# WTO: Governing Globalization Forces in the International Trade System

*Paola Zoccoli*  
*Università degli Studi di Salerno, Italy*

## Abstract

The international trade is characterized by uncertainty, variability of events, but also and, above all, by the differences among the entities that populates the same context and shaping its configuration. This situation gives back more consideration to the dynamics shaping the deployment of the international trade system. Investigating the international trade actual context, identifying its actors, connections and interactions among them, the influences and the critical positions/roles that act in it is useful to understand the origin and nature of this dynamics. In this way is facing more and more relationships among structure and functions of components: it's emerging a system. Then the adoption of the perspective of viable systems will allow to identify the connections and the critical forces conditioning the operating system and its continuity. These forces, tight interconnections and their control ask for a structure, but also to govern such a reality. The aim is to depict the supra-national order in which becomes critical the determination of a capable entity to develop an institutional role exerting a crossing coordinating/governing action.

## Introduction

World liberalization of goods and services represents a crossing deregulation originated by nations concerned in General Agreement on Tariffs and Trade (GATT). The Agreement aim, when it was subscribed, was the progressive reduction of barriers to trade mobility. WTO (World Trade Organization) is the international institution overseeing processes and conditions for progressive reduction of artificial barrier erected by nations to protect national economies. Its supervising and regulating function was founded at the end of 1940s conjoint to the foundation of IMF (International Monetary Fund) and WB (World Bank). In succeeding of years it evolved in WTO. The organization is constituted of 148 nation-member (at now). Its action is supervised by Director-General who coordinates the units concerned in specific critical sectors for trade liberalization.

Nations joining WTO shares the usefulness of the principle of the lowering barriers for economic development and, consequently, they are engaged with their policies. Linked to these one is reaching of competitive advantage of nations. In a similar liberalized and ruled system of international trade, governments trade policies (and not only trade policies) are interrelated with dynamic interactions. They are able to influence also performances of international firms. National policies and international competition are causes for actions and determinants of performances of firms. Governments policies are directly and indirectly linked to actions of firms and they are causes of effects (intentional or not) on firms decisions and performances.

The international institution (WTO) influences competitive advantage of nations, originates conditions determining influences on competitive advantage of firms operating in nations and through its action could influence directly firms in a situation, like now, in which globalizing dynamics get over nations and crossing states through the boundaries.

Undoubtedly now there is a reality of the international trade characterized by uncertainty, variability of events, but also and, above all, by the differences among the entities that populates the same context and shaping its configuration. This situation gives back more consideration to the dynamic shaping and deployment of the international trade system. This dynamism represents the more critic factor of the reality that, moreover, takes on more features of system.

And is for this reason that we think to proceed to the analysis of the international trade in a systemic perspective, particularly following viable systems analysis, fit deduction to answer the interpretative requirements of such elusive, and sometimes evanescent, expressions of the system. The adoption of this perspective, putting itself in the side of the control unit of the system – we can say “catalyst subject” and potential governor of the system - will

allow to identify the connections and the critical forces conditioning the operating system and its continuity. These forces, tight interconnections and their control ask for a structure, but also to govern such a reality.

To complete this we have to investigate the international trade actual context, identifying its actors, connections and interactions among them, the influences and the critical positions/roles that act in it. We aim to depict, in this way, the supra-national order in which becomes critical the determination of a capable entity to develop an institutional role exerting a crossing coordinating/governing action. In this situation the institution components could be change and it has to adapt the formal procedures to relate with them because of their different nature and of their different requirements and "behavioral" features.

To the light of recent dynamics, also, and above all, in the international trade, then becomes clear that its unwinding escapes to the influence of the national authorities, and this situation becomes a crossing/transnational reality on which can intervene organisms that have a different role respect to the same governments and it is placed above of them.

The system, given this assumption, it will not work anymore for the international trade regulation, but its task will be monitoring and addressing trajectories of action and balancing the influences to reach the equilibrium among interests of relevant subjects in the context of the international trade. It will pass, so, to a condition of regulating system to the governance and government of the system that will need structures, methods and tools for the action.

In this way we can work out a model of analysis, but reaching also the logical diagram and the conceptual structure by which the "organ of governance" (the WTO) should operate.

## **Phenomenology**

International trade proves to be, in its external expression, a whole deal of goods and services, transported from a place to another beyond the geographic and national boundaries. From that emerges the dimension of the phenomenon engaged with analysis: its composition made up kind of assets, layout of the quantities/volumes of merchandises shaping international exchanges. The study of the phenomenon brings to the inquiry about the origin, the destination, the quantity and means by which movements realize themselves. The result makes us to know the feature of the phenomenon: structure and function mechanisms.

Such factors are fundamental elements to understand the dynamics and the causes that produce and that determine the activation of the whole events of the trade. The subordinate results from the development of such events are further cognitive moment to establish the effective activations by whose the exchange is accomplished. The awareness of the result and the way by which it is reached, in other words, draw out the pattern through which it is formed, allows to know the interferences and the manipulations that influences it and the way by which the process is carried out, shaping a specific form, is productive of results directly connected to the fact that it is been realized. Furthermore defining the dynamics of the process supplies information about pushes that determined the choices of the actors. However, any formulation will have always tied up the observer different interest determining a different perceptive context. This premise allow us to understand differencies among international trade scholars: e.g mercantilists meant commercial exchange a phenomenon of the production of the wealth; classical and neoclassical economists meant, instead, the study of the phenomenon as a part of the general economic equilibrium. Since classical period a lot of theories supported the analysis of the international trade in the limits of real and financial balances. Financial equilibrium objective strenghtned the need to consider the exchanges beyond boundary also in the key of public intervention and, therefore, of economic politics and involvement of the public power. The analysis of the composition of the international trade and its origins outlined how, since a certain period was not ever nations to influence the direction and the quantity of international goods, but a new player: firms.

Unveiling this reality and uncovering the role the firm palyed in the field of international trade led to highlight the way firms create wealth, their strategies, their decisions making about decentralization in foreign countries, the management of the international operations. Infact, studies enlarged from international trading and international markets to the strategies in international market, opening the road to set up the international marketing studies. This perspective met the evolution of the dynamics of the international trade, whose features was changing.

These dynamics steered also the theories of the international trade. The intense activities of the scholars, from Ricardo to Ohlin, to the same Porter that allowed a bridgehead between theories with macro base to those with basic micro, to the managerial theories (Fayerweather, Thorelli and others had spoken from trading to marketing strategies) are a witness to this.

However, the international trade, over the emphasis about the different sights of study, is conditioned and shaped by various subjects that influenced its course, its direction and its composition. Working and performing of each of them determines the same existence of the international trade. For example there are subjects that activate relations, on that influence the governmental politics so like the preferences of the consumers. This whole of entities interact across connections established among them to the accomplishment of the exchange, but their actions are influenced by consumer preferences, lifestyles and rules of consumptions that determines implicit or explicit rules of the game: in this way is emerging a system. It's the same to say that all the interacting parties move themselves towards the precise end of the exchange beyond boundary even if the interest of the individual has precise nature and is autonomous in the respect of the interest of every other party simultaneously involved in the same process.

Since the ancient times, the search for necessary furniture to survival and/or instrumental to the self development or making easier human life was the activity that distinguished the social being. The systematic unavailability of goods and their consequent search, united to the exceeding availability of other kind of goods (which of the two causes was the first one to move human action?) originated flows of exchange among different populations even separated by wide geographic distance or whose achievement natural obstacles made difficult. The civilization helped the exchange activity more structured, on which some populations based the acquisition of their power on the possession and the control of resources - so, today we would say it was a way creating value - and that provided them the supremacy, the geographic expansion and the economic and political glory and the pride.

The Mediterranean sea was the kingdom of the trade: Phoenicians was the first, then the Greeks and again the Romans. For these one trade had a meaning even more detailed: it was not alone an exchange with other populations, but precious transfer of furniture, equipments and assets from the colonies towards the rich places of the Empire, above all Rome.

Moving away over time and space from the events of the precursor civility of the European culture, dealing in goods against something of other, constituted the engine of the human activity<sup>[1]</sup>. We can think about the Celts, the Scandinavians (with their ships), the Mongolians of the steppe and to the Arabians and to the Tuareg of the desert that dealt in goods to increase their availability of assets<sup>[2]</sup>.

In the medieval age the "mercatura" remained, in an isolating and decline landscape, a flourishing activity. Those merchants who developed such an activity, little by little, succeeded in a position to compare with those people who had the power of the land, the feudatory.

Some of them were able to accumulated richness and treasures by trade. This was also financial availability. Meanwhile, shapes of government were evolving. Well, the master of the territory to preserve the geographic extension of its national power had to support productive (trading) activities and subjects producing wealth: this was the way to maintain the safety of the state. The consequence was the increasing importance of the issue to find resources to maintain the state and the faithfulness of the subjects that provided wealth. In practice, it resulted of a thick institutional plot constituted by the state shape, the legal regulation that sustained it and the taxation structure, in which took on fundamental importance the production of wealth<sup>[3]</sup>. This institutional framework convey to form and to emerge international trade structure system whose central reference was the institutional entity: the sovereign<sup>[4]</sup>.

In this historical situation-institutional the first positions to favor of the trade took shape like prior factor to growth of the wealth of the States. Different needs of the states addressed to different study center. All of the cognitive efforts, however, lead to and converged towards a unique interpretation: the international trade like a factor of creation of the wealth managed managed by the sovereign for the well-being, the obedience and the legitimization in respect of the subjects. Contingencies in each state characterized the contributions of the scholars that studied of the phenomenon<sup>[5]</sup>. Monchrétien in France, Haley in England, Scaruffi and Davanzati in Italy<sup>[6]</sup> - was some of these scholars - did not discuss other that of the solutions to the problem of the coffers of the State and the growth of the wealth that international trade could create. The economical motion cultural that it is formed around such phenomenon was named, mercantilism and steered first studies that brought to the to rise of the economic

science<sup>[7]</sup>. In England the matter was transfers from colonies, in France the issue was precious finding of metals rebalancing the coffers of the State, in Italy the culture of the commercial exchange had been the situational factors that marked the interest around the international trade<sup>[8]</sup>.

The wealth of the nations was still the object of the analysis of Adam Smith, but its interest moved toward the allocation and the production of the richness and towards the study of the value<sup>[9]</sup>. The laissez-faire economics that derived treated with allocative matters for economic equilibrium. The international trade, in such conceptual landscape, was integral part of the formation of such an equilibrium. Its belief was into the balanced strenght of the forces of the market. The laissez-faire, in fact, has its ideal essence of system in which the natural forces steer the allocation of the resources of a society without political and social manipulations of the national authority<sup>[10]</sup>. The international forces are governed by the flow of the exchanges and balancing forces of the advantages. The nature of such advantages was explored, deepened and, so, fundamental object of Ricardo studies.

The phenomenon of the international commercial exchanges was explained, at the period of the Industrial Revolution, like exchange enabled between two countries in the productions in which each of two pit specialized, in which everyone possessed, in virtue of the specialization, an advantage of cost that make suitable the exchange of the good produced in a country with that of the another country<sup>[11]</sup>. In reality, in the ricardian theory, the advantage was derived from the labour factor; in fact, the theory has like a reference the specialization of the labour. Then Heckscher-Olin<sup>[12]</sup> studies emphasized, instead, that the production in which a nation has an advantage is that in which is employed the factor of the production endowed by the Country, and of which surely an endowment presents a cost, compared to other countries, is specially low, determining a total advantage of cost relatively to the same productions of the other Countries. In truth, actual such last condition gave back necessary a greater articulation of the theory – the initial hypothesis very restrictive with respect to the reality - as does not hold account of the dynamic reality of the economical phenomena, it not perfect equality in the productions, of the organization of the production (the increasing yields of staircase, for example) and l'imperfection of the competition in the markets<sup>[13]</sup>. The back concept remains that of the strong incidence of the original endowment of the factors of the production. Infact in subsequent economic studies the nation is considered as a complex system provided of infrastructures, systems of production and offer. Such advantages are fit to represent a compared advantage that is expression of everything been it nation, such to be depicted it as a competitive advantage of the nation, determined and built across actions of the comprehensive national system. And the nation system that in the competitive advantage of the nation gives specific endowment to the state-nation changing its role and function. Such theories emphasize the role that comes away taking on nations from the end of the Fifties, when the development of the international trade was driven by the activity and by the actions of the enterprises. They were the multinational enterprises to give strong impulse, how we said, to the motions of goods and of capitals, producing a true and actual economical phenomenon formalized by the theory of the international cycle of the product. Then also the theory of the international trade emphasizes the way by which a central role in the international development goes to the enterprises. The World Bank, even if in different perspective, had always considered as international trade have a critical role in the economical dynamics of development of the States, of the enterprises and individuals<sup>[14]</sup>.

The competitiveness of the nation is a result of the system of resources/factors, conditions of the demand, strategy and structure of the competition, correlated and support areas, than the national politics and governmental actions<sup>[15]</sup>. These last determine a virtuous circle that influences investments in the attraction capacity, but simultaneously creates positive conditions for businesses development that, persuading firms to invest<sup>[16]</sup>.

## **From the Trade to the Actors: The Enterprises**

The most significant changes in the composition and in the direction of the international flows of changes of goods recorded in the XX century, between the end of the Forties and the begin them some Fifties. At that time these changes emphasized important events in financial transfers and in the productive investments. The first, in fact, found their engine not more in exclusively financial investments with speculative nature, but in profit bearing investments. The international exchanges were sustantious in 1850 and their development was considerable: from 1% to 7% of middle growth annual at the end of XIX century to 14% of the XX century<sup>[17]</sup>.

The statistical charts on movements of goods between the end '800 and 1929 show a continuous development stopped by 1929 crisis<sup>[18]</sup>. In the successive two decades the world trade pointed out a slowing, started an up and down process caused by protectionism that followed to the great crisis and political nationalist motions that stretched out to close the nations to the exchange. Only after 1950<sup>[19]</sup>, after a first phase of a geo-politicians order reorganizations, there was a renewal of the exchanges of goods. The data point out, however, the features than a world order went taking on.

During Fifties the flow of goods from the traditional productive countries towards the countries did not increase because of the fact that the firms located production units in the countries previously consignees of the exports. That it provoked, comprehensively, a movement from flows of goods to flows of capital, but also in the the direction of the same ones. The flows of capital directed themselves in entry in the countries to realize direct investments, then in exit from the countries of production towards the countries of origin of the houses-mothers. The flows of capital arisen from direct investments of foreign countries (IDE) became more significant. Capitals has been about destined to the accomplishment of the investments and resulting from the IDE<sup>[20]</sup>.

In the Seventies the energy industry consolidated its power that met the transformation in monetary and producing flows, outlining a strong interdependence on the economical phenomena<sup>[21]</sup>. In these last years is pointed out a slowing in the growth of the volume of the exchanges that not alone drift from an economic situation of crisis, but from a productive change of specializations and from the change of the origin of the same exchanges. Also a light slowing in the growth of the flows from Countries that held the greater contributions of the international trade depressed the comprehensive rates of growth of the exchanges. The variations in the courses of the international exchanges were derived also by the internationalization of the production that if, from a part, make move the flows to the markets of the capitals, on the other hand determined corresponding changes in the productive national autonomies. That it was testified from the invisible growth of entries, namely specific flows of wealth not by goods, but by capitals and services. In the same period it changed also the composition of the exchanges of goods: the leading assets (agricultural, mining, the so-called commodities) lost the supremacy to favor of the manufacturing products. It provoked the development of the exchanges of the whose countries structure productive was based on the manufacturing areas.

In synthesis, all that steered to a new layout of the commercial connections, creating new orders of the international trade<sup>[22]</sup>. The years '80-'90 confirmed the comprehensive growth of the exchanges of goods, with changes in their origin. In 1980 the international exchanges of goods were alone 68% (in volume) and 59% (in value) with respect to 1999. The development tendency is continued also in the period 1990-1999, in fact the international exchanges of goods are increased of 74% (in volume), of 60% (in value)<sup>[23]</sup>.

## **Subjects and the Connections in the International Trade**

The exchange of goods and/or services beyond the national boundaries is established between two coincident interest centers, but with an opposite mark. It is a connection purely contractual, that it has as an object the trading practice. Technical practice describes the mechanisms of operation and the framework to enable mechanisms and the subjects that enter in the connections activated. In this way, we can draw network of relations among subjects that, to different right, enter in the construction of an operation diagram corresponding to the international trade. The exchange of goods and services took place, in fact, among entrepreneurial entities (different firms or also subsidiaries of the same enterprises geographically decentralized); but to carry out the relation other connections are needed make or facilitate the accomplishment of the commercial transfer possible.

The firm has to fulfil its duties imposed by local or national public agency, for example state regulations of commercial protection, or sanitary rules, to carryout rules and of international conventions (e.g. International Chamber of Trade and the Incoterms)<sup>[24]</sup> that are only examples of bind and rules condition the pattern and the flow of the exchanges. Nevertheless, the exchanges accomplishment is also determined by the presence of subjects similar to the firm, moved from the same interest and from the same needs of survival and that enter in the same context in the conquest of the connection with the opposing party, as competitors so as final consumers. The flow of goods and services, in fact, is influenced by consumers that, to second of their capacity of the acceptance of the

business output, can determine the choice of the quantity of products to destine to a specific geographical area. In this way the arrangement of the consumption of a goods or services influences the direction and the layout of the international trade.

It has seen, besides, like in the international economy it is pointing out the role the States play. Depending on political positions and/ideological, either, the role of the State remains always critic to determine the fluidity or rigidity of the international exchanges. The productive interest nature and safeguarding the economies persuades to protection positions and tariffs and duties imposition, in other words erection of barriers to the entrance of products, services, investments or technological transfers. The national power does some governments the agents of reference for the overcoming of the national boundaries. The state institution, in virtue of the actual position, supervises, observes and intervenes to maintain the coffers of the State, to develop and/or to protect the social and economical situation of the nation. The achievement of these purposes is obtained through executive structures that apply the more fitted program to the area of interest that carry out the governmental programs. The action of governs, moreover, more often, it is coordinated to the events that could verify in the national territory; both the power of repercussion of these events is so wide to exercise on the inside reality (economical, market or political fluctuations), and the effect of the intensification of the international interrelations – agreement bilateral, multilateral nell'longed for of international organizations – that, at the same time, are cause and the effect, of the necessary coordination inside national boundaries. The decisions of the governments breed a trial of cause- effect, in an iteration process, of the realtions in the international trade also. The action that they can develop through executive structures – like ICE and the SIMEST in Italy or the JETRO (Japanese Enterprise Trade Organization) in Japan – would allow to activate the relationship among firms for the international operations. The considerable role of the states, in the merit of the protection, promotion and development of the international commercial realtions, is carried out about of creation of infrastructures that are determinant factors for the competitive generation of advantage of the firms and of the nations. The competitive position of the nations is expressed across the entities operating in national field<sup>[25]</sup>.

Just firms, their productive and/or commercial units that are able to activate the basic relationship of the exchange of goods and/or services. Distribution channel structures determine as much as connections (because they are subsystems of firms) in the international trade, because of their capability of influence on the acceptance of the consumers<sup>[26]</sup>. On the other hand consumer associations and the consumer culture and values make the consumer become an entity in a position with direct influence on the decisions of consumption and of purchase from which derives the capability to increase or except the intensity of the international flows of the exchange. The same connection can allow to reach different ends, then the international realtion of exchange could enable a sale, transfer knowledge among branches placed in different countries or create a collaboration. The distribution of the preferences, the economical availability-financial and the cultural level are all factors that determine the distribution, the quantity and the direction of the trade among countries. The distance, the lack of knowledge, the scarcity of means to go beyond the ignorance of the foreign system could require the support of other subjects establish the relation. This question carry out other features and other relation in the flow of the international trade: trade intermediaries. They could play a strong role influencing the trade in the hypothesis of indirect export and a medium level of influence in the case of direct export. This figure could alter the order or the structure of the trade, without considering trading companies that succeed to define their same the international connections with considerable capacity of influence on the whole system and its structure.

The entities that enter, to different title in the relational net of the system of the international trade have equal interests, but of opposite mark, creating a composition of interests to establish and to maintain a consonant relation to make interconnected their mutual structures; even if, however, let remind that among different structure, driven by different values, it exist divergences of position in the definition of the formal procedure across that the interrelationship activate themselves and/or on their potentials consequences on the other systems, so much to carry out the entity to find conflicts in order to deteriorate the system of connections and interactions in the system of the international trade.

## The System of the International Trade: Viable Systems Perspective

The international trade of goods and services seems to be only a phenomenon that results from the synthesis of a plot of relations and interrelations among different entities that are involved in it to operate/to work; but it is the activation of such a tangle of relations carries out the system. Its essence is given by interrelated and interacting<sup>[27]</sup> parts for the accomplishment of a common end, that makes the system emergence<sup>[28]</sup>. The characteristics of the phenomenon pointed out that, also based on the description drawn in the previous paragraph, the entities that populate it, in various roles, are involved in the international trade of goods and services. The reason for which the entities activate relational channels among them is found in the need to carry out the transfer of the object of the exchange from an area to another, between areas submitted to be able state/governmental different, with social founding, economical, regulations and political too different. Subjects representing the different interest centre, so, constitute the parts. The role of the exchange of relations and/or services, of transportation, of mediation, of territorial promotion, politics and financial, and of authorization are the various kind of relations to establish to carry out of the system. Their continuous activation and existence does to emerge the system.

The system of the international trade exists when there is in fit a flow of contacts between two or more enterprises than either have an interest to transfer goods or services from different sides of the globe and, to the end to obtain the spacial passage of the good and/or service – realized by banks for payments safety, or will do the same for fluctuations in the prices of the good/service object of the transaction. But the system emerges also when a single firm explores the market to identify attractive foreign markets, supported, or not, by a skilled and capable intermediary, rather than by public structures supply information on the features of the foreign markets, instead of research collaborations on foreign markets with other firms (or to undertake all and three the typologies of contact cited simultaneously).

Each of this entity constitutes a concentration of interests which define the fundamental substrate to the search and the activation of connections to determine the grade of the span of the firms to dialogue with other components of the system.

In practice, the need to place on the market the actual products (structural) and the orientation to the internationalization landscape can define the necessity and the will to open the system activating relations with the other parts.

In the time, in the international context, there was structural changes combined with orientation, value and ideological changes, revealed and specified in the values and in the structures of the entity that are components of the system. These modifications had caused changes in the capability and the willingness of the activationa of relations. Like a consequence the experience is that of difficulty to find consonance (in viable system, means identify points of common interests by which the entities meets the dialogue to make value). We can remember conflicts and different interests expresse by some entities appeared on the stage in the last years, it is seen the NGO, environmentalists, ecologists and no global movements). Although the difficulty of connection exists a certainty, sprung by perpetuating the exchange in the time. Such a perspective lead, already to the end of the Forties of the XX century, some States to sign an agreement across which pledged to dismiss themselves all the possible causes could obstacle the functioning of the system<sup>[29]</sup>. That it outlined the logical diagram to define the first rules of address, creating fundamental a whole of rules that subscriber Countries committed to observe. Rules had the scope to liberalize, they did not define how to market, thing and with who to related with. This framework was the GATT (General Agreement on Tariffs and Trade).

The agreement traced principles – like the fundamental Most Favoured Nation clause - with the purpose to reach the development of the exchanges and through them the production of the wealth<sup>[30]</sup>.

Now the system of the international trade is characterized by a net of relations connected in the principle of the free exchange like unifying element.

The system was not ever a viable system in an embryonic state, but began to evolve itself towards a system in accomplishment. It tended to the completion of the viable state, but it has not reached it. There were events that acted as introduction of fact for the to be depicted itself of an accomplishing system and actual completion had been the continuous adherence aside of an always greater number of states, a lot include in the actual action part of the

earthly surface, namely of the national territories in which the globe was divided. The agreement concetion would show a top-down creation pattern, even if joining the agreement happens across a bottom up trial. The institutionalization of the agreement a top-down draws up the first vialtal phase of development of the system. (It is a demonstration like the system is becoming viable).

Such an institutionalization becomes more and stronger when there is a tangible structure than is not alone a declaration of purposes, but takes on the clear configuration through the identification of decision-making, of staff and executive and of control organs. That it happens in 1994 with the constitution of an international organism: the WTO.

The complexity of the context and the real and potential conflicts already steer States to unite itself in an organism that supervises to the fulfilment of the rules of the free exchange (in origin that was functional to the to finish itself of a most spacious economical system international). In reality a free exchange has to be also fair<sup>[31]</sup>.

What emerges it is the equity and of stable composition and importance of the property and of their governing body, that are all of the states; without the abuse of power deriving from strong positions is possible to obtain the comprehensive growth.

The phenomenon of the globalization, in fact, would carry in short time to make to reflect the abuses of power of transgressor. In the opposite case it arrives to a demote system of exchanges and to a degeneration of the value created. The presence of a supranational organism, to this point rises also to function of safeguards some survival of the world system of exchange to create that value that can be derived alone by it. Conflicts rise up for scarcity of consonantic capacity between the entities. Then there are some entities, like the environmentalist or ecologist associations, no global and social forum that dispute the possible pathologic dependence (we could define it “resonance”) that each powerful entity could release resources with respect to the consumers, to the states and other enterprises can establish in the system, or rather dispute the system of the international trade like the supra system in which stretches out to make to cancel the systems that enter to do it.

The institutive agreement of the WTO fixed a “physical” architecture that formerly was alone an ideal/logical framework. The operating structure is completed by a component that has a function of control. Besides of the presence of such a component defines also precise rules. This happens across the DSB (Dispute Settlement Body) that begins bureaucratic process resolving trade quarrels between states and that “is vital for enforcing the rules and for ensuring that trade flows smoothly”<sup>[32]</sup>. Again, the system shows its nature, more and more when the ONG enter into decision process, even if in order to give simple advisors or information; when 148 Countries of the globe joins the agreement, representing 90% of the world population. All these components (national governements, ONG and others) enter in a relation of “consonance” in which they outline themselves those we call “opening conditions” that are channels and way to dialogue and interact one another. The whole consideration of each part of the system of the international trade in the formation of the will, the insertion of each the problematic and all of the objects of the international trade and the force of the rules shared a lot to make them become constraints for the functioning, because of the unfulfilled rules constitutes disapproval (and decreasing of “consonance”) and gone out or to marginalize by the system caused by incapability to relate with others.

The respect of the variety and the consequent maintenance of the degree and capacity of opening and the consequent relations of consonance obtain themselves with the clear definition of the of the organizational diagram across the introduction of an agenda/summit of the Parliaments, would carry out the completion of system.

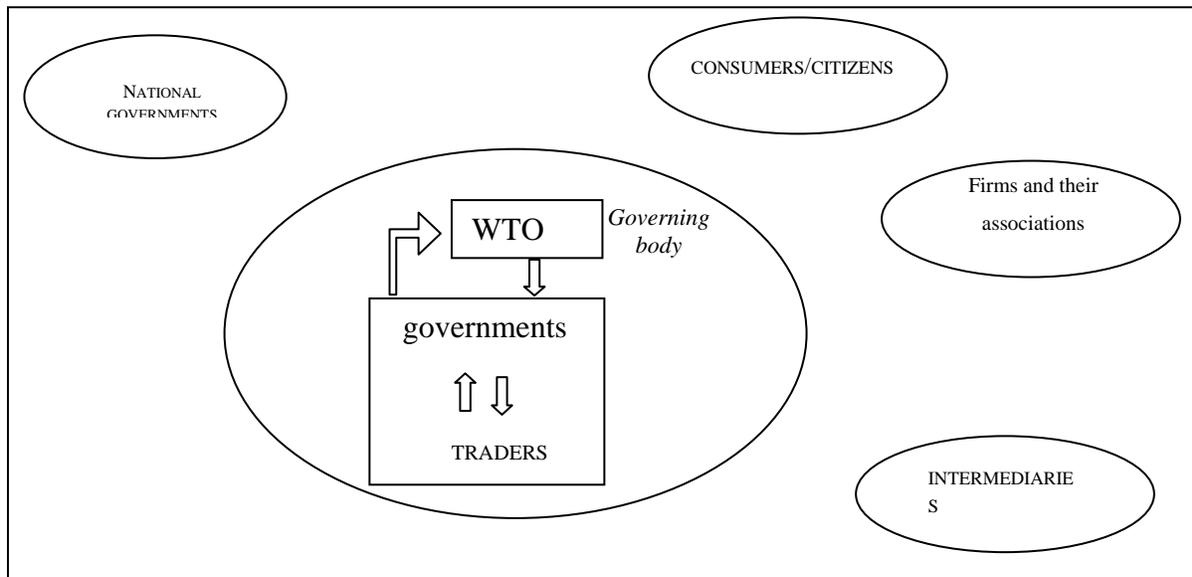

FIG. 1: THE CONTEXT OF THE INTERNATIONAL TRADE AND THE SYSTEM

## Conclusions

The international trade constituted and constitutes a flow in a position to create and increase the available wealth for the player of the system. The transfer of goods and services in their motions, almost like mechanical flow activated by the productive entity moved, actual for its role to allocate wealth. Every perspective of study was anchored to specific points of observation that risked to privilege some dynamics, misconsidering others ones. The application of the systemic approach allowed to frame the phenomenon in the present context, to make free it by the single perspectives exploited up to now. These ones, in their reductionistic approach give the emphasis of some components, leaving the others in a misconsiderations and risking to not succeed to attribute the parts their actual role, in function also the interpretation and the determination of the typology of connections that united them. Besides of, with viable systems approach is possible to consider the emerging dynamics by the operation of the system that the same parts form. Viable systems approach, so, into consider the parts, is the connections that connect agrees to pick them the reality of the phenomenon in its operation. In this way, it is possible to snatch the changes caused by the deployment of complexity that it is tested in the system like an effect of indeterminacy conferred by variety and variability of the components of the system. The incoming of such new components goes attributed indeterminacy of the operation of the system, as has “confused” the equilibrium of the present connections, intervening with new capacity of flu and of pressure. That it make emerges requirement of a point of reference, namely of a component in a position of to take on such role between the parts involved, deputy part of the system. From that it emerges a pertaining to perspective sight of warning sign towards the formation of an organ of coordination and for the to form itself of a true and actual viable system. Recognizing the system viability makes more and more important its governance. In the international trade system this role corresponds to that one of WTO. Qualifying the WTO as governing body of international trade implies consequent consideration about its framework and structure fit that it opens new ways for the analysis.

# **The WTO's Challenges in the New Era: Membership of the Former Communist Countries and the Development Issues**

*Angela Solikova  
Comenius University, Slovak Republic*

## **Abstract**

**One of the traits of the economy after the World War II. is the increased importance of the globalization. This brought about the need for common rules in trade between countries and the idea arose to establish an organization that would handle the multilateral trading system. Countries signed the General Agreement on Tariffs and Trade (GATT) that set a framework for international trade and liberalized it by lowering tariffs on imports of products. This was the initial step towards today's World Trade Organization, which unites countries with various economic powers in order to improve the welfare of the whole world. In our work we would like to present the WTO, its historical development, basic rules and procedures. In the second part, we will show various cases of former communist countries in their effort towards their accession into this organization, and finally a special focus is put on Slovakia and describe its relation to the WTO.**

## **From GATT to the WTO**

The World Trade Organization (WTO) is up to date the only international body dealing with the rules of trade between nations. As stated in the Paragraph 1 of Article II. of the Agreement Establishing the World Trade Organization, "The WTO shall provide the common institutional framework for the conduct of trade relations among its Members in matters related to the agreements and associated legal instruments included in the Annexes to this Agreement."<sup>i</sup> Accordingly, the WTO agreements negotiated and signed by the bulk of the world's trading nations define and provide important and necessary legal ground-rules for international commerce. They are essentially contracts, binding governments to keep their trade policies within agreed limits.

Establishing of the WTO was neither fast nor easy. In fact, it took almost fifty years until such a complex legal organization, that would be able to facilitate all the needs of today's trade, could come into being. And yet, this long-lasting process is not finished, daily bringing many new problems to be solved.

### **Historical Background**

After the World War II. the idea was developed to create an institution that would be in charge of handling international economic cooperation. This was supposed to become the third part of the "Bretton Woods Institutional System", joining two institutions today known as the World Bank and the International Monetary Fund.

The plan of the 50 countries, participants of the World Conference on Trade and Employment which took place in Havana in 1946, was to create a specialized agency of the United Nations called the International Trade Organization (ITO). "Restoring international economic growth and stability through the promotion of trade was crucial to securing a lasting peace after World War II. It was this vision that led to the creation of the multilateral trading system in 1948."<sup>ii</sup> At first, even before the ITO Charter could be approved, 23 countries decided to start the negotiations to reduce and bind the customs tariffs and in this way to support the trade liberalization. The negotiations took almost two years and resulted in about 45,000 tariff concessions. In order to protect the value of the negotiated tariff concessions, they were combined with some of the trade rules from the draft of the ITO Charter, and signed by above mentioned 23 countries on October 30, 1947. In January 1948 they came into effect as the General Agreement on Tariffs and Trade (GATT).

The ITO Charter was agreed to only two months later in March, but never entered into force. The opposition in the US Congress and legislatures in some other countries made it impossible to ratify the Charter, and the formation of the ITO was definitely ruined. As a result, the GATT, which was a "provisional" agreement based on tariff reductions, remained the only multilateral instrument governing international trade until establishment of the WTO in 1995. However, the contracting parties agreed to abide by the rules and needed to meet occasionally to

discuss related issues and to hold trade negotiation. This had shown a vital necessity of a supporting directive and control body, what lead to the later creation of an international organization with the same name.

## **The GATT**

### **Basic Principles**

Adoption of the Agreement was the breaking point in the post-war free trade efforts. Already during the initial negotiations about the trade liberalization the contracting parties showed strong ambitions for “...entering into reciprocal and mutually advantageous arrangements directed to the substantial reduction of tariffs and other barriers to trade and to the elimination of discriminatory treatment in international commerce.”<sup>iii</sup>

To reach and to fulfill the above-mentioned objectives the GATT applied some simple, fundamental principles of the multilateral trading system. These run throughout all of the agreements, rules and documents:

- *Trade without discrimination*

- a.) The Most Favorite Nation Treatment (MFN) – countries cannot discriminate between their trading partners. This is so important that it became the first article of the Agreement stating that “... any advantage, favor, privilege or immunity granted by any contracting party to any product originating in or designed for any other country shall be accorded immediately and unconditionally to the like product originating in or designed for the territories of all other contracting parties.”<sup>iv</sup>
- b.) National Treatment (NT) – countries have to give others the same treatment as one’s own nationals. The NT applies once a foreign product has entered the domestic market, and since then should be treated equally to the locally produced good.

- *Freer Trade*

Encouraging the negotiations towards gradual lowering of trade barriers (both tariff and non-tariff) and this way opening markets to gain more benefits.

- *Predictability and transparency*

Country’s trading rules should be as clear to others as possible and any change has to be made public and transparent.

- *Fair Competition*

Discouraging unfair practices such as export subsidies, dumping and promoting non-discrimination.

- *Encouraging development and economic reform*

More benefits to less developed countries and countries in transition by giving them more time to adjust, greater flexibility and special privileges.

“The idea of the GATT as multilateral agreement is to provide the same rights and advantages for each contracting party by eliminating non-tariff barriers to trade and granting the MFN to all contracting parties.”<sup>v</sup>

### **Trade Rounds**

Since its adoption in 1947 until formation of a new institution for the international trade – the WTO, the legal text of the General Agreement remained almost unchanged. “The main GATT’s activities were the trade-tariffs conferences at which the negotiations proceeded according to the reciprocity and mutual advantages.”<sup>vi</sup> These conferences, also called the trade rounds, served as the multilateral negotiation place for common efforts to liberalize international trade and continue reduction of tariffs.

During existence of the GATT (1947-1995) eight trade rounds took place. As we can see in the Table 1, the first two decades were devoted to further reduction of tariffs and only the mid-sixties brought about new topics that should be taken into consideration.

TABLE 1 THE GATT TRADE ROUNDS

Year	Place/name	Subjects covered	Countries
1947	Geneva	Tariffs	23
1949	Annecy	Tariffs	13
1951	Torquay	Tariffs	38
1956	Geneva	Tariffs	26
1960-1961	Geneva Dillon Round	Tariffs	26
1964-1967	Geneva Kennedy Round	Tariffs Anti-Dumping measures Non-Reciprocity rule	62
1973-1979	Geneva Tokyo Round	Tariffs Non-tariff measures “Framework” agreements	102
1986-1994	Geneva Uruguay Round	Tariffs Non-tariff measures, rules Services Intellectual Property Dispute Settlement Textiles and Agriculture Creation of the WTO	123

Source: Trading Into the Future: The World Trade Organization. 2<sup>nd</sup> edition, WTO, Geneva, 1999, page 9.

The sixth – the Kennedy Round (1964-1967) introduced the Anti-Dumping Agreement, but the biggest change in the international trading system was the newly introduced non-reciprocity. This rule was exactly the opposite to mutual reciprocity principal and allowed lower tariff exceptions or usage of some barriers to the less developed countries and infant industries. Although at first it might seem incomprehensible, the truth is, that it brings positive results and many benefits for development in these countries.

Big importance received the Tokyo Round that took place in 1973-1979. Participants’ number grew to 102, what was almost five times as much as during the establishment of the GATT thirty years ago. At this conference was introduced the system of tariff “harmonization”, i.e. the higher the tariff the larger the cut. Attempts to reform the system and tackle trade barriers that did not take the form of tariffs emerged for the first time, leading to a series of agreements on non-tariff barriers. These barriers were divided into three categories: (1) barriers derived from customs value, subsidies and countervailing measures; (2) quantitative restrictions and quotas; and (3) technical and economical norms, sanitary and phytosanitary measures. Numerous agreements were signed only by few GATT members and, therefore, did not become part of the GATT. They were known as the “codes”, and some served as the base for future amendments during the Uruguay Round.

#### **The Uruguay Round**

With the development and changes in the international trade arose in the early 1980s voices to adjust the so long unchangeable General Agreement. After more than three decades the world trade became more complex, trade in services received higher importance and the foreign investments have expanded considerably. The GATT was no longer relevant to the realities, what convinced the members to reinforce a major transformation of the whole multilateral system.

The Uruguay Round was the last and the most significant of all trade conferences. The Conference was launched on September 1, 1986 in Punta del Este, Uruguay at presence of representatives from 92 countries. It took participants seven long years of discussions and negotiations to finally produce an Agreement, which, with annexes, ran to over 20,000 pages, and is one of the largest treaties ever signed. By the end already 123 countries took part at signature of the Final Act in Marakesh that closed the Round on April 15, 1994.

Originally, the agenda involved not just trade in goods, but also the expanding services sector, which at that time represented already 20% of global trade. Talks were supposed to extend the system also into new area of intellectual property, improve the complex machinery of the dispute settlement, and reform the sectors of agriculture

and textiles. Ministers did not have problems and agreed fast on the package that included concessions on market access for tropical products, the dispute settlements system and the Trade Policy Review Mechanism – the systematic and regular reviews of national trade policies and practices of the GATT members. But the problems arose during negotiation on the sensitive issues of agriculture and textiles. Two main actors, the USA and the European Communities (EU), had different views on the protection of agricultural producers and neither side was willing to give up its position. To add, new subjects on anti-dumping rules and the proposed creation of a new institution arose and prolonged the negotiations even more. Finally, the conclusion came after the compromise between the USA and EU in December 1993.

The delay in negotiations that were planned to last only four years brought about certain merits. Some aspects in the area of services and intellectual property progressed further than would be possible in 1990, which made the Uruguay Round Agreement the most comprehensive trade agreement to date, not to forget establishing of the WTO.

“The National Council of the Slovak Republic approved the final document by Resolution number 31 from December 13, 1994 and it was ratified by the President on December 22, 1994. The Agreement came into effect on January 1, 1995, according to the Paragraph 1 of the Article XIV., and complying with Paragraph 3 of the Final Act.”<sup>vii</sup>

#### **Formation of the WTO**

The World Trade Organization came into being after the Uruguay Round on January 1, 1995. It is the biggest organization dealing with the international trade with a fairly simple structure (Annex 1), where all decisions are made by the member countries through their ministers or officials. The seat of the organization is in Geneva, Switzerland with secretariat staff of 560 people headed by General Director Mr. Mike Moore from Australia. Secretariat’s main responsibility is to support WTO bodies’ performances both administratively and technically before, during, and also after the negotiations. Its budget for year 2002 is counting with 143 million Swiss francs.

As of January 1, 2002 the WTO has 144 members. With the most recent accession of China and Chinese Taipei in December 2001 “... the WTO’s multilateral trading system is now near-universal, covering more than 97% of total global trade.”<sup>viii</sup> Thirty other countries have interest to join; 28 of them are currently negotiating their terms of membership in the Accession Working Parties, and 2 are holding status of an observer.

The WTO replaced the GATT as a new multinational institutional framework for international trade. It is charged with overseeing the proper functioning of the expanding trade system and ensuring that it continues to promote the ideological objectives of free and open trade set forth by the original framers of the GATT after the World War II. It also monitors the trade activities of its members and secures that they adhere to agreed set of rules. Fulfilling the above mentioned is done through following functions:<sup>ix</sup>

- Administering trade agreements
- Acting as a forum for trade negotiations
- Settling trade disputes
- Reviewing national trade policies
- Assisting developing countries in trade policy issues through technical assistance and training programs
- Cooperating with other international organizations

#### **WTO Agreements – The Legislative Base of the Organization**

“The Uruguay Round saw both a widening and a deepening of the GATT multilateral trade system as it has been functioning for almost fifty years: a widening through the inclusion of cross-border services, protection of intellectual property fights and other additional agreements, and a deepening through the extension and supplementing of the existing GATT provisions.”<sup>x</sup> The General Agreement on Tariffs and Trade, which always dealt with trade in goods exclusively, has been amended and incorporated into the new WTO Agreements. Additionally, the General Agreement on Trade in Services and the Agreement on Trade-Related Aspects of Intellectual Property were included, and thus formed three pillars for the present-day multilateral trade system. All three agreements adopted GATT’s key principles, follow a single set of rules and a single system for dispute settlement.

*The General Agreement on Trade in Services (GATS)* sets the legally-enforceable rules covering international trade in all services sectors such as banking, tourism, transportation, insurance and telecommunications

to name few. It operates similarly to GATT on three levels: the main text with general principles, annexes dealing with rules for specific sectors, and individual countries' commitments stating which of their services sectors they are willing to open to foreign competition. Supplemental fourth element is special to the agreement in services only, listing areas where the MFN principle is temporarily not applied. To ensure that all operations are being followed properly, the Council for Trade in Services was established as an overseeing body.

*Agreement on Trade-Related Aspects of Intellectual Property* (TRIPS) deals with rules for trade and investment in ideas and creativity. Copyrights, trademarks, patents, geographical names for product identification, undisclosed information and industrial design should, according to this agreement, receive protection around the world. "The protection and enforcement of intellectual property rights should contribute to the promotion of technological innovation and to the transfer and dissemination of technology, to mutual advantage of producers and users of technological knowledge and in a manner conducive to social and economic welfare, and to a balance of rights and obligations."<sup>xi</sup> The TRIPS combined and expanded significantly the existing standards of the World Intellectual Property Organization (WIPO) that were set in the Paris Convention for Protection of Industrial Property (1967, patents and industrial design) and the Berne Convention for the Protection of Literary and Artistic Work (1971, copyrights). For proper functioning of this system is important to ensure that member countries implemented and are enforcing the adequate protection standards.

	Goods	Services	Intellectual property	Disputes	Trade policy reviews
<i>Basic principles</i>	GATT	GATS	TRIPS	Dispute settlement	TPRM
<i>Additional details</i>	Other goods agreements and annexes	Services annexes			
<i>Market access commitments</i>	Countries' schedules of commitments	Countries schedules of commitments (and MFN exceptions)			

FIG. 1: THE BASIC STRUCTURE OF THE WTO AGREEMENTS

Source: Trading Into the Future: The World Trade Organization. 2<sup>nd</sup> edition, WTO, Geneva, 1999, page 15.

The new system incorporated also number of special agreements, which became part of the general binding commitments of the WTO. Among these are for example the Agreements on Agriculture, Sanitary and Phytosanitary Measures, Rules of Origin, Subsidies and Safeguards, Textiles and Clothing, Government Procurement, and others.

#### Ministerial Conferences

The countries can make decisions through specialized committees and councils, where all WTO members have their representation, but "...the WTO's top level decision-making body is the Ministerial Conference, which meets at least once every two years."<sup>xii</sup> The Ministerial Conference settles the most important matters of functioning of the WTO, approves the most important agreements, and has the authority to take decisions on all matters under any of the Multilateral Trade Agreements. Every conference brings about significant results that play a great role for the future direction of the WTO and international trade. Four such conferences took place since the WTO began its activity: Singapore, 1996; Geneva, 1998; Seattle, 1999 and Doha, 2001.

There was put a huge stress and expectations towards the so called "Millennium Conference" that took place in Seattle in 1999. However, Seattle failed because Members were too far apart on substantive issues. They

disagreed on agriculture, labor, the environment, on competition policy, on rules, and on how to deal with developing countries' problems with implementing their Uruguay Round commitments.<sup>cxiii</sup> After this mayor setback, the WTO had to evaluate its actions and learn from the situation. It devised a two-year preparation strategy to ensure that the next Ministerial Conference in Doha, Qatar would be a success. During this preparatory process a great stress was put on transparency and a "bottom-up" approach to make sure that the wishes of Members will be reflected. Thus, the responsibility for bringing inputs was placed with the proponent of particular issues. The issues did not change much since the last conference, but the process of consensus-building consultations contributed enormously to the spirit and outcome of the meeting. Close attention was also given to the external environment. In two years the WTO Director-General Mike Moore, who personally drove the process, met with more than 300 ministers, and the dialogue of the Secretariat with NGOs and parliamentarians intensified considerably.

#### **The Fourth Ministerial Conference – Doha, 2001: Launch of a New, Development Trade Round**

Despite all above-mentioned efforts, the outcome of the conference remained in doubt. Representatives of the member countries met from 9 to 13 November 2001 in the capital of Qatar, Doha to negotiate a range of subjects. Neither the public, nor media (at least in Slovakia) put much attention to this meeting, because it was overshadowed by the September 11 terrorist attacks in New York and from that resulting war conflict in Afghanistan. Influence of this act was felt during consultations, too.

The first successful result was the unanimous approval of accession of China, who became the 143-rd WTO member after long fifteen years of negotiations. Yet, much effort and political will had to be made to fulfill the main motive of the Conference – the launch of a new Trade Round. "Due to some controversial topics, to which belong for example intellectual property or trade with agricultural produce, were the negotiations marked by contrary positions of developed and developing member countries."<sup>xiv</sup> The Ministers recognized the urgent need for solidarity in the face of dangerous economic and political uncertainty and at the end of the Conference consensus on the final text of the Doha Development Agenda was achieved. The meeting launched the "Development Trade Round" – the first since the Uruguay Round in 1986, making it a turning point in the history of the WTO and in the negotiations between developed and developing countries.

*The Doha Agenda* places development issues and the interests of the poorer Members at the very heart of WTO's work. It pursues further liberalization of trade in services, as well as adoption of rules for new issues that were until now not included in any agreement. The final result is a three-year work program with number of objectives for all areas that should be closed by January 1, 2005. The negotiations take place in the seven Trade Negotiations Committees (TNC) formed and active especially for this purpose since January 2002. Their progress was reviewed at the Fifth Ministerial Conference in 2003.

Main areas of the working program:<sup>xv</sup>

#### ➤ Agriculture

Members recall the long-term objective to establish a fair and market-oriented trading system through a program of fundamental reform. They committed themselves to enforcing substantial improvements in the market access, reducing all forms of export subsidies, and applying major reductions in trade-distorting domestic support. Special and differential treatment is guaranteed to developing countries during negotiations to support their development needs, including food security and rural development.

#### ➤ Services

The negotiations in this sector should be conducted with a view to promoting the economic growth of all trading partners and the development of developing and least-developed countries. The basics for the ongoing negotiations adopted by the Council for Trade in Services on March 28, 2001 in the Guidelines and Procedures for the Negotiations should be followed as stated. The participants were to submit initial requests for specific sectors, in which the entry of foreign services will be liberalized, by June 30, 2002 and initial offers by March 31, 2003.

#### ➤ Industrial goods

Negotiations on market access for non-agricultural goods should aim to reduce or eliminate tariffs, tariff peaks, escalation, and non-tariff barriers in particular on products of export interest to developing countries. Here too, the special needs and interests of developing and least-developed countries should be taken into account.

➤ Intellectual property rights

The Declaration stressed the importance attached to implementation and interpretation of the TRIPS Agreement in a manner supportive to public health (e.g. access to existing medicines, research and development of the new medicines). Negotiations will continue, according to Article 23 paragraph 4, on the establishment of a multilateral system of notification and registration of geographical indications for wines and spirits before the next Ministerial Conference. Countries also agreed to examine relationships between the TRIPS and the Convention on Biological Diversity, the protection of traditional knowledge and folklore, etc.

➤ Trade and investments

Negotiation on conditions for long-term cross-border investment that would contribute to the expansion of trade should follow during the Fifth Ministerial Conference. Until then a special Working Group focused on the clarification of the sections as: scope and definition, transparency, non-discrimination, development provisions, exceptions and balance-of-payments safeguards, and others. A balance should be found between interests of home and host countries. Parties should take due account of development policies and objectives of governments, their right to regulate trade in the public interest, and also consider the abilities and financial needs of developing and least-developed countries.

➤ Trade and competition policy

The needs of developing and least-developed countries for technical assistance and capacity building in this area should be supported. Therefore, the cooperation with intergovernmental organizations and through regional and bilateral channels was relevant. The Working Group focused on the clarification of the core principles (transparency, non-discrimination, and provisions on hardcore cartels), modalities for voluntary cooperation and support.

➤ Transparency in government procurement

Negotiations will take place after the Fifth Conference and should take into account participant's development priorities, especially those of least-developed countries. The process shall be limited to the transparency aspects, not restricting preferences to domestic suppliers.

➤ Trade and environment

Environment received considerable attention from the WTO, as this topic becomes more and more important for the whole society. Therefore, the goal of the Organization is to strengthen mutual synergic effect between trade and environment. Numerous assignments are planned for the Committee on Trade and Environment to be pursued during next three years to fulfill the Doha Agenda. Negotiations are agreed on the relationship between existing WTO rules and specific trade obligations in multilateral environmental agreements; on the procedures for regular information exchange, the reduction of tariff and non-tariff barriers to environmental goods and services, as well as the reduction of fisheries subsidies that do not benefit the environment. Particular attention should be given to the environmental measures and their effect on trade and also to labeling requirements for environmental purposes in order to identify any need to clarify relevant WTO rules.

➤ Others

The Declaration defines the plan of action for number of other topics. Most of them were introduced for the first time, as "new issues" brought by changing international trade environment. They will surely expand over the time and receive higher attention during the next rounds. The topics include:

- electronic commerce
- small economies
- trade, debt and finance
- trade and transfer of technologies
- technical cooperation and capacity building
- least-developing countries
- special and differential treatment

The good results achieved in Doha give hopes for the future. As the WTO's General Director Mike Moore proudly summarized after the Conference: " There is much to do to ensure that the Fifth Ministerial Conference in Mexico in 2003 is a success, and that the new negotiations are concluded within the three-year timeframe agreed by Ministers in Doha. We have made a good start – we have approved a new budget, chosen the Conference venue, put in place a negotiating structure, and agreed on the chairpersons of the negotiating committees – all within three months of the Doha launch. That process took considerably longer after the launch of the Uruguay Round in 1986."<sup>xvi</sup>

## Contribution of the New Multilateral Trading System

Practice and also numerous economical researches proved the fact that a free and liberalized trade within the country fosters its economic growth and well-being. "It is expected to improve resource allocation in line with social marginal costs and benefits; to facilitate access to more advanced or better-suited technology, inputs, and intermediate goods; to enable a country to achieve economies of scale and scope; to bolster competition in domestic markets; and to provide pro-growth externalities."<sup>xvii</sup> But the same rule applies also in a broader spectrum. Another words, free trade encourages countries to specialize on producing the goods they make the best while importing the rest from other countries. This exchange supports the expansion of production and brings new opportunities for further growth. But important is that the trade among all actors is really free, without distortions of any kind. To work on reaching this stage is a main priority of the WTO.

The trade liberalization started by the GATT more than 50 years ago. By now we could already find out that numerous tariff reductions and continuing elimination of non-tariff barriers had brought significant results. Some of them are:<sup>xviii</sup>

- The growth of the world trade has averaged 6% annually, resulting in 18-fold growth of the total world trade
- The industrial production grew annually by 4.2%, what increased the total volume eight times
- The share of the trade on the world's GDP increased from 7% to 17.4%
- The world's GDP per capita grew annually by 1.9%
- The average world income per capita was in 1998 2.5 times higher then in year 1945

And yet, the process is not finished. In contrary, the Uruguay Round was a turning point that started the general implication of the agreed steps in the international trade liberalization in such a wide dimension, as has never been applied before. While the average trade weighted tariff of the developed countries was approximately 40 per cent at the beginning of the 1950s, after the first seven Trade Rounds it declined to 6.3 per cent to end up at 3.9 per cent agreed during the Uruguay Round (e.g. the USA agreed on 3.4% and the EU on 4.1%). Accurate estimates on the impact of the Uruguay Round are hard to make. Some, based on all above-mentioned measures have calculated that "...the new liberalization will add an extra ECU 180 billion of global income per year by 2005."<sup>xix</sup> "The new rules open up to international tenders a global public procurement market worth ECU 346 billion. The innovation will bring more competitive bidding, greater efficiency and consequent savings in public expenditure. And, it is estimated, the overall level of world merchandise trade will be USD 755 billion higher in 2005 than it would have been without the Uruguay Round's Commitment to opening up markets."<sup>xx</sup>

As every well-known institution or organization, the WTO has both supporters and opponents. I agree that the WTO might not be a perfect vehicle for the trade relationships in multinational area, but it is nowadays the "only doctor in town" and does bring significant benefits. Just based on the simple fact that any increase in the range of trading partners is beneficial to the open economies, the WTO provides a wide spectrum of opportunities to its member countries, no matter if small or large, developing or developed. "All the participating governments recognize the contribution that liberal trading policies can make to the healthy growth and development of their own economies and of the world economy as a whole."<sup>xxi</sup> If trade flows smoothly, the conflicts are less likely to arise. Therefore, the confidence that the WTO Agreements bring to its members is very important.

To summarize: "According to the World Bank, complete liberalization of merchandise trade and elimination of subsidies could add US\$ 1.5 trillion to developing country incomes. And reshaping the world's trading system and reducing barriers to trade in goods could reduce the number of poor in developing countries by 300 million by 2015 and boost global income by as much as \$2.8 trillion over the next decade."<sup>xxii</sup>

### Post-Communist Countries in the Multinational System

The political changes at the end of the twentieth century played an important role in the start of the liberalization processes of the formerly centrally planned economies. Right after the end of the Cold War, the post-communist countries had begun a long lasting journey from a large economic isolation towards the reintegration into a global trading system. "Since the late 1980s, the challenge has been, and continues to be, to manage this reintegration so that all countries benefit from greater specialization and trade of the part of the transition countries, while

minimizing the inevitable adjustment costs.<sup>xxxiii</sup> These countries in transition account for almost one third of the world's population, and even if we exclude China they contain more people than the EU or the NAFTA (Table 2). Therefore, it is an area with a great potential.

TABLE 2: ECONOMIES IN TRANSITION - POPULATION INDICATORS

Country	Population (mil.)
Central and Eastern Europe	192.0
Russia	145.5
Former Soviet Union (excluding Russia)	73.9
China	1282.4
Rest of Asian	192.0
Total	1885.8
EU	370.2
NAFTA	412.9
World	6056.7

Source: United Nations Population Division, 2000. Counted from the indicators for individual countries.

Following in this paper, we will focus mainly on the development of the Central and Eastern European transition economies that used to be members of the Council for Mutual Economic Assistance (CMEA).

The CMEA was a foreign trade organization of the communist countries under the influence of the Soviet Union, where the countries agreed on determined trade flows among the member states “The economies of the CMEA member states were together very closely combined. They realized up to 50 per cent of their foreign trade turnover in a reciprocal good exchange.”<sup>xxxiv</sup> But this mechanism was completely different from customs union or the free trade zone, as we know it today. Communist countries were state regulated, and therefore could not follow a non-discriminatory, open market policy. Most centrally planned economies maintained a number of direct interventions in investment decision-making and regulated their economies by stating quantities of goods that should be produced during five years periods so called ‘five-year plans’. They also used many state subsidies, and no common external tariff or common trade policy within CMEA existed.

#### **Specific Treatment for Transitive Economies**

During the Cold War the political aim was to secure the technical superiority of the West. The economical relations between the GATT and the communist countries were minimized only to the direct relations between individual Western and Eastern countries. “Before accession of a communist country to the GATT Western governments willing to enter into closer trade and cooperation with communist countries on a concessional basis were granting MFN treatment in bilateral trade agreements in exchange for easier access to the market in the communist country or for other, often political aims.”<sup>xxxv</sup> When communist countries started to negotiate the terms of their accession into the GATT, several safeguards were implemented into the agreement. These measures were applied to assure that the western countries could respond quickly if new contractors did not follow the basic principles and their governments determined prices of export in a discriminating and distortive way. Otherwise, it would be almost impossible that two so different economies as the centrally planned and regulated state economy and the neoliberal market economy could be brought at least to a partial agreement. The GATT membership of the socialist states was, therefore, in most of the cases based on specially designed conditions. Numerous safeguards permitted contracting parties an easy application of new restrictions. At the same time, the member countries could use the provisions of the Article XXXV. of the GATT Agreement, which permits contracting party not to enter into GATT obligations with respect to a newly contracting party, and vice versa. This tool was used extensively by the USA. For all above-mentioned reasons, the immediate economic gains for the communist countries were rather modest, and accession was seen more as a sign of a political independence from the USSR. It could be the first step towards a membership in the IMF or the World Bank, important institutions that provided access to financial means.

Being a contracting party to the GATT gave the communist country an opportunity to enter into new trade negotiations with their Western counterparts from an improved basis. However, “...the GATT diverged from a rule-based approach and established precedents of differential treatment of some centrally planned economies in the

1960s and 1970s. These have become embodied in practices, especially with respect to anti-dumping actions, which discriminate against non-market economies and which continue to be applied to economies in transition from central planning.<sup>xxxvi</sup>

#### **Czechoslovakia**

Czechoslovakia (CSR), the same way as Cuba, was one of the founding members of the GATT. “As a country without a direct access to the sea, but with a significant machinery and processing industry, with inadequate resource base and not self-sufficient agriculture, from which resulted its dependence on foreign trade, had Czechoslovakia a positive interest on setting binding rules for international trade and this way assuring its share on the economic benefits that would emerge from this cooperation.”<sup>xxxvii</sup>

It was one of the reasons why the CSR participated very actively in the preparatory conferences and also during the Trade Rounds in Geneva (1947), Annecy (1949), and Torquay (1950-51). But in the early fifties, after it turned into a communist regime, problems arose. The US Congress passed a provision, which stated that the United States would not grant any tariff reductions or the MFN treatment to the socialist states. Based on this, the USA denounced the bilateral trade agreements with countries that were not members of the GATT. The case of the CSR was more complicated, because the relations were based on a multilateral agreement (the GATT). The USA could not use the Article XXXV., since it was applicable only towards newly acceding countries. In 1951 both Czechoslovakia and the United States complained to the GATT that the other country was not meeting its GATT obligations. The obligations were consequently suspended by a Declaration from September 27, 1951 and the USA imposed a maximal tariff on Czechoslovak exports. Otherwise, the CSR was considered to be a “silent contracting party” taking part on following Trade Rounds and applying negotiated tariff reductions and concessions, but having no decisive power.

After the “Velvet Revolution” in 1989, Czechoslovakia started the process of transition and the political system changed as well. It brought about a change in relations between the countries and Czechoslovakia “took back” its old position as a full member. The USA opened its market to Czechoslovakia by granting it a MFN at the end of 1990, but the suspension of its GATT obligations was officially withdrawn only in 1992.

When Czechoslovakia split in January 1, 1993, the Czech and the Slovak Republics became two independent states. They both separately applied to join the GATT and on April 15, 1993 became separate contracting parties.

#### **Other Countries**

**Poland** received an observer status in 1957 and two years later applied for accession. During the Kennedy Round the accession working group discussed the terms of accession, which were very different from a standard protocol, because Poland was a state trading country. Since Poland did not have a meaningful tariff, it obliged itself to increase its imports from contracting parties to the GATT by not less than seven per cent annually. Poland became contracting party on October 18, 1967 as the first state trading country. After the collapse of communist power Poland, the same way as all other post-communist members, presented the request to renegotiate its terms of accession on the basis of a market economy system.

**Romania** was granted an observer status in 1957 and applied for accession in 1968. The accession protocol was similar to Poland’s, but Romania obliged itself to increase imports from contracting parties by not less than the overall growth rate of total imports as in the respective current five-year plan. In 1971 Romania became contracting party, but the USA applied the Article XXXV. There were no relations between the two countries until August 1975, when the United States granted Romania the MFN.

**Hungary** applied for accession in 1969 and became a contracting party four years later. Since it underwent economic reforms, acknowledged by Western world as successful and trustworthy, and its tariffs were considered a meaningful device for regulating trade, no quantitative import obligation was implied. Nevertheless, the USA invoked the Article XXXV. in their case, too, granting the MFN since 1978.

**Bulgaria**’s negotiations were not so successful. It became an observer in 1967 and applied for accession after lengthy preparations in 1986. The prolongation of negotiations was caused by not transparent economic reform moves that was Bulgaria proceeding during second half of the 1980s. Problematic were also its close relations with the USSR which met political resistance. In 1991 the new terms of negotiations were applied in reference to transition of the economy and Bulgaria became contracting party to GATT in 1995 and member of the WTO in

December 1996.

The **Soviet Union** notified the GATT about its interest to become observer during the Uruguay Round in 1986 and got this status in 1992. After the collapse of the USSR and Yugoslavia a series of new states showed interest in becoming GATT contracting parties and later members of the WTO. Working parties were set up and the negotiations are being held continuously.

While the accession of communist countries in the past 30 years was seen by Western countries as a sort of political measure, it is now considered to be a necessary ingredient in the transition process of post-communist countries to the market economy. Almost all post-communist countries in transition from central planning have accepted rather than challenged existing principles of the world trading system embodied in the WTO, and generally pursue multilateral non-discriminatory trade policies. The reality proves that transition is not easy, takes a long time, and the countries need help and support from their Western partners. Integration process into the world economy requires several steps.<sup>xxviii</sup>

- a.) To open up the domestic economy through an orthodox commercial policy
- b.) To obliterate quickly all vestiges of the CMEA's trade, pricing, payment, and settlement regimes
- c.) Integration into the world economy from the beginning envisioned to encompass full participation in global economic regimes

Even though the collapse of communism and change of the system occurred more than a decade ago, countries still work hard on securing a well-functioning liberalized trade.

TABLE 3: WTO STATUS OF THE CENTRAL AND EASTERN EUROPEAN ECONOMIES

Country	Status	Date of accession
Czechoslovakia	Original GATT signatory	Jan. 1948
Slovak Republic	Succeeded CSR	Apr. 1993
Czech Republic	Succeeded CSR	Apr. 1993
Yugoslavia <sup>1</sup>	Joined GATT (state trading econ.)	Aug. 1966
Poland	Joined GATT (state trading econ.)	Oct. 1967
Romania	Joined GATT (state trading econ.)	Nov. 1971
Hungary	Joined GATT	Sept. 1973
Slovenia	Joined WTO	July 1995
Bulgaria	Joined WTO	Dec. 1996
Latvia	Joined WTO	Feb. 1999
Estonia	Joined WTO	Nov. 1999
Albania	Joined WTO	Sept. 2000
Croatia	Joined WTO	Nov. 2000
Lithuania	Joined WTO	May 2001
Moldova	Joined WTO	July 2001
Bosnia & Herzegovina	Negotiating (applied - May 1999)	
Macedonia	Negotiating (applied - Dec. 1994)	
Yugoslavia Fed. Rep. <sup>2</sup>	Negotiating (applied - Jan. 2001)	
Belarus	Negotiating (applied - Oct. 1993)	
Ukraine	Negotiating (applied - Dec. 1993)	
Russian Federation	Negotiating (applied - June 1993)	

<sup>1</sup> Former Yugoslavian Socialist Republic. In 1991 Slovenia, Croatia and Bosnia & Herzegovina declared its independence and new Yugoslavia was not allowed to claim successor status.

<sup>2</sup> The new Yugoslavia (Serbia, Kosovo, Vojvodina, and Montenegro) applied for membership.

### **Slovakia in the WTO**

As we mentioned earlier, Czechoslovakia was one of the GATT's contracting parties since its beginning. When in 1992 the common parliament of Czech and Slovak Federal Republic (CSFR) agreed on its division into two sovereign states: the Czech Republic (CR) and the Slovak Republic (SR) the new states separately applied to join the GATT. The accession started already before their independence by negotiating the exact process. Both CR and SR expressed their will to respect to the fullest extent all the provisions and commitments made by former CSFR as its successive states. For this reason, the accession process was different from the standard. In a common Memorandum the successor states formulated their determination to become contracting parties under the same conditions as were followed in the CSFR. Therefore, no working group was formed (normally used to consult and prepare the accession of a new country), but delegates submitted a proposal of the Protocols about the accession together with the schedule of concessions. The Proposal was submitted and approved on February 9, 1993 by the Council and already ten days later more than two-thirds of members agreed that the CR and the SR could become contracting parties to the GATT. The Minister of Economy signed the Protocol of Accession on March 16, 1993 in Geneva, and this way the Slovak Republic became the full contracting member under the same conditions that were valid for the CSFR. This Act came into the force retroactively from January 1, 1993.<sup>xxix</sup>

Slovakia made extensive commitments during the Uruguay Round both in trade of goods and services, and after the establishment of the WTO became automatically its original member. During the Fifth Conference the countries agreed to continue negotiations on liberalization of some sectors that were not included in the WTO Agreement, but are important and will probably be discussed in the near future. Slovakia participated on these meetings as well, made certain commitments and signed some of the resulting plurilateral agreements, e.g. Agreement on Government Procurement, Information Technology Agreement (ITA), Agreement on Trade In Civil Aircraft. Slovakia also participated in the negotiations on basic telecommunications, financial services, e-trade, and transport services.<sup>xxx</sup>

### **Institutional Cooperation and Performance Appraisal**

The Ministry of Economy is responsible for the representation of the Slovak Republic in the WTO. Our country has representatives in the Permanent Mission to the United Nations and in other international organizations with the seat in Geneva, who take part at work of different committees and working councils, and this way support Slovakian needs. Nevertheless, the Ministry of Economy remains the main governmental body responsible for the formulation, coordination and implementation of trade policies within the framework of domestic and international laws, including the establishment of safeguard measures against imports, and countervailing actions against subsidized exports. It is responsible for the coordination of bilateral and multilateral trade policies and negotiations, including implementation of obligations; it operates the foreign trade licensing regime and administers import quotas, except for tariff quotas, which are administered by the Customs Directorate; it is responsible for industrial policy and dispenses most financial assistance to industry, including state aid, which is monitored by the State Aid Office. The Ministry closely cooperates with other policy departments.

Since its establishment, the Slovak Republic has enacted a large number of trade and trade-related laws and regulations and amended existing ones. Many of these changes have been made due to the need to harmonize the legal framework with the EU's *aquis communautaire*, but also because of the implementation of number of the WTO's key provisions. Today, after almost ten years of the Slovak independence, we may say that our country has finally developed a compact legislative framework applied in the foreign trade. It is comparable with other world open economies and provides greater security of trading environment for our investors, trading partners as well as for our own trade. All of the significant WTO Agreements have now their corresponding Slovak regulation.

The conclusion of the Trade Policy Review of the Slovak Republic from November 2001 reaffirmed our ongoing liberalization as a means of improving economic efficiency and further integration into the world economy. During the period under review (1995-2001) the simple average MFN tariff decreased from 8% to 6.1% in 2001 and the rates were skewed towards duties in a range from 0 to 5 per cent. These rates covered 45 per cent of tariff lines in 2001, what meant a ten per cent increase from year 1995. The share of duty-free items also increased from around 15 percent in 1995 to 19 percent nowadays.

At the same time, Slovakia is granting the Generalized System of Preferences treatment to developing countries. All products imported from least developed countries are granted duty-free access, and the imports from developing countries are classified into three groups:

- a.) Sensitive to domestic production - receive no preferences (56% of tariff lines). This group includes mainly agricultural products, but also certain industrial products, for example mineral products, carpets, wood pulp, footwear, iron, and steel.
- b.) Less sensitive - dutiable at a preferential tariff of 50% of the MFN rate (29% of tariff lines).
- c.) Non-sensitive - enter duty-free (15% of tariff lines).

Currently, GSP applies to 98 developing and 48 least developed countries and these imports are limited annually to US\$2 million per country annually. Developments are also being made toward liberalization of services' sector, mainly in banking, insurance, telecommunication and transport.

## Conclusion

We see that the recent world trend supports membership of the small economies in the bigger international bodies. They should take part in the international trade in order to equalize their resource limitation with the actual demand and thus improve their performance.

Based on this, the external trade that brings greater access to inputs is a vital part also for the Slovak economy. Slovakia's priority is to be a vital part of the international trading system. Therefore, it is a member of the WTO since its independence in 1993. As a member it participates on all actions in order to help the expansion of the liberalized trade. It supports the idea that the new Development Trade Round, launched during the Doha Ministerial Conference, should be based on agreed principles and take into consideration the needs that arose from the changes in economy. Only through development and mutual cooperation can countries reach the WTO's principal aim – to guarantee the sustainable economic development and welfare for peoples of all member countries.

Our membership in the WTO brings certain rights, but responsibilities, too. Slovakia has to comply with all agreements it signed under both the GATT and the WTO, and apply them in relations with its trade partners. On the other hand, membership does not only bind Slovakia to follow the rules, but gives our country numerous possibilities. Since Slovakia is quite a small country, the opening of the markets gives us a chance to widen the area of the export possibilities and thus to promote economic growth and development. The WTO grants Slovakia the same treatment and chances as to the big economies. It is only up to us to use the chances given.

# The Dynamism of East Asian Economic Integration

*Rujhan Mustafa*  
*Universiti Malaysia Sarawak, Malaysia*

## Abstract

The East Asian economic integration started in 1990 due to increase regionalism in Europe and North America and the difficulties of concluding the Uruguay Round of trade negotiation. The 1997 Asian financial crisis is an eye opener for East Asia to integrate their economies. The conceptual leap on East Asian economic integration occurred in 2001 when the East Asian Vision Group submitted a report on an East Asian Community to the leaders of the ASEAN+3 meeting. The purpose of this paper is to explain the factors that influence the economic integration in East Asia. Integration act as a platform for East Asia to discuss on economic issues and play a much-needed role to balance the power of North America and Europe. It also strengthened the region integration into the world economy. The factors that accelerate the economic integration in East Asia include economy, security, political, leadership, the Asian financial crisis, historical, socio-cultural, regional identity and knowledge management. The economic integration in East Asia can be measured by the intensity of intra-regional trade and economic interdependence. The region is believed to be a role model of market-driven economic integration.

## Introduction

Asia Pacific Economic Cooperation (APEC)<sup>i</sup> was launched in the late 1980s as part of the Asian and American response to the success of European regionalism.<sup>ii</sup> Soon after, in December 1990, after the breakdown of the Brussels negotiations in the Uruguay Round, the then-Prime Minister of Malaysia, Dr. Mahathir Mohamad suggested the formation of what he called the 'East Asian Economic Group' (EAEG).<sup>iii</sup> The EAEG proposal aimed to counter the threat posed by the emergence of trade blocs in the EU and North America and to provide a stronger voice for Asia in global trade negotiations. In late 1991, at the ASEAN (Association of Southeast Asian nations) Economic Ministers' Meeting held in Kuala Lumpur, Indonesia put forward the proposal to replace EAEG with EAEC or 'East Asian Economic Caucus' and was immediately accepted by Malaysia and the rest of ASEAN.<sup>iv</sup>

The EAEC was initially rejected due to opposition both from within East Asia and externally. It met with strong opposition by the non-Asian APEC members, particularly the United States (US) and many participants of the 1991 2<sup>nd</sup> APEC meeting in Seoul. The US Secretary of State, James Baker, demanded that the Japanese and South Korean foreign ministers not to support EAEC.<sup>v</sup> At that time, Japan agreed to oppose such a notion and Japan seems not to take part in any kind of proposal, of which America was against it. Under the pressure from the US and for lack of support from some Asian nations such as Japan, and with rapid success of APEC, the EAEC faded away. Japan failed to utilize this golden opportunity to lead the economic integration in the East Asian region despite the fact that it was the sole economic superpower in Asia.

Owing to the commitment of APEC to protect the interest of Asia Pacific and after the EAEC setback, ASEAN started an economic integration initiative with the establishment of ASEAN Free Trade Area (AFTA) in 1992. ASEAN desire to be a viable organization towards economic integration was satisfied by accelerating the schedule of AFTA, creating forums centering on ASEAN activities such as ASEAN Regional Forum (ARF) in 1994, ASEAN-Europe Meeting (ASEM) in 1996, and expanding dialogues with various countries in the "ASEAN Plus (+)" format. The launching of ASEM, in particular, was the European answer to the rapid progress of APEC. This enhanced sense of urgency enabled ASEAN members to agree on the first framework of comprehensive regional economic integration in East Asia.

Cooperation involving ASEAN and its North Asian partners (Japan, South Korea and China) gained momentum as a result of the necessity for consensus during the initial Asia-Europe Meeting (ASEM) in 1996. The East Asian countries, while participating in the ASEM process, came to realize the need for their own grouping to

deal with the European counterparts. While, the European countries had the European Union, the East Asian countries didn't have anything of their own, and so there was urgent need to have an identity. The *de facto* grouping that emerged was further forged by regional initiatives to combat the Asian financial crisis at the 1997 Kuala Lumpur ASEAN Summit. The financial "contagion" convinced ASEAN and Northeast Asian countries that they need a regional forum for economic cooperation that reflected their common interests, priorities and increased their voice in the global arena.

In 1997, under Dr. Mahathir's chairmanship, China, Japan and South Korea were invited to the ASEAN Summit in Kuala Lumpur. It was the time when the ASEAN and Northeast Asian countries leaders started to realize the importance of a stronger East Asian grouping. They began to have an East Asian caucus within the ASEAN meetings and the first of the annual ASEAN Plus Three (APT or ASEAN + 3) summit meetings was held following the ASEAN Summit in Kuala Lumpur aimed at greater regional economic coordination. Prior to the 1997 financial crisis, it was hard to imagine the formation of a group such as the APT.<sup>vi</sup> But the 1997 Asian currency crisis changed the tide. And today, people speak about the possible formation of an East Asian Community and the governments explore possibility of a pan-East Asia FTA (Munakata, 2002).

In 1999 the APT leaders commissioned an East Asian Vision Group to study the possibility of formalizing an East Asian grouping. The conceptual leap on East Asian economic integration occurred in November 2001 when the East Asian Vision Group submitted a report on an East Asian Community to the leaders of the APT meeting. The leaders of ASEAN, Japan, China and South Korea formally acknowledged an East Asian FTA vision. They have agreed that economic ministers should begin study on an East Asian FTA. Meanwhile, the whole process of regionalism in East Asia has been somewhat '*ASEANized*' in its norms. The current situation can be characterized as "talking regional, acting bilateral" (Munakata, 2002). Meanwhile, regionalism in Europe and North America maintained momentum and continued to expand geographically and functionally. East Asian economies are convinced there is no way to stop it and they should also get involved in trading block or preferential trade agreements.

Up until around 1997, China kept to the sidelines in moves toward regional cooperation. For instance, China belatedly joined the APEC forum in 1991, two years after the regional framework was created, and it opposed to an idea to create an "Asian Monetary Fund." From around the summer of 1999 when tensions grew in its relations with the U.S., China began to step up efforts to strengthen ties with neighboring countries as part of its "multipolarity" strategy. While being engaged in negotiations for its accession to the World Trade Organization (WTO), China watched the acceleration of moves toward bilateral FTAs within Asia from 1998 onward, feeling frustrated and strongly recognizing the need to join the trend. It has also come to see an FTA, which provides a special access to the Chinese market, as an effective tool to defuse persistent fears among its neighbors over a "China threat." When Sino-US relations were particularly tense and in the wake of the US bombing of the Chinese embassy in Belgrade in May 1999, China has embarked on '*ASEANized*'. At the ASEAN-China Summit in November 2000, China proposed an ASEAN-China Expert Group on Economic Cooperation to recommend measures on how to further enhance ASEAN-China economic cooperation and integration, including the possibility of establishing a free trade area. This move was the precursor to China's active efforts to seek an FTA with ASEAN and its leadership role in East Asian framework for economic integration. In November 2001 China and ASEAN agreed to negotiate for an FTA to be completed within 10 years. China's offer of early harvest by reducing tariffs of interest to new ASEAN members had a decisive role in persuading ASEAN to accept China's FTA proposal.

Japan and has been criticized for lagging behind China in the "FTA race" over ASEAN economies. Following China's step, in January 2002, Japan proposed an Initiative for Japan-ASEAN Comprehensive Economic (JACEP). According to a joint declaration by Japanese Prime Minister Junichiro Koizumi and ASEAN leaders, Japan and ASEAN aim to complete the implementation of partnership measures (including an FTA) as soon as possible within 10 years. South Korea was also considering an FTA with ASEAN.

In November 2002, a series of meetings among East Asian leaders—the 8th summit of the Association of Southeast Asian Nations (ASEAN), the 6th APT summit among leaders of ASEAN countries, Japan, China and South Korea, ASEAN+1 summit meetings between ASEAN and Japan, China and South Korea respectively, and Japan-China-South Korea summit—took place in Phnom Penh, Cambodia, and there were some developments in moves toward the integration of East Asian economies. Hence, at this stage, all East Asian economies are engaging

in various bilateral free trade efforts. President Roh Moo-hyun summed the inevitable East Asian economic integration when he told the ASEAN business leaders (October, 2003) at the Bali Summit, "If we join forces, South Korea and ASEAN members and by extension, all of East Asia, will become the engine of growth for the world economy and the 21<sup>st</sup> century will be the age of East Asia". According to Chinese Premier Wen Jiabao (2003), the world could see a free trade area with nearly two billion people and gross domestic product of almost US\$3 trillion in East Asia by 2010.

In October 2003, ASEAN and China agreed on a special tariff-busting program to start their grand plan to set up the world's largest FTA. ASEAN and China adopted a protocol paving the way for the implementation from January 1, 2004 of a so-called "early harvest program" under the FTA (AFP, 2003). The three-year program is largely a concession by China to give early benefits to the ASEAN states through tariff reductions on a host of agricultural and manufactured goods while the actual implementation of the FTA begins on January 1, 2005. The early harvest program allows ASEAN products to be exported to China at a very concessionary rate so that ASEAN countries can actually get benefits of a free trade arrangement even before the agreement is finalized. The ASEAN states reciprocated by giving tariff concessions to their giant neighbor under a so-called tariff harmonized system for agricultural products.

## **The Dynamism of East Asian Economic Integration**

East Asian cooperation had become more urgent after the 1997 Asian financial turmoil, regional crises such as the SARS and bird flu epidemics, and the terrorism threat. After the 1997/1998 financial economic crises, there has been growing concern and recognition by the East Asian leaders that a major regional crisis cannot be handled by any individual state alone, hence the gradual emergence of East Asian cooperation or regionalism, such as the ASEAN Ten Plus One, ASEAN Ten Plus Three (APT), ASEAN Ten plus Five.<sup>vii</sup>

APT process has started to take shape. Government leaders, ministers, and senior officials from the 10 members of the ASEAN<sup>viii</sup> and the three Northeast Asian states—China, Japan, and South Korea—that together comprise the participants in the process are consulting on an increasing range of issues. The APT's emergence raises questions about relations between it and other regional groupings such as the Asia-Pacific Economic Cooperation (APEC) forum and ASEAN itself, as well as about the overall prospects for its future development. There are a number of obstacles to this development that arise from the many differences among the countries of East Asia.

Subsequent meetings of the APT heads of government took place at each of the following annual ASEAN summits. In addition APT finance ministers, economic ministers, and deputies from senior ministries also began meeting regularly. More recently, meetings have taken place among such groups as the APT Young Leaders, the APT labor ministers, the e-APT Working Group, APT patent office chiefs, and members of the ASEAN committee on science and technology and their Northeast Asian counterparts. The ASEAN Summit in Vientiane, Laos, marked the 10th Leaders' Summit for what is an increasingly significant regional dialogue process.

When the AFTA idea was first proposed, many Asian leaders saw the creation of an East Asian currency as one of the ultimate objectives of regional integration. The idea was given further impetus by the Asian financial crisis in 1997-98 and, more recently, the launch of the 'euro'. The first achievement of APT was as quick as "quick response" to the financial crisis. Immediately after the Asian crisis, Japan suggested that an Asian Monetary Fund (AMF) be created, and take on the role of the IMF in boosting regional recovery. But the idea was quickly dropped because of strong opposition from the IMF and the US, as well as lukewarm support from China, which felt that it was too reminiscent of Japan's infamous Greater East Asian Co-Prosperty Sphere program, launched during World War II.

The network of currency swap arrangements between the 10 ASEAN countries and China, Japan and South Korea established in Chiang Mai in 1999, set the stage for Pan-East Asian financial cooperation. Chiang Mai Initiative (CMI) that consists of a series of bilateral currency swap agreements build on the expanded intra-ASEAN US\$1 billion standby swap arrangement. During 2001 Japan reached bilateral currency swap agreements with Malaysia, South Korea, and Thailand. In addition, South Korea has conducted negotiations on bilateral swap

agreements separately with China and Thailand. The spirit of Chiang Mai should live on; a common East Asian currency should be an active goal of our region.

Given the enormous political and economic problems involved in the creation of a free-trade area, a common currency—which represents a much deeper form of regional integration—would take much longer to materialize. At present, East Asia has neither the political institutions, such as those of the EU, nor a central bank to decide on common monetary policies. An Asian currency, therefore, is at best a long-term objective.

Economic reason is one of the nine factors that accelerate the economic integration in East Asia. The East Asian economies growing concern about regionalism gaining momentum in Europe and North America after the Cold War hasten the need for economic integration in the region. East Asia requires an effective mechanism for cooperation and to promote sustainable economic development. The development of regional cooperation with both economic and security aspects has substantially enriched the development of East Asian regionalism (Liu, 2003). The desire for regional security cooperation helps to deepen the process of regional cooperation in East Asia. The efficient and effective management of regional order in East Asia would contribute to the economic integration of the region.

According to Drake-Brockman and Drysdale (2002), the motive for regional economic cooperation is often political as well as economic. East Asian economies are searching for means of closer cooperation on political motives. In the broad APT framework for cooperation among ASEAN, Japan, China and South Korea, the choice of partners for closer cooperation is driven by political motives. Extraordinary leadership is the quintessential to the success of the East Asian integration. The question of right leadership is critical for the success of East Asian economic integration. China has the potential to be the leader of East Asian countries due to its physical size, population, and economic power. The Japanese attempted to unite Asia by creating the Greater East Asia Co-prosperity Sphere but has not been able to repudiate their past. As the bitterness over the Japanese occupation fades with time and the passing away of those who suffered under the Japanese occupation, East Asian nations are level headed enough not to allow the historical legacy to affect economic relations with Japan.

The Asian financial crisis in 1997 has brought about a serious commitment of regional governments to push forward for East Asian economic integration. It also made the East Asian countries to realize how interconnected they were for what started off as a mere currency crisis in Thailand spread very quickly to Indonesia, Malaysia and South Korea. Thus the momentum developed for a regional approach which would be more sensitive to East Asian condition and which could pool together East Asian financial resources that would help the affected countries. Some analyst said that there is very little cultural unity in East Asia that binds the countries in East Asia. There is no common religion that binds them and there are many countries with majority of the populations profess Islam, Christianity, Buddhism and Confucianism as their religion. Regionalism must be built on some common shared values and create a cohesive awareness in the East Asian region. The East Asian regional consciousness will further stimulate regional coherence and send an image of a unifying East Asian region to the rest of the world. The vision of East Asia should incorporate the concerted efforts to build a knowledge-based East Asian economies and information-rich East Asian societies that can compete with the best region in the world. In fact information and knowledge sharing helps to accelerate the economic integration in East Asia.

## **Measurement of East Asian Economic Integration**

The economic integration in East Asia can be measured by the intensity of intra-regional trade, economic interdependence and complementarities of East Asian economies. Intra-regional trade intensity can be defined as the share of trade flows within the same region. According to International Monetary Fund (IMF), Direction of Trade Statistics 2000, the total trade flows appears particularly high within the East Asia group of countries. At least 40% of the total exports from 6 out of these 9 countries are directed to countries within the region. The intra-regional export share for the East Asian region reached 41.5% in 2000 and this figure is lower than the 47.5% reached in 1996, the year before the 1997 Asian financial crisis. Europe and North America, which have major regional trading agreement already in operation, show corresponding figures of close to 63% for EU and 46.7% for NAFTA.

Rao (1995) identified that the intra-regional trade intensity in Asia increased from 32.0% in 1980 to 43.7%

in 1993. This relatively high intra-regional concentration of trade flows within East Asia implies strong interdependence among the economies of the East Asia group (Park, 2002). This economic interdependence in East Asia can be measured by the share of intra-regional exports and/or imports in the Gross Domestic Product (GDP) of each country and in the aggregate GDP of the group as a whole. Intra-regional export dependency shows how much of one country's GDP is generated by its export activities (Park, 2002). The intra-regional export dependency is remarkably high for Singapore (73.2%) and Malaysia (54.1%) and relatively low for Japan (3.3%), South Korea (13.8%) and China (11.4%). The remaining of Southeast Asian countries and Hong Kong show the contribution to the generation of GDP of intra-regional trade, which range from between 20.9-23.8%. The intra-East Asia trade relations are substantially important especially for the ASEAN 5 countries in generating their GDP. Hence, when pursuing regional integration, ASEAN has to consider seriously the inclusion of Northeast Asian countries if it wants to maximize the integration-related benefits. Data from IMF (1997), World Bank (2001) and World Development Report (2001) shows that the economic interdependence of East Asia in 2000 as a whole (minus Japan) stands at a relatively high level of 15.7%, compared to 14.9% for EU and 10.6% for NAFTA. This intra-regional export dependency indicator is lower for the whole East Asia group at 9.1% because Japan is significantly less dependent on trade with East Asian countries and more dependent on trade relations with non-East Asian countries.

The East Asian region was long believed to be a role model of market-driven economic integration. This view is supported by Soesastro Hadi (1993) when he mentioned that the growing economic integration in the region is largely market driven and is in some way closely related to the region's high economic growth performance. Due to a lack of cooperative experience at the regional level, the development of regionalism in East Asia has not been directed by political will but is largely driven by the natural course of economic forces. It is therefore obvious that this form of regionalism is characterized by market dynamism. This is in stark contrast to the institutionalized or policy-induced regional economic integration of the EU and NAFTA. The economic integration in the East Asian region should be modeled on the principle of equality, mutual benefit, free but fair trade. Besides, it must be integrated, comprehensive and encompassing all sectors. It would be a living example to the whole world of how East Asian countries despite its diversity unselfishly help to enrich or develop each other economies through cooperation and integration.

Historically, the Asian countries have not had a strong sense of an "Asian identity", unlike their European counterparts. But economic developments over the past decade, especially in the wake of the 1997-1998 Asian financial crisis, have altered peoples' attitudes significantly, and a new regionalism is now emerging. A number of forces have contributed to this process.

First, intra-regional trade, led by foreign direct investment, has developed rapidly in recent decades. Large companies and transnational corporations have established horizontal and vertical production linkages among the neighboring Asian countries, in order to exploit scale economies and to enhance their value chain.

These in turn, has resulted in enhanced production networks across the region and increasingly close economic ties, providing a strong impetus for Asian governments to seek closer economic collaboration. The economic success of other regional trading blocs, such as the EU and NAFTA, has convinced the East Asian governments that they could achieve similar results emulating such organizations.

Second, Asian countries were greatly dismayed by the solutions prescribed by the IMF and western governments for tackling the Asian crisis of 1997-98. To a certain extent, some countries are still suffering the side effects. Unable to change the existing international frameworks, many Asian countries realized that in order to avoid future economic crises and reduce their reliance on external support, they should co-operate more closely.

Third, new WTO negotiations—albeit unsuccessful so far—have added a new a sense of urgency to the calls for greater regional collaboration. Some developing Asian countries are also increasingly concerned that labor and environmental proposals made by some rich members will undermine their competitiveness. The growing demand for East Asian countries speak with "one voice" has been given added impetus by the specter of a more unified EU and a strong NAFTA together deciding the future agenda for international trade.

Fourth, China's WTO accession has added further impetus to regional co-operation. In addition to increasing access to each other's markets and encouraging mutual investment, many Asian governments also believe

that closer economic ties will help them to reap the benefits of China's membership, thereby reducing their dependence on US markets.

What's more, China's integration into the region will not only contribute to greater economic stability for all of Southeast Asia, but it may go some way towards allaying fears that China's economic growth might be achieved at the expense of its neighbors.

## **From APT to East Asia Community**

A significant step forward was an official proclamation of the East Asian Community as a goal to be pursued in the declaration that followed the summit meeting of Japan and the 10 ASEAN members held in Tokyo in December 2003. It marked the first time that all of the ASEAN leaders met outside the region. The declaration put the Community's creation on an official agenda for the region.

It is still fresh in memory that then Malaysian Prime Minister Mahathir's proposal for an EAEG in the early 1990s was stalled by the strong objection from the U.S. and Japan's reluctance to go for it for fear of offending Americans. Again, in 1998, in the midst of the Asian financial crisis that dealt a crippling blow to the region's economic growth, Japan's initiative for a regional financial mechanism, something to be called an Asian Monetary Fund (AMF), intended to rescue Asian economies affected and prevent a repeat of the crisis, collapsed due to the IMF's (actually Washington's) opposition. But the re-emergence of EAEG in APT form has been taking place now.

At the meeting in early July 2004 of foreign ministers of the APT in Jakarta, Malaysia indicated its willingness to host the first East Asian summit meeting in 2005 or even earlier. The recent November 2004 ASEAN Summit in Vientiane, Laos, decided to hold the inaugural East Asia Summit (EAS) in Kuala Lumpur December 2005. The summit will mark the first milestone in the "irreversible" journey towards an integrated region and send a powerful signal to the world of their deep level of trust and cooperation. It will mark the first major step toward the East Asian Community. But the important thing is for the countries concerned to try to give substance to the [concept--with](#) a clear-cut view of common interests to be pursued in the face of the differences that exist in the region. It is the realization of a 1990 proposal by Mahathir for an East Asian Economic Caucus more than 10 years ago, which failed to take off due to opposition from the United States that feared it would undermine the 21-member Asia-Pacific Economic Cooperation forum.

## **Conclusion**

With their rapid economic development, the East Asian countries strengthened their integration into the world economy. Economic integration in East Asia would enable the region to maintain a united view and have bigger clout in international decision-making. The APT can play a much-needed role to balance the power of North America and Europe. With its market power of 1.98 billion people (2004), East Asia would be able to bargain on equal terms and not accept rules set by others. This will allow East Asian countries to protect themselves from foreign interference. The APT would act as a platform to enable all the countries in East Asia to talk, discuss and act on economic or trade issues as one united voice. The economic integration in the East Asian region would be a living example to the world how East Asian countries despite of its diversity unselfishly help to enrich or develop each other economies through cooperation and integration. This has significant implication to the economies of East Asia, the EU, NAFTA and global trade.

Overall, the APT has considerable promise. Its immediate competitors, APEC and ASEAN, are in danger of stagnating and do not represent the interests of East Asia directly. In contrast, the APT is moving forward on a number of issues, the most important of which is the web of currency swap agreements. The round of trade talks under the WTO agreed to in late 2001 will also give the APT a further boost as East Asian states seek to maximize their influence on the outcome. And the long-term 'regionalization' trends identified in this analysis will continue to help knit the region together. All these factors bode well for the emergence of the APT as a major regional and international player.

# Changes to Government Export Promotion – Response to Global Challenges in the Developed World

*Krisztina Molnar*  
*The University of Sydney, Australia*

## Abstract

Governments in the industrialised world have changed their role in export promotion over the past two decades. Considering the growing dominance of free-trade principles as well as the WTO's limitations on government's trade policies, one might expect government forces to gradually withdraw from trade promotion. However, in most industrialised countries, there has been a definite increase in government involvement in export promotion, evident in the cases of Austria, Germany, Sweden, the United Kingdom, the Netherlands and Italy. This phenomenon has taken place irrespective of the countries' export performance, domestic institutional or political arrangements. The argument put forward in the paper is therefore that the challenges of globalisation have led governments in industrialised countries to become more interventionist in export promotion.

## Introduction – Conceptualising the Export Promotion System

There is no generally recognised definition for export promotion [26]. One of the reasons for this is that export promotion can be interpreted on different levels – most notably on the national, industry and firm levels. Accordingly, in its broadest sense, export promotion covers measures which “actually or potentially enhance exporting activity at the company, industry or national level” [59]. For the purpose of this paper, export promotion is interpreted from a strictly micro or firm perspective, thus limited to assistance provided for companies to enhance their exporting activities.

Export promotion on the firm-level usually has an institutionalised form, that is, companies receive assistance from an established organisation or agency. There are three major types of organisations differentiated, depending on the type of export promotion assistance they specialise in: those providing financial services, including export credits and guarantees for exporters (e.g. export-import banks); insurance for exports (e.g. insurance firms with export insurance services); and all other, i.e. general assistance or ‘real’ services [19] for exporters.

This paper focuses only on organisations of the third type, which are referred to as trade promotion organisations or export promotion organisations (EPOs). EPOs in this study are defined to only include organisations with overall responsibility regarding exporters of *any* products. Hence, organisations set up for a specific group of exporters (e.g. food export councils, meat boards, tourism agencies, etc.) are not considered here as EPOs. At the same time, EPOs as organisations with major export promotion responsibilities, often have a broader scope than ‘just’ export promotion, providing for instance general business development services, or undertaking investment promotion beyond their export promotion activities.

EPOs' general export promotion services span from standardised reports and seminars, to customised research and sales leads databases, and through to in-market experience gained from participation in international trade fairs and visits to foreign markets [7]. Typical EPO activities, adapted from [41] are summarised in Table 1.

TABLE 1: EPOs' ACTIVITIES – TYPES OF EP SERVICES

<b>Product and market promotion and development</b>	Export supply studies Identification of export constraints Preparation of product profiles Preparation of market profiles Analysis of opportunities in foreign markets Complete market studies	Purchase of foreign samples Identification of export potential for development Export promotion programmes on a product basis Trade information service Selective dissemination of information
<b>Specialised support services to exporters</b>	Export procedures and documentation Transportation (information and negotiation) Guidance on export financing Marketing Costing and pricing Quality control	Product adaptation Export packaging Publicity Legal matters/ settlements of disputes Direct training Export of services
<b>Activities abroad</b>	Participation in trade fairs Organisation of sales missions	Invitation to foreign buyers Subcontracting of production facilities
<b>Support activities to other entities</b>	Training programmes of specialised schools Pre-shipment financing Export credit insurance Free zones: promotion or administration Motivational campaigns Promotion of tourism Economic studies/ advisory service to the government	Support to small and medium sized enterprises Promotion of joint export mechanisms Quality control and standardisation programmes Export packaging improvement Import rationalisation programmes Preparation of investment profiles Financing of new investment

For the purpose of this paper, export promotion is defined as export-related assistance excluding direct export credit or guarantee and export insurance provided by an EPO and targeted at any firm in the country.

Naturally, there is usually more than one EPO in a country. Besides organisations with national competence, regional or local bodies and small export consultancy firms also provide export promotion services in an institutionalised form. On a broader level, the framework of the International Trade Centre (ITC), co-governed by the United Nations Conference on Trade and Development (UNCTAD) and the General Agreement on Tariffs and Trade (GATT), provides perhaps the most significant international forum for EPOs. UNCTAD and GATT established the ITC in 1983, to create an organisation that undertakes systematic research on EPOs in both developed and developing countries [41]. Importantly, the ITC also represents a forum for national EPOs' cooperation. Other major organisations providing forum for EPOs' collaboration are the European Trade Promotion Organisation's Working Group on Information Processing and the Working Group on Trade Promotion organised by the Asia-Pacific Economic Cooperation. Nevertheless, both of these organisations have a regional scope, as opposed to the ITC's more global reach (including all WTO member countries).

It should be noted that the ITC and other international EPO associations include only the 'leading' EPO of each country. In view of this, they have clearly identified which EPO in a particular country is considered as the actual leading or official EPO. Accordingly, in all national export promotion systems, there is always *one* EPO with a (mostly) clear leading role, stipulated by the ITC and/or other international EPO associations, and most probably acknowledged within the country's export forces as well. This leading or official EPO is usually an organisation with export promotion competence throughout the entire country, having not only home-based, but also foreign operations as well.

EPOs, including the country's leading EPO, can be either government or private organisations. Private forces are able to organise and manage EPOs without significant government involvement. Therefore, the government does not have to directly participate in export promotion provision. Nonetheless, there is a variable extent of government involvement in all countries' national export promotion arrangements. That is to say, even when a country's leading EPO and other significant EPOs are private organisations, the government usually plays a deliberate export promotion role. This government role may range from creating and maintaining the general frameworks for private EPOs' operations, to establishing a deliberate EP policy, but without direct involvement in EPOs' operations, through to direct participation in EPOs' activities.

This paper thus postulates that any particular country's overall export promotion arrangements comprise, firstly, some sort of government involvement in export promotion; second, a leading EPO, which is organised by

either government or private forces; and third, further EPOs, which are also either government or private bodies. All forces participating in export promotion constitute the country's overall *export promotion system*.

## **Background – Gap in the Literature and Objective of the Paper**

Export promotion (EP), even in the fairly narrow interpretation presented above, has attracted a great deal of research attention since the late 1970s. EP research has predominantly involved 'snapshot' studies, that is, EP is investigated at a single point of time; rather than a longitudinal research, where EP and its changes are analysed over time. Both 'snapshot' and longitudinal EP analyses can be grouped into studies that analyse EP (1) from the firm's perspective (micro-level EP research); (2) from the EPO's perspective (mezzo-level EP research); (3) from the national, mostly government point of view (EP research on the macro-level); and (4) studies on the EP system, where it is interpreted in line with this paper's conceptualisation (systemic EP research). Certainly, there are no clear dividing lines between these groups, since most studies have been written considering several levels of EP.

First 'snapshot' studies will be briefly reviewed then studies with more dynamic, longitudinal focus. On the micro-level, research on EP from individual companies' perspective has attempted to answer questions such as *why* EP is needed and *how* it works for firms. In terms of why EP is needed, the numerous positive effects of exporting on companies' overall business performance have been well-researched (see for instance in [46], [16], [79], [4]). Furthermore, the literature on export barriers explains why many companies, despite the attractiveness of exporting, hesitate to start exporting; and also why those already engaged in exporting face serious problems in their future progression along the internationalisation path [10] (also see [49], [10], [64], [79], [21], [46], [5], to name a few). Some studies have addressed specific export barriers in detail, such as the lack of export information ([49], [32], [45], [1], etc.), while also explaining why small and medium sized firms are most exposed to the informational barrier (e.g. [64], [16], [45], [3], [58]).

Another body of literature has placed emphasis on how EP assistance changes companies' export behaviour (see extensive reviews e.g. in [49] and [71]). For instance, studies of this nature have revealed how the different stages of companies' internationalisation ([70], [1], [31], etc.) causes firms to require different EP services over their lifecycle. In addition, other researchers have analysed how EP as a means for companies to build their export networks improves their export performance ([50] or [78], for instance).

In mezzo-level EP research, i.e. when one considers EP through the lenses of the actual EPOs, an interesting aspect that has been widely researched is the scope of EP that EPOs provide (see in [1], [33], [25], [51], [15], [65], [36], to mention a few). Amongst studies dealing with EPOs' actual services, some only focus on one particular EP service, e.g. trade missions (e.g. [60], [61], [69]); others compare different EP services ([79], [36], [44], etc.). Further ways to analyse EPOs' activities is to investigate how they target their EP (for instance in [13], [70], [51]), or how effectively they work (e.g. [47], [70], [15], [31], [53]). Of these, the dimension with the most ambiguity is the effectiveness of EPOs. In other words, there has been a high level of uncertainty and disagreement as to how effective EPOs and their actual EP services are in enhancing companies' exports [63].

Looking at EP from the nation's or government's point of view (on the macro-level), exports' overall benefits for the country (for instance by [2], [4], [16], [17], [50]), as well as the role and objectives of government EP have been commonly examined (e.g. in [18], [25], [1]). A number of studies have focussed on the government's strategy of EP, drawing attention to the fact that 'blind transplantations' of EP strategies across cultures and nations may be undesirable, as an export promotion strategy needs to take into consideration the cultural, legal, and political environment, as well as the stage of economic development [62] (and also see in [43], [9], [12], [14]).

Systemic EP research, unlike research on micro, mezzo and macro-level EP has not been such a widespread area within the 'snapshot' EP research. That is to say, the composition of countries' EP forces, including the relations between the government, the leading EPO and further EPOs has been explored by only a few academics. Research of this nature has been undertaken either by focussing on one particular country (e.g. [20], [39], [66], [6]), or by contrasting several countries' EP systems (e.g. [27; 64]).

Compared to the above literature with 'snapshot' focus, EP changes over time – or longitudinal aspects of EP – has attracted significantly less research attention. For instance, on the micro-level, studies addressing

information barriers from a company perspective tend to emphasise the fact that global changes have caused an increased complexity of information, which has created or aggravated difficulties for companies to compete internationally. The dynamics of firms' potentially deteriorated export performance (due to the growing information barriers) have not been investigated in detail.

Another example of the lack of dynamic studies is in the field of EPO-focussed research (mezzo-level). It has been argued that a significant improvement in EPOs' services has taken place since the 1980s ([13], [27], [21]), including that the availability and diversity of EPOs' services have grown markedly [62]. Nevertheless the milestones of these improvement processes have not been analysed.

Some researchers who have analysed EP on a national or macro-level, focussing on EP provided by the government, have proclaimed the existence of an 'increasing drive' [21] or 'strengthening commitments' [32] for governments for EP, as a consequence of the 'changing landscape' [48] and 'new thinking' [17] in trade policy. Neither the actual steps, nor the evidence for these phenomena have as yet been sufficiently explored.

It should be noted that some macro-level EP research has revealed how regulations imposed by the General Agreement on Tariffs and Trade (GATT) and its successor, the World Trade Organisation (WTO) has limited the governments' room to manoeuvre in EP over the past two decades or so ([37], [17]). The overall conclusion of these studies is nevertheless those governments' EP capabilities, besides some specific areas such as export subsidies, have not been by and large reduced by GATT/WTO protocols.

Overall, the topic of countries' EP systems have not been a well-researched topic in its 'snapshot' form, nonetheless, it has been even more neglected from a longitudinal perspective. This current paper attempts to fill this gap in the literature while investigating how EP systems of selected industrialised countries have changed over the past two decades, with special emphasis placed on the government's changing role in the respective EP systems.

The objective of the paper is to demonstrate that governments have become more involved in EP in general, and more influential within the overall EP system in particular. Hence, there has been a shift toward government EP in countries' EP system. The paper also seeks to find the answer to the question as to why these processes have occurred in the countries investigated in this study.

## **Methodology – The Structure of the Paper**

This paper takes a case study approach, focussing on some of the most developed countries' EP arrangements and their changes since the 1980s. Seringhaus and Rosson [62] have conceptualised industrialised countries into three clusters: country-groups where export promotion is (1) provided predominantly by private forces; (2) provided by both the government and the private sector; and (3) mainly provided by the government. This paper does not focus on the third group (where governments traditionally have had the leading role in export promotion). Rather it analyses the same country examples as Seringhaus and Rosson gave for the first and second groups – namely Austria and Germany in the first, and Sweden, the United Kingdom, the Netherlands and Italy in the second group [62].

It is demonstrated through the case studies that Seringhaus and Rosson's descriptions of the respective countries' overall EP system prevails, however there has been a definite move toward the government's more influential EP role and intervention into the EP system in all of these countries since the 1980s.

The final section of the paper draws conclusions from the phenomena revealed in the case study analysis. This section also describes general economic and export performance of the case study countries, as well as their institutions and some national political and cultural characteristics.

## **Case Studies**

### **Austria**

The Austrian EP system has been described as one that "operates in the private sector" [64], exhibiting a "broad and integrated private sector-led export promotion structure" with minimal government involvement [62]. The major EPO is situated within the framework of the association Federal Economic Chambers (Wirtschaftskammern

Österreichs or WKÖ). In the WKÖ, established in 1848, all Austrian companies' membership is obligatory, which leads to the WKÖ's position of the legal representative of the entire Austrian business community [80]. Established by public law, the WKÖ is exclusively business driven, financially self-sufficient and managed through democratic self-government, making it fully independent from government" [42].

The WKÖ is responsible for providing a number of business-related services for its member companies. It also operates an integral but largely separate foreign division called Austrian Trade (Aussenwirtschaft Österreich or AWO), established in 1945, nearly hundred years later than its parent association the WKÖ. Thus, the AWO is in effect the WKÖ's sub-organisation primarily in charge of EP, described as the "key player in export matters, mainly in non-financial export promotion" [75]. The International Trade Centre (ITC) also reconfirms that AWO of WKÖ is the official EPO in Austria, describing AWO as the only institution responsible for EP [41].

The AWO of WKÖ's home network includes a head office located in Vienna, which has coordinating and controlling role over the AWO's Austrian (regional) as well as foreign-based EP activities. Its regional or provincial network consists of EP experts working at the nine provincial Chambers. These EP officials (at least one at every Chamber) are responsible for providing assistance for Austrian companies' exports. Outside Austria, the AWO of WKÖ's foreign network comprises seventy offices called Foreign Trade Offices (or FTOs) in fifty-two countries around the world.

The AWO of WKÖ's EP activities (within and outside Austria) include information provision on markets and products, counselling for exporting companies, seminars, matchmaking, export clubs, assistance provision regarding companies' participation in fairs and missions and even provision of certain kinds of financial assistance, to mention the major forms.

Besides the AWO of WKÖ, Industry Associations also participate in EP provision. In 2004, there have been approximately a hundred and ten industry-specific trade associations in Austria [42]. Nevertheless, their EP activities are rather limited compared to those of AWO's; including for instance buyer-seller contacts, as well as study visits or trade missions to export markets [64].

#### ***Changes to the Government's Role in the EP System***

As EP has traditionally been left to private forces, the Austrian government has not had a deliberate or strongly expressed EP policy. The two ministries somewhat involved in EP are the Ministry of Foreign Affairs (MFA) and the Ministry of Economy and Labour (MEL). The MFA has participated in EP through foreign diplomatic missions, mainly by cooperating with the FTOs; whereas the MEL, albeit having a foreign economic branch, has not directly participated in EP.

The EP initiative 'Go International', launched by the MEL in 2004, is an important milestone in the EP system's evolution in Austria, indicating that Austrian governments no longer stay away from EP matters [81]. Until the early 2000s, the rather symbolic government program 'Exportoffensive' was the only noteworthy form of government involvement in EP. Through the program 'Go International' however, the government has established a new, more active form of co-operation between government and the private EP providers: an informal 'contract' between the government and the WKÖ resulted in the government providing funding for EP, and established EP guidelines and overall targets which are to be implemented by AWO of WKÖ. It should be remembered however, that the AWO of WKÖ has still remained an independent private EPO, fully responsible for the implementation of EP activities.

This new government approach, which signals a more active engagement with EP matters, has been met with a positive response by the Austrian exporting community. At the same time it has also been perceived by the contemporary Austrian press as a great achievement in Austria's EP (see in [54]).

#### **Germany**

In Germany, the government has traditionally opted for minimal involvement in EP [62], and therefore German exporters have received "surprisingly few governmental export promotion and trade assistance funds" [27]. The philosophy behind this general government approach on EP has been the strong belief in the free enterprise system which has led to the dominant role of the private sector [51]. This philosophy has been also strongly expressed by government forces in the early-2000s: "In our free market economy, the own initiative of companies is to the fore. State promotion of foreign trade cannot replace industry's own efforts" [24].

Accordingly, most EP efforts have been channeled through private organisations [27], mainly through Chambers of Commerce and Industry Associations [8]. In fact, the major force behind EP provision for German companies has been the centrally organised Association of German Chambers of Industry and Commerce (Deutschen Industrie- und Handelskammertages or DIHK), established in 1861. The DIHK is the umbrella organisation for all Germany-based as well as Bilateral Chambers, and because every German company is legally obliged to join a local Chamber, the DIHK in effect represents the entire German industry. The DIHK's dominant role in EP is demonstrated by various government documents, where the DIHK is referred to first as the most significant institution in providing support for companies' internationalisation (see in [24] or [22] for instance).

The DIHK's home network includes eighty-one local Chambers, which all have standardised EP services in place, regulated by the DIHK. At the same time, the DIHK's foreign operations (since 1888), have by 2004 comprised a closely-knit network of approximately one hundred and twenty Bilateral Chambers in more than eighty countries [23]. Bilateral Chambers are considered as "independent institutions which earn a major share of their income themselves through the services they provide" [23]; nonetheless their EP tasks, similarly to Chambers within Germany, are centrally (by the DIHK) defined with great precision. Importantly, Bilateral Chambers provide EP services for members and non-members alike.

EP assistance undertaken by the DIHK's home and foreign networks (that is, by Chambers within and outside Germany) includes information provision on markets and products, export consulting, seminars as well as organisation of missions, fairs and conferences, amongst others.

Besides Chambers, Industry Associations and the Federation of the German Export Trade are perhaps the most significant private organisations that undertake EP activities, e.g. information provision or contact search. Their EP services however are less extensive or centrally organised compared to the Chambers' EP provision. The German Center for Productivity and Innovation (RKW) should also be mentioned, as a nationwide private company with a general business development profile, mainly targeted at small and mid-sized companies. The RKW however has only limited EP focus in their service provision. On the other hand, due to the unique focus on trade fairs in the German economy, there is a single body called the Association of the German Trade Fair Industry (AUMA) the main responsibility of which lies in trade fair matters. Even though the AUMA is not a typical EP organisation, its high importance for German exporters and its activities to mediate trade fair-related EP between government and private companies make AUMA an important component of Germany's overall EP system.

