably simplified. However, there were some instances where one variable loaded on several factors. If items cross-loaded greater than 0.35 (Coakes & Steed, 2003) on more than one factor, the variable was considered for deletion. Once deleted, all variables were again subjected to another run of factor analysis. The ultimate objective is to minimize the number of significant loadings and make each variable associate with only one factor (Hair, Anderson, Tatham, & Black, 1998). Reliability analysis was then conducted on the factors extracted. In line with Nunnally and Bernstein (1994) guidelines, a minimum reliability (Cronbach's alpha) of 0.60 was decided.

Factors with eigenvalues greater than or equal to 1.00 were selected. Twenty-five items loaded cleanly into six factors explaining a total of 68.16% of the variance. All extracted items had factor loadings greater than 0.30. The Kaiser-Meyer-Olkin value for the items was 0.92 and the Bartlett's Test of Sphericity was significant. Principal component factor analysis with varimax rotation revealed six clear factors. A total of six items were deleted due to cross loadings. These items were: three in-role items namely, "He/she neglects aspects of the job he/she is obligated to perform" (reverse-coded), "He/she fails to perform essential duties" (reverse-coded), and "He/she adequately completes assigned duties"; one courtesy item "He/she is aware of how his/her behavior affects other people's jobs"; one civic virtue item "He/she attends functions that helps improve company's image even though his/her attendance is not compulsory", and one conscientiousness items "He/she follows company's rules and regulations even when no one is watching".

Factor 1 included five items, all of them dealing with sportsmanship. Therefore, the label "Sportsmanship" was retained. Reliability was 0.89. A second factor generated by the analysis comprised of five items and was labeled "Altruism" since all the items referred to helping another person. The resultant reliability for this factor was 0.92. The third factor was named "In-role Behavior". It comprised of four items reflecting the formal performance requirements on the job. Its reliability was 0.90. In-role behavior was included only as a control variable throughout

this study. The common thread across the four items in the fourth factor reflected on always consideration to others and not to create problems with them. This factor was named as “Courtesy”. One item, “He/she takes steps to avoid problems with other workers” was dropped so as to increase its coefficient reliability from 0.79 to an improved reliability of 0.82. The fifth factor which was represented by four items was defined as “Civic Virtue”. One item “He/she attends meetings that are not compulsory, but are considered important”–was dropped from the measure to improve the reliability from 0.63 to a stronger reliability of 0.71. The sixth factor was more of an impersonal sort of OCB. In accordance with literature, this three-item factor was labeled “Conscientiousness”. All the items included in this factor displayed conscientiousness and responsibility towards the normal operation of the organization, over and above formal requirements of job duties. A reliability of 0.62 was achieved.

Our findings from Table 1 indicated the results of two hypotheses. Individual innovativeness was found to have significant influence with all the five dimensions of OCB and LMX. Thus, hypothesis 1 and hypothesis 2 were substantiated. It was also found that LMX, which was taken from the perspective of the superior, was positively related to OCB dimensions. Thus, Hypothesis 3 was fully supported. In essence, the results showed that quality of LMX was influential to the subordinates to perform OCB.

## Regression Analyses

To further investigate the relationships among the variables, a series of multiple regression equations, one for each criterion variable, were conducted. In-role variable showed significant influence on the criterion variable (William & Anderson, 1991). For the sake of clarity, only in–role behavior was included in the regression equations as control variable.

Table 2 presents the results of the analyses among variables. *R* squared provides evidence on the variance in the dependent variable (OCB) being explained by the model (Pallant, 2001). Using multiple regression procedure, all five regressions were found to be significant: sportsmanship,  $R^2 = .17$ ; altruism,  $R^2 = .45$ ; courtesy,  $R^2 = .34$ ; civic virtue,  $R^2 = .38$ ; and conscientiousness,  $R^2 = .33$ . Thus, the model explained individual innovativeness as having 17% of the variance in sportsmanship; 45% of the variance in altruism; 34% of the variance in courtesy; 38% of the variance in civic virtue, and 33% of the variance in conscientiousness. Since the sample was sufficiently large, the assumptions of normal distributions were met. The homogeneity and linearity assumptions were met by visually examining the scatter plots of the residuals. The variance inflation factor (VIF) and tolerance value were examined to detect multicollinearity. Tolerance values that are greater than 0.10 and VIF values not exceeding 10 indicate that problem of high multicollinearity are not present (Tabachnick & Fidell, 1996). In Step 2, over and above in-role variable which was included as a control variable in Step 1 of the regression, the predictor for altruism was individual innovativeness. Civic virtue and conscientiousness were also predicted by individual innovativeness. Individual innovativeness was, however, seen to be the more important predictor to altruism than civic virtue and conscientiousness. Individual innovativeness did not predict sportsmanship and courtesy.

TABLE 2: STANDARDIZED MULTIPLE REGRESSION BETA WEIGHTS FOR OCB DIMENSIONS ON INDIVIDUAL INNOVATIVENESS

Variables	<i>Criterion</i>				
	Altruism	Courtesy	Civic Virtue	Conscientiousness	Sportsmanship
<i>Control Variable</i>					
In–role behavior	0.53**	0.55**	0.53**	0.45**	0.07**
<i>Predictor</i>					
Individual innovativeness	<b>0.25**</b>	0.08	<b>0.17**</b>	<b>0.20**</b>	0.06
$R^2$	0.45**	0.34**	0.38**	0.33**	0.17**
$F$	153.27	98.63	115.79	91.48	39.81

Note.  $N = 385$ . \* $p < 0.05$ ; \*\* $p < 0.01$ .

## Testing for Mediation

The test of the hypotheses that LMX mediates the relation between individual innovativeness toward OCB was carried out. Testing for mediation required considering the results of three separate equations. The regression results in which measures of OCB were regressed on individual innovativeness is presented in Table 3. It should be noted that because of the high correlations (Table 1) between in-role behavior and OCB (sportsmanship, altruism, courtesy, civic virtue, and conscientiousness), in-role behavior was first entered into the regression to control the potential bias that might result from autocorrelation effects.

TABLE 3: STANDARDIZED MULTIPLE REGRESSION BETA WEIGHTS FOR OCB DIMENSIONS ON INDIVIDUAL INNOVATIVENESS AND LEADER-MEMBER EXCHANGE

Variables	<i>Criterion</i>						
	SLMX	Altruism		Civic Virtue		Conscientiousness	
<i>Control Variable</i>	<i>Eqn 1</i>	<i>Eqn 2</i>	<i>Eqn 3</i>	<i>Eqn 2</i>	<i>Eqn 3</i>	<i>Eqn 2</i>	<i>Eqn 3</i>
In-role behavior	–	0.53**	0.21**	0.53**	0.31**	0.45**	0.24**
<i>Predictor</i>							
Individual innovativeness	0.59**	0.25**	0.04	0.17**	–0.01	0.20**	0.08
<i>Mediator</i>							
Supervisor leader-member exchange (LMX)	–	–	0.64**	–	0.48**	–	0.40**
<i>R</i> <sup>2</sup>	0.35	0.45	0.65	0.38	0.51	0.33	0.40
<i>F</i>	202.28	153.27	231.47	115.79	129.54	91.48	84.40

Note.  $N = 385$ . \* $p < 0.05$ ; \*\* $p < 0.01$ . LMX = Leader-member exchange.

Using the analytic techniques suggested by Baron and Kenny (1986), the first requirement was to demonstrate that the independent variable (i.e., individual innovativeness) was related to the mediating variable (i.e., LMX). The control variable was entered first in Step 1, followed by the predictor in Step 2.

In order to fulfill the condition for mediation, the second requirement was to regress the criterion variables on the predictor. If the predictor in Equation 1 was also found to be significant in Equation 2, the test for the mediation effect (Equation 3) was carried out. As evidenced from Table 3, individual innovativeness fulfilled the requirements for mediated regression (Baron & Kenny, 1986) on altruism, civic virtue, and conscientiousness. Hypothesis 4 was thus partially supported. It was found that LMX fully mediated the relationships between individual innovativeness and altruism; individual innovativeness and civic virtue, and individual innovativeness and conscientiousness in such a way that the direct effects of individual innovativeness on OCB decrease and become insignificant after LMX is considered. LMX did not mediate the relationships between individual innovativeness and courtesy and sportsmanship.

Results showed that individual innovativeness predicted altruism, civic virtue, and conscientiousness. Employees who are high on openness to change have an appreciation of the merits of new ways of doing things and the potential for improving and changing the status quo (George & Zhou, 2001). The willingness for employees to change leads them to want to perform OCB. They feel open towards wanting to help people around them—their colleagues, subordinates, and superiors. They try to prevent work-related interpersonal problems and they do things that benefit the organization (e.g., being punctual, obeying rules).

One concern that might be raised, however, is the correlation between individual innovativeness and OCB. Some researchers may argue that both these constructs are one and the same. To help allay this concern, we would make three points. First, the measures used for individual innovativeness (George & Zhou, 2001) are related to the willingness of employees to change, whereas the measures for OCB (Podsakoff, MacKenzie, Moorman, & Fetter,

1990) reflect items on the behavior of employees at work. Individual innovativeness is described as an inert quality within a person. One can be innovative and not express this innovativeness or one can express this innovativeness. One of the avenues of expression is through OCB. Second, the zero-order correlations (Table 1) show that individual innovativeness and OCB are correlated with one another: with sportsmanship, altruism, courtesy, civic virtue, and conscientiousness. Although the correlations between them are significant, they are related at a level where they can be treated as independent from one another. Third, when we conducted regression analyses between individual innovativeness and OCB, we see that individual innovativeness directly predicts altruism, civic virtue, and conscientiousness. Being innovative makes the individual have the effect of helping specific other person (altruism), carry out roles well beyond the minimum required levels such as not taking long breaks than necessary (conscientiousness), and participates in the political life of the organization such as attending meetings, voting, speaking up, and discussing issues on personal time (civic virtue). Individual innovativeness does not however predict sportsmanship and courtesy. From the results of the findings, being innovative does not make an individual “touching base” with others whose work would be affected by one’s decisions or commitments (Organ, 1988). Innovativeness does not relate to the OCB dimension of courtesy such as giving advance notices, reminders, passing along information, consultation, and briefings to others. Innovativeness also does not relate to sportsmanship such as avoid complaining and petty grievances.

LMX mediates the relationships between individual innovativeness and altruism, civic virtue, and conscientiousness. When employees see the presence of LMX at the workplace, feeling of confidence is felt in terms of their appearance, ability, and power (Buss, 2001). When employees are satisfied and happy with their interactions with their supervisors, they feel self-worthy of themselves which may be described as the issue of character (Buss, 2001). Through good leader–member exchange between employees and supervisors, employees who are innovative are willing to perform OCB at their workplace.

## **Limitation**

Several aspects of this research pose limitations to its power and generalizability. This study measures perceptions at a single moment of time. It does not speak to dynamics over time. We should improve our knowledge about the importance of OCB (Cohen-Charash & Spector, 2001). Although we may have a wealth of information concerning correlates of OCB, we need studies that address causal relations. These include quasi-experiments and field experiments as well as longitudinal studies. Admittedly, it would have been ideal to gather such evidence to determine the longer term behavioral effects of individual innovativeness manipulation.

Data were obtained from non-supervisory employees in the domestic commercial banks. Consequently, the extent to which the findings reported here are generalizable to members of other types of banks (e.g., merchant banks, finance companies) in Malaysia cannot be ascertained.

A further reservation about the data concerns anonymity. At the survey sites it was necessary to leave the survey for respondents to complete and turn in to a designated bank’s representative. Some respondents may have felt less confident that their answers would be anonymous although envelopes were enclosed for them to place the questionnaire and seal.

## **Conclusion**

The purpose of this study is to provide an understanding of OCB and its relevant correlates for practitioners, academicians, and researchers, by exploring whether OCB has an important role in contributing towards organizational effectiveness. Findings suggest that individual innovativeness predicts three dimensions of OCB. Thus, the perspective offered in this study poses a direct challenge to one of the main assumptions underlying much of OCB research, which is, there is a need to promote employees’ innovativeness. Although trying to detect individual innovativeness in a natural work context is a complex and difficult task because it is often difficult to validate, the fact that organizations face increasingly turbulent environments, the need for this kind of research is ever increasing.

# Motivation and Performance

*Peter Gal*

*Comenius University, Slovak Republic*

## Abstract

Motivation theory attempts to explain why people behave in the way they do. It is crucial to management's success to find the link between motivation theory and practice, to successfully implement motivation theory. To implement the theory into the practice the managers have to know what motivation is, what causes the motivation and what influences the motivation of people. Motivation cannot be reviewed as a single variable. A number of other significant factors within the organization influence the performance of an individual, not only the motivation. We need to see the interdependence of motivation and other factors, especially when these factors can multiply or nullify the contribution of motivation to performance. In the article are discussed the Model of factors influencing the individual performance, job motivation programs including compensation programs and non-monetary motivation programs, causes of job satisfaction and dissatisfaction and the punishment and discipline in organizations.

## Introduction

Motivation theories attempt to explain why people behave in a certain way. It is crucial for manager's success to successfully implement the motivational theories into practice. To implement the theory into the practice managers have to know what is motivation, what causes the motivation and how influences the motivation the performance of employees.

Motivation cannot be viewed as a single variable that influences the performance. A number of other significant factors influence the performance of individual. Manager has to see the interdependence between the motivation and other factors, especially if these factors multiply or nullify the impact of motivation on performance.

There is a need to distinguish between the two different types of performance:

- In-role performance – performance required by the job description, the employee is actually paid for it and is enforceable by the employer to a significant extent;
- Extra-role performance – performance not required by the system, interpreted as a social behavior of employees because of interactions and interdependence of people within the organization.

### **In-role Performance**

Manager willing to influence the performance of employees through motivation has to know two basic aspects of motivation. First it is difficult to measure the motivation. Manager can more or less precisely measure the performance of employee, but it is not always clear what causes the level of performance. Is it the motivation or other factor mentioned in the following model? Manager should be aware of over motivating people. Motivation to a certain limit could increase the performance but over this limit employee pays too much attention to his work. He puts too much physical and psychological effort to his work and after a period of time he feels exhausted and tired. The final result of over motivation is decrease in performance.

Performance at work does not depend just on motivation. To see the difficulties of implementing the motivation theories it is necessary to discuss important factors in the performance model. Change in other factors than motivation can lead to a higher increase in performance.

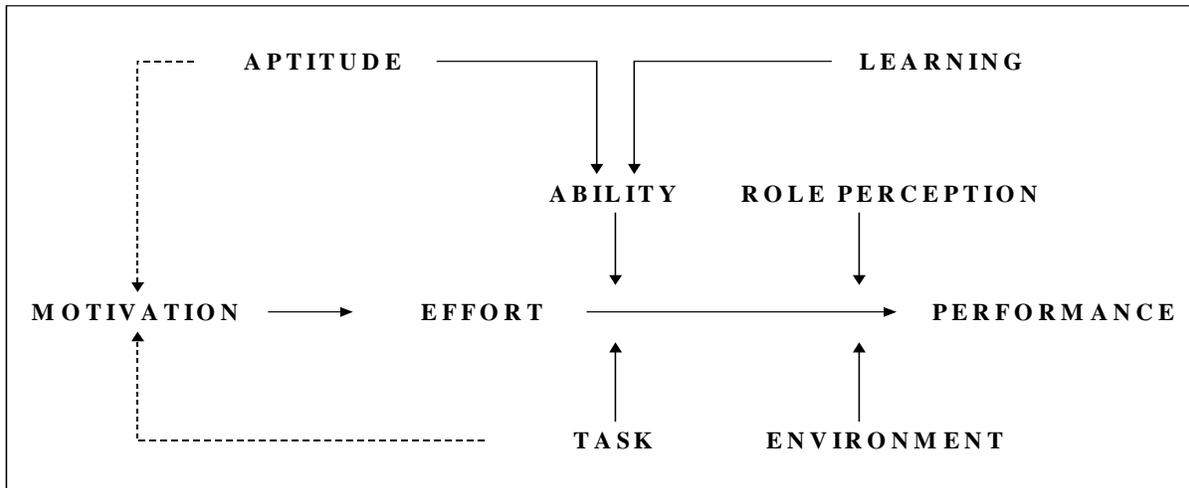

FIG.1 FACTORS UNDERLYING THE INDIVIDUAL PERFORMANCE

**Task (Task Design)**

Based on the Herzberg's hygiene theory, task itself influences the motivation through satisfaction or dissatisfaction of psychological needs of employee. High frequency of simple tasks negatively affects employee. He can build up resistance to these tasks and his motivation decreases. In this situation change in job duties can be undertaken. Manager can change design, method or sequence of work. He can also apply job enrichment program. Job enrichment strengthens such motivational factors as responsibility or recognition.

**Ability**

If motivation determines the quantity of effort, ability of employee then determines the quality of effort. Ability is the result of aptitude and learning. Learning process contributes to employee's ability of mastering different tasks and increases employee ability. Usual example of learning in organization is training program. Aptitude refers to individual differences in the facility of learning and mastering a task. Some aptitudes are related to general intelligence (e.g. logic, abstract reasoning), others are related to physical and motor skills (e.g. hand-eye coordination). Every employee comes to the organization with his individual level of ability. The task of the human resource department is to attract people with the highest level of skills relevant for the job. These people are expected to perform well and to master difficult tasks in the organization.

**Environment**

Physical environment also influences the performance of employee. The most significant variables of physical environment are noise and heat. Noise acts as a stressor. Up to some limit noise increases the performance because of overall energizing effect. Over this level noise effects performance negatively. The highest performance is achieved at standard temperature. Changing the standard temperature in both directions decreases the performance. Other factors of physical environment are quality of lightning, work space, special design tools. The effect of environment on performance is higher in jobs demanding strong concentration and in jobs with long working hours.

**Role Perceptions**

In the Maslow's hierarchy social needs are on the third level above the security and basic physical needs and under ego and self-esteem needs. Role perception is the understanding of employee's role in the organization. Employee wants to be also a member of the team. Therefore he has to understand his role in the organization and in the team. If

this condition is not fulfilled, employee's social needs are not accomplished and his motivation decreases. Potential breakdowns in role perception are:

- Role ambiguity – employee does not know what other's expectations are, he is not sure what to do, what is his role;
- Role conflict – employee is caught between parties with opposite demands, he wants to satisfy both parties, but he can not;
- Wrong role perception – employee misunderstands his role.

The best way to avoid non-satisfaction is to tell the employee exactly what the manager wants him to do, where he belongs, what is his role.

#### **Extra-role Performance**

Extra-role performance includes the concept of organizational citizenship behavior (OCB). That means the social interactions and interdependence of people within the organization. It serves to accomplishment of social needs, the need of affiliation, generally said the social needs. OCB consists of contributions that are not enforceable requirements of the job.

- Willingness to help – e.g. telling the newly hired colleague important information;
- Courtesy – effort to prevent problem from occurring, e.g. when undertaking special tasks telling the involved parties in advance;
- Sportsmanship – the way of dealing with stress and frustration;
- Involvement – be involvement in the processes, offering opinions, suggestions, communicating with others;
- Respect to rules and policies of organization – attendance, punctuality, etc.

### **Job Motivation Programs**

Motivation could be characterized as the motive power, which supports in employee certain activity to satisfy his needs (*Bajzikova, 1999, p. 10*). Motivation could be extrinsic and intrinsic. Intrinsic motivation originates from the relationship between the employee and his work. Examples of intrinsic motivation factors are responsibility, liberty, action, chance to use his abilities and competences, respect at the workplace, interesting and demanding job, chance for career advancement and others. Extrinsic motivation originates in the external environment and is stimulated by a certain person (manager). Examples of extrinsic motivation are financial compensation, compliments, promotion, as well as punishment, criticism, decrease of bonuses, etc. (*Bajzikova et al., 2004, p. 159*).

To put the motivational theory into practice, job motivation programs are implemented. These programs try to enlarge motivation of employees focusing on their needs. Motivation programs are usually divided into two categories, compensation programs focusing on financial aspects and non-monetary programs that use other than financial motivators.

#### **Financial Motivation Programs**

This kind of programs is used primarily in less developed countries or organizations and on lower job levels, where people work to satisfy their physiological needs, as clothing, food, and housing. These needs are usually satisfied through adequate wage. In Slovak republic, people listed out of 16 goals they want to satisfy mostly by their work these goals on the top five places: wage, security, recognition, relationships to subordinates, contribution to society (*Ruiz Quintanilla, 1992, p. 22-24*). The author of this research made a conclusion that financial motivation plans would work in Slovakia well. Although we quoted quite an old research, we can say, that financial compensation is still very important work goal for Slovak employees and plays in their motivation a very important role.

For motivational purposes a good compensation program has to accomplish these three objectives:

1. Establish standard level of pay high enough to meet market rates – this satisfies the purpose to attract sufficient number of qualified applicants for various jobs.

2. Provide internal equity – this should assure that employees believe they are paid fairly for their competitive input. Employee establishes his own input-outcome ratio and then compares the results of his ratio to ratio of other employees. When the results are similar, this means that for the same contribution (input) he receives

the same wage (outcome), employee's sense of fairness is satisfied. If not, motivation decreases and the result is even lower performance or lower quality.

To establish equity a job evaluation program has been developed. It comes with the idea of comparable worth. Every job is evaluated on contribution to organization, skills needed for this job, education needed for this job, etc. Jobs that score the same should be similarly compensated.

3. Provide incremental rewards for above-average performers – this motivates people to act actively in work, to perform above average. Examples of such reward systems are:

- Piecework – amount of money for each unit of output;
- Bonus plan – standard hourly wage plus pay increments for productivity beyond the norm;
- Merit pay – based on measurements of individual contribution.

Newer reward systems provide higher efficiency:

- Skill based pay – the better skills the bigger wage;
- Profit sharing plans – involve employees on higher productivity through giving them percentage of organization's profits.

#### **Non-Financial Motivation Programs**

These programs focus not on physiological needs of employees, but they focus on higher needs on the human needs scale. They actually emphasize ego, self-esteem and growth needs of an employee. The mostly used programs are organizational behavior modification, job redesign and management by objectives.

#### **Organizational Behavior Modification (OBM)**

This program uses positive reinforcement. Reinforcement theory is based on the premise that rewarded behavior is likely to be repeated while behavior that has been punished is less likely to recur. OBM is a process focused on maintaining certain behavior and diminishing the occurrence of undesirable behavior. The process of OBM implementation consists of following steps:

- Precise definition what is the target behavior;
- Baseline audit – exploring the frequency of behavior's occurrence before reinforcement;
- Setting of criteria – setting the frequency of target behavior that the organization wants to achieve;
- Choosing a reinforce – usually it is praise coupled with positive feedback, e.g. improvements posted on wall, points that could be accumulated and exchanged for merchandise;
- Shaping stage – step by step process till the goal is reached, it is important to reinforce any improvement that leads closer to the goal.

Disadvantage of the OBM is the decrease of target behavior after the reinforcement stops. It can be successfully applied only to work behavior that can be precisely defined, quantitatively measured and frequently repeated.

#### **Job Redesign**

In addition to Herzberg's job enrichment theory, jobs can be redesigned also based on important job characteristics that influence the psychological state of employee. Important job redesign strategies are (*Rudy et al., 2001, p. 118-122*):

- Job specialization;
- Job enrichment;
- Job rotation;
- Job enlargement;
- Teamwork organization.

The basic job characteristics are: skill variety, task identity, task significance, autonomy and feedback. First three of them lead to employee's sense of meaningfulness of the job. Autonomy leads to feeling of responsibility and feedback is significant for the knowledge of results. Giving the employee job that score high in all these five characteristics, employee's psychological needs are satisfied. The outcome is intrinsic job motivation and work satisfaction.

#### **Management by Objectives (MBO)**

Management by objectives underlines the requirement of clearly defined objectives that are integrated across levels.

This program shows the necessity of collaboration between managers on vertical level (subordinate-superior). MBO follows this sequence of events:

- Definition of objective – subordinate creates a written statement specifying objectives for the next period
- Review – superior manager reviews the statement and discusses his view of objectives for the period with subordinate, discussion might lead to modification of the statement;
- Progress discussion – superior and subordinate meet on regular bases during the period and discuss problems and try to find solutions
- Performance discussion – at the end of given period they discuss the extent of achieved objectives regarding also the development in the external environment and whether the goals were set realistically.

MBO programs are implemented mostly among managers. They also force managers to set measurable objectives. Another handicap is the amount of paperwork connected with the statements creation.

## Job Satisfaction and Dissatisfaction

One criterion of the quality of motivation theory application in practice is the level of employee satisfaction. The level of the job satisfaction is important because of several reasons:

- The first is the fact that people spend a sizable portion of their lives at work. From the humanitarian point of view it is desirable that the time should be more-less pleasant;
- Secondly job satisfaction is closely connected with mental and physical health of the employee. The studies show that employee's overall view of the job satisfaction influences the length of his life and opinion about its quality.

Job satisfaction represents the attitude toward the job. It is the function of the employee's beliefs, feelings and behavior tendencies. Job satisfaction is measured by standardized attitude or opinion surveys. The major determinants of job satisfaction are usually income, autonomy and intrinsic psychological rewards.

Based on the Herzberg's theory job satisfaction and dissatisfaction are not mirror opposites, nor are they caused by the opposite things. His theory was a subject to the criticism. However subsequent findings give some support to the theory and based on these a model that defines four categories of satisfaction and dissatisfaction was created.

The satisfied – dissatisfied dimension is defined by whether the employee's job attitudes are generally positive or negative. The active – passive distinction refers to the frequency with which the attitude is aroused and actually becomes the force on job behavior.

TABLE.1 MODEL OF SATISFACTION AND DISSATISFACTION BEHAVIOR

	Satisfied	Dissatisfied
Active	I	IV
Passive	II	III

I – those who enjoy what they do and are intensely involved;

II – those who are with current conditions satisfied;

III – those who are not sufficiently involved to present even the mild protest;

IV – those who voice their problems, lead the way to union activity, even sabotage.

Job attitudes predict with some reliability the extent of turnover (based on the social and corporate culture and level of unemployment), absenteeism (attitudes toward co-workers, supervision and benefits) and union activity. Job satisfaction influences the productivity as well. Unfortunately, it is not true that the higher is the job satisfaction the higher is the productivity level. There are two reasons for this:

- Many jobs don't lend themselves to objective, concrete performance measures;
- Individual performance level simply cannot vary to the great extent.

## **Punishment and Discipline in Organization**

Extended discussion about the job satisfaction illustrates the methods of achieving the desired behavior, but overlooks the fact that organization has to eliminate the undesired behavior, to use punishment and this is done quite often.

Punishment occurs if an aversive consequence follows a response. Some opinions say that punishment should not be used, but generally it is not possible to avoid the usage of punishment in the practice. To replace the punishment there are several suggestions what to use instead of it: the extinction, environmental engineering, rewarding of desirable or neutral behavior and finally the adjustment, development or maturation. Another view is that punishment is natural, because all the nature punishes us, furthermore we usually learn rather quickly and without emotional scars.

To punish effectively there are some conditions managers have to fulfill:

- Punishment is more effective, if it is applied before an undesired response has been allowed to gain the strength;
- Other things being equal, punishment is generally more effective when it is relatively intense and quick;
- Punishment should focus on specific act, not on the person or on general patterns of behavior;
- Punishment should be consistent across persons and across time;
- Punishment should have informational value;
- Punishment is most effective when it occurs in the context of a warm or nurtured relationship.

It is necessary to understand that the punishment has to be always based on certain rules – discipline. Discipline is a deliberate attempt to punish. It becomes very important for the administration to provide in advance clear and persuasive reasons why certain rules exist and why certain behavior cannot be tolerated. The rules that have to be followed depend on the personality of manager: pure humanitarian, pure legalistic or more clinical or judicial approach.

## **Conclusion**

Performance of an employee is influenced by a variety of factors that have been described in the Model of factors influencing the individual performance. Motivation is only one of these factors. The other important factors are task, ability, environment and role perception. Two basic types of motivation programs are financial and non-financial. Financial motivation programs function in situations, when employee is focused on satisfaction of his basic physiological and security needs (lower positions, less developed countries). The non-financial motivation programs function well if employee wants to satisfy his higher needs on the Maslow's hierarchy of needs (esteem and self-actualization needs). The empirical evidence shows, that financial motivation programs function well in lower positions (manual workers, sales representatives), the mix of financial and the non-financial motivation programs starts functioning well in the middle positions (middle management, professional workers) and non-financial motivations programs function well in higher positions (senior management, top scientists and top professionals) in Slovak republic. The financial motivation programs are basically based on money. The non-financial motivation programs described in this article are: organizational behavior modification, job redesign and management by objectives. In case when positive motivation is not enough to eliminate the undesired behavior, the manager might use punishment. Punishment is connected with discipline, which should be based on a set of rules saying which behavior cannot be tolerated in organization and why.

# Outsourcing of Goods and Services Practices: Human Resources Management Issues

*Graham Mahony  
Laurence Dickie  
Curtin University of Technology, Australia*

## Abstract

The paper reviewed the nature of outsourcing and the impact of outsourcing decisions on employees against the objective of achieving value for money throughout the life of a contract. The value for money concept was discussed in light of a revised definition arising from recent research outcomes. Human resources issues were considered also in the context of the purchaser-provider separation, the level playing field and changing nature of industry and the public service. Examples were provided to illustrate some of the key issues.

## Introduction

The decision to outsource non-core of goods and services was part of the strategic decision of many private companies and government organisations. Through the market testing process, jobs performed by employees may be targeted for outsourcing. The purpose of this paper was to consider some of the human resources management issues arising from outsourcing in the context of value for money in outsourcing.

Competitive Tendering and Contracting (CTC) also known as Outsourcing, was a form of contracting-out and was defined as the “the process whereby activities traditionally carried out internally are contracted out to external providers” (Domberger, S 1998, p. 12)

Quiggin (1996, p. 173) commented that “at first, moves towards contracting out were seen primarily as bringing the public sector in line with the standard practices of large private business enterprises. Private businesses generally had been more willing than the public sector to contract out peripheral activities such as cleaning or the provision of car fleets. This tendency, frequently referred to as ‘outsourcing’ has increased in the private sector over time. A typical slogan of this phase of contracting out was ‘sticking to the knitting’; that is, focusing on core activities rather than seeking to do everything more or less badly. These views were supported by Domberger (1998) and others (Cook 1994; Department of Defence 2002a).

The handling of employment issues in outsourcing can become one of the key issues in the decision to outsource and, often, involved a great deal of complexity.

## Human Resources Issues

The affect of outsourcing on employees had the potential to negatively impact on the workforce, families and industrial relations, if not handled carefully. Staff could be affected through redeployment elsewhere in the agency, transfer to another agency, negotiated transfer to the contractor, or redundancy (Domberger, S 1998). Cost cutting was a most important factor in outsourcing and reducing staff often became a very definite goal (Birmingham 1994). Further, human capital input to the provision of services was an important consideration in determining effects on cost and quality of output (Borland 1994).

Quiggin (1996, p. 186) pointed out that outsourcing was driven “by the desire to cut costs of service provision, frequently at the expense of employees,” which was branded the “privatization of labor” (Clark & Corbett 1999, p. 80) . Further, Quiggin (1996) argued that transfers of labor, leading to lower wages and conditions, did not contribute to the economy as a whole; a view supported by Clark and Corett (1999) and the Industry Commission (1996). Clark and Corbett (1999, p. 92) considered that “the contribution that the public sector makes to local and regional economies, through employment and the ‘multiplier effect’ of public sector spending, is often unacknowledged”.

Employees needed to be supported during outsourcing activities (Domberger, S 1998; Industry Commission 1996; US General Accounting Office 2003). For instance, employee issues were of prime importance in outsourcing activities in a State Government department, where a set of guidelines was developed to assist employees in the outsourcing process<sup>1</sup>.

Issues relating to employee positions targeted for outsourcing included:

- Accepting lower wages and conditions, which made no contribution to the economy as whole (CTC Research 1996a; Quiggin 1996) nevertheless, there were examples of higher wages (CTC Research 1996b). The issue was identified of “two-tier workforces arising when public services are contracted out under regulations that broadly protect the terms and conditions of workers transferred; but the regulations do not protect new staff, who can be hired on worse conditions, resulting in two-tier, and even multi-tier, workforces” (Nicholas 2001, p. 27).
- The Industry Commission (1996, p. 159) lent weight to the argument that “savings derived from outsourcing are achieved mainly at the expense of employees, primarily through job loss and reductions in wages and conditions. Others disagree with that view”
- The issues of outsourcing and the effects on employment were not always understood as Domberger (1998, p. 172) observed, viz. “the employees directly affected by contracting may be those who bear the greatest cost, faced disruption to their current activities, uncertainty about future job prospects, and possibly a worsening of terms of employment, which had the potential to arrest the contracting process in its tracks, particularly if it is met with union opposition”.
- Domberger and Hall (1995, p. 8) in addressing the concerns about transfer of employees from the public to the private sector in outsourcing, indicated the concerns were “much exaggerated”, based on outcomes of their studies, nevertheless, costs may be higher “because they were not previously monitored”. The Betts case<sup>2</sup> provided a stronger position to avoid taking overstaff from an existing contractor (Davies 1997) and whether the effects of this case would eventually impact on transfer of employees during outsourcing in Australia remains to be seen; however, Australia traditionally has followed the U.K. in outsourcing privatization.
- As mentioned, some contracts stipulate the number of agency staff that must be taken on by the winning tender (Domberger, S 1998) and under the Department of Defence Commercial Support Program, in the evaluation of offers tenderers could be penalized for the number of agency staff not contracted (Department of Defence 2003). There was also a moratorium of one year placed on the contractor employing those who opt to take redundancy (Department of Defence 2002a) to avoid, as The Industry Commission stated double dipping (i.e. taking redundancy package and then joining the contractor), which it viewed as “inequitable and should be prevented” (Industry Commission 1996, p. 391). The Senate Finance and Public Administration References Committee (2001) supported the “clean break” approach.
- The background to outsourcing in relation to human capital was examined by Hanson and Sarros (2001) who pointed out that “organizations are increasingly using outsourced workers to create a variety of efficiencies ... [thus] ... displacing risk to outside entities ... and reducing the size of their own bureaucracies” (Hanson & Sarros 2001, p. 5).
- Hanson and Sarros (2001) indicated the ‘tenured employment model’ was not sustainable in outsourcing because of improved efficiency and flexibility within areas of labor specialization.

The importance of keeping staff fully informed during the contracting process was emphasized by Domberger (1998) who indicated it was part of all contracting guides and manuals. The case study discussed in Table 9, illustrated this.

TABLE 1. CASE STUDY – OUTSOURCING

**Case Study**

A government agency considered outsourcing editorial services for its technical journal publications, the multi-media services associated with its publications, photographic services (micro and macro) and other services.

During this period a coordinating committee was established to facilitate communication with all stakeholders, including the employees and union. Ethical guidelines were drawn up for employees affected, advising them how to handle approaches from tenderers for employment and other information.

A set of ethical guidelines was drafted to guide employees when contacted by bidders and asked to provide information and opinions.

The contracting process involved an in-house bid and a management buy-out (MBO) proposal.

The result was that editorial and multi-media services were outsourced and photographic services were sold to an MBO. Eventually it was decided not to outsource the other services.

(The current researcher was directly involved in these processes and was later invited by the agency to assist both the in-house and MBO bid teams prepare their offers.)

Source: Personal experience of the current researcher

The US General Accounting Office (2003, p. 10) considered that it was “not the size of the in-house or contractor workforce or the number of positions competed to meet arbitrary quotas” that provided value for money to the taxpayer. The Australian Department of Defence (2003) on the other hand, viewed the size of the contractor workforce as important, whereby the tenderer incurred penalties against its bid prices for the cost of those offered for employment but not potentially employed. Meeting quotas for positions that were market tested was important in the Defence CSP program (Department of Defence 2002a).

The issues relating to employees in outsourcing extended to the contracting process. The US General Accounting Office (2003, p. 5) raised several issues pertinent to employees affected by outsourcing, which had validity in outsourcing activities generally and which could impact on value for money outcomes, viz.:

- the need for agencies “to maintain capacity to manage outsourcing competition, preparation of in-house bids and overseeing outsourcing activities, regardless of whether an external or in-house solution is selected”;
- the need for employees “to be assisted during outsourcing activities, namely:
  - what is happening and when during the transition process;
  - improving skills for in-house bidding and monitoring performance;
  - managing the issues of redeployment, severance and transfer;
  - facilitating transference to a private contracting environment; and
  - employee retention programs aimed at keeping employees”.

Employee issues could determine whether outsourcing proceeded or not, because, according to Domberger (1998, p. 172) “financial and intangible costs associated with employment can place contracting in the balance” and considered the extremes of abandonment altogether due to “internal and external opposition ... [or interpretation being] ... less successful” due to a non-cooperative attitude of staff”.

Employment issues associated with outsourcing were taking on a global dimension whilst becoming more visible in Australia with Telstra considering outsourcing some its service development to India, for example. Glass and Saggi (2001, p. 67) considered the effects of increased outsourcing of production to low wage countries and concluded that “increased international outsourcing lowers the relative wage ... [and aggregate spending] ..., a negative level effect” and indicated “increased international outsourcing fuels the rate of innovation leading to faster arrival of product improvements, a positive growth effect”. Transfer of technology from developed countries to

lesser developed countries could result in benefits derived from increased demand and lesser developed countries also benefited from vertical international outsourcing and reduced the double marginalization problem; i.e. the amount of surplus that could be bargained between labor and firms (Pack & Saggi 2001; Zhao 2001). The issues relating to global outsourcing and employment, were not considered in this paper.

Subsidiary issues concerned the justification of awarding outsourcing contracts to overseas-based companies which expatriated profits overseas. The argument was that companies registration with the Australian Security and Investment Commission (ASIC) qualified as an Australian company and as such could not be discriminated against in the contracting process<sup>3</sup> because it paid Pay As You Earn tax, company and other taxes and employed local people in its Australian based operations. Quiggin (1996) has raised such issues in relation to the overall economic impact of outsourcing and value for money outcomes.

Nevertheless, the Australian Department of Defence, Commercial Support Program tender evaluation methodology positively discriminates against outsourcing companies that do not take on the workforce displaced through the award of outsourcing contracts, by loading their bid with the costs of those not employed.

## **Value for Money**

The first phases of the procurement cycle involved planning and formation of the outsourcing contract, leading to the choice of a service provider. The selection of service provider could involve consideration of employees occupying positions within the organisation which would no longer be retained under outsourcing. Following contract award, the subsequent phase involved management of the contract through-life. The aim was to achieve the best value for money outcomes during all phases during the contract cycle.

The value for money concept was well established as a basic principle in outsourcing procurement in Australia and other Commonwealth countries and originated from the United Kingdom. Traditional definitions of value for money include, for example:

- The optimum combination of whole of life costs and quality (UK National Audit Office 2001, p. 3).
- “Achieving the best outcome for every dollar spent by assessing both the costs and benefits of each purchase rather than simply focusing the evaluation of offers on the lowest purchase price alone” (State Supply Commission 2000, p 5).
- “A procurement concept which requires objective consideration of all factors contributing to the utility, usability and usefulness of items offered for sale as inputs to a procurement decision, rather than automatic choice of the suitable item having the lowest purchase price” (Department of Defence 2002b, Chapter 1.1).

A revised definition of value for money emerged from the recent research (Mahony 2004), namely:

Value for money is the purchasing principle, absolute standard and objective of the procurement process, providing the primary basis for procurement policy formulation and manifesting itself as a qualitative measure in tender evaluation process and price consideration.

The consideration of options, during the evaluation period, relating to employees, namely redundancy, redeployment or transfer to the service provider can impact on value for money. Industrial action, for example may present an immovable barrier to outsourcing. Redundancy involves not only a cost the organisation, but may involve the broader costs social welfare payments, for example.

The options for treatment of employees in outsourcing is driven to some extent by the views of the purchaser/provider separation or split.

## **Purchaser/Provider Separation**

The separation of purchaser from provider was a form of specialization with “separation of the client from the vendor ... [and] ... the purchaser from provider, purchaser focus on output and outcomes ... [with] ... provider focus on inputs, processes and effective, but flexible, interface between the parties, underpinned by a contract”(Domberger, S 1998, p. 47; Productivity Commission 2003, p. 3.2). The Commonwealth Productivity

Commission endorsed the purchaser/provider model for outsourcing with the objective of achieving better value for money (Cox, Wendell 2002).

Under the purchaser/provider separation two organizations replaced one; organizational accounts were split and there was a sharper focus on “cost of resources across organizational boundaries” (Domberger, S 1998, p. 47) output specifications were developed that did not previously exist, contracts defined the terms of the transaction and firms concentrate on ‘core’ business; he also considered this as one way of contracting that reduced the cost of outsourcing.

The purchaser/provider model “preserves public funding for the service but creates incentives for efficiency and innovation by requiring both in-house and private operators to bid for the right to operate services – systems are tendered to multiple operators to bid for the right to operate services” (Cox, A 2001, p. xx). O’Faircheallaigh et al.(1999) agreed with Cox. In Australia this model works within the National Competition Policy (O’Faircheallaigh, Wanna & Weller 1999) discussed below.

Domberger (1998) in emphasizing the separation of the purchaser and provider indicated it was not normal or traditional for services to be provided in-house, which differed with the explanation provided by Cox (2001) above in respect to in-house service providers operating under the outsourcing regime. Delivery of services also required experience, possibly comprising many functions and was not the responsibility of a single agency, where demand could be highly uneven over time and where the purchaser/provider split existed (Domberger, S 1998; O’Faircheallaigh, Wanna & Weller 1999).

A contrary view was expressed by Miranda and Lerner (1995 cited in O’Faircheallaigh et al. 1999, p166) referring to studies undertaken for government outsourcing in the United States “that simply transferring a service from the public to private sector is unlikely to yield improvements in quality or cost savings if new private supplier is, like the public one it has replaced, in a monopoly position” (State Supply Commission 2001). Domberger (1998) considered the issue of ‘natural monopoly characteristics’ i.e. there was only one service provider at any one time. Community organizations or private firms can become service providers for government agencies and Domberger (1998, p. 174) observed an increase use of ‘private not-for-profit’ organizations as service providers in order to get more value for money.

One of the on-going issues relating to the purchaser/provider model which was seen as a barrier was that of the concept of the level playing field, arising from market testing.

#### **Level Playing Field**

Market testing involved the issues of the level playing field and competitive neutrality. The concept was that in-house bids, when competing against private sector providers, were costed and evaluated on exactly the same price basis.

The options allowing in-house bids in outsourcing impacted on value for money and employees undertaking service functions in the outsourcing agency were permitted to bid, on a competitive neutrality basis, against external service providers for the outsourcing contract as part of market testing. A number of issues arose from these, considerations, which were summarized by The Industry Commission (Industry Commission 1996, section C5.3) viz.:

- the potential benefits and costs [was a key consideration];
- appropriate framework [must be established] under which they should operate;
- agencies [must provide] an appropriate competitive neutrality framework;
- the organizational structure within which the in-house team operates [must include] formal separation from service regulation and specification and tender evaluation;
- [must be operated separately] from all aspects of contract management; and
- [must be] subject to monitoring and reporting arrangements to ensure that the agreed price and performance standards are achieved.

Many practitioners were skeptical about the so called ‘level playing field’ in contracting out, both in respect of public and private sector competition, and particularly the in-house bid, (Baueris 1993; Industry Commission 1996). The case study, Table 2, illustrated some of the difficulties regarding in-house bids where “it is essential that a selection procedure is implemented ... that is seen to avoid conflict of interest and contains some measure of

external independence” (Domberger, S 1998). The evaluation also extends to the methodology adopted for evaluating offers, which was often traditional (State Supply Commission 2003) and did not always consider the economic costs involved, particularly relating to human resources. This was exacerbated by the focus on internal reform within organizations and government, particularly outsourcing of non-core business.

## Changing Nature of Industry & Public Service

The changing nature of government, for example, has affected in various ways the achievement of value for money in outsourcing. Corporatisation, convergence and governance all impact in some way on value for money in outsourcing (Domberger, S 1998; Sozzani 2001; US General Accounting Office 2003). The importance of this stemmed from the trend towards privatization and adopting ‘commercial principles’ for government procurement wherein contracts were perceived to be more efficient and cost effective than in-house provider options (Domberger, S 1998). These considerations impact on the employee issues and decisions of how to treat employees as was mentioned above.

### Changing Nature of Australian Industry

The nature of changes in government and procurement methods has resulted in challenges to the traditional views of value for money. Consider an Australian example.

TABLE 2 RESTRUCTURING AUSTRALIAN INDUSTRY (AN EXAMPLE)

Restructuring of Australian industry has impacted on some major capital acquisition projects and outsourcing of major services and this was most evident in the Defence sector. Major industry changes were identified in the prime-contractor and second-tier subcontractor hierarchy, wherein many key second-tier contractors were taken over by prime contractors, effectively removing the second tier of competition from the market. This has left a Prime-third tier structure. The growth of companies like Serco, Transfield and British Aerospace in Australia, has been based on managing outsourcing contracts as a core strategic business activity. Examples included the take-over by Transfield Australia of the AMECON<sup>4</sup> (the ANZAC Frigate Prime) consortium members (ICAL, Eglo Engineering and Australian Shipbuilding Industries) and the acquisition of Stanilite (Defence communications experts) by AMECON and absorption into the Australian Defence ANZAC Frigate Project. The sale of the Commonwealth owned Defence contracting organization, ADI Limited, to Transfield and Thales (i.e. Thompson CSF) in 1999 changed the balance of Defence prime contracting in Australia (ADI Limited 1999). In addition, the entry into the market of major overseas primes, e.g. Boeing Defence, has also contributed to the changing nature of outsourcing competition in the market place, both federally and in the States, including the move towards partnering by the Australian Department of Defence.

The effect of these changes has been twofold:

- Rationalization among the prime fraternity in Australia, effectively reducing competition; and
- The ‘bulking up’ by Defence of scopes of works for service contracts, (e.g. Garrison contracts), and more recently the Western Australian Government (e.g. stationery, school furniture and business card contract under mandatory Common Use Arrangements, effectively eliminating Western Australian small businesses from competing for such work and favoring Prime companies or groups; e.g. Defence garrison outsourcing contracts have combined into a single contract what used to be separate contracts for services including security, gardening, administration, cleaning, catering and facilities maintenance.

The more recent development within the Department of Defence of uncontested, long-term partnerships or alliance contracts (e.g. 15 year contract with two options to extend a further 5 years each – effectively a 25 year contract) challenges the underlying policy basis of value for money, and the taxpayer really have no way of judging whether value for money outcomes were being achieved (Department of Finance and Administration 2002)

In essence, the changing nature of Australian and Western Australian industry has partially affected the balance of competition for procurement and contracting which in turn could impact on competition for outsourcing

and in the longer term on the value for money outcomes achieved from the outsourcing process. This trend is exacerbated by the changing nature of government itself.

#### **Changing Nature of Government**

The changing nature of national governments and the public service impact on outsourcing were highlighted by Rivlin (1996 cited in O'Faircheallaigh, Wanna & Weller 1999) at the Organization for Economic Development and Cooperation (OECD) as:

- globalization and pressures to cooperate and compete in new ways;
- dissatisfaction because of ever rising expectations of citizens; and
- budget stringency focused on reducing deficits and curtailed expenditure.

The changing nature of government organizations manifested itself in many different ways, including through business 're-engineering' through adoption of core business strategies of contractual management, contestability, benchmarking and best practice in the new learning organization (O'Faircheallaigh, Wanna & Weller 1999). This involved less 'red tape' through focus on results, greater efficiency, reduced staff, charging end-users for services and performing fewer non-core functions in-house, and doing more with less, where managers were more accountable, permanence of employment was not guaranteed and positions were contestable (O'Faircheallaigh, Wanna & Weller 1999). Further, the discrete separation of functions allowed governments to contract-out and, in theory at least, deliver cheaper service enabling "focus on core activities and improving the range or quality of services purchased from providers" (Davis et al. 1997 cited in O'Faircheallaigh, Wanna & Weller 1999, p. 25).

Certainly the issues associated with the changing nature of government impact on the nature the purchaser-provider separation which in turn affects how employees are treated in terms of retention within the organisation, being offered for transfer to the potential provider, facing redundancy or retrenchment or transfer within the organisation, group or government. More could be said about the economic considerations involved, for instance the cost of redundant employees seeking welfare benefits, creates a cost for the taxpayer and needs to form part of the transaction costs and evaluation of the proposal to outsource services, but is not always taken into account, which raises the issue of whether such decisions actually provide value for money.

## **Conclusion**

Some issues human recourses issues relating to the impact of outsourcing decisions on employees were considered against the objective of achieving value for money considered throughout the life of the contract. There are many issues yet to be considered, including the transaction costs associated with human resources and outsourcing issues relating to employees that could be retained, redeployed, made redundant or transferred to the provider.

The consideration of value for money through the life of a contract provided a basis for considering the impact of employment issues in outsourcing during the various phases of the procurement cycle, particularly at the tender evaluation and contract award stages. The issues of the economic costs consideration related to employees and outsourcing provides fertile ground for further research and reconsideration of the traditional evaluation methodologies in tendering.

### End Notes

---

<sup>1</sup> The guidelines were developed by the current researcher who was assisting the Department of Agriculture with outsourcing projects during 1996.

<sup>2</sup> (Ayse Süzen v Zehnacker Gebäudereinigung and Betts v Brintel Helicopter) challenged the Transfer of Undertakings (Protection of Employment) Regulations 1981 (TUPE),

<sup>3</sup> Mr Mahony was involved in debating these issues through his membership of the Australian Defence Commercial Support Program Consultative Forum (CSPCF) and the Contracting Consultative Forum (CCF).

<sup>4</sup> ASI, Eglo Engineering and ICAL were the original members of the AMECON consortium that purchased the Commonwealth operated Williamstown Dockyard in Victoria and completed the \$400M Australian Frigate program, building two guided missile frigates (FFGs) for the Royal Australian Navy. The current researcher was the AMECON consortium coordinator for the successful Williamstown Dockyard and Australian Frigate program acquisition.

# Role Play: New Method for Interpersonal Skill Development

Mohamed Ishak Badarudin  
Samsudin Wahab  
Universiti Teknologi MARA, Malaysia

## Abstract

In the new millennium, most managers, try to implement new method in improving their interpersonal skills among the staff. In the age of globalisation, every staff in the organisation has to master the skill because the focus of the organisation nowadays is more towards customer friendly. Research has proven that the use of Role-play is suitable in organisational development. Role-play can be a powerful way of practicing inter-personal skills. (Micheal Maynard, 2003). Currently, problems, which arise in working areas, have resulted in failures of management planning in relation to human resource. This paper will highlight the benefit of using role-play in training the undergraduates, especially to improve their interpersonal skills. Ten undergraduates were interviewed and the data was analysed using narrative analysis based on the theme of the research paper. This research found that role-play method is effective in training Interpersonal skills among the research participants. This paper will end with a suggestion to the managers on how to conduct the training by adapting role-play as a tool to the organisation.

## Introduction

Role-play is **NOT** like most traditional methods of instruction, which incorporate rote learning, reading and writing. Role-playing has proven to be an effective method of developing interpersonal communication skills. A popular Chinese proverb can be recited to support this statement. *“Tell me, I will forget, show me, I may remember, involve me, and I will understand”*. In role-playing, getting involved is the most important aspect. To understand a real life situation, is to have that situation created in a role-play. Therefore learning through role-play is similar to experiential type of learning, that is, learning by doing.

To somebody who is new to this concept, role-play is similar to a mini-drama, but in contrast role-playing accelerates the acquisition of knowledge, skills, and attitudes, and offers trainers the opportunity to observe growth and progress in a practical style. Role-play is not about teacher-centred pedagogical approach, but it is more concerned with active participation of learners to new roles and behaviours, and these roles are closely associated to roles and behaviours of real-life situations. It is a way to acquire interpersonal practice, whether it is related to management skills, job interviewing, supervising, technical assisting, counselling, or whatever position as long as it is to acquire the desired experiences.