#### ***Changes to the Government's Role in the EP System***

The German government, having promulgated the private sector's supremacy in EP, has not traditionally laid emphasis on creating a coherent EP policy. The Federal Foreign Office (FFO) has been involved in EP through foreign diplomatic missions, but diplomats have mostly had only symbolic EP roles rather than providing actual EP services. The Ministry of Economy and Labour (MEL), however, has been more engaged with EP policy, most notably through its operational body German Office for Foreign Trade (BfAI), and by supporting (mainly through the AUMA) German companies' trade fair participation.

Since the 1990s, there has been a general shift towards the government's more active engagement with EP, which has manifested in several operational changes. Firstly, the government has extended the BfAI's EP responsibilities, so that the BfAI has been transformed from an information-providing agency with limited EP responsibilities, into the leading 'informative-harmonising' body in Germany's overall EP system. This includes that Germany's major export portal, iXPOS, has been launched (in 2001) and maintained by the *government* – rather than the DIHK.

Secondly, the government in 2003 established an initiative with EP focus, which, albeit not having major budgetary implications, has indeed signalled the more proactive stances of German governments. This has been most apparent in two specific areas: the BMWA's aim to strengthen the foreign network of Bilateral Chambers; and to further enhance German companies' participation in international fairs.

It should be noted that some international sources consider the government (through the BfAI) as Germany's major EP organisation (see [41; 42]). Within Germany, the BfAI, since its establishment in 1951, has challenged the leading role of the DIHK as private EP organisation, and the BfAI's EP influence has become stronger since the 1990s. At the same time, outside Germany, Bilateral Chambers' leading role in EP is still evident and has not been challenged by government forces. Overall, the government's increasing engagement with EP is

more significant within Germany, whereas in foreign countries EP assistance is still mainly provided by private rather than government forces.

#### **Sweden**

In Sweden, the EP system is described as one where there has been an “active involvement of the industry in the Government financed export promotion” [67], constituting a form of organised collaboration where government shares EP responsibilities and intensely cooperates with private EP providers [62]. In other words, the government has a leading role in EP, nonetheless a “major responsibility for Swedish trade [promotion] rests with the Swedish firms” [66].

The official leading EP organisation is the Swedish Trade Council (STC). The STC is co-governed and co-owned by two principals, the government through the Ministry for Foreign Affairs, and private forces through the Confederation of Swedish Enterprise. In its current organisational form, the STC has operated since 1972, and has been funded by both government and private contributions.

The STC headquarters in Stockholm, and has a regional network of twenty (recently established) one-stop-shop offices within Sweden. At the same time, the STC operates a long-existing foreign network, including forty-eight offices in forty countries [72]. The STC’s major EP services can be summarised as export information, e.g. about Swedish exports and market information, identification of business opportunities and conveying them to companies, advice where export techniques are concerned, promotional activities; export consulting, covering tailor-made solutions for setting up business in international markets; and export programmes, which focus on networking between companies or on companies that are new to the export market [73].

In the overall EP system, the two major private forces are the Confederation of Swedish Enterprise and the Swedish Chambers of Commerce. EP responsibilities of the Confederation of Swedish Enterprise are integrated into the leading Dutch EPO, as it is one of the co-owners of the STC. At the same time, the private Chambers of Commerce also constitutes major forces in EP. Chambers have an umbrella organisation, the Association of Swedish Commerce and Industry, and their major EP services are limited but standardised (see in [35]).

#### ***Changes to the Government’s Role in the EP System***

Swedish government EP has been administered by the Ministry of Foreign Affairs (MFA), the Ministry of Industry, Employment and Communication (MIEC), as well as organisations attached to the MIEC, i.e. Almi and Nutek. EP involvement of the MFA has been especially significant since the 1972 establishment of the STC (which the MFA co-governs). Besides, the MFA has undertaken some EP activities through diplomatic missions, albeit this has been subordinated to the STC. The MIEC, as well as Almi and Nutek, have participated in general business development, which has included EP provision. EP activities across these government bodies have traditionally been uncoordinated, and the government is yet to start harmonising its EP policy structure – apart from a proposed increase in consultation through the STC. Therefore, the overall government strategy for EP policy appears to be a ‘no-strategy’ approach [66].

On the operational level of EP, however, the government has since the 1990s implemented a number of significant changes. First, government-private forces have deepened their close affiliations – institutionalised in 1972 with the establishment of STC, through the government’s legal assignment of Sweden-based Chambers with EP responsibilities in 1990 and through including them in the STC’s operations, when in 1995 the STC was expanded with a regional network. At the same time, Bilateral Chambers have traditionally worked closely but independently from the STC’s foreign operations.

Second, not only Chambers, but also Almi’s operations have become better coordinated within the overall EP system, as Almi’s EP activities have become clarified and at the same time integrated into the STC-network in 1995. This has signified the government’s intention to reduce duplications within its own EP activities. Altogether, by means of the three-pillar-based Export Centres (constituted by Chambers, Almi posts and the STC itself), the government has attempted to supply a healthy one-stop-shop environment for the export efforts of enterprises [67].

The third change has been the government’s increasing control over the STC’s activities. Since 1990, the government has not just simply allocated funds for STC’s free of charge services, but it has also set up guidelines and requirements for the STC. Despite the significant decline in the extent of government funding for the STC, the government has become more interventionist in the STC’s operations.

Overall, in Sweden, coordination across EP organisations has not increased structurally on the government policy level. Nonetheless, the government has indeed instigated better cooperation on the operational level by increasing its involvement in Sweden's overall EP system.

#### **The United Kingdom**

In the UK, EP is provided by both the government and the private sector under an “[o]rganized partnership approach with extensive *sharing* and *cooperation*”, with the government dominating the system ([62], emphasis added). Sharing aspects of government-private partnership refer to the fact that the government makes “extensive use of private [forces] for the delivery of [its own EP] programs” [7]. At the same time, cooperation between government and private forces in the field of EP can also be described as a ‘grass-roots’ system that “integrates suggestions and monitors changes from organizations and individuals in close contact with occurrences in the field” [27].

The body that has leading role and main responsibility for the provision of EP assistance is the UK Trade & Investment (UKTI). UKTI as a government agency falls under the dual responsibility of the Ministers for the Department of Trade and Industry (DTI) and the Foreign and Commonwealth Office (FCO), and is entirely funded by the government (see [42] or [7]).

UKTI's onshore network consists of the London headquarter and forty-five national branch offices, whereas outside the UK around two-hundred commercial posts at diplomatic missions constitute UKTI's overseas network. UKTI's EP services include information provision on countries, companies and products, database of local offices that offer assistance to exporters, export sales leads, tailored market research, trade fair and trade mission sponsorship, grants to cover companies' export marketing research costs and costs stemming from export difficulties faced with due to foreign culture and language in the destination country, amongst others.

Major private organisations that have participated in EP provision include Business Link hubs and Chambers of Commerce (with optional membership), which are organised under the British Chambers of Commerce (BCC); as well as Trade Associations. Further private organisations, such as Export Clubs, the Confederation of British Industry (CBI) and the Institute of Export are also involved in certain aspects of EP. Underlining this, UKTI sources refer to these latter organisations as the government's partners when *developing*, whereas the former ones are cooperating with the government when *delivering* its EP services [74]. It should be noted that the Export Clubs, the CBI and the Institute of Export do not get directly involved in the actual provision of EP services.

#### ***Changes to the Government's Role in the EP System***

On the structural or policy level, the UK government has made extensive attempts to harmonise its traditionally divided onshore and offshore EP activities since the late 1980s. As a result, EP operations inside the UK, operated by the DTI; and those outside the UK, organised by the FCO through diplomatic missions, have become unified by creating the organisation UKTI (established in 2000). UKTI is thus the first single government body in the UK which is jointly in charge of and has integral targets for both onshore and offshore EP.

In parallel with these processes, the government has also introduced operational changes to the UK's overall EP system, including reforming both its own (government) EP networks as well as private EP providers' operations. Within the UK, links between government and private EP providers have become tighter. Most notably, the government has become more engaged and more authoritative with EP activities of Business Links and Chambers of Commerce (which are greatly overlapping). The outcomes of this process have been that the government has delegated more EP tasks to the Chambers (since 1988 and 1996); and that by the 2000s, the government has developed a more integral, but still privately managed home network for EP, through Business Link offices.

Outside the UK, the government has significantly strengthened its EP forces. Most notably, offshore government EP services have become more precisely defined and highly centralised, with the number of diplomats involved in EP trending up, and their funds relatively increasing.

These processes imply that UK government forces, having traditionally dominated the country's EP system while also assigning private forces to deliver EP services on their behalf, have become even more hands-on in EP. This has resulted in an EP system which is more coordinated and controlled by the government.

#### **The Netherlands**

The Dutch EP system is characterised by parallel-existing government and private services, where the government's role is central [41]. On the operational level, beyond the government's activities, EP services have been largely

carried out by independent organizations [62]. In areas where government and independent private EP bodies have provided similar EP services, they often competed with each other – causing potential clashes between government and private forces. Nonetheless, cooperation rather than clashes between government and private EP organisations has been more representative in the Dutch EP arrangements [20].

The official leading Dutch EP organisation is the Netherlands Agency for International Business and Cooperation (abbreviated as EVD, based upon its original Dutch name, Economische Voorlichtingsdienst). The EVD legally constitutes a part of the Ministry of Economic Affairs and is thus entirely funded by the government (see [28]). It should be noted that besides the EVD that has operated since 1936, the Centre for Promotion of Imports from Developing Countries (CBI), an agency of the Ministry of Foreign Affairs, has also worked with an EP focus since 1971 [52]. Nonetheless, as the CBI does not target Dutch companies, it is not considered as a major EP body for the purpose of this research.

The EVD has a central office located in The Hague, and has not traditionally had formal integral networks either within or outside the Netherlands. Since the early 2000s, however, the EVD has managed foreign operations, through the Netherlands Business Support Offices (NBSOs). The EVD's activities include export information provision, such as export data published on the web, export newsletters, tailor-made export services; matchmaking (i.e. bringing together Dutch suppliers and potential foreign buyers), including managing data bases, organising trade missions, amongst others; and general 'Holland promotion', for example through trade fairs, special events, etc. (see in [28]).

Of the major private EP providers, Netherlands Chambers of Commerce, where all Dutch companies' membership is obligatory; and Bilateral Chambers of Commerce Abroad should be mentioned in the first place. They do not have a strong umbrella organisation, however, EP services, especially in the case of Netherlands-based Chambers are largely standardised. Other private organisations with EP responsibilities include the Federation for Netherlands Export (Fenedex), the Netherlands Center for Trade Development (NCH) and the Netherlands Export Consortia (NEC). Traditionally, Chambers (both within and outside the Netherlands) have been the best-known and most widely-used private organisations for EP [20], nonetheless the NCH and Fenedex have also been significant.

#### ***Changes to the Government's Role in the EP System***

In the Netherlands, the ministry mainly in charge of EP is the MEA (as the parent organisation for the EVD), with its EP responsibilities complemented by those of the MFA. A great level of EP policy coordination between the MEA and the MFA has taken place since the 1950s, resulting in EP activities of the MFA-operated foreign diplomatic missions have becoming integrated into and controlled by the MEA's central EP operations (at the EVD's The Hague-based headquarter). Therefore, the MEA has not been compelled to open foreign (EVD) posts for EP.

The EP policy equilibrium between the MEA and the MFA was underlined by the 2003 government decision to reform the information system across the two Ministries and the EVD, by introducing the Hermes intranet system. This has caused the EVD to become an organisation with official 'clearing-house' and coordination responsibilities regarding EP-related information exchange between the MEA and the MFA. Overall, by the early 2000s, the government has cemented its highly integrated policy approach towards EP, making it very unlikely that EP policy becomes fragmented across the MEA and the MFA in the foreseeable future.

On the operational level, the mixed government-private EP system has shifted towards more government involvement since the 1980s. This shift has manifested in the EVD's significant enhancement, including the extension of its operational roles as well as creating foreign EVD posts to add to diplomatic missions' EP work; and the tightening government-private EP relations under government leadership.

The EVD's organisational evolution from passive information provider to "active export promoter" [20] has been apparent since the 1980s, with its main manifestations being the EVD's increasing EP responsibilities with the inclusion of tailor-made export consulting, matchmaking, specific country promotion programmes, etc., as well as the EVD's merger with other government bodies with internationalisation focus. In addition, the EVD has also been strengthened by the government's establishing foreign EVD offices since 1997. Creation of foreign EVD posts has taken place despite the long-established MEA-MFA agreement that diplomatic missions constitute a sufficient foreign network to support the EVD's EP activities (and thus no separate EVD foreign representations are needed).

Bearing this in mind, as well as that private forces of Bilateral Chambers have traditionally constituted a strong foreign network for Dutch EP, the fact that the government has indeed decided to open foreign EVD posts signals a definite increase in the government's commitment to foreign EP arrangements.

Government cooperation with Chambers and the NCH has been intensified remarkably. This has resulted in that, on the one hand, Netherlands-based Chambers have by the early 2000s become considered as the EVD's integral home network. On the other hand, almost every NCH office has had government officials participating in their EP activities, causing that the NCH has been referred to as a 'government agency', despite its fully private budgets and decision making capacity (see in [30]). In addition, establishing the Dutch Trade Board (DTB) in 2004, the government has intended to involve all major EP providers (the organisations of Fenedex and NEC as well, beyond the more traditional government allies of the Chambers Association and the NCH) in the planning and coordinating processes of the Dutch EP system. Thereby the government has not only aimed at improving the transparency and efficiency of the country's overall EP arrangements, but has also clearly expressed its own leading role in the system.

To conclude, the most significant changes to Dutch EP arrangements have occurred on the operational rather than the structural policy level. This is due to the fact that EP policy has traditionally been well-harmonised in the Netherlands, thus it has not been necessary for the government to carry out reforms in this respect. On the other hand, the government has recently intensified its involvement in EP, by strengthening its own EPO's influence at the expense of other EP provider organisations, both within and outside the Netherlands; and by more closely cooperating with and coordinating private EP providers' activities.

#### **Italy**

In Italy, government and private forces have traditionally "carried out own separate [EP] activities" [62], constituting a symbiotic EP system where the government dominates. Nonetheless, there have not been a great deal of positive synergies gained from this symbiosis, as private EP providers have not been well integrated with the Italian government [27]. In addition, EP policies and mechanisms between government and private forces have been criticised for being "largely inadequate in terms of [...] coherence, homogeneity and functionality" [6].

The main Italian EPO has been the Italian Institute for Foreign Trade (Istituto Nazionale per il Commercio Estero or ICE). ICE as a statutory organisation responsible to the Ministry of Industry and Trade and was established in 1926 [42]. Funding for ICE is dominantly, at around eighty per cent, by the government, whereas the remaining twenty per cent of ICE's budget stems from the private sector in the forms of charges to customers for services as well as subscription and membership fees [40].

ICE's headquarter is in Rome, and operates through sixteen (recently established) national offices across Italy; whereas ICE's foreign networks include hundred-and-four offices abroad. ICE's major EP services (provided through its onshore and offshore networks) are divided into four groups: information, promotion, multilateral cooperation and training services; ranging from market analysis, through partner identification and corporate promotion, to technical and operational assistance.

Besides ICE, other major actors participating in EP provision include the organisations of Chambers of Commerce (where all Italian companies' membership is compulsory), Trade and Industry Associations and Export Consortia. These organisations also play a significant role in EP provision, especially Chambers and Export Consortia (see in [6] and [76]). However, EP services of individual Chambers or Consortia are not standardised, therefore they do not constitute as homogenous organisations as for instance ICE's networks.

#### ***Changes to the Government's Role in the EP System***

The Italian government has implemented structural changes to EP policy by improving coordination between ministries involved with EP matters; and operational changes regarding both government and private EP providers' services, including enhancing the government's own operations, increasing government intervention into private EP providers' activities and better coordinate between the two.

The Ministry of Foreign Trade (MFT) and the Ministry of Industry, Trade and Crafts (MITC), as well as the Ministry of Foreign Affairs (MFA) have traditionally undertaken separate and un-coordinated EP activities, which has led to a highly fragmented overall policy for EP. The MFT's involvement in EP has been most significant by virtue of the fact that the MFT is the steering body behind the ICE. At the same time, the MITC has undertaken EP activities through its general business development bodies, such as the Institute for Industrial

Promotion (IPI), while the MFA has also been engaged with EP, mainly through diplomatic missions' 'Italy promotion' activities.

Bringing about structural changes to EP policy have been considered vital since the late 1990s, and thus the government has initiated an extensive harmonisation process, signalled by the 1999 creation of 'super-ministry' Ministry of Productive Activities (involving the MFT and MITC), and the 2003 establishment of the National Coordination Body for Foreign Economic Policy.

On the operational level, the government's shifting approach on its own EP activities has been apparent in that ICE, after a trial of changing it into a semi-private-like organisation, became operated under full government control again in 1997. Moreover, the government has intended to take better advantage of EP capacities at Italy's diplomatic missions, and thus throughout the 1990s strengthened the EP support undertaken by commercial diplomats, while harmonising it with ICE's foreign operations.

On the other hand, the government has also carried out changes to the overall Italian EP system by increasing its own authority in private EP providers' activities – mainly with regards to Chambers, when the government's regulative power over EP operations of Bilateral Chambers was extended in 1993. EP activities of the Export Consortia started to be regulated by the government in 1989 and 1991. The government has also intensified cooperation between government and private forces in EP. Major manifestations of the improved cooperation have been the establishment of Consultative Committee (1997); Programmatic Agreements (since 2000); creation of one-stop-shops for internationalisation both within Italy and abroad (from 2003); and developing common information network between government and private EP providers in 2004.

Overall, the most crucial change to the EP system in Italy has been the government's attempt to resolve problems caused by the fragmented nature of the overall Italian EP system. Government EP operations (mainly through ICE and EP activities of diplomatic networks), accompanied by a number of private EP providers, previously constituted a system of "useless duplication and frequent overlapping" (Bonvicini et al 1998). As the government has increasingly perceived EP as an important policy area, and has established a more harmonised EP policy, the obvious disadvantages of the parallel EP structures between government and private EP providers became increasingly intolerable.

## Conclusions

The major steps of the government's increasing engagement with EP are summarised in Table 2.

Comparing some of the fundamental constant (or slowly changing) differences across the investigated countries' EP systems; the first remark to make is that these countries have different institutional systems. Adapting Hall and Soskice's framework (see in [34]), the case study countries can be grouped by different values of capitalism. The UK is the only country with liberal market economy institutional arrangements; Austria, Germany, the Netherlands and Sweden are coordinated market economies; whereas Italy cannot be clearly grouped into either. General characteristics of systemic arrangements in liberal market economies are described as "firms coordinating their activities primarily via hierarchies and competitive market arrangements" as opposed to the coordinated market economies', where "firms depend more heavily on non-market relationships to coordinate their endeavours with other actors and to construct their core competencies" [34]. These fundamental differences have contributed to some of the traditional differences across the investigated countries' EP systems.

Another difference, overlapping with the above general institutional reasons, is the framework of Chambers of Commerce. Four of the investigated countries, namely Austria, Germany, the Netherlands and Italy, have Chambers with public law status where companies' membership is obligatory [29]. These Chambers are unique in the sense that they represent both public and government as well as private interests within their internal structures [77]. In theory, it appears relatively easy and cost-effective to organise an integral EPO within the existing framework of Chambers networks (both in their home and foreign countries). Of the four countries, in Austria (clearly) and Germany (less clearly) the leading EPO has operated through the Chambers system. In the Netherlands and Italy, however, the government has developed its own EPO, with both home and foreign operations.

TABLE 2: SUMMARY OF CASE STUDY FINDINGS – BY COUNTRIES

	AUSTRIA	GERMANY	SWEDEN	UK	THE NETHERLANDS	ITALY
<b>THE EP SYSTEM</b>						
Major EPO	AWO of WKÖ (private org.) - AWO (est. 1946) is a separate org. within the Chambers' framework (est. 1848), with a home-based headquarter and strong foreign network for EP - All companies' membership is obligatory in Austria-based Chambers	DIHK (private org.) - Germany-based Chambers (est. 1861) and Bilateral Chambers (est. 1888) with clear and standardized EP responsibilities - All companies' membership is obligatory in home-based Chambers	STC (government-private org. since 1972) - Traditionally rather foreign-based, with 1 home-based headquarter	UKTI (government org.) - Foreign operations within the diplomatic missions' organisation, home operations traditionally run by the DTI - Est. in 2000 in its current organisational form	EVD (government org.) - Traditionally 1 home-based headquarter (est. in 1936), strongly cooperating with diplomatic missions	ICE (government org.) - Traditionally rather foreign-based, with 1 home-based headquarter (est. in 1926)
Other major organizations involved in EP	- Private, industry-specific trade associations	- The government body BfAI - Industry Associations - Federation of the German Export Trade - RKW - AUMA	- Private Chambers, where membership is <i>not</i> obligatory	- Private Chambers, where membership is <i>not</i> obligatory - Private trade associations	- Chambers (with obligatory membership) - Private NCH - Private Fenedex - Private NEC	- Chambers (with obligatory membership) - Private Trade and Industry Associations - Private Export Consortia
<b>THE GOVERNMENT'S ROLE IN THE EP SYSTEM AND ITS CHANGES</b>						
Ministries/ gov. departments traditionally involved in EP	- MFA: cooperates with foreign AWO posts, through diplomatic missions - MEL: operates a foreign economic branch, however traditionally has not had a specific EP policy	- FFO: diplomatic missions' involvement is mainly only representative rather than actively participating in EP - MEL: more significant involvement in EP, mainly through supporting trade fair participation	- MFA: its involvement has been significant since the 1972 formation of the STC, in which the MFA is co-owner; additionally, involvement through diplomatic missions - MIEC: EP involvement through its business development bodies	- FCO: in charge of offshore EP through diplomatic missions - DTI: in charge of onshore EP, traditionally through its headquarter office for EP	- MEA: responsible for steering the EVD - MFA: diplomatic missions' strong EP cooperation with the EVD	- MFT: responsible for steering the ICE - MITC: EP involvement through general business development bodies - MFA: involved in EP through diplomatic missions
Overall gov. policy for EP and changes	- As EP provision is mainly left to private forces → the government does not get significantly involved in EP matters, even on the policy level	- EP is handled mainly by the MEL, through the BfAI; however, this does not involve developing a strong EP policy, as EP provision is dominantly left to private forces	- No apparent government effort to better coordinate EP policies of the two Ministries to create one coherent, overall EP policy	- The two Ministries' EP policies have recently become fully harmonized → the result is the creation of UKTI (2000)	- Traditionally good harmonization of the two Ministries' EP policies - EP collaboration between the two Ministries have become even closer with a common information system (2003)	- Strong government view that EP policy harmonization across all participating government bodies is vital → deliberate coordinating efforts since late 1990s
Operational changes to the overall EP system	- The government started to initiate EP programmes (1998, 2004), while also providing guidelines and targets for the AWO of WKÖ's EP operations → - The AWO of WKÖ, although still independent, has become closer linked to government forces	- The government has extended the BfAI's responsibilities (1990s) → the government has become the 'information-ruler' in the EP system - The government has established initiatives (2003) to enhance trade fair participation and boost AHKs	- The government legally assigned Chambers with EP responsibilities (1990) - The government has included Chambers into the STC's home network, Export Centers (1995) - Increasing cooperation between the STC and Almi (a MIEC agency), through joint participation in the Export Centers (since 1995) - Government's more direct intervention into the STC's overall operation (since 1990)	- The government has intensified its EP ties with Chambers through delegating more EP tasks to Chambers (1988, 1996) - EP activities of Business Link private offices (mainly run by Chambers) have become more directly regulated by the DTI (2000) - UKTI's foreign operations (undertaken by commercial diplomats at diplomatic missions) have been enhanced (since late 1990s)	- The government has expanded the EVD's roles (since 1980s), as well as merged the EVD with other internationalisation agencies (2004) - The government has created foreign EVD posts, to establish an integral EVD network at strategically important markets - Chambers have traditionally cooperated with the EVD, but this has been even more intensified through a covenant (1990) and common campaigns (2003-2004) - The government has intensified its EP cooperation with the NCH (early 2000s) - The government has also intensified its cooperation with the Fenedex and the NEC, through establishing the DTB (2004)	- The government has strengthened its control over the ICE (1997) - Diplomatic missions' EP activities have been enhanced (1990s) - The government extended its regulative power over Bilateral Chambers' EP activities (1993) - The government started to intervene into Export Consortia's EP (1989, 1991) - Government initiatives to improve cooperation across all EP providers: establishing the Consultative Committee (1997); Programmatic Agreements (2000); internationalisation one-stop-shops both in Italy and abroad (from 2003); common information network (2004)

This signals that governments in the latter two countries have traditionally had more proactive stances on direct intervention in EP.

Cultural differences can also explain some aspects of the variation of EP systems. Within the ‘culture’ of exporting, companies’ motivations to export or the lack of them are worth considering. Exporting and especially, starting to export is always associated with a certain degree of uncertainty. Therefore, cultural dimensions can be traced back to firms’ ‘avoidance of uncertainty’ [38]. The level of uncertainty avoidance varies to a great extent across the case study countries, which is demonstrated in Figure 1<sup>(1)</sup>. Due to space limitation, no detailed analysis is provided here. Nonetheless, uncertainty avoidance, being correlated with companies’ perceived need for EP, appears to contribute to the differences across the investigated countries’ EP systems.

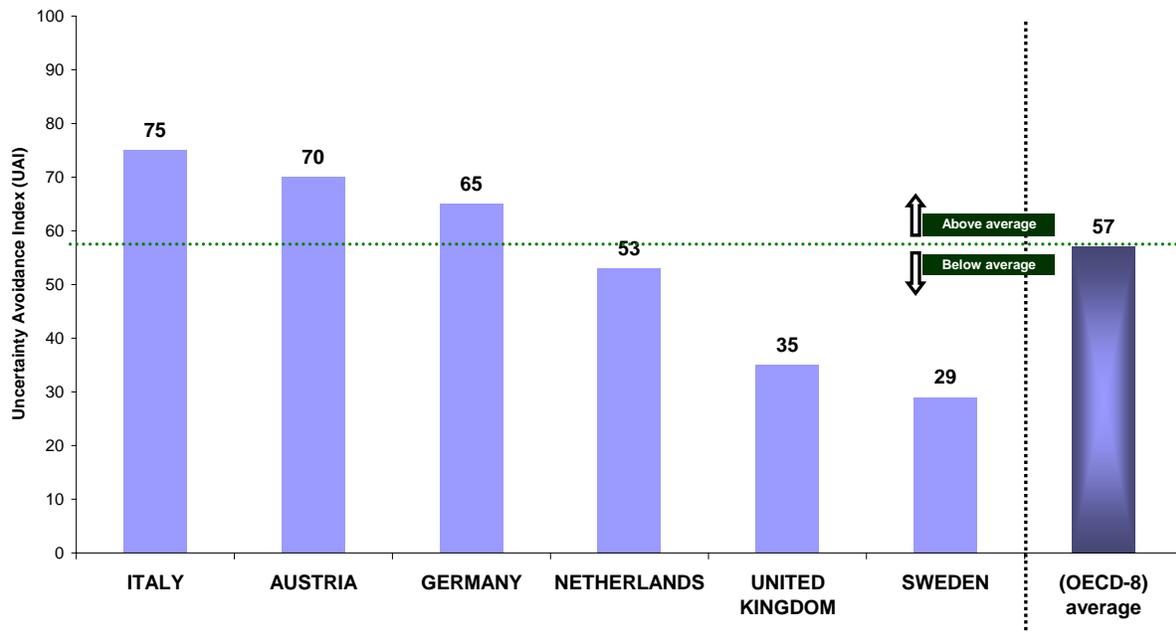

FIG. 1: CASE STUDY COUNTRIES’ NATIONAL CULTURES – THE ‘UNCERTAINTY AVOIDANCE’ ASPECT  
Source: [38]

These differences partly account for the traditionally large variation in the investigated countries’ EP systems. However, they do not explain why *all* case studies exhibit a definite shift toward *more* government involvement in the EP system. Seeking the rationale behind this common phenomenon, other, less constant factors with significant impact on a country’s EP system are considered. One of the most obvious factors is perhaps the countries’ export performance, as poor macro-economic and export indicators can lead governments to intensify their EP policies.

Figures 2-4 present some indicators on the case study countries’ general economic performance, export growth and trade balance. First, Figure 2 establishes comparability across the case study countries from a general economic perspective, as neither the past decade’s gross domestic product (GDP) growth rates, nor recent GDP and GDP/capita rankings of the case study countries exhibit a great deal of variation. In other words, all these countries perform well by overall economic standards.

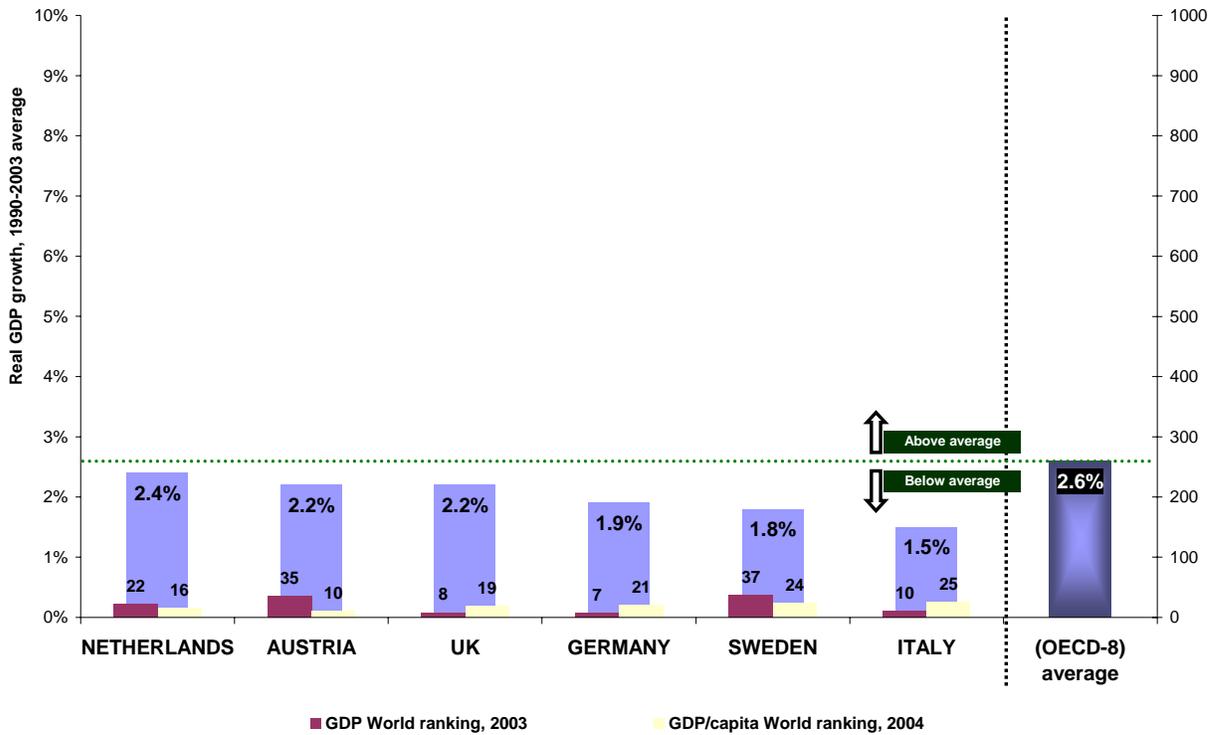

FIG. 2: CASE STUDY COUNTRIES' GENERAL ECONOMIC PERFORMANCE – GDP GROWTH  
 Source: [55] and [11]

At the same time, the case study countries show slightly more variation in their exports growth. As Figure 3 shows, Sweden, Germany and Austria, as well as the Netherlands to a lesser extent, exhibit close to average export growth. The UK and Italy, on the other hand have slightly slower export growth, ranking amongst OECD countries with the lowest exports/GDP level.

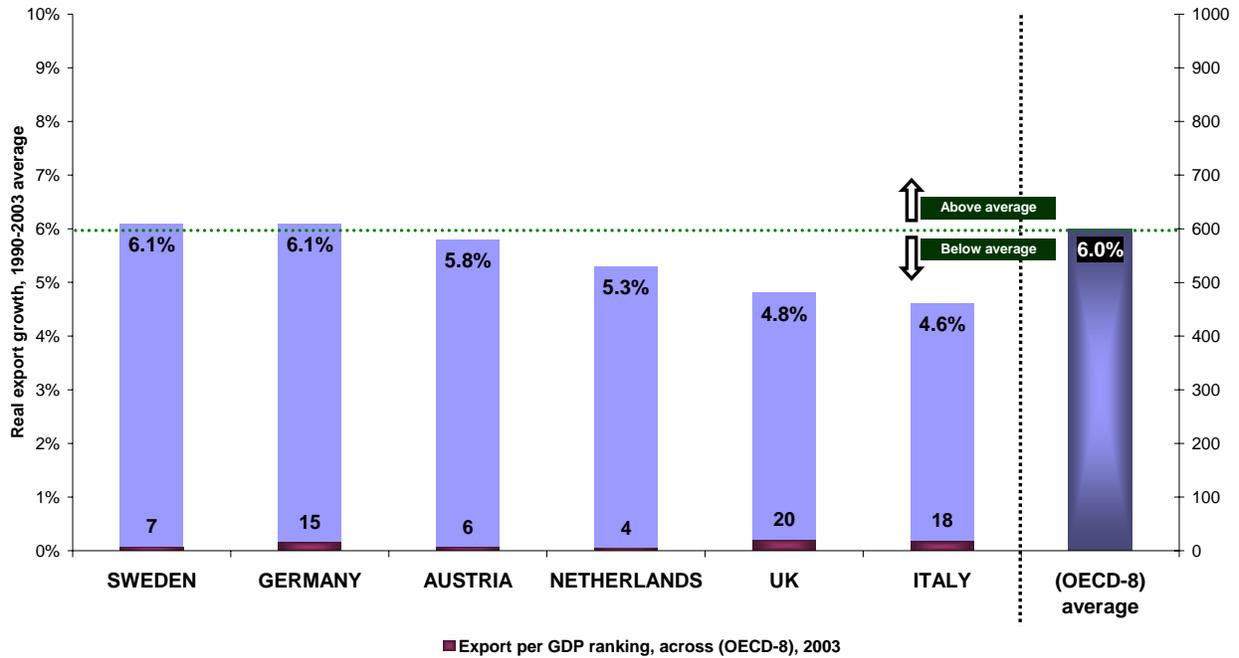

FIG. 3: CASE STUDY COUNTRIES' EXPORT PERFORMANCE – EXPORT GROWTH  
 Source: [56] and [68]

Figure 4 provides the indicators which perhaps play the most important role in government decisions on export policy that is the trade balance indicators (i.e. the country's overall exports minus imports, expressed as the proportion of the country's GDP). As it is demonstrated, only Sweden and the Netherlands have had very 'healthy' trade balance indicators, while Germany and especially Austria and the UK have exhibited strong deficits in their trade balance over the last decade.

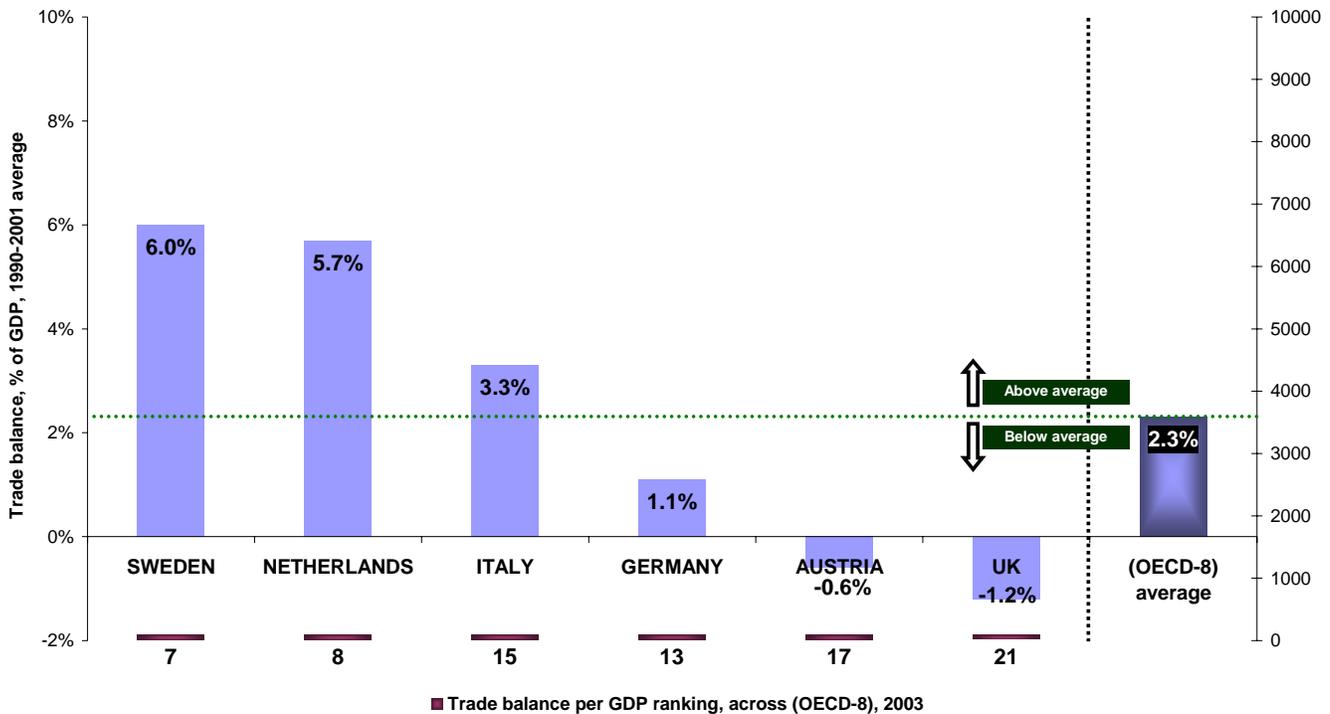

FIG. 4: CASE STUDY COUNTRIES' TRADE BALANCE SITUATION  
Source: [57]

Overall, the most significant export-related differences lie in the investigated countries' trade balance indicators. The UK and Austria's poor trade balance situation has certainly put pressure on governments in these countries to improve their export policies, and perhaps intensify their EP engagements. In Sweden and the Netherlands, however, due to their healthy trade balance indicators, this pressure has not been present.

There are other factors that potentially cause governments to become more active in EP, for instance domestic political groups, the companies themselves, or other country-specific factors. However, these significantly vary across countries. Therefore it is unlikely that domestic factors influencing governments' engagement with EP would bring about similar tendencies across the case study countries' EP systems.

In conclusion, the investigated countries exhibit great variation in terms of their institutional systems, company-organisation methods (i.e. the Chambers system), export culture and export performance (expressed by trade balance indicators). Nevertheless, they all have experienced an increase in government involvement within their EP systems. Hence, the shift towards the government's EP influence has occurred irrespective of *domestic* factors influencing the EP system. This indicates that factors that have caused EP systems to undergo analogous changes have come from the *global* arena.

<sup>1</sup> In Figures 1-4, data on the case study countries is compared to the average of twenty-two OECD countries (which includes the case study countries as well). These countries, referred to as (OECD-8) include all OECD members, excluding those which are not amongst the world's top fifty countries in terms of their GDP ranking, namely the Czech Republic, Hungary, Mexico, Poland, Slovakia and Turkey [11]. In addition, Luxembourg and Iceland have been omitted, due to their small size. Hence, (OECD-8) refers to the following countries: Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Japan, Korea, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, United Kingdom, and United States.

## **Regional Financial Arrangements in Pacific Asia**

### **Abstract**

Globalization, if properly managed, may help push some developing countries into modernity and affluence. But as the Asian financial crisis of 1997-98 suggests, embracing global financial markets can also be highly dangerous and costly. The severity and contagiousness of the crisis underscored the need for reforming the international financial system. Numerous proposals have been put forward, but little progress has been made. As long as the structural problems on the supply side of international capital flows are not addressed, the emerging market economies and developing countries will remain as vulnerable to future speculative attacks on their currencies and financial crises as they were before the Asian crisis. Given this reality, emerging market economies and developing countries may have no choice but to develop their own defense mechanism. In light of the Asian financial crisis, this paper examines the recent debate for establishing regional financial arrangements such as the “Asian Monetary Fund” and the Chiang Mai Initiative as a defense mechanism against speculative attacks on currencies in the future.

### **Introduction**

The Asian financial crisis has raised a series of questions regarding international financial architecture, including the governance of the international financial system and exchange rate regimes. Unlike the two previous financial crises in the first half of the 1990s—the ERM crisis of 1992 and the Mexican crisis of 1994-95, the Asian crisis of 1997-98 provided a wake-up call to the international financial community. The severity and contagiousness of the crisis underscored the importance of renewed interests in reforming the international financial architecture, and numerous proposals have been advanced and debated. The G-7-led reform, however, ignores the problems of the supply side of international finance, and concentrates its efforts on reforming the financial and corporate sectors of developing countries. From the perspective of developing countries, therefore, it appears that they will remain vulnerable to future financial crises even if they faithfully carry out the kinds of structural reform recommended by the IMF and the World Bank.

In light of the Asian financial crisis, this paper examines a few select issues dealing with: (1) the role of international financial institutions such as the IMF, (2) the choice of an appropriate exchange rate regime for the emerging market economies (EMEs) and developing or less developed countries (LDCs), (3) the impact of financial liberalization and capital controls, and (4) the arguments for and against for establishing regional financial arrangements such as the “Asian Monetary Fund” as a defense mechanism against speculative attacks on currencies. Each of these issues will be examined and discussed from the perspective of the East and Southeast Asian EMEs and LDCs.

### **Financial Market Liberalization in Developing Countries**

Since the early 1990s, financial markets in the world have been integrating rapidly. This has led to surges in private capital flows to developing countries and other EMEs. Major advances in information technology have reduced transaction costs. Foreign investors saw higher long-term rates of return and the new opportunities for risk diversification in developing countries. At the same time, ongoing economic reforms and financial liberalization have made developing countries more attractive to overseas investors.

Outstanding economic performance of the Asian “miracle economies” in the late 80s and the early 90s attracted a surge in private capital into these emerging economies. That surge in capital inflows helped fuel the increase in the bank credit-financed investment boom. At the same time, however, the surge in private foreign

capital made these economies extremely vulnerable to a financial panic. According to the Bank for International Settlements (BIS), the total net private capital flows into the Asian emerging markets during 1994-96 amounted to a whopping \$184 billion. In 1996 alone, there was a record capital inflow of \$93 billion into Thailand, Malaysia, Indonesia, the Philippines and Korea (hereafter called the Asian 5). With the onset of the crisis in the second half of 1997, markets overreacted and international investors panicked. Off they ran with \$105 billion! This reversal was equivalent to 11 percent of the combined GDP of the Asian 5. This was the greatest reversal of private capital flows ever recorded in the world economy, and represents “the most significant geo-financial adjustment to date in the relatively new era of globally integrated capital markets” (Makin 1999, p. 408).

#### **The East Asian Meltdown**

It was this reversal of capital flows that precipitated the Asian currency crisis, eventually pushing “miracle” economies into a dramatic financial meltdown with serious economic, social and political consequences. Grenville (1998, p. 13) sums up the story of the “Asian meltdown”:

Large capital inflows led more-or-less inevitably, to excessive credit growth and growth of the financial sector, because it was not possible to sterilise them fully. The large flows meant, also, that there was easy funding available for projects (both good and bad), and that asset prices were bid up. Similarly, the large capital flows made it difficult to raise interest rates higher (they were already quite high), for fear of inducing even more capital inflow. High domestic interest rates, at the same time, persuaded many borrowers to take the risk of tapping into attractively lower foreign currency-denominated borrowing. Further, with quasi-fixed exchange rate regimes in these countries, there was little incentive for institutions borrowing in foreign currencies to hedge their debt. These issues should have been recognised as sources of vulnerability, but the focus was on growth, without enough concern about resilience in the face of *variance* in growth.

The crucial combination was the large volatile foreign capital flows and fragile financial systems. These two elements, in combination, made the Asian emerging market economies extremely vulnerable to changes in investor *confidence*. Thus, “In a matter of just a few months, the Asian economies went from being the darlings of the investment community to being virtual pariahs... Suddenly, Asia’s leaders could do no right. The money fled.” (Sachs 1998).

#### **The International Financial Architecture**

The Asian financial crisis has rekindled the debate on the role of international institutions, especially that of the IMF, and has raised a series of questions regarding international financial architecture, including the governance of the international financial system and exchange rate regimes. The Asian crisis has shown that there are serious systematic problems inherent with the current global monetary and financial arrangements. It has increased our awareness of the need for global governance of international finance so as to prevent the recurrence of similar crises in the future.

One of the main problems with the current international financial system is that there is no governance of international financial transactions similar to that found in the area of international trade. The present structure is designed to discipline international borrowers rather than international lenders. International institutions and arrangements that we now have are designed to manage rather than to prevent crisis. With ever-rapidly increasing degree of financial integration taking place in the world economy, the global impact of interest and exchange rate policies has become much more important than before. There is no effective surveillance mechanism in these areas. There is also a dire need for the orderly workouts based upon rules and bankruptcy procedures that govern international debtor-creditor relations. All countries in the international community need to focus their attention to these issues as part of their efforts towards improving the governance of international finance.

#### **Alternative Foreign Exchange Rate Regimes for Developing Countries**

The recent Asian crisis has shown that in the world with increasing degree of capital mobility, the traditional means of fixing the exchange rate do not work. The goals of exchange rate stability and capital mobility are simply incompatible as can be explained in terms of the so-called “open economy trilemma.”<sup>1</sup> Countries now face two crucial questions: One is the question of choosing appropriate exchange rate regimes, and how flexible they should be. The other is the question of liberalizing international capital flows, and how rapid it should be.

Countries have three choices in determining the monetary linkage between their economy and the rest of the world: (1) Flexible regimes where countries let their currency float in the exchange markets against all other

currencies; (2) fixed regimes where they can fix the price of their currency against a specific foreign currency or a basket of foreign currencies; (3) intermediate regimes where they let their currency float to some extent but intervening to limit those fluctuations according to some pre-determined parameters such as “target zones,” “crawling bands,” and so forth.

The choice of exchange rate regime depends on the particular circumstances facing the country under question. One proposition is that countries should move toward increased exchange rate flexibility. Those who take this position point to the consequences of the futile attempts to maintain the fixed rates in Thailand, Indonesia, Korea, Russia, and Brazil, which all ended in costly currency crashes. Another proposition is that all countries should move toward making institutional commitment to firmly fixing the exchange rate. For instance, use of currency boards in Hong Kong and Argentina has enabled these economies to weather successfully the storms of financial crises in recent years.

In the wake of the Asian financial crisis, however, there appears to be an increasing consensus on the view that the intermediate exchange regimes are not sustainable in a world with large scale capital flows, and consequently, countries are increasingly forced to choose either free-floating or firm-fixing. The logic behind this proposition can be explained by the open economy trilemma. The principle says that with its open economy, a country simply cannot achieve all three goals of exchange rate stability, monetary independence, and financial market integration simultaneously; it must give up one of three goals at a given time. Two goals of exchange-rate stability and monetary independence can only be attained with the imposition of *capital controls*; in other words, the goal of financial market integration with increased capital mobility must be sacrificed. Likewise, two goals of exchange rate stability and capital mobility can only be achieved at the expense of giving up the autonomy of monetary controls. With freely floating exchange rate regime, currency volatility is the price for attaining goals of monetary independence and free capital mobility.

The globalization of financial markets has increased the degree of cross-border capital movements in recent years. In terms of the open economy trilemma diagram, this trend of greater financial integration has pushed most countries toward the lower part of the triangle. If further financial liberalization efforts push these countries to the bottom line of the triangle, the choice will be narrowed down to choosing either free-floating or firm-fixing as in the case of a monetary union. As emphasized by Jeffrey Frenkel, however, “there is nothing to prevent the country from choosing an intermediate solution between floating and monetary union” even under perfect capital mobility (Frankel 1999, p. 6).

Free-floating allows a country to maintain its freedom in conducting monetary policy and other macroeconomic policies since it does not have to use them to defend the exchange rate. However, markets can overshoot the economic fundamentals: They can push the value of currency far below its underlying economic value, generating inflationary pressures and raising debt servicing costs, or they can push the exchange value far above the true value, hurting the country’s export competitiveness and therefore its trade balance. On the other hand, fixed exchange rates can help countries avoid those costs if the governments can successfully establish the rate at a sustainable level and convince the markets of their willingness and ability to maintain the rate at that level. Fixed exchange rates also reduce the transaction costs of international trade and investment. Moreover, the option for adjusting the fixed rate according to some predetermined parameters provides countries with “an additional policy tool that can be used to correct an excessive external deficit or surplus” (Bergsten 1999, p. 2). In fact, this has been the most important rationale for adopting a variety of intermediate exchange rate regimes by many countries, including the Asian 5 since 1976.

The pegged exchange rates were frequently singled out as one of the leading causes of the Asian crisis of 1997/98. Before the crisis, many East and Southeast Asian countries pegged their currencies to the U.S. dollar in one form or another, even though their economies were more closely linked to the Japanese economy. As a result, these countries benefited any time the yen appreciated against the dollar, but lost their export competitiveness in the world market badly whenever the yen depreciated against the dollar. In other words, the exchange rates of the Asian currencies simply could not reflect the fluctuations in the dollar/yen exchange rate, and their economies were highly susceptible to these dollar/yen rate fluctuations. Thus, as was pointed out by McKinnon (1998), it is more correct to say that the Asian crisis was caused by the instability of the dollar/yen exchange rate rather than the pegged system

itself as used by these countries. Also, the performance of the stock markets of East Asian countries was greatly influenced by the dollar/yen exchange rate fluctuations (Moon, Rhee & Yoon 2000, p. 165, Figure 2).

Successful defense of a fixed rate can be costly, requiring a country to raise interest rates and slow down its economy to avoid speculative attack. The main trouble, however, is that governments may try to maintain a rate at unsustainable level for too long until private capital flows will eventually force devaluations or revaluations. Such “forced” adjustments in exchange rate can become very devastating and costly, as was amply demonstrated by the Asian crisis. In the era of globalization of financial markets with huge private capital flows, there is a growing consensus that countries can enjoy the benefits of fixed exchange rates only in two ways. They can impose and maintain extensive capital controls in order to directly limit their vulnerability to speculative attack. Or they can establish a currency board as adopted in Hong Kong and Argentina, officially dollarize their currency as in Ecuador, or establish/join a monetary union as in EU.

#### **Financial Market Liberalization and Capital Controls**

One lesson we have learned from the Asian crisis is that opening up the financial market before nurturing a sound financial system and institutions is a very risky business. Korea, for instance, has overestimated the potential benefits of joining the OECD (Organization for Economic Cooperation and Development). One of the requirements for joining the club was to liberalize its financial market.

Several lessons can be drawn from the Korean case of premature financial market liberalization. First, domestic financial systems must be liberalized before opening to foreign capital. By and large, the East and Southeast Asian countries were more or less in the same boat as was Korea. Ceilings on interest rate, government-directed lending, insider relationships between banks and borrowers have all served to channel credit without regard for rates of return, thus leading to misallocation of resources. Foreign capital inflows were channeled through the same process of intermediation, leading to excessive investments and maturity mismatches in assets and liabilities. Second, financial liberalization requires strict bank regulation and supervision in order to prevent a reversal in capital flows. This includes the imposition of ceilings on foreign currency exposure for the banks. Third, free capital movement and pegged exchange rates are simply a dangerous mix: Goals of capital mobility and the stability of foreign exchange rates are not compatible. A fixed exchange rate regime prevents central banks from using higher interest rates to keep the economy from overheating, but it also encourages foreign currency borrowing when interest rates overseas are lower than those at home. Fourth, financial markets require reliable information and transparency to function efficiently. If foreign lenders had better information about the borrowing activities of Korea's private sector, they would have pulled back their funds earlier, and the impact of the abrupt withdrawal of funds on the economy would have been much less severe.

Many in the economics profession argue against capital control measures. They argue that the financial market is the best device for allocating global capital efficiently among countries and between competing uses. Global capital markets will provide capital-needy countries with additional funds for their growth, while allowing investors to diversify their portfolios. If capital is allowed to flow freely, markets will reward countries that pursue sound economic policies and pressure others to do the same. We all become beneficiaries of free capital movement. The Asian crisis, however, has given us an important lesson-- that is, financial liberalization must come only after nurturing of the incentive structure and capacity to regulate financial markets. Until then, various measures for restricting capital flows may be in order.

*The Tobin Tax*—One way of limiting international capital flow is to selectively tax capital account related transactions, such as the Tobin tax or variants of it.<sup>2</sup> Such a tax involves the differential taxation of foreign exchange conversions arising from capital flows (Tobin 1978; Eichengreen, Tobin & Wyplosz 1995; Garber & Taylor 1995). The Tobin tax provides market participants with an incentive to take a long-term economic outlook rather than short-term hunches in buying and selling foreign exchange and securities. Traders must pay a tax (for example, say, 0.1 %) for every transaction so that they would buy or sell only when the expected returns justify the additional expenses, resulting in fewer transactions. One difficulty for implementing the Tobin tax, however, is that all major currency trading countries must apply the tax at the same time. Otherwise, traders could simply shift their transactions to tax-free countries (Kasa 1999).

*Controls on Short-Term Capital Flows*—One way of preventing the possible unproductive use of foreign capital when channeled through the domestic banking and financial system is to prohibit its entry by imposing

capital controls. Capital control measures used by Chile, for instance, are not designed to discourage inflow of foreign capital at large, but they are specifically aimed at discouraging short-term capital inflows. Local firms that borrow abroad are required to keep 30% of all non-equity capital on deposit at the central bank, interest free for one year. This deposit requirement is tantamount to a tax on capital inflows with a maturity of less than one year; it is aimed at encouraging firms to borrow more for longer-term purposes. Studies have shown that such capital control measures in Chile have not adversely affected the size of foreign capital inflows, but simply affected the composition of such flows, although capital controls in Chile caused “a large increase in the cost of foreign financing for Chilean companies.”

Chile also requires that any foreign money coming into Chile must stay in the country for at least one year. This requirement has discouraged many hedge funds and pension funds from investing in Chile at all. In the wake of the Asian financial crisis, several countries have adopted capital controls. Among them was Malaysia, which imposed currency controls and prevented foreign shareholders from taking their money out of the country for a year. Taiwan delayed implementation of its plans for full liberalization of international capital flows. Financial liberalization is critical in this era of globalization for a country’s long-term growth and development. But financial liberalization should follow a sequence. The East Asian countries made the mistake of increasing their vulnerability by wooing foreign capital through capital account convertibility before addressing their fundamental financial weaknesses in a timely manner.

## **Regional Financial Arrangements**

### **The Role of International Financial Institutions**

In the mid-1990s even before the onset of the Asian financial crisis, some observers were suggesting that the IMF should be closed down. The crux of the argument was that in a world of floating exchange rates and globalized financial markets, an agency such as the IMF was no longer needed. Opinions differ widely on whether the IMF has a systematic role as under the Bretton Woods system—such as “managing global exchange rates, coordinating macroeconomic policy, and seeking to ensure that the quantity of international reserves was adequate” (Bird 1999, p. 955).

In “bailing out” the three crisis-stricken Asian countries—Thailand, Indonesia and Korea, charges were made against the IMF for prescribing the same old medicine for a new illness. Take Korea as an example. The immediate cause of the financial crisis in Asia in general and Korea in particular was the abrupt withdrawal of foreign capital, especially short-term hot money flows. Especially for the case of Korea, the crisis was clearly a case of temporary illiquidity rather than fundamental insolvency. The IMF adjustment program called for a severe contractionary macroeconomic policy of higher taxes, reduced spending, and high interest rates, raising a specter of slow or no economic growth and of massive layoffs. The program was applied in the 1980s, when macroeconomic imbalances, government profligacy and hyperinflation were behind the Latin American debt crisis. The prescription was little more than the same old medicine for a new illness, and thus ill-suited as a cure for the troubled Southeast Asian economies in general and for the Korean economy in particular.<sup>3</sup>

Unlike the currency crises in Thailand, Indonesia and Malaysia, the currency crisis in Korea spread irrationally from the other currency crises, which were compounded by the so-called “reverse free rider” behavior of foreign lenders. In a sense, therefore, the 1997-98 Asian financial crisis can be characterized as an “international liquidity crisis as much as a fundamental economic crisis” (Y.S. Park 1999, p. 27). What Korea needed was the rollover of their short-term loans. The IMF could have taken initiatives in convincing the international financial community to provide coordinated action by creditor banks in the G-7 countries to restructure Korea’s short-term debts, lengthening their maturity and providing temporary credits to help meet the interest obligations (Felstein 1998).

Others charge that the IMF “bailout” programs for the Asian countries involve tax money being used to “bail out”—rather than “bail in”—multinational banks and financial institutions in the North (read, developed countries or the G-7). These banks and institutions had extended loans “recklessly” without careful risk analysis to private banks and business firms in emerging markets. They were equally responsible for the Asian financial crisis—a crisis of “international liquidity” in this era of globalization. What the IMF was doing in East Asia was a replay of

the debt crisis of the 1980s in Latin America, when the Fund recycled public funds through indebted governments in Latin America to the coffers of the heavily exposed banks and financial institutions in the North.

Other critics of the IMF contend that the Fund's approach to Asia was simply a "continuation of its policies since the early 1980s, when, together with the World Bank, it imposed programs of 'structural adjustment' on over 70 Third World developing countries." The indebted countries in Latin America and Africa were allowed to use the IMF-released funds to service their debts only on condition that they accept programs of radical liberalization, deregulation, and privatization (Bello 1999b & 1999c).

In its rescue package for Korea, the IMF demanded a fundamental overhaul of the Korean economy. There is no denying that many of the structural reforms that the IMF included in its program for Korea (in exchange for the \$57 billion bailout) would improve the long-term performance of the Korean economy. Failure to undertake some of the badly needed structural reforms earlier was, no doubt, one of the root causes of the Korea's financial crisis. However, "a nation's desperate need for short-term financial help does not give the IMF the moral right to substitute its technical judgments for the outcomes of the nation's political process" (Felstein 1998, p. 27). The structural reforms "demanded" by the IMF were those well recognized by Korea, but they were not needed for Korea to gain access to capital markets. The legitimate political institutions of the country, not an international agency such as the IMF, should determine the nation's economic structure and the nature of its institutions (Felstein 1998).<sup>4</sup>

#### **In Search for Regional Monetary Cooperation and Stability**

The severity and contagiousness of the Asian financial crisis underscored the need for reforming the international financial system. Numerous proposals have been put forward. The G-7-led reform, however, ignores the problems of the supply side of international finance, and concentrates its efforts on reforming the financial and corporate sectors of developing countries. Again, as in the case of the Mexican peso crisis of 1994-95, the appetite for radical reform of the international financial system has receded considerably in the wake of economic recovery of the crisis-hit countries. From the perspective of developing countries, therefore, it appears that they will remain vulnerable to future financial crises even if they faithfully carry out the kinds of structural reform recommended by the IMF and the World Bank.

Given this reality, developing countries may have no choice but to develop their own defense mechanisms against recurring speculative attacks on their currencies in this era of volatile capital movements. Some of these defensive mechanisms may include pooling of foreign exchange reserves to be used for emergency purposes, establishing a system of capital controls, and adopting an exchange rate regime that lies between the two extremes of free floating and fixed, e.g., an intermediate regime such as "BBC" as recommended by Williamson (1996, 1999a, 2000c). Developing and implementing such defensive mechanisms would require close monetary cooperation and integration among countries in the region, whose economies are closely linked and are susceptible to similar external shocks.

In this respect, the case of EMU holds many lessons for regional financial arrangements and monetary cooperation. It has been successful in maintaining stability in intra-regional exchange rates, containing financial contagion, and coping with fluctuations in exchange rate vis-a-vis the dollar and the yen. There are many important questions, however, that must be answered beforehand such as: (1) to what extent such arrangements can be replicated by LDCs as a means of collective defense against systematic instability emanating from global financial markets; (2) whether it would be feasible for LDCs to establish regional financial arrangements among themselves without involving G-3 countries, and to follow a path similar to that pursued by Europe, that is, moving from a regionally secured exchange rate band to a currency union; or (3) whether they could move directly to currency union by adopting a regional currency (UNCTAD 2001, pp. 121-124).

In the wake of the Asian financial crisis, interest in regional financial arrangements and monetary cooperation in the developing world has increased rapidly. As mentioned earlier, this increased attention on regional solutions has been attributable to little progress so far made in the reform of the international financial architecture, and especially to the resistance of the G-7 countries to "genuine reform" of the system (Park & Wang 2000). For instance, the G-7 finance ministers at their meeting in Cologne in June 1999, explicitly ruled out the creation of any new institutions and made it clear that their aim would be to work with the existing system, strengthening it when necessary. The trouble with such an approach only involving some incremental changes is that it would not safeguard financial stability in the EMEs and LDCs. As long as the structural problems on the supply side of

international capital flows are not addressed, the EMEs and LDCs will remain as vulnerable to future speculative attacks on their currencies and financial crises as they were before the Asian crisis. Instead of waiting for the G-7 to create a new financial architecture, which now appears highly unlikely, it would be in the interest of the EMEs and LDCs to find ways of developing an alternative safeguarding scheme in the form of regional financial arrangements and monetary cooperation. Such an alternative scheme is, of course, aimed at supplementing and complementing, but not replacing, the existing international financial architecture.

When the Asian 5 were attacked by massive capital outflows and were short of international liquidity, they could not depend on the IMF or other international institutions as a lender of last resort. Liquidity is key to self-protection: A country with substantial international liquidity is more likely to defend itself better in the face of a currency attack (as in the case of Taiwan, Hong Kong, Singapore, and China as compared to the Asian 5 during the Asian financial crisis). The Asian crisis has shown that no matter how much liquidity a country holds, the amount could easily be dwarfed by the sheer magnitude of international capital movements that can be generated nowadays in the global financial markets, and that a country alone cannot protect itself against the attack of such capital flows.<sup>5</sup> Given this reality, self-protection of the EMEs and LDCs can be done better only through collective action via regional financial arrangements and monetary integration.

For these reasons, there has been increased discussion and support in East Asia for establishing a regional defensive mechanism in the form of financial cooperative arrangements. The proposals for such arrangements include the Asian Monetary Fund (AMF) of 1997, the Asia Pacific Monetary Fund (APMF) of 1998, and the Chiang Mai Initiative in May of 2000.

#### **The Asian Monetary Fund**

In the middle of the Asian financial crisis (at the 1997 annual meetings of the IMF and the World Bank), a proposal was made by Japan to establish an Asian Monetary Fund (AMF) with a US\$100 billion funding and Japan as the main contributor. The AMF should operate at the regional level to help maintain monetary stability in the region. The ASEAN members and other Asian countries welcomed the proposal. The proposal, however, was immediately and effectively blocked by the U.S., which favored the exclusive control by the IMF over emergency funds, and feared that such regional institution could undermine the U.S. leadership role in the region.<sup>6</sup> Despite the defeat of the proposal, the idea of an AMF did not die. In 1998, Japan launched a plan drawn up by its finance minister, Kiichi Miyazawa. The Miyazawa plan involved a US\$30 billion financial assistance scheme to help overcome the Asian currency crisis. This time, the Japanese initiative was even supported by the IMF, and the U.S. did not attempt to block the proposal. But the amount provided by the plan was too small and was too late to be used as emergency funds in a timely manner.

This idea of a regional financial arrangement in East Asia was modified by Bergsten (1998) to include the United States and several other Pacific Asian countries to be called an “Asia Pacific Monetary Fund” (APMF) instead of an AMF. According to Bergsten (1998), there are at least three reasons why such an expanded regional scheme is necessary: One, at the present time there are no Asian countries that could effectively lead the regional efforts towards financial cooperation and integration. Few Asian countries will accept Japan-dominated/led arrangement at the present time, and China is not yet ready for such a role. Two, an Asian grouping, exclusive of non-Asian countries, would have the effect of dividing rather than uniting the two sides of the Pacific. Three, the United States as a member of the Pacific community, could play a decisive role in making an Asia Pacific Monetary Fund work, thereby contributing greatly to the regional monetary stability.

#### **The Chiang Mai Initiative**

In May 2000, an initiative was launched in Chiang Mai, Thailand, to discuss currency swap and repurchase arrangements among members of the ASEAN and three East Asian countries—China, Japan and the Republic of Korea, the so-called “ASEAN + 3.” The agreement is widely perceived as a major step toward strengthening financial cooperation among the East and Southeast Asian countries. This so-called “Chiang Mai Initiative” is aimed at “building networks for multi-layered financial cooperation to match the growing economic interdependence of Asian countries and the consequently greater risk that financial shocks could lead to regional contagion” (UNCTAD 2000, p. 125, Box 5.2). The Initiative envisages the use of the ASEAN+3 framework to improve exchange of information on capital flows and to build a regional economic and financial monitoring system. At the core of the Initiative is a financing arrangement among the ASEAN+3 countries to provide intra-

regional support against currency runs. The arrangement is intended to supplement, but not replace, existing international facilities.

For self-protection purposes, many EMEs and LDCs, especially those hit hard by the Asian crisis, are taking measures to build up foreign exchange reserves beyond the level that has been regarded as adequate in terms of their import requirements. Holding excessively large foreign exchange reserves, however, is costly and represents a misallocation of resources. A regional financial arrangement could create new credit facilities by pooling a certain percentage of member countries' reserve holdings. An individual member country would not have to hold as much reserves as it would otherwise if it can borrow from the credit facility of the regional monetary fund.<sup>7</sup> These regional financial arrangements could be structured and managed to be complementary to the role of the existing international institutions such as the IMF.

Regional financial arrangements and monetary cooperation may also involve establishing regional currencies, as opposed to the adoption of official dollarization as adopted lately by Ecuador and El Salvador in Latin America. If established and sustained, regional currencies among EMEs and LDCs could bring considerable benefits, similar to those expected from the introduction of the euro. They can reduce transaction costs of doing business within a region and eliminate exchange rate risks associated with intra-regional trade and investment. Few believe that the EU's experience with regional financial arrangements and monetary cooperation can easily be replicated in the other regions of the world. But the EMEs and LDCs must begin seriously to examine the possibilities and desirability of closer financial cooperation and coordination in conducting exchange rate policies, establishing credit facilities, creating a regional currency unit, and eventually a common currency. From the perspective of Pacific Asia, an Asian Monetary Fund or the Chiang Mai Initiative could serve well as a forum for examining and discussing these long-term, but crucial issues.

## **Concluding Remarks**

The Asian countries (and all other non-Asian countries as well) have been simply too slow to fully appreciate the new challenges and risks posed by the rapidly globalizing financial markets. Consequently, they have been too slow in formulating appropriate responses and policies. Globalization has increased the speed and magnitude of the market reactions. It has magnified the costs of bad, inconsistent policies and weak, inefficient institutions. In today's global environment, the forces of globalization are simply beyond one's control. In short, Pacific Asian countries have simply fell victim to globalization.

Globalization, if properly managed, may help push some developing countries into modernity and affluence. But as the Asian financial crisis suggests, embracing global financial markets can also be highly dangerous and costly. The severity and contagiousness of the Asian financial crisis underscored the need for reforming the international financial system. Numerous proposals have been put forward. The G-7-led reform, however, ignores the problems of the supply side of international finance, and concentrates its efforts on reforming the financial and corporate sectors of developing countries. Again, as in the case of the Mexican peso crisis of 1994-95, the appetite for radical reform of the international financial system has receded considerably in the wake of economic recovery of the crisis-hit countries. From the perspective of developing countries, therefore, it appears that they will remain vulnerable to future financial crises even if they faithfully carry out the kinds of structural reform recommended by the IMF and the World Bank.

Given this reality, developing countries may have no choice but to develop their own defense mechanism by establishing a system of capital controls and by adopting an exchange rate regime that lies somewhere between the two extremes --free floating and fixed. In this respect, the EU experience may provide the EMEs and LDCs with useful lessons about the institutional arrangements for the maintenance and adjustments of intra-regional currency bands, intervention mechanisms, and various facilities designed to provide payments support for member countries in the region. An attempt to apply the EU experience for arrangements for developing countries may pose all sorts of difficulties, however, especially in the area of choosing the exchange rate regime to be pursued vis-à-vis reserve currencies and access to international liquidity. Thus, in effectively facilitating regional financial arrangements, the involvement of a major reserve-currency country may be required. In this respect, the Asia-Pacific Monetary Fund

as suggested by Bergsten and the recent Chiang Mai Initiative adopted by ASEAN+3 represent an important first step towards a difficult path to closer regional monetary integration and, hopefully, to a more stable global financial system.

For a summary discussion of the open-economy trilemma, see Asia Development Bank, "The Financial Crisis in Asia," in *Asian Development Outlook 1999* (Manila: Asia Development Bank, 1998), pp. 22-46; Jeffrey A. Frankel, *The International Financial Architecture*, Policy Brief #51 (Washington, DC: Brookings Institution, June 1999); C. Fred Bergsten, "Alternative Exchange Rate Systems and Reform of the International Financial Architecture," statement given before the Commission on Banking and Financial Services, US House of Representatives, May 21, 1999.
2. Originally proposed by James Tobin, "A Proposal for International Monetary Reform," *Eastern Economic Journal*, 4, 1978, pp.153-59. For a recent debate on the Tobin tax, see B. Eichengreen, J. Tobin & C. Wyplosz, "Two Cases for Sand in the Wheels of International Finance," *Economic Journal*, 105 (428), 1995, pp. 162-72; P. Garber & M. Taylor, "Sand in the Wheels of Foreign Exchange Markets: A Skeptical Note," *Economic Journal*, 105 (428), 1995, pp. 173-80; Peter Kenen, "Capital Controls, the EMS and EMU," *Economic Journal*, 105 (428), 1995, pp. 181-92. For a summary discussion of the relevance of the Tobin tax, see Kenneth Kasa, "Time for a Tobin Tax?" Federal Reserve Bank of San Francisco *Economic Letter*, April 9, 1999.
3. Some of the harshest critiques came from Martin Felstein, "Refocusing the IMF," *Foreign Affairs*, 77 (2), March/April 1998, pp. 66-79; Joseph Stiglitz, "What Caused Asia's Crash?: Bad Private-Sector Decisions," *Wall Street Journal*, February 4, 1998; Jeffrey D. Sachs, "Restoring the Asian Miracle," *Asian Wall Street Journal*, February 2, 1998.
4. But, then, one has to recognize that significant institutional changes that have taken place in Korea in recent years would not have been enacted in the absence of the painful and (to many Koreans) "humiliating" implementation of the IMF regime.
5. No country is immune to currency crisis in a world of capital mobility. No country would be safe in the face of a massive international capital outflow such as one that took place in Southeast and East Asia in 1997, which precipitated the Asian financial crisis. As discussed earlier in the paper, there was a record capital inflow of \$93 billion into Thailand, Malaysia, Indonesia, the Philippines and South Korea. Then there was a net outflow of capital of \$12 billion in the following year 1997. This greatest reversal of private capital flows ever recorded in the world economy involved \$105 billion, the amount equivalent to 11 percent of the combined GDP of these five Asian countries. In terms of the U.S. economy, this would be equivalent to a change in capital flows of over \$940 billion, which would no doubt wreak havoc on the U.S. financial markets!
6. During the annual meeting of the IMF and the World Bank in Hong Kong, Japan's vice finance minister of international affairs, Eisuke Sakakibara, was summoning a number of East Asian officials to discuss the AMF proposal without informing the Americans. When the U.S. deputy secretary of the Treasury, Larry Summers, found this out, he immediately left his own meeting and went into their room, sat down by their table and said, "Now, where were we?" The cost of blocking the AMF proposal was high. The contagion from the Thai meltdown might have significantly be reduced if the AMF agreement had been in place by October 1997. The foreign investors' knowledge of a US\$ 100 billion defense line to be used on short notice could have calmed down the market (Nordhaug 2000, pp. 5-6).
7. The group of thirteen countries in the ASEAN+3 has a combined total foreign exchange reserves estimated at more than US\$ 800 billion. Depending on how these reserves are pooled together and managed, a mere ten percent of the total amount will be sufficient to provide a first and second line of defense against any speculative attack. If,

on the eve of the Thai meltdown, the East Asian countries had a regional credit facility in place to be able to supply short-term liquidity to Thailand, the world could have been spared the Asian financial crisis (Park & Wang 2000).

# **Optimal Choices for Risk Management: The Economic Value of Institutional Reform in Globalizing Economies**

*Phillip LeBel  
Montclair State University, USA*

## **Abstract**

Increasing interdependence in the global economy entails increasing levels of risk in economic decisions. For economies engaged in global economic integration, success depends to no small degree on the effective management of risk through institutional innovation. In this paper, we apply panel regression analysis to a sample of 103 countries for the 1980-2002 period to examine the determinants of aggregate country risk, and in turn, to estimate the economic value of changes in those determinants on a country's level of per capita income. We provide estimates for the economic value of improving a society's degree of property rights, judicial independence, civil liberties, and political rights on the underlying rate of growth. Our findings are consistent with studies on corruption, economic freedom, and democracy and provide a concrete basis for assigning weights to the value of economic reform.

## **Introduction**

Increasing interdependence through globalization provides both a challenge and an opportunity. For developing and emerging market economies, globalization offers the prospect of increases in real per capita income through expanded international trade and investment. At the same time, successful integration in the global economy also poses increased levels of risk. These risks reflect changes in political, economic, financial, and environmental conditions. For many developing and emerging market economies, institutional innovation that can manage these risks is often neglected in the process of reform, with the result that the benefits of globalization are either weakened or negated, thus leading some to call for a return to a more autarkic model of development. A retreat to autarky is likely to increase even further the gaps in per capita income that now exist<sup>1</sup>. Economic reform is thus essential, but the institutional choices that need to be addressed must first and foremost take into consideration the impact of risk. In this paper, we provide a model for the economic assessment of country-level risk, and from which we provide estimates of the economic value of institutional reform.

## **Risk Management Innovations**

Risk exists in the presence of incomplete markets. To the extent that markets are incomplete, risk shows up in four broad institutional settings: financial and economic markets, political instability, as well as in environmental quality. While important innovations have taken place to identify sources of risk and to derive pricing instruments in financial markets, in other areas, risk management tools have been less well developed. As a result, risk management choices involve some combination of market forces and public sector intervention.

To the extent that market institutions lack instruments for the pricing of risk, government intervention will be greater. Historically this has shown up in public sector intervention to address risks in health (Goldstein and Goldstein, 2002), but also in terms of the provision of social security and other forms of social insurance (Kotlikoff, 1992; Kingson and Schulz, 1997)<sup>2</sup>.

Of the four major sources of risk, some of the most important advances in measurement and in developing risk management instruments have taken place in the field of finance. Bernstein (1996) provides a detailed discussion of the evolution of risk measurement with particular emphasis on applications to the field of finance. Advances include not just the existence of financial markets for pricing various types of insurance, but also for

developing asset specific risk management tools, notably the market for derivatives, even though they may not provide efficient signals in all cases (Shleifer, 2000; Lo and MacKinlay, 1988).

While financial contracts generally contain various insurance default options, innovations in the field of finance have helped to make the task of pricing those defaults much more precise. Innovations include optimal portfolio management tools (Markowitz, 1952), along with the development of derivative contracts. The latter include in particular the stock option pricing models of Black and Scholes (1973), and Merton (1973), and which have since been extended to a much broader range of tradable assets (Malcolm, Sharma & Tanega, 1999), including interest rate, foreign exchange, and primary commodity assets. These innovations have been further extended to include value at risk and risk metric models (Jorion, 1997; J.P. Morgan, 1995).

At the macro level, risk management tools include measures that address interest rate stability, inflation, and balance of payments dynamics, including the pricing of sovereign debt instruments and country insurance contracts (Cordella and Yeyati, 2004; Canales-Kriljenko and Habermeier, 2004; Das, Quintyn, and Chenard, 2004; Lee, 2004; Schinasi, 2004; Shiller, 2003). However, while tools for pricing risk exist at the micro and macro levels for financial assets, they do not operate in all markets and do not cover all forms of risk, especially in developing and emerging country markets<sup>3</sup>. The result is that the problem of incomplete markets is far from resolved<sup>4</sup>.

Globalization is the process of opening up both domestic product and factor markets, The case for its role in raising per capita incomes is the standard principle of comparative advantage first stated by David Ricardo (1817), and since restated in any number of studies (Bhagwati, 2004; Easterly, 2002, 2001; Tokarick, 2004). What makes globalization problematic is that when factor market mobility exists and where risk is present, it is not obvious that expanded globalization will raise per capita incomes at expected rates of growth. Financial crises such as the one that severely affected a number of East Asian economies in 1997 have cause some to question the benefits of globalization. This has raised critiques of standard models of globalization (Stiglitz, 2002; Samuelson 2004; Mattoo and Subramanian, 2004). In turn, this debate has also turned on the relative importance of international aid versus private capital market flows, particularly to developing and emerging country markets (Sachs, 2004; Hansen and Tarp, 2001; Guillaumont and Chauvet, 2001; Burnside and Dollar, 2000)

The literature on growth and globalization has been further expanded to address the role of democracy, particularly its effects on controlling for corruption (Huther and Shah, 2000; Jones, et.al. 2000; Knack, 2000). Barro (1999, 1998, 1996) finds that while democracy can be important, it is not as critical as other determinants such as an efficient pricing regime. This finding has been questioned for some areas (Boko, 2002). It leaves open the question of whether democracy is a necessary pre-condition for economic development or whether other variables such as the level of economic freedom are more important<sup>5</sup>.

In our view, much of the debate on globalization through international aid and democracy misses the important role that institutions play in the management of risk (Arestis and Basu, 2003; Obstfeld, 1994; Shaw, 1973, McKinnon, 1973). In placing emphasis on the measurement of risk and the choice of tools for its management, globalization can make important contributions to economic growth and development. However, for globalization to succeed, institutional innovation for effective governance is a necessary pre-requisite (Moss, 2002). This is particularly true for developing and newly emerging market economies (Loukoianova and Unigovskaya, 2004). In this context, the role of institutional economics (Williamson, 2000, 1996) is central even though governance has only recently become a focus of globalization mechanisms (Gradstein, 2003; Kaufmann et. al. 2002, 1999a, 1999b; North, 1990; Olsen, 1982).

## **An Institutional Model of Risk**

Risk generally is measured in terms of some level of volatility of an asset<sup>6</sup>. Yet if markets are substantially incomplete, capturing the underlying level of risk will be imperfect at best, even if we choose to model such environments under uncertainty, or subjective risk<sup>7</sup>. What is clear is that in the presence of such incomplete markets, risk has a negative effect on the level of income, since it adds to the transactions costs of production and exchange.

At the macroeconomic level, some efforts have been undertaken to general indices of financial risk (IMF, 2004; Gasha and Morales, 2004; Worrell, 2004; Gilson, 2004). Many of the indices have been developed to determine the level of financial instability of an economy, particularly in response to such episodes as the East Asia financial crisis of 1997, and prior episodes in Central and Latin America, notably Mexico in 1984, and Argentina in 1982. Yet these measures have not yet been capable of anticipating such financial crises, perhaps because the sources of risk go beyond what may be more directly observable in financial markets.

Given the importance of risk to economic growth, and given the absence of suitable risk instruments that can capture its various dimensions, we pose the question of whether one can utilize a risk proxy to explain differential levels of per capita income. We propose that one can do so through an index that incorporates the influence of financial, economic, political, and environmental factors.

The index we choose for our analysis is aggregate country risk. The appeal of such an instrument is that it does seek to incorporate various sources of risk that are not likely to be reflected in existing financial measures. Investors operating in a global economic environment often seek to assess whether the expected rate of return reflects the major sources of risk, and thus whether a given risk premium is adequate to compensate for perceived levels of risk. In economies with sufficient financial intermediation and institutional development, one can look at sovereign debt ratings, reports on political and economic stability, as well as on the level of environmental quality to make judgments. However, as we have noted, in many instances, such measures are not readily available, and proxy measures must be used. Our choice of the ICRG aggregate country risk index is based on the consistency of aggregation across sectors, countries, and time, which is perhaps also the reason why it is included among the World Bank's development indicator series<sup>8</sup>.

This ICRG index is not a traded asset, but one that could be used in framing derivative contracts for purposes of risk management choices<sup>9</sup>. However, it has the advantage of including assessments of political, financial, economic, and environmental risk. In our view, it is likely to be more representative of the various sources of risk than a macroeconomic volatility index, for example.

We proceed with the specification of an institutional model of risk in several steps. First, we conduct a simple test to determine if our ICRG index explains differences in levels of per capita income across regions and across time. To do so, we use panel regression estimates for a sample of 103 countries for 1980-2002 in two simple initial models of economic growth.

Panel regression models take the following general form:

$$Y_{it} = \alpha + \beta X_{it} + \varepsilon_{it}, \text{ for } i = 1, 2, \dots, N, \text{ and } t = 1, 2, \dots, T, \quad (1.)$$

where N is the number of cross-section units and T is the number of time periods.

Because there often are aggregation problems within panels, we do not use a pooled regression model. Instead, we rely either on an ordinary panel regression estimate, or on a fixed effects panel regression model<sup>10</sup>. In a fixed effects model, dummy variables enable the intercept term to vary over time and over cross-section units. For a fixed effects model, we write:

$$Y_{it} = \alpha + \beta X_{it} + \gamma_2 W_{2t} + \gamma_3 W_{3t} + \dots + \gamma_n W_{nt} + \delta_2 Z_{i2} + \delta_3 Z_{i3} + \dots + \delta_T Z_{iT} + \varepsilon_{it}, \quad (2.)$$

where:

$$W_{it} = \begin{cases} 1 & \text{for the } i\text{th individual, } i = 2, \dots, N \\ 0 & \text{otherwise} \end{cases}$$

$$Z_{it} = \begin{cases} 1 & \text{for the } i\text{th time period, } i = 2, \dots, T \\ 0 & \text{otherwise} \end{cases}$$

First, for a given panel, we write the level of per capita GDP as a function of two key variables, namely, a country's rate of national saving and its level of trade dependency:

$$PPPRPCGDP = f(\text{GNSGDP}, \text{TRDEP}), \text{ where:} \quad (3.)$$

PPPRPCGDP is the purchasing power parity estimate of real per capita Gross Domestic Product.

We now factor in the ICRG revised aggregate country index to determine the importance of risk in explaining the level of per capita GDP<sup>11</sup>:

$$PPPRPCGDP = f(\text{GNSGDP}, \text{TRDEP}, \text{RCCRISK}). \quad (4.)$$

Results for these two initial equations are given in tables 1 and 2 for a global sample, and sub-samples for Africa, Asia, East Europe, West Europe, the Middle East and North Africa, and Central and Latin America<sup>12</sup>. As can be seen, when risk is taken explicitly into account, it works adversely on the level of per capita real GDP. Given the significance of risk, we choose to include the ICRG index as a determinant of real per capita income.

Given the significance of aggregate country risk, we now develop a model of its determinants. Instead of treating aggregate country risk as a direct determinant of per capita GDP, we now specify a model of the determinants of a country's rate of national saving and its level of trade dependency. We further develop two separate sub-models, and then incorporate the estimated level of risk on a sample's rate of national savings and its level of trade dependency. This framework will permit us to examine the economic value of institutions that determine a given level of risk through the estimated effects on the level of per capita income that operate on a country's rate of national saving and its level of trade dependency.

Using Granger causality tests, we construct a hierarchical model of the determinants of growth. Instead of savings and trade dependency alone, we look at separate determinants for these two variables. In this model, we find that savings depends on a country's rate of market capitalization, the level of international aid, as well as on the level of aggregate country risk. In turn, we find that the level of trade dependency depends on the foreign direct investment ratio, as well as on the level of international aid and aggregate country risk. In turn, we find that a country's level of aggregate country risk is a function of the underlying level of economic freedom and democracy, and that these determinants depend in turn on the level of property rights, judicial independence, civil liberties, and political rights. Property rights, judicial independence, civil liberties, and political rights thus become the institutional variables that drive the level of aggregate country risk.

Fig. 1 illustrates the structure of the model, and includes the directional sign that each determinant has on the respective variable for the global sample. It also lists the Granger 2-lag causality F statistic for the global sample, along with the corresponding probability value in parentheses.

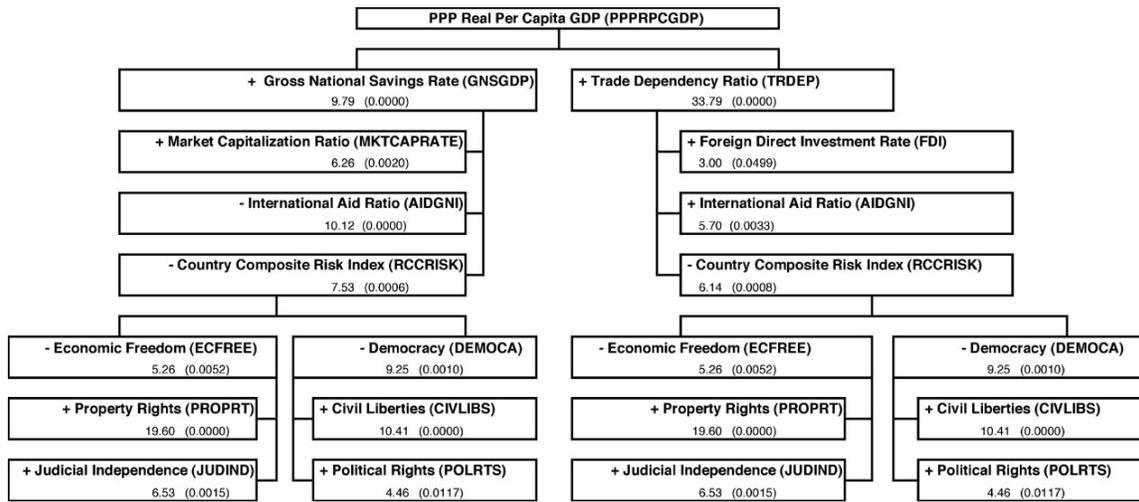

FIG. 1

From the structure of Table 1, we can now write a set of nested panel regression equations as:

$$ECFREE = f(\text{PROPRT}, \text{JUDIND}) \quad (5.)$$

$$\text{DEMOCA} = f(\text{CIVLIBS}, \text{POLRTS}) \quad (6.)$$

$$\text{RCCRISK} = f(\text{ECFREE}^*, \text{DEMOCA}^*) \quad (7.)$$

$$\text{GNSGDP} = f(\text{MKTCAPRATE}, \text{AIDGNI}, \text{RCCRISK}^*) \quad (8.)$$

$$\text{TRDEP} = f(\text{FDIGDP}, \text{AIDGNI}, \text{RCCRISK}^*) \quad (9.)$$

$$\text{PPRPGDP} = f(\text{GNSGDP}^*, \text{TRDEP}^*), \quad (10.)$$

where asterisks denote estimated values of variables that are then used in the hierarchical model.

One useful feature of the model is that it leaves open the relative separate effects of international aid on a country's national saving rate and its level of trade dependency. In some cases, international aid may work adversely on a country's saving rate while increasing its level of trade dependency, effects which we would like to estimate separately to determine the net effects. Because international aid serves a variety of objectives, we choose to include it in our model to link it to institutional factors that influence the level of aggregate country risk.

Data sources for the variables used in these regressions are listed in Appendix 1. In general, data on PPRPGDP, GNSGDP, TRDEP, MKTCAPRATE, FDIGDP, and AIDGNI are taken directly from the World Bank sources. Beyond these sources, our index of economic freedom (ECFREE) is based on estimates reported in *The Index of Economic Freedom*<sup>13</sup>. We use the measures for property rights (PROPRT) and judicial independence (JUDIND) from the broader index as determinants of the level of economic freedom.

Measuring democracy is a more complicated question. Although some work exists on tracking the frequency and fairness of elections across countries (Gurr, et.al., 2000), we rely on a simpler measure, namely estimates of the degree of civil liberties (CIVLIBS) and political rights (POLRTS), that are reported by Freedom House<sup>14</sup>. Our measure is an index of democracy based on the product of a country's index of civil liberties and its index of political rights<sup>15</sup>. The resulting democracy index (DEMOCA) thus does not attempt to measure the frequency or accuracy of elections but is designed to serve as a proxy for their operation.

Results of the panel regression estimates for equations 3 through 8 are given in the following tables.

(t-statistics are reported in parentheses in all regression estimates for all tables.)

Democracy depends directly in all regressions on higher levels of civil liberties and political rights at statistically significant levels. Differences in coefficients reflect differences in baseline values of the underlying level of democracy. While regression estimates are statistically significant, we cannot reject the null of reverse causality in some cases. Our Granger null tests for civil liberties cannot be rejected in the case of the Middle East and North Africa sample and in the case of the Central and Latin America sample. In addition, we cannot reject the reverse causality null for political rights in the cases of Africa, Asia, and East Europe. We thus treat our regional findings as conditional even though the maintained hypothesis holds true for the global sample.

In terms of economic freedom, we find that the Granger null tests can not reject reverse causality for property rights in East Europe, and the Middle East and North Africa sample. In terms of judicial independence, we cannot reject the null in terms of judicial independence for the Africa, East Europe, West Europe, and Middle East and North Africa sample, even though the maintained hypothesis holds true for the Global and other samples.

(\*Asteriks denote estimated values used in the given panel regression estimates).

Our nested panel estimates of country composite risk generally uphold the maintained hypothesis of an inverse relationship between economic freedom and risk and between democracy and risk. The only exception is in the Middle East and North Africa sample, where there is a slight positive effect of democracy on risk. As to our

Granger tests, we find that the null cannot be rejected for economic freedom in the Africa, Asia, West Europe, and Middle East and North Africa samples. As to the democracy determinant, we cannot reject the Granger null in the cases of Africa, Asia, West Europe, the Middle East and North Africa, and Central and Latin America, even though the maintained hypothesis holds true for the global sample.

(Western European countries are generally donor rather than international aid recipients. Hence there are no data applicable to the estimate of the national saving rate for this panel)

We now proceed with using our estimated value of country composite risk as a determinant of the national savings rate (GNSGDP). Other determinants include the market capitalization ratio (MKTCAPRATE) and the international aid to gross national income (AIDGNI) ratio. The market capitalization ratio generally varies directly with the national saving rate, but the international aid ratio has a more mixed effect. With the exception of the Middle East and North Africa sample, international aid generally has a negative effect on a country's rate of national saving. As to aggregate country risk, it displays a negative effect on saving at statistically significant levels for the global and regional samples, consistent with our general hypothesis.

In terms of Granger causality tests, the market capitalization ratio null cannot be rejected for the regional samples, even though it does hold true for the global sample. As to international aid, we cannot reject the null in the regional cases of Asia, and the Middle East and North Africa samples. In terms of aggregate country risk, we cannot reject the Granger null for Africa, Asia, and Western European countries, even though it holds in the global, E. Europe, Middle East and North Africa, and Central and Latin American country samples.

(Western European countries are generally donor rather than international aid recipients. Hence there are no data applicable to the estimate of trade dependency for this panel)

Turning to trade dependency, we find that with the exception of East European countries, international aid generally increases the level of per capita GDP, as does the level of foreign direct investment. FDI has a greater effect on the level of trade dependency than international aid. However, for all regional samples, risk lowers the level of trade dependency, consistent with our maintained hypothesis.

Taken together, risk works adversely on a country's rate of national saving and on its level of trade dependency. Measures that reduce a country's level of risk thus increase the rate of saving and trade dependency, which in turn increases the level of per capita GDP. With this framework in mind, we now examine the separate effects of changes in institutional variables on the underlying level of risk, and thus on a country's real per capita GDP.

## Estimates of the Economic Value of Institutions

From our nested panel regressions, we now turn to our estimates of the economic value of institutions. In our model, property rights and judicial independence determine the level of economic freedom, while in turn, civil liberties and political rights determine the level of democracy. We derive estimates of changes in these institutional variables through the nested effects that these variables have on a country's level of aggregate country risk, and in turn, on its rate of saving and trade dependency, and then on the level of PPP per capita GDP.

Our estimates proceed in several steps. First is to determine the difference in PPP per capita income from a one point increase in the corresponding index of an institutional variable. We then use the real rate of interest to derive the present value of a one point increase in each institutional variable. Finally, we estimate the relative change in per capita income through both a one-year change in per capita income and on the present value of per capita income. For purposes of comparisons we use change in the estimated value of real per capita GDP for 2002. Results of all four estimates are summarized below.

## Policy Implications

Our estimates provide a framework within which to determine the economic value of institutions. Policy reforms that strengthen a country's level of property rights and judicial independence can increase its level of per capita through a corresponding reduction in the level of aggregate country risk via an expansion in economic freedom. This is also true for expanding the level of democracy via increases in civil rights and political liberties. However, the impacts vary across regions and suggest that there is a hierarchy to a sequence of proposed reforms.

From our estimates, we note that for our global sample, strengthening property rights has a greater positive effect on the level of per capita income than does an increase in civil liberties and political rights. This is not to suggest that a democratic political system is inconsistent with a globalization model built on expanding levels of per capita income. Rather it reflects debates about illiberal democracy in which an expansion of democracy per se may not be as effective in raising per capita incomes as strengthening the underlying institutions that more directly affect the underlying level of risk. It is not a brief for postponing democratic incentives but simply places a metric value on the relative contributions of economic freedom and democracy in shaping which choices will produce a greater effect on risk, and thus a country's level of per capita income.

Strengthening a country's property rights, judicial independence, civil liberties and political rights does not work evenly across our sample of countries. We find that property rights dominate other institutional variables in determining a country's level of aggregate country risk. As to international aid, we find mixed effects by sample and by type of influence. With the exception of Middle East and North African countries, international aid generally reduces a country's rate of national saving. This is not surprising, given that international aid can create moral hazard by reducing incentives for national saving. However, as general as this finding is, it does not distinguish among forms of aid, notably whether aid consists of loans or grants, or by source of funding, such as bilateral or multilateral funding. Our primary purpose is to recognize that where aid is concerned, it may often be driven as much by political as economic considerations, and thus tends to be less effective than it could, a finding consistent with the general literature.

In terms of trade dependency, international aid generally works to strengthen trade dependency, which would be consistent with raising levels of per capita income. Again, we find the opposite result in the case of our Middle East and North Africa sample. Taken together, then, the net effect of international aid is that it tends to reduce a country's rate of saving while increasing its trade dependency, but the net effect is generally negative except in the sample of Middle East and North African countries where it shows a positive effect. The general implication is that international aid can have a positive effect on a country's level of per capita GDP, but as long as political criteria outweigh economic ones, it may be less effective than efforts to strengthen institutions that reduce the level of aggregate country risk.

By adding the separate effects of the determinants of economic freedom and democracy we find that with the exceptions of Africa, West Europe, and Central and Latin American countries, economic freedom adds more to a country's level of per capita income than does an increase in democracy. We also note that we undertook separate panel regressions on the effect of international aid on democracy and economic freedom and found that it has a small positive effect on democracy but a generally negative effect on economic freedom, suggesting that political criteria are more important than economic ones in determining international aid levels.

TABLE 12: NET EFFECTS OF AN INCREASE IN ECONOMIC FREEDOM AND DEMOCRACY  
ON PER CAPITA GDP

	Global	Africa	Asia	E.Europe	W.Europe	MENAf	CLAm
Economic Freedom	\$148.80	\$56.25	\$119.03	\$283.63	\$547.58	\$26.38	\$50.80
Democracy	\$33.39	\$33.28	\$12.53	\$63.29	\$981.04	-\$13.06	\$36.72
AIDGNI	-\$0.35	-\$13.23	-\$27.66	-\$139.04	\$0.00	\$23.30	-\$3.84

The effect of economic freedom is derived from the sum of the separate increases of a one point change in property rights and judicial independence. The democracy effect is derived from the separate one point increase effects in civil liberties and political rights. The international aid ratio is included for purposes of comparison.

## Conclusion

We have provided evidence of the role of risk in determining a country's level of per capita income. Measures to expand international trade and investment will produce positive effects on per capita income if countries also embrace institutional reforms that strengthen property rights, judicial independence, in concert with an expansion of democratic institutions. International aid, which often has been driven by political criteria, has historically produced generally negative effects on per capita income. If international aid is to serve as a tool for successful globalization, it needs to be crafted in ways that strengthen risk management institutions.

Secondly, we find that economic freedom carries stronger weight in raising per capita incomes than the level of democracy. This is not to say that measures to promote an expansion of democracy have no positive effects, but that economic reforms that strengthen property rights and judicial independence will produce stronger effects on per capita income. This finding is consistent with ongoing studies regarding the level of governance as a precondition for expanding per capita income (Kaufmann and Kraay, 2004; Zakaria, 2004). What these findings leave open is what incentives may be needed to bring about the kinds of institutional reform that are most effective in raising real per capita incomes.

## End Notes

<sup>1</sup> The Great Depression of the 1930s is instructive on this point. As individual economies erected barriers to trade in a beggar-thy-neighbor cycle, per capita incomes either declined or grew at far lower rates than took place during the 1920s. This response was anticipated by John Maynard Keynes in his 1919 analysis of the Versailles Peace Treaty, *The Economic Consequences of the Peace* (London: MacMillan, 1971 [1919]). See also Christina Romer, "The Great Crash and the Onset of the Great Depression," Quarterly Journal of Economics 105(3) (1990): 597-624.

<sup>1</sup> Much of the New Deal programs in the United States during the 1930s were driven by the absence of markets to address various forms of risk: unemployment, old age and disability, bank deposit insurance, and the distribution of income. To the extent that market institutions offer asset choices to manage these risks, the justifiable level of

public sector intervention is reduced. Where no such market institutions exist, it falls inevitably on the public sector to manage those risks, even though the result may be substantial transactions costs and the presence of moral hazard by economic agents.

<sup>1</sup> One emerging macro financial risk indicator is the Chicago Board of Options Exchange Volatility Index, or VIX. While the VIX seeks to measure stock market volatility, it does not capture other sources of risk for untraded assets such as political instability and environmental quality. Historical data on VIX daily prices can be found at <http://cboe.com/micro/vix/historical.aspx>

<sup>1</sup> One example is the risk of terrorist attacks. In the muchdebated discussion over re-organizing intelligence services to anticipate terrorist attacks, some have proposed inclusion of terrorist futures markets as a way of pricing such risks. Such a market was proposed by DARPA director John Poindexter in the aftermath of the 9/11 terrorist attacks in the U.S., but was dropped following protests that it confounded such risk with the presumption of encouraging such attacks.

<sup>1</sup> The question acquired a broader framework with the Fareed Zakaria's 1997 essay, "The rise of Illiberal Democracy," *Foreign Affairs*, 76:6 (November-December):22-43, and restated more recently in *The Future of Freedom* (New York: W.W. Norton, 2004).

<sup>1</sup> While the standard deviation of the volatility provides an absolute measure, relative risk is measured in terms of the coefficient of variation. The existence of such measures requires the existence of functioning markets in which the volatility of a traded asset can be observed. Yet risk can exist for nontraded assets, which makes the measurement issue more problematic, and which is why we adopt an index of aggregate country risk in the present analysis.

<sup>1</sup> This becomes even more problematic in the context of conditional risk, rank ordering, and the framing of alternatives. The field of behavioral finance derives from insights derived from psychology, in particular, work undertaken by Kahneman and Tversky. See, for example, Kahneman, Daniel, and Amos Tversky (1979), "Prospect Theory: An Analysis of Decision Under Risk," *Econometrica*, 47:263-91.

<sup>1</sup> In more complete markets, aggregate country risk can be tracked to some extent through sovereign bond ratings, measures of political stability, indicators on environmental quality, and on the presence of financial risk management instrument prices. Since many emerging and developing countries lack these measures, our use of the ICRG aggregate country risk serves as a proxy to those measures.

<sup>1</sup> This is a qualified statement. It is possible that the ICRG index may be used in some derivative contracts, although we have not direct evidence to support or refute this possibility.

<sup>1</sup> Two factors motivate the choice of an ordinary or fixed effects approach. One is that with a random effects model there is a considerable loss of degrees of freedom. The other is that because we include developed countries in our sample, the international aid to GDP ratio is absent.

<sup>1</sup> We have rescaled the ICRG index so that higher values of the index reflect higher levels of risk, and thus to derive a more intuitive insight on the inverse relationship between aggregate country risk and per capita income. Our revised index is thus listed in various regression estimates as RCCRISK.

<sup>1</sup> Two criteria have been used in the selection of countries. One is data availability, while the other is a simple grouping by geographic region. No attempt has been made here to disaggregate countries by policy reform environments, as is done in many World Bank studies.

<sup>1</sup> The Index of Economic Freedom is based on an unweighted average of ten factors, based on a compilation of 50 independent variables drawn from a sampling of expert opinion and published data sources. The ten factors are: trade policy, taxation, government intervention, monetary policy, capital flows and foreign investment, banking, wage and price controls, property rights, regulation, and black market conditions. We apply the property rights and judicial independence indicators as independent variables for this analysis.

<sup>1</sup> Ted Robert Gurr and others have developed various polity measures as indicators of the level of democracy across countries. While the polity index does provide some insights, it does not cover the range of countries we seek to examine, nor does it resolve the issue of whether one is measuring elections as the primary determinant of

democracy or whether civil liberties and political rights can capture important pre-conditions for electoral democracy to function effectively. See T.R.Gurr, K Jagers and M. Marshall (2000). *Political Regime Characteristics and Transitions, 1800-1999*. (College, Park, Md.: Center for International Development and Conflict Management, University of Maryland).

<sup>1</sup> One other variant we considered is the weighted average of the index of civil liberties and political rights. The product index works better as it matches more closely the range in per capita GDP for the sample of countries used.

# Apulian Agribusiness: Typicality versus Globalisation in Consumer Perception

*Luca Petruzzellis*

*University of Bari, Italy*  
*Marilene Lorizio*  
*University of Foggia, Italy*

## Abstract

Italian agriculture is one of the “made in Italy” systems which characterises the whole Italian production system. The present organisation and production of the Italian agro-industrial system results from a complex evolution leading to the modernisation of this sector. Consumer food buying behaviour proves to be influenced by brand (46%), expiry date (41%), ingredients (29%), price (28%), brand experience and previous purchases (13%), production origin (9%), promotion (8%), store loyalty (6%). So far typical products, which present a strong socio-economic link with the territory, play a proactive role in this system. This paper investigates the performance of Apulian olive oil, both from the production side and the consumption one. It deals with its typicality and its contribution to local development.

## Introduction

Following its important role in the 1960s the Italian agricultural sector was, on the one hand ‘involved’ in the country’s process of industrialisation which greatly influenced the manufacturing industry, while on the other it was progressively reorganised both in terms of workforce and in the share of income produced, bringing it into line with the rest of Europe (Casati, 1997). The demographic rise of the 1960s, together with this increase as a consequence of the modernisation of production in the manufacturing industry, resulted in increased agricultural demand. This in turn created an analogous increase and reorganisation in supply which tried to follow the trend of demand by continuously increasing productivity and technical progress in the production processes. However, in conformity with Engel’s law, the incidence of food consumption on Italian family expenditure gradually decreased; on increase in absolute values of demand resulted also in a decrease in relative values due to the growing interest in the quality of goods purchased. [1]

In this context supply was re-evaluated in terms of its contribution to the national income – and therefore to employment – while simultaneously undergoing a type of ‘industrialisation’ in the productive “filiera”, characterised by closer and atypical relationships with other sectors; initially with inward production input and machinery suppliers, and outward product transformation and distribution. These circumstances, together with the introduction of technical progress in agriculture, led to a continuous increase in productivity. Over time this also led to the ‘historic’ surplus of agricultural labour which continues to characterise the industry even at European levels.

Although now a perfectly integrated process, the national agrifood industry also showed a series of unusual factors which, at times, seem to restrict the total and efficient modernisation of the system, and at others create opportunities which may lead to a real growth process. In this context the main characteristic is the small or very small size of the agricultural businesses which permeate every aspect of the production unit involved, from the number of hectares (90% of national agricultural businesses are between 1-10 hectares; slightly more than 1% is more than 50 hectares) to the derived income (in 2003 more than 60% of national agricultural businesses – which account for about 1/3 of total production – declared an average income of 7,000 euros, while slightly more than 10% declared around 65,000 euros, accounting for 2/3 of total production). In a context of rapid intensification of commercial exchange, expanding markets and increasing organisation of the production process, the smaller businesses may undermine the competitiveness of the national agricultural industry. If the highest level of productivity is not achieved then a good result as regards standardised goods will not be reached and may prove to be a limitation

in satisfying market demand for raw materials, resulting in reduced market power compared to the larger distributors (Pieri & Venturini, 1995; Casati, 2003).

This paper deals with typicality as a competitive asset for the agricultural sector in a global scenario (par. 2 and 3). In particular Apulian olive oil has been chosen as a typical product, which contributes to industrial and economic development. The performance of Apulian olive oil has been studied, both from the production (par. 4) and the consumption points of view (par. 5).

## **Agribusiness: The SMEs Production Approach in the Global Era**

Small sized firms are characterised by traditional methods of production and of goods, which consequently are closely linked to their original areas. This creates a type of 'identity trademark' which renders the product, and the firm, semimonopolistic. Moreover, the persistently traditional nature and high demand for territorially linked traditional products is partly becoming a competitive advantage for the national agrifood industry which seems to find a market in those segments where product 'typicality and quality' are appreciated. Within the sector territorial differences are extremely important and related to a complex mix of factors ranging from the obvious differences in environmental and geographical conditions, to the various historical events which influenced different areas of Italy, to recent economic development which affected different areas to varying degrees, in some cases reducing the differences between stagnant and dynamic areas and increasing them in others.

The first significant dualism is the well-known one between North and South. Northern agriculture appears industrialised, capitalised and part of a developed and organised agrifood system, characterised by more efficient productive units, due also to the numerous productive infrastructures. Southern agriculture, however, while having the 'exogenous' advantage of a favourable climate, providing an agricultural offer in keeping with the rest of Italy and most European partners, is limited by the low number of territorial infrastructures. The different environmental, geographical and historical conditions previously mentioned, the different rate of technical progress as well as the varied physical territorial conditions have, over time, led to a type of division in the national agricultural industry which is reflected in the type of cultivation. This ranges from intensive agriculture, mostly in the North, characterised by high economies of scale, product standardization and the continued use of technical progress (Iacoponi & Marotta, 1995), to the so-called quality agriculture characterised by non-standardised production which is differentiated according to the area and therefore typical, and is potentially very competitive even when considering that relative demand seems to be more elastic.

The national agribusiness, however, is influenced by other more significant differences which are more closely linked to the type of supply and relative production methods. The many environmental differences which characterise the country create specialised production areas which are restricted and homogenous, so much so that many of the principal national agricultural products are almost exclusively from particular areas. This concentrated area of production and the smaller size of the productive units together with a society deeply rooted in its own territory are the factors which create the unique productive "filiera" known as "sistemi produttivi locali" (Garofoli & Mazzoni, 1994), in which the businesses involved in the different stages benefit from the presence of firms which are differentiated, complementary and interactive. In this way the smaller dimensional economies linked to production technology are balanced, making use of significant economies of localisation and agglomeration thus creating a greater differentiation in production (less standardisation) having greater flexibility in the organisation of processes which only small interactive production units can generate.

Other positive influences on competitiveness of production concentration are the possibility of lower transaction costs due to the proximity of the businesses and continued mutual contacts. This type of production is closely linked to the territory and its history and initially operates on the local market but in time acquires an added 'competitive' value, even in global markets, for its 'typicality'.

Based on this categorisation for industrial districts (Becattini, 1987; Becattini & Rullani, 1993), the unique factors necessary for a hypothetical agroindustrial district ought to be:

- Typical quality products;
- Co-ordination between agricultural and local transformation industries;

- Flexible specialisation;
- Ability to use innovations;
- Good training and entrepreneurship;
- A common market;
- Local institutional support networks.

These factors identified different types of local development models which vary from local agricultural systems to local agrifood systems, from local agroindustrial protodistrict to agroindustrial area (Gurrieri et al., forthcoming).

Most of the identifying factors of an agroindustrial district can be seen in the typical traditional cultivation by clusters of small businesses and, even more noticeably, in the offer of organic products which can be defined as a 'niche market', now increasing both in competitiveness and in satisfying all the 'new' needs of the demand for agricultural goods (traceability and origin, food safety, typicality, territorially linked history, culture and tradition).

The identification of these products (brand, label) whether it reflects the choice of the business or the existing related law, has a signalling function necessary for food products which become an experience goods and for which correct customer information through the brand is a basic requirement for market functioning or credence, as for the case of organic products.

### **Agribusiness: The SMEs Consumption Approach in the Global Era – Typical Products**

Typical products not only represent an important resource for the local economy, rooted in a delimited area, but also impact positively on the consumer systems to whom they are targeted. Therefore they are linked in a biunique relation with the territory and its economic systems (both production and consumption). So far typicality derives from place specific factors that, in turn, are a source of wealth especially if boosted by the interaction between place governance and local entrepreneurship (Golinelli C.M., 2002).

This kind of goods communicates its own identity, transferring emotions, sensations and tradition. They are also a tool for understanding the local community, its habits, traditions and spatial features; it is more than an economic asset, it is a cultural matter, a way of life.

Typicality can be appreciated in two ways: the production one, that derives from the qualitative peculiarities of the raw materials, their origin, the environmental and morphological conditions of the area, and the know-how of the transformation industry. The consumption direction depends on the relation with the consumer market, on the consumers' perception, who, by identifying themselves in the product ambience, contribute to strengthening the product and the community images (Cardinali, 1998; D'Amico, 2003). Again the biunique relation summarised in the word typicality, is obvious.

Typical products result as being the offer of a whole, complex system, that group together the benefits derived from taste, traditions, and place (see Fig. 1). Being typical constitutes the added value that can differentiate the physical product; in this sense it is no longer important to invest in branding or packaging but in trying to preserve the values through *typical* brand or packaging. That is not to say that marketing actions are not to be used, but the classic marketing thrusts should help to retain and constantly renovate this particular source of differentiation, avoiding all the niche problems that occur.