Role-play can be presented in various forms such as, experiential learning, sensitivity training, simulation, action learning, encounter group, psychodrama and socio drama laboratory method and drama. Whatever it maybe called, role-plays should be carried out between thirty seconds to five minutes. Some role-playing activities needed longer session depending to the complexity of the role-play. Trainers often conduct training session in rooms where the participating individuals will be exposed to observation by the audience. Sometimes their actions are being videotaped for assessment purposes.

The kind of role-play we are dealing here is geared towards the analysis of personal values. It is mend to train employees the ability to develop strategies for solving personal and interpersonal problems. To develop confidence and the feeling of empathy towards others is the main concern. After getting involved in role-play, employees should be able to learn how to express their own opinion with certainty and have the feelings of empathy towards others. This paper will offer suggestions to the managers on how to conduct the training by adapting role-play as a tool to the organisation.

## Literature Review

### The Modern Role Play

There are a number of definitions to role-play. Thiagarajan (1996, p. 521) defined role-playing as an exercise in which "players spontaneously act out characters assigned to them in a scenario". A role-play can also be defined as a structured scene or series of scenes involving interactions between two or more persons. Participants are assigned roles, which enable them to demonstrate or practice interpersonal skills related to a training objective or outcome. In short, a role-play is but an activity, which requires a person to take on a role that is real or imaginary, it involves spontaneous interaction of participants as they attempt to complete a task.

As we turn the pages of history, role-play had already come into existence as a favourite teaching instrument by students because it got rid of the boredom and brings trills and excitement into the classroom or training session. Experiencing what you learn is far different from mere reading and listening. According to (Land, 1987) who says, this model brings forth detailed and concrete study materials, which are more difficult to pinpoint by the way of lecture and discussion. And his argument is strengthened by Ments (1989, p.23) who says, although conventional methods of teaching and learning such as lectures, reading, films, discussions and writing can be used successfully to help students acquire knowledge of factual material and the essential theoretical framework into which future experiences may be fitted, they are incomplete. According to McDonald-Mann, (1998, p 117) ... lectures are needed in most skilled-based training because they are the most efficient way to deliver large amounts of information and theory. But no matter how well done, lectures alone are never sufficient. From these arguments, we can clearly see that role-playing is not just interesting to the employees but it is an additional factor that will complete the training.

According to Olusegun Agboola Sogunro(2004) role-playing has been proclaimed as a powerful technique used in the upper levels of cognitive domain of learning, especially in both individual and group situations such as counselling, interviews, customer service and sales, personal relationships, negotiations, public meetings, team working committees, research, and change processes which require a great deal of practical engagement of participants in the act of doing (Buchan, 1972; Harris, 1985; Hershey, 1985; Cranton, 1989, 1992; Ments, 1989). As indicated by Hughes *et al.* (1993, p. 44): learning new leadership skills means acquiring knowledge through lectures and then practicing that new knowledge through role-plays.

According to Olusegun Agboola Sogunro (2004) role-playing has the advantage of letting trainees actually practice relevant skills and thus has greater transferability to the workplace than do didactic lectures of abstract discussions about leadership.

Realistically, role-playing encourages participants to view situations or problems from various perspectives other than their own. When participants are assigned roles different from their usual roles, they are provided opportunity to examine and question their assumptions and are enabled to learn new roles, become more aware of their own roles, and understand more clearly other people's roles and points of view (Ments, 1989, 1999; Cranton, 1992).

### Role-playing as a Method for Interpersonal Skill Development

The interpersonal communication is defined in this research as a communication, which is the transmission of information and meaning from one party to another through the use of shared symbols, Thomas.S.Bateman,(1996). He explained interpersonal communication as a process where there are two parties, the receiver and the sender. The sender encodes the message, and transmits it through a channel, either in a verbal or non-verbal manner to the receiver who decodes and interprets.

From the statement, we can see that interpersonal communication skill is actually a complex skill because it involves relationship between individuals and the situation they are in. In order to train employees to understand the situation they are in, they must be subjected to an environment, which is similar. This is where role-playing comes into the picture. Through role-playing, employees will experience virtually real situation and real problems. Harris (1985) posited that role-playing has its greatest value in developing insight into complex professional situations, developing skills in person-to-person relationships and as a direct training activity for interviewing, discussion-leading, and teacher-questioning skills.

Real situation involves the students having the feel of the real happenings in the work place. They take the role of the character in a scenario created by the trainer. Hershey (1985) evoked a scenario explaining how role-playing can be used as a tool for improving interpersonal skills and customer-employee communications in an organization. He claimed that in a role-playing activity, where one employee assumes the role a manager, another plays the role of an irate customer, and others play roles, including a receptionist or secretary, and a typist who has two other rush jobs, employees are enabled to gain better understanding of problems as seen by others. In essence, the role-playing method will help employees enhance their understanding regarding the ethics of teamwork and how to maintain a good and effective customer-employee relationships. In 1972, Buchan reported success in using role-playing to help high school students develop various skills, including marketing, job interviewing, obtaining loans and insurance, and building personal relationships with others.

Currently, with the increase need of able workers in the management, role-playing is becoming important. The management are looking at role-play as a means to train their personnel in areas, especially the interpersonal communication. In order to train the management personnel, learning should be similar to the real situation. According to Crawley & Errand (1981), role-playing is used for its promise to engage learner and instructor alike in a specific learning experience. It can be employed for its rich transfer of learning potential to each participant's own learning repertoire.

Lately role-play has been much more organised. Indeed role-play has become a powerful way for practising inter-personal skills (Maynard *et al.* 2003). Johnson and Johnson (1997, p. 59) have described role-playing as "a way in which you can experience concretely the type of interaction under examination". According to these two experts, "The more real the role playing and the more effective the exercise, the more emotional involvement you will feel and the more you will learn" (Johnson and Johnson, 1997, p. 60). Through role-playing activities, the instructors may change the students' behaviours and attitudes, and may experiment with new ways of managing situations, and may also understand new emotional experiences that they did not expect during the early stages of the role-play. Thiagarajan (1996) claimed that role-plays are most useful for practicing and developing interpersonal skills, including conflict management, negotiation, influencing, team building, active listening, giving and receiving feedback, and communication.

When using role-play in training interpersonal skills, it will focus not just the physical involvement of the participants but also their emotional feelings. Benfari (1999) recommended practicing role-playing with a person who has an opposite view in order to kindle interaction and consequently diminish their feelings of rejection, isolation, and anger. According to Benfari (1999, p. 202), "By walking in another's shoes, an introverted thinker can break through the self-absorption and feelings of anger". As humans we need to understand feelings of others in order for them to work as a team and to deal with clients or customers. It is utmost important for the organisation to improve both external and internal communication, without jeopardizing the relationship of a business with its clients or customers.

Effective practice behaviors are mastered by doing them, and the learning is affirmed with the valid experience of having done so. The experience of one's own efficacy solidifies learning (Bandura, 1977). In brief, to upgrade the standard of the human resource in the management sector, in relation to person-to-person relationship, the use of role-play is without doubt, effective.

**In summary, this study aims to examine the benefit of using role-play to improve the interpersonal skills in an organisation.**

## **Methodology**

The respondents were undergraduates of MARA University of Technology Terengganu Branch, who are pursuing a diploma in Accountancy Program. They are now in their third semester. They were selected by judgement sampling to cover only students from the rural areas of the state of Terengganu in order to make this finding more authentic presenting the effectiveness of the role-play.

Ten selected respondents from various parts of the states of Terengganu were selected for the open-ended interview session. The qualitative research consisted of face-to-face in-depth interviews with students doing semi-

professional courses. The interviews were conducted in a semi-structured format that allows respondents to express their own viewpoints (Flick, 2002). A set of interview topics guided the interviews, with a list of probing questions to draw out respondents' opinions. Topics were discussed as respondents brought them up, occasionally supplemented by new issues that arose during the interviews. The interview included student's opinion regarding the use of role-play in interpersonal development.

All in-depth interviews were conducted in the English language. Extensive notes were taken during the interviews. We highlighted key issues mentioned from each interview and combined the most common issues mentioned by the interviewees. What is it meant to achieve? It is carried out in order to identify the component of interpersonal skills like confident, understanding, ice breaking, maintaining relationship and negotiation skill. Major questions posed during each interviews were: (1) Do you think role-play improves your self-confidence? (2) Do you think role-play will help you to understand others? (3) Can role-play help you in the ice breaking process? (4) Can role-play help to maintain relationship? (5) Can role-play help you in negotiation?

Among the role-playing activities that has been carried out are; Story telling, mock debate, talk show, sketch and Impromptu role-playing. The researcher chooses these selections of role-plays as they do correspond with the syllabus. Besides, improved interpersonal skills will enable students to be marketable in the job market. Students were subjected to the role-playing activities three times a week during their lessons and each session takes about an hour. It is rational to keep role-playing short and fun, rather than long and tedious. Students at this level tend to loose their interest if the session is too long. Despite the interest shown by the students, the researcher has to set a time limit. The numbers of role-play is limited due to time constraint such as meeting exam deadlines and reports.

Two interview sessions had been carried out, which are, the pre-interview and post-interview. The pre-interview was to gauge the respondents' readiness and perception about role-play. The second is to get feedback from the activities, in relation to interpersonal skill. An audio tape recorder was used in each interview, which lasted for one to two hours. A transcription was done soon after each interview. A total of ten participants were chosen as respondents as this number was considered to have reached the data saturation point. The general view of their feedback is in table 1. After all the transcriptions have been completed, the constant comparative method was used by the researcher for the formation of data categories pertaining to their understanding and factors contributing their Interpersonal skills. The respondents' experiences in doing the role-play were also analysed to strengthen these research objectives.

## Finding/Result/Analysis

TABLE 1: REPRESENT THE RESPONDENTS' RESPONSES TO THE RESEARCH QUESTIONS; THIS TABLE ANSWERS FIVE RESEARCH QUESTIONS

No	Name	Feeling Confident	Under-standing Others	Negotiation	Ice-break	Maintain Relationship
1	Wan Nur Alwani	"When I do the activity, I am not shy anymore"	"... we can understand why the boss is angry"	"Some activities taught me to respect other people"	"... when we do talk show, we practice to introduce people"	"We learn to understand other people"
2	Farah Diana	"Yes of course. Last time I was nervous"	"... we will know if the person is angry, or happy or sad"	"... during mock debate and talk show, because we have to argue"	"When we do role-play we can do ice breaking"	"If we can work with our friends than we can work with other people"
3	Nor Aiza Amizan	"Yes, very little"	"Yes, ... I can speak them in English, but I cannot..."	"Yes. Mmm...when do activity"	"I don't understand"	"Yes..."
4	Noor Haiza	"I think I a little"	"We understand"	"Yes...When we"	"I learn how to"	"When we know"

		<i>bit confident... not like when I do story telling”</i>	<i>with our friends. We understand their feelings... and they understand our feelings”</i>	<i>debate, we accept our friend’s ideas. But sometime no. But we do not quarrel”</i>	<i>know other people. How to talk to them, and not be afraid to talk to people.”</i>	<i>them, then we can work with them”</i>
5	Ida Zuraity	<i>“I am not nervous to be in front of the class”</i>	<i>“We understand each other better after the activity”</i>	<i>“I think the mock debate teach me how to negotiate”</i>	<i>“I have no problem when I want to talk to friends”</i>	<i>“When we know them then there is no problem”</i>
6	Azmaruhayu	<i>“I don’t feel shy to stand in front of the class to do my presentation”</i>	<i>“Sometimes I understand, but... I cannot understand everybody”</i>	<i>“Yes... Sometime we agree with what our friend say. Sometime no. Our friend also same”</i>	<i>“If we see other people... students, we can talk to them”</i>	<i>“Yes, because we practice how to talk to other people”</i>
7	Norhidayu	<i>“I think it improves my self-confidence. I can do the activities and speak English at the same time”</i>	<i>“Yes... when we understand than only we can be close”</i>	<i>“When I talk... during the activity I tell my friend whether I like or not like her idea”</i>	<i>“Like when we meet new people we must be able to talk to them. We must start first. Maybe we are shy. But we must start. If not, nobody wants to talk.”</i>	<i>“Yes... can. If people can talk to each other than they can be friends”</i>
8	Mohd. Nasrol	<i>“Yes, because I am not shy to do the activities in front of the class”</i>	<i>“I think in class I can understand my friends”</i>	<i>“ Yes... when we do the activity, people talk many things when try to settle problem. We cannot listen everything. We must talk also. Other people must listen also. Then can settle problem:</i>	<i>“... Because in role-play we learn to talk to people. When we talk to people we can conversation</i>	<i>“Yes ... and when other people also talk so can become our friend. Role-play can help can get many friends”</i>
9	Muhd Mazlim	<i>“I can speak and do the drama in class. Last time I don’t like, because I am shy of the girls. Now I am more confident”</i>	<i>“Yes ... I must understand other people. I think role-play help to understand other people”</i>	<i>“Yes... I learn to negotiate when doing the activity ... talk show. Also debate”</i>	<i>“Yes. Like do talk show or role-play, you must know how to talk to other people. Sometime you don’t know other people”</i>	<i>“Yes. Because when we understand other people, we can work together all the time”</i>
10	Norhaswani Baizura.	<i>“At first I don’t have the confidence because my English was bad... but after</i>	<i>“I think I have no problem. When we talk we will understand our friends”</i>	<i>“Yes. I think I learn to negotiate during debate and talk show. Because in the activity we</i>	<i>“Role-play can help in the ice-breaking process, because when we do the activities, we</i>	<i>“Yes. Because role-play helps us to speak to other people. Sometime we need help from other people. If</i>

		<i>the activities I think I am more confident"</i>		<i>have to settle a problem. We must not quarrel"</i>	<i>sometime so acting, like meeting new people.</i>	<i>we don't know how to talk how to get help.</i>

## **The Use of Role-play in Developing Interpersonal Skills**

There are numerous ways to teach interpersonal skills, and it is up to the trainer to choose whichever method he wishes to implement. In this case, the respondents are undergraduates of UiTM Dungun. They undergo various and vigorous language training. The training they received is specially formulated to prepare them for jobs later on. Basically, the students here are Malays or the bumiputras. Most of them are from the rural areas of the East coast of Peninsula Malaysia and they are a bit shy when it comes to performing in front of the class. To develop them to be capable executives or managing personnel, they have to experience the use of the English language in 'real' situation. After carrying out the role-plays, it is found that the students have improved considerably in their interpersonal skills.

Since we want to find out if role-play can develop the interpersonal skills, the explanations below will answer the research questions formulated which are the major questions posed during each interviews. The questions are focused on whether role-play improves their self-confidence in communication, helps to understand others, helps in ice-breaking process, maintain relationship and negotiation.

### **Role-play can Improve Confidence in Communication**

From the activities being carried out in the classroom, the researcher can acknowledge with certainty that the respondents have been optimistic and determined to improve their person-to-person communication. Most of the respondents have shown that they have improved their level of confidence in their presentation. All the respondents except Nor Aiza have clearly state that they are confident after undergoing the role-playing activities. Ida Zuriaty bt. Abdul Razak for example, says that after going though a number of role-playing, she has improved her confidence to use the language and socialize with others. Most of the respondents complain of being shy and feeling nervous. Most of them had to some extent overcome the fear of standing in front of the class after a number of sessions. Wan Nur Alwani is one clear example. Role-play and simulation activities stimulates authentic learner-to-learner conversational interaction (Richards, 1985). The activities also develop conversational competence among second language learners. According to Brumfit (1983), he refers to role-play as a fluency activity where opportunities arise for the learner to use language freely and creatively. Role-play focuses on using language as a conversational resource.

Azmaruhayu said, "*I can talk to people and not feel shy*". When she said those words, I can see that she meant what she says. She was always smiling and laughing to cover her shyness. But after the session, she looks confident. Students have been subjected to scrutiny by their teachers and that is the reason for them being shy. It was de-motivating. They have been told that making mistakes is wrong and punishable. In role-plays teachers or trainers do not jump in and correct every mistake. In role-playing, if there are mistakes, it can either be self-corrected, peer-corrected or negotiated with students on how they would like to be corrected. These may be the reason why students feel that they are motivated to talk and able to improve themselves in their communication skills.

### **Role-Play will Help in Understanding Others**

Students are mostly self-conscious of themselves. To the timid, they felt that their shyness is a factor that is transforming them to be different from others. They felt the others are watching and measuring them. So they shun themselves from talking. Bear in mind, these activities was carried out in English. Not being able to speak in English is a problem to them. What the respondents found out was, role-play helped them to overcome that

problem. Wan Nur Alwani said, *“Last time, I feel shy because people laugh at me. Now I know they also shy”*. This shows that from role-play, the respondents found that other people experience the same problem.

According to Noor Haiza, *“We understand with our friends. We understand their feelings... and they understand our feelings”*. She clearly mentions the importance of understanding others. When she understands others, then only she would be comfortable working with them. When you are comfortable with others whom you are working with, you would not face problems. This is supported by Norhaswani Baizura who says, *“I think I have no problem. When we talk we will understand our friends”*. Clearly, conversation will help us to solve our problems (at the work place) and at times, the problems of others.

Role-play helps students or the respondents to understand others. This is an important aspect of interpersonal development. According to Olusegun Agboola Sogunro (2004), by understanding the feelings of others, an empathetic leader is able to internalise the predicaments or situations of his/her followers and will be able to make the right decisions toward solving a particular problem. Being empathetic towards others is a quality of a leader. Being able to master a good interpersonal communication skill will definitely help an employee to have a leadership quality. This is a starting point towards a brighter future. It can lead to success or a better position in an organisation.

## **Role-Play Engages Negotiation**

To negotiate, there must be conversation. Sometimes the conversation would be drawn to an argument. Whatever the intensity, the purpose for a negotiation is to come up with a solution or answers. In a role-playing or simulation, the respondents were put into a real situation where their ability to negotiate was tested. In the mock debates, the respondents are to argue and they have to come to a conclusion. There is no right or wrong, but they have to communicate and exchange ideas and come up with a solution. According to Noor Haiza, *“Yes...when we debate, we accept our friend’s ideas. But sometimes no. But we do not quarrel”*. When the respondents do the mock debate, they learn to accept other people’s suggestions or arguments. But there are certain points given during the debate, which she could not accept. She has to state her stand. But they are not to quarrel. Everything about the debate has to end when the activity ends. They learn not to be emotional and to learn to accept. This is further supported by Noorhidayu who said, *“When I talk... during the activity I tell my friend whether I like or not like her idea.”*

When negotiating, students are to learn and understand the problem. Learn to listen, to communicate and to make choices. As Mohd Nasrol said, *“Yes... when we do the activity, people talk many things when try to settle problem. We cannot listen everything. We must talk also. Other people must listen also. Then can settle problem.”*

We can say that it is essential for would be leaders or managers to be able to negotiate. This can be clearly stated by Eitington (1989, p. 67) who asserted: In role-playing activities participants are learning "full time." This accrues because they are either experiencing (acting out the role-play), introspecting, engaging in self-critique, or critiquing others. In negotiating, one can never run away from engaging in a serious conversation. There is a lot of thinking going on and a lot of decision to be made. Sometimes we need to learn to accept criticism and sometimes we need to critic others too. But what is important is the outcome of the negotiations. It should be for the benefit of both parties. Participants must be taught to play a win-win situation.

## **Role-Play aid in Ice Breaking**

Ice Breaking is an essential skill in interpersonal skill. When you meet new people or meeting people having problem, you need the skill to start the conversation. Conversation is capable of healing the wounded heart. In management too we confront with a lot of uncertainties. We are not going to be quiet about it. We have to resolve the problem and the best way to resolve the problem is through communication.

Role-play is essential and in some instances is capable of solving multiple problems. The respondents have given positive remarks regarding the role-play. Noor Haiza said, *“I learn how to know other people. How to talk to them, and not be afraid to talk to people”*. A conversation is not something to be afraid of. It actually helps in reducing fear. And according to Norhidayu, *“Like when we meet new people we must be able to talk to them. We*

*must start first. Maybe we are shy. But we must start. If not, nobody wants to talk*". Most often students would not talk because we take for granted that others will start the conversation. But in most instances, the other party also waits for us to start. In a conversation, we should be the first to start. And Muhd Mazlim said, *"Yes. Like do talk show or role-play, you must know how to talk to other people. Sometime you don't know other people"*. Role-play can evidently show that students who are able to talk will be able to carry out ice breaking process. Even though when they perform the role-play, it was carried out among their peer group but when they encounter people who are unfamiliar they will be able to start a conversation. This can be best explained by Hershey (1985) who evoked a scenario explaining how role-playing can be used as a tool for improving interpersonal skills and customer-employee communications in an organization.

## **Role-Play Maintain Relationship**

Maintaining relationship in an organisation is important in order for the organisation to have an effective interpersonal relationship. From the respondents' responses the researcher finds that the respondents are able to understand the importance of this relationship. According to Noor Haiza, *"When we know them, then we can work with them"*. In an organisation, knowing whom you work with is a predominant factor. The relationship can be between employee-to-employee, employer-to-employer or employee-to-employer. And according to Norhidayu, *"Yes... can. If people can talk to each other than they can be friends."* Communication here seems to be the main focus again. As long as there is communication, the relationship will be maintained.

Norhaswani Baizura reckon, *"Yes. Because role-play helps us to speak to other people. Sometime we need help from other people. If we don't know how to talk, how to get help"*. It is very important for the students to speak because through interpersonal communication, only then you will be able to get assistance and help from others. If you are quiet, secluding yourself in your cubicle, you will be on your own and that might lead to a problematic relationship. According to Olusegun Agboola Sogunro (2004), the role-playing method will help employees enhance their understanding regarding the ethics of teamwork and how to maintain a good and effective customer-employee relationships. Thus, a good interpersonal communication will enhance and maintain a pleasant relationship. The management will profit by having employees who will be able to work together as a team.

## **Discussion**

After going through the activities, this paper will offer a few suggestions to the managers on how to conduct the training by adapting role-play as a tool to the organization. It is a fact now that playing out roles can be a vital educational tool to develop interpersonal skill. If playing roles is successful to the undergraduates of this university, it will undoubtedly be effective to train employees or the managing personnel in any organisation.

Now, instructors have to set a clear objective of the role-play. What purpose is the role-play being enacted? According to Maier, 1981 and 1985, with role-playing as an educational device of choice rather than a politicised tool, it can be adopted and effectively applied so long as the instructing persons are clear about the learning objectives. When referring to interpersonal communication skills development, the actual or real situation being applied is the only way to develop the skills. In interpersonal skills, it involves the interplay of verbal and non-verbal behaviours. And these behaviours are too complicated and subtle to be taught through mere reading and observation. The instructors thus, need to assess the educational appropriateness of each role playing assignment or simulated exercise.

## **Suggestions**

Managers should focus on these four main aspects when setting up a training session. Firstly, managers must think of the materials that they need to utilize during the session. Since the focus is more toward real life situation, therefore any items that are related to this training must be of real life too. The choice for the location of the training

should also be taken into consideration. The location should be adequate and effective where the participants should not be distracted. Besides that, it should appear less formal to the participants and able to reduce the level of stress.

Secondly, managers need to identify the manpower, or the choice of instructors. Organisations or institutions that are interested in training their employees in interpersonal skills should consider hiring instructors who are competent in this field. The best way to train is to employ professional role-player to help in the role-play. For example, according to Geoff Cotton (1996) Roleplay UK has established itself as the leading supplier of professional role players throughout the British Isles. Their clients include large insurance companies, which will assess all their sales forces to determine their competence. I would suggest the managers to employ professional role players for this task. Professional role players will be able to produce positive result and it has proven to be effective in role-play.

Thirdly, the method or the technique of delivery should also be an important aspect to be considered. Managers should see role-playing as a provider of opportunities to react to working situations and to give the employees a taste of real life. A well-planned and focussed utilization of role-playing fosters targeted learning while maintaining the inherent hands-on features of this powerful teaching tool. With a module as guidance, the role-play should have a beginning, during and an end development. Participants should always be supported and given feedback by the trainers and instructors. In brief, managers must set a clear objective and direction.

The last factor is, monetary or the financial support. Most organisations would not face any problem in terms of financing training for their employees. As this is important in term of improving the management of the organisation, managers would be ever willing to reserve a portion of the budget for the training.

## Conclusions

This research found that role-play is effective and a method to be utilized and exploited for interpersonal skill development. Role-playing has never been outdated; in fact it has taken a new terminology and approach. It is appropriate to regard role-play as a modern training tool due to the fact that it suits the present organisational needs.

Currently, when management is complex, relationship between the various levels of management is also similar in complexity. Especially when it comes to relationship between the administrative level and the employees, or with the consumers. I suggest that future research takes into account the training of senior personnel in interpersonal relationship. Breakdown in relationship occur, and it can be due to uncertainties between the workforces. Therefore in the training there should also be focus on eradication of uncertainties. Therefore Berger (1987) states how important to instil understanding in communication especially when it comes to developing the bond between the management and the employees.

The researcher is hopeful that in this age of globalisations, where the target of having a customer friendly organisation is important, role-play should be implemented in the training of interpersonal relationship. The advantage of role-play in whatever term it is being used is more than the disadvantages. Role-playing will continue to be in existent as long as participants are motivated, enthusiastic, and take their roles seriously.

# **Service Skills: Impacts on Employee-Related Quality, Process-related Quality, and Outcome Quality**

*Sherriff T. K. LUK*

*Hong Kong Polytechnic University, Hong Kong*

*Irene H. S. Chow*

*The Chinese University of Hong Kong, Hong Kong*

## **Abstract**

**The present study aims to provide empirical evidence to illustrate how service skills will determine the performance of frontline service employees and the relative contribution of employee performance to customer satisfaction and, subsequently, customer loyalty. Survey interviews were conducted to collect data from consumers who had just consumed personal loan service. The results of statistical analysis indicate that both technical service skills and functional service skills have direct impact on the three aspects of service quality: employee's service behavior, service process, and service outcome. Service behavior is the most power predictor to customer satisfaction. In addition, higher level of customer satisfaction will lead to higher level of and loyalty.**

## **Introduction**

Recent investigations in the area of human service delivery have recognized that employee performance is a vital factor influencing the quality of human service provided (eg. Bitner, 1995; Boxall, 2003; Hurlley 1998; Mohr and Bitner, 1995). Critical to the performance of service personnel is their service skills (Farrell et al., 2001; Mitchell, 1994; Pitt and Jeantrout, 1994; Sjoholt, 1999). Schneider and Scheeter (1992) have suggested that service employees need two complementary capacities: service competencies and service inclination. The former refers to service skills and knowledge needed to perform the service task and they can be enhanced through training.

Skill can be conceptualized as knowing how to make something happen (Senker, 1995). In a service process, skill refers to the ability to carry out the service role and related service tasks. The skills of the service provider become an integral part of the service in the mind of the customer (Farrell et al., 2001). Zeithaml et al.'s (1988) research work demonstrates that service failures are attributed to service employees' lacking of the required interpersonal skills, language skills, and other skills for the service job. Luk and Roger (2004) have found that service skills have positive impact on perceived quality of hotel service. Nevertheless, their empirical work is suffered from two major limitations. Firstly, the findings are industry-specific and whether they can be generalized to other kinds of consumer service is open to debate. Secondly, the service skills required for effective delivery of the intended service in fact vary from service to service. As such, the domain of the scales developed for the measurement of both technical service skills and functional service skills respectively based on the findings in the hotel industry may need to extend to cover additional service skills that are required to for smooth delivery of non-hotel services.

Following this line of thinking, this study is thus designed to achieve the following objectives:

- a) To develop a scale based on the ones created by Luk and Layton (2005 with modifications for service skills.
- b) To investigate the effects of various types of service skill on frontline service employees' service behavior, service manner and the service processes/procedures via which the service is delivered.
- c) To examine the impact of service behavior, service manner and service process on overall customer satisfaction.

### **Service Skills Crucial for Performance**

Skills refer to a person's ability/capacities to perform a set of specific tasks and are developed as a result of training and experience (Blanchard and Thacker, 2000; Gronroos, 2000). Experiences in various service industries indicates that product knowledge of the service, knowledge of the service firm and its policies, knowledge of competing services, and operation skills for service delivery are basic skills every frontline service provider has to learn (Christiansen et

al.1996). According to the suggestion by Gronroos (1985), this set of skills is highly related to the technical aspect of service quality and can be considered as technical skills.

Gronroos' (1985) explanations on functional quality and the SERVQUAL findings (PZB, 1988, 1991) provide theoretical basis for the types of functional service skills that should be included in service training packages for frontline employees. Based on the conceptualization of functional quality, the SERVQUAL findings, and literature review on service quality, organizational behavior, and training management, Luk and Layton (2005) have identified twelve types of service skills, including operational skills in delivering the service, knowledge of competing offers, information acquisition and communication skills, skills to manage customers' expectations and evaluation criteria, skills to identify and solve need-related problems, skills to orchestrate and control the service encounter, skills to reduce the risk of consuming services and to instill confidence in consumers' choice, skills to tangibilize the service and to help the customer assess its quality/benefits, and skills to educate /encourage customers to assist in performing the required service tasks.....and so on. Consistent with the suggestion from Gronroos (1985), the findings from their study indicate that these skills make up two service skill scales, technical versus functional. The first seven types of skills are technical skills whereas the remaining are functional skills. However, Luk and Layton (2005) also pointed out that the domain of these two skill scales could vary from service to service for some specific service skills may be required for certain types of services but not for others. Therefore, research efforts aiming at identifying more service skills crucial for service performance and customer satisfaction are warranted.

### **Service Performance and Customer Satisfaction**

PZB have suggested service quality as an antecedent to customer satisfaction and introduced the SERVQUAL scale for the measurement of service quality perceived by the customer right after consumption. However, the SERVQUAL scale has been criticized for placing too much emphasis on process, or peripheral service elements. Leithnen and Leithnen (1982) have conceptualized service quality as the determinant by three sets of service elements, process, behavioral, and outcome. Recent studies have also found that the outcome of consumption is critical to customers' evaluation of service quality as well (eg. Powpaka, 1996; Luk and Layton, 2003). Therefore, three aspects of service quality, service process, service behavior and service outcome, must be considered simultaneously if one want to explain the variations in customers' perceptions of service quality and its impact on customer satisfaction.

Customer satisfaction is a kind of fulfillment response (Oliver, 1997). It is defined as "a judgment that a product or service feature, or the product or service itself, provided (or is providing) a pleasurable level of consumption-related fulfillment, including levels of under- or over-fulfillment" (Oliver, 1996 p.13). The confirmation-disconfirmation schools has suggested customer satisfaction be subject to the comparison between perceived performance and expected performance and has argued for the use of gap scores to explain the level of satisfaction/dissatisfaction. However, some scholars have proposed to use performance-based model to measure customer satisfaction towards the overall performance of the services, encounters, and experiences with a particular firm (eg. Cronin and Tatlor, 1994; Johnson, 1998; Jones and Suh, 2000).

In services marketing literature, customer loyalty is defined as "the degree to which a customer exhibits repeat purchasing behavior from a service provider, possesses a positive attitudinal disposition toward the provider, and considers using only this provider when a need for this service arises" (Gremler and Brown, 1996 p.173). This definition suggests behavioral, attitudinal, and cognitive aspects of loyalty. Behavioral loyalty refers to repeat patronage, repeat purchasing, or commitment to repurchase (Dick and Basu, 1994; Gremler and Brown, 1996; Oliver, 1999). Attitudinal loyalty is a conscious effort to evaluate competing brands and consumers' preferences or intentions to select the brand (Gremler and Brown, 1996). Cognitive loyalty is referred to a brand that comes up first in customer's mind and that is more preferable than other alternatives when making a purchase decision (Dick and Basu, 1994; Oliver, 1999). Accordingly, it has been recommended that measures pertaining to these three types of loyalty should be adopted for a valid measurement of loyalty.

Based on the literature review in the preceding section, three hypotheses are developed for statistical test:

*H(1): Both technical and functional service skills will have positive impacts on frontline employees' service behavior (employee-related quality), the service delivery process(process-related quality), and the service outcome.*

*H(2): Frontline employees' service behavior, the service delivery process, and the outcome of service consumption will have positive effects on customer satisfaction.*

*H(3): Higher level of customer satisfaction will lead to higher level of customer loyalty.*

### **Research Method**

Survey interview technique was employed to collect data from respondents. All respondent were recruited through mall-intercept technique and interviewed at the entrance of the bank that was located inside the mall. All respondents must have just consumed personal loan service; otherwise, they would not be qualified for participation in the survey.

Eighteen items of service skills (Appendix I) were developed mainly based on the scales developed by Luk and Layton (2005), the extant literature and the information collected from focus group study with 32 managers from 11 retail banks in May 2004. Nine measures (Appendix I) for the measurement of the behavioral aspect of customer loyalty were employed. Each respondent was asked to report their satisfaction level with three service aspects, including service behavior of the frontline service provider, service manner of the provider, and the processes and procedures through which the service was delivered. These, together with customers' overall satisfaction with the service, were all evaluated with a single measure.

### **Findings and Discussion**

A team of five interviewers who majored in marketing were recruited and attended two sessions of training in interviewing technique specially designed for this survey. We used street-intercept technique to sampled respondents from different retail banks at the banking center in Hong Kong. All sampled respondents were asked to evaluate the performance of the tellers who had just delivered personal loan service to them.

A total of 265 respondents were interviewed with four questionnaires having quite a number of questions not answered. Therefore, a total of 261 completed questionnaires were used for analysis. Table (1) summarizes the demographic characteristics of these respondents.

TABLE (1): RESPONDENT PROFILE (N = 261)

---

Gender: Male = 121, Female = 140
Age: Below 20 = 10.3%, 21-30 = 53.3%, 31-40 = 25.3%, 41 or above = 11.1%
Education: Primary = 6.9%, High School = 42.7%, University = 48.8%, Others = 1.5%
Average Monthly Income (HK\$): Below 10000 = 60.2%, 10001 – 20000 = 26.8%, 20001 – 30000 = 10%, Above 30001 = 3.1%

---

Since the items for the constructs were all developed based on the established scales with modifications only, confirmatory factor analysis was used to test the reliability and validity of these scales. As evidenced in Table (2), the Alpha value of each scale ranges from 0.81 to 0.94, displaying a high level of reliability. Moreover, all these constructs are positively correlated with large  $r^2$  value. These provide preliminary supports to the hypothetical relationships among these constructs.

Then we used LISREL program to test the proposed structural equation model. The fit measures indicate the model has an acceptable level of goodness of fit (Chi-square = 1106.64,  $df = 430$ , NFI = 0.959, CFI = 0.974, PNFI = 0.887, RMSEA = 0.077). Except three items, the Squared Multiple Correlation values of the items forming all these scales are higher than 0.5, showing good reliability.

As indicated in Figure (1), both H(1) and H(3) are supported. Both technical and functional service skills have significant and positive impacts on frontline service providers' service behavior, the service delivery process, and the service outcome, though overall the former has relatively greater impact than the latter. The positive effect of satisfaction on customer loyalty is confirmed as well.

Considering technical service skills alone, the magnitude of their effects on service behavior, service delivery process, and the outcome is about the same. However, functional service skills are found to have strong impact on frontline service employee's service behavior but weak to moderate impact on service outcome.

The findings reveal that H(2) is partly supported. It is interesting to observe that customer satisfaction is by and large determined by service behavior of frontline service provider and that service process has negative impact, instead of positive effect as hypothesized, on customer satisfaction. These phenomena can be explained by the fact

that in Hong Kong the prime interest rate is set by the Hong Kong Association of Banks and banks therefore use it as reference to determine the interest rate of various types of personal loan. Variations in the interest rate offered by competing retail banks are minimal. As such, the cost of transaction to, or the interest earned by, each customer will not vary much regardless which bank the customer banks on. In other words, the outcome of similar retail banking services is about the same and its contribution to customer satisfaction is not as great as expected.

On the other hand, imitation has been the major approach adopted by banks in Hong Kong when introducing new services. Most banks render the same type of retail banking service like passbook service, credit card service, and fixed deposit service via similar operation procedures. In addition, having living in a major financial center like Hong Kong for years, local inhabitants in Hong Kong are very familiar with different types of retail banking services. Some of them can even assist in the delivery of the required services so that they can have the transaction completed as speedy as possible. A teller who delivers the required service step by step along the prescribed procedures without flexibility may make some customers feel that s/he was inexperienced and/or less confident.

### **Conclusion**

The findings confirm the important role of both technical and functional service skills in three aspects of service performance – behavior, process, and outcome. As perceived by customers, both types of service skill have relatively greater impact on service behavior of the frontline service employee. In the situation where there is low level of differentiation in service process and service outcome, service behavior of the employee appears as the most important determinant to customer satisfaction, which has significant impact on customer loyalty. All these suggest service firms should invest in service training to equip frontline employees with good technical and functional skills, particularly the former, if they would like to improve service performance.

The scales for technical service skills and functional service skills appear as valid instruments for the measurement of training efforts and potential effects of service training on service behavior, service process, and service outcome. However, the scales may be industry-specific and future replication studies in other service markets could help to examine the generalizability of them and their power in explaining variations in frontline employees' performance in behavioral, process, and outcome aspects of service.

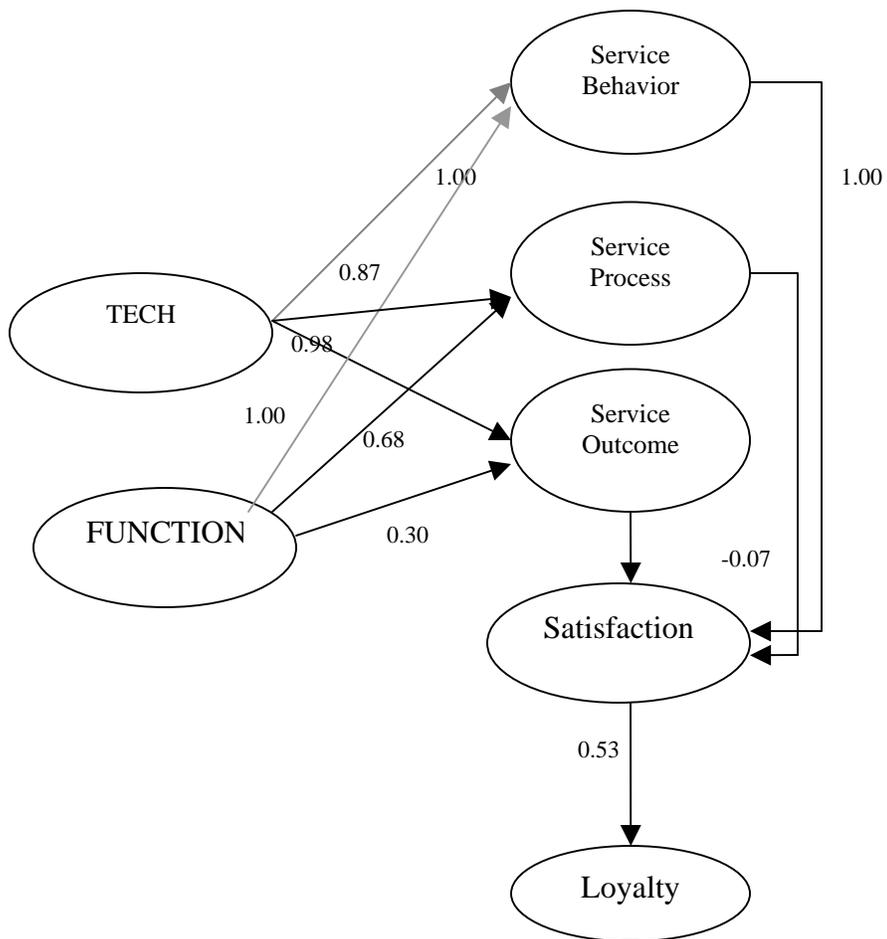

FIG. (1): RELATIONSHIPS AMONG TECHNICAL SERVICE SKILLS, FUNCTIONAL SERVICE SKILLS, PERFORMANCE ON SERVICE BEHAVIOR, SERVICE PROCESS, SERVICE OUTCOME, CUSTOMER SATISFACTION AND LOYALTY

TABLE (2): FACTOR STRUCTURE AND THE RESULTS OF RELIABILITY TEST

Skill Factor 1: Technical Services Skills (Alpha = 0.89)

- *Ability to handle complaints from customers*
- *Skills in identifying customers needs*
- *Skills in having good conversation with customers*
- *Skills in judging individual customers' own problems*
- *Skills in convincing the customer to maintain good relationships with the bank*
- *Skills in solving any problems with teller/loan service*
- *Skills in helping customers understand the features and benefits of the bank's service*
- *Listen to customers attentively and patiently*
- *Skills in helping customers provide the information necessary for smooth delivery of the service*
- *Skills in educating to customers form a right expectation of the bank's services*
- *Skills in advising customers how to select and asses various types of retail banking service*

Skill Factor 2: Functional Service Skills (Alpha = 0.81)

- *Knowledge of retail banking service*
- *Knowledge of the bank*
- *Skills in encouraging customers to assist in performing the required service tasks for personal loan service*
- *Language skills in English and/or Mandarin*
- *Clerical skills required for efficient delivery of the service*
- *Knowledge of the procedures for the delivery of the services required by the customer*
- *Understanding of the bank's polices regulating the delivery of the service asked by the customer*

Factor Structure of Customer Loyalty (Alpha = 0.94)

- *The experience of this transaction will enhance a favorable image of this bank*
- *I can count on the employee taking actions to address my needs*
- *I think I did the right thing when I decided to use this bank's services*
- *I will say positive things about this bank's services to other people*
- *I will recommend this bank to someone who seeks my advice*
- *I will encourage friends and relatives to do business with this bank*
- *I will consider this bank my first choice if I want the same service*
- *I will do more business with this bank in the next two years*
- *I will continue to do business with this bank if the service fee increases somewhat*

## APPENDIX (I): MEASURES FOR THE SCALE OF SERVICE SKILLS AND CUSTOMER LOYALTY

### A). For Service Skills

- *Ability to handle complaints from customers*
- *Skills in identifying customers needs*
- *Skills in having good conversation with customers*
- *Skills in judging individual customers' own problems*
- *Skills in convincing the customer to maintain good relationships with the bank*
- *Knowledge of retail banking service*
- *Knowledge of the bank*
- *Skills in solving any problems with teller/loan service*
- *Skills in helping customers understand the features and benefits of the bank's service*
- *Listen to customers attentively and patiently*
- *Skills in helping customers provide the information necessary for smooth delivery of the service*
- *Skills in educating to customers form a right expectation of the bank's services*
- *Skills in advising customers how to select and asses various types of retail banking service*
- *Skills in encouraging customers to assist in performing the required service tasks for personal loan service*
- *Language skills in English and/or Mandarin*
- *Clerical skills required for efficient delivery of the service*
- *Knowledge of the procedures for the delivery of the services required by the customer*
- *Understanding of the bank's polices regulating the delivery of the service asked by the customer*

### B). For Customer Loyalty

- *The experience of this transaction will enhance a favorable image of this bank*
- *I can count on the employee taking actions to address my needs*
- *I think I did the right thing when I decided to use this bank's services*
- *I will say positive things about this bank's services to other people*
- *I will recommend this bank to someone who seeks my advice*
- *I will encourage friends and relatives to do business with this bank*
- *I will consider this bank my first choice if I want the same service*
- *I will do more business with this bank in the next two years*
- *I will continue to do business with this bank if the service fee increases somewhat*

# Synergizing Human Excellence through TQM & QC

*Manisha Agarwal  
Rajeshwari Narendran  
M L Sukhadia University Udaipur, India*

## Abstract

We live in a world driven by *excellence* and the *will to excel*. It has been realized by management all over the world that among all resources that we have for producing goods and services i.e. man, machines methods and materials, the most important one is the human resource. No matter how sophisticated the technology or machines one has, until and unless the human element in the organization is given adequate consideration, there would be a limit to what could be achieved by way or results. Human which is the most coveted resource is managed by human which is again a similar resource having vast creative potentialities and capabilities. TQM and QC are such pathways which *create a climate in which every employee discovers, develops and uses his or her capabilities to the fullest extent* by creating a cooperative workplace. Both these concepts is such an exquisite which could develop synergy of belongingness, dedication, motivation, commitment character, high performance and overall excellence in terms of cost quality productivity and human resource.

## Introduction

During the past few decades, many management approaches have emerged, been hailed as panaceas and then faded into oblivion after a very short time. However, Total Quality Management (TQM) outlines all such fads and continues to provide guidance in the new century. Numerous successful companies worldwide have implemented TQM Systems and made this transformation an irreversible, benign process. Those companies are capable of innovating and achieving better performance through quality improvement efforts. In light of the prevailing economic crises and intense competition in global market, the strategic implementation of TQM in improving quality, reducing cost, and delivering goods on time (QCD) as well as in stimulating new product development plays a critical role in strengthening the competitive edge. Currently TQM is considered an important cultural element of business corporations. In other words, TQM is an element of corporate culture, which represents a vision and behavioral patterns shared by all members of an organization.

India is a geographically vast country with diverse cultures, languages and management practices. Although its economy has been liberalized at a slower rate than those of the Asian tigers, yet it has achieved steady growth. In today's difficult economic circumstances, India and China have maintained a continuing if unspectacular economic growth rate; India has achieved nearly total self-sufficiency in all areas of manufacturing and services. Today, India is seen as a manufacturing destination of choice in such areas as textiles, automobile components and computer software because costs are lower and quality levels are comparable to the best worldwide. Currently numerous Indian companies are seen as benchmarks of quality in their respective industries. Even there has been a rapid increase in the number of consultancy firms specializing in TQM applications, along with the number of firms attempting to achieve ISO 9000 certification.

This is all because quality is the most important strategic weapon in the economic revolution overtaking the competitor and become the world-class leaders. To achieve quality TQM is such a pathway, which can nurture this quality component in an organization in a fruitful manner. Though many countries like Japan, U.S.A., Korea, Europe and many developing nations have implemented the concept very successfully and TQM has played a pivotal role in shaping and influencing business success. But after a strategic implementation strategy TQM becomes a regular feature activity of business processes and that is where the system lacks with synergy, enthusiasm and zeal of the concept. It happened in Western countries but still there are certain unfolded aspects associated with TQM making its potentials stronger to be once again revived in an organization.

TQM has evolved itself to be associated more often with statistical tools and process control techniques but in its essential sense TQM has much to do with human resource. Human synergies and potentials can be explored to

a much greater extent under TQM philosophy. May be it is like an old wine in a new bottle but again old is gold so thinking again on TQM with a different angle gives a different and new perspective to sustain this concept. This paper presents two case studies of TQM response in India.

## **Hindustan Zinc Limited (HZL)**

HZL is one of the India's leading zinc- Lead producers with vertical integration in other non-ferrous metals as well. Incorporated in January 1966 HZL operates 4 Lead – Zinc Lead producers with vertical integration in other non ferrous metals as well incorporated in January 1966 HZL operates 4 Lead- Zinc mines with a total Lead zinc ore production of 3.34 million tonnes per annum (tpa) and four smelters with installed capacity of 1,69,000 tpa zinc and 43,000 tpa lead.

### **Focus on Training**

- Covering the top management with 85% executives to develop multi- functional and leadership skills for strategic management and covering the area of attitudinal change.
- For middle management level concentrating on insights and skills of inter- personal relations, working in groups and inter- disciplinary affiliation.
- For junior level management level programs focus on developing appreciation of supervisory role, cost reduction, safety and discipline issues.

### **Training and Development Strategies**

It has been sought to be achieved through a multi pronged, which includes:

- One-year comprehensive and rigorous induction, rotational, on the- job training and foundation course in management.
- Theme based training and development intervention to lift the threshold of skill level of employees to a very significant higher level in areas like productivity, leadership, team building, computer applications and performance counseling.
- Sponsoring to specialized programmes on technical managerial areas to a professional institutions.
- Continuous learning environment (CLE) launched on 15<sup>th</sup> Oct. 2002 emerged as a dynamic model in which 4484 employees at the shop floor have been trained through 155 programs covering almost all areas where learning needs were identified.

## **Quality Oriented Goals**

- Provide products and services at a quality level that meets initial and continuing needs and expectations of customers.
- Achieve leadership in quality and technology; and provide an environment and education in which every person is committed to and activity involved in error- free performance.

### **TQM to Back up Mission and Vision**

The basic elements in HZL of TQM programs are:

- Emphasizing doing things right the first time;
- Contributing to excellence by setting objectives and evaluating actions.
- Corporate Environment and safety & health policy has been implemented.
- Employee participation and development.
- Customer driven quality in product and services.
- Implementing ISO series criteria in daily operations.
- Pursuing quality excellence through continuous process improvement are the prerequisites for TQM culture is adopted.

### **JK Tyre (JKT)**

JK Tyre is the only tyre manufacturer in the country to produce high performance “T” & “H” rated steel radial tyres. Besides Indian, JKT have a worldwide customer base in over 45 countries across all 6 continents. It is the largest manufacturer of truck and bus tyres in India covering 74% of the total tyre business in India. It is operating at a capacity of 166 MT/ day approx.

**Quality Policy:** “We the people of JK Tyre will have an organization committed to quality in everything we do. We will continuously anticipate and understand customer’s requirements, convert these into performance standards for products and services and meet these standards every time. Full customer satisfaction – both internal and external is our Motto”

**Quality Management Systems:** JK tyre has integrated all aspects of operation with ISO 9001. It has QS 9000 in 1998 for multi operations. It has ISO 14001 certification and “E mark” certification for exporting tyres to Europe certification for exporting tyres to European markets.

To meet stringent international standards “INMETRO”(Instituti Nacional De Materiologia- Brazil) certification is with JK tyre.

Consistent total quality culture is fostered through:

- Training of all employees in quality system and trained managers is technique of self-assessment.
- Assessing awareness through self assessment & identifying areas for improvement, reviewing key performance parameters
- Encouraging cross-functional teams, small group activities, performance appraisal, and career planning and job rotation.
- Presentation meetings in presence of top mgt. are organized to appreciate effort and success.
- Involvement with customers and supplier is through: Dealers visit to plant and executives visit to market. Product performance review product meeting and weekly service returned product meeting.
- Various contributions to quality awareness programs and research work in field of tyre technology.

## **Research Design and Methodology**

The present study brought out some of the humanistic aspects related to TQM. The study was conducted between the two aforesaid organizations where the magnitude of change in the people working is tried to be highlighted from this study. The total sample size was 60 divided equally amount both the organizations. The questionnaire was administered on the managerial level of employees of both the organization who supervise, regulate, coordinate and manages TQM activities. Responses throw light on various aspects of improving human excellence implementing the concept of TQM.

### **Humanistic Elements through TQM: The Research Parameters**

TQM as a way of creating the right attitudes among human resources and controls to make the prevention of defectives, possible and optimize customer satisfaction by increased efficiency and business effectiveness. This right attitude needs vigorous training session, which could develop, more motivation and motivation and commitment. As the same time this motivation and commitment character has be to self sustaining so as not to get extinguished in the torrents of opposing forces. This foundation should be shaped voluntarily through self-actualization. TQM is such an exquisite, which could develop behavioral aspects of employees. Some of the aspects, which are taken for the study, are:

- Satisfaction perception
- Cultural change response.
- Product Quality Improvement.
- Improvement in Quality of work life.
- Improved human relations.
- Empowerment of employees.

TQM is such an exquisite acting like an umbrella to protect from sweeping changes and global crisis as well as nurturing an organization with different human behavioral aspects.

## Results

It was found from the first hand information that the implementation and institutionalization of TQM and its different aspects is much properly and progressively handled by JKT as compared to HZL. Definitely TQM apart from productivity, cost effectiveness, quality is able to hit on the heart of human synergy to enhance their 'performance at their best levels.

### Satisfaction Perception

Satisfaction perception is the extend to which the people related to the growth of the organization are satisfied with the organization. This is a vital factor as the organization's growth depends on it. Broadly speaking satisfaction perception is decided by two factors

- Customer satisfaction.
- Employee satisfaction

The overall figures of both HZL and JKT revealed that satisfaction perception is found to be more in JKT with **63.33%** respondents found to be at 4<sup>th</sup> Rank i.e. maximum extent of satisfaction whereas this is **16.67%** in HZL.

TABLE 1: OPINION ON SATISFACTION PERCEPTION AFTER IMPLEMENTING TQM

Rank	HZL (%)	JKT (%)
4	16.67	63.33
3	40.0	23.33
2	36.66	6.67
1	6.67	6.67
<b>Total</b>	<b>100</b>	<b>100</b>

### Cultural Change Response

TQM encourages a change in culture towards satisfaction. Cultural change response can be considered as sum total of values, behaviors and norms of the organization towards healthy working conditions to achieve the required quality. The factors indicative of cultural change include:

- Quality workmanship values.
- Management attitude
- Motivation
- Ability and skill improvement
- Cohesive work force.

In JKT & HZL cultural change response found to be resting on 3<sup>rd</sup> rank i.e. to a certain extent with JKT having **50%** and HZL **46.67%**. The first hand information review positive response for cultural change through TQM but only **30%** respondents from JKT and **13.33%** from HZL found the response to be on 4<sup>th</sup> rank.

TABLE 2: OPINION ON CULTURAL CHANGE RESPONSE AFTER IMPLEMENTING TQM

Rank	HZL (%)	JKT (%)
4	13.33	30.0
3	46.67	50.0
2	20.0	20.0
1	20.0	NIL
<b>Total</b>	<b>100</b>	<b>100</b>

### Product Quality Improvement

This improvement can be perceived from:

- Enhanced reputation.
- Improved reaction to competition.
- Reduced liability risks.
- Smoother new product development.
- Better customer response.

The overall figures of both the organizations i.e. JKT & HZL reveals that in JKT this improvement seems to be more as compared to HZL. **60%** respondents in JKT and **50%** in HZL mentioned about improvement in product quality to a maximum extent i.e. 4<sup>th</sup> rank. Definitely TQM is above to leave its impact on the ultimate services been provided by the organization.

TABLE 3: OPINION ON ACHIEVING PRODUCT QUALITY IMPROVEMENT AFTER IMPLEMENTING TQM

Rank	HZL (%)	JKT (%)
4	50.0	60.0
3	26.67	30.0
2	16.66	10.0
1	6.67	NIL
Total	100	100

### Improvement in Quality of Work-Life (IQWL)

Quality of work life approach assumes the perspective of the individual worker as regards his or her skills, potential and feeling about the job and promotes meaningful recognition for the worker as an individual improved in quality of work life is assessed by:

- Motivational progress.
- Orientation and training programs
- Communication
- Employee responsibility

In JKT **50%** respondents mentioned IQWL to 4<sup>th</sup> rank i.e. to maximum extent whereas in HZL **43.33%** respondents revealed the same. This shows that TQM is leaving its impact on different aspects of employees' performance.

TABLE 4: OPINION ON ACHIEVING IMPROVEMENT IN QUALITY OF WORK LIFE AFTER IMPLEMENTING TQM

Rank	HZL (%)	JKT (%)
4	43.33	50.0
3	26.67	30.0
2	23.33	20.0
1	6.67	NIL
Total	100	100

### Improved Human Relations

Viewing to the humanistic aspect of TQM we can see that the employees relations with other people should have an improvement. This can be spitted in three 'parts which shows relations with:

- Management
- Co- workers
- Social relations.

It is an intangible advantage of TQM. The overall figures revealed that in JKT **36.67%** and in HZL **20%** respondents mentioned improvement in human relations to maximum extent. The figures reveal that TQM is able to improve human relations and build a strong bond of team spirit among the employees.

TABLE 5: OPINION ON ACHIEVING IMPROVED HUMAN RELATIONS AFTER IMPLEMENTING TQM

Rank	HZL (%)	JKT (%)
4	20.00	36.67
3	33.33	40.00
2	30.00	23.33
1	16.67	3.33
Total	100.00	100.00

**Empowerment of Employees**

The best way to ensure involvement of every one in the process is encouraging participation and team work with empowerment of employees. Empowerment provides an attitude of mind based on pride in the job, in the self-ensuring satisfaction and commitment of the employees. Empowerment of employees is done under the frame work of quality circles, quality improvement teams, suggestion schemes to explore their potentials.

The overall figures revealed that in HZL 30% and in JKT 46.67% respondents revealed that empowerment of employees with the implementation of TQM is to a maximum extent i.e. 4<sup>th</sup> rank. It shows that empowerment which is one of the objectives of TQM is successfully accomplished in both the organization with a much higher degree in JKT as compared to HZL.

TABLE 6: OPINION ON EXTENT OF SUCCESS IN EMPOWERING OF EMPLOYEES AT ALL LEVELS AFTER IMPLEMENTING TQM

Rank	HZL (%)	JKT (%)
4	30.00	46.67
3	36.67	26.67
2	26.67	23.33
1	6.66	3.33
Total	100	100

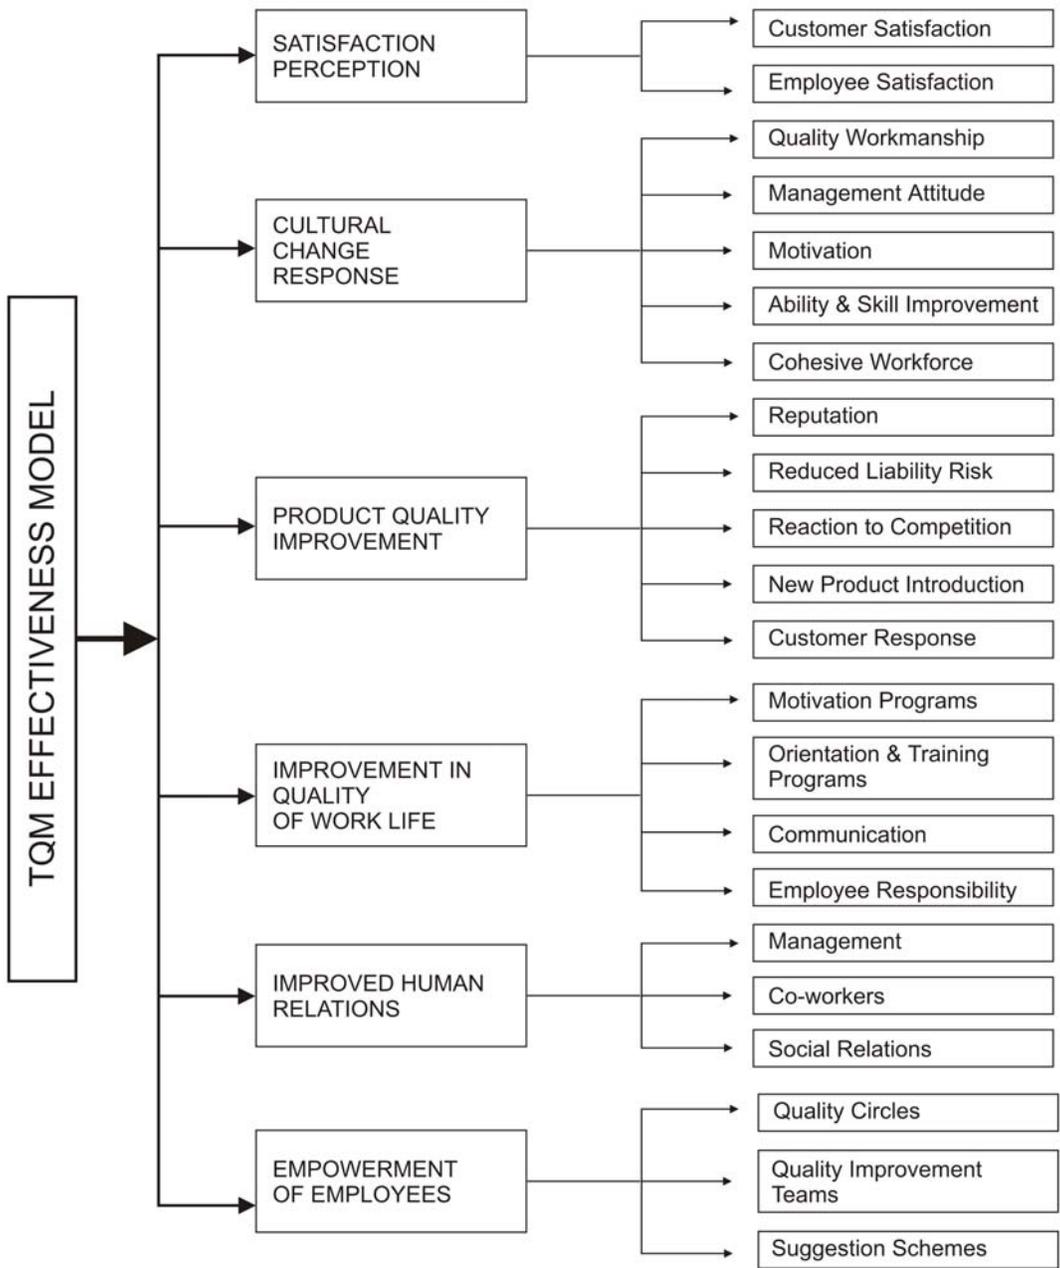

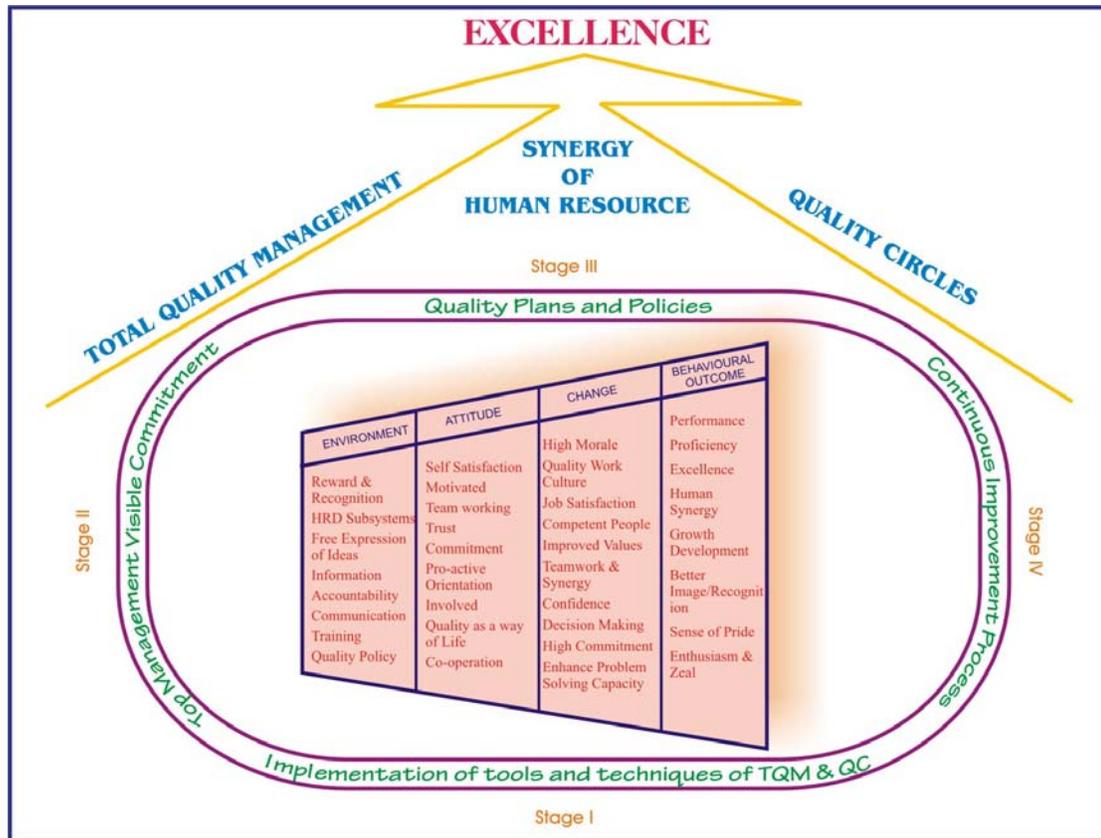

FIG. 1 TQM EFFECTIVENESS MODEL

## Conclusion

Most Asian countries are currently struggling through a traumatic economic scenario. Organizations are concentrating on survival into the 21<sup>st</sup> century. It is clear that only those organizations with the courage and capability to use quality as a competitive tool will succeed. TQM has played a major role in implementing the quality component. It has acted like putting a roof on the house of quality. Fig.2 aptly depicts the model emerged for synergizing human excellence through TQM & QC

## Synergising Human Excellence through TQM & QC

FIG. 2: SYNERGISING HUMAN EXCELLENCE THROUGH TQM & QC

Approaching the humanistic elements through TQM has shown a new face of TQM, which is able to boost new synergy, enthusiasm and zeal among the employees. This is clearly visible in both the organizations selected for the study. This new face of TQM is capable enough to stop questioning on the validity of TQM and recharge the whole system of an organization to once again revive the TQM as one of the major management strategies. This humanistic approach of TQM could give drastic returns in western countries as well as in developing countries like India.

# The Link between Employee Benefits and Motivation – Conceptual Model for Slovakia

*Ivan Kincel*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

Attracting and retaining talent is a key challenge for organizations today. The essence of this challenge makes the understanding of the employee side of psychological contract imperative. Additionally, it aids in developing and sustaining a competitive advantage within the human resource management systems. Two specific areas, where the comprehension of employee desires is critical are benefits and motivation. A successful understanding of the link between employee benefits and motivation leads to individually tailored benefit plans which further result in higher employee satisfaction and retention. It is a general belief of economics that incentives improve effort and performance, but in psychology, their effect is much more controversial. The objective of this article, rather than suggesting a solution to this controversy or providing evidence to support either side of the argument, is to propose framework for a quantitative model to determine the optimal compensation package satisfying the needs of employees.

## Introduction

Today, attracting and preserving talent in organizations is becoming more and more difficult. The challenge of retaining organizational talent makes it imperative that companies understand what employees want from employment relationships. Once obtained, that understanding becomes a key to developing and sustaining a competitive advantage.

One of the most frequent answers to a question ‘why people work’ is ‘money’. However, people work for more than money. When asked, most employees invariably respond that cash compensation does not top the list of what they value the most. While competitive, performance-linked compensation is necessary to keep employees focused and interested, the fact is that for most employees, the value proposition includes a great deal more than just hard cash. Employees consider their employment choice more like investors consider their options. They invest their commitment and talent and thus expect a reasonable return on their investment through the rewards of work: affiliation, meaningful job content and the opportunities for a career, direct and indirect financial rewards. Moreover, they derive value from their affiliation with or simply belonging to their organization; their opportunity to pursue a career; the satisfaction of making an impact through meaningful work that is also recognized and benefit programs that help make them feel secure.

When concentrating on employer preferences in determining desirable components of a benefits package, one can argue that they are affected by a large number of factors. The most obvious and usually adopted by managers is the costs of such a package. Additionally, the second important concern for the employer is the issue of tailoring the benefits package precisely to the needs of the employees. Finding the link between employee desires and employer ability to provide the fulfillment of these desires leads to establishment of a strong psychological contract.

It is a general belief of economics that incentives improve effort and performance, and there is a lot of evidence that they often do (e.g. [3], [5]). Contingent rewards are perceived as ‘positive reinforcements’ for the desired behavior. In psychology, however, their effect is much more controversial. A long-standing paradigm clash has opposed the defenders of the economic view to the ‘dissonance theorists’, who argue that rewards may actually hurt performance, making them ‘negative reinforcements’, especially in the long run (see, e.g. [9] for an account of this debate, and [1] for a comprehensive meta-analysis of experimental results).

The concept of employee benefits as known in Western Europe is a new phenomenon in transition economies of Central and Eastern Europe. The development of ‘new’ compensation systems in this region have been in the last fifteen years more focused on a adaptation of ‘western’ models with a growth in usage of pay-for-performance [10] where seniority matters less than ability to perform along with decline of average age of managers,

and more mobility between jobs ensuring equity and fairness. Furthermore, aspects of performance management have been successfully implemented into the human resource management systems in the region and are frequently used as the key tools to increasing employee motivation [8].

Today, however, the attention should be turned to the employee benefits from the motivational point of view. A successful understanding of the link between employee benefits and motivation leads to individually tailored benefit plans which further results in higher employee satisfaction and retention and thus contributes to identifying the human resource management as the source of competitive advantage. In a tight market for talent that is mobile and short in supply, organizations have to pay close attention to the employee preferences. Otherwise, they lose the talent war. This concept links benefits to individual motivation factors and points to the relationship between employee satisfaction and benefits package being tailored to employee needs. There is no doubt, that pay is an important factor of extrinsic motivation, which, if used incorrectly can undermine intrinsic motivation. On the other hand, even the best use of pay can not motivate employees, because they perceive the salary and benefits as an entitlement, not an incentive [2]. It is in the interest of organization to avoid employee dissatisfaction and offer the compensation package that best reflects the needs of individual employees.

Hence, the objective of this article is to offer a framework for a quantitative model, which would allow employer to determine the optimal compensation package in order to satisfy the needs of employees, thus reducing job dissatisfaction and creating strong basis for acquiring the motivated workforce. It is necessary to remark, that this work does not consider compensation as sole source of neither motivation nor dissatisfaction, but for the purposes of creating the model, compensation was perceived as the only extrinsic form of motivation and the intrinsic forms are avoided. The goal is to pay people well and fairly, much in accordance with [6].

## Model Proposal

Let us assume, that an organization offers a compensation portfolio consisting of a cash compensation  $C$  and a single benefit  $B$ . Suppose  $B$  and  $C$  are both measurable and dividable into indefinitely small fractions. One could object, that having a single benefit in a compensation portfolio is nowhere near reality, but this can be quite quickly avoided by stating that it serves only for the purpose of simplification and is by no means a limitation to generality as  $B$  can be easily expressed as  $n$ -dimensional vector. In that case only slightly more difficulties in the following analysis is to be expected, as it would deal with  $n+1$  and  $n+2$  dimensions instead of 2 and 3 described in the text. The condition concerning divisibility of both variables is not necessary to find the solutions in real cases, it is just helpful in gaining analytical solutions instead of numeric ones.

In order to describe the relationship between compensation and motivation in the most general possible way, there is a need to define an auxiliary variable, which in this text is called utility. The utility  $U$  is to be defined as the perceived value gained by the employee by receiving certain compensation portfolio. From opposite point of view, utility can be described as the amount of performance employee is willing to give away for the compensation provided. This amount, however, does not have to be equal to his actual performance. Just imagine someone willing to work 6 days a week, but he is only required to work 4 days in order to reach the limits for this level of compensation. Of course, he will work only for four days and keep the change. Utility therefore can be described as the maximal possible performance on the given level of compensation. Reaching this maximum is the matter of well-designed pay system in an organization as well as other forms of motivation. In our model, however, only one of the extrinsic factors of motivation, compensation, is dealt with.

The natural thing to do now is trying to find out how to raise the utility by some required amount. Obviously, there is the possibility of increasing the amount of one part of the compensation portfolio until the desired increase in utility occurs. The solution would be raising benefits by some  $\Delta B$  or compensation by  $\Delta C$ . Consequently, while using the combination of both, the solution would be raising the compensation by  $\Delta = \lambda \Delta B + (1 - \lambda) \Delta C$ , where  $\lambda$  is any number from the interval  $0 \leq \lambda \leq 1$ . If drawn, this relationship describes any point on the line segment from point  $A=(0;\Delta C)$  to point  $B=(\Delta B;0)$  (Fig. 1).

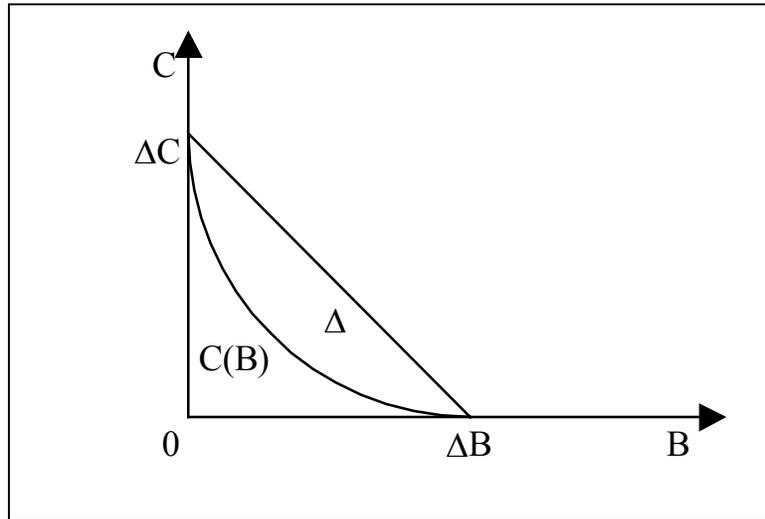

FIG.1.Possible relationships between B and C

This is where the employee preferences step in. It is quite reasonable to suppose that the utility of every unit of cash or benefits added is smaller than the utility of the previous one. Therefore, for the first unit of benefits, the employee would give up more cash than for the second, third etc. Thus, one can easily observe, that the real solution for combining both parts of compensation to achieve desired increase in utility can not be  $\Delta$  as described above. Instead, the result is a smooth curve shaped similarly to the one in Figure 1.

Determining the exact parameters of this curve, which would involve finding a function describing all the possible ways of increasing utility by a desired amount is a task that has to be performed empirically. Probably the best way to collect the data necessary for creating such a function would be changing the compensation in an organization while keeping other variables constant and observing the relationship between these changes and productivity. Unfortunately, this approach seems to be quite impossible to conduct, as the compensation is highly sensitive area in every organization and is unlikely to be used for research purposes. Moreover, it is highly probable that quick changes in compensation, required by this method, violate the condition of keeping other variables constant, as they certainly reduce the perceived fairness of compensation system as well as security feeling of employees.

Another possible way of collecting necessary data is the determination of employee preferences by questionnaires. Though the outlooks of collecting data this way are much brighter, a reliable questionnaire that would truly and faithfully reflect employee preferences in the manner that is useful for constructing our function is still to be created.

From now on, the function describing all the possible combinations of B and C that will cause utility raise by a unit will be referred to as  $C(B)$ , which is amount of cash dependant on the amount of benefits. Of course, it is possible to construct this function as an amount of benefits dependant on the amount of cash, but this is not important, as the decision concerning which of the variables is independent depends only on the free will of the creator and will have no influence on the final result whatsoever.

It seems probable (almost certain) that  $C(B)$  will be defined on the interval  $\langle 0; \Delta B \rangle$ , range of values would be interval  $\langle 0; \Delta C \rangle$  ( $B(C)$  defined on  $\langle 0; \Delta C \rangle$  etc. ). Note, that  $\Delta B$  and  $\Delta C$  are positive values, but do not have to be finite. In extreme cases, it seems probable that no amount of any form of compensation added can reach that extra unit of utility.

Going on with the features of function  $C(B)$ , it is easy to see it is monotonously declining, continuous, smooth (thanks to infinite divisibility of B and C) and convex in every point of the definition range. Despite the hopefully temporary inability to determine the  $C(B)$  function more precisely, it is possible to continue with the analysis. The reason for such an analysis is quite obvious: the precise parameters of  $C(B)$  are dependant on the

individual preferences of every employee and these are undoubtedly related to their current compensation level and their current structure of compensation portfolio. These changes in preferences caused by the current standings in compensation can be once more traced back to the diminishing utility of every unit of any form of compensation added.

Therefore, it seems useful to create a function that would describe the dependence of utility on both parts of compensation: cash and benefits. For this purpose, it would be most useful if such dependence could be obtained in all the points, in other words all the possible combinations of benefits and compensation. This is obviously impossible simply because of the infinite number of such combinations. Even approximation (using finite number of points) can be hardly practical, because the absolute value of utility is hard to obtain, unless it is put equal with productivity. Though the simplifications and assumptions in the model may be tempting, one can argue that this is not acceptable, because it denies other possible forms of motivation influencing productivity. That is why another approach has to be applied.

Suppose there is a possibility to determine an exact expression describing the function  $C(B)$  for one individual employee. Consequently, it is quite easy to create a function describing the same relationship for a group of employees. Whether this will be an aggregate or average of individual functions depends on the will of the analyzer, but average seems more appropriate.

Thus, it is possible to determine, what change in compensation portfolio is needed to increase utility by a unit. If it was possible to do so in more points (described as unique combinations of  $B$  and  $C$ ), certain set of functions would be obtained and this set could be used for approximating the sought for function. It seems very probable, that the required points could be gained by grouping together employees in similar positions, but slightly different pay. Individual  $C(B)$ s of these employees, properly averaged, could serve as  $C(B)$ s of one employee in different points and thus providing the means to create the function describing the dependence of utility on cash and benefits.

However, this newly acquired function would only describe how much it takes in order to get from one level of utility to another. What it lacks is some absolute reference, therefore it is impossible to express utility in absolute numbers. The solution to this is considerably easy: reference point has to be set. There are two main possibilities for doing this. First one, more practical, is to consider the utility of the lowest-paid employee in the group to be zero. The other possibility is quite reasonable assumption, that the only point in which  $U=0$  is when  $B=C=0$ . Following this assumption, it is necessary to find the  $C(B)$  function in this point.

Choice of the reference point is completely on the free will of the analyzer, but let it be reminded, that it is absolutely necessary in order to gain the desired function and the possibilities mentioned here are just two of the most obvious.

The function, describing the dependence of utility on both cash and benefits (marked  $U(B;C)$ ) will probably have following features: defined on  $\langle 0;\infty \rangle \times \langle 0;\infty \rangle$ , monotonously inclining in all directions on the whole definition range, converges to a finite value for  $B \rightarrow \infty$  and all  $C$  as well as for  $C \rightarrow \infty$  and all  $B$  (Fig. 2).

## **Cost Effectiveness**

The analysis of employee preferences is finished. However, it can not be satisfactory for an organization. The problem is, if one tries to maximize utility according to the model outlined above, one would come to conclusion that it is, according to the features of the described function  $U(B;C)$  necessary to offer infinite amount of cash as well as infinite amount of benefits. These costs, letting aside absolute financial impossibility, can be by no means covered by the returns offered by the employee. This calls for the determination of effectiveness. The basic question is: what structure of the compensation portfolio is the most effective one?

The first step is to determine the costs paid by the organization. This should be relatively easy, as every company has a precise idea of how much it pays for every form of employee compensation. When the costs are determined, one of the following approach can be chosen:

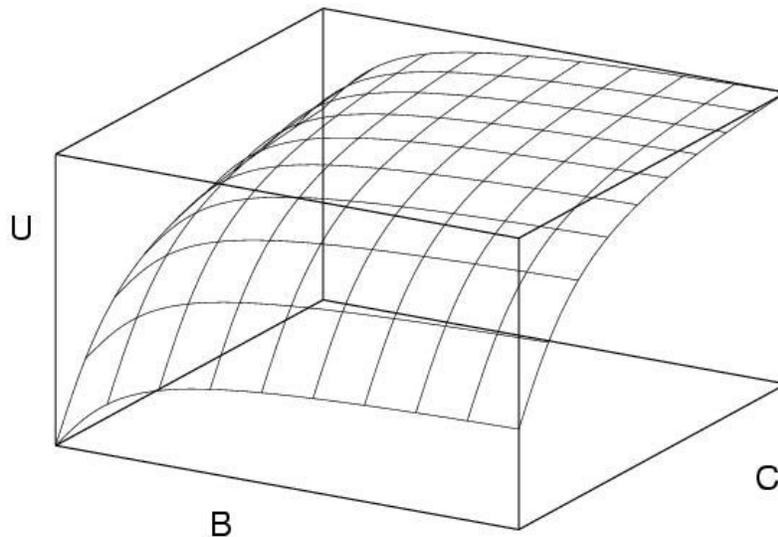

FIG. 2: A POSSIBLE SHAPE OF  $U(B;C)$

1. Determine the level of utility desired and find the combination of cash and benefits that is on the desired level and at has the requires possible costs. The advantage of this method is, that there is practically no need to find the  $U(B;C)$  function, because everything needed is obtainable from the reference point set at current compensation portfolio and  $C(B)$ . The disadvantage is, that utility is considered a priori measurable, what inevitably leads to the assumption, that the employee is motivated only by compensation.
2. Determine the maximum affordable costs of compensation and find the maximal utility for this amount of costs. The disadvantage here is that it is slightly more laborious, but the assumption of “utility equals motivation equals productivity” is lost. Utility in this case is really what it should be: an auxiliary variable describing one of the motivation factors.

There is a third possible approach: to add B and C until the costs of the last unit added are lower or equal to the return of the last unit of work, the employee is willing to give. This approach is even more difficult and meets the same problem as the first one: the necessity to accept compensation as the only form of motivation. These are the reasons to consider this approach acceptable but unsuitable.

### Limitations and Further Research

It is necessary to admit some limitations of the proposed method. The first objection is usually “averaging” people. This approach is based on the belief that similar people have similar needs and is used as a tool of simplification. It is possible to avoid this problem and create the needed relations individually. However, this approach seems so labor and time demanding, that the slight change in results can not justify this waste.

Another possible objection is relating motivation to productivity too much without the concern for quality. This is true, but it is hardly possible to expect a discussion on quality from a quantitative model. And quality is very much influenced by intrinsic motivation, which is completely out of the scope of this study. Probably the most important limitation of presented model is that it is static. It describes only one moment in time. A dynamic model,

describing the changes in compensation costs as well as employee preferences in time would be surely more interesting and more truthful. Logically, that is the way to go in further research. First, introduce a practical application of the presented model, then broaden the model to more dimensions by adding more benefits and finally (if it shows possible and soundly difficult) create a dynamic model describing the maximization of compensation portfolio effectiveness.

## Conclusion

In this article a framework model for the optimization of compensation portfolio was introduced. As it is vital to tailor the compensation to employees needs to reduce pay dissatisfaction and at the same time to keep the costs of compensation as low as possible in order to ensure profitability of an organization, these two conditions often seem contradictory. The presented model offers quite simple and not very laborious, while still satisfyingly exact method to deliver good results. It is the author's belief that fast and useful results are needed mainly in the area of Central and Eastern Europe. The main reason is that the concept of employee benefits is still relatively new to this area. Benefits did not evolve here in time as in western countries, but were brought in by the investors from the West. These investors (logically) brought their compensation systems with them. This does not mean they can not be functional, but still one can assume that employee preferences change from country to country, depending on (if nothing else) dimensions of national culture defined by Hofstede [4]. Moreover, Hofstede's dimensions have not been thoroughly examined in the whole area of Central and Eastern Europe, especially Slovakia (for an account on this, see [7]). It is not possible, however, to derive the employee preferences in compensation area directly from these dimensions. Therefore it seems necessary to identify these preferences directly and evolve (or modify) the compensation systems accordingly.

The presented model does not serve itself as an ultimate tool to ensure effectiveness of the compensation portfolio or employee satisfaction, it forms a basis for further examination. There is a need to conduct a more specific research in employee preferences as well as actual practices of organizations in the area of Central and Eastern Europe.

# Trust as the Key Value of Successful Russian Business Leaders

*Bella Butler*

*Curtin University of Technology, Australia*

## Abstract

Russia is playing a significant role in world business therefore Western managers need sound knowledge of Russian organisational behaviour for effective communication with their Russian counterparts in international joint projects. This paper examines trust as the key factor of success among Russian business leaders. In Russia, a level of trust is so low that it was identified as the second largest threat to Russian organisations, after poor succession management. This study confirms the emergence of trust among Russian business leaders who recognise its crucial importance for the effectiveness of their business. This research presents five Russian managers from Yekaterinburg - the strategic centre of the Ural region of Russia- in the form of case studies, aimed at helping potential Western partners and shareholders extend their understanding of the leadership style, organisational practices and expectations of a broad cross-section of Russian business people.

## Introduction

Researchers who examining building partnership with foreign companies and international joint ventures (Inkpen & Beamish, 1997; Arino & de la Torre, 1998; Chatterjee, 1998, Dasgupta, 2000, Currall & Inkpen, 2002) have argued that mutual trust is crucial for successful international alliances. Dasgupta suggests that “trust is important because its presence or absence can have a bearing on what we choose to do, and in many cases what we can do” (Dasgupta, 2000: 330). Business transactions are influenced by “the atmosphere of trust in which they occur. Trusting that the other person will honor their side of the trade is fundamental to encouraging particular trades and economic activities in general” (Pollitt, 2002: 120). According to Chatterjee (1998), “successful business depends on relationships and trust rather than on contract.” As Currall and Inkpen (2002) noted, building trust is a particularly challenging task to achieve in international joint ventures because the normal risk and uncertainty involved in domestic joint ventures are strengthened there by cross-national differences between partner firms.

Western investors considering business engagement opportunities in Russia face different cultural environments and, therefore, need knowledge of institutional, managerial and contextual nuances, which include the managerial values of Russian business leaders. Furthermore, “the identification by Westerners of salient management values and attitudes helps predict and increase shareholder value when dealing with Russian organisations. An understanding of cross-cultural differences and corollary institutional configurations contributes to the increased success of those doing business in Russia and/or with Russians, and by extension those doing business with many of the former Soviet-bloc countries in Eastern Europe”. (Kets de Vries, Shekshnia, Korotov, & Florent-Treacy, 2004, p.640). This paper examines trust, as the key value of successful Russian business leaders.

The current level of trust in Russia is very low. As Russian sociologists (Afanassiev, 2002) have stated, a post-Soviet person does not bear the traditional communal mentality or socialists collectivism. Generally, he [post-Soviet person] is an individualist who counts on himself and people of his closest circle. According to Fukiyama (1996), the situation with trust in Russia is catastrophic. No one trusts anybody. This is aligned with the results of a study conducted by Kets de Vries, Shekshnia, Korotov, & Florent-Treacy (2004, p.648): “distrust is the second largest threat (after poor succession management) to Russian organisations”.

The reasons of such low trust include weakness of post-Soviet state institutions (Afanassiev, 2002, Gudkov & Dubin, 2002) and lawlessness of Post-Soviet time (Butler & Purchase, 2004). People cannot be sure that the law and the state would protect them. This forces them to form close personal ties and rely on trusting relationships – a phenomenon that has been found in other countries such as China and Italy (Fukyama 1996, Hamilton 1996).

Trust is one of the three elements of the Putman’s definition of social capital: “features of social organisations, such as trust, norms and networks that can improve the efficiency of society by facilitating

coordinated actions (Putman, 1993: 167). The last task – facilitating coordinated actions - has been vitally important to Russia in the period of transformation. Thus, researching trust can contribute into developing the concept of social capital in the Russian business context.

### **The Study**

This research built on the previous studies of Russian national culture (Afanassiev, 2001; Husted & Michailova, 2002, Gudkov & Dubin, 2002, Butler & Purchase, 2004); the factual data collected in Russia no longer than a half a year ago, and drew on the personal experience of the author who is Russian. In forming the factual data 18 face-to-face open-ended interviews with Russian managers from diverse cultural backgrounds were conducted, manager's behaviour was observed, several focus groups with Russian managers was conducted to get their consultations and feedback on the preliminary study's results. From the interviews and focus groups "sound" portrayal came out, that led to a multisided and detailed study of the outcomes of trust in the Russian business context.

In the academic and professional literature of the early 1990s, or published in the late 1990s – early 2000s and reflected the studies on Russian national business culture, there are many assumptions that all the newly rich Russians made their wealth by either "exploiting the mistakes of the Government" (Stiglitz, 2001), by getting assets from the former socialist's stage, via quick privatisation or via corruption. These perceptions are common, but in most of the cases they are inaccurate. This study proves the existence of new Russian business leaders whose success has resulted from their own efforts and who are guided by more than just political connections. The new Russians have designed "organisational systems and structures that draw on Western (or Asian) best practices yet remain uniquely Russian." (Kets de Vries, Shekshnia, Korotov, & Florent-Treacy, 2004, p.639).

Russian Business class is highly heterogeneous. There are many differences among Russian business people in terms of their ethnicity, age, education, professional training and experience, origin of their wealth, leaderships' style, the size and power of their companies. This study presents five Russian managers from Yekaterinburg - the strategic centre of the Ural region of Russia- in the form of case studies which are aimed at helping potential Western partners and shareholders to go beyond received biases to fully understand the leadership style, organisational practices and expectations of diverse business people.

### **Case Studies: A Profile of Diversity**

In designing this research, the choice was made to show the diversity and scope of the emergence of a new wave of young generation Russian business leaders and their attitude towards trust. Transformation of the Russian economy caused the birth of new industries which previously did not exist, such as information technologies and cellular phones, or were totally owned by the State such as banking or transport. The further establishment and development of these new industries would not be possible without new business leaders.

The group of Russian Business leaders, examined in this study, is very heterogeneous and unpredictable. This article provides a profile of business leaders of similar age group but the way in which they entered the business has different features. The five leaders have different professional expertise and experience. Some of them - Maxim Grokhulskiy, Oleg Bannykh, and Alexander Korjev - own their companies, others – Olga Zotova and Denis Michailov work at senior positions in well established large private companies. Two of our leaders – Maxim Grokhulskiy and Oleg Bannykh have closely followed their university specialisation, others had to find other areas of expertise and get another type of formal education. Four of leaders have an engineering degree. Many undergraduates in Communist Russia chose an engineering profession because this profession guaranteed them a stable income and a respected job. Not to mention, the fact that Russia has had an advanced education in the technical area. In the market economy, demand for engineering profession has declined due to the industrial production's fall. Many engineers had to retrain and to get an expertise in other areas, such as Olga Zotova.

Three out of the leaders in the study own their companies and established these companies using their own savings, from scratch. This fact sharply distinguishes them from the entrepreneurs of the first wave who were granted their wealth by the state. Two out of the leaders – Maxim Grokhulskiy and Alexander Korjev- have fluent English and the experience of working abroad, however they see their future in Russia. All the leaders are very enthusiastic about their job and count on the people who work with them. They all can be called self-made people for their energy, the ability to start a new enterprise from "scratch" and the high level of trust which they have built within their circle of communication.

### **Olga Zotova, “Ural Treasures Bank”, JSC**

Olga completed her first university degree in building engineering and worked six years as an engineer- builder managing industrial projects. She refers to that time as a “great experience” and to her colleagues as “a wonderful team of soul mates”. In the early 1990s when the new Russian regime cut off all investment in industrial development, she, as well as other professionals at that time, lost their job.

In 1993 her new career started in a new structure of an emerging field of commercial banks - the Ural Treasures Bank. This operator job was found via her acquaintances from students’ network, some of whom worked in this bank. At that time, Olga knew nothing about accounting and therefore went to study it in the machine building college. After this study was completed, Olga got her first promotion to a senior manager position in the VIP room.

This was followed by her study by correspondence in the Russian Financial Academy (Plekhanov’s Academy). Olga stressed that “all senior managers of the bank studied there (in the Plekhanov’s Academy) in recent years”.

There were a number of other positions to which Olga was promoted before she took her current position of head of the division of bank products development. Recently, Olga completed her postgraduate study in the President Program (the program founded in 1998 to increase market competence of young leading specialists and managers of public and private enterprises). Olga is in her middle 30s.

Olga emphasised the importance of having “a strong backbone in their bank which has worked together for ten years” (Zotova, 2004). “This means that we are not afraid of any crises at the moment. We will resist to the end. We have experienced together so many shakes to our stability; we survived the financial crisis of 1998. We went together through serious shocks and crises and many new people joined the bank. The best personal available for banking in the Ural region joined the bank. This means something.” Olga explained that they do not have a command style of management in the bank. There are many opportunities for people to grow and develop their career by opening new branches or divisions. “We are constantly learning through various courses for banking specialists, the President program etc”

Olga pointed out that good relationships with external parties such as the bank’s partners, built on mutual trust, “can work as a good deal”. The positive image of the bank leader also contributes to business success: “Everyone knows that he (the bank’s general manager) works here and even if he does nothing, it (his good image) would be useful”. Olga explained that if the bank’s manager has a good image, this increases a level of trust to the bank from potential as well as existing clients, and thus, makes stronger its competitive position.

### **Maxim Grokhulskiy, Software Mastering, LTD**

Maxim holds a computer science university degree. He worked as a high school teacher, running programming classes, before signing a contract with a company in the USA for a few years. As his contract expired and Maxim came back to Russia, he called his friends and “like-minded people” and offered to organise a new company with the focus – provision programmes of information management systems. Maxim and his friends did not have much capital at that stage, neither had they support from elsewhere. The company was established on the private savings of Maxim and his close friends. Maxim recently completed his postgraduate study in the President Program. He is 31 years old.

Maxim noted that for the company’s success it was very important from the beginning for people to believe in their ability to succeed. Another key issue is proactive cooperation with the company’s partners. As Maxim said, its company tries to do joint projects if these projects are too large to be undertaken by the company on its own. Maxim can trust the partners because, as he explained, “Yekaterinburg is a relatively small city in terms of computer technologies and I know personally those who work in this field. I have dealt with computer technologies since their appearance. I am 31 years old now and I started when I was 19. There is a very small circle of people with such experience in this field.” (Grokhulskiy, 2004) Such a close circle of communication makes it easier to obtain useful information. For example, one source of information is the specialists in computer technology. As Maxim explained, “those are people who work in companies – users of programming services – such as factories, industrial enterprises and other companies... Those informal relationships are more open than some formal relationships. We receive important information from the experience of those people.” Such constant communication with professionals from

close circle of communication helps Maxim to be always aware of the needs of potential customers and the coming trends of the market of computer technologies.

Maxim stressed that his firm significantly values the security of their customers. The company struggles to do everything legally. For example, recently the company registered their trade signs and other intellectual property. This was the matter of “doing legal things.” As Maxim explained, “the whole [economic] situation has changed in Russia. And now it is crucial to present to the customer that we are serious and we are not going to close down. We want to show our customer that our technologies are long-term oriented.”

Last but not least, the important issue that contributes to the company’s success is having a strong team of talented people. As Maxim noted, “Program development involves close interaction among people. Firstly, they need to find a solution. Anybody who comes up with a possible solution must prove it to other people that it works. At the same time, they should be able to listen to the critique of other people, even if it is not very constructive. Thirdly, they should be able to look critically at their own solution. Finally, when the decision is made, they have to perform it.” Maxim admitted that they have some difficulties working in the team environment. One talented programmer did not fit in the team therefore they had to sack him and still did not find a replacement. Maxim suggests that to work as a team, “one has to be able to communicate with people and help them and not be ashamed to ask for help. People should complement each other. Everyone needs to put effort into the team – both emotionally and psychologically. If people can put those efforts, then the team is united and people there can rely on each other.”

**Denis Michailov, Ural Tel**

Denis is an electronic engineer. He has an extensive experience in FSB in the field of electronic crime. In the late 1990s Denis’s expertise was required by a new company of another emerging industry in Russia – cellular phones. From that time, Denis has been a manager of informational security of Ural Tel, a region’s leading cellular phone company, providing the GSM standard connection. He completed his postgraduate (Russian equivalent of Western Master) study in Management in the late 1990s. He is in his early 30s.

Denis stressed that for the company’s success, the experience and the personality of its director played crucial role. The company’s director had previously managed the telephone division of the government’s company and therefore had necessary knowledge of the work and had been known in the industry. The company managed to win a tender conducted by the government institution, responsible for distribution of the frequency plan as a result of these factors. The government officials knew that they could trust this person [the company’s director] and his team.

The cellular phone industry is one of the fast growing in Russia yet it is a very competitive. The issue of constantly monitoring competitors is a very serious concern. Denis explained that getting the right information about competitors and customers determines the company’s security. To a large extent, old trustful connections or so called “smoking room effect” (Michailov, 2004) help to obtain the right information: “It is the Russian mentality. If you have a good, positive relationship you can obtain certain information without much effort. It is a postulate of officers of the criminal investigation department. So it is important to establish informal relationships. Some questions could be of a sensitive character, or they should be kept as a secret. Certainly, there are limits. There are certain rules [in informal information exchange] that should not be forgotten.” (Michailov, 2004). Answering the question regarding the accepted level of the information to “give away”, Denis said: “Frameworks are initially predetermined by the amount of damage that any of the parties could bring”. He emphasised that the principle “do not hurt” is used extensively when professionals exchange their information informally. A professional always knows that he or she can trust those to whom he or she is passing important information. Thus, trust helps to ensure the security of informal information exchange.

**Oleg Bannykh, Lex- Information Technologies.**

Oleg is an electronic engineer. He was a pioneer of promoting Automatic Systems of Management in the early 1990s. Oleg gained his first professional experience in a former state enterprise and soon established his own company from scratch, using his own savings. Recently, his company merged with the company of a former partner. Together, they have become a strong player in the rapidly growing information technology market in Ural. Oleg holds a postgraduate degree (Russian equivalent of Western Master) in Management. He is 37 years old.

The recent merger of two companies which have had partner relationships for many years clearly shows that partners trust each other enough to work as one company. Answering questions about the reason of their merger, Oleg and his partner noted that economic reasons are secondary. “We are united by one goal. We are

interested in what we are doing. In our company, we do not have a clear leader; everyone works on one common goal. No one feels like a small screw, everyone feels like a pavement” (Bannykh, 2004) Oleg emphasised the importance of trust in business, not only within a company but also at the interfirm level. “We are now working with Expert Ural [the regional edition of the National journal for Russian business elite] on the issue of self-organisation of middle business in the Ural community. This organisation should undertake strategic development of the Ural region. Why? Our government officials did not do this. [There is The Committee for Economic Development of the Ural region within the Government of the Sverdlovsk region]. Large corporations do not think in regional terms, they are spread all over Russia. Small companies have grown to be middle sized companies and feel responsible for the regional development.” Oleg continues with idea of consolidation of the middle businesses of the Ural region by stressing out the importance of interpersonal trust. He believes that interfirm trust can be achieved via interpersonal trust of the companies’ leaders. “When 50 leaders get together and trust each other, they do need to check each other’s calculations [price structure]. If you say that you cannot sell it cheaper, then your word is enough for us.” Oleg thinks that trust can be built only via informal communication and not via formal such as publishing an annual report officially. “Even if a company publishes their annual report, they can hide certain things and associated costs... They may state that this bank will be stronger than another one in five years, but people [the general public] will not believe such a statement. Today we need to increase trust in each other and it may be possible at a personal level via informal communication only”

**Alexander Korjev, Yekaterinburg Travel, LTD.**

Alexander has very extensive business experience. At the end of the 1980s during Gorbachev’s perestroika, Alexander had a cooperative – an organisational form promoted by the state of that time. His cooperative dealt with a scarcity of popular music providing semi-legally taped audio and video tapes of popular groups and singers. After a serious limitation of this business by a number of laws, Alexander worked as a private tutor in English and German before he went to visit his friend in Brazil. After various jobs there, Alexander returned to Russia and worked as an English/Russian interpreter. When his friend asked him to help with the translation of her personal correspondence to her American fiancé and later with his reception in Yekaterinburg, Alexander discovered his market niche – hospitality services for foreign guests of the Ural capital. A little later a comprehensive website with all the information for potential foreign guests of Yekaterinburg was created. Currently Alexander is the director of his company. He is in his early 30s.

According to Alexander, the Russian business is developing so rapidly that businessmen have to constantly learn on their way. “We were growing up during perestroika. The situation in Russia has changed several times since those times. We had to adapt to all these changes.” (Korjev, 2004). The most important issues that arise nowadays are honesty and decency. As Alexander noted, “It is difficult to get into business working privately and not fooling people...On the other hand, good image, publicity and trust can bring us new customers. The person who needs our services will not go to another company because he knows and trusts us.” Alexander emphasised this aspect of trust as a factor in attracting new customers is especially important for small and medium size companies who, as opposite to large travel agencies, cannot afford an extensive advertising.

**Finding Common Ground**

Despite the obvious heterogeneity of background among the examined Russian business leaders they have similar qualities and attitudes to business people everywhere in the world: they are struggling to succeed, they are concerned about security of their respective jobs, partners, customers and the community; they are future-oriented. Furthermore, Russian business leaders can be differentiated from businessmen in other parts of the world in the specific Russian mentality which affects their managerial style. These Russian businessmen did not get their wealth from the previous regime or through mafia connections. Success of the examined leaders was determined by their optimism, the ability to adapt their talents to the continuously changing environment, by emerging trust both within their companies and in the interfirm communication.

All examined managers admitted that the current level of trust in Russia is very low. Although building trust is a very challenging task, all examined managers expressed a high degree of recognition of the importance of trust as the key success factor of their businesses. In this study, examination of the case studies of Russian business leaders led to the formulation the following outcomes for the company’s success which can be achieved by having trusting relationships.

### *The outcomes for the company's success which can be achieved via trust*

#### **Outcome 1: Effective Team Cooperation**

For company stability and development, it is crucial to have a team of like-minded people who trust and support each other despite any negative influences from the business environment. The transformation processes in Russia have thrown serious challenges to the business class and only those who have formed strong relationships with colleagues, partners and customers, who have long-term oriented goals, manage to survive and become successful.

#### **Outcome 2: Effective Interfirm Cooperation and Regional Management**

Trust among business leaders at a personal level makes their communication easier and more effective, yet it helps to solve the regional problems and enhance regional development. The leaders feel responsible not just for the progress of their own companies. They realise that their future is inseparable from the future of the territories in which they live and work.

The desire of middle sized companies' managers to influence regional development via interfirm networks confirms the increased independence of Russian people from the weak governmental institutions in solving their problems. According to Russian sociologists, since the end of 1990s, most Russians have been convinced that the best way to succeed in life is to use one's personal connections (Afanassiev, 2002). In the 1990s, the number of respondents oriented on personal connections increased from 74% to 84%. Another study (Gudkov & Dubin, 2001) found out that 29% of Russians used personal connections with the state officials or with professionals, connected to state institutions that use these competencies for personal gains. This number is three times higher than the number of people who applied for help from state institutions. This statistic shows that Russians do not rely on the state in creating their wealth and value personal relationships and trust for their success.

#### **Outcome 3: Strong Customer Base**

The positive image of the company's leaders and earned trust of existing customers and the general public significantly contribute to the attraction of new customers and work more effectively than the advertising. The general public and potential customers do not believe in advertising due to a low level of trust. They do believe, however, in individuals and organisations that live up their promises by their actions.

#### **Outcome 4: Effective Information Exchange**

Information exchange and knowledge sharing have always been difficult due to the national mentality ("The less one knows, the better he sleeps" as a folk saying reveals), mistrust and misinterpretation of received information, and knowledge hoarding (Husted & Michailova, 2002) in Russia. People are more confident to share information with someone they can trust; therefore trust can significantly improve information exchange and overall effectiveness of operations at a firm as well as at an interfirm level.

#### **Outcome 5: Long-term Security for Firms, their Partners and Customers**

Companies' stability and the orientation on future require long-term relationships with their customers, partners and the general public. It is very important to prove to these parties that the company will not be closed down and will be there for those who are engaged in business with it. Trust can enable companies to plan ahead and, therefore, be more flexible and creative.

#### **Future Research - Incomes of the Process of Trust**

Considering the complex business environment, knowledge hoarding and mistrust, Russian managers and entrepreneurs are not very enthusiastic in participate in business research projects. They are resistant to give away specific information and examples about their companies, partners or customers. The cases presented in this paper are the results of collaboration between examined business leaders and the author of this paper. These cases can encourage other Russian business leaders to cooperate with both Russian and foreign business researchers.

In the recent years, Russia has become a significant participant in the world economy. Despite this, Westerners have not much knowledge about Russian business people and their organisational behaviour. Given the importance of understanding the managerial values of Russian business people which include the emergence of trust as a process, the next research issue should be studying the inputs of this process.