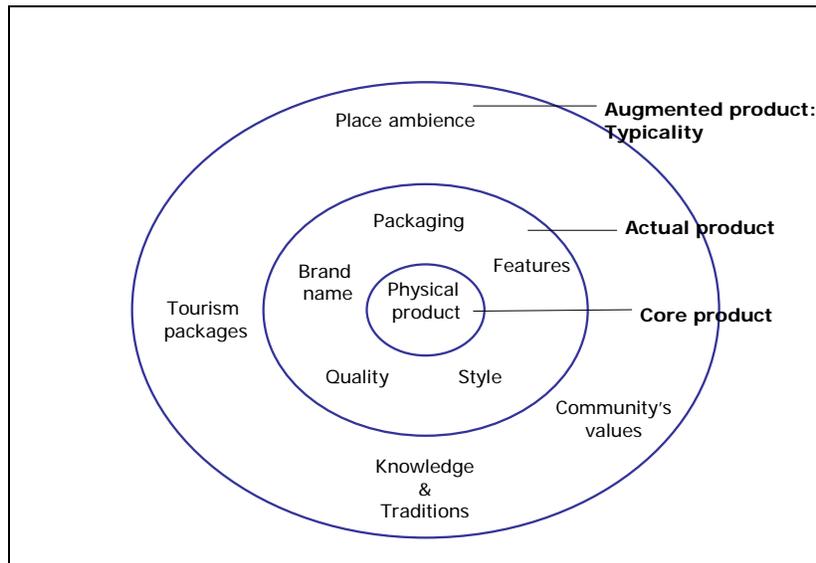

FIG. 1: THE LEVITT MODEL FOR TYPICAL PRODUCTS

Source: elaboration on Levitt (1980)

The more typical the product, in a sense linked to the territory's production and consumption, the more difficult is its success in global competition (Gurrieri et al., forthcoming). Therefore, in order to change the weaknesses into strengths and exploit the market opportunities boosted by globalisation, a systemic approach (Golinelli G.M., 2001) in the offer management should integrate consumption models and different regional diets, to project/design a unique selling proposition under a collective brand. In fact, the approach now used does not manage to support the growth of typical Italian products, because it does not succeed in customer loyalty, or in turning non resident consumers into regular ones.

The threat is represented by the lack of consumption culture, identified in the link with the territory and its traditions. Therefore global acceptance is an important factor based on local specificities and using a market orientation, product differentiation, brand image, innovation, packaging, and long term relations with a proactive distribution, both in department stores and specialist retailers (Magni & Santuccio, 1999; Malagoli, 2002).

### Apulian Olive Oil: The Production Side

Italian domestic expenditure for typical products is showing a slight decrease due to the price cut that is higher than sales volume increase, olive oil shows the strongest performance, together with wine, with a growth of 243.7% per year due to an increase in sales volume linked partially to the drop in the average price. This product scores an AC Nielsen penetration index [2] less than 5%, showing a niche performance. On the contrary higher index performance are recognisable for products with a long tradition in the convenience category, such as cheese, salami and wine (e.g. Parmigiano Reggiano, Prosciutto di Parma e Prosciutto San Daniele).

Therefore, olive oil is one of the most traditional foodstuffs on the national agricultural market. It was chosen not only because it is produced nationwide but it is also 'linked' to the area with different results in supply, information and mainly in typicality and tradition which distinguish it from other national products and especially foreign ones (Nomisma, 2000).

In this context the term 'typicality' presupposes and summarises a quality product, in particular virgin olive oil. Quality has also become the subject of European Community Agricultural Policy (Ari & Datar, 2002) since the 1990s adopting Community regulation 2081/92 on PDO and PGI and 2092/91 on organic agriculture. According to Community regulation the PDO trademark can be applied to "agricultural and food products deriving essentially or

exclusively from a geographical environment which includes natural and human resources and where production, transformation and elaboration occur in the place of origin” [3]. Therefore, all stages of the production process must occur in a restricted geographical area. PGI on the other hand, is applied to agricultural or food products in which quality and characteristics or reputation are attributable to geographical origin and production and/or transformation, and/or elaboration occur in a specific geographical area, therefore only one stage of the production process must meet this requirement (Federalimentare, 2001).

In adopting the Regulations of PDO and PGI the EU decided to protect and increase the value of the quality and typicality of some products. Moreover it tried to satisfy the consumers’ increasing need for information and support the local rural reality, especially in outlying and disadvantaged areas of the Union, as well as aiding the development of quality control systems based on respecting specific productive regulations established by the production controllers.

These European initiatives for safeguarding quality were favourably accepted by the producers as an important opportunity to increase the value of local agricultural products by certifying origin both in terms of geography and variety. As regards Italian olive oil in particular, in the areas of oil cultivation where most of the virgin olive oil was sold unbottled and anonymously, obtaining a PDO and PGI certificate could give additional value and partly repay those producers interested and involved in the production of quality oil. The introduction of this certification has the natural and advantageous consequence of favouring the production of virgin olive oil of consistent typicality as this can be obtained only from certain varieties of olives typical to the production area and of a very specific nature. Table 1 shows the different types and consequent commercialisation of nationally recognised PDO and PGI olive oils.

The Italian regions with the highest recognitions are Apulia, Sicily, Calabria, Campania and Abruzzo, testimony to the southern tradition of oil production which merits protection and interest. While PDO and PGI recognition presents good opportunities for becoming well-known, of specific additional value and transparency and safeguarding for the consumer, it must be stated that this potential can be neutralised by a series of restrictions which reduce the effective potential.

Firstly, size restrictions determine the main decision of producers to satisfy family needs, reducing the final amount available. This partly reflects the expression of what appears to represent, in the short term, the greatest restraint on PDO/PGI development, identifiable not only in the real availability of the product but in the low propensity of the producers to have it certified and commercialised. This behaviour should be considered a response to the difficulty in finding a market for a certified product at the price which this added value implies, or rather, a price which covers the main production costs when respecting PDO/PGI regulations. A possible short term solution could be the reduction of certification costs, thus 'unburdening' the company accounts.

The role of the Protection Agencies would seem to be important, and ought to be widespread and active in the support and promotion of PDO/PGI recognition, both individually on a territorial level and at national and international levels. This would help the local, national and international consumers who are inclined to buy quality products but also require guarantees on choice by offering them further security which may justify the higher cost of certified products on the market compared to similar conventional ones (see table 2).

In this scenario Apulia is the major Italian producer of olive oil, with 350 thousand hectares that represent 70% of the agribusinesses. This product is strongly linked with the region's morphological structure and landscape. So far it has become an identification symbol all over the world. While the oil production is strong, it also shows

huge weaknesses in marketing, especially in packaging and promotion. So far it does not impact the entire Apulian economy, failing in its role of typical product and local development tool.

The creation of a protected denomination of origin (PDO) label should be the basis of a successful action to compete on domestic and foreign markets. In fact, Italian olive oil has a well established image abroad, which, together with the expansion of demand in non-consumer countries, represents a good opportunity to exploit. In foreign markets, where the elasticity of demand to price is higher, Italian oil is positioned in the convenience category offering a high value.

The consumption evolution and the attention given to the Mediterranean diet, especially by the large organised distribution, create some opportunities for the Apulian system. The high and stable national consumption, on one hand, pushes towards differentiation strategies, while on the other hand it gives the opportunity to plan long term investments without the risk of demand and commercial margin fluctuations.

In this sense the first step to restructuring the oil system is to improve the product image focusing attention on the product and the Mediterranean diet during the purchase action. Therefore synergy between producers and bottling firms should be fostered in order to promote the typical oil (see Table 3).

TABLE 3: SWOT ANALYSIS OF APULIAN OLIVE OIL

<b>Strengths</b>	<b>Weaknesses</b>
<ul style="list-style-type: none"> <li>• Territory with a long tradition in olive production, that is relevant all over the world.</li> <li>• Favourable environment for cultivation.</li> <li>• Various types of olives in relation to the area of origin.</li> <li>• Strong link with the territory, that offers the possibility to exploit this product for the environment, landscape, tourism.</li> <li>• PDO, geographical features and production standards are tools for product differentiation.</li> <li>• Predisposition of the farmers to invest especially for machinery.</li> </ul>	<ul style="list-style-type: none"> <li>• High fragmentation of the sector that impedes the renewing of the plants and the use of new methods of harvesting because of high costs.</li> <li>• Lack of bottling firms in the region: a high percentage of the production is bottled outside the region transferring the added value.</li> <li>• The need for rotation and so the misuse of adequate techniques.</li> <li>• Low propensity to export.</li> <li>• Production localised in marginal, profitless areas.</li> <li>• Insufficient infrastructures.</li> <li>• High presence of illegal work.</li> <li>• Lack of associative behaviour.</li> <li>• Lack of investments in research and experimentation.</li> <li>• Lack of marketing actions, especially promotion.</li> </ul>
<b>Opportunities</b>	<b>Threats</b>
<ul style="list-style-type: none"> <li>• Strong demand for typical extra virgin olive oil, with a stable and high national consumption.</li> <li>• Very good image abroad and a steady demand growth in non-consumer countries.</li> <li>• Convenience positioning on the foreign food market.</li> <li>• The development of irrigation and storage practices to reduce production rotation and stabilise consumer prices.</li> <li>• Widespread oil mill distribution, together with modern cultivation techniques, to produce a valuable oil.</li> <li>• Consumer sensitivity to quality and rediscovering of local traditions.</li> <li>• Political action to foster cooperation among all those involved, also providing incentives.</li> <li>• A territory with a tourism vocation.</li> </ul>	<ul style="list-style-type: none"> <li>• Risk of not exploiting the PDO or PGI from the EU properly.</li> <li>• Increased competition from Mediterranean countries with similar production and all the requirements for EU financial help, due to European market enlargement.</li> <li>• The high amount of direct selling, that does not reach the break even point to bear the higher promotion costs.</li> <li>• Due to personal relation in the direct selling, the oil quality could not fulfil the qualitative standards required by the EU regulations for bottled oil.</li> </ul>

### Apulian Olive Oil: The Consumer Side

Considering the consumer evolution, olive oil, as a typical product, evokes a sense of “we-ness” and rediscovers the link with the territory; while, as a firm product, stating its strong demand and rapid supply growth, differentiation

strategies based on territorial aspects, production standards and promotion are needed in order to underline the different features.

In an attempt at analysing the performance of Apulian olive oil as a typical product, this paper investigated consumer attitudes towards the product by a questionnaire distributed in department stores, supermarkets and superstores. The objective was to measure the consumer perception of olive oil typicality and territoriality and to what extent the link with the Apulian territory is a purchasing choice criterion.

Olive oil is a demand-oriented market, differentiated by high product quality (Ismea, 2000). On the other hand informational asymmetries between producers and consumers cause a persistent gap between the tangible quality of the various types of oil and the perceived quality of the segments. Therefore buying behaviour is based on income, social, cultural and psychological factors such as food habits, personal opinions, acquired knowledge, traditions.

Data were collected by interviewing a random sample of 353 people, near to the possible points of purchase in the province of Bari, where 1/3 of the regional production is carried out. The dataset was analysed with SPSS; firstly by descriptive statistics, in order to describe the main characteristics of the sample; secondly by the MDS technique and the factor analysis (Molteni & Troilo, 2003) to measure Apulian olive oil perception and its presence in consumption attitudes and in the shopping basket.

The sample was of 52% of women, who are, generally, mostly involved in the household shopping especially regarding food, and the average age is 40. Surprisingly, men from 30 to 50 years old were the most informed and very precise in answering, confirming consumer behaviour evolution. As regards buying behaviour, they are strong consumers of typical products, especially pasta (28%) and mozzarella (23%); this derives from their food culture that is strongly shaped by their origin.

In order to investigate the link between the sample's buying behaviour and geodemographics (Roth, 1995; Peterson & Jolibert, 1995), a chi-square analysis was carried out, correlating the place of purchase (oil mill, supermarket, private and own production) to sex, age, and profession. Thus it has been hypothesised that there is a relationship between the purchase of oil and consumer culture, namely tradition, search for quality and healthiness; but also the available income can influence purchasing, since consumers can pay a premium price for a quality product. In fact, the analysis showed that the point of purchase is correlated only to profession, as a measure of money supply [4].

In order to understand why olive oil, and in particular the Apulian one, is bought, an in-depth analysis has been carried out on the benefits and features sought, the different types and brands bought.

Of the oil features that are predominant in the decision making process, taste is the first characteristic that the sample looks for (72%), so a hedonistic feature, but also a quality index of the product; secondly, consumers look for density (30%) and colour (36%). These two attributes regard the outward appearance and the oil pureness in relation to the refining process [5]. Moreover, the benefits sought by consumers are identified in fig. 2. Two main areas are identified: the first regards the healthy consumers, the latter the price oriented ones; while in the middle there is a third area identified by the single "usage" variable.

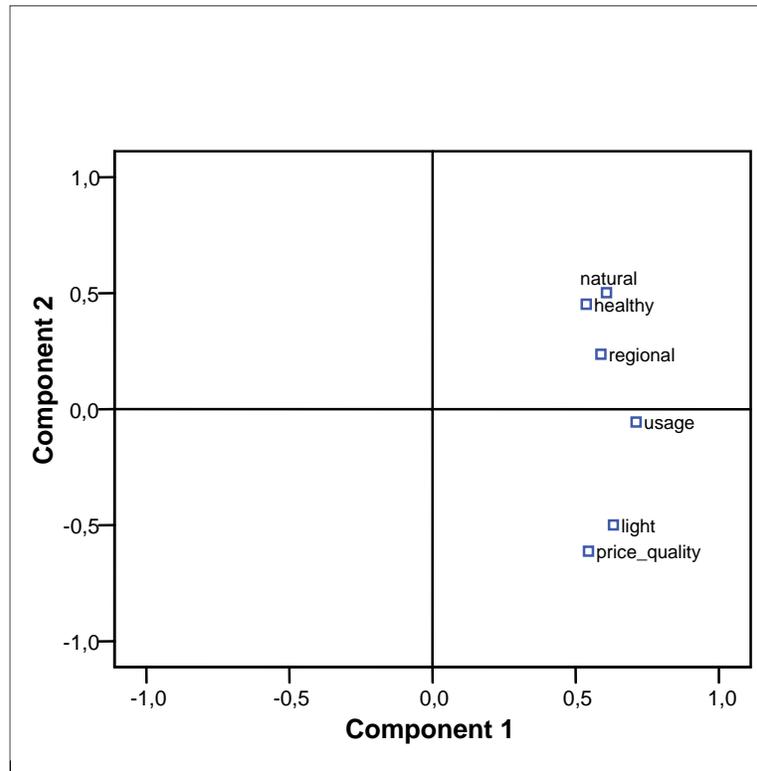

FIG. 2: APULIAN OLIVE OIL FEATURES

The first segment is composed of people very focused on the genuine quality of the product and the benefits they gain in diet and consequently in health. They consider the Apulian product better than others from other regions. Instead the second one has underlined the importance of the relation between price and quality, even though from the production side the olive oil still has high costs. The affordability increases the use of the oil that is considered in this segment, “light” in the sense that it can be used to flavour most foods, as also required in the Mediterranean diet.

Lastly, an analysis on the brands’ position in the consumer perception has been carried out (see fig. 3). A local brand (De Santis) resulted as being the most well known and purchased, due to its link with the territory, acting on the made in and the authenticity. The main competitors prove to be two national brands (Bertolli and Carapelli) that can have access to better marketing actions, such as advertising and wider distribution. However in the buying choices, consumers do consider the oil mills, which provide a product they trust, being typical. In fact, the oil mill choice can give the consumer the possibility to appreciate the distinctive features of local production and the producer to establish a high level of differentiation.

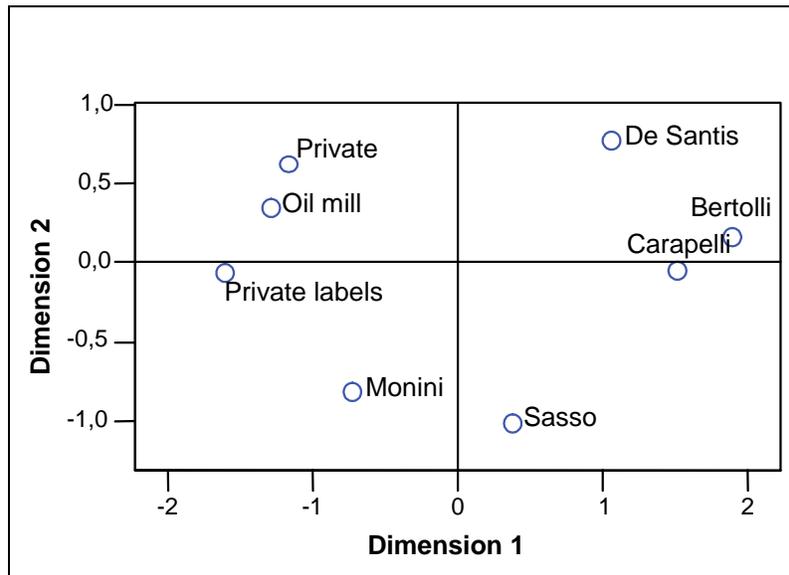

FIG. 3: OLIVE OIL BRANDS' POSITIONING MAP

In confirming the findings, data on the percentage of purchase for each ACNielsen area in the two opposite channels (modern – Hyper & Supermarkets - vs traditional distribution) show how in Nielsen's area 4 (Southern Italy) the gap between the two distribution forms is less than the other areas, with a greater weight for the traditional one, due to the culture and the purchase behaviour of southern consumers. This confirms the fact they are not greatly influenced by advertising and classical marketing tools, but are more focused on “typicality” assets, in the fact that they look for direct contact with the “producer” acting on trust and genuine assurance (see fig. 4). In fact, in the rest of Italy, except for the North East, the bottled product is consumed, especially in the modern distribution channels. In conclusion, the purchases of oil are strictly correlated to consumer socioeconomic features: high income, high level of education, and a preference for modern distribution in order to buy quality products at good prices.

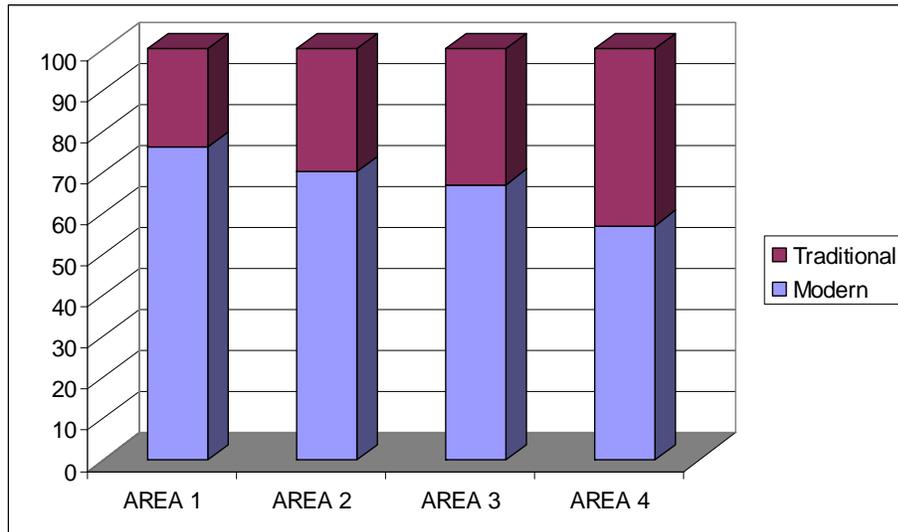

FIG. 4: PURCHASE FOR AREAS AND DISTRIBUTION IN ITALY  
Source: elaboration on ACNielsen data (2004)

As can be seen in fig. 5, the market shares confirm the brands' positioning. The national and the local situations show a fragmented market, in which the link with territory plays an important role. The market can be divided into six groups in relation to distribution strategies and level of differentiation, three of which are clearly identifiable in both the figures: 1) the big firms, with national and international markets, a strong penetration in the modern distribution, and brands with a well-established image that requires huge investments in promotion and advertising (i.e. Carapelli, Sasso and Monini); 2) the big modern distribution chains, with their private labels that are correlated to their logo; 3) small and medium enterprises, with a limited territorial market, differentiated by product quality, geographical origin, local traditions and taste (i.e. De Santis and the oil mills). Moreover, on the national scene three more players are operating, such as 4) firms that distribute their products through door to door and mail order selling (i.e. Fratelli Carli); 5) multibusiness firms, with niche strategy, producing extra virgin olive oil with a high price and quality (i.e. De Cecco, Del Verde); and 6) export only oriented firms (i.e. Olitalia, Oleifici Colavita). In the local arena there are a lot of very small (micro) enterprises (labelled private in the figure) which serve small segments, mostly linked by kinship and friendship.

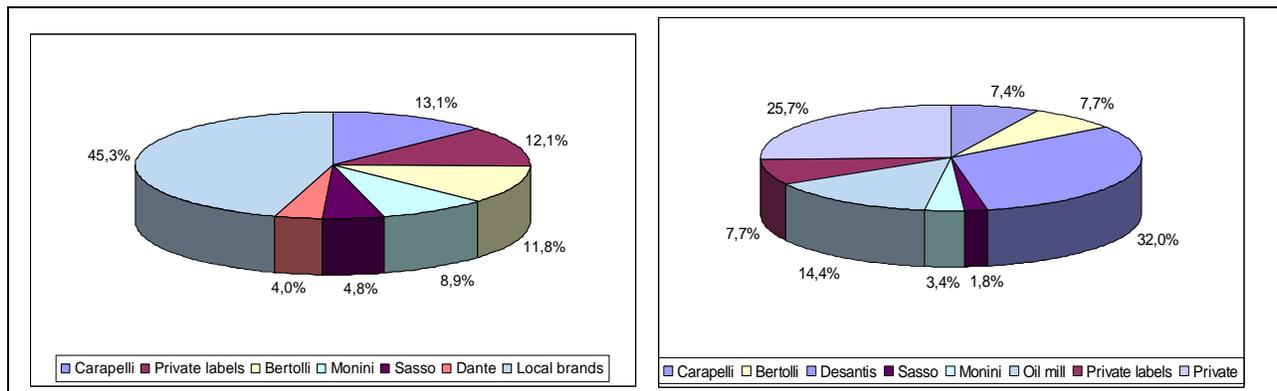

FIG. 5: OLIVE OIL BRANDS' ITALIAN AND APULIAN MARKET SHARES  
Source: elaboration on ACNielsen data (2004)

## Conclusions

Globalisation has opened many opportunities to the Apulian agribusiness, in particular for olive oil, as well as many challenges, such as new competitors (i.e. Spain, Greece, Tunisia, Morocco), managerial issues (i.e. organisation of the “filiera”, new productive process, marketing activities). The expansion of demand is due to cultural and social phenomena, which have shifted consumer attention on quality, traditions, and typicality.

This last feature proves to be the main asset on which a strong management approach should be based to foster the position of oil in order to enhance its image effect and increase its global market penetration. In this sense consumer attitude and perception represent the first elements on which typical products can develop successful competitive strategies in global markets, exploiting the product and the competitive advantage of national system.

### **End Notes**

The authors wish to thank the voluntary interviewers.

L. Petruzzellis contributed specifically to section 3 and 5, A.R. Gurrieri to section 4, M. Lorizio to section 1 and 2.

1. National food consumption was approximately 55% of total consumption in the post-war period, but in the 1990s was less than 20%.
2. The index measures the percentage of families that have bought the product at least once.
3. To date 111 Italian PDO and PGI have been registered within the Community, including both agricultural and agrifood production. The registered production are present in all regions of Italy and divided into six main areas: cheese, fresh and processed meats, fruit, vegetables and cereals, extra virgin olive oil, condiments and essential oils. Cheese is the leading group with 30 types/categories, followed by fruit, vegetables and cereals = 28, fresh and processed meats = 26, extra virgin olive oil = 24, condiments (traditional balsamic vinegar) = 2 and essential oils = 1. As regards regional division, the highest number of types/categories is in Emilia Romagna (20), followed by Lombardy (18) and Veneto (13). The division of number of types by region shows that almost 70% are from production areas in Northern Italy, with slightly more than 30% of products from the Centre- Southern area.
4.  $p = 0.001$  for the variables point of purchase-profession;  $p = 0.683$  for point of purchase-sex;  $p = 0.941$  for point of purchase-age.
5. For example, the green colour means that the oil is very pure; the greener the oil the less it has been treated.

# **Agriculture and Development: Prospects and Dilemmas**

*Jassodra Maharaj  
University of East London, United Kingdom*

## **Abstract**

The agricultural sector has a central role in the development process and the challenges facing agricultural development has both national and international implications. In recent years there is much concern for the maintenance of the ecosystems which is featured high on the agenda particularly as the pressures for agricultural growth occurs with an increasing global population. According to the FAO's agricultural department there are inevitable links between agriculture and the ecosystem. However a positive outlook by the FAO stated that in 2030 there is hope that the average arable land per agricultural person is expected to increase a little allowing the opportunity for more land to be cultivated in a sustainable way. This paper addresses the following questions: what is the relationship between agriculture and development? Who depends on agriculture? Which agricultural policy objectives should receive most emphasis? Is it growth, modernisation, increased marketed output and export or equity?

## **Introduction**

In virtually all developing countries agriculture continues to play a major role within the process of development. It may be appropriate to begin by stating that out of the 5.1 billion people who live in developing countries, 3 billion live in rural areas and 80% (2.5 billion) of the rural population depend upon agriculture for their livelihood [16]. But what is of major concern is that it is estimated that 70% of the poorest people in developing countries are located in rural areas and engaged primarily in agriculture bearing in mind that the differences in levels of poverty vary from country to country. In a recent World Bank presentation Mellor [18] highlighted the importance of tackling rural poverty to change the situation of those who work in agriculture. Mellor [18] stresses that the crucial employment creating linkages that stems from agricultural growth will inevitably have a beneficial impact on the rural poor. Accelerated growth in agriculture indirectly boost demand for goods and services within the local rural community and towns. Furthermore knowledge of the behaviour of the landless peasant farmer and near landless rural households who account for the majority of the world's poor is vital for shaping any government policy aimed at reducing poverty.

## **Historical Perspective**

Presently there is a lot of focus on industrialization which is seen as a means of upgrading society to improve the overall standard of living. However, it is without doubt that agriculture still remains the dominant sector in many developing countries. In countries like Zimbabwe and Tanzania agriculture accounts for about 65% of the total labour force whilst in Nepal, Malawi and The Gambia it accounts for roughly 80% of the labour force [9]. One of the most amazing phenomenon of developing countries during the 1950's and 1960's was the neglect of agriculture even though a high proportion of the population were engaged in agricultural production. But a high cost was paid when the rural – urban migration resulted in higher poverty levels.

A major explanation for the poor performance of agriculture is that traditionally poorer countries have tended to exchange primary commodities ( food and unprocessed raw materials ) for manufactured consumer durables. Even today about 50% of developing countries' exports comes from trade in primary goods [16]. This pattern of trade has persisted since the days of colonization when the trade of developing countries were subservient to the needs of colonial powers. The pattern of trade has often resulted in deterioration in the balance of payments of developing countries due to fall in the price and demand for primary in relation to those manufactured imports. The latter lead many governments to reorient their economies by pushing industrial development within their strategic

planning programmes. During the 1950s and 1960s Import Substitution Industrialization (ISI) strategy was epitomized as the way forward to the achievement of development. In Latin America Prebisch [10] was the instrumental force behind ISI which many Latin American countries followed at the time. In a nutshell Prebisch [10] and other advocates including the development economist Singer [12] argued that the developing countries were in a dynamo of “unequal exchange” as they exported vital raw materials at low value due to the existence of an unorganised labour force and an abundant supply of labour whilst they imported high cost industrial goods from developed countries where labour was highly organised and workers received high salaries. Prebisch termed this trade “unequal exchange between the centre and the periphery”. ISI advocated the philosophy of self-reliance and it arose out of the economic experience of developing countries which were experiencing balance of payments deterioration leading to indebtedness and dependency which meant that developing countries needed to produce what they were importing. In order to cut off dependency, ISI stresses that the state needs to protect infant industries from foreign competition until such time when they can gain economies of scale to allow them to compete internationally. More importantly it implicates more economic sovereignty i.e. less dependence by developing countries on the imports of technology and capital from developed economies.

In response to the problems there was a quest for industrialization by some Asian, African and Latin American developing countries. This led to negligence of the agricultural sector which suffered from both institutional and moral support. Most governments laid emphasis on urban investment and rural areas received little or no attention. Poor infrastructural development in the form of poor transport, lack of water facilities and lack of farming technology resulted in low output. Many farmers left the land in search of the flourishing urban life resulting in a shortage of labour in rural activities. Poor farming methods lead to insufficient innovation, cultivation on marginal land leading to severe erosion and deforestation. In some African countries civil wars and high occurrences of tropical diseases caused massive disruption in normal farming activities. Moreover the effect of colonial economies left a very unequal divide between rich and poor farmers. Most crops were geared exclusively for exports and neglect of the internal markets by post-colonial governments resulted in failure of reformation.

### **The Contribution Agriculture Makes to Growth?**

The agricultural sector is crucially important since billions of people in developing countries live in rural areas and depend upon agriculture for sustenance. Agriculture still remains a means of livelihood for about 60% of the people in countries like Indonesia, Sri Lanka, India, Bolivia, The Gambia, Ethiopia, Zaire and Malawi.

Moreover estimates have also shown that women participation in agricultural labour force within developing countries is very high amounting to about 80% from a recent study [17]. It shows that women do most of the agricultural work yet they generally lack credit facilities or land ownership.

The Lewis [8] model predicts that agricultural changes occur via an overall shift in the pattern of investment encouraging increased productivity and better wages. According to Lewis [8] in the initial stage of industrial development surplus labour from the agricultural sector can be attracted to the industrial sector which offers a wage above the subsistence wage in agriculture. The industrial's sector demand for labour depends on the marginal product. If the marginal product is above the wage rate then more labour would be employed as this would increase the profit levels of employers. However one consideration within the strategy of agricultural policy in poor countries is that the growth of the workforce outstrips the rate of job creation in the non-agricultural sectors. The surplus labour in agriculture contrary to Lewis's model may remain an unemployed pool as there comes a point in time where no room is left for absorption of labour in industry. Moreover concentration on industrial expansion exacerbated income inequality in many developing countries during the 1950s and 1960s and the trickle-down process took many years before any benefits could be felt by the working population. The Lewis model justified industrialization policies biased towards capital-intensive production and ignores agriculture's contribution to economic development other than labour release.

During the 19th century the production and export of cotton from the UK and dairy products from Holland gained substantial revenues for development. Even in Cuba in the 1960s the production and export of sugar helped in achieving massive revenues for development. But there are insufficient reasons for the present developing

countries to follow the same pattern of historical development pursued in the past by rich countries. Although there is a large amount of technology and experience to gain from, developing countries face an entirely different and highly adverse environment from that which existed when present rich countries developed before their industrial growth. There is stronger competition for export markets than that which existed during the nineteenth century. Huge barriers are set up against the exports of agricultural products by developing countries and products like sugar and pulses are subsidized in developed countries. For example although the EU's cost of sugar production is the highest in the global markets subsidization enables it to be ranked as the second largest exporter of sugar in the world. Moreover political and institutional structures are more complex in developed countries determining the current options for the development of poorer countries.

## **The Dual Carriageway between Agriculture and Industry**

The agricultural sector not only provides output to other sectors but it can be viewed as an important source of demand for other sectors' output. To quote Viner [14]: "there are no inherent advantages of manufacturing over agriculture or for that matter of agriculture over manufacturing". A thriving agricultural sector is useful for the manufacturing sector as it provides tax income, supplies food and raw materials to the rest of the population. Raw materials such as timber, jute, cotton and rubber are all essential inputs for the industrial sector for helping a country to sustain itself and the production and exports of such agricultural products where the country has a comparative advantage can help to earn valuable foreign exchange. Agriculture also utilises inputs supplied by the industrial sectors such as tractors, agricultural tools and equipment. According to Meier [9] the demand for farming inputs from industry depends upon the dynamic growth in agriculture. Moreover the tertiary sector expands together with marketing and transport to cater for the additional demand from agriculture. But one setback faced by farmers is that the prices of such commodities have low price elasticities of demand because when world supply increases, prices fall placing exports in a disadvantageous position when compared with exporters of industrial goods.

The experience from current developed countries shows that as countries develop, the proportion of GDP and employment accounted for by agriculture falls. It has been observed that the rise in living standards shape consumption patterns which increases demand for durable goods and services whilst proportionately less income is spent on food. The richer developing countries like South Korea, Malaysia, Brazil, and oil-rich countries have peaked on the size of the agricultural labour force whilst many of the poorer countries need to development strategies to firstly develop agriculture which spreads timely industrial development. Very poor countries like Ethiopia and Sierra Leone are still far from this goal.

## **State of Agriculture in Selected Developing Countries**

Sub-Saharan Africa contains most of the poorest countries in the world which are extremely dependent on agriculture for support. Since the mid 1950s food output per capita has been falling. The decline was 0.4 % annually from 1960 to 1984 with further decline in the 1990s [16]. Per capita income has been falling since the 1960s in most of Sub-Saharan Africa. Droughts from the 1960s up until the 1990s have deteriorated their food problems. An estimate of poverty given by Deaton [3] for Sub-Saharan Africa showed that 49.7 % of the people are living in poverty where poverty is calculated as the proportion of the population living on less than \$1 a day. Much of the land mass is not water fed and so will require expensive irrigation schemes to expand its potential for cultivation. The United Nations Food and Agriculture Organization (FAO) has helped to increase the amount of arable land that can be cultivated. Financing transport infrastructure is very expensive but the governments have also failed to invest in agriculture. Moreover these countries are highly indebted and are heavily dependent on aid. It must be mentioned though that Kenya was successful in Schultziian policies as it developed the high yielding variety of maize and increased its tea output within the region.

China accounts for approximately one fifth of the world's population and highly deserves attention in any discussion of agricultural production. Between 1950 and 1978 when the command economy was in operation in China the growth rates in grain production was as high as the growth rate in population though the full potential of

Chinese agriculture was not realised. The incomes of the rural farmers were depressed resulting in a loss of morale and at the same time interregional trade was very limited. The reforms involving more free trade which took place in agriculture after 1978 led to exceptionally high gains in agricultural production. But removal of intervention in agricultural markets has led to much higher prices offset a little by a rise in public sector wages. A dramatic revision of policy reforms since 1979 has led to vast technological improvements and capital inputs into Chinese agriculture though China also experienced high inflation and income inequality in the 1990s. Technological innovation increases the welfare of society but market forces work in such a way that that innovating producers may not be able to increase profits or may suffer from loss of profits. Presently China has been very successful in reducing poverty to an all time low partly due to the success of the Green Revolution.

## **Land Reforms**

The economic rationale for land reforms is that it reduces land inequality and gives more opportunity to increase productivity. Griffin [6] argues that land reform is a pre-requisite for agricultural growth. An analysis of economic development of countries post 1945 by Dovring [2] showed that there is a positive relationship between land reform and productivity. However the results of land reforms are mixed and it may be a necessary condition but not always sufficient. Extensive land reforms pursued in Taiwan, South Korea and India resulted in massive gains to subsistence farmers giving them a chance to engage in mixed farming as well as a sense of worth and identity. Gini coefficients for land ownership calculated by Todaro [13] showed that Taiwan, and Japan had a low Gini, ranking them high in terms of an egalitarian land structure of ownership. India, Pakistan and Mexico had moderate inequality in land ownership whilst Brazil and Columbia came out with very high inequality in land ownership. During the 1970s low productive agriculture stood side by side with an unevenly developed industrial sector in Brazil where there was a high concentration of land ownership. This has led to high concerns for radical changes to develop a more egalitarian system which is not only beneficial for poor farmers but for the country as a whole.

Taiwan makes an interesting case for the analysis of agricultural progress. Before 1945 almost two-thirds of Taiwan's labour force was engaged in agriculture producing food surpluses for Japan, its colonizer. Agricultural production between 1923 and 1937 grew by 4% a year when new technology helped to transform agriculture. During this period a high diffusion of a new high yielding rice was introduced to Taiwanese farmers backed by the support from local agricultural institutions funded by the USA. Land reforms led to rapid growth in agriculture during the 1950s and 1960s. Savings from agriculture helped to promote productivity in the industrial sector and later on mechanisation in agriculture raised the profile of the sector incorporating it as part of the modern economy.

## **Barriers against Exports of Agricultural Goods**

One of the factors affecting the demand for primary product exports is that trade barriers have been erected by the industrialized nations against agricultural imports from developing countries. Both tariff and non-tariff barriers which include sanitary laws regulating food and fibre imports, packaging, safety regulations, import quotas and production subsidies in importing countries are the main forms of protection against agricultural goods both (processed and unprocessed) from developing countries. These barriers principally operate against the class of products exported by developing countries. In spite of the Uruguay and Doha round of talks within the WTO forum there still needs to be much more reduction in barriers against agricultural goods from developing countries by developed countries.

Another issue at stake is that the export of agricultural goods both (both food and non-food products) have been subjected to falling demand and prices. One of the factors affecting demand for agricultural goods exports is that the per capita income elasticities of demand for agricultural foodstuffs are relatively low. When relative agricultural prices are falling as they have been for the last fifty years (real commodity prices have fallen by 50% between 1957-1992, (see Todaro [13] and World Bank, [16]). All of these have devastating effects on developing countries' export earnings. Even the EU's Common Agricultural Policy discriminates more against developing countries' food exports than the policies that had previously prevailed in the individual EU nations.

The supply of agricultural products has been affected by the structural rigidity of many developing countries production systems. These structural rigidities include limited resources, poor climate, arid land, undeveloped rural institutions and non-productive land tenure. No matter what the global demand for a product is, export expansion is stifled by the rigidities facing supply.

Developing nations also face dualistic farming structures where multinational corporations are engaged in capital –intensive agriculture side by side with low-production farming pursuits. Multinationals have a powerful position and a strong hold over the production and exports of major agricultural commodities produced in developing countries. These multinationals are both forward and backward integrated controlling the exploitation of raw materials, processing, manufacturing and marketing allowing huge economies of scale to be gained. Examples include Broken Bond control of tea production, Del Monte involvement with pineapple, Cadbury control of tea cocoa and Nescafe holdings of coffee plantations in Brazil. It remains to be seen what impact globalisation would have on agriculture.

## **Research and Development in Agriculture**

According to Schultz [11] the transformation of traditional agriculture would bring huge gains in productivity if there is increased investment in new technology. Schultz argue that traditional farmers have peaked out in production with existing technology and the usage of modern techniques would benefit farmers' research. But poor farmers are unable to finance new technology so state support is necessary to create dynamic changes. However the impact of technological change creates unequal distribution of benefits as the consumers gain more than producers. Consumers gain more in the case of inelastic demand as the more inelastic the demand the greater the price reduction as supply increases. The crux of economic development is that technological change leads to a decrease in real prices enabling consumers to spend an increasing part of their income on consumer durables.

In agriculture technological innovation increases the welfare of society but market forces work in such a way that innovating producers may not be able to increase profits. Bhagwati [1] calls this immiserising growth since increased production and exports leads to lower price and deterioration in the terms of trade.

Estimates show that research expenditure has more than tripled over the last three decades. But research expenditure in the Pacific region and Asia increased more than in Sub-Saharan Africa. As early as 1944 the Rockefeller and Ford have been involved in the establishment of more than five international research centres which provided a huge stimulus to the implementation of modern techniques in developing countries agriculture. The high –yielding varieties of wheat and rice was the breakthrough in agriculture gained from research and technology transfer by CIMMYT (Centro Internacional de Mejoramiento ) and IRRI (International Rice Research Institute) leading to the formation of the central features of the Green Revolution. The Green revolution stemmed from the latter created a huge impact on agricultural yields of rice, maize, wheat and many other crops. In many cases the new hybrid varieties were adapted by local research centres to suit the local environment. The central features of the Green Revolution are easily divisible for small farmers (irrigation, fertilizers, hybrid seeds, fungicides and insecticides) are all scale neutral. According to Griffin [6] it is often found that credit availability and interest rates are much less favourable for small farmers than for big landlords which still remains the case presently. While small farmers face a disadvantage as small loans cost more, many subsidised loan schemes are specially targeted at better –off farmers whereas small farmers have to rely on the higher cost informal loan market. Such strategies are clearly unhelpful to smaller poor farmers who are vastly out-competed by the big farmers. According to De Janvry [4] in Latin America there is a self reinforcing nexus of interests amongst large landowners, industrialists and politicians resulting in benefits to the better off farmers.

India gained substantially from the Green Revolution as it became self sufficient in grains during the 1980s when previously it was an exporter of wheat. In some African countries the problems of structural deficiencies exist within agricultural markets and institutions which include lack of rural infrastructure and general government support. But sometimes local expertise and knowledge have been ignored by international research bodies in the design of production and agricultural strategies. Critics argue that if research is to be beneficial to poor farmers then

more attention must be paid to the preferences and ideas of locals and local conditions. In some cases the local adaptive research programmes have enhanced the value of the international varieties to particular locations.

In the past insufficient attention has been given to drought resistance food crops in Africa or to tree management whilst the bulk of attention has been given to export crops and a few major food crops. If changes are to occur amongst the poor the research programmes should be more closely geared to the perception which the poor have of their problems, to the resource they work with and to their own ranking of agricultural priorities and ideas for solutions. Very recently research has led to the introduction of New Rice for Africa (NERICA) is a high yielding rice variety developed to combat attacks by pests and weeds as well as problems of droughts. The New Partnership for Africa's Development partly assisted by the FAO has proposed investments amounting to US\$250 billion between 2002 and 2015 to raise agricultural productivity in a sustainable way. Hopefully this can solve many of the regions' problems.

## Conclusion

In spite of the strong controversy of what is development, there is agreement about certain key criteria of development as a process which elevates human society economically, socially, politically and culturally. We can fairly say that the centre-periphery still remains as the economic order especially so since the majority of developing countries are becoming increasingly excluded from global affluence. There is still much to believe that the future of agriculture lies in institutional transformation

# Global Forces and International Marketing: Decision Support Framework

*Greg Walton*

*Victoria University of Wellington, New Zealand*

## Abstract

**Descriptive theories of the internationalisation processes of firms are authors' observations that describe what firms have done to internationalise. Conventional theories about the internationalisation processes of firms appear less able to explain observed behaviour in a contemporary global marketplace. This paper posits that management decisions (and internationalisation theory development) need to be responsive to, and generated in response to pervasive global forces, as this is the environment all firms must compete in. In a global world that values choice, speed, information, collaboration, risk transfer, market convergence, business cost reduction and increased consumer value, the focus of theory and model development to explain firm internationalisation processes might better be shifted towards providing more practical guidance to firms. This paper seeks to provide a decision framework around international marketing planning and assist firms to decide 'what' they should do in response to the dynamic environment they're obliged to operate in.**

## Introduction

Business will not be as usual in Asia/Pacific in the third millennium. There will be new ways of doing business in a new environment with new players using new communication and product delivery technologies and product distribution systems. This premise alone questions the validity of theories developed to explain the internationalisation of firms. This is a function of time and change. As more and more firms internationalise in greater numbers than ever before for fundamental reasons (and operate in a more dynamic and turbulent trading environment than ever before), it may now be preferable for academics to provide more practical guidance than to perpetuate internationalisation theories that explain past behaviour.

The consequences of globalisation has seen increased regional integration of economies and markets Solberg, (1997) and Rugman, (2001), increased mobility of human capital and skills, and flows of foreign direct investment across borders. Trade liberalisation has opened markets. The current phase of liberalisation is supported by rapid progress in technology in telecommunications and transport services. According to Moen (2000) and Jolly, Alahuhta and Jeannet (1992), ongoing globalisation is believed to have an important impact on the nature of competition. Like trade liberalisation and regional economic integration, information technology and e-commerce are powerful and new drivers of change and growth in the Asia Pacific region. 'Interconnectedness' is already drastically transforming regional economies and reshaping how companies operate with one another. Lazer and Shaw (2000) suggest, 'As multinational firms increase their global outreach, the interconnectedness and linkages among companies and countries will intensify,' (p68). The shape of competition and the 'unit of analysis' moves from an individual firm to a network of firms that compete against other networks. Elements of Porter's 'value chain' undergoes change that effectively reflects vertical integration and interdependence between companies.

Internet and e-commerce applications are affecting the basis of competition by radically altering the buying behaviour of all businesses and consumers. Possibly even increasing competition by fostering lower prices and improving service delivery. IT and e commerce offers companies opportunities to build an infinite number of end customer relationships that will increasingly threaten and transcend middle layers of the supply chain. Consumers seeking information about products will be less reliant on intermediaries to identify, filter and deliver options. As a consequence of these factors conventional customer definition, supply chain management practice and basis of competition are rapidly becoming redundant.

The global pervasiveness of broadcast media is an enormous 'driver of change' and has added weight to academic and commercial arguments about consumer convergence (Levitt 1983), (Czinkota and Ursic, 1984), (Bell, 1995), (de Chernatony et al 1995), (Schlegelmilch and Sinkovics, 1998), (Ohmae, 2000) in many industries,

especially consumables Schlegelmilch and Sinkovics (1998). Further, not only are consumer needs converging and homogenising, but they transcend geographical borders making the unit of analysis no longer country by country. Consumer and businesses are demanding similar satisfactions driven by new communications (IT and broadcast media) and faster transportation and product delivery options. Global competition intensifies and product choice increases. Herein lie enormous implications for marketers and marketing academics. How do conventional theories of firm internationalisation fit with these global phenomena?

In his empirical study Fletcher (2001) proposed a holistic model of internationalisation with recognition of a dynamic global business environment. To empirically test the model Fletcher (2001) suggested an operational model with four distinct constructs and a fifth construct, which he called 'linked' that placed his model within a network perspective as well as an 'environmental' approach. He was very critical of what he terms,

*"...early approaches to internationalisation, such as the 'stages', 'learning' and 'contingency' approaches [which] were developed on the basis of empirical surveys of past export practices in the US and Europe in the 1970s and 1980s, the ...changes in the international business environment mean that such approaches may no longer be relevant. These changes in the environment call for a new approach that embraces a more holistic view of internationalisation," p 29.*

Fletcher is not specific about what the 'changes in the international business environment' are, as this paper suggests, but agrees that a new and more holistic approach to internationalisation is appropriate now. That is, a contemporary approach to business development that embraces awareness of, and awareness of the impact of global forces and in turn, the measured responses (marketing activities) of exporting firms transpire.

## **Conceptualisation**

Understanding this paper and research area might best be achieved by constructing a conceptual framework around what the author considers is the essential problem. Rather than understand the process of internationalisation the paper posits there a salient 'marketing problem' exists. It concerns managers' ability to recognise there are pervasive and 'impactful' forces operating in the global marketplace. And that these forces need to be identified and evaluated with implications determined for their international business operations. The entire problem however, is not only about recognising, identifying and evaluating forces and trends at play in his environment, but just as importantly, to determine what decisions need to be made and what 'responses' are appropriate. Potentially, otherwise, business responses may be impulsive and/or ill conceived. Ill conceived decisions are very probable if pervasive global forces are not recognised at all or their impacts are misinterpreted or underestimated. The problem is essentially about strategic pathways, global marketing management and simply making better marketing decisions. It can be conceptualised in the following manner, Fig. 1.

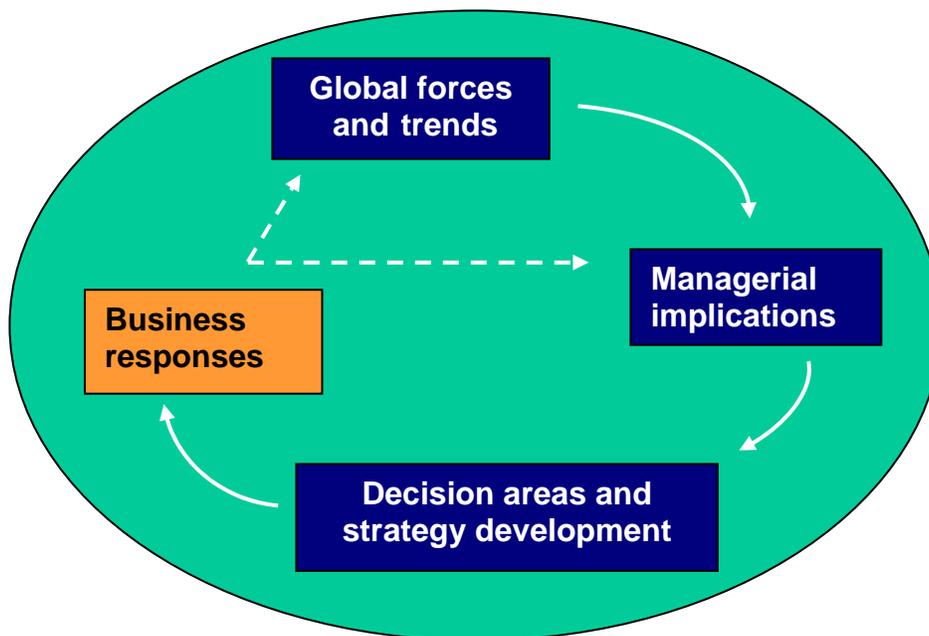

FIG. 1: CONCEPTUALISING THE INTERNATIONALISATION PROBLEM

Companies need a clear understanding of the relationships between pervasive external forces and trends that impact upon growth, and well conceived marketing ‘responses.’ The consequence of businesses not recognising this is equally evident. A poor understanding of external factors or intelligence gathering ability about possible opportunities/markets by exporters, may lead to ill conceived or impulsive responses. For example,

- “Lets develop an e-commerce strategy,” or
- “Let’s enter China” (new market development), or
- “Lets appoint this distributor” (assuming this is the appropriate market entry mode and that this is the most suitable distributor) or
- Lets ‘cluster’ with other similar companies and meet capacity constraints

Heresy? “Of course firms need an e-commerce strategy these days.” But why does it need one? Why cluster? Why diversify markets now? This conceptualisation is an attempt to tie these decisions to the fundamental reasons to make them in the first place. Addressing fundamental issues of marketing, resource and capability.

The four essential elements of this model seek to provide a decision making process that addresses internationalisation problems in a reasoned and integrated manner.

The business planning begins by defining the key ‘exposures’ the firm/industry faces (Box 1). These exposures may represent a mix of threats and opportunities. Box 2 identifies the implications of these exposures and opportunities. Box 3 details significant business decision areas that are (un) consciously made by managers. Box 3 is also about strategy development. Finally, Box 4 are the responses and actions the entity makes. A decision support framework.

**Global Forces and Trends (Box 1)**

- The widespread pervasiveness of global broadcast (Western) media and its content
- Increasing regional integration (Solberg 1997, Lazer and Shaw (1999), Rugman (2001) witness CER, ASEAN, ASEAN Plus Three, NAFTA, MERCOSUR, EU and common currencies, with 10 new members ratified in 6/04’)

- Trade liberalisation and the opening of markets (Lazer and Shaw 1999, DeRosa 2000, Sacha 2001) topical developments such as new trade agendas at multilateral trade forums eg agriculture at WTO 11/01', China/Taiwan's entry into the WTO 11/01')
- New multi and bi-lateral trade negotiations that are forged between Government Ministers and their foreign counterparts (NZ & Hong Kong 2001, NZ & Singapore 2000, NZ & Chile 2000 & 2001, NZ & US negotiations currently and also NZ & China)
- Structural changes in the way markets operate and are regulated (Lazer and Shaw 1999, Lowengart and Mizrahi 2000)
- 'Consumer convergence' (Levitt 1983, Czinkota and Ursic 1987, Bell 1995, de Chernatony et al 1995, Schlegelmilch and Sinkovics 1998, Ohmae 2000) and the internationalisation of lifestyles (Douglas and Craig, 1999)
- Economic and business cycles (Weber 1996, Lazer and Shaw 1999)
- Unexpected 'wildcards' (Trade NZ 1996, Petersen 1997, Cornish 2003) for example the Asian economic crisis of 1997-8, Sept 11, geopolitical crises Iraq 4/03', SARS 5/03,' Bird Flu 4/04,' tsunami 12/04' ...)
- Global branding issues including their decline/demise (The Economist, 8/9/01 p 26-28) and
- Last but not least, the diffusion and rapid adoption of IT and e-commerce technologies by both exporters and foreign customers (Vlahos 1995, Molloy et al 1995, Hamill 1997, Hamill and Gregory 1997, Schlegelmilch and Sinkovics 1998, Lazer and Shaw 1999, Douglas and Craig 1999, Cummings et al 1999, Heintze et al 2000).

Lazer and Shaw (1999) suggest,

*'Marketing managers will have to give increasing attention to company specific implications of WTO rulings, IMF pronouncements, G7 meetings, regional trading block arrangements, government actions on trade and tariffs...(p72).'*

Lazer and Shaw don't go far enough to illustrate the host of other externalities that managers have to be mindful of but the relevance of their statement is clear; that managers will have to be more diligent than in the past because of a more turbulent external environment. These 'drivers of change' encourage managers to come back to the basics of business planning beginning with review or audit of the situation. This invites fundamental questions. These may be a revelation to practitioners and academics alike whereby challenging conventional thinking, commercial practice and approaches to IM strategy development.

These forces can be made or interpreted to be industry specific. The corollary of this is that industry specific and customised responses may be made that reflect the reality of industry global trade.

#### **Managerial Implications (Box 2)**

There are significant implications for firms and entities given an understanding of the impact of these 'drivers of change' upon international business. These include a need to redefine their...

- Customer groups (who are our future customer groups, what do they look like and how do we reach them?)
- Global supply chain management (both forward and backward, what partner characteristics do we need? What do we want them to do?)
- The nature of competition (can companies continue to operate independently or are interdependencies (to source and supply) salient for competitiveness? What is the new nature of competition? and 'business to business' relationship management?)
- Risk transfer to local partners, (Osland 1994))
- Dis-intermediation trends and consequential product distribution and channel selection
- Company location issues (how can companies operate from fewer locations yet find, keep and supply a wider array of customers?)
- Increasing global competition and the greater proliferation of products and consequently, greater consumer choice. More discerning consumers (what is the appropriate basis of competition we should adopt?)
- Market research and market intelligence gathering systems.

These are big issues. How are companies responding to these paradigm changes that reflect a contemporary global business environment?

Research has looked extensively at ‘internal’ or ‘firm specific’ determinants of internationalisation and performance (Cavusgil et al 1993; Diamantopoulos and Schlegemilch, 1994; Thirkell and Dau (1998), and specifically product attributes (Day and Wensley, 1988; Cavusgil and Zou 1994; Terpstra and Sarathy, 2000), firm resources (Reid 1982; Terpstra 1987), resourced based theory (Grant 1991), firm capabilities (Aaker 1988) and linking resources, capability and competitive advantage in studies by (Grant, 1991; Day and Wensley, 1988). Other bodies of research have focused on government influence via export development programmes and assistance etc (Cooke, 1991; Julian, 1995). However, this literature has not been written with a view towards the externalities of the global trading environment that prevailed at the time these were researched.

### Strategy Development and Decision Areas (Box 3)

This framework is iterative. Table 1 details the business decision and strategy formation areas that reflect analysis of the implications (Box 2) of the ‘drivers of change’ mentioned in Box 1. Much of the rest of this paper discusses elements of strategy development.

TABLE 1: BUSINESS DECISION AREAS AND STRATEGY FORMATION

Decision Areas	Dimensions
Market performance measures	<ul style="list-style-type: none"> <li>▪ How do/should companies determine when they should or need to diversify their market and supply activities?</li> <li>▪ How do companies determine business exposures?</li> <li>▪ What economic and financial market performance measures should they use?</li> </ul>
Resource allocation	<ul style="list-style-type: none"> <li>▪ How should resource allocation be determined?</li> <li>▪ Commensurate with market/segment investment priorities?</li> <li>▪ and actual and forecast return?</li> </ul>
International market portfolio management	<ul style="list-style-type: none"> <li>▪ How are markets/segments rated against each other according to market share, ROI and other objectives for being in each?</li> </ul>
Global marketing management and positioning	<ul style="list-style-type: none"> <li>▪ IPLC analysis, customer and competitor analysis, internal objectives by market and product</li> </ul>
Company location issues	<ul style="list-style-type: none"> <li>▪ Business done over ‘the ether’ is forcing a change in the physical nature of firms. Will companies need multiple locations in all markets?</li> <li>▪ Are there contemporary mechanisms that allow companies to expand their reach, product supply and customer servicing abilities, yet operate from fewer locations?</li> </ul>
International market selection (IMS)	<ul style="list-style-type: none"> <li>▪ When should companies do this? Importantly, is the validation to (further) internationalise solid?</li> <li>▪ How do they go about this fundamental activity?</li> <li>▪ Is market concentration preferable to diversification? What circumstances lend to diversification rather than market concentration? How do companies determine which strategy is appropriate?</li> </ul>
Market entry strategy (MES) development	<ul style="list-style-type: none"> <li>▪ How should companies determine entry mode and international marketing plans based around the corporate and marketing objectives (of each market)?</li> <li>▪ How should market investment alternatives be evaluated to determine the trade-offs to be made?</li> <li>▪ What contemporary thinking would lend towards long term and sustainable market development mechanisms? That is, mechanisms beyond simple indirect exporting.</li> </ul>
Product strategy	<ul style="list-style-type: none"> <li>▪ Do companies ‘customise or standardise’ their offerings in light of their understanding of their markets?</li> <li>▪ Is there growing homogeneity amongst previously disparate markets that will simplify marketing mix decisions?</li> <li>▪ How is ‘brand strategy’ affected by these trends? And what is the value of our ‘equity’ now?</li> <li>▪ Does ‘product management’ take a different form? NPD? Product and market lifecycles?</li> </ul>
International supply chain management	<ul style="list-style-type: none"> <li>▪ Do companies compete by themselves or do the combination of the linkages</li> </ul>

(forward and backward integration) and company inter-dependence.	<p>forged with other companies (networks) compete?</p> <ul style="list-style-type: none"> <li>▪ Should company thinking reflect network competition rather than their individual entity competition?</li> <li>▪ Does this contemporary thinking transfer risk? And is this a desirable goal anyway?</li> <li>▪ Is there a correlation between supply chain management decisions and market entry mode choice?</li> </ul>
Forward and scenario planning, and sensitivity analysis	<ul style="list-style-type: none"> <li>▪ Are these still relevant disciplines in global environments that are ever more uncertain and more turbulent than ever before?</li> <li>▪ Can alternative scenarios be adequately envisioned in these contemporary times?</li> </ul>
E-commerce, intra company 'interconnectedness.'	<ul style="list-style-type: none"> <li>▪ Is this important? Why?</li> <li>▪ Is this decision supplier, customer or competitor driven? Does it matter?</li> </ul>
Developing a competitive model	<ul style="list-style-type: none"> <li>▪ What is the appropriate and contemporary 'business to business' model?</li> <li>▪ How do companies determine this?</li> </ul>

These decisions are not new. They are already, either consciously or unconsciously being addressed by managers. What is perhaps more important is that they are addressed in isolation of a framework that does two things

- Links them together in a holistic manner and,
- Validates each decision against a better understanding of the reasons for it in the first place. 'Trade-offs' can be made after careful evaluation.

What is the alternative for competition in a modern global environment?

We should imagine a third column to Table 1 entitled the 'Answers.' These answers are also known to us (marketing academics) and to a varying extent, practitioners as well. The answers are a mix of theoretical concepts often grounded in practice and may also be described as 'best practice.' The pathways to answer each one of these decision areas may be disciplined and proven by academic/empirical research. Practitioners may not always be operating to best practice standards and herein lies another challenge for academic educators and Crown export development agencies to disseminate and transfer what may be described as best practice knowledge.

## Strategy Development Discussion

Wild cards will always be played. Imagine your own delight (or despair) when the left bow is played. It's played when it should be by you or your partner, or when expected, or not. The key in global commerce success however, is how companies do respond when their environment is dealt a wildcard (a new competitor, a new competitive product, compliance change, change in channel configuration, consumer preference change, geopolitical upheaval...)? How should these scenarios be planned for and pathways charted that take into account sensitivities when forecasting? How can any of these scenarios reveal the extent of exposure?

Alternatively, can companies create 'wild cards' or outcomes that advantage themselves? For example, a new technology, breakthrough in product development or new delivery channel to market, a precise redefinition of customer groups that competitors have not realised, other developments that extend competitive advantage? Generating and responding to wild cards should be a part of strategy development.

China and Taiwan's admittance into the WTO (WTO Doha, Qatar 11/01'), might be the single largest influence on Australasian companies' international market selection decisions in 2003 and beyond. China's entry to the WTO means relaxed market access barriers in accordance with a rules based system advocated by the WTO. With its mass market potential, world beating cost base, high skills level and intensive internal consumer demand it has a strategically dominant position in the minds of many Australasian exporters who previously would have concluded the barriers to entry into China are too onerous including psychically difficult. The demand prospects alone of consumerism are expected to significantly weigh China as a priority new market for entry and development by Australasian exporters. This risks displacing any 'methodical process' exporters may use to determine international market selection (let alone valid reasons to diversify in the first place).

In addition to trade liberalisation and regional integration trends, business done over ‘the ether’ is forcing a change in the physical nature of firms. Will companies need multiple locations in all markets? Possibly not in the future. The company location decision is a relatively new and exciting area in the global management area. In part, this area of decision-making has been driven by IT and e-commerce as much as being responsive to market demands. IT systems linking downstream supply allows commensurate resource allocation according to (future) market value. IT and e-commerce practice is also both a reflection of and driver of new values (choice, speed, consumer value, collaboration, risk transfer, cost reduction etc). We might expect to see further advancements in IT and e-commerce enabling companies to develop strategies of broader geographic reach yet operate from fewer physical locations based on real time information management. A combination of wireless and broadband technologies, revised ‘forward and backward’ supply chain management arrangements and contemporary in-market investment mechanisms including appropriate network partnerships will set in place a company’s forward growth pathway including its physical infrastructure.

Blankenburg (1995) and Fletcher (2000) provide models that offer more holistic views of the external environment facing the firm. Blankenburg suggests that the firm may perceive this environment as one that comprises both internal and external perception of the forces that comprise the external environment. The model views markets as being structured as networks, with the focal firm, to some extent dependent upon its connected actors and their interactions. Our posit has not changed despite discussions of relevant and semi relevant models in that model and theory development needs to first identify both external forces and the commercial environments and necessarily be responsive to both.

Crick (1995) found that decisions to enter markets with a perceived low ‘psychic distance’ were less important than decisions based on global trends in technology markets and relations in networks. The markets served were perceived to be those with growth opportunities for a firm’s particular niche products, i.e. the desire to be close to particular customers played a major role in the decision to invest in subsidiaries overseas. Initial modes of market entry tended to be limited, but the types and pace of further internationalisation varied.

Burgel and Murray (2000) suggested that an organisational capability perspective on young, resource-constrained, technology-based firms’ behaviour offered a better explanation of their entry decisions than either transaction cost or stage theory. Qualitative case study research by Walton and Lukyanovic (2003) suggests New Zealand technology companies emphasised ‘product functionality, design superiority, technical & product support in-market and price advantages’ in preference to country imagery and distance to markets as these factors influenced their international marketing activities.’ Importantly, the sample of this study revealed that their overseas customers did not place importance on any awareness (if they had any) about environment or sporting images etc, on their choice of technology products and New Zealand as a source of supply. Are some industries and products less dependant on traditional ‘country of origin’ themes and psychic distance in their international marketing decisions?

The discussions of the notions of company collaboration and network theory and practice evident in some industries (Madhok 1997, McKinsey 1993, Oviatt and McDougall 1994, Knight and Cavusgil 1996, and; Burgel and Murray 2000) leads to another important business response. That of ‘born global’ companies and the born global phenomenon. Conventional literature on this phenomenon has focused on ‘sunrise’ knowledge intensive or ‘new economy’ industries and concluded that the phenomenon is restricted to such firms and is of recent origin. Zhao and Du (2000) typify this view with their empirical study of electronic commerce companies (ECCs) by saying these companies are

*“virtually born global...and ignore national boundaries and jump into global markets in early years, p1.”*

Waters (1995) states that one manifestation of a globalising world is the emergence of the ‘entrepreneurial start-up’ that has an international outlook from inception. Knight, Bell and McNaughton (2001) conclude from their study of a ‘sunset’ industry (the NZ seafood sector) that the majority of the firms sampled in their study display the same attributes as the knowledge rich ‘born global’ companies that much of the existing literature refers to. They further refute another existing tenant in internationalisation literature, that of the ‘psychic distance’ phenomena. They concluded that,

*'in their choice of international market entry, these firms (seafood) frequently ignored psychically close markets (such as Australia) and confidently launch straight into supplying customers in Japan, Korea, Taiwan or Saudi Arabia without any reference to psychic distance (p1).'*

Fascinating work about the foundation of the 'born global' entity and the motivations of its founders is acknowledged in (Rasmussen, Madsen and Evangelista 2001). Their empirical work with Australian start up firms concludes by affirming

"an increasing number of firms ...do not follow the traditional stages pattern in their internationalisation process..." (p 76).

Arguments of geographic distance and its relationship to psychological distance appear to be increasingly overshadowed by commercial objectives. Official trade statistics of both Australia and NZ ([www.stats.govt.nz](http://www.stats.govt.nz)) point to both nations being Asia/Pacific players primarily. This point is made also by Brewer (2001). Export statistics are records of trade patterns and transcend arguments of geographical and psychological distance. 7 out of New Zealand's top 10 markets are on the Asia Pacific rim and 14 out of the top 20 are also (Statistics NZ, 3/04'). Both Australia and NZ export to countries that 'psychic distance paradox' would have us feeling very uncomfortable with.

Due to limited resources many 'born global' companies are not able to invest in market knowledge and market infrastructure on all markets. They are often only able to invest in close market contacts in very few country markets. Such factors may force them to use more low-commitment types of operation modes, often distributor agreements only/first. In addition they may not need or want a sales subsidiary since their targeted market segment may be too small to justify the investment (Madsen, Rasmussen and Servais 1999). However, contrary to this conventional stages approach to mode selection, is Zhao and Du (2000) work with high tech companies. They suggest innovative born global companies, possibly because of resource constraints, apply innovative solutions to questions of market selection and entry mode strategy (mode selection). And thus transcend 'in-direct' entry modes preferring instead to select market entry mode options further along the continuum towards partners that are committed to both product and market development (direct market entry). This is consistent also with the contemporary notions of 'shared or transferred risk' and return. Walton and Ashill's (2001) qualitative case study work also determined this emerging practice to select entry modes on a strategic basis despite resource constraints. However, while traditional and new or start-up firms need to operate and compete in the emerging global business environment an integrated approach to the 'drivers of change' still requires reflective strategy formation.

Knight, Bell and McNaughton are essentially concluding that such a conventional internationalisation ("incremental stages" - Johanson and Vahlne 1977, "Psychically close countries first" - Johanson & Vahlne 1990 nor more recent theories; "management innovations" – Reid 1981, Czinkota 1982) path, may not be exclusive to knowledge intensive or high tech industries. In agreement with Reid (1981), Knight, Bell and McNaughton (2001) consider these conventional theories are too

*'deterministic and their resultant models of internationalisation are 'individualistic, industry specific and contingent on resource availability... (p1).'*

Australia and New Zealand with small domestic markets are characterised by Small and Medium Enterprises (SMEs) that are obliged to look and operate outside their domestic markets. Both countries et. al. have organised productive capacity and marketing efficiencies around 'industry' collaboration. This may be an example of a business response (Box 4) whereby a raft of reasons (resource, capability and marketing) to cluster or collaborate as an industry body are resolved through an 'on-shore' mechanism like collaboration. In NZ, a large number of industry collaboration examples (see Table 2) can be cited from primary producers to high tech, consultancies and elaborate manufactures and other intellectual property rich companies/industries. Sectors within larger industries also organise themselves to collaboratively compete in a broader global marketplace.

TABLE 2: INDUSTRY COLLABORATION FROM SMALL ECONOMIES (AUSTRALIA AND NZ)

Primary industry	Fonterra (dairy), wool, fruit, meat, seafood and forestry. Agritech, floriculture, aquaculture...
Knowledge rich, IP rich, services	Consultancies (resource management, financial, engineering...), film/media, publishing, education, pharmaceuticals, biotech, nano-technologies, yacht building, information/communications technologies, software, telecommunications and electronics...

Industry (re) organisation is responsive to global forces, primarily global competition. Network theory and practice forms an important part of company strategy development and contemporary business organisation and might possibly be the single remaining academic theory of contemporary relevance that still goes some way to explain company internationalisation in this new millennium.

There is a growing body of literature (a dominant proponent being the International Marketing and Purchase Group) suggesting that SMEs may have to rely on networks and relationships to overcome disadvantages due to their small size as they internationalise (Madhok, 1997) and compete. This appears to be a response (Box 4) to address identified barriers to progress. Networking between companies is not new, but marketing/business literature on the subject is, relatively.

*“Firms do not survive and prosper solely through their own individual efforts, as each firm’s performance depends in important ways on the activities and performance of others and hence on the nature and quality of the direct and indirect relations a firm develops with these counterparts.”* (Wilkinson and Young 2000, page 4).

The relevance of the network models to SMEs and international marketing is important to this paper in terms of business strategy development and the responses to global forces and trends.

“The IMP Group describes the industrial system as a network of firms engaged in production, distribution...lasting business relationships with customers, distributors, suppliers...” (Turnbull, 1986 cited by Whitelock, (2002)). Just as company competitiveness is a key objective that facilitates local industry or the development of international networks, so too is the motivation to ‘transfer risk’ (Walton and Ashill 2001) to other partners and to better enhance network efficiencies in both forward and backward supply chains.

Jolly (1989) and Junkkari (2000) both argue that the growth in alliances is as a direct result of globalisation. The global logic of strategic alliances is based on the observation that the fixed costs of manufacturing, R&D, building and maintaining a brand, and operating a sales and distribution network on a global scale are too high for most companies to incur alone. When considering the limited resources of ‘born globals’ one can assume that all types of co-operative modes, ranging from partnership agreements through strategic alliances to networks, will play an especially important role in the implementation of their globalisation strategies (Junkkari 2000).

A number of models of *networks* and the internationalisation process (Evangelista 1996, Merrilees and Tiessen 1999) and network strategy development (Wilkinson, Mattsson and Easton 2000, Wilkinson and Young 2000) have been identified in the literature. Prior studies suggest that international marketing relationship networks vary by industry (Merrilees and Tiessen 1999, Madhok 1997). Literature also suggests that there are different types of internationalisation processes for SMEs and that there are more complex network processes by SMEs in high technology industries than in low technology industries (Merrilees and Tiessen 1999, Madhok 1997).

Wilkinson, Mattsson and Easton (2000) in their contemporary enhancement of Porter’s Value-Chain thinking (Porter 1990) suggest that companies are organised into ‘primary and ancillary’ networks surrounding the major elements of the ‘value chain.’ Company (or network) competitiveness, is determined by the linkages that occur between the firms. Importantly for this paper is that these company linkages (Fletcher 2000), and company interdependence is about ‘international supply chain management.’ These inter and intra company linkages transcend borders. Both forward and backward integration occurs where networks of partners formalise an arrangement between themselves thus modifying the Wilkinson, Mattsson and Easton (2000) model, page 7, further with vertical lines which are the national borders.

Incidental with the notion and practices of ‘networking’ and ‘supply chain management’ is the notion of ‘outsourcing.’ Management theorists might suggest these inter-company linkages are about concentrating on ‘core

competencies' Hamel and Prahalad (1994) and outsourcing or contracting out non-core same. Scholl (2001) suggests,

*"...experience with IT and transaction outsourcing has begun to give companies the confidence to undertake "strategic" outsourcing, handing over more integral aspects of business, p55."*

Scholl (2001) claims, behind the growth of outsourcing are a realisation that a specialist may be able to provide a routine service at lower cost, and with better technology. The links between outsourcing core or ancillary or routine functions to other companies although an example of inter company dependencies, are yet to be researched in international business arenas across the primary business functions as suggested in 'value chain' analysis. White (2001) suggests the next primary ingredient to be outsourced will be 'procurement.' Companies will likely continue to specialise.

Walton and Ashill (2001) suggests these inter-company linkages are about 'transferring risk' to other network partners in that companies needn't be good at all significant business functions. In support of Hamel and Prahalad thinking, companies contract out or transfer some 'economic, political, commercial, legal and cultural risk' on to local partners. It is conceivable that theory development might see companies not having to develop in-depth and significant in-house capability in each of these international knowledge areas and business functions in the future. And they can allow their network partners to 'manage' what they are inherently not, nor will ever be, competent at. This thinking appropriately belongs in this 'strategy development and business response' part of this paper. Potentially, this 'risk transfer' notion and the evolving importance of network theory may also encourage International Marketing text authors to rewrite chapters 3, 4, 5, 6 and 7 of their texts. The 'Political, Economic, Socio/cultural and Technology' (PEST) acronym used by management consulting firms might also be becoming redundant in a global world that values choice, speed, information, collaboration, market convergence, business cost reduction and increased consumer value - forces driving greater global integration.

Business response to the 'drivers of change' in the Asia/Pacific region at least, is challenging conventional stages approach in company 'market entry mode' choice also. Contemporary research into company internationalisation process is beginning to reveal that incremental 'in-direct' market entry (the appointment of an agent or distributor) is being 'leap-frogged' in favour of a more strategic approach to market entry and long term company competitiveness. Companies including start-up and born global, are considering and evaluating contemporary market entry mechanisms such as contract & licensed manufacturing, licensing technology transfer, equity intensive joint ventures and other strategic alliances, along the continuum towards total market investment mechanisms like wholly owned subsidiaries (Carstairs and Welch 1982, Reid 1984, Root 1987, Fletcher 2000, Walton and Ashill 2001), before they export or further internationalise.

New business-to-business models are emerging in response to these drivers of change, albeit not fast enough. Response speed is not commensurate with the speed of change. Perhaps the most dynamic challenge to conventional understandings of supply chain management comes from the 'distributor/market model.' There are companies in the dynamic Asian region whom have dedicated their entire businesses to introducing buyers to suppliers via the web. But none have matched the radically new model emerging that challenges conventional understandings of supply chain management, like Hong Kong based Li & Fung. Li & Fung understood globalisation trends meant 'specialisation.' The company itself has become a product of specialisation. They recognised company supply chains once consisted of some five links. Yet the reality of contemporary global competition means significantly more complex inter-company links and thus, interdependence. Li & Fung have focused on optimising supply chains for other companies facilitating links between multiple buyers with multiple suppliers. Participating firms pay transaction fees to the distributor (Li & Fung), which provides the order matching services.

This new business-to-business model relies on the interdependence of many companies and is an example of business response to changing global management - company specialisation and interdependence. This Li & Fung model is neither overly complex nor shrouded in magic. It's not selfishly vertical in orientation either. It is both a vertical and horizontal exchange that allows transactions across the diversity of companies and industries. We should explore this further to determine if models like this are potentially rewriting international supply chain management.

## **Conclusions and Future Research**

This paper is about shaping global marketing management in response to identifying and understanding a rapidly changing global environment. The paper suggests orthodox marketing practice will not be sustainable in the light of new values emerging by consumers and firms and driven by pervasive global forces and trends.

The direction of future research would seek to determine the extent and nature of the relationships between 'cognitive' business responses, and recognition of pervasive global forces. These forces can be made industry specific and therefore customised to reflect the reality of global trade that is industry specific. Future research would test the extent strategy development and response is 'intentional' and reflects understandings of global forces and trends and their impact. Theory testing (empirically) would likely be the goal of future research because the theory here is beyond a formative stage.

# The Role of Indigenous Management Practices in Global Companies

Sugumar Mariappanadar  
Australian Catholic University National, Australia

## Abstract

This study attempts to understand indigenous management practices in a host country using '*emic*' rather than using '*etic*' approach. Therefore to help practitioners and researchers in the field of globalization of companies to appreciate that better clarity of indigenous management practices will help design effective diversity management for a global company. To achieve this study draws on literature to discuss the limitations of culturally alien management practices in global companies. Then a common framework of how organisational effectiveness is affected by micro and macro levels (cultural, socio-economical, and political) of organisation and indigenous work culture is discussed. Lastly, the indigenous management framework is used to analyse three organisational stories to understand the impact of national culture and indigenous management practices on organisational effectiveness among global companies. Implications of study findings and further research opportunities in this area are discussed.

## Introduction

In globalisation, investment flows from developed countries to foreign investment hungry developing countries. Along with investments, the globalisation processes attempt to introduce Western management practices hoping that it would help achieve above-average return on investment [21]. This paper is not about convergence or divergence in management practices of global companies but explores whether unscrupulous transfer of Western management practices to a country of focus through globalization is effective or not. It further attempts to understand indigenous management practices in a host country to help design diversity management practices for global companies using *emic*, an 'insider' view, rather than using *etic*, an 'outsider' view [1]. For example, China is labelled as having a high-context culture by Onkvisit and Shaw [33] based on observing Chinese behaviour, which is an 'outsider' view. But Jizhong and Shan [22] in their article have highlighted how symbols (Chinese scripts) and forms of thinking of the traditional Chinese (originated 2000 years ago) are understood based on the context it is used in, and related to Chinese culture. This is another explanation why Chinese behaviour is high-context based, which is an 'insider' view.

Many management theories and practices used in current management literature have originated from Western countries and particularly from the USA and that have benefited the industrialised world for its economic achievements [21]. Hence, many developing countries choose to use these Western management practices grossly disregarding the fundamental differences in socio-cultural constraints, local conditions and circumstances. Why do many developing countries blindly believe that Western management practices are transferable to their countries? This can be explained by 'social comparison' in the social identity theory [40]. In social comparison people compare their own group with others and look for reasons why the other group is better and identify themselves with that group.

The term 'Western' management practices are too broad based because even among Western countries the cultural values are different, for example USA and Australia [44]; USA and Scandinavia [15]. Hence I have used a term, 'culturally-alien' management practices, to refer to management concepts and practices that are not evolved or commonly used in a particular country of focus.

I am sure many management theorists will have reservations in accepting the indigenous management practices argument because they might believe that management practices evolved through the period of Feudalism till socio-technology. Hence management practices have to be innovative at every evolutionary stage to make it work effectively for the organisation. My contention here is that indigenous management practices evolved along with the country's national culture, and is time tested. Therefore adequate consideration has to be given to develop synergies between the indigenous management practices of the country of focus and company's management

practices that are evolved from 'alien' cultures [2] [4]. This article is not about stereotyping indigenous management practices, but attempts to help practitioners and researchers in the field of globalization of companies to understand that better clarity of indigenous management practices will help design effective diversity management for a global company.

Taking up this notion, firstly this paper draws on literature to discuss the limitations of culturally alien management practices in global companies. Secondly a common framework of how organisational effectiveness is affected by micro and macro levels (cultural, socio-economical, and political) of organisation and indigenous work culture is discussed. This framework has been evolved from Kanungo and Jaeger's [23] model of socio-cultural influence on organisational effectiveness. Thirdly, the indigenous management framework is used to analyse three case studies to understand the impact of national culture and indigenous management practices on organisational effectiveness among global companies.

## **Understanding of Previous Literature**

### **Civilization and Culture**

Work is a pattern of behaviour, which gives a person a sense of identity and purpose and may be necessary for mental well being. It is not very clear whether desire to work is an innate behaviour but it is evident that human beings' capacity to learn and persist goal directed behaviour is an innate pattern that is different from animals. The learnt behaviour of work is a product of cultural factors: through historical processes a society develops certain attitudes to work and ways of working, and these are passed on to children in the course of education and other kinds of socialization. Different civilizations in the past and different nations (like Japan, South Korea etc) in the contemporary world have evolved very different work attitudes and types of organisation.

The human being is a tool-making animal and it is tool making that constitutes civilization. The civilization of a race is simply the sum total of its achievements in adjusting itself to its environment. Advancement in civilization depends upon the improvement of tools (eg. Stone Age, the Bronze Age, the Iron Age, steam, the Electricity, Electronic and Digital Age). The difference between East and West is primarily based on the tools used. The West has moved far ahead because of the tools devised to enable the conquest of nature and the multiplication of the power to do work. Oriental civilization is based on people, and Western civilization is based on power of machinery and hence the cultural values towards work are also different. Now we will try to understand culture and how it affects values in general and work values in particular.

The Webster's New Collegiate Dictionary defines culture as, "the integrated pattern of human behaviour that includes thought, speech, action and artifacts and depends on person's capacity for learning and transmitting knowledge to succeeding generations." Williams [46] explained three general categories in the definition of culture. Firstly, it is considered as the 'ideal', in which culture is a state or process of human perfection, in terms of certain absolute or universal values. Secondly, there is the 'documentary', in which culture is the body of intellectual and imaginative works that is the details of the language, form and convention, which are described and valued. Finally, third, there is the 'social' definition of culture, in which culture is a description of a particular way of life, which expresses certain meanings and value in institutions and ordinary behaviour. The third definition is more appropriate to the present article because it reflects how culture affects values and behaviour in a society.

Culture also influences behaviour in a group and that leads to sub-culture. Clarke, Hall, Jefferson, and Roberts[13] explain that culture is the way the social relations of a group are structured and shaped, but it is also the way those social relations are experienced, understood and interpreted. Groups that exist within a society might share a common historical condition but they might be ranked different based on their productive relations, wealth and power and this leads to the dominant and subordinate culture. The dominant culture of a complex society is never a homogeneous structure. It is layered, reflecting different interests within the dominant class, containing different traces of religious ideas within a secular culture, as well as emergent elements in the present such as multiculturalism. It is more appropriate to use a term 'cultures' instead of culture because it is no more one dominant culture, but has traces of coexisting subordinate culture in the dominant culture itself. But in this article I have used the term 'culture' reflecting 'cultures', that is a dominant culture with traces of other subordinate cultures.

Culture and sub-culture moulds employees' values and values influence employees' perceptions and decisions. Values represent stable, long-lasting beliefs about what is important. They are evaluative standards that help us define what is right or wrong, good or bad, in the world [35]. In each country there are different work values because of the dominant and subordinate cultures, which coexist in that country.

Oscar Wilde's well known saying, "a cynic is a man who knows the price of everything and the values of nothing," is a poet's reminder that we tend to view everything in life in quantifiable 'fact' and/or non-quantifiable 'value' terms. The relative importance of 'facts' to 'values' in top-level decision making will vary depending on situations but more often managers make decisions because they value certain ways of action in spite of the price they must pay.

#### **East and West: Business Culture**

Cultural differences are not solely a concern of East and West because the countries referred as East and West are not homogeneous, and hence this reference is not going to be useful in future. For example, there are cultural differences between Japanese and Chinese in respect to data processing [30], and between French and British firms in respect of hierarchy and authority [17] leading to different management practices. The reference to 'East' and 'West' is contrary to the core theme of this article, but its usage is only because of the limited literature in national culture and indigenous management practices compared to literature under the umbrella of East and West [17]. One of the objectives of this article is itself a step forward in developing and collating literature of indigenous management practices based on organisational stories.

#### **Limitation of Culturally-Alien Management Practices**

Developed and developing countries are contrasted on the characteristics of their socio-cultural environment because of their views on the nature of causation and control over life outcomes. Most Western societies believe that they have considerable control over their environment and of events in their life, whereas developing societies perceive themselves as being at the mercy of events in the environment. Thus, in developing countries, the notion of context dependence (external locus of control) will be more likely to guide their management practices in organisations and for Western societies it would be internal locus of control. Another difference in cultural assumptions, which affect management practices, is the beliefs about human potential and malleability [21]. Western societies believe that human potential is unlimited and highly creative; in contrast developing countries view it as more or less fixed with limited potential.

### **Need for Indigenous Management Practices**

Management practices are not new to any civilization because every civilization managed its environment and scarce resources (money, people etc) effectively to survive and prosper. In industrial countries the prosperity of economic achievement is far more than the developing countries, and hence many developing countries blindly adopted the Western management theories hoping to achieve economic prosperity. Uncritical transfer of management theories and techniques based on Western ideologies and value systems has in many ways contributed to organisational inefficiency and ineffectiveness in the developing countries as well as in other countries which does not share the same value systems [23].

Employees' assumptions, beliefs and values are moulded by the culture to which they belong. Basic assumptions and premises are fairly deep rooted in an individual, and hence the culture cannot be changed to meet the demands of management. In a nutshell, culture facilitates and/or inhibits behaviour subconsciously. The impact of culture on indigenous management practices will be twofold. First, the management practices are natural hence they reflect the value of the local culture and it will not include behaviour which runs counter to the culture. Second, it influences employee's perception of the external and internal environments, and hence the evaluation of those factors leading to decision-making [31].

The external and internal environments constantly influence organisation, and the management practices effectively help manage a good fit between these two environments to achieve organisational effectiveness. Uncritical adaptation of Western management strategies is neither necessary nor desirable for managing organisations in developing and other countries [23]. It is important for these countries to develop relevant management theories and practices based on the local conditions and circumstances, and socio-cultural forces. Thus

it is significant to recognize explicitly the context of economic, political, and cultural differences between the developed and the developing countries and appropriately to develop and modify the knowledge and technology that is best suited to managing organisations in these areas. This is quite evident in the newly industrialized Asian countries such as South Korea, Taiwan, Singapore and Hong Kong as well as in Japan, where their management styles and work attitudes are rooted in Confucian values, familism, and institutional structures that are not necessarily Euro-American [38].

## **Criticism of Culture Specific Studies**

In the past, many social scientists and social advocates criticized culture specific studies. Some believe that such inquiry is nothing but unscientific stereotyping, usually with malevolent intent and effect. Some others assert that culture studies obscure the uniqueness of the individual and also lead to racism and bigotry. It is also believed that cross-cultural comparisons are used to legitimize cultural generalization by comparing it with other cultures and but this in no way reduces the misuse to oppress or persecute a particular group [29].

Yes, it is true that culture specific studies are like a double-edged knife, if it is not used carefully and judiciously it will oppress or persecute a particular group. The negative aspect of the culture studies should not over shadow the positive aspect of it. The positive aspect of culture studies in understanding indigenous management studies is its use in diversity management. In diversity management it is accepted that individuals are different and it is well documented in psychology that culture is one of the determinants of individual differences. Hence using the understanding of culture based individual differences for managerial decision-making is very useful in the global management context. For example, team based management is becoming the more common human resource (HR) management practice but the Western management structure is not suitable for such management practices. Hence we can draw from the African, Indian, Chinese and other Eastern social structure, which enhances group based performance and achievement, and apply it in designing Western organisation structure so as to be successful in using team-based management. There can be similar applications of indigenous culture based management practices in diversity management.

## **Indigenous Management Model**

The Fig. 1 provides a framework to study the impact of external and internal environments and indigenous management practices on organisational effectiveness. Also the factors which are important to measure and understand each of the variables in the model. The political, economical and social conditions of a country are the external variables shown in the model that affect cultural values. These cultural values subsequently mould and shape the indigenous management practices in a country. In the present context it will be interesting to explore the compatibility of national cultural values of a country to the alien (Western) management practices, and also to the indigenous management practices.

Organisational functioning depends on the behaviour and attitudes of people within a given society. The socio-cultural environment within which the organisation operates profoundly influences organisational behaviour (OB) and hence the model (Fig. 1) is based on the OB model. The characteristics of management practice can be understood based on the three levels of OB study (individual, group and system level). The determinants of each level of OB are moulded by the socio-cultural environment as well as by the management practices. The determinants of each level that are of main focus in this article are provided in Table 1.

TABLE 1: DETERMINANTS OF OB TO UNDERSTAND MANAGEMENT PRACTICES

OB level	Determinants
Individual level	<ul style="list-style-type: none"> <li>• Motivation</li> <li>• Perception</li> <li>• Decision making</li> <li>• Values</li> </ul>
Group level	<ul style="list-style-type: none"> <li>• Group structure</li> <li>• Power &amp; politics</li> <li>• Leadership</li> <li>• Conflict &amp; conflict resolution</li> </ul>
Organisation system	<ul style="list-style-type: none"> <li>• Technology</li> <li>• Organisation design &amp; structure</li> <li>• Behaviour at strategic level</li> </ul>

The management practices will have different impact on these determinants according to the cultural values and beliefs in a society. To understand the characteristics of management practices it is possible to use these determinants. For example, Lane and DiStefano [26] studied the effect of the value orientation of Kluckhohn and Strodtbeck [25] on management behaviour and argued that goal setting would tend to be “qualified, hesitant and vague”, and that budget systems would be futile with predetermined outcomes among developing countries. The feeling of being subjugated to nature and context dependent would, in effect, make specific planning and budgeting seem pointless, as events could alter their expected outcomes.

Cultural values are studied using different frameworks like Kluckhorn-Strodtbeck [25], Hofstede [20], Trompenaars [41] and Schwartz [37] framework. Each one of these authors has chosen a different approach to understand cultural values and management practices. Schwartz approach has combined Kluckhorn-Strodtbeck and Hofstede approach, and has provided 11 broad based domains, which can be useful for understanding different national cultural values. The Domains are self-direction, stimulation, hedonism, achievement, power, security, conformity, tradition, spirituality, benevolence and universalism.

International business and cross-cultural management studies recognize the importance of socio-cultural environmental variables as a major determinant of organisational effectiveness within a given country and across various countries in the world [24]. But in this article, to understand indigenous and alien management practices in an organisation the behavioural determinants are used. Now that the model has provided the framework to understand the impact of national culture on organisational effectiveness, it is important to explain how it is going to be studied.

## Methods for Studying Indigenous Management Practices

Using the model (Fig. 1) an attempt is made to explore the effect of indigenous management practices on organisational effectiveness. Also the model highlights that based on the management practices for different behavioural determinants in the three levels of an organisation, it is possible to understand whether indigenous or/and alien management practices are used in an organisation. Organisational effectiveness, productivity, absenteeism, employee turnover and job satisfaction are the products of different management practices in an organisation, and the latter in turn is influenced by national culture.

In this study the characteristics to distinguish indigenous and culturally alien management practices in organisations are understood based on the organisational stories told by three top-level managers from different global companies. Subsequently the organisational stories are used to study the impact of those characteristics on organisational effectiveness too.

The story telling literature provides a different perspective to study organisational behaviour [6], helping to understand indigenous and alien management practices based on the implicit and explicit themes in the stories narrated. Organisational stories are the primary qualitative means of collective understanding of an organisation [9], specifically if the events being described are complex and perhaps contradictory [7] [10]. In this article, a story is

operationally defined as explanations provided by the participants to explain the cultural reasons for a particular management practice relating to the three levels of organisational behaviour. This operational definition is based on Weick's [42] definition of stories, that is, stories reflect individual sense making. Further, stories by themselves do not create understanding in employees or others [8] but assist in describing and making sense of corporate practices [6].

The three stories discussed in this study are based on the interviews conducted with three top-level managers currently working in Australia. Participant-1 is an Australian, participant-2 and participant-3 is born in India and China respectively, but naturalized Australian citizens. All the three participants are above 45 years of age, participant-1 is a female and the other two are males. They all worked at least once in a global company in Australia, India and China during their respective professional careers. Three thirty-minute sessions were used to document the organisational stories, which were prompted by cues relating to organisational behaviour determinants. The author conducted all interviews.

The story lines (cues) used in the interview relate to dominant culture(s) and indigenous management practices in employee motivation, leadership, and organisational structure of a global company in participants country of origin. Further, the effectiveness and ineffectiveness of indigenous and culturally alien management practices used in achieving global company's goals are also probed.

The stories narrated by the participants were recorded and fully transcribed and classified based on indigenous and alien management practices debate. Participants' explanations to different management practices were used for analysis, that is, when a management practice is identified as indigenous management practice then further cultural reasons for that practice was probed. When the managers narrated any culturally alien management practices in the stories, then the characteristic of 'constructive imitation' by Alattas cited in Sapre [36] was used for analysis. "Constructive imitation is a law of social law and is characterized by the following:

- 1) it is based on a conscious and rational choice;
- 2) it supports an existing and sound value;
- 3) it would hamper the development of the society concerned if not adopted;
- 4) it does not disrupt other aspects of social life considered more valuable
- 5) it enters into the collective value system; and
- 6) it is not the effect of manipulation by external groups, motivated by their own interests".

In this study, except characteristic (3) and (4), all other four characteristics were used for analysis of culturally alien management practices. In analysis the 6<sup>th</sup> characteristic is further split into two separate characteristics (see Table 2) for the purpose of analysis. This approach to story analysis is considered acceptable, because the whole story was told by participants to explain the context and explanation of various management practices, and their relationship with organisational effectiveness, whereas theme coded approach has less safeguards to capture the whole story. In strategic management research it is common to use manager's reflections to measure company's performance – organisational effectiveness [14] [28]. Manager's mental map is based on social construction and this reflects the reality [6] as described by the participants. All participants did not narrate their stories for all the cues (story-line) used in this article, but overall they have provided indigenous and culturally alien management practices explanations for many organisational behaviour determinants.

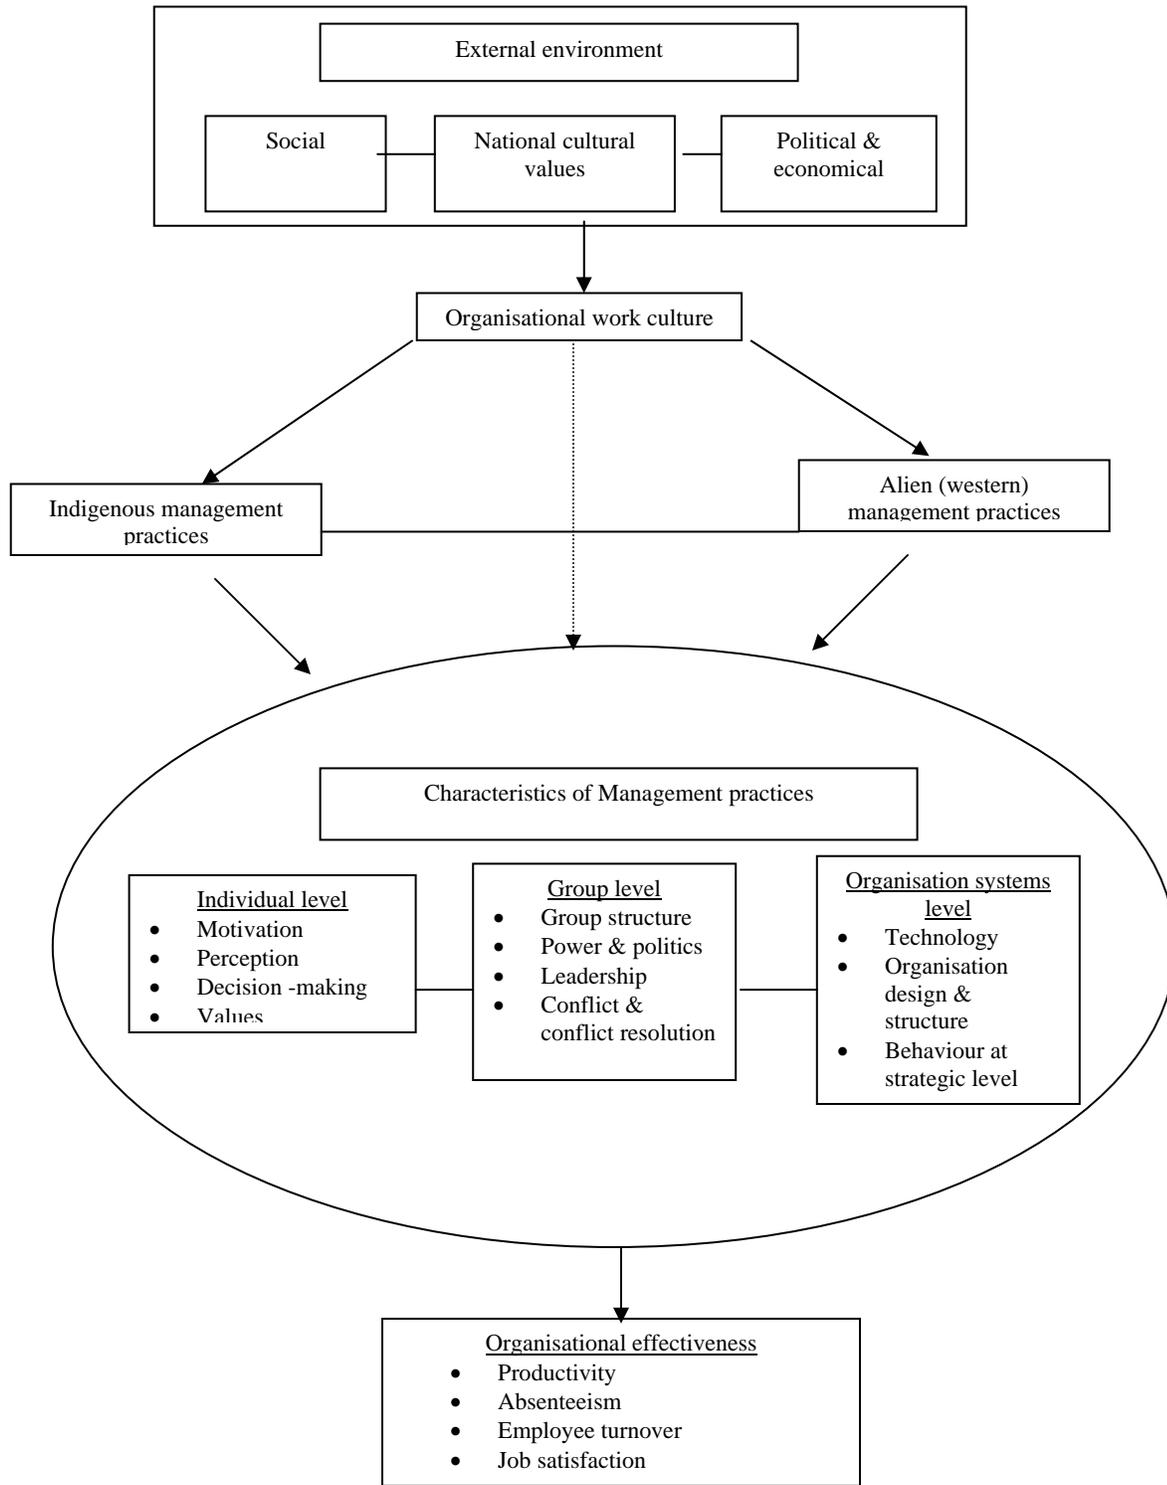

FIG. 1: THE IMPACT OF EXTERNAL AND INTERNAL ENVIRONMENT ON INDIGENOUS AND CULTURALLY ALIEN MANAGEMENT PRACTICES

## Analysis Summary

The participants provided multiple cultural explanations (both culturally alien and indigenous) for different management practices used in their organisations. Their stories pointed that they have used many indigenous and culturally alien management practices in individual, group and organisational structure levels of organisational behaviour. Initially indigenous management practices in Australia, India and China are discussed using indigenous and culturally alien management practices model (Fig. 1). Subsequently, culturally alien management practices in these countries are analyzed with Alatas' characteristics of constructive imitation.

### **Indigenous Management Practice Debate**

#### **National culture**

Individual's assumptions, beliefs and values are moulded by the culture to which they belong. Basic assumptions and premises are fairly deep rooted in an individual and hence the individual's culture cannot be changed to meet the demands of management. In a nutshell our culture facilitates and/or inhibits our behaviour subconsciously and that moulds organisational work culture. The participants believe that Australia, China and India have unique national culture, parts of their respective stories detailed below highlight their predominant views about national culture.

*Participant 1 (Australia): "Classical Anglo-Saxon culture, changed towards more 'egalitarian' culture – opportunity to all, as migration increased from other parts of the world. Our newspapers report more about 'individuals are being disadvantaged' to highlight the egalitarian culture. Many Australians love sports, and that infers their positive demonstration of energy, competitive nature and fighting spirit".*

*Participant 2 (India): "In India, employees are driven by their cultural value of being 'duty' bound (Karma). Work is viewed as an extension of their personal lives; people rarely differentiate between work and personal life. Also another important cultural value is where they believe that their life is predetermined at the time of birth. This does not mean that they believe in 'fate' and don't work hard. This simply means that they strive for excellence in whatever they do without looking forward to any tangible reward, this part of their value is reinforced by 'Karma' as discussed earlier in this part".*

*Participant 3 (China): "The national culture of Chinese is context based. This can be traced to the evolution of Chinese language. Initially Chinese used pictures to communicate to others and subsequently scripts were developed. Many non-Chinese who learn Chinese know that it is difficult to learn to write Chinese and it is more difficult to speak because the Chinese language uses tone-based explanations. For example the word 'Gong' it can mean sugar, soup, hot or lie down based on the tone of the speaker. The Chinese language influences their culture, and hence the culture is also more context-based".*

It is clearly evident from the snapshot of stories about national culture that it is unique, and it does influence employees' work culture in respective countries. An understanding of national culture will provide a better platform to explain and appreciate indigenous management practices in a country. Now the relationship between national culture and indigenous management practices are explored, as depicted in the model (Fig. 1).

#### **Importance and Application of Indigenous Management Practices**

*Participant 1 (Australia): "The organisation I am currently working with is a multinational company. The Australian operation has much flatter organisational structure compared to other locations. This is because of the egalitarian culture, the power relationship between levels of organisation is low, and leader's 'earn' respect rather than by virtue of authority. A good understanding of this is very important for a manager to be successful in Australian organisations".*

*Participant 2 (India): "As an example, let us discuss about the implementation of organisational change in India. It is less difficult than in Western countries because most Indians believe that such an incident is predetermined in their lives and hence they feel that they can do very little to resist such situations. Therefore they are less anxious, accept changes, and move on with their lives more positively".*

*Participant 3 (China): "When we used to receive delegations from China for business purpose, I used to suggest to the CEO of the company (Australian) that establishing personal relationship is very important in doing business with Chinese. Invite the Chinese delegation for a BBQ on weekends and let them know about your family and you also should know about their family. Businesses are done based on personal level networks instead of it*

*being done in formal meetings. This is because in China, the host makes them available one hundred percent of their time to their guests, and it is not like in Australia where we believe that work is eight-hour shifts”.*

Clearly the snapshots of stories infer that the debate about indigenous management practices is important for businesses. It highlights that ‘emic’ approach to understand the cultural reasons for management practices is useful rather than just learning to replicate a culture specific management practice as in cross-cultural context.

#### **Characteristics of Management Practices**

Motivation, leadership and organisational structure are the only determinants that are chosen to discuss in this study from the respective levels of organisational behaviour (see Fig. 1). It was not possible to include all the determinants because it will be too much to cover in this article.

##### **Individual OB Level - Motivation**

*Participant 1 (Australia): “Money is an important motivator to some extent, but for Australians collegiality and commitment to work relationship are also very important. I have heard from employees leaving company to take up another role for less money in a different company because of negative work relationships. This is because of the egalitarian culture of Australia”.*

*Participant 2 (India): “It is not only important to entice Indian employees’ hearts and minds as stated in the Western literature, but also the soul of employees’. That is, Indians believe that performing their duties (Karma) is a means to liberate themselves from the clutches of re-birth. Hence any tangible and/or intangible motivators used in the Indian context should also focus on the soul of employees”.*

*Participant 3 (China): “Monitory rewards in China have become more common only in the last 15 years, it was political or spiritual motivation that was important before that. In China, anyway there are no significant monitory gains for employees because the government administers it centrally. Managers in this context invest in emotional network like establishing paternalistic relationship with the employees’ family instead of monetary reward promises”.*

##### **Group OB Level - Leadership style**

Participants 1 and 2 alone provided information about leadership style, and there was no information about leadership style in the story narrated by participant 3.

*Participant 1 (Australia): Leadership style to manage Australians is distinct. The managers/leaders are more casual and egalitarian in approach. Power distance between top-level managers and the front line staff is low compared to other countries where I worked before this job. Leaders are expected to be a coach and use participative approach in decision making”.*

*Participant 2 (India): “It is common that many managers use paternalistic style leadership, but outsiders view it as autocratic style leadership. Paternalistic style leadership signifies that managers care about employees’ welfare and betterment rather than enforcing their ideas and opinions to their subordinates”.*

##### **Organisation Systems OB Level - Organisational structure**

*Participant 1 (Australia): “Flat organisation structure is more common in Australia. Front line staff can speak more freely with the top management staff. Communication from the top managers also happens more freely with the front-line staff. This means that the decision making process is more participative compared to the other cultures where I have worked”.*

*Participant 2 (India): “Power distance between different levels in organisation is high. This because the society is highly structured and hence it is a common practice for the managers to inform subordinates what to do, and subordinates also wait for instructions from managers before starting any task”.*

*Participant 3 (China): “Over the years organisational structure has become more centralized from the beginning of dynasty rule in China. Today organisational structure is also centralized because of political reasons and political culture in China”.*

##### **Indigenous Management Practices and Organisational Effectiveness**

*Participant 1 (Australia): “Australia is a multi-cultural country and values diversity in its culture. As managers we try to use diversity management practices in our company, which means that our work norms and practices are not just based on Australian cultural values alone. We try to adapt different cultural values in our company, and hence it is challenging for me to just pick on Australian indigenous management practices and state how it has affected organisational effectiveness. But I am certain that the understanding of egalitarian culture in the Australian context*

has made me appreciate diversity more than ever, and many employees have highlighted to me that they enjoy working in such work culture”.

*Participant 2 (India): “There are three types of organisations in India. Firstly, multinational companies, which uses predominantly Western management practices. Secondly, Hybrid companies that uses both indigenous and Western management practices. For example, in marketing function the companies use predominantly Western management practice, and in HR function more indigenous management practices are tried. Thirdly, small businesses that are not exposed to Western management practices continue to use indigenous management practices. I believe that in India more than 72 percent of employment is created by small businesses, and hence I assume that those businesses are effective in achieving their goals by using indigenous management practices. I cannot say for certain that my assumption is true, but I strongly believe in it”.*

*Participant 3 (China): “It is challenging to state that organisational effectiveness is achieved in China using indigenous management practices because till recently all companies were owned and managed by the government. But I can say that overseas Chinese (those Chinese living other than Mainland China including Hong Kong) also have similar cultural values as Chinese, and they use indigenous management practices in their businesses. Overseas Chinese are successful in their business ventures and hence it can be inferred that indigenous management practices do contribute to organisational effectiveness”.*

#### **Culturally Alien Management Practice Debate**

An attempt is made in this study to explore the basis of imitation of culturally alien management practices in an organisation based on Alatas’ characteristics of constructive imitation. The participants were asked to provide a brief response to the characteristics provided in the Table 2, and subsequently asked to explain descriptively the brief responses provided by them. Table 2 captures the brief responses provided by the participants regarding the characteristics of constructive imitation of culturally alien management practices.

Responses from all three participants indicate that there was no conscious and rational choice made by the companies in imitating culturally alien management practices in the host-country indigenous companies. But analysing characteristic-4 in Table 2, it reveals that the participants feel that culturally alien management practices are not the effect of external group’s manipulation. Further analysis for descriptive responses for the characteristics-1 and -4, it was found that the three participants’ focus of companies for analyses were multinational companies in respective host countries. Hence the culturally alien management practices are alien to the host countries but not to the companies. Moreover, in this study all the companies of focus were multinational companies, they are from Western countries, and they follow their own management practices irrespective of the country of business operations. This is supported by participants’ responses to characteristic-2 that culturally alien management practices are not compatible to employees’ existing values in their respective countries.

**TABLE 2: CHARACTERISTICS OF CONSTRUCTIVE IMITATION OF CULTURALLY ALIEN MANAGEMENT PRACTICES IN THE HOST-COUNTRY INDIGENOUS COMPANY**

<b>Characteristics of constructive imitation</b>	<b>P1 Australia</b>	<b>P2 India</b>	<b>P3 China</b>
1. The culturally alien management practices used in the host-country indigenous company are based on a conscious and rational choice of the company.	No	No	No
2. Does the culturally alien management practice support an existing and sound value of employees in the host-country indigenous company?	No	No	No
3. Can culturally alien management practices enter into the collective value system of employees in the host-country indigenous?	Yes	To some extent	Slowly enforced by the company
4. Culturally alien management practices in the host-country indigenous company are not the effect of manipulation by external groups (like multinational, global companies etc.).	Yes	Yes	Yes
5. Culturally alien management practices in the host-country indigenous company are motivated by company’s interests	Yes	Yes	Yes

In summary, the stories provided in this study narrate different indigenous management practices used in organisations of focus, and also how it influences organisational effectiveness. The participants have indicated that there are indigenous management practices and culturally alien management practices in large companies, but this study failed TO establish the relationship between indigenous management practices and organisational effectiveness.

There are two interesting findings in this study regarding imitation of culturally alien management practices in the host country indigenous companies. Firstly, continuous exposure of culturally alien management practices by companies to their employees can make such values as part of any established value systems of employees in all three countries. This means that employees' value systems evolve over a period of time based on compatibility of new and existing value systems. Secondly, participants in this study believe that company's interests motivate culturally alien management practices, and it didn't matter whether it matched with employees' value systems or not.

## Implications

### **Indigenous and Culturally Alien Management Practices in an Australian Company**

The snapshot of stories provided by participant-1 highlight that Australians have egalitarian culture, which is a dominant culture, and their management practices are influenced by the egalitarian management style [11] [27]. Westwood and Posner [45] have revealed that the personal values held by managers have increasingly been shown to have an impact on their behaviour and performance and, ultimately, on organisational effectiveness. Although in this study the link between personal values and organisational effectiveness is supported, it is not clear whether indigenous management practices in Australia have impact on organisational effectiveness. This is because participant-1 believes that Australia is a multi-cultural society and hence in Australia diversity management is a preferred approach to indigenous management practices. The important finding is that in Australia managers practice diversity management (practices drawn from different cultures) in their approach without being aware of the cultural reasons for it, which supports the assumption in this study that it is important to be aware of the cultural reasons for such practices rather than just replicating the practice without '*emic*' understanding.

In understanding imitation of culturally alien management practices, participant-1 has indicated that convergence of management practices in global companies is because of trying to achieve level of consistency in their management practices among operations in other geographical regions. This highlights the 'institutional transferability' – the practice of the affiliates of multinationals exporting their management practices to their host country employees [4]. The data from this study reveals that culturally alien management practices in the company does not support existing and local values of employees, and Bartlett, Lawler, Bae, Chen and Wan feels that this lack of synergy between these cultures would pose problems to employees. But in the present study there was no indication of this. This may be because of 'strong' organisation culture [19], which is based on alien culture, compared to the 'weak' indigenous culture.

### **Indigenous and Culturally Alien Management Practices in an Indian Company**

The stories about indigenous management practices in an Indian company highlights the '*emic*' understanding of the national culture compared to the '*etic*' understanding of the same culture reported in Aycan, Kanungo, Mendonca, Yu, Deller, Stahl, and Kurshid [2] study. In the same study it is reported that Radhakrishnan [34] suggests, "unfortunately the theory of Karma became confused with fatality in India.... It was made into an excuse for inertia and timidity and was turned into a message of despair and not of hope". But participant-2 in this study has pointed that the confusion between 'Karma' and 'fatality' is not true. Indian employees use 'Karma' to perform their organisational duties as an extension of their own life, and hence work harder to liberate their soul from re-births. Beer [5] examined the *Bhagavad Gita* (a part of the epic *Mahabharata* c. 900 BC) and explains 'Karma' that deals with devotion to duty without attachment or desire for reward. Further, the participant believes that fatalism is used to overcome effectively the uncertainties during organisational changes, being complacent and accepting the state of despair in a person's life is an effective way in coping with any change in life. Therefore in this study the participant has indicated that there exist no confusion between 'Karma' and 'fatalism' among Indian employees in particular.

The other indigenous management practice discussed by the participant in this study is about 'paternalism'. He has stated that in Indian companies the common leadership style used is paternalism, and this is not the leadership style how authoritarianism discussed in Western cultural context [32], but it is about guidance, protection, nurturance and care to the subordinate. In return, the role of subordinate is to be loyal and deferent to the superior [2]. The participant's stories also highlight that paternalistic leadership style in the workplace is not about authoritarianism, which is supported by Aycan and Kanungo's [3] finding that paternalism is strongly negatively correlated with authoritarianism. A great Indian poet Kalidasa said, "a leader should be harder than a thunderbolt and softer than flowers".

The participant has indicated in his stories that culturally alien management practices are commonly used in multinational and hybrid large companies, and small companies tend to use more of indigenous management practices in India. Bartlett, Lawler, Bae, Chen and Wan [4] study supports the participants' stories, where they have found that multinational companies tend to use uniform policies and practices across different geographical locations. Diffusion of knowledge and imitation are also likely to influence indigenous firms of a country to become hybrid companies [18].

A significant finding from this study is that to understand indigenous management practices in India it is important to study small businesses instead of multinational and large hybrid indigenous firms in the country. Many studies on this topic highlight that convergence of traditional and reform values imposed by external environment [12], convergence in policies and practices for uniformity among multinational companies and imitation by host-country indigenous firms [4], and India's managers exposure to Western ideas through its system of management (higher) education [36] has lead to the mindless adaptation of culturally-alien management practices. The point I would like to make here is that the mindless adaptation of culturally alien management practices in Indian companies is because of external pressures, and hence managers have limited options to try indigenous management practices. If research could prove that small businesses in India are still successful in achieving their company goals in spite of indigenous management practices, then it will valuable to facilitate dispersion of indigenous management practices from small business to large indigenous firms in the country. Now the Western literature based management education in India does not give many opportunities for prospective managers (current students) to appreciate the role of indigenous management practices in managing businesses in India.

#### **Indigenous and Culturally Alien Management Practices in a Chinese Company**

The snapshot of stories narrated by participant-3 highlight the basis for context-based Chinese culture, and this is supported by Jizhong and Shan's [22] article on how Chinese traditional forms of thinking was moulded by the language development. Chinese language development as a basis for the explanation of context-based culture in China is a significant contribution made by this study to the cross-cultural management literature. Also this study highlights the role of '*guanxi*' (special relationships) in Chinese indigenous management practices and the reason that 'real decisions are made outside of the meeting – indirect communication' [39].

Participant-3 indicated in his stories that organisational structure in Chinese companies is hierarchical. Chinese see old age as a glorious thing and respect seniority because of the rich experience and wide knowledge they have acquired. Hence seniors lead the company and inturn the company becomes more hierarchical based on 'gunxi' [43]. Decision-making in Chinese companies is highly centralised, this can be traced back to Confucianism in China. Confucius (551 BC) endorsed a 'Paternalistic government' in which the leader is kind and honourable and the subjects are respectful and obedient. In this study, based on the stories there is no clear relationship between indigenous management practices and organisational effectiveness in a Chinese company, but inference from overseas Chinese with similar cultural values [16] indicates that indigenous management practices do impact organisational effectiveness. Regarding culturally alien management practices in a Chinese company, it is revealed that convergence of management practices is the common reason along with 'institutional transferability'. This means that culturally alien management practices in Chinese company does not support existing and local values of employees, and hence it would pose problems to employees in the future.

In conclusion, the stories provided in this study explain the cultural reasons for indigenous management behaviour, but the participants failed to reveal the cultural basis for the culturally alien management practices, which are adopted in their company. This is because of unscrupulous imitation of culturally alien management practices or

institutional transferability of management practices by multinationals to their host country employees. Although companies of focus have a few indigenous management practices and more culturally alien management practices, the managers in these companies have limited cultural understanding of those culturally alien management practices. This highlights the lack of 'emic' understanding of culturally alien management practices, and hence the diversity management in these companies are just based on 'etic' approach. It has become clear to certain extent that 'etic' approach in diversity management is more common than 'emic' approach. It is useful to conduct further research on the effectiveness of 'etic' and 'emic' approach on implementing diversity management in companies.

The participants have indicated that there are indigenous management practices and culturally alien management practices in large companies, but this study failed to establish the relationship between indigenous management practices and organisational effectiveness. The framework to understand indigenous and culturally alien management practices is found to be useful in extracting useful information from the stories narrated by the participants.

There are two interesting findings in this study regarding imitation of culturally alien management practices in the host country indigenous companies. Firstly, continuous exposure of culturally alien management practices by companies to their employees can make such values as part of any established value systems of employees in all three countries. Secondly, participants in this study believe that company's interests motivate culturally alien management practices, and it didn't matter whether it matched with employees' value systems or not.

The research findings are limited because of the modest sample size and geographical area. Culture is important in understanding management behaviour and organisation system, but other factors like political and economical structure are also important but it was not included in this study. The organisational stories narrated by the participants are a good source of qualitative understanding of indigenous management practices, but it lacks generalizability. This area is a promising focus for further research. The purpose of this study is to understand the importance of indigenous management practices in large companies, a small step in the ever-lasting journey of understanding national and organisational culture.

# Strategic Partnerships as a Factor of Competitive Advantage in European Union

*Eva Smolková*

*Lucia Dobrucká*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

The goal of the article is to introduce strategic partnerships as a factor of competitive advantage that can be used in non-standard situations according to formulation of goals and ways of reaching the goals too. We show strategic partnerships as a useful tool by introduction of conception of competitiveness of regions. Competitiveness of regions is a strategic project that is step by step defined, modified, presented and achieved in European Union. We also try to name particular relationships and relations that can be influenced and lead to success that wouldn't be possible to reach without regional development. A term strategic partnership will be used according to book of Eva Smolková [7]. Third part of the article shows some examples of projects of regional development in Slovak Republic based on usage of strategic tools and partnerships.

## Strategic Goals of European Union

Strategic goal of European union is set as follows: "To become the most competitive and most dynamic economy in the world by 2010 based on knowledge and taking care on sustainable development and better social environment." [9] According to goal of sustainable development European Union set basis for understanding region as an organism. With no doubts it is a progressive approach not only influencing the Union but also enabling it to deal with problem of unequal and heterogeneous development of individual regions and parts of the Union as well as resolve differences given by history and cultures.

It is obvious European Union supports regional development heavily. The support mostly comes from the state into which the certain region belongs. Specific goals can be defined as regional or inter-regional according to specific characteristics of the regions. Especially in cases of geographical conditions such as mountains an inter-regional cooperation and coordination of the goals and activities is very welcomed. In these particular cases there is no importance of state borders and the support comes from the Union.

Development of small and medium enterprises was defined as a key factor of reaching the strategic goal of European Union. [9] Small and medium enterprises play the main role in regional competitiveness. They form the character and possible strengths of each region. SMEs guarantee flexibility and creativity and increase employment. They help to prevent monopolies, insure competitive environment and variety of products and services. In comparison to large companies they hire more young people, women and part-timers. About 99.8% of all companies in European Union belong to category of SMEs. They create about 55% of aggregate turnover and 66% of workplaces.

## Regional Strategy

"Inter-professional and inter-functional integration is a heart of each strategy. It means ability to join and integrate activities in the whole range of value chain and to create situation in which all the activities complement into an integrated entity." [5]

Regional strategy is a term integrating all types and kinds of activities that we understand while talking about strategy in economy and management in general. Strategic development plan in a plan of development consisting of tangible goals, steps and timetable needed to reach the goals.

Before talking about potential of strategic partnerships in region we have to remember that usage of any partnerships, in entrepreneurial as well as non-entrepreneurial sphere, is determined by a strategic conception. In case of regions there should be a conception of regional development. Strategic conception functions as a motivator

or goal that region wants, can and has to reach in a long period of time. Competitiveness of region is based on inside-regional factors. Success of region is partly given by competition among different regions, but much more it is given by identification of key activities of each individual region. Key strategic goals and alternatives to reach them should be settled in correlation to identified key activities. As well as in profit sphere strategic goals of region should be set according to opportunities using strengths, specialities and unique characteristics of the region. Strategic goals should be based on identifying and using of competitive advantage.

Process of identification of all key issues is given by consensus among entrepreneurs, public authorities, non-profit organisations, public institutions, inhabitants, etc. All of the mentioned subjects have to cooperate at regional development to make it successful. None of the set key issues should come out from individual motives and goals of mentioned subjects. None of the key issues should serve to satisfy individual needs and wishes. The sense of the key issues has to be given by development of whole region by taking opportunities of internal sources.

Coming out of premise the regional management is comparable to business management it has to deal with all aspects of complex management like we know it from the literature and practise. According to this we can say successful regional development in the long-term is possible only by cooperation and coordination of all subjects and activities inside.

Region isn't a system existing in a vacuum. There are plenty of relationships and links of different types and forms inside and outside the region. The main task of regional management is to identify and manage strategic potential of region. To reach the task it is necessary to identify, adapt and manage all of the relationships inside and outside region and transform them into strategic partnerships. Nowadays regions identify and use their natural differences and unique only in industry of tourism. It should be changed so that each region would be able to manage its special strengths, heritage and skills in the way of successful strategy and future profitability.

## **Strategic Partnerships as a Factor of Competitiveness of Regions**

Strategic partnerships become to be a factor that strongly influences present shape of world economics and factors of competitive environment. Their popularity increases mainly because they are one of the most effective tools to increase competitiveness of companies. Partnerships enable to define and use growth strategies and influence existing business environment per partners. Use of strategic partnerships became to be a standard during last ten years and nowadays it is hard to find a company that wouldn't create and keep partnerships with another firms. An amount of companies as "individual players" decreases. Standard contractual relationships transform into partnerships because it shown to be preferable. Companies learned to make profit from above standard relationships and its potential. It helps them to prevent problems and solve them be "roundtable" negotiation if any occur. Companies can profit from possibility to create and realise common strategic goals and prevent risks by common activities

We try to state that partnerships among companies became a standard tool in present business environment. It seems their strategic potential is available for future usage. It also seems there are some types and forms of partnerships that can be successfully used in another than business environment.

If we understand strategic partnerships to be a factor influencing not only profit but also non-profit and public sphere and regional characteristics, we have to look on them also from different point of view that only the one described in economical literature. Economical literature describes joint ventures to be the only type of common companies that others than profit organizations can participate on. We think all types of well-known partnerships can occur in term of regional development. There are also new types and forms of partnerships not used in entrepreneurial environment used in regional development.

If we come out of premise there is a strategy established as a consensus of all touched and participating parties, it has a strong motivating elements in it. This strategy influences everybody and that is a reason why lots of different subjects want to participate on its development. To enable them to cooperate a strong feeling of cooperation and coordination has to be taken into the process. As we already pointed, lots of different kinds of subjects should be involved such as large companies, small and medium enterprises, non-profit organisations, state and public institutions, official authorities, research centres, universities, professions and individuals, etc. More

heterogeneous subjects participate on development and reaching strategy and strategic goals, more interesting, unique and useful solution can be found and implemented.

At the same time a problem of power for negotiation occurs. Large companies and official bodies have more power to carry their point than other subjects. In reality they often try to underline their own goals and interests. Chosen development plan could satisfy just one or some of subjects in region. One more problem can be met. Even though the cooperation should be based on “everybody with everybody” principle to get optimal results, there is a threat of never-ending and too abstract negotiations can occur in this case. Regional management has to remember these facts and be able to prevent them.

There are some factors helping to prevent or resolve mentioned problems. First, main goal of regional development plan is to develop the region not to develop individual subjects. This has to be clear and understood by everybody. Second, profit-oriented organisations tend to manipulate other participating subjects the most. That means non-profit and public institutions should play the role of coordinators. Also, some of the competences can be delegated the way it is usual in partnerships among companies and enterprises. Third, all of involved subjects have to see and understand their own real advantage and benefit. Fourth, a factor of common learning process has to be involved. If there is a possibility for powerful subjects to learn and get new experiences they are much more willing to accept less powerful partners. And fifth, climate of trust has to be created.

Coming back to learning-oriented cooperation that is a point enabling subjects to identify and understand their environment. It is a key point to understand changes of environment and successfully implement progressive strategies. It helps to increase creativity and development process of competitive advantages.

Cooperation and coordination of different professions and individuals plays very specific role in the process of regional development. Each profession is unique and has its own innovative ideas about region.

In case of non-cooperation of professions these ideas and proposals exist parallel next to each other and there isn't any integration of them. Often the situations of confrontation of different proposals are insoluble, for example confrontation of environment protection versus industrial development. Coming conflicts cause wastage of time and capital and slows down the development process. Final decision and solution will not be the optimal one but the one wanted by the stronger subject for sure. There is variety of reasons for conflicts and misunderstanding of professions such as lack of information, capital, time and willingness to listen to different opinions, distrust, disability to understand alternative points of view, etc.

On the other side a team composed from various professions has a great opportunity to achieve long-term success. Strong synergic effect can be created by complementation, mutual understanding and enriching. Participants have to be patient, trustworthy, listening to each other, opened and willing to work for common heritage of the region.

## **Examples of Regional Development in Slovak Republic**

Question of regional development became to be more and more important in Slovak Republic after joining European Union in May 2004. We describe three examples of regional development that show importance of implementation of strategic management tools into management of regions and possibilities of strategic partnerships in regions.

### **Project of Methodology of Strategic Development Plan**

Comenius University in Bratislava understood the importance of participation of educational institutions on regional development in Slovakia. Basically there is a lack of scientific methodologies and approaches official helping regional authorities to make successful development plan in practice. In 2005 Comenius University starts a project called “Methodology of development of strategic development plan for municipalities”.

Goal of the project is to develop the methodology in such way it would be usable for both scientific as well as practical purposes. It should be used as a textbook for students studying various topics connected to regional development. It should be used by professionals dealing with regional planning or regional development in practice too. Basically it should be used by official authorities of small municipalities up to two thousands inhabitants. The methodology will be tested on two chosen villages and modified according to identified problems and ideas of aggrieved parties.

The project is managed by Faculty of Management Comenius University but the research team is composed from young researchers coming from different faculties such as Faculty of Fine Arts, Faculty of Natural Sciences and Faculty of Architecture Slovak Technical University in Bratislava. According this fact almost all of relevant professions will participate on methodology development such as managers, regionalists, architects, landscape architects, sociologists, historians, environmentalists, etc.

Not only people from scientific and educational institutions will take part at the project. There is a need for people from practice to cooperate too. Comenius University asked some of Slovak well-known professionals to cooperate such as representative from regional development agency<sup>1</sup>, representative from non-government organisation “Agrogenofond<sup>2</sup>”, authorised architects, landscape engineer, etc.

The project should finish in 2007. The outcome will be in a form of publications, textbook and inter-professional conferences.

#### **Village of Halzice**

Strategic conception of development of a small rural village Haluzice can be shown as an example of cooperation of different subjects on regional development. Conception was created during the project “Summer atelier – Haluzice” in 2003-2004. Teachers and students of three Slovak universities took part at the project. They were Faculty of Management Comenius University in Bratislava, Faculty of Landscape Engineering Slovak Agricultural University in Nitra and Faculty of Pedagogy University of Constantine the Philosopher in Nitra. By cooperation of the universities three different professions took part at the project. They were managers, architects and artists. There was cooperation with the mayor of the village, the biggest entrepreneur and representatives of inhabitants too.

The project was composed from three stages. First, students of each university spent a week in the village experiencing the region, talking to inhabitants and each other and developing ideas. Second, there was a presentation of ideas in front of inhabitants and discussion about future possibilities of the region. Third, according to all the ideas and comments a conception of possible regional development was created. Fourth stage should take place in 2005. There should be presentation of the conception in front of inhabitants and investors. At present a publication of all ideas developed since today is in the process of preparation.

The outcomes of individual universities and ideas of inhabitants are as follows:

FLE SAU – Projects of landscape architecture using traditional genofond<sup>3</sup> of Slovak plants. Projects of fruit-grove and medicinal herbs estate. Projects of revitalisation of the village from the point of view of architecture.

FP UCP – Design and land art. Ideas about logo, design of textile, glass, package of souvenirs. Usage of objects of art in landscape outside the village.

FM CU – Projects of revitalisation of the village from economical point of view, financial analysis of mentioned ideas, business plan of fruit production.

Ideas of inhabitants – There will be a “Repositoryum<sup>4</sup>” established in the village consisting of fruit-groves and estates of utility, medical and decorative herbs. The biggest local entrepreneur invested his lands into the project of Repositoryum. Inhabitants want to establish almshouse in the village. Third, they want to bring tourists into their village concentrating on agro-tourism<sup>5</sup>.

Final development conception of the village was developed as a summary and combination of all of the mentioned ideas and projects. The conception looks as follows:

Repositoryum gives a great opportunity to produce co called “original products<sup>6</sup>” made out of fruits and to turn all of regional activities on the production of traditional regional souvenirs<sup>7</sup>. This idea is supported by the fact inhabitants want to establish the almshouse. Older people in Slovak Republic have a strong relationship to handwork, traditions and habits. They know how to produce lots of interesting and rare products. If people staying in the almshouse have possibility to use their skills and knowledge they would work hardly feeling useful, happy and motivated too.

Image and communication of the village should be based on traditions, habits and originality. All of the products produced by different subjects should have the same mark, logo and package design. That would strengthen position of the village as well as position of all individual producers. All of the producers, profit oriented as well as socially oriented, can share risks and costs and serve customers with wider range of products and services. The image of the village would help to attract agro-tourists to come later on too. New job possibilities will be created in field of tourism.

But, before attracting tourists to come in the village has to be revitalised. Basically new inhabitants should come to live in the locality. It is necessary to attract young families. It can be reached by reconstruction of old empty houses that could be offered to live in. Except of obligatory rents cooperation with older people in the almshouse could be asked. Especially cooperation of children and young people brought up in foster homes could bring strong relationships, social stability and sense of life for participating parties.

Some of the ideas of artists are very useful too. Except of logo and package design, a great idea of lavender<sup>8</sup> labyrinth was introduced. It would be placed at a hill behind the village visible from the near highway. A strong purple colour can attract and motivate people passing by to stop here. Together with high art statues placed at the top of the hill it is an example of a little avant-garde but innovative way of promotion.

#### **Town of Sládkovičovo**

Third example is a bit different to the previous one. While village of Haluzice is an example of rural development and inter-professional cooperation, town of Sládkovičovo is an example of industrial region and inter-regional cross-border cooperation.

Town of Sládkovičovo takes place about 30 kilometres far from capital of Slovak Republic city of Bratislava. It is located in so called “golden triangle” connecting city of Budapest, capital of Hungary, city of Vienna, capital of Austria, and city of Brno, second largest city of Czech Republic. There are plenty of highways connecting these cities and lots of large companies come to this region to build their subsidiaries here. There is a potential for industrial development here.

The mayor of Sládkovičovo understands the opportunity and invests all of his energy into attracting investors to come. An industrial park occupied by eight foreign companies functions near the town. A second one should be opened soon. Companies established in the industrial parks will perform as subcontractors of Samsung located in near region of Galanta.

A business incubator will be opened in October 2005. The incubator was planned together with representatives of business incubators in Hungary and Austria. Cooperation and transformation of ideas, technologies and entrepreneurs are agreed. Also there is cooperation with Regional Development Agency in Galanta about attracting small entrepreneurs to come in and with Comenius University about education process of workshops and seminars. The project of business incubator won Union aid in 2004.

## **Conclusion**

We introduced theory of usage of strategic management tools and strategic partnerships in a process of regional development. Given examples prove it is possible to identify strategic priorities and competitive advantages of regions and implement strategic management into management of regions. As we can see inter-professional and inter-regional teams are able to identify key strategic issues as well as original and unique details.

Potential of strategies is much wider than we know it from profit and economical sphere. Regional development should get into hands of skilled and innovative strategic managers that could identify and implement strengths and opportunities of regions and guarantee its success and future profitability.

### End Notes

The article was written as a part of following grants:

1. A-200 Uchovanie a trvalo urdzateľné využívanie genetickej základne úžitkových druhov rastlín pre výživu a poľnohospodárstvo
  2. GP VEGA č. 1/1314/04 Zásady obnovy štruktúry vidieckeho sídla.
  3. APVT-20-032104 Metodika tvorby strategického rozvojového plánu obce
  4. 220/2003/UK Prieskum pripravenosti slovenských MSP na vstup do EU (2. časť)
1. Regional development agencies are non-profit public institutions taking care of development of individual regions. Each district in Slovak Republic has its own RDA. The one mentioned in text is situated in middle part of Slovak Republic.
  2. The organisation deals with traditional genofond of Slovak plants. Its goal is to collect, take care and reproduce very unique and old sorts of plants together with traditional recipes of traditional products made out of the plants. The activity helps to protect and save our national heritage in a very specific field of interest. Especially small rural regions can benefit from the collection.
  3. Genofond is a variety of genetic information.
  4. Repositorium is a place where genofond is collected and saved. In case of Haluzice it is in form of fruit-grave and estates of herbs.
  5. Agro-tourism became very popular in European Union. Slovak Republic is basically a rural country where more than 60% of inhabitants live in rural areas. It gives a great opportunity to build a network of centres of agro-tourism in the country.
  6. Original products are very unique and rare products. Their production is close-knit to locality, local sort of plant or animal and old traditional recipe of production. There are acts and principles at the over-national level of European Union defining patents and rights connected to production of original products. Their price is very high. The profit margin is calculated in hundreds of percentage.
  7. Traditional hand made products made out of wood, corn lives, sheep wool, Salix, textile, ceramics, etc.
  8. Lavender is a medical herb usable in many ways in pharmacy, cosmetics and honey production. Its flowers stay almost half a year. It is more than half a meter high and makes a very compact clumps that seem like a carpet.

# Market Valuation of Global R&D Alliances in High Technology Industries

Byung Hee Lee  
Hanyang University, South Korea

## Abstract

Existing literature on interfirm cooperation has not clearly explicated how stock markets value new knowledge development through international R&D alliances. Based on the perspectives of inter-organizational learning and technology capabilities development, this study develops a theoretical model with factors that are proposed to affect stock market valuations of cross-border R&D activities. The proposed factors include past linkages between partnering firms, individual firm's absorptive capacity, similarity of technology bases between partners and intellectual property protection level of partner's home country. With a sample of 160 dyad-international R&D alliances formed during the period of 1995-2000 in high tech industries, this study tested the proposed model separately for U.S.-firms and non-U.S. firms. Empirical findings suggest that individual firm's absorptive capacity significantly influenced market valuation of international R&D alliances for both U.S. and non-U.S. firms sample groups. Past direct linkages and technology bases similarity were significantly associated with market valuation of only U.S. firms sample. However, intellectual property level of partner's home country did not have any substantial impact on stock market valuations. These findings provide new insights for managers to develop alliance management capabilities.

## Introduction

Geographic diffusion of collaborative innovation activities and cross-border investments for new technology development has instigated the rapid proliferation of international R&D alliances (Hagedoorn, 2002). Firms have exploited this interfirm cooperation as a new source of competitive advantage and as a mean of sharing risks and costs associated with new technology development (Contractor and Lorange, 1988; Stuart, 2000). Given the rapid proliferation of interfirm cooperation in the globalized business environment (Hitt *et al.*, 2000), valuing international R&D alliances that intend to develop new technology may shed a new light on understanding firms' strategic behavior and performance.

An extensive body of research has suggested that competition is fundamentally knowledge-based, and companies strive to learn and develop capabilities faster than their rivals (Kogut and Zander, 1992; Teece and Pisano, 1994). Teece and Pisano (1994) posited that organizational learning enabled firms to acquire new capabilities, and a strategic alliance was a primary medium for organizational learning. This prediction was supported by an increased use of strategic alliances to facilitate inter-organizational learning (e.g., Ahuja, 2000; Gulati, 1995). Accordingly, an extensive body of literature identifies the characteristics of strategic alliances and partnering firms that facilitate the flow of knowledge among firms involved (Kogut, 1988; Mowery *et al.*, 1996; Powell *et al.*, 1996). Hagedoorn and Schakenraad (1994) showed a positive relationship between formation of technology alliances and firm innovation. Ahuja (2000) also suggested that alliances help firms develop and absorb technology from outside firm boundaries.

Many empirical studies on market valuation of interfirm cooperation have been conducted. However, inconclusive results of past studies (e.g., Das, *et al.*, 1998; Koh and Venkatraman, 1991; Lee and Wyatt, 1990) have demanded more theoretically sound and methodologically rigorous studies to advance the existing knowledge on strategic alliances. Based on the literature of inter-organizational learning (e.g., Gulati, 1985) and technology capabilities development (e.g., Cohen and Levinthal, 1990), this study purports to examine how stock markets value new knowledge generation, an expected outcome of international R&D alliances, by identifying factors that account for the changes in stock returns and comparing market valuations of U.S. firms with those of non-U.S. firms. Methodologically, this study differentiates itself from past studies that examined market valuation of only U.S. firms, not including their foreign partner firms. Given the exponentially growing interfirm collaborations between U.S. and non-U.S. companies and their impact on firms' global competitiveness (Hitt *et al.*, 2000), previous research

that used samples of only U.S. partnering firms may provide incomplete and misrepresentative results. Consideration of both U.S. and non-U.S. firms is necessary in that all partnering firms engaged in alliances may not be valued by stock markets in identical ways.

In this study, the term “international R&D alliance” is defined as a cooperative agreement formed by a U.S. firm and its foreign partner firm with a strategic purpose of technology sharing and co-development. This cooperative agreement does not involve the creation of a new independent business entity as in joint ventures, but it allocates resources, operational responsibilities, and financial risks and rewards to each partnering firm. Unlike joint ventures where new knowledge generated from interfirm cooperation may reside in joint venture firms, alliances formed by contractual agreements are better in returning the benefits to participating parent firms directly, so valuation effects can be measured more accurately with this mode of alliances.

## Hypotheses

### **R&D Alliances in High Technology Industries and Market Valuation**

While firms recognize the strategic significance of creating knowledge within their organizational boundaries to outperform their competitors, the rising cost of R&D, rapid technological diffusion, compression of product life cycles and globalization often require the use of interfirm cooperation as a means for knowledge acquisition, sharing, and creation (Grant and Baden-Fuller, 1995; Hitt *et al.*, 2000). Especially, in high-velocity business environments (Eisenhardt, 1988), very few firms would be able to, or willing to, independently carry the risks of accelerating R&D costs (Hagedoorn and Schakenraad, 1990). Therefore, a firm may consider developing a nexus of cooperative relationships with other firms in order to keep up with many emerging technologies, while concentrating internally on its specialty area. Powell (1990: p.315) noted that “firms pursue cooperative agreements in order to gain fast access to new technologies or new markets, to benefit from economies of scale in joint research and/or production, to tap into resources of know-how located outside the boundaries of the firms, and to share the risks for activities that are beyond the scope of the capabilities of a single organization.” Madhok and Tallman (1998) also posited that firms enter into collaborative relationships because firms expect to yield superior value through the relationships relative to other forms of organizational economic activities. These collaborative relationships *per se* tend to offer potential opportunities for synergistic combinations of complementary resources and capabilities and could be considered to be productive resources for value creation and realization.

Another benefit of interfirm cooperation is that it provides a venue for experimenting with new innovations and technologies. Mody (1993) suggested that the flexibility inherent in alliances facilitates experimentation with new combinations of participants in the pursuit of new technology strategies. The ability to experiment should be particularly valuable to rapidly growing firms, including so called high tech firms that compete in the environment characterized by rapid rates of changing in product design and process technologies, with significant risks of failure at the development stage, and rapid obsolescence of products once they enter production.

Despite the popularity of interfirm cooperation, previous studies have reported that half the collaborations made fail to achieve their intended goals (Pearce, 1997). Therefore, a body of studies concerned with the performance implications of interfirm cooperation has questioned whether formations of alliances contribute to firm value creation (e.g., Das *et al.*, 1998; Koh and Venkatraman, 1991, Park and Kim, 1997). However, empirical results of past research have been equivocal. Several studies reported that firms generally obtained a positive return when announcing the formation of an alliance (Chen *et al.*, 1991; Koh and Venkatraman, 1991). Other research found a negative (e.g., Chung *et al.*, 1993; Lee and Wyatt, 1990) or non-significant return (e.g., Das *et al.*, 1998; Merchant, 1997). Hence, as an effort of overcoming limitations of the past studies, this study investigates whether factors drawn from the literature of inter-organizational learning and technology capabilities development significantly influence market valuation of international R&D collaborations.

### **Inter-organizational Learning/Technology Capabilities Development and Market Valuation**

#### *Prior linkages between Partnering Firms*

With the repeated alliance formations with the same partner, firms may gather information pertaining to a partner’s capabilities, behavior and managerial style. This additional information may reduce adverse selection problems in

alliance formation (Balakrishnan and Koza, 1993). Further, communication and coordination may be enhanced in the current alliance, improving alliance outcomes.

While past research rooted in transaction cost economics has underscored the emergence of trust through repeated alliances and its role of deterring potential opportunistic behavior and limiting the transaction costs associated with an alliance (Gulati, 1995; Parkhe, 1993), the inter-organizational learning perspective emphasizes a learning process by which repetition and experimentation with the same partner enable alliances to be performed better. These routines become patterns of interactions that represent successful solutions to particular problems (Teece and Pisano, 1994). Recent studies provide some preliminary support for the benefits of prior linkages. It has been reported that parent firms with prior international joint venture experience with a partner manage better and gain benefits from subsequent joint venture formed with the partner (Barkema *et al.*, 1997). Zollo *et al.* (1998) found similar evidence of the experience benefits in their study of post-acquisition integration success. In conclusion, it is hypothesized that international R&D alliances formed between firms that have extensive past alliance relationships with each other will increase market value more than those between firms with fewer prior collaborations.

Hypothesis 1: Market valuation of international R&D alliances will be positively related to the number of prior alliances formed with the same partnering firm.

#### *Absorptive Capacity*

Cohen and Levinthal (1990) suggest the importance of an existing competence base, termed “absorptive capacity”, with which firms are capable of detecting, assimilating, and utilizing external knowledge. The key component of this notion is R&D investments. They suggested that a firm’s R&D investments contribute to not only the generation of new knowledge but to the firm’s absorptive capacity. When a firm uses an alliance to internalize new technology-based capabilities from a partner, the demands of the technology absorption process are such that the technology-acquiring firm must have considerable in-house technical expertise that complements the technology development activities of the alliance. Hence, the accumulation of R&D resources within a firm enhances the firm’s ability to acquire external technology and combine it with existing internal development activities for the commercialization of the learning object, technology.

The relationship between R&D expenditures and firm innovativeness has been extensively researched in the strategy literature (e.g., Mowery *et al.*, 1996). The level of a firm’s R&D investments tends to determine the ability of the firm to assimilate new technological capabilities of other partner firms in alliances. Knowledge absorption depends on the firm’s ability to add new knowledge to existing knowledge. The accumulated R&D investments may be an indicator of the firm’s willingness and readiness to absorb new knowledge through alliances.

Hypothesis 2: Market valuation of international R&D alliances will be positively related to the level of the firm’s absorptive capacity.

#### *Similarity of Technology Bases between Partnering Firms*

Motives for establishing alliances differ among firms, and these different motives may affect both the choice of partner firms and the effect of partner choice on the capabilities of participating firms. Firms jointly pursuing collaborative development of a technology or product within an alliance are likely to require some level of technological similarity to facilitate knowledge exchange and development. Cantwell and Barrera (1996) suggested that “firms with dissimilar profiles of technological effort will be likely to have less incentive to exchange knowledge,” (p.2). Hence, firms participating in an R&D alliance should possess ex ante technology-based capabilities that are similar in scale and scope at the time the alliance is formed.

Mowery *et al.* (1996) proposed that firms with high technological similarity tend to combine their complementary knowledge resources more effectively than firms with low technological similarity, and found that the extent of a firm’s absorption of technological capabilities from its alliance partner is positively related to its pre-alliance level of technological similarity with partner firms. As a result, firms establishing R&D alliances with partners that have similar technological bases will benefit more from the alliances than firms of which partners in R&D alliances have dissimilar technology bases<sup>1</sup>.

Hypothesis 3: Market valuation of international R&D alliances will be positively related to the similarity of technology bases between partnering firms.

### *Intellectual Property Protection of Partner's Home Country*

Intellectual property is an aspect of property rights that augments the significance of know-how assets. Knowledge assets are often inherently difficult to imitate. Moreover, some knowledge assets such as patents and trademarks are protected against illegal copy or theft under the intellectual property laws of individual nations. However, some know-how or intangible assets are exposed so as to be imitated, and firms striving to maintain their capabilities, and manage their knowledge resources effectively, may resort to intellectual property protection as a barrier to imitation (Teece, 1998).

Cross-border R&D alliances are established with the goal of pooling complementary resources and leveraging intellectual property, thus helping firms to keep pace with rapidly changing environments. Firms involved in such alliances face concerns as to how they successfully achieve their intended goal of combining complementary resources of each partnering firm without losing core proprietary knowledge or capabilities to the partner (Hladik, 1988). The concern is exacerbated by the fact that the degree of protection and coverage of intellectual protection laws significantly varies among individual countries. As alliances between firms from different countries have become an accepted feature of the globalized business environment, the protection of intellectual property has emerged as a primary concern of the firms participating in international R&D alliances.

For firms concerned with leakage of their valuable intellectual property, it is required to write and execute a reliable contract for the use of proprietary technological knowledge. However, adequate specification of property rights, monitoring, and enforcement of contractual terms are costly, and thus are to be implemented cautiously in international knowledge-intensive alliances. Oxley (1999) demonstrated how differences in the level of intellectual property protection across countries and alliance characteristics affected the choice of governance mode in interfirm alliances. Her findings implied that equity-based alliances are better than simple contracts, such as licensing agreements, in protecting proprietary knowledge through close alignment of the incentives of the partnering firms and enhancement of monitoring and control capabilities. Based on her findings, it is predicted that the stock markets will favorably (unfavorably) value announcements of U.S. firms' alliances with firms from countries with high (low) degree of intellectual property protection, because proprietary knowledge of U.S. firms will be more (less) likely to be protected in such alliances.

Hypothesis 4: Market valuation of international R&D alliances will be positively related to the level of intellectual property protection of partner's home country.

## **Methodology**

### **Sample**

The primary source for the data on international technology alliances is the Securities Data Company (SDC) database of Joint Ventures and Alliances. The data in this study consist of international R&D alliances formed between one U.S. and one non-U.S. firm during the period of 1995 - 2000. To effectively manifest the strategic roles of technology alliances, this study includes alliance activities of firms in high technology industries. For the scope of high technology industries, this study followed the work of Hadluck *et al.* (1991). Following these criteria, the final sample data are composed of 160 alliances, each of which involves one U.S. firm and one non-U.S. partner.

### **Analytical Methodology**

We employed the event study method to measure the impact of international R&D alliance formation on a partnering firm's market value. Although it is almost impossible to disentangle the value creation effects attributable to a particular alliance from those generated by the firms' other operations, event study methodology overcomes this problem in that it captures only the value created from an alliance formation on its announcement day, relying on the efficiency of stock market mechanisms.

The standard approach in event studies is based on estimating a market model for each firm and then calculating abnormal returns (McWilliams and Siegel, 1997).

$$R_{it} = \alpha_i + \beta_i * R_{mt} + \varepsilon_{it}$$

where

$R_{it}$  = the rate of return on the share price of firm  $i$  on day  $t$ ,

$R_{mt}$  = the rate of return on a market portfolio of stocks on day t,  
 $\alpha_i$  = the intercept term,  
 $\beta_i$  = the systematic risk of stock i,  
 $\varepsilon_i$  = the error term for stock i on day t  $\sim N(0, \sigma_{\varepsilon_i}^2)$

The deviation of the actual return from the expectation (abnormal return, AR) is computed for firm i on the day t as

$$AR_{it} = R_{it} - (\alpha_i + \beta_i R_{mt})$$

where  $\alpha_i$  and  $\beta_i$  are the firm-specific ordinary least squares (OLS) parameter estimates obtained from the regression of  $R_{it}$  on  $R_{mt}$  over a certain estimation period preceding an event, the announcement of an alliance. Based on the methodological tradeoff and previous alliance research, the estimation period in this study is 150 days from  $t = -170$  to  $t = -21$ , where  $t = 0$  corresponds to the date of an alliance announcement. We also set up 20 trading days before and after an alliance announcement date. During these pre- and post-alliance periods, the abnormal return of each day is measured.

Next, market valuation is measured by summing the abnormal returns between two days  $t = t1$  and  $t = t2$  within the event window.

$$CAR_i = \sum_{t=t1}^{t2} AR_{it}$$

Generally, CARs over a short interval are preferable in order to reduce the amount of noise in the dependent variable. In this study, the impact of the announcement on the stock price is captured with cumulative abnormal returns of the three-day trading period consisting of  $t = -1$  and  $t = +1$ . After identifying the statistical significance of the cumulative abnormal returns (CARs), we explained the cross-sectional variation in the returns across the firms in the alliances sample by running OLS multiple regressions. OLS regression can be used despite the fact that the abnormal returns used as dependent variable in OLS regression are essentially residuals that may be heteroscedastic and be correlated with the independent variables (Karafiath, 1994).

#### **Measurement of Dependent Variable<sup>ii</sup>**

The dependent variable of this study is captured by the standard event study method that measures abnormal returns of partnering firms on the day of alliance announcement. For the U.S. partnering firms, daily stock prices during the data collection period were drawn from the CRSP database. The stock prices of the foreign partners were obtained from the Datastream database.

#### **Measurement of Independent Variables**

##### *Prior linkages between Partnering Firms*

Prior linkages are measured by counting past alliances formed by a pair of partnering firms. Data were collected from the SDC database and Dow Jones Interactive for the last 10-year period prior to an alliance announcement date.

##### *Absorptive Capacity*

A firm's absorptive capacity is operationalized as accumulated R&D investments, adjusted by the sales of each firm. It is not clear from prior research on how many years of R&D expenditures should be included. Pakes and Griliches (1984) suggested that R&D lags of order 6 and higher have a significant effect on patenting. Because R&D data for foreign firms were available from the data sources since 1991, however, we constructed a 3-year depreciated R&D investment with a 15 percent annual depreciation rate, which is recommended by Griliches and Mairesse (1984). The measure is as follows:

$$R \& D(Investments)_{it} = \sum_{n=t-1}^{t-4} (1-0.15)^{t-n-1} (R \& D)_{in}$$

where  $R\&D_{in}$  is firm i's sales-adjusted R&D expenditures in year n. The data for R&D expenditures were collected from COMPUSTAT and Bloomberg.

### *Technology Bases Similarity*

Technological similarity is measured by the patent cross-citation rate between two partnering firms. The measure developed by Mowery *et al.* (1996) was adopted. The cross-citation rate for firm  $i$  and firm  $j$  is defined as follows:

$$\text{Cross-Citation Rate (firm}_i, \text{firm}_j) = \text{Citation Rate (firm}_i, \text{firm}_j) + \text{Citation Rate (firm}_j, \text{firm}_i)$$

$$\text{where Citation Rate (firm}_i, \text{firm}_j) = \frac{\text{Citations to firm}_j \text{ patents in firm}_i \text{'s patents}}{\text{Total citations in firm}_i \text{'s patents}}$$

All U.S. patent citation data were gathered from the U.S. Patent and Trademark Office database, which contains all information recorded on the front page of every patent granted in the United States since 1975. To measure a level of technological similarity, we calculated the cross-citation rate of two partnering firms for the three-year period prior to an alliance announcement date.

### *Intellectual Property Protection*

This variable is measured by the index of patent rights, developed by Ginarte and Park (1997). The index is based on an examination of five categories of patent law: extent of coverage, membership in international patent agreements, provisions for loss of protection, enforcement mechanisms and duration of protection. This index shares some of the limitations of other intellectual property measures, particularly with respect to the narrow focus on patents rather than on alternative forms of protection (such as copyright or trade secret law). However, the inclusion of enforcement issues in the index, including the availability of preliminary injunctions, contributory infringement pleadings and burden-of-proof reversals, mitigates an important shortcoming of alternative measures. Another limitation of this measure is that the index is available for every 5-year term since 1960. However, the level of intellectual property protection has been highly stable since 1980 in the countries included in this study. In this study, the average values of 1995 and 2000 index were used for all the sample alliances, and the values were not assigned to non-U.S. firms because they are identical for all the non-U.S. firms. One advantage of the index is that it is available for a broader range of countries (110 in all) yielding a larger sample of alliances for which complete data are available. In conclusion, it is one of the most comprehensive and systematic indices among the published measures of intellectual property protection.

### **Control Variables**

#### *Cultural Relatedness*

Since international alliances considered in this study involve two firms located in two different countries, there may exist alliance management costs resulting from cultural differences between the two firms. Cultural differences indicate the extent to which work-related assumptions between the firms converge (Hofstede, 2001). When the firms are culturally similar, they may be able to form more accurate predictions about their partner's work-related conduct. Hence, alliances between two firms located in culturally close countries will be more likely to reduce alliance management costs and thus create high firm value. Cultural difference is measured as an index of cultural distance developed by Kogut and Singh (1985). The cultural distance measure is defined as follows:

$$CD_{jk} = \frac{1}{4} \sum_{i=1}^4 \{I_{ij} - I_{ik}\}^2 / V_i,$$

where  $CD_{jk}$  is the cultural distance between countries  $j$  (i.e., the U.S.) and  $k$  (i.e., partner's home country), and  $I$  indicates four scales representing uncertainty avoidance, individuality, tolerance of power distance, and masculinity compiled by Hofstede (2001). In the formula,  $I_{ij}$  is the score of scale  $i$  for country  $j$  and  $I_{ik}$  is the score of  $i$  for country  $k$ .  $V_i$  represents the sample variance of scale  $i$ , which is used to correct the squared deviations for differences in variances across the four scales.

#### *Firm Size Differences*

It is suggested that alliances comprising similarly sized firms generate higher value because such alliances diminish the need for partnering firms to standardize dissimilar internal policies and procedures to implement interfirm cooperation (Merchant and Schendel, 2000). This size difference was measured as the logarithmic value of the absolute difference between the annual sales of two partnering firms.

### Market Size

Market size is included as a control variable in that it may relate to the potential profitability and growth opportunities of a country (Buckley and Casson, 1996). The inclusion of a market size variable controls country differences in these aspects. Market size was operationalized as a log of Gross Domestic Product (GDP) of the partner country.

### Industry Dummies

Dummy variables for the chemical, computer, and precision instruments industries were included to test if there are any significant differences across the industries.

## Results

Table 1 presents the market valuation results of 160 international R&D alliances, categorized by firms' geographical locations and signs of market returns. It shows that U.S. firms realized positive returns more than non-U.S. firms and not all partnering firms were positively valued by the stock markets.

TABLE 1: CATEGORIZATION OF MARKET VALUATION OF 160 DYAD-INTERNATIONAL R&D ALLIANCES\*: U.S. VS. NON-U.S. FIRMS\*\*

	U.S.-based Firms	Non-U.S. Firms	Total
Positive returns	98	83	181
Negative returns	62	77	139
Total	160	160	<b>320</b>

\* 160 international R&D alliances are composed of 160 U.S. firms and corresponding 160 non-U.S. firms;

\*\* Non-U.S. countries include Belgium, Canada, Denmark, Finland, France, Germany, Ireland, Japan, South Korea, Sweden, Switzerland and United Kingdom.

For U.S. firms: AR (t=-1) = 0.25; AR (t=0) = 0.77 %; AR (t=1) = 0.42 %; CAR (t=-1,1) = 2.68%

For Non-U.S. firms: AR (t=-1) = -0.13%; AR (t=0) = 0.18 %; AR (t=1) = -0.32 %; CAR (t=-1,1) = -0.46%

Table 2 and Table 3 provide descriptive statistics for U.S. firms and non-U.S. firms, respectively. The average change in firm value for three trading days on and after alliance announcement day was 2.7% for U.S. firms and -0.46% for non-U.S. firms. On average, the sampled firms had only one direct alliance experience with each other during the last 10-year period prior to forming a new alliance. U.S. firms showed much higher R&D investment activities than non-U.S. firms. Refer to Table 2 and Table 3.

We conducted multiple regression analyses, as we need to investigate which factors in the model possibly account for the differences in the potential economic benefits of international R&D alliances. Table 4 presents the regression results for testing Hypotheses 1-4. All control variables were entered first and then a group of explanatory variables were entered. Model 2 was specified as the full testing model for non-U.S. firms and Model 5 for U.S. firms<sup>iii</sup>. For non-U.S. firms, only the proposed relationship between individual firm's absorptive capacity and market valuations was found to be significantly positive, supporting H1. In contrast, for U.S. firms, the proposed positive associations of previous linkages between partnering firms, technological similarity level and firm's absorptive capacity with market valuation were statistically significant, supporting H1-H3. However, the level of intellectual property of partner's home country was not found to be significant. Refer to Table 4.

### Robustness of Tests

There was a possibility that unobservable heterogeneity in firm-specific capabilities affected the firm value creation effects of international technology alliances. Hence, we ran a hierarchical regression with firm fixed effects and found that there were no differences in organizational capabilities across firms. We also ran similar multiple regressions with fixed effects of year and country. No significant differences in stock market valuations were found.

## Discussion and Conclusion

Based on the literature of inter-organizational learning and technological capabilities development, this study delineated what factors influence market valuation of international R&D alliances. The empirical findings suggest that firms must carefully weigh the soundness of their rationale for forming international R&D alliances because not all the firms engaged in cross-border R&D alliances are equally valued by markets. Alliance managers should be careful not to ride on a “bandwagon” of participating in R&D alliances, seduced by the potential economic benefits presumably to be expected from interfirm cooperation. Many other factors also affect market valuation of international R&D alliances in direct or indirect ways.

Hypothesis 1 proposed a positive relationship between previous linkages and market valuation. Similarly, previous research also suggested that direct alliance experiences produce positive outcomes, such as trust and longer durations of interfirm collaborations (Gulati, 1995; Park and Russo, 1996). This study found that the proposed positive relationship was significant only with U.S. firms sample. This result may indicate that U.S. firms tend to be conservative in selecting partners because of a possible appropriability concern.

Hypothesis 2 postulated that cumulative R&D investments would be positively associated with market valuation, based on the concept of absorptive capacity, which suggests the importance of an existing competence base (Cohen and Levinthal, 1990). Consistent with the concept, the empirical finding indicated that the level of cumulative R&D investments positively influenced market valuations of both U.S. and non-U.S. firms, implying that stock markets viewed firms with considerable in-house technical expertise as successfully being able to internalize new technology-based capabilities from their partners. Therefore, alliance managers in high tech industries should be concerned with their R&D investment activities when they wish to realize positive market returns from international R&D alliances. In order to fully explore potentially positive opportunities of international R&D alliances, firms should be prepared to acquire new technological knowledge from their partners through continuous investments in their R&D function.

Hypothesis 3 proposed a positive relationship between technology bases similarity and market valuation. The analysis found that the proposed positive relationship was significant only with U.S. firms sample. This may indicate that U.S. firms form international R&D alliances in such a conservative way that they select partner firms with similar technology bases. However, this result should be interpreted with caution. The variable of technological similarity was measured with cross patent citation rates using the patent database compiled by the U.S. Patent and Trademark office. Because patent application activities of non-U.S. firms are less frequently recorded in the U.S.-based patent database, the calculated citation rates may be undervalued. However, this measurement problem may be mitigated by the fact that the U.S. market is the largest and most significant business marketplace so that firms in high technology industries have a high tendency of protecting their proprietary knowledge assets through patent filings (Albert *et al.*, 1991).

Lastly, we found that the level of intellectual property protection in non-U.S. countries was not significantly related to market valuation of U.S. firms. This result may be explained by a tendency of high tech firms’ protecting their innovative knowledge with legal contracts such as cross-licensing (Gridley and Teece, 1997).

The preceding discussions should be considered in light of the study’s limitations. The first limitation of this study is that empirical findings about the value-creating role of international R&D alliances are limited to stock markets’ (investors’) expectations about the performance of international technology alliances. These expectations do not represent actual or realized economic performance outcomes for each participating firm. Similarly, cumulative abnormal returns used as the dependent variable do not represent *ex post* actual alliance performance, despite a large number of evidence for the accuracy and efficiency of the stock markets. Combined with the fact that investors have a limited information processing capacity in a short-time period (Madhavan and Prescott, 1995), the expected performance measure may have compounded the challenge of examining its relationship with the tested explanatory variables.

The second limitation results from the problems of data collection for the variables used in this study. Due to the data availability of the dependent and independent variables, the sample firms were confined to public firms and large enough to be included in multiple databases. This problem was exacerbated by collecting data for non-U.S. firms because firms in many foreign countries are not required to disclose accounting information and report major changes in their strategic activity as comprehensively as U.S. firms. Naturally, the final sample firms were limited to firms in developed countries such as the OECD member countries.

Lastly, the operationalization of some explanatory variables warrants further analyses. For instance, prior linkages were assumed linearly related to market valuation. However, as inferred from the learning theory, there may be a minimum number of direct linkages at which prior linkages start to take effective. On the other hand, there may be an upper limit on the number of effective direct linkages, beyond which additional alliance linkage has an insignificant marginal effect.

Notwithstanding these limitations, the fact that international R&D alliances have proliferated in recent years opens up a wide range of future research possibilities. As data collections of interfirm cooperation have expanded in terms of sample period and scope, future research may be able to draw rich insights from more diverse forms of alliances with more extended temporal ranges. Additionally, further developments of fine-grained measures of alliance performance and its contribution to parent firms will enhance the explanatory power of the model in this study. The relationship between market valuation and international R&D alliance formations will be delineated better with those new performance measures beyond the use of stock market reactions as a performance indicator.

# Globalization and International Taxation

*Vasanthi Peter*

*Whitireia Community Polytechnic, New Zealand*

*Raja Peter*

*Massey University, New Zealand*

## Abstract

The forces for co-operation among various countries in the global economy are powerful and are inflamed by the utilitarian attitudes of the current leaders, who share a global vision with a motive of maximising individual gains. The trend within the Asia Pacific region is toward international reconciliation as APEC and ASEAN expands and as trans-Tasman economic relationships grow between Australia and New Zealand. The internationalisation of economic activities has significant implications for tax systems. Universal direct tax reforms have resulted in reduction of marginal income tax rates and preferential tax treatment given to promote both domestic and foreign investment. Tax reform is one reason for the speedy growth of some of the APEC countries. Tax policy in selected economies such as China reflects the economic and political environment for promoting domestic and foreign investment. The encouragement of competitive forces has made government policy more purposeful, selective and efficient.

## Introduction

There is a renewed interest in "globalization" and "internationalization" and in recent decades certain major moves have been made in this direction. It is appropriate, nevertheless, to state the 'fear of rapid change' from Thomas L. Friedman's book, *The Lexus and the Olive Tree*.

"If the defining anxiety of the cold war was fear of annihilation from an enemy you knew all too well in a world struggle that was fixed and stable, the defining anxiety in globalization is fear of rapid change you can't see, touch or feel - a sense that your job, community or workplace can be changed at any moment by anonymous economic and technological forces that are anything but stable." With the advent of globalization, the world has entered into a new era of economic competition and co-operation. The tax policy has been one of the instrumental variables affecting interjurisdictional equity, savings, investment and wealth creation of national economies.

Several international studies in taxation (such as Niemann 2004 [9], Desai and Hines Jr. 2003 [2], Desai, Foley and Hines Jr 2003 [3], Peter 2001 [13], Kerr 1996 [5], Musgrave 1990 [7]) assert that there is a need for cooperation among states not only in setting common rules to promote interjurisdictional equity and growth; but also to protect themselves against destabilizing their own tax systems. Interjurisdictional equity is difficult to achieve due to the following reasons: the problem of attribution of profits is not simple, especially for a corporation that is economically interdependent. Treating each subsidiary as a separate entity and determining profits by a separate accounting system is only an arbitrary procedure, since profits can be easily shifted when there is buying and selling between them. A country's tax share of the profits depends not only on its rate of tax but also on its share in the tax base.

Moreover, the problems of tax administration include tax evasion and avoidance. Though avoidance is legal, it reduces the tax base and results in inefficiency. Though there are international tax treaties that are available for reciprocal reporting arrangements, it is difficult to enforce 'arm's length' accounting procedures to prevent profit shifting into low-tax jurisdictions.

These problems can be corrected through a system of centralization of tax, by source taxation of primary profits at reciprocally equal rates (to promote interjurisdictional equity). For example in the case of European Union, international equity can be promoted by applying residence principle to profits earned by EU investors outside the union and source principle within the union members. Finally, tax evasion can be prevented by providing

administrative cooperation in tax matters. This is not impossible, since the members of European Union have already shown cooperation with respect to monetary and financial issues.

Another important objective of International taxation is to ensure that there is no adverse effect on domestic employment, investment and growth. However, this objective is difficult to achieve due to the following reasons. For example, the decision of a multinational corporation to invest abroad instead of its domestic country due to tax and commercial reasons adversely affects the interests of domestic workers and investors. Thus, foreign investment displaces domestic investment and results in massive unemployment when whole plants close down and moves abroad. Real wages reduce due to the loss of capital. The second loss to domestic economy may occur if the capital outflow leads to deterioration in the terms of trade. Foreign investment may replace export sales abroad, leading to fall in net exports (exports-imports). The third loss is the loss in tax revenue and national income. These revenue losses are reflected either in higher taxes paid by domestic sources or reduced government expenditure. According to Musgrave in United States, for example, there is an overall national income loss due to the losses accruing to US labour on account of investment abroad.

This paper is divided into 4 sections. Following the introduction is a section that deals with international taxation issues of selected Asia-Pacific countries. Section 3 examines the role of taxation in promoting FDI inflows into China. Finally, we have a concluding section.

## **International Taxation Issues of Selected Asia-Pacific Countries: Australia and New Zealand**

There has been a considerable tax reform measures taken by the Australian tax authorities in order to improve the country's international competitiveness. These measures include reduction of corporate income tax, from 34% to 30% (See Table 1 for the history of corporate income tax rates), the abolition of stamp duty on most share transactions, an end to the Financial Institutions Duty (FID), a 50% cut in CGT for individuals on assets purchased after October 1st 1999 and an effective CGT rate of 10% for complying superannuation funds and some trusts. Major changes to corporate taxation recommended by the Ralph Report in 2000 have been introduced on a piecemeal basis with changes in 2002, 2003, 2004 and further legislation expected in 2005. New consolidated tax rules which allow groups of companies to be taxed as a single entity were reintroduced in 2002.

The international taxation regime for businesses was improved further in July, 2004, when the government relaxed Controlled Foreign Company (CFC) rules as they apply to countries possessing broadly similar taxation regimes, such as the US, the UK, Germany, France, Canada, Japan and New Zealand. "Once the package is complete", said Ernst and Young, "Australian multinationals doing business in these major commercial centres will no longer need to be overly concerned with measures that are aimed at tax haven operations. The Government has clearly recognised the fact that business takes place in these countries for commercial rather than tax related reasons."

TABLE 1: INCOME TAX RATES OF AUSTRALIA 2004-05<sup>1</sup>

<b>History of Company Tax Rates: Australia</b>							
	1982-86	1986-88	1988-93	1993-95	1995-00	2000-01	2001-04
<i>Rate (per cent)</i>	46.0	49.0	39.0	33.0	36.0	34.0	30.0
<b>Income Tax Rates:</b>							
<i>Type</i>	<i>Bracket</i>			<i>Per cent</i>			
<b>Personal (a)</b> (marginal tax rates applicable for each individual bracket)	\$0 - \$6,000			nil			
	\$6,001 – \$20,000			17			
	\$20,001 – \$50,000			30			
	\$50,001 – \$60,000			42			
	above \$60,000			47			
Medicare levy for singles (b)	\$0 – \$14,539			Nil			
	\$14,540 – \$15,717			20% of excess > \$14,539			
	above \$15,717			1.5			
	above \$50,000			1.5 + 1.0 per cent surcharge if private patient hospital insurance is not held			
Fringe benefits tax (FBT) (c)	grossed up taxable value of fringe benefit			48.5			
Capital gains tax (CGT) (d)	discounted value, add to taxable income			taxed at marginal rate			
<b>Withholding Tax (e)</b>							
<i>Non-resident income tax rates</i>	\$1 - \$20,000			29			
	\$20,001 – \$50,000			30			
	\$50,001 – \$60,000			42			
	above \$60,000			47			
Resident (without tax file no.)	gross amount			48.5			
Non-resident							
-Dividends and Royalties	gross amount			30, unless affected by a DTA (f)			
-Interest	gross amount			10			
Mining payment (g)	gross amount			4			

Source: Australian Income Tax Legislation 2002-04.

If we compare the personal income tax rates of Australia and New Zealand, we observe the highest marginal income tax rate for New Zealand is lower at 39% for income above \$60,000 compared to 47% in Australia. Though the company tax rate is lower in Australia, 30% as compared to 33% in NZ, since the highest marginal personal income tax rate is 47% an Australian investor pays a higher effective tax on the total income earned. Table 2 provides the individual income tax rates of New Zealand. Note that the earners' levy is charged at a flat rate of 1.2% on almost all earnings.

TABLE 2: INDIVIDUAL TAX RATES OF NEW ZEALAND, 2004-2005

<b>Taxable income</b>	<b>Tax rate for every \$1 of taxable income (excluding earner levy)</b>	<b>Tax rate for every \$1 of taxable income (including earner levy<sup>1</sup>)</b>
up to \$38,000	19.5 cents	20.7 cents
\$38,001 to \$60,000 inclusive	33 cents	34.2 cents
\$60,001 and over	39 cents	40.2 cents
No declaration	45 cents	46.2 cents

Source: <http://www.taxpolicy.ird.govt.nz/publications/files/html/transtasman/c4.html>

It is important to note, the high standard of living, modern telecommunications and transport networks, wide variety of investment opportunities, and generally very well educated and trained workforce all contribute towards making Trans-Tasman countries, Australia and New Zealand potentially a very rewarding place in which to do business<sup>ii</sup>. In addition, these countries are in a very favourable position to access emerging Asian markets, and the combination of federal and state incentives for those prepared to locate their regional headquarters in these countries, becomes even more appealing. All exchange controls have now effectively been abolished in these countries and the government generally welcomes foreign direct investment (FDI) which will be of national interest. Foreign investment policy is implemented by the Foreign Investment Review Board (FIRB) in Australia, and although in principle the board must be notified of all foreign investment proposals, in practice those involving assets of AU\$50,000,000 or less are not usually examined. The factors that the FIRB considers are:

- Whether the enterprise will create new employment opportunities for Australian citizens, or allow Australian participation in some way
- Whether the enterprise will introduce new technological, managerial, or technical skills to the country
- Whether the enterprise will help to develop new export markets

## **International Taxation Issues of China**

Having seen the tax policies of small but highly developed economies among the APEC countries, Australia and New Zealand, this section deals with a large transitional economy, China (For further details on tax policy and stages of growth, see Hinrichs 1966 [4] & Peter 1998 [10]). The first national tax law of the People's Republic of China was implemented on January 1, 1994. The tax system of China comprises of a mixture of one or more categories of taxes including tariffs on imports, export taxes, income or gross receipts taxes on enterprises, and taxes on goods and services. The structure of China's tax system combines the characteristics of developing countries and transition economies, as well as of industrial countries. In terms of the share of income taxes in GNP, China is comparable to middle-income developing countries. However, the individual income taxes are negligible in China, whereas they contribute, on average, the equivalent of about 2 per cent of GNP in other middle income countries (For further details refer to Luo 1998 [6], Peter & Yao 1999 [15], Tung and Cho 2000 [16]).

The share of enterprise income and profit taxes in tax revenue in the centrally controlled Chinese economy was as high as 34 per cent, on average, in the first half of the eighties. However, the share of these taxes has declined to 14% in 1994 with the transition from a centrally controlled economy to a market oriented economy. It has further been reduced to 10% in 1998. In terms of taxes on international trade, China is comparable to industrialised countries, where such taxes raised, are around 3% to 5% of total tax revenue in the nineties.

The tax system in China prior to the reforms was complex, inefficient, and highly inelastic and the tax burden was distributed unequally. The tax reform of 1994 was aimed to improve the buoyancy and efficiency of the tax system and is more suitable to meet the needs of a market-based economy.

### **Enterprise and Personal Income Tax in China**

State owned enterprises (SOEs), collective enterprises, private enterprises, joint-ownership enterprises, joint-stock enterprises, foreign investment enterprises and foreign enterprises and any other organization that derive income from production and business operations and other income defined by law, including income from sources both within and outside China, are subject to the enterprise income tax. The coverage include the transfer of property, interest (except from government bonds), leasing, royalties and license fees, dividends, and other income.

Before the middle of 1980s, the chief characteristic of enterprise taxation in China was to tax various forms of enterprise ownership differently, based on their economic importance and social desirability. The state-owned enterprises paid three different taxes: the enterprise income tax, special levies on profit and the "income adjustment tax". The enterprise income tax was paid by large and medium-sized SOEs at an uniform rate of 55 per cent of their profit, while smaller SOEs paid the tax at rates ranging from 10 per cent to 55 per cent. In addition to the enterprise income tax, a number of special levies were imposed on SOEs, and that resulted in the marginal tax rate on the after-tax income of SOEs to exceed 65 per cent. The income adjustment tax was essentially a charge for the capital invested in SOEs with rates on average, equivalent to about 10 per cent of taxable profits.

With the tax reforms of 1994 there has been a rationalisation of enterprise income tax and the rates range from 18 per cent for taxable income below 30,000 Yuan to 33 per cent for taxable income above 100,000 Yuan per year. The enterprise income tax for all foreign investment enterprises in Special Economic Zones was reduced from 30% to 15%.

The Personal Income Tax is levied on the income of all individuals who reside in China or have stayed in China for more than one year. Income from wages and salaries are taxed at a rate of 5 per cent for taxable income below 500 Yuan per month and 45 per cent for the income over 100,000 Yuan. While for the production and business income of individual household and leasing and contracting income of enterprises, the tax rates are from 5 per cent for the monthly taxable income under 5,000 Yuan to 35 per cent for the monthly taxable income over 50,000 Yuan.

#### **Taxation in China's Special Investment Areas**

China has developed a regional policy such as Special Economic Zones, New Development Zones and Free Trade Zones to attract foreign investment. Table 3 shows that the Guangdong province is the largest recipient of FDI with the share of USD 12,019 million in 1998, accounting for 26.5% of total realized FDI. This is evident from Table 1.

Generally, creating a favourable tax climate in the host country is seen as the key to achieving greater foreign capital inflows. One of the important ways the government has adopted is to apply the preferential tax rules to the foreign funded enterprises to attract the foreign investment. The corporate income tax rate levied on the foreign investment enterprises is a flat rate of 15 per cent, while it is 30% for SOEs. The Chinese government has provided for the foreign business established in the Special Economic Zones, a variety of tax and investment incentives including lower land costs and more flexible labor policies. In general, the SEZ tax rules provide for exemptions from or reductions in taxes normally not applied to enterprises outside the SEZs under China's national tax legislation. For example, as one of the earliest Special Economic Zone, Zhuhai provides favourable conditions allowing for reduction and exemption of tariffs for the imported equipment, and Value Added Tax for import duties for the encouraged industry.

Also, a productive enterprise with an operation period over 10 years can have a first-two-year exemption and a 50 per cent reduction within the following three years counting from the first profitable year. There are also varied tax exemptions given to the enterprises with investment over USD 50 million, and construction and financial institutions. Through tax planning, foreign invested enterprises, FIEs pay an average income tax rate of only 5% in the special economic zones, 9% in other open coastal zones, and 15% in inland areas, all substantially less than the statutory 33% rate that applies to SOEs, Naughton, 1997 [8]. However, it should be noted that the various tax incentives provided to foreign investors have multiplied the growth of direct foreign investment in China (For further details on growth in foreign direct investment refer to Balasubramanyam, et al. 1996 [1] and Wu 1999 [17])

The total approved foreign investment has multiplied more than 25 times from a low base of USD 4,798 million in 1984 to a peak of USD 123,273 million in 1993. Correspondingly, the foreign direct investment approved and realised rose to USD 111, 436 million and USD 27,515 million in 1993, respectively. Since 1993, the approved direct investment has declined. Nevertheless, there has been a steady increase in the realised foreign direct investment. This is evident from Fig.1, given below.

From Fig.1, we see an inverse relationship between FDI to GDP ratio and tax mix ratio. FDI to GDP ratio was negligible in 1980, but it has increased to more than 5% of GDP in 1990s. The linear trend line shows an increasing trend during the period of study. However, the tax mix ratio (direct tax which includes personal income tax, corporate income tax and wealth taxes to total tax revenue) has been declining over the years. Direct tax incentives provided to special economic zones had also been a contributory factor for the decline of tax mix ratio. There had been a 20% decline in the tax mix ratio and the linear trend line shows clearly this decreasing trend.

## Concluding Remarks

This paper examines the existing international taxes in selected Asia-Pacific economies, including direct taxes and the tax incentives provided to promote global growth. Australian Treasurer Peter Costello stated that Australia has nothing to gain from a cut in corporate tax, "We have cut the company tax rate in Australia from 36 to 30 per cent and I think that is quite a competitive rate." Mr. Costello believes introduction of GST and a reduction in company tax, have gone far enough to improve Australia's international competitiveness. There has been more than twenty years of closer economic relations between Australia and New Zealand with the trans-Tasman economic relationship supported by the CER - free trade agreement. There is a stark contrast between developed and developing countries in terms of tax incentives provided. Low enterprise taxes and generous tax incentives in special economic zones in China has helped this economy to grow faster in the last two decades.

# Recent Reforms in Corporate Governance in Asia: The Experience of Five Countries

Helen Cabalu  
Curtin University of Technology, Western Australia

## Abstract

This paper reviews recent reforms in corporate governance in selected Asian countries introduced after the financial crisis of 1997-98. Since the financial crisis, corporate governance has become a key policy issue in most of Asia. A commitment to improving corporate governance has grown as governments recognise the need to protect investors' interests, reduce systemic market risks, maintain financial stability and enhance investors' confidence to encourage the return of capital to the region through better accountability and transparency. The incentive for corporations to follow best practice is to boost their corporate performance and attract investment. Effective corporate governance is also recognised as essential for economic growth. Governments are realising that good governance of corporations is a source of competitive advantage and critical to economic and social progress. After the financial collapse of 1997, several crisis-affected economies have overhauled their corporate governance, strengthening market forces, implementing tougher regulations and focusing on transparency in decision-making and accountability. Progress in reforming corporate governance, however, has been uneven across Asia. While considerable progress has been made in the ongoing process of corporate governance reform gaps to achieve best practice remain. Implementation has been weak due to poor compliance and enforcement.

## Introduction

Weak corporate governance has been recognised as one of the major sources of East Asia's vulnerabilities in the lead up to the financial crisis of 1997-98. Many corporations in the five crisis-affected economies of Indonesia, Korea, Malaysia, Philippines and Thailand suffered from over-capacity, poor quality of investments and excessive diversification and exposure to debt brought about by decisions of ineffective board of directors, weak internal controls, poor audits, lack of adequate disclosure and weak legal and administrative systems (Capulong, *et. al.*, 2000). The corporate failures and excesses were often the result of incompetence, fraud and misuse of power. The business environment was largely relationship-based where close links among firms, their banks and the government have developed through ownership, family ties and political deal making. Perverse connections between lenders and borrowers led to insider and poor quality lending. Not only did firms rely heavily on related parties for finance but also for inputs and distribution. The relationship-based system protected both firms and banks from market discipline, undermining the need to develop adequate corporate governance mechanisms.

Since the financial crisis, corporate governance has become a key policy issue in most of Asia. A commitment to improving corporate governance has grown as governments recognise the need to protect investors' interests, reduce systemic market risks, maintain financial stability and enhance investors' confidence to encourage the return of capital to the region through better accountability and transparency. The incentive for corporations to follow best practice is to boost their corporate performance and attract investment. Effective corporate governance is also recognised as essential for economic growth. Governments are realising that good governance of corporations is a source of competitive advantage and critical to economic and social progress (Economic Analytical Unit, 2002). Stronger market forces, tougher regulations and a move towards rules based system are gradually transforming the business environment in Asia. The new focus on transparency in decision-making and accountability has emerged to prevent future abuses. Progress in reforming corporate governance, however, has been uneven across the five crisis-affected economies. Although a number of measures to strengthen and modernise the regulatory framework for a rules based corporate sector have been in place well before the crisis, implementation has been weak. Poor compliance and enforcement due to weak courts, lack of well-trained and resourced regulators, powerful vested interests and lack of political will have hindered corporate reform in some economies.

After the crisis, more recent reforms in the broad areas of corporate ownership structure, shareholder participation and protection, creditor protection, transparency and disclosure, and bankruptcy procedures have taken place. The following is a survey of recent developments in these major areas of corporate governance reform. The discussion in this paper is focused on reforms affecting the major participants in corporate governance namely the board, the owners or shareholders and the stakeholders in particular, creditors.

## Corporate Ownership Structure

Ownership structure is an important area of corporate governance. It determines the nature of the agency problem, that is, whether the dominant conflict is between managers and shareholders, or between controlling and minority shareholders. The interests of those who manage the company can differ from those who supply the company with external finance. The principal-agent problem grows out of separation of ownership and control. One aspect of corporate ownership structure is the degree of ownership concentration, which determines the distribution of power between its managers and shareholders. Ownership concentration is not necessarily bad. When ownership is concentrated, large shareholders are good for corporate governance as they could play an important role in monitoring management. Indeed, in Asia where corporate ownership is concentrated, corporate management is usually in the hands of controlling shareholders. The problem with ownership concentration is when it is combined with weak outside shareholder protection laws, an uncompetitive financial system, and opportunities for malfeasance and corruption by big powerful (insider) shareholders that the cost of failures becomes high (Prowse, 1998).

Another aspect of corporate ownership structure is its composition. It determines who the shareholders are and who among them control the company. A shareholder can be an individual, a family, a bank, a holding company, an institutional investor, or a non-financial corporation. Depending on who the significant shareholder is, the involvement in the company's management could vary. For instance, a family would be more likely to get interested in control and profits than an institutional investor who would probably be only interested in profits (Capulong, *et. al.*, 2000).

A research conducted by Claessens, Djankov and Lang (2000) investigated the separation of ownership and control in selected Asian countries. Their key findings indicated that the control of a single shareholder was prevalent in more than two-thirds of firms and the separation of management from ownership control was rare, giving the owners excessive power to pursue their own interests at the expense of minority shareholders, creditors and other stakeholders. While concentration of ownership and extensive family control characterized corporate ownership in most Asian countries, it is particularly severe in Indonesia, Philippines and Thailand. A small number of families control a significant share of corporate assets with 16.6 per cent in Indonesia and 17.1 per cent in the Philippines, of the total value of listed corporate assets could be traced to the ultimate control of a single family. In Indonesia, the Philippines and Thailand, the largest ten families controlled up to 50 per cent of market capitalization while the largest ten families in Korea controlled about one-third of the corporate sector. Control was enhanced through dual-class shares, pyramid structures, and cross-holdings among firms.

While ownership concentration in Asia is not unique to the region, it raises the possibility of increased risk taking. The high concentration and family-based ownership is a typical sign of weak corporate governance. It has led to governance structures that enabled the dominant shareholding families to make key decisions on their own. Appointments of board members are almost entirely decided upon by those families in control of the firms. This has led to conflicts of interests between dominant family shareholders/managers and minority shareholders. It has reduced the effectiveness of shareholder protection, as presumably the dominant and politically powerful shareholders will not be a source of pressure for improvements in disclosure and governance for fear that these may erode their control and benefits. It has also resulted in the expropriation of non-controlling (outside) shareholders by the controlling shareholders. In some countries, controlling shareholders have frequently utilized inter-firm transactions as a means to divert resources from one held firm to another to increase their welfare at the expense of outside shareholders. Diversion of money by a dominant shareholder could also take the form of paying himself special dividends and engaging in excessively risky projects at the expense of minority shareholders' investments.

## **Korea**

In Korea, the *chaebols*—large diverse conglomerates, dominated the corporate sector and operated in nearly all sectors prior to the crisis. They were mostly owned and managed by families using cross-ownership and pyramid structures and received favorable bank treatment.<sup>1</sup> It was quite common in Korea that minority shareholders had to take intolerable risks as the firm in which they held shares made loan guarantees to other firms controlled by the same family, or lent money directly to them at below market interest rates. Other episodes of expropriation were abundant where *chaebol* owners acted in ways that were inconsistent with the maximization of firm value by investing in big projects whose prospects of return did not justify the investment but were ways to transfer wealth. Equity participation by connected firms frequently resulted in similar expropriation where outright transfer of wealth occurs from participating firms to an insolvent firm issuing new equities. This has led many large corporations to insolvency or bankruptcy costing lending institutions and taxpayers a substantial amount of damage (Nam, *et. al.*, 1999).

When the Korean government announced its ‘Big Deal’ initiatives in 1998, it disclosed an extensive economic reform program highlighted by bold restructuring of Korea’s *chaebols*. It aimed to reduce the *chaebols*’ market power and excessive sectoral diversification by forcing them to focus their business operations on a small number of core industries. The program also aimed to reduce *chaebol*’s strong reliance on debt financing, to improve transparency in decision-making, and to enhance the accountability of controlling shareholders and managers. The specific initiatives included (Woo-Cummings, 2001; Economic Analytical Unit, 2002):

- Requiring the largest *chaebol* to undertake voluntary workouts including converting debt to equity and selling non-core subsidiaries and other assets to disperse *chaebol* ownership;
- Banning cross-guarantees of loans of *chaebol* group of companies;
- Removing incentives for *chaebol* to retain non-core businesses;
- Exempting or reducing taxes on asset transactions, encouraging merger and acquisition activity, assets sales and business asset swaps;
- Introducing new listing rules for holding companies, assisting restructuring; and
- Starting a corporate restructuring fund and easing requirements for public offerings.

The ‘Big Deal’ measures were particularly applied to the five largest *chaebols* including Hyundai, Samsung, Daewoo, LG and SK.<sup>2</sup> Several laws related to *chaebol* restructuring such as the Commercial Law and the Securities Exchange Law were also revised in 1998.

Considerable progress has now been achieved in *chaebol* reform. The four largest *chaebols* cut their total number of subsidiaries from 232 in 1997 to 137 in 1999 (Korea Times, 2000). Apart from a reduced number of subsidiaries and elimination of cross debt guarantees among *chaebols*, debt-equity ratios have fallen from their excessively high levels. For instance, from an average of 700 per cent debt-equity ratio before the reform, Hyundai and LG cut their debt-equity ratios to 181 per cent and 184.2 per cent, respectively and Samsung and SK registered debt-equity ratios of 161 per cent and 166.3 per cent in 2000. The conglomerates have either been broken up or sold like the Daewoo Group, which once had 37 subsidiaries in diverse industries, or forced to focus on their core competencies by divesting collateral business lines like the Samsung, LG and SK Groups. The Hyundai Group has been separated with its components on the international auction block. Overall, 16 out of the top 30 conglomerates of 1997 are no longer in the list in 2002 (Ministry of Finance and Economy, 2002).

## **Indonesia**

In Indonesia, it is very common to find control by families or by limited number of shareholders in the corporate sector. The highly concentrated and family based ownership resulted in a governance structure where corporate decisions were made by controlling families. In many instances, these controlling families had political connections that allowed their companies to enjoy special privileges, particularly in gaining easy access to credit. There is no separation of ownership and control. In 2001, around 67 per cent of publicly listed companies were family-controlled while only 7% was widely held. Ownership concentration in Indonesia is highest in the region. It is demonstrated by the fact that the top five largest shareholders controlled between 57 per cent and 65 per cent of company shares. Indonesia has the largest number of companies owned by a single family. In terms of capitalization, the top family controlled 17 per cent of total market capitalization while the top 15 families controlled

62 per cent of the market. Concentration of corporate control has been enhanced by cross-shareholdings, which is allowed by Indonesian law without restrictions (Kurniawan and Idriantoro, 2000).

As in other countries in Asia, Indonesian conglomerates range widely in size, scope, importance, and nature and degree of political connections. Chinese Indonesians assumed a dominant position in the highly concentrated ownership structures. It was generally known that some 15 families, 14 of them Chinese Indonesians were predominant. They controlled 61 per cent of all publicly listed companies, while other families only controlled another 5.4 per cent (Claessens, *et. al.*, 1999).

Each conglomerate controlled at least one bank, which financed company investments with little autonomous decision-making or objective investment project analysis. Virtually all banks have made “connected loans” to sister companies far in excess of the legal limits, which have caused a number of insolvencies particularly during the Asian crisis. The failure of one company led rapidly to failure of the bank it owned and other affiliates. These were taken over by the government’s Indonesian Bank Restructuring Agency (Patrick, 2001).

Many corporations in Indonesia are now under government ownership, though some are still operated by former family owners. Recent commitments by the government to privatize the large state-owned enterprises have been delayed because of vested interest opposition and hence the privatization program has not yet made much progress.

#### **Malaysia**

Corporate ownership in Malaysia is distributed among outside investors, families and the government. Hence, unlike the other crisis-affected economies, concentration of ownership is not as pronounced. Malaysia’s top ten families controlled only around 25 per cent of market capitalization while the government held 35 per cent. Recent moves to sell substantial government equity in listed companies suggest that the government is reducing its role in the corporate sector. Foreign fund managers were an active group in shareholding, far more active than domestic fund managers. They were reported to account for almost 50 per cent of the turnover of the blue chip companies during the 1990s. Domestic institutional investors have emerged as a significant force in the equity market, with *Perbadanan Nasional Berhad* (PNB) and the Employees Provident Fund (EPF) as the most important. Foreign fund managers and domestic institutional investors have opted to play a passive role in corporate governance (Thillainathan, 1999).

#### **Philippines**

In the Philippines, family ownership dominates. Large shareholders that dominate ownership are families whose wealth dates back to the country’s colonial past, early industrialists and ethnic Chinese immigrants and entrepreneurs, and professionals from the middle class. Large shareholders managed their investments through corporate group structures, which would commonly include a commercial bank, other financial institutions like insurance and finance companies. Large shareholders either directly owned these banks or controlled them through companies they owned. Once banks became part of a corporate group, member companies of the group accessed loans at favorable interest rates and terms. The corporate culture promoted sweet deals to well-connected people and other misuses of capital.

The average ownership of the largest shareholder in the Philippines was 40.8 per cent of the market value of non-financial companies and 27.2 per cent of the financial sector in 1997. The largest five shareholders owned about 65.3 per cent of the non-financial sector and 59.2 per cent of the financial sector in the same year (Saldaña, 1999).

Publicly listed companies are not widely held by public investors. Most of them are part of family business groups that went public to raise capital. Public listing rules required public issuance of only 10 to 20 per cent of outstanding shares. Hence, ownership by large shareholders (mostly families) of publicly listed companies is very common. Many companies listed in the Philippine Stock Exchange have issued only the minimum number of shares needed to gain public listing. By limiting the ownership shares issued to public investors, controlling shareholders reduce minority shareholders to passive roles in corporate governance. Concentration of ownership at these high levels demonstrates that publicly listed Philippine companies are not truly publicly owned (de Ocampo, 2000).

#### **Thailand**

As in most Asian countries, ownership of Thai corporations is concentrated. The average size of equity share of the top five largest shareholders was 56 per cent of total outstanding shares in 1998. This implies that the control of an

average Thai company is typically in the hands of a few persons (founders or their associates). The management of most large Thai corporations listed on the Stock Exchange of Thailand has been predominantly family-run as pioneered by Chinese merchants. Many of these families have built their empires and prospered in many sectors, particularly in banking, finance and securities, agro-industry, and telecommunications. Around 62 per cent of all publicly listed companies in Thailand are family controlled. Although some of the businesses have become publicly listed companies, their founders managed to keep a controlling share within their family. The Public Company Act of 1992 allowed ownership and control of these companies to remain with the founding families even as they became increasingly dependent on non-family resources. It has also been a practice of Thai corporate founding families to set up holding companies to own shares in affiliated companies or subsidiaries. Through these holding companies, founding families maintained effective control of entire groups, including those that are publicly listed (Limpaphayom, 2000).

The emerging post-crisis Thai corporate sector is one that is less family dominated. It has experienced more government and foreign ownership. For instance, the government has become the largest equity owner in the banking industry subsequent to the nationalization of commercial banks. Significant increase in foreign shareholding has also occurred in many sectors such as banking, finance and securities, insurance, and public utility services.

Despite many family owned corporations still hanging on to non-core assets with high leveraging and low cash flows, several other families have made early progress in restoring their companies through voluntary restructuring, have listed their companies and sought external managers and directors.

## **Shareholder Participation and Protection**

Shareholder participation and protection is crucial in corporate governance because expropriation of minority shareholders and creditors by the controlling shareholders occurs so often. When outside investors finance firms, they face a risk that the returns on their investments will never materialize because controlling shareholders or managers expropriate them. A major concern for minority shareholders is how they can effectively monitor management so that managers will act in the shareholders' best interest. In general, expropriation is related to the agency problem. A conflict of interest occurs when controlling shareholders use the profits of the firm to their own benefit rather than return the money to the minority shareholders and other investors.

A sound corporate governance framework requires that shareholders actively participate in and exert influence on corporate decision-making, and are protected from exploitation by company insiders. Reforms in the area of shareholder protection have focused mainly on strengthening the system of the board of directors and minority shareholders' rights. These have involved amending listing rules and corporate laws and introducing voluntary codes of corporate governance.

A number of mechanisms exist for shareholder participation and protection. When shareholders and other investors finance firms, they become entitled to certain rights or powers that are generally protected through the enforcement of corporate laws and other legislation. The most important are the system of board of directors, shareholder participation through voting in meetings, legal protection of minority shareholder rights, and transparency and disclosure requirements.

Shareholders have the right to elect their representatives on the board of directors of a company who assume responsibility of monitoring, directing and appointing the firm's managers. Boards are expected to draft corporate policy, approve strategic plans, authorize major transactions and the sale of additional securities, and declare dividends. They are also expected to hire, advise, compensate and, if necessary, remove management, subject to the approval of shareholders. Boards should be independent of management and shareholders for them to be effective in resolving conflicts in situations where the interests of shareholders and management diverge (Choe, 1998).

Basic shareholders' rights, usually captured in company laws, should allow for active participation and influence on corporate strategic decision-making (e.g., decisions concerning corporate changes such as amendments to the articles of incorporation and decisions on mergers and dissolutions, among others). Shareholders should have

the right to participate and vote in annual and special general meetings, share in the residual profits of the company, obtain relevant company information on a regular basis and convey or transfer shares. Rules in some countries allow proxy voting by mail, which makes it easier for minority shareholders to exercise their voting rights while others allow cumulative voting, which makes it easier for a group of minority shareholders to elect at least one director of their choice. Allowing cumulative voting strengthens the position of minority shareholders under concentrated ownership structures. Other rights include provision for outsider representation on the board, anti-dilution provisions, limits on self-dealing or insider trading by controlling shareholders, and takeover rules limiting the power that controlling shareholders can appropriate (Johnson and Shleifer, 2001).

Timely and accurate disclosure and transparency on all matters material to company performance, ownership, and governance relating to other issues are keys to effective shareholder control and protection. The benefits that emanate from effective monitoring, disclosure of information and transparency meant that capital providers were able to protect themselves from the opportunistic behavior of managers.

Financial information should be independently audited and prepared following internationally acceptable standards. The quality of transparency and disclosure depends on accounting and auditing standards and the financial reporting system adopted. Before the Asian crisis, corporate transparency and disclosure were generally weak in most crisis-affected countries. After the crisis, important measures have been introduced to improve them. Many countries have introduced changes in accounting and auditing rules to move towards international standards, particularly with those issued by the International Accounting Standards Committee.

#### **Korea**

Simple diversion of money by a dominant shareholder from a firm under his control was not uncommon in Asia. In Korea, minority shareholders had to take intolerable risks as the firm in which they held shares made loan guarantees to other firms controlled by the same owner, or lent money directly to them.

A number of amendments to Korea's laws and regulations to increase the accountability of management and controlling shareholders, and strengthen the rights of minority shareholders were implemented in 1998. These changes included (Chopra, et. al., 2001; Korea Stock Exchange, 2002):

- The Korean Stock Exchange (KSE) required that all publicly traded companies had at least one outside board director; by the end of 1999, a quarter of their boards should be outside directors. Moreover, for listed companies and financial institutions with the assets of KRW 2 trillion or more, there must be at least three outside directors and they must account for at least half of the total board members. It is also recommended that listed companies appoint outside auditors.
- The Commercial Code and Securities and Exchange Act were reformed to lower the threshold for exercising rights to file suit, make proposals at a general shareholders' meeting, inspect company's financial accounts, and request the dismissal of directors or internal auditors. The previous requirement of 1 per cent ownership to bring a derivative suit was eased to 0.01 per cent and the 1 per cent ownership to request the dismissal of a director or auditor for an illegal act was relaxed to 0.5 per cent. The minimum ownership required to examine corporate books has been reduced from 3 per cent to 1 per cent.
- The shareholder proposal scheme entitled a shareholder of a listed company with a stake of 1 per cent or more of total voting shares to exercise the right to submit agenda items for the shareholder meetings.
- As part of an effort to encourage institutional investors to play an active role in monitoring corporate management, restrictions in voting rights for institutional investors were removed.
- A limited form of cumulative voting for the selection of directors was introduced.

In 1999, the Code of Best Practice for Corporate Governance required listed companies to prepare financial statements that were audited in accordance with international standards and to bring financial disclosure standards in line with best practice.

More recently, the Corporate Restructuring Promotion Law is enforcing transparency for the big groups. It introduced a number of measures strengthening accounting rules and audit oversight. These included:

- Combined financial statements that net out intra-group transactions were required for the top 30 *chaebols*;

- In addition to annual and semi-annual reports, listed companies were required to release quarterly reports and establish audit committees composed of outside directors, shareholders, and creditors' representatives within the board of directors; and
- Legal changes have been made so that domestic accounting practices conform to international standards.

At the start of 2002, Korea introduced revised listing regulations, which provided for stricter compliance and stronger delisting criteria and introduced a penalty system for non-compliance with regulations (Korea Stock Exchange, 2001). Hence in March 2002, ten companies were delisted from the Korea Stock Exchange for accounting irregularities. In June 2002, the Korea Corporate Governance Service was established to conduct research and analyze trends of corporate governance in Korea and overseas, make policy recommendations and provide consultancy services on corporate governance.

#### **Indonesia**

In the case of Indonesia, most disclosure requirements have tightened and accounting standards have improved after the crisis, although from a low base. In 1999, a code for good governance was introduced, which guided subsequent reforms. All companies were required to provide annual reports with audited and annotated financial statements and consolidated reporting has become mandatory. In order to improve the quality of reporting, a 'Guidelines for the Financial Reporting Systems of Listed Companies' was jointly prepared by the Indonesian Institute of Accountants, the Indonesian Issuers Association and the Faculty of Economics of the University of Indonesia.

By 2001, the Jakarta Stock Exchange (JSX) has tightened listing rules especially disclosure and liquidity rules. It required listed companies to form audit committees, appoint independent directors comprising at least 20 per cent of the board and strengthen the company secretary's function. The JSX required listed companies to disclose information concerning company performance in an accurate and timely manner through the publication of periodical and non-periodical reports but at the same time tightening the rules and regulations governing the disclosure of information. These reports should enable interested parties to review listed companies' performance objectively to protect themselves from undertaking excessive risks (Jakarta Stock Exchange, 2001). Major initiatives have been taken to harmonise Indonesia's Financial Accounting standards with International Accounting Standards. By the end of 2001, 247 listed companies have appointed independent directors and 168 have established audit committees.

To encourage listed companies to conform to the Code of Good Governance, the JSX implemented a pilot program of monitoring and reviews of listed companies' level of compliance with the principles of good corporate governance. These efforts combined with routine education and development programs have improved the overall level of compliance that by end of 2001, 73 per cent of total listed companies in the JSX were fully compliant with the principles of good corporate governance, from 65 per cent in 2000.

#### **Malaysia**

Malaysia was well advanced in its corporate regulatory environment. Even before the crisis in 1997, listed companies were already required to appoint independent directors to their boards and establish audit committees. Listed companies were subjected to a disclosure based regulatory regime where authorities were allowed to regulate securities offerings by assessing the investment merits and pricing of the offering. Its accounting standards were among the highest in Asia and were generally consistent with international accounting standards (Kuala Lumpur Stock Exchange, 2001). After the crisis, Malaysia has maintained significantly higher standards in corporate governance and at the same time has developed more sophisticated and adequate legal systems to protect shareholders' and creditors' rights than the rest of the countries in the region. In 2000, through the Malaysian Code on Corporate Governance, authorities have set out principles and best practices for companies to follow in an effort to maintain high standards of corporate governance. The Code set out principles guiding (PricewaterhouseCoopers, 2000):

- The composition of the board of directors to include a balance of executive and non-executive directors; appointments to the board and re-election of all directors; and directors' remuneration to be linked to corporate and individual performance; and
- Listed companies to include in their annual reports a full disclosure of information relating to the extent of compliance with principles of good governance and the state of internal control.

- The Kuala Lumpur Stock Exchange in 2001 implemented new listing requirements that strengthened provisions in areas relating to disclosure, financial reporting and enforcement through the following (Kuala Lumpur Stock Exchange, 2001):
- Enhancing the definition of independent director and strengthening the composition of the board of directors;
- Requiring directors to attend a prescribed minimum number of board meetings;
- Enhancing the composition of the audit committee, its functions, rights and authority; and
- Express statement of directors rights; and
- Imposition of obligations on directors.

### **Philippines**

The Securities and Exchange Commission (SEC) enforces regulations on conduct and disclosure according to the Philippines' US-based Corporation Code. Publicly listed companies have to meet conduct and disclosure requirements. Basic rights of shareholders are adequately protected. Shareholders are entitled to a one share-one vote rule, with proxy voting legally allowed and practiced. The Corporation code required an annual general shareholders meeting to confirm decisions made by management. A shareholder can discuss concerns during the meeting without any required minimum shareholdings for such privilege. Major transactions made by the company such as amendment of articles, bonded indebtedness, sale of major corporate assets, investments in other companies, and mergers required approval by two-thirds majority vote of shareholders (Saldaña, 1999).

In 2000, authorities initiated several useful reforms including the new Securities Regulation Code which provided protection to minority shareholders through mandatory tender offers and prohibition of insider trading. In 2001, the SEC reinforced this with initiatives promoting transparency and improved regulatory environment through a new framework based on international standards. Financial reporting was tightened requiring companies to provide annual reports with balance sheets and profit and loss statements to the SEC. New rules on shareholder representation, board structure and legal actions against erring directors were imposed (Securities and Exchange Commission, 2001).

In April 2002, the SEC approved the Code of Corporate Governance which required listed companies to draft their respective manuals on good corporate governance based on the principles of the Code. Under the Code, a company's board of directors was held responsible for adhering to fairness, accountability and transparency in overseeing the operations of the company. Board members who do not attend meetings regularly and do not disclose the extent of their business interests may be suspended from the board. Board members and top management were also required to undergo a regular performance evaluation. The Code required listed companies to form four board committees which would oversee audit and compliance, nomination, compensation and risk management and to rotate their external auditors or handling partners every five years (Philippine Daily Inquirer, 2002).

Board members number between 7 and 11 representing the largest shareholders of a company. The board of directors is not explicitly mandated by the Corporation Code to consider the interest of minority shareholders. However, the Code prohibits the removal of a director without reason only if minority shareholders shall lose their representation on the board as a result of such action. A shareholder can file derivative suits against directors, but this process is costly and ineffective as conflicts take a very long time to resolve. Independent directors are not acceptable for most companies because family members and close associates who dominate ownership prefer to discuss business issues within the family.

In general, the legal framework for shareholder rights is adequate. However, in practice, shareholder protection is undermined by the dominance of large shareholders in corporations even for major decisions involving two-thirds vote. There is very little deterrent on management regarding conflict of interest and insider trading because the Corporation Code only required special approval by two-thirds vote, which can be done by large shareholders due to dominant control. Insider trading regulations are poorly enforced.

### **Thailand**

The Public Limited Company Act 1978 regulated Thai publicly listed companies. However, some rules and regulations of this law were perceived to be too restrictive and were discouraging companies from going public. There were concerns that the provisions regarding criminal prosecution and penalties of directors and management

were harsh and inappropriate. It disallowed cumulative voting. The law also prohibited the largest shareholders, as a group, from holding more than 50 per cent of total outstanding shares and other shareholders from holding more than 10 per cent of outstanding shares individually. Hence, in 1992, this law was amended as the Public Company Act of 1992 and promoted the development of public companies. It relaxed the contentious provisions of its predecessor. Cumulative voting was made optional, the limit on shareholdings by the largest shareholders was increased to 70 per cent of total outstanding shares and lighter penalties for management misconduct were imposed. However, the new legislation removed a number of provisions that would have kept public companies prudent and diligent in their operations and this may have contributed to the 1997 financial crisis.

The protection of minority shareholders was inadequate under the Public Company Act of 1992. The minimum share required to exercise some of the shareholders rights were too high. For example, the right to call emergency shareholders meeting requires 20 per cent of total eligible votes, which is 10 per cent in other countries. There are also regulatory loopholes. For instance, in case the required quorum is not met in shareholders meetings, decisions are made and recorded regardless. Minutes of shareholders meetings are often drafted prior to the meeting and can take up to one year to get disseminated. Thus, small shareholders are minimally involved in corporate decision making and inadequately informed of corporate decisions (Lipaphayom, 2000).

The Securities and Exchange Commission of Thailand (SET) requires that at least two directors be independent directors. However, in the Thai context, "independent" is interpreted only as being non-executive, which would only exclude insiders (i.e., management and employees) but could include anyone with personal ties with certain insiders. Hence, independent directors can come from friends and family of controlling shareholders who would not oppose management. A more serious issue is the accountability of the directors with the current rules and regulation. It would be very difficult to prove misconduct on the part of a director because much is subject to interpretation.

In the area of transparency and disclosure, accounting in Thailand is notorious for its creativity and imagination. Most companies maintain two accounts: one for management, another for the authorities. The major weakness in Thai accounting was in the method used to value assets. Rules are unclear regarding the methods by which assets can be valued and accountants can manipulate the numbers to make financial reports look good. Poor accounting standard can be attributed to insufficient regulatory supervision and light penalties in case of negligence or violations. Auditing is also poor and suffers from potential conflict of interest. Auditors often develop a good business relationship with its clients and thus unwilling to report potential anomalies.

Since 1997, the Thai government has implemented new measures to protect shareholders' rights and interests, including the upgrade of accounting and audit standards, which required listed companies to establish audit committees and to appoint independent directors to company boards. The May 2000 Accountancy Law made company management, not the auditor or accountant, responsible for legal behavior. More importantly, in 2001, the Thai Securities and Exchange Commission amended the Public Limited Company Act which provided mechanisms for adequate protection of minority shareholders, transparency and disclosure. For instance, mechanisms to prevent directors from making use of companies' opportunities for their own benefit and to ensure that minority shareholders can exercise their rights in making decisions for the company have been put in place. Many disclosure standards now match best practice. Companies were required to provide shareholders with sufficient and timely information before shareholders' meetings, facilitate shareholders' rights to call for meetings, and by providing proxy. A number of corporate governance initiatives are planned for 2002: to introduce a "governance rating" which will rate listed companies on the basis of transparency, fairness, accountability and responsibility of companies and directors and to create an independent association of minority shareholders to act as a representative of minority shareholders in meetings and monitor business operations of listed companies (Securities and Exchange Commission, 2002).

## **Credit Monitoring and Protection**

Creditors have some control rights in companies and hence are also important players in corporate governance. A major mechanism to protect creditors interests is the implementation of effective bankruptcy or insolvency

procedures. These procedures provide means by which creditors can settle their claims against an insolvent company in an orderly manner. They also provide a forum for debt restructuring and an opportunity for the insolvent company to reorganize. The laws governing corporate insolvency are usually contained in bankruptcy laws or company laws.

Before the crisis, bankruptcy regimes were generally weak in most affected countries, and some were out-of-date. They were biased towards borrowers and did not provide sufficient protection for creditors. Following the Asian financial crisis, many of the affected countries began to reform their corporate insolvency, restructuring and debt recovery laws and procedures. Significant progress has so far been made, although significant implementation problems persist.

Three broad strategic approaches exist for corporate restructuring that could lead to more efficient bankruptcy procedures: centralized, decentralized and London. Governments play a major role in centralized approaches where its strategies prove more effective with small debts, simple corporate structures and high levels of shareholders' confidence in governments. On the other hand, the decentralized approach requires relevant shareholders to reach voluntary restructuring arrangements. This approach is more effective with large debts and complex corporate structures. An intermediate strategic approach, the London approach, is when creditor financial institutions and indebted firms worked closely with a government institutions outside formal judicial processes. It involves full information sharing between all parties; collective decision-making among creditors; standardized and binding agreements between creditors and debtors particularly in honoring restructuring agreements; clear timetables for resolution and penalties for broken agreements. This approach requires strong confidence in the official mediating institutions (Haley, 2000).

All the crisis-affected countries followed broadly the London approach. All the countries developed new out-of-court systems to restructure large corporations' debt such as the Jakarta initiative in Indonesia, corporate debt restructuring committees in Korea and Malaysia, and Thailand's corporate debt restructuring advisory committee.

#### **Korea**

Before the financial crisis, Korea had a formal liquidation and bankruptcy procedure. This procedure was furthered enhanced after the crisis. Banks and non-bank financial institutions have been taken over and recapitalized by the government, reorganized under government supervision and liquidated. A number of purchases and mergers have occurred prompted by injections of government capital. A portion of bank assets have been shifted to the Korea Asset Management Corporation (KAMCO), which, at the end of 2002, had resolved 57 per cent of the face value of non-performing loans purchased from financial institutions since 1997. In October 2000, through the Law on Corporate Restructuring Investment Company, Korea has established a range of corporate restructuring vehicles (CRVs) that can acquire non-performing loans, distressed assets and assist in the restructuring and recovery process. The distressed debtor then dealt with the CRV to formulate a workout process. A workout process involved debt/equity conversions, term extensions, deferred payment of principal or interest, reduction of interest rates, waiver of indebtedness, provision of new credits, sale of non-core businesses and new equity issues. This process was introduced through the "Big Deal" measures. The Agreement Among Creditor Financial Institutions on the Establishment of CRVs strengthened this process in February 2001. In September 2001, the Corporate Restructuring Promotion Law was implemented. It provided a framework by which creditors of a distressed debtor that owed 75 per cent of the debt owed to financial institutions could grant a moratorium to the debtor to allow it to prepare a Memorandum of Understanding for their restructuring. This would streamline the resolution of creditor disputes (Ministry of Finance and Economy, 2001).

#### **Indonesia**

After the crisis, the government raised creditor protection by amending its bankruptcy laws, establishing a new commercial court and introducing an out-of-court framework for restructuring non-performing loans. In January 1998, the Indonesian government established the Indonesian Bank Restructuring Authority (IBRA) to restructure troubled banks while the Indonesian Debt Restructuring Agency (IDRA) was established to restructure foreign debt in July. This allowed debtors and creditors to insure themselves against exchange risks, once rescheduling agreements were reached. In August 1998, the Indonesian government introduced a substantially revised bankruptcy law that modernized the legal infrastructure for bankruptcy and established a Special Commercial Court that facilitated the rapid resolution of commercial disputes. The revisions to the bankruptcy law included the following (Iskander, *et. al.*, 1999):

- Procedural rules designed to ensure that bankruptcy proceedings were efficient and transparent;
- Provisions that allow for the appointment of receivers and administrators from the private sector to administer the estates of debtors;
- Greater protection of debtors' assets; and
- Limitations on the ability of secured creditors to foreclose on collateral during proceedings.

Subsequently, in 1999, a law against corruption, collusion and nepotism was adopted. In 2000, the Jakarta Initiative Taskforce (JITF) was created to assist in workout procedures and restructuring mainly for out-of-court corporate settlements. The JITF is an independent government agency whose mandate was to facilitate active corporate restructuring and accelerate the approvals required for restructuring plans. As of December 2002, the JITF had worked out about \$18.9 billion out of the total \$29 billion in corporate debt that it had been tasked to restructure.

Despite the comprehensive legal and institutional framework, the progress of corporate restructuring seems slow. The IDRA has registered little debt with 80 bankruptcy cases despite almost half of Indonesian corporations experienced insolvency while IBRA has disposed only about 20 per cent of the total assets under its management at the end of 2002. Much of the restructuring has focused on debt-to-equity swaps, loan extensions and debt discounts rather than asset sales.

#### **Malaysia**

Even before the financial crisis, Malaysian bankruptcy laws were sound by international standards and corporations carried less debt than companies in other East Asian countries. With reforms being introduced since the crisis, the resolution of non-performing loans was facilitated. In 1998, the government established Danaharta, an asset management corporation, as a pre-emptive measure to purchase non-performing loans from banking institutions. Danaharta could also acquire the assets and liabilities of a company in financial difficulty, if requested. In September 2002, Danaharta announced that it had dealt with its entire portfolio of non-performing loans projecting an expected recovery rate of 57 per cent. The Malaysian government also established the Corporate Debt Restructuring Committee (CDRC) to assist creditors and debtors to agree on restructuring and workout programs. As at the end of July 2001, the CDRC was involved in the restructure of 46 applications involving debts of over RM26 billion, representing about 40 per cent of the total value of debts referred to the CDRC. In August 2002, the CDRC ceased operation after successfully completing the restructure of all the debts it accepted (Ariff, *et. al.*, 2001; Asian Development Bank, 2003).

#### **Philippines**

Unlike the other crisis-affected countries, the Philippines did not establish an asset management corporation relying instead on banks to work out their own non-performing loans. In 2002, however, due to the rising level of non-performing loans, which was about 17 per cent of the total assets of the banking system, the Government proposed a bill for the creation of a specially designed asset management corporation or special purpose vehicles. The proposed bill was signed in early 2003 and laid out a framework for debt relief and recovery measures to financially distressed enterprises and offers four modes of rehabilitation: pre-negotiated rehabilitation, fast-track rehabilitation, court-supervised rehabilitation, and dissolution-liquidation. The Securities and Exchange Commission, *Bangko Sentral ng Pilipinas*, Department of Justice, Capital Markets Development Council and the Insurance Commission favorable endorsed the law (Committee Affairs Department, 2002; Asian Development Bank, 2003).

#### **Thailand**

The bankruptcy system in Thailand prior to the crisis was weak. It made it difficult for creditors to obtain payment against bankrupt borrowers. Debtors used different ways to stall the bankruptcy process, including procedural disputes, which could cause a delay by at least a year. Actual bankruptcy proceedings took more than five years to complete, on average.

Thailand introduced a number of legislative reforms to its insolvency laws and practice following the financial crisis, which strengthened creditor rights.

These reforms included:

- Enactment of new corporate reorganization procedure in 1998; establishment of a specialized bankruptcy court in 1999;
- Establishment of the Corporate Debt Restructuring Advisory Committee which facilitated formal out-of-court debt workouts; and

- Introduction of taxation and other incentives to promote restructuring and investment.

In September 2001, Thailand established the Thai Asset Management Corporation which managed and restructured non-performing loans transferred to it by state and some commercial banks. To date restructuring has often involved only debt rescheduling with long grace periods and lower interest rates. There are only very few cases of thorough corporate restructuring involving write-offs on banks and forcing companies to shed non-core assets (Economic Analytical Unit, 2002).

## **The Role of Government in Corporate Governance**

Governments have a major influence on corporate behavior and corporate policies, including corporate governance. They play an important role in encouraging stronger market forces and requiring corporations to behave responsibly and in accordance with the law. Governments provide the basic institutional framework for rules based business. Most governments in Asia have privatized state enterprises and banks, deregulated controlled sectors, boosted regulation supporting corporate transparency and engaged in corporate restructuring.

## **Policy Implications and Conclusions**

Stronger market forces and tougher regulations are gradually transforming the business environment in East Asia. Company financial reporting, accounting and auditing standards provide for adequate transparency and disclosure. For instance, many of Thailand's disclosure standards are close to matching best practice with 95 per cent of auditing standards and 90 per cent of accounting standards complying with international standards. Tougher bankruptcy laws and listing rules have started to protect minority shareholders' and creditors' rights. Hence, in March 2002, ten companies were delisted from the Korea Stock Exchange for accounting irregularities; the Jakarta Stock Exchange exposed and sanctioned 40 companies for non-compliance while the Kuala Lumpur Stock Exchange had a total of 481 investigations against listed companies for breaches of listing requirements. The *chaebols'* market power has been reduced with some broken up and sold while the others were forced to focus on their core competencies by divesting collateral business lines. Based on experience in other countries, corporate governance improved when the extent of disclosure increased, the power of large inside shareholders was curbed, and an adequate number of outside shareholders were present.

While considerable progress has been made in the ongoing process of corporate governance reform in the five crisis-affected countries, gaps to achieve best practice remain. Despite sound and comprehensive laws and regulations, weak implementation and enforcement have hindered progress due to weak courts, lack of experienced personnel, powerful vested interests and lack of political will.

There is no single model of good corporate governance. Differences in corporate governance among countries depend on their respective economic, institutional and legal structures, and cultures. However, to remain competitive in a changing world, corporations must innovate and adapt their corporate governance practices to meet challenging demands and face new opportunities. Similarly, governments have the responsibility for creating an effective regulatory framework that provides for flexibility to allow markets to function effectively and respond to expectations of shareholders. There should be a strong commitment in increasing transparency in the judicial system and regulatory bodies by building the necessary institutional capacity.

### End Notes

<sup>1</sup>A *chaebol* is characterised as a group of large corporate groups operating in diverse and mostly unrelated industries, usually under the ownership and control of a single family. The success of *chaebols* has highly depended on the strong support of the state by channelling cheap credit to them, coordinating investment and export strategies and controlling wages.

<sup>2</sup>Restructuring of the 6<sup>th</sup> to the 64<sup>th</sup> largest *chaebols* was carried out through a program referred to as 'Workout'. The top five *chaebols* were given a different treatment from other smaller *chaebols* since their business activities involved key sectors and are linked to hundreds of subcontractors; thus, their economic influence was even greater than their size would suggest. The five largest *chaebols* were a target of more extensive reforms than the other conglomerates.

# **Women and Business in Era of Globalization: Some Implications and Strategies for Empowering Women**

*Rohana Yusof  
Universiti Utara Malaysia, Malaysia*

## **Abstract**

**Globalization: what does it mean for women? Globalization is primarily viewed as a complex and multifaceted economic process, it impacts at various level of political, social and cultural interfaces. This paper discusses women's issues and gender concerns in globalization and how businesswomen has been impacted as a result of globalization. As we are aware globalization has confronted business with a range of drastic changes in markets, technology, society and consumer behavior. Understanding such change has become crucial for women business owners because as business people they have to anticipate the effect of globalization on their business. Discussion is focus on issues in relation to opportunities and threats for women in this era of globalization such as the changing role of women, empowerment of women and greater independence for women. The effect globalization has had on culture is immense and diverse. It has affected people's cultural behaviors in different ways. People have had to change their living ways. The loud echoing advertisement rhythms of the famous coca-cola drinks can be heard across boundaries in towns, cities and township and even in remote rural areas where drinking water is a problem to get. On the face of it, there are gains for women but many challenges remain. The paper concluded with some possible action of looking at this phenomena which might give feminist the basic to think, unite and act.**

## **Introduction**

The concept of 'globalization' is primarily viewed as a complex and multifaceted economic process, it impact at various level of political, social and cultural interfaces. Globalization is then certainly not a simple term. The ideology that undermines globalization focuses on trade as the vehicle for improving the condition of people everywhere. It is an old idea which sees the increasing integration of international economics as a positive step and one which inevitably occurs, if markets are not unduly hampered by governments. The restructuring associated with globalization doesn't even attempt to promise anything to those traditionally disadvantaged in our society : the unemployed cannot expect jobs, the poor cannot expect prosperity and women an other disadvantaged people cannot expect equality (Cohen, 2000) [1].

Hence what I thought I would do is to reflect on globalization as the broader context of global production system and the challenges for women in business. I would like to take us to a discussion and see the connection between globalization and what it means for women in business. Is being self - employment and success in business a way to empowerment or the vice-versa ?

As we are aware globalization has confronted business with a range of drastic changes in markets, technology, society and consumer behavior. Understanding such change has become crucial for women business owners because as business people they have to anticipate the effect of globalization on their business. Discussion is focus on issues in relation to opportunities and threats for women in this era of globalization such as the changing role of women, empowerment of women and greater independence for women. On the face of it, there are gains for women but many challenges remain. The paper concluded with some possible action of looking at this phenomena which might give feminist the basic to think, unite and act.

## **Defining Globalization**

Globalization mean different things to different people. Some proponents see it as not only inevitable but fundamentally beneficial, if only we could distribute the benefits better. Yet many millions experience it not as progress, but as a descriptive, even destruction force. Much has been said and written about globalization. Many

intellectuals, politicians, businessmen, management gurus and others have touched on this much hyped phenomena. But what is globalization? Is it a new and recent phenomena? Is globalization accidental or a natural evolution of mankind's ever - advancing civilization? It is imperative that we all understand globalization is an on -going process and not a static condition. This implies globalization is a progress in mankind's continuing course of development. In general term, globalization can be defined as a process that disintegrates the geopolitical borders between countries and transforms the world into one global unit (Saifuddeen, 2000) [2].

'Globalization simply meant that businesses knows no national boundaries. Capital and work - your work ! - can go any where on earth. The consequences of all this is painfully simple; if the world operates as one big market, every employed will compete with one person in the same job. There are a lot of them, and many of them are very hungry ' (Grove, 1995) [3]. At its simplest, it is about footloose corporations taking investment wherever labor is cheapest and most productive, and it is about the growing plight of unskilled labor. People around the globe are more connected to each other than ever before. Information and money flow more quickly than ever. Goods and services produced in one part of the world are increasingly available in all parts of the world. International travel is more frequent. International communication is common place. This phenomenon has been titled 'globalization'. The 'era of globalization' is fast becoming the preferred term for describing current time. Just as the Depression, the Cold War Era, the Space Age and the Roaring 20's are use to describe particular period of history, globalization describes the political, economic, and cultural atmosphere of today. While some people think of globalization as primarily a synonym for globalization business it is more than that. The same forces that allow business to operate as if national borders did not exist also allow social activist, labor organizers, journalists, academics and many others to work on a global stage,' We can therefore define globalization as a social process in which the constrain of geography on economic, political, social and cultural arrangement recede, in which people become increasingly aware they are receding and in which people act accordingly' (Waters, 2001:5) [4].

The core of the idea is that the world is under going a process of ever - intensifying interconnectedness and interdependence, so that it is becoming less relevant to speak of separate national economies, or separate national jurisdiction founded upon principal like the sovereignty of the territorial nation - state. The idea of a global system suggest that this interconnectedness and inter dependent is making it increasingly difficult for social units like nation - state, localities and even individuals to sustain identity without reference to more encompassing structure and flows. At the same time, diversity is still rife in what is undeniably a pluralistic world; indeed it many be heightened by a sharpened awareness or consciousness of global pressures and expressed in form of cultural resistance or attempt at economic and political autarky (Oxford, 1995) [5].