In their study on trust in international joint venture relationships Boersma, Buckley and Ghauri (2002) stated that "the emergence of trust is a process. Every process has inputs and outputs". This paper outlined the outcomes of trust for business success. The incomes of the emergence of trust should be the focus of following studies. It is important to recognise the sources of trust in Russia and answer the following questions: How do

Russian business people build their relationships with their partners? How can people be sure who they can trust and for how long? How do people keep and secure their relationships? How can Western managers build trusting relationships with Russians? Can Westerners and Russians trust each other?

Last but not least, researching trust as one of the elements of social capital can help to clarify the issues: How can business increase social capital? How can society increase the amount of social capital?

# **Workplace Counselling Downunder: Caring HRM or A Licence to Print Money?**

*Robert-Leigh Compton  
Australian Catholic University National, Australia*

## **Abstract**

**Several Australian studies have highlighted to exponential development of workplace counselling programs in Australia. An explanation of this development is provided along with survey results taken across a large number of organisations across Australia. The paper concludes that such programs may well claim great success but there is a serious lack of program evaluation to support these claims.**

## **Introduction**

A quick perusal of current HRM texts indicates that the subject of workplace counselling tends largely to be ignored by most authors. Indeed, employees are counselled from the day they join an organisation to the day they leave yet most of this counselling is informal. In the past there has often been no logical or structured policy and strategy in place, let alone a consistent approach to counselling issues. Up until ten years ago most small- to medium-sized Australian organisations had no formal counselling programs in place. However, the 1990s and onwards have seen an exponential increase in the establishment of such programs with some 80 of our top 100 organisations now having a formal, outsourced workplace counselling program in place.

## **What is Workplace Counselling?**

In counselling, a relationship is established where one person endeavours to help another to understand and to resolve a problem, whether it be work-related or personal. It must be a confidential and professional service provided as an employee benefit which complements and extends in-house resources in the constructive and supportive management of people impacted by concerns in their personal and work lives. (Meganahan, 1989).

These definitions immediately raise the issue as to the role of team leaders and HRM professionals in the counselling process. Employee counselling must always focus on work performance. Personal issues that are not affecting the employee's output are not the business of business and managers need to understand this critical aspect. The exception to this principle is where the employee seeks the assistance of the team leader or HR manager. Thus, the viewpoint adopted in this article is that personal problems not affecting work performance are not the business of the organisation. Only where performance is in some way affected should the supervisor intervene. (Compton, 2004)

## **Who is the Problem Employee?**

While many authors talk of the 'problem employee', it should be made clear that this terminology seems to imply that an employee's private troubles invariably will somehow be the business of employers. In times when diversity management literature uses terms such as 'hearing-impaired', 'intellectually impaired', and 'physically impaired', it seems appropriate to talk of the 'work-performance-impaired' employee. The sole aim of the employer in this situation is to bring a worker's performance back to an acceptable standard. (Nankervis et al., 2005) The emphasis of any remedial strategy must be on work performance and nothing else.

The simple solution might be to discharge the worker, but this approach may not be appropriate for a number of reasons, the most compelling being that the employee may be worth saving! The 'problem' employee may well be a key member of the management team.

In a recent interview with a group of professional, external counsellors I asked that they provide a summary of their caseload over a typical four-week period. The reasons for referral covered the following broad areas:

- financial                      grief                                      gambling
- bulimia                        self mutilation                      post-traumatic stress
- anorexia                      workload issues                      cross-dressing
- substance abuse              suicidal tendencies                      pre-hospitalisation
- self-image                    terminal illness                      workplace stress
- outplacement                organisational change                      workplace bullying

It should be obvious to managers that any attempt to provide counselling for most of these issues will be well beyond their level of competence. They will often cause far more problems than they resolve.

## **The Emergence of Employee Assistance Programs (EAPs)**

Many Australian organisations have established Employee Assistance Programs (EAPs) to provide free professional, confidential counselling to their employees and their families. Examples are the multinationals DuPont and 3M, large Australian companies such as Lendlease and Qantas, retailers Coles-Myer and Woolworths, the emergency services, hospitals and local government instrumentalities, several banks including NAB, through to organisations as diverse as Greenpeace and NIDA. In 1999, IPS – Employee Assistance Global, one of Australia's largest providers of EAPs, established an EAP for the Sydney Olympics to cover both fulltime staff together with the 5000 volunteers involved. Australia's other largest supplier of counselling programs, Davidson-Trahaire CorpPsych, has similar programs in place and between the two companies some 80 of the top BRW 100 companies now have a structured, outsourced program in place.

The growth of EAPs has been quite remarkable. The first documented program was set up by Macey's in 1917. (Porteous, 1997). In 1973, there were 500 programs in North America, by 1977 there were 2400, and by 1980 there were 4400 programs. By 2000, 80 per cent of the Fortune 500 companies had established EAPs. (Alker & McHugh, 2000)

In the United Kingdom the uptake of EAPs has been far more modest. Although 94% of companies report concern in the area of employee assistance, only 12% have active programs in place. Alker & McHugh, 2000)

In Australia, the history of EAPs is by comparison, quite short. As in the US, early Australian programs focused on alcohol and other drug problems. However, programs in Australia are different from those in the US.

In 1976, the Alcohol and Drug Foundation of Australia convened the National Alcohol and Drug Dependence Industry Committee (NADDIC), which was made up of senior representatives of the Australian Council of Trade Unions, the Confederation of Australian Industry, the Alcohol and Drug Foundation of Australia and the federal government. Because management and labour agreed jointly to combat the problems of alcohol and drug dependence in industry, funds were obtained from the federal government to commence coordinated programming. This national committee was mirrored at state level with management/union committees formed in every state and territory.

Programs commenced in earnest in February 1977, when the federal government made funding available for fulltime industry program coordinators (IPCs) and support staff to promote and develop industrial alcoholism programs. Unfortunately, in the first instance, Australia went the way of the US and tried to implement occupational drug and alcohol programs. This approach saw many organisations in Australia establish policies and procedures, but very few providing comprehensive services.

Not surprisingly, again this approach was unsuccessful. The lessons that had been learnt in the US during the 1950s and 1960s hit home hard by 1980. At this time, all the Australian players decided to change course and a new Australian EAP approach was adopted throughout Australia by 1984.

Since that time the growth in EAPs in Australia has been quite rapid. In 1984 IPS reported only a handful of EAPs in operation in Australia – NSW State Rail and BHP being the most notable. By 1990 there were approximately 500 programs, whereas in 2000 there were some 3000 programs conducted across the country. (Nankervis et al., 2005)

To some, EAPs can represent a ‘big brother’ meddling in employees’ private lives. (Vickers and Kouzman, 1999) To others, they are yet another management fad and a waste of time. A more positive approach is adopted by IPS, which sees an EAP as an effective strategy for assisting employees when personal or work-related problems are affecting their work. The programs are characterised by effective, early and minimum intervention. They offer a broad-brush policies and strategies and aim at resolving problems such as those listed above.

An effective EAP has to be more than policies and procedures; action must be taken to implement these plans. The second point that needs to be made is that EAPs cater for problems other than those affecting job performance. A person may self-refer to receive assistance with a personal problem that is not causing any deterioration in work performance.

It is important to note that the modern EAP aims at a wide range of problems. This approach varies from earlier approaches in the US, the UK and Australia where the emphasis was placed solely on alcohol-related, and later drug-related, problems. The modern EAP has resulted from the failure of earlier drug and alcohol programs. During the 1980s and 90s, there was a wide development of this EAP model. It offered a broader approach to problems, such as financial difficulties, emotional, marital and legal problems. The acceptance by employees and management was exceptional. The stigma of the alcohol programs was almost totally gone. EAPs offered free, confidential and professional counselling services to employees in the workplace for a wide variety of problems, including alcohol and other drug problems. Early intervention is the key to the success of EAPs.

## **Philosophy of the EAP Model**

The early drug and alcohol programs were largely seen to have failed in meeting their objectives both in Australia and overseas. The programs generated a great many policies and procedures, but little action. From these early attempts emerged four principles, as outlined here.

### **The Total Person**

One principle on which an EAP is based is the belief that organisations employ the total person, not just 40 hours per week of the person. Employees simply cannot – and do not – leave their problems at the front door on the way in and then pick them up going home. In addition, in most cases, employers are in many ways employing not one person but, indirectly, their partner and a number of children.

If it can be agreed that job characteristics play a significant part in an employee’s physical and mental health, then it is the total person who may need assistance from time to time. These problems may or may not be work-related but, in the final analysis, they may affect work performance.

### **Confidentiality**

Confidentiality is crucial to EAPs. There must be no doubt in the minds of employees that their participation in the scheme is totally confidential. Any breach of trust will destroy the credibility of the program. A consequence of this requirement is that the company will, in many cases, know neither who is seeking assistance nor on what basis. Similarly, if the problem involves a supervisor, EAP counsellors may find their hands tied as they can hardly approach that supervisor and still maintain confidentiality (unless written permission of the employee is obtained).

## **Reactive and Proactive Strategies**

The early EAPs tended to be reactive rather than proactive: action was taken after the problem became apparent. Employees either self-referred or were referred (voluntarily) to the program after performance had reached unacceptable levels. The belief was that if problem workers were recognised, aided and allowed to work out their problems, they would be salvaged and returned to a satisfactory position.

Today's EAP takes on both a reactive and proactive mode. Preventive services complement and extend the benefits derived from the program by advising on organisational methods to prevent personal or work-related problems and by actively promoting employee health, well-being and personal development. The types of programs offered can be broadly categorised into two areas: employee health promotion programs and employee development programs.

Employee health promotion programs address common concerns among employers, unions and employees. Programs include alcohol and drug education, stress management, heart disease prevention, AIDS education, and quit smoking campaigns.

Specialist employee development programs are available where recurrent preventable problems have been highlighted through counselling or other assessment methods. Specific courses are then devised to meet the needs of the organisation. These include the management of problems associated with the organisation, such as:

- occupational trauma, specifically stress
- effective inter-personal communication
- coping with organisational change
- preparing for redundancy or retirement.
- effective job seeking skills

The emphasis in these programs is on teaching practical skills and, where appropriate, integrating with the EAP for individual counselling.

It should be made quite clear that management's legal responsibility is no longer limited to ensuring that fire extinguishers are full and machine guards in place. Physical and mental health are now covered by occupational health and safety legislation.

## **Professional Counselling**

Another principle of EAPs is professional counselling. While the success of all EAPs rests largely on the supervisors' observational skills (of work performance decline), there is great danger in assuming that they are able or even willing to take on the counselling role. Their job should be to detect a work performance problem at the earliest time and offer referral to the person for assistance. This should happen only when two conditions are satisfied: first, the problem must be affecting work performance, and second, the employee must agree to accept assistance.

The supervisor should not become involved in private matters which he or she is not qualified to counsel. If a private matter is not affecting performance, it is not the business of supervisors. The overriding principle here is that counselling must always be voluntary and provided by qualified and experienced professionals capable of working with a broad range of personal problems. The focus of the supervisor must always remain on the work performance of the employee.

It should be remembered, however, that where an external agency is used and direct self-referral is available, the supervisors may not know the troubled worker is undertaking counselling assistance. Programs offer self- and supervision-initiated referral.

While supervisors are key people in any EAP program, counselling must be left to the counsellors. Supervisors should be made aware of their limitations in this field. One- or two-day staff development courses in employee counselling will most likely do far more harm than good. Such courses should be limited to teaching work performance monitoring and referral skills, rather than attempting to make expert counsellors of supervisors.

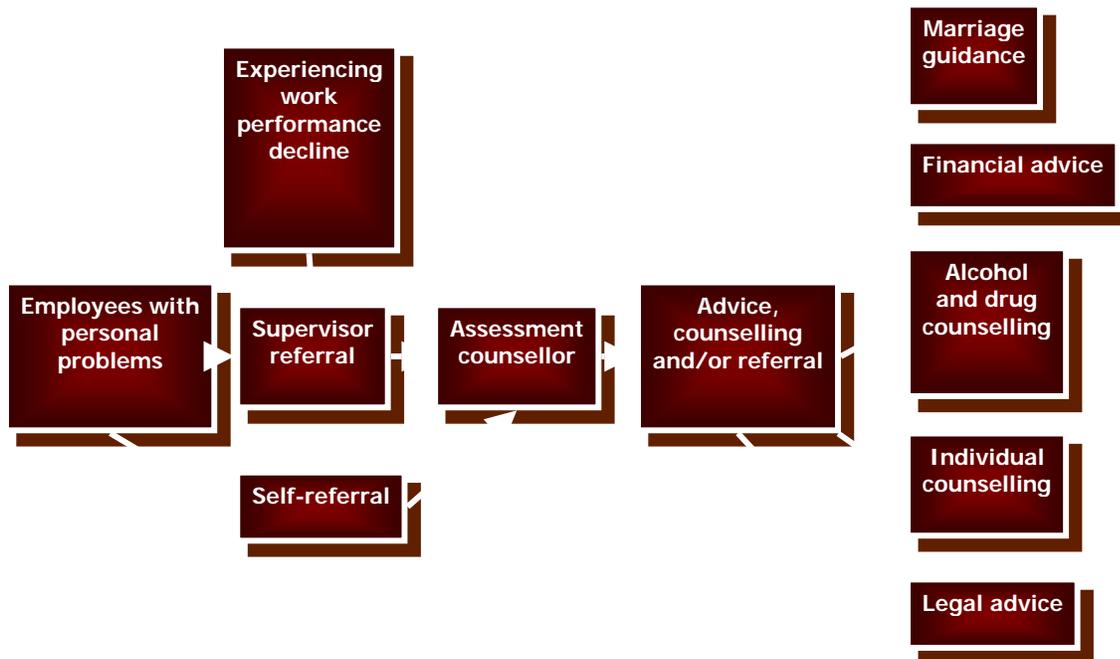

Professional counsellors carry malpractice insurance whereas supervisors (and HR managers) usually do not. (Buon & Compton, 1990)

### **How does an EAP Work?**

A simple model of EAP operation is shown below and demonstrates the following requirements.

- If there is a problem related to a person's private life and it is not affecting his or her work performance, then it is not the business of the employer. The employer may be concerned, but has no right to become involved.
- The employer may provide a counselling service, but the decision about using it rests with the employee.
- It is important to provide the resources for people to seek help voluntarily, in a professional and confidential way.
- The basis of supervisory intervention is the recognition that employees have a responsibility to perform adequately on the job, and supervisors have the responsibility – and should have the training and support – to encourage and guide them to do so.
- The continued monitoring of job performance is the only method of assessment open to the supervisor or manager. When performance is below established standards, the supervisor or manager should discuss the facts with the employee and assist that person to return to an acceptable standard within the framework of the organisation's disciplinary policy.
- The referral for assessment counselling is made strictly on the basis of declining work performance every time a manager or supervisor formally approaches an employee about performance deterioration. This frees supervisors and managers from trying to assess personal
- EAP supervisor or manager referral procedures should be tailored to fit the organisation's present policies.

# AN EAP MODEL

In a 1997 study of members of the Australian Human Resources Institute, Compton found that only 37 per cent of respondents had in place a formal counselling program. Of these organisations, 18.7 per cent were in the finance sector; 27 per cent in education; 18 per cent in government; and 11 per cent in manufacturing. A significant finding was that workplace counselling is far more likely to be found in larger organisations, with 82 per cent of those employing over 20000 people utilising a workplace counselling service.

The main reasons given for introducing workplace counselling programs were as follows: union pressure (11.6 per cent); multiple workplace problems (23.2 per cent); keeping up with latest HRM trends (11.1 per cent); and as part of integrated HRM program (41.6 per cent). The most commonly presented counselling issues were: stress (26.75 per cent); relationships (25.08 per cent); retirement/redundancy (13.58 per cent); drugs of addiction (12.2 per cent); finance (5.95 per cent); grief (6.52 per cent); and gambling (2.93 per cent).

Interestingly, the study began to dispel the popular myth that counselling services are only accessed by the lower levels of the organisation. Respondents reported utilisation rates of 6.65 per cent for senior management; middle management 10.6 per cent; first line management 12.5 per cent; administrative/clerical 24 per cent; sales 2.3 per cent; manual 21 per cent. Counselling sessions were dominated by female members (80%) of those organisations participating in the study.

On a less positive note, it was disappointing to discover that of those organisations that reported a formal program, the majority were staffed by unqualified counsellors. Where an informal program was reported, the situation was much worse, with 80 per cent of counselling being performed either by the relevant line manager, or the HR officer/manager. Of all respondents, only 25 per cent reported their counselling staff as holding a degree in psychology or similar. Of almost equal concern was a lack of any clear link between workplace counselling and other HRM strategies such as performance appraisal, career counselling, training and development or absentee control. At the same time, respondents perceived improvements to absenteeism (65 per cent); turnover (40 per cent);

productivity (57 per cent); morale (65 per cent); and motivation (46 per cent). However, less than five per cent of respondents were able to specify how they intended to monitor any such benefits! (Nankervis et al., 2005)

## **Current Research**

In a follow up study Compton (Nixon, 2003) has confirmed most of his earlier findings but with some notable exceptions. In a study involving a broad cross-section of 650 Australian organisations, he found that 55 per cent of counselling sessions were attended by men and 45 per cent by women. This is indeed very close to the composition of the current workforce and dispelled the myth that counselling was not for real men. The top three reasons for attending counselling were relationships (20 per cent) general feelings of stress (15 per cent) and work–family conflicts (10 per cent). Interestingly, the much publicised issue of workplace bullying was only presented by 3% of respondents. The study also found that those people in the 30–49 years age group were most likely to go to a counsellor. People in this age range often reported feeling the pressures of high mortgages and juggling work/family issues. Almost 33 per cent of those seeking counselling were managers or professionals, with another 15 per cent identified as para-professionals. This dispelled the myth that managers did not seek out counselling as this service was somehow the province of lower paid employees. Consistent with his earlier study, very few counselling sessions were attended by persons with a non-English speaking background.

On a more positive note, today's accredited EAPs are staffed entirely by professionals with either degrees in psychology, psychiatry or social welfare.

The modern EAP has continued the trend towards one-stop, broad-brush counselling services. In 2004, the EAP has matured and is now offering a more sophisticated and broad range of consulting and counselling services. A number of the major players have either merged or adopted an international strategy. Two of Australia's largest counselling organisations have just merged to form Davidson-Trahaire PsychCorp making it the largest supplier in the country. IPS – Employee Assistance, the oldest and formerly our largest supplier, has now changed its name to IPS -EA Global to reflect its growing presence in SE Asia.

It seems that today's HR professionals demand that their EAP providers offer them a one-stop cafeteria style of service. In addition they demand a service that is more proactive so that emerging problems can be addressed before they take on greater significance. Organisations want meaningful feedback regarding trends which are being detected by psychologists during their counselling sessions. HR managers are asking that their EAP act as an early warning system with demands for more analytical and interpretive data being made available on a regular basis. (Parry, 1996).

## **Evaluation of EAPs**

EAPs have in fact grown out of historical traditions rather than empirical research. Much of the claimed cost benefits are based on US research that is, in many cases, rather suspect. A close reading of this material illustrates that much of the claimed benefits of EAPs are more rhetoric than fact. However, this is not to dismiss the beneficial report of EAPs' effectiveness in individual Australian organisations.

With this in mind, a recent study claims that EAPs save organisations \$7.50 for every dollar spent. The claim comes from the former counselling provider CORPsych. Their figures are based on a US study together with statistics from the 50 EAPs that they manage. Savings come from reduced absenteeism, increases in productivity, decreases in conflict and employees being better able to cope with change. (HR Report, 2000).

Such claims must be questioned. The very confidential nature of counselling means that employers will not know who is attending counselling sessions unless the employee tells them. We also know that around 80 per cent of employees self-refer. This in turn means that evaluation of EAPs is very difficult to quantify in dollar terms. One great concern must be the lack of effective evaluation of the EAP. Despite extensive research along with interviews with Australia's largest providers of EAPs, it appears obvious that there is no systematic evaluation of the effectiveness of this HR strategy. There is little if any evidence of any form of survey feedback from the users of EAP services – the clients who may or may not have been assisted! Without this type of effective evaluation of their

programs EAP providers leave themselves open to criticism that workplace counselling services may well be not only faddish but indeed a mere licence to print money. HR professionals leave themselves open to criticism of conducting “soft” HR strategies that add little if anything to the business of the business.

## Who needs an EAP?

The question ‘who needs an EAP?’ may well be posed. Unfortunately, there appears to be no typical profile of a corporate EAP user. Factors such as size, type of work, level of technology and composition of the workforce all seem to vary. The one constant factor is that EAPs are found in organisations that exhibit a genuine concern for their employees. Managers in such organisations show a readiness to invest in their people programs; they demonstrate a commitment to the well-being of their staff. One writer has gone as far as to suggest that EAPs belong in the welfare model of HRM that was so popular immediately after 1945 and remaining popular through to the 1960s. (Alker & McHugh, 2000). Each organisation is different in its goals, culture, problems, technology, and so on, and so there can be no single answer that will suit every situation. HR practitioners, given that they may well be placed in the key role of managing the scheme, will need to look carefully at the advantages and disadvantages of each approach. Anecdotal evidence appears to support the view that once established organisations are reluctant to dispense with the service. If HRM professionals are to cope with claims of a welfare mentality they must ensure that the EAP integrates with and builds upon existing human resource management programs and vitally, that those programs are evaluated to ensure that they are indeed meeting their objectives.

# The Role of the Leaders in Diversity Management

*Carlos Emilio Morales  
Martin Rahe  
EADA, Spain*

## Abstract

Much of the literature supports the hypothesis that diversity has impact on the results of an organisation. This research responds to the need to determine a relationship between diversity and the perception of performance. It is a field research that shows vertical data from only one organisation. The research was conducted in the “BCN”, which operates as a service centre that attends fifteen European countries from Barcelona. Due its international reach, “BCN” needs employees that speak at least three of the ten “*work languages*”. In our research we surveyed 118 respondents, who responded on three scales: Perception of performance, Sensitivity to diversity and Diversity management by leaders. Relationships between variables were analysed through regression. The results indicate that there exists a relation between diversity management and performance. The findings provide support for organisational practices that increase the extent to which diversity is understood as an strategic variable into the organization.

## Introduction

Diversity is a reality of organisational life these days, spurred on by technological development, the increase in mobility of human groups and the varied needs of the markets, it is now a phenomenon which has taken on considerable importance in societies and organisations today.

In Spain the migratory phenomenon has been on the increase (particularly over the last two decades) the diversity ratios being related to the country of origin, race, ethnic group and religion<sup>1</sup>. Although the Maastricht Treaty regulates legal working conditions for immigrants in countries other than those of the European Union, most immigrants from these countries work in Spain illegally. In any event, whether the foreign workforce is illegal or not it carries out a crucial role in the Spanish economy<sup>2</sup>.

Spain will be one of the developed countries with the greatest economic growth up until 2020 with a growth rate higher than the European average<sup>3</sup>. However the economic growth is dependent on population growth and the current Spanish birth rate of 1.5 per one hundred inhabitants is lower than 2.1, which is the level that ensures population reproduction<sup>4</sup>. This means that the possibility of “economic reproduction” without sufficient population growth will only be viable thanks to immigration<sup>5</sup>. Moreover, if immigration were to maintain its current high level, the growth of the Spanish economy could be higher than that already forecast and would put the per capita income in Spain at a higher level than Great Britain in the next decade.<sup>6</sup>

Along with the migratory phenomenon, the mass entry of women into the workplace has brought a huge change to the population distribution of recruitment agencies in Spain. Although the rate of professionally active women is lower than that of men, (45%, compared to 68%, approximately), the number of women who have entered the workplace in recent years is higher than that of men. In 2004 alone, almost 285,000 women gained employment compared to 99,500 men.<sup>7</sup>

This social, political and economic situation poses a key question to Spanish organisations: Which policies must be introduced into the workplace to manage a group of workers who are becoming increasingly diverse? One reply to this question would be to consider not only the ways of preventing the intercultural conflict but also ways of directing this diversity towards enriching the organisation and enabling it to achieve its objectives. The main idea behind this concept of diversity is to get the most out of the human resources provided by heterogeneous groups, which means that they are diverse in terms of gender, age, race, ethnic background, nationality etc.<sup>8</sup> In the last 10 years diverse multilateral bodies have acknowledged this growing relevance of cultural diversity on the political, social and economic agenda of the states<sup>9</sup> and 30th Session of the general Conference – UNESCO (1998); World Bank (1995); World Commission of Culture and Development (1995); G-7 Summit of Brussels (1995); Inter-

American Bank of Development (1999); OSCE (1999); Organisation for African Unity (2000); Board for the Cultural Cooperation of the European Council (2000); Board of Ministers of the European Union (1999); Cultural Exchange Programme of the OAS (1998); Work Group on Cultural Diversity and Globalisation of the RIPC (2003); European Commission (1995, 2000, 2002, 2003); etc.). However, the degree of recognition and understanding of this area varies from one forum to another and in some cases; the debates held concerning this are not reflected in any specific actions.

The General Management of Employment of the European Commission published a report at the end of 2003, in which it suggests that companies with policies which favour encouraging diversity achieve better results. The first *fundamental question* which the report deals with is: “*Companies which apply policies of diversification of personnel identify important benefits which reinforce competitiveness in the long term and in some cases, improve results in the medium and short term*”.

Many organisations have adapted their structure to meet the challenges of diversity, frequently motivated by the understanding that there could be some economic benefits to this. The development of programmes on diversity in organisations usually includes: Support from senior management (as a critical aspect for the success of the programme), Evaluation of the organisational practices (Evaluation of culture, values and attitudes in the workforce with the aim of identifying difficulties and posing solutions to facilitate a successful introduction) and Programmes to attract diverse employees (by way of effective practices of recruitment, accommodating employees to their cultural and familiar needs)<sup>10</sup>.

The evidence which this research provides with regard to the *results* of the diversity is varied and has two main aspects: Diversity can have some positive effects with regard to creativity and decision making in teams<sup>11</sup>; and it can also have some negative effects such as the degree of satisfaction with work and the group, the commitment and level of involvement of the team members<sup>12</sup>. Although the findings of the research report tend to coincide in that the main negative effect of diversity is related to individual satisfaction with the group, they show greater divergence in the positive effects which it has on team performance.

Some researchers point out that research on the effects of diversity on the team performance, depend on the theoretical framework which the research draws from<sup>13</sup> and that according to this, the effects of diversity will be concentrated either in the quality of the relationship in the work team or on the quality of the tasks which the team carries out<sup>14</sup>.

When we talk of results of the work teams, we often talk of leadership, assuming that the leader figure helps to produce the right conditions for the team to reach its objectives. Various theories have dealt with the importance of the role of leader in people management and each one places emphasis on different aspects which are usually related to tasks to be carried out or with the type of relationship which is established between the employees and the leader.<sup>15</sup> Kotter (1990) establishes a difference between the management and leadership. He states management deals with facing complexity, whereas leadership deals with change. Therefore in a diverse labour environment, new leadership competencies are required in line with the changes which diversity in organisational processes implies.

One aspect which has also been researched in detail is the degree of agreement between members of a diverse team concerning the strongest identity in it and its influence on the performance and life span of the team. Some research sustains that sharing the understanding of identity is necessary to know just what conduct is appropriate and acceptable in its members.<sup>16</sup> Earley & Mosakowski (2000), argue that determining the identities of the role within teams is indispensable for multinational teams to be effective. This means that team members who share a common outlook concerning their group identity, improve the team results as a result of the trust and positive feeling generated within the team.<sup>17</sup>

In any case, an extensive bibliography explicitly accepts the hypothesis that diversity and its management do have an effect on the results of a company.

However, *in operational terms*, How do we measure the results of diversity management? Is there really a relationship between diversity and effectiveness of diverse teams in a company?

This research is based on the idea that describing a possible *relationship* between **diversity management** and the perception of members concerning the **efficiency of their work teams**. The impact of Diversity management on the Perception of Efficiency within teams needs to be assessed.

This is a field study, which presents vertical data from one single organisation. In this way it is a case study adapted completely to the characteristics of the company which is being researched. The study aims to apply itself completely to the reality of this company and at the same time maintain rigorous methodological conditions which adequately support the management decisions which arise from the results.

## Methodology

Work was carried out with an organisation which we will call "BCN". BCN is the Spanish subsidiary of a multinational in the financial sector. It is a service centre based in Barcelona which deals with customers in fifteen European countries, which means that employees need to speak at least three of the ten languages which the company considers to be *working languages*. There are 41 different nationalities being represented in this organisation.

In BCN, **Diversity** is a strategic variable and a key success factor in that it is an indispensable condition for the business to function. It enables a reduction of operational costs as its services are centralised in one single city which serves all of Europe.

**The relevance of diversity in BCN means that investment in the diverse human resources processes involved is necessary.**

This means that training team leaders in the diversity of management and the development of sensitivity programmes for the workforce are two of the most important policies in BCN needed to develop efficiency in the diverse teams. In this study we analyse both variables in terms of the importance given to them by the company being researched.

We consider that diverse teams are made up of people from different identity groups, which in this case we identify with some of the following aspects: Gender, Origin country, Ethnic group, and/or religion.

The purpose of this research study was to determine if there is a relationship between diversity management (the work of the leader managing diversity in his or her team and the sensitivity to diversity in the workforce) and the internal perception of effectiveness which they have of their work teams. To gain this information three scales were drawn up:

- Perception of effectiveness in work teams
- Sensitivity to Diversity
- Diversity Management by leaders

The three scales were developed along with the Human Resources managers BCN attempting for them to be adapted to the work conditions and characteristics in the company. For the three variables they used the Likert type scales with 5 alternative replies.

A total of 118 people replied to the three instruments. Control information was compiled concerning the variables which identify the identity groups (sex, country of origin, ethnic group and religion). In addition further information was requested about: age, degree of identification with religious belief, area of work in the company and time spent working at BCN. For the analysis only the variables were used: sex (women 69, men 49), country of origin (13 countries), age (average = 30.5, deviation = 6.03) and area of work in the company. No analysis was made with the other variables as there was no statistical representation in the sample.

## Perception of Efficiency in Work Teams

An evaluation is made of the perception of the people in BCN with regard to the general performance of their teams. 14 items were evaluated: Time management, decision making, continuous improvement objectives, Efficiency, Conflict management, Task sharing, Quality of results, Learning, Common commitment to targets, Capacity to give and receive feedback, Effectiveness, Planning processes and Climate of Team. A General Evaluation of the team was also requested.

### Sensitivity to Diversity

Opinions, attitudes and conduct as a whole, which reflect the value which is given to diversity in the workplace,

were all assessed. It included a sub-scale of 4 items to assess whether or not the diversity should be neutralised, ignored, tolerated as something natural or considered something positive, in relation to controlling the team. In this instrument it also incorporated five items concerning the perception of: the degree of diversity within the team, the frequency of contact of people of diverse identity groups in and outside the workplace, the influence of diversity on achieving objectives and the influence of diversity of the team climate. These five items were included in the reliability analysis of the instrument. The scale had a total of 23 items.

**Diversity Management by Team leaders**

Another evaluation made was of the opinion about the degree of effectiveness of the behaviour of a leader of a diverse team. This degree of effectiveness refers specifically to: fostering the integration of all the team members, considering the differential characteristics of each group in daily working situations, giving them a positive evaluation for the fact that they are a diverse team, resolving conflicts provoked by diversity, enabling a good atmosphere to be created as well as conduct which encourages the knowledge and respect of the specific characteristics of the diverse groups. This third scale had 12 items.

The three scales have had some high reliability measurements.

**Results and Discussion**

We will present the main results divided into two groups in terms of their use as tools of management within BCN.

**1. Descriptive results:** Although the descriptive results (percentages, standard deviations and frequencies of replies of the three scales) are more numerous, they are not the final objective of this case study. Because of this, we will mention only the most relevant of them.

The possibilities of reply of the three scales from 1 to 5 (1 is the lowest and 5 being the highest) and in accordance with this, the final averages per scale were obtained.

- The general perception of the effectiveness of the work teams is average. The final average of this first scale was 3.38. In BCN the people considered that the most notable thing in this perception of effectiveness in their teams is the climate. The item **Climate within the team** has obtained the highest points on the scale (3.94) and a high degree of agreement from the people being questioned.
- The workers in BCN perceive their work atmosphere as being highly diverse. 52.6% perceive the degree of diversity within their teams is *high* or *very high*. In the same way, the general perception of the influence diversity is that it influences the climate of the team more than the work objectives which were obtained. Although a diverse work atmosphere is perceived, the people in BCN do not find a strong correlation between diversity facilitating the achievement of objectives. This conclusion needs to be looked at in depth within the organisation, as it could be paradoxical considering that diversity is a key success factor in BCN given that it is this which enables it to provide a service to Europe at a lower operational cost.
- 77.1% of the sample is *in agreement* or *completely in agreement* that in multinational teams, the role of the leader is important in attaining high objectives.

Of the descriptive results which have been presented, we can conclude that the good climate is the most outstanding internal characteristic of the teams. People perceive that diversity influences the climate of the team more than the achievement of objectives and the responsibility of achieving these objectives is mainly that of the leader. This is related to the impact of the role of the leader on the perception of effectiveness and it corroborates the importance of the role of the leader in diverse teams, but it means that the involvement of workforce takes on a reduced role. With regard to management policies this means two things:

- Employing and training leaders who are capable of managing diverse environments.
- Encouraging an active role in the workforce to convert diversity into a platform to achieve objectives.

FINAL RESULTS OF THE SCALES

SCALE	FINAL AVERAGE
Perception of efficiency on work teams	3.38
Diversity Awareness	3.53
Management Diversity in the leader	3.52

PERCEPTION OF INFLUENCE OF DIVERSITY ON THE CLIMATE OF THE TEAM

REPLY	%
Very negative influence	0
Negative influence	0.8
No Influence	28.8
Positive influence	11.0
Very positive influence	59.3

PERCEPTION OF INFLUENCE OF DIVERSITY ON ACHIEVEMENT OF TEAM OBJECTIVES

REPLY	%
Very negative influence	1.7
Negative influence	2.5
No Influence	5.,6
Positive influence	33.9
Very positive influence	4.2

2. **Relationship between variables:** The equations of regression which describe the relationship between variables are:

**Diversity Management by Leaders (DML) and Perception of Effectiveness**

$$PE = 1.971 + 0.397(DML)$$

R2 = 0.173. This means that 17.3% of the Perception of Effectiveness in the teams is consequence of the Diversity Management by the leader.

**Sensitivity to Diversity (SD) and Perception of Effectiveness**

$$PE = 1.970 + 0.399(SD)$$

R2 = 0.083. 8.3% of the Perception of Effectiveness in teams is consequence of the degree of Sensitivity to Diversity.

**DML + SD in Perception of Effectiveness**

$$PE = 1.382 + 0.342(DML) + 0.221(SD)$$

R2 = 0.194. 19.4% of the Perception of Effectiveness in teams is consequence of Diversity Management by the leader and the degree of Sensitivity to Diversity working together.

The three regressions are valid with values of less than 0.05 meaning.

We can conclude that although leadership has a more notable impact than sensitivity on effectiveness, neither of the two variables has a very high relationship with the latter. The reason behind this lies in the level of maturity of diversity which has been reached and its management in BCN. The company strategy incorporates diversity as a starting point from which to understand the service which is provided to the clients. Internally it is something quite natural, totally accepted and incorporated in the culture of the organisation and it does not bring about any intercultural conflict. Within this framework, the management of the leaders in the team does have an influence but is fundamentally related to maintaining conditions so that diversity does not generate any conflict. In the same way, although people feel that the leader has a great relevance on the achievement of objectives in teams, the relationship between the effectiveness perceived and the work of the leader who is managing diversity is low. This leads us to the conclusion that the objectives of those who the leader is in charge of have little to do with the team's internal performance. His or her task is related to achieving objectives which the organisation sets concerning work which is done (for example, number of clients dealt with, limit of mistakes etc.)

Another important point is that BCN has been in existence for almost a decade as an organisation which has gradually consolidated its diversity management policy. This has meant that the training programmes for both leaders and for the workforce change and adapt to the times which the organisation is passing through and to the multicultural nature of Barcelona as the city where the centre is operating. The increase of foreign residents in Barcelona in recent years has had a direct relationship on the growth of the work market in which BCN recruits its personnel, which has an effect on other internal processes in the organisation.

The existing relationship between what the leader does to manage diversity and the perception of general efficiency within the teams, would probably have been higher when the organisation began to implement its policies of diversity on deciding to centralise its services in one single town. This leads us to consider that the role of team leaders managing diversity, needs to vary and accommodate itself as the organisation undergoes different stages of life.

## **Conclusion**

The information received in this study shows that the role of leaders in managing diversity has a repercussion on the perception of efficiency in teams, but that this role revolves around specific tasks related to the incorporation of diversity in the organisational culture and in the way which the organisation plans its strategy with regard to diversity.

Although it is not high, the extent to which the leader's role explains the perception of effectiveness is higher than how it is explained by the sensitivity that people can develop towards diversity. With regard to efficiency, the contribution of awareness is marginal compared to the management of leaders.

The context of these results increases and acquires greater relevance if we incorporate the relationships which exist between the perceived effectiveness and performance, knowing that the effectiveness perceived is a variable predictor of the performance of the work teams.

These results are not conclusive. But in the diversity management environment they provide a relevant statistical step towards the analysis of the Leader-Results relationship, as being more effective than other relationships, for example, Training in Sensitivity -Results.

Normally when reference is made to the role of leaders in diverse implantations of programmes, there is a mention made of the degree of involvement required from senior management, in order for the programmes to work. The findings of this study support the idea that the work of the team leader in his daily activity with his / her team has more of an impact than the work of diversity sensitivity which may have been developed in the workforce. The study does not demonstrate this but by taking this idea we can pose the hypothesis that the leader could be the main agent of development of diversity awareness in the workers.

This study should ideally be repeated in organisations of similar characteristics with the aim of carrying out an in-depth search of efficiency predictors in diverse organisations. Other research scenarios may be considered, being related directly to the diversity data (management of the leader and sensitivity towards diversity) with indicators of efficiency, measurements of achievement of objectives, figures of evaluation of performance or with some indicator of financial results by area (EBIT for example) and we can see just what an impact a specific diversity management policy would have on them.

For the organisation, an important conclusion to be drawn is that the improvement on team performance is linked to encouraging the competencies of Diversity Management in leaders. Investment in training should be aimed at developing programmes for team leaders rather than working in the development of others programs with the employees.

The operational application must also be carried out in other Human Resources processes. Apart from training, it will be important to incorporate the variable Management of Diversity for processes of Personnel Selection, the Performance Evaluation and Internal promotion.

One relevant aspect for the company is the development of the idea that diversity should be considered by the workers as a platform for improving team performance. The results show that in BCN, diversity is more important in maintaining a good climate than for developing internal effectiveness in teams or in achieving objectives. This means that people perceive their work atmosphere as diverse, they value the diversity, but they do not find that this diversity is more related to the results of team work.

Although the results presented are of a preliminary nature for Spanish companies as a whole, they are the first step towards aiming to quantify the effectiveness of diversity policies in the Spanish organisation. We have aimed to use these research questions dealing with specific and operational aspects of diversity management policies, bearing in mind that this is a relevant strategical phenomenon in the way organisations function nowadays.

# Leadership at the Threshold to the Third Millennium

*Harald Kupfer*

*Harald Kupfer Consulting & Human Resources, Germany*

## Abstract

In the course of the past ten years, the importance of the term leadership has been constantly increasing. Business science and especially HRM show substantial interest in the area of leadership. If we deal with the matter of leading, we encounter a huge assortment of sources on this theme. However, in any case, the term leading is very hard to describe. A huge amount of already executed trials for definition of this term shows us, that only a few specialized publications were able to capture this multi-layer concept. Something that attracts attention in this matter is the fact, that leading is often understood as superior/subordinate relationship between the person leading and the person being led - providing that one of them is obliged to leading and the other one to loyalty. The need for leadership spans all of the historical periods and various cultures of the mankind: The need for leadership arises, if more than two persons are organized in a group in order to distribute their work actively. The term leading is interpreted in various ways, what is related to the historical-time perception of the given period, however leading itself, in the understanding of goal-oriented interpersonal influencing, has become a subject for systematic research only at the beginning of the last century. In the meantime, the analysis of the leading phenomena is being carried out by various sub-disciplines, however to this day the problem of different approaches integration into an extensive and generally accepted theory has not been resolved. Urgently needed interdisciplinary research program of the Leading topic is only in the process of shaping in the behavior-oriented business science.

## Introduction

In general, leading is an effort affecting the behavior of one or multiple persons, so that the prescribed and common goals can be achieved by mutual cooperation. In the term leading, we understand an aspect that concerns science as well as practice. Different problems associated with leading include the fundamentals of the company management (expressed in its values), interpersonal impacts within the framework of people leading and an introduction of leading models (Gabele/Liebel/Oechsler, 1982). We came to a conclusion, that since people have joined together for the purpose of common task realization, a complex multi-layer problem associated with leading has arisen.

The need for leading is constantly rising, due to the fact that task fulfillment and the achievement of appointed targets requires higher team member flexibility as well as sustainability of actions coordination. Further developments will be based on following definition: Leading is goal oriented, social influencing for the purpose of mutual task fulfillment (Wunderer/Grunwald, 1980). Leading is subsequently described as an action that includes regulation and formation of other persons' activities. This is done in so-called partial processes as e.g.: goal determination, planning, decision-making, controlling, etc., that are also called leading processes. Successful or actually, effective leading is therefore the fundamental building block of all prospering companies.

Theory and practice were always confronted in the face of leading. At the same time, identified leading problem areas were sufficient for their time and scope of leading research. Starting from the fundamentals, through introduction of the leadership models over to interpersonal influencing within the framework of people leading, but the research by means of targeted influencing in the interpersonal sphere, which transforms into the success of the company, has started only recently as a problem within the framework of business science.

However, it must be insisted upon, that the leading theories content is based on social-psychological approaches, that rely on empirical studies and that can be applied without any larger criticism to the problems encountered in company leading. Opposite to these concepts are the leading models that are based on company management practice, that indeed are very widespread, but they are missing out on theoretical soundness, what results in only partial practical application. We come to a conclusion, that the leading force is situated in an

insoluble dilemma, caused by the complexity of the subject matter as well as by forcing, what results in an almost insoluble tangle with a little hope for solution.

The aspect leading in every day life is described as influencing. However, we often meet with slightly misused interpretation in the form of synonym leading to manipulation. In this context, influencing means the accomplishment of two fundamental tasks of leading: cohesion and locomotion. Under the term cohesion, we understand the creation and up-keeping of the group integrity and durability (Stroebe/Stroebe, 1990), under the term locomotion we understand the group motivation for the purpose of common goals achievement (Stroebe/Stroebe, 1990). If the company on one side represents an efficient organization, and on the other side represents a social organization, cohesion is necessary. The group stands in the forefront. Cohesion therefore defines the human or actually the relationship dimension of the leading. Research has shown that the employee satisfaction is much higher in the groups with cohesive character. Because a company is primarily an effective company, which goals must be achieved, locomotion is necessary - the goal is in the center of the attention.

Therefore, the leading forces are on one side responsible for the results, providing that the possibilities of leading are only partially controlled or influenced, on the other hand, they must find the middle path between two contradicting requirements. Leading forces are assigned with roles, that are not precise enough or also stand in the contrast and therefore they undergo constant change. In each case, the leading forces utilize their own experience to solve the problems. The faster the change or higher complexity of the environment, the higher is the uncertainty. The actual leading is therefore a mix of personal experience and uncertainty, arising from experienced implications of own inconsistency and environment imperfection. These influences support the need for support, certainty and transparency. At the end, there is a substantial interest in guidance help or actually procedures for action, that contribute to role uncertainty or conflict elimination. If the models and concepts of leading are to be relevant in practice, they must be measurable, because they explain the process of leading in all of its complexity and/or offer the guidelines for effective leading in a complex environment and contribute to compromise identification between not imperative, but necessary alternatives (Bisani, 1985).

## **Theories of Leadership**

The subject of leading shows the complexity of the matters, evidence of which are the various theories, hypothesis and speculations from all fields of social sciences, so that the problem of leading could be explained not only theoretically, but could also be kept under control in practice. From the fact-side, the theory is the basis for technology. Technology is therefore perceived as transformation of theory and its utilization in practice. The technology of leading is presented in a wide arrangement of recommendations in a form of leading models, what means that valid arguments will be worked out, that assist the leading forces in the process of changing behavior of the others, considering the goals and desires of the leaders. Leading theories focus mainly on clarification of the conditions, that result in the development of leading and they are trying to identify the inherent basis of leading.

Within the framework of leading theories, one of the oldest approaches is the so-called trait theory. The basic implication of the trait theory is such that the person with specific personal qualities is apt to lead others. Mainly in 50' and 60', a lot of research on the identification of these attributes or actually the leading traits was carried out (Gabele/Liebel/Oechsler, 1982).

The goal of the research was to identify personal traits or properties standing alone or in combination form the inherent qualities of the leader. It was referred to the fact, that already Aristotle represented the opinion that some people are more suited for commanding than others. Results of the research have shown that there are no personal traits, which would be able to guarantee continuous and consistent success in leading for the leader. However, numerous properties predetermine the success of leading. When analyzing or evaluating leading processes, the personality of the leader cannot be omitted.

Personal theory has shown to be highly practice-relevant. Its realization relies on the basis, to select the leading forces on base of relevant leading properties. The tests, according to which is resolved, whether the potential candidates for leading positions have the necessary leading traits are carried out on this basis. However, until this day, no selection procedure has shown that the traits identified in the test relate to later leading successes. Therefore,

there are justified any doubts or speculations on the practical utilization of the personal-trait theory. Property theory can therefore be reduced to one central point and that is, that some leader traits in any event do not stand in the way of leaders' success. That leads to the fact that the actual leader traits are very hard to identify specifically.

According to the group theory, the role of the leader is defined from the view of outside of the group. The role of differentiation, that is developed inside the group therefore specifies the leading itself. The leader can lead only in such extent that is allowed by the group (Bisani, 1985). The research of small groups has shown that there is no such group, where a leader would not develop.

Of course, the leader becomes the person, from which the other team members expect the fastest achievement of their goals. It also means, that the one supported by the others, will enforce the achievement of his/her interests. If positive interpersonal relations are developed to other team members, the leader can retain his leader status for a prolonged period of time.

Representatives of the situation theory on the other hand present a notion, according to which behavior of the leader is supposed to adapt the individual conditions of the relevant situation, if the success is to be guaranteed. Due to this, the process of leading is merely an interaction between the superior and subordinate. With regard to variety of other situation, one cannot prefer any leading behavior that would enable success in the entire situation. Following demands result from the relevant situation. Situation is determined by the present persons, organizations, task structure as well as environment influences (society, government and economy system).

One can modulate the occupation of the leader role according to the situation and task. The person that knows the way out of situation problems is the leader – however, he must do more than just push the others towards the goal fulfillment. Leading is considered more as a function than as a person. The crux of the matter remains the character of the leader role.

Critics of the situation theory, that emphasize the problem of improper situation clarification, are supported by the fact, that the situations are never stable. Changing situations change the leaders' role and according to the circumstances require a change at the position of the leader. (Gabele/Liebel/Oechsler, 1982). Contrary to all of the criticism, one must not forget that in situation theory one can see significant improvement. When taking into account the practice, there are no general or non-specific proposals laid out, but the situation circumstances of the leading processes are evaluated individually. In this way, the possibilities to include the business reality into the research of leading are much better.

The interaction theory represents a different model of leading process description; Recommendations for the practice at this level, however cannot be developed. With the interaction theory approach, the necessity of integration within the framework of leadership science is also connected and the success of the management depends on diverse variables (Gabele/Liebel/Oechsler, 1982).

Under interaction, we understand mutually contrary relations that are associated with the efforts to gain influence. Leading is split into a system of influence determinants, where only the successful trials for gaining of influence allow the difference between the leader and subordinate. Within the framework of the interaction theory, there is a substantial transition of the crux of the matter, because the structure of leadership situation context is shifted into the background. To the forefront is shifting the concentration for expectations and positions i.e. to personal factors, where the possibility of prediction is again very disadvantageous (Gabele/Liebel/Oechsler, 1982).

## **Leading Styles**

In the scientific literature, only those approaches to leading are usually discussed, where it concerns the typical concentration of leader's behavior. Some of the best-known leading styles are authoritarian and cooperative approaches that can represent the Leadership style Continuum.

Authoritative approach to leading is based on a principle of order and obedience. Usually the authoritative superior is the formal leader whose authority is based on the power associated with his position. The area of interpersonal relationship between the leader and the person being led is hierarchically exactly formulated and is more distant from the human factor. The core of the authoritative style remains in the fact, that the superior makes all of the decisions and these decisions are further distributed by means of directions and orders. There is no dialog

with the subordinate in the process of decision-making. Subordinates receive an order to fulfill everything what is asked from them with no discussion, even though they are not convinced on their correctness. If the orders are not fulfilled sufficiently or not at all, subordinates must reckon with sanctions. As a controlling tool are used often or actually regular controls carried out by the superiors or his assignee.

Superiors have exact visions concerning their subordinates; leading instruments are utilized that lead to material reward on one side and sanctions on the other side. The vision of the subordinate is based on the fact, that his capabilities are very limited. There is no room for the independence of the subordinate; therefore, the assigned orders are exact and precise; besides there are strictly executive tasks specified for the subordinate. Information for the subordinate is accessible only in extent required for successful task execution. Such information policy, limits the view of the subordinate in the overall company interactions. This results in further strengthening of the leader power - and besides that, the possibilities for purposeful and targeted manipulation by leader are growing.

In cooperative style of leading, the leader comes to a decision in cooperation with the subordinates or the subordinates at least take part on decision-making; however, the leader is responsible for the relevant decision by himself. Subordinates, that took part in the process of decision-making, will enforce their decision in the discussion with their superior, providing that this enforcement of decision is usually done individually and at your own responsibility. Everyday tasks are usually delegated to the subordinate for realization. On base of a continuous cooperation and mutual information, the controlling by the superior is required only in a limited extent. This information policy enables the employee to identify and allocate more important connection and responsibility for the overall company performance.

The relation between superior and subordinate is in cooperative style of management usually hierarchically structured, naturally the subordinates are more-than-less considered to be partners by the superior; the presence of power is pushed into the background. This weakens and loosens up the hierarchical structure. Cooperative style of leading is typical for its mutuality, it even gives space for the creation of quite friendly relations among subordinate and superior.

Described forms of leading styles, authoritative and cooperative, are considered ideal types that are in practice in their true form very hard to implement. More vividly, they represent fixed points in the basis of the Continuum. Between these two extremes, there is a wide space for multiple modifications of leadership relations that are classified on the scale of individual leader's elements significance (Bisani, 1985). According to the rules in force until the 60's of the last century, authoritative and cooperative leadership styles were two incompatible contradictions. This view however is no longer suitable: From the existence of Continuum we can deduct, that between authoritative and cooperative style of leading is a smooth transition. The leaders can accommodate their own style of leading to be less authoritative or more/less cooperative. In literature there are also discussed besides central styles of leading also other style of leading, that are all assigned to authoritative leading.