To this end, it is demanded that, whatever the nature of their economies, their level of development, and whatever their location in the global economy, all countries must pursue a common set of economic policies. In particular, they must permit the free and indiscriminate operation of transnational corporations in their economies: open their economies freely and indiscriminately to imports and concentrate on exporting what they are supposed to be good at; reduce the role of governments in the economy to that supporting the market and private enterprise; and leave the determination of prices of goods, currencies, labor, as well as the allocation of resources to the operation of the market. Seen in this way, globalization is primarily not an impersonal process driven by laws and factors of development-such as technology-operating outside human control and agency. Rather it is a conscious program of reconstructing international economic and political relations in line with a particular set of interests (the profit motivations of the businesses, especially the transnational corporations of the advanced industrial countries) and vision (the dogma of the primacy of the free market and of private enterprise in all processes of human development) (Manenji, 2005) [6].

## **Gender Implications of Globalization**

Clearly gender is important along the whole range of our concerns with globalization. Gita Sen (1999) [7] has out line some of the women's issues and gender concerns in globalization. There is women's labor and employment - the attention to the global assembly line and the fact that women are increasingly in the so-called services sector particularly in this region, as well as, in Latin America. It shows women have become central to current production

systems. There is no doubt that in very many parts of the South as well as the North, women are part of the labor force in a way that we were not before and the employment issues are key issues for us, right now. Related to this is women's migration and the nature of migratory laws. Where as previously international migration used to be largely male, migrants are now very heavily female in many regions, including South-East Asia. What has been happening as a result of the increasing colonization of resources, is that rural women, particularly those who belong to communities used to managing resources on the basis of common property and indigenous knowledge of biodiversity, are increasingly being squeezed. Women are also found in the informal sector, itself changing as a result of either its integration within or marginalization by transnationalized production systems.

Data gathered from research in Asia, Africa, the Caribbean, the Middle East and Latin America on the impact of structural adjustment programs on women indicate that: (Sparr, 1994) [8].

- an increasing number of women look for income-generating work outside the home to compensate for the husband's loss of job, less steady income and/or sharp fall in family purchasing power.
- more women than men may become unemployed;
- working conditions for women deteriorate;
- wage differentials between men and women grow;
- as the formal sector of employment diminishes, more women enter the informal sector;
- women do not experience increasing employment as a result of export promotion of manufactured goods;
- export cropping often does not benefit in terms of paid work, better economic status, or bargaining power within the household;
- women's unpaid work escalates with structural adjustment outbacks in social services, higher prices for basic necessities, unemployment and job insecurity;
- progress in girl's education slows as women's unpaid work becomes heavier and mothers ask them to assist in the home;
- food consumption diminishes as a result of rising food prices and changing agriculture policies;
- girl's health and mortality rates worsen as a result of the above;
- women's reliance on credit places them under greater pressure by creditors to pay back debts;
- an increased number of women are heads of household; and
- many women lose the support of the extended family as families become nuclear.

The Asian Rural and Indigenous Women's Conference Against Globalization Convened by The Asia-Pacific Forum on Women, Law and Development in 1998 has taken a close effects on women, their families and that communities. It is realized that the onslaught of the global market and foreign monopoly capital not only on their living condition but also on the political, social and cultural aspects of their lives as such:

- i) Multiple role of women in sustaining the family and the community and contributing to the national and regional economies, yet the worsening unjust, inhuman and marginal treatment that they get in the supposedly "new economic order",
- ii) Further undermining of the rights of indigenous women to their ancestral resources : land, water, forests and other livelihood sources-due to logging concessions, mining operations and hydroelectric projects;
- iii) Large-scale, export-oriented agricultural production such as oil palm, cocoa, pineapple, cut flowers, teak trees, bananas, and trees for paper and pulp which threatens food security, worsens landlessness, intensifies impoverishment, further marginalizes and dislocates women, and degrades the environment;
- iv) Migration of rural and indigenous women who get heavily indebted, selling or mortgaging what little property they have for job opportunities abroad, ending up with low wages and at times sexual and physical abuse, and having to deal with disrupted families, adverse effects on young children losing their mothers' care, family breakdowns, loneliness and cultural shock;
- v) Sacrifice of the agricultural sector to an export-driven industrialization strategy in so called NICs where women are not acknowledged as independent producers nor managers of agricultural production; and where they are excluded from opportunities in farming education, subsidies for the purchase of farm machinery, financial support from and participation in agricultural cooperatives;

- vi) Destruction of rural self-reliant economy, inflation, high cost of production inputs and deterioration in social services resulting from opening up to the global market and adoption of globalization policies and programs in Indochina and Central Asia;
- vii) Increasing resourcelessness and enslaving conditions of women particularly created through the new economic disorder that more than ever guarantees profits for the multinational and transnational corporations (MNCs/ITNCs) and their partners, the local ruling elite, while destroying nascent local manufacturing and trading due to unequal competition from imported goods;

In most countries of the world, if not all women form a disadvantaged section vis-avis men. Malaysia is no exception. If the country's economy has to fight an unequal battle with the development countries in the international market, its society is doubly burdened by the inequities suffered by women, enhanced by the effects of this unfavorable competition. It is true that a section of Malaysian women - the elite and the upper middle class has gained by the exposure to the global network. More women are engaged in business enterprises, in international platforms and have greater career opportunities as a result of international network. Freer movement of global, and capital is helpful to this section.

On the contrary Rowena (2001) [9] has presented a case study of the Philippines showing how indigenous women in varied ecological setting in the Philippines survive and struggle as a result of globalization. She also highlighted the issues attendant to the changing role of indigenous women, as well as the issues that must be address by policies and women programs. The three features of globalization - liberalization of trade investment privatization of public assets, and deregulation of social and ecological concerns - have increasingly placed the women of indigenous communities at the central of the social arena. Indigenous peoples(cultural communities whose traditional, pre-colonial institution have persisted) are characterized by their strong adherence to the ecological principal of sustainable resourced management in their production system. Whether farming in the uplands or plains, or surviving on riverine and marine resources, women of indigenous communities across diverse habitat in the Philippines have served as caretaker of the environment and the family in what use to be self-sufficient villages.

In Africa, women have mostly been involved in farming, in employment as civil servants, and in industry. They have also been involved in small-scale entrepreneurships. No doubt, these sectors have been severely affected by the introduction of trade liberalization. Women on this continent contribute the most critical factor in agricultural production and agriculture. Yet liberalization has failed to ensure the availability of credit, agricultural inputs such as fertilisers and insecticides at affordable prices. The marketing of their produce has been thrown in the hands of businessman whose sole objective is profit maximisation. The result-food security in Africa is highly threatened. Women constitute 60% percent of the communal farmers in Zimbabwe. In rural areas the impact has been so serious that rural urban migration has increased to unfortunate proportions. This in turn has led to the increased of squatters in urban areas and crime which affects mostly women and children (Manenji, 2005).

In Zimbabwe, some women have resorted to across-border trade. This has had its own social and cultural repercussions. Children in this case are left out of parental care and the number of rape cases on young children has become an alarming cause of concern. In Zimbabwe alone, there is an average of four reported cases of rape every day. In other cases there have been reports of married women getting involved in extra-marital affairs once they across the border while the spouses they have left behind indulge in the same, complicating and worsening the AIDS pandemic situation. Children no longer sit around the fireplace in the evening to listen to stories to promote the values of respect, integrity, peace, love and unity, even in the rural areas where this sort of environment would fit best. People-men, women and children-are all angrossed and embroiled in the struggle for survival-the struggle to get a bowl of meal to fill the tummy at least for the day (Manenji, 2005).

Globalization and associated increase in foreign direct investment have had a major impact on employment in the developing countries, particularly in the export - led manufacturing sector where the labor force is predominantly female. Figures from the International Labor Organization showed that women employment has grown at a faster pace than men's in the last 20 years. In 1978, for example, Bangladesh had only four garment factories. By 1995, it had 2,400 employing 1.2 million workers 90% of whom were young women. In 1992, women held 84.8% of jobs in exports processing zone in Sri Lanka, compared with 46.4% in the economic as a whole,

Although not high, and consistently lower than for men wages in such enterprise are often more attractive to women worker than alternatives, (Department for Economic and Social Affairs, United Nations, New York, 1999) [10].

On the face of it, these are major gains for women. A deeper analysis shows, however, that many challenges remain. Improvements in employment opportunities do not necessarily lead to greater independence for women, or improved bargaining power within the household. Studies of women workers in garment factories in Bangladesh and India, for example, have shown that close to half of them hand over their wages to their husbands, or some other male member of the household. Time allocation studies from a diverse selection of countries around the world show that in general women's burden of household work, and primary responsibility for childcare, do not diminish with increased participation in paid work. Thus, paid employment in many instances gives rise to a "double day" for women.

The main benefits to women from globalization have been in formal sector employment. Overall, however, this only accounts for a small proportion of women's work. In developing countries most employment opportunities, for both women and men, are in the informal sector. In India and Pakistan, it is estimated that informal employment makes up 75% and 70% respectively of total manufacturing. In Africa, the informal sector share of non-agricultural employment is equally high. The reality for most poor women is that new work opportunities are some distance away from formal production lines, as firms increasingly favor sub-contracting and outworking. This provides precarious employment at best, and fragments and isolates the female labor force in ways which reduce bargaining power and exert downward pressure on the terms and conditions of work. The uncertainties and volatility of global markets act as disincentives to firms to provide more secure and better paid employment. As a result, a very high proportion of women workers work long hours for low pay, in insecure jobs with little or no social protection (Dollar and Gatti, 1999) [11].

Outside of the formal sector, women are very active in both micro and small enterprise, and in agricultural and other forms of rural activity. A very large proportion of women's work in these sectors remains "invisible", and is rarely accounted for in economic analysis or national accounts. Many women work in sectors of the economy servicing mass markets, where price-based competition is fierce. Small, women-run businesses often can not compete with cheap imported products. The general lack of skills development and training tend to perpetuate women's economic disadvantage. Poor information flows, combined with low levels of literacy, act as further barriers to women's economic advancement, along with women's limited access to, and control over assets such as land.

A study by Cecilia Ng (2000) in Malaysia has also show that globalization has imparted the Malaysia women. The export boom in Southeast and East Asia in the last quarter of the 20th century was fuelled by the contribution of women in export-related activities and through the remittances made by migrant women workers. In Malaysia, the electrical and electronic products comprise about 60 percent of the total manufactured exports of the country with the industry generating about one-third of manufacturing employment in Malaysia, Majority of those employed, particularly at the operator level, are Malay women. As noted above, this trend towards the feminisation of paid employment in Asian countries was driven by the need of employers, usually transnational corporations (TNCs), for cheaper and more flexible sources of labor, Global capitalism makes use of the existing patriarchal ideology whereby women are perceived to be more subservient to (male) managerial authority, less prone to organize or be organized and easier to dismiss using such life-cycle criteria as marriage and childbirth. (Cecilia Ng, 2000) [12]

On the one hand, the globalization of trade and the economy has definitely opened up economic and income opportunities for women, resulting in her improved status in the household and an increase in her position in society as well as her self esteem. It has opened up choices for women in both the manufacturing and services sectors and for those in the manufacturing and services sectors; and for those in the higher-valued industries, it has also meant an increase in her skills. Cecilia's (2000) research on women electronics in two TNCs found that they are confident, have a great sense of pride in their company and a positive perception of themselves as part of the company in which they work. With the expansion of ICT, information processing work can now be globally distributed, leading to new modes of working, such and telework, teletrade and e-commerce. Women as off shore data entry workers, software programmers and system analysis are finding novel employment opportunities in this digital aged. In her study of software companies in Malaysia 30% of the software personal were women. However,

on the other hand, Cecilia's (2000) have also noted that the majority of the women workers labor under inferior working condition and often on shifts with serious implication for the social and physical health. Those in the lower end, labor - intensive consumer electronic industries suffer from health problems that include extreme fatigue and general health problem due to chemical hazards and job stress.

## **Women's Issues, Challenges and Gender Concerns in Globalization for Businesswomen in the Informal Sector**

The increasing employment of women in the informal sector points to the fact that women will engage in various odd jobs and economic activities to ensure the survival of their families in time of crisis. As men were displaced from their jobs in agricultural, manufacturing and construction, women take of their place in the workplace, such as i) multiple burden as they attend to both production and reproductive chores, ii) below minimum wages, longer washing hours and harsh working condition, as their activities are largely unregulated and unmonitored iii) lack of social protection due to absence of clear employer - employee relations and lack of access to benefits such as maternity, medical, etc. iv) job insecurity, v) lack of capital, vi) limited access of profitable markets and vii) lack of skills (Mendoza 1996) [13].

Development specialists have noted that "in developing countries, where jobs in officially licensed enterprises are scarce, much of the population makes a living by working outside the official tax and regulatory systems. These people who make up the informal sector, are innovators, skilled at surviving, and sometimes prospering, in a highly regulated environment. Although the informal sector is an important source of jobs, income and even housing, its participants lose their full rights as citizens by operating outside the legal economy." (Lee, 1994) [14].

This legal vulnerability affects women particularly because so many are employed in the informal sector. According to a study of the Malaysian economy from 1985 to 1992, an average of 47.05% of women in the female labor force were employed in the informal sector. Of those, the vast majority, 61.2%, were employees, 21.8% were unpaid family workers, 16% were self-employed, and only 1 % were employers. Within the informal sector; an average of 26% of all self-employed workers were women. Of all unpaid family workers, 65% were female. Thus a significant portion of women's contribution to the economy -- in Malaysia and throughout the developing world -- is unrecognized and uncounted,(Department of Statistics, Malaysia, 1990) [15].

The typical urban or rural woman in Malaysia's informal sector has a primary education and an average household size of five. She entered the sector after she married and began bearing children; now she contributes substantially to the total income of her household. Approximately one third have incurred debt to provide capital for their businesses. Most urban women have worked previously in the formal sector. In recent years, a relatively new group has entered the informal sector. They are professionals with good earning power who have opted to go into business for themselves, often working out of their homes. Advancements in information technology and the democratization of work have made it possible for them to work outside the formal sector. Despite their contributions to the overall economy of the country, women in the informal sector face significant obstacles and challenges of low pay, lack of access to such resources as capital, education, and training; and exclusion from the policy-making process (Faridah et,al, 1991) [16].

Despite their numerical importance, women's business face special difficulties and are generally marginalized in the both national and international arenas. Women and therefore the business that they operate, are disadvantaged in many areas within the era of globalization. I quoted few cases here:

- (i) **Access to Capital:** For example, in Australia 43 per cent of women operating small enterprises, compared to only 29 per cent of men, commenced their businesses with less than AUS\$ 1000, These women were also less likely than the men to use personal savings or to borrow money to start their business [46 per cent of women sole-operators compared to 56 per cent of men].
- (ii) **Access to Technology:** Women may lack access to technology because of their lack of capital, poorer access to information or cultural stereotypes that either limit their effective access or make them dependent on men for access. For example, in some countries women's participation in education and particularly

technical and vocational education is restricted by cultural stereotypes, However, in the developed countries where these barriers are less serious, women's businesses have been found to use new technologies, at least in the field of information. For example, a 1994 survey of home-based women-owned businesses in the US found that more than 56 per cent had at least one computer, almost 4 in 10 had more than one, 213 had a fax or computer modem, 55 per cent used a cellular phone, 30 per cent used CD-ROM and 32 per cent used an on-line information service [National Association of Women Business Owners].

- (iii) **Access to Information:** Women are often excluded from active participation, and sometimes from membership, in business networks and professional associations. Their exclusion may result from lack of time due to their need to balance their domestic roles as wife and mother with their business roles. It may result from the social nature of the networks themselves, since many centre on shared non-business (for example, sporting, same school or club) interests that also tend to exclude women. It may also result from cultural barriers. For example, both businesswomen and their male colleagues may feel uncomfortable if the women participate in the social activities (such as after-work dining out and drinking) around which the business networks operate. Even in the US, women still find themselves doing less business travel than men and are excluded from certain kinds of [more policy-oriented] meetings.

In this section, I have made an attempt to analyze the challenges face by the Malay business women in this era of globalization. I briefly summarize the profile of the Malay businesswomen revealed by my study (Rohana, 2001) [17]. A number of 31 businesswomen were interviewed. The age of the businesswomen varied greatly, but more than half of them are between 31-50 years old and most of them are married and one of them a divorcee. Most of them have 3 children and above which is still in their schooling age. Generally, these women have the primary responsibility for children and for household maintenance. They tend to be middle-born rather than among the eldest as revealed by most previous studies. They have an average of 9 years of schooling for average Malaysian women thus they are considered to attained a low academic qualification. In term of work experience, more than three quarters of the businesswomen do not acquire any work experience (working outside the home) before they started their business, as they are full-time housewife.

Half of businesswomen were sole-owners of their business enterprises and the other half created their business in partnership with their husbands who are actually businessman and only 3 of them were in partnership with a non-family member. Businesses owned by these women are rather young (18 of them are 5 years old or less) and in most cases, it is the first and the only business of the businesswomen. They started their business with a very small capital investment (74% involved less than RM 1000) mostly from the development agency (Amanah Ikhtiar Malaysia) and a few from personal and family savings. Generally they have been found to venture into food production, food-trading and service-oriented type of business. Their average monthly income of between RM 1000 - RM 2000 is considered encouraging as this amount is equivalent to a person who attain a diploma working as a wage-worker in the government sector in Malaysia. The quantitative data has revealed that this group of Malay rural businesswomen are 'pushed' into self-employment and majority was unemployed before start-up. However, unemployment is not the sole determining factor in the self-employment decision among these Malay rural women. More positively, 'pull factors' such as economic rewards, ambition and desire for autonomy are also cited by these business women as motivations.

These businesswomen encounter distinct problem in managing their business. These problems fell into two categories : (i) specific gender - related problem and (ii) business ownership problems which can have a gender dimension. Among the specific gender - related problems are conflict between domestic commitments and business ownership, lack of confidence, lack of role models and feelings of personal isolation. Apart from these problems that falls under business ownership problem includes the restricted access to finance and lack of relevant business skills and experience, The study indicated that finance was the most common problem quoted by the businesswomen in this study. Majority quoted that their source of capital came from the family members and from the Amanah Ikhtiar Malaysia Project. These women face financial problems of which financial institution make it difficult for the women to borrow of which the bank wants collateral that the women do not have.

The problem and issues that emerged from this study were considered by the women to be those which posed as challenges to them as businesswomen, Among others are proper management of cash flow, bookkeeping and marketing of their products. Apart from their problems, they expressed difficulties in managing the dual roles

they have to perform. These women perceived themselves as living a double life, where half of the day they had to be hard driving at work and then the next half switch to feminine and caring after working hours. But on close examination, this conflict was experienced by those businesswomen who were concerned about maintaining their femininity, and appeared to be outwardly symbolized by manner of dress always wearing the 'baju kurung' and 'tudung' (the headdress).

For small countries like Malaysia, this globalization process is difficult to contain given the complexity of its impact. In the country's efforts to minimize constraints associated with the globalization process, the role of the state, organization and women herself is indeed critical if the businesswomen wish to become a successful businesswoman. It is only through the enhancement of these capabilities that Malaysia will be able to face the complex challenges posed by the globalization process. Hence, in recognition of the social implication of the current economic crisis and its gender - specific impact on women and women's businesses. I recommend that we establish and expand social safety nets for women by taking actions such as :

- i) promoting access to credit and alternatives methods of financing women's enterprises in both the informal and formal sectors.
- ii) promoting women's knowledge and awareness of the economic crisis and the effects of trade liberation and globalization on women.
- iii) initiating alternative strategies for improving women's livelihood in the informal sector - a sector which should be reassessed as a potential energizing and growth sector, not as a sector of last resort (Rohana, 2001) [18].

## **Strategies to Empower Women in Facing the Effects of Globalization**

### **Humanizing Globalization**

A study by A.H Ronning et. AI (2001) [19] suggested that a strategy to empower women in this era of globalization is 'humanizing globalization'. Putting a human face on globalization means drawing attention to the many positive aspects of our new global world which enable us to communicate and network across national, social and sexual boundaries. However, as we interact globally we must ensure that the effect of globalization, whether political, economic, or cultural on the individual human being is always borne in mind. Globalization should not be sought at the cost of the weaker segment of society, of the disadvantaged. On the contrary, globalization should contribute to making the lives of people, both men and women, easier, and increase access to the benefits of modern technology and the advanced systems of the world.

However, if women are to be a part of this New Economy they must be thoroughly equipped with the necessary knowledge and skills to accommodate themselves to live along the new wave of economy. In other words, women should be empowered in terms of the economy. Since economic globalization can no longer be stopped, it is imperative for women to educate and train themselves and be provided with fair opportunities, so that they can utilize the economic and technological developments to their own advantage in ways that enhance, rather than detract from human experience. It is important for women to be present and active so that a human face and not just profit motives can control what happens to local societies and their families.

### **Empowering Women**

If women are to participate in the ongoing global process they need to be enabled. All women have a contribution to make to society. They must be enabled and empowered to develop a sense of self-confidence and belief in their own abilities, and to use their actual competencies This means acquiring educational skills of different kinds including competence in the use of, and in the designing and implementation of information and communication technologies (ICTs). Members of women organization should focus on mobilizing this new power to enhance human rights, increase access to education, prevent environmental degradation and protect workers' rights.

A power-shift is taking place, as the world becomes increasingly connected by "bandwidth," or the capacity of a country's cable, telephone lines, satellites, and fibre optics. This has changed the traditional way of looking at power as a hierarchical chain of command and control with national government officials or corporate officers at the top of the structure. Globalization and the mass media is driving the world increasingly toward decisions that place economic self-interest above that of other interests. The amount and rate of information dissemination within a

population places power in the hands of those who can access it, connect to others, and know what to do with the knowledge and connections gained. Women must learn to use the power of media technologies from the Internet to radio and simple tape recording. Learning media techniques and objectives; and advocating for one's country to improve its media infrastructure is essential. Empowerment entails learning new skills, obtaining knowledge, and taking action to force policy changes that reflect women's concerns upon governmental institutions and private corporations.

Programs implement should develop skills in understanding the new nature of power, and methods of obtaining it negotiating, mentoring, partnering and networking for advancement in careers and civic affairs so that women can reach social and political decision-making positions conflict prevention, management and resolution methods at the personal, local, national and transnational levels. So that women and girls do not fall into the digital divide, it is important to be information literate. This means being a competent, independent learner and one who recognizes that accurate information is the basis for intelligent decision-making. Hence, women organization and other related agencies should take the initiative to set up programs for adults in basic literacy and post-literacy, as well as programs concentrating on economic literacy, legal literacy and health literacy and ensure that such programs are on women's own terms and adapted to their specific cultural and local needs.

## **Conclusion**

Globalization and trade liberalization have the potential to bring huge benefits to women, but these are far from being fully realized. Women in many parts of the globe are undoubtedly better off as a result of the opening of markets and upswings in global demand. Many others, though, have seen reductions in livelihood security and poor terms and conditions of employment. At the same time, new global conventions and agreements on human rights and labor standards, improvements in information flows, and the development and strengthening of women's global networks, all create opportunities to harness globalization for the benefit of poor women as well as men.

These benefits will not be obtained without actions being taken at global, national, and local levels, to open up opportunities for women, and remove barriers which stand in their way. In supporting actions of this kind, we as women, academician and researchers will.

- encourage and support governments in implementing programs for women's economic empowerment and identifying policy instruments to remove barriers to this, including gender-aware approaches to land reform, credit and other financial and non-financial services, human development, market and other forms of information, and skills development and training;
- provide technical and other forms of support for the gender-sensitive reform of legislation and regulations, to improve conditions of employment including adherence to core labor standards, equal pay for equal work, and attention to the rights of informal sector and home based workers;
- promote and support the development of social protection systems that shield women from adverse shocks in export and domestic markets, and strengthen other forms of social provision and risk management for women;
- promote women's participation in economic decision making, both nationally and internationally; including through support to national and international women's organizations;
- support research which will improve our understanding of the impact of globalization on women, and into improved mechanisms for monitoring its gender impacts.

Hence, I call for collective political action at different levels, supranational, national, local etc. Among others I would suggest that government should adopt gender-sensitive policies and programs of economic and social development at national and international level. Women should be given full and equal access to economic resources to credit and the right to own land and to inherit. Women should be given full and equal access to education and training. Countries should promote and develop the mean by which women communicate and share information through out the world, and within countries, in particular in impoverished countries. Only solidarity amongst women will ensure that globalization of the economy will promote social rights, conflict prevention and economic and social justice.

It is thus important for the women's movement to link up with other social movement to seriously incorporate women's concern. However, we must be able to present alternative to the present trends of commoditisation, individualism and materialism as well as the forces of conservatism if we, indeed, want to engage with globalization on equal terms and in the context of our own interests . According to Zeti (2000) [20], staying ahead and surviving involves pursuing strategies that aims to secure durability and sustainability over the longer term. Entrepreneurs and small business women that have caught a wave and prospered on a short term business trend without developing capabilities and competitive positions will risk the future of their businesses, as the wave subsides. For the women business - owners to remain resilient and competitive over the long term, it is important to understand the effect of the powerful force of these waves of change that are constantly shifting and reshaping the economic and financial landscape . This needs to be supported by efforts directed at continuous building the capacity and capability not only to deal with the emerging risks but more importantly, to become well placed to take advantage of the opportunities presented by the new environment. Hence, what is needed as women in business in the face of globalization are changed mindset and productive linkages. Women have to accept and do the following in reframing development policies to help women in business manage globalization and to address the need of women in some major areas such as: i) Access to Market ii) Access to Data iii) Access to Technology and Continuing Education iv) Access to Finance.

In conclusion all women need to accept that "no woman is an island." Women in micro, cottage and small industries need to join a cooperative, a supply chain. Together, they learn and reinforce values of hard work and fair business practices, Together, they look for anchors, source of technology, market or finance. Together, they gain access to shared data and technology.

Women need to advocate, we need to look beyond themselves and their businesses. They need to pro-act, lobby for the passage and/or implementation of women-friendly business laws, They should support Government and NGO initiatives that work for economic empowerment of women and who encourage the establishment of linkages. They have to support the moves for concretization, for transparency and accountability in public governance. Their businesses have to be women-friendly. Likewise, they have to be in the forefront in espousing fair trade practices and transparency and accountability even in private governance. Hence we need to be proud of who we are. We are Women! Born to be nurturers and caregivers. Born to be supportive of male heads of families, rehearsed in the art of compromise, but unbending in pushing for issues that threaten inner values we hold dear. Especially if we personally had a relatively easy climb up, we should never forget that half of the world's sky is being held up by women. If we look around, power is not shared equally by men and women, We should be women working for women.

I would like to take the opportunity to point out the many battles which the strong international women's movement has fought and won on behalf of women and society as a whole. However, these have been mainly around social issues. There is obviously now a need to turn our attention much more to organizing women around economic issues internationally. As episodes such as the Asian Crisis paint out, this increasingly is the new battlefield.

## Appendix

### ESTIMATED FIGURES ON THE POSITION OF MALAYSIAN WOMEN IN THE WORK FORCE AND BUSINESS OWNERSHIP FROM THE YEAR 1990-2020

	1 9 9 0	2 0 0 0	2 0 2 0
Total Population	18 Million	22.6 Million	33.7 Million
Woman (50%)	9 Million	11.3 Million	16.85 Million
The Production Population (15 - 64 years old)	10,4 Million (59.7%)	13.5 Million (59.9%)	20.0 Million (61.0%)
Women (50%)	5.2 Million	6.8 Million	10.0 Million
Population (15-44 years old)	8.3 Million (46%)	10.2 Million (59.9%)	14.5 Million (43%)
Women (50%)	4.2 Million	5.1 Million	7.3 Million
Working Women (percentage from the women population that is productive)	1.9 Million (36%)	2.6 Million (38%)	4.0 Million (40%)
Business Women (percentage from working women)	9-10% 190,000	15% 340,000	30% 1,2 Million

### Abstract

Globalization is increasingly becoming tangible in men's mind. People get familiar with its consequences through media, their interpersonal relations and the effects that their civil society has on them. Civil societies are gaining greater importance and control. This paper seeks to make sense of the impact of nonprofit, nongovernmental organizations on globalization. It has been argued that globalization processes have contributed to the rising numbers and influence of NGOs in many countries, and of course NGOs also made a great deal in converging the global trends. International NGOs and NGO alliances are emerging as increasingly influential players in international decision-making, so here some of the roles they can be expected to play are discussed with a brief look at their relations with governments and other national and international actors more from cultural point of view rather than economical.

### Introduction

The term "Globalization" which is appeared from about two decades ago now has been increasingly under discussion among the scholars in different fields of science. Its vast concept includes cultural and sociocultural studies, international trade and even FDI (foreign direct investment). Globalization, in fact, is a historical trend that came to existence since the down of Communication. Communication is the basic element for globalization and through which ideas can be shared and converged to each other and makes our world more homogenous. It is an invertible stream; you may reduce its pace but no one can fully terminate it as long as people are alive and have access to each other's way of living, thoughts and works.

We can define globalization as "a simultaneous and converging trend of different nations and societies through communication towards a certain situation that is constructed and shaped by all of them"; of course this is only one of the interpretations which can be considered for its concept. When it comes to economy, in the long run, that is the best hope for the developing countries in their quest for reduction of their distressing poverty. Though the short-run effects are undoubtedly more questionable, the experience of the affluent countries indicates that with the passage of time productivity growth does not merely trickle down. It is not only the developing countries that stand to gain. The booming economies can benefit from cheaper imports, which raise real incomes and can, in particular, benefit the remaining impoverished inhabitants of those nations. Thus, in the long run globalization may well offer benefits for all; particularly it will prevent unemployment, make those stagnant economies move and flourishes tourism industry namely in developing countries.

So globalization, as a process, is by now a historical fact which enriches the interactions of people in many different countries. Indubitably, every biased government or organizations that want to sticks to its own criteria can be considered as an obstacle for this trend. But the point is that globalization is not an intention phenomenon, in need of other's attention. It actually is like growing of a child among his school friends. Whether you like it or not, he will acquire some of his peers behavior and of course if he has something to say, the others will also take it. Now you may ask: If the parents persist to keep him away form his friends and control him in an isolated place what will happen? For sure, it does not go very far because life is bound to change and grow. Parents in the picture illustrated above are governments, the kid resembles NGOs and supranational organization and growing happen through increasing in the number of active NGOs.

NGOs and other third parties and private sector companies, free from usual restrictions and inefficiency which normally exists in the state-run organizations and with the power of their self-confident and self-motivated

peoples who run it, can act as a facilitator and make that communication between the different nations and societies much faster. They are more people-friendly institution and actually they themselves, are people.

Globalization has many facets and countries do not either accept or reject it in totality. There is considerable flexibility in embracing some aspects more fully than others or not embracing some aspects at all. But it is usually discussed in the field of economy or culture; these are also some of the main proven outcomes of this phenomenon:

- A link between different ideas that helps innovation, technology transfer.
- Giving a better understanding of different peoples from others.
- Facilitating flowing of technology and its application.
- Thriving the economy (if the essential potentials exist)
- Maintaining peace and preventing conflict between nations because of homogeneity that is replaced instead of heterogeneity.

## **NGOs and Civil Society**

According to Organizational Development theories a nation falls into of three main sectors, these sectors are the Government or public or state sector, the Business or Private or market sector, and the Voluntary or Civil society sector. These sectors are differentiated from each other though they are inter-related. The purpose of the government is usually to protect, regulate the lives of citizens and approve policies and laws. The main purpose of the business sector is to create and accumulate wealth, while f the Voluntary sector is to pursue individual and group interests or tackle problems or advocate for a certain cause. The motivation behind the actions of each of the sectors is also different. The Government is motivated by the need to govern; that is to see that things are running smoothly and there is respect of rule and law. The business sector is motivated by profit, and the voluntary sector is supposed to be motivated by the improvement of the quality of life among the people, personal and group values. There are some overlaps in these sectors since it is necessary for any organization to have some rules and regulations to guide its activities and it is also true that all the three deal with the same citizen although from different angles.

There are diverse definitions of the Civil Society. Sometimes the word is used to mean just Nongovernmental Organizations NGOs<sup>1</sup> while many times the word includes all Non State Actors such as Non governmental organizations (NGOs), Faith Based Organizations (FBOs) Trade Unions, Political Parties, and even Sports Clubs. Usually the Civil society mission is striving to achieve ideal situation where:

- Good governance is prevailing and the state is well managed.
- There is a fair competitive market economy driven by the consumer choice internationally, nationally and locally.
- The Civil Society is vibrant and strong in policy advocacy and can hold the state and the business sectors accountable to the citizens.
- Social Justice (Justice equality) and equity is guiding all service delivery and programs including the allocation of resources

Although NGOs themselves are part of civil society, these situations need NGOs efforts as well, so in most of the cases we see NGOs as an actor in both two sides (determinant and influenced). It is because of their natures that makes them act officially and organized along with the government while basically they are people oriented and have easy and flowing procedure among their own members.

The membership of civil society is quite diverse, ranging from individuals to religious and academic institutions to issue-focused groups such as not-for-profit or non-governmental organizations. In the realm of environmental governance, NGOs are the most prominent actors. NGOs involved in environmental governance are highly diverse, including local, national, regional, and international groups with various missions dedicated to environmental protection, sustainable development, poverty alleviation, and other issues. The diversity of civil society and its value to official intergovernmental processes on the environment are acknowledged in Agenda 21, the comprehensive sustainable development blueprint adopted at the 1992 Rio Earth Summit. The document does

not make use of the term civil society, although it expressly recognizes the members of civil society as a major constituency.

Historically, the UN has cooperated with NGOs primarily as partners in the implementation of certain programs, particularly in the areas of emergency response, human rights, and election monitoring in suspicion areas. Accordingly civil society has much more to offer to intergovernmental processes. Indeed, the very legitimacy of international decision making may depend on NGOs as a way to ensure connectedness to the publics around the world and substitute for true popular sovereignty, which international bodies, devoid of elected officials, lack. A number of UN projects and programs are already benefiting from the contributions of NGOs in areas as varied as information collection and dissemination, policy implementation, monitoring and assessment, norm-setting, and policy development. A revitalized global environmental governance system must facilitate both an expansion of these roles for NGOs and the development of better-defined processes of participation.

A number of difficulties still remain. Civil society participation requires a significant commitment of time as well as substantial financial resources from governments and intergovernmental bodies. Diversity within the global civil society community precludes the reaching of a consensus position that could be easily channeled into intergovernmental negotiations. It is imperative that NGOs explore innovative forms of networking through regional coalitions, for example, to help ensure the inclusion of a multitude of voices from developing countries and to make civil society involvement in governance more effective.

## National Functions of NGOs

The small size and limited financial resources of most NGOs make them unlikely challengers of economic and political systems sustained by the prevailing interests of big government and big business. Yet the environment, peace, human rights, consumer rights and women's movements provide convincing examples of the power of voluntary action to change society. This seemingly paradoxical entity can be explained by the fact that the power of voluntary action arises not from the size and resources of individual voluntary organizations, but from the ability of the voluntary sector to coalesce the actions of hundreds, thousands, or even millions of citizens through vast and constantly evolving networks that commonly lack identifiable structures, embrace many chaotic and conflicting tendencies, and yet act as if in concert to create new political and institutional realities. These networks are able to encircle, infiltrate, and even co-opt the resources of opposing bureaucracies. They reach across sectors to intellectuals, press, community organizations. Once organized, they can, through electronic communications, rapidly mobilize significant political forces on a global scale.

The academic literature has addressed NGOs as the citizen sector, NGOs as agents of accountability, NGOs as the magic development bullet and the expanding role of NGOs in global governance. Especially in developing countries, since people except from their traditional get-togethers usually among their tribes, regions or families do not have much of organized and structured group work experiences; it needs long run and powerful efforts to make the society move toward NGOs or organized team work. Lack of cultural and social infrastructure, and the absence or weakness of *sense of asking* about their natural and legal right from those who are responsible also adds to the difficulties.

To overcome these problems one of the possible solutions is to preparing a proper base for establishing NGOs. To do so we should first, link the upstream and downstream versions of laws and regulations affected by rulings of NGOs and supranational organizations, regardless of country of origin; and second, link the various entities involved in bringing about these legislative and regulatory changes in order to clarify their roles and relationships; Which it needs a global supporting to the nation's decision.

After establishing essential bases like legal and official permission and room for work, the job of entrepreneurs start. Beginning is usually in the areas which are more in trouble, felt and recognized by the people, like economical and developmental issues in their region, women's right or problems dealing with children. In general "Maslow hierarchy of needs" can be seen in them. In a state which has a lot of potentials for development like plenty of oil, land and labor; it is predictable to try to reach the minimum level of life standards in economical terms first, and then go for cultural matters or youth affairs. As an instance in Table 1<sup>2</sup>, in a developing country like

Iran, we see a comparison between NGOs according to their subject of study Ilam a poor province with very cheap labor force and totally 110 NGOs; While Tehran is a huge city about ten times bigger in terms of population, much richer and very much globalized in terms of economy and culture and totally 326 NGOs.

**Table 1**

<i>Field</i>	<i>Tehran</i>	<i>Ilam</i>
<b>Research</b>	<b>% 5.33</b>	<b>%0.92</b>
<b>Advanced &amp; Syndicatory</b>	<b>% 2.19</b>	<b>% 0</b>
<b>Advanced &amp; Scientific</b>	<b>% 16.61</b>	<b>%42.20</b>
<b>General</b>	<b>% 6.27</b>	<b>% 0</b>
<b>Youth</b>	<b>% 7.21</b>	<b>% 0</b>
<b>Donators</b>	<b>% 18.18</b>	<b>%11.93</b>
<b>Environmental</b>	<b>% 4.08</b>	<b>%15.60</b>
<b>Sociocultural</b>	<b>% 28.84</b>	<b>%14.68</b>
<b>Culture &amp; Art</b>	<b>% 11.29</b>	<b>%14.68</b>
<b>Total No of NGOs</b>	<b>326</b>	<b>110</b>

As you may notice, population and the number of NGOs do not match in these two mentioned cities. The reason is lied on the philosophy of NGOs, they are voice of people; where they can not get what they believe to have, they try to make themselves more powerful and cover the weaknesses in order to obtain them in an organize way. While Tehran has a lot of potentials in terms of national funds, private and governmental factories and other points of reliance the Tehrani residences do not go for establishing NGO at least they prefer to be member rather than runner, but people of Ilam are already more in trouble and have much lesser access to the resources and governmental funds, try putting more time for NGOs.

From the political consideration, NGOs are mostly under the supervision of the ministry of interior in each country. The role of NGOs in one nation in its nest scope is like supranational cooperations in global business world; they do their best within the existing rules and restrictions to get the maximum benefit for their stockholders and their homeland. NGOs also, at their best level act beyond the borders of provinces and states, they facilitate the flow of information for wishful scholars, gather charities where governments are not involved and give chance to ordinary people to have access to some of their needs. Less official and bureaucratic procedure, people-friendly atmosphere and closer relations with people and in some cases more reliable sources of information make the NGOs more functional than governments in many fields.

The main task of NGOs in a country is unifying the people for what they want and what they deserve for. The bigger the domain of their work, the more chance they have to reach their target. So if an NGO works internationally besides having lots of members inside of the country that makes it more powerful and effective, and enjoys the support of its domestic members it will be more power full and effective in transferring newly offered ideas.

Although in this era where you live can not be counted as the level that you can access to the information or influence others, still in developing countries the idea of being superior is quite common and deeply internalized among the people in the capitals because since the appearing of the civil societies capital men have been potentially problem solvers for other cities. Naturally they see far distance between themselves and the strictly structured, organized and always victorious outsiders. That sense of confidence is not something teachable at schools. Instead, it should be practiced, and internalized in each of their child perse through a serious and self-run plan, community or organization. This is how NGOs give their directors and members the great sense of self-believing and make them unified.

#### **What People Expect from NGOs?**

The Organization for Defending Victims of Violence (ODVV) is one of the most successful NGOs in Tehran, Iran. We saw it worthy to mention some information about it as a sample for an effective NGO; they have started their mission since 1988 and now they hold “Special Consultative Status to the ECOSOC” and are very active in the field

of human rights and humanitarian activities. The Organization is an associate NGO to the United Nations Department of Public Information (UNDPI), and cooperates, in various issues with the local and international NGOs. During the last eleven years, we have been, mainly informative in regards with human rights violations, and supportive in regards with the victims of violence. Like any other NGO they met a lot of difficulties but the need that is felt by the people can give enough intensity to keep going.

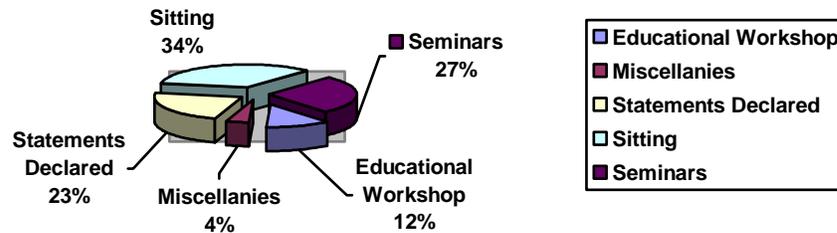

FIG. 1

Their objectives are "limiting and eliminating all kinds of violence", "promoting a nonviolent culture", and "defending and supporting the victims of violence"; But the Organization also pays attention to the research fields and conducts different project about the human rights, culture, civilizations, roots of violence, etc. They also publishes a monthly bulletin in Persian and English entitled Defenders' Newsletter which, in general, gives valuable information on the situation of human rights in Iran and the whole region<sup>3</sup>.

### Globalization, NGOs and Governments

Neither central nor local government has the financial capacity to provide the same level of public service provision as in the past [4]. This only can be achieved by rethinking the role of the state and its link to the market and institutions of civil society. Governments need to do more than raise more revenue, although this clearly would help. First, they need to re-think substantially their role in public service provision, eliminating the remaining subsidies and distortions left over from the centrally planned system. Government at all levels needs to complete the transition from being the sole provider of services to being a regulator and coordinator: 'steering' rather than 'rowing' the boat as the World Bank says. They should provide those services as the last resort in the cases for which there is no market or markets fail such as the life situation in shanty-towns or in the time of economical crises. Incentives are needed to encourage local governments to pay greater attention to social development. Local finances should be concentrated at the county level to allow better investment decisions to be made and redistributive mechanisms to be developed. Transparency of local government work should be increased further and the role of democratic, competitive elections should be expanded beyond the village level. This will allow better monitoring of local government performance and combat the diversion of resources that can be used for the public good. Reforms of government functions should be accompanied by an enhanced role for the market in areas such as housing and pension management and an expansion of the not-for-profit sector as service providers.

Beside them all, there has been always a fundamental tension between governmental departments and nongovernmental organizations. Governments prefer sovereignty (or at least operating control) over critical infrastructure, especially in visible and/or "strategic" industries [3]. This tension practically, is inevitable in any governmental department but particularly is by far more seen in the services. The main reasons are discussed in following.

Any governmental service is more like a community or a family which are defined by the bonds that hold its members together. Services become tradition - bounded and these traditions, along with the bonds of loyalty, can result in stagnation. As a result, almost any governmental department, agency or service acts as an agent for stability

and continuity with a tendency to block or at least slow down the changes. Organizations of this type are, by nature, inert. But Government is Government. Governments are alike all over the world. We can try to change the nature of government, but what will happen to the other things we need to do while we are trying. It may be more useful to try and change some of the distressing elements in society and environment that government itself wants to change, but -- with all its power -- cannot. According to Peter Drucker, however, the non-profit (or voluntary) organization exists to bring about a change - in individuals and in society.

In that illustrated situation NGO is a catalytic. It is a destabilizer. Its members normally consider it their duty to bring about change (sometimes even when it is not necessary or justified!). Naturally there will be tension between government organizations and non-governmental organizations. Bureaucracy by nature does battle with innovation. The stronger and more centralized a Bureaucracy, the more it seems to inhibit the change. Change, or innovation, is good however. Change is stimulating and creates a climate of creativity, excitement and enthusiasm. In forestry, for example there was very little change for quite some decades – activity revolved around plantation and exploitation. NGO movements perhaps helped to catalyze the progress towards involving people in forestry and also in giving protection to forests as habitats for a diversity of plants and animals. In my own office, I am afflicted with ‘occupational blindness’ - I can't see the dust under my own desk or understand that my employees are suffering. Someone from another office can see -- because he is objective and uninvolved. If he is sufficiently caring and courageous to point these things out to me, and if I have the desire or at least the willingness, to improve, improvement in my office can take place.

## **International Functions of NGOs**

The globalism process is going to transform the nature of communications in the traditional societies. While in most of the developing countries they have their own kind of media like: Friday Prayer, mosques and Husseiniehs<sup>4</sup> can all play a key role in resisting forceful global media. The new substructure of the communications on the minds of the countries of the north such as the United States and Western Europe has not taken into consideration the special characteristics of the countries of the south. These countries have become hopeless and disheartened by not being allowed to play in the global mass media games. It forces their NGOs to go for a solution and they find the easiest and the best one as compensation their short comings as much as possible and take highest possible advantage from what they have in terms of knowledge and facilities. They try to make connection with the resources in the society like some well known companies or international organizations and above all, to each other. Having a firm correlation between NGOs can assure their progressive trend and will make them updated and stronger against any common threats. Building a "NGOs network" is the best choice for this case. NGOs in developing countries may face some difficulties but the real problem is when an NGO does not believe in its power and important role. This is a very common problem in all 3<sup>rd</sup> world nations; therefore sitting between older and more funded NGOs with smaller and less formed ones. This is the way to a global NGO society in a nation.

In international view NGOs are a kind of moderators. From political point of view, we have the capital city of any country and other cites are more or less just followers. It is usually happens that every one quite traditionally are focused on some major cities and ignorant of some other rapidly growing areas. Where we think that for example the idea of 5 cites in our country are determining for national decision making, the actual reality is showing few growing areas of effectiveness in different regions. In economy it is more tangible; when we study of an international currency flow among different countries we find that it is not bounded to main governmental contracts. Informed observers estimate the global volume of foreign exchange transactions at \$US 1,300,000,000,000 or \$1.3 trillion each day [5]. The reserves of no government, not even the USA, can support an effective intervention in these transactions: at most, they allow any state to divert part of the flow of funds in a slightly different direction, and so can delay—but not prevent—exchange rate adjustments forced on the market by the realities of the economic situation. Correspondingly, a map of the locations where currency and exchange transactions occur yields a network that only partly fits the standard political map of nation states. Its nodes are located less in Washington DC and Bonn, than in New York, London, Frankfurt, Singapore or Tokyo; while an increasing fraction of the transactions takes place electronically, by communication channels that evade attempts by governments (even the People's

Republic of China) to monitor or block them. So, there is tension between actual business dealings and the wishes of governments for financial control, the same as what has been told for politics.

Even more ambitious, though, are the small number (to date) of NGO initiatives that are designed to drive the mutation of existing business models towards more sustainable variants, reshaping markets in the process. Examples here would be Greenpeace on renewable energy, the *Rocky Mountain Institute* (RMI) on the hyper car and the *Foundation on Economic Trends* on the hydrogen economy. The work of academics and consultants like C.K. Prahalad and Stuart Hart on 'bottom of the pyramid' strategies, or B24B (i.e. business-to-the-world's-4-billion poorest people, designed to meet their needs in innovative but still commercial ways), indicates fertile territory for future NGO initiatives.

#### **NGOs and Globalization in International Level**

Globalization forces at the national level can reduce state controls over the economy, increase pressure for democratic accountability, or raise questions about state sovereignty. These developments can create political space for civil society organizations as alternative sources of services once provided by the state, as watchdogs over and advocates for government policy formulation and implementation, as policy entrepreneurs or implementers with state partners, and as social innovators to guide improved services. When globalization expands political space, civil society actors may emerge to respond to the concerns of impoverished and marginalized groups that would remain voiceless under prior regimes.

It is not immediately obvious that political, cultural and economic facets of globalization will necessarily co-vary or reinforce one another. Globalization will not simultaneously highlight the importance of core cultural values, or open more political space for civil society initiatives, or create economic consequences that exacerbate poverty. Governments may open doors to international markets while trying to control the political implications of globalization, or vice versa. They may close their boundaries to cultural impacts as well. In general, however, the more open the country is to globalization, the more we would expect civil society organizations to become important actors in the country's development. This is a function of three factors[1]: (1) globalization has impacts on consciousness—both liberating and counter-revolutionary—that are likely to be expressed via civil society organizations; (2) globalization is likely to place enhanced emphasis on the political ideologies of individualism, freedom, and equal rights for which NGOs are both a product and an exemplar; and (3) globalization invites in international actors (INGOs, international agencies) that actively promote and strengthen the emergence of national civil societies.

#### **Channels for NGOs Participation in International Organizations:[2]**

1. NGO representatives can be included on a national delegation to an international conference to advise delegates from their government (Cairo Population Conference in 1994);
2. Representatives from a NGO can be included on a national delegation to an international conference to represent the NGO and conduct negotiations (International Labor Organization);
3. NGOs can send delegates to semi-public international conferences (IUCN has a membership that includes 699 NGOs as well as states and government agencies);
4. An international organization can set up an advisory group that includes experts from NGOs, who do not represent the NGO (UN Advisory Board on Disarmament Matters);
5. An international organization can give NGOs an opportunity to participate in ongoing policy development (Convention on International Trade in Endangered Species);
6. An international organization can enlist NGOs to help in implementing programs (UN High Commissioner for Refugees);
7. An international organization can give NGOs an opportunity to participate (not necessarily in a negotiating role) in an official conference to draft a treaty (ECOSOC);
8. An international organization can give NGOs an opportunity to participate in preparatory committees for an international conference (Rio Earth Summit in 1992, Johannesburg Summit on Sustainable Development in 2002);
9. An international organization can hold a special session to give NGOs an opportunity to make presentations (General Assembly on sub-Saharan Africa in 1986);
10. An international organization can include NGOs as members (International Commission for Scientific Exploration of the Mediterranean Sea).

## Conclusion

We have argued that civil society organizations are increasingly important actors in international arenas as well as in many nations. Their emergence in the last few decades is associated with and in part caused by the forces of globalization, which have contributed to the personal, economic, political and social dynamics that give rise to stronger civil societies. The rise of civil society organizations has been uneven across countries, though openness to globalization seems in general to be associated with growing strength and diversity of NGOs and other civil society organizations. The growth of international NGOs and NGO alliances has also been shaped by globalization, with impacts particularly visible for provides of services and disaster relief, policy analysis and advocacy, and social learning and problem-solving. At the international level NGOs and NGO alliances have identifies emerging problems, articulated new values and norms, created or reformed institutional arrangements, fostered innovations in international practice, and helped resolving conflicts and managing differences. These contributions to international governance in turn highlight problems of democratic and institutional accountability of international NGOs and NGO alliances, and the possibilities of multisectoral cooperations to solve complex problems of international governance.

A fundamentally important component of “civil society” is the local community. With the emergence of “global civil society” as a burgeoning idea, linked to more and more evidence of “global civic culture”, globalization is not just a description of world business or a tangle of political institutions. Globalization is a fact of life. And Nongovernmental organizations are already becoming more professional in their research and more effective in their advocacy—partly by recruiting bright young men and women who have been trained in universities and major “think tanks” to think about complex problems—and complicated power structures. The representation in international processes of nongovernmental organizations (NGOs) should be balanced between “North” and “South”. That means NGOs in developing countries should get more support to enable them to participate in international intergovernmental meetings.

Inclosing, NGOs convey globalization into societies so smoothly and peacefully that no other institution and no other method can do that because of up-ward spreading trend into a nation. It starts from the ordinary people in a society and grow with them to top levels of consideration of the authorities. They put their direct impact on their members. It is like spreading seeds on the members land. Since the land is prepared, the seeds will grow on double. This gradual changing happens through inter-personal or voluntary activities and will have permanent and functional effect. NGOs instinctively have this ability to simply do things that government must try very hard to achieve them.

# Asian Clearing Union: A Perspective on its Reach, Relevance and Future in an Age of Multilateral Regional Cooperation

*Sivakumar Venkataramany  
Ashland University, USA*

## Abstract

Globalization has advanced the efforts of multilateral regional cooperation among countries in transition and also industrialized economies. Regional currency arrangements, payment unions and clearing unions are some of the strategies through which monetary cooperation may be achieved. This paper explores the reasons for the growth, longevity and success of the Asian Clearing Union while similar efforts in other regions have encountered problems threatening their continuance.

## Introduction

Emerging economies are engaged in group efforts to cope up with the wave of globalization. Many developed and developing economies are collectively adopting several steps of efforts of monetary integration. Economies in transition have understood the need for unifying some of their strengths through a sustained sequence of steps of liberalization, which involve economic and financial reform, privatization of the state owned enterprises and deregulation of their markets. Numerous instances of currency crises in the last twenty-five years, particularly the Asian Financial Crisis of 1997, have provoked central banks, international financial institutions and researchers pursue an interest in pegged and floating exchange rate regimes and regional coordination in monetary policy.

Following the crises in East Asia, Russia and Brazil, international financial system experienced issues related to transparency, governance, loss of asset values and steep devaluations. Increased participation of the private sector has been recognized as the utmost need for building stable financial architecture [Arista 2000]. Relaxation of exchange regulations as a part of liberalization efforts requires thorough financial supervision and control [Lii 2001]. The successful launching of the Euro as a common currency for the twelve nations and possible expansion of the currency into the newly admitted member nations of the European Union have raised the motivations for common currencies in other groups of countries. Certain other countries have also shown their willingness to replace their sovereign currencies with that of a foreign country. *Dollarization* has not provided the panacea that Ecuador envisioned primarily because of its lack of a stable banking system.

Problems emanating from exchange rate volatility brought countries to numerous multilateral arrangements including payments and clearing unions. Payment unions provide for credits and convertibility of currencies while clearing unions do not [Eichengreen 1993]. Currency convertibility is indeed an important condition for sustaining asset prices [Polak 1991]. All problems pertaining to cross border payments may altogether be resolved through the formation of an international clearing union. This concept has been debated by numerous economists along with the advantages and limitations of flexible versus fixed exchange rates [Gnos and Rochon 2004]. As risk management has attained better sophistication with the advent of technology, real time gross settlement (RTGS) systems are being implemented in many countries but in stages [Collins 2004].

This paper examines the success of the Asian Clearing Union that has survived a thirty-year period while similar arrangements worldwide have fallen short in numerous ways. The member nations of the Asian Clearing Union have recognized their divergence in culture, political stability, size, growth, education, infrastructure and technology and therefore have shown adequate restraint in their efforts of integration.

## **Lessons from Recent Currency Crises**

International diversification of financial assets is necessary to overcome exchange rate volatility [Fooladi and Rumsey 2002] and at the same time, banking systems have to be built on strong foundations of regulation to ensure supervision, examination and control [Mujica and Rocha 2003]. Asian financial crisis emphasized the need for financial cooperation and building sound financial institutions in many developing economies and particularly East Asia. Strategies involving regional financial cooperation ensure strong international financial architecture but do not necessarily lead to a monetary union [Kohsaka 2004]. Currency crises in Latin America prompted by large fiscal deficits in the last two decades unlike in the case of East Asian countries have laid the foundations for heavy private sector involvement [Takatoshi 2004]. Regional monetary integration helps synchronization of business cycles in the region and convergence of economic structures [Kim, Ryou and Takagi 2005]. The perils of non-performing assets in Japanese banking system may not lead to *yenization* by countries in Asia. The large fiscal deficit in the United States may result in a huge sell-off dollar denominated securities leading to fall in asset prices and subsequent rise in interest rates [Eatwell and Taylor 1999]. Increased national savings and export competitiveness are being suggested to improve current fiscal deficit in the United States.

## **The European Payments Union**

Multilateral trade and payment arrangements in the post war Europe helped creation of the European Payments Union (EPU) [Rees 1963]. Problems of distribution and enforcement were addressed by centralized and flexible institutional designs [Oatley 2001]. Increased exports and high investment contributed to Europe's economic growth [Eichengreen 1993 and 1994]. Later, this also led to the formation of European Economic Community. Nearly fifty years after the war, twelve countries in Europe have achieved something unprecedented in history through establishing a common currency the euro [Szegö 2003]. The EPU model is recommended suitable for the Commonwealth of Independent States by adopting the euro as the clearing currency [Shagaloy, Kivikari & Brunat 2001]. To warrant a payments or a clearing union, these countries in the former USSR will have to achieve macroeconomic stability [Eichengreen 1993 and 1996].

## **The Euro**

The success of the euro was pronounced when it replaced the US dollar as the preferred reserve currency in September 2003. There are several reasons for its broad acceptance. First, countries in the European Union have entrusted monetary policy to the European Central bank but their respective central banks continue to maintain all other obligations, particularly, domestic credit. Secondly, the euro has shown proper evaluation of credit risk in the borrowers and euro-denominated securities reflect risks pertaining to industrial sectors independent of individual country risks [Galati & Tsatsaronis 2003]. The United Kingdom and Sweden are members of the European Union but still maintain a 'wait and see' attitude with regards to adopting the euro [Miles 2004]. Among other member countries, the Danish krone, the Estonian kroon, the Lithuanian litas and the Slovenian tolar are linked to the euro, but the exchange rate is not fixed. Ten countries, namely, the Czech Republic, Estonia, Cyprus, Latvia, Lithuania, Hungary, Malta, Poland, Slovakia and Slovenia have joined the European Union in 2004 and will seek formal adoption of the currency in the near future, provided they achieve stable exchange rates, converged long term interest rates, price stability and sound fiscal conditions.

## **Regional Currency Arrangements**

Countries in Asia have been initially slow in coordinating their efforts in formulations of monetary and fiscal policies [Ronall 1971] but the Asian Development Bank has provided them the necessary framework for enhanced regional cooperation. Recently, the ASEAN nations (Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, the

Philippines, Singapore, Thailand, and Vietnam) along with China, Japan and Korea have adopted a system of swap arrangements [Goad 2000]. These countries seem to have laid the necessary foundations for a common currency but they have not even started steps towards intensive monetary policy coordination. Therefore, the researchers' suggestions for higher levels of integration are not immediately likely. In addition to economic cooperation, developing countries require strong political will and an administrative commitment to remove exchange rate volatility through careful intervention [Hutchinson 2003].

Some forms of integration, much less sophisticated than monetary unions, mostly within regional and sub-regional organizations have led to consistent application of legislation related to banking operations, financial policies and procedures, and mutual consultation on monetary issues among certain African countries as in the cases of the Economic Community of West African States (ECOWAS). ECOWAS was created in 1975 among fifteen nations for trade promotion and economic integration. Mercosur (Mercado Común del Sur) is another similar cooperative effort in Latin America to reach convergence of exchange regimes but the member countries always resorted to settling payments in US dollars in the past. Bilateral payments are nowadays settled in each period thereby resulting in considerable cost reduction by eliminating commissions and transaction charges. The Latin American Integration Agreement (LAIA; in Spanish ALADI) seeks economic cooperation among its eleven members, namely, Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Mexico, Paraguay, Peru, Uruguay, and Venezuela. Established in 1980, LAIA promotes regional tariff preferences but with little success of a common market.

## **Clearing Unions**

Among the numerous forms of trade promotion, establishment of clearing unions was the most prominent. Seven such clearing unions were established among developing countries to promote regional monetary integration. Three of them were in Africa (West African Clearing House, Clearing House of the Economic Community of Central African States and Preferential Trade Area of Eastern and Southern Africa Clearing House - PTACH), and three were in Latin America (Central American Clearing House - CACH, LAIA Payments and Reciprocal Credit System and Caribbean Multilateral Clearing Facility - CMCF) one in Asia (Asian Clearing Union). The PTA Clearing House introduced travelers' checks in PTA monetary units in 1988 with plans to cover all payment transactions in PTA monetary unit but the proposals did not materialize. Trade promotion through tariff preferences and establishment of PTA Clearing House in 1984 was conceived but only with very little accomplishments [Jenkins 2001] as intra-regional trade was as low as four percent of the total trade. The operations of the CMCF had to be abandoned in 1983 due to defaults on payments and unsettled balances. The CACH abandoned in 1984 was resuscitated in 1990 as the Central American Payments System to settle intraregional debts but due to liberalization of exchange rate regimes, the operations have dwindled within the system.

## **Asian Clearing Union**

Asian Clearing union (ACU) was established in 1974 and began its operations in November 1975 with six member countries (Bangladesh, India, Iran, Nepal, Pakistan and Sri Lanka). Myanmar subsequently joined the ACU in 1977 and Bhutan much later in 1999. The objectives of the ACU are multilateral settlement of current account payments, conservation of foreign exchange, promotion of monetary cooperation among central banks, increasing relationships among the banking systems of member countries and providing currency swaps arrangements. At present, the headquarters of ACU is in Teheran, Iran.

ACU was formed at a time when countries in the Indian subcontinent were facing acute shortage of foreign exchange and were therefore compelled to adhere to stringent exchange controls. The union provided member countries multiple advantages including short term credit during the billing cycle, reduction of transaction charges and above all economizing the use of their foreign exchange. Lower transaction costs benefited traders and banks as well. In the process of participation in the union, governments, monetary authorities and central banks have achieved

purposeful working relationships. Table 1 gives us a snapshot of the economies of member countries in the ACU. India has outperformed all other members in each measure and thus has emerged as the leader of the group.

Table 2 presents the total foreign direct investment stock in ACU member countries. We are able to assess the potential of these countries to engage in increased international trade, enhance competitiveness through competition in their markets and join the wave of worldwide liberalization efforts.

TABLE 2 FOREIGN DIRECT INVESTMENT STOCK (2003)

Country	FDI Stock	
	Inward	Outward
Bangladesh	2,695	62
Bhutan	4	0
India	30,827	5,054
Iran	2,925	6,804
Myanmar	4,376	0
Nepal	148	0
Pakistan	7,764	635
Sri Lanka	2,897	102

Source: UNCTAD, World Investment report, 2004

At the time of commencement of operations, the ACU adopted the Asian Monetary Unit (AMU) as its accounting unit. It was defined to be equal to one US dollar. With creditable success over two decades, the union switched its accounting unit to the US dollar in 1996. Traders in the union are now permitted not only to invoice their documents in US dollars and also to effect transactions in dollars. Commercial banks in member countries use their nostro accounts to facilitate receipts and payments. Central banks monitor the funding and absorption of excess liquidity from these accounts. This has provided a complete convertibility to the current accounts of member countries.

Financial market liberalization has resulted in relaxation of exchange control regulations and international

foreign exchange markets have benefited by advanced technology in communication through satellites. The switchover to the dollar thus has enabled member countries to apply rates in a real-time and enhance the operations of ACU mechanism.

## Evaluation of ACU's Performance

The primary reason for the success and longevity of ACU is the prompt payments of all balances by the member countries without delay or default. When payments are not disputed for their timeliness, any relationship is guaranteed to be long standing.

TABLE 3 SWAP FACILITY ENTITLEMENTS, 2001

Country	Swap Facility Entitlement (\$ millions)
Bangladesh	228.7
Bhutan	0
India	138.6
Iran	42.9
Myanmar	0
Nepal	2.5
Pakistan	42.1
Sri Lanka	133.8

Source: Asian Clearing Union, Annual Report 2001

Table 3 shows the entitlements available to member countries in 2001. Bangladesh availed \$150 million with \$135 million paid by India. Nepal, Pakistan and Sri Lanka provided \$15 million collectively. Pakistan also availed \$42.1 million from Bangladesh, India, Iran and Sri Lanka for \$4.6, \$16.0, \$16.4 and \$51 million respectively. The volume of intraregional trade stood at \$50 million in 1975 and has currently reached near \$7 billion. The size of intraregional trade is shown in Table 4.

TABLE 4 VOLUME OF INTRAREGIONAL TRADE IN ACU (2004) IN \$ MILLIONS

Country	Debits	Credits
Bangladesh	1,773	104
Bhutan	0.02	8
India	2,415	3,328
Iran	335	2,929
Myanmar	0.02	2
Nepal	11	5
Pakistan	650	216
Sri Lanka	1,495	87
Total	<b>6,679</b>	<b>6,679</b>

Source: Asian Clearing Union, December 2004 Monthly Report

The member countries have recorded an average growth of 4 percent in 2004. The ACU primarily now covers the Indian subcontinent and naturally. India has emerged as the leader of the group. India is the only country that has cherished and valued its principles of democracy. Even when the administrations change thanks to an effective and periodical electoral process, India has shown the political will to adopt modernity in risk management strategies in its banking institutions, recognize and provide for non-performing assets, and invoke carefully planned steps in financial liberalization, in proper sequence. In fulfilling its role as the leader in the group, India has rapidly improved its communication technology by implementing BANKNET (comparable to SWIFT) in inter-bank and intra-bank communications. Its bilateral trade with China currently exceeds \$14 billion. Other members are the beneficiaries of India's leadership in monetary integration and multilateral cooperation.

## Conclusion

Even with a common currency, the absence of exchange rate flexibility is likely to cause adjustment problems in the context of differential growth among countries [Beachill and Pugh 1998]. Also, presence of parallel economy undermines the benefits of a common currency [Schneider 2000]. Besides monetary cooperation, authorities in different countries need to adhere to harmonized standards to encounter black market for foreign currencies and issues of money laundering [Judith 2002].

Formation of several groups of trade promotion and economic cooperation has been very intensive in the last decade in Asia. So, the future of ACU may include expansion of its membership among other countries in Asia, particularly, in the Far East and also those countries in the ASEAN and APEC. India anticipates Maldives, Thailand, China, Malaysia, Tajikistan and Uzbekistan to join the ACU. The technical team of the ESCAP is presently providing assistance to the ACU in strengthening its future role and performance. The team has found administrative procedures hampering the progress of ACU. If the volume of trade among its members increases, other countries may perceive the potential benefits of membership in the ACU. In future, the ACU may also pave way for a central clearing house in the short term and adopt more currencies for mutual settlement in the long term.

# **The Digital Divide: The Complexity of the Inequality Dimension in a Global and Local Perspective**

*Flávio Nunes  
University of Minho, Portugal*

## **Abstract**

At the same time that information and communication technologies (ICTs) are gradually becoming a central infrastructure tying together our society, the spatial cleavage between Internet-haves and have-nots (those without access or unable to use it effectively) is becoming an unexpected source of inequality, promoting new dimensions of social and economic exclusion for many people and firms around the world. The present paper, aims to develop a deeper conceptual understanding of the disparity between information-rich and information-poor, based on the conviction that the spatial boundaries of this digital inequality are much more complex than simplistic distinctions between north/south, central/peripheral or urban/rural. Based on several statistics and cartographic analysis, we intend to demystify the bipolar societal split that supports the “digital divide” concept, showing that disparities and have-nots exist also in developed countries and even inside its most urbanized areas. Such conclusion needs a special meditation, especially in a new era where development without the Internet would be the equivalent of industrialization without electricity in the industrial era.

## **Introduction**

As the diffusion of ICTs has taken place and consequently its potential to foster economic growth and human development, the issue of the digital divide has emerged to represent the major threat to harness the opportunities offered by ICTs (Cuervo and Menéndez, 2004). However, it has been a little reducer to use the digital divide concept as a way to simply treat the causes and effects of the uneven geographical distribution between ‘Internet haves’ and ‘Internet have-nots’. Besides the availability of the infrastructure (the physical access to computers and connectivity) it should also be considered the skills required to use these technical resources (language, education or literacy), in other words the digital divide should be seen as a complex problem involving both technical access and social access (Kling, 1998).

In some recent works, digital divide is used as a concept that refers to the gap between those who can effectively benefit from ICTs and those who cannot. In this sense, Crampton (2003) defines the digital divide as the unequal access to knowledge in the information society. In his view, this term not only includes the access to technology, but also the competence to use these technological tools (particularly computers and Internet) as well as the ability for a meaningful use of the accessed information. This means that ICT does not exist as a single overriding factor for determining such a divide.

According to Warschauer (2003, p. 6) “a second problem with the digital divide concept is its implications of a bipolar societal split”. There is not a binary division between those who can and cannot benefit from ICTs but a rather gradation based on different degrees of access and use of information technology. For example, African Americans are often presented as being on the wrong side of the digital divide; despite the divisions between blacks and whites in Internet access decreases as income increases. As a consequence, nowadays it is more and more clear that this is a complex and multidimensional concept, involving not only a geographical dimension (the gap between countries, or the international digital divide) but it also refers to the gap between individuals, households and businesses, according to their different capacities to use the Internet for a wide variety of activities and for meaningful ends (the gap within countries, or the domestic digital divide).

Concerning the international digital divide, Borbora (2004) underline the results of some researches showing that countries with lower income and lower education attainment tend to show lower rates of ICT access and use. Regarding domestic digital divide there is a clear “risk of digital exclusion by women, the elder, those with lower income and education attainment, with disabilities, living in rural areas, belonging to race or ethnical

minorities” (Borbora, 2004, p.4). Like Crampton pointed out (2003, p. 144) “access to cyberspace is geographically very uneven, and that it varies widely between class, race, and income”.

Under this perspective it is too simplistic to analyse the geographical digital divide considering only real disparities that exist in access to and use of ICTs between countries, in our point of view the relationship between knowledge and space is uneven across multiple scales: globally, regionally and locally. If it is true that “all countries are increasing their access to and use of ICT, but ‘information have’ countries are increasing their access and use in an exponential rate that tell us that the divide between countries are growing” (Borbora, 2004, p.5), a deep analysis shows that nowadays the access to computers and the Internet is not equally available across cities even if they are located in developed countries; the quality of this access (being a widening or narrowing access) is not always equal and consequently the potentialities are not comparable; and inside the poorest countries we can find areas with high income presenting a better connectivity to the global information flows.

Within this context we believe that before the suitable actions for bridging those gaps can be decided, it is necessary to know more about the magnitude of the digital disparities, particularly of the main components that support and explain the complexity of the digital divide as a multidimensional phenomena. With this goal the conclusions of this study will be supported by empirical research, conducted in order to highlight significant variations at a global, macro-regional and urban levels, not only concerning the physical presence of computers and connectivity to the internet, but also the accessibility to other resources (as money or education) that allow people, private institutions and businesses to use ICTs for meaningful ends, for instance, stimulating local business environments by the attraction of global flows of investment, trade and resources.

The global distinctions will be possible by exploring the database provided by the International Telecommunication Union, in order to present update world maps showing the recent evolution provided by proactive initiatives, which have been developed in order to introduce and extend the use of the Internet in developing countries. At a macro-regional level we will explore the diffusion process of ICTs throughout Europe, as a good example to emphasize the attraction of the information networks by existing urban structures, supporting given centralities and enhancing traditional spatial disparities. However, this urban agglomeration tendency clearly masks significant variations that should be exposed, and that is what we will try to underline with an intra-urban investigation conducted within the city of Porto (located in the north of Portugal), with a special emphasis to the differential access to high-speed broadband service.

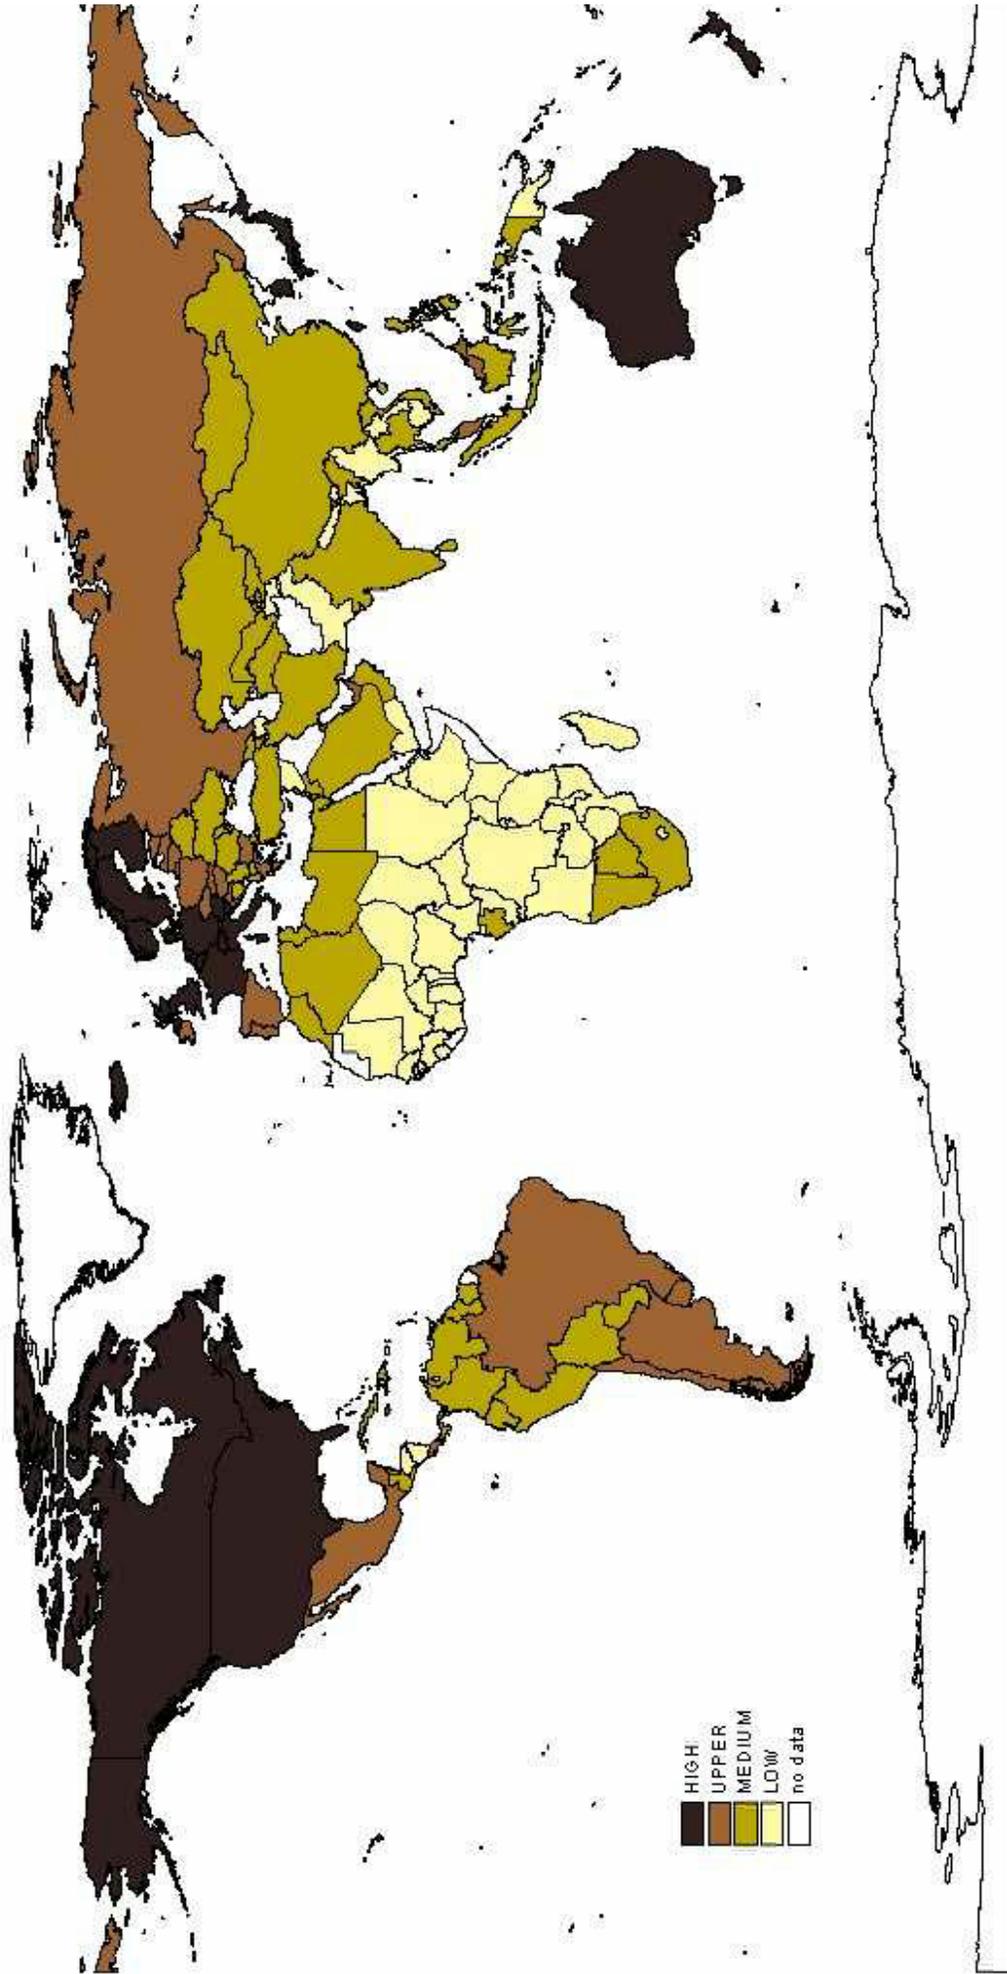

## **The Digital Divide at a Global Scale**

In order to analyse the positive impact of ICTs in terms of productivity and economic growth we can consider two different approaches. On the one hand, the direct impact for the development process of a country, involving IT related export of goods and services and their effect on employment and income (ICT-growth). On the other hand, the indirect impact resulting from the use of information technologies to increase efficiency and productivity of the domestic real sectors (ICT-diffusion).

In this section we will only analyse the ICT-diffusion as a tool for economic development and human welfare, concluding that its positive impact are mostly visible in developed countries while developing countries are yet to reap such benefits fully. Diffusion and use of the Internet is proceeding unevenly throughout the planet, and it is clear that IT induced growth is acting as a force that reinforce existing and pronounced social and economic imbalances that already exist between developed and developing countries.

In order to measure the digital divide as a multidimensional phenomena, a selection of indicators compiled into an index gives a better overview than any single indicator. Under this perspective there are several methodological approaches based on a broader spectrum of indicators than just Internet penetration rates. Among other composite indicators, Cuervo and Menéndez (2004) highlighted the Information Society Index by IDC/World Times; the New Economy Index by the Progressive Policy Institute; the Technology Achievement Index by UNDP; the Infostate Index by Orbicom, and the Networked Readiness Index by the World Economic Forum.

Figure 1. ITU Digital Access Index, 2003

Source: data collected from ITU (International Telecommunication Union), 2003

In this study we will focus exclusively on the Digital Access Index presented in 2003 by the International Telecommunication, and covering a total of 178 economies, in order to measure the overall ability of citizens to access and use ICTs (Figure 1 and 2). This index is based on eight variables<sup>1</sup>, covering five different areas (Table1), allowing countries to find their relative strengths and weaknesses by each considered dimensions of the digital divide.

TABLE 1: CATEGORIES AND INDICATORS MAKING UP THE DIGITAL ACCESS INDEX

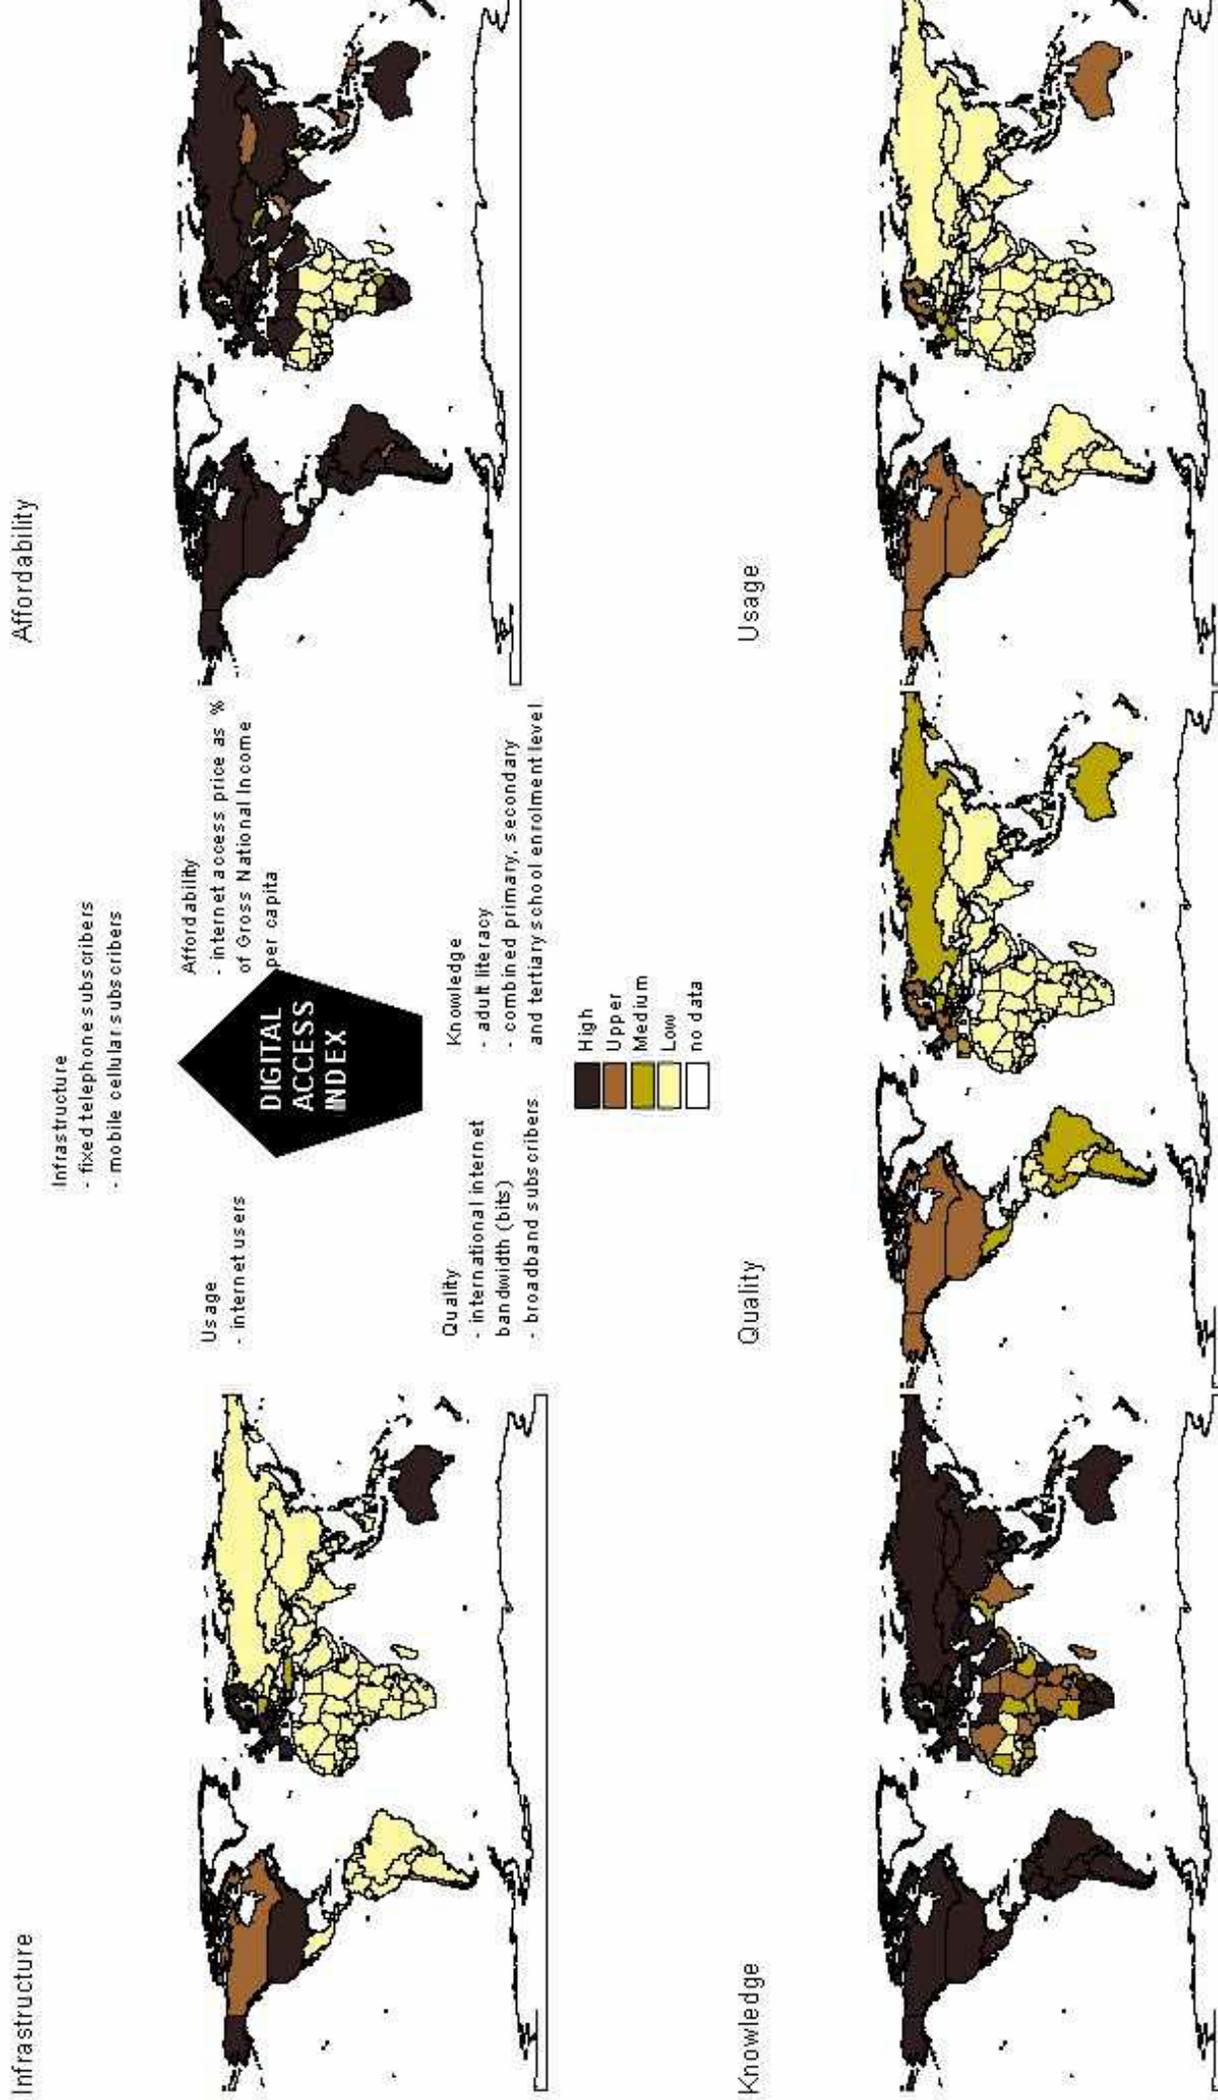

Availability of infrastructure - Fixed telephone subscribers - Mobile cellular subscribers	The infrastructure category contains variables related with the networks that provide the means for voice, text and data communications (including dial-up Internet access and broadband access by DSL technology). Both variables (fixed telephone subscribers and mobile cellular subscribers) are given equal weight in the infrastructure category.
Affordability of access - Internet access price as % of Gross National Income per capita	Affordability was defined as the price of Internet access as a percent of per capita income, assuming a usage factor of one hour per working day (20 hours per month: 10 peak hours and 10 off-peak hours). This is a relevant factor to determine the digital divide since the Internet must be affordable if it is to be used by the greatest number of people.
Educational level - Adult literacy - Combined primary, secondary and tertiary school enrolment level	Knowledge was defined as a factor to determine the digital divide as a result of its significant impact on the ability to use ICTs. The variables considered were adult literacy weighting two-thirds (% of people aged 15 and above who can, with understanding, both read and write a short, simple statement related to their everyday life) and school enrolment weighting one third (number of students in primary, secondary and tertiary school divided by the population of that school age).
Quality of ICT services - International Internet bandwidth (bits) per capita - Broadband subscribers	The quality factor is justified because with a slow speed of access, either people will not use ICTs, or they will not be able to use them effectively and creatively. It were considered two variables with equal weight in the category, on the one hand the amount of international Internet bandwidth per capita (measured in Mbits/s), on the other hand the number of broadband subscribers per 100 inhabitants.
Internet usage - Internet users	The number of Internet users is important to estimate the extent of a country's ICT utilization. This variable also incorporate aspects of access not easily captured by other categories, for instance the presence of Internet cafés or public locations with free access Internet, would be reflected in the number of users.

Based in ITU, 2003-c

The analysis of the economies included in the high access category reveal some surprises, namely the absence of United States in the top ten economies, or the presence of the Republic of Korea in the fourth position, which is not usual in international rankings but in this issue is not really a surprise as a consequence of the strong government commitment to ICTs. South Korea was the first nation to launch third-generation mobile, and it is the world leader in broadband penetration, with 21 broadband subscriptions per 100 inhabitants at year-end 2002 (ITU, 2003-d).

Apart from Canada, ranked 10<sup>th</sup>, the top ten economies are exclusively from northern Europe (Sweden, Denmark, Iceland, Norway, the Neetherlands and Finland) or from Asia (Republic of Korea, Hong Kong (China) and Taiwan (China). These results “suggest that English is no longer a decisive factor in quick technology adoption, especially as more content is made available in other languages” (ITU, 2003-b, p.6). Nowadays Chinese, Korean and Japanese make up 11% of Internet content, a higher figure than either French or Spanish.

Figure 2. Indicators making up the ITU Digital Access Index, 2003

All the economies in this higher category belong to the developed regions of Western Europe, North America, East Asia and the Pacific. The single exception is Slovenia, in the Central Europe, where in consequence of some government-sponsored initiatives the Internet growth has been rapid, as well as mobile phone subscribers, and where literacy and school enrolment levels are close to the averages of the European Union.

In the second level (upper-access) there are 40 economies, the most part from Central and Eastern Europe, the Caribbean, Gulf States and emerging Latin American nations. These countries are characterized by the imbalanced in a specific category from the five areas considered, particularly infrastructure, quality of access or usage. Many of these countries intend to graduate to a higher level of digital readiness with ambitious government projects or by following a market liberalisation strategy for the telecommunication sector.

The middle-access category is the most represented with 58 economies, especially from Latin American and South East Asian, including also some countries from North Africa and Middle East. These countries are weak in access to the information society, particularly in what concerns to a shortage of infrastructure. Despite this drawback some countries have developed strategies resulting on a high level of Internet access, is for instance the case of Peru based on the widespread availability of Internet cafés, or Egypt with an almost free Internet access by dial-up connection, or Tunisia that is trying to increase the number of Internet users by the expansion of a network of public access facilities.

In the lower category we find the poorest and least developed countries, facing several other deprivation besides the digital access. The main problems are related with low levels of communications infrastructures but above all high access prices. "In most of these nations, an hour a day of Internet access exceeds the average daily income. There is little hope of them joining the information society unless prices are dramatically reduced" (ITU, 2003-d, p. 17).

## **The Digital Divide in Europe**

In spite of being on the right side of the global digital divide, a deeper analysis shows that at the same time the changes driven by ICTs have swept across the world and through nations they have begun to reshape differently the economies. This is in part a result of their different ability to have access to and exploit new possibilities offered by ICTs, namely: increasing the locational choice of firms; promoting more flexible ways of working, or new solutions to problems of access to services (Milicevic and Gareis, 2003).

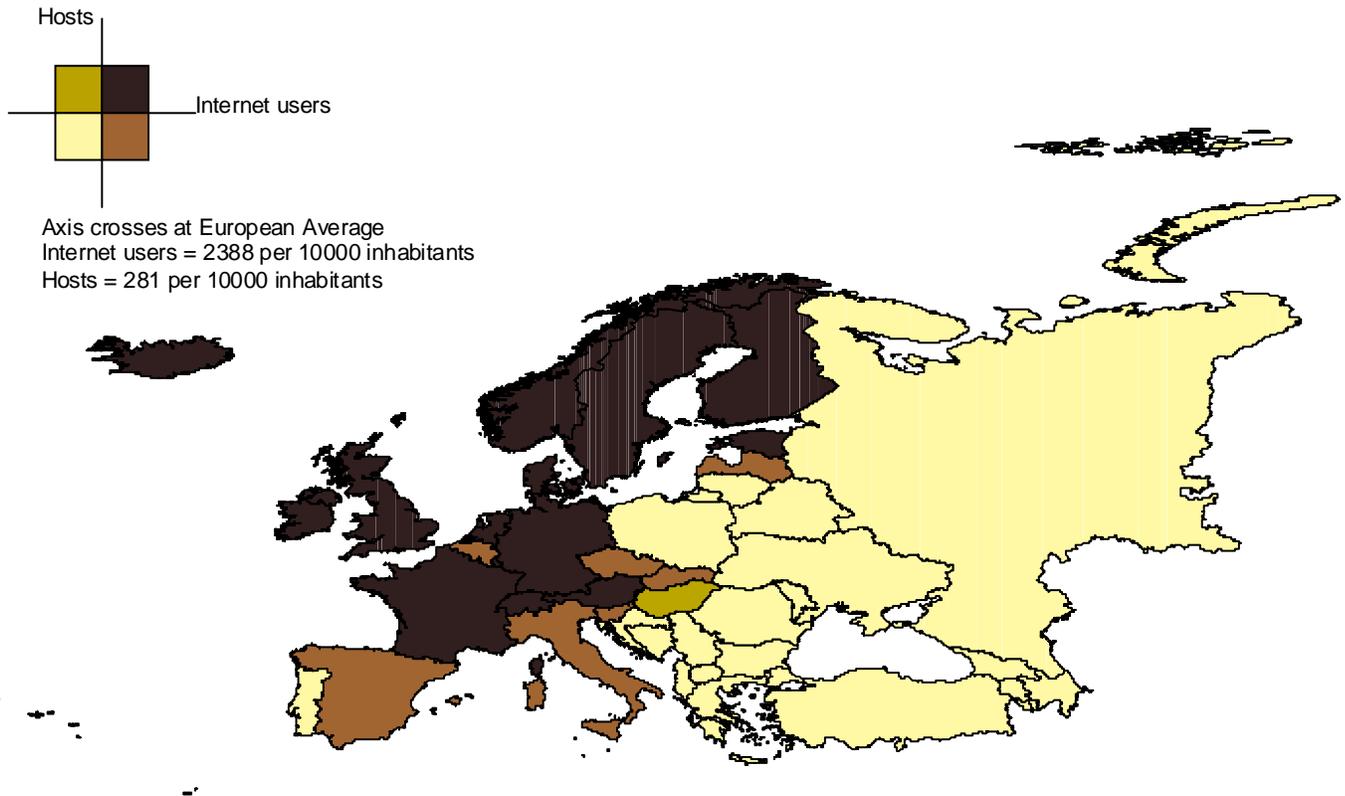

In Millard's opinion (2003, p.2) "despite the apparent potential for economic decentralisation riding on the back of ICT adoption, most empirical research is pointing strongly the other way". Within Europe there is clearly unequal access between countries to the technologies that underlay the Information Society, this variation is expected to have different effects on the prosperity of their economies. Indeed, the general picture about the actual state of the European countries in relation to ICTs access and usage shows that those that are already more advanced are also better positioned to gain any additional advantages associated with the advent of the Information Society.

The main purpose of this section is to identify patterns of Internet diffusion among European countries, crossing recent data about Internet access and usage. Host computers is the most commonly used indicator to measure the stock of communication equipment needed for accessing the Internet, it is considered as a "useful infrastructure indicator of the number of computers in a nation that are connected to the Internet" (Minges, 2000, p. 2), however it must be complemented with other indicator measuring the internet usage by population (the number of internet users per 100 inhabitants).

The results obtained by crossing both indicators reflect the asymmetric in the development of the information society within Europe (Figure 3). To sum up we may regroup these countries into three main categories in terms of their digital development (Figure 4 and Table 2).

In the northern part of the European Union we find those countries with a higher digital development in terms of ICT infrastructure and also in terms of Internet usage. Iceland leads the group both in terms of access and usage, we may highlight that more than two thirds of their inhabitants are regular Internet users. Estonia is also present in this category, in spite of being a new member of the European Union it is best positioned in both indicators than countries from the south of Europe, as Spain, Portugal or Greece. In the last position but also above

Figure 3. Spatial distribution of Internet Infrastructure and Usage in Europe, 2003

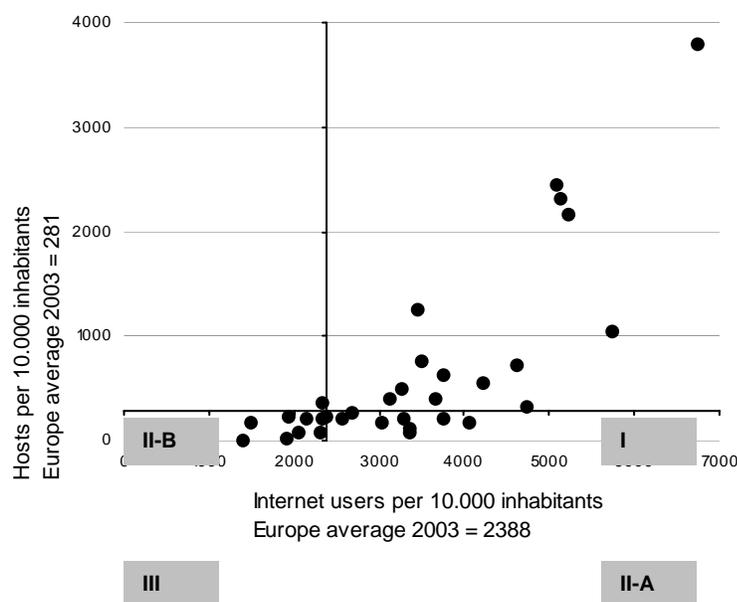

Source: data collected from International Telecommunication Union, 2004 [<http://www.itu.int>]

the averages we find Ireland where the ICT sector has become the engine of a productivity growth rate higher than the majority of European countries.

An intermediate group, composed by nine countries concentrated in the central and southern part of Europe, present a higher number of Internet users in relation to the European average but below the average in what concerns ICTs infrastructure measured by the number of hosts.

Mostly from the central and eastern part of Europe, including some of the more recent EU member states, we find those countries with lower levels of ICT development (both in terms of ICT infrastructure and usage). From this category eleven countries present less than a tenth of their population as regular users of the Internet, and by a simple extension their residents are less likely to have experienced ICT enabled changes to their everyday working life. These figures emphasize the message that many people from traditionally European less advanced regions still lack basic opportunities to participate in the Information Society. In this category we find also countries as Portugal and Greece, considered as the poorest countries of the European Union before the recent enlargement.

European Average: hosts = 281 per 10.000 inhabitants; Internet users = 2388 per 10.000 inhabitants

Country	Hosts per 10.000 inhabitants	Internet users per 10.000 inhabitants	Country	Hosts per 10.000 inhabitants	Internet users per 10.000 inhabitants	Country	Hosts per 10.000 inhabitants	Internet users per 10.000 inhabitants
<b>I</b> > 281 > 2388			<b>II - A</b> < 281 > 2388			<b>III</b> < 281 < 2388		
Iceland	3789,65	6747,4	Latvia	178,84	4056,87	Poland	203,82	2324,5
Sweden	1050,72	5730,74	Slovenia	214,76	3757,52	Croatia	67,77	2318,24

 FIG. 4. EUROPEAN COUNTRIES ACCORDING TO INTERNET INFRASTRUCTURE (HOSTS) AND USAGE (INTERNET USERS), 2003

## The Digital Divide in Portugal

The ability to use ICTs is widely assumed by most commentators as a basic requirement to living and working in the information society (Selwyn, 2003). However in Portugal there is no data source currently defined about the use of the Internet by citizens or enterprises at a local scale. Periodic population censuses do not include any questions connected with this issue, at the same time that the more frequent surveys on the diffusion of ICTs, among households and firms, are based on samples without a representative purpose at a municipality scale.

The complete absence of official statistics spatially disaggregated, on the ways that citizens and firms have been using the Internet, creates great difficulties to the research work concerned with a more complex understanding of the digital divide in the Portuguese context. For this reason we will focus our attention in a merely attempt to identify the geographical differential access to high-speed broadband service. Nowadays speed and bandwidth are essential for fulfilling the promise of the Internet, and if “access alone does not solve the problem, it is a prerequisite for overcoming inequality in a society whose dominant functions and social groups are increasingly organized around the Internet” (Castells, 2001, p. 248).

Broadband penetration in Portugal was 5% of the population in January 2004 (571.500 broadband access customers). Portugal is one of the very few countries in the European Union where the number of cable subscribers is greater than the number of DSL customers, 59,4% and 40,1% respectively of the total broadband customers in the first quarter of 2004 (ANACOM, 2004). The initial preponderance of cable subscribers may be related to the fact that the extension of broadband accesses depends on the improvements of the initial infrastructure. Benefiting from the fact that cable television networks were deployed in the past in Portugal, it was possible a quickly provision of broadband access by cable while it was necessary to invest in the implementation of DSL technologies over the cooper telephone network.

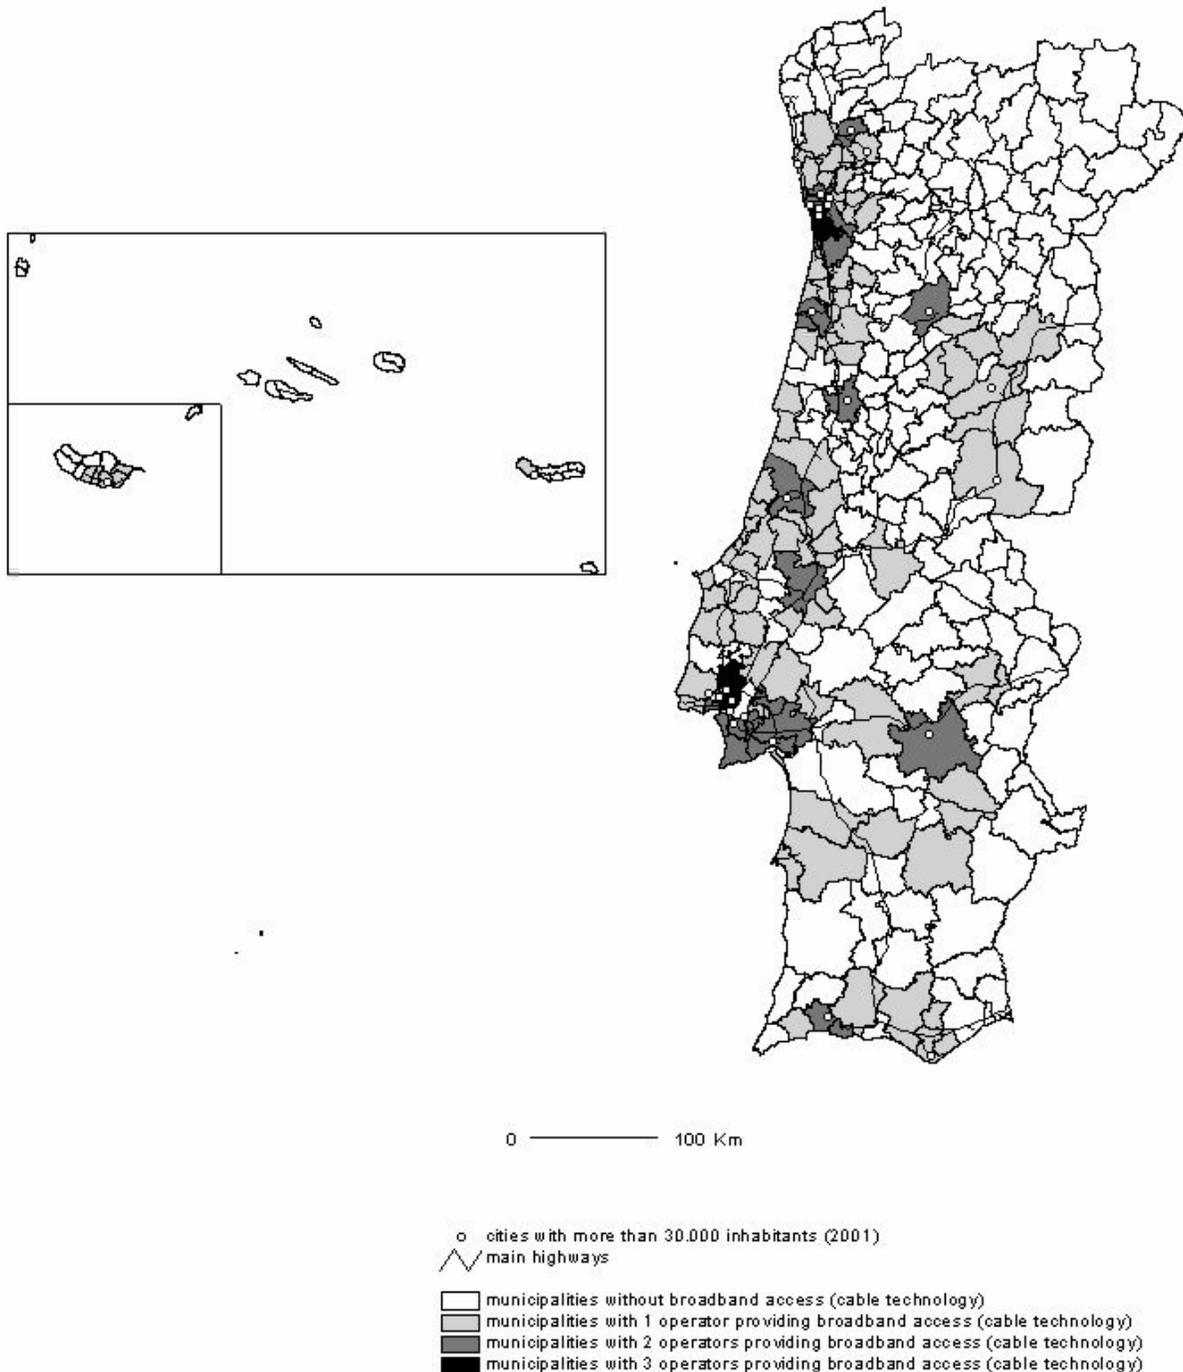

Concerning the spatial distribution of broadband connection by cable<sup>ii</sup> (Figure 5), one main conclusion is the non-existence of this broadband option in 199 municipalities in the mid-2004 (in a total of 308 municipalities in Portugal). Non-served municipalities correspond to almost 67% of Portuguese surface, but it is obvious that excluded areas from cable broadband deployment are larger, because coverage in most served municipalities is far from complete<sup>iii</sup>.

With the single exception of Viana do Castelo, the city that limits the north extension of the area institutionally, demographically and economically more dynamic in Portugal (close to the littoral border and stretching south as far as Setúbal Peninsula), all Portuguese cities with more than 30 thousand inhabitants benefit from Internet access with a speed significantly faster than dial-up connections. It is observable a clear correspondence between the municipalities served with the best levels of road accessibility and the cable broadband penetration, which emphasize the role of ICT's as a contribute to improve territorial disintegration tendencies, reinforcing existing patterns of physical communications.

Such conclusion is underlined by the analysis of the competition in broadband access by cable (generally responsible for higher quality services and in some cases lower prices), which is mainly taking place in densely populated areas. Only four municipalities, all of them placed in the central cores of the Lisbon and Porto metropolitan areas, are characterized by the presence of three cable ISP's. With two cable ISP's there are only 26 municipalities, which can be found in the periphery of the two metropolitan areas or in the municipalities where are located the Portuguese middle-sized cities (Nunes, 2004).

In spite of the benefits of broadband are particularly significant for remote and rural areas, as improved interactive services can address a variety of challenges posed by distance, cable ISP's do not find profitable to roll-out infrastructure in areas where expected demand is insufficient to ensure a positive return on investment (rural consumers generally have modest income and education levels). This consequence of the privatisation of telecommunications service is responsible for pronounced geographical digital divide in the broadband access by cable technology. Not a single cable ISP's provide service in four of the eighteen Portuguese districts: Viana do Castelo, Vila Real, Bragança and Portalegre.

Figure 5. ISP's competition by Portuguese municipalities, in the provision of Internet broadband access by cable technology (June 2004)

The Netcabo, which belongs to the Portugal Telecom (the incumbent operator and concessionaire of the telecommunications public service), reveal a market strategy that avoids the scarcely populated municipalities of Portugal. Being concentrated in the more developed and dynamic areas, Netcabo exposes a clear preference for the two metropolitan areas and its surrounding municipalities, as well as some of the Portuguese middle sized-cities. Cabovisão, the other cable ISP with an extensive cable infrastructure, presents a covering area that also include the most urbanised areas (with the exception of the north extension of the two metropolitan areas), and as a consequence of the ring configuration of its network it also provide access to some urban agglomerations do not covered by Netcabo (specially the Beira Interior urban system: Guarda-Covilhã-Castelo Branco) as well as some rural municipalities in the North Alentejo.

From all Portuguese cable ISP's, Colt is the single one that provide broadband access with a network totally constructed with fiber optic technology (transmission of digital signal by the use of light waves, which is responsible for the maintenance of a huge bandwidth – Gigabits per second). Its network in Portugal (around 85 kilometres) is restricted to the municipalities of Lisbon, Oeiras, Amadora and Loures (all of them in the central section of Lisbon Metropolitan Area). The economic viability of such investment depends on a spatial concentration of enterprises with interest to transmit electronically huge amounts of information (from economic sectors as: financial, information technologies, informatics, media...). As a consequence, the implementation of such networks are restricted to the urban areas that concentrates those enterprises, according to market rules in search of profitable returns of initial investments. This prerequisite can be a clear contribute to an increasingly over-concentration of those units, specially because the accessibility to fiber-optic cable is becoming a new location factor for the implantation of firms that are currently emerging in these economic branches.

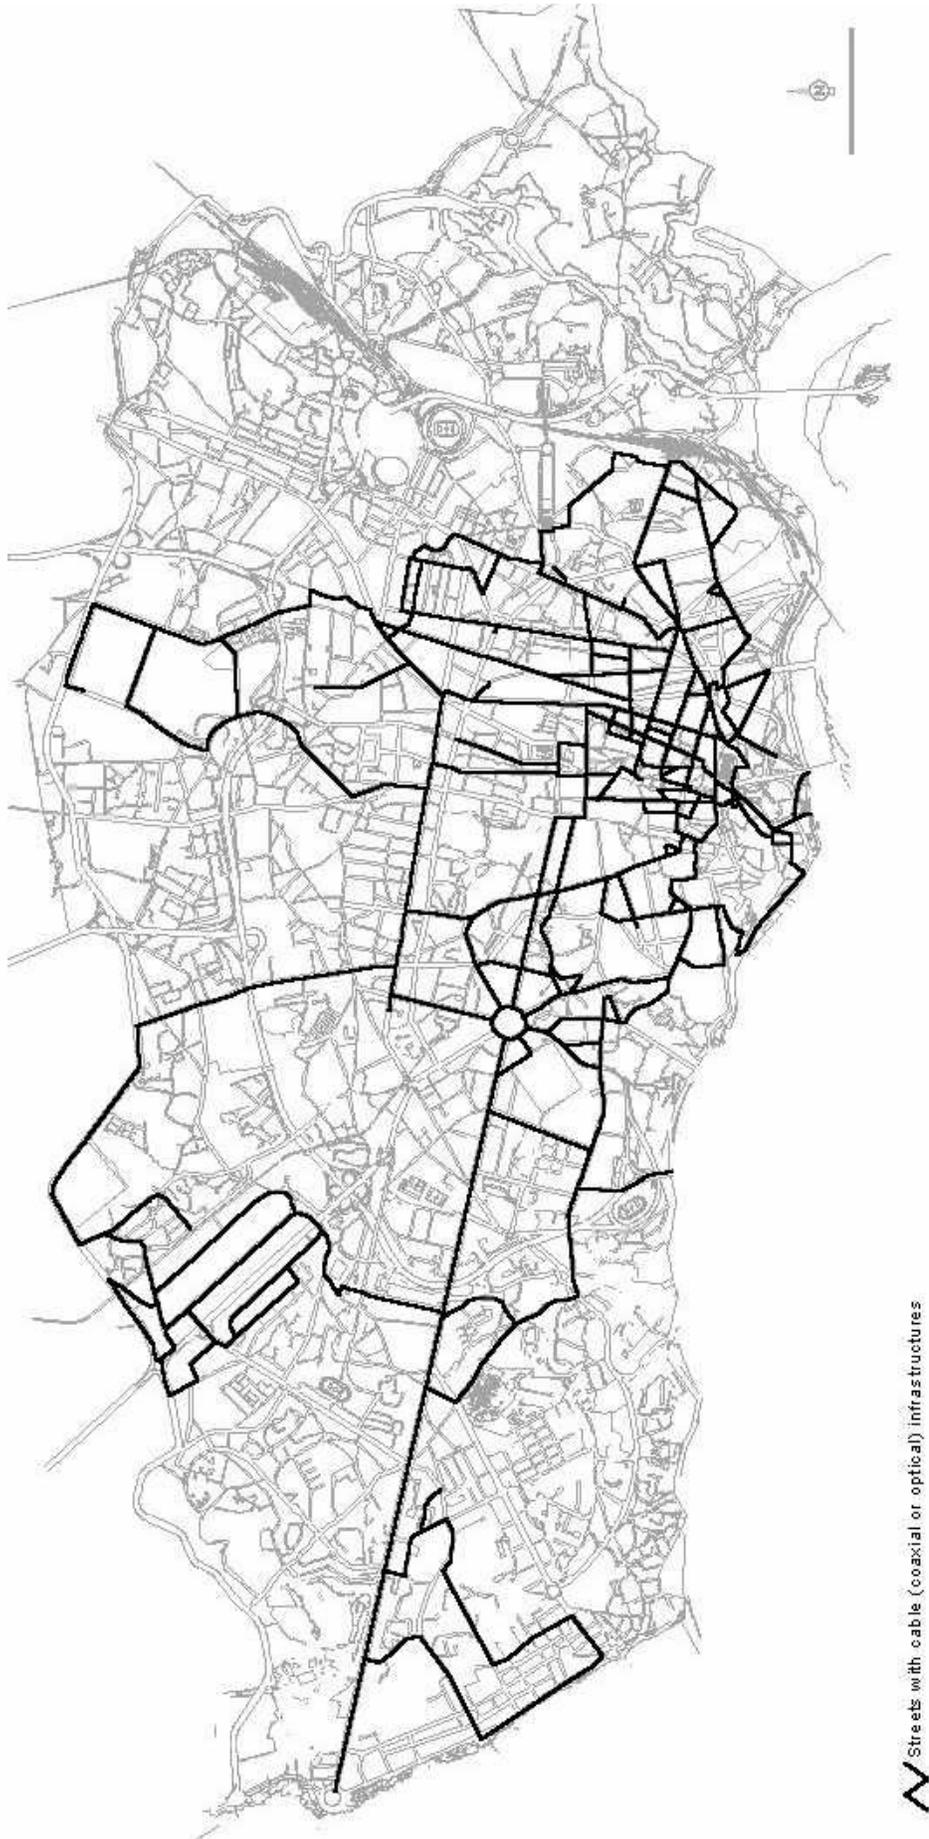

This is a clear illustration how ICT impact on the location of activities can be a decisive contribute to improve already marked territorial disintegration tendencies.

In spite of this general tendency, a deeper analysis shows that the spatial boundaries of the broadband access by cable technology are much more complex than simplistic distinctions between urban/rural areas. In order to expose significant variations masked by this urban agglomeration tendency we have done an intra-urban investigation conducted within the city of Porto, located in the north of Portugal (Figure 6).

Served areas correspond essentially to the two main symbolic centralities of Porto in terms of retailing services, banks, offices or hotels (the downtown and the Boavista). It is also possible to highlight three other areas served by cable ISP's but with a functional profile more specialized: an area where are concentrated several universities and health care services and which is being assumed as a new centrality of the city attracting new residents and economic activities; the Porto industrial zone and a residential area strongly connected with high income residents (Foz).

Analysing the streets where cable ISP's have considered profitable to roll-out cable infrastructure, it is clear that according to the network approved by the City Council up to 2004, the main criteria of these private operators is to provide the access to this high speed information network in areas where there is already an expected demand in order to minimize the risk of such investments: basically economic activities or residential segments with high income. Furthermore according to information transmitted by persons in charge from the City Council, this infrastructure has been only punctually updated for the past two years. The actual network is basically the same since 2002, which help us to contradict general assumptions about the preferences of private operators to fill in non-served areas inside already supplied cities, in spite of being investing in rural municipalities. Therefore, this recent expansion tendency, clearly slow and based exclusively on market rules, will make it difficult to extend the cable network to a great number of residents even if they live inside the most important Portuguese urban agglomerations.

Figure 6. Porto streets with cable infrastructures (coaxial or optic cable) promoted by private operators - 2004

Source: information reached from Porto Town Hall, network licenced by the City Council to 4 private operators (Jazztel, Oni, Novis, Vodafone)  
Note: cable network promoted by the incumbent operator (Portugal Telecom) do not need a City Council licence and for that reason is not included in this map

## Conclusion

In this paper we discussed several statistics based on cartographic analysis, in order to contrast, at a global, national and local scale, the dual effects of the Information Age: on the one hand a new opportunity to promote employment and economic competitiveness, as well as supporting social integration policies; on the other hand the general conviction that productivity gain from ICT is widening the gap between developed and developing economies (areas) while the information networks are mainly attracted to existing urban structures and more developed regions.

The results obtained with this research contribute to clearly demystify the bipolar societal split that supports the “digital divide” concept, showing that disparities and have-nots exist also in developed countries and even inside its most urbanized areas. Spatial boundaries of this geographical digital inequality are basically a result of market rules: household and business density, as well as income and education, play an important role in the provision of such services or in the ability to use them effectively. Consequently and from a territorial occupation model perspective, the digital divide adds a heavy burden to any attempt of correcting disparities and stimulate socio-economic cohesion strategies.

The signals collected in this study underline ICTs as forces with strong territorial discriminatory effects, from a global to a local scale. As we have demonstrated the mere application of pro-competitive policies in Portugal was not sufficient to generate a widespread dissemination and use of telemediated services and applications by citizens, as well as for enterprises to carry out electronic transactions helping them to boost local economic development. In order to adjust market failures or complement market forces, public funding in under-served areas must be considered necessary in order to stimulate investments to allow ICTs access and usage, otherwise the full exploitation of the new opportunities provided by ICTs would be known in a near future as a way to increase already marked geographical disparities and territorial disintegration tendencies.

### **End Notes**

<sup>1</sup> Each variable is converted to an indicator with a value between zero and one by dividing it by the maximum value or "goalpost". Each indicator is then weighted within its category and the resulting category index values are averaged to obtain the overall Digital Access Index value.

<sup>2</sup>We will analyse both coaxial cable and fiber-optic cable because some Portuguese ISP's decided to provide a hybrid solution with the conjugation of both these two technical supports.

<sup>3</sup> It is considered as served municipalities those where one or more operators provide the service in at least some part of the municipality limits.

# Agency Problem in the Context of Chinese Transitional Economy: A Case Study

Ming Men

University of International Business & Economics, People's Republic of China

## Abstract

This paper analyzes the agency problem in the context of Chinese transitional economy. Chinese economy has been transformed from the command economy to the current market economy. The characteristics of transitional economy make the agency problem in China even more complicated, which calls for more time and patience to deal with. After analyzing agency problem in the case of China Aviation Oil, this paper discusses policy options to deal with the problem, including convertible debt, preferable equity and risk management with financial derivatives, which call for further development of Chinese financial market.

## Introduction

Agency problem is rooted in the corporation capital structure defined by the generally accepted decree of Anglo-Saxon corporation governance. The difference between the creditors' and equity holders' positions in claiming on corporations' assets is the institutional foundation of the conflict between corporation creditors and shareholders. The priority of payment from the operation of the corporation is, first, to the creditors in the form of interest and principals, then, to the share holders, in the form of dividends. Therefore, the creditors are the fixed benefit claimers who take less risk of investment and benefit from the operation first. The shareholders are the residual claimers of the corporation benefit distribution.

Corporation shareholders, however, functioning through the board of directors, are in the position to make investment decisions to maximize their wealth. As a result, there is a natural incentive for the equity holders to take risky investment project whenever possible. The underlying reason for the adverse selection is that if the investment project pays off, both creditors and shareholders benefit from the satisfactory performance. But, the creditors only get the fixed payment and the shareholders get all the rest of the benefit. Hence, the more risky the investment project is, the more benefit will the shareholders gain. On the other hand, if the investment project fails to pay off, both the shareholders and creditors have to bear the loss. This indicates that the benefit structure of shareholders and creditors are asymmetric.

By taking risky projects, the equity holders could utilize the leveraged asset from corporation creditors to pursue their own interest at the expense of the interest of creditors. The severity of the conflict between the shareholders and bondholders is determined primarily by the debt-equity ratio. As debt level in the capital structure rises, the conflict becomes more significant. But other factors, such as the range of investment projects available to the firm, also affect the severity of the bondholder-shareholder conflict.

Chinese economic regime has been transformed from the command economy to the market economy since 1980s. Nowadays, many important features of Chinese economy stay between a command economy and a market economy. However, the state-owned enterprise culture and the creditors' practice have the closest relationship with the agency problem in Chinese corporations.

Based on a case study, this paper explores the agency problem in the context of Chinese transitional economy and tries to figure out the possible causes of it, and then discusses policy options to deal with the agency problem.

## Literature Review

Agency problem is also sometimes referred to as the principal-agent problem. The difficult but extremely important and recurrent organizational design problem of how organizations can structure incentives so that people ("agents") who are placed in control over resources that are not their own with a contractual obligation to use these resources in the interests of some other person or group of people actually will perform this obligation as promised -- instead of using their delegated authority over other people's resources to feather their own nests at the expense of those whose interests they are supposed to be serving (their "principals").

Agency problems are caused by the separation of ownership from control in large firms (Berle, 1932). Jensen and Meckling (1976) apply agency theory to the modern corporation and formally model the agency costs of external equity. Managers who own anything less than 100% of the residual cash flow rights of the firm have potential conflicts of interest with the outside shareholders, since they choose to reinvest the free cash rather than return it to investors (Jensen, 1976, 1986).

Grossman and Hart (1982) were the first to argue that managers could pre-commit to work hard by using debt rather than equity. Similarly, Jensen's (1986) free cash flow theory considers additional debt beneficial since the firm attempts to improve the productivity of its assets as a result of additional debt acquired. Debt not only reduces the free cash flow but also provides discipline to management through the debt market. Debt monitoring hypothesis is formalized by Harris and Raviv (1990) and Stulz (1990) and empirically demonstrated by Maloney et al. (1993). Shleifer and Vishny (1997) provided extensive survey about the role for debt in reducing the conflict of interests between managers and shareholders. On the other hand, increased leverage also induces agency costs. As leverage increases, the usual agency costs of debt rise, including bankruptcy cost (Jensen 1986). Myers (1977) pointed to the debt overhang problem where firms may forego positive net present value projects if they have significant debt outstanding. The reason is that for a firm facing financial distress, a large part of the returns of a good project goes to bondholders. Therefore, in choosing their debt-equity level, firms should trade off between the agency costs of debt and the agency costs of equity. By appropriately allocating refinance between equity and debt, capital structure can balance the conflicts between investors and management as well as that between management and creditors. Agency problems of Chinese listed firms have also been widely discussed. The main characteristic of the Chinese corporate governance, among others, is the over concentration of equity structure (Zhang 2002). Most of the listed firms in China are transformed from state-owned enterprises (SOEs). Ownership structure displays the phenomenon of the co-existence of control shareholders, who are normally related to the state holds shares of most listed firms in great concentration. Of the listed firms, 54% of the equities belong to the state or state-owned corporate persons. Among the 1104 listed firms on Shenzhen and Shanghai stock exchanges, the proportion of shares of the number one shareholder had reached 45% and the second largest shareholder made up 8%. One major problem in the governance of Chinese listed firms is that the management lacks long-term incentive and restraining mechanism. The board of directors is mainly formed by control shareholders. The lack of independent directors makes it difficult to display their regulating and balancing roles. Among all the directors of the listed firms, 73.3% have the background of state shares (27.9%) or shares of state-owned corporate persons (45.4%). Since the manager holds fewer shares, and is subordinate to controlling shareholders, the agency problem between shareholders of a firm and its manager has turned into the second dimension, the conflict between the controlling shareholders and small shareholders.

The vast majority of China's listed firms are formerly state owned or state controlled firms, mostly large and better performing firms. Before initial public offering, they do their best to dispose of the debt. So, the debt to asset ratio of listed firms is lower during the first couple of years after initial public offering. Due to the special ownership structure of listed firms, state share is absolutely the largest among total shares and the representatives of state shares are usually absent. This reduces the restriction to management, and the managers are likely over pursue the control right the cash flow. The consequence is that re-financing of listed firms would have partiality for equity rather than debt. In addition, there is not much pressure of dividend payment from shareholders, so refinancing of listed firms in China usually place the order of debt after additional or right offerings.

Contrary to Myers argument, which pointed to the debt overhang problem where firms may forego positive net present value projects if they have significant debt outstanding, this paper focuses on the other end of the agency problems caused by the leverage of the corporation. Particularly, this paper argues that there is a tendency of the corporate shareholders to take risky projects to pursue extraordinary interest for themselves at the expense of the interest of creditors.

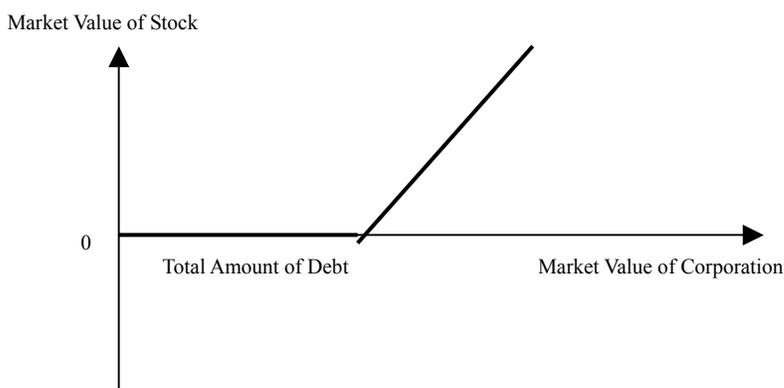

## The Option View of the Agency Problem

An option is a derivative contract that can be traded both in the exchanges and over the counters. An option, by definition, is the right, not the obligation, to buy (in the case of a call option) or to sell (in the case of a put option) the underlying asset at a pre-determined price in the prescribed period. The option contract differentiates itself from other financial derivatives, such as futures, forward contract and swaps, because of its kinked-shaped value line, which gives option contract unique advantages in managing financial risks.

In addition to the general perception of the meaning of the plain vanilla options, there are wide spread interpretation of corporation equity as an option in the academic world of finance. This is because not only the similarity between an option and the equity in interpreting the residual claims of the investors, but also the implication of the option view of equity in interpreting the speculative behavior of corporation shareholders.

When investors hold stocks of a corporation, they are expecting the price of the stock to rise in the future. If the price of the stock rises, the investors obtain capital gains by selling (exercise the option) the stock to other investors. If, on the other hand, the price of the stock falls, investors can hold the stock to wait for future bull market opportunities. In this case, investors do not exercise the option. The investors will not lose anything by not exercising the option. Therefore, the stock is pretty much the same as the call option in nature.

Then, what is the exercise price of the option when we view the stock as a call option? As a matter of fact, it is the total amount of debt that the firm is carrying. This is because the stockholders are the residual claimer of the corporation's wealth according to the corporate governance. The value of the stock as a whole equals the difference of the market value of the corporation and the total amount of debt of the corporation. This enables us to depict the payoff of the stock as a call option in Fig. 1. Please note that the value line of the stock takes a kinked shape, which indicates that it resembles the nature of a call option.

According to the Black-Scholes (1973) Option Pricing Model (B-S Model), the value of a call option can be expressed by the following formula: (1)

$$C = SN(d_1) - Ee^{-rT}N(d_2)$$

As for the parameters in the formula,

$$d_1 = \frac{[\ln(S/E) + (r + \sigma^2/2)T]}{\sigma(T)^{1/2}}$$

$$d_2 = d_1 - \sigma(T)^{1/2}$$

where, S represents the value of stock;  
 E represents the exercise price of the option;  
 r represents the risk-less interest rate;  
 $\sigma$  is the standard deviation of the stock price;  
 T is the maturity of the option;  
 N( $\bullet$ ) represents accumulated normal distribution value.

With the B-S model, it is possible to calculate the price sensitivities of the option to the exogenous variables. The sensitivity of a call option to the standard deviation of the stock price is called Vega. The Vega of a call option, which equals the first derivative of the call option to the volatility (expressed as the standard deviation) of the underlying asset is given by the following formula:

$$\text{Vega of a call option} = [S(T)^{1/2} \exp(-d_1^2/2)] / (2\pi)^{1/2} \quad (2)$$

Let the stock price be \$164 and the exercise price of the option be \$165. If the continuous risk-less interest rate is 5.21%, the variance of the stock price is 0.0841 and the time to maturity of the option is 0.0959, the call option value can be calculated according to the B-S Model. The result is \$5.803. Vega =  $164(0.959)^{1/2} \exp(-0.0328^2/2) / [2(3.14)]^{1/2} = 20.25$ . It means that when there is a change on the standard deviation of the stock price, say 0.01, the change of the call option value would be  $20.25(0.01) = 0.20$ .

Please note that the value of Vega is always positive. That means when the volatility of the underlying asset raises (the risk of the asset increases), the value of the option increases. This proposition is fairly important in interpreting the speculative behavior of the corporation managers. This is because the mind set of B-S Model of option value is just contrary to the traditional asset valuation regarding the risk involved.

In the traditional Dividend Discount Model (DDM), the present value of an investment project is the sum of the discounted value of the future cash flows, which given by the following formula:

$$NPV = \sum CF_t / (1+r)^t \quad (3) \quad \text{Where, NPV stands for net present value;}$$

$CF_t$  denotes the cash flow at time t;  
 r is the discount rate.

When the risk involved in an investment project is higher, creditors will increase the discount rate to pursue a risk premium. This is the norm in banking industries' practice throughout the world. Therefore, the underlying philosophy of DDM is that the higher the risk of the investment, the higher the required rate of return, which is used as the discount rate to calculate the present values of the future cash flows.

By comparing the underlying philosophies of B-S and DDM Models, we conclude that valuations of investment project by these two models are exactly opposite. By employing the B-S Model view of the option valuation, we find out that the decision makers of corporation have the natural tendency to take risky investment projects because the more risky the projects, the higher the value of the option. It provides a rational clue for us to understand the motivation behind the adverse selection of investment project by shareholders.

## The Characteristics of Chinese Transitional Economy

In the economic spectrum, command economy is at one end and market economy is at the other. A command economy relies exclusively on administrative mechanisms of control. Resources are combined by fiat and contracts and laws play an insignificant role. The autonomy of various parties is limited. The state sanctions all significant interactions and risks and rewords are largely socialized. As a result, pecuniary incentives are not emphasized. By contrast, a market economy allocates control over resources primarily through formal and informal voluntary contracts between autonomous agents. The state provides a legal and regulatory framework for private arrangements and an enforcement mechanism for such agreements. The system is flexible and dynamic, whereby different solutions emerge within a common framework as participants combine the basic components of a governance structure to fit their own particular circumstances.

With few exceptions, most command economies have been opening up and liberalizing since 1989 when the Berlin Wall fell and the Soviet bloc broke apart. Chinese economy has been transformed from the command economy to the current market economy. Since the transformation is still under its way towards market economy, the legacy of Chinese command economy is still showing up in the process of economic development one way or the other. This paper concentrates on the role played by the state-owned enterprise culture and creditors' practice, which are largely accountable for the agency problems in China.

### The SOE Culture in China

For corporate governance to be effective and efficient, the following conditions must hold: First, equity holders as the owners of the firm must have adequate incentives to select the highly competent manager and to discipline the manager. Second, the manager must have adequate autonomy as well as adequate incentives to make business decisions with the business judgment rule, and is well-motivated to work hard. Third, creditors must have adequate incentives as well as effective measures to enforce debt contacts through bankrupt procedure. None of these conditions hold in Chinese SOEs. The debt finance has evolved into the debt crisis in China because although corporate finance of SOEs has changed a lot, corporate governance has changed little.

The government as the only equity holder has malfunctioned with both selecting and disciplining management because of the agency problem on bureaucrats' side. The most distinct feature of SOEs from capitalist firms is that, by definition, the role of principals in state-owned enterprises is played by the 'state' (government) rather than by natural capitalists: it is the government who appoints, motivates and disciplines managers. This fundamental feature of SOEs remains intact even today. Particularly, the government still holds full authority of appointing management. As Zhang (1994) pointed out, because of the adverse selection problem, selecting good management is hard work. It requires that selectors must have adequate incentives to find information about candidates' abilities and to install high quality candidates. Adverse selection is most serious in China, because, with no personal stake to signal ability, too many people pretend that they are qualified for management. Worse is that bureaucrats, unlike their capitalist counterparts, have the right to select, but do not bear consequences of their selections. This asymmetric structure implies that, not only would-be managers, bureaucrats themselves also have the adverse selection problem. They have no adequate incentive to search for good managers, and even if they know some are capable, they still lack the adequate incentive to install them. Observation suggests that bureaucrats, more often than not, base their selections on personal connections rather than merits. Appointing friendly managers is the most effective way for bureaucrats' rent seeking. Because of this, management pool of SOEs is full of lemons.

Although economic reform has gradually shifted considerable autonomy to management through various ways, the government still exercises arbitrary administrative intervention in business of SOEs. Separation of the government from enterprise business has been assumed as one of the major targets of the reform since the reform was inaugurated. Nevertheless, this purpose has so far never been materialized. This is true even after the state enterprise is corporatized in which case the government is formally and legally defined as the 'equity holder' and bureaucrats are appointed as 'board directors'. The fundamental reason for this is that when the state is the owner of the firm, bureaucrats are delegated with ownership rights to control the firm but bear no financial risk for their intervention. By definition, any owner has to supervise management through control rights. The state as a (and in most cases the only) equity holder will naturally intervene.

Furthermore, Chinese SOEs suffer not only from arbitrary administrative intervention but also from inadequate managerial incentive. Although the reform has improved the management's incentive to make quick profits through profit sharing, the long-term incentive problem has yet to be solved. Casual observation suggest that managers of SOEs prefer to distribute retained profits to employees or make investment in quick revenue-generating projects rather than to make investment in long term productivity-enhancing projects and R&D (Huang, Woo, Kalirajan and Duncan, 1998). They have over-incentive to expand their empire by borrowing from banks and to keep insolvent enterprises as going concerns, but under-incentive to make efficient use of borrowed money and to repay the creditors. In many cases, abnormal short-term profits are made at the large expense of long-term productivity (Broadman and Xiao, 1997). The reason for management myopia is that, given that there is no personal capital stake in the firm, the manager's enjoyment of benefits from the firm cannot beyond his firm tenure. He is very uncertain whether he will still be in the position even next year. This is because his firm tenure is mainly dependent upon bureaucratic preferences which are little related to firm performance. With bureaucrats making selection of management, good performers are just as equally likely to be removed as bad performers, if not more. This is because once a firm becomes highly profitable, bureaucrats have every incentive to collect rents by replacing the incumbent with their favorite. Thus, the best way for the incumbent to secure his position is to make the firm not too good and not too bad. This also partly explains why SOE managers typically underreport their profits.

### Creditors' Flunk

Creditor banks can exercise control over corporate governance in debtor enterprises in several ways (Gray 1997). Foremost, banks can exert influence by means of credit. By giving or denying credit or by making credit terms more or less favorable, the bank allows its debtor to strengthen or expand or obliges it to resort to a less attractive, alternative source of financing. The extent of this influence depends largely on the availability of such alternative sources, while the quality of the influence depends to a large extent on the bank's credit decision process.

Creditors exercise influence over borrowers based on laws and contracts. Legislation or contract covenants often give creditor banks the right to receive information, impose audits, require prepayment, veto certain strategic decisions, and so on. Some of these rights apply in the normal course of business, and others refer to the use of the bank credit or to developments that increase financial risk. In addition, creditors may exert influence in informal ways, such as being consulted about major decisions, invited to shareholder meetings, appointed to boards, or asked to second bank staff to work at the firm. Debtors may accept such practices if they have few alternative sources of financing because of weak competition among banks and little chance of accessing nonblank financing.

The approval or denial of credit by a bank can have a significant impact on a firm's strategic development. This is particularly true in China, where firms' access to securities markets is de facto tightly rationed and various other forms of nonblank financing have yet to develop. Thus a pertinent question in relation to corporate governance is whether the banks' credit decisions are sound. Until the mid-1990s, the lending decisions of state-owned commercial banks (SOCBs) were often not driven by borrowers' creditworthiness and the financial merits of their projects, but rather by persuasion by local or national authorities and by personal rent-seeking on the part of bank personnel. Efforts to rectify this situation have intensified in the last five years by such means as curtailing instructed lending, measuring bank performance more on the basis of profits than of lending targets, overhauling banks' credit approval procedures, and expanding training in credit analysis.

Nevertheless, the scope for improvement is considerable. While branch managers may be evaluated in part based on the performance of credits that they approved, the underlying portfolio classification may be manipulated by those same managers because internal control practices and regulatory supervision are still weak. Moreover, banks still consider project analysis a secondary matter, given their exclusive reliance on collateral and third-party guarantees. In addition, the financial performance of state-controlled enterprises still depends largely on government decisions about industry rationalization, technological upgrading, and other forms of support. This limits the usefulness of assessing borrowers and their projects on their own merits.

Chinese banks have few rights to influence their clients' strategic decisions. The standard credit contracts include few covenants that permit real involvement. On such matters as major financial or asset restructuring, ownership changes, or changes in business lines, at best they usually require "information" rather than consultation, let alone approval. Neither do they require strict maintenance of key financial ratios. The only strict covenants tend to concern repayment terms, credit security, use of the credit funds, and perhaps adherence to government programs related to the credit. To date banks have had little direct influence on their borrowers' strategic decisions through means other than legal and contractual requirements. Client enterprises do not generally consult the principal bank before making major decisions. More often than not, they even make investment decisions before approaching the bank for credit.

Publicly listed firms do not tend to invite key bank personnel to their annual shareholders' meetings, and bank managers are rarely appointed as external members of their client companies' boards of directors. While an increasing number of external members do sit on company boards, they are usually representatives of major shareholders, including local governments. In some cases bank managers avoid seeking board memberships, because they believe it violates the prohibition of second jobs by bank managers under the Commercial Banking Law. If their borrowers default, creditor banks' rights are weak. Banks have less influence on defaulting debtor enterprises than in industrial market economies. The lack of a credible threat of bank influence in the case of defaults has also weakened the banks' overall clout under normal circumstances.

## Chins Aviation Oil Co.: A Case Study

### The International Background

Let's have a look at the background of the event of China Aviation Oil (Singapore) Co. Ltd. (CAO). Since the 9/11 event of 2001 in the U.S., the international anti-terrorism war has entered into a new phase. In March 2003, the U.S. started the Iraq War regardless the disagreement of other members of the UN Security Council. In the mean time, OPEC kept cutting the output of crude oil again and again. Other oil-producing countries (Russia is one of the biggest among them) also controlled their crude oil production.

Meanwhile, China's economy has entered a high growing track. In the last ten years, the average growth rate of Chinese GDP is 9.3%. The rapid growth of Chinese economy pulls up the world demand dramatically. According to a report of *Business Week*, "China needs energy more than ever. Its quest for oil and gas to keep its economy humming will change the world."<sup>vi</sup> At present, "China's energy consumption is 12.1% of the world total, which is second only to that of the U.S. (24%)."<sup>vii</sup> Largely due to the factors mentioned above, the world oil price has rocketing to an unprecedented level in 2004. This perhaps was one of the most striking phenomena of world economy in 2004.

Fig.2 gives international oil price change during the period of 2001 to the beginning of 2005.

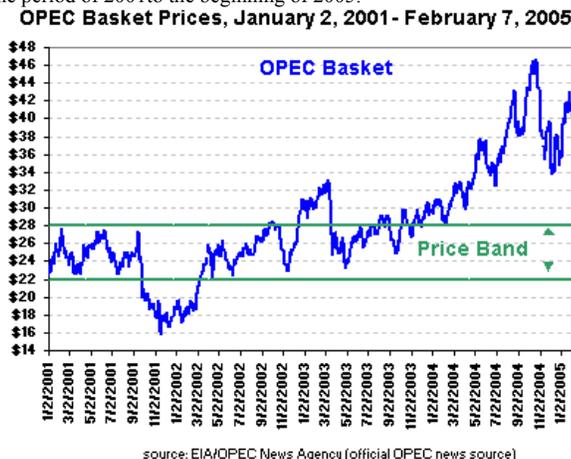

FIG. 2: WORLD OIL PRICE IN 2001-2005

### China Aviation Oil Co.'s Event

CAO was established in Singapore in 1993 as the over seas division of China Aviation Oil Group (CAOG). CAO made its initial public offering on December 6, 2001 in Singapore Security Exchange. In the third quarter of 2003, CAO entered the futures market by taking a long position of 2 million barrels of crude oil futures and gained considerable profit. In the first quarter of 2004, the price of crude oil spiked. Since CAO took a short position in option and the price of oil went in the opposite direction to CAO's expectation, it lost \$ 5.8 millions. In the second quarter, CAO continued to lose in its crude oil futures positions. The loss became \$30 million then. In order to avoid further loss, CAO postponed the delivery dates of some of its option contract to 2005 and 2006. In October, 2004, the total number of CAO's futures contract was increased to a record high of 52 million barrels. As the price of crude oil spiking, CAO was facing huge losses. On October 10, CAO reported the loss of \$180 million to its mother company, CAOG, for the first time and submitted \$80 million maintenance margin to Singapore Security Exchange. During October 26 – November 17, CAO had to deliver crude oil of several option contracts because they were matured. Since the price of crude oil was opposite to what CAO was expecting, CAO suffered a total loss of \$550 million. On November 29, Mr. Jiulin Chen, CAO's CEO, asked bankruptcy protection from Singapore Court. On the next day, CAO stopped its transactions on crude oil futures.

### CAO's Trading Strategy

Let's have a look at the trading strategy of CAO, which caused huge loss in 2004. Mr. Jiulin Chen took a short position in crude oil call option.<sup>v</sup> The payoff of this trading strategy is illustrated by Fig. 3.

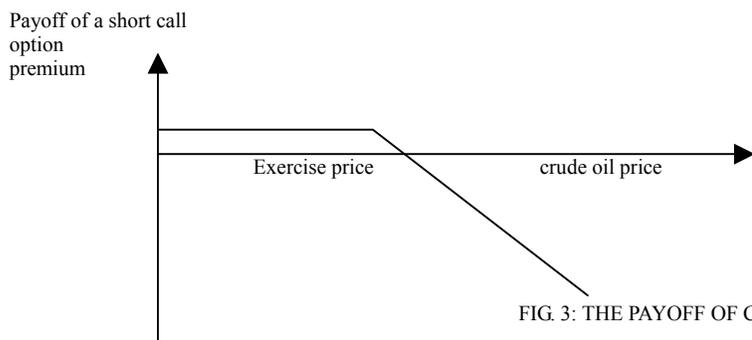

FIG. 3: THE PAYOFF OF CAO'S TRADING STRATEGY

From Fig.3, we know that the investor selling short an option is holding a stake on the future direction of the price change of the underlying asset, the crude oil in this case. If the oil market turns out to be a bear market, which means the price goes down in general, the investor will gain from this trading strategy. This scenario is exactly what CAO was expecting when Mr. Chen initiated a position in short call option. Nevertheless, if, contrary to what the investor is expecting, the oil market turns out to be a bull market, which means the price goes up in general, the investor has to bear the loss<sup>vi</sup>. As a matter of fact, this is exactly what happened to CAO. The loss of CAO was \$550 million in total. The loss was so high that CAO was called "the second Baring Bank".

### What Went Wrong?

It is not difficult to understand that then trading strategy taken by Mr. Jiulin Chen is not a hedging strategy, but rather a speculative strategy. The risk involved in the strategy of selling short a call option is considerably high. When the crude oil market turns out to be a bear market, the investor selling short a call option will gain from this trading strategy. According to Fig.3, the magnitude of the gain, however, is limited. The maximum of the gain from this trading strategy is the option premium of the selling call option. Nevertheless, when the oil market turns out to be a bull market, the investor selling short a call option will bear the loss. Even worse, the magnitude of the loss is unlimited. Putting it in another way, the risk of selling short a call option is unlimited, at least theoretically.

There are obvious shortcomings in the financial risk management system of CAO. It declared that it would purchase Singapore Petroleum Corporation (SPC)'s shares from Indonesian Satya Capital at a cost of \$220 million on August 18, 2004. After Mr. Chen's reporting of huge loss of the option trading on October 10, CAOG decided to stop purchasing SPC. However, this decision has never been disclosed to investors in any occasion. Furthermore, CAOG sold 15% of its shares through Deutsche Bank on August 20, 2004. The total income of the sales of shares was \$108 million. CAOG paid these \$108 million for the maintenance margin of the trading position of CAO. However, it was told to the investors that it was used for the purpose of purchasing SPC<sup>vii</sup>. One insider of CAO said, "He (Mr. Jiulin Chen) was promoted as the vice general manager of CAOG. After that, the supervision and risk control on him have become weaker and weaker."<sup>viii</sup> An article in the *Economic Observer* pointed out that "Mr. Chen is not the only person who should be responsible for this event. The management of CAO's taking risky projects, violating the regulations of the corporation and making serious decision error are the truly causes for this huge loss".<sup>ix</sup> In addition to the shadow of SOE culture, we can also see the creditors' flunk in the process of CAO's event. Mr. Jiulin Chen was a super star in Singapore Security Market. Although we can detect the signs of risk in management selection and risk management system, the risk is actually rooted in the heart of people. By leading the company for 8 years, Mr. Jiulin Chen made a personal miracle for himself. In 2003, he was awarded as the "New Economic Leader of Asia". The news release from every newspaper is full of praises. In addition, the operation of CAO became a successful case in the MBA program of Singapore State University<sup>x</sup>. In 2003, the rate of return of the shares of CAO was breathtakingly as high as 346.3%<sup>xi</sup>. All these brought CAO and its CEO, Mr. Jiulin Chen, a shining ring of light, which deepened the investors' believe in their investment in CAO. However, only one year later, the event of CAO became the top scandal in the media of Singapore at the end of 2004. It was reported recently that CAOG released \$100 million in order to save CAO from

## A Discussion on Policy Options

In Chinese SOEs, where results are not readily measurable with much precision, the nature of the board of directors' work is such as to require a very high degree of expert judgment and lines of responsibility and authority are very complex, the top managers work individually in widely dispersed work places, the managers' activities necessarily involve a lot of "judgment calls" to cope with rapidly changing circumstances and highly uncertain information, and large numbers of investors have only relatively small individual "stakes" at risk -- the incentives for agents faithfully to represent their principals may easily become so weak as to be largely ineffective. Experience demonstrates that these kinds of organizations often come to be run mainly for the benefit of the agents (shareholders) rather than their purported principals (investors).

The agency problems in Chinese transitional economy are intensified by the aforementioned characteristics. From the Principle of Self-Interested Behavior, we know that agents may be tempted to put their own self-interest ahead of those of the principal. As a result, an agent's decision making becomes suspect when the interests of agent and principal compete. The conflict arises when there is moral hazard inside the firm, which is called the agency costs of equity. This agency problem can be solved by increasing management ownership because high management ownership aligns the interests of management and shareholders (Jensen, 1976). Other possibilities include monitoring of management by large shareholders (Shleifer, 1986), and the use of debt financing to discipline managers (Jensen, 1986; Stulz, 1990). Two of the important tasks of the academic disciplines of business administration and public administration are to identify, and then to devise cheaper substitutes or remedies for, organizational arrangements that are characterized by costly agency problems. In order to better deal with the conflict between bondholders and stockholders, firms might need to consider one or more policy options discussed in the following paragraphs.

### Make the Debt Convertible

A convertible bond is a bond or other fixed-income security which may be exchanged for a number of shares of common stock. Convertible bonds contain embedded equity options—a standard bond plus a call option on the value of the issuing firm's equity. But this right to convert to equity also can be viewed as an option held by the bondholder on the behavior of the firm's shareholders. If the shareholders behave opportunistically so as to transfer value from bondholders to shareholders, the right to become a shareholder becomes valuable. The aim of making the debt convertible is to align the interest of bondholders with those of the shareholders. Therefore, convertible bonds can serve as a mechanism to curb shareholders' speculative behavior to take risky projects.

### Issue Preferred Stock

Preferred stock has features similar to both equity and debt. Like a bond, it promises to pay to its holder a fixed amount of income each year. In this sense preferred stock is similar to an infinite-maturity bond, that is, a perpetuity. It also resembles a bond in that it does not convey voting power regarding the management of the firm. Preferred stock is an equity investment, however. The firm retains discretion to make the dividend payments to the preferred stockholders. It has no contractual obligation to pay those dividends. Instead, preferred dividends are usually cumulative; that is, unpaid dividends cumulate and must be paid in full before any dividends may be paid to holders of common stock. In contrast, the firm does have a contractual obligation to make the interest payments on the debt. Failure to make these payments sets off corporate bankruptcy proceedings.

Preferred stock is issued in variations similar to those of corporate bonds. It may be callable by the issuing firm, in which case it is said to be redeemable. It also may be convertible into common stock at some specified conversion ration. A relatively recent innovation in the market is adjustable-rate preferred stock, which, similar to adjustable-rate mortgages, ties the dividend to current market interest rates. The preferred stock makes the corporation rely less on the stocks and more on the debt financing and thus reduce the probability that future adverse market conditions will lead to default.

### Manage Financial Risks

The aim of this approach is to take necessary actions to reduce firm's financial exposure. Firm's attitude towards financial risk will send a strong signal to the debt holders that the firm is financial conservatism and in a good position to repay the interest and principals to the creditors. The impact of risk management hedging is to reduce the variance in the distribution of firm value. Risk management can add value by avoiding investment decision errors. The M&M proposition implies that if hedging policy increases firm value, it does so by reducing contracting costs, by reducing taxes, or by controlling investment incentives.

Let's take a look at the same issue from the standpoint of creditors. Basically, bondholders, or rather, potential bondholders, are concerned about the probability that they will be left holding the bag, that the value of the firm's assets will be insufficient to cover the promised payments in the indenture. In addition to concerns about future market conditions, potential bondholders are concerned about opportunistic behavior on the part of shareholders who might declare a liquidating dividend, burden the firm with extra debt, or select risky investment projects. Potential bondholders, however, recognize the possibility of opportunistic behavior of the shareholders and protect themselves by lowering the price they are willing to pay for the firm's bonds. To convince potential bondholders to pay more for bonds, shareholders must assure them that wealth transfers will not occur. The risk management reduces the probability of company default, so potential bondholders will be willing to pay more for the bond. Hence, risk management can increase the debt capacity of the firm. Likewise, risk management can decrease the coupon the firm will have to pay on its debt. There are some empirical results regarding the impact of the risk management on firm's value. Block and Gallagher find a positive relation between the debt-equity ratio and hedging. Smithson and Smith's survey results (1) that firms that use the hedging instruments have significantly higher R&D expenditures and (2) that firms with more investment options have both lower leverage and more hedging suggest that firms that use hedging instruments have more growth options in their investment opportunity set. Although policy options have been proposed, the bottom line is that the agency problem can never be 100% solved in a world where virtually everyone has a healthy regard for their own self-interest and the relevant information for evaluating performance is imperfect, costly to obtain and unequally distributed between the agent and his principals. Indeed, rational principals will only pursue the available techniques for control to the point that the marginal increment in "agency costs" rise to equal the marginal benefits to them of the additional increment in "faithfulness" that they produce. That is to say, sometimes it is cheaper for principals to endure a certain amount of dereliction of duty by their agents than it is to pay for the precautions needed to prevent or punish it.

# **Analyzing Public Relations Position and Activities of Public Administration Bodies in Transitional Slovak Economy**

*Robert Štefko*  
*University of Prešov, Slovak Republic*

## **Abstract**

The study deals with the public relations activities, its position in public administration bodies, and specific features of performing PR in public sector. Next part of the study is dedicated to presenting some significant selected research results. Research was performed in the Eastern-Slovakia public administration bodies; respondents were heads of those bodies (chairmen). In the research very interesting question was the most suitable education- branch of study, or combination of branches. The opinion of respondents – practitioners from public administration - is presented and it gives us also some suggestion for the university offer adjusting.

## **Public Relations and its Specific Features in Public Administration Bodies**

As a matter of course the care of public relations activities is for public sector organizations inevitable. Neglecting that area can lead to very negative implications in the public opinion of the institution and to problems in its work.

Many people often equate public relations with publicity - obtaining publication of favorable stories about the institution – but that is only part of the public relations task. The most frequently quoted definition of public relations is the following: Many specialists agree with the view of public relations, that it is the management function that evaluates public attitudes, identifies the policies and procedures of an individual or an institution with the public interest, and executes a program of action to earn public understanding and acceptance

In accordance with Philip Kotler & Gary Armstrong [2] public relations involves building good relations with the institution's various publics by obtaining favorable publicity, building up a good "corporate image", and handling or heading off unfavorable rumors, stories, and events.

The essence of the relations with the publics is the same, whether one speaks of political sphere "social or business relations, charitable or foundation associations each of which has its own specific needs. And since diverging external milieu is contained within significant specific features (entrepreneurial sphere, offices, associations, political parties, variety of clientele, etc.), we raised a question whether the managers, directors of public administration bodies work in such a manner that they obtain the agreement from the former through the outcomes of their performance, suitable forms of communication with external milieu, whether the managers acknowledge the substantiality of PR (under the centrally planned model of managing the society such activities more or less did not exist, the primitive form of "books of complaints" may not be identified with PR!).

A public relations manager in public administration bodies is then adjusted within considerably different conditions as a manager in the organizations with entrepreneurial activities. The differences are given by both internal and external factors, their mutual relations and mutual conditioning. Apart from the above differences, one should briefly mention the following (from these the position of public relations is prevalingly derived):

- Specific communication with clients, citizens, by providing services in public sector, and public administration bodies [1].
- In public sector organizations there is absence of economic markets - consequence: lesser stimuli to decrease the costs, to increase the effectiveness and total outcomes,
- absence of market indicators and information (prices, costs, yields, profits, labour productivity, etc.) - consequence: narrowed space for taking one's own decisions,
- The performance of government is frequently of force-exerting character - consequence: absence of creative, innovative thinking, etc.,

- A greater tendency toward confliction of aims - consequence: looking for compromises (conflicting requirements from the clients and political representatives - effectiveness versus openness, effectiveness versus social equality, etc.,
- More frequent encounters with interventions, external interest groups and political bodies,
- More frequent occurrence of tendency to lower respect for relationship between the flattening organizational structures and effectiveness,
- Organizational structures of public organizations are usually given from the top (they are under bureaucratic pressure, are a bureaucratic structure, etc., etc.

## **Selected Significant Results of the Research**

The objective of the research was obtaining the knowledge of the level and quality of forming the relations with the public and mapping the cooperation and contacts of local state administration with communication media. The subjects of the research were all of the district administration bodies in the region of Eastern-Slovakia, which is the largest third part in Slovakia. The essential file was formed by the local administration bodies. These are the institutions, which in relation to the citizens perform the largest spectrum of functions. In data collection, 81% returns (returnability) of the questionnaires have been achieved.

The research was performed in 30 public sector institutions – district administrations bodies of the Eastern-Slovakia region in April and May 2003. There were researched the heads of bodies (directors, managers). It offers a sufficiently qualified view of the problems defined by the structure of the present paper. Let us repeat that the main objective of the research was obtaining pieces of knowledge, opinions, and evaluations from individual district administration bodies concerning the level and quality of building the relations with the publics and mapping the cooperation and contacts of local state administration with communication media (the research was performed in form of questionnaires and 9 hypotheses had been defined in advance). From the results of research herewith select only those which answer the questions defined by us as those of having priority (for the present paper).

The questionnaire contained dichotomous scale, open questions and their combinations. 9 hypotheses have been prepared, out of which, due to the limitations of the present paper, we verbatim quote merely those whose verification confirms the state of PR position in district administration bodies and those pieces of knowledge which may be used in devising university educational strategies (preferences of study branches by the district administration bodies employees).

The paper stresses the specific characteristics of public administration management and the standpoints of the officials and employees of district administration bodies toward public relations. Despite the facts given to the attention of public administration management, it offers a topical appeal by Jan Rudy [3].

We have set hypotheses based on the results of research probe. The main selected results of the research are following:

- 54% of the heads of bodies consider public relations a significant element of management and 46% of the bodies consider the same to be exceptionally significant.
- As many as 62 % of the total number of district administration bodies have not a short-term or long-term plan of work with the public elaborated in which they focus on the solution of specific problems and requirements of the citizens and advertising the work of the body and only 38% of the same have such a plan.
- Over 51% of district administration bodies provide for the activities belonging within public relations by means of their own departments, only minority of such bodies use external agencies since the body has not been used to enjoy such services.

In the next part of the research we supposed that the examined set of respondents – district administration bodies chairpersons, consider the most frequently employed tools of public relations the following: meetings and conferences, notices issued by the administration body, information leaflets and bulletins, radio and television, boards, regional press (see the scheme, Fig. 1).

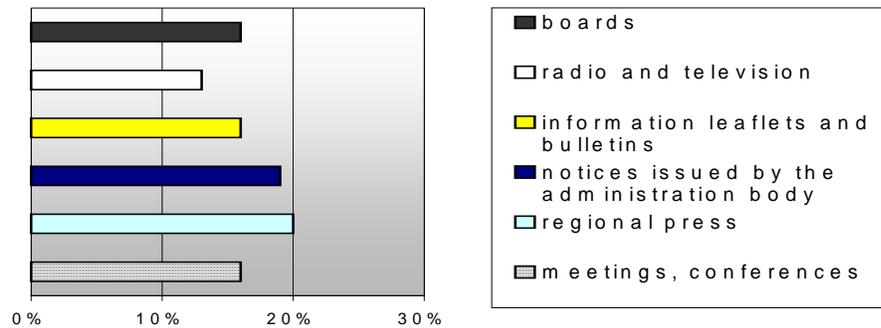

FIG. 1: THE MOST FREQUENTLY EMPLOYED TOOLS OF PUBLIC RELATIONS (VIEW OF RESPONDENTS)

The most successful three types of sectors of the public relations performance are, in the views of the respondents, from the total number 18 types of sectors, the first three being: area planning (29%), environmental (21%), housing policy (18%).

### Educational Branches Suitability for Public Relations Worker Profile

Very important task is to analyze the most suitable branch of study (university study) for the worker who should deal with public relations.

Public relations are multidimensional term and it contents many various activities. Optimal preparation should be combination of study branches, or interdisciplinary study [4].

Our research gives us one of the next results based on opinions of practitioners:

The most suitable branch of education for a PR worker is considered by the chairpersons of district administration bodies the following 4 study (academic) branches: law (27%), psychology (21%), sociology (18%), and economy (11%), see the Fig. 2.

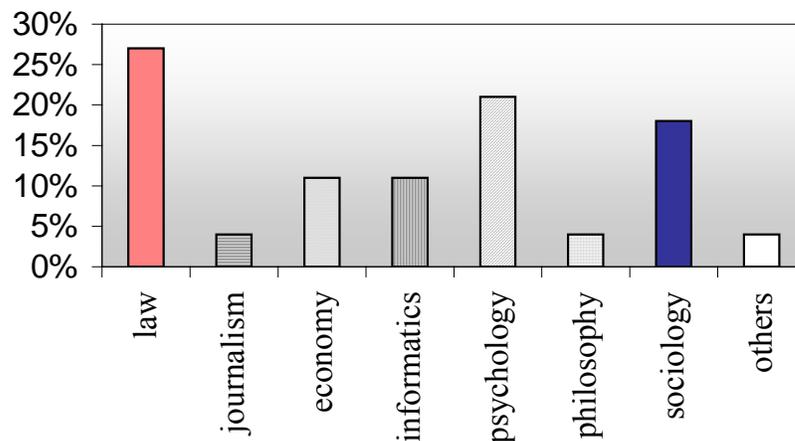

FIG. 2: THE MOST SUITABLE BRANCH OF EDUCATION FOR A PUBLIC RELATIONS WORKER BY OPINION OF RESPONDENTS:

The remaining hypotheses have been represented by the verified attitudes in decision-making and legal power, contacts with clients and relations to them, and the system of priorities in preferring the selection of target groups within state administration.

Public relations represent then work for the publics, with the publics, and in the publics, they bring in the organization the information on the responses from the public to their own performance, whereby creating a basis for inspiring and critical moments pertaining to the entire organization. They are then one of the essential functions of management [5].

In Slovak transitional economy there is necessary to transform public administration organizations, public administration bodies also nearer to clients, to citizens. Public service must be very responsive organizations.

A responsive institution makes every effort to sense, serve, and satisfy the needs and wants of its clients and publics within the constraints of its mission and its budget.

The highly responsive institution not only surveys current client satisfaction, but also researches client needs to discover ways to improve its service. Institution selects and trains its people to be client-minded.

Unresponsive institutions usually reflect bureaucratic mentality, tendency to routinize their operations, replace personal judgment with impersonal policies, specialize the job of every employee, create a rigid hierarchy of command, and convert the institution into an "efficient machine".

Each institution should evaluate how responsive it can and wants to be and then implement the programs to create and to optimize (raise) the level of clients' satisfaction. The reaching high client satisfaction is one of the best ways to improve the state of public relations and of image of public institution.

The formation of relations with the public from the level of public administration is justified since they pertain to all citizens, while the trust of the citizens is derived from the given relations between the citizens and public administration.

# **International Strategic Alliances in Malaysia: Role of Research & Development on Knowledge Acquisition**

*Fariza Hashim  
Abdul Rahim Abu Bakar  
Universiti Utara Malaysia, Malaysia*

## **Abstract**

International strategic alliances are currently a strategic mechanism by which firms acquire knowledge from potential partners. In accelerating the knowledge acquiring process, firms need specific activities that enable them to focus their learning efforts. Research and development (R&D) is believed to be the most effective way for firms to focus their efforts and maximise their knowledge acquisition from partners. Sixty Malaysian firms engaged in international strategic alliances were surveyed to examine the extent of R&D involvement in international strategic alliances. The effects of R&D activities and R&D expenditure were also analysed using censored regression. The findings reveal that the involvement of R&D in international strategic alliances in Malaysia is rather low. R&D activities show a significant effect on knowledge acquisition, while R&D expenditure shows insignificant effect on knowledge acquisition.

## **Introduction**

The 1980s and 1990s witnessed increasing complexities and uncertainties in technologies and products. This turbulent environment has forced firms to react aggressively as it affects their strategies and competitiveness in the market (Ohmae, 1989). International strategic alliances have become an option to deal with these rapid changes, as it enables firms to conduct their business across national boundaries. International strategic alliances are essential as they help firm to overcome potential difficulties and regain their competitive position in international markets. Thus, international strategic alliances, also known as collaborations, become necessary in order for firms to compete efficiently in the current turbulent and interdependent environment (Astley, 1984; Bresser & Hall 1986).

The rapid growth of international strategic alliances has been encouraged by several factors: speed and uncertainty of technological development (Contractor & Lorange, 1988); access to new markets & becoming innovative (Hagedoorn, 1993); coordinating and formulating technical standards and dominant design (Grindley, 1995); and increased market power by coordination among competitors (Porter & Fuller, 1986; Hagedoorn, 1993). One of the most widely cited motives for strategic alliances is the acquisition of new technical skills or technological capabilities from partner firms (Mariti & Smiley, 1983; Hamel et al., 1989; Shan, 1990; Hamel, 1991; Powell & Brantley, 1992; Moody, 1993; Khanna, 1996).

As acquiring new knowledge or technological capabilities is the most significant motive for collaboration, strategic alliances have become a strategic learning channel for firms to accomplish such a goal. Strategic alliances provide opportunities for exploring and learning new knowledge, which is becoming a managerial priority as it provides the basis for organizational renewal and sustainable competitive advantage. Strategic management researchers have begun to recognize knowledge as the most important resource that managers need to value and understand if they are to create sustainable competitive advantages (Epple, Argote & Devadas, 1991; Doz, 1996; Barkema, Bell & Pennings, 1996).

As many firms have now realized that self-sufficiency is becoming increasingly difficult in a business environment that demands strategic focus, flexibility and innovation (Drucker, 1995), the importance of international strategic alliances has grown significantly. International strategic alliances provide local firms with opportunities to pool their strengths with the help of foreign partners and create potential for firms to acquire knowledge associated with partner skills and capabilities (Inkpen, 1996). This knowledge can then be assimilated into the local firm's systems and structures. Without an alliance, access to the foreign partner's skills would probably be restricted, thus limiting opportunities for learning. The formation of alliances represents strategic

initiatives that create potential for creating experiences, actions, and strategic choices that provide the basis for learning. However, the formation of the alliance cannot ensure that its learning potential will be realized. Firms must take explicit steps to capitalize on the alliance's knowledge potential.

## **Learning and Knowledge Acquisition**

The core component in the knowledge acquisition process is learning. Without the learning process, knowledge cannot be transferred and acquired by others. Learning involves more than the mere taking in of information. Learning, instead, is a process that is about enhancing capacity. Learning is about building capability to create that which the firm previously could not create and is ultimately related to action, which information is not. Learning within the organization can occur at three levels: individual, team and organizational. Senge (1996) asserts that organizations learn only through individuals; individual learning per se does not guarantee organizational learning, but without it no organizational learning occurs. Argyris and Schon (1978) also emphasize that individual learning is a necessary, but insufficient condition for organizational learning.

In order to understand knowledge, firms have to value the complexities of acquiring, transferring, and integrating knowledge in a learning environment. The complexities of acquiring, transferring and integrating knowledge are more intense when firms from different countries are involved. The complexities are greater as firms have to deal with cross-border issues like skills and cultural differences, and the challenge of adapting organizational skills in diverse settings. International strategic alliances create learning prospects for the partner firms, as they bring together firms with different skills and knowledge bases. The primary interest in the strategic alliances is to gain access to the skills and knowledge of partners. This access can be a powerful source of new knowledge that would not be possible without the formal structure of an alliance (Inkpen, 1998).

Research and development (R&D) is known to be an activity that sparks new knowledge within an organization. Nonetheless, in the context of strategic alliances and learning, this activity has not been widely studied, particularly in the Far East region. Looking at learning capacity, Cohen & Levinthal (1990) argue that research activities would enhance firms' ability to learn as research activities enhance firms' technical expertise. As a result of such technical expertise, knowledge can be easily diffused to another firm or partner. This would facilitate the process of acquiring knowledge from the partner. Cohen & Levinthal (1990) similarly emphasize that R&D activities also indicate a firm's effort to learn and develop its absorptive capacity. The level of R&D activities and effort to learn can be represented by the allocation of expenses spent on research activities every year.

In Malaysia, international strategic alliances are growing dramatically as the Malaysian government, represented by Malaysian International and Trade Industries (MITI) strongly encourage local firms to collaborate with firms from other countries for the purpose of acquiring knowledge from foreign firms. Firms from developed countries, in particular, are the target, as these firms are assumed to possess the technologies that are required by the country. Establishing alliances with foreign firms is a means to access partners' knowledge, and conducting R&D activities is one way to speed up the knowledge acquisition process.

However, understanding of R&D activities and their role in enhancing the knowledge acquisition process between Malaysian firms and foreign partners is rather limited. Hence, this paper attempts to examine the extent of R&D involvement in the knowledge acquisition process in Malaysian international strategic alliances. The discussion will begin with an exploration of the link between R&D and knowledge acquisition, followed by assessment of the strategic roles of R&D in international strategic alliances in Malaysia. The paper will also highlight the influence of R&D activities in learning from the foreign partner and the degree of involvement and control of foreign and local partners in R&D activities. R&D expenditure is also examined to see its effect on knowledge acquisition.

## **Theoretical Background**

### **Knowledge Acquisition and Learning Capacity**

Acquiring knowledge from a partner is not a straightforward process. There are other elements that might influence the knowledge acquisition process. Knowledge acquisition is a function of learning capacity, which is largely determined by other elements. Studies show that prior related knowledge (Cohen & Levinthal 1990, Mowery, Oxley & Silverman, 1996), bureaucracy level (Dodgson 1993; Lyles & Baird 1994, Brown & Duguid 1991, Fiol & Lyles 1985, Hedlund 1994, March 1991), determination of firm to learn (Hamel 1991, Mansfield 1988, Inkpen 1998) and R&D (Cohen & Levinthal 1990) are likely to influence the ability of firms to learn, and result in knowledge being acquired.

Learning capacity is a concept that indicates the learning speed that a firm has where absorption and utilization of information is concerned. This learning speed varies among firms, there are some firms learn faster than others. Learning capacity enables a firm to absorb capabilities or knowledge outside its boundaries, and development of this capacity will result in the accumulation of knowledge (Cohen & Levinthal, 1990).

Cohen & Levinthal (1990) argue that prior related knowledge is a prerequisite for firms to assimilate and use the new knowledge. The absence of prior related knowledge would retard the process of putting the new knowledge into memory, thus slowing the process of acquiring knowledge. A non-bureaucratic and non-hierarchical structure and management approach would create flexible conditions that enhance the capacity of a firm to absorb new knowledge. Flexible conditions also encourage cooperation and information exchange among members and allow them to adjust their manner of operating to meet changing needs (Brown & Duguid 1991, Fiol & Lyles 1985, Hedlund 1994, March 1991). Valuable competences cannot be transferred without the intention to learn. Intention to learn represents the firm's determination to learn from the other partner (Hamel, 1991). Inkpen (1998) argues that if a firm does not aggressively seek to acquire knowledge, it is unlikely that knowledge acquisition will take place. Therefore, the firm has to be active in learning, as a passive approach would mean less knowledge will be acquired. Another element that determines the extent of knowledge acquired is R&D. R&D is an activity that leads firms to learn and acquire knowledge, as it provides hands-on experience to the firm. Knowledge will only diffuse to another firm when the firm has sufficient technical expertise. Thus, the firm's research activity would enhance its ability to learn (Cohen & Levinthal, 1990). In fact Cohen & Levinthal (1990) emphasize that a firm's R&D activity reflects its effort to learn and develop its absorptive capacity. R&D activities will not only encourage new knowledge, they will also boost the firm's absorptive capacity in the learning process. The level of R&D activities and the firm's incentives to learn and acquire knowledge can be indicated by the allocation of funds to these activities. The higher the spending on R&D, the more knowledge is expected to be acquired from the activity.

### **Learning Capacity and R&D**

As R&D contains activities that are full of knowledge and expertise, it becomes a platform for firms to facilitate learning and acquiring knowledge. R&D enables firms to recognise necessary information and utilise it accordingly by conducting their own activities. Therefore, R&D tends to function not only as a source of learning, but also as an applied training centre. Studies show that firms that conduct their own R&D can use external information better than firms that do not (Tilton 1971, Allen 1977, Mowery 1983). This indicates the importance of R&D as a learning mechanism. Having their own R&D enables firms to be directly involved in manufacturing operations. Firms that have direct manufacturing involvement recognise and exploit new information better than those that do not. This is because the production experience provides the firm with necessary background to recognise the value of and implement methods to reorganise a particular manufacturing process (Abernathy 1978, Rosenberg 1982).

Simultaneously with firms' prior related knowledge of the partner (Cohen & Levinthal 1990, Lyles & Salk 1996, Mowery et al. 1996), bureaucracy level within an alliance (Dodgson 1993, Lyles & Baird 1994, Lyles & Salk 1996, Brown & Duguid 1991, March 1991) and determination to obtain the new knowledge (Hamel 1991, Mansfield 1988, Cohen & Levinthal 1990, Inkpen 1998, Grant 1996), R&D provides vast opportunities for a firm to enhance its absorptive capacity and thus boost the learning and acquiring process of knowledge. Therefore, R&D was examined together with these three variables in this study.

Previous literature has not shown the relationship between knowledge acquisition and the local firm's involvement in R&D activities. Nonetheless, it is believed that the involvement of the local firm and the degree of

control that the local firm has on the R&D activities would increase the local firm's experience and thus increase the level of knowledge acquired. Previous studies revealed that the involvement of the receiver or learner in the learning process, such as R&D activities, would encourage greater knowledge acquisition (Lyles & Salk 1996, Huber 1991). Hence, this study attempts to discover an effect of local firms' direct involvement and control in R&D on the knowledge acquisition process.

The following hypotheses were designed to test the effect of R&D on knowledge acquisition:

- H1: The existence of R&D activities in the relationship will increase the knowledge acquired.
- H2: The greater the R&D expenditure, the greater the knowledge acquired.
- H3: The more local firms are involved in R&D activities, the higher the knowledge acquisition.
- H4: Local control of R&D activities will increase knowledge acquisition.

## Methods and Findings

### Research Design and Sampling

A survey was conducted in this study and a questionnaire was distributed to Malaysian manufacturing firms involved with foreign partners in their operations. The population of this study is high technology manufacturing firms that are currently engaged in international strategic alliances with foreign firms and operating in Malaysia.

Databases from the Malaysian Manufacturing Association, the Federation of Malaysian Manufacturing (FMM) and Malaysian industry-promoting agency, the Malaysian Industrial and Development Authority (MIDA) were taken as a sampling frame. 823 Malaysian firms were identified as having strategic alliances with foreign partners. Thus, census sampling was adopted. Personal interviews were conducted with a top management representative; either Managing Director or General Manager, for each alliance and appointment was made prior to the interview.

65 firms participated in this study. However, not all sample firms conducted their own R&D activities. 37 firms conducted their own R&D activities while another 28 firms either did not conduct R&D at all, or R&D was conducted only by the foreign partner in the home country and did not involve the local partner at all. Pearson correlation and censored regression were used to analyse the data with the aid of SPSS Version 11 and Limdep Version 7 software.

### Hypothesis Testing

TABLE 1: RESULT FOR T-TEST AND CORRELATION

Hypotheses	Group sample (Correlation between)	Mean value (N)	Test used	Sig	Reject/Not reject
H1	No R&D Has R&D	3.56 (28) 3.93 (37)	t-test t = -2.440	0.017	Reject H0 at 5%
H2	R&D expenditure and knowledge acquisition	N = 56	Pearson r = 0.104	0.222	Do not reject H0
H3	Locals involvement and knowledge acquisition	N = 37	Pearson r = 0.023	0.446	Do not reject H0
H4	Local Foreign	3.91 (14) 4.11 (7)	t-test t = -0.782	0.444	Do not reject H0

Table 1 summarises the findings for hypotheses 1, 2, 3 and 4. H1 tested the presence of R&D and its relationship to knowledge acquisition. T-test was used to test H1 and the result is statistically significant. This indicates that the presence of R&D is related to the knowledge acquisition experienced by the local firms. Having Research and Development (R&D) activities within the company is an advantage to the local firms as firms learn more from the foreign partner when this kind of activity is carried out.

H2 tested the relationship between R&D expenditure and knowledge acquisition. Pearson correlation was used to test this hypothesis. The result shows that the relationship between R&D expenditure and knowledge acquisition is not statistically significant. This indicates that R&D expenditure is not related to the knowledge

acquisition experienced by the local firm. Therefore, it is not clear that the amount spent by the firms on these activities will generate more knowledge acquired by the locals.

H3 tested the relationship between local involvement and the knowledge acquisition process and Pearson correlation was used to confirm the hypothesis. The result was insignificant. This indicates that the involvement of local employees in the R&D activities has no effect on the knowledge acquisition process. The involvement of the local firm in the R&D activities is believed to depend on the types of activities carried out and the extent to which locals were given opportunities to conduct the whole of these activities.

Finally, H4 tested the degree of control between local and foreign firms and its link to knowledge acquisition. The result is also statistically insignificant. This indicates that whoever controls the R&D activities, either local or foreign partner has no effect on the knowledge acquisition. Hence, it not possible at this level of analysis to generalise that R&D expenditures and local control will increase the level of knowledge acquired

In order to investigate the effect of R&D activities and expenditure on knowledge acquisition, further statistical analysis was carried out. As R&D was examined together with other learning capacity variables such as prior related knowledge, bureaucracy level and determination to learn, non-linear regression analysis was conducted. The non-linear regression technique used was a censored regression model, also known as a tobit model. Prior knowledge refers to knowledge that the local firm has before the relationship was established, this includes basic skills and technological development in the industry such as product markets and other technical activities. Bureaucratic level refers to the extent of bureaucracy and hierarchy in its structure and management approach. Determination to learn represents the intention of the firm to learn from the foreign partner where valuable competences can be acquired.

TABLE 2: RESULT FOR CENSORED REGRESSION

	Model 2	Model 4	Model 5	Model 6

Table 2 summarises the results of censored regression. It shows four models to examine the effect of R&D activities, R&D expenditure and learning capacity on knowledge acquired. Model 1 shows a relationship between years, joint venture, firm size, Research and Development (R&D) and learning capacity towards knowledge

acquired. Model 1 (Table 2) shows that Research and Development (R&D) is significantly associated with knowledge acquired, where a firm that conduct R&D activities tends to acquire more knowledge than a firm that does not. As R&D activities reveal the firm's effort to learn and develop its absorptive capacity, the activities not only act as a platform for the local firms to learn new knowledge and skills from the foreign partner, but they also boost the firms' absorptive capacity in the learning process. Joint venture, size of firm and learning capacity showed a significant contribution to the knowledge acquisition. Joint ventures lead to more knowledge acquisition by Malaysian partners than contractual agreements. In terms of firm size, the level of knowledge acquired is more obvious in large firms compared to small firms. This means that large firms have an extra advantage in acquiring knowledge compared to small firms. In terms of learning capacity, the result showed that the higher the capacity that the firm has, the more knowledge could be acquired.

In Model 2 (Table 2), the simple R&D dummy variable is replaced by R&D expenditure. Unlike R&D activities in Model 1, Model 2 shows that R&D expenditure has no effect in acquiring knowledge from the foreign partner. R&D expenditure refers to the allocation of fund to the activities. The result indicates that the knowledge acquired by the local firm was not influenced by how much the firm spent on the R&D activities. A firm might spend a large amount of money on R&D activities, but this is not a guarantee that much knowledge will be acquired. How the R&D activities were conducted between the foreign and local partner is more important. Some firms might have to spend a large amount of money on equipment and materials, depending on the industry. However, if a smaller amount of money is spent on human factors, the return of investment cannot be seen in terms of knowledge. Investing in equipment and materials will not involve much knowledge transfer, as it is limited to the knowledge of handling the machinery to produce finished goods. Knowledge of learning how to develop innovative products is more significant and essential for firms to acquire. The prospect for knowledge acquisition is less favourable when maintenance and repair activities depend on the foreign firm. The reason is that some local firms are not willing to train employees abroad to obtain the technical knowledge about the capital equipment, as it is quite costly for the organization. As a result, dependence on the foreign partner becomes greater. This situation would further limit the knowledge that could be acquired by the local firm. Hence, the large amount of money spent is not rewarded in terms of knowledge, which is an intangible asset; instead, the money is rewarded in terms of equipment, which is a tangible asset. Model 2 also shows that joint venture, size of the firm and learning capacity has significant effect on knowledge acquired. Joint venture firms and large firms tend to acquire more knowledge compared to contractual relationships and small firms. Learning capacity also showed a positive relationship with knowledge acquisition.

Model 3 and Model 4 (Table 2) show a relationship between R&D activities, R&D expenditures, joint venture, size of firm, and learning capacity elements - prior knowledge, bureaucracy level and determination to learn towards knowledge acquired. Model 3 differs from Model 4 in that the former includes R&D activity, while in the latter; this is substituted with R&D expenditure. Joint venture, size of firm and all the learning capacity elements showed a significant positive effect on knowledge acquisition. Joint venture relationships and large firms would generate more knowledge to be acquired compared to contractual relationships and small firms. The results also indicate that firms that have prior knowledge, flexible management, and high determination to learn from the foreign partner tend to acquire more knowledge from the relationship. The higher the prior knowledge of the locals firms, the more flexible is the management, and the higher the determination of the local employees to learn, the greater the knowledge that could be acquired by local firms.

From the above results, it can be concluded that as learning capacity has a significant positive effect on the knowledge acquired from the foreign partner, R&D activities play a vital role in this effect. Firms that conduct more R&D activities are likely to have a greater learning capacity and are likely to acquire more knowledge, whereas firms that do not have R&D activities are less likely to learn and acquire knowledge from the foreign partner. This implies that R&D activities, together with prior knowledge of the technologies or products, a flexible management in terms of alliance relationship, and determination to learn from the foreign partner, are the factors that encourage acquisition of knowledge from the foreign partner.

## **Discussion, Limitations and Conclusions**

### **Discussion**

This study found that R&D activities could enhance the scope of learning and could facilitate the process of acquiring knowledge from the partner. The existence of R&D activities could boost the firm's learning capability, together with other elements such as the firm's prior related knowledge, bureaucracy level and determination to learn. However, the finding revealed that the international strategic alliances established are not extensively occupied by knowledge generating activities such as R&D. The small number of R&D activities conducted in these relationships reveals that firms place a low value on R&D activities. This might be due to several obstructions that restrain local firms from aggressively engaging in these activities. The findings show that there are three major obstructions that prevent Malaysian firms from participating in R&D activities. The first is the nature of R&D itself, which entails a high investment cost. This is a major obstruction, as most local firms lack capital investment. When local firms perform manufacturing activities which also require high capital investment, especially for manufacturing equipment, they do not have sufficient capital to invest in R&D activities. Thus, R&D activities receive less priority. The second obstruction that inhibits aggressive effort by local firms to engage in R&D activities is the lack of human capital. The scarce supply of qualified local employees to carry out technical activities in particular, has delayed the process of knowledge acquisition among partnering firms. The reliance predominantly on expatriates in R&D activities has caused other adverse effects, as it not only increases administrative costs, due to their higher salaries and fringe benefits, but also defers the learning process within the strategic alliance relationships. The final obstruction that the study revealed is a lack of support from the government itself. Local firms claimed that the government authorities are not very supportive in providing necessary facilities for them to carry out R&D activities. Assistance such as funding is considered vital for local firms to grow, as lack of it is their major constraint at the moment.

This study also shows that though Research and Development (R&D) activities are imperative to encourage learning and knowledge acquisition process among the partner firms, R&D expenditure did not depict the same pattern. The amount that a firm spent on R&D activities did not represent the extensiveness of knowledge acquisition activities. Therefore, the amount spent for R&D activities does not necessarily contribute to enhance learning and knowledge acquisition. Though this result seemed to be contrary to the theory of R&D, it might be explained by the prevailing Malaysian environment.

### **Limitation and Future Studies**

The role of R&D activities in acquiring knowledge from a foreign partner is encouraging. However, the small number of international strategic alliances that have R&D activities limits further understanding of the relationship between R&D activities and knowledge acquisition. A small sample size also limits our further analysis on R&D activities. This study may also be biased towards better performing firms, as their management might be expected to be more willing to share information with the researcher. It should also be borne in mind that the findings derived from correlation do not establish any causation, but merely explain the existence of a relationship. Further study on international strategic alliances based on R&D cooperation would be interesting to explore, as it could increase an understanding on R&D and strategic alliance structure.

### **Conclusion**

This study focuses on international strategic alliances, which are widely adopted by firms at present in order to sustain their competitiveness in the market. Although international strategic alliance has been a strategic mechanism for firms, an understanding of this mechanism, and especially its impact on learning and knowledge acquisition is, however, rather inadequate. R&D is considered as one of the activities that is rich with new knowledge and expertise. Thus, by engaging in such these activities, firms are expected to learn and acquire more knowledge from their partners. Nonetheless, this process is not that straightforward in Malaysia. Though R&D activities are significant to the knowledge acquisition process, these activities are not widely conducted among strategic alliance firms, due to several constraints that they endure. Consequently, these constraints adversely affect the knowledge

acquisition process. Hence, the objective of learning and acquiring knowledge from the foreign partners might not be possible to accomplish.

# Link of Performance Appraisal to Compensation: A Case of Slovak Republic

*Stanislava Luptáková*

*Martin Šlachtič*

*Comenius University in Bratislava, Slovak Republic*

## Abstract

The presented article seeks to find the degree of link between assessment of employee performance and compensation in the Slovak companies. The findings of the article are based on an analysis of a questionnaire sent to human resource management executives or the top human resource position. The study is based on the responses of 40 organizations operating within Slovakia. The companies involved in the study cumulatively employ over 26000 people and represent a wide specter of industries, 68% of the sample were the companies with majority of foreign capital in their capital structure. The aim of the research was to examine the degree of performance related compensation within the surveyed companies. The article examines the differences between practices and procedures of Slovak companies and foreign owned companies. Moreover, it focuses on the degree of performance-driven pay related to a position of managers within the organizational structure.

## Introduction

Over the past decades, there has been an immense attention of both researchers and practitioners given to performance appraisal. Recently, we have, however, seen a shift in attention – from performance appraisal as a technique that needs to be valid, reliable, legal and accepted by both appraisers and appraised to performance appraisal as a tool that can link other human resource management activities and enhance organizational citizenship behavior among the employees.

In today's work environment, the key managerial issues are grouped around efficiency, performance, compensation and employee motivation and satisfaction. With concepts of teamwork and empowerment and by recognizing excellent performance, organizations seem to be shifting ever more responsibility onto the individual employees. Performance management is a set of activities that is aimed at the best possible utilization of performance appraisal. The best utilization of performance appraisal is achieved when the information gained from performance appraisal can be used for subsequent decisions in other human resource management activities such as compensation, training and career development. While performance management provides the synergy of linking different human resource management practices, pay for performance is a direct tool that can enforce motivation and attitudes of employees. Pay for performance represents the evaluative function of performance appraisal and thus can enforce the acceptance of performance appraisal feedback by the employees.

If designed and executed properly, performance appraisal can serve several purposes in an organizational setting:

1. Source of formal communication
2. Source of employee motivation
3. Source of organizational consistency and procedural justice

### **Performance Appraisal as a Source of Formal Communication**

Performance appraisal is a source of formal communication in several cases. First, and the most important, it communicates to employees the standard, quality and/or quantity of work performed on the job. As the key aspects of performance are typically evaluated in performance appraisal, the employee should understand what is the expected satisfactory behavior and performance.

Second, when delivering results of appraisal to the appraised employees, both the form of performance appraisal method and the style of feedback provided by the manager is an important source of formal communication within the organization. Methods that require interactive feedback, such as management by objectives, create space for clarification and potential improvement of the evaluated employee more than methods of

one-way evaluation e.g. in ranking or forced distribution. During the evaluation session when the manager provides feedback to the employee, both style of communication and topics covered are important signals to the employees.

#### **Performance Appraisal as a Source of Employee Motivation**

Performance appraisal can play an important role in almost any theory of motivation. It can enhance the intrinsic motivation of people because feedback on performance puts value and importance on the job done. It signals to the employees that the organization cares about the work they are performing, thus increasing the status of the job and the jobholder. Performance appraisal can also enhance extrinsic motivation, as it can be linked to both financial rewards and non-financial incentives. However, there are at least three main theories of motivation that directly reflect performance appraisal: Equity Theory, Reinforcement Theory, and Goal-Setting Theory. According to the Equity Theory, employees compare themselves with their reference employees; specifically they compare their performance and the subsequent reward with performance and reward of the reference person. Based on the outcome of such comparison the employees can perceive equity or inequity. In case of perceived inequity, the person's motivation decreases. Although these comparisons are always subjective and may contradict reality, they influence the person's motivation and performance. Performance appraisal can enable the individuals to make more reliable and more objective comparisons with their reference colleagues. In case performance appraisal is used as a basis for variable part of pay, the basis for comparison is even more straightforward and the sense of unfair inequity is diminished.

Reinforcement Theory looks at motivation from a viewpoint of a manager, not the managed employee. The main proposition of the theory is that there are two sets of behaviors – desired and undesired. Managers can then punish or ignore the undesired ones and reward or not punish the desired ones. By rewarding the desired behaviors, attitudes and performance, the managers reinforce the required quality and quantity of work. The employees feel motivated, as their effort is recognized and compensated. They, thus, have an incentive to perform at high level.

Goal-setting Theory says that people are motivated to achieve goals, however, they need to perceive the goals as acceptable and they need to put value on the possible reward that follows successful accomplishment of the goals. The acceptance and commitment to goal is as important as the desire for the reward. For managers, there is an important question concerning the difficulty of the assigned goal. Goals need to be specific and difficult goals lead to better performance than easy goals. Goal setting is most effective when there is feedback showing progress towards goal [3]. This requires feedback to be provided to the employees and also to make a follow-up in a form of reward.

#### **Performance Appraisal as a Source of Organizational Consistency and Procedural Justice**

Performance appraisal is a tool that can enhance a sense of procedural justice among the employees. As a procedure, it can enhance the sense of justice and trust among employees towards the organization. However, performance needs to be assessed regularly and the feedback has to be accepted by the employees. Moreover, the employed performance appraisal technique has to reflect the assessed job and person and there has to be a follow-up after the assessment. If employees believe that performance appraisal is done consistently and that the information gained from appraisal is used for decisions about compensation, training, development and/or termination of employment, then it is likely to create procedural justice. Moreover, a pay-for-performance system is perceived as fair if it is consistently applied to all employees, employee participation is included, employees can appeal and the data used are accurate [6].

The importance of performance appraisal as a sole managerial tool is significantly enhanced when it is connected to other human resource activities, namely compensation, career development, and training. Linking performance appraisal and compensation reflects the evaluative part of performance appraisal. There is also a developmental part of performance appraisal, which focuses on improvement of employees, on identification of strengths and weaknesses of the assessed employee. As argued by Boswell and Boudreau [1], these two functions need to be linked together, because the evaluative form enhances the success of the developmental. In other words, if there is a need to improve performance, the manager can influence extrinsic rewards that follow appraisal and the employees will recognize the need to improve. The employees will believe that the potential improvement in skills or abilities will positively influence the results of future appraisal and thus positively influence either financial rewards or career movements.

Pay for performance is commonly known as paying employees while considering their job performance. In

other words, better performers should be recognized and rewarded more significantly and poor performers should be awarded less. Deciding what is good or bad performance is the matter of setting standards and desired behaviors. These should be consistent with the organizational objectives, as this is likely to improve the overall performance of the organization.

As argued, there is a need to link performance appraisal to other human resource activities. The most crucial remains the link to variable pay; however employee development and training need to complement the usage of performance appraisal information to enhance the connection between evaluative and developmental functions of performance appraisal.

The aim of this paper is to describe the usage of performance appraisal for decisions about compensation on a case of the Slovak Republic. The main aim is to explore the link between performance appraisal and other human resource management activities, namely pay for performance and development. The paper also analyses whether position of an employee within the organizational hierarchy influences the decisions about variable pay and to what degree is variable pay linked to the individual's performance. Therefore we have formulated the following research questions:

- a) Is pay driven by performance?
- b) Is there a preference in usage of merit pay over merit increase?
- c) To what degree does variable pay depend on individual and corporate performance?

#### **Methodology of the Research**

Considering the above stated aim of this paper, a research has been conducted in March and April 2004. It consisted of a written questionnaire, which was distributed to randomly selected organizations operating within the Slovak Republic. There was only one questionnaire per organization sent. Respondents were in the most cases human resource managers; in cases of small organizations, general managers were asked to answer the questions. The questionnaire incorporated closed and multiple choice questions which were considered relevant to the subject under study, namely questions regarding performance appraisal practices in general as well as questions focusing on pay for performance.

#### **The Sample**

Altogether 40 organizations employing over 26,000 employees filled out and returned the questionnaire. Companies from all relevant business segments were proportionately included in the obtained sample, including Manufacturing, IT & Telecommunications, Pharmaceutical, Retail & Wholesale, and Financial Services. Nearly 68% of organizations making up the sample were organizations with majority of foreign capital in their capital structure, most of which came from EU countries. Regarding the size of the organizations, the sample consisted of small, medium-sized, as well as large organizations. Ranges for distinguishing the categories were set as follows: a) less than 150 employees, b) 150 to 500 employees, and c) more than 500 employees. Only three of all the organizations were state-owned at the time of the research, thus no generalization could be made with respect to state ownership.

#### **Findings**

Out of the 40 companies that participated in the research, 39 have confirmed the existence and use of formal guidelines for assessing performance of their employees. This represents 98% of all participating companies and demonstrates the importance and significance of performance appraisal to companies operating in the Slovak Republic. The fact, that 11 of these 39 companies (28%) confirmed the intention of changing the current performance appraisal system, indicates that there is still room for improvement and that more changes are likely to come in the nearest future regarding the usage of performance appraisal in Slovakia.

#### **A) Is Pay Driven by Performance?**

Our research confirms findings of other studies that performance assessment is a common managerial tool in companies in the Slovak Republic [5], [7]. This study further inquires whether the system of performance appraisal has been adopted from the parent companies. The reason for this interest is that transfer of know-how and western management processes are commonly stated as one of the advantages of foreign investments for transition countries. We wanted to know whether this was true also for performance appraisal practices as these are an essential element of an effective pay for performance compensation system. The outcomes of the research show that two thirds of the foreign companies\* that participated in the research have adopted the parent company's performance assessment system. Only 22% of these companies were not allowed to change the adopted system, the rest could adapt the

system to the local conditions and requirements. This can be considered as beneficial for the business environment in Slovakia, as the majority of foreign companies transfers their management practices but at the same time allows the system being adapted to the local requirements and conditions. Consistently with the so called “best practice approach”, we believe the performance appraisal and pay for performance practices transferred from the foreign headquarters are more effective and elaborated than the ones that were used in the territory of Slovakia over the previous decades.

Performance appraisal can serve various purposes and functions. The purpose pursued should in the best case determine the techniques, raters, and the timing of the assessment. According to our findings, 92% of organizations that have a formal performance appraisal system appraise the performance for pay administration purposes. When differentiating between Slovak and foreign companies, it turns out that all of the foreign companies pursue this purpose while only 75% of Slovak companies do.

Linking the variable pay to the results of regular performance appraisal enhances the meaningfulness of performance assessment and formal communication within an organization. If applied consistently, it also serves as a tool to alter perception of procedural justice among the employees. The outcomes of our research reveal that while there are companies that appraise performance for pay administration purposes, the employees are not really paid based on their performance. The question that arises in this case is why they actually make the effort to measure performance of employees when the outcome is not considered in the final reward? The opposite situation was also observed in one case. The company rewards its employees for their performance; however, it does not conduct performance assessment according to some formal rules or guidelines. One might oppose, that informal assessment techniques could have been used in this case, however, it is very likely that such techniques will not serve as a source of procedural justice and will not be perceived as fair by employees. In the worst case, it could lead to a perception of inequity and followed by undesired employee behavior. Summing up, of the 40 organizations that took part on the research, 34 (85%) operate an appraisal-driven compensation system; i.e. they conduct performance appraisal with the purpose of gaining information about employee performance, and afterwards this information is used to allocate rewards. Based on the fact that 93% of foreign companies and 69% of Slovak organizations employ an appraisal-driven compensation system, we can state that foreign organizations tend to employ such systems to a greater extent than Slovak companies do.

#### **B) Is there a Preference in Usage of Merit Pay over Merit Increase?**

It can be concluded that there is a link between performance appraisal and compensation in both Slovak and foreign companies operating in the territory of the Slovak Republic. Our further research questions concern the way and extent to which the actual performance appraisal outcomes affect the pay. In the following section of this paper, we present an analysis of such companies that do have an appraisal driven compensation system. Table 1 summarizes the different ways in which performance appraisal outcomes affect pay in Slovak and foreign companies. The figures are presented with respect to the particular management levels, as some differences can be observed at different levels. The column labeled "Total" presents the overall occurrence of the link between performance appraisal and compensation in managerial positions.

TABLE 1: HOW DO PERFORMANCE APPRAISAL OUTCOMES AFFECT PAY?

	Line Management		Middle Management		Top Management		Total	
	<i>Slovak</i>		<i>Slovak</i>		<i>Slovak</i>		<i>Slovak</i>	
	<i>Foreign</i>		<i>Foreign</i>		<i>Foreign</i>		<i>Foreign</i>	
	Abs.	%	Abs.	%	Abs.	%	Abs.	%
Pay increase decisions – merit pay	<b>18</b>	<b>53%</b>	<b>19</b>	<b>56%</b>	<b>15</b>	<b>44%</b>	<b>19</b>	<b>56%</b>
	3	33%	4	44%	3	33%	4	44%
	15	60%	15	60%	12	48%	15	60%
Decisions about variable part of pay – merit awards	<b>26</b>	<b>76%</b>	<b>24</b>	<b>71%</b>	<b>21</b>	<b>62%</b>	<b>28</b>	<b>82%</b>
	8	89%	7	78%	5	56%	9	100%
	18	72%	17	68%	16	64%	19	76%
Promotion decisions	<b>13</b>	<b>38%</b>	<b>13</b>	<b>38%</b>	<b>8</b>	<b>24%</b>	<b>13</b>	<b>38%</b>
	2	22%	2	22%	0	0%	2	22%
	11	44%	11	44%	8	32%	11	44%

As can be seen in the Table 1, performance appraisal outcomes affect the variable part of pay rather than the decision about pay increases or promotions. This is true for both Slovak and foreign companies and for all management levels. When talking about variable part of pay, we mean merit awards, i.e. bonuses, lump-sum payments, commissions, or piece-rate payments. Merit awards reflect the appraisal outcomes in 82% of the companies while pay increase decisions are made on the basis of performance assessment only in 56% of the organizations. Some differences can be observed when differentiating between Slovak and foreign organizations. For example, it is more common in Slovak companies than in foreign ones, that appraisal outcome affect merit awards, 100% of cases and 76% of cases respectively. In contrast, the influence on merit pay, i.e. increases of the base pay, is more common in foreign companies than in Slovak organizations (60% and 44% respectively). These trends can be observed at all management levels, even though there is a declining tendency to use either merit awards or merit pay with the increasing position within the organizational hierarchy.

For performance management to be efficient and effective there is a need to link the results of assessment to various human resource management activities – career moves, compensation and training are of the main focus. While career moves and promotions are usually not viewed as a component of the compensation system, they usually tend to be influenced by the individual's performance and from the employee standpoint, career advancement is considered to be a reward. The findings of our research (see Table 1) illustrate a weak and rather infrequent use of performance appraisal for decisions on promotion and career advancement. The usage is more apparent in foreign companies (44%) than in Slovak companies (22%). This is consistent with findings of Weidlich [8] who on a sample of foreign companies states that career advancements are made on a basis of performance rather than seniority. The findings also support the results of Luptáková and Vargic [4] where the link between development and performance assessment is stronger in foreign companies than in companies with Slovak capital ownership.

When looking at the relative figures in Table 1, one can see a slightly decreasing trend with the movement toward higher management positions. It is rather intriguing to note that the link between individual performance and variable part of compensation is weakened with higher positions. This can be interpreted as a decreasing importance of performance appraisal outcomes for compensation purposes at higher management positions. This is especially true for Slovak companies and indicates that there have to be some other processes in place to determine the pay of top managers. It is difficult to determine, which these could be, since quantitative goals like overall company performance can easily be implemented into the formal performance appraisal process. The most common one found in theory is to reward top managers based on the overall performance of the organization. With the increased position within the corporate hierarchy, there is an increased need to link compensation with the responsibility for overall results rather than the individual efforts of a manager. This was confirmed by our analysis (see Table 3).

#### **C) To what Degree does Variable Pay depend on Individual and Corporate Performance?**

Since performance appraisal outcomes influence the variable part of pay the most, we took a closer look at the extent to what the outcomes actually influence the variable part of pay. The organizations were asked to state how much of the variable part of pay is actually affected by the individuals' performance. The findings are presented in Table 2. One note is necessary before looking at these findings, namely that the relative figures are presented as a percentage of all companies that have an appraisal driven compensation system and at the same time performance assessment outcomes affect the variable part of pay. In other words, only companies that are stated in the second line of Table 1 are used as the base for the analysis in the next paragraphs.

TABLE 2: INFLUENCE OF INDIVIDUALS' PERFORMANCE ON VARIABLE PART OF PAY

	Line Management		Middle Management		Top Management		Total	
	<i>Slovak</i>		<i>Slovak</i>		<i>Slovak</i>		<i>Slovak</i>	
	<i>Foreign</i>		<i>Foreign</i>		<i>Foreign</i>		<i>Foreign</i>	
	Abs.	%	Abs.	%	Abs.	%	Abs.	%
0% to 33% of variable part of pay	<b>8</b>	<b>31%</b>	<b>5</b>	<b>21%</b>	<b>2</b>	<b>10%</b>	<b>8</b>	<b>29%</b>
	4	50%	2	29%	0	0%	4	44%
	4	22%	3	18%	2	13%	4	21%
34% to 66% of variable part of pay	<b>4</b>	<b>15%</b>	<b>5</b>	<b>21%</b>	<b>6</b>	<b>29%</b>	<b>7</b>	<b>25%</b>
	1	13%	2	29%	1	20%	2	22%
	3	17%	3	18%	5	31%	5	26%
More than 66% of variable part of pay	<b>10</b>	<b>38%</b>	<b>10</b>	<b>42%</b>	<b>8</b>	<b>38%</b>	<b>13</b>	<b>46%</b>
	2	25%	2	29%	2	40%	3	33%
	8	44%	8	47%	6	38%	10	53%

It is evident that individual performance plays a great role in the most cases. However, there are some differences between Slovak and foreign organizations. For example, it turns out that in Slovak organizations individual performance affects a smaller portion of the variable part of pay than it does in foreign organizations. While in 53% of foreign companies individual performance affects a significant part of variable pay (third line of Table 2), it is only 33% of Slovak companies where this is true. On the other hand, while in 44% of Slovak organizations a rather insignificant portion of variable pay (the first line of Table 2) is affected by individual performance; it is only 21% of the foreign companies where this is true.

However, in both Slovak and foreign companies, we can observe the highest proportion of variable pay influenced by the performance of the employee among top management positions. In both Slovak and foreign companies we see a tendency to increase a proportion of variable pay with the increasing position within an organizational hierarchy.

As mentioned above, the actual performance of an individual is not the only factor that determines his or her variable pay. It is known that companies sometimes tie the variable part of pay to the performance of the whole organization. Organizations that took part on the research were asked to state how much of the variable pay is influenced by the overall company performance. By 'company performance' we understand performance in monetary terms, i.e. profit or loss. The outcomes are presented in Table 3. Similar to Table 2, only companies that have an appraisal driven compensation system and where performance assessment outcomes affect the variable part of pay are used as the basis when calculating the relative figures.

TABLE 3: INFLUENCE OF COMPANY'S PERFORMANCE ON VARIABLE PART OF PAY

	Line Management		Middle Management		Top Management		Total	
	<i>Slovak</i>		<i>Slovak</i>		<i>Slovak</i>		<i>Slovak</i>	
	<i>Foreign</i>		<i>Foreign</i>		<i>Foreign</i>		<i>Foreign</i>	
	Abs.	%	Abs.	%	Abs.	%	Abs.	%
0% to 33%	<b>14</b>	<b>54%</b>	<b>9</b>	<b>38%</b>	<b>6</b>	<b>29%</b>	<b>15</b>	<b>54%</b>
	4	50%	3	43%	1	20%	4	44%
	10	56%	6	35%	5	31%	11	58%
34% to 66%	<b>4</b>	<b>15%</b>	<b>7</b>	<b>29%</b>	<b>3</b>	<b>14%</b>	<b>8</b>	<b>29%</b>

Looking at the figures presented in Table 3, it is obvious that the overall company performance affects rather small portions of variable pay. This is true for both Slovak and foreign organizations. Also true for both Slovak and foreign companies is a trend that can be observed. With the movement toward higher management positions more significant portions of variable pay are affected by the overall company performance. This finding only supports the theory, which says that at top management levels compensation is more tied to the performance of the whole organization.

## Conclusions and Discussion

Based on our findings, it can be concluded that the companies operating within the territory of the Slovak Republic consider performance appraisal an important tool and the outcomes of the appraisal use for decision about compensation of their employees in managerial positions. Still, the practice is more commonly used in foreign companies than in Slovak companies. Majority of the foreign companies transfers their management practices from their mother companies, but many of them are allowed to adapt the system to the local requirements and needs.

Of the 40 organizations that took part on the research 85% operate an appraisal-driven compensation system; i.e. they conduct performance appraisal with the purpose of gaining information about employee performance, and afterwards this information is used to allocate rewards. However, this practice is more common among foreign companies (in 93% of cases). For a comparison, 69% of Slovak organizations employ an appraisal-driven compensation system.

On the other hand, Slovak companies prefer the usage of merit awards while merit pay is more popular among the foreign companies. These trends can be observed at all management levels, even though there is a declining tendency to use either merit awards or merit pay with the increasing position within the organizational hierarchy.

Both Slovak and foreign companies differentiate the degree to which the performance of a manager influences his/her variable pay. With an increase in position within the organization we can observe an increase in proportion of variable pay influenced by the performance of the manager and of the organization.

While performance driven pay can be considered a common practice among organizations operating within the Slovak Republic, companies could utilize the potential of performance appraisal more, if they linked a more significant part of pay to the individual and organizational performance.

# **Managerial Decision Making Style in Slovak Organizations: Shift from Administering Orders to Employee Empowerment**

*Branislav Vargic  
Comenius University, Slovak Republic*

## **Abstract**

The article seeks to find whether the managerial decision making, in the transformational economy of Slovakia, has experienced a shift from an administrative to an interactive nature. In addition, it examines how the Slovak managers approach decision-making and whether the concepts of delegation and empowerment have been implemented into the scope of their managerial skills. Furthermore, it carries out a comparison of decision-making style in subsidiaries of multinational companies and local organizations in Slovakia. The findings of the article are based on a research that examines a sample of 512 respondents from 35 organizations, which cumulatively employ 11,765 people.

## **Introduction**

Organizational decision-making is a process through which members of an organization choose a specific course of action to respond to both the problems and the opportunities that confront them in relation to various organizational subjects: people, materials or information. From the managerial perspective, decision-making represents one of the crucial elements of managerial work and defines one of the most essential managerial skills. Additionally, the managers' approach to the decision making process reveals their notion of preferred leadership style as well as the level of empowerment and sharing of responsibility in an organization. Moreover, the level of subordinates' involvement and their input into the process of decision making has major implications for a number of other areas of managerial work, such as motivation, control, performance management or organizational communication.

The region of Central Europe has in the last decade undergone major social, political and economic changes that have gradually led to the transformation of attitudes and the development of 'new' skills in the local managerial work force. In 1989, there was a significant change of the political system in Slovakia that was followed by a transition from a centrally planned to market economy. This transition caused a shift in the nature of business environment that has moved from being relatively stable and predictable towards a more competitive and frequently changing system. The employment mode has shifted from egalitarian towards a tournament – there has been growth in usage of pay-for-performance compensation models where seniority matters less than ability to perform along with decline of average age of managers, and more mobility between jobs<sup>[1]</sup>. Moreover, in order to be able to implement successfully new strategies and to transform local enterprises, it is necessary to change their corporate cultures from a 'socialistic-bureaucratic' type to a business oriented one<sup>[2]</sup>.

Without a doubt, one of the areas of managerial work that has experienced the most dramatic shift has been decision making. It has mainly been multinational companies entering the central European markets and introducing different managerial practices that have influenced the gradual change of the business environment, including the skills and attitudes of the local workforce. Local companies, in order to stay competitive, have had to introduce different styles of management and change the attitudes and skills of their managers. A shift from strict centralization, wherein very little opportunity for independent decision making and the administrative role of managers in executing decisions, to a more participative decision-making and subordinate empowerment has been evident.

Such a shift has called for more flexibility of managers and workers, for market orientation in designing human resource management (HRM) activities, and for redefining the role of HRM as a strategic partner within the managerial activities in the companies. Within the redefined HRM system, quality of decision-making is certainly one of the key success indicators. In the past decade, it has been mainly foreign multinational companies entering the Slovak market, which have been introducing different managerial practices and influencing the changes in the

business environment. Slovak companies, in order to stay competitive, have had to introduce different style of management and change the attitudes and skills of their managers. Hence, the main goals of this article are to a) find whether the managerial decision making, in the transformational economy of Slovakia, has experienced a shift from an administrative to an interactive nature; b) examine how the Slovak managers approach decision making and c) carry out a comparison of decision making style in subsidiaries of multinational companies and local organizations in Slovakia.

### **Empowerment**

Empowerment is defined as the process by which managers help others to acquire and use power needed to make decision affecting themselves and their work<sup>[3]</sup>. In more general terms, it is a concept of allowing employees greater freedom, autonomy and self-control over their work, and responsibility for decision-making. However, there are differences in the meaning and interpretation of the term empowerment. For example, Buchanan and Huczynski refer to empowerment as the current term for decentralization<sup>[4]</sup>. Wilkinson suggests that it is important to see empowerment in a wider context<sup>[5]</sup>. It needs to be recognized that it has different forms and should be analyzed in the context of broader organizational practice.

Additionally, Lashley suggests it is possible to summarize four managerial initiatives and meanings which claim to be empowering<sup>[6]</sup>; a) empowerment through participation; b) empowerment through involvement; c) empowerment through commitment and d) empowerment through delaying. Lashley further concludes that the success of a particular initiative will be judged by extend to which the empowered employees feel personally effective, are able to determine outcomes and have a degree of control over significant aspects of their working life.

Furthermore, Stewart suggests that to support true empowerment there is a need for a new theory of management, which states that managers are more effective as facilitators than as leaders, and that they must devolve power, not just responsibility, to individuals as well as groups<sup>[7]</sup>. Morris, Willcocks and Knasel believe, however, that to empower people is a real part leadership as opposed to management and they give examples on the way empowerment can actually set people free to do jobs they are capable of<sup>[8]</sup>. Both make the point; however, that true empowerment is much more than conventional delegation.

The concept of empowerment also gives rise to the number of questions: For example how does it differ from employee involvement?, or is empowerment just a more fanciful term for delegation? Some see the two as quite separate concepts whilst others suggest empowerment is a more proactive form of delegation<sup>[9]</sup>. This paper takes the latter as the ground for statistical analysis of the data.

## **Questionnaire and Research Data**

Questionnaire, comprised of three parts, was created. The first section regarded the demographics of the respondents, asking their gender, position in the company (top, middle, low level management), type of ownership of the company (Slovak or with foreign capital investments); the number of employees in the company as well as the number of direct subordinates. The respondents were also asked to identify their age by choosing one of the following categories: less than 30 years of age, 31-45, and 45 and more. Additionally, they were asked to indicate their tenure with the organization: a) working with the company for up to one year; b) two to five years; c) six to twelve years or d) more than thirteen years.

The second part of the questionnaire consisted of 30 statements evaluated on a 1-5 Lickert scale, where '1' indicated the least acceptance of the statement and '5' indicated that the respondent fully agrees with the statement. There were various statements from different areas that evaluated the attitudes of managers towards their work, their managerial style, performance appraisal and communication style. For the purpose of this paper only questions related to decision making style and empowerment were analyzed.

The third part of the questionnaire consisted of questions where the respondents were asked to evaluate statements qualitatively, indicating all the responses that are relevant or those that are the closest to what they think about the statement. There was also space available for personal responses/comments. For the purpose of this paper, only those questions were analyzed that were relevant to the topic. In these questions, we have not received any individual open-ended responses, so there was no need for additional grouping and coding.

## Data Analysis

The findings of the article are based on research that examines a sample of 52 companies that operate within the territory of the Slovak Republic. There were a total number of 718 questionnaires sent with final count of returned filled out questionnaires amounting to 512 from 35 organizations. There were 432 respondents from Slovak companies and 79 from those with capital investments from abroad (in one case the respondent did not state, whether he/she worked for Slovak or foreign company). We have considered this sample sufficient to generalize the main trends in a particular HR practice within the business environment of Slovakia.

To achieve an objective view, we have addressed companies from all regions of Slovakia, companies of different sizes, and both Slovak and foreign in terms of capital investment [Note: further in this text companies with foreign capital investment are often referred to as 'foreign' for simplicity of terminology]. We have addressed managers at all levels of management. We have not addressed employees who are not in managerial positions and do not supervise any subordinates. Moreover, as the questionnaire was in Slovak language, foreigners working in the Slovak Republic were not included in the sample.

There were 115 (22.55%) top managers, 205 (40.2%) middle managers, and 190 (37.25%) line managers. The group consisted of 390 (76.32%) male respondents. Out of the sample, 64 (12.52%) were younger than 30, 190 (37.18%) were from the group 31 – 45 years of age, and 257 (50.3%) people were older than 45. Furthermore, 432 respondents were from companies of Slovak capital ownership 72 from those with capital investments from abroad, representing 13 foreign companies and 22 Slovak companies. The most frequent number of direct subordinates was four, indicating a rather narrow span of control. The extreme numbers of direct subordinates, however, ranged from 1 to 135. There were 511 respondents who identified their tenure, out of which 33 (6.46%) had worked less than one year for a company, 101 (19.77%) who had worked 2-5 years with the company, 123 (24.07%) who had worked 6-12 years with the company, and 254 (49.71%) who work longer than 13 years with the company. The enterprises actively involved in the research cumulatively employed 11,765 people.

In terms of the field of business the companies participating in the research; 4.1% (21 respondents) were from food and beverage production; 14.06% (72) from transport and transport related services; 3.32% (17) from consulting and knowledge services; 4.69% (29) from banking and insurance; 6.84% (35) from pharmaceuticals; 13.28% (68) from telecommunications; 6.45% (33) from the field of energy production and distribution; 12.70% (65) form heavy industrial production; 8.59% (44) from health care services; 4.1% (21) from information technologies; 17.58% (90) from chemical engineering and 4.3% (22) from retail.

### Cluster Analysis

Following the demographic analysis of the sample, questions related by content were grouped into six clusters. Subsequently, the clusters were paired and then using the Frequency Procedure, followed by the Chi-Square test and checking for Phi Coefficient the pairs of clusters were tested to see whether there are any relationships between the clusters that would further indicate strong tendency in managerial actions and thus confirm the relation between individual aspects of power distance. The analysis was carried out using SAS software.

All of the statements from the second part of the questionnaire and some of the responses from the third part of the questionnaire were included in the cluster analysis. The questions were grouped into 6 clusters: empowerment, delegation, communication and feedback, formality/informality, decision making and managerial style. For the purpose of this article, two pairs of clusters were analyzed: cluster pair # 1 empowerment/ delegation (questions from these clusters are presented in Table 1.) and cluster pair # 2 decision making/ managerial style (questions from these clusters are presented in Table 2.)

Questions 1, 2, 5 and 29 formed the cluster empowerment. To empower is to pass decision-making to others. Within an organization, this often means passing the decision-making to a lower level of the. Furthermore, empowerment is an aspect of organizational culture – it fosters initiative and responsibility. A manager, with a controlling role, is involved only when work is finished, yet he/she is perceived as open to help when needed.

TABLE 1. QUESTIONS FROM THE QUESTIONARIE IN THE CLUSTER PAIR #1

1. I consider my subordinates as independent.	1	2	3	4	5	cluster empower r
2. I leave routine decisions to my subordinates	1	2	3	4	5	
5. I think that subordinates should be always controlled.	1	2	3	4	5	
29. My superior lets me work independently and only controls the finished projects.	1	2	3	4	5	
3. I have difficulties to obtain inputs form my subordinates at the meetings.	1	2	3	4	5	cluster delegate
4. My subordinates expect to be told what exactly is to be done.	1	2	3	4	5	
11. My subordinates seek my advice without hesitation when they have a problem.	1	2	3	4	5	
14. Subordinates expect that problems are solved by a manager.	1	2	3	4	5	
18. In my opinion the subordinates should only fulfill tasks assigned by the manager.	1	2	3	4	5	
21. I consider the decisions of my superiors as final.	1	2	3	4	5	

Cluster *delegation* was formed out of statements that reflected the concept of assigning tasks; as this is a part of day-to-day work and stems from the formal authority of the respondent. This cluster reflected the attitude of the respondents both towards their subordinates and the assigned goals as well as their attitude towards receiving assignments from their superior. Furthermore, questions that dealt with the everyday practice of controlling tasks were included. Moreover, a set of questions regarding the formality of the style of managers towards their subordinates were added to this cluster. Additionally, as delegation also reflects initiative/passivity in the relationship between a manager and a subordinate, questions of this nature were included. This decision was based on the concept, that the more dynamic the relationship, the more manager believe that the decisions of their boss are negotiable and the more they are willing to let the subordinates work independently. Questions number 3, 4, 11, 14, 18 and 21 were included in this cluster.

TABLE 2. QUESTIONS FROM THE QUESTIONARIE IN THE CLUSTER PAIR # 2

6. I consider autocratic decision of higher quality than group decisions.	1	2	3	4	5	cluster decision -making
7. I consult my subordinates on work related issues.	1	2	3	4	5	
15. My superior seeks my advice when he/she needs to discuss a problem.	1	2	3	4	5	
17. I make decisions about important issues alone.	1	2	3	4	5	
9. The role of the manager is take care of his/her subordinates/	1	2	3	4	5	cluster mgg. style
10. For me as a manager the number one priority is fulfillment of the tasks.	1	2	3	4	5	
16. I am interested to know what my subordinates think of my approaches to work situations.	1	2	3	4	5	

The next set of clusters that was analyzed dealt with the way respondents approach decision making and their attitudes to the job they perform. Thus, the cluster *decision-making* dealt with the degree of consultative style in decision-making. This cluster focused on the degree to which managers consult and involve subordinates in the process; rather than focusing on judging the nature of these decisions. It also examined whether the respondents were being consulted by their superiors and whether they perceived themselves as being involved in the process of decision-making. Questions 6, 7, 15 and 17 were included in this cluster.

The cluster *managerial style* addressed the general perceptions of the respondents as to what was expected from them and what was the role of a manager in the context of responsibilities and duties. This cluster reflected the values of respondents that underline their overall leadership style. Furthermore, it provided valuable information on how the respondents viewed their relationship towards their superiors as well as subordinates and whether they were interested in learning how their subordinates perceived them. Questions 9, 10, 16, were included in this cluster along with questions from the third part of questionnaire asking the respondents how would they characterize the relationship with their superior/subordinate [the options give were a) friendly an open; b) professional but friendly; c) professional; d) formal and e) other].

Following, the clusters were paired for the purpose of statistical analysis. The first pair consisted of the clusters empowerment and delegation. These two clusters were paired in order to test the consistency in managerial

tendency to empower employees and the actual practice of delegating responsibility for decision on the subordinates. The second pair consisted of the clusters decision-making and managerial style. The main reason behind grouping these clusters was to search for interdependence in preference for a certain nature of managerial decision-making style (participative versus individual).

Before the actual analysis was performed, however, adaptations of certain data were necessary. First, since some questions that were included in the clusters were from the third part of the questionnaire [multiple choice questions], the responses had to be transformed to resemble the Likert type of answers. This was done for each question individually, assigning the value 1 through 5 for each of the multiple choice answers, resembling the tendency of the cluster.

Second, a Likert scale type of a value had to be assigned to each of the clusters. For individual questions, value '1' indicated disagreement whereas value '5' presented full agreement with a statement. Following the computation of responses, clusters were assigned values '1' (never) through '5' (always) according to the following key. If there were four questions in a cluster, then sum of answers in a range of value '4' - '5' was assigned value '1'; if there were six questions in a cluster, then sum of answers in range of values '6' – '8' was assigned value '1'; and so on (for an illustration, see Table 3).

TABLE 3. ASSIGNING VALUE TO CLUSTERS (EXAMPLE)

EMPOWERMENT (4 QUESTIONS)		EMPLOYEE DELEGATION (6 QUESTIONS)	
Sum of responses from Likert Scale	Assigned Cluster value	Sum of responses from Likert Scale	Assigned Cluster value
4-5	1	6-9	1
6-9	2	10-14	2
10-14	3	15-21	3
15-18	4	22-26	4
19 - 20	5	27-30	5

Finally, since each of the clusters contained a control statement, responses to which were logically inverted; in order to cluster the responses and maintain the same pattern in assigning the value, numerical values for the control questions was inverted as well; i.e. if the answer was '5', it was assigned value '1', if the answer was '4' the value assigned was '2', and so on. Following these adaptations, the statistical analysis on the whole data set was performed using the Frequency Procedure to see what the co-dependence between the clusters was. Subsequently, the obtained results were tested through Chi-Square test, the probability of which should be <0.05 to be considered significant; and Phi-Coefficient the value of which should be >0.5 to show significance (Table 4). In addition, data analysis was then performed across the demographic indicators to obtain more thorough picture of the cluster codependence.

TABLE 4. CHI-SQUARE AND PHI-COEFFICIENT VALUES FOR THE CLUSTERS #1 AND #2

CLUSTERS	CHI-SQUARE PROBABILITY	PHI COEFFICIENT VALUE
EMPOWERMENT/EMPLOYEE DELEGATION	<.0001	0.6377
DECISION MAKING / MANAGERIAL STYLE	<.0001	0.26

When comparing total data of the clusters *employee delegation* and *empowerment* a strong relationship between the values of '3' (usually) and '4' (almost always) was observed; 346 responses of value '3' in employee delegation have been divided between value '3' and '4' in empowerment, 166 and 180 respectively. This indicates a positive tendency of managers to delegate assignments and responsibilities to their subordinates and to empower and trust their employees. Furthermore, both Chi-Square probability and Phi-Coefficient value showed statistical significance. Overall, the responses suggest that while delegation and the attitude of managers towards their subordinates is neutral, Slovak managers tend to believe that their subordinates are independent, can be trusted with decisions (albeit routine) and generally, they both provide and receive quite large autonomy in their work. Yet, as

the responses group around the values of '3' (sometimes) and '4' (usually) we can observe a rather conservative attitude that is in line with the score of '52' on the power distance index.