The model of patriarchal style of leadership is based on absolute authority of the father in family; the roots of this view span all the way to the 19<sup>th</sup> century. Patriarch has absolute, authoritative right for power and right for leading those under him. The right for power of the patriarchal leader is legitimated by the degree of adulthood, wisdom and experience. Subordinates do not take part on the decision-making; information is restricted to limited amount. Those being led have the right for loyalty and procurement: Patriarch feels responsible for those under him and constantly tries to establish family atmosphere. Patriarch leader can be in this perspective classified as authoritative leader. The right of a charismatic leader for leadership is based on individuality and positive effluence of the leader. The fundament of power in this matter is charisma that brings those being led into dependence. There is no need for predecessor, deputy or successor. Charismatic leader can, not only in the concept of obedient behavior, ask from all of its subordinates any kind of sacrifice – and that also with passion. As a counter value for required and expected obedience is a successful prospect. Charismatic leader therefore does not emphasize his power as well as sanction authority based on his position: He leads on base of an emotional relation that can be also irrational. There is no need for coercion, but the subordinates present required behavior willingly and with particular passion. Emanation or actually the charisma as a personal trait is something that cannot be learned. Charismatic style of leading is expressed much more in particular situation and cannot be marked as a purposeful part of a leader's behavior.

From the early forms of power has developed the autocratic leading, despite of personal style of leading, institution comes into the forefront: autocratic leader is an authoritative leader that disposes with valid title for power; absolute entitlement and order obedience, the person itself is in the background of the institution, represented by him. Autocratic leader perceives his power not from the viewpoint of personality, but from the prevailing respect and adoration towards the institution. The institution is not led directly, but with the help of the whole leading apparatus. This has enabled the autocratic leaders, as shown by the history, to create huge social formations.

Autocratic style of leading is different from patriarchal and charismatic, due to the fact, that these are dependant upon person and situation. Autocratic leadership on the other hand is independent on persons. The fundament of power does not change in any way: If the leader falls, he will be without hesitation replaced by another one. Autocratic leadership is therefore dependant upon an institution.

The leading apparatus of an autocracy builds the fundamentals for development of bureaucracy that is considered the answer to the caprice of the autocratic leadership: directions and orders are in connection to individual laws, investigable. Bureaucratic leadership means legal power of the bureaucratic institutions through professional competence.

In bureaucratic management, there is no leading person or leading institution, but much more specifically described function within the framework of the whole, hierarchical apparatus. Based on this, the bureaucratic leadership knows the clearly defined power competences that are transferred to persons with relevant qualification. Control and counter-control are dominant. Contrary to the fact that bureaucratic leading was at the beginning of the century celebrated as a contradiction to the caprice of the constitutional monarchy, but today this term has prevalently negative meaning. In the course of its development, its advantages and its striving to be perfect has transformed into its mistakes and faults (Bisani, 1985).

## **Models of Leadership**

The difference between theory and the model is very difficult, due to the fact, that models from work of scientists always find their application. Not every model is a theory, but theory can quickly become a model. Models are within the framework of scientific research used for simplified reproduction of real events, so that the amount of complexity is minimized. Creation of a model always brings with it a certain reduction of complexity (Worpitz, 1991).

Different alternatives of leadership system search translate into the leadership model construction, that is more or less equipped with ideally typical characters and issue orders on the structure of the leadership systems as well as how to act on personal components. There is a reason for models in the fundamental concept of the leading, due to the fact that in practice is the extent of very specific instructions very small. These recommendations are therefore targeted to limit the specific leadership problems.

In business scientific literature we find models of leading much more directed towards the description and evaluation; contrary to the status of the matter, there are individual discourses to each of the concepts. From time to time, you can find classification that specifies total and partial models.

Whereas the total models take into account all of the variables and can be named also as full models, partial models cover only limited parts of the leadership system and subsequently are applicable as only partial or restricted leading models, it is often due to their frequent integration into total models. Leadership models are designed as multi-dimensional structures, providing that their use is in creation of the leading processes and leads to leadership efficiency improvement, what results in relieving of the company management.

In 60's and 70's there was a vivid interest for leadership models in Europe. Lots of consultants and business institutions exploited the fact what translated into general discussion in media. Business science in these countries was incapable of covering the demand for additional knowledge on leadership science and was hunted into a corner by these events; naturally, its reactions were very hectic. In substance, the leadership is based on these criteria:

- Leadership models are a tool for representation of the practice.
- Company leadership processes should be illustrated in a simple way.
- Individual elements of the leadership should be covered.

- Leadership models should reflect the leadership process.

The debate on models was followed by sound, as well as partially destructive criticism. The crux of the leadership models remains in missing forecast ability. The critical question therefore sounded: How to attribute the impacts of leadership measures, without any relation to the theoretical foundation? Because this scientific postulate in the leadership science is not sufficiently developed, models must bring with them also limitations that offer place for criticism. If we consider criticism as legitimate or constructive, in any way we cannot deny the exceptional influence of leadership models on the German economy and from this resulting leadership concept.

Leadership models include two separate areas: On one hand, it is the scientific function and on the other hand, the pragmatic function. Scientific function represents models as a concept of solution providing that each hypothesis, even if its complex is transformed to a simple statement. If certain conditions are considered the fundamentals, certain measures should get us to necessary implications and effects. On the other hand, pragmatic function in its substance focuses on the task of general rules that should result into homogenous solution of the leader problems. This leads to reduction of leadership complexity (Wild, 1974).

Models work always as a complexes of hypothesis, however they always need scientific verification. Their most important function is the expression of specific question, evidence of which is deducted from scientific research. In summary we can say, that leading models can be understood as possibilities of different structures that reflect, connect and offer a whole package of guidelines within the framework of the whole process of leading. Concepts conform to evaluation of feasibility and practice vicinity, because the leading force has to offer sufficient knowledge on the process of leading, so that the company goal can be achieved in its best way. These main components are necessary: leadership model must contain all of the process aspects and leading structures, in order for it to be recognized as full-value model (Steinle, 1978). Management concepts therefore embody only main ideological stances, expression of which is exercised in the leadership models (Bleicher/Meyer, 1976).

Leadership models, that have shown to be applicable in practice in the last decades, were developed on the rich experience of the practitioners, without any influence from laid out theoretical approaches. It means that these leadership models are in overall understanding in contradiction to the development trends of the new leadership theories. Practice oriented leadership models build on the fact that they represent total leadership models. This enables them to solve any leadership problems that could eventually occur; Factors as expectations, interactions or attitudes are after all not that interesting. Just to mention a few, total practical leadership models utilize organization tools, as e.g. career planning or job description. Therefore, there is no immediate concentration in the process of leading and a structured description of a leadership situation is of a very high value, and consequently are the following contact areas for the purpose of formulation of question associated with business.

If the models are formulated purposefully, it represents an effort of the practice as well as of the theoretical approach, to offer a catalogue of behavior rules that should serve as a fundament for practical generation of the leadership processes (Hecking-Binder, 1974). It means that, in order to evaluate leadership models relevant for practice, we must fulfill the requirements for a comprehensive leadership model (Hecking-Binder, 1974).

## **The Harzburg Model**

In the core of the Harzburg model is situated the leadership model with relation to the subordinate (Hecking-Binder, 1974), that means, that Harzburg model considers as a fundament the principle of task, competences and responsibility delegation. Subordinate must find recognition as individually thinking and executing subject, as it is laid out in the Harzburg concept. We build on a basic concept and that is, not to limit the leading functions only to the top of the company hierarchy, but parts of them should be transferred to the operational level as well, and in this way distribute the responsibility to individual members of the organization. Subsequently, the other main aspect of the Harzburg model is the process of overcoming authoritarian principles and implementing new fresh thoughts on cooperation.

Harzburg model offers the set-up of such access guidelines that enable the main intention of the cooperative leading to be closer to practice than ever. One of those is in the simple substance of the Harzburg model, delegation

and responsibility. The basis of the approach is that leading is not carried out on multiple tasks, but is carried out by means of division and transfer of the whole task areas.

One of the instruments of the Harzburg model is the so-called general leadership guidelines that include a list of principles or leadership styles. It is a concept of rights and duties, which should provide concurrence of members and organization. Besides, the information and its usage is governed by rules. Harzburg model talks about three types of information movement: Information from top to bottom and vice versa as well as criss-cross information movement. General leadership guidelines are leveraged by the team leading principles, employee interview principle as well as dealing with complaints and representation.

Another instrument of the Harzburg model is the job description, the need for anchoring of employee competences and responsibilities is pretty much a basis for implementation of the Harzburg model. Job description specifies exactly defined areas of the employee and his relevant competences. The employee is obliged to carry out the tasks and find the solution individually. Job description also has a goal to assist in finding the right person for the position, what is derived from the main purpose of the JD; the person identified must be compatible with the job description (Hecking-Binder, 1974).

## **“Management by” - Techniques**

Lots of „Management by“ - techniques has developed in the last decades on the market and they exerted a lot of effort to come into the forefront. Individual concepts were often formulated as the best. As we now know, none of the techniques offers holistic concept of knowledge, in a much higher extent the both techniques overlap. Some of the techniques as e.g. Management by Exception, Management by Delegation and most of all Management by Objectives, declare higher degree of entirety than others. From all of the presented Management by - models, even due to the change in business, primarily only Management by Objectives, what is leading by means of target specification, is utilized in today's companies. This model represents the basis of the improved company leadership concept, providing that the partial concepts, as for example Management by Exception and leadership behavior and principles are integrated. Management by Objectives has shown to be if not the right one, than at least one of the useful leadership models (Worpitz, 1991).

Leading model Management by Exception (MbE) that is used for leading in exceptional situations completes other approaches, and above all the principle of Management by delegation. The substance of Management by Exception rests in the fact that superior is called in exceptional situations only, in all other events the subordinate processes the tasks individually and individually decides on situations that arise. If serious deviations from normal situation occur, superior as a nearest higher instance designated for posting on the new situation and orders are expected from him (Rumpf, 1991).

All of the tasks that must not be taken into account by the superior are delegated. Management by Exception represents a certain relief for the leaders. Only in the event of extraordinary situation, which are out of the decision scope of the subordinate, the leading force acts. This extraordinary situation occurs when the scope of subordinate's decision-making is exceeded. Subordinates act in strictly specified borders. To normal situations belong those, that are within these limits and the subordinate is capable to solve them individually and responsibly. Eventual extraordinary situations fall within the scope of decision of the leading force. Powerful management information and control system is necessary. In this way, we increase the reliability of speedy reaction. One must not forget that the development of a new extraordinary situation might lead to new definition of the goal. By these means, the leading forces are freed from routine everyday decision-making and are for the disposal for other tasks issued by the management. Own responsibility of the superior is increased in his scope of action and thus it prevents his overloading, when deciding on each and every situation. Following aspects should be emphasized in order to prevent possible problems:

- Management by Exception requires clear goal definition.
- Communication slowdown prevents early reaction.
- Extraordinary situations can be evaluated improperly.
- Even straightforward activity, within the scope of activities must be evaluated and approved.

- Faulty information can cause problems in coordination (Stroebe/Stroebe, 1992).

MbE principle must often face heavy critique, due to the fact that it brings only negative information to the superior and everyday routine cases do not get to them; however as was already said, it brings the advantage of freeing the leaders from decisions and results in a higher effectivity especially what regards the company generated outputs. Correct definition of borders in which the subordinate can act on his own is still the central problem of the Management by Exception concept. If the borders are set too far, there is a real threat, that the subordinate, who from this point of view does not dispose with such qualification as his superior, might adopt a wrong decision. On the other hand, if the borders are set too near, the individuality of the subordinate will be lost and the effect of freeing the superior from work will vanish (Rumpf, 1991).

Management by Delegation, what can be translated as, leading by Delegation of responsibility and decision competence, strives to eliminate the authoritative-patriarchal style of leading, for which are typical: individual task resolution, obedience and orders. As a concept of leadership, the principle of delegation is less specific than lower discussed model of Management by Objectives, even though the common points remain the same: the tasks are assigned to the subordinate on his own responsibility and individual actions. In this principle of delegation, the influencing of subordinate is being done by issuing work orders and behavior guidelines - on the other hand in case of Management by Objectives model the influencing is being carried out by individual goal setting and eventual frame conditions.

In the whole spectrum of these guidelines and orders, that are specified „too tight“, the subordinate can or actually must contribute to leading by his own activity. As was already stated the principle of delegation could be implemented also in relatively authoritarian structures, as it is visible on the example of bureaucratic style of leading.

The principle of Management by Delegation presumes that each employee receives his/her own field for delegation, competences and responsibility. Within the framework of this area, the employees will work on their own. Any decisions that must be dealt with are resolved at the level, where they belong. These leading forces, that are on the other hand subordinate in other areas, take care of all leading as well as subject-matter tasks. In case of the leading tasks person accepts his/her own responsibility for his/her decision. In case of the subject-matter tasks person accepts his/her own responsibility for his/her actions. It is necessary to insist on a rule, that a leading force cannot accept responsibility from employees if the employees do not have the possibility to forfeit their responsibility in favor of the leading force. Exceptional cases are discussed between leading force and employees.

Model of Management by Delegation is due to these traits very frequently criticized; therefore, models Management by Objectives or Management by Exception are preferred:

- Leading forces always interfere with the work of their subordinates.
- Emphasis is put on thinking in areas/fields rather than holistic thinking.
- Partially the process of delegation is perceived is the transfer of unattractive tasks
- The leader has the monopole for decision-making, common decisions retreat to the background.
- There is a higher tendency towards orientation on more tasks as compared to the goal-oriented thinking.
- The influence of informal communication is not sufficiently taken into the account, hierarchical communication is prevalent.
- Job description often specifies only detailed tasks - not goals.
- Employee remains with more responsibility for execution and his actions.
- Sometimes the responsibility from the employee is destined to the leaders.
- Management by Delegation practically eliminates motivation (Stroebe/Stroebe, 1992).

Management by Objectives means leading through goals or, if we take it from the view of the subordinate, leading through uniting on one goal. It is necessary to note, that in German speaking countries there is no unified translation of the term Management by Objectives.

Management by Objectives can be best described on an example: Superiors and/or management discuss with subordinates a goal in a specific area. By means of a statute or mutual agreement is then specified a goal for the concerned area of the company. Leaders of the concerned area in the company try to conform to frame conditions, with relative freedom in their actions. Management of the company carries out in regular intervals the fulfillment of goals in the relevant area, than follows the process of company area leaders' performance evaluation.

Management by Objectives therefore offers advantages for both superior as well as for subordinate: Management of the company is no longer responsible for the individual areas of the company; Leaders of the concerned can express their own initiative or independence – For many of the leading forces, is this very interesting challenge. In any case, the Management by Objectives is not limited to the highest level possible; the application of Management by Objectives is much more useful in those areas, where workers can master the situation individually, on their own responsibility (Rumpf, 1991).

Everyday company stereotype has shown, that the idea behind leadership models does not rest in their earliest acceptance without any further consideration and criticism, but these models represent only idea base for the leadership concepts; consequently, tendency develops toward the use of only the most effective leadership mode parts. We basically divide Management by Objectives on two approaches behavior oriented and pragmatically oriented approach:

- Supporters of the pragmatically oriented approach are dealing with questions from practice and the emphasis is in the research of the goal setting process.
- Advocates of the behavior-oriented approach insist that the Management by Objectives should be presented and should be taken into account with respect to the interests of the employees.

In company practice there is often an effort to enforce cooperative concept of leadership in line with corresponding management behavior. As tools, the style of leadership and instruments as the basics of leadership are formulated. If those are successful, we can talk about leadership concept realization. As is generally known, this is the main crux of the problem; it is much easier to present the basics of leadership than to practice the relevant leadership. Thereby, the need for constant control of the behavior is generated, so that the concept of leading could be constantly optimized. If we omit this view, any specific results cannot be derived from the fundamentals of leading. As a premise of successful application of Management by Objectives is the cooperative search for goals, providing that in the process of goal planning as well as control should be engaged all of the Management levels. In order to utilize the Management potential sufficiently, individual goals in sense of the layered concept should not be situated too high or too low (Gabele/Liebel/Oechsler, 1982).

Creation and planning of the goals are more or less starting point of the Management by Objectives process. In the term goal formulation, we understand both quantitative as well as qualitative measures. This process influences all of the leading functions; important leadership functions find their basis in the basic principles of leading. In order to successfully fulfill goals in sense of the Management by Objectives concept, it is very difficult to include diverse aspects and conditions. In literature, the Leadership concepts are divided into 5 principles:

1. Goal orientation principle, i.e. Allocation of tasks to employees is carried out in connection with specified goals.
2. The principle of multi-phase goal searching process, i.e. expected goals are the result of multi-phase process, starting with company goals and ending with specification of individual small goals.
3. The principle of decision-making competence delegation, it means decisions regarding the implementation of the goal are delegated, providing that the employee has the space to choose specific measures, in any event he is however responsible for his/her actions.
4. Participation principle, expects the utilization of until now unused capabilities and skills, because the worker is taking part on the process of goals setting and control.
5. Performance oriented principle, i.e. specific target tasks assume the existence of evaluation criteria that are “invited” to the process of achieved goals evaluation (Hentze/Brose, 1990).

It is necessary to insist on the fact that only leadership model structures that originate in the organization and have the potential to motivate the workers are the right ones.

## **The Situation Leadership Models**

In the context of the leadership models must be included also the situation leadership models. On the other hand, trait approaches as well as behavior theoretical approaches, where the relevant situational variables are only in a limited extent or not at all accounted for in the process of leadership. Fiedler’s approach is a mature step towards

this direction. Fiedler's contingency leadership model, developed on base of empirical studies, is considered as a fundament of the leadership situation theory. The result is that, the success of leadership depends on the cooperation of until now neglected situational variables and practiced leadership style. Fiedler's approach has therefore a historical significance: It is a theory that offers recommendations for actions as well as for the process of leading according to the actual situation (Rumpf, 1991).

Fiedler's model builds on the premise, that for example efficiency of a workgroup is governed by interaction between the leader and workers or from his behavior as well as from the degree of situational preference in favor of the leader. We know three basic variables that are defined. Subsequently Fiedler came up with another implication, i.e. that present way of selection and integration of leader personality is insufficient. Personal traits even if they are supplemented by experience from other situations, do not give absolutely any guarantee for success.

Fiedler doubts possible success in case of short-term training programs for superiors for the purpose of their behavior modification. If possible at all, than maybe after a couple years of intensive psychotherapeutic care. Fiedler's basic premise still remains: Either find a proper leader personality for the given situation or it is necessary to modify the situation.

In modern literature, there was a lot of criticism against Fiedler's model. Contingency model is despite all of the criticism one of the most complex behavior leadership efficiency theory. Fiedler's approach was able to incorporate a change in the process of leadership thinking research and with its activities; it gave significant impulse for other activities. In this time period, no other model has gone so far as this one. However according to general estimates, it is yet too early for relevant and responsible utilization of this model in personal decisions. The importance of Fiedler's approach does not lie in the model of leadership, but much more in the knowledge theory.

Fiedler's approach was further developed by scientists Vroom and Yetton, what was followed by presentation of a new situational decision-making model. From the viewpoint of superior or subordinate seven symbols of situational conditions were that are either present or not. Theoretically, with two variations of each symbol and 8 symbols we get to altogether 256 various situations, from which the authors have selected only 14, that are considered practically meaningful (Bisani, 1985).

Model is embroidered with its seemingly present preciseness. The model claims, that it can identify the correct method of decision-making in order to achieve the goal of the organization as soon as possible. In its optics are present only two formal aspects, first is the quality of decision and the second is the acceptance of the decision by the concerned employees. Model seems to be logically build and transparent in its basic structure. Out of reach are the impacts on the process of leading, as for example personality structure and status of motivation as well as other situation factors. The result is such, that this model is closer to decision-making model than to the leadership model. With the assistance of the decision tree, it can be recorded on a diagram. Five ideally typical styles of decision-making are confronted with types of problems, that are according to the degree of groups and their members' participation differentiated in the process of decision-making. It focuses on seven types of decision-making rules that can be deduced with respect to the validity, so that the division according to types could be justified. Method of decision-making cannot be deduced from pure air, in order to get to the correct method of decision-making we must utilize the decision tree. One of the aspects of the problem is the time necessary to come up with a decision, completely contrary effect has the process of decision-making on motivation and work satisfaction.

Less successful were all of the experiments trying to prove this model empirically. Within the framework of research, the leading forces were forced to classify the situations according to the chosen decision-making strategy and expected result. These data were than compared with expert data. The comparison has shown that the higher the identification with the logical build and structure, the more similar was the data in comparison with the data collected from experts.

Diverse leadership models anticipated unified type of personality and concluded independent and optimal style of leading from different situations and extent of impact. 3-D model for the improvement of management performance that was developed by W. J. Reddin observes, in comparison with behavior grid, only one style of leading. Reddin criticizes in the first place the normative requirement of the behavior grid, the 9,9-style of leading as an optimal style. He also expressed a demand to incorporate into the research the environment of management. 3-D-Model is based primarily on two fundamental dimensions of the leadership: task and relationship orientation.

The third dimension embodies a substantial development: Efficiency of the leading power, providing that the efficiency is a scope of results achieved by the manager at his position (Stroebe/Stroebe, 1992). If the manager only looks efficient or he strives for personal goals, he cannot be considered truly effective. Results achieved are always more important than the actions. Efficiency is therefore not only the capability or property that can or cannot be presented by somebody – it is much more about correct understanding of the specific leadership situation and consequent influencing. Before the situation is resolved, it must first be evaluated.

In coordination environment, Reddin differentiates, with reference to Blake and Mouton, four types of styles, so-called basic styles: Integration style, relationship style, methodical style and task style. In practice, are these basic styles used efficiently as well as less efficiently. It depends on the environment situational conditions, which style of leadership will be the most successful. It is noteworthy, that not every situation can be managed with similar tools: Training is an important pillar of the 3-D-Model.

Two other representatives of modern Management have developed another Model that builds on the leadership research knowledge acquired in past centuries and offers the manager help in various different leadership situations (Stroebe/Stroebe, 1992). The starting point is such that the effective behavior of the superior depends on the degree of employee maturity, providing that the degree of maturity is a consequence of motivation and competence. Maturity is also the necessity, to specify goals and take over the responsibility. We know 4 degrees of maturity.

Hersey/Blanchard model is illustrated in two axes, providing that one of the axes illustrates behavior with respect to task and the other axis illustrates behavior with respect to colleagues. From the second axis you can see, how is the employee motivated by the leading force. In other words, it means: Depending upon, whether the behavior towards colleague is strong or weak, discussions are frequent or seldom, compliments are granted or not, one can feel assistance and support - or not. From the behavior with respect to task, it is visible, how precisely is the task specified by the leading force for the employee. Depending on the fact, whether the emphasis on tasks is bigger or smaller, Management issues more or less orders that are to be carried out by the employee. If the tasks are delegated, emphasis on their completion is weaker. If we associate emphasis with tasks as well as with employees, we can get 4 different styles of leading.

## **The Managerial Grid**

On base of dimensional orientation towards task or towards employee was generated a scheme for leadership behavior, known as behavior or managerial grid. This is an effort to classify a multitude of possible combinations and to illustrate their interdependence in two-dimensional coordinate system. Two-dimensionality of the behavior grid consists of two leadership dimensions: task and employee orientation. For each axis, there are 9 degrees between low and high intensity, thus creating a grid with 81 fields. Each of these 81 fields describes possible leadership behavior and captures possible combination of both leadership dimensions. Leadership styles are not incorporated in the Blake/Mouton model, e.g. authoritative or sympathetic; they are by contrast specified in two numbers that specify the position of the superior in the grid. First number measures the task orientation; second number specifies the employee orientation. At this point, it is not necessary to go over all of the combinations one after another.

Blake/Mouton explicitly promotes 9,9-leadership style. They build on the combination of tasks and employees, 5,5-compromise is not worth the effort. Considering the fact, that the 9,9-leadership style is an ideal beyond reach, realization of this goal remains only a vision. Due to this, most of the behaviors concentrate around the optimum line, i.e. diagonal from 1,1 (left bottom) to 9,9 (right top). The further are the leadership styles from this line, the less they are convenient.

## **Limits of Model Thinking**

A huge amount of different approaches to all possible leadership styles leaves us with conclusion, and not only due to insufficient empirical base and contradicting results, that the holistic leadership theory simply does not exist.

Scientists doubt, that it will be possible to reduce such complex system to the level of if-then relations, just like what the contingency model strives for, due to the simple fact that the multitude of various situations and relations is just too big: (contingency model). Providing certain leadership behavior occurs, it is necessary to create corresponding leader situation.

Leader, due to the complexity of the diverse leadership situations in practice, will always speculate on those factors that are the result of his development, his experience and wisdom. His behavior is therefore limited only to what was successfully used in the past. Other measures of influences will not be taken into account; huge amount of simplification is going on here. After all, almost all of the supporters of the individual models warn before such manipulation or action. Fiedler's model is restricted only to three situational symbols, what in two positions of each symbol means 8 combinations. After all situational factors can be completely left out and consequently only one style of leadership can be promoted, as for example managerial grid 9,9-style of leading or Harzburg Model of leadership with creation of relationship towards an employee. However, surveys have shown, that such simplification base on circumstances simply cannot guarantee necessary success.

Each leadership model has its advocates and its adversaries, successes and falls are discussed in detail; time has shown however that advocates are dominant. What can this be associated with is not yet clear. It is however clear, that connection between success and failure can be looked for in positive or negative situational conditions.

## **Actual State**

It is very hard to evaluate the actual state of the whole process of leadership research in its whole scope. It can be partially deducted on base of a scientific specialization, which have been utilized for a long time and has led to many different theories. On the other hand, many more marketing interests are coming to the forefront, what can be seen on the number of different leadership models. From the outside view, the process of leadership investigation is somewhat questionable.

The research of leadership is trying to find theoretical fundaments for leadership structures and processes, from which the content of the leadership "technology" could be developed. Present science on leadership relates mainly to influence factors, leadership goals and tasks, properties of the leaders and those being led, relations between the leaders and leaders behavior. Nevertheless, even today a popular notion is that there is no appropriate leadership theory in the scientific sense. Today's leadership science focuses just like in the past on classification, description and systematization of leading. The huge variety of present theoretical approaches can be considered as a theoretical framework, in other words the predecessor of exact theory.

On base of the knowledge, that to this day there is no comprehensive and generally accepted leadership theory, we will very often use the term leadership theory to call the innumerable leadership models and theoretical approaches. After all, individual theoretical approaches differ only by various forcibility and emphasis on certain aspects of leading.

There is unity among scientist and practitioners on the fact that it is necessary to try and work out, such comprehensive leadership theory. However, it is evident, that this theory must have a different character, than that to which we are used to in natural sciences (Worpitz, 1991). It is surprising, but all of the models and approaches in the last decades originate from American Management Schools.

Conditions for leading are constantly changing; and this is decisive also for the future development. Research of leadership must stand against the challenge of modern business: Models, concepts and theories must accommodate to modified conditions that are characteristic for the area of leadership in the last decades.

Leadership science must build on psychology, sociology and business science. As the results of the economy show, concepts and models are based mainly on social-psychologically oriented research of leading that means that social-psychologically oriented psychology of leading will guide the direction of leadership research also in the future, and that contrary to the fact, this heading is starting to show some deterioration. This is attributed to the fact, that scientific perspective was focused on a specific, frequently too narrow heading (Wiendieck/Wiswede, 1990).

When we deal with various leadership models, we come to a conclusion that all of them have concentrated on emphasizing of a certain trait and none of them has strived to put all of the various results from various fields into one comprehensive leadership theory. The causes might be the variety of the topics and it is not possible to derive without serious complications a multi-layer field of problems without structure. Partially responsible is the formulation of the leadership science.

On one hand the leadership science did not evolve from business science, but from various sociological disciplines, even on sleeping, as e.g. sociology or psychology, on the other hand the leadership science developed due to the need for recommendations for action and solution of problems that have arisen, as well as for the purposes of formulation explanation.

Demand for practical models has partially led to assertion of Learn-theory approaches, and partially to the development of easily comprehensible theories, or models, as well as to almost unlimited acceptance of results from various surveys. The knowledge that remained is such that, that the model has become exact and clear by narrowing down of certain aspects, but reliably is still more distant from the circumstance of the reality.

Models that are utilized in practice generate certain amount of dynamics. Advocates of various concepts frequently negate all of the criticism and consider their approaches to be confirmed, by the fact that with each new model we get nearer to success in leading. This may be the source of the problem; this is why big successes of various models or theories from USA were not reproducible in Germany. The reason for this is the fact, that the results of the American consultants are accepted without criticism and with no hesitation, no differences in value systems, traditional normatives due to completely different business-, society- and social-structures are taken into account (Bisani, 1985).

## **Tendencies**

Within the framework of science and various different theories and models development, again a question arises, where the future challenges are. The leadership aspect must accommodate to ever-changing conditions. On one hand, this change affects the level of values, due to the fact that superior as well as subordinates require motivation background, on the other hand, it affects the area of structure through new forms of communication, or actually through new technologies. Utilized approaches or models are more and more behind the reality and just cannot keep up with everyday reality and company practice circumstances. Science and research have to face these modified conditions; Goals, techniques as well as leadership functions must be in face of such challenges newly reconsidered (Wiendieck/Wiswede, 1990).

Only change can stimulate the companies to internal renovation/innovation. The times when situational conditions were presented as relatively stable are long forgotten. We see everyday how fast the conditions around us are changing. In addition, there is no visible end to these changes: Globalization, internationalization, new information systems, networking and an increase of complexity are the key words of nowadays. Moreover, even stronger turbulences are ahead of us.

Constant change is transferred also into the society, so it is not only short-term, insignificant interference but also something much bigger. A new image of a man in the company is being created. More and more people will understand, that their profession is closely connected with the meaning of the word "profession", and that the profession should besides the purpose of making money contribute to the overall development of personality, providing that the organization of the companies would be different (Miehle/Weisflog, 1998).

The results of the research are distributed very slowly due to the complexity of leading; this distribution is being done usually through consultants. Existing approaches are often accepted without any criticism or investigation of their applicability, they are quoted everywhere and figure as the only option. In practice, the models offered and/or sold to companies are usually very simplified and thereby very comprehensible for everybody. On base of various backgrounds a development of so-called brand products has occurred. Mentioned leadership models, Harzburg Model, Model of Management by Objectives as well as managerial grid have therefore become known as brand names. What regards the situation leadership models similar success has accomplished the model from Reddin and in a slightly smaller extent the maturity model from Hersey/Blanchard.

Considering the fact, that brand name products respond to demand and supply, the same applies to leadership models. In practice, a lot of attention is given to the process of distribution, sale and presentation of the model, with goal to start up the demand. Individual publications are formulated purposefully evasively so that the customers become curious and authors could receive orders for subsequent seminars and consultations (Bisani, 1985).

There is very little evidence on the results of the individual models that could prove the true success of the model. All of the efforts for creation of generally accepted framework for the purpose of individual model and concept comparison have stumbled. First of all, the generally accepted criteria are missing. As a first should be the employee satisfaction: The question is, according to what procedures should be this satisfaction evaluated and on the other hand, how is this term defined or limited. As a second should be the view on the successfulness of the individual leader: This is the place of confrontation, due to the fact the neither leader behavior, nor situation remains the same for an extended period of time. Besides the survey period always proves to be insufficient; subjective and objective traits always form mutually corresponding influences. Moreover, as a third factor, during discussion we cannot overlook the success of the individual company. Research has shown that even if the conditions are as close to reality as possible, the results cannot be identified as representative; besides there is an important role for values and norms. Authoritative behavior therefore brings poor performance and missing motivation, what leads to uprisings and aggression, cooperative and participative behavior on the other hand increases performance and motivation and improves interpersonal relations. In conclusion, we insist, that the results are always more significant.

The present complexity cannot be eliminated due to the natural human individuality and ever-changing situations. If we consider this fact, it is clear that leadership science must create a certain framework for actions, rather than modify leading forces into simplifiers. This would mean, that the spectrum of models, approaches and concepts would be given, so that according to situation the best solution could be adopted. At present, there is not a single construct for the generation of instruments that could describe the area in which the leadership science is operating. Here should and must be the leadership science very active.

Scientists and practitioners pose questions, whether it will be possible to work out typical statements on human behavior. At present, the Leadership science shows every indicium of constant development, each approach, each concept and model profits from the imperfections of its predecessors. Practically oriented science, with respect to necessary guidelines for business practices, must contribute to this effort with its share.

# Impact Of Enforcement And Co-Management On Compliance Behavior Of Fishermen<sup>1</sup>

Jamal Ali  
Universiti Utara Malaysia, Malaysia

## Abstract

The purpose of this paper was to examine the factors affecting compliance behavior with regard to zoning regulation of 284 Peninsular Malaysian fishermen. Frequent violations of regulation will impact on the demand for protection, and therefore lead to greater expenditure on law enforcement. The theoretical models of compliance behavior tested include the basic deterrence models, which focuses on the certainty and severity of penalty as a key determinants of compliance, and models which integrate economic theory with theories from social psychology to account for legitimacy, deterrence and other motivations expected to influence individuals' decisions whether to comply. Policy makers who want to improve compliance face two choices: the first choice is whether to focus only on building staff capacity to detect and correct non-compliance, or the second choice a combination of strategies building staff capacity and at the same time building commitment among fishermen so that they will comply with regulations. The results of the empirical analysis provided evidence of the relationship between co-management strategies on the one hand, and types of fishermen on the other. These findings imply that co-management activities should be strengthened to complement the deterrence strategies in the management of fishery resources in Peninsular Malaysia.

## Introduction

Over-fishing and declining marine fish landings, especially along the West Coast of Peninsular Malaysia are two important issues in Malaysia. According to Department of Fisheries Malaysia (DOF), this stagnation or decline in coastal fisheries production is expected to continue as the maximum sustainable yield has been reached (DOF 1997). This is of great concern to economists, as the fisheries sector in 2000 contributed 1.6 percent to Gross Domestic Product (GDP) and employed 81,994 fishermen (DOF 2002).

Like in most countries, the fishery industry of Malaysia is an open-access resource, which means fishing is open to any new entrant. Even though the fishermen may be well aware of catching less fish today, they are also aware that any future catch may be large enough to make it worthwhile to 'invest in the stock'. They also know that any curtailment of their current catch simply results in an increased catch for someone else. As a result, fishermen may try to "harvest" what they can, when they can, before anyone else catches it.

With the introduction of more progressive and efficient fishing techniques, as has been witnessed over the past decade or so, the need for stock management policies has become more and more acute. New technology means that fishing is no longer limited by the captain's skills and the crew's strength. A fishing vessel can use directional sonar to help captains "see" shoals of fish and even distinguish between species. Through the implementation of a Vessel Tracking and Monitoring System (VTMS), based on the *Global Positioning System* and *Inmarsat* satellite communications technology, fishing vessels can now lay their nets precisely where fish have schooled in the past. At the same time VTMS will allow the authorities to detect and identify the location of the fishing vessels (Malaysian Institute of Economic Research (MIER) 1999).

The function of existing regulatory institutions like the Department of Fishery (DOF) is to protect fish resources from over-exploitation by traditional and commercial fishermen. The DOF typically controls fishermen activity through monitoring, surveillance, and enforcement under the Fisheries Act (1985). Policy makers who want to improve compliance face two choices: the first choice is whether to focus only on building staff capacity to detect

and correct non-compliance, or the second choice a combination of strategies of building staff capacity and at the same time building commitment among fishermen so that they will comply with regulations.

Some scholars of “Environmental Management” like Morelli (1999) think that the reliance on enforcement statistics is not a healthy indicator of enforcement programs. Morelli points out that more arrests and convictions do not mean enforcement institutions have done a good job. He argues that only when there is less crime and fewer convictions, then we can consider a regulatory institution is doing a good job.

These points make a valid argument for not having such a heavy dependence on enforcement numbers. Volokoh & Marzulla (1996), and Morelli (1999) argue that society does need to have a strong enforcement program, but fines, penalties and criminal prosecutions should be a last resort, used only after the agency has tried to encourage compliance or where obvious environmental damage occurred from not following the regulations.

## **Research Problem**

The fishing industry in Malaysia is characterized by a distinct dualism between the small-scale (traditional) and the large-scale commercial operators. Small-scale defines as fishing within five nautical miles from shore along the coastline of their fishing villages. Mostly use long-tail outboard-motored fishing vessels of less than 10 ton gross weight. The main fishing equipment used are push net, shrimp drift gillnet, and hook and line. The operations of the large-scale commercial fishermen, on the other hand, are carried out on a larger scale and are highly profit motivated. Commercial fishermen use motored fishing vessels of over 10 gross Tonnes (GRT). The main fishing equipment for commercial fishermen is trawl, purse seine, and other large gillnets. To reduce conflicts between the small-scale fishermen and commercial fishermen, the Fisheries Authorities have established Management Zones (Fisheries Act 1985). The establishment of Management Zones is aimed at providing equitable allocation of the fisheries resources among different sizes of fishing vessels and types of fishing equipment. The zoning system determines the allocation of fishing grounds, which is based on the types of fishing equipment, size of vessel, and ownership. Under the Fisheries Act (1985) of Malaysia the commercial fishermen can only operate in the waters beyond 5 miles from the coastline.

In spite of the prohibition on trawling within five miles from shoreline, trawlers are often found fishing within these areas. The ban on commercial fishermen operating within five nautical miles of shore (the area in which small-scale fishermen do most of their fishing) was imposed to prevent destructive gear from degrading coastal fishing areas and tearing up stationary gear (such as stake nets and stationary traps). Conflicts among small-scale and commercial fishermen mostly occur when commercial trawlers stray into the prohibited zones. Numerous reports and personal interviews with fisheries officials and fishermen suggest that commercial fishermen persistently ignore the ban, creating smaller catches of fish for small-scale fishermen.

When the rate of non-compliance with regulations is thought to be significant, policymakers generally focus on increased deterrence, which in practice usually means greater enforcement effort as the only solution. However, effective monitoring and enforcement means higher expenditure and the Government may not be able to bear such costs. Given the high costs of monitoring, a better understanding of fishermen’s motivation for compliance to the management arrangements is urgently needed.

The usual economic analysis of enforcement in fisheries, in common with that of the fishery management problem in general, assumes that fishermen act in all circumstances as self-interested rational agents. Given a choice of alternative actions, firms will seek to maximize profits and individuals will seek to maximize their utility in monetary terms, and the illegality of an action is only reflected in its expected cost. The shortcoming of this assumption is that not all fishermen may want to violate the regulation, even though it is financially profitable to do so. The role of moral and social norms, as well as instrumental factors such as social pressure, in shaping individual behavior is examined extensively in the sociology and social psychology literature. These factors, in addition to threats of sanctions, are recognized as important in determining individuals’ compliance decisions. Compliance with the rules and laws imposed by an external authority has been shown to depend to a significant extent on the perceived legitimacy of the authority and the laws it enacts. It is often suggested that greater involvement of fishermen in the process of management, through local management or “co-management” approaches will lead to

increased levels of compliance because regulations will then be accorded greater legitimacy as a result. There appears, however, to be little empirical evidence to support this assertion.

## Literature Review

A large number of survey studies have been conducted to test the economic model of criminal behavior as originally formulated by Becker (1968). Sutinen & Andersen (1985) examined the impact of enforcement under the Magnuson Fisheries Conservation and Management Act of 1976 (MFCMA) in the United State of America. They raised a question on the assumption of most literature on fisheries management and regulation, i.e. those laws that can be perfectly enforced without cost. Their empirical result showed that the expenditure on enforcement of MFCMA is high relative to the potential benefits from the United States fisheries. They presented a model of fisheries law enforcement, which was used to examine how fishing firms behaved and how fishery policies were affected by costly and imperfect enforcement of fisheries law. Sutinen & Andersen (1985) concluded that enforcement costs were a major determinant of regulatory policy for nonexclusive resources.

Sutinen, Rieser & Gauvin (1990) used deterrence theory to conduct an econometric study of regulatory enforcement and compliance in the commercial inshore lobster fishery of Massachusetts in the United States. They set five testable hypotheses, namely: (1) lobstermen who were more income-dependent have a stronger conservation motive and were more likely to comply with conservation and management regulations; (2) lobstermen with more years in the fishery were more likely to perceive and appreciate the long-term benefits of conservation and management measures, and were more likely to comply with regulations; (3) younger lobstermen faced greater financial pressure and were more likely to violate regulations to realize short-term gains; (4) lobstermen with relatives in the fishery have a greater interest in the long-term health of fishery and were less likely to violate regulations; and (5) frequent violators tend to remain in the fishery for short-term gains only.

The model used by these researchers assumed that violation rates were a function of probabilities of detection and conviction, level of economic gains from violation activity and variables reflecting fishermen's commitment to the fishery. The data from a survey of people holding commercial inshore lobster licenses (lobstermen) for the year 1986 were estimated using ordinary least square (OLS), tobit and logit regression. The results indicated that lobstermen comply with the regulation even when illegal gains were so much larger than expected penalties. Many of them refer to the need to "do the right thing". That was, they express an obligation to obey a set of rules imposed by the authorities.

The first compliance study carried out in Malaysia was by Kuperan & Sutinen (1998). They conducted a research on the compliance behavior of fishermen with zoning regulations in the Malaysian Fishery. In their study, Kuperan & Sutinen used both Positive Theory (Deterrence Theory) and Normative Theory (Social Influence and Cognitive Theory) to estimate a compliance model. In their study on a sample size of 318 trawler fishermen, they included variables relating to social influence, behavioral norms and the legitimacy of regulations. They noted that, in practice, the costs of enforcing fisheries regulations result in relatively low probabilities of detection, but penalties were not usually sufficiently high to produce a deterrent effect. Despite this, the authors observed that a high proportion of fishermen complied with regulations. This led them to look for other factors explaining individual compliance behavior. The researchers developed an extended model that alongside monetary incentives included variables such as "moral obligation" and "social influence". In their model, moral obligation included variables related to moral norms, as well as the perceived legitimacy of the regulator and the regulations.

The three objectives of Kuperan & Sutinen study were: (1) to describe the incidence of non-compliance of trawler fishermen with the zoning regulations in Peninsular Malaysia; (2) to identify the factors responsible for the observed non-compliance, and then develop and test a theoretical model of compliance that extends the traditional deterrence model of compliance, and (3) to propose strategies for improving compliance.

They employed the ordinary least squares (OLS) method to run the first stage equation of probability of detection and conviction as a function of resources and evasion inputs. Then, they applied Logit and Tobit models to explain compliance decisions for individual fishermen.

The key results of their study were that income potential plays a major role in the compliance decisions of fishermen. When the difference in the catch per unit effort between the zones become more pronounced, increasing the incentive for the trawlers to violate the zoning regulation. The researchers also found that moral development and social influences factors were statistically significant in explaining compliance behavior in the normative model. The normative perspective on compliance behavior, which emphasized the role of legitimacy of enforcement institutions in securing compliance, was not significant by their estimates.

Their findings have two interesting implications. Firstly, it becomes theoretically possible to observe full compliance, even where enforcement is imperfect and costly, if the regulations accord with the individual's sense of what is "right" and the regulator and regulations are considered legitimate. It would therefore seem that (i) individual perceptions of "what is right" influence compliance decisions; (ii) such perceptions may also determine the perceived legitimacy of rules and regulators; and (iii) greater legitimacy leads to greater observed compliance.

Kuperan & Sutinen (1998) developed their model, which included legitimacy, moral and social influence variables, in a single regression function. The difference between this study and Kuperan & Sutinen's study is that this study will construct a set of variables related to the stated moral obligation to comply with, a set of variables related to the perceived legitimacy of the regulation, and a set of variables related to the perceived social influence on individual compliance decision; and then use the index of moral, legitimacy and social influence in the regression analysis.

Previous studies concerning compliance with fisheries regulations have followed two explanatory lines of argument. The first deals with the positive theories (i.e. deterrence theory), i.e. the higher the probability of detection and the rate of fines imposed, the lower the rate of violations committed. The second line of explanation focuses on normative theories, i.e. using factors that cause fishermen to become conscious of fisheries regulations. Factors such as the fishermen's personal characteristics, their "psychological/attitudinal" orientations, and existing fisheries policies were the focus of this line of enquiry. Age, experience, fishermen's income, household characteristics, their perceived attitudes toward regulator and regulations, moral values, as well as their perception of other fishermen's compliance activity affect their own compliance with fisheries regulations.

The operational variables that will be used in the present study were selected from the related theories and studies that have been reviewed. The model used was an extension of the work of Kuperan & Sutinen (1998) with certain modifications, especially the effect of co-management programs on compliance behavior, programs introduced in 1994 in Malaysia and other South-east Asia countries such as Indonesia, Philippines, Thailand and Burma (Pomeroy, Katon & Harkes 2001).

## Theoretical Framework

The main assumption in the economic analysis of criminal behavior is that the individual is a rational decision maker who considers the costs and benefits of participation in illegal activities. In the present context, fishermen are assumed to subjectively weigh the potential gains and losses of committing a regulatory infraction. A fisherman's decision of whether to comply with regulations or not is modeled as a function of: 1) the probability of getting caught violating fishery regulations (*PDETECT*), 2) severity of the penalty (*PENALTY*), 3) illegal gains (*IG*), 4) a set of demographic and individual characteristics (*EXPER*, *CONV*, *HP*, *SIZE*, *EXPEVA*, *AREA*, *FSIZE*, *REG*, *INV*, *CONV*), 5) involvement with co-management activities (*CO-M*), and 6) a set of normative (non-economic) factors such as moral, social control and legitimacy factors. By incorporating the details of the fishery laws with the regulatory, economic and normative (non-economic) factors, a more complete assessment of the decision of the fishermen to violate the law can be developed.

An individual's utility from illegal activity (rule violation)  $U(V)$  can be written as a function of the anticipated monetary return under violation  $Y_v$ , the subjective probability of detection  $p$ , and of incurring an expected monetary penalty  $F$ , if caught and penalized, with the standard form

$$U(V) = (1 - p)U(Y_v) + pU(Y_v - F) \quad [1]$$

In many cases it may be assumed that in addition to the imposition of a fine  $F$ , the value of the illegal income  $Y_V$  will be forfeited if an individual is caught. Note that  $Y_V$  is the income under violation and  $Y_{NV}$  is the income under no violation. Then:

$$U(NV) = U(Y_{NV}) \quad [2]$$

Violation will occur if  $U(V) > U(NV)$  and that  $Y_V > Y_{NV}$ .

Time spent on non-compliance activity is assumed to contribute directly toward fisherman's utility in term of generating higher income ( $Y_V$ ). Income generated from illegal activity is used to consume goods that contribute to utility. However, subjective probability of detection  $p$ , and an expected monetary penalty  $F$ , if caught and penalized will also affect utility from non-compliance activity.

Within the standard economic framework of crime and punishment, the optimal remedy for non-compliance is

$$F^* = \frac{\text{monetary return under violation}}{\text{probability of detection}} = \frac{Y_V}{p(r)} \quad [3]$$

where the optimal fine ( $F^*$ ) is (at least) equal to the financial gain of non-compliance ( $Y_V$ ) divided by the probability of being detected and punished for the particular violation ( $p(r)$ ). Whereas  $p(r)$  shows that the level of resources  $r$  determines the probability of detection. For some fixed expected financial gain ( $Y_V$ ), the optimal fine will be declining when the probability of detection ( $p(r)$ ) increasing.

In this study the focus is on an illegal act, i.e. violating zoning regulations. Since compliance simply represents the certain outcome  $U(NV) = U(Y_{NV})$  we can focus only on the decision to violate or not to violate the regulations. The individual's expected utility from violation depends upon the expected monetary gain ( $Y_i$ ), the perceived probability of detection ( $p_i$ ), and the expected size of the penalty if caught ( $F_i$ ). The violation decision by individual's fisherman ( $V_i$ ) related to the first three of these variables as mentioned in deterrence theory can be written as

$$V_i = f(Y_i, p_i, F_i, \mathbf{X}_i) \quad [4]$$

where  $\mathbf{X}_i$  represents a vector of other variables including personal characteristics such as the individual's experience, size of the boat, fishing areas and involvement with co-management activities.

Dowell, Goldfarb, and Griffith (1998) and Hatcher *et al.* (2000) proposed a good theoretical framework on extended compliance model. In their theoretical utility framework, individual's behavior is influenced by their own moral values.

We can now re-write the supply of violations [3] to include index variables for moral obligation ( $M$ ), perceptions of legitimacy ( $L$ ), and social influences ( $S$ ). With this in mind we can write the individual's supply of violations function as

$$V_i = f(Y_i, p_i, F_i, CO-M_i, M_i, L_i, S_i, \mathbf{X}_i) \quad [5]$$

for the initial form for estimation.

## Data Collection Strategies

### Data Collection Strategies

The data for this study were collected using primary (standardized questionnaire) and from secondary sources. The nature of the study required primary data and information on co-management activities in the selected fishing areas. Data on compliance behavior were collected from primary sources. The questionnaire used in the study was developed over a period of three months (from April to Jun 2001) during which it was tested and retested with respondents in the study areas. Most of the questions used in the questionnaire come from Kuperan & Sutinen

(1998) and Hatcher, Jaffry, Thebaud & Bennet (2000). After the pilot study, changes were made to the sequence of the questions and their wordings to enable easier understanding by the respondents. The actual survey was undertaken in each of the study areas from November 2002 to April 2003.

Secondary data necessary for the study were obtained from different relevant sources. The Department of Fisheries and the Fisherman's Association were the two main sources of secondary sources. Moreover, visits to other statistics offices and district extension centers were made to collect more detailed data required by the study. Examples of data collected from secondary sources were names of fishermen who have violated the regulation and the Department of Fisheries activities.

### **Sampling Technique**

The unit of analysis in this study is the individual commercial fisherman in Peninsular Malaysia. As for drift net fishermen, the questionnaire was only given to fishermen's who have fishing vessels more than 20 GRT, which has to follow zoning regulations. The questionnaire was administered personally to 284 fishermen who were chosen using a disproportionate stratified random sampling basis. This study applied stratified random sampling to make sure the sample would provide more information within each group of fishermen. Firstly we stratified the fisherman population into three groups, according to the main fishing equipment being used in their fishing activity – trawl nets, purse seine nets and drift nets. Then, a sample of members from each stratum was drawn using simple random sampling.

A survey was conducted in selected fishing areas in Peninsular Malaysia where these three types of fishing equipment were used, namely, Perlis, Kedah (Kedah Utara and Kedah Selatan), Pulau Pinang, Perak (Krian), Selangor (Selangor Tengah and Selangor Selatan), Johor (Mersing), Pahang (Kuantan), Terengganu (Kuala Terengganu) and Kelantan (Pasir Putih, Bachok, Kota Bahru and Tumpat). Two states, Melaka and Negeri Sembilan were excluded from this study because in these two states, there were no trawler fishermen. There were two reasons for taking more than one region in this study. Firstly, the probability of being caught between regions was expected to be different, depending on the number of enforcement officers and enforcement activities. Secondly, it was easier to test the impact of co-management strategy between different regions, because the activities of Fishermen's Associations are expected to be different between areas.

It can be assumed that if Fishermen's Association (FA) committee members are themselves pro-co management, then the ordinary fishermen will tend to be more involved with co-management activities. In other words, if the members perceive their leaders to be supporters of co-management, then they will also be supportive of the program. For this reason explains the difference in activities related to co-management program between fishery districts.

Table 1 shows the sample size and population of licensed fishermen with inboard-powered vessels of more than 20 Gross Tonnage (GRT) or using trawl nets and purse seine nets as their main fishing equipment. The names and addresses of the surveyed fishermen were obtained from the records of the DOF (Department of Fisheries) and the Fishermen's Associations. All data were collected by means of face-to-face interviews with the skippers of the vessels. From the full sample of 284, 51% (146) was trawler fishermen, 27 % (77) (purse seine fishermen, and 22% (61) drift net fishermen.