When comparing the total data of the clusters *decision-making* and *managerial style* a statistical relationship is observed, when 333 responses of value '3' (usually) in decision-making have also chosen the answer value '3' in *managerial style*. Another 37 respondents have indicated value '4' (almost always) in *decision-making* and value '3' in *managerial style*. However, there was little statistically significant relationship between the style of management and preference towards decision-making. Although Chi-Square probability value shows significance, Phi Coefficient for the whole sample does not show noteworthy relationship. Following the analysis of the whole set of data, the responses were grouped across the demographic indicators and statistically important relationships were sought. Again, the most noteworthy results were found within the pair of clusters *empowerment* and *delegation* and a difference of significance was found when comparing companies of Slovak and foreign ownership against the cluster decision making/managerial style (Table 5).

A significant difference in responses of Slovak managers working for foreign companies and Slovak managers working for domestic companies was observed. In the case of Slovak managers working for foreign companies a strong co-dependence of the clusters was found whereas with Slovak managers in Slovak companies this was not the case. This indicates that there is stronger tendency for the prevalence of a certain pattern of managerial behavior across multinational companies than in Slovak companies.

Furthermore, a significant relationship was found across the hierarchy of the organizations. All three managerial groups (top, middle and line managers) showed a strong co-dependence in terms of delegation and empowerment. This is an important finding, because it points to a level of consistency across all organization in the sample and indicates a tendency of all managerial groups toward empowerment and delegation.

The relationship between the style of management and style of decision-making has been confirmed only on the sample of foreign companies in Slovakia with Phi Coefficient 0.7028. Most responses were grouped in the value of '3' indicating that the respondents believe their relationship with their subordinates is professional and friendly, they are interested in learning what their subordinates think of their actions, and they balance their understanding of needs of subordinates with achieving goals.

In summary, the statistical analysis performed via cluster analysis showed that managers in Slovakia are generally trusting towards their subordinates; they have a style of management that tends to involve subordinates in decision-making, to let them work independently and to appreciate the opinions of the employees. Furthermore, the notion of empowerment is commonly used in Slovak organizations.

## **Decision Making Style**

To obtain a further analysis of the view of the managers' approach to decision-making [and because of statistically insignificant results obtained by Chi-Square analysis], questions (Table 2) dealing with this aspect of managerial work were analyzed in more detail. The content of these questions was focused on deciphering the perception of managers on autocratic and group decisions, their approach in situations when making difficult decisions, and the tendency of managers to consult their subordinates as well as to be consulted by their superiors on work related issues. The mean scores for each of the questions were calculated. Furthermore, in order to get a more detailed picture, the responses were examined across demographic factors. The results of the analysis are presented in Table 6.

TABLE 5. SIGNIFICANT CHI-SQUARE AND PHI-COEFFICIENT VALUES ACROSS SELECTED DEMOGRAPHIC INDICATORS

<i>CLUSTER EMPOWERMENT/DELEGATION</i>		
<i>DEMOGRAPHIC INDICATORS</i>	<i>CHI-SQUARE PROBABILITY</i>	<i>PHI COEFFICIENT VALUE</i>
<b>Foreign Companies</b>	<.0001	0.9575
<b>Slovak Companies</b>	<.0001	0.3453
<b>Line Managers</b>	<.0001	0.6957
<b>Middle Managers</b>	<.0001	0.5042
<b>Top Managers</b>	<.0001	0.6865
<b>Under 30 years of age</b>	<.0001	0.9353
<b>Between 31 – 45 years of age</b>	<.0001	0.4334
<b>Over 45 years of age</b>	<.0001	0.3793
<i>CLUSTER DECISION-MAKING/MANAGERIAL STYLE</i>		
<i>DEMOGRAPHIC INDICATORS</i>	<i>CHI-SQUARE PROBABILITY</i>	<i>PHI COEFFICIENT VALUE</i>
<b>Foreign companies</b>	<.0001	0.7
<b>Slovak companies</b>	<.0019	0.1987

As can be seen from the outcomes of the analysis, managers in Slovakia rarely consider autocratic decisions as more qualitative than the group decisions. This is indicated by the mean score 2.36 for question number 6, suggesting that responses ‘never’ and ‘almost never’ were most frequently marked (this is further supported by the mode and median of this question set being 2). However, the responses ‘sometimes’ and ‘almost always’ prevailed when asking managers whether they make important decisions alone, as indicated by the mean score of 3.22 on question 17. This finding points to a certain level of discrepancy – similarly to the performance appraisal and leadership style - between the perception of managers on decision making (believing that group decisions are better than autocratic ones) and the actual practice (making more autocratic decisions on important issues than would be expected from their view on autocratic decisions). It further suggests that the awareness of managers on the advantages of group decisions is rather strong, but their actions are somewhat different. This difference in responses could be, however, influenced by managers’ definition of what is considered an important issue, as this was not specifically identified in the questionnaire and thus left to each manager’s subjective judgment.

Nevertheless, the mean scores for question 17 and question 6 on the total data group point to managers using a combination of participative and autocratic decisions. One can argue that the choice of the approach toward decision-making depends on a situation and that in more difficult situations; managers tend to behave more autocratically. This finding for Slovakia is partially in alignment with the research results found in other Central European countries and presented by the project GLOBE, where managers from Poland and the Czech Republic showed a certain level of combination of autocratic and participative decision making style. Moreover, it also reflects notion about countries of Central Europe presented by the research project GLOBE, where managers showed less negative attitudes towards autocratic leadership behavior<sup>[10]</sup>.

TABLE 6. DATA ANALYSIS OF QUESTIONS FOCUSING ON DECISION MAKING STYLE

		Q6	Q7	Q15	Q17

	13 and more	2.33	3.78	4.12	3.26
<b>FORM OF OWNERSHIP (MEAN SCORES)</b>	Slovak	2.40	3.78	3.99	3.41
	Foreign	2.27	4.03	4.12	3.02

The questions 7 and 15 sought the manager's attitude towards consulting their subordinates and them being consulted in turn by their superiors. The results of the analysis suggest that managers are slightly more often consulted by their superiors (mean score being 4.07 indicating the most frequent use of the answer 'almost always') than they consult their subordinates (the mean score being 3.83 indicating a combination of answers 'sometimes' and 'almost always' with the latter marked more often). The results suggest that the higher the position of a respondent in the hierarchy in the organization, more consultative approach is taken, since managers are being slightly more often consulted by their superiors than they consult their subordinates. However, both of the scores indicate that managers do consult and are consulted on work related issues; thus consultation is a rather frequent practice in the organizations presented in the sample.

When looking at the results across demographic indicators the most significant differences can be seen between the companies of Slovak capital ownership and multinational companies. Respondents from multinationals, in comparison to the managers from Slovak companies, consider autocratic decisions as lower in quality; consult their subordinates and are consulted by their superiors more often than their Slovak counterparts. The largest difference between managers from multinational companies and those of Slovak capital ownership, however, can be seen in the responses to the question regarding the autocratic decisions on important issues where managers from multinational companies show a stronger tendency towards the response 'sometimes' as oppose to their counterparts.

Analysis across other demographic data did not show differences of such a magnitude as in the case of multinational companies and those of Slovak capital ownership. However, there is interesting tendency across the managerial levels, where top managers do not consider autocratic decisions as of sufficient high quality; as opposed to the line managers. A similar tendency can be seen in the answers to question 17, where top managers' responses indicated lesser tendency to make autocratic decisions than in the case of middle or line managers. This notion indicates again, that the higher the positions within the hierarchy, the more likely managers are to make consultative decisions.. Another interesting notion can be seen across the demographic factor of gender, where females tend to make autocratic decision less than male counterparts, they consult their subordinates more but are consulted by their superiors to a lesser extent. Furthermore, employees with lower tenure tend be less autocratic, but are also consulted the least by their superiors. These findings are interesting from other aspects of managerial work, for instance gender issues in Slovak organizations, where there is still a dual attitude of female managers, differentiating between everyday, more informal situations in which they are cooperative and open to their subordinates and the formal settings during which they tend to assume the 'masculine' role of a strict, goal-oriented manager<sup>[11]</sup>.

## Conclusion

In conclusion, the results of the decision making style showed, that there is a strong tendency towards the consultative approach to decision making in Slovakia. On the other hand, they also revealed a tendency to make autocratic decisions in certain situations. Furthermore, the results exposed differences in terms of decision-making practices between multinational companies and those of Slovak capital ownership, with an autocratic style prevailing in the latter. This finding is in alignment with the results presented in other research project of the author on performance appraisal practices, where the tendency in multinational companies was also stronger towards dialogue-based practices, whereas in Slovak companies the tendency was towards more authoritative approach<sup>[12]</sup>. Since all of the respondents were of Slovak nationality, these differences further emphasize a strong influence of multinationals on perceptions of their employees on various managerial practices. Additionally, the fact, that there is a certain level of autocratic decision making in Slovak organizations is in alignment with findings from other Central European countries<sup>[13]</sup>. Nevertheless, the findings on decision making in Slovakia portray a strong tendency for participative decision making and more open approach of superiors towards consulting their subordinates combined with certain level of authoritative decision-making.

# **Measurement of Performance in the Rubber Industry: A Comparative Study in the Czech Republic, India and the United States of America**

*Drahomira Pavelkova  
Adriana Knapkova  
Tomas Bata University, Czech Republic*

## **Abstract**

**The goal of this study is to analyse possibilities for the measurement of companies' performance and to identify factors influencing the companies' performance in the rubber industry on the basis of comparing companies in different geographical regions – the Czech Republic, India and the U.S.A. Some differences in the rubber companies' performance in the investigated regions have been correlated to economic development, technological level and financial ratios reflecting the management and financial health of the companies.**

## **Introduction**

The rubber industry has developed in a dynamic manner since the mid-nineties in the world in general. There are host of factors for such development. Increased manufacture of transport and electrical equipment, namely in the third world countries, is an important reason for such development. Moreover the possibilities of application of rubber products increased manifold in manufacturing, energetics, agriculture, construction, household appliances, etc. The rubber processing industry has a wide variety of raw materials, processes, and final products. In developed economies fully automated production facilities are predominant and assure a certain independence from labour costs. In developing economies lower initial investments in rubber manufacturing facilities with higher proportion of labour are more common. Additional significant differences can be seen in the management methods applied. In developed countries the sophistication and effectiveness of management is on a higher level, particularly in the area of financial management, marketing, and clearly defined concepts of development. The evaluation of the effectiveness of management can be done indirectly, usually based on the results of subjects operating under similar conditions. Here the Value Based concepts could be eminently suitable for the evaluation of companies' performance.

### **Measurement of the Performance**

The choice of a suitable indicator for measuring a company's performance is one of the most widely discussed areas in today's corporate management circles. If an enterprise wants to be successful, it is absolutely essential that the criteria of its performance and the ways to express it and measure it are clearly defined. In the past, the main goal of an enterprise was very often the maximization of profit. Today, the tendency is to modify the top goal of the enterprise and to accept the criterion of the growth of value. The value-related concept then becomes the way of finding a common denominator for all activities within the company and interconnecting all levels of management [8], [10].

There are some requirements for the suitable indicator:

- ✓ To have a close relation to shareholder value (this relation should be statistically verified);
- ✓ To be able to use as much information from accounting as possible;
- ✓ To take into consideration the risk calculation.

It is not very easy to find such a measure. There are many approaches and measures that follow up Value-Based management. The comparison of some approaches is shown in the **Table 1**.

TABLE 1: COMPARISON OF VALUE-BASED MANAGEMENT APPROACHES [11]

	Stern Stewart & Co.	Marakon Associates	McKinsey & Co.	Price Waterhouse Coopers	L.E.K. Consulting	HOLT Value Associates
<b>Fundamentals for value creation</b>	Strategy, Structure and metrics	Strategy	Metrics & Belief Systems	Structure	Structure & Metrics	Strategy & Metrics
<b>Main elements in the consultants approach</b>	Systems with focus on measuring, training and rewarding	Culture, structure and systems with focus on decentralised strategy development	Culture, structure and systems with focus on corporate strategy and valuation	Culture, structure and systems with focus on training and communication	Culture and systems with focus on strategy and education	Systems with focus on valuation
<b>Focus in strategy deployment</b>	Increasing EVA as general objective	Profitable growth instead of growth	Profitable growth instead of growth	Maximization of shareholder value	Max. of expected shareholder value added	
<b>Preferred Metrics</b>	MVA (corporate), EVA (corporate, business unit (BU) and product line)	Equity Spread (corporate, BU, customer and product line)	Enterprise DCF (corporate, business unit), EP (corporate, BU, customer and product line)	CFROI (corporate), SVA (corporate, BU), FCF (corporate, BU)	SVA (corporate, operating level), Change in residual income or change in EVA, leading indicators of value (operating level)	CFROI (corporate), Accounting-based measures (lower levels)

**Economic Value Added<sup>i</sup> (EVA)** is a widely used performance measure. Many important companies, for example Coca-Cola, Siemens AG, Harsco Corporation, Volkswagen and many others, accepted it.

It shows what additional value the enterprise was able to create by its activity compared to using the capital for other investment opportunities with equal risk. When compared with indicators that are established on the return on capital, EVA shows these differences: EVA uses economic profit, it takes into account an alternative cost of capital;

- EVA covers only revenues and costs that are related to the main entrepreneurial activities and do not cover revenues and costs from extraordinary activities;
- EVA considers only capital used in the main entrepreneurial activity and only capital of investors who expect profit from this allocation;
- EVA is expressed as an absolute value, which means that does not need a comparative standard.

There are several models that can be used to calculate EVA. Accordingly, the Stern & Stewart EVA model is defined [8]:

$$\text{EVA} = \text{NOPAT} - (\text{C} \times \text{WACC}) \quad (1)$$

where NOPAT - Net operating profit after tax

C - Invested capital

WACC - Weighted average cost of capital<sup>b</sup>

According to Neumaierová-Neumaier [4] EVA can be defined in the following fashion:

$$\text{EVA} = (\text{ROE} - r_e) \times \text{E} \quad (2)$$

where: ROE = return-on-equity

$r_e$  = cost of equity

E = equity

Main advantages of the EVA indicator:

- Indicator can be used as a performance measure;

- EVA can be used as a management concept – the connection of all companies’ activities by one basic criterion for increasing company value (for example related to the investment decision - we accept only such decisions that lead to the increasing of EVA. The classical indicator ROI (return on investment) can fail in some cases;
- EVA can be used as a rewarding tool (employees are interested in EVA increasing due to EVA bonuses – they are in the position of „owners“);
- EVA interconnects strategic and operating decisions in the company;
- Easier concept in comparison with other value-based indicators.

Main disadvantages of the EVA indicator:

- Calculation of NOPAT and C (capital) requires some modification of the input accounting data;
- Problems with the calculation of the cost of equity – usage of all models does not provide an unambiguous result;
- EVA is not adjusted for inflation;
- Application of this indicator can lead to investment activities that can increase EVA – but only in the short run.

The EVA indicator expresses the contribution of the main entrepreneurial activities in the defined periods in connection with the company aims and ignores extraordinary impacts. EVA comes from accounting data that are further adjusted. This criterion can also be used for value-based management in small business units, which have the possibility to influence the amount and usage of some part of a company’s assets.

On the other hand it takes into consideration only results of entrepreneurial activities that are recognized as a cost/revenue in the defined period. This indicator cannot be used as the basis for the appraisal of strategic company development. The empirical research points to this speculation. Peterson-Peterson (1996) shows that the correlation between EVA and firm market value is very similar to the correlation between ROE and firm market value. Stern Stewart’s research shows the better results for the EVA indicator – see **Table 2**.

TABLE 2: CORRELATION OF FINANCIAL INDICATORS WITH FIRM VALUE (SOURCE: STERN STEWART).

<i>EVA</i>	0,5
<i>ROE</i>	0,35
<i>Cash flow growth</i>	0,22
<i>Earnings per share (EPS)</i>	0,18
<i>Dividend growth</i>	0,16
<i>Sales growth</i>	0,09

For the increasing of a company’s competitiveness, and its ability to create economic profit, the concept of EVA could be very suitable. It permits companies to identify and manage operating, investing and financing activities that are important factors influencing a company’s performance – see **Figure 1**. Using this measure company’s management is forced to look for sources of value – e.g. value drivers. EVA is very useful in connection with the Balanced Scorecard concept [2], as a measure of financial perspective. Changes in other BCS perspectives will influence this measure. The problem arises in cases that are difficult to quantify. But – „what we cannot measure, we cannot manage“ [2]. Therefore we have to find measurable impacts of the changes in a company’s management.

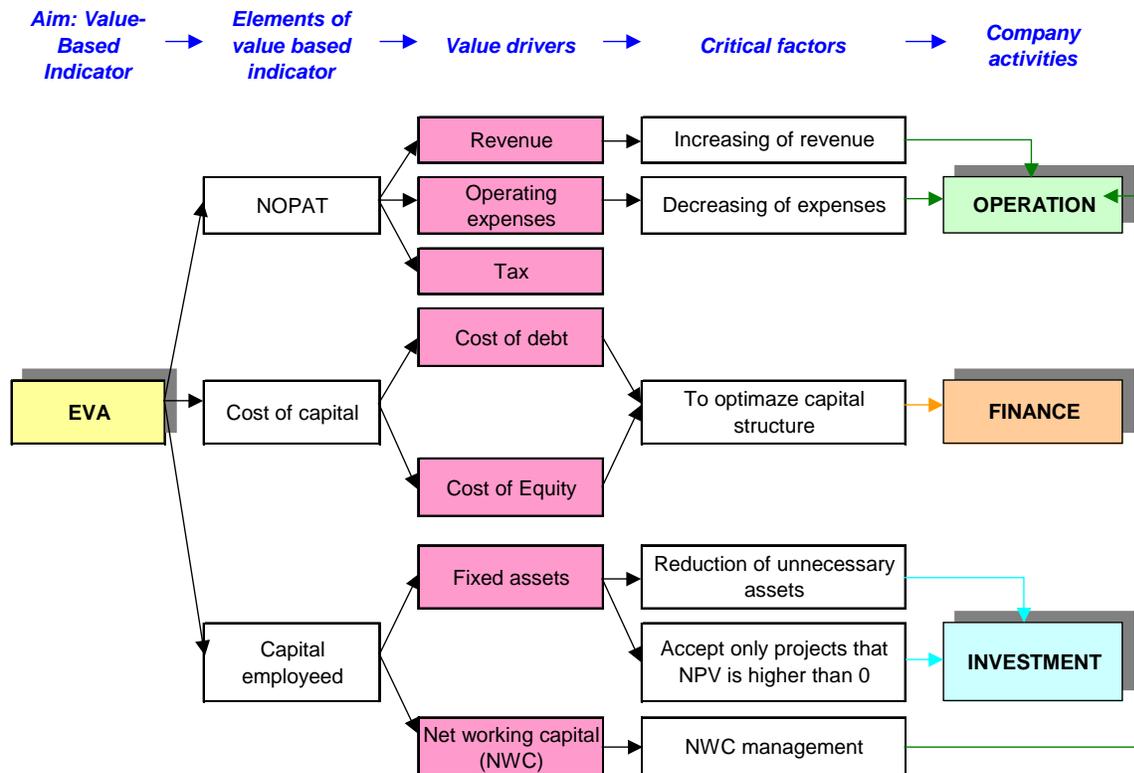

FIG. 1: EVA – VALUE DRIVERS

If we analyse the method of calculating EVA, we observe a host of factors, which could *favourably affect the performance of a company and the growth of its market value*. These are discussed below.

- i) *The amount of operating profit:* This is given by revenues (sales) and operating expenses. The amount of revenues is related to the volume of realized production and by the selling price of goods produced. The amount of operating expenses depends on the type and level of manufacturing processes and on the ability to utilize the available manufacturing facilities effectively. We observe the share of different costs on value added or sales, e.g. financial ratios such as labour/sales, depreciation/sales, (raw material+stores+ energy+services)/sales, interest/sales, etc. Companies increase their ability to compete as long as they create a sufficient margin between the sales price of the product and the variable manufacturing costs, and in the total of its activities that attain profit.

The performance in this field can be measured by financial ratios of profitability such as ROA (return-on-assets = EBIT/assets), ROE (return-on-equity = EAT/equity), ROS (return-on-sales = EBIT/sales), etc.

- ii) *The amount of capital employed:* This corresponds to the total value of the company's assets. The ratio of revenues and the assets available to the enterprise is important. If assets do not create a sufficient amount of revenues, they are not being used effectively and thus may have an unfavourable effect on the amount of operating profit (the value of operating profit is reduced and so is EVA). At the same time, a high amount of capital is required for covering these assets (again a negative effect on EVA). The structure and the rate of turnover of the components of assets, such as fixed assets, inventory, accounts receivable, and cash are important. Long turnover time generally causes high expenses and lost profits. For measuring the performance

in this field we can use financial ratios such as assets turnover (sales/assets), inventory turnover (sales/inventories), average days of debtors and creditors, etc.

Because only interest-bearing capital is used in the formula for the calculation of EVA, it is important to analyze its allocation in assets. As long as it is long-term capital, it should cover the fixed assets and part of current assets (the part that is permanently located in the company). This means a share of long-term capital and fixed assets should be higher than 100 per cent. This in turn creates working capital for the company. Low working capital may cause liquidity problems. High coverage of current assets by long-term capital may be too expensive. For evaluation of liquidity we can use the current ratio (current assets/current liabilities), the quick ratio (receivables+cash)/current liabilities) or the cash position ratio (cash/ current liabilities).

iii) *The cost of capital available to the company:* This relates to the capital structure i.e., to the ratio of equity and debt bearing interest. Differences in capital structure (the share of debt and equity) influences the level of the cost of capital and ROE in consequence of the financial leverage.

The cost of capital depends on the possibility of a company obtaining the capital, and on the effectiveness and the risk of business activities of the company. Companies with high credit ratings usually obtain capital at lower costs or can obtain it easier and at a lower cost in international financial markets (it is possible to take advantage of different interest rates and taxation in different countries). A company can enter international financial markets either independently or as a part of existing multinational corporations.

Companies operating in different areas of business have different asset and capital structures that depend on the type of business. Their structures of returns, costs, and profitability are also different. Currently companies carry different degrees of risk in ventures and finances, and consequently different opportunity costs i.e., different costs of equity ( $r_e$ ). These costs can be expressed (in percentages) as the sum of the risk-free interest rate of a given capital markets, and risk surcharges (for the venture risk, for the reduced liquidity of assets, for financial structure, and for financial stability) or can be calculated using Dividend Model or by the Capital Assets Pricing Model. Risk surcharges are connected with indebtedness (measured by debt/equity), liquidity, ability to pay interest (measured by the interest coverage ratio), the size of the company, and type of business.

In the next part of the paper we focus on EVA in selected rubber companies in the Czech Republic, India and the U.S.A. Companies were selected based on the availability of data and their importance within a region.

**Selected Financial Ratios and EVA in Rubber Industries in the Czech Republic, India and the U.S.A.**

**Tables 3, 4 and 5** show financial ratios and EVA for selected rubber companies (domestic and multinational) in the Czech Republic, India and the U.S.A.

Sources: <http://finance.yahoo.com/>

Comparing the economic results of the selected companies it is possible to identify the factors that positively affect the creation of Economic Value Added. A company creates EVA if the spread ( $ROE - r_c$ ) is positive. However, ROE (return-on-equity) may increase as long as the company increases profit margin, improves

utilization of assets, and increases debt. However, greater debt contributes to the increase of return-on-equity only as long as the return-on-invested capital is higher than the interest rate at which the company borrows money from creditors. On the other hand, as long as a company increases its debt, it can result in reduced liquidity and an increase of surcharges for the financial structure (as high indebtedness in Megum, Avon Automotive, Westland, ZPV Roznov, Dow Chemical Co, The Goodyear Tire&Rubber Co, Bharat Rubber Regenerating, Gujarat Reclaim & Rubber Products, Magnus Rubber), low interest coverage (as found in Dow Chemical Co, The Goodyear Tire&Rubber Co, Bharat Rubber Regenerating, Ceat, Indag, Magnus Rubber, Pullangode Rubber), and for financial stability (as low liquidity ratios found in Avon Automotive, Gumarny Zubri, Rubena, Falcon Tyres). Higher debt brings about higher interest expense and consequently a reduction of profits after deduction of interest expenses. A high coverage of long-term assets by long-term capital brings about financial stability but, on the other hand, reduces profitability of the company. Long-term capital is usually more expensive than short-term capital (for example see Indag or Obnova-Vyrobni zavody, both of them have high ratio of long-term capital to long term assets, high liquidity, but very low profitability.)

It is evident that among the companies being analysed in the sample, the major problems for those that do not create EVA are small profit margin (almost all companies in the sample with negative EVA), and/or high costs of capital. Falcon Tyres and Gujarat Reclaim & Rubber Products have competitive ROE but their costs of equity are high and their EVA is negative. These higher costs of equity ( $r_e$ ) are due to the smaller size of these firms (higher risk surcharges for a reduced liquidity of property shares as found in Gujarat Reclaim & Rubber Products, Mahalaxmi Rubtech and others), and higher risk surcharges for high indebtedness and low liquidity. Mahalaxmi Rubtech compared to other Indian companies in the sample has a low cost of equity (a risk surcharge only for the small size of the company), high liquidity, and low indebtedness. On the other hand the profitability (ROE) is low and EVA is negative. In addition the collection period for receivables is too long (three times longer than the period for paying current liabilities). This shows that the company keeps a lot of money in receivables and quickly pays to sundry creditors. The company also does not take the advantage of the capital gearing (debt to equity is very low). A quite similar situation we can see in the company Semperflex and Bandag Inc. Goodyear Tire&Rubber Co has losses, extremely high indebtedness (causes even deeper negative profitability) and low liquidity results in extremely negative return-on-equity and extremely high cost of equity. Vulcan International Corp has negative EVA, but high profit margin - the reason being very low asset turnover. Companies with negative equity have not been considered in calculating ROE (if company has losses as well) and the cost of equity and ultimately EVA.

The positive value of EVA was in D Plast because of high ROE and high profit margin. In Cooper Tire and Rubber Co and Barum Continental a very low cost of equity (because of the size of the company) and high financial stability made the EVA positive, whereas in Wetest Pneu good inventory turnover, good receivables management, and financial stability created the environment for better ROE by using more short-term capital for financing current assets. As spread is quite small in Rubena, in future the company must increase profit margin to benefit from the positive effect of leverage. ROE is very high in ZPV Roznov due to the very small amount of equity. However, the company has a very high surcharge for financial instability. Indebtedness is also high. MRF Ltd experienced a very low risk surcharge because of positive affect of leverage on ROE and financial stability, and the size of the company.

Generally Indian companies in the sample bear higher costs of equity due to a higher risk-free rate. For the Czech economy the cost of equity in 2002 was 5.1 percent, for the Indian economy 7.42 percent and finally for U.S. economy 4.6 percent.

At the same time the selected companies with a significant foreign ownership interest show distinctly better economic results. This interest enables a company to use the markets, gives it better access to cheaper capital, and especially brings know-how and modern management concepts to the company.

## **Conclusion**

Economic Value Added can be used as a management concept and performance measure. Identification of the factors influencing the creation of EVA could help to improve the companies' financial management and

performance, and to make use of the opportunities for rubber companies. There are several factors significantly supporting the creation of positive EVA. The analysis of the selected Czech, Indian and U.S. rubber companies showed the main value drivers - sufficient profitability covering the cost of capital, capital structure taking advantage of financial gearing and keeping financial stability. It analysed the solvency, the allocation of financial sources to structure of assets effectively ensuring production, sales and profits, cost management, and risk management that results in decreasing cost of capital.

# Measuring Globalization of Economies as a Tool for Managing Global Complexity: The Case of Slovenia and Nine Comparable Economies

*Romana Korez Vide*  
*University of Maribor, Slovenia*  
*Vito Bobek*  
*University of Primorska, Slovenia*

## Abstract

The issue of managing global complexity is becoming increasingly important not only for the firms but also for the economies. However, numerous existent approaches towards measuring globalization of economies are based upon very narrow understanding of globalization. This paper introduces the systemic approach towards measuring globalization of economy, which is based upon the contemporary theoretical comprehension of national competitiveness and economic growth. The main purpose of such approach is to emphasize the importance of holistic view on global economy. Thus, the significance of measuring globalization of economy is to get the information not only on the position but also on the potentials of economy for international integration. In the empirical part of the paper, the composite indicator of global economy is developed by the principal components analysis. Then the ordinary least squares and panel regression analyses confirm the hypothesis that global economies achieve higher long-term cumulative economic growth.

## Introduction

National governments are increasingly interested in the position and potentials of their economies in the period of contemporary globalization. This interest is combined with realization that the economies that actively participate in the globalization processes achieve higher positive effects of globalization. According to Srinivasan [44] globalization is a benevolent force that creates opportunities for rapid growth and faster poverty alleviation, namely in the economies that are ready for it, that is, in those economies in which domestic economic, political and social environment is conducive to underpinning the globalization processes. Thus, the active participation of economy in these processes comprises the creation of such environment, which then increases the possibilities for higher economic growth and welfare. The framework of these conditions depends upon the theoretical concept of global economy.

It is argued that globalization is a manifestation of complexity, which flows from conditions of multiplicity, interdependence, and ambiguity, all of which are interrelated [22, 49]. Some researchers, who study globalization of economies, define the global economy by means of the indicators of international integration of markets, such as international trade, foreign direct investment (FDI), activities of transnational companies, international financial flows and information-communication technology [56, 20, 11, 55, 27, 2, 57, 5, 50, 34, 12, 46]. Others deal with this topic in a more holistic way: they view global economy as its competitiveness which influences the economic growth [41, 18]. These authors define the economy as a complex system of mutually dependent spheres of operation. The economic system attains the most favorable effects if all of the mutually dependent spheres are able to adapt at the same time to the demands of the changed techno-economic and socio-institutional paradigms<sup>1</sup>.

The main purpose of our paper is to present an alternative approach to measure the globalization of economies, which is based upon the theory of systemic framework of national competitiveness and economic growth. On this basis we will set up a system of indicators, which will be combined into a composite indicator of global economy, using a two-step principal components analysis approach. Reliability of each indicator will be verified by Crombach's Alpha. Based on the obtained composite indicators we will rank the economies in the sample, with special stress on the position of Slovenia among nine comparable economies. In the second part of the analysis we will try to measure the impact of globalization of economies on their growth. Different specifications of the model will be tested, including ordinary least squares (OLS) and panel regression.

## Defining the Global Economy

### Systemic Approach

Our concept of global economy is based on the *assessment of position and potentials of economy for achieving higher economic growth in the period of contemporary globalization*. The definition of global economy is based upon Porter's diamond of national competitive advantages, Hämäläinen's systemic framework of national competitiveness and economic growth and Dunning's [7] eclectic paradigm. The systemic approach suggests that for achieving long-term economic growth, the configuration of the entire economic system is crucial.

The theory of selection of indicators is based upon the consequences of growing problems of the old techno-economic paradigm and the characteristics of new techno-economic and socio-institutional paradigms. Accordingly, the elements of systemic framework of economic growth in the period of globalization are described with the following characteristics:

*Productive resources*: economic growth in the period of new techno-economic paradigm is based upon created and specialized resources. The increasing importance of these resources stems from the changed demand and supply conditions in factor markets [7, 41]. The demand for created and specialized resources is also increased by the changing nature of production processes. The increasing specialization and complexity of production processes decreases the importance of direct production activities relative to transaction and coordination activities. Since many transaction and coordination activities require advanced technology and highly skilled human capital, the demand for knowledge-intensive, created and specialized resources tends to increase.

*Technology*: during a techno-economic paradigm shift, the technological competitiveness of the nation can be measured with the indicators that capture the dynamism of national innovation processes and the extent to which the economy is able to utilize the core technologies of the new paradigm. The competitiveness and growth impact of new technologies is determined by a two-phased process of innovation and diffusion. Countries that experienced the highest levels of growth in the 1990s are likely to be those that can most rapidly develop new products, processes and services based on these new technologies and apply them most efficiently to other sectors of the economy [35]. Radical innovation by a few organizations, together with incremental technological and organizational innovation will therefore remain essential to ensuring the sustainability of economic growth over the long term.

*Organizational arrangements*: new organizational arrangements, demanded by the new paradigm, include, for example, increasing horizontal links with suppliers and customers, greater emphasis on horizontal communications and cooperation within organizations, flatter hierarchies and decentralization of decision making [42]. Another change is the reduction in the specialization of occupations and in the number of occupational categories. Firms have decentralized the information processing and coordination tasks to lower levels of the organization and arranged the overall coordination with non-hierarchical means such as shared corporate vision, mission, culture and values [15].

*Product market characteristics*: the paradigm shift is also rapidly changing the nature of product markets [18]. Traditional mass markets are splintering into a myriad of differentiated niche markets. At the same time, the quality of product market regulation and user-producer relationships have become increasingly important for firms' innovation processes and international competitiveness.

*International business activities*: in the 1970s the increasing problems of the old techno-economic paradigm began to influence firms' investment patterns and innovatory activities. The decreasing profitability of firms forced them to look for new profit opportunities. The more extensive, international and differentiated markets allowed firms to increase the geographical scope of their activities and the degree of specialization in their production processes. National economies have become tightly linked with international trade, foreign direct investment, cross-border cooperative ventures and international financial transactions. The globalization processes have made international business activities an important determinant of national competitiveness and economic growth [6].

*Institutional framework*: the growing demands for efficiency and innovation in the world economy increase the importance of good institutional incentives. Institutions play an important role in reducing the bounded rationality, opportunism and uncertainty which characterize complex economic systems [30, 53]. The institutional

framework influences economic competitiveness and growth by shaping the individual and organizational incentives. These incentives shape the processes of resource accumulation and upgrading, technology development and diffusion, resource reallocation, utilization and coordination, the interactions of buyers and sellers in the product markets, and the internationalization of business activities.

*Government role:* at the beginning of the 1990s, rapid structural changes in the world economy forced industrialized countries into a situation where they had to reassess the balance between the two main duties of government - enhancement of overall efficiency and growth of economy versus reduction of social inequities. Increasing competition among firms and the growing international mobility of productive assets and technologies put increasing weight to government policies that provide efficient framework conditions for firms [33]. At the same time the rapid diffusion of the ICT and “best practice” organizational arrangements created severe structural adjustments problems in the industrialized countries. These problems led to high unemployment rates, continuous public sector deficits and growing social inequalities [31, 32]. To successfully overcome numerous inefficiencies of the market mechanism, i. e. market failures, the equilibrated government intervention is required.

In accordance with the ascertainment, that the increasing internationalization and specialization of firms' activities could not be accommodated within the old techno-economic and socio-institutional paradigms [18], we define the global economy as a system of above mentioned seven mutually dependent spheres. Thus, the global economies are those, which take advantage of positive influences of globalization by better adaptation towards the new techno-economic and socio-institutional paradigms.

The hypothesis of our paper has been deduced from the statement, that during and after a major techno-economic paradigm shift, the economic growth of an economic system depends upon its particular socio-economic starting point – i.e. the existing resources, technologies, organizational arrangements, product market structures, external business activities, institutions and government role – and its adjustment capacity vis-à-vis the new techno-economic and socio-institutional paradigms [26, 16]. A good starting point and adjustment capacity give society a clear advantage in socio-economic development due to 'increasing returns' associated with the adoption of the new paradigms. This is where the systemic nature of socio-economic change becomes particularly important. We presume that:

*Hypothesis:* Global economies achieve higher long-term cumulative economic growth

#### **Systemic Approach – the Possibilities of Empirical Testing**

Numerous of quantitative and qualitative indicators are required for the empirical testing of systemic approach towards measuring globalization of economy. Therefore, the empirical studies are confronted with four main difficulties: shortage of comparable statistical data, the question of objectivity of soft indicators, which are based on the questionnaires results, the necessity for combining large extent of information into the easily examined form of communication (individual indicators should be combined into the composite index, which for the price of more holistic information, partly loses its reliability) and the possibility of performing regression analysis – mutual dependency of the various spheres of the system creates the problems of multicollinearity.

These facts have created doubts about the credibility of benchmarking economies on the basis of composite indicators [21]. At the same time, however, in line with the statement, that countries not only cooperate, but compete as well [4], benchmarking keeps its informative significance. Such information is applicable not only because of the informational gap of the official statistics in the field of qualitative indicators, but because of the pragmatic way of communication as well. The composite indicators have gained importance as a communication and political tool because of their ability to integrate wide extent of information into a form, comprehensible to wider circle of users [14]. Their applicability is increasing in different areas of economic and business statistics, which shows their political importance and operational adequacy in the field of decision making [8, 28].

#### **The Construction of Composite Indicator of Global Economy**

In the selection of data sources, we have tried, as far as possible, to rely on statistical databases of international organizations [35, 34, 39, 36, 40, 37, 38, 50, 45, 46, 47, 48, 54, 19]. In order to guarantee the comparability, we have also preferred data sets which cover most of the statistical sample (44 countries) and all five years of observation (the period from 1998 to 2002). Due to the systemic and interdisciplinary nature of our theoretical framework, we could not rely on traditional data sources alone. We were forced to use many unconventional data sources and proxy

variables in order to match our theoretical arguments (we have mainly relied upon the data of Economist Intelligence Unit (EIU) [9, 10] and World Economic Forum (WEF) [51, 52].

## Methodology

### The Selection of Indicators

The joint composite indicator of global economy has been constructed on the basis of 83 individual indicators, linked into the seven spheres of economic growth<sup>2</sup> - the system of indicators is presented in the Table 1 (Appendix).

In order to verify the suitability of selected indicators to the theoretical framework, we decided to construct the composite indicator by the use of the PCA, at the same time making the final selection of indicators and determining the weights. Thus, from the broader assortment of theoretically grounded indicators only those, which are the part of the same common component, were kept. In the selection of indicators two criteria were applied: communalities of individual variables and the weights of factors [43, 17]. The indicators with the communalities above 0, 2 and with the positive weights of factors with the minimum value of 0, 3 have been included in the composite indicator.

### Standardization and Weights Determination

With the intention of their greater comparability the indicators have been standardized. The standardized normal variables have been obtained by subtracting the arithmetic mean from the observed value of the variable and by dividing the difference with the standard deviation of the variable.

The weights of single indicators in the composite index have been determined in two levels by means of the PCA approach. On the first level, the weights of the indicators in the sub indices were determined, whereas on the second level, the weights of the sub indices in the joint index of global economy were determined. From the technical viewpoint, the weights of the indicators have been determined at the correlation matrix. This practically means that each of the indicators, which form the component, has the same weight; the actual weight, however, is determined by the structure of correlation with other variables.

### The Problem of Missing Data

The missing data were quite a considerable obstacle in the analysis. Due to their structure, in the individual parts of the analysis the elimination of observations with at least one missing value caused a considerable loss of observations. We have applied the combined approach to dismiss the problem of missing data. The entrance correlation matrix for the PCA has been calculated by means of in pairs eliminated observations with the missing values – coefficients of correlation have been calculated on the basis of at least 167 and at the most of 220 pairs of data. With the actual calculation of the index, the missing values (after the weights have been calculated) have been ignored. The value of the index in each observation has been calculated from the available indicators and corrected by the factor of correction

$$k \equiv \frac{\sum_i w_i}{\sum_j w_j} \quad (1)$$

where  $w_i$  is the weight with the single indicator,  $i$  is the weight of particular index and  $y$ , however, the weight with the non-missing values.

### Results of the PCA

By the PCA, the high reliability of five composite indices has been ascertained: productive resources, technology, organizational arrangements, products market characteristics and institutional arrangements. With these indices, the values of Crombach's Alpha are high, and the first component comprises more than 50 % of the variability of all of the indicators that are included in the particular sub index (Table 2). The PCA has eliminated some of the proposed indicators of these spheres, yet, this has not substantially influenced the reliability of composite indices.

TABLE 2: RESULTS OF THE PCA – SINGLE SUB INDICES

Indicator	Crombach's Alpha	Total Variance Explained
PRODR	0,84	55 %
TECHNOL	0,92	62 %
ORGAR	0,98	72 %
PROMC	0,96	82 %
IBA	0,72	33 %
IFRAM	0,94	57 %
GOVMR	0,65	39 %

With the view to the Crombach's Alpha and the total variance explained, the composite indices »international business activities« and »government role« are less reliable. This is partly the confirmation of theoretical arguments and partly the consequence of international incomparability of statistical data. Theoretically, the role of these two spheres in the systemic framework of global competitiveness of economy justifies this result. Namely, it is rather interested that the results of analysis are to the great extent in accordance with the hierarchical structure (different role) of single spheres in this framework. Another possible reason for this result could be the trade-off between exporting to a certain country and investing into it. This means that the correlation between international trade and net foreign investments is not necessarily strong or positive, a fact that makes »international activities« a multi-dimensional rather than a one-dimensional concept, that could be sufficiently explained by the first principal component. Lower reliability of composite indicator of government role can certainly be assigned to the international incomparability of collected statistical data (heterogeneity of presentation of the structure of government consumption) and to a lot of missing observations in the dataset, regarding these indicators.

In the continuation, the composite indicator of global economy has been constructed from composite sub indices. Single composite indicators were the input variables for the second level of weights determination and the selection of indicators by means of the PCA. The sub indices have been standardized once again in order to eliminate the influence of different number of indicators in each sub index.

Table 3 shows the high reliability of composite indicator of global economy, on the basis of five the most reliable sub indices. If »international business activities« and »government role« are included, the composite indicator is statistically less reliable.

TABLE 3: RESULTS OF THE PCA – JOINT COMPOSITE INDICES

IFRAM		
GOVMR		

Notwithstanding the above mentioned, and according to the theory and the argumentation of possible reasons for unreliability of these two groups of indicators, the sub indices of international business activities and government role are included in the joint composite indicator.

Fig. 1 shows the position of Slovenian economy in the year 2002 in comparison to nine comparable economies<sup>3</sup>. Its position is similar to the position of other new members of EU (Czech, Hungary, Poland), which according to the main aspects of economic growth – the exception are already discussed »international business activities« and »government role« - attain lower ranking. On the basis of this composite indicator, Slovenia is positioned on the sixth place among the observed countries.

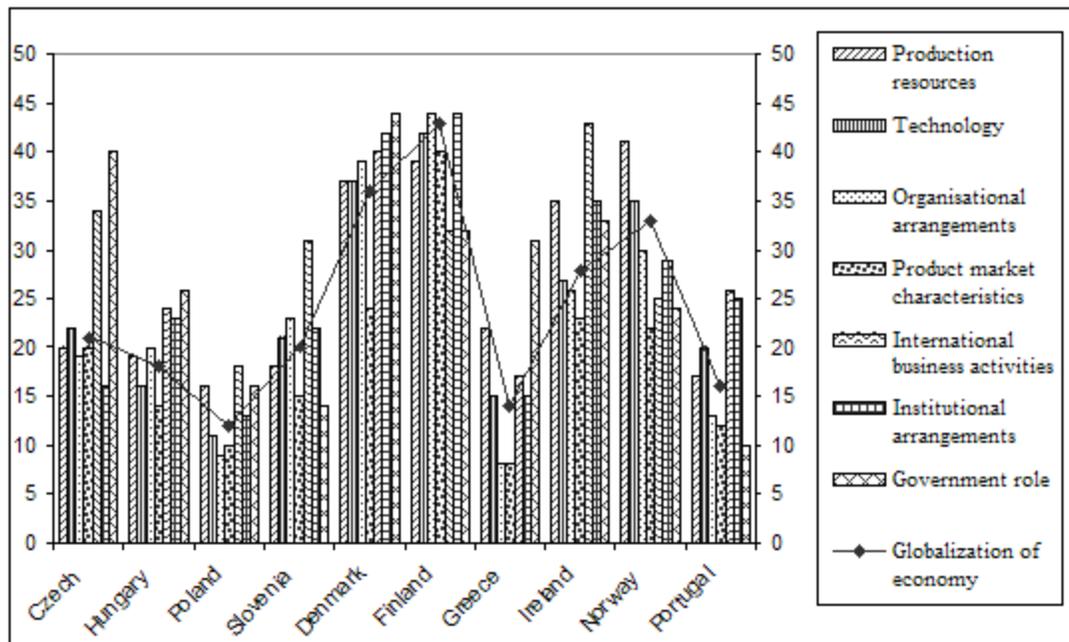

FIG. 1: RANKINGS OF SLOVENIA AND NINE COMPARABLE COUNTRIES

From Fig. 2 it is evident, that on the basis of this composite index, Slovenia is the second most global economy among more developed new members of EU. It has an advantage over Poland in all aspects, in comparison to Czech Republic the advantages are in organizational and institutional arrangements, in comparison to Hungary, however, Slovenia lags behind in productive resources and government role but it has advantages in all other aspects.

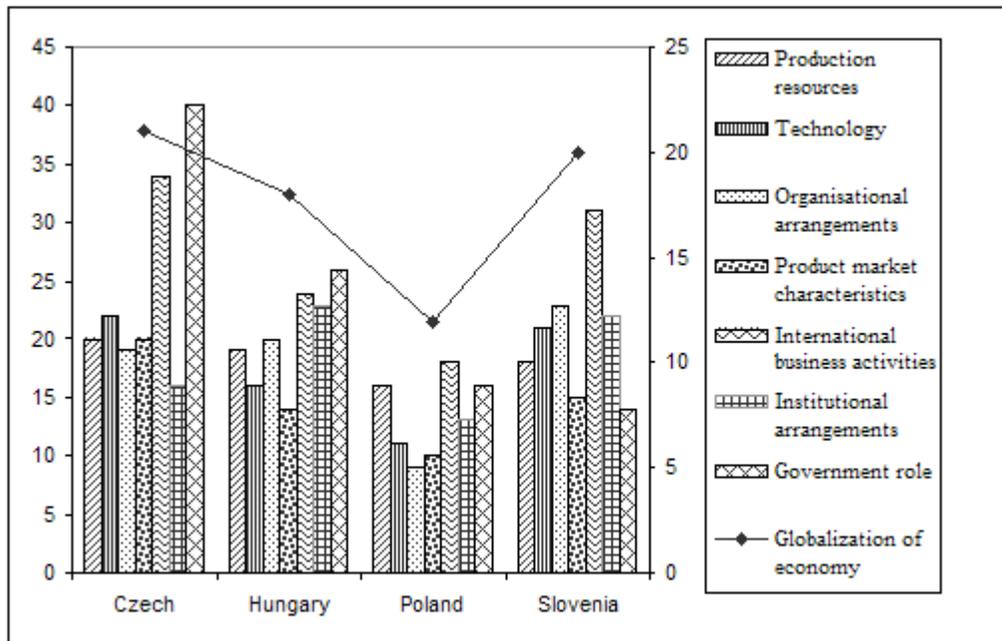

FIG. 2: RANKINGS OF SLOVENIA AMONG MORE DEVELOPED NEW MEMBERS OF EU

The results of the PCA analysis also suggest that Slovenian economy has relatively good potentials in the field of technology. With regard to the ascertained advantages in organizational arrangements, testing of statistical significance of partial correlations between some of the variables in these two fields offers new research challenges. Particularly interesting would be assessment of partial coefficients between variables of ICT-diffusion and some variables of organizational arrangements. One of the arguments that support this interest is a commonly held belief in scholarly and trade literature that ICT plays an increasingly critical role in the organizational transformation. Indeed, empirical studies support the idea that ICT helps companies develop and implement strategy, and yields direct economic benefit [3]. Yet some other studies suggest that up to two-thirds of small and medium size enterprises (SME) relegate ICT to performing routine operations only rather than leveraging it to help advance the company's strategy [23]. The results of the analysis conducted between Slovenian SMEs, however, suggest that these companies indeed are using some applications of ICT strategically and that strategic ICT usage is associated with two or three factors. Additional analyses show that companies adopting a low-cost strategy are the least likely to use ICT strategically whereas firms emphasizing innovation and, to a lesser extent, an efficiency strategy, use ICT more strategically [24, 25]. The latter ascertainment could be a good starting-point for further analysis in this field.

It is necessary to take into consideration the fact that the weights of the indicators are determined statistically, i.e. by means of the PCA approach. However, the main weakness of this approach is similar to the weakness of arbitrary determination; namely, the approach does not reflect the actual importance of the single sub index in the joint composite indicator. This weakness is even more evident in the case of shortage of comparable statistical data. But, with regard to the Porter's argumentation [41], that individual economies go simultaneously through different development stages (resource driven, investment driven, innovation driven and wealth driven) with different importance of single factors of economic growth, the authors, that are studying measuring globalization of economies, prefer statistically over arbitrary determination of weights [29, 27, 2]. The main basis for the reliable statistical weights is the availability of the appropriate statistical data.

## Globalization of Economies and Economic Growth

### Methodology

In the second part of our empirical study we will test the general hypothesis of our study: *global economies achieve higher long-term cumulative economic growth*. In order to test our hypothesis we estimated the following OLS regression model

$$\Delta GDPpc_{it} = \alpha + \beta X_{it} + \gamma Z_{it} + \varepsilon_{it} \quad (2)$$

where  $\Delta GDPpc_{it}$  is the relative increase (growth) of the GDP per capita in economy  $i$  in the year  $t$  as compared to the year  $t-1$ ;  $X$  is the vector of independent variables values for country  $i$  and  $Z$  is the vector of control variables values for country  $i$ , whereas the  $\varepsilon_{it}$  represents the error term. In the panel specification of the model, the error term is divided into country-specific error  $v_i$  and remaining  $\varepsilon_{it}$ .

There are two main differences in our empirical analysis, compared to the approach of Hämäläinen [17]. First difference is the improvement in the construction of composite indicator of globalization of economies. Instead of arbitrary assigning of weights we used the PCA approach, and also tested for the reliability of composite indicators. The second difference lies in the use of different specifications of the model, thus getting more reliable results.

The dependent variable of our study, economic growth, is operationalized with GDP/capita level, as a measure of long-term cumulative economic growth. The independent variables include: a) the composite indicator of globalization of national economy; b) composite indicators of seven spheres of economic growth in the period of globalization; c) three control variables. The seven spheres of economic growth are: productive resources (PRODR), technology (TECHNOL), organizational efficiency (ORGAR), product market characteristics (PROMC), international business activities (IBA), institutional framework (IFRAM) and the government role (GOVMR). The two control variables include consumer price inflation (INF), long-term interest rates (LTINTR) and BDP per capita level (BDPPCL). The first control variable is included to test the known hypothesis that less-developed countries tend to grow faster than the leading countries [1]. The intention of other two variables is to test the importance of macroeconomic environment in the new techno-economic paradigm.

### Results

If we take a look at the results we can see from the model 1 (Table 4) that globalization of economies does not have an effect on growth. However, if we control the effects of interest rates, inflation and level of GDP per capita, globalization of economies has a positive effect on growth (Model 2). This means that more developed countries do grow slowly, but especially for less developed countries it is true that they grow faster, if they are more global.

The statistical weakness of most of the theoretically important spheres of economic growth can be seen in the context of mentioned difficulties with the empirical testing of systemic framework of economic growth. Thus, one of the main reasons for apparent insignificance of these spheres may be the high multicollinearity among the key variables of new paradigms. This may seriously distort the significance and even the signs of the independent variables. Due to interdependencies other variables may have assumed some of their explanatory power. Some of

the insignificant variables may also influence economic performance with a rather long time lag. For example, technological investments and inventions may take years to influence economic growth. However, testing such lagged relationships requires improvements in the availability of longitudinal data on many indicators.

## Conclusions

During the past few decades the continuous growth and geographical integration of markets has led to an increasingly complex international division of labor where national economies are tightly linked by international trade, foreign direct investment and cross-border cooperative ventures. The globalization has created serious problems for the established techno-economic and socio-institutional paradigms. These problems were an important catalyst to the current paradigm shift. The new ICT paradigm requires rapid and balanced techno-economic and socio-institutional adjustments of nations. Structural adjustments are not easy, however, because they have to overcome significant mental inertia and rigidities. In this context, the increasing competition, specialization, complexity, structural change and knowledge intensity of modern economies is challenging the efficiency of the market mechanism, the governments and the whole society.

On the basis of the thesis that during and after a techno-economic paradigm shift, the growth of an economic system depends on its particular socio-economic starting point - and its adjustment capacity vis-à-vis the new 'best practice' techno-economic and socio-institutional paradigms, it is reasonable to define the global economy not only as globally integrated, but as globally competitive as well. Such economies are complex systems where 'everything depends on everything else'.

The composite indicator of global economy, constructed by the PCA on the basis of indicators of systemic framework of economic growth, has proved as reliable. But in spite of the fact that statistically, like arbitrary, determined weights of indicators in the composite indices, do not reflect their actual importance, they have proved as the most appropriate for measuring the entanglement of globalization of economies. The second suitable method for determining weights could be regression analysis, which results, however, due to the mutual dependence of the spheres of economic growth and consecutive multicollinearity of variables, could be distorted.

When testing the hypothesis, the implementation of regression analysis in the case of measuring of globalization of economies has proved as problematical. With the inclusion of control variables into the regression model, however, it has been proved that the globalization of economies positively influences their economic growth. This is particularly true for the less developed economies.

TABLE 1: THE SYSTEM OF INDICATORS OF GLOBAL ECONOMY

<p><b>INDICATOR 1: Productive Resources (PRODR)</b></p>
<p><b>Sub indicator 1: Venture Capital</b></p> <ul style="list-style-type: none"> <li>• Availability of venture capital (1=low, 7=high)</li> <li>• Venture capital investments (% of GDP)</li> <li>• Venture capital investments in high-technology sectors (% of total investment)</li> </ul> <p><b>Sub indicator 2: Human Resources</b></p> <ul style="list-style-type: none"> <li>• Percentage of the population between 20 and 29 years of the age enrolled in tertiary education</li> <li>• Percentage of the population between 25 and 34 years that has attained tertiary level of education</li> <li>• Brain drain (1=high, 7=low)</li> </ul> <p><b>Sub indicator 3: Science</b></p> <ul style="list-style-type: none"> <li>• Number of scientific publications per million inhabitants</li> </ul> <p><b>Sub indicator 4: ICT-infrastructure</b></p> <ul style="list-style-type: none"> <li>• Telephone lines per 100 inhabitants</li> <li>• Internet hosts per 10000 inhabitants</li> </ul>
<p><b>INDICATOR 2: Technology (TECHNOL)</b></p>
<p><b>Sub indicator 1: Research &amp; Development (R &amp; D) inputs</b></p> <ul style="list-style-type: none"> <li>• Expenditure on R &amp; D (% of GDP)</li> <li>• Number of researchers per 1000 of labor force</li> </ul> <p><b>Sub indicator 2: Innovations</b></p> <ul style="list-style-type: none"> <li>• Resident patents per 10000 inhabitants</li> <li>• Technical sciences graduates in R &amp; D per million inhabitants</li> </ul> <p><b>Sub indicator 3: ICT diffusion</b></p> <ul style="list-style-type: none"> <li>• Personal computers per 1000 inhabitants</li> <li>• ICT Environment (1=bad, 7=very good)</li> <li>• ICT Readiness (1=low, 7=very high)</li> <li>• Internet users per 100 inhabitants</li> <li>• ICT usage (1=low, 7=very high)</li> <li>• E-business (1=undeveloped, 7=highly developed)</li> </ul>
<p><b>INDICATOR 3: Organizational Arrangements (ORGAR)</b></p>
<p><b>Sub indicator 1: Allocative efficiency</b></p> <ul style="list-style-type: none"> <li>• Unemployment (%)</li> <li>• Female share of labor force (% of total labor force)</li> </ul> <p><b>Sub indicator 2: Adjustment to the new paradigms</b></p> <p><b>Sub indicator 1: Operation and behavior of companies</b></p> <ul style="list-style-type: none"> <li>• Sophistication of production processes (1=labor intensive, 7=high-technology demanding)</li> <li>• Nature of competitive advantages (1=cheap or local natural resources, 7= unique products and / or processes)</li> <li>• Sophistication of value adding chain (1=resources exploitation and/or production, 7=development, marketing, sale, logistics and after-sale activities)</li> <li>• Marketing development (1=low, 7=high)</li> <li>• Human management (1=low investment into education and development of employees, 7=high investment into acquirement, education and retainment of qualitative employees)</li> <li>• Companies-customers relations (1=bad, 7=qualitative)</li> <li>• Ethical behavior of companies (interactions between defined company and other companies are in international perspective 1=poor, 7=very good)</li> <li>• Universities/industry R &amp; D collaboration (1=undeveloped, 7=highly developed)</li> <li>• Innovation potential (1=licensing, imitation, 7=development of own products and/or processes)</li> <li>• Inclination for innovation (1=low, 7=high)</li> <li>• Company spending on R &amp; D (1=low, 7=high)</li> <li>• Firm-level technology absorption (1=low, 7=high)</li> </ul>

**Sub indicator 2: Management of companies**

- Relationship employers – employees (1=uncooperative, 7=cooperative)
- Management responsibility (1=low, 7=high)
- The role of supervisory boards (7=high)
- Management professionalism (1=low, 7=high)
- Management wages (1=mainly fixed, 7=high flexible part)

**Sub indicator 3: Environmental development**

- Consideration of international environmental standards are a priority of a country (1=not agree, 7=agree)
- Disposability of government subsidies for environmental friendly energy and materials (1= extensive, 7=not disposable)
- Usage of environmental management systems in companies (1=low, 7=high)

---

**INDICATOR 4: Product Market Characteristics**

---

**Sub indicator 1: Demand conditions**

- Total domestic demand growth (%)
- Sophistication of domestic demand (1=low, 7=high)

**Sub indicator 2: Supply**

- Extent of local suppliers (1=few, 7=many)
- Quality of local suppliers (1=low, 7=high)
- Intensity of local competition (1=limited, 7=intensive)

**Sub indicator 3: Cooperation of companies**

- Cluster development (1=limited, 7=high)
- Intensity of cluster development (1=low, 7=extensive – between suppliers, local customers and research institutions)

---

**INDICATOR 5: International Business Activities (IBA)**

---

**Sub indicator 1: International trade**

- International trade (% of export and import of goods and services in GDP)
- Import penetration (% of import in total industry demand)
- Intra-firm export (% in total export)
- Intra-firm import (% in total import)
- Total intra-industry trade (% in total industry)
- Intra-industry trade in high technology sectors (% of high-technology sectors)

**Sub indicator 2: Foreign direct investment**

- Foreign direct investment (% of inward and outward flows of FDI in GDP)
- Inward and outward mergers and acquisitions (% of GDP)

**Sub indicator 3: Technology transfer**

- Patents of non-residents and residents abroad per 10000 inhabitants
- Technology transfer income per capita (million US\$)

**Sub indicator 4: International portfolio investments**

- International portfolio investments (% of assets and liabilities in GDP)

---

**INDICATOR 6: Institutional Framework (IFRAM)**

---

**Sub indicator 1: Tax regulation**

- Tax regulation (1=bad, 10=qualitative)
- Tax income (% in GDP)
- Corporate income tax rate (%)
- Value added tax (%)

**Sub indicator 2: Financial regulation**

- Financial regulation (1=bad, 10=qualitative)
- Openness of financial system (1=low, 5=high)
- Sophistication of financial market (7=high)
- Financial-accounting standards (7=high quality)

**Sub indicator 3: Regulation of international trade and capital flows**

- Non-tariff barriers (7=low)
- Mean tariff rate (%)
- Government policy towards FDI (5=good)

- FDI protection scheme (1=bad, 5=good)
- FDI environment (1=bad, 10=good)
- Access of foreigners to local capital market (1=bad, 5=good)

**Sub indicator 4: Politics toward enterprises and competition**

- Companies setting-up regulation (1=high, 5=low)
- Freedom of competition (1=low, 5=high)
- Efficiency of anti-monopoly regulation (1=low, 7=high)
- State ownership/control (1=high, 5=low)
- Price control (1=high, 5=low)
- Number of administrative procedures for company setting-up
- Number of days for company registration

**Sub indicator 5: Environment for knowledge-based economy development**

- Innovation policy (1=undeveloped, 7=developed)
- Government subsidies /reliefs for R&D activities of companies (1=low, 7=high)
- Quality of research institutions (1=low, 7=high)
- Intellectual property protection (1=low, 7=high)

**Sub indicator 6: Labor market**

- Restrictiveness of labor regulation (1=high, 5=low)
- Hiring and firing of workers (1=high regulation, 7=low regulation)
- Wage regulation (1=high, 5=low)
- Industrial relations (1=bad, 5=good)

**Sub indicator 7: Political and legal environment**

- Effectiveness of legal system (1=low, 7=high)
- Courts independence (1=low, 7=high)
- Unfairness of government officials (1=high, 7=low)
- Courts bribery (1=high, 7=low)
- Government officials bribery (1=high, 7=low)

## End Notes

<sup>1</sup>The highest type of technological innovation, which do not change only the products and technologies but require fundamental adjustments in organizational and socio-institutional arrangements of society (socio-institutional or mental paradigm) as well [13].

<sup>2</sup>With the view to the Porter's [41] statement, that the relative importance of microeconomic part of the economic development is increasing in the period of globalization, the indicators of macroeconomic environment have not been included among the factors of economic growth. They were included as control variables in the subsequent regression analysis.

<sup>3</sup>Comparability criteria with Slovenia are: developed countries of EU enlargement round in 2004 (Czech, Hungary, Poland), developed European countries with up to 5, 5 millions inhabitants (Ireland, Denmark, Finland, and Norway), European countries with similar GDP per capita (Greece, Portugal).

# Minimum Wage in the Wage Structures in the Slovak and Czech Republic

*Lubica Bajžíková*  
*Comenius University in Bratislava, Slovak Republic*

## Abstract

Varied levels of minimum wage increases can be observed as well as different development in unemployment rates and wage inequality in the two countries. After initial stagnation in the development of minimum wage rates there were a series of significant increases in levels over the last few years. These legislative steps, especially in the context of a permanently increasing unemployment rate, have induced heated debate about the effects of minimum wages on employment, skill formation and the overall economy. The question as to the effectiveness of minimum wages as a policy tool, revolves around, the positive aspect of, its ability to boost hourly wage rates and, the negative aspect of, minimizing its adverse side effects on employment and skill formation.

## Introduction

After 75 years as a common state, Czechoslovakia divided into two separate nations. This occurred in 1993 and resulted in the formation of the Czech and Slovak Republics. Given their history of unity both economies had very distinct similarities in terms of economic development.

Varied levels of minimum wage increases can be observed as well as different development in unemployment rates and wage inequality in the two countries. After initial stagnation in the development of minimum wage rates there were a series of significant increases in levels over the last few years. These legislative steps, especially in the context of a permanently increasing unemployment rate, have induced heated debate about the effects of minimum wages on employment, skill formation and the overall economy. The question as to the effectiveness of minimum wages as a policy tool, revolves around, the positive aspect of, its ability to boost hourly wage rates and, the negative aspect of, minimizing its adverse side effects on employment and skill formation. If the amount of minimum wage is assessed unreasonably high than through boosting wages it can affect the whole wage structure in such a way as to subsequently cause inflation. Moreover higher wages would mean a strong cost load and would affect the investment policy of companies. Disproportionate and rapid increases in minimum wage influence the means for the creation of new job positions, the maintenance of already existing low qualified or unqualified job positions and simultaneously, badly paid jobs. The above-described situation could result in companies giving up on business activities in branches where this type of work prevails and consequently, result in unemployment. High minimum wages can also create an indirect effect on worker categories with the lowest incomes and can cause movement that would narrow the gap between low-wage earners (the first 10<sup>th</sup> percentile of wages) and middle-wage earners (the median or 50<sup>th</sup> percentile). Paradoxically, it can also dull the economic stimulation of people, or lead to a situation wherein people lose interest in working in certain professions.

The evidence as to minimum wage studies is mixed and there are still many unanswered questions. When taking into consideration the huge minimum wage increases in the case of the Czech and Slovak Republic, the following questions are worthy of investigation. How do minimum wage increases influence the labour market in both countries? How do minimum wage increases affect wage distribution?

The aim of this paper is to shed some light on some of the above-mentioned questions and evaluate the minimum wages increases in the Czech and Slovak Republics. Given the similarities between the economies and the data gathering methodologies it will be possible to analyze the varying impact of minimum wage adjustments on the labour markets of these two economies with a possible comparison.

## The Minimum Wage Policy

In 1991 a minimum wage rate was first introduced into the Czechoslovak Federative Republic Labour Code. The levels of the minimum wage were set for workers paid on both an hourly and monthly basis. *Minimum wage was understood as the lowest monetary performance that an employer is obliged to provide an employee for his/her work in compliance with the law.* The minimum wage was flat, the same for all employees in Czechoslovakia within employment contracts or in a similar work relation and it did not distinguish between an employment contract for a fixed or indefinite period, whether it is the individual's main job, overtime/additional or parallel employment contracts. No worker could receive less than the minimum wage. However, differentiated lower rates were assessed for receivers of partial or full disability benefits, and for employees younger than 18 and 16 or for young people who are within their first employment contract.

The minimum wage levels were established by law upon preliminary discussions within a tripartite system called the Council of Economic and Social Agreement (RHSD). There was, however, no formula for increasing the minimum wage and due to insufficient pressure on the part of labour unions for an increase in the minimum wage, the governments in both countries made decisions in accordance with their own needs and circumstances. The minimum wage has been the basis for calculating a number of social benefits, such as health, pension insurance and unemployment benefits. Given the fact that a percentage of the state payments to the social system was derived from minimum wage levels, it should come as no surprise that both governments were in no hurry to increase the minimum wage.

After the split of the Czechoslovak Federative Republic in 1993, both countries maintained the previous Czechoslovakian legislature, which became the corner stone for present-day Czech and Slovak legislature. This was also the case with the law concerning wages. In both countries the minimum wage is assessed by the tripartite system. The influence, however, of trade unions on the assessment of minimum wage has not changed, it has i.e. been extremely weak. Even the tripartite itself did not have any power to negotiate in this area at a nation-wide level.

In 1993 the government committed itself to updating the level of minimum wage so as to maintain a sufficient advance before subsistence wages with a simultaneous modification of wage tariffs. Such a reasonable interval was supposed to stimulate people to look for work. The government carried out this objective and in 1993 decided to increase the minimum monthly wage from 2,200 to 2,450 SKK.

The minimum wage in Slovakia had an influence on other social institutions for which it served as the basis of assessment. Most of the above mentioned links were disconnected and transferred to the subsistence wage as of April 1, 1999. Nevertheless, up until that time, there was little interest in increasing the minimum wage in the case of the Slovak Republic, see Table 2. In spite of the increase to the minimum wage in 1996, the contribution of the minimum wage towards the average earning continued to drop to the low point of 29.3 % in 1997. At that point, a series of more intensive increases to the minimum wage rates began in 1998 up until its final rate of 4,400 SKK. In this way, the percentage of the minimum wage in relation to the average wage increased to 35.9 % in the year 2000. In 2004 the minimum wage reached 6,500 SKK. The relationship of the minimum wage to the subsistence wage is also of interest. The paradox in evidence in the Czech Republic did not occur, nevertheless, the development of the minimum wage in Slovakia was not much more successful. Thus the minimum wage failed to stimulate work in Slovakia as well.

## Theory and Literature

Economists traditionally agree with the opinion that a growth in minimum wage has a negative impact on employment. This traditional view is a result of a basic simple competitive model, which assumes there are many companies in existence, and that manpower is homogenous. The model assumes that the workforce will offer more work with an increased wage whereas the marginal work product decreases with other additional units of work. These assumptions result in the declining curve in labour demand. If the directed obligatory minimum wage is above the equilibrium, market-clearing wage, employment must decrease and a certain number of employees are made

redundant. A further economic conclusion follows out of the economic theory which is that the affect of minimum wage is stronger in small, open economies. This is the case because, as mentioned above, minimum wage increases result in a higher wage cost burden for companies, which at the same time raises the costs of domestic production and decrease its competitiveness. This means, in the conditions of small open economies, the substitution for domestic production for imported and a decrease in employment.

The basic competitive model has, however, many simplifying prerequisites that are not valid in a real economy. All of these and other simplifying presumptions support the idea that the growth of minimum wage does not have to necessarily result in a decrease in the employment rate. Elimination or incorporation of other presumptions leads to models, which reject the common impacts on the employment rate. The essential study on the California fast-food industry and many other following studies strengthened this reality. Many empirical studies found that minimum wage increases might be a strong instrument for redistribution, that impact on the employment rate is not always negative and that it is necessary to seriously consider the existence of monopsony in the labour market, which may also result in positive effects on the employment rate, as was supported in some studies. The results of the studies also reveal that the intensity of minimum wage growth and especially of real minimum wages is of key importance in the evaluation of minimum wage as an instrument of economic policy.

#### **A Study Investigating the Impact of Minimum Wage on Employment**

Most empirical studies concerning minimum wage focus on youths and young adults with low qualifications, as they are the most frequent representatives of groups traditionally earning minimum wage. The research in this sphere deals especially with the impact of minimum wage on the employment of these worker groups.

Most of the studies concerning the effect of minimum wage increases on employment were carried out in the United States. The earlier research focuses on youths and young adults with low qualifications considered as the most frequent representatives of groups traditionally earning the minimum wage. All these studies have generally supported the traditional view that minimum wage has a negative affect on employment, res. unemployment amongst young people. Specifically, a 10 % increase in the minimum wage will result in a 1 % to 3 % decline in total employment of young people. For a general survey and a summary of research from these years, see Brown, Gilroy and Kohen (1982).

Later studies from the 1980's showed a far lower effect of minimum wage on employment. For example, Hamernesh (1982) investigated the variations of minimum wage through various branches of industry and discovered that a 10 % increase in the minimum wage will lead to a 1.2 % increase in unemployment of young people and that this decline will be greater in cases of industrial production. One possible explanation follows from the above mentioned theory that of the open economy theory and substitution for import.

The results of the above mentioned studies are contrary to the findings of Card and Krueger. In their controversial book (Card and Krueger, 1995) concluded that the effects of minimum wage increases are close to zero. Such results were based on a variety of empirical analyses of mainly employment in restaurants of the so called "fast-food" type, used as a natural experiment.

This approach, however, as well as the research results, was met with criticism from Neumark and Wascher (1994) who asked the question whether the method of "natural experiments" is a suitable tool for analysing minimum wage change consequences on employment. Their criticism makes use of the following arguments: firstly, this method fails in cases when including the delay of the minimum wage effect with the addition that when the delay in the consequences of minimum wage changes cannot be determined unambiguously, it can be far greater. Secondly, they object by pointing out it would be more appropriate to put the emphasis on adult workers, whose wages closely fluctuate near the border of the minimum wage as young workers are only beginning their professional career and it is consequently natural that most of them will move out of this minimum wage level quickly.

In cases of adults working at the level of minimum wage, the opposite situation occurs with mostly those belonging to low-income groups of employees for a long time period. Neumark and Wascher (1994), with the application of panel data, again using the sample of the national level but on a state level on the employment of young people. They came to the conclusion that with an increase in the minimum wage a significant decline in employment occurs. A survey of an academic debate from the 1980's and 1990's is mentioned in Table 4.

As far as Europe is concerned, a number of similar studies also exist; however, their intensity is far from

the academic debate in the United States. E.g. Bazen (1990) carried out an empirical study of the impact of minimum wage on employment in Great Britain from the macro-economic viewpoint. He applied a simulation of the impact resulting from a minimum wage, which would fluctuate at the level of half of an adult male income median. The result of this simulation was the conclusion that minimum wage would cause a decline in employment. This work, however, was highly criticised by Machin and Manning (1992), who stated that the application of a macroeconomic approach was unsuitable for an analysis of changes in relative wages. They, instead, decided to apply a micro-economic approach. They worked out a model based upon equations from which they calculated the correlation between employment change and the change of minimum wage share.

The authors concluded that there is no negative effect of minimum wage on employment and that minimum wage even had a positive effect for catering. This result was also confirmed by the study of Dickend, Machin and Mannig (1994). A recent study by Steward (2002) found, however, a slight negative employment effect of introducing a minimum wage in the UK.

In France, which has a unified minimum wage for the whole economy, similarly as in the Slovak and the Czech Republic, empirical studies exist as well. Research from the 1980's reveals, similarly as with the studies carried out in the United States, a strong negative effect of minimum wage on employment, see Rosa, 1980 and Martin, 1981. Both studies, however, were subject to sharp criticism (Skourias, 1995) concerning the shortages in statistical methodology. The studies of the 1990's, again similarly as in the United States, led to the conclusions that although the growth of a minimum wage led to strong pressure on average earnings growth, employment declined only negligibly. e.g. Dolado et al. (1996) carried out an analysis of wages and employment dynamics in two time periods of the 1980's. In the first period 1981 to 1985 the minimum wage SMIC increased relative to average earnings. In the second time period 1985 to 1989, the SMIC remained at a constant level in comparison with average earning. The authors determined moderate growth dynamics for low earnings at the beginning of the 1980's in comparison with the second half of the decade, although their results showed a certain decline in employment. Nevertheless, the authors emphasise that the different wage dynamic along with the employment effect might differ with the position in the economic cycle.

The changes in minimum wage levels in the Czech and Slovak Republic provide a unique opportunity to research their impacts on employment and wage distribution. Buchtíková (1995) carried out a simulation in an effort to answer the question as to what is the reaction of employment on an increase in wages in industry due to minimum wage growth. It is necessary, however, to take into account the short time series of the study (1991 to 1993) and the negligible changes in minimum wage over the observed time period. Furthermore, the research was based upon statistics from state companies, which is why the results cannot be applied to the economy as a whole.

From this point of view, the following study will be very interesting as these countries have experienced "jump-increases" in the minimum wage level, resulting in a longer time period at our disposal and a large data base, which allows the authors to deduce conclusions for the economies as a whole. As there are no detailed studies carried out up until now for Czech and Slovak Republics, the following study may consequently reveal certain new features in the minimum wage discussion.

#### **A Study Investigating the Impact of Minimum Wage on Income Redistribution**

As shown by many empirical studies minimum wage affects wage distribution in many aspects (Brown, 1999). Firstly, employees who would work, under normal circumstances, for lower wages than the minimum one, will in all probability be employed less or employed for fewer working hours. The loss of this low-income category for working positions leads to even more wage distribution or to downward pressure on wages, also in the case of workers who are not affected directly by minimum wage growth. Secondly, a wage increase for workers directly affected by the minimum wage level will lead to their substitution by workers who are more attractive and thus increase demand for the labour force located closely above the minimum wage level. Thirdly, minimum wage growth may lead to the so called "ripple effect" in higher wage levels as well, despite the fact that most empirical studies prove that this effect is small.

One of the first empirical studies pointing out the ripple effect was carried out by Gramlich (1976). He discovered that with an increase in the minimum wage, the wage ripple effect arises in the form of an income increase not only in low-income groups of workers, but also among qualified workers.

The existing studies by DiNardo, Fortin and Lemieux (1996) and Lee (1999), provide contrary evidence,

namely that the effect on the real value of minimum wages due to inflation in the 1980's led to the substantial dispersion of the lower part of wage distribution and a subsequent increase in the minimum wage in the years 1900-1991 called upon the pushing of wage distribution.

Machin and Maning (1994) found out, using data concerning British industry that a higher minimum wage leads to a decrease in wage dispersion.

Wage compression and increases in costs for a low qualified labour force leads to unemployment growth in this group of workers. The study by Krugman (1994) is quite well known, where high unemployment in Europe is explained as a result of wage compression. According to this paper, the labour market institutions in Europe have prevented wage imbalance growth leading to higher wage compression. In addition, the study of Blau and Kahn (1996), which investigated the difference in the entire imbalance between the United States and many European countries, contains conclusions confirming Krugman's statement. This means that the amount of minimum wage, strong trade unions and a generous social network are responsible, to a great extent, for relative wage compression in Europe.

One particular study, which is interesting from the present author's point of view, is the study by Neumark, D., Schweitzer, M. and Washer, W. (2000), which investigated the effect of minimum wage increases on wage levels, number of hours worked, employment and total income. They discovered that employees whose wages were close to the minimum wage were generally adversely effected by its increase. In contrast, the income of employees from a lower income category is increased, their hours worked and employment will decrease, and, therefore, the total effect of such changes in the minimum wage moves toward a decrease in the wages of these employees.

With performance as success indicator, the need to assess performance and benefit from the gained information has become a vital part of managerial job and a common practice in the Slovak business environment. Managers understand it as a tool to motivate their subordinates and incorporate it into activities they regularly perform. Performance is assessed on regular basis and the gained information is then used for decisions about compensation, training and development, and for setting further goals. Still, there is a gap between managerial practices of companies that have foreign capital investment and those that are Slovak (Luptáková, S. & Vargic, B., 2003).

## Data and Model

To analyse the affect of minimum wage increases on wage distribution the authors made use of the Neumark, Schweitzer and Wascher (2000) approach. Our model has the following form:

$$\begin{aligned} \Delta w_i = & \alpha + \sum_{j=1}^9 \beta_j \frac{MW_2 - MW_1}{MW_1} \cdot 100 \cdot R(w_{i,1}, MW_1)_j + \sum_{j=1}^9 \beta_j^L \frac{MW_1 - MW_0}{MW_0} \cdot 100 \cdot R(w_{i,0}, MW_0)_j + \\ & + \sum_{j=2}^9 \gamma_j R(w_{i,1}, MW_1)_j + \sum_{j=2}^9 \gamma_j^L R(w_{i,0}, MW_0)_j + \sum_{j=1}^9 \pi_j R(w_{i,1}, MW_1)_j x \frac{w_{i,1}}{MW_1} \cdot 100 + \\ & + \sum_{j=1}^9 \pi_j^L R(w_{i,0}, MW_0)_j x \frac{w_{i,0}}{MW_0} \cdot 100 + X_{i,1} \delta + \varepsilon_i \end{aligned}$$

R is a variable, newly created dummy, which determines the position of an individual wage in relation to the level of minimum wages in a basic period. The positions are determined as follows:

$w \leq 1.3$  multiple of a minimum wage of a particular year.

This is followed by intervals 1.5, 2, 3, 4, 5, 6 and 8<sup>6</sup>.

Lagged effects (L) on wages of individuals, unemployment etc. related to the increase in minimum wage from 1998 to 1999 are defined depending on where the wage of a particular employee was situated in 1999 within a determined wage distribution in relation to the level of the minimum wage in year 1. Such determination of a lagged effect is

interpreted like other interpretations when „it does not matter what the previous wage of an individual was“. This reflects a usual delayed effect when, under a condition that  $w_1 =$  for example, whether the wage of an individual was still at the level of  $w_1$  – for example, whether the wage of an individual was still at the level of  $w_1$ , or whether it was rather initiated and shifted to the level of  $w_1$  rightly due to the increase in minimum wage.

## **Concluding Remarks**

This study examined the impact of minimum wage increases on wage distribution and employment. Using the matched employer-employees dataset the authors looked at wage distribution using the model based on the Neumark, Schweitzer and Wascher (2000) approach.

The model employed arose out of the assumption that growth in minimum wages will have an influence on wage distribution of groups of employees. The results demonstrate that this effect is significant. The percentage of individuals in the wage groups near the minimum wage is increasing. With a growth in the minimum wage, the highest number from group 6 moved (five times the minimum wage) from group 5 (four times the minimum wage). The lowest wage group multiplied from 1.3 to 1.5 increased the number of persons from 0.13 % to 1.23 %, which is a very significant growth. Out of this it is obvious that the assumed influence of growth of the minimum wage has been empirically proven, even though it is probable that the number of persons in these groups was very low. On the other hand, there was a significant decrease in the number of individuals in the upper half of the wage distribution, in particular the group with six times the minimum wage and more. The curved line of the percentage of persons in the year 2002 dropped from the fifth group (four times the minimum wage) steeply downward in contrast to the gradual decrease in the year 1998.

The growth in wages was over this time period relatively high, but not high enough to compensate for the effect of the several times multiplied minimum wage over the 3-year time period observed.

### **The Effect of Growth in Minimum Wages on Wage Distribution and Wages**

In 1999, the first quite significant increase in minimum wage occurred after quite a long period of stagnation or moderate increase in minimum wage. The expected influence on wages was not manifested in principle, however, the results are varied. Estimations clearly indicate that wage increases with an increase in minimum wage for a group of employed who are either paid a minimum wage or wage just above its level (in the present case by 1.3 its multiple). The elasticity is even higher than one, which means that the increase in wage evoked by the increase in minimum wage was higher than its respective growth. The minimum wage increase effect can be demonstrated by the fact that the rate of elasticity decreases with increasing distance of wage from the beginning of wage distribution in both the periods observed by the authors. This hypothesis can also be demonstrated by the fact that a delayed effect in an increase in minimum wage in the first period resulted in a decrease in the wages of low paid employees over the next period, relative to the level of the previous wage classification. A great number of cases of statistical insignificance in most wage distributions were probably caused by the method of data panel creation. In addition, the compliance of observed values with a balanced curve of wage values is low, not even reaching 10 % in any model.

Thus, one partial result is that the increase in the minimum wage in the period of 1999 to 2000 immediately influenced the increase in the low wages of employees, and it falls or is not provable with increasing distance from wage distribution commencement. In 1998, the minimum wage was so low and separate from the real wage structure that its large relative increase in the years 1999 and 2000 had no effect on the overall structure of wage distribution but only on low wages.

### **The Effect of Growth of Minimum Wages on Hours Worked**

The results of effects of increase in minimum wage on hours worked are very unstable. Only a result for the first group of wage distribution can be considered relevant. When the minimum wage increases, employees also tend to increase their total income by increasing the number of hours worked, i.e. offering an increased amount of work. In the next year, employers respond by reducing the number of hours worked with the objective to reduce total labour cost caused by the previous increased minimum wage. This circumstance occurred in the results with a negative mark in the delayed effect. Other statistically significant results of the analysis can be considered rather the result of many other influences, which is also shown by a very low determination index.

### **The Effect of Growth in Minimum Wages on Unemployment**

A fall in employment, which was replaced by the growth or fall of regional unemployment rates in our model, is a typical effect of minimum wage increase. The statistically indicated dependence for the first group of distribution in both periods could be predicted, however, estimates are low and insignificant. A different direction on the part of its behaviour can be commonly interpreted in terms of economy; however, in two successive years it is not logical, *ceteris paribus*. The index of determination is higher than the effect on hours worked, being however, still very low.

### **Conclusion**

Minimum wage has been discussed in professional circles since its original introduction. Its existence has both undoubtedly negative sides as well as positive which are contingent upon when they were introduced, the economic situation, the labour market, and the political and societal interests. The present authors are not interested in evaluating the circumstances as to whether or not it is appropriate to introduce minimum wages. Our goal is to instead evaluate its development and attempt to analyse its influence on the labour market generally.

Minimum wages were introduced when the nation of Czechoslovakia was still in existence in the year 1991. Their level was set above the minimum standard of living and amounted to 50 % of the average wage. Over the following years, its development broke off from the development of other quantities which have a closer or wider connection with the minimum wage, that is to say the level of the average wage, the minimum standard of living for individuals and families and the level of unemployment support. Minimum wage stagnated and stopped fulfilling its social function economically as well. Not until the year 1999 did a significant turning point occur in its development when the minimum wage began to rise significantly.

Consequently, it is obvious that the minimum wage does not fulfil any of the standard functions, which were expected of it (not taking into account the function which it fulfilled or fulfils as a part out of which derived from drawing off of support). Its existence from the period of 1993 up until 1999 did not have any practical economic basis. This can be said about both countries even after their separation. There was little political or economic interest in making use of this form of redistributing pension funding. The fact that minimum wages existed, though on only a very low level, meant that it began to have a rather negative influence. It made it possible for companies to employ foreigners at cheap rates, pay extremely low wages, resulting in the fact that it was no longer advantageous for employees to offer their work on the market. Extremely low minimum wages began to mean social labour costs for the state. The present authors believe that the situation on the labour market in both countries would have actually been better in this interim period without the existence of a minimum wage. The above-mentioned negative effects would have been limited, and the positive influence of wage agreements would have increased, meaning fewer individuals remunerated on the level or barely above the level of minimum wages.

After the jump and very rapid growth in minimum wages, the situation changed dramatically in both countries. Its level however did still not reach the "standard" recommended by the European Commission, that is to say, approximately 60 % of the level of an average income. The significance of minimum wages did however increase and has begun to have an impact on more and more numbers of people, companies and organizations.

Companies will have to adapt to new conditions and will have to start to take the work effectiveness of employed individuals into consideration more than in the past, as well as the number of employees in a company, etc. It has been exactly the most recent developments in minimum wages which have made possible the examination of the influence of growth of minimum wage on wage distribution, unemployment and completed work hours. The main reason behind the employed model will be to analyse the growth of minimum wages and their influence on wage distribution, employment and completed work hours in the Czech Republic (appropriate data was not available, in the case of Slovakia, due to the extremely demanding).

The growth of minimum wage confirmed the expected influence on wages and wage distribution, though the results are somewhat uncertain. Wage distribution of employees has started to slightly undulate due to the fact that the wages of employees near the minimum wage has significantly grown and this growth decreases in connection with growing distance from the beginning of the wage distribution. This has confirmed the assumption that minimum wages were, after so many year of stagnation, so low and disconnected with the actual wage structure

that even with its rapid growth in the year 1999 to 2002, and one can add in the following year as well, it has had very little influence on the undulation of the overall wage structure.

The effect on the growth of minimum wages on unemployment and completed work hours has only become apparent for employees with the lowest wages; estimates are however few in number and insignificant. Nevertheless, the author can state that the basic direction of movement in terms of numbers of completed work hours and reactions on the part of employers has occurred according to expectations over the following period. The effect on unemployment has been at least decisive. The results are influenced by the insufficiencies caused by data pane. The authors believe however that in actual economics a more significant relationship and more decisive results for the observed variables would be attained.

Minimum wages should not be the basis for any social payments, contributions, advantages, etc. Minimum wages should be increased systematically, regularly and in connection with the development of key economic factors (the medium being the average wage with an eye to inflation and the level of the minimum standard of living). The decisive criteria for growth of the minimum wage should not however only be its percentage in relationship to the average wage and the main goal should not be an increase in its percentage share.

The level and growth of the minimum wage must reflect the level and growth of the minimal efficiency of work in companies. Non-transference of a larger percentage of the social costs onto corporate bodies, would particularly affect small and medium-sized companies.

Systematic observation of the impact of growth of minimum wages on the behaviour of low-income groups of the population must take place.

# **Internationalising in a Remote Location: Why German Companies Settle in Perth and Western Australia**

*Werner Soontiens*

*Curtin University of Technology, Australia*

*Peter Schulz*

*Andreas Kufferath GmbH & Co. KG, Germany.*

## **Abstract**

**Successful internationalisation hinges on the selection of an appropriate strategy and target market. This paper considers the general nature, and German specific nature of internationalisation. It furthermore refers to presence of German companies in Australia and the attractiveness of and Western Australia. The paper reports on data identifying the nature of German companies in Western Australia and their assessment of the state as a destination.**

## **Background**

Traditionally, a company will start to compete internationally by entering just one or a select few foreign markets. First experiences are often collected in a familiar environment and proximity plays a core part because cultural awareness and business exposure are likely to contribute to higher levels of success (Wild, Wild & Han 2001). Fast-paced change in the global marketplace increasingly forces companies to enter distant markets and to view business strategies from a global perspective. In approaching foreign markets, a distinction between multinational competitors and global competitors has to be made.

Multinational competitors have a deep involvement throughout the world, incorporating a worldwide perspective in management and decision making-processes (Wheelen & Hunger 1998). While a multinational industry is present in many countries, competition occurs on a country-by-country basis (Wild, Wild & Han 2000). According to Bowman and Asch (1996), successful competition depends on the ability to respond effectively to changes and opportunities arising in the local marketplace, i.e. localisation or acting local.

Global competitors in turn operate with resolute constancy as if the entire world were a single entity (Levitt 1983). Forces for becoming a global competitor are stronger when competitive conditions across national markets are linked sufficiently to form a true international marketplace and when leading competitors compete head to head in many different countries (Thompson & Strickland 2001). Global industries, in turn, are a series of linked domestic industries in which rivals compete on a truly worldwide basis (Porter 1986).

The distinction between multinational and global competition impacts the choice of an international expansion strategy. In a multinational industry, competing internationally is discretionary, and a firm can choose to remain domestic or expand internationally. Ideally, the international strategy comprises of a series of domestic strategies, as subsidiaries abroad should control important local activities, enjoy a high degree of autonomy and be guided largely by the circumstances in that particular country. Porter (1987) refers to this phenomenon as 'country-centred strategy'.

A firm operating in a global industry, on the contrary, must attempt to integrate its activities on a worldwide basis to capture the existing linkages among countries. Its international activities have to be regarded as an overall system, while maintaining some country perspective. According to Porter (1986), the balancing of these two perspectives becomes one of the most essential tasks in a global strategy. In a multinational competition, rivals vie for national market leadership. In globally competitive industries, rival firms vie for worldwide leadership. All this impacts on the strategic approach to compete in foreign markets (Thompson & Strickland 2001). A core aspect of the strategic approach impacted by the choice of competitive strategy is the target market selection.

## Target Market Selection

After a company has made a decision about how to approach foreign markets, the decision about which countries to enter and what specific entry strategy is appropriate for each country needs to be taken. Overall, risk diversification and the limiting dependency on a few markets are two of the main rationales for companies to globalise.

A company needs to identify the market that offers the greatest potential by considering individual characteristics of each market. In a multinational strategy, it is also important to analyse to what extent foreign markets are integrated with others or how geographical issues can facilitate the establishment of a group of countries that are linked within a certain region.

According to Fletcher & Brown (1999), it is necessary to compare a vast number of markets in order to identify the most promising one. The quality of data used for decision-making varies from country to country and recency, rigour and restrictions of data need to be assessed in each specific case.

Various approaches to selecting a promising market are available, each based on different criteria for market attractiveness. A market may be regarded as attractive because of the following attributes (David 1997; Fletcher & Brown 1999; Thompson & Strickland 2001):

- Customer demand for the company's products
- Resource access
- Cost savings in manufacturing due to cheaper labour costs than in the firm's domestic market
- Governmental incentives, such as tax holidays, subsidies etc.
- Higher profit opportunities
- Securing an enlarged customer base to earn economies of scale

The destination selected will address the most prominent issues for the company contemplating internationalisation. These issues will most likely differ from industry to industry and be influenced by national business culture attributes. The next section briefly considers aspects of German business internationalisation.

## German Internationalisation

German-style business indicates culturally embedded practices and principles employed within Germany. Behavioural and institutional aspects of the German business system have been combined in an integrative fashion in order to provide a realistic picture of the German business environment and systems. Glunk, Wilderom and Ogilvie (1996) summarize the German business environment as a consistent pattern of business-related practices built around a 'competence first' principle. German companies continuously invest in human resources, with an emphasis on technical and professional competence. This, together with a strong quality and innovation orientation, seems to be the pillar of German-style management. The remaining features such as effective and harmonious labour relations and formalised production management tend to fill a supporting role or are logical outcomes of central features such as loyalty of managers and the unique economic system that prevails in Germany.

German companies have retreated from their initial traditional industries of coal mining and ore processing, moved into heavy industry and allow for restructuring for growth in the service sector, information technologies and telecommunications (European Australian Business Council, 2001). Germany has transformed into a high-tech country, with technology industries being of great importance for the nation's further economic well-being.

The global orientation of Germany's economy represents the foundation for economic growth and stability (Möbius, 2000). German companies have relatively early recognised the need to expand outside Germany, described as "a mighty export tradition that has meshed with the need to reduce the inflexibility and expense of producing in Germany" (The Economist, 1998, p. 60). Dorrenbacher (2000) adds that a recent compilation of data on the internationalisation of the 100 largest German companies has found that it is difficult to find a strictly national company, as even most of the utility companies are to some extent active in foreign markets.

As a result of the global orientation, German companies hold significant market positions in international trade, particularly in industries such as machinery, motor vehicles, electrical engineering and chemical products.

These positions in world markets are based on the efficiency to conduct business, competitive strengths in key industries and a favourable reputation abroad by the positive image of 'Made in Germany', as discussed hereafter

German companies have been present in the international arena for a long time. German-based companies in sectors of mechanical and electrical engineering, automobile and chemical industries are well-known and recognized around the globe (Federal Ministry of Economics, 1992). It is, however, important to note that a large contingent of small- and medium-sized companies is decisively salient to Germany's appearance on the international stage. These companies form the *Mittelstand* and account for half of the country's Gross National Product. The names of these companies are less known, but they play a salient role in Germany's presence worldwide as the majority has expanded their focus outside of Germany.

## **Destination Australia**

Traditionally German companies have a strong and reputable presence in Australia as a geographically distant market. Germany's Federal Minister of Economics, Dr. Werner Müller (EABC 2001), relates the presence of German companies to the advantages that Australia offers. Australia's positive business climate, its image of an internationally competitive high-tech location, its reputation as a commodities supplier, and the cultural environment creating a feeling of being 'at home' transform Australia into an attractive marketplace. In addition, German firms increasingly view Australia in terms of a regional business perspective, i.e. a base from which to operate throughout the Asia-Pacific region. Australia itself is one of the largest Asia-Pacific markets, but additionally offers a link to Asia for German companies.

Müller (EABC 2001) goes on to raise the point of the history of German-Australian partnership, dating back to the first years of European settlement in Australia and still going strong. The trade partnership between the two countries traditionally favoured Germany, as German exports increased significantly in recent decades, while Australian exports remained rather stable (GACIC 2000).

In 1999, German direct investment in Australia amounted to 7.23 billion DM, equivalent to approximately 5.9 billion AU\$ (GACIC 2000). German subsidiaries in Australia (50 percent or more German control), number 325 companies while a further 470 regional branches throughout Australia increase the number of German-owned multinational establishments to around 800. Location wise, New South Wales is the most attractive state for German companies. Of the 325 subsidiary companies, 173 firms have their headquarters in New South Wales while 126 companies operate from a base in Victoria. The other states prove to be less popular with German investors, with Queensland, Western Australia and South Australia only attracting eight each and Tasmania two companies.

Almost three quarters of all German companies employ fewer than 100 employees and only twelve subsidiaries employ more than 500 people. GACIC (2000) states that Siemens Australia Ltd. is the largest German company in Australia, with 2,300 employees in their manufacturing operations in Melbourne. Overall it is estimated that German companies jointly provide approximately 35,000 workplaces throughout Australia, increasing by a further 30,000 jobs when considering flow-on jobs with suppliers, the service sector and other sectors.

The year of foundation or acquisition is another relevant statistic in analysing German business presence in Australia. Prior to 1960, eleven companies were established in Australia, compared to some 800 in 2000. The strongest growth in number of businesses being founded or becoming German by means of acquisition has taken place between 1986 and 1990 and again since 1995 (GACIC 2000).

A significant number of small- and micro-sized German-owned companies are present in Australia. Not only well-known global players operate in Australia, but also a number of companies founded by German entrepreneurs or established by less-known German companies can be found across Australia. These companies are not necessarily members of the German-Australian Chamber of Industry and Commerce, but do play a vital role in the German business presence in Australia. Throughout the project a number of less-known German companies were identified in Western Australia.

## ... And Western Australia

Western Australia and Perth as its capital is one of the most remote cities in the world. With a population of about 1.3 million people, Perth is about 3000 km from its nearest city, Adelaide. In the regional context Perth is nearer to Jakarta and Singapore than it is to Sydney. In addition, Western Australia as a state stretches about 3000 km from north to South. The state is characterised by a fair amount of mining activities, predominantly towards the north, and agriculture towards the south. Services, distribution and mining and agriculture associated activities are centralised in Perth, which in itself can be several hundreds or thousand km from the operational activities. The question is thus how this environment positions itself to attract foreign investment and involvement.

Regarding the specific role of Western Australia (WA), the German Ambassador to Australia describes the state as dynamic and competitive, playing an important role in Australia's economy as a whole. The Ambassador states that WA's share in the relationship between Australia and Germany is significant, as German chemical and engineering companies have long been aware that especially WA is offering good conditions for investment projects, partly due to its rich resources (WAGBA 2001). In addition the WA economy is diversifying rapidly, moving away from traditional industries into innovative technologies and evolving new industries.

The attractiveness of the WA market possibly influences the internationalisation of German companies. Transformed into a question this becomes: why did German companies invest in WA and what are current issues that continue to prove WA's attractiveness to foreign companies? A number of publications associated with the WA Chamber of Industry and Commerce and the WA Government's Department of Industry and Technology supply a framework why WA is an attractive market for investors. The advantages outlined have to be regarded cautiously as these institutions in nature attempt to promote and thus convey a very positive opinion of their own business environment.

The slogan adopted by the Western Australian government is that WA is "Australia's economic driver" (Government of WA 2001, p. 2). In addition, Bode (2002) highlights several aspects on the expected growth potential of the WA market. This, and a number of sources, including Commerce & Trade News (various issues 2000), Doing Business with WA (2001), WA – Open for Business (2001), and Western Australian Business and Investment Gateway – (online) jointly argue why WA is an attractive destination. The arguments put forward include the following:

- A highly skilled population  
The WA workforce of about one million has educational and technical skills among the highest in the world. Almost half have post secondary or tertiary qualifications and two-thirds have completed the highest level of secondary education. WA aims at establishing itself as an international knowledge hub; an exporter of education services to international students; and a key provider of education infrastructure and support services.
- A stable economic and political environment  
WA has a stable system of governing and a sound, well established legal framework, providing the basis for a secure and confident investment culture.
- Lifestyle  
WA is characterised by a tolerant and open lifestyle, high standard of living and a moderate climate, all of which contribute to employee motivation
- Gateway to South East Asia  
The capital of WA, Perth, is a preferred location for a number of international companies choosing a regional base for South East Asia. Perth shares a time zone with many Asian centres, enabling contact during normal office hours. In addition, Perth's proximity to Asia reduces the transport and distribution costs of goods to Asia.
- Energy State  
WA is also often labelled 'the Energy State', being the most productive producer of oil and gas in Australia and the Asia-Pacific region. In addition, WA promotes the establishment of strategic partnerships for research, development and investment in areas such as solar, wind, and tidal power, biodiesel, fuel cells and gas-to-liquids technology. This in turn has led to large and sophisticated infrastructure and service industries to support the energy sector.

- Increasingly diverse economy  
WA actively pursues a policy of developing and implementing 21st century industries and technologies. Expertise range from bio-science to new digital content industries; exports range from ferries to smart cards, and pharmaceuticals to construction skills.
- Government support  
The state government's main objective is to offer an environment in which businesses can grow and prosper. Initiatives include the introduction of prospective investors to major international businesses present WA providing a gateway to government programs and investment opportunities in industries such as biotechnology, educational services, wood processing and information and communication technology.
- WA's 'culture of innovation'  
WA recognises that innovation is a key to sustaining competitiveness. The State Government fosters innovation through a focus on:
  - Creating a supportive environment
  - Encouraging exchange of new ideas and knowledge
  - Developing infrastructure required to enable world-class innovation
  - Establishment of university-based centres of excellence for focused research and development
  - Improving the skills of public and private sector research and development personnel in commercialising research
  - Promoting the opportunities created by the internet and e-commerce
  - Ensuring that WA has world-class communications infrastructure.
 The aim of these initiatives is to ensure a sustained competitiveness for the state as a destination.
- Infrastructure and cost  
Perth is considered to be an attractive and affordable location, with office rentals, business inputs and living costs among the lowest in the nation and lower than major business centres in Asia and around the world. In addition, Perth offers comprehensive air, land and sea transport systems and services for both people and freight, making it an attractive location with inter-continental connections to Asian countries and markets.  
The above points supporting WA as a destination are argued from a local government's perspective. The following section reports on data derived from a survey amongst German businesses in WA.

## The Project

The data relevant to this paper reflect the collection of primary data by means of a questionnaire based on a Likert scale and basic statistical interpretation. The first section covers demographic data including size (turnover or number of employees), nature of activities and geographic location and foundation or German association dates. The nature of Western Australian operations is interpreted based on ownership, the composition of workforce and the nature of management. The questionnaire also addressed issues of the nature of WA as a destination for German companies.

Suitable respondents were identified from both the Western Australian-German Business Association (WAGBA) and the German-Australian Chamber of Industry and Commerce membership lists. In addition, electronic media such as the internet also attributed a number of respondents. In total, 138 companies with a German identity in WA were contacted of which a total of 62 valid responses were received

### Demographics and Activities

Responses to the question on the type of product/service respondents are involved in are summarized in Table 1. Of the companies operating in WA, Perth dominates (57 or 92.3%) as a location, with 3 firms stating operations in the Goldfields/Esperance region and 1 each in the South-West and Kimberley regions.

Table 1 indicates that the alternatives of the nature of the business were slightly inappropriate as 17 (27%) respondents selected the 'other' option. Respondents in this group indicated a diversion of sectors including legal services and IT implementation to telecommunications. The second largest group of respondents is in 'manufacturing' (14 respondents or 23%) and 'engineering' (12 respondents or 20%).

TABLE 1: TYPE OF PRODUCT/SERVICE

n=62				
Mining	Agriculture	Manufacturing	Engineering	Consumables
2 3%	1 2%	14 23%	12 20%	4 6%
Retail	Transport	Maintenance	Education	other
6 10%	4 6%	2 3%	0 0%	17 27%

TABLE 2: MAIN FUNCTION IN WESTERN AUSTRALIA

n=62				
Sales office	Manufacturing plant	Service/repair unit	Distribution of German products	Other
33 53%	5 8%	10 16%	13 21%	1 2%

The main function of the respondents in WA is reflected in Table 2. Of the 62 respondents that operate in WA, 33 (53%) indicate to be sales offices. In addition, 13 (21%) distribute German products and 10 (16%) are servicing and repair centres. Manufacturing is the main activity of 5 respondents (8%).

TABLE 3: NATURE OF COMPANY IN AUSTRALIA

n=62					
Licensed manufacturing	German Entrepreneur	Contract manufacturing	Joint venture	Strategic alliance	German-owned subsidiary
1 2%	4 6%	3 5%	6 10%	5 8%	43 69%

The nature of the company, as indicated in Table 3, is not restricted to WA but rather refers to the overall presence in Australia. A majority of 43 respondents (69%) indicates the company to be a German-owned subsidiary. In addition, 6 respondents (10%) are part of a joint venture and 5 (8%) are part of a strategic alliance while 4 (6%) indicate that the company is owned by a German entrepreneur. Contract manufacturing fits the identity of 3 respondents (5%) while 1 (2%) conducts licensed manufacturing for a German company.

The size of respondents is reflected in both annual turnover and the number of employees as shown in Tables 4 and 5 respectively.

TABLE 4: ANNUAL TURNOVER (million AU\$)

n=62				
W. Australia	< 0.25	0.25 - 1	1-5	>5
	12 19%	9 14%	15 24%	26 42%

TABLE 5: NUMBER OF EMPLOYEES

n=62				
0-5	5-20	20-100	100-500	>500
7 11%	16 26%	23 37%	13 21%	3 5%

The annual turnover of companies in WA shows that 26 respondents (42%) indicate a turnover of more than 5 million AU\$. One quarter of the respondents (15 or 24%) fall in the category of 1-5 million AU\$ turnover while 9 (14%) companies achieve annual turnover levels of 0.25-1 million AU\$. The remaining fifth of respondents (12 or 19%) states annual turnover to be less than 250,000 AU\$.

Table 5 indicates that the largest group of respondents (23 or 37%) employ between 20 and 100 employees while a quarter 16 or 26%) employ between 5 and 20 employees. In addition, 13 respondents (21%) indicate to employ between 100 and 500 staff, 7 (11%) employ less than 5 people and only 3 (5%) respondents have more than 500 employees in their Australian operations.

#### Western Australian Market Issues

Table 6 indicates the attractiveness of WA as a market and investment location for German investors.

TABLE 6: ATTRACTIVENESS OF THE WESTERN AUSTRALIAN MARKET

	n=62					
	Disagree		Neutral	Agree		
	Totally	Somewhat		Somewhat	Totally	
a) Skilled workforce	0 0%	2 4%	31 50%	24 39%	5 8%	
b) Stable environment	0 0%	2 4%	14 22%	29 46%	17 28%	
c) Market opportunities	0 0%	2 4%	8 13%	37 59%	15 24%	
d) Gateway function	7 11%	11 17%	15 24%	20 33%	9 15%	
e) Resource base	6 9%	6 9%	23 37%	16 26%	11 18%	
f) Diverse economy	0 0%	8 13%	37 59%	16 26%	1 2%	
g) Government assistance	7 11%	12 19%	30 48%	12 20%	1 2%	
h) Culture of innovation	2 4%	12 20%	26 42%	20 32%	2 4%	
i) Affordable location	0 0%	7 11%	20 33%	29 46%	6 9%	
j) Expected future growth	0 0%	7 11%	12 19%	33 54%	10 17%	
k) Competitive pressures	0 0%	4 7%	37 59%	19 30%	2 4%	

From Table 6, the following can be concluded:

- Half the respondents (31 or 50%) have a neutral stance to the workforce while 29 respondents (47%) label WA's skilled workforce as being an attraction.
- Nearly three quarters of respondents (46 or 74%) regard WA as a stable political and economic environment. Of the remaining respondents, 14 (22%) judge this factor neutrally.
- A total of 52 respondents (83%) indicate that the WA market can offer opportunities to German investors while 8 respondents (13%) indicate a neutral opinion with regard to market prospects. Another 2 (4%) state that WA cannot offer market opportunities to their respective companies.
- The role of WA as gateway to Asia appears to be less clear cut among the respondents. Although 7 respondents (11%) totally disagree with the function of WA as a gateway to other markets, 9 (15%) totally agree. In addition, 11 respondents (17%) somewhat disagree, with 15 respondents (24%) taking a neutral stance and 20 respondents (33%) somewhat agreeing.
- A total of 12 respondents (18%) somewhat disagree that a large commodity resource base makes WA an attractive market, with 6 each for 'totally disagree' and 'somewhat disagree'. A neutral stance is taken by 23 respondents (37%) while 27 respondents (44%) argue the importance of the resource base.
- It appears that respondents do not consider WA as a diverse economy as a majority of 37 companies (59%) hold a neutral view of this issue. Furthermore, 8 respondents (13%) somewhat disagree with the statement that WA's economy is diverse while 16 firms (26%) somewhat agree.
- A group of 12 respondents (19%) somewhat disagree and 7 respondents (11%) totally disagree that assistance and incentives granted by the WA government transform the state's market into an appealing investment opportunity. On the other hand, 12 respondents (20%) somewhat agree with the statement, while nearly half of all respondents have a neutral opinion of the role of government (30 or 48%).
- The presence of a culture of innovation in the WA economy is deemed an important factor by 22 respondents (36%) while 14 respondents (24%) label this characteristic as unimportant.

- WA is seen as an affordable location by 35 respondents (55%). At the same time, 20 respondents (33%) have a neutral stance and 7 (11%) disagree that WA is an affordable location.
- A vast majority of respondents (43 or 71%) indicate that growth prospects for WA contribute as an attractive aspect. Of these, 33 respondents (54%) somewhat agree and 10 (17%) totally agree. Only 7 respondents (11%) view expected future growth as not an attractive aspect of WA while 12 respondents (19 %) hold a neutral view.
- About two thirds of respondents (41 or 66%) do not perceive competitive pressure to make WA appealing to foreign investors. A total number of 19 respondents (30 %) somewhat agree that competitive pressures are a benefit to WA markets.

## Conclusion

The presence of a foreign organisation in a heavily biased remote market has its unique set of dynamics. The Western Australian environment is dominated by natural resource players while its location is nearer to Asian capitals than other major Australian cities. Although organisations with a German association in Western Australia are predominantly service and sales oriented, the majority is fully German owned and reflects SME characteristics.

The choice of Western Australia as a destination is influenced mostly by the market opportunities, stable environment and expected future growth. This is somewhat supplemented by a reasonable resource base and skilled workforce. The function as gateway to the region and the presence of a culture of innovation is relatively balanced while government assistance is the smallest factor for settling in WA.

In the case of WA, the presence of German companies is dominated by the unique market conditions and availability of natural resources and the flow-on thereof.

## Abstract

This paper is an empirical examination of the role of the government in promoting Photovoltaic (PV) systems in the context of a developing country. Primary research was conducted in the hotel industry in India as it is not exempt from the detrimental effect of frequent scheduled and unscheduled power-cuts. A structured questionnaire was used by a prestigious market research firm in India to collect the data from a sample of 205 hotels located in different parts of India. Empirical results show that majority of the respondents have emphasised that the initiatives taken by the government is very important to fostering the commercialisation of PV systems. Therefore, the government should play a leadership role in regards to policy development, legislation, fund mobilisation, institutional support, tariff formulation, training, information dissemination and education. A variety of government initiatives are required to stimulate a 'market pull' for alternative energy sources.

## Introduction

India like other developing countries faces a tremendous challenge in meeting its domestic and commercial energy requirements. Approximately a third of the world's population still do not have access to electricity. The annual demand for electricity in developing countries is expected to grow at 4.6%, which is higher than the projected global demand for electricity estimated to grow at 2.8% per year [1, 2]. India has the opportunity to move towards alternative energy sources to meet its energy requirements as power from solar photovoltaic (PV) systems offers effective and viable solutions to bridge the energy gap. Solar photovoltaic energy is one of the special-purpose decentralized forms of power-generating units that the Ministry for New Energy Sources is trying to promote to try and alleviate the power problem in the country. The way forward is to adopt the 'sustainable energy path' which requires the formulation of a national master plan. This plan needs to be supported by appropriate policy, legislative and regulatory measures. The measures that are required to foster the promotion of alternative energy sources are inextricably linked to the support that renewable energy technologies (RETs) require at the national level and at the state level. Hence, this paper discusses the support that RETs require, and once these mechanisms are in place it will undoubtedly help the cause of solar based photovoltaic (PV) systems too.

The traditional electricity production, distribution and transmission systems in India are characterised by highly centralized generation, costly grid systems and poorly managed State Electricity Boards (SEBs). To a large extent developing countries are dependent on grid supply of electricity. The beneficiaries are largely the urban and industrial sectors because the vast majority of the population still live in rural villages [2]. There has to be a big shift in power generation and distribution from the traditional approach to alternative modes such as decentralized PV systems. Long-term benefits of this include reducing the cost of supplying energy and related services, reducing emission of carbon dioxide and other pollutants. Further, users and commercial establishments will have access to reliable, continuous supply of good quality power. Policy measures and corresponding mechanisms should seek to remove the barriers for the commercialisation of technologies such as PV systems [3]. The modular characteristics of PV systems enable them to readily function as a decentralized system. Therefore government initiatives should address restructuring the prevailing centralised system and encourage power generation through alternative renewable energy technologies such as decentralized PV systems.

This paper is the result of research efforts to empirically examine the role of the government in fostering the

adoption of alternative energy sources such as PV systems, in the context of a developing country. This paper commences with an integration of the research findings in the areas of renewable energy technologies and the diffusion of photovoltaic technology. The methodology section includes a discussion on the sampling methods used, operationalisation of the variables, and the methods employed to collect data. Analysis of the data provides empirical evidence to the role of government initiatives in fostering the adoption of photovoltaic technology in a developing country, India.