**TABLE 1: SAMPLE SIZE FOR TRAWLER, PURSE SEINE AND GILL NET FISHERMEN**

Gear Groups	Number of respondents interviewed (sample)	Number of licensed fishing vessels (Population)	Sample as a percent of population
Trawl-nets	146 (51.4%)	4,609	3.2%
Purse seine nets	77 (27.1%)	748	10.3%
Drift nets	61 (21.5%)	400	15.3%
Total	284 (100%)	7,557	3.8%

**Statistical Analysis**

The data obtained from the survey questionnaire were analyzed by the statistical software package SPSS (Statistical Package for Social Sciences) and STATA. Results of the study were obtained by performing statistical tests including correlations, independent groups t-tests, chi-square and logit regression. The probability of detection ( $p_i$ ) and the probability of violation ( $V_i$ ) models were estimated using logit regression. The logit model extends the principles of generalized models to better treat the case of dichotomous dependent variables. Logit differs from linear regression in that it estimates the parameters of the model using maximum likelihood method instead of the ordinary least squares method, and the function used in the logit model is the natural log of the odds ratio (Ramanathan 1995).

**Pilot Studies**

As mentioned earlier, this study used survey instruments previously developed by Furlong (1991) and Kuperan & Sutinen (1998). However, we did some qualitative pilot studies before using the instruments. A pilot study was carried out on a small diverse group of fishermen (40 fishermen) to confirm appropriateness of the questions in the questionnaire.

The pilot survey also tested the responses of the fishermen. For example, how do they react, does the questionnaire make sense, and whether they co-operate and also to find activities related to self-regulation and co-management. After the pilot survey, we refined the questionnaire – by using the suggestions of the respondents to identify and change confusing, or offensive questions and techniques. We also found out that respondents took about half an hour to answer the questions. After refining the questionnaire, we used it as the survey instrument to conduct the actual survey.

**6. Analysis and Interpretation of Results**

This chapter reports the findings of the empirical analysis, starting with a checking the Reliability and Validity of instruments, descriptive analysis, and followed by the result from the hypothesis testing. For the hypothesis testing, the *t*-test was used to test the difference level of involvement with co-management activity between violator and non-violator fishermen. Then, the same technique was used to test the difference between mean income of violator and non-violator fishermen. This was followed by a chi-square statistic test to examine the relationship between violations of fishery regulations with the type of fishing equipment fishermen use (trawl-nets, purse seines, or drift nets). For both the deterrence model and violation decision model, we used the logit regression technique.

## Descriptive Statistical Analysis

### Comparative Analysis

*Research Question 1:* Is there any difference in experience, involvement with co-management activities, expenditure on evasion activities, and income between violators and non-violators among different groups of fishermen?

Descriptive findings for the respondents' compliance behavior are summarized in Table 2. For more information about respondents' profile, see Appendix G. We used comparative analysis to provide insight on four characteristics of the respondents (income, experience, size of the boat, and expenditure on evasion activity) between violators and non-violators, and among different types of fishermen (trawlers, purse seines, and drift nets fishermen). From the results, it may be seen that the mean of the co-management index is higher for non-violators than violators. The mean of the co-management index for non-violators (trawler fishermen) is 2.1, while for violators only 1.2. The result suggests that fishermen who are more actively involved in co-management activities are more tendencies to comply with the fishery regulations. The same situation occurs with purse seine versus drift net fishermen. Whereas the mean of the co-management index (*CO-M*) for non-violators (purse seiner fishermen and drift net fishermen) is 2.3, the mean of the co-management index for violators (purse seiner fishermen) is 2.2. However, the co-management index for violators (drift net fishermen) is only 0.8.

Fishermen's income was defined in the survey as the sum of the monthly cash income from fisheries activities. As shown in Table 2, mean income (*INCOME*) of violators was higher than that of non-violators. For example, the mean income for trawlers who violate the regulations (violators) is RM1,598 per month, while the mean income for non-violator trawlers (complier) is only RM1,102 per month. In other words, the result suggests that income might be one of the factors that influence fishermen to violate the regulations.

The result also shows that mean expenditure on evasion activity (*EXPEVA*) by non-violators is higher than that of violators for trawler and purse seine fishermen. For trawler fishermen, non-violators spent about RM2,194 per month for evasion activity, compared to violators, who spent only RM1,349 per month. The same characteristics were found for purse seine fishermen. Non-violators (purse seine fishermen) spent about RM2,364 per month for evasion activity, compared to violators, who spent only RM1,465 per month. These descriptive findings indicate that fishermen who spend more on evasion activity are more likely not to get caught by enforcement officers.

### Inferential Statistics: Pearson Correlation

*Research Question 2:* Is there any correlation among these variables: experience, age, level of education, size of the vessels, horsepower of the vessels, income and co-management activities among fishermen in Peninsular Malaysia?

The Pearson Correlation Matrix for the seven interval-scaled variables is shown in Table 3. From the results, we see that the co-management index is, as would be expected, significantly, positively correlated with experience, age, and size of the boats (*SIZE*). That is, more experienced (*EXPER*) fishermen are more likely to be involved with co-management activities (*CO-M*). Fishermen with bigger boats (*SIZE*) are also more likely to be involved with co-management. Age (*AGE*) is negatively correlated with education (*EDUC*). That is, older fishermen have less education compared to younger fishermen. However, we found that older fishermen (*AGE*) are more likely to be involved with co-management activities (*CO-M*).

**TABLE 2: DESCRIPTIVE STATISTICS: COMPARATIVE ANALYSIS BETWEEN GROUPS OF FISHERMEN**

Fishing Equipment	Violate	Variables	N	Minimum	Maximum	Mean	Std. Deviation
<b>1. Trawler</b>	No	Experience	58	4	45	22.11	11.61
		Co-management	58	0	7	2.05	2.06
		Expeva	43	0	11000	2194.19	2924.94
		Income	58	300	5000	1101.75	1053.14
	Yes	Experience	88	1	58	21.01	12.82
		Co-management	88	0	6	1.18	1.80
		Expeva	66	0	15000	1349.24	2652.12
<b>2. Purse seine</b>	No	Experience	48	1	55	24.63	13.91
		Co-management	48	0	7	2.29	1.60
		Expeva	22	0	20000	2363.64	5379.99
		Income	47	300	10000	1082.98	1454.13
	Yes	Experience	29	2	53	19.34	14.27
		Co-management	29	0	8	2.17	1.89
		Expeva	23	0	20000	1465.64	4141.98
<b>3. Drift net</b>	No	Experience	55	1	41	21.69	11.83
		Co-management	55	0	8	2.25	2.82
		Expeva	41	0	6000	1575.61	1386.32
		Income	55	300	5000	1156.36	929.91
	Yes	Experience	6	4	35	23.33	14.07
		Co-management	6	0	2	.83	.75
		Expeva	2	100	3000	1550.00	2050.61
		Income	6	500	3000	1433.33	1025.02

Note: Expeva = expenditure on evasion activity

We also find that income is positively correlated with experience, size of boat (*SIZE*), and size of engine (*HP*). The correlations are all in the expected direction. However, more experienced and older fishermen have a lower level of education (correlation of -0.49 and -0.46). It is important to note that the correlation between experience (*EXPER*) and age (*AGE*) is very high (i.e. 0.72) and significant. We have expected this result because

older fishermen, obviously, have more experience in the fishing industry. From this information, we will only use *EXPER* in the regression analysis, and leave out *AGE*, to avoid the multicollinearity problem.

**TABLE 3: CORRELATION MATRIX BETWEEN VARIABLES, PENINSULAR MALAYSIA**

	EXPER.	AGE	EDUC.	SIZE	HP	CO-M	INC.

INC.							1.000

\*\* Correlation is significant at the 0.01 level (2-tailed);

\* Correlation is significant at the 0.05 level (2-tailed).

The Pearson correlation matrix also indicates that experience (*EXPER*) is positively correlated with co-management (*CO-M*) activities, while education (*EDUC*) is negatively correlated with experience (*EXPER*). A question that arises is whether the fishermen are able to manage fisheries resource through co-management because of their lack of knowledge and know-how. However, the relevant knowledge about fishery is not the same as formal education. It is well known that knowledge about fishery that has been accumulated by the fishermen via cultural transmission is relevant for resource management. Thus we can say that level of education does not determine degree of involvement with a co-management program, but experience does influence level of involvement. The findings appear to be consistent with the views of Pomeroy *et al.* (2001) that knowledge about cultural background and experience of the fishermen are two important factors for a success of co-management system. If the Department of Fisheries wants to encourage fishermen to get involved with co-management activities, they should use a simple but practical extension program to make sure all the fishermen understand and are willing to participate in the program.

#### **Involvement in the regulatory system**

*Research Question 3:* Is there any difference in the degree of involvement in the design and operation of the fishery regulation among different groups of fishermen?

The surveyed fishermen were also asked to state their opinions regarding their involvement with the regulatory system. We expect that fishermen who are actively involved with the regulatory process are more likely to comply with zoning regulations. The findings are reported in Table 4. Sixty-two percent of drift nets as well as purse seines fishermen reported that they were involved (very involved, quite involved and involved a little) with the regulation system, compared to 46 percent of trawler fishermen. However, 11 percent of the trawler fishermen reported that they were not involved with the regulatory system, compared to only two percent of the drift nets fishermen. This result suggests that drift nets and purse seines fishermen are more involved in the regulation system, compared to trawler fishermen. That is, there is a significant difference in degree of involvement with the regulation system among fishermen using trawl nets, purse seine nets, or drift nets. A higher percentage of involvement with regulation system for drift nets fishermen can perhaps be explained by the popular opinion that this group of sustainability of the fishery resources. Discussions with the Department of Fisheries confirmed that most drift-nets fishermen were quite involved with their (DOF) activities compared to trawler and purse seine fishermen.

**TABLE 4: INVOLVEMENT IN THE REGULATORY SYSTEM**

Response	Trawl nets	Purse seines	Drift Nets	Total
Very involved?	2 (1.6%)	2 (2.6%)	3 (6.4%)	7 (2.8%)
Quite involved?	31 (25.2%)	12 (15.8%)	15 (31.9%)	58 (23.6%)
Involve a little?	24 (19.5%)	21 (27.6%)	11 (23.4%)	56 (22.8%)
Not involved?	52 (42.3%)	34 (44.7%)	17 (36.2%)	103 (41.9%)
Actively ignored?	14 (11.4%)	7 (9.2%)	1 (2.1%)	22 (8.9%)
<b>Total</b>	<b>123</b> (100.0%)	<b>76</b> (100.0%)	<b>47</b> (100.0%)	<b>246</b> (100.0%)
Response	Trawl nets	Purse seines	Drift Nets	Total
Involved	57 (46.3%)	35 (46.1%)	29 (61.7%)	121 (49.2%)
Not-Involved	66 (53.7%)	41 (53.9%)	18 (38.3%)	125 (50.8%)
<b>Total</b>	<b>122</b> (100.0%)	<b>76</b> (100.0%)	<b>58</b> (100.0%)	<b>246</b> (100.0%)

Note: Q 48: How big a say do you think you personally have in the design and operation of the fishery regulation?

Are you (tick only one answer)?

#### **Compliance behavior of peers**

*Research Question 4:* Is there any difference in perception towards compliance behavior of other fishermen among different groups of fishermen?

To assess the respondents' perception towards compliance behavior of other fishermen in their fishing areas, they were asked to report other fishermen's behavior toward zoning regulations. As shown in Table 5, 62 percent of trawler fishermen reported that other fishermen violated the zoning regulation; compared to only 38 percent of drift net fishermen, and 37 percent of fish purse seines reported their peers did not comply with the regulations. In other words, a majority of trawler fishermen reported that other fishermen usually violated the regulations. This finding shows that majority of trawlers had the perception that violation of the zoning regulations was a normal activity in the fishery.

**TABLE 5: COMPLIANCE BEHAVIOR OF PEERS**

Response	Trawl nets	Purse seines	Drift Nets	Total
All comply with the zoning regulations most of the time	10 (7.0%)	2 (2.6%)	16 (27.6%)	28 (10.1%)
Most comply with the zoning regulations most of the time	44 (31.0%)	46 (60.5%)	20 (34.5%)	110 (39.9%)
A large minority regularly violates the zoning regulations	53 (37.3%)	21 (27.6%)	4 (6.9%)	78 (28.3%)
Many regularly violate the zoning regulations	16 (11.3%)	5 (6.6%)	15 (25.9%)	36 (13.0%)
Most regularly violate the zoning regulations	19 (13.4%)	2 (2.6%)	3 (5.2%)	24 (8.7%)
Total	142 (100.0%)	76 (100.0%)	58 (100.0%)	276 (100.0%)
Response	Trawl nets	Purse seines	Drift Nets	Total
Not-violate	54 (38.0%)	48 (63.2%)	36 (62.1%)	138 (50.0%)
Violate	88 (62.0%)	28 (36.8%)	22 (37.9%)	138 (50.0%)
Total	142 (100.0%)	76 (100.0%)	58 (100.0%)	276 (100.0%)

Note: Q41: Considering the skippers of other vessels in your areas, would you say that (tick only one answer)?

**Estimation Results**

The individual's supply of violations shown in equation [7] (page 93) is specified as

$$V_i = f(Y_i, p_i, F_i, CO-M_i, \mathbf{M}_i, \mathbf{L}_i, \mathbf{S}_i, \mathbf{X}_i).$$

Where  $V_i$  is the self reported violation rate,  $p_i$  is the perceived probability of detection,  $F_i$  is the expected size of the penalty if caught ( $F_i$ ), and CO- $M_i$  is the level of involvement with co-management activities.  $\mathbf{M}_i$ ,  $\mathbf{L}_i$ , and  $\mathbf{S}_i$  are vectors of variables measuring moral obligation to comply, perceptions of regulatory legitimacy, and social influence. While  $\mathbf{X}_i$  is a vector of variables to describe the characteristics of the fishermen and his vessel.

As suggested by Ehrlich (1973), Kuperan & Sutinen (1998) and Hatcher, Jaffry, Thebaud & Bennet (2000), there is the possibility of bias arising from an endogenous relationship between  $V_i$  and  $p_i$ . In order to overcome any simultaneity bias arising from an endogeneity between the left- and right-hand sides of the function, this study will estimate a two simultaneous equation system (following Kuperan & Sutinen 1998). A subjective probability of detection function was estimated as

$$p_i = f(CONV_i, \mathbf{X}_i),$$

where  $CONV_i$  is experience of conviction,  $\mathbf{X}_i$  is a vector of variables to describe the characteristics of the fishermen and his such as experience, size of the boat, and horsepower ( $EXPER_i$ ,  $SIZE_i$  and  $HP_i$ ), fishermen's expenditure on evasion activities ( $EXPEVA_i$ ) and fishing areas ( $AREA_i$ ).

### **Hypothesis 1: Use of the Logit Estimation on Probability of Detection**

*Research Question 5:* To what extent will the six independent variables of the experience of being convicted, experience in the fishery activity, size of the boat, horse-power of the boat, expenditure on evasion activities, and fishing areas explain the variance in the perception of probability of detection by an individual fisherman?

H1<sub>A</sub>: The six independent variables (the experience of being convicted, experience in the fishery activity, size of the boat, horse-power of the boat, expenditure on evasion activities, and fishing areas) will significantly explain the variance in the perception of probability of detection by an individual fisherman.

The results of the logit analysis of the estimated probability of detection are summarized in Table 6. To evaluate the goodness of fit, the predictive ability of the model is calculated. It is found the percentage correctly predicted is 77.4%. Thus, it is concluded that the model estimated has satisfactory predictive ability. The Pseudo R<sup>2</sup> (i.e., 0.29) is quite reasonable and the computed value of the Wald test statistics (i.e., 49.21) is much larger than the critical value of the chi-square statistics with 13 degrees of freedom. The null hypothesis that the non-intercept coefficients are jointly zero is rejected at the 1 percent level. This means that the empirical logit model is highly significant in explaining the perception on probability of detection by fishermen.

From 284 observations, only 186 observations were used in this regression because of the problem of missing observations (98 observation). This represents an attrition rate of 34.5%. Of the 186 usable observations, 98 were violators (52.69%) and 88 non-violators (47.31%).

From Table 6 we can see that the experience of conviction (*CONV*) is found to have a significant negative impact on the probability of detection. The results suggest that those who had experience in violating the regulation and got caught (self-reported), *ceteris paribus*, perceived themselves as having a lower probability of detection. Looking at the p-values we can say that the coefficient is significantly different from zero at the 5% level. It is postulated that the history of fisherman 'i' with enforcement officials can influence perception towards probability of detection. In terms of the discrete change, those who have experienced conviction, have a 27.6% lower probability of detection. The significant and negative sign on the experience of conviction (*CONV*) towards probability of detection (*p*) follows the theory as has been mentioned in compliance literature.

Fisherman's experience (*EXPER*) does affect perception of probability of detection. The coefficient of *EXPER* is negative, and significant at the 10% level. That is, more experienced fishermen, *ceteris paribus*, perceive a lower probability of detection compared to their less experienced counterparts. Since experienced fishermen are likely to be older, the result is consistent with the contention that older fishermen have more knowledge about how to evade enforcement. Besides, we also find that the expenditure on evasion activity (*EXPEVA*) variable is significant in explaining the probability of detection model at the 5% level. In fact, it is found that more expenditure on evasion activity (other things equal) will reduce the probability of detection. The coefficient of *HP* in Table 6, even though negative, is not significant. Thus, perception of the probability of detection is not different between a fisherman using a faster boat and their slower boat counterparts.

**TABLE 6: LOGIT ESTIMATION OF THE PERCEIVED PROBABILITY OF DETECTION**

Variables	Expected Sign	Estimated Coefficients	Marginal Effect/ Discrete change	P-value
The experience of conviction ( <i>CONV</i> )	+	-1.1345	-0.2755	0.021**
Experience in fishery sector ( <i>EXPER</i> )	-	-0.0312	-0.0078	0.063*
The weight of boat ( <i>SIZE</i> )	-	0.0007	0.0002	0.952
The power of the vessel ( <i>HP</i> )	-	-0.0003	-0.0001	0.323
Expenditure on evasion activity ( <i>EXPEVA</i> )	-	-0.0003	-0.0001	0.007**
Fishing areas - Kedah Utara ( <i>Da_1</i> )	+/-	-2.0736	-0.4464	0.009**
Fishing areas - Kedah Selatan ( <i>Da_2</i> )	+/-	-2.1545	-0.4678	0.000***
Fishing areas - Krian ( <i>Da_4</i> )	+/-	-2.6812	-0.4764	0.023**

Intercept ( <i>_cons</i> )		2.9520		0.000

Notes:

1. For the dummy variable of Fishing area (*Da\_*), the comparison group is Perlis.
2. For the continuous variables (*EXPER*, *SIZE*, *HP*, *EXPEVA*), the value shown is marginal effect. The marginal effect is evaluated by holding all the other variables at their mean values respectively. For the dummy variables, the value shown is the discrete change from zero to one. The discrete change is evaluated by holding all the other variables at their mean values respectively.
3. Log likelihood = -91.48; Wald Chi-square (D.F.) = 49.21 (13); Pseudo's  $R^2 = 0.29$ ; and Percentage of Correct Predictions = 77%.
4. \*\*\*, \*\*, \* Indicate that the variable is significant at the 1%, 5% and 10% level respectively

Lastly, statistically significant parameter estimates show that *AREA* is significant in influencing the perceived probability of detection. Compared to Perlis, it is found that four areas, namely the Kedah Utara, Kedah Selatan, Krian and Bachok areas have a lower probability of detection than Perlis. The significant effect of the variable *AREA* (4 dummy variables) is indicative of the fact that different fishing areas do affect the perception of probability of detection. The significant effect of area may be due to the fact that the monitoring and enforcement strategies vary across fishing areas. Some fishing areas have more enforcement officials per fisherman compared to other fishing areas, where this would imply a greater probability of being caught violating the zoning regulations.

**Hypothesis 2: Use of the Logit Estimation on Probability of Violation.**

*Research Question 6:* To what extent do the economic factors (Probability of Detection, Penalty and Illegal Gains), demographic factors (experience, family size, income, size of the boat, the power of the vessel, ownership of the vessel, involvement with the designing and operation of the fishery regulations, perception on penalty severity, type of fisherman, and fishing areas), co-management index, and non-economic factors (legitimate, moral and social influence) explain the variance in the probability of individual fisherman violating a fishery regulation?

H2<sub>A</sub>: The four independent variables, namely, the economic factors, demographic factors, non-economic factors (normative factors) and co-management index will significantly explain the variance in the probability of violation by an individual fisherman.

Table 7 presents the logit estimation of probability of violation. To evaluate the goodness of fit, the predictive ability of the model is calculated. It is found that the percentage correctly predicted is 82.9%. Thus, it is concluded that the model estimated has satisfactory predictive ability. The Pseudo R<sup>2</sup> (i.e., 0.44) is reasonable and the computed value of the Wald test statistics (i.e., 87.74) is much larger than the critical value of the chi-squared statistics with 33 degrees of freedom at the 1 percent level. This means that the empirical model is significant in explaining the probability of violation by fishermen.

From 284 observations, only 146 observations could be used in this regression because of the problem of missing observations (138 observations). This represents an attrition rate of 48.6%, which is rather high. Of the 146 usable observations, 76 were violators (47.95%) and 70 non-violators (52.05%).

From Table 7, at the 5% significant level, the estimated probability of violation (*VIOLATE*) is found to be negatively related to perceived probability of detection (*DETECT*), co-management index (*CO-M*). *VIOLATE* is positively related with the power of the vessel (*HP*), illegal gain (*IG*), type of fishermen (*DTYPE1*) and self-regulation (*REG*).

The finding that the probability of violation *VIOLATE* is negatively related to the probability of detection *DETECT* is expected – it follows from the theoretical predictions made earlier (in addition, the estimate is significant at the 5 percent level). A negative sign implies that the higher the perceived probability of detection, the lower the probability of a violation.

The co-management index *CO-M* is found to have an effect on the probability of violation. We have expected that the higher the co-management index, the lower probability of violation. The inverse relationship between probability of violation and the co-management variable *CO-M* suggests that fishermen who are more involved in the design and implementation of the management system are less likely to violate zoning regulations. There appears to be a positive relationship between the horsepower of fishermen's engine (*HP*) and probability of violation. Fishermen with more powerful engines are more likely to violate regulations because of the potential for them to get away very quickly.

Illegal gain (*IG*) is an influential factor in the violation models, as implied by the positive coefficient of *IG*. As expected from the theory of deterrence, the size of illegal gains does influence fishermen's tendencies to violate the regulations – the bigger the gain the higher is probability of violation.

Compared to those who use "purse seine nets and others", fishermen who use "trawler" (*DTYPE 1*) are found to have a higher probability of violation. This positive relationship is significant at the 5% level.

Self-regulation (*REG*) is found to have an unexpected positive relationship with probability of violation. The positive sign for the *REG* variable implies that a fisherman who says there is some form of agreement among fishermen in the fishing areas is found to have a higher probability of violation. This may appear puzzling but it could be because the fishermen know about the agreements but do not care about them, and still violate the regulation.

**TABLE 7: LOGIT ESTIMATION OF THE PROBABILITY OF VIOLATION**

Variables	Expected Sign	Estimated Coefficients	t-statistic
MORAL	-	-0.066	-0.477

Notes:

1. Log likelihood = -56.35; Wald Chi-square (D.F.) = 87.74; Pseudo's  $R^2$  = 0.44; and Percentage of Correct Predictions = 83%.
2. \*\*\*, \*\*, \* Indicate that the variable is significant at the 1%, 5% and 10% level respectively.
3. CMDA is interaction between co-management and fishing areas

## Discussion and Conclusions

The purpose of this research is to examine the determinants of fishermen's behavior with a focus on the impact of traditional monitoring and enforcement practices, and co-management strategies. Our results provide some insights for public policy making. The basic finding that probability of detection and involvement with co-management activity are negatively related with violation decisions implies that fishery policymakers can do a number of things for effective strategy to improve regulatory compliance in fisheries.

Firstly, a higher probability of detection and penalty from enforcement activities will discourage people from committing illegal activities. Improving the enforcement process and its intensity can do this. As noted above, in almost any group of individuals subject to regulation there is a core subgroup of chronic violators motivated by high return (illegal gains) of their actions. Enforcement institutions are very well established in Malaysia, so what is needed is to implement enforcement more effectively. However, this policy, which depends on central management, is not very economical because of the high costs of monitoring and enforcement. For example, the number of staff and patrol boats for law enforcement is limited compared with the coastal length of 1,640 km and the huge number

of fishing vessels (i.e. 18,846 fishing vessels in year 2001) that operate various types of fishing gears. Besides that, the construction and operation costs of patrol boats are quite expensive. It is reported that the enforcement institutions such as Department of Fisheries allocates quite a big budget for monitoring activities, yet it is still inadequate. When the capacity of enforcement resources is limited many violators will escape detection. The prospect of a hefty fine clearly provides an incentive to engage in such evading activities. As the regression of probability of detection model has shown, as expenditure on evading activities increases, the fisherman's perception of the probability of detections decreases. The findings show that even through improving probability of detection and increasing penalty severity to the violators can influence compliance behavior, factors such as budget constraint and spending on evading activities can make this strategy to be limited in improving regulatory compliance. However, since improving probability of detection and increasing penalty severity to the violators can influence compliance behavior, policy makers still should use this technique in addition to another alternative technique such as co-management programs.

Secondly, the significance of the amount of illegal gain (*IG*), in the decision to violate, poses some serious problems to policymakers. A large fine with a small probability of being detected may result in the optimal fine being lower than the offender's illegal gain. So, there is more incentive for fishermen to violate the regulations to get the benefits from the illegal activity. This action follows the theory of compliance from economic perspectives. It is interesting to note that in a somewhat different model, Kuperan & Sutinen (1998) obtained results of a similar nature. These authors developed a violation model with the difference in income potential between fishing inshore and offshore as one of their independent variables. They found, inter alia, that if enforcement becomes more successful at keeping trawlers out of inshore areas, the difference in the catch per unit effort between the two zones will become more pronounced, increasing the incentive for fishermen to violate. From the perspective of policy design, a given target level of compliance can be achieved by increasing the magnitude of the fine to these violators.

Thirdly, we also found that trawler fishermen are more likely to violate zoning regulations compared to other types of fishermen. Thus if the regulator's objective is to monitor fishermen's activities where it is more likely to observe non-compliance, then, in order to make the most of its limited resources, enforcement activities should concentrate more on monitoring the trawler fishermen. The argument is a simple one. When we know the groups that frequently violate the regulations, the least costly way to achieve a given expected compliance is to use enforcement resources on this group of fishermen. Department of Fisheries (DOF) can control the number of fishermen using trawl nets as their fishing equipment. No more licenses should be issued to the new fishing vessels that want to use trawl nets. Only the fishermen who have this type of fishing equipment licenses can apply for an annual extension of their fishing licenses. Even DOF can set a policy that the fishing licenses are non-transferable to other operators. When fishermen die, the normal practice is that the licenses are transferable to their children. We suggest that DOF should make a regulation that fishermen's children have to change their fishing equipment from trawl nets to drift nets or purse seine nets. Hopefully this policy can control the number of fishermen using trawl nets equipment.

Lastly, we found that fishermen who were more involved in the co-management activity were more likely to comply with zoning regulations. This study shows that non-monetary factors such as co-management approach can improve compliance decision. Instead of depending on monitoring and enforcement, application of co-management strategies in the fishery industry can be seen as a complement to the normal practice, which depends on deterrence strategies. The significance of the co-management variable in the decision to violate posits some good new ideas for policymakers. Application of co-management needs co-operative participation among the fishermen as resource users, stakeholders, such as the tourism industry, non-government organizations, academicians, boat owners, fish traders and the government. The government makes regulations based on scientific information plus local knowledge of the status of the resources, while the users, recognizing the long term benefits to them of good management, follow and enforce better management practices.

## Abstract

According to Mead's (1934) symbolic interaction theory, social roles are learned through interaction and experiences in everyday life. Over time, these rules of behavior become internalized and serve to structure one's actions accordingly. Ultimately, these rules provide us with a powerful means of controlling our actions, and in time, they define our identity. Transforming the socialization process is one's conscious interpretation of stimuli through the use of symbols, which acquire their meaning beginning in childhood. Furthermore, society's perceptual processes can be shaped by the symbols we learn, and we as a society see only what our culture has determined is "worth" seeing. The meaning of symbols can be learned from a variety of social influences, one of which may be mediated messages and advertising. This paper attempts to establish a link between media exposure and one's perception of social reality regarding character judgements made of unknown others based on the target's product or brand usage. Using magazine advertisements for fictitious products, the experiment herein seeks to establish two fundamental goals: 1) to determine if perceptions can be manipulated via association with companion symbolic elements; and 2) to detect whether television exposure is a moderating factor. Respondents were asked their perceptions of both product quality and of product users.

## Introduction

We as humans possess the ability to communicate using symbols. This is done through the use of words. Other methods, such as icons denoting a restroom, communicate symbolically. All these examples illustrate a common denominator - society has reached a level of shared agreements between the symbols and the referent objects or ideas they represent. Factors that influence symbolic meaning are largely social in nature. It is a combination of social agents that "negotiate" meaning of what symbols represent.

Another agent of social influence is one's exposure to mass media. Many argue society and media influence each other in a dialectic relationship. Certainly media exposure is part of a social learning process of symbolic meaning regarding products and brands that we as consumers purchase.

Another form of symbolic communication is symbolic consumption- the use of brands or products as "tools" to communicate the construction of the "self". Interesting is the role that media plays in such "symbols for sale", and the relation to one's perception of social reality by their usage. Advertising can serve to create or maintain a brand's "personality" or "meaning", but this meaning is also negotiated through the interaction of one's self and society. Because many marketing efforts are aimed at creating a brand's personality in the interest of differentiating it from similar, competing products, it seems apparent that consumers accept in part these fabrications via symbolic consumption to "say" something about one's self. This concept serves to illustrate that society and marketing influence each other.

As receivers of symbolic communications from others, people make judgments of others based on heuristic cues involving brands or products. The research reveals that communication may be intended by the consumer.

## Literature Review

### Symbolic Interaction

George Herbert Mead (1934) provided unique insight for understanding social life in ways different than behaviorist notions that one's learning is influenced by social environment. Contrasting the behaviorist notion that views people and social life as stimulus-response mechanisms, Mead proposed a "socialist" behaviorism concept, inclusive of the social environment in which learning takes place.

Social roles are learned through interaction and experience in everyday life situations. Over time, people internalize the inherent rules in situations and structure their actions accordingly. Once internalized, these roles provide us with a powerful means of controlling our actions, and in time, they define our identity.

Definitions of three terms relevant to symbolic interaction are prudent. Based on Baran and Davis's(1995) summary of these terms, a *sign* is any element in the environment used to represent another element in the environment. Artificial signs only function properly if two or more people agree on their meaning and respond to that sign in a consistent fashion.

*Signals*, within the symbolic interaction context, are artificial signs that produce highly predictable responses (like traffic signals). *Symbols*, conversely, are artificial signs, for which there is less certainty of response and may be more dependent on context. As Faules and Alexander (1978) explain, "Signals are used to regulate normative behavior in a society, and symbols are used to facilitate communicative behavior in a society"(p.36).

Central to the focus of the current research are the meanings that products and brands can communicate to others. While many social agents exist that influence one's perceptions, mass media also play an active role in illustrating their viewers what symbolic meanings are attached to a brand or product class. Television viewers are constantly exposed to possessions that act as symbols to help communicate concepts, which serve to paint a picture more clearly. One perspective is that media also influences and helps shape society's "understanding" of product meanings.

In the case of brand names, however, it is certain that society is not the only influence of brand's meaning or personality. Successful marketing efforts create to their audience specific brand meanings and brand personalities. As a result, it will be shown in this research that consumers may, in turn, use such brand meanings as "tools" to communicate similar meanings in construction of the "self".

In an effort to confirm these main dimensions and their generalizationability, a study was conducted using a different sample of brands and subjects. The results showed that the same number of factors resulted with similar weights as those factors as revealed in the first sample.

In regard to commercial promotion of goods and services, a dialectical relationship exists between advertising and the consumer. While advertising helps create, modify, and transform cultural meanings for the consumer, it also represents shared cultural meanings from the consumer's worldview and invests it into advertised products.

Liagas and Cotte(1999) explore brand meaning and consumer negotiation within a framework consisting of three environments-marketing, individual, and social- using a symbolic interactionists perspective. They claim a brand does more than signal its utilitarian attributes- it can also have particular meaning, making the product personally meaningful for the consumer and intrinsically relevant. Brand meaning offers a mode of communication- an agreed upon way of recognizing the product. In order for brand meaning to apply in social contexts, meaning agreements are necessary regarding three component: physical make up, functional characteristics, and characterization.

### Cultivation, Symbolic Conditioning, Thought Processing and Persuasion

Aspects regarding the effects of mass media on audiences may explain how TV can 'teach' viewers meanings associated with symbolic communication and perceptions of societal beliefs. Cultural analysis, developed by George Gerbner(1976), combines aspects of both macroscopic and microscopic cultural theories. It can be considered macroscopic because it addresses broad questions about the role of media in society, and microscopic because of its relation to and measurability of individual viewers. Simply stated, cultural analysis claims that the more people watch TV, the more they tend to perceive the world as its presented on TV rather than how statistics show it to be in

reality.

Cultivation analysis does not claim people are unable to separate the "real" world from the TV world in a childlike naivete. Rather, that our perceptions of reality are subtly, gradually, and unknowingly skewed towards TV presentations or reality. As Baran and Davis summarize(1995), the central argument is "TV 'cultivates' or creates a world views that, although possibly inaccurate, becomes the reality simply because we, as people, believe it to be the reality and base our judgements about our own, everyday worlds based on that 'reality'"(p.303).

Cultivation analysis research(i.e., Gerbner, 1976; Gerbner and Gross, 1976; Gerber, Gross, Morgan, and Signorielli, 1980; Morgan and Shanahan, 1997; and Gerbner, 1998) makes five fundamental assumptions. The first is that TV is essentially and fundamentally different than other forms of mass media. TV is virtually ubiquitous in home, it does not require literacy, it's free, it combines pictures and sound, and it allows "interaction" beginning with the toddler stage and extends through to the elderly. A second assumption is that the medium is the "central, cultural arm" of Society. And the third assumption further relates to the shared reality concept. " The substance of the consciousness cultivated by TV is not so much specific attitudes and opinions as more basic assumptions about the 'facts' of life and the standards of judgement on which conclusions are based(Gargner and Gross, 1976, p.175. Fourth T.V.'s major cultural function is to stabilize social pattern and to cultivate resistance to change. The fifth assumption of cultivation research is that the observable, measurable, independent contributions of TV to the culture are relatively small.

The method used by cultivation researchers to scientifically demonstrate the concept of TV as a culturally influential medium employs a four-step process. First reoccurring and consistent presentations of images, themes, values, and portrayals. The second step is formulation of questions about the viewers' social realities. Surveying the audience is the third step-posing those questions developed, and other questions concerning TV consumption. The fourth step is to compare the social realities of light and heavy viewers.

Cultivation theorists argue that T.V.'s main contribution is cultivation-a process relating to coherent frameworks or knowledge and to underlying general concepts. This occurs, in part, from "mainstreaming". Closely associated with the concentration of this paper's focus of symbolic consumption, Harmon(2000) conducted cultivation research aimed at connecting TV exposure and one's sense of materialism. He contends that the most consistent and significant message of TV is commercialism and that place to look for the long-term, subtle, and persuasive effects of TV is in materialism among heavy viewers. TV(i.e., symbolic usage and advertising efforts) may teach viewers learning which consumable items serve as signifiers that we in turn feel a need to possess for reasons of image management for the self and to project to others.

## **Hypothesis**

As demonstrated, symbolic interaction reveals insight to the role of marketing efforts affecting the perception of consumable symbols as signifiers of meaning. Combining the concepts of symbolic interaction and elements related to media exposure, persuasion, and advertising involve symbolic consumption that may serve to create or maintain the construction of "self". Also, exposure to media exposure other than advertising(i.e., T.V. programming) implicate broader issues less related to brands, but more so to the consistent, overall message patterns relating to consumerism and materialism in general. Through an understanding of the implications of mass media affecting audience perceptions, one can become more sensitized to the pervasive glamorization of material goods that audiences learn to signify.

The broader implications that media exposure imposes on the topic of symbolic consumption implies a need not to separate branded products as the only opportunity for symbolic communication. Mass media influences outside the world of advertising are apparently among the various social agents that define or maintain our understanding of symbolic referents. Thus communicative ability can also be achieved through the ownership and display of non-branded products, attributable in part by media consumption and the alleged link to heavy viewers' potentially skewed perception of social reality, which may suggest concepts related materialism.

Intuition suggests that interactions exist between symbolic "understanding" of brand names and one's exposure to advertising. Although advertising is as ubiquitous as mass media, audiences are more captive with T.V.

compared to other forms of mass media(Morgan and Shanahan, 1997; Garbner, 1998). T.V. viewers are all too familiar with the concept of watching their favorite programs and having to "pay" the price by enduring the commercials. It would seem that the more one is exposed to T.V. advertising, the more one is likely to become familiar with brands and their associated meanings and personalities, and therefore be more likely to infer associated symbolic meanings of other consumers based on brand name usage. Along these same lines about consumers based on brand name usage due to their lack of advertisement-created "knowledge".

Similarly, with regard to symbolic meanings based on product type-regardless of brand name-it is suspected that T.V. exposure in general may contribute to this social "learning process. Based on consideration of such research that did not involve brands-but product by type-that support symbolic communicative ability, it seems likely that mediated influences beyond marketing efforts(i.e., T.V. programming contents) are at play.

The combined findings of the research reported herein lead to the following four hypotheses that are based on the potential influences of companion brands or products within fabricated advertisements as stimuli.

Two ads used to test these hypotheses will use companion branded products, while another two ads will use companion products as a class. All four hypotheses regard perceptions concerning either the proposed product itself of character judgment of an unknown other target who uses the proposed product.

H1: Proposed products will be perceived more favorably when accompanied by "upscale" companion products compared to "practical" companion products.

H2: Proposed products accompanied by "upscale" companion products will be perceived more favorably by heavy T.V. viewers than light viewers.

H3: Alleged users of proposed products will receive more favorable character judgments when the companion products are "upscale" compared to "practical".

H4: Alleged users of proposed products accompanied by "upscale" companion products will receive more favorable character judgments among heavy viewers than light viewers.

## **Methodology**

This study is a 3 X 3 factorial design seeking to establish a link between T.V. exposure and product/consumer perceptions based on the manipulation of accompanying elements shown in fabricated magazine advertisements for fictitious products. Respondent's T.V. exposure is categorized into three categories(light, medium, and heavy); the stimulus material also has three versions. Each of the ads contain manipulated referent materials in categories of "upscale," "practical," or neither(as a control). Headlines, body copy, product name, and packaging remained the same between all three versions. The accompanying/companion elements manipulated(with each ad) were either brand name products or products as a class. Support for H1 and H3 will reveal the main effects of the ad versions. In other words, support will suggest that the experimental manipulations served as cues that created a symbolic "meaning: or "understanding: for the new product(or its users) via association with the companion branded products or "environments." As support found for H2 and H4 will reveal an interaction between T.V. consumption and the adoption of such symbolic communications, such may illuminate whether such socially understood symbolic "meanings" are influenced directly by T.V. exposure measures.

### **Pretest**

The stimulus material ultimately compares products and brands having opposing positions of perceived "meanings," similar to Baran et. al.'s(1989) shopping list design that compared "upscale" and "practical" products. Unlike the Baran et.al. study, the present experiment uses companion products that may act as indirect cues to influence judgements of advertised product and/or product users. To establish relevant, bipolar category comparisons for the stimulus material in the main study, a pretest was necessary to measure the strength and congruency of such perceptions. The results of the pretest were meant to provide insight as to which brands to group together in the first two advertisements of the main study slated to use branded companion products.

Respondents were surveyed regarding their perceptions on six categories of products-carry-out coffee, cars, watches, magazines, MP3 players, and sunglasses. Each of the six product category evaluations contained four individual color photographs of branded products. All photographs showed only isolated products-that is, they were presented

on white backgrounds completely void of any competing elements within each product categories, subjects were asked to indicate on a photo.

For each of the six product categories, subjects were asked to indicate on a 10-point continuum where each product ranked from "upscale"(1) to "practical"(10). For example, pictures of four watches were shown to respondents who were asked to indicate where they felt each watches ranked on the continuum. After evaluating those four individual items, subjects were asked, "Among these four watches(product type), which do you consider the most practical?"(The underscoring appeared in the response material for emphasis.) The last question for each category asked, "Among the remaining three watches(product type), which one do you consider the most upscale?" This same format was followed for all six product categories.

The brand names for each product category that revealed the greatest agreement for "upscale" and "practical" were used in the second phase of the study. In order to maintain internal validity, the criteria for selecting respondents in the main study met similar selection criteria for the pretest subjects.

### **Main Study**

The stimulus fabricated magazine advertisements for fictitious products were presented to respondents as "proposed magazine ads for new products." Three different versions of advertisements were created for each of the three fictitious products- practical, upscale, and control. Therefore, nine different advertisements were produced in all. Two ads varied the brand names of the companion elements, the other varied product category or type suggested by setting of the companion elements, without the use of brand names. The first two ads-for car wax and a portable clock- varied on the name brand names visible on the incidental companion products. For example, the advertisement created for the "proposed" product Max Wax car wax also included other products, placed incidentally in the ad. In the foreground, a hand held the car wax product that also had a watch on the wrist; in the background was a car with a pair of sunglasses on the car's hood-varied were the type of watch, car, and sunglasses. The control version for the car wax ad had no wristwatch. The car and sunglasses were both substantially blurred in the background to make indistinguishable any brand-identifying resemblance.

Another two sets of ads showed the product pictured with other items, but these ads did not use accompanying brand name products-instead they used product category or types to suggest status. For example, The third ad for silverware shows an environmental table setting. One version suggested "upscale" by showing a dining room in candle light, cloth napkins, a linen tablecloth, fresh flowers, and long stemmed glassware. The opposing "practical" version used the same silverware wet at an eat-in kitchen table set with place napkins, casual drinking glasses, and a small plant as a centerpiece.

## **Questionnaire Instrument**

After viewing each ad, respondents were asked to respond to statements on a 5-point semantic differential scale regarding each ad. For example, " The quality of the car wax seems like it would be..."with a response ranging from "high quality"(1) to "low quality"(5).

In the interest of gathering data from a diversified subject pool, respondents were randomly assigned from convenient samples using a variety of commercial establishments and social environments. No persons who participated the main study had any exposure to the pretest, and the main study sampled similar populations as the pretest.

It was then analyzed using factor analysis to collapse related data into composite variables. Analysis of Variance and Multiple Analysis of Variance procedures were used to determine the influence of the manipulated ad versions, T.V. exposure, and the interaction of the two on how people responded to the stimulus material. Analysis of covariance controlling of age, education, and parent's education was attempted but gave no advantages in improving findings, so the results of those controls are not reported.

## **Results**

### **Pretest Results**

Thirty eight respondents (55% male/ 45% female) participated in the pretest. The ages ranged from 20~58 with a mean age of 29 years.

Results showed that all of the categories had clear separation of judgments regarding practical and upscale; this was determined by the frequencies of either the "overall" practical or "overall" upscale ranking. What follows are the specific brands used in the pretest along with their accompanying frequencies based on overall practical or upscale judgments. The six categories of products in the pretest were carry-out food(that is, coffee), cars, watches, magazines, portable music CD players, and sunglasses.

This first product category for the pretest, carry-out food(coffee), were each represented by a photo of the bag bearing the restaurant's logo. Judged most upscale(31.6%) was Coffee Bean, while Holly's was found most practical(31.6%) by the respondents. The other two carry-out coffees used were Rose Bud, and Java city.

Among the cars used in the pretest, the SM5 was found to be most upscale (47.4%) and the Optima was rated as most practical(47.4%). The other two cars shown were the Sonata and the Magnus. All car photos showed the car from the same angle-including the hood ornament-with no suggestion of people or the environment.

Wristwatches were the third category in tile pretest. The Seiko watch was rated most upscale (42.1%) and the Diesel as most practical (50.0%). The other two watches used were a DKNY and a G-Shock. Among the magazines, Movieweek(about movie) was found to be the most upscale (44.7), and Economy was found as the most Practical (47.4%). The other two magazines were Ceci(about fashion), and Hivi(about music).

The fifth category was music MP3CD players. iRiver was found to be most upscale(38.8%), and an Sony as most practical (39.5%). The last of the six product categories was sunglasses. Escada was found to be most upscale (30.0%), while Dior sunglasses were found to be most practical(50.0%). The other two brands were Bulgari and DKNY. None of the sunglasses had distinctive lettering or logos visible in the photograph. In this case, what appeared to separate brands from each other regarding respondents' judgments appeared to be the distinctive shape/style (or lack thereof) for each model.

Incidentally, in most cases the products perceived as most upscale were more expensive than their practical counterparts. Within any of these product categories, it is possible that other products could have been found to be even more practical or even more upscale. However, the pretest was not meant to be an exhaustive collection of branded product representation; rather, the pretest was meant merely to distinguish a baseline for a bipolar comparisons for manipulation in the main study.

#### **Main Study Results**

One hundred and twenty eight subjects participated in the experiment. The age of the subjects ranged between 18 and 83 years, with a mean age of 34 years, and a mode age of 29 years. Respondents' gender was 40% male, 60% female. Six of the respondents failed to indicate their age of sex.

Results showed television exposure ranged from 0~6 hours per day. Respondents were then divided equally into third and categorized as either light, medium, or heavy television exposure groups. Hourly ranges of each group was light=0-1.3; medium = 1.3~2.3; and above. The dividing into these three groups was mirrored after the model typically used in cultivation analysis.

In the current study, this categorization was necessary for later testing H2 and H4, which each predict an interaction between perceptions and television exposure. Using three groups of television exposure (rather than two) allowed for easier detection of a possible trend between television exposure and the perceptions of the respondents. The "medium" exposure group also served to further separate extreme measures of heavy and light viewers.

It was previously stated that in all, five stimulus subsets were created to determine whether previous ad version influenced subsequent ads. A manipulation check was employed as prerequisite to subsequent analysis of hypotheses that was designed to determine whether practical/upscale order of exposure influenced any bias on subjects perceptions. ANOVA tests revealed that - regardless of whether subjects previously saw an upscale or practical ad - there was no influence in their responses to any of the remaining ads. Cells were therefore collapsed from the five subset packets down to the individual level of each ad and its three versions - practical, upscale, or control.

Factor analyses (principal components, varimax rotation) were performed separately for each advertisement. As expected, the results of the first three questions - product beliefs - indicated measurement of the same concept thereby creating factors regarding beliefs of the product itself. the first ad's product factor was labeled

" wax product status" (eigenvalue= 1.33, total variance=54.6%), with variables loading between .60 and .70. the second ad revealed a similar factor, " clock product status" (eigenvalue = 1.64, total variance=57.9%), with variables loading between .50 and .75. The silverware ad factor was labeled "silverware product status" (eigenvalue=1.35, total variance=56.4%), with variables loading between .58 and .83.

The premise of H1 is whether proposed products are perceived more favorably when accompanied by upscale (versus practical) companion products - thus as main effects, regardless of television exposure. This was tested for each product by running univariate analysis of variance model using ad versions and television exposure as independent variables.

Support for H1 was found by the significant main effect found in the car wax ad across ad versions. In the comparison of homogeneous subsets, Student-Newman-Keuls' showed statistically significant differences) between upscale, practical, and control). This suggests that upscale companion products affected higher product status beliefs than did practical or control companion products. Thus, the manipulation of companion products was shown to have influenced opinions regarding the overall of the car wax product.

Also yielding support H1 was the main effect difference across ad versions seen in the silverware advertisement. In the comparison of homogeneous subsets, Student-Newman-Keuls' test showed statistically significant differences that separated upscale version from the other two versions of control and practical. This lends support that the upscale setting/environment provided more favorable influence on product status beliefs than did the control setting, while the practical setting was perceived as even less favorable. As a reminder, the control version showed both the elegant dining room setting and the eat-in kitchen.

Regarding main effects for the portable clock ads, no significant differences supporting H1 based ad versions were found. To detect whether respondent's age was an influencing factor for product perceptions, separate tests were run that controlled for the effects of age. Controlling for age yielded no further support for any of the four ads.

That an interaction exists between television viewing and the perception of proposed products when accompanied by upscale products (or environments) is the premise of H2, whereby heavy would react more favorably than light viewers. No statistical support was found regarding this hypothesis for any of the four ads. Whether subjects' age was an influencing element affecting such perceptions was also examined. Controlling for age yielded no support for H2 regarding any of the ads.

Hypotheses 3 and 4 involve perceptions of the "typical user" of the proposed products. The last six questions for each ad's response sheet were aimed at probing this concept. As done with product beliefs, user beliefs were also examined to detect whether an factor(s) would emerge. Factor analyses (principal components, varimax rotation) were performed separately for each advertisement. Unlike the factor found of "product status", no acceptable factors emerged for users. In other words, respondents rated typical users differently depending on what type of character judgment was asked, and no "user belief" response indices emerged that tended to measure as a group in statistically similar directions.

The premise of H3 is whether "typical users" of proposed products will be perceived more favorably when accompanied by upscale (versus practical) companion products - regardless of television exposure. This hypothesis will be explored first for each of the three product ads, beginning with the car wax ad, Multivariate tests revealed significant differences were caused within the dependent variables using Wilks' Lambda. Examination of the individual dependent variable contributions to the MANOVA showed that the dependent variables of responsibility and career successfulness showed significant deviations from the null hypothesis. For user's responsibility, the upscale ad differed significantly based on Student-Neumann-Keul's test from both the practical and control ads. This suggests that the upscale ad reflected more favorably on user responsibility than did the control or practical versions. The differences between the practical and control ads were insignificant.

For user's career success regarding the car wax ad, the upscale ad differed significantly from both the practical and control versions, but the practical and control versions did not differ significantly from each other. This suggests that the manipulation in the upscale ad also reflected more favorably on user career success than did the practical or control ads.

According to multivariate analysis, none of the other four user-based dependent variables yielded any support for H3 in the car wax ad. Non-significant (n.s.) dependent variable contribution to the MANOVA revealed

the following outcomes: generosity; sincerity; outgoingness ; and attractiveness. In essence, the combination of branded products-the Mercedes car, Oakley sunglasses, and Seiko watch-positively influenced the perception of user responsibility and successfulness. yet they did not significantly influence any other user attribute judgments.

The portable clock ad showed no support for H3. No significant differences were found between ad version and any of the six user judgment indices based on the results of the MANOVA using Wilks' Lambda).

Support for H3 was found in the silverware ad. Multivariate tests revealed significant differences using Wilks' Lambda regarding the dependent variables of career successfulness and attractiveness. lambda. This concludes the results of all four advertisements regarding H3.

The premise of H4 is whether television exposure affects the perceptions of the product's "typical users" when accompanied by upscale (versus practical) companion products. No significant results were found in support of this hypothesis with any of the three advertisements.

## Conclusion

The main intention of this study was two fold. One was to detect differences in judgements made by respondents based on companion elements seen in the ads, while the second intention was to see if those judgements were influenced by T.V. exposure. The respondent judgements measured were of both the product itself as well as alleged users of product. The use of incidental companion elements in the advertisements was a method to indirectly measured their impact rather than overtly. In natural environments, one's possessions are only a "piece" of the entire "picture", therefore it may be that people make judgements about unknown people or unfamiliar products. Also if the conclusions people reach about passers by is indeed based on such indirect "cues", then to explicitly ask people to make judgements based upon them would interfere with an otherwise subconscious thought process.

The varying conclusions reached about unknown others are likely a byproduct of a variety of influences, including mass media effects(e.g., advertising, product placement in movies and T.V.), social groups, and personal experiences. If so, the same could be concluded about material possessions themselves, which can in some situations serve as incidental cues. Supported in components of the current study is this very concept- that incidental companion elements influenced people's judgements regarding other products and the alleged users of those products.

Limitation that may be inherent in using advertisements for stimulus in this type of research is it may be too indirect. Interference from other competing elements in each ad may distract from the manipulations themselves. If so, it imposes limits to findings to only those ads using more "obvious" cues compared to those subtler.

# A Voice of Customer Based Logistics Quality Improvement Through Quality Function Deployment Perspective

*Tzong-Ru Lee*

*National Chung Hsing University, Taiwan*

*Jiun-Hung Lin*

*National Chiao- Tung University, Taiwan*

## Abstract

Logistics service providers act as a key in connecting and smoothing demand and supply of supply chains; hence, logistics quality has important effect on the performance of supply chain. In recent business environment of bitter competitive, firms must provide customer wanted service according to customer demand to ensure their market share. How could logistics service providers make customer service improvement strategy according to customer demand to ensure that customers can really experience the rise of level of service. This study utilize quality function deployment (QFD) as tool for making customer service improvement strategy. According to the analysis technique of QFD, voices of customers, customer demand, is transferred to quality function of logistics service, then a customer service improvement strategy which customers can experience highest rise of level of service can be selected. The empirical case in this study is logistics service providers in Taiwan. The empirical result indicates that the best customer service improvement strategy for logistics service providers in Taiwan is “improvement of efficiency through information technique”.

## Introduction

Providing service according to customers' demands is the key to consolidate the primary customer for ensuring the market share. Among supply chains, logistics service providers play an important role in connecting supply chains; hence, logistics quality has important effect on the performance of supply chain.

In today's competitive business environment, corporations must formulate strategies of boosting customer service; in this way, customers can really experience the rise of service quality. It becomes an issue that how logistics service providers formulate and improve their strategies of customer service in response to customers' demands, so that their customers could find the increasing quality of service. Regarding the skills of boosting service strategies, lots of firms work hard on practicing some TQM activities for entire company in order to boost service quality and avoid or reduce service mistakes for maintaining good relationship with customers.

However, to promote service quality, most of these TQM activities don't focus on their customers, but improving interior operation. As a result, the strategies of boosting customer service formulated by logistics service providers cannot make the customers sense the increasing service quality. And it can cause the difference between expected service quality and practical service. The QFD is an analytic method for formulating strategies of boosting customer service.

The fundamental concept of QFD is to turn voice of customers into the improvement of their products and service quality, ensuring that customers can sense the rise of their service. Therefore, QFD helps corporations not only balance corporations' abilities and customers demands, but also assist in finding new niche. Meanwhile, the QFD is also the one of the best strategy-making tools for expanding market share and increasing high profits

For that reason, this research will use the QFD as an analytic tool to study the decision-making and service improvement. The purpose of this research is, based on the opinion of experts, to turn the items of quality that customer demand into the items of quality function of logistics service by the QFD principles, in order to support logistics service providers formulating strategies of promoting customer service.

The customer-service strategies obtained from this research can really make customers sense the improvement of service quality and make less difference between expected service quality and transmission of practical service.

The rest sections of this research are arranged as follows: the 2nd part is literature review; the third part is to do the case by using QFD; the fourth part is the conclusion.

## **Literature Review**

### **The Evolution of Quality Management**

The issues of quality management had not been discussed until F. W. Taylor brought up the theory of scientific management in the early twentieth century. During the period of ten decades, the production technique improved consecutively so that the strategy of quality management developed sturdily. After the refinement of one century, the strategy of quality management had achieved the phase of maturity. Look back on the past century, we can divided the development of quality management into three stages approximately, that is, quality test, statistical quality control and total quality management. The following are introductions to the procedure of each stage (Zhang Kuong Tui, 1996).

The stage of quality test began from early twentieth century to early 40's. The method of quality test is through a certain standard of test and separates the products into two categories, which are conformity and nonconformity. Nonconformity are not allow to deliver to next procedure process or send out of the factory, that is a method of quality management which filtering nonconformity by afterward checking.

The stage of SQC began approximately from 1940 to late 1950. Since the straight improvement of production technique, the number of the products rose abruptly so that the method of quality management that tests all products didn't work anymore. In this way, we need introduce the scientific testing method, which is new and efficient. SQC is a method, which combined quality management and statistics. Compared with quality test stage, SQC emphasized on quantitative analysis and showed the evidence by data, which indeed took big strides.

The stage of Total Quality Management began from 1960 to nowadays. The concept of TQM came from the book "Total Quality Management" which published by A.V. Feigenbaum in 1961. A.V. Feigenbaum considered that quality is the sum of development, maintenance and enhancement from all the departments in an enterprise. He stressed that the quality needs economical aspect as well. The working method of TQM adopted the PDCA circle from E. Edwards Deming. That is, Plan (P) → Do (D) → Check (C) → Action (A). This means a working method of consecutive circles.

### **Quality Functional Deployment (QFD)**

#### **The Definition of QFD**

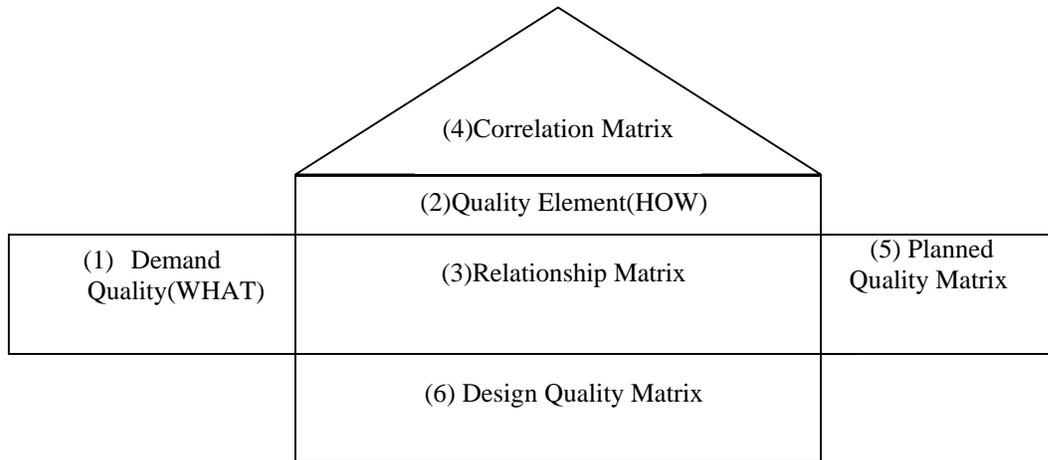

Quality Functional Deployment is a technique, which takes both quality and quantity. Its efficiency is to convert the quality design of products according to the demand of customers. The procedure of the change needs cooperation among some departments such as marketing, products developing, quality design and producing departments, etc. Therefore, QFD helps a lot among departments in the enterprise and enhances the efficiency of communication and information sharing. However, the definition of QFD is hard to define due to the expansive range and detail of its technique. Bicknell and Bicknell (1955:28) shortly defined QFD as a technique, which takes matrix, quantization and other qualitative methods. Using systematical method, QFD combined customers' demands and then made them become the products and parameter, which are definable and measurable. QFD think about not only customers but also the procedure of organization. Sullivan (1986) pointed that QFD is a whole concept. Which means each stage of producing products could convert customers' demands into appropriate technique. Akao (1990) defined that QFD is a method of developing quality design in order to satisfy customers. The concrete content is the main guarantee of the designing goal, which converted through customers' demands. Bossert (1991) considered that QFD offered a structural method to assist the system in enterprises and we could know the demands of customers more by QFD.

Since the foundation of consumptive market was led by customers, the key points to contact customers are to make sure what they need and satisfy them as soon as possible. This is also a critical element to operate a business. Logistics service providers need to keep enhancing the quality of logistics so that they can maintain their competitive ability in such a competitive business environment. QFD develops the quality of design according to customers' satisfactions, and then converts what they need into appropriate quality neediness. Those make customers feel the quality of logistics improvement through executing the improvement of quality function.

Therefore, the quality function neediness of QFD has an effect to make their customers sense the quality. In this way, logistics service providers could draw up efficient strategy of enhancing logistics service by QFD.

#### House of Quality

House of quality is an assistant tool to operate QFD. That is to embody the qualities which are their customers' demands by languages. Then express the connection between qualities and features, and convert the quality into technique. House of quality includes six parts. Figure 1 is American house of quality. The main difference between American and Japanese house of quality is that Japanese house of quality doesn't include Correlation Matrix.

Resources: Sui Zs Huei, TQM, original, Hua Tai, 1999, page 256.

FIG. 1: STRUCTURES OF THE HOUSE OF QUALITY.

1. **WHAT:** By using the method of interview, questionnaires, and the data of marketing survey or focused interview to convert customers' voices into their real demands. Besides, record them in WHAT part.
2. **HOW:** The team could draft solution together according to the demanding quality on the quality list, and converts what customers' need into technique neediness in order to set up the target value of products or procedure features.
3. **Relationship Matrix:** Connecting each "What" and "How", relationship matrix connects customers' demands and solutions into QFD matrix.
4. **Correlation Matrix:** Correlation Matrix shows the relationships among "Hows" and find out the good or bad relationship among each case while setting up solutions.
5. **Planned Quality Matrix:** Which means to decide the importance of quality according to customers' demands, market evaluations and comparing the advantages and disadvantages with other competitors.
6. **Design Quality Matrix:** Which means to consider each alternative's contribution to customers' demands and set goals as standards.

The conditions of operating QFD successful are correct faith, certain targets and developing efficient strategies (Lee Chian Hua, 1996). We could develop a set of strategies which could satisfy the customers' demands and enforce the competitive advantages by taking positive attitudes toward quality, enhancing the satisfaction of customers, using the resources of enterprise efficiently and setting up a goal of promoting market share.

#### The Demand Quality Items and Quality Elements of Logistics Service

There are lots of elements, which affected the service quality regarding logistics service system. In the past, the scholars had adverted the following 20 elements: the ratio of completing orders, the correction of handling orders, the period of handling orders, delivery goods on time, handling of returning goods, stockout ratio, broken ratio, ability of handling emergent orders, handling the complaint of customers, fault of bills or delivery, frequency of delivery, convenience of ordering goods, cleanliness of goods, the freshness and quality of goods, demanding

attitudes by departments, focusing on the satisfaction of customers, satisfaction of logistics service providers, satisfaction, communication and service information, etc. (Zhang Iou Hong, 1998; Chiang Mei Fong, 1996; Bowersox and Copper, 1992; Bowersox and Closs, 1996). Generally speaking, the evaluation of service quality in logistics system differs due to the different types of logistics service providers. Therefore, how to find out the common evaluation rules among different logistics service providers is an important affair of industrial analysis. Thus, this research based on above twenty evaluation rules and discussed with experts and providers to determine the common demanding quality items of Taiwan logistics service providers.

Second, not all of the quality elements help with improving the service quality of these demand quality items. Besides, too much quality elements could confuse evaluator's judgments easily. So that the efficient quality elements must be considered on the basis of demand quality items and devises the connecting quality elements of demand quality items. This research discussed with experts and providers as well after devising the common demand quality items of Taiwan logistics service providers. In accordance with these quality items, we devised some helpful quality elements, which could enhance the demand quality items.

## **Developing Customer Service Improvement Strategy for Logistics Service Providers in Taiwan through QFD**

### **The Information Gathering and Current Situation of the Logistics Industry in Taiwan**

There are more than one hundred providers of the logistics in Taiwan nowadays. The logistics company could divide into three types according to different service items and clients' components. Type 1: The logistics service providers provide services only to the regarding companies which belong to their enterprise, not other providers. Type 2: The logistics companies provide service to both the regarding companies which belong to their enterprise and other companies not belong to. Type 3: The logistics service providers are independent logistics companies, not the subsidiary companies of an enterprise. These kinds of logistics service provider's clients are all outer enterprises.

In the phase of designing QFD questionnaires, this research adopted expert opinion to generalize the common voice of customer and quality elements of logistic service providers in Taiwan through the discussion with experts and providers. The experts dealing with this research includes practical experts and the scholars engaged in logistics service. The content of the questionnaires is to evaluate quality elements, which logistics service corporation provided with by grading. The range is from one point to five points (1~5 pts). And 5 points represent strong satisfaction or emphasis; 4 points represent normal satisfaction or emphasis and so on. The lower scores mean the less satisfied or less emphasized. There were 40 questionnaires delivered and 13 questionnaires retrieved.

### **Analyzing Result**

#### **Demand Quality and Quality Element**

The common quality items required by customers (voice of customer) has been concluded and screened through this research after the scholars and logistics service providers discussed. The following are the findings: 1. Internal management 2. Supply management 3. Orders management 4. Goods transportation 5. Customer service. However, the quality elements (service improving alternatives) concludes 1 Increasing efficiency with IT 2. Customer Relationship Management 3. Distribution of Value-Add Service for Customers 4. Total Quality Management

#### **Weight Calculating of Customer Required Quality Items**

The weight-calculating method of quality items should take most requisite improvement, which is lower satisfied but most valued into consideration. According to logic, full marks (5 points) minus the degree of satisfaction equal the values. For example, if the value of satisfaction is one, then the original weight would be the emphases multiply four; and if the value of satisfaction is two, then the original weight would equal the emphases multiply three. The rest may be deduced by analogy. Therefore, weight of quality items, which is the higher degree of emphasis but the lower degree of satisfaction, will project higher. First, do multiplication of the degree of satisfaction and the degree emphasis. Then gives the standardization (normalization) again. This weight computational method can succinctly also concretely perform each weight distribution of quality items that customer requests. Shu Fen Huang (2003) also uses this procedure in her paper.

#### **Weight Calculating of Quality Elements**

The production of values in Relation Matrix of House of Quality forms with every correlative department's

collaborative discussion through the questionnaires or meetings as a manner. Therefore, the statistics are judged by staff's subjective experiences in the corporation (Pei Juan Tsai, 1999). Demanding for correction and carefulness, we request experts, scholars, and staves of logistics service fill values according to related intensity of demand quality and quality elements separately into relationship matrix( High involvement :5 points; Moderate involvement: 3 points; Low involvement: 1 point) in order to show the relationship between demand quality and quality elements objectively. And the algorithm of weight in items of quality elements is to make the score of the related intensity multiply the standard weight at first, and then sum it up as the second step. The last step is to normalize the result and get the weights of each item of quality elements finally.

#### **Analytic Result of Logistics Service Providers in Taiwan through QFD**

While proceeding, we analyze individually according to the types of logistics service providers. Since logistics service providers are divided into three types so that three different results produced. After the questionnaires which experts filled up had been retrieved, we compute the emphasis of the quality items and the demand quality elements (quality-improved strategy). The computed values of House of Quality, which belongs to three different kinds of logistics service providers, are combined through this research as Table 1. This research uses Japanese House of Quality; therefore, correlative matrix does not exist in Table 1 as we have in Figure 1. The following items in Table 1 are demand quality items: C1 Internal Management C2: Supply Management C3: Order Management C4: Good Transportation C5: Customer Service. However, the quality elements this research presumed are as follows: Q1: Increasing efficiency with IT Q2: Customer Relationship Management Q3: value-add service for customers Q4.Total Quality Management.

In the relationship matrix, the matrix value that three kinds of different logistics service providers relates is the related intensity score obtained between demand quality and the quality elements through the questionnaires.

The part of "planned quality" is the weight of quality items demanded by customers as we have mentioned. In "planned quality" matrix, values in columns of Type 1 are weight of each quality element of logistics service providers in Type1, which is requested by customers. The high value of weight expresses the customers emphasizes this item of demand quality more. In other words, logistics service providers should increase the quality standard more diligently regarding the higher-valued quality items. The same as above, values in columns of Type 2 are weight of each quality element of logistics service providers in Type 2 which is requested by customers and so on.

"Design quality" part is each quality element (strategy of quality), which could be carried out according to the demand quality items by customers. In design quality matrix, the numeric in the rows of Type 1 represents the relative weight, which could be carried out according to the customers' demand quality items of this kind of logistics service providers. The higher value of weight means this quality element could assist businessperson to enhance each standard of quality according to customers' demands more. Therefore, the providers should take this quality element as the strategy of improving quality as a top priority. The numeric in the rows of Type 2 represents the relative weight, which could be carried out according to the customers' demand quality items of Type 2 logistics service providers. The numeric in the rows of Type 3 represents the relative weight, which could be carried out according to the customers' demand quality items of Type 3 logistics service providers as above statement.

First, from the analysis in Table 1, to Type 1 logistics service corporations in Taiwan that only serve the related corporations which belongs to its own bloc and rule out other outside corporations, the most important demand quality items by customers are "Internal Management". The second is "Goods Transportation", the third is "Order Management", the fourth is "Customer Service", the fifth is "Supply Management". Moreover, among the four projects of improving logistics' qualities, the strategy which could make customers feel the enhancing of quality is "Promoting Efficiency with IT", then "Total Quality Management", "Distribution of Value-Add Service for Customers", and last "Customer Relationship Management". Therefore, to Type 1 logistics service corporations; the best strategy of enhancing qualities is "Increasing Efficiency with IT" after considering customers' demands.

TABLE 1: ANALYTIC RESULT

		Quality Element				Planned Quality		
		Q1	Q2	Q3	Q4	Type 1	Type 2	Type 3
Demand Quality	C1	Relationship Matrix				26.38	27.32	22.17
	C2					15.28	15.31	19.31
	C3					19.02	17.81	18.98
	C4					22.49	19.09	20.93
	C5					16.83	20.47	18.61

Type 1	33.30	18.17	21.03	27.50
Type 2	29.14	22.59	22.38	25.89
Type 3	31.53	21.41	19.43	27.63
Design Quality				

Note: Q1: Increasing Efficiency with IT; Q2: CRM; Q3: Distribution of Value-Add Service for Customers; Q4: Total Quality Management; C1: Internal Management; C2: Supply Management; C3: Order Management; C4: Goods Transportation; C5: Customer service

Second, from analysis in Table 1, to Type2 logistics service corporations whose customers are all enterprises not only serve the related corporations which belongs to its own bloc but also serve other outside corporations, the most important item of demand quality is "Internal Management", next is "Goods Transportation", the third is "Customer Service", the fourth is "Order Management", the fifth is "Supply Management". Moreover, among the four projects of improving logistics' qualities, the strategy which could make customers feel the enhancing of quality is "Increasing Efficiency with IT", then "Total Quality Management", then "Customer Relationship Management", and last "Distribution of Value-Add Service for Customers". Therefore, to Type 1 logistics service providers, the best strategy of enhancing qualities is "Increasing Efficiency with IT" after considering customers' demands.

Third, from the analysis in Table 1, to independent Type3 logistics service corporations which belongs to no bloc, the most important item of demand quality is "Internal Management", next is "Goods Transportation", the third is "Supply Management", the fourth is "Order Management", the fifth is "Customer Service"

Moreover, among the four projects of improving logistics' qualities, the strategy, which could make customers feel the enhancing of quality is "Increasing Efficiency with IT", next is "Total Quality Management", the third is "Customer Relationship Management", and the last is "Distribution of Value-Add Service for Customers". Therefore, to Type 3 logistics service corporations; the best strategy of enhancing qualities is "Increasing Efficiency with IT" after considering customers' demands.

## Conclusion

This research helps three kinds of different types logistics service providers find their own boosting strategies of customer service, which make customers, really sense the improvement of service standard by QFD. The analytic result shows that Increasing Efficiency with IT is the best boosting strategy in response to the customers' demands among three results; although the customers request the dissimilar points of quality items regarding three different types of logistics service providers. However, this represents nowadays customers of every type of logistics service providers all expect to use IT effectively and to strengthen the quality of logistics service. This finding can be a reference resource when logistics service providers boosts its competence through increasing its quality.

Formulating boosting strategies of customer service, which make customers actually feel the improvement of service standard, is a key point to maintain market competence. And logistics service providers should map out

all kinds of strategies making customers sense the improvement of service standard.

This research produces strategies, which increase service standard through QFD. QFD is able to integrate customers' evaluation and quality elements emphasized by customers; therefore, using QFD to increase strategies of customer service can present customers' demand effectively, and then let the customers truly feel the improvement of service level.

To competitive logistics service business, using QFD to find effective service-boosting strategies can help it maintain its own competitive ability or even raise its competitive ability.

Similarly, other industries in other nations may also discover effectively service-boosting strategies of this industry or this company through the QFD method to increase its market competence.

# A New Way of Buyer-Supplier Relationship in Korea

*Jeong-Wook Choi*  
*Kookmin University, Korea*

## Abstract

**When generous supplier development activities in Korea came to a screeching halt after the country was hit by the Asian economic crisis, the big conglomerates had to find new, more economical ways to develop their suppliers, short of cash incentives. Hard choices had to be made. But so far these choices, though made under duress, appear to be sound ones that are helping to forge new patterns of supplier development in Korea. This paper examines how to manage this recovery in terms of buyer-supplier relationship paradigm.**

## Introduction

To compete effectively in the global marketplace, a company must have a network of competent suppliers. A supplier development program is designed to create and maintain such a network-and to improve various supplier capabilities that are necessary for the buying organization to meet its increasing competitive challenges. Generally speaking, supplier development refers to an organization's efforts to create and maintain a network of competent suppliers. From a narrow perspective, it can be defined as identifying new sources of supply where no adequate ones exist. Defined more broadly, however, supplier development also involves a long-term cooperative effort between a buying firm and its suppliers to upgrade the suppliers' technical, quality, delivery, and cost capabilities and to foster ongoing improvements. The ultimate goal of these programs is to form a mutually beneficial relationship that will help both firms compete more effectively in the marketplace.

Discontinuous changes abound in the modern business world. Survival depends on how readily and how well firms adjust to such changes. To meet the impending economic challenges in the aftermath of the Asian economic crisis, large conglomerates in Korea have accepted the end of generous "supplier nurturing" practices and have turned to no-frills, draconian approaches to supplier development. Before the economic crisis, large Korean conglomerates were nurturing their domestic suppliers by engaging in generous practices to bring them up to world-class levels. The rapid ascension of the Korean conglomerates, which relied largely on learning from foreign suppliers and joint venture partners with advanced technical know-how, had outpaced the growth of (their domestic suppliers, leading to an unbalanced domestic supply chain. Ultimately, they had to reckon with the consequences-bring domestic suppliers up to world-class standards or continue to pay the high price tags of foreign suppliers. Their approach had been to aggressively nurture their domestic suppliers by offering financial and technical aid and extended managerial and technical training. However, this all changed abruptly when the economic crisis descended upon them.

Indeed, the landscape surrounding the domestic supply chain became much more precarious. On top of the same persistent problems, new problems emerged. There was still a large gap in performance capabilities in their domestic suppliers, but the conglomerates now lacked the financial resources they once had at their disposal. Simply put, the new supply chain conditions showed persistent problems in a worsened economic condition. Desperate times called for desperate measures.

What happened to the supplier development practices in Korea in the aftermath of the Asian economic crisis? What were the desperate measures taken by the Korean conglomerates? Did they exhibit fundamentally sound business measures that other Asian neighbors may benefit from, and from which other trading partners in North and South America and Europe may learn? With a discussion of the background of the Asian economic crisis, how it changed the basic principles involved in developing suppliers in Korea, and how the new principles were manifested in new strategies of supplier development, we hope to answer these questions satisfactorily.

## The Impact of the Crisis

No one knows for sure how such an economic catastrophe came to sweep through Asia during the late 1990s. The debates over its causes have ranged from conspiracy theories and exchange rate problems to financial panic on the part of international creditors. Regardless, at least in Korea, a few clearly discernible problems aggravated the effects. Manufacturing companies had relied too heavily on short-term foreign capital to build long-term capacity; when the loans were called in during the crisis, the companies struggled to pay off the debt. Financial institutions had been engaged in excessive speculative lending for many years, and their early reluctance to take strong corrective actions did not help the situation. Worse yet was the fact that weak financial supervision and poor accounting standards made it hard to measure the full extent of the impending crisis. In the end, the Korean conglomerates suffered from a shortage of funds.

Prior to the crisis, the conglomerates in Korea had assumed "an active role in leading, guiding, and convincing suppliers to develop new capabilities and manufacture new parts," thereby helping the suppliers leapfrog to the level of their foreign competitors. Recognizing the need for reliable local suppliers, but knowing that such suppliers' capabilities fell considerably short of world-class, the conglomerates had taken an aggressive posture in working with their suppliers in the areas they needed help on and in delivering solutions to many different types of problems, ranging from cash flow to technical issues. With the advent of the crisis and their own financial troubles, the conglomerates could no longer engage in munificent and all-encompassing supplier nurturing.

In general, after the crisis, large Korean conglomerates understandably became much more cautious and deliberate in how they spent precious resources to develop suppliers, from lending a helping hand to just about any domestic suppliers that needed help, they were suddenly much more selective and judicious in picking partners. One critical step taken under this new orientation was to rationalize the supply base. The conglomerates went through a lengthy process of reevaluating their suppliers and, in the end, reduced the number of them. As a purchasing manager from a leading electronics conglomerate pointed out "Even before the crisis, we knew about the built-in inefficiencies in our supply base. Nobody wanted to tackle this issue because it was a tough job and things seemed to be all right. But after the crisis, the issue all of a sudden became crucial, even urgent. So we tackled supply base rationalization head-on as if our lives depended on it". In a few short years, this manager's company cut the number of its suppliers from 2,300 to 600. The company also discouraged the remaining suppliers from having a high reliance on one specific conglomerate in terms of percentage of total sales. Instead, it encouraged them to venture out beyond the comfortable walls of the conglomerate's keiretsu and diversify their customer base.

This type of approach marked a significant departure from pre-crisis days, when suppliers generally followed the instructions and guidelines from a conglomerate in a vertical relationship in return for support in whatever competitive areas they needed. After the crisis, the conglomerates naturally became more dependent on their remaining few suppliers. Relationships became much more equal and interactive than before. To this end, the conglomerates changed the orientation of their supplier training from providing specific solutions to teaching them the general principles of management. "We couldn't give them fish to eat every time they got hungry," quipped one purchasing manager. "We needed to teach them how to fish." The underlying intent was to help the suppliers help themselves, rather than giving them solutions to their specific problems. Following the same orientation, the conglomerates asked that each supplier pick one competitive focus, quality, cost, delivery, or flexibility, and to become world-class in that area. Most notably, the conglomerates favored cost and technology as the two key foci. The underlying premise was that quality and delivery were supposed to be prerequisites, and the remaining suppliers needed to be able to compete in either cost or technology. Cost had been Korea's competitive key for a number of years, and technology was considered the necessary focus for the next generation of products, given the emergence of China, the Philippines, Malaysia, and other Southeast Asian countries as the lower cost providers. The conglomerates did not want to abandon their area of expertise; meanwhile, they needed to gain a new competitive edge in the changing environment. What they did not want from their suppliers was for them to get "stuck in the middle." where they would have no strong competitive edge in any one area but would achieve mediocre outcomes in several.

## Emerging Strategies after the Crisis

There has been an evolutionary process of the new supplier development strategies stemming primarily from the shortage of funds. In addition to struggling with limited resources and having to discontinue the generous programs developed under a supplier-nurturing paradigm, the conglomerates were receiving much of the blame for the crisis on the way they had managed their finances. Consequently, much of the government funding that had been channeled through the conglomerates for supplier development activities ran dry. In the end, the new situation translated into a more competitive approach to supplier development. When suppliers came to the conglomerates with a development proposal, they were asked to provide more concrete evidence that they needed help. The representatives of the conglomerates would then subject the proposal to a careful evaluation. One purchasing manager from a conglomerate expressed the prevailing sentiment: "We were in a shaky position financially, and suppliers were also having a hard time surviving. We realized that we needed to continue helping the suppliers, but we also needed to approach this very carefully, which means we needed to consider every possible case and evaluate it carefully by setting contingency plans and doing lots of what-if analysis". At the same time, in an effort to reduce the supply base, all suppliers were asked to submit the focus of their competitive advantage. The conglomerates were asking, "Why should we keep you as our supplier?" In this request competitive advantage was defined as "the ability to compete on world-class standards." After a massive push to measure the competitiveness of its suppliers, one conglomerate classified them into five levels of capability: (1) world-class leader, (2) very competitive in the world market, (3) Korean top class, (4) doing OK but not competitive, and (5) problematic, the intent was to treat suppliers differently based on where they ranked on the five levels of capability. Suppliers in the first three categories were assured of continued business; those "doing OK" were placed under close scrutiny; and those in the "problematic" category were removed from the supplier base.

In one case, in January 2003, a conglomerate called a large meeting to which it invited its remaining suppliers, and disclosed its new vision, strategy, and policies for the coming years. Then, in a stunning move, it asked for written feedback from the suppliers about the proposals. Something like this had never happened before the pre-crisis days, the conglomerate always dictated strategy and policy and never asked for any feedback from a supplier. Moreover, it made a formal announcement that it would now invite more bilateral discussions and would regard the suppliers more as partners. Suppliers knew full well that in the old days they were always on the receiving end of specifications and other instructions. Now they were being asked to participate in discussions before specifications were finalized. They were being given the opportunity to voice their opinions about a new product regarding its potential cost, quality, and other performance features. In the end, one could not help but notice the more conciliatory tone of the conglomerates toward their suppliers and a higher level of information sharing than ever before.

Because supplier development could not take place across all performance areas, another conglomerate decided to adopt a policy that called for selective support for its suppliers. The policy centered on helping them either gain high-tech capability or maintain continued excellence in low-cost capability. If the former was deemed as an appropriate competitive advantage for a particular supplier, the conglomerate would typically enter into a joint venture with that supplier. In this way, the development of high-tech capability would entail a much more interactive process than if the conglomerate simply awarded a grant to a supplier with some technical help, as it used to do before the crisis. Moreover, if a supplier decided to compete on low cost, not only would a conglomerate work with it by creating and implementing a very tight target pricing schedule, it would also help the supplier relocate its plants to neighboring Asian countries with lower labor costs.

In all, the conglomerates used to practice little risk analysis before the Asian crisis. Perhaps they had seen little need for it because economic conditions and business prospects were deemed stable and secure. However, after the crisis, at least one conglomerate would engage in careful risk analysis prior to undertaking a development program for a particular supplier. Specifically, risks associated with the potential gap between the plan and the actual implementation were carefully reviewed. With the supplier's inputs, the conglomerate devised a carefully delineated set of contingency actions depending on the size and type of the gap.

Risk analysis included three dimensions: (1) the probability of a misfortune occurring, (2) its probable

duration, and (3) the impact on the overall business. Risks associated with each dimension would be rated on three levels. Based on the results, the managers would then set up plans for how to deal with the risks. To this end, a rather involved, step-by-step monitoring mechanism was implemented to gauge the status of the progress after the supplier development. Purchasing managers were required to meet with the suppliers every month to review progress and file a written report. Moreover, to diffuse the potential risk for the suppliers, the conglomerate now allowed them to seek out contracts from other companies. The landscape of supplier development in Korea was still undergoing a tremendous post-crisis upheaval and transformation.

## Cases of New Supplier Development Practices

As can be seen, the rise of new supplier development practices in Korea did not come from some grand vision initiated by far-sighted conglomerates with ample resources across some long-term time horizon. Instead, it sprang mainly from having to do whatever possible to survive the Asian crisis. One might say it was prompted by the lack of resources and short-term time horizon. Three cases illustrate the significant changes from the days before the crisis. As they show, conglomerates now do less of granting monetary awards, offering immediate solutions, and operating in a top-down fashion, and more of transferring technologies, creating system-wide changes, and forging supplier's partnerships. In these cases, the firms' names have been disguised to ensure anonymity.

### **Daehan Manufacturing**

Daehan produces parts for semiconductor equipment. It grosses about \$40 million in annual sales and employs about 50 people. Ninety percent of its revenue comes from one large conglomerate. Despite the relatively small size, the president of this company has invested heavily in his workers and cutting-edge production facilities. His goal has focused on becoming one of the most productive companies in Korea in the area of semiconductor equipment parts manufacturing.

Meanwhile, the conglomerate that Daehan supplies has continued to struggle with its high reliance on foreign suppliers for semiconductor equipment parts. It had traditionally maintained about a 65/35 ratio between the foreign versus domestic content; however, with worsening financial conditions and exchange rates, it could no longer maintain this ratio. It needed to both increase the domestic content and develop the domestic suppliers to produce the high-tech parts it had been buying from abroad. So it contacted Daehan.

Before the crisis, the modus operandi in this type of situation would have been to grant a monetary award to Daehan, present the performance specs of the needed parts, and offer consultative support services as necessary. There was no money to give away, however. The conglomerate could offer Daehan the only thing it had to give: the technical know-how it had accumulated over the years.

The conglomerate asked Daehan to consider manufacturing low-pressure chemical vapor deposition (LPCVD), 100 percent of which it was buying from a foreign supplier. In return, in lieu of developmental grants, it would make available the ample knowledge base it had in its research center. According to its purchasing manager: "We were desperate. We needed to develop this technology fast and couldn't wait for the supplier to come up with something on its own. At the same time, the company informed me that it had no money to spend on suppliers. So we had to figure out a new way to develop the technology without the financial support". Daehan agreed to this new approach, and five engineers were dispatched from the conglomerate's research center to work with Daehan's engineers and transfer the knowledge they had on manufacturing LPCVD. As new proto-types were developed at Daehan, they were tested concurrently at the conglomerate's production lines. Working together cooperatively in this fashion led to two primary benefits-development lead time was reduced, and once the product was approved it required no additional testing at the conglomerate's production site.

Eventually, the conglomerate acknowledged the HSG (hemispherical grain) that Daehan developed to produce LPCVD as the new standard for all future products and awarded Daehan a multi-year, long-term contract. As a result, Daehan now enjoys a reputation as a world-class manufacturer of LPCVD and is expanding its market to Taiwan and other countries. Its president explains: "Without the help of [the conglomerate], this project would never have been achieved. Since we had no experience in making LPCVD, it is true that we were extremely cautious when we were first approached about this project. However, we were eventually convinced that we should do this, and if we worked together, we would make it happen. Something like this actually never happened before. Usually, we

would make the proposal for a new project first and then they would respond. But this time, they drove us and gave us lots of help”.

### **Samil Engineering**

Samil manufactures labor-intensive, low-tech components for complex, high-tech products, specializing in molding and cleaning plastic parts and the manual kitting of simple electrical components. Because the parts it produces are easily copied and substitutable, Samil must compete in the market with low overheads and low-cost products. Indeed, having been competitive for many years, it has emerged as the cost leader in its market sector. Capitalizing on its experiences and its position as the market leader, Samil has continuously improved its cost structure based on high economy of scale, virtually non-existent learning curve effects, good labor resources, efficient manufacturing methods, and a high return on its facility investments. Consequently, Samil and the conglomerate it supplies have enjoyed a long-term, symbiotic relationship. Samil has received a steady stream of business from the conglomerate, which in return has obtained a good price and reliable supplies from Samil.

This cozy relationship crashed into a wall when the crisis hit. As the general business environment became tighter, the pressure for cutting costs even further began to mount in Samil's already streamlined, cost-efficient manufacturing process. In a nutshell, Samil was threatened with losing what little profit margin it had; it knew full well that it could lose out altogether and become extinct. The messages from the conglomerate were clear: "You have to cut your costs dramatically. Otherwise, you risk losing our business." But there was a bright point in these dire circumstances: The conglomerate was willing to assist and advise Samil, so long as they could work on this task of cost-cutting together.

At first Samil did not quite comprehend the extent of working together. It assumed, as before, that the conglomerate would help in making some type of piecemeal improvement changes. However, when they began working together, it realized the improvements required were much more extensive and systematic. A senior manager at Samil recently recounted what transpired afterwards: "The biggest thing that the conglomerate helped us on was to approach cost management in a strategic way. We are a small company. We used to try to focus on one cost driver at a time, and we focused primarily on production lines. We felt good so long as we were able to cut costs compared to the previous year, and it was line with line conglomerate. But after the crisis, things changed. It seemed that cost reduction from the production was considered a given, and we began to attack all kinds of cost drivers from the whole organization- We began to learn about the total cost concept, early supplier involvement savings, life cycle costing, the economic value-added concept, and so on. Overall, it has been good for us as well as our customer". More specifically, the application of a total cost concept was the focus of the initial big push toward cost cutting. From on-site training at the conglomerate's training center, Samil was asked to come up with the concrete plans to take the cost out systematically from all parts of the organization and move beyond the short-term-based cost reduction management practices that focused mainly on unit cost-cutting, one-dimensional cost analysis, and onetime cost reduction. In the end, Samil realized the big potential for cutting administrative and overhead costs. By analyzing the cost drivers from the whole of its organization, the firm was able to slash 17 percent from its overhead.

Another area that became a serious target of cost reduction after the conglomerate agreed to share information with Samil was inventory. Before the crisis, the conglomerate saw no real need to share information, because it regarded Samil as a small player. It simply placed orders and expected Samil to comply. However, with additional information from the conglomerate on demand and forecasting, Samil now needed to carry fewer inventories, which translated into savings. Of course, both companies knew that information replaces inventory, but it took the crisis to convert this knowledge into practice.

The two companies also began to focus on the practice of target costing. Like many Japanese companies that engage in this practice, the conglomerate as the buyer would bring the target cost to Samil, the supplier. However, realizing that a tight target price would sometimes lead to unnecessary quality problems (such as being forced to cut corners to meet the target price), the conglomerate decided to undertake more bilateral discussions with its supplier and engage Samil in "cooperative target costing" practices. In this context, the conglomerate brings the market target price to the table, while Samil brings the manufacturing cost. They then engage in a rather lengthy discussion to arrive at the mutually agreeable target price.

Yet another major project on which the two companies worked together was the relocation of Samil's plants

to other Asian countries with a lower labor cost. Samil accepted the conglomerate's proposal to move to China and Malaysia, where the conglomerate already had plants. Samil received no developmental grants from the conglomerate for this expansion, and the burden of coming up with additional capital was solely on its shoulders. However, the conglomerate helped Samil with all other aspects of the move, such as identifying a good plant site and interacting with the foreign government. A purchasing manager from the conglomerate summed it up: "I think the suppliers in Korea that used to compete in cost are now caught between a rock and a hard place. They can't compete against companies in China or other Asian countries on cost, and at the same time they can't compete in the global market with any other competitive dimensions such as quality or new product development. The only option they have is to relocate to the countries with inexpensive labor costs and apply the cost management techniques they have acquired over the years". In the end, the conglomerate was willing to help Samil as much as possible, short of doling out monetary subsidies. However, it was also clear that if Samil did not meet expectations, the conglomerate was fully ready to switch over to other low-cost suppliers available in the global marketplace.

#### **Dongjin Company**

Dongjin offers us an example of how a small, technically oriented company can be developed into a more significant player in the business by working with a conglomerate as the buyer. Since Asia's economic crisis, more and more cases have occurred in Korea in which a large conglomerate in high-tech business (personal computers, network equipment, work stations, and the like) gets into a partnership with small but promising companies in order to stay current with emerging, home-grown technologies. Dongjin's story is of a small design house that became a major supplier of data storage components with the help of a conglomerate. This company was originally founded by a few graduates from one of the top-ranked engineering schools in Korea and began designing network data storage and data access appliances. The storage products it designed include stand-alone and networked CD/DVD-ROM servers and arrays as well as memory backup products. Along the way, it obtained several patents and managed to stay current with the latest data storage technology.

Dongjin was then noticed by a conglomerate in the high-tech business. This particular conglomerate had already made a strategic decision that it would be better to get into partnerships with small firms that could develop cutting-edge technologies than to try to develop the technologies internally. It had been searching for a component supplier of CD/DVD-ROM and NAS and found Dongjin. However, because Dongjin was a design house, it had no manufacturing capability. A series of meetings ensued between the two companies, and Dongjin eventually agreed to expand its capability into manufacturing. In return, the conglomerate agreed to provide manufacturing know-how and to acquire a certain amount of Dongjin's stock. Thus, a symbiotic relationship was created - the conglomerate would get the cutting-edge technology from Dongjin, while Dongjin would get the injection of capital it needed to become a major player in the business. The financial fate of the two companies was now tied together.

The engineers and managers from the conglomerate helped Dongjin ramp up its new production lines and then taught it how to manage a manufacturing plant. The areas of learning ranged from quality, labor, and cost issues to general management issues. The lessons truly were learned on all fronts. Dongjin is now growing into a stable, medium-sized manufacturing company with design capability, and is quickly becoming a leader in the area of data-storage component manufacturing.

A purchasing manager from the conglomerate summed up the relationship for us: "Technology advances so fast we can hardly keep up with all that is happening. With the large size, we tend to be a bit slow in action, and we often miss opportunities in new areas of technological development. So we look for small companies with real talent and the capability of developing and keeping up with the latest technologies. We ask them to be our partners and we will work together. If they need a cash injection, we'd be willing to do that but only if it comes with a payback schedule. So far, we have gotten our money's worth from investing in this way-the results have been amazing".

# A New Statistical Approach on Marketing Survey and Decision Making

*Berlin Wu*

*National Chengchi University, Taiwan*

*Ching-min Sun*

*Jen-Wen Institute of Technology, Taiwan*

## Abstract

In social science research, many decisions, evaluations, or purpose of evaluation are done by the survey or questionnaire to seek for people's consensus. The commonly used method is asking people to think in binary logic way from a multiple-choice design. However, these processes often ignore the fuzzy, sometimes even ambiguous thinking behavior perceived in human logic and recognition. In this paper we will employ the membership function and statistical fuzzy analysis and will provide the definitions of fuzzy mode, fuzzy median as well as investigation of their related properties. We also give some empirical examples to illustrate the techniques and to analyze fuzzy data. Result shows that fuzzy statistics with soft computing are more realistic and reasonable for the social science research. Finally certain comments are suggested for the further studies.

## Introduction

Many fundamental statistics, such as mean, median and mode etc, are useful measurements in illustrating some characteristics for the sample distribution. These statistical parameters can be quickly computed from a set of data and its basic information has been widely employed in many academic areas. Each statistics has its special application. For example, when we want to investigate people's opinions or consensus on certain public issues, the using of mode or median will be more proper than that of mean.

However, traditional statistics are reflecting the result from a two-valued logic world. To investigate the population, people's opinions or the complexity of a subjective event more accurately, it is suggested that we had better use the fuzzy logic. Especially, when we want to know the public ideology on the environmental pollution, fuzzy statistics provides a powerful research tool. Moreover, since Zadeh (1965) developed fuzzy set theory, its applications are extended to traditional statistical inferences and methods in social sciences, including medical diagnosis or a stock investment system. For example, Lowen (1990), Ruspini (1991), Dubois and Parde (1991), Tseng and Klein (1992) demonstrated the approximate reasoning econometric methods one after another. Wu and Hsu (2002) developed fuzzy time series model to overcome the bias of stock market, which might be explained unreasonable.

There are more and more researches focus on the fuzzy statistical analysis and applications in the social science fields, such as Hwang and Wu (1995) proposed fuzzy statistical testing method to discuss the stationarity of Taiwan short-term money demand function; Guariso, Rizzoli and Werthner (1992) identified the model construction through qualitative simulation; Wu and Sun (1996), Wu and Yang (1997) demonstrated the concepts of fuzzy statistic and applied it to social survey; Wu and Tseng (2002) used fuzzy regression method of coefficient estimation to analyze Taiwan monitoring index of economic. Recently, along with the raising of intelligent knowledge consciousness and soft-computing, many investigators focus on the application of fuzzy set in calculating the human thought or public polls under the uncertain and incomplete condition.

Since mode and median are essential statistics in analyzing the sampling survey. Calvo and Mesiar (2001) proposed the generalized median by discussion aggregation operators closely related to medians and to propose new types of aggregation operators appropriate, both for the cardinal and ordinal types of information. But they didn't give any realistic examples. In this paper we present the definitions of fuzzy mode and fuzzy median, related properties, and proofs. Comprehensive examples about EIA with fuzzy mode and fuzzy median on human thought analysis are well illustrated. We hope via these new techniques the people's thought can be extracted and known in a more precise understanding. Finally, conclusions as well as suggestions are provided.

## The Nature of Fuzzy Samples

Traditional statistics deals with single answer or certain range of the answer through sampling survey, but it has difficulty in reflecting people's incomplete and uncertain thought. In other words, however, these processes often ignore the intriguing and complicated yet sometimes conflicting human logic and feeling. If people can use the membership function to express the degree of their feelings based on their own concept, the result will be closer to their real thought. For instance, when people process a pollution assessment, they classify the distraction into two categories: pollution and non-pollution. This kind of classification is not realistic, since the pollution is a fuzzy concept (degree) and can hardly be justified by the true-false logic. Therefore, to compute the information based on the fuzzy logic should be more reasonable.

### The Degree of Human Feeling

In considering the question related with fuzzy property, we consider the information itself has the uncertainty and fuzzy property. Hence, let's firstly give an easy and precise explanation about fuzzy numbers.

#### Definition: Fuzzy Number

Let  $U$  denote a universal set,  $\{A_i\}_{i=1}^n$  be a subset of discussion factors on  $U$ , and  $\lambda(A_i)$  be a level set of  $A_i$  for  $i=1,2,\dots,n$ . The fuzzy number of a statement or a term  $X$  over  $U$  is defined as:

$$\mu_U(X) = \sum_{i=1}^n \mu_i(X) I_{A_i}(X) \quad (2.1)$$

where  $\{\mu_i(X), 0 \leq \mu_i(X) \leq 1\}_{i=1}^n$  are set of membership functions for corresponding factor in  $\{A_i\}_{i=1}^n$ , and  $I_{A_i}(x) = 1$  if  $x \in A_i$ ;  $I_{A_i}(x) = 0$  if  $x \notin A_i$ . If the domain of the universal set is continuous, then the fuzzy number can be written as :  $\mu_U(X) = \int_{A_i \subseteq A} \mu_i(X) I_{A_i}(X) \circ$

In the research of social science, the sampling survey is always used to evaluate and understand public opinion on certain issues. The traditional survey forces people to choose one answer from the survey, but it ignores the uncertainty of human thinking. For instance, when people need to choose the answer from the survey which lists five choices including "Very satisfactory," "Satisfactory," "Normal," "Unsatisfactory," "Very unsatisfactory," traditional survey become quite exclusive.

The advantages of evaluation with fuzzy number include: (i) Evaluation process becomes robust and consistent by reducing the degree of subjectivity of the evaluator. (ii) Self-potentiality is highlighted by indicating individual distinction. (iii) Provide the evaluators with an encouraging, stimulating, self-reliant guide that emphasizes on individual characteristics. While the drawback is that the calculating process will be a little complex than the conventional one.

**Example 2.1** The use of fuzzy number in the sampling survey about favorite games.

Consider a fuzzy set of favorite games for a person as shown in Table 1. Note that in the extreme cases when a degree is given 1 or 0, that is "like" or "dislike", a standard "yes" and "no" are in complement relationship, as in binary logic. Let  $A_1$  represents the semantics of "favorite game",  $A_2$  is "dislike the game".

TABLE 1: COMPARING FUZZY NUMBER WITH INTEGRAL NUMBER FAVORITE GAMES FOR

Favorite games	$A_1$	$A_2$	$A_1$	$A_3$
Degree of feelings	$\mu_{A_1}(X)$	$\mu_{A_2}(X)$	binary logic	
Baseball	1	0	✓	
Basketball	0.3	0.7		✓
Football	0.8	0.2	✓	
Golf	0.4	0.6		✓
Tennis	0.2	0.8		✓

Based on the analysis of binary logic, we can find that he likes the baseball and football game, dislikes basketball, golf and tennis. On the other hand, the fuzzy statistical result can be represented as:

$$\mu_{A_1}(X) = 1I_{baseball}(X) + 0.3I_{basketball}(X) + 0.8I_{football}(X) + 0.4I_{golf}(X) + 0.2I_{Tennis}(X)$$

$$\mu_{A_2}(X) = 0I_{baseball}(X) + 0.7I_{basketball}(X) + 0.2I_{football}(X) + 0.6I_{golf}(X) + 0.8I_{Tennis}(X)$$

Which means that the person likes the baseball game with 100% of degree, likes the basketball game with 30% of degree and likes the football with 80% of degree? While, he dislikes the basketball game with 70% of degree, dislikes the football game with 20% of degree, dislikes the golf game with 60% of degree, and dislikes the tennis game with 80% of degree.

Therefore, based on the binary (like or dislike) logic, we can only see the superficial feeling about people's favorite game (cf, the right side of Table 1). While via the information of fuzzy response we will see a more detailed data representation.

## How to Compute Sample Mode for Fuzzy Data

Traditional statistics deals single answer or certain range of the answer through sampling survey, and unable to sufficiently reflect the complex thought of an individual. If people can use the membership function to express the degree of their feelings based on their own choices, the answer presented will be closer to real human thinking. Therefore, to collect the information based on the fuzzy mode should be the first step to take. Since a lot of times, the information itself embedded with uncertainty and ambiguity. It is nature for us to propose the fuzzy statistics, such as fuzzy mode and fuzzy median, to fit the modern requirement. In this and next section we demonstrate the definitions for fuzzy mode and fuzzy median generalized from the traditional statistics. The discrete case is simpler than the continuous one's.

### Definition: Fuzzy Mode (Data with Multiple Values)

Let  $U$  be the universal set (a discussion domain),  $L = \{L_1, L_2, \dots, L_k\}$  be a set of  $k$ -linguistic variables on  $U$ , and  $\{FS_i, i = 1, 2, \dots, n\}$  be a sequence of random fuzzy sample on  $U$ . For each sample  $FS_i$ , assign a linguistic variable  $L_j$  a normalized membership  $m_{ij}$  ( $\sum_{j=1}^k m_{ij} = 1$ ), let  $S_j = \sum_{i=1}^n m_{ij}$ ,  $j = 1, 2, \dots, k$ . Then, the maximum value of  $S_j$  (with respect to  $L_j$ ) is called the fuzzy mode (FM) of this sample. That is

$$FM = \{L_j \mid S_j = \max_{1 \leq i \leq k} S_i\}.$$

**Note:** A significant level  $\alpha$  for fuzzy mode can be defined as follows: Let  $U$  be the universe set (a discussion domain),  $L = \{L_1, L_2, \dots, L_k\}$  be a set of  $k$ -linguistic variables on  $U$ , and  $\{FS_i, i = 1, 2, \dots, n\}$  be a sequence of random fuzzy sample on  $U$ . For each sample  $FS_i$ , assign a linguistic variable  $L_j$  a normalized membership

$$m_{ij} (\sum_{j=1}^k m_{ij} = 1), \text{ let } S_j = \sum_{i=1}^n I_{ij}, j = 1, 2, \dots, k, I_{ij} = 1 \text{ if } m_{ij} \geq \alpha, I_{ij} = 0 \text{ if } m_{ij} < \alpha, \alpha \text{ is the significant level.}$$

Then, the maximum value of  $S_j$  (with respect to  $L_j$ ) is called the fuzzy mode (FM) of this sample. That

$$\text{is } FM = \{L_j \mid S_j = \max_{1 \leq i \leq k} S_i\}.$$

If there are more than two sets of  $L_j$  that reach the conditions, we call that the fuzzy sample has multiple common agreement.

### Definition: Fuzzy Mode (Data with Interval Values)

Let  $U$  be the universe set (a discussion domain),  $L = \{L_1, L_2, \dots, L_k\}$  be a set of  $k$ -linguistic variables on  $U$ , and  $\{FS_i = [a_i, b_i], a_i, b_i \in R, i = 1, 2, \dots, n\}$  be a sequence of random fuzzy sample on  $U$ . For each sample  $FS_i$ , if

there is an interval  $[c, d]$ , which is covered by certain samples, we denote these samples as a clustering. Let  $MS$  is the set of clustering which contains the maximum number of samples, then the fuzzy mode  $FM$  is defined as

$$FM = [a, b] = \{\cap [a_i, b_i] \mid [a_i, b_i] \subset MS\}.$$

If  $[a, b]$  does not exist (i.e.  $[a, b]$  is an empty set), we say this fuzzy sample does not have fuzzy mode.

Suppose eight voters are asked to choose a chairman from four candidates. Table 2 is the result from the votes with two different types of voting: traditional response and fuzzy response.

TABLE 2: RESPONSE COMPARISON FOR THE EIGHT VOTERS

Voter \ Candidate	Traditional response				Fuzzy response			
	A	B	C	D	A	B	C	D
1		✓				0.7	0.3	
2	✓				0.5		0.4	0.1
3				✓			0.3	0.7
4			✓		0.4		0.6	
5		✓				0.6	0.4	
6				✓	0.4		0.4	0.6
7		✓				0.8	0.2	
8			✓				0.8	0.2
Total	1	3	2	2	1.3	2.1	3.5	1.6

From left part of Table 2, we can find that three are there people choose B. Hence the mode is B. But if we examine the right part of Table 2 for fuzzy response, we find that B only gets the total memberships 2.1. Which is less than  $C=3.5$ , the fuzzy mode. Hence we can see that the fuzzy response will illustrate people's thought more faithfully.

#### Heuristic Statistical Properties Related to the Fuzzy Mode

Though features of a population can be illustrated by certain statistical parameters, there we still many characteristics, which are left out, such as expectation, medium, and mode. Especially, when we are going to investigate the public opinions in the social science research, traditional parameters don't seem to be enough for application. In order to depict the whole picture more carefully, we implement the fuzzy mode.

Let  $U$  be the universe set,  $L = \{L_1, L_2, \dots, L_k\}$  be a set of  $k$ -linguistic variables on  $U$ , and  $\{FS_i, i = 1, 2, \dots, n\}$  be a sequence of random fuzzy sample on  $U$  (data with discrete fuzzy number). The following properties aim to illustrate the useful applications for the presented definition of fuzzy mode and discuss some valuable properties. We will also compare these two types of modes with the traditional ones.

#### Property 3.1

If the maximum membership  $m_{ij}$  in each  $FS_i$  is larger than the significant level  $\alpha$  and located at  $L_j$ , then the fuzzy mode is consistent with the traditional mode.

#### Property 3.2

If there exists a membership  $m_{ij}$  in each  $FS_i$  with values  $m_{ij} > 0.5$ , then fuzzy mode consists with the traditional mode for any significant level  $\alpha \geq 0.5$ .

#### Property 3.3

If there are samples whose maximum membership falls on two or more of  $L = \{L_1, L_2, \dots, L_k\}$  values. Then we cannot compute the traditional mode without discarding these samples. However, by choosing an appropriate significant level  $\alpha$ , we can compute it by

$$S_j = \sum_{i=1}^n I_{ij} \quad \text{and} \quad FM = \{L_j \mid S_j = \max_{1 \leq i \leq k} S_i\} \text{ to get the fuzzy mode.}$$

#### Property 3.4

We can adjust the values of  $S_j = \sum_{i=1}^n I_{ij}$  and then change the location of fuzzy mode by choosing the different significant level  $\alpha$ .

**Note:** If the significant level  $\alpha$  is chosen to be too large, the value of fuzzy mode will be low. If we lower the significant level  $\alpha$ , the value of fuzzy mode will increase. So, the degree of significant level  $\alpha$  is an important point that will influence the state of fuzzy mode. The prior experience can help us to choose an appropriate significant level  $\alpha$  according to the human thought or social utility.

## How to Compute Sample Median for Fuzzy Data

### Definition: Fuzzy Median (Data with Multiple Values)

Let  $U$  be the universe set (a discussion domain),  $L = \{L_1, L_2, \dots, L_k\}$  be a set of  $k$ -linguistic variables on  $U$ , and  $\{FS_i, i = 1, 2, \dots, n\}$  be a sequence of random fuzzy sample on  $U$ . For each sample  $FS_i$ , let  $m_{ij} (\sum_{j=1}^k m_{ij} = 1)$  be the normalized membership with respect to the linguistic variable  $L_j$ .

Let  $S_j = \sum_{i=1}^n m_{ij}, j = 1, 2, \dots, k$ .

Then, the  $L_j$  corresponding to the median value of  $S_j$  is called the Fmedian of this sample. That is

$$Fmedian = \{L_j : \text{the } j^{\text{th}} \text{ linguistic variable such that } S_j = \text{median } S_i\}_{1 \leq i \leq k}$$

### Definition: Fuzzy Median (Data with Interval Values)

Let  $U$  be the universe set (a discussion domain),  $\{FS_i = [a_i, b_i], a_i, b_i \in R, i = 1, \dots, n\}$  be a sequence of random fuzzy sample on  $U$ . Let  $m_j$  be center of the interval of  $[a_i, b_i]$  and  $L_j$  be the width of  $[a_i, b_i]$ . Then the Fuzzy Median is defined as:

$$Fmedian = [M-r, M+r], \text{ where } M \text{ is the median of } m_j, \text{ and } r = \frac{\text{median } \{L_j\}}{2}$$

Note that for the ordered intervals/terms, the fuzzy median, like the traditional median computing, is the midway of the cumulative memberships, which links the human thought to a more continuous flow rather than as discrete.

Suppose a community wants to set up a penalty for an environmental pollution. Hence they invite 5 experts to judge the penalty. Table 3 shows amount of penalty that the 5 experts propose.

TABLE 3: THE AMOUNT OF ENVIRONMENTAL PENALTY FOR 5 EXPERTS

Five experts	A	B	C	D	E
Environmental penalty (10 thousand)	3~5	6~8	5~8	7~10	13~19

Since the penalty proposed by the expert E is much too high than the others did, if we use the average (mean) to decide the amount of penalty, it will be unfair since the result will be dominated by the E expert. However, using the fuzzy median seems an appropriate idea when the traditional median does not work. The computational process for the fuzzy median is shown below:

1. Find center points for each estimated interval, which are 4, 7, 6.5, 8.5, and 16. Hence the median is 7.
2. Find the width of each estimated interval, which are 2, 2, 3, 4, and 6. Hence the median is 3 (radius = 1.5)
3. According to Definition 3.4, the fuzzy median is [5.5, 8.5]

The following statements aim to illustrate certain heuristic properties applications for the presented

definitions of fuzzy median and discuss some valuable factors.

**Property 4.1** For samples with the continuous type, if the sample comes from a symmetric and unicorn distribution, then the center of its fuzzy mode will be coincided with the center of the median.

**Property 4.2** The fuzzy median is unique, while the fuzzy mode is not.

**Property 4.3** For samples with the continuous type, we can use the significant level  $\alpha$  to control the number of samples which the fuzzy median inherits by itself.

## Miscellaneous Applications

### Evaluate the Pollution Problem (Fuzzy Mode Application: Data with Multiple Values)

In a field study, we ask 12 experts to evaluate the degree of pollution  $P$  ( $0 < P < 1$ ) for a special topic. The Language variables  $L = \{L_1 = \text{OK}, L_2 = \text{Moderate}, L_3 = \text{Unhealthful}, L_4 = \text{Very unhealthful}, L_5 = \text{Hazardous}\}$ . Table 4 and 5 illustrate the results from the 12 experts.

TABLE 4: MEMBERSHIPS FOR THE 12 EXPERTS OF ENVIRONMENTAL PROTECTION

Pollution Experts	o.k	moderate	unhealthful	very unhealthful	hazardous
1	0.5	0.4	0.1		
2		0.4		0.6	
3		0.4	0.6		
4		0.6	0.4		
5	0.4	0.6			
6				0.3	0.7
7		0.4		0.6	
8			0.4	0.6	
9				0.2	0.8
10		0.1	0.3	0.6	
11	0.7	0.3			
12		0.7	0.3		
Total	1.6	3.9	2.1	2.9	1.5

TABLE 5: POLLUTION EVALUATION (TRADITIONAL RESPONSE)

Pollution Expert	o.k	moderate	unhealthful	very unhealthful	hazardous
1	✓				
2				✓	
3		✓			
4			✓		
5		✓			
6					✓
7				✓	
8				✓	
9					✓
10				✓	
11	✓				
12		✓			
Total	2	3	1	4	2

From Table 5, we find that there are four experts choose *very unhealthful*. Hence the mode is *very unhealthful*. But if we examine the Table 4, we can find that the item *very unhealthful* gets the total memberships

2.9, which is much less than the maximum membership  $unhealthful=3.9$  of this survey. Comparing the traditional result at Table 5 with that of Table 4, it is clear that the fuzzy mode enables to be more robust in recording the data. In other word, fuzzy mode can more realistically reflect the common agreement than the traditional mode does.

**7-11 Chain Stores Plan to Introduce Lunch Box Services (Fuzzy Mode Application: Data with Interval Values)**

In order to understand consumers' pattern, the manager decides to take a survey to investigate the price of a lunch box, which will be taken for granted and acceptable by consumers. They randomly select 50 customers reside in Taipei city. The investigator asks them, after they ate the lunch boxes, to fill up the questionnaire which price with a list single value and an interval value, which represents an acceptable range.

TABLE 6: PRICES OF LUNCH BOXES (NT DOLLARS)

<i>Fuzzy answer</i>	35 ~45		40 ~45		49 ~55		49 ~59		55 ~59		59 ~65		45 ~59		
<i>Frequency</i>	5		2		15		10		8		4		6		
<i>Traditional answer</i>	35	45	40	45	49	55	49	55	55	59	59	65	45	55	59
<i>Frequency</i>	3	2	1	1	10	5	6	4	2	8	3	1	2	3	1

From the above result, we could obtain the fuzzy mode is between NT\$49 to \$55 with size 31. While based on the traditional answer, it is easy to find that the mode is NT\$49, which is an accepted price for 16 persons. Note that there are still 14 customers choosing NT\$55 as a reasonable price of a lunch box. Therefore we had better conclude that it is more realistic to say that the reasonable price of a lunch box will be \$49 to \$55.

**The Design for English Lecture Hours in Primary School (fuzzy median application: interval data)**

The design for lecture hours of different subjects in primary school should be carefully discussed by teachers and scholars. Assume a researcher would like to collect the information about rational lecture hours of English for primary school. So, we invite 30 teachers and scholars to set the rational lecture hours so that the result can be applied into nine-grade whole curriculum. The question is, "In your opinion, what will be the optimal English lecture hours per week in primary school?"

We ask people to fill out the two types of surveys, for instance, write range in the fuzzy survey and mark certain lecture hours in the traditional survey. So, every sample will contain both the results from the fuzzy survey and traditional survey. Table 7 shows that, based on the traditional survey, the mode is only 9, which means 9 out of 30 (less than 1/3) people would like 6 English lecture hours per week. However according to the definition of fuzzy mode, Table 7 also shows that up to 19 of 30 (almost 2/3) people would like (*generally agree*) 5~7 lecture hours per week based on the fuzzy survey.

TABLE 7: THE ENGLISH LECTURE PER WEEK FOR PRIMARY SCHOOLS

<i>Fuzzy Hours</i>	3~6		4~7		5~7		6~9		3~8		5~10		7~10	
<i>Number of People</i>	2		5		6		3		5		3		6	
<i>Exact Hours</i>	4	4	5	5	6	6	7	3	5	6	5	8	7	8
<i>Number of People</i>	2	4	1	2	4	2	1	1	1	3	2	1	4	2

**How Many People should be Hired? (Fuzzy Median Application: Interval Data with  $\alpha$ -cut)**

A company wants to establish a new office. So the boss asks for 5 related managers to evaluate the number of newcomers that should be hired. Table 8 shows the 5 managers' evaluation as well as the membership function.

TABLE 8: FIVE MANAGERS' EVALUATION AS WELL AS THE MEMBERSHIP FUNCTIONS.

<i>Manager</i> \ <i>Numbers</i>	1~3	3~6	6~9	9~12	12~15	15~18	18~21	21~24
A	0.4	0.6	0	0	0	0	0	0
B	0	0	0.3	0.7	0	0	0	0
C	0	0	0	0	0.7	0.3	0	0
D	0	0	0	0	0	0.1	0.2	0.7
E	0	0.4	0.6	0	0	0	0	0
Total	0.4	1.0	0.9	0.7	0.7	0.4	0.2	0.7

The significance of Table 9 lies on the fact that there are little overlaps among 5 experts' answers. This is what the  $\alpha$ -cut can jump in and resolve the problem without bias. Table 8 shows the sum memberships via different significant level  $\alpha=0.4$  and  $\alpha=0.7$ . It is clear to find that under  $\alpha=0.4$ , the fuzzy median for the answer "How many people should be hired is 6~9 people". While under  $\alpha=0.7$ , the fuzzy median for the same question is 9~12 people.

TABLE 9: FUZZY MEDIAN FOR THE ORDERED MANAGERS' EVALUATION

<i>Sum</i> \ <i>Numbers</i>	1~3	3~6	6~9	9~12	12~15	15~18	18~21	21~24
Membership	0.4	1	0.9	0.7	0.7	0.4	0.2	0.7
Membership( $\alpha=0.4$ )	0.4	1	0.9	0.7	0.7	0	0	0.7
Membership( $\alpha=0.7$ )	0	1	0.9	0.7	0.7	0	0	0.7

**Penalty Evaluation for a River Pollution (Fuzzy Median Application: Linguistic Data with Weight)**

Suppose a community wants to set up the penalty for a river pollution. They ask 10 experts to estimate the total amount of the penalty. Table 10 is the result of the surveys.

TABLE 10: PENALTY FOR A RIVER POLLUTION

<i>Expert</i> \ <i>Factors</i>	<i>Water</i> $w_1=0.4$	<i>solid waste</i> $w_1=0.25$	<i>Odor</i> $w_1=0.2$	<i>Chemical toxins</i> $w_1=.1$	<i>Noise</i> $w_1=0.05$
1	[10,12]	[15,20]	[12,15]	[22,30]	[8,10]
2	[8,9]	[8,10]	[10,13]	[6,8]	[12,13]
3	[5,7]	[20,25]	[19,20]	[9,11]	[20,22]
4	[12,15]	[20,28]	[11,12]	[20,23]	[15,18]
5	[20,30]	[14,19]	[10,20]	[14,16]	[16,20]
6	[7,9]	[16,21]	[13,15]	[8,9]	[25,30]
7	[8,10]	[10,12]	[22,24]	[10,11]	[31,35]
8	[5,6]	[7,8]	[17,19]	[12,15]	[20,23]
9	[11,12]	[11,14]	[22,28]	[18,20]	[10,12]
10	[11,13]	[22,26]	[14,16]	[10,12]	[16,22]
Fuzzy Median	[9,11]	[14.5, 19.5]	[14,16]	[11,13]	[17,20]

unit=million dollars

The fuzzy median estimation process is as follows:

- (1) Deciding the influence factors about the pollution.
- (2) Applying the fuzzy ordering method to calculate the weights  $\{w_1, w_2, \dots, w_k\}$ .
- (3) Calculating the sample fuzzy median  $FM$  of the penalty for each item.
- (4) Calculating the total penalty via soft computing  $FM^* \{w_1, w_2, \dots, w_k\}$ .

Take the first term quality of water as an example: (1) the center point and the radius  $[m;r]$  are [11;1], [8.5;0.5], [6;1], [13.5;1.5], [25;5], [8,1], [9;1], [5.5;0.5], [11.5;0.5], [12,1]. From Definition 3.4, we can find that the

(10,1) will be the fuzzy median of these 10 data, that is [9,11]. Finally multiply the weight by the fuzzy median, we can get the amount of penalty for a river pollution, which is

$$10 \cdot 0.4 + 17 \cdot 0.25 + 15 \cdot 0.2 + 12 \cdot 0.1 + 18.5 \cdot 0.05 = 13.375.$$

## Conclusions

Fuzzy statistical analysis grows as a new discipline from the necessity to deal with vague samples and imprecise information caused by human thought in certain experimental environments. In this paper we, we made an attempt to link the gap between the binary logic based on multiple choice survey with a more complicated yet precise fuzzy membership function assessment, such as fuzzy mode, fuzzy median, fuzzy weight and  $\alpha$ -cut etc. We carefully revealed how these factors can be properly and easily utilized in various fields to reveal the contradictory characteristics of human concepts. Through these processes, human ideas are no longer presented as discrete but as a natural and continuous flow. There are illustrated examples demonstrated to explain how to find the fuzzy mode and fuzzy median, and how to use the results to help people reaching their decisions.

However, there are still some problems we need to investigate in the future:

1. We can further the research on data simulation so that we can understand features of the fuzzy linguistic, multi-facet assessment, and the balance of the moving consensus. Moreover, the choice of different significant  $\alpha$ -cut will influence the statistical result. An appropriate criterion for selecting significant  $\alpha$ -cut should be investigated in order to reach the best common agreement of human beings.
2. There are other types of membership functions we could explore in the future. For the fuzzy mode of continuous type, we can extend the uniform and triangular types of membership functions to non-symmetric or multiple peaks types.
3. The degree of correlation between the ambiguity of human thoughts and the uncertainty of human behavior. That is: how true does the human behavior honestly reflect the human thought.

# Affecting Consumer Behaviour through Retail Concentration: The Shopping Streets

*Luca Petruzzellis*  
*University of Bari, Italy*

## Abstract

Location has been long considered as an important competitive factor in retailing. Nowadays, firms are more focused on in-store customer profitability than product profitability. Retailers are competing for a front space on the streets in order to gain more visibility, while cities are experiencing a renewal and enlargement process in their shopping “spaces”. In fact, high-traffic locations, even though are costly, still represent the best location to meet customer needs. This has been enhanced by retail concentration, especially in the case of fashion products. This paper tries to understand which factors affect shop attractiveness and to which extent the territorial variable, i.e. agglomeration, influences shopping expeditions and store loyalty.

## Introduction

Since retail represents the link between consumers and products, communication and service, the proximity between demand and supply has not been efficiently exploited by the distribution system. Firms often emphasise buying behaviour, logistics and product assortment rather than customer relationship management.

Nowadays, economic changes are pushing towards strategies which are more focused on in-store customer profitability than product profitability. The variety of distribution has led to developing many levels of relationship with the public space and many levels of attraction. In this sense the distribution system evolves from the craftsman’s studio to the big shopping centre, through intermediate situations such as open markets, department stores, supermarkets, and superstores.

Location choices, depending on the type of activities and level of competition, vary from city centres as huge “traffic” magnets, to suburbs, especially for innovative retail types in which shopping is mixed with leisure. Above all, changes in consumer lifestyle strongly affect the retail demand, forcing the distribution system to reorganise and reposition its offer. Therefore, shopping proves to be a differentiating “activity”, given that buying behaviour is even more characterised by psychological and emotional factors, thus the purchased goods and the stores frequented become lifestyle symbols.

Distribution formula and leisure services can satisfy different needs (i.e. entertainment and necessity) from different segments in the same shopping expedition, so stores become a tool to increase customer satisfaction and stimulate consumption. On the other hand, there is a dualism between the retail dynamic needs and the existing spatial conditions. The former, especially in the case of fashion and shopping goods, requires a strategic position as close to customers as possible, namely huge spaces – almost 150 square metres with 2 windows -, attractive locations – often the city centre – where the consumer need for experience and entertainment is met. The latter could be modified gradually and partially, determining a location hierarchy (Berry, 1963), as confirmed by data in real estate markets: this results from wider changes in politics, economy and society.

It is through location that goods reach the potential customers. It can allow quick access to the market, attract a huge number of consumers and increase the potential sales. In the actual competitive formula, localisation has a significant effect on market share and firm profitability, so the choice is not only a matter of physical accessibility but also of consistency between market spatial features and a firm’s marketing objectives (Ghosh & McLafferty, 1987; Ingene & Ghosh, 1991). Consequently, all cities are experiencing a renewal and enlargement process in their shopping “spaces”; retailers are competing for a front space on the streets in order to gain more visibility – through huge and sparkling stores - and “label” their products through values, symbols, and emotional/entertaining experience (Pellegrini, 2001).

This paper investigates the spatial/territorial dimension of consumption, analysing the concentration phenomenon among shops from the same sector or complementary ones. In fact, by exploiting agglomeration economies shops can be positioned in the consumers' mind, firstly, with the street's collective image and then with the shop's specific image (par. 2). The phenomenon has been studied in Bari, an Italian city with a strong commercial tradition (par. 3). Moreover the fashion sector has been chosen, as the process of agglomeration is mostly taking place in many cities.

In this paper an in-depth analysis will be carried out to investigate shopping behaviour in three of the city's streets, in an attempt to underline the link among shops, shopping behaviour and streets. The paper will try to understand which factors affect shop attractiveness and especially to which extent the territorial variable, i.e. agglomeration, influences shopping expeditions and store loyalty.

## Retail Strategies to Match Consumer and Territorial needs through Shopping

In the present economic situation consumer evolution and the change in buying behaviour have shifted the focus from the product to the experience that it provides. Brands label the extraordinary experience that identifies a social and emotional condition. They represent consumer personality: the product transfers a set of values, emotions and bonds that legitimate the system (product $\Rightarrow$ consumer) identity, in order to maintain in time and space the product messages and values (Pine & Gilmore, 2000; East, 2003).

TABLE 1: THE EVOLUTION OF CONSUMPTION KEY CONCEPTS

1980	1990	2000
Mass consumption	Selective consumption	Extraordinary experience
Quantity	Qualità	Excellence
Social status and position	Self-expression	Lifestyle
The others as benchmark	Yourself as benchmark	Social networking
Brand ostentation	Brand authenticity	Brand personalità
Brands as social symbols	Brands as emotions	Brands as personality identification
Brand loyalty	Brand switching	Brand identity

In particular, fashion has a symbolic function with a psychological dimension – the expression of personality – and a sociological one – the identification and differentiation of the human being – (Baudrillard, 1972).

The economy's new structure is challenging the retail sector, through technologies, Internet, enlarged international markets, the brand role, the new consumer attitude, drawing a highly competitive arena. Actually, despite the fact that retail seems to be in its maturity phase, there are many opportunities to exploit: stores, in particular, have obvious development opportunities; also the threats, namely intense international competition, market enlargement and the consequent role of the global and food retailers, are accelerating the modernisation process of distribution. Moreover, the increased space demand, and consequently higher rents, and the more sophisticated and value-seeking consumption behaviour, are challenging the key concepts on which retail is based (Anderson, 1992; Ramshaw, Brockwell, & Mardones, 1999).

Therefore differentiation is the successful strategy, especially in more and more commoditised sectors, such as fashion. Retail and brands represent the key success factors to compete in the international arena.

Stores become the place where the marketing strategies of a firm come to life; in them firm communicates, fosters the loyal relationship with their customers and constantly monitors market tastes and needs. The store is a determining factor in the brand image and brand identity building processes, since it is the first place to contact the consumer. Store interactivity has to be boosted in order to collect more information on consumer needs and shopping behaviour.

To date retail caters to a wider specialisation, serving specific target markets with different lifestyles and transmitting images, symbols and emotions. On the other hand it presents deep fragmentation, limited efficiency in the distribution network and the high presence of small independent shops. This structure derives from the sector's

need for differentiation, since the point of sale increases the product added value (Ravazzoni & Panciroli, 2002). Store is no longer only a logistic-operative thrust but also a more complete marketing one, especially from a relational point of view.

The new competitive scenario and consumer evolution draw new dimensions for retailers; they should tailor their offer to the continuous changes in consumer preferences for the store assortment and spatial and architectural features.

Localisation, and consequently the point of sale, have two dimensions: the firm one and the consumer one. They should be combined in the search for a store loyalty that matches the brand one. So far stores are physically structured in relation to the spatial position and the products sold, in order to attract consumers and create an ambience (Kotler, 1973) in which to live an experience.

In order to enter the consumer evocative set, the store has to make such an impression as to be positively remembered in the decision-making process while choosing products and brands (Stoltman et al., 1990). Empirical studies (Paulins & Geistfeld, 2003; Mulhern et al., 1998) found localisation, service, assortment depth, price strategies, quality, and store ambience to be discriminatory factors in the relation between retail and customers. In particular, the physical features such as layout, colours, music and crowding, result as strongly affecting shopping behaviour and store choice (Finn & Louviere, 1990; Arnold, Oum, & Tigert, 1983). For example, overcrowded stores can inhibit the shopping behaviour and cause various reactions, that range from reducing the store visit frequency to postponing the scheduled purchases or giving up the shopping expedition entirely (Donovan et al., 1994).

Moreover, store positioning proves to have a strong correlation not only with product features, such as quantity, quality and services, but also with marketing ones, namely price strategies, store format, time factors, benefit sought, consumer's perception and shopping behaviour. All these elements are summarised in the store image, that is strictly correlated to the quality and reputation of the brands sold in it. The store ambience features strongly affect the consumption volume and nature.[1]

This phenomenon is obvious especially for fashion products, in which brand notoriety is combined with particular locations. Firms try to create a glamour context around brands in order to realise an unforgettable experience not only in buying and consuming the product but also in the time spent choosing it within a stylish environment.

## **Retail Concentration as a Marketing Tool for Firms and Cities: The Shopping Streets and their Perception**

In this scenario retail is spatially redefining social spaces and the relations within the city, through the traffic flows it causes. The complex functions of selling require specific locations; from city centres, suburbs, high streets, stations, airports, and so on; while globalisation and the consequent enlargement of space and time relations, necessitate easy access, no separation of the street by huge windows, and free service. Therefore a new relation between consumers and retailers is created, based exclusively on psychological and emotional factors; image and the consumers perception of it play an important role.

Consumption, and its display – shopping-, are shaping city's identities and functions in relation to consumers' needs. The so-called "percorsi degli elefanti"[2] (Amendola, 1998) create a network that assigns new vitality and dynamism to goods and people flows.

Therefore localisation strategies tend towards concentration in order to follow the evolution of consumer needs: for convenience goods concentration results in purchases in a single store; while for shopping goods concentration is the solution to the issue of minimising search costs. On one hand, consumers look for detailed information on product prices, quality and variety, and on the other for entertainment and fun while shopping. To match consumer needs firms are forced to locate their stores near their competitors in the so-called shopping districts/streets.

Such a concentration derives from belonging to complementary sectors and from the presence of magnet stores that modify shopper traffic and mobility, given also the customer exchange among nearby similar commercial

types (Mc Keever & Griffin, 1977). So agglomeration is demand pull; it is possible to offer a complete set of products, that can be bought in the same shopping expedition, granting savings of time and space.

At present distance is no longer the main discriminating factor, it becomes a marketing factor rather than a geographical one. Nowadays accessibility results as the key “shopping” criterion. To be located in the city centre does not assure success in itself; it is the “accessibility image” that counts. So far the trade-off between distance and dimension is influenced by consumers’ perception of the specific store image and of the store network one (Campo et al., 2000).

Urban areas seem to be the best locations for shopping agglomerations by nature. They offer visibility and direct contact as near as possible to consumers, both potential and actual. On the other hand, firms are searching for larger spaces to locate their activity and create an ambience in which consumers can experience more fun and entertainment while shopping. Unfortunately, these requirements match higher location costs and are suitable only for certain products, such as fashion ones. However, spatially they stimulate a repositioning process of city centres and their streets.

A measure of this phenomenon is given by the real estate market performance. In fact despite the overall economic slowdown, retail markets have held up well and retail rents rose approximately by 3% with a relevant performance from Central and Eastern Europe. In Western Europe, the real estate market shows a good demand with a limited supply of good quality space, that has caused strong, or even exceptional, growth for the high streets. Italy scores a slight slowdown in the growth rate in 2003 (3,7% vs 5,3% in 2002) confirming the high level of the rent values (Cushman & Wakefield, 2004). (see Fig. 1)

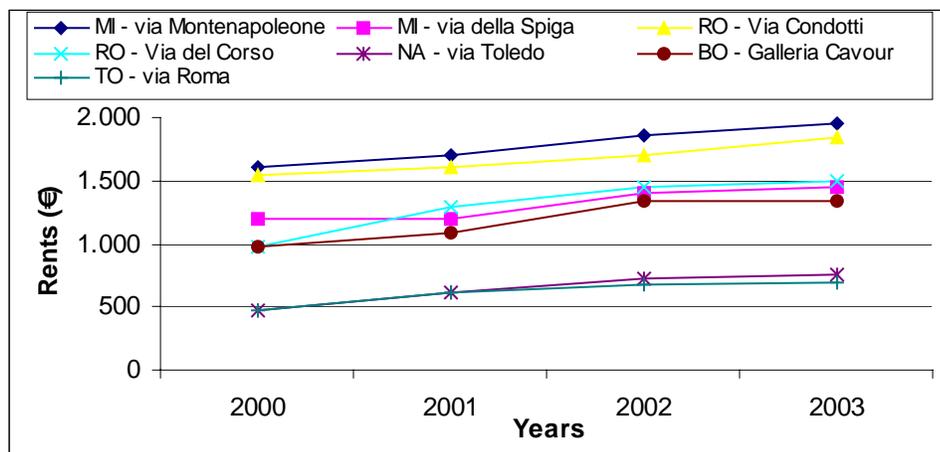

FIG. 1: RENT DYNAMICS IN SOME ITALIAN SHOPPING STREETS  
Source: Cushman & Wakefield (2004)

Throughout all the Italian cities, Bari has been chosen for its long established commercial tradition. As it can be observed in most of Europe, the city is repositioning its image, having lost its regional and provincial commercial leadership. Within its structure, the city centre is suffering strong competition from the suburbs where shopping malls are able to attract many consumers from different areas due to price strategies, the worsening of urban accessibility and the lack of “entrepreneurship”/collaboration among central retailers (Petruzzellis & Falcone, 2005). [3]

Secondary data on Bari highlight the repositioning phase. The trends of rent market and consumer goods prices show the general situation in the city, creating a difficult context in which the match between demand and supply needs new strategies, such as retail concentration.

Firstly, the real estate market trend draws the vivacity of the retail sector which is constantly adapting its offer to consumer needs. The opposite trend of demand and supply is contributing to the progressive increase of the

average prices. In fact, an increase in the real estate market measures an increase in the area's values that can attract further values in a virtuous cycle (D'Arcy and Keogh, 1998).

Secondly, in confirming the results of the real estate market, the price trend of consumer goods, in particular clothing and shoes, are indices of the macro environment that affect and explain the concentration phenomenon. They show parallel trends, the annual average increase is similar with a perfect fitting (see Fig. 2).

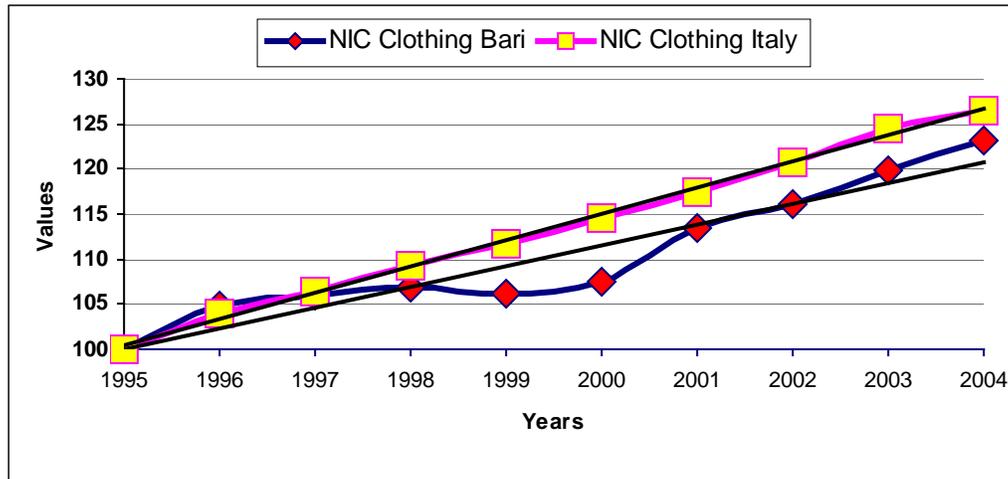

FIG. 2: NIC INDEX FOR CLOTHING AND SHOES: BARI VS ITALY

Source: Istat, 2004.

The linear function with OLS method is for NIC Clothing Bari  $y = 2.33x - 4535$  with a  $R^2 = 0.91$ ; while for NIC Clothing Italy  $y = 2.92x + 5720$  with a  $R^2 = 0.99$

However, the field study is exploratory in nature and intended to develop an understanding of consumer perception of retail concentration, namely shopping streets. Street perception from the place and retail marketing point of view has been analysed. This paper investigates which factors push through retail concentration and attract consumers in three streets in Bari (via Argiro, Corso Cavour and via Sparano).

Data have been collected in one day by interviewing a random sample of 500 people, who were in the three streets analysed. [4] The sample is mostly composed of women, due to sociological and marketing factors, and the average age is approximately forty. As regards sex, sociology explains women's natural attitude through shopping, while marketing explains the huge presence of clothing and shoes stores. Instead the young age is due not only to the location of glamour stores in the streets considered, but also to the location of exclusive cafes and meeting points (see Table 2).

TABLE 2: THE RESPONDENTS BY AGE AND SEX

Age	M	F	Total
< 19	21	26	47
20-25	40	56	96
26-35	26	41	67
36-50	20	39	59
51-65	22	22	44
> 66	15	6	21
<b>Total</b>	<b>144</b>	<b>190</b>	<b>334</b>

These three streets are the most representative from the shopping point of view, both for store number and type, and for their tradition and position. They are perceived as a shopping district within the commercial heart of the city but each with a specific feature: via Argiro is a female oriented street, via Sparano is the city's showcase or "promenade", corso Cavour is the most accessible both physically and for the products sold.

The dataset has been analysed with SPSS; carrying out firstly descriptive statistics, in order to describe the main characteristics of the sample; secondly the correspondence analysis to measure consumer perception of the shopping streets (Molteni & Troilo, 2003).

Like the whole city, the three streets experienced a repositioning process that follows consumer evolution, especially for the fashion sector. In fact, via Argiro was formerly a wholesale street, but has now become an exclusive street to find specialty goods; corso Cavour, due to its strategic position and its easy physical and commercial access, is the middle class street. Lastly via Sparano, one of the oldest city's streets, is the commercial heart of Bari, in which its identity is displayed. Most of the single brand stores of the city are located there.

Firstly, the relation between demographic factors, such as sex, age and distance, and customer loyalty, that measures shopping behaviour, has been investigated through the chisquare statistical analysis (Johnson, 1997). The demographic variables do not influence customer loyalty and consequently shopping behaviour, but influence the image and characterisation of the streets, considered as a structured set of stores. Only via Sparano shows a dependent relation between customer loyalty and age and distance (see Table 3). This seems to derive from factors related to store typology, specifically fashion, and from territorial factors combined with marketing ones, such as the street's image, especially for via Sparano.

TABLE 3: P VALUES OF  $\chi^2$  FOR THE THREE STREETS IN BARI

<b>Variables</b>	<b>Via Argiro</b>	<b>Corso Cavour</b>	<b>Via Sparano</b>
<i>Age-Customer loyalty</i>	0,335	0,392	0,001
<i>Sex-Customer loyalty</i>	0,893	0,313	0,372
<i>Distance-Customer loyalty</i>	0,001	0,834	0,016

In order to analyse why the street is frequented and its influence on shopping behaviour, the usage of the streets has been investigated. Via Argiro and corso Cavour result to be used only for shopping while via Sparano is used also for walking or meeting people, and often, while crossing it, the buying decision is taken.

In particular, via Argiro is used only for feminine glamour shopping, even though it is physically one of the first streets of the city. Also the time spent on shopping confirms the findings: 61% spends 1-3 hours, 21% less than 1 hour, and 18% more than 3 hours. Moreover, the other facilities such as cafes and meeting points, can attract potential users/shoppers, rendering the street enchanting. Corso Cavour has a strong commercial vocation, so consumers frequent it only for shopping without being loyal to specific stores. They spend much time (more than 2 hours for 39%) shopping in the street due to the opportunity it provides to compare products and to the "distance" factor [5]. On the contrary via Sparano is also used for walking, especially because it is a pedestrian precinct, that has labelled it as the "living room" of the city, although the street is losing its brightness due to the worsening of the accessibility conditions.

Finally, to investigate the position of the three streets in the consumers minds, the purchase motivations have been analysed (Grewal et al., 1999) (see fig. 3)

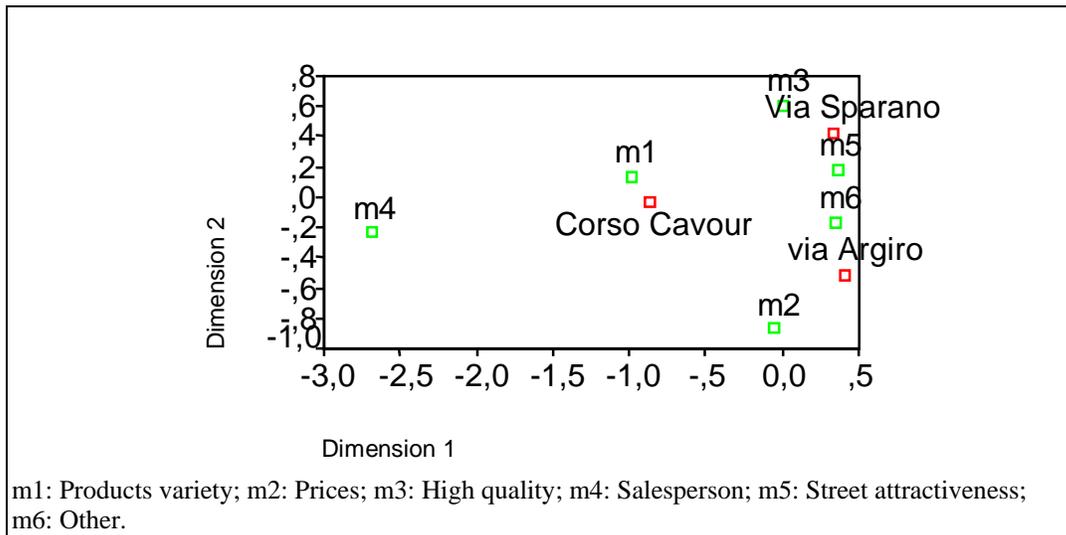

FIG. 3: PURCHASE MOTIVATIONS IN THE THREE STREETS

As can be seen in the figure, people choose to shop in the three streets for different reasons; in particular, corso Cavour is chosen for its wide range of products, that, as in figure 4, represents a weakness rather than a strength because it contributes to a confused image. Via Argiro is chosen for its prices that, even though considered high, do not prevent consumers frequenting it. Instead they contribute to fostering the perception as a stylish shopping street and creating a sort of loyalty discriminated by premium price. In fact, the street customers are willing to pay high prices for fashionable and trendy products. Finally, via Sparano attracts consumers for the high product quality and its good reputation. In fact, it is the street with the high percentage of loyal customers (60%) especially for the prestigious fashion brands sold.

In conclusion, the positioning map (see fig. 4) defines three areas in relation to shoppers' perception. For via Sparano and via Argiro the perception results as well defined, as stylish streets, whose fashionable and trendy products and stores are differentiating elements that contribute to legitimise the firms' brand identities and the opportunity to charge a premium price to justify the location. Especially in the case of via Sparano, the street positioning derives from its tradition, but has repositioned itself in order to follow consumer and fashion evolution, by changing its front and store type. [6] On the other hand, corso Cavour has a less clearly defined positioning, due to its confused perception. That is why the high variability and the wide variety of store typology, that are not often coordinated.

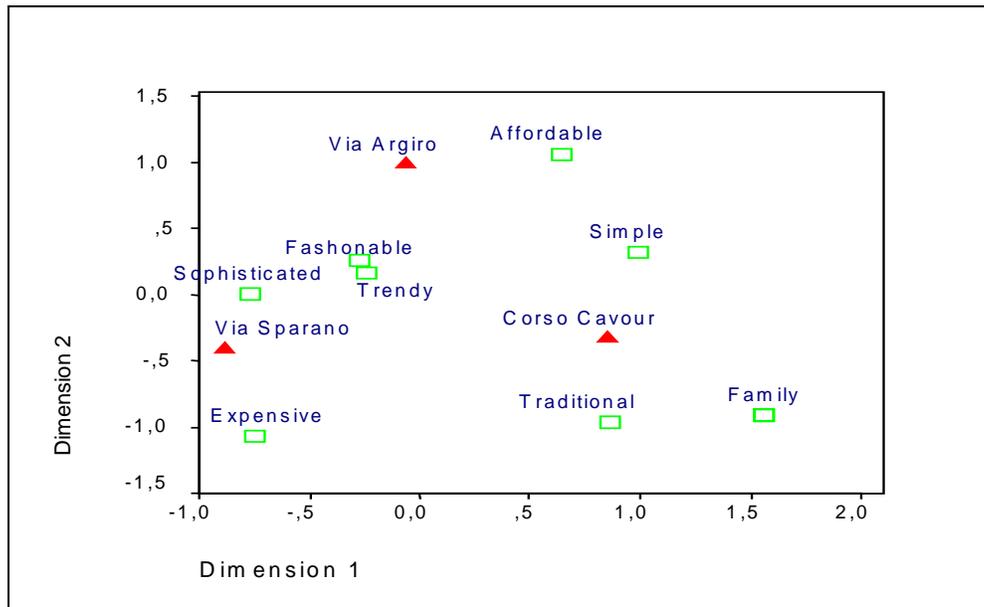

FIG. 4: POSITIONING MAP OF THE THREE STREETS

## Conclusions

The case analysed highlights how retail concentration is based on market multi-segmentation. It results as a new strategic opportunity to avoid the saturation of customers' positioning perceptual map, filled by similar values and messages (Featherstone, 1994). The store proves to be the place where a firm's identity is displayed and brand identity is built, and, together with the territory and the competitors (Nalebuff & Brandeburg, 1996), creates a relational contest to provide pleasant experiences.

The shopping streets and city centre are seen as brands with "symbolic value and personality" (Brown, 1992) which can be developed and maintained (Warnaby & Davies, 1997). The shopping district can be seen as a "bundle of benefits", both tangible and intangible. As all networks (Davidow and Malone, 1992; Van Haken et al., 1998; Baccarani & Golinelli, 1992; Lorenzoni, 1992), shopping streets create relations which cause crossing flows in proportion to the dimension and the attractive capabilities of the various retail activities, and that foster vitality for the city they serve.

In conclusion, retail concentration is a strategic element both for firms and for cities in order to be part of the competition. Therefore it is a marketing thrust that boosts and helps create brand identity, increasing the relational tools to impact consumer perception. Location plays a new role in the competitive formula, stimulating the use of a systemic approach (Golinelli, 2001) in relative management choices.

### **End Notes**

1. As Lovemark (1972) found, “sunshine stimulates shopping”, in order to define purchasing behaviour especially in the northern regions.
2. They are the streets that are automatically covered by all the transport means, unconsciously following paths designed by custom stratifications.
3. Interviews showed that they are confident that central location will always grant a position income. It is clear that they do not understand how to maintain their leadership and to gain higher value from their location.
4. The response rate was 66.8% of the sample.
5. 47% of the interviewees did not come from Bari.
6. A clear example of the repositioning is Palazzo Mincuzzi, that used to be an elite store, while now is a medium one. Moreover the fifty-year-old interviewees underlined the shift of the street perception from “living room” to “arcade”, in order to mark the less exclusiveness.

# Brand Behaviors and Descriptors of Malaysian Teenagers

*Sofiah Abd. Rahman  
Karunakaran Madhavan  
Deviga Vengedasalam  
Universiti Teknologi MARA, Malaysia*

## Abstract

A critical function of market research is to inform managers of consumer behaviours in the markets in which they serve. For sporting wear operators, one of the key inputs in making strategic decisions is data on the attitude of shoppers towards brands. In this study, two areas of consumer behaviours – (teenager) awareness and acceptance towards international and local brands were examined. In addition, moving away from past works on teenage consumers that focussed mainly on peer groups and media influence as descriptors, this study offers another angle to the determinants of brand behaviour using Gaedeke & Tootelian (1983) framework. The findings established that international brands reigned supreme in the teenagers' mind and heart. On the other hand, confidence, identification and familiarity emerged as the dominant descriptors of brand behaviour. Indeed, the outcome presents great challenges to local producers in time of rapid global change.

## Introduction

Many products and services differentiate themselves from competitors by doing a better job of giving customers the perception that they are of higher value or better at a particular product characteristic. One of the key ways to convey perceptual difference is branding. Retailers, therefore, are very interested to understand the behavior of their consumers towards the various types of brands that they carry as this knowledge will have a major impact on their merchandising strategy and profitability.

The number of Malaysian teenagers is expected to stand roughly 20 percent of the population or 6 millions by year 2005 (Euromonitor, 2003). Although no data of their spending amount can be found, this research has shown that on average, they were given RM100.00 per month to spend, amounting to RM7.2 billion per year. Consequently, knowledge of how, what, where, which brand and how much a teenager spends is critical to the business stakeholders.

This paper takes a look at two dimensions of brand behavior – brand awareness and brand acceptance in the context of the footwear industry with Malaysian teenagers as the samples. The aims are to describe and compare the awareness and acceptance levels towards international and local footwear brands as well as to establish the factors that significantly affect these two brands behavior. Specifically, this research answers the questions of: What are the awareness and acceptance level of Malaysian teenagers towards international and national sporting footwear brands? What are the descriptors of teenagers' brand choice? Will 'family' influences teenagers brand decision? Is there any relationship between teenagers' ethnicity and brand choice?

## Literature Review

According to Gardner & Levy (1955); King (1973); Madden, Hewett & Roth (2000), in earlier days, brand was simply seen as a name. However, it underwent a fundamental change in the middle of the twentieth century when the Westerners tried to develop an increasingly diverse interests and lifestyle (Rogers 1991; Cook & Walters 1991). In line with this change, the Westerners began to seek those brands that were able to impress their friends, display wealth or signal style (Porter & Claycomb, 1997). Therefore, a brand, by then was seen as 'a complex symbol that represents a variety of ideas and attributes' (Gardner & Levy, 1955). In short, a brand symbolizes a 'personality' (King, 1973; Madden, Hewett & Roth (2000)).

### **Brand Awareness and Acceptance**

Rossiter and Percy (1987) describe brand awareness as being essential for the communications process to occur as it precedes all other steps in the process. Without brand awareness occurring, no other communication effects can occur. For a consumer to buy a brand they must first be made aware of it. Brand attitude cannot be formed, and intention to buy cannot occur unless brand awareness has occurred (Rossiter, Percy, & Donovan, 1991). Therefore, awareness is the necessary first step towards adoption (Crawford & Di Benetto, 2000). What is then brand awareness?

Churchill (1995) sees brand awareness simply as 'what people do or do not know about an object or a phenomenon'. Schiffman & Kanuk (2000) suggests that awareness encompasses the notion of customer's interest level or buyer readiness state, while Mandler (1980) believes that the meaning of awareness ranges from a simple identification of a brand to a highly developed cognitive structure. Dave (2004); Levy & Weitz (2004), on the other hand, defined brand awareness as "when people recognize your brands as yours". According to them, brand awareness consists of both brand recognition which is the ability of consumers to confirm that they have previously been exposed and brand recall which reflects the ability of consumers to name the brand when given the product category, category need or some other similar cue. Further, in a study involving marketing managers as subjects, 61% of respondents defined brand awareness as simple recognition of a brand (Macdonald & Sharp, 2003).

The above scenario obviously illustrates the different views and extents of the meaning of brand awareness, from simply 'knowing' to as complex as 'a highly developed cognitive structure'. To operationalise the awareness dimension, the one used by Dave (2004) and Levy & Weitz (2004) is adopted in this study - that is the ability to recognize or recall brand sufficiently. Further, as noted by [www.allaboutbranding.com/index.lasso](http://www.allaboutbranding.com/index.lasso), brand awareness is the realization by a consumer of the existence and availability of a particular product through either unaided awareness (spontaneous) or aided awareness (when the name is recognized among others that are listed or identified). To study these two dimensions, the research instrument contained both brand recall and brand recognition tests.

Brand acceptance is the psychological process relating to information assimilation about the brand that will lead to the decision that the brand is an acceptable alternative. Brand acceptance is very important from a marketing perspective because it is a precursor to brand choice and purchase. Acceptable brands are evoked from memory for further consideration. Further acceptance also can be classified as the decision maker's personal agreement with attributes of the brand. The concept of consideration sets makes brand choice a two-step process. Households first construct a consideration set which not necessarily includes all available brands and conditional on this set they make a final choice. To measure brand acceptance, the research instrument in this study contained both the recall and recognition of brand choice and brand purchase.

#### **Descriptors of Brand Awareness and Brand Acceptance**

Brand awareness is very important in consumer decision making for several reasons. Firstly it is important for the consumers to think of the brand as they are thinking about the product category. Secondly, expanding brand awareness raise the likelihood that the brand will be included in the consideration set and receive serious concern for purchase. Thirdly, brand awareness can influence decision about brands in the consideration set. According to Petty and Cacioppo (1986) consumers will choose products based on brands in the consideration set. Finally, brand awareness affect decision- making by influencing the formation and strength of the brand association and the brand image.

Establishing a good brand name is a very complex process (Gaedeke & Tootelian, 1983). This view is supported by many past studies. Further, research works conducted on branding and issues related to it proposed that once consumers become aware of a product, they evaluate it to determine the level to which it is acceptable to them. The evaluation factors, according to the above authors can be broken down as follows:

1. Familiarity  
Consumers are generally more comfortable with something that is known.
2. Confidence  
When consumers trust a product, they will return to it again.
3. Differentiation  
The brand concepts allow the consumer to differentiate one from another.

#### 4. Identification

A brand stance that allows an individual to identify with a specific product in a way that reflects her own taste and life style.

#### 5. Prestige

Consumers often use products to gain group approval.

Past studies such as that of Hoch & Banner (1993); Gardner & Levy (1995) had underlined that compared to local brands, consumers, in the past viewed international brands as having 'superior' personality. Moreover, the study conducted by Bristow & Asquith (1999) has shown that, '*the higher is the need for recognition, the higher is the need to purchase branded items (designer names)*'. These scenarios provide a platform for this study, as teenagers tend to exhibit this kind of behavior. In addition race has been found to be an important factor influencing teenagers behavior in Malaysia (Selamah & Ruzita, 1999; Abd. Rahman, 1999:2002). Though bonded by Eastern cultures, past experiences imposed contrasting values on the three major ethnic groups. These differences led to diverse lifestyles, which in turn shaped their buying behaviours. The following excerpts provide the background to their diversity.

Excerpt 1:

*"The real Malay is courageous...but he is extravagant, fond of borrowing money and slows in repaying it...he is proud of his country, his people, venerates his ancient customs and traditions and has a proper respect for constituted authority..."* (Andaya, 1982).

Excerpt 2:

*"Those (the Chinese) who made the journey (to Malaysia) and survived were exceptionally hardy and determined. Their attitudes were, and had to be, fiercely competitive"* (Jayasuriya, 1983).

Excerpt 3:

*"The planters wanted a labour force which would be more disciplined and industrious than the Malays and more docile than the Chinese. For a solution to their problems, they turned to the Tamils of South India"* (Snodgrass, 1980).

Indeed, in the study of shoppers, ethnicity is an important descriptor to Malaysians' buying behavior. Past literatures, such as the works of Abd. Rahman (1999:2002), for example, have highlighted that the Chinese adults are price conscious shoppers while the Malays and Indians are more brand conscious. It is expected therefore, in this study, that the outcome would be parallel to the above (Abd. Rahman, 1999:2002) work.

Generally speaking, many brands found in the consumption world act as social tools for communication between the individual and significant others (Leigh & Gabel (1995). The constant search for acceptance and identity are reflected by the brands that they chose and can also be influenced by media, peer groups, reference groups, role models, and family (Wee, 1999; Childers & Rao, 1992; Martin & Bush, 2000). Therefore, being young, it is understandable that teenagers prefer to own internationally branded items. Nevertheless, there are instances in which, international brands may not always win teenagers' hearts. In his study (Wee, 1999) on popular brand names involving 600 teenagers in Singapore, although the respondents cited Nike – an international brand as the most popular sport shoes, they picked Giordano, a home-based brand as the most popular casual wear. Thus, this outcome signals the potential of local brands to be in the consideration set and accepted as the brand of choice.