## Literature Review

Photovoltaics (PVs) have attracted increased attention in the recent years. Since 1954 photovoltaic technology has progressed in leaps and bounds. Improvements in efficiency, progressive reductions in cost and increasingly high reliability have contributed to the expansion of PV technology globally [4]. PVs are commonly cited as one of the 'bright lights' for future electricity generation and they have many advantages over other energy technologies [5]; e.g.,

- PV systems are dependable, reliable and they have a long life often with a lifespan of about 20 years. Many of them have a guarantee of at least 10 years [2, 6-8].
- They are simple to install and easy to maintain. Since PV systems are modular, they facilitate easy installation at a site where power is needed [6, 9].
- Construction of PV systems can be very quick. Hence there are almost no interest payments during construction or extended start up period for a purchaser [8].
- PV systems can be designed to fit specific needs and because of the proximity between supply and demand, distribution losses are minimal. Since PVs are a modular technology, arrays can be built to suit any application [9, 10].
- PV systems have low operation and maintenance costs. Even large sites are unmanned and there are no consumables [6-8].
- PV systems have diverse uses and are able to provide economical power to applications as diverse as calculators, wristwatches, telecommunications, satellites, remote industrial applications and remote communities. They are capable of providing power from less than 1 watt to many megawatts [9, 10].
- PVs are cost-effective for numerous applications in remote locations [7] and peakpower generation where demand matches solar insolation extremes [11]. PV systems in remote areas compare favourably in cost with diesel generators and with national grid extensions [9]. The world's largest solar powered microwave systems through the northwest of Western Australia are now into their third set of batteries and have outperformed their diesel counterparts in cost, maintenance and reliability [12].
- PV systems are flexible. They can be used to meet the immediate demands as well as being modified for unusual surges in the demand. By comparison a conventional grid is not very efficient in handling demand fluctuations. They can be applied with a power inverter to nearly any end-use. Coupled with a battery back up, they are capable of providing power on a continuous and indefinite basis.
- PV systems emit no pollution. They do not emit any fumes and they do not contribute towards acid rain or the greenhouse effect. PVs are a clean energy provider [2, 6, 7, 11].
- PVs have no moving parts, need no fuel transport and no ill-health effects result from their use. No other electricity-generating technology has lower risk in terms of accidents, pollution or ill effects to humans or the ecosystem [5, 6].
- PV systems have shown good performance reliability [6, 8, 9].
- The voltage produced by PV modules is quite constant and there is little variation with changing solar radiation intensity; therefore PV systems are suitable for storage using batteries. The stored energy, then, can be used at night [7].

### Government Initiatives

The government can play a leading role through the formulation of favourable policies, by showing a practical commitment and by enhancing public awareness of the potential of PV in all walks of life. Often, the majority of the

people constituting the potential market are unaware of the existence and systems' capabilities of PV technologies [13]. The lack of information about renewable energy benefits, economic and financial costs is a major barrier to adoption [14]. The government should assume the responsibility for creating awareness among the industry and public about the benefits of PV. It could disseminate information pertaining to the environmental and other benefits of PV with a view to educating the public [15]. This can be achieved through a variety of ways including advertising campaigns, PV documentation programs that reach the people through radio, television, newspapers, highway billboards and setting up demonstration sites [9]. It is reported that the publicity and awareness campaign undertaken in Zimbabwe generated an awareness and demand for solar systems in the country [16].

According to Adurodija [9] the government could establish a financing system, which favors PV diffusion, and also provide financing and access to affordable credit line plans in order to convert potential users into actual users. The government could promote the development of the local PV market by encouraging local manufacturing of PV components and the removal of constraints on the market growth. This can be achieved by providing temporary tax exemptions for the purchase of PV equipment. Additionally allowing duty free imports of solar equipment, components and appliances would help in lowering the initial costs of PV systems. It is widely regarded that the high initial costs of PV systems often slow down the growth of the PV market. Hence any measure taken by the government to lower the initial cost of PV systems is a step in the right direction.

At the national level the government could establish a strong scientific, technological and industrial development program with the active participation of national and international developmental agencies. The government can also support and promote national Research and Development institutions. It can use the purchasing power of the state to obtain resources for PV research programs. It can facilitate the forging of collaboration and technology transfers, and render institutional support for local and international research institutions [9]. Additionally the government can also consider providing incentives for research and development [15].

Another option before the government is to attract foreign investment in the production of PV systems. In order to do this successfully it is necessary for the government to create an appropriate economic and political climate. The progressive removal of barriers to foreign investment and the easing of restrictions for the import of PV technology has led to the establishment of joint ventures between Indian and foreign companies [17]. The government should adopt measures to promote local industries and contractors by encouraging them to take an active role in the production and promotion of PV technology. The government could ensure a healthy market by restricting monopolies, fostering the development of standards and developing codes of practice [9].

The success of the wind energy program in India is attributed to the proactive policies of the Ministry of Non-Conventional Energy Sources [18] in the Government of India. The key elements of this program include wind resource assessment, government-sponsored demonstration projects, awareness creation and providing operating experience to industry and State electricity boards (State-run utilities). Incentives were made available to wind-power plant entrepreneurs which included tax concessions such as accelerated depreciation, tax holidays, customs and excise duty reliefs, soft loans and liberalized foreign investment procedures [19].

Government intervention for fostering the diffusion of renewable energy technologies include provision of: information to consumers and manufacturers, tax benefits, subsidies, credit services and direct support of the distribution system [13, 14]. In an effort to promote the use of solar systems the government should also publish the results of comparative analysis of solar systems and conventional systems [15]. Government intervention, therefore, is necessary in a number of ways to promote solar energy [20].

#### **Subsidies**

Technologies such as grid power and diesel generators have enjoyed a series of subsidies such as tariff support, tax holidays in both developed and less-developed economies [13]. It has been argued that incentives, which include tax concessions such as accelerated depreciation, tax holidays, customs and excise duty reliefs, soft loans and liberalized foreign investment procedures, will foster the diffusion of renewable energy technology [19]. Likewise, [13] believed that governments should consider subsidies for PV technologies in order to stimulate the PV market. In the initial stages of market development the government should examine using international tenders to supply quality equipment at subsidized price; such subsidies could be phased out as the price of PV system falls [9]. The government has a key role to play in not only providing fiscal incentives and subsidies but also ensuring that an appropriate institutional framework is in place to accelerate the commercialization of PV systems.

### **Institutional Framework**

Despite the work done by the Ministry of Non-Conventional Energy Sources over the years, PV technology is still new to India. There is a greater thrust that is required to promote the use of PV systems as an alternate source of power supply. The industry is relatively new and therefore the existing market infrastructure which includes marketing networks and support systems needed to provide the required after sales service and ongoing maintenance needs to be strengthened [21, 22]

There is a need to develop system standards for all the main system components. Standards are required to be established for certification or qualification for designers and installers. Establishing performance standards for PVs, establishing independent testing centres and government endorsing of solar systems are measures that will serve to boost the confidence level of PV users [15]. Standards are necessary to guarantee the satisfactory performance of solar systems and to ensure the high quality of installations. The standards are set with the assistance of industry and the Standards Association of the respective country. These standards, then, are used while inspecting the systems that have been installed [16]. In addition to specific PV standards, each country has regulations governing the connection of independent generators to the utility grids. These regulations are often inappropriate for PVs and, therefore, have to be revised.

The absence of institutional frameworks and legal structures that create the proper climate for investments in renewable energy have been barriers in many countries [23]. India is among the few countries which has a separate government department to accelerate the deployment of renewable energy technologies. The Ministry of Non-Conventional Energy Sources [18] is responsible the development, production and utilisation of PV devices in India [17].

### **Lack of Strong Private Sector Participation**

The slow rate of participation of the private sector in the renewable energy sector is because of issues relating to economic viability and inadequate infrastructure to support this industry [24]. An interesting development is the 'Photovoltaic Market Transformation Initiative' (PVMTI) which is designed to increase the participation of the private sector in market development activities leading to creating and sustaining new markets for PV systems. The PVMTI has been initiated in India by the International Finance Corporation (IFC) and the Global Environmental Facility (GEF). An estimated USD 15 million is available under this initiative to provide long-term low interest loans to companies and to refinance consumer credit schemes. In an effort to support market development initiatives the fund provides a one time grant of up to 10% of the loan to cover costs associated with Market development [22, 25].

The private sector needs to view PV systems as alternative solutions to the problem of power shortages, power-cuts and erratic power supply. They need financial support, fiscal incentives and technical know-how for installation, operations and maintenance. Firms that use PV systems for captive consumption need to be assured of reliable performance, service guarantees and adequate warranties. This is required to minimise the perceived risk and uncertainty associated with PV systems since the technology is new. Financial institutions and IREDA can assist the private sector by developing financing instruments which render PV systems to be operationally viable. The government and SEBs need to provide the required policy, legislative and regulatory framework. The combined effort of the government, financial institutions and the private sector will lead to the much needed strengthening of the infrastructure in the power sector in India [26].

## **Methodology**

### **Data Collection**

The Directory of Hotels and Resorts in India was used as the sampling frame as it provided a comprehensive listing of the target population. The mail survey method of data collection was adopted initially to obtain the primary data for this study since it was less expensive and more time-efficient than telephone and personal interviews. A mail survey was advantageous in that it reduced interviewer bias and social desirability bias. Besides, it was considered that mail questionnaires could reach a geographically dispersed sample simultaneously and were relatively low in cost compared to personal interviews. Self-administered questionnaires that were mailed to respondents gave them

the flexibility of filling it out when the respondents had time. Anonymity of the respondents also could be maintained and, therefore, respondents were considered more likely to provide accurate information [27].

The chief concern about this method was the problem of response rate, which traditionally was regarded as being low for mail surveys [27, 28]. The following steps were taken to increase the response rate:

- *Cover letter*: The questionnaires were mailed to the respondents along with a covering letter. The covering letter introduced the researcher, the nature and scope of the study, and the purpose of the study. The assurance of confidentiality was also emphasized in the cover letter.
- *Incentive*: In order to encourage respondents to participate in the study, an incentive in the form of summary report of research findings was also offered to the respondents.
- *Local Academic contact*: In order to establish a higher credibility for the study and to facilitate return of the completed questionnaires to a local address in India, it was decided to enlist the help of a local academic in India who willingly agreed to help the researcher in this regard. The respondents were requested to mail the completed questionnaires back to the academic's contact address via the mail-back envelopes that were provided.

The questionnaires were administered through a mail survey, which is very common in industrial marketing research [31]. The mail interview package consisted of the outgoing envelope, cover letter, questionnaire and return envelope. A summary report of the findings was also offered as an incentive. These are the common elements of a typical mail survey [32]; however, out of the 769 questionnaires that were mailed only 25 were returned yielding a very low response rate of 3%. The response rate was very low despite the respondents being requested to mail the questionnaires back to the address of a local academic in India. The response rate for the follow up mail out was no different.

Marketing Research firms and trained interviewers are frequently used to collect data and administer questionnaires in research settings [33-45]. Personal interviews are the dominant mode of collecting survey data in many European countries such as Switzerland, newly industrialized countries (NICs) and developing countries [28]. Personal interviews are used extensively in research [46-55]. Because the response rate to the mail survey was so low it was decided to administer the questionnaires through a team of trained interviewers in India. Although this method of administering the questionnaires is expensive, it was adopted in view of the time constraints and the need for high quality data for the current research.

The following steps were taken to get the best out of this research – correct selection of the population from which the sample is drawn, adopting random sampling techniques, having an adequate sample size, having professionally trained interviewers, having clear and objective survey questions in the questionnaire and ensuring that the researcher has no vested interest in the survey results. These are in accordance to the criteria recommended by Pollock & Ryan [41] to get the most from any research.

The hotels in the sampling frame were categorized according to their star ratings and adequate care was taken to ensure a representative random sample. The sample size was 205 and was spread across six Indian cities covering the different regions of the country using stratified sampling technique. The data was finally collected from the hotels using a structured questionnaire by a prestigious market research firm in India. Multi-item scales were resorted to and the development of multi-item scales was based on the underlying theory of the construct being measured.

#### **Operationalisation of the Variables**

Government initiatives refer to the actions that are required to be taken by the government to promote and foster the adoption of solar-based power supply systems. This construct was assessed by eleven items (GI1 to GI11) drawn from Cesta and Decker [15], DeLaquil [56] Adurodija [9] and Muntasser [13]. Respondents were asked to rate the importance of the role of government in fostering the commercialization of solar PV systems on a seven point Likert type scale from 1 = Not Important to 7 = Very Important as the anchor points [15]. The eleven variables measuring government initiatives are:

- GI1: Creating awareness by providing helpful information [9, 15].
- GI2: Disseminating relevant information [9, 15].
- GI3: Promoting use of solar systems [15].

- GI4: Publishing results of comparative analysis of solar systems with conventional systems [15].
- GI5: Providing tax incentives for users [15, 56].
- GI6: Providing tax incentives for producers [15, 56].
- GI7: Providing subsidies for installing PV systems [15].
- GI8: Providing concessional financing for installing PVs [9, 15].
- GI9: Establishing performance standards for PVs [9, 15].
- GI10: Establishing independent testing centers for PVs [15].
- GI11: Removing subsidies to fossil fuels such as diesel [56, 57].

## Results

Results as shown by the mean values in Fig.1 indicate that respondents considered ten of the eleven items as very important and one item as important. There was no great deal of variation in the mean values of these ten items as can be seen from Fig.1.

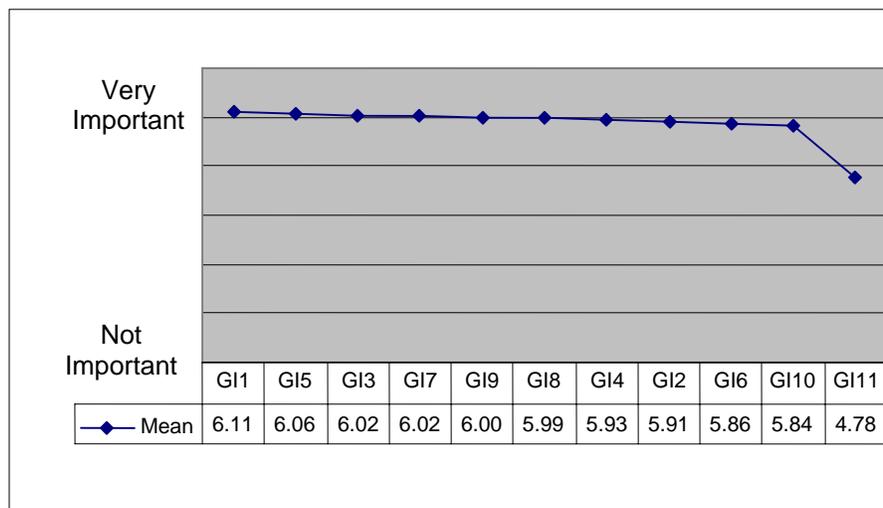

FIG 1: GOVERNMENT INITIATIVES

Creating awareness by providing helpful information had the highest mean rating (GI1:  $\bar{x} = 6.11$ ) followed by: Providing tax incentives for users (GI5:  $\bar{x} = 6.06$ ); Promoting the use of solar systems (GI3:  $\bar{x} = 6.02$ ); Providing subsidies for installing PV systems (GI7:  $\bar{x} = 6.02$ ); Establishing performance standards for PVs (GI9:  $\bar{x} = 6.00$ ); Providing concessional financing for installing PVs (GI8:  $\bar{x} = 5.99$ ); Publishing results of comparative analysis of solar systems with conventional systems (GI4:  $\bar{x} = 5.93$ ); Disseminating relevant information (GI2:  $\bar{x} = 5.91$ ); Providing tax incentives for producers (GI6:  $\bar{x} = 5.86$ ) and Establishing independent testing centres for PVs (GI10:  $\bar{x} = 5.84$ ). The eleventh item which is removing subsidies to fossil fuels such as diesel had the lowest mean (GI11:  $\bar{x} = 4.78$ ). These findings are also highlighted in the analysis of frequencies of responses shown in Table 1.

TABLE 1: GOVERNMENT INITIATIVES – FREQUENCIES AND PERCENTAGES (N = 205)

	Not Important		Very Important	
	N*	%**	N*	%**
Creating awareness by providing helpful information (GI1);	6	2.9	177	86.3
Providing tax incentives for users (GI5)	8	3.9	173	84.4
Promoting use of solar systems (GI3)	2	1.0	177	86.3
Providing subsidies for installing PV systems (GI7)	7	3.4	170	82.9
Establishing performance standards for PVs (GI9)	6	2.9	171	83.4
Providing concessional financing for installing PVs (GI8)	6	2.9	170	82.9
Publishing results of comparative analysis of solar systems with conventional systems (GI4)	3	1.5	170	82.9
Disseminating relevant information (GI2)	6	2.9	172	83.9
Providing tax incentives for producers (GI6)	11	5.4	162	79.0
Establishing independent testing centres for PVs (GI10)	8	3.9	166	81.0
Removing subsidies to fossil fuels such as diesel (GI11)	37	18	113	55.1

\*Number (N) of responses \*\*Percentage of responses

Nearly 80 % or more of the respondents indicated that the government has a very important role to play in fostering the commercialization of PV systems. There is a very strong emphasis on the important role of the government in this regard. 86.3% specified that ‘promoting the use of solar systems’ (GI3) and ‘creating awareness by providing helpful information’ (GI1) are important; 84.4% revealed that ‘providing tax incentives for users’ (GI5) is important; 83.9% indicated that ‘disseminating relevant information’ (GI2) is important, 83.4% stated that ‘establishing performance standards for PVs’ (GI9) is important; 82.9% revealed that ‘publishing the results of comparative analysis of solar systems with conventional systems (GI4)’, providing subsidies for installing PV systems (GI7), and ‘providing concessional financing for installing PVs’ (GI8) are important; 81% indicated that ‘establishing independent testing centres for PVs’ (GI10) is important; 79% have specified that ‘providing tax incentives for producers’ (GI6) is important; and lastly, 55.1% indicated that ‘removing subsidies to fossil fuels such as diesel’ (GI11) is important.

In this frequency analysis, those who circled a 1, 2 or 3 as their response were grouped together to denote ‘Not Important’, which is the lower end of the scale. Those who circled a 5, 6 or a 7 were grouped together to denote ‘Very Important’, the higher end of the scale. In a seven point scale, 4 represents a neutral response and therefore those who had indicated 4 as their response to a particular statement were not included in the frequency analysis. Hence the percentages shown in the Table 1 do not add to 100 percent.

## Implications

An overwhelming majority of the respondents have emphasised that the initiatives taken by the government were very important in fostering the commercialisation of PV systems. These relate to creating awareness by providing helpful information ( $\bar{x} = 6.14$ ); disseminating relevant information ( $\bar{x} = 5.91$ ); promoting the use of solar systems ( $\bar{x} = 6.02$ ); providing tax incentives for producers ( $\bar{x} = 5.86$ ); providing concessional financing for installing PVs ( $\bar{x} = 5.99$ ); and establishing independent testing centres for PVs ( $\bar{x} = 5.84$ ).

As potential users of PV systems, respondents noted that it was important for the government to provide tax incentives for users ( $\bar{x} = 6.06$ ) and provide subsidies for installing PV systems ( $\bar{x} = 6.02$ ) as these measures directly benefit the users. They also pointed out that the government must take appropriate steps to establish

performance standards for PVs ( $\bar{x} = 6.00$ ); publish results of comparative analysis of solar systems with conventional systems ( $\bar{x} = 5.93$ ) and remove subsidies to fossil fuels such as diesel ( $\bar{x} = 4.78$ ).

Empirical results show that in order to foster the commercialisation of PV systems, the government must do all that it can to create awareness of PV systems by stepping up its promotional effort and providing helpful information. Appropriate policy measures must be put in place to provide the needed incentives, subsidies and concessional financing. The government should take the leadership role in establishing performance standards for PV systems, setting up independent testing centres for PV systems and in publishing the results of comparative analyses of solar systems with conventional systems

## **Conclusion**

The development of the renewable energy industry in India is still in its early stages. Therefore the government should continue to play a leadership role in regards to policy, legislation, fund mobilisation, institutional support, tariff formulation, pricing of electricity from renewable energy sources, testing and standards, training, information dissemination and education. Nevertheless, greater involvement by the private sector is required, and concentrated effort is required to expand the marketing infrastructure. Private sector participation has to be supported by research and development, demonstration projects and support needed to commercialise new technologies such as provision of financial incentives, subsidies and tax rebates. A variety of financial incentives are required to stimulate a 'market pull' for RETs. The goal is to increase market demand for RETs and accelerate the adoption of technologies such as PV systems. It is expected that all these measures will aid the adoption and diffusion of renewables [26, 58].

In a country like India where chronic power shortages are rampant there is a strong market potential for PV systems. Power from PV systems offers effective and viable solutions to bridge the energy gap. Creation of an effective institutional framework involves close co-operation between policy makers, government agencies such as MNES and IREDA, manufacturers, dealers, vendors, providers of after-sales service and financial intermediaries. India is endowed with plenty of sunshine and there is urgent need to hasten the adoption of environmentally friendly technologies such as PV systems. This can be accomplished by providing appropriate financial incentives, subsidies, strengthening of the supporting infrastructure to ensure reliability, quality and efficiency. Further it is necessary to provide the required regulatory, legislative and policy support for the rapid diffusion of PV systems.

The contribution of the study emerges from the integration of literature in the areas of renewable energy technologies and the diffusion of photovoltaic technology in developing countries. The significance of this research is that it provides empirical evidence to enhance the understanding of the role of government initiatives in fostering the adoption of photovoltaic technology in a developing country, India.

# **Mindset Orientations of Senior Indonesian Managers in the Higher Education Sector: An Empirical Pilot Analysis**

*Samir Ranjan Chatterjee  
Subramaniam Ananthram  
Curtin University of Technology, West Australia*

## **Abstract**

The Indonesian higher education sector is experiencing unprecedented institutional reform with assistance from the indigenous government, the Asian Development Bank, the United Nations and Asia-Pacific countries in recent times. The forces of globalization are impacting on Indonesian universities, polytechnics and higher education institutions to remodel their strategies, change their governance systems and revamp their academic programs to successfully compete in the competitive global environment. The paper develops a model of the globalization of higher education sector in Indonesia to test the linkages between the organizational level paradigms of entrepreneurial orientation and technology intensity and the micro level skills, competencies and mindset orientations of senior Indonesian executives. Analysis of data from 28 senior rectors and managers offer support to the linkages postulated in the model.

## **Introduction: Globalization and the Higher Education Sector in Indonesia**

With a population of over 220million, Indonesia is the fourth largest country in terms of population after China, India and USA. In spite of more than 7 percent annual growth for a decade up to 1997, the Asian Financial Crisis had crippled the economy in a major way. The International Monetary Fund had provided rescued packages to the tune of 50 billion USD and in response; the country had agreed to initiate a comprehensive reform agenda including education. In recent years, the Asian Development Bank and the World Bank had been focusing on reforms in the higher education sector as a means of generating an economic renewal.

Higher education sector in every country was built around the societal culture, tradition and economic development. Global imperatives have initiated a dramatic shift in the role of higher education in Indonesia. Quality, access and equity, autonomy, accountability and other related issues have suddenly become major challenges through which national well-being and competitiveness can be ensured.

The major stakeholder of higher education in Indonesia, namely, government, is no longer able to maintain its traditional budgetary and leadership role. Other stakeholders like industry, multi-lateral agencies, international collaborators etc. are also becoming dominant forces in institutional leadership and management. This calls for the weaving of a new mindset for leaders in this sector. The global requirement of university leaders to devote their vision and energy in areas beyond their core functions of creating, disseminating and applying knowledge cannot be responded only by culture development – it needs a radical shift in the ‘global mindset orientation’ of the leaders. This is the only guarantee to overcome the danger of a society in becoming a mere centre of specialized global function or a vehicle of prosperity for others. A broader global thinking can envision a higher educational environment where a society can empower individuals to be creative, self-sufficient and contributing to a societal progress.

## **Purpose of the Paper**

As the higher education sector in Indonesia adopts an ambitious goal of overcoming a locally focused regime in response to the needs of economic and social reform, the global mindset orientation of the leaders of the sector becomes an indicative measure of the robustness of this venture. The purpose of this paper is to assess the global mindset orientation of higher education leaders in terms of their culture, structure, strategy, positioning and international links. The aim is to ascertain the ambition, purpose and vision through an empirical investigation of a

select sample of leaders across the nation may provide a broad frame for other researchers, educators and policy makers.

## The Logic of Globalization

Globalization has become one of the most widely debated and controversial topic today. Societies, organizations and individuals are undergoing unprecedented upheavals as global linkages in economic interdependence are responded to, differently, at different levels. The macro-level converging forces of economic globalization translate onto the meso and micro level frames which makes it important to understand the symbiotic relationship of the macro-meso-micro interaction. This macro-meso-micro interaction is of foremost importance in the education industry (Chatterjee, 2004; Bray and Thomas, 1998). With the opening up of the economy, Indonesian higher education sector is striving towards achieving a competitive advantage through quality improvement and academic development measures (Suhendro, 1996). The Asian Development Bank (ADB) is working closely with the Indonesian higher education institutes and providing impetus in terms of funding, research and development, academic development initiatives and policy and governance structures (Neave and Van Vaught 1994; World Bank 2004). The Rectors (equivalent to University Presidents or Vice-Chancellor status) of higher education institutes in Indonesia have the onus on them to revamp the environment in which they operate and convert the local initiatives of various universities, institutes and polytechnics into global linkages through global initiatives. This provides a rationale for a deeper level understanding of the societal, psychological, cultural, economic and individual level parameters shaping the mindsets of senior higher education executives in Indonesia (Begley and Boyd, 2003; Gupta and Govindarajan 2002; Jeanett 2000; Beechler, Taylor, Boyacigiller, and Levy, 1999; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993, 1992; Bartlett and Ghoshal, 1989).

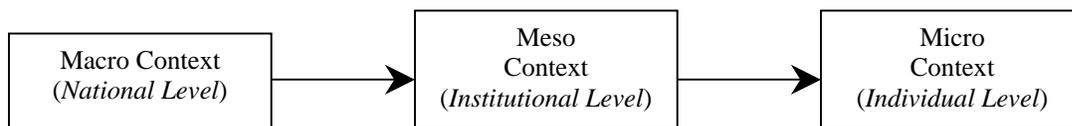

FIG. 1: CONTEXT DRIVEN LOGIC OF GLOBALIZATION

Source: Ananthram and Chatterjee, 2004

### Macro Level Pressures of Globalization

Fig. 1 highlights the context driven logic of globalization. At the macro level, the Indonesian national government is seriously considering strategic reform in terms of embracing the benefits of internationalization of the higher education sector. Government policies are increasingly moving away from 'introvert' policies and are allowing foreign investment in the indigenous economy (Isaak 2005). Apart from *government* being one of the driving forces towards globalization at the macro level in general, industrial organization theory has identified three other forces impacting global orientation: Market, Cost and Competition (Yip, Johansson & Roos 1997; Yip 1989). Drawing on seminal work by above researchers, the paper proposes to define the macro level forces impacting globalization of the higher education sector in Indonesia and test their significance:

- *Market forces* enable the extension of the Indonesian higher education sector's market-scope beyond national boundaries. They are indicated by new customers from global markets, use of global channels and adoption of techniques and processes from global sources.
- *Cost forces* enable the extension of the Indonesian higher education sector's operation-scope beyond national boundaries. They are indicated by global economies of scale, favorable logistics, differences in country costs (including exchange rates), and outsourcing.

- *Government forces* enable the extension of the Indonesian higher education sector's legal and regulatory-scope beyond national boundaries. They are indicated by tariff and non-tariff barriers and regulations encouraging an economic climate that fosters global linkages.
- *Competition forces* enable the extension of the Indonesian higher education sector's competitive-scope beyond national boundaries by creating well-established benchmarks. They are indicated by the matching of structures, processes, systems and strategies employed by competitors.

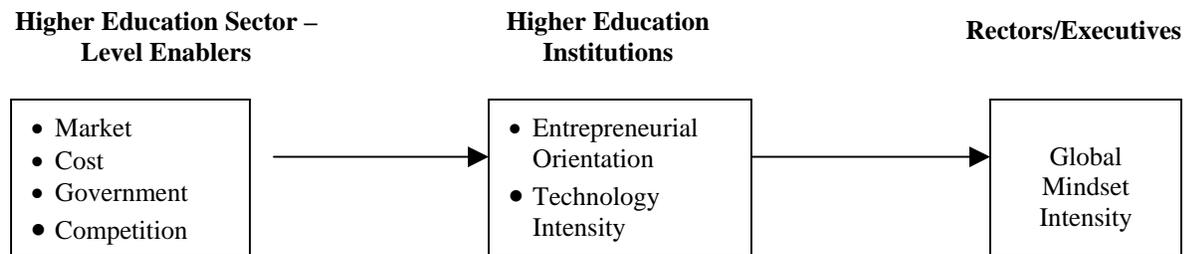

FIG. 2: INTERNATIONALIZATION OF HIGHER EDUCATION MODEL  
Source: Adapted from Ananthram and Chatterjee, 2004

Fig. 2 highlights the symbiotic macro-meso-micro level relationship of the Indonesian higher education sector. The model has been adapted from Ananthram and Chatterjee (2004) which provides a generic conceptual framework of the context of global mindset development underpinned by the theory of the logic of globalization. The macro-level enablers are represented by the four factors outlined earlier (market, cost, government, competition). The macro-level forces impinge on the higher education institutions to rethink their strategies and processes and focus on converting their local presence into a global advantage which in turn puts the onus on senior higher education executives to cultivate a global mindset by developing values, skills, competencies and a culture favorable to compete in the global environment. A detailed explanation of the theoretical underpinning of the meso and micro level frames of the model in Fig. 2 is presented next.

**Institutional Paradigms (Meso Level Pressures): Building Institutional Support for Global Reach**

The industry (macro level) forces of market, cost, government and competition now put pressure on higher education institutes, i.e., at the meso level to be able to take advantage of the favorable macro environment and shape their structure, processes and strategies to give them a competitive advantage. Institutional paradigms shape the way they relate to the environment in which they operate. Decisions made by institutions on the possibility of moving into overseas economies are strongly influenced by their institutional paradigms (Burpitt and Rondinelli, 1998). Dutton (1993) has defined an institutional paradigm as a “theory of action” whereby institutions with a commitment to entrepreneurship perceive external possibilities (supplemented by the macro level forces enabling globalization) as opportunities. He further highlights the importance of contextual conditions, institutional conditions and overall competitive orientation at the meso level as the important support builders for institutions to attain global reach. Two of the key institutional factors identified in the international management literature, which have enabled global linkages at the meso level include *technology intensity* (Cavusgil and Knight, 1997; Kohn, 1988) and *entrepreneurial orientation* (Burpitt and Rondinelli, 1998; Covin and Slevin, 1989). A detailed explanation of these two organization paradigms follows.

*Entrepreneurial Orientation*

Entrepreneurial orientation has been the subject of much attention amongst researchers (Covin & Slevin, 1989, 1988; Miller and Friesen, 1983) and has been linked to institutional growth (Covin & Slevin, 1991). Numerous studies offer different definitions of the term entrepreneurial orientation, however, in summary, they contend that entrepreneurial orientation is defined as an economically oriented mono-dimensional paradigm, encompassing the extent to which institutions engage in risk-taking, innovation and proactiveness in international expansion (Harveston, 2000). However, the paper contends that entrepreneurial orientation has another dimension that of learning, especially with the growing importance of managing knowledge in a knowledge oriented economy in

Indonesia (Hampden-Turner and Tan 2002). Knowledge as an asset and knowledge management as a process has been of utmost importance to organizations across the world. “The process of knowledge integration is being increasingly considered a phenomenon bounded by the cross-verging demands of global and local parameters” (Chatterjee, 2003: 44). A similar view was shared by Dutton (1993) and later by Burpitt and Rondinelli (2001) who examined the organizational paradigm of a two-dimensional entrepreneurial orientation (*economic* and *learning*) influenced organizational decision-making and ultimately, the overall competitive orientation of the firm. A recent study on work goals of managers across eight divergent Asian contexts revealed the importance managers and organizations are placing on the importance of learning (Chatterjee and Pearson, 2002). This competitive or entrepreneurial orientation is seen by management as one of the driving forces towards successful global expansion and management across multinational organizations and institutions are moving towards a shared-emphasis of economic as well as learning goals.

Entrepreneurial orientation at the meso or organizational level is related to micro level managerial orientation, in terms of mindset intensity of managers (Burpitt & Rondinelli, 2001). Senior level management (Rectors and senior executives) with high global mindset intensity would be instrumental in shaping the overall entrepreneurial orientation of the higher education institutions. Building on the discussion within the context of the macro-meso-micro logic of globalization, the paper postulates the following two hypotheses:

*H1: Entrepreneurial orientation will be related to the macro level globalization pressures of market, cost, government and competition.*

*H2: Entrepreneurial orientation will be related to the micro level managerial mindset intensity.*

#### *Technology Intensity*

Another source of organization specific advantage identified in international management literature arises from the appropriate use of technology (Hymer, 1976). Consistent with the work of Palvia (1997) and Harveston (2000), technology intensity is defined as the extent to which organizations and institutions utilize their core technology to gain maximum competitive advantage. The more technology intense an organization or institution is, the more likely it is to leverage its core technology to gain some form of competitive advantage. However, core technology differs from organization to organization and industry to industry. Higher education institutions with a global brand name like Ivy League universities – Harvard and the University of California at Berkley in America, Oxford and Cambridge in Europe, National University of Singapore and the Indian Institute of Technology in Asia and the University of Melbourne in Australia are constantly updating and upgrading their core technologies to enter new markets (Times Higher Education Supplement, 2004). Cavusgil and Knight (1997), and Oviatt and McDougall (1995) found that even small organizations can overcome the disadvantage of their small size through their unique product or the distinctive use of a unique, core technology to produce that product. They contend that in order for an organization or institution to gain sustained competitive advantage in global markets from its technological advantage, its core technology should be difficult to imitate. Tacit know-how, unique manufacturing process or service delivery process provides organizations with the strategic competitive advantage. Several studies have evaluated the relationship between technology intensity and globalization (Eriksson, Johanson, Majkard & Sharma, 1997; Almeida & Bloodgood, 1996; Grant, 1996; Walters & Samiee, 1990; Johnston and Czinkota, 1982; Kothari, 1978; Tesar, 1977) and have reported significant positive relationships.

Managers in today’s competitive world operating in a complex global marketplace need to constantly rethink their strategies, including the appropriate use of their core technologies. Technological isolation can lead to organizations losing out to competing organizations, which are constantly on the lookout for making the first pre-emptive strike by taking advantage of their core technological advantage. Managers need to think, act and transcend beyond national boundaries using technology as one of their core organization paradigms, which further reinforces the importance of the possession of a global mindset, which allows managers to think and act globally. Consistent with the macro-meso-micro contextual model of the logic of globalization, two hypotheses are generated:

*H3: Technology intensity will be related to the macro level pressures of market, cost, government and competition.*

*H4: Technology intensity will be related to the micro-level paradigms of managerial mindset.*

#### **Micro Level Pressures – Managerial Enablers**

The meso level contextual pressures of *entrepreneurial orientation* and *technology intensity* operate together, now putting the onus onto managers to develop values, skills, competencies and a culture favorable to compete in the

global environment. Many recent studies have emphasized on micro-level global reform and the cultivation of a global mindset to create an intelligent global institution (Gupta and Govindarajan, 2002; Jeanett, 2000; Rhinesmith, 1995). A critical success factor for any institution is the level of global mindset orientation amongst its managers (Harveston, 2001; Murtha, Lenway and Bagozzi, 1998). This provides a rationale for a deeper level understanding of the societal, psychological, cultural, economic and individual level parameters shaping the mindsets of senior managers in the Indonesian higher education sector (Begley and Boyd, 2003; Gupta and Govindarajan 2002; Jeanett, 2000; Beechler, Taylor, Boyacigiller, and Levy, 1999; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993, 1992; Bartlett and Ghoshal, 1989).

The concept of global mindset has received a growing interest amongst researchers over the past decade. Global mindset has been conceptualized in the international management literature as cognitive structure, a set of observable behaviors, individual competencies, leadership traits and strategic maturity (Gupta and Govindarajan, 2002; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993, 1992). The concept assumes that human beings and organizations are limited in their ability to absorb and process information. The constant challenge of complexity, ambiguity and dynamism of this information environment is responded by individuals through a process of cognitive filtration, which involves the selection of what they absorb and the unique way in how they interpret the information (Gupta and Govindarajan, 2002). An integrated view of the concept can be summarized as *'the ability and willingness of managers to think, act and transcend boundaries of goals, values and competencies on a global scale'* (Ananthram and Chatterjee, 2004)

## Methods

### Sample and Site

The study respondents were 29 executives and senior managers of Indonesian higher education institutions. Specifically, 69 percent of the respondents were Rectors (equivalent to university Presidents or Vice Chancellors), while the remainder were from senior managerial positions. Few of these respondents were female. Other respondent attributes are reflected by the high levels of formal education and the wide range of higher education institutions in which they held office. For instance, organizational size (small private polytechnics to large universities), structural configuration (public and private entities), and ownership (within government and local government sectors) provided a wide base from which data were collected. A profile of the study participants is presented as Table 1.

TABLE 1: DEMOGRAPHICS % (N = 29)

Managerial Level	Percent	Educational Background	Percent
Executive	69.0	University Degree	100
Supervisory	24.1	Professional Degree	55.2
Other	6.9		
<b>Age (Years)</b>		<b>Experience in Education Industry (Years)</b>	
Less than 30	3.4	Less than 10	6.9
30 – 39	10.3	10 – 19	34.5
40 – 49	31.0	20 and above	58.6
50 and above	55.2		
<b>Gender</b>			
Male	96.6		
Female	3.4		

## **Procedure**

Data were obtained with the support of the convenors of a Higher Education conference that was held in Bali during April 2004. The conference, which had a theme of Higher Education Governance, was sponsored by the Asian Development Bank (ADB) and the Directorate of Higher Education, Indonesia. Understandably, almost every Indonesian higher education institution was represented, often by their Chief Executive Officer (CEO). These executive and senior managers were invited, through the conference convenors, to complete a questionnaire. Subsequently, the data were examined by appropriate statistical procedures. In this study is presented some of the results of the assessments of some of the variables that were measured by the questionnaire.

## **Measures**

Four measures were employed in this study.

### *Macro – level Enablers of Globalization*

The study adopted a measure developed by Yip (1989) and has adapted the definition of the four macro – level enablers of globalization to suit the higher education context. Participants were asked to rank the four macro – level enablers, (i.e. market, cost, government and competition) according to the order of importance of the level of impact of globalization each force has in the education industry. Number 1 signified the highest impact; number 2 the second highest impact; number 3 the third highest impact; and number 4 the least impact. It was made clear to the participants that each digit could be used only once in order to avoid overlapping. The mean scores of the ranks and their inter-correlations are represented in Table 2 in the Results section.

### *Meso – level Enablers of Globalization*

#### Entrepreneurial Orientation

This construct is defined as the extent to which organizations engage in risk taking, innovation and proactiveness in global expansion, which shapes its overall competitive orientation. Two dimensions of this organizational paradigm have been identified from Burpitt and Rondinelli's (1998) adaptation of Dutton's (1993) entrepreneurial orientation definition: (1) Economic Orientation and (2) Learning Orientation. Both dimensions specifically focus on managerial perceptions of organizational level activities regarding global entrepreneurial orientation. Though the literature linking entrepreneurial orientation to global activities is scarce (Barringer, Macy & Wortman, 1996; Burpitt & Rondinelli, 1998; Caruna, Morris & Vella, 1998), strong linkage between entrepreneurial orientation and firm growth have been well established in the literature (Covin & Slevin, 1991; Miller & Friesen, 1983). This study adapted a scale originally developed by Burpitt and Rondinelli (1998). Respondents were asked to answer eight questions from their organizations point of view, four of which measured the degree of economic orientation and four measured the degree of learning orientation. Responses were coded on a seven-point Likert scale where "1" = Strongly Disagree and "7" = Strongly Agree. The statements loaded onto two factors giving a reliability alpha of 0.61 for economic orientation (one item was deleted to increase the external validity) and 0.87 for learning orientation.

#### Technology Intensity

This construct is defined as the extent to which organizations utilize their core technology to gain competitive advantage. Several studies have found a relationship between the type of technology employed or the use of technology and globalization (Almeida & Bloodgood, 1996; Johnston & Czinkota, 1982; Kriplani & MacIntosh, 1980; Tesar, 1977). The measure employed in this study was adapted from Harveston (2000) which was adapted from Palvia (1997). Responses were coded on a seven-point Likert scale where "1" = Strongly Disagree and "7" = Strongly Agree. The original measure reported employed four questions. In the current study, however, an original item was added and respondents were asked to answer five questions regarding their primary product or service technology. The responses were subjected to principal component factor analysis using varimax rotation in order to reduce the number of variables. One factor emerged with an Eigenvalue of 2.84 a reliability alpha of 0.81

### *Micro – level Enablers*

#### Global Mindset

This construct is defined as the ability and willingness of managers to think, act and transcend boundaries of goals, values and competencies on a global scale. Global Mindset has been conceptualized in international management literature as cognitive structure, a set of observable behaviors, individual competencies, leadership traits and strategic maturity (Gupta and Govindarajan, 2002; Murtha, Lenway and Bagozzi, 1998; Rhinesmith, 1995, 1993,

1992). Following the work of Burpitt and Rondinelli (1998), global mindset was assessed by asking managers a series of questions about their attitude towards globalization. The questions were adapted to suit the context. Responses were coded on a seven-point Likert scale where “1” = Strongly Disagree and “7” = Strongly Agree. The responses were subjected to principal component factor analysis using varimax rotation in order to reduce the number of variables. One factors emerged with an Eigenvalue of 2.67 and a reliability alpha of 0.83.

### Results

Table 2 presents the mean scores, ranks and correlations of the four macro – level enablers of globalization. The four items are very independent, further reinforcing their distinctiveness and unique importance. The mean score ranks the four macro – level enablers in order of importance. Indonesian higher education institutions are undergoing unprecedented reform facing pressures of competition at the national and international level, consistent with the findings (Yip 2000; World Bank 1996). This renewed competition has compelled the Ministry of Higher Education and Directorate of Higher Education in Indonesia to provide assistance to the higher education institutes in terms of resources for infrastructure, research and development and more recently governance structures (Kotler and Kartajaya 2002; Prahalad 2005; Singleton 2002). The inverse relationship between competition and cost is logical given the renewed competition pushing costs down. The Asian Development Bank has been working closely with the Ministry and the Directorate General of Higher Education in Indonesia and more recently the Australian Government has expressed an interest in the reform of the higher education sector in Indonesia (Chatterjee 2004).

TABLE 2: MEANS AND CORRELATIONS OF MACRO-LEVEL ENABLERS OF INTERNATIONALIZATION

	<i>Mean Scores</i>	<b>Competition</b>	<b>Government</b>	<b>Cost</b>	<b>Market</b>
<b>Competition</b>	1.83 <sup>1</sup>	1	-0.153 (.427)	-0.588* (.001)	-.136 (.482)
<b>Government</b>	2.17 <sup>2</sup>		1	-.166 (.391)	-.760** (.000)
<b>Cost</b>	2.93 <sup>3</sup>			1	-.174 (.368)
<b>Market</b>	3.07 <sup>4</sup>				1

Note: 1. Superscripts on mean scores are their rankings in order of importance from 1 to 4.

2. Values in parentheses are the significance levels of the correlations

3. \* p < 0.01, \*\* p < 0.001 (two-tailed)

Table 3 provides the multiple regression analysis results for the meso (entrepreneurial orientation and technology intensity) and micro level (global mindset intensity) frames. The table provides the overall regression result when the three meso level variables are entered into the regression analysis together, with the micro level variable being the dependent variable. The analysis indicates a significant relationship between the meso level factors as a whole and the micro level mindset variable. However, owing to the higher degree of multi-collinearity between the meso level factors, none of the meso level variables was shown as significantly related to the mindset variable individually. Hence, each of meso level variables were independently regressed onto the micro level mindset variable. Table 4 further strengthens the support for H2 and H4 as the meso level variables are independently regressed onto the micro level mindset variable. Though all the three meso level variables have significant relationships with the micro level global mindset intensity, the findings suggest that economic orientation has the maximum impact in shaping the global mindset intensity of managers. Indonesian higher education institutes have only recently begun expanding their services beyond national boundaries and the macro level forces of competition are driving them to attain a comparative advantage through low cost means, consistent with the findings of this paper.

## Discussion and Conclusion

The 1997 Asian Financial Crisis and the recent democratic reform movement had created a new environment in Indonesia where higher education sector has become a critical force for change. In order to energize this large economy and gain a competitive momentum, meaningful global depth is desperately needed for its higher education sector. This limited study of perceptions of senior leaders indicates that the global forces are emerging as a very important trigger in spite of the general culture of bureaucracy in the higher education sector. The forces of market have impacted on the technology intensity and entrepreneurial orientations shaping the competency base of this diverse nation. In spite of the cultural biases in completing the questionnaire based surveys, the pattern of responses do substantially point to a clear emphasis of global mindset.

The brave new world of global higher education system inevitably will make Indonesian universities pay more attention to corporate values of entrepreneurialism, competency and partnership development. Building global and regional capacity in this area becomes inescapable realities for future managers in this sector.

# Privatization Process in Mexico: Prospects and Effects in Economic Development

*José G. Vargas-Hernández*  
*University of California at Berkeley, USA*

## Abstract

This paper is aimed to analyze historical development and background of privatization in Mexico, prospects of the privatization program in Mexico and effects of the Mexican privatization program. It is safe to conclude that changes of ownership through the privatisation process in Mexico has led to the foreign investors to own the most profitable former state owned enterprises which under the spirit of globalisation of business has terminated any sentiment of national capitalism. Also, it is concluded that the policy of privatization in Mexico has not achieved the aims related to increase economic growth and development, but has contributed significantly to become a subsidiary economy owned and managed by transnational and multinational corporations. However, this aim is politically neither desirable nor feasible for the economic development of Mexico. If good performance of privatisation is required, actually it is successful only if state-owned companies are so well managed that there is no need to privatise.

## The Political Economy of Privatization and Regulation

The international wave of privatizations in the last twenty two has been reflected in the Mexican economy. In the broadest sense, privatisation refers to the introduction of market oriented institutional reforms, which includes the sale of publicly owned assets as well as the deregulation of product markets. Privatization is when the ownership of production units changes from public to private. The question to any privatisation is how it affects competition as the key to efficiency.

Therefore, ownership matters for efficiency. The argument that literature favours private ownership over public ownership (Megginson and Netter, 2001) is not consistent. Willner (2001, 2003a) finds not difference and concludes that public ownership may even be superior in water, electricity and insurances, whereas some labour intensive industries such as refuse collection and bus transport tend to be cheaper under private ownership.

Economic theory sustains that changes in ownership lead to performance improvements where there are appropriate changes in the competitive or regulatory environments (Parker, 2004). A state owned company that have good financial performance become more likely to be privatised. An economic appraisal of privatisation demonstrates that the roles of competition and regulation may be crucial if ownership change is to have reliable efficiency results (Kay and Thompson, 1986; Vickers and Yarrow, 1988; Martin and Parker, 1997)

State enterprises ownership is associated with cross-subsidies and 'no undue discrimination' clauses that lead to uniform pricing (Parker, 2004). Where markets become more competitive after privatisation, it might be expected that prices would move closer to marginal costs, implying higher allocative efficiency. Privatization, when coupled with competition, is expected to lead to prices more closely related to the marginal costs of supplying different user groups. However, this depends upon the pricing strategy followed under state ownership (Parker, 2004:10).

Principal-agent theory and public choice theory provide a powerful theoretical rationale for privatisation (Boycko, Shleifer and Vishny, 1996). Privatisation often requires regulation and hence an additional agency problem (Shapiro and Willig, 1990/2000; Laffont and Tirole, 1991). Principal-agent theory suggests that in privately owned enterprises management faces higher incentives to maximize productivity and to drive out waste (De Alessi, 1980; Bös, 1991; Boycko et al., 1996). The theory of incentives critics the state ownership of firms behaving as "a weak and erratic "shareholder", hesitating between the maximization of short-term financial or political benefits and a "laissez-faire" approach supposed to let the state firms develop as they wished, in spite of the bureaucratic control of their activities" (Berne and Pogorel, 2004:4).

Under the principal agent framework in order that investments materialize it is necessary the development of safeguarding institutions and regulatory agencies to prevent the engagement of opportunistic behaviors. Public

choice theory maintains that within government, as elsewhere in the economy, self-interest is the dominant motive, with the result that state ownership is associated with empire building, gold plating of public investments, over-manning and, in general, economic waste (Niskanen, 1971; Tullock, 1976; Mitchell, 1988).

The design of regulation has two choice variables or components for governments undertaking public sector reforms, which are limited by institutional endowments of the Mexican country. Heller and McCubbins (1997) called these two variables as political stability and price risk. Levy and Spiller,(1996) denominated as regulatory governance and regulatory incentives. Political stability is defined as a situation with minimum risk that government would introduce changes to the way it treats investment. Regulatory governance refers to “all the mechanisms that a society uses to restrain government discretionary moves and to solve conflicts between firms and regulators” (Abdala, 1999:3). Price risk is considered in same terms as the structure of regulatory incentives, which “involves the specific norms related to price regime, subsidies, competition policy, barriers of entry, interconnection rules, etc.” (Abdala, 1999:3).

The reform of regulatory governance include the institutionalized framework of regulatory agencies, the delimitation of their independent powers and mechanisms of financial autonomy, arbitration of controversies, access to competition in liberalized markets, etc. As factor closely related to governance culture to explain growth and success of state owned companies, experimental research emphasises fairness, reciprocity and intrinsic motivation in explaining individual behaviour, collective action and cooperation (Fehr and Schmidt, 1999; Fehr and Fishbacher, 2002). Also experimental research emphasizes organizational design supportive of . intrinsic motivation (Fehr and Fishbacher, 2002). Kaufmann et al. (2003) compares observable governance indicators to explain growth, such as accountability, political stability, government effectiveness, regulatory quality, rule of law, and control of corruption, (Jalilian et al., 2003),

Development of safeguarding institutions must accompany the regulatory reform and privatization of utilities because asset's specificity and the nature of tradability of services supplied.

Transaction costs political economy are the result of institutional design and have some applications in privatization processes. Privatization reduces the structure of costs through more flexible mechanisms of labor management, production and distribution. Economies of scale and fixed costs in the production of public services have become a more important factor in the cost function. Privatisation has relatively minors impacts on R&D costs and taxes and deregulation has a major impact on marketing and commercial costs (Berne and Pogorel, 2004).

The welfare benefits of transferring ownership from state owned enterprises to private investors of some utilities that have natural monopoly components, such as telecommunications, may not be large.

## **Historical Development and Background of Privatization in Mexico**

Mexican economic nationalism emerged as a result of promoting public and private Mexican capital to avoid unwelcome foreign investment, mainly by the United States. Nationalisation was ruled out for ideological and practical reasons. State-owned companies in Mexico were offshoots of political nationalism. Nationalised companies were at the core of the Mexican state enterprise model based on economic nationalism. The Mexican State was characterized by an historical distrust of capitalism and a belief in the ability of the government to intervene and regulate economic affairs through its explicit constitutional mandate (Grier and Grier, 2000: p. 245).

Public ownership can be a substitute when capital markets are underdeveloped, or investors too short-termist or risk-averse (Rees, 1984) but public ownership has been criticised for dynamic inefficiency and high costs. In Mexico, public ownership has dominated public utilities sector, infrastructure industries manufacturing and banking as well, although the Mexican state found opportunities of expanding to sectors where public ownership was not the only alternative. Mexican industry became a rent seeking culture protectionist and depending on tariffs, quotas, state purchasing and other forms of state aid. This dependency on the state and on politicians was institutionalised for economic benefits during the thirties.

However, from the 1930s and until the 1970s a model of import substitution industrialization (ISI) favored private Mexican investments and was also believed to benefit the people. Industrialisation process of Mexico was an economic policy to create and protect new born industries of needed goods and services through the promotion of

benefits such as fiscal and tax exemptions, subsidies, providing access to credits and loans with reduced interest rates, etc.

The Mexican state owned enterprises sector was larger because it was established to contribute to the industrialization process due to scarcity of domestic private venture capital and the unwelcome foreign investors always ready to take over the most profitable manufacturing sectors, as it was established the limits in Constitutional provisions. The system of political patronage of appointments to state owned enterprise boards was based more on political loyalty rather than commercial ability, increased the political clientalism and reduced the independence of the state owned commercial enterprises which with politically appointed boards and weak management were heavily unionised by public sector trade unions

State owned enterprises in Mexico became over time identified with dependency culture, subsidy rent seeking, regulatory capture, high costs, producer dominance and indifference to consumers, The Mexican public sector enlarged the number of publicly owned corporations. In 1982 state owned enterprises produced 14 percent of gross national product (GNP), received net transfers and equal subsidies of 12.7 percent of GNP and represented 38 percent of investment in fixed capital. There was no provision to regulate the market of state owned enterprises which were treated as an end in themselves to provide jobs for an increasing work force but facing conflicting roles of owning the company and regulating the market. Higher social benefits, considerations of social welfare and public service rather than private returns on investments and slow enterprise formation despite good profit opportunities might also explain why state-ownership was included among the growth strategies (Miettinen, 2000; Geroski, 1995).

The new market orientation is a response to the increasing economic pressure on the welfare state in late 1970's, The 1980s was also a decade of reassessment in Mexican national economic policies. State spending was not anymore considered as an engine of economic growth but to have a negative impact of competitiveness. Therefore, the Mexican economic model of development changed from the closed economy to an open economy with emphasis on competitiveness in the global economy during the 80s.

The Mexican privatization process began in the wake of the Mexican debt crisis in 1982 as a response to pressures from creditors, but since then, there has not been any specific privatisation program in Mexico, in such a way that each case has been treated according to contingencies..Therefore, after the 1982 crisis, Mexico entered into a painful, distressful, and controversial period of state restructuring when the government signed a Letter of Intent with the International Monetary Fund (IMF), which conditioned IMF lending on privatization and other economic measures of austerity in public spending and market liberalization, aimed to offer better terms for foreign investors and to promote exports. Neoliberal economic reforms, also known as the "Washington consensus", entail public policies that are directed toward tight fiscal discipline, privatization of public sector organizations in order to downsize and achieve balanced budgets, deregulation and lowering of trade barriers...

The most important structural changes experienced by the Mexican State were linked to economic policies congruent with the new global environment. Some of these changes include the restructuring of productive plants, privatization of the *ejido* (communal property), improvement of public finances, modernization of education, privatization of state enterprises, negotiation of external debt, deregulation of the economy, commercial and financial liberalization and greater foreign investment. The changes included: economic reorganization; national market openness; elimination of commercial barriers; elimination of price controls and subsidies; privatization of public enterprises and state property; reduction of social policy expenses; free money exchange, and also wide political reforms and administrative modernization. It abandoned the import substitution model and called economic intervention in the state into question.

Since 1982, nearly 1,000 state-owned enterprises out of around 1, 2000 have been sold off, since. The reasons for the privatisations seem to have been largely fiscal. International Financial Institutions used the leverage of foreign debt to require among other changes in the Mexican economy designed to encourage foreign investment, the privatization of state-owned enterprises which include, airlines, airports, ports, railroads, banks, telephone services, oil and electric industries and so on. The wave of privatization in Mexico implied transfers of property rights, control, profits and liability of state owned enterprises from the state to private share holders. Ownership of state owned companies by taxpayers was a theoretical rather than negotiable property right. The Mexican government has gradually reduced state intervention and its role in the management of the economy over the last 22

years with the shift from a policy of import substitution to the implementation of policies of trade liberalization and export promotion.

Since then, the Mexican government has pursued a policy of privatisation, selling off Telmex, the national telephone company, the banks, steel companies, and numerous other industrial and agricultural enterprises. Mexico also has pursued a policy of deregulation, reducing or eliminating bureaucratic red tape for numerous processes. As Berne and Pogorel (2004) contend, the existence of competition makes public management very complicated.

The Mexican privatization and divestiture process of more than 1,000 state owned enterprises in Mexico started in the wake of the debt crisis in 1982. The implementation of the privatization program was part of the arrangements that the government of Mexico had to obtain loans from both the World Bank (WB) and the International Monetary Fund (IMF) with the specific goal to earn foreign exchange through the promotion of exports and foreign investments. In a sense, no specific privatisation program or plan was settled down rather than a policy evolved in terms of the government's ability to sell off the state owned enterprises.

In 1979, the technocrats in cooperation with Dow Chemical envisioned a North American Energy Project that would connect the electrical grids of Mexico, the US and Canada.

The main thrust of the reforms encouraged in Mexico was the development of a competitive, broad-based export sector of nontraditional goods. Mexico joined the General Agreement on Trade and Tariffs (GATT) in 1986 and became an exporter of manufactured goods. The strategies adopted for the design of the Mexican State, as it was for other states, was reduction of state structures and facilities, privatization of state owned enterprises, and economic deregulation.

The decision to privatize Telmex was made in 1988 presidential campaign, a profitable and wealthy state-owned company. "Telmex was chosen partly for its symbolic importance and partly as a potential source of a sizable amount of revenue. The privatization of Telmex would dramatically serve notice that Mexico was serious about privatization and the development of the private sector." (Tandon, Ch. 16, p. 3).

Vast programs for the privatization of public enterprise in Mexico had been successful, to a certain point, in ameliorating the economic intervention of the State. Mexico ranked second in privatization in Latin America during the decade of the nineties when the government transferred to private corporations assets that amounted to 31,458 million dollars, which represented 20.4 percent of the total sales of state owned enterprises in Latin America. Privatization reached 3,160 million dollars in 1990, increased to 11,289 million in 1991, and totaled 6,924 million dollars in 1992.

Before the privatization of Telmex, the government drastically raised the prices of telephone services to consumers.

According to two annual reports of The World Bank (1989:150, 1990:150) the provision of a US\$ 500 million loan to Mexico was made in 1989 to reduce the "heavy burden Pes (public enterprises) impose on the economy" through their privatization and deregulation program. In 1990 the government eliminated the indirect tax on telephone services and the remained taxes were absorbed into the prices and transferred to the consumers. (Tandon, p. 23-24)

After the Mexican government official announcement to sell 51 percent of voting stock of Telmex, in December 1990 was sold for a total price of US\$ 1.67 billion to the winning bidder Grupo Carso who bought 51 percent of the stock sold. France Telecom purchased 24.5 per cent and Southwestern Bell the remaining 24.5 percent. Additional shares owned by the government were sold in 1991 and 1992. The Mexican government owned 56 percent of total Telmex's stock which was sold on the total amount of US\$ 6.2 billion. The remaining 44 percent was publicly traded. Another loan of US\$ 22 million in technical assistance from the World Bank was provided to the privatization of Telmex according to The World Bank (1989:150, 1990:150).

After privatization of the Mexican state-owned telephone company in 1990, the price of Telmex' stock increased due in part to the increment of consumer prices and to a questionable improved efficiency. A report from The World Bank in 1992 "the privatization of Telmex, along with its attendant price-tax regulatory regime, has the result of 'taxing' consumers -- a rather diffuse, unorganized group --and then distributing the gains among more well-defined groups, [foreign] shareholders, employees and the government." (Tandon, p. 39) The report estimated that the consumers were worse off by 92 US\$ 33 billion, although the analysts of the report predicted that consumers would benefit from reduced prices in the long run, projection that has not been accomplished until today.

Foreign investors captured 90 per cent of the net benefits from privatization and gained 67 trillion pesos while domestic shareholders 43 trillion pesos, employees 23.5 and government gained 16 trillion pesos. A 10-15 per cent dropping in prices in international long distance service mainly due to competition of foreign telephone companies abroad México, Telmex increased the prices of national long distance in the same percentage in 1996. This trend has continued and it is likely to continue. Telmex's monopoly in telephone long distance services ended in January 1997 with the attraction of the interest of USA based telephone companies to form alliances with Mexican investors setting their own prices while entering to the national market. Rural telephone services will continue subsidizing by the government despite the pressure to keep down public expenditures from the international financial institutions.

In 1991 took place the Mexican bank privatization. It has been described as a successful program of privatization because its clear objectives, transparent and credible procedures adopted (Barnes, 1992). However, lack of legal and regulatory framework that shadowed the technical process were, among other, causes of the banking crisis that had to deal the financial system in 1994, and needed to re-privatize at a greater cost to the taxpayers. as Unal and Navarro (1999) contend. In order to increase and broaden the quality of the financial services available to the public, Mexican banks were re-privatised

The privatization model adopted by the Mexican government was to sell the banks one at a time to maximize returns, expecting increasing interests and thus, higher prices. Although the program designed was transparent and effective to privatize the banking system in México, it was not sufficient to ensure a sound and safe financial system. The buyers of the banks and other financial institutions were mainly stock brokerage houses. Privatization and regulation of the Mexican banking system resulted in the creation of financial conglomerates with banking, insurance, leasing, factoring, money exchange, stock brokerage, mutual and pension fund operations. Husted and Serrano contend that the financial and marketing synergies were rather high since the banks acted as holding companies and were a sure source of low-cost capital for the other financial entities.

The newly privatized banking system operated under outdated regulatory system already dysfunctional, as well as the set of supervisory agencies incapable to implement and enforce new regulations and rules. The privatisation of the banking system brought mixed results for the Mexican economy. According to Husted and Serrano (2001) returning private ownership and management to the banking industry was the good news, but unfortunately, very high prices were paid for the banks, which inherited problems from uncollected loans. The already private banks needed significant infusions of financial resources to cope with their problems of bad debt and with the financial crisis of 1994, when the federal government intervened, but without renationalising the banking and financial system.

In reality, the privatization of the banking system into financial groups emerged from the "steam" and complicity among investors and politicians who took advantage of international organizational finances channeled to rescue Mexico from the debt crisis. However, their differences in crisis management took them into highly indebted economies, which had the opportunity of transferring charges to society. Still now a days, taxpayers are supporting the burden of the financial crisis of 1994 caused for the lack of a well designed legal and regulatory framework to be enforced during the privatization process of the banking system..

In 1992 foreign companies were allowed to build and operate energy plants in México so long as they exported the energy produced or sold it to the Federal Electricity Commission. The same year, the Federal Electricity Commission and the Power and Light Company halted new construction of power plants.

In 1992, Labour organizations opposed and delayed the privatisation program for both pensions and health care, but in 1995 were only able to partially stop or delay such reforms.

The government of President Zedillo privatized airports and railways between other important sectors. In 1996, labor unions, new social movements and civil society joined together to protest the privatization of the Mexican state-owned oil company *Petróleos Mexicanos*. Oil and electrical industries were not included in negotiations of NAFTA.

In 1995, it was partially privatised the Mexican public pension system provided by the IMSS for private sector workers, but the actual implementation was delayed. On July 1997 the pension and retirement system in Mexico was privatized and workers were allowed to deposit their pensions along with employer contributions in their own accounts. Privatisation of the public pension system included a shift from a defined benefit to a fully

funded, defined-contribution market-based pillar and based upon privately administered individual accounts. This new system is based on individual sovereignty as a notion opposed to solidarity, notions that get lost in rhetoric and ordinary Mexicans do not understand how this affect their lives. The shift toward privatisation of pensions may also perpetuate stratification if only certain public pension schemes are included in reforms,

The Mexican pension reform has entailed a shift of pension and retirement responsibilities from the state to the market. Under this new system, individuals' private accounts are managed by private pension fund companies know as "afores" which invests the money in capital markets. The privatization of the pension fund system, motivated Mexican financial institutions to develop strategic alliances with their counterparts from all over the world in order to acquire managerial expertise and capital. (Husted and Serrano, 2001).

According to Vásquez, Director of the Project on Global Economic Liberty at the conservative Cato Institute, this privatization "differs from previous Mexican privatizations because, at least in theory, it does not intend to generate revenue for the state. Instead, it seeks a laudable goal, admittedly one that politics already appear to be compromising: turning Mexico into a country of property-owning workers." (Vásquez, 1997). He argues that this is revolutionary concept in Mexico, a concept that again gets lost in rhetoric.

On the other hand, Dion () concluded that the pension reform never addressed the gender impacts and further erodes social citizenship rights, especially those of women. The reform resulted in a net deterioration in the welfare of women in Mexico at retirement and predicted that the reform likely increased the dependence of elderly women upon family networks for their welfare. Since women generally have a disadvantaged position in the labour market in terms of participation and wages, this shift in emphasis to market provision of pensions is unlikely to benefit women.

In the case of the electrical sector, the first time that the privatization scheme not succeeded was when Zedillo proposed in 1999 privatization of electricity, the labor union formed the National Front of Resistance to the Privatization of the Electrical Industry which confronted the neoliberal reforms. The formed movement hosted an international conference and brought delegations, non governmental organizations, union representatives, political parties and academics from other countries, the National Association of democratic Lawyers (ANAD), the Worker's University of Mexico (UOM), the Party of the Democratic Revolution (PDR) a leftwing party, among others. Finally the movement of resistance defeated the privatization scheme of the electrical industry.

The year in which the state recorded most privatization was 1991 with a total of 11,289 million dollars, while in 1998 Mexico the lowest was 999 million dollars. By June of 1992, the Mexican government had privatized 361 out of approximately 1,200 enterprises owned by the state. Privatization during 1993 represented 2,131 million dollars. In 1996 it increased to 1,526 million dollars, in 1997 to 4, 496 million, and in 1998 decreased to 999 million dollars. A report from the World Bank states that between 1990 and 1998 privatization of public enterprises reached a total amount of 154,225 million dollars, an amount only less than the balance of the total external debt of Mexico which in 1998 was of 159,959 million dollars.

Still more, there is a connection between Mexican government's scheme of privatization with Enron. 64 subsidiaries of Enron to operate in the Mexican power market, from which some executives are advisers on energy policy. On April 4, 2002, Enron Energia Industrial de Mexico in partnership with Vidriera Monterrey and Vidriera Guadalajara (two big glassmakers), Grupo IMSA, (a steel and autoparts giant), Industrias Whirlpool and other big Mexican companies received a license from Mexico's Electricity Regulatory Commission to build a plant. InterGen Aztec Energy is a partnership between Bechtel Enterprises and Shell Generating Ltd , built a plant near Mexicali. Sempra Energy Resources is an energy maquiladora that built another power station near Mexicali. Its 600 megawatts will all be sent to the US, and the gas for its boilers will come from the US in a Sempra-built pipeline."These are the same companies that robbed and defrauded people in the US," Bob Filner, San Diego Congressman, told the daily La Jornada being critical of the sempra and InterGen border plants.. "The question, therefore, is why should Mexicans trust them not to do the same here?"

Carl Wood, member of the California Public Utilities Commission also warned of another danger -- that the swings of the market could bring about manipulated shortages and periods of extremely high prices, as they did in California. "Mexican industry might not be able to absorb those price increases, nor raise prices on its own products in the world market," he explained. "Price spikes in electricity might therefore cause industrial activity to stall." He called the US companies behind the proposal "the same old gang of thieves." (Bacon, 2003)

In May 2002, the Mexican Congress has passed a resolution opposing any changes in the Constitution to make privatization possible. One of the principal arguments for the privatization plan is that there is necessary to make amendments to articles 27 and 28 of the Mexican Constitution to legalize foreign investments that already exists in the energy sector, although it is clear that industry of the energy sector can be self-financing if it weren't for the government's policy of disinvestment. An introduction of a bill ban the increasing 10 per cent of current generation done by private companies.

In a comparative perspective of privatization programs advancement between Mena countries and Latino American countries during have been developed by Godstein (2003) where can be inferred several points. First, latin American countries have advanced more in privatization than the five MENA (Mediterranean partners) countries. Second, during the same period of time, among the Latin American countries compared, Argentina and Brazil had advanced faster than México who is lagging behind. Third, the sectors where Mexican program has not privatize are those politically sensitive, such as the case of oil and electricity.

### **Prospects of the Privatization Program in Mexico**

By 2004 there are less than 200 public owned enterprises out of more than 1 200 to privatise, and the model of welfare state in Mexico is under attack by privatisation of public services, mainly public education, public health-care services, public transportation, housing, etc. The new government of Mexico under the Fox administration, plans to privatize the energy sector, oil and electrical industries, water, education, health-care services and the list goes on and on..

In education, there are public and private schools at all levels, including graduate and postgraduate studies. In health care services, also exist public funded and private ownership. Both, public education and public health care, are increasingly underfunded and the fees are raisin every year, to promote consciously the use of private services. This is more relevant in public universities and hospitals managed by the Secretariat of Salubrity and Welfare, but also it includes the health care systems supported by contributions of workers, employers and government, the Mexican Institute of Social Security (Instituto Mexicano del Seguro social, IMSS) and the Institute of Security and Social Services for State Workers (Instituto de Seguridad y Servicios Sociales para los Trabajadores del Estado, ISSSTE).

The World Bank has worked closed with global water corporations to push privatisation of water in México and numerous loans have contained conditions mandating water privatisation and full cost recovery through increasing consumer fees for water. Conditions to meet to be eligible for the loans are such as economically efficient pricing, self-sufficiency of the project through cost recovery, appropriate competition and regulatory framework, and enhancing the participation of the private sector.

Privatization and opening the energy sector to competition, especially the electric and petrochemical industries, won't work according to the same managers. Efforts at privatization of the Mexican petroleum company, Petróleos Mexicanos (Pemex), the World's third largest producer of crude oil and to the Comsión Federal de Electricidad (CFE) have been opposed by labor unions, political parties from the left, new social movements and the civil society.

The privatization program of these two state owned companies has long been a sensitive matter in politics since the nationalization of all oil properties and assets of all foreign oil and gas companies in 1938. School children all over the country contributed pennies to the national fund established to compensate foreign investors. In 1960, the electrical industry was nationalized as well. Nationalization of oil industry and nationalization of electric industry are the symbol of Mexican national sovereignty. Foreign investments and participation in the energy sector were proscribed by the Mexican Constitution that prevented foreign investments in oil and gas industry in exploration, production and refining and only allows Pemex to engage in these operations. Even legislators have rejected the draft of the amendments to the Constitution that will allow to be more attractive the opening of energy sector to foreign investors.

“The country functions well... entrepreneurs don't want to buy Pemex or CFE. As a private sector what we want is to be allowed to compete, to participate in certain areas of production, to make them competitive at the

international level... it is not necessary to put padlocks on foreign investment so that it intrudes in the electricity and hydrocarbon industries. The only rules for national capital and foreigners should be a free market economy, open commercial prices set by international competition” (Becerril, 2000).

However, there have been sold some petrochemical industries and contracted drilling operations to foreign investors, undertaken joint ventures abroad. Foreign companies as Amoco, Chevron, Mobil, Occidental, Royal Dutch/Shell, and Texaco are optimistic in investing in the oil industry sector in México. Shell oil’s Deer Park, Texas has an equity investment in refinery operations that allowed Pemex to replace the domestic shortfall.

The Electric Workers Union (SME) accuses the government to subsidize large users of electrical power instead to benefit the poor and draining resources from the Power and Light Company, the other state owned electrical enterprise by forcing it to buy power from the Federal Electricity Commission (CFE) undermining modernization of equipment. The government scheme of privatization is to provoke bankruptcy of both state-owned electric companies or to be replaced by foreign-owned companies. For the SME the prospects are doomsday according to the bitter experience of privatizations in México: rates will increase for small users, workers will be fired, and so forth.

Cutting social expenditure in education and public health would reduce the weight of bureaucracy gradually by transferring these functions from the State to the private sector. Fox has said that they will reduce the cost of government in the next six years by subjecting it to a rigorous but gradual diet of federal public administration. Changes were needed to eliminate the lock on 51 percent of national investment to give a bigger opening to private and foreign investment and to invigorate the financial system. The neoliberal model not only weakens the political autonomy of the State; it also diminishes the capacity of the state to formulate social policies. The adoption of economic neoliberalism has led to an anti-statist ideology. As such, the state’s structure and functions have been transformed, allowing for greater assumption of responsibility by the private sector.

Until now, the neoliberal state model seemed to be the only course, with privatization, deregulation, tight fiscal discipline and slashing of social benefits and taxes, a formula which promised a dollop of austerity and little else for the time being. Some important economic issues on which the three main parties agree, are the acceptance of North American Free Trade Agreement; defense, support and stimulation of domestic private initiative, and acceptance of foreign investments as a complement of domestic savings. Although PRI and PAN have the same thesis and agree on privatizations, the PRD criticizes it arguing that it has favored a small group of investors.

The National Action Party (PAN) stresses that the reform to the State implies increasing its efficiency and not necessarily downsizing, although traditionally, the State had activated the economy with full charges and burden, now it should be looking for to leave these responsibilities to the private sector. Similarly, the Institutional Revolutionary Party (PRI), according to its economic platform, has stated there is no optimum government size or ratio of spending to GDP and supports existing privatizations. Democratic Revolution Party (PRD) points out the need of public participation in strategic, priority, and/or natural resources areas. It implicitly acknowledges the reduced role of the government and does not propose either nationalizations or the reversal of previous divestitures. It only wants to avoid them in the future and in fact it explains its platform would only marginally increase the GDP participation of public expenditure.

## **Effects of the Mexican Privatization Program**

Any word on the effects and impact of privatisation process in Mexico may be premature, because the turbulent macroeconomic environment since the 80s..The precise economic effects of Mexican state owned companies privatisation remain uncertain and controversial. In terms of its scope, the privatisation process has been dramatic. Undoubtedly, the large number of firms sold off and their size make privatisation a profitable operation for the Mexican government. Thus, the public unprofitable firms forces the Mexican government to make them profitable through different mechanisms such as restructuring, reduction and fresh capital.

Empirical research about the effects of privatisation on the Mexican economic growth and on former Mexican state-owned companies are very limited. Privatization in Mexico has not been the expected economic

miracle needed to increase economic GDP growth and lowering the rate of unemployment, although to a some extent it has contributed to reduce the burden of the state in the economy.

The former state owned companies that have been fairly successful, after privatisation there is not evidence of improved financial performance or cost efficiency despite stronger focus on profits, due to lack of mechanisms of regulation and governance rules and information transparency. However, it is clear that prices of goods and services of these already private companies have increased and overall their privatisation have resulted in concentration of wealth and profound disparities of income distribution.

Under the influence of the PRI, the Mexican State initiated economic modernization and participation in the globalization processes, as a response to the trends of the economic globalization of markets, and the technological revolution that began during the last two decades of the past century. Under the pretext of cleaning up the economy, the Mexican State privatized strategic enterprises of the public sector, most of which were acquired by foreign investors, who had already penetrated all economic sectors.

The program of privatizations in Mexico has been carried out both through strategies of direct sale and public offerings. Privatisation of some owned-state companies were used to give back previously nationalised firms to the private sector, such as the banking and financial institutions. However, the sale of the largest and most profitable state-owned enterprises known as the 'crown jewels', TELMEX AND CFE has been opposed by labor unions, civil society, leftwing political parties and even legislators. The process of decision making about privatisation of public utilities was more centralized in Mexico than in Argentina for example (Abdala, 1999). The high concentration of capital in a few corporations through the privatization process of public enterprises unleashed the phenomena of political privatization.

The benefits of privatization have not yet been evident to the Mexican people even though defenders try to demonstrate the opposite. According to data provided by the former President of Mexico, advocator and implementer of the privatization program, Salinas de Gortari (1988-94), privatization reduced budget expenditures to finance social programs thus preventing a fiscal deficit. It is said that Salinas has also privatized politics in Mexico. However, it might appear to be cynical when we state that the privatisation process has been subject to the electoral agenda and to economic opportunism of decision makers and political actors, acting out of conviction and for personal gains in terms of corruption, more than to achieve social welfare and benefits.

Also, the effects have not been satisfactory over all. An analysis of the welfare gains from privatisation addressing the distribution of them economic net benefits, have been regressive in terms of impact on income and wealth Mexican privatisations may have some improvement effects on productivity but negative and regressive effects on the distribution of income and wealth. Some privatizations programs, after transferring the property of state-owned companies to private companies that get caught by the financial crisis of 1994, reflects the socialization of losses and privatization of profits such as the financial and banking system and not to mention the privatization of motor ways and roads.

The impact of privatization and deregulation on workers has been devastating not confirming the principle of Berne and Pogorel (2004) which states that strong union presence hinders privatisation, as it has not being the case of Mexico.. In 1986, Aeroméxico, one of the two main Mexican airlines was the governments response to a strike while firing more than 12, 000 workers and selling off the company in 1988. On the other hand, during the privatization process of Teléfonos de Mexico, or Telmex, the national telephone company, organized labor had little subsequent opposition and remained quiet after receiving 4.4 percent share of ownership of the company (Tandon, 1992: 6-13) an also because there has been little pressure for job or wage cuts so far.

During the process of privatization of the Port of Veracruz, soldiers had to occupy it and the workforce had to be fired. Similar actions were taken in the privatization of the copper company in the late 1990s, when the miners at Cananea fought against job reductions but firing the workers of the stated owned cooper company was also a response of labor apposition to the privatization process The railroads labor union had wildcat strikes to hit the company services when they were sold to Grupo Mexico and the private owners reduced workers from 90 000 at around 36 000 during the last decade. The labor union of drivers of Ruta-100 in Mexico City fought the sell off of the company although the leaders were imprisoned. These actions are the cause that organized labor have had little subsequent opposition to the privatization process. When the National Autónoma University of México, a public university, had the intention to increase enrolment fees, students did not allowed it having a strike that lasted one

calendar term.. However, some other public universities in the states have been more successful in slowly but steadily increasing the fees every term.

Employment in the Mexican public companies has declined rapidly due to privatisation and employment reductions in the remaining enterprises. Programs of privatization in Mexico have reduced employment by half, while production has increased 54.3 percent with a significant reduction in investment. A study by Galal et al (1992) analyzed the after-privatization performance of twelve companies in different countries, including Mexico, and documented an increase of 26 percent in profits in eleven cases but an increase of benefits to workers in only three of the cases.

Resistance by labor unions, social movements and social society groups to privatization has often been fierce, but most of them have defeated. However, the Mexican government has not achieved the sell off of PEMEX and the CFE. unions and civil-society groups joined together in 1996 to protest the sale of *Petróleos de México*, the state-owned oil company. The political strength to reject the privatization program is bound up with changes in the labor unions movements in Mexico. When collateral petrochemical industry was privatized during the last decade, union membership fell to 7% while PEMEX still hovers at around 70 per cent. In the electrical sector at least, the labor movement began to change with the announcement to put the electrical system up for sale after the election of President Zedillo in 1994.

Although the privatization of the pension system was achieved in 1997, the opposition of state employees labor unions and of the Mexican Institute of Social Security (IMSS) employee union prevented the privatization of both health care provided by the IMSS system and any overhaul of the state employees' social insurance system (ISSSTE). The pension reform erodes social citizenship rights, and in the overall, the pension privatisation will have a negative impact on women's welfare in Mexico (Dion, )

At the Union for Electrical Workers of the Mexican Republic (SUTERM) at the Federal Electricity Commission (CFE), the government seized control of it in such a way that the leader head the *Congreso del Trabajo*, the main government affiliated labor federation. When the Union refused any defense against the privatization of the CFE, the workers that resisted formed a new union federation, the National Union of Workers, and declared open opposition to the sale of the Federal Electricity Commission. On May 22, 1999, 3000 of SUTERM members defied their national leaders and allied themselves with the SME, well respected for its internal democracy and gained legitimacy.

Another demonstration on August 28, the formation of a national coordinating committee and an alliance with national Union of Workers, the leftwing Party of the Democratic Revolution, and nationalist elements in the PRI have all vowed to cooperate in mass protest. More recently, at the end of September 2003, the Mexican Electric Workers Union (SME) and allies mobilized more than 50, 000 people to the *Zocalo* the main central square in México City in opposition and protest over privatization plans and distributed 10 million leaflets across the country to urge actions against the government proposal to provide incentives to private companies to build generating plants financed with national pension funds. A statement signed by leaders of both Mexican electrical unions argues that "In Mexico, the people rightly think that the electrical industry and the petroleum industry should be public property and that such public property is the fundamental basis for their nation's existence and of their national sovereignty." (Bacon, 2003)

The controversial Mexican privatization program has led to a high concentration of capitals and income of local and foreign investors who have penetrated the strategic sectors of the Mexican economy. One major concern in the privatization process of Mexico is that the new owners of privatized companies are foreign investors as it is the case of the bank and financial institutions where less than 10 percent is in the hands of Mexicans and for some other firms, the percentage of foreign ownership has grown to very high levels.

Privatisation in banking and financial services is associated with mergers and acquisitions done by larger international banking groups and only a limited domestic investors remain in control of less than 10 percent of banks. City group from USA has bought BANAMEX, BBVA from Spain has acquired BANCOMER, HSBC from Hong Kong and Shanghai is the owner of BITAL, Santander from Spain has SERFIN, Nova Scotia Bank bought COMERMEX and the list continues. Prices for services have increased in such a way that last year's profits came mainly for the sale of services.

These acquisitions and mergers make it difficult to distinguish the effects of ownership and reorganisation. The possible benefits of privatisation can be overshadowed by higher profit margins, in particular if there is also higher concentration because of mergers (Willner, 2003b). Mergers may also aim at offsetting the competition that integration was meant to achieve (Neumann *et al.*, 1985; Sugden, 1983). We agree with the conclusive statement of Willner (2003b: 19) that mergers in manufacturing as well as in banking “may be a reason for concern in the future, and a return to non-commercial objectives might require renationalisation”.

The World Bank has admitted that privatization of state-owned companies in Mexico has contributed to an increase in private monopolies with the consequent concentration of wealth acknowledging that "there has been a worsening of the already skewed and concentrated pattern of ownership distribution in the economy and an increase in vertical integration. Only a small group of local conglomerates have been involved in purchasing public enterprises" According to the 1991 Internal Audit Report (Heredia, and Purcell, 1994: 5). In Mexico, the number of billionaires rose from 2 to 24 in only six year period, from 1988 to 1994.

Two years after the privatization of its banking system, in December 1994, Mexico was forced to devalue its peso which set off a macroeconomic crisis characterized by increased exchange rate volatility, further devaluation of the peso and was followed by a financial sector crisis and bailout. The meltdown of the Mexican stock exchanges resulted in the loss of half of the stocks value and share prices, for major Mexican companies quoted on Wall Street, dropped 75 percent within a few months. However, after this situation was resolved a deeper crisis in financial markets came in the form of the devaluation of the peso and the sovereign-default crises. The majority of the governmental crises, without a degree of investment (as is the case of Mexico), were caused by characteristic weakness in governance. Concerns about corporate governance in Mexico has increased due in large part to the demands of international investors and the pressures faced by newly privatised companies (Husted and Serrano, 2001). If local people and foreign investors fear the Mexican peso will be devalued, they may convert pesos into dollars.

The privatization process in Mexico has not been used in to increase competition by eliminating the former public monopolies. Rather than leading to increased competition and economic efficiency, the privatization process has led to a increasing concentration of income and wealth, while at the same time in the penetration of strategic sectors of the Mexican economy by foreign investors, such as in the electricity and oil industries.

Some state owned companies referred to as ‘public utilities’ considered unsuitable for private ownership because they operated in natural monopoly markets, reflecting their economies of scale and scope, such as the Mexican Telephone Company (TELMEX) and Ferrocarriles Nacionales de Mexico, the Mexican rail transport, nevertheless, were privatised without any market regulations and fatal consequences for the consumers. Further more, prices of these services conceal disparities in the distribution of the welfare gains between different consumer groups affecting the ones with lower income. In most of the privatised public utilities companies, prices have risen, such as the case of the increasing toll of roads, transport and telecommunications. Prices are market-oriented with very limited controls, as for example in the case of toll roads and bank and financial services, prices have gone up to become one of the most expensive in the world and had been the main source of profits.

After the transferring property from public to private ownership monopoly positions still exist such as the case of TELMEX. From a normative perspective, consequences of competition in the markets for network telephone services are the abolishment of monopoly rents with a subsequent reduction of tariff levels, increasing incentives for cost efficiency, optimization of telephone service networks, more rapid reaction of prices to changes in the costs and demand structure, increasing price-quality options. Changes in service quality considered as a multi-dimensional variable, are difficult to measure since privatisation, but there are some evidences that service quality is at the expense of prices.

The privatisation of Telmex was a landmark which established the antecedent that in spite of their size, the public utilities could be sold off to a large investors, opposing the principle of creating a share-owning democracy. Until today, as a private company, Telmex has manipulated the political and economic environment to remain as a monopoly demonstrating that the privatization program in Mexico has not led to the expected increase of competition and economic efficiency. The total assets of the new owner of Telmex are more than the annual income of the combined poorest 17 million Mexicans. Although it had been projected by some analysts, that consumers would benefit in the long run, consumers have not received any benefits on improvement of cost and quality of

telephone services. For privatised companies operating in non competitive markets reducing service quality to the disadvantage of consumers not necessarily leads to a loss of market share.

There is not any specific regulatory agency to protect the telephone consumer services from monopoly abuses until real competition will develop. The weak competition on the market has caused prices to go up, In the utilities sector, the high households' prices for telephone is maintained by the privatized monopoly TELMEX. Since the privatization of the TELMEX, the infrastructure for long distance telephone services are monopolistic bottlenecks, with the need for adequate access regulation and a massive private investments in alternative long distance infrastructures is needed to be both more active and potential competition

## **Some Concluding Remarks**

The state owned enterprises were created to promote growth and industrialization and consequently, their performance must be assessed according to these objectives in such a way that their success or failure is to a large extent a question of weather the aims have been reached at reasonable costs. State owned companies were downsized during the deep crisis of 82 and 94 despite some rescue operations. Today, the remaining state owned companies become more oriented to customers and to achieve growth through higher output, productivity and profitability share holder value oriented, more conscious about technological development and environmental considerations and still are responsible to take social welfare, support private firms at the expense of their own profitability such as the case of CFE supplying low prices of energy to the private manufacturing and services sectors.

Furthermore, still supply income revenue from their profits to the federal government representing a substantial part of the budget. The distributional effects on income have an impact on social welfare and consumer welfare. This is consistent with the finding of Wilner (2003b:17) who contends that "Social welfare can be reduced despite lower costs and vice versa. But it can also increase despite a fall in consumer welfare, so it may make sense to analyse distributional effects and quality as well". Social welfare has been severely damaged with privatisation process because the distributional effects on income and the concentration of ownership in private hands, affecting more the poor people with lower income per cápita, As Willner (2003b:19) concludes "social welfare has hardly changed because of privatisation in manufacturing and banking, because of the absence of a change in objectives and the lack of evidence of an ownership effect on financial performance and cost efficiency."

Therefore, public and state owned companies are in good health despite the campaign against their prestigious while some privatisations have resulted in an economic mess. For historical and ideological reasons, privatisation has been a large and hot political issue in Mexico as there has been more than 1,200 state owned companies to privatise. Nationalised public enterprises were at the core of Mexican economic nationalism and have faded as Mexico became part of the North American Free Trade Agreement. To summarise which sectors privatisation in Mexico has failed or was successful could be very often ambiguous and subject to qualitative judgements in particular cases.

The privatization policy in Mexico has not achieved the expected economic growth and developed promised. The success of privatization process is partly a question of its objectives. Regarding prices to sell of public companies these have not always been sold at a satisfactory price which means sales revenues for the State. If the aim was to achieve divestiture and widespread share-ownership which are not ends in themselves, until now the results have being disappointing with high concentration of private ownership in only few investors. Only part of the sales proceeds had been used to reduce public debt and not for public investment in infrastructure required for the development of the *country*. *Unfortunately, most of the sales revenues have been mismanaged.*

Unfortunately, the lessons from Mexican privatisations, deregulations and movement to free trade and away from state protectionism are not always positive. Deregulation and privatisation of state owned firms are factors in changing the competitive situation while the state owned enterprises can also promote competition with private companies. Some of these privatisations have resulted in private monopolies or quasi monopolies, such us privatisation of TELMEX, the Mexican Telephone Company. Privatizations of utility monopolies led to meet higher investors expectations on returns and profits becoming the main gainers rather than the consumers.

To develop regulatory governance of privatized companies with market dominance activities not only takes time but also a new culture. Mexico does not have a long tradition of independent regulatory agencies while monopolies are regulated through: direct intervention as the case of the oil company, the two electrical firms and the privatized telephone company. Therefore, regulation of competition is necessarily a pressure on time and culture to establish a new economic policy with fairer environment for investors and consumers at large.

It is often unclear to what extent privatisation rather than other factors are responsible of higher competitiveness and economic efficiency. Parker (2004) contends that empirical studies often proves difficult to separate out the effects of ownership, competition, regulation and technological change on efficiency. Ownership change does not appear “to have a significant effect in terms of improving economic performance where there is market dominance, especially in terms of welfare gains to consumers.” (Parker, 2004: 21).

In terms of the effects and impact of privatisation on firms’ efficiency, available the evidence available is not conclusive and suggests that there are other factors more important than ownership change, namely competition, the buyer type and the firm’s size and capital intensity. These factors can do that privatisation always would play a complementary and reinforcing role (Villalonga, 2002). Therefore it is often unclear how far privatisation rather than other factors is responsible for any economic efficiency gains achieved.

Nevertheless, the lessons from the Mexico’ privatisation are far away from the lessons of UK’s privatisation which, according to Parker (2004:21) are that “the empirical evidence is consistent with economic theory and suggests that competition and in the absence of competition effective state regulation are important if privatisation is to lead to performance improvements, including lower prices and improved services”.

Two different deep ideas about economic development and workers rights have emerged in Mexico after the implementation of the privatization plan. These two ideas are separated by over whose priorities of workers or investor will prevail. Wages and working conditions were better in state owned enterprises in comparison with privatized companies bus companies often because of different collective agreements.

The neoliberals behave in a two-way strategy: on one side, destroying the activities of the social society and in the other side, destroying the traditional functions of the State, and assigning a new role under the principles of liberal democracy and policies of free market relations... as it were another private enterprise. All this destruction is done in name of a more slim State and privatizing its functions, but the State do not disappear or diminish and what is really wanted, is to impose a distinct State capable of destroying the capacity of civil society to exercise resistance and opposition in front of the State policies, inspired on total market policy, which responds to interests of globalization and allows the instauration of a "New International Order", where collective security rests on general acceptance of principles of free market.

From this perspective, it is the same Mexican State who assumes the anti-State ideology promoted by government, entrepreneurs, bankers and entities of the neoliberal model who assign an active role to the State as propulsion of its own reduction to allow a major protagonist to the private sector of the economy in such a way that do not compete each other for financial resources. But at the same time, upon oppositions emerging from the breaking down of social equilibrium and consensus require that the Mexican State may be the most strong possible to fulfill its functions within the economic model and guarantee the macroeconomic equilibrium.

State owned enterprises are privatized when they are profitable and the government stuck with the unprofitable ones, except few like the “crown jewels” PEMEX AND CFE that belong to the energy sector. Specifically, these enterprises were nationalized in the last Century and remain public because the privatization process is heavily loaded in terms of ideological reasons and for being considered in provisions of the Mexican Constitution for public ownership for being strategic for development of Mexico, although have been serious intents to sell them off. To push over the selling off of these state owned companies, neoliberals strategize for achieving an Energy Reform to make Constitutional amendments favorable to remove ideological arguments to finally achieve privatization plans.

If the energy sector privatization plan succeeds, the nationalist development policy will be buried. However, if the privatization plan is defeated could be possible to recover national economic sovereignty and independence. The privatization program can not be defeated without having an alternative project of development based on a strong internal market with well paid workers to oppose to the neoliberal economic development project.

Trough mechanisms of cooperation, trade unions, new social movements and civil society have resisted and fought to oppose privatisations plans, with a limited success, because they consider that results are unfair. Thus, today privatisations are not widely accepted in principle due to the reluctance to fulfil requirements of transparency information and governance rules during the promotion of the privatisation process..

However, it is safely to conclude that changes of ownership through the privatisation process in Mexico has led to the foreign investors to own the most profitable former state owned enterprises which under the spirit of globalisation of business has terminated any sentiment of national capitalism.

Finally, we can conclude that the policy of privatization in Mexico has not achieved the aims related to increase economic growth and development, but has contributed significantly to become a subsidiary economy owned and managed by transnational and multinational corporations. However, this aim is politically neither desirable nor feasible for the economic development of Mexico.If good performance of privatisation is required, actually it is successful only if state-owned companies are so well managed that there is no need to privatise. As Berne and Pogorel (2004;15) contend, “it is always easier to privatise profitable companies... But at the same time, it is more difficult to explain why well-run entities need to be privatised”

*Hanyang University, Korea*

## Abstract

Globalization of economy brings both opportunities and threats especially for companies in developing countries such as Korea. Globalization is an opportunity because it may expand the size of market for the company where globalization brings a threat for developing global competitiveness. If the company has already built competitive advantage in its business domain, the company can easily transfer market growth to profit improvement. However, if the company has not developed competitive advantage, globalization of economy will give a serious threat for the survivor of the company. The company might lose its own domestic market share. For the less famous brand of product or company name, international expansion is a challenging strategy. The study evaluated organizational performance of companies that try international expansion by utilizing Miles and Snow's strategy typology. We clustered organizations based on their strategy typology (prospector, analyzer, defender, and reactor) in view of the level of product diversification, new product development instances, level of localization, and autonomy of foreign subsidiary. With the strategy typology, we evaluated international strategy in view of product competitiveness, marketing strategy, human resource strategy, and organizational strategy. The regression result demonstrates that the performance of the company is significantly higher when the company employs prospector strategy. We also found out that product quality and emphasis for developed countries in international expansion are the most important factors for success.

## Introduction

Organizations have long sought to achieve competitive advantage in dynamic environment. Gaining competitive advantage sometimes represents to be different from market participants. Many strategic management researches found out that applying different strategies eventually reshapes organizational internal processes and external market structure (Child, 1972; Bogner, 1993).

However, similarity among organizations also has received a great deal of attention in strategic management and organizational theories (Deephouse, 1999). Institutional power that forces the organizations to be similar each other was the main stream of research. For the most part, researchers have focused on one side of the similarity question, that is what the value of being different is, or what is the value of being the same.

Where gaining competitive advantage has been a foremost objective for the organization, being the same (utilizing identical strategy) cannot generate the main objective. Being different, an organization benefits because it faces less competition, *ceteris paribus* (Barney, 1991; McGrath et. al.,1995). By being the same, an organization benefits because it is recognized as legitimate, *ceteris paribus* (Dimagio and Powell, 1983; Meyer and Rowan, 1977; Pfeffer and Salancik, 1978).

Globalization of economy enforces organizations into two mutually exclusive directions. One way leads organizations being the same by adopting global standard in organizational management and production processes. The other way leads to be different pursuing organization specific competitive advantages. Researchers recognized the tension between the need for a firm to be different and the need for a firm to be the same. Porac, Thomas, and Baden-Fuller (1989) suggested that strategist needed to balance on a competitive edge between simultaneous pressures to conform and to differentiate. Abrahamson and Hegeman (1994) observed that strategic conformity reduces both competitive risk and opportunities for competitive advantage. Chen and Hambrick (1995) noted that theory and research on competitive conformity – its cause and effects – should be a high priority for the field of strategy.

## Miles and Snow's Strategy Typology

The Miles and Snow (1978) strategic typology – defenders, prospectors, analyzers, and reactors – has generated a comparatively large amount of interest, investigation and support (Hambrick, 1979; Meyer, 1982; McDaniel and Kolari, 1987). Although these studies have contributed significantly to the body of knowledge on strategic archetypes, there is nevertheless a need for further research. For instance, a review of strategy literature reveals an increasing level of operationalization and measurement of strategy constructs (Bourgeois, 1981; Ginsberg, 1984). In this context the paragraph approach to measuring Miles and Snow's strategic types employed in a number of previously referenced studies reveals a tendency to oversimplify the multi-dimensionality of archetype construct (Conant et al., 1990). Typically, only two of three of strategic dimensions explicated in Miles and Snow's adaptive cycle model are considered and evaluated in this approach. Furthermore, most previous research has tended to exclude the reactor type from the scope of analysis. The need for multidimensional construct of strategic behavior is gaining a strong support for assessing organizational strategy. Furthermore, the relationships with overall performance have not gained strong references yet.

Miles and Snow (1978) proposed a relatively complex strategic typology interrelating organizational strategy, structure, and process variables within a theoretical framework of co-alignment. The theoretical foundations of Miles and Snow typology can be traced to Child (1972) classic conceptualization of strategic choice. Miles and Snow proposed that organizations develop relatively enduring patterns of strategic behavior that actively co-align the organization with its environment. They viewed the 'adaptive cycle' characterizing this process as involving three imperative strategic 'problem and solution' sets.

The first one is an entrepreneurial problem set. It centers on the definition of an organization's product-market domain relating how the organization orients itself to the marketplace

The second one is an engineering problem set. It focuses on the choice of technologies and processes to be used for production, service, and distribution.

The third one is an administrative problem set. It involves the selection, rationalization, and development of organizational structure and policy processes. It involves how the organization attempts to coordinate and implement its strategies. Each of the three problem sets involves multiple dimensions.

Based on the three domains of adaptive cycle, the characterization of strategy typologies can be expressed below. A firm following a prospector strategy frequently adds to and changes its products and services, consistently attempting to be first in the market. Such a firm tends to stress innovation and flexibility in order to be able to respond quickly to changing market conditions.

An analyzer's strategy is to maintain a relatively stable base of products and services while selectively moving into new areas with demonstrated promise. An analyzer tends to emphasize formal planning processes and tries to balance cost containment and efficiency with risk taking and innovation.

A defender's strategy is to offer a relatively stable set of services to defined markets, concerning on doing the best job possible in its area of expertise. It emphasizes tight control and continually looks for operating efficiencies to lower costs.

A reactor essentially lacks a consistent strategy. Its strategy has characteristics of each of the other type's strategies at different times and thus is difficult to categorize clearly.

A recent extensive review of research using the Miles and Snow typology found few attempts to assess the reliability or validity of its measures systematically (Zahra, 1990). Snow and Hambrick (1980) and Hambrick (1981) reported interrater reliability assessments for expert raters ranging from .49 to .76 and Boeker (1989) reported reliabilities ranging from .57 to .82. Hambrick (1983) also found that prospectors had a significantly higher ratio of research and development expenses relative to sales than defenders and a significantly higher ratio of marketing expenses relative to sales. Smith and colleagues (1986) found mixed support for the typology's validity. For the most part, researchers have inferred its validity from various qualitative observations without conducting further testing (Snow and Hrebiniak, 1980).

Researchers have used the typology to study strategic behavior in a wide variety of organizations and industries. Snow and Hrebiniak (1980) found that prospectors, analyzers, and defenders outperformed reactors in

competitive but not highly regulated industries. Hambrick's (1983) data indicated that defenders consistently outperformed prospectors in profitability and cash flow but that prospectors outperformed defenders in market share gains in innovative industries. Zajac and Shortell (1989) discovered that prospector and analyzer hospitals outperformed defender hospitals in the rapidly changing health-care environment, results that Shortell, Morrison, and Friedman (1990) subsequently confirmed. The typology has also been used to differentiate tobacco firm's responses to environmental threats (Miles & Cameon, 1982).

## Research Design and Methodology

Snow and Hambrick (1980) distinguish between four broad approaches for identifying strategy typology. The approaches to measure strategy typology are self-typing, objective indicators, external assessment, and investigator inference.

Conant et. al., (1990) identified some missing rationales in four approaches. Based on their arguments, all four of these approaches have been employed in previous operationalizations of Miles and Snow's strategic typology. Some studies have relied on single-item scales when operationalizing what is recognized to be a multi-dimensional construct.

The paragraph approach has been the most widely employed method to operationalize Miles and Snow's strategic typology. Recent attempts have been made to operationalize and measure Miles and Snow's strategic types using multi-item scales. Although many researchers have advocated the use of multiple approaches to operationalize and measure key operational constructs, few studies have employed multiple approaches to operationalize and measure Miles and Snow strategic typology.

The use of single-item scale is generally viewed appropriate, when they relate to a simple unidimensional construct, and can be measured with minimal measurement error. However, such scales are of limited value when they cannot adequately capture the broader concept being measured (Nunnally, 1978).

Hambrick (1983) proposed unidimensional approach for the strategy measurement because strategy typology needs to be captured in integrative nature and aspects. The paragraph approach requires that respondents read short paragraph-length descriptions of each of the four strategic types, and then select only one type that best represents his or her organization. Even though the paragraph approach has been widely used, it cannot be free from personal bias. The respondents' behavior may vary when they really make a decision and when they make an evaluation themselves.

We decided to employ integrative measurement using self-typing, objective indicators, and investigator inference. Self-typing is used for the questionnaire responses. Objective indicators are used to measure respondents' strategic behavior such as market orientation, process definitions, and foreign business strategies and so on. However, the final judgment for organizations' strategic typology is based on the factor analysis, which made composite components into a single strategy typology.

The advantage of this process is two folds. First, this process does not generate any bias for the respondents to be only one strategy typology. Responding various strategic process questions, the respondent's strategy typology is naturally declared. Second, the concept of strategy typology can employ some other distinguishing factors to differentiate strategy typology. For example, the global economy emphasizes the strategy for internationalization whether the organization is big or small. International business for the organization is not an option any more. Bringing respondents from the relatively homogeneous pool, Korean companies, we could generate international strategy as another aspect for strategy typology.

The questionnaire items were developed for strategy and market orientation of organization. The sample was selected from top 2,000 leading exporters in Korea. As Korean economic policy has been an export orientation from early 1960s, top exporters can be safely regarded as industry leaders.

The response rate was 22.5% (458 respondents) and most respondents were middle level managers. As the respondents were not top level, utilizing strategic orientation from the multiple measurements is more appropriate.

Table 1 presents descriptive statistics for the research variables.

TABLE 1: DESCRIPTION OF VARIABLE AND CONSTRUCT USED IN THE ANALYSIS

	N	Minimum	Maximum	Mean	Std. Deviation

Defender	378	.00	1.00	.3122	.46399
Prospectors	378	.00	1.00	.3228	.46815
Reactors	378	.00	1.00	.1746	.38013
Analyzers	378	.00	1.00	.1905	.39320
Valid N (listwise)	344				

We developed and modified questionnaire items in order to differentiate strategic typology. Based on the Miles and Snow’s theory and multiple components from the responses, we applied cluster analysis in order to classify organizational strategy typology. Our study generated four clusters that are significantly different each other and four clusters successfully categorized four strategy typology. Table 2 shows cluster analysis.

TABLE 2: FINAL CLUSTER CENTERS

	Cluster			
	Defender (n=118)	Prospector (n=122)	Reactor (n=66)	Analyzer (n=72)
Prod_diversity	4.13	6.25	3.64	5.68
New_prod_intro	3.62	5.95	3.18	5.50
Adapt	2.24	1.65	3.05	2.39
Atonomy	6.03	6.19	3.24	3.68

The cluster analysis shows four distinguished aspects for each strategy typology. The aspects are product diversity, new product introduction, adaptation, and autonomy. Product diversity refers that the organization’s strategic intent to provide various versions of the product. New product introduction means the organization’s ability to introduce new product in a short period of time. Adaptability denotes the organization’s effort to modify the product for the various markets. Autonomy indicates the level of decentralized decision-making structure.

Table 3 shows frequencies of strategy typology from the data. The number of responses shows that defender and prospector are similar and reactor and analyzer are also similar.

TABLE 3: FREQUENCY TABLE

Frequency	Valid Percent	Cumulative Percent	
Defender	118	31.2	31.2
Prospector	122	32.3	63.5
Reactor	66	17.5	81.0
Analyzer	72	19.0	100.0
Total	378	100.0	

We developed the rationale that the relationship between organizational strategy typology and organizational performance should be somewhat significant. As most strategy typology researches have not concluded, using relatively homogeneous sample (Korean leading exporters) is expected to generate significant result.

First, we utilized ANOVA in order to investigate the performance relationship with strategy typology. We devised three components for performance, such as profit, sales and future sales expectation. The rationales to regard this way are two folds. First, the sample is relatively homogeneous. The leading exporters in Korea are relatively stable in their market position and their strategy has not been changed very much. Second, compared to domestic business oriented organizations, exporters need to concentrate their strategy for increasing sale and improving profit in relatively in short period of time. The government policy and incentives lead relatively narrow scope for foreign business

Table 4 presents the relationships among dependent variables and strategy typologies. The analysis shows only profit demonstrates significant relationship with strategy typology.

TABLE 4: ANALYSIS OF VARIANCE

		Sum of Squares	df	Mean Square	F	Sig.
sales	Between Groups	955.342	3	318.447	1.256	.289
	Within Groups	94350.467	372	253.630		
	Total	95305.809	375			
profit	Between Groups	26.340	3	8.780	5.893	.001
	Within Groups	557.205	374	1.490		
	Total	583.545	377			
fsales	Between Groups	15.999	3	5.333	2.450	.063
	Within Groups	811.831	373	2.176		
	Total	827.830	376			
	Within Groups	700368.932	371	1887.787		
	Total	716958.251	374			

Based on the ANOVA result, we decided to investigate the most contributing factor with organizational performance, in other words the relationships with profit.

The export market has been defined as product competitiveness (Porter, 1980). The price competitiveness or quality advantage may lead to the superior performance. Considering strategy typology, product competitiveness may be independent if we consider relatively short period of time. If we consider longitudinal standpoint, strategy typology and product competitiveness may be strongly correlated. Based on this short-term perspective, we developed hypothesis 1 below:

H1: Organizations that have higher level of product competitiveness will have higher rate of profit.

As we investigated middle managers, their time frame could not be long enough. In the cross sectional research, but not in the longitudinal research, organizational profit is strongly related with marketing strategy. Rigorous marketing strategy tends to improve short-term profit. However, strong marketing strategy without improving competitive edge eventually erodes the initial advantage. We considered marketing strategy as a significant factor related with profit. Based on this argument, hypothesis 2 was developed:

H2: Organizations that have strong marketing strategy will have higher rate of profit,

In the global business, the most important factor for competitiveness has been considered as human resources (Peng & Luo, 2000). Where technical resources or institutional advantages can be easily eroded, human resources are hard to imitate and to substitute. Organizational human resource is the only source of sustainable competitive advantage. Based on this argument, we developed hypothesis 3:

H3: Organizations that have higher level of human resource will have higher rate of profit.

The argument of strategy typology is sometimes criticized as ex post description. This means the rather than managerial decisions and actions, organizations' decision making habits are articulated afterward. In order to minimize this critic, we evaluated the strategy typology based on respondents' questionnaire items so called 'integrative measurement using self typing, objective indicators, and investigator inference.' We believe that strategy typology and organizational performance may have somewhat stringent relationship. Based on this argument, we developed hypothesis 4:

H4: Organizations that have different strategy typology will have different rate of profit.

## Results

The basic model includes the size of the organization such as capital range and number of employees and target market. Capital and number of employees were recoded with natural log because the value is high. Target market is distinguished by the main foreign market is either less developed countries or developed countries. The strategic orientation may vary by the target market with organizational demographic variables. If the organization emphasizes developed countries for its target market, the strategy should be different from the organizations for less developed countries. The strategic orientation for different level of countries will also end different level of profitability by dealing with more value added products. The basic model results show that target market orientation has a

significant relationship with the profitability. Other factors that reflect the size of the organization such as capital and number of employees did not show significant relationship.

The second model, adding variables concerning product competitiveness factors show that only quality is the significant predictor for profitability. R square change was .029. Price ratio and brand equity did not have significant relationship with organizational profitability.

The third model added marketing strategy resulted that no significant relationship with the level of profitability. R square change was .014.

The fourth model adding organizational human resource also resulted in no significant relation with performance. R square change was .008. Human resource in this study measured organizational members' foreign language capability.

The final model adding strategic typology resulted in significant relationship with organizational performance. Prospector strategy is significantly outperformed other strategy organizations. We based prospector as a reference group to investigate significant relationship. Many strategy typology researches concluded that prospector strategy demonstrated significantly higher level of performance (Conant et. al., 1990; Shortell and Zajac, 1990). Based on the past research results, we based prospector as a reference strategy. R square change was .034 and R square was .011.

## Conclusion

The study employed Miles and Snow's strategy typology for evaluating organizational performance of Korean leading exporters. The results demonstrated that prospectors outperformed other strategies.

This study contributed to the academia and practitioners in three perspectives. First, strategy typology study has pushed respondents to be only one set of strategic behavior. Other options were not available. In the information age, fast changing and very turbulent environment urges organizations to be fast adaptors. Strategy typology research should adopt this phenomenon. Based on organizations' various strategic behavior, researchers could apply triangulation to assign organizations' representative strategic behavior.

Second, not many studies are done for Korean exporter recently. Entering into information age, the Korean exporters showed structural change from utilizing cheap labor to creating new technology and market such as MP3 players and multi functional cellular phones. In the transitory environment, this study will light a way that organizations should follow.

Finally, this study shed a light to both academia and industry analysis practitioners. Two strategic options in global environment, being the same or being different, have not met any conclusive remark. Still some researcher and practitioners emphasize organization specific factors as the only source of sustainable advantage. Others start to consider revitalized institutional power considering fast spreading technology and standard setting environment. Keeping organization specific advantage might lose whole market abruptly as Sony's Beta max video cassette disappeared. Our study shed a clue for strategic options such a turbulent digital business arena. Organizations need to use bold competitive position with maximum flexibility. Traditional marketing strategy may not appropriate. Emphasizing quality in the arena, bold prospectors will survive in the global marketing arena.

# The Creation of Academic Biotech Start-ups as the Commercialization Technology of Life Science: On the Basis of Example of Hokkaido Biotech Cluster

*Takao Fujiwara  
Toyohashi University of Technology, Japan*

## Abstract

Traditionally there have been many government-university-industry cooperative biotech research projects in Japan. But in almost cases, the university researchers had so far left patents as the research results to large-scale business partners except the rights of paper writing as custom. As the result, if large-scale pharmaceuticals firms could not find the promising possibilities of enough size markets in their ROI standards from those patents, they usually tended to make those the dormancy patents in order to prevent rival's use. But according to the successful influence of Bayh-Dole Act in US as a factor, Japan's universities and national research institutes as NIAIST are also becoming eager for technology transfer as the licensing and start-up incubation. In this paper, by focusing on Hokkaido biotech cluster as a recent emerging success model, I wish to examine Japan's style of academic and public support system for biotech spin-off, and cases of pioneering biotech start-ups.

## Introduction

Even if they are on the same R & D (research and development) process, there is a big development gap in function between such stages as basic research and technology commercialization. For example, as many common results of university-industry cooperation in Japan, the articles so far tended to belong to university researchers and the patent did similarly so to large industrial partners. However, when such patents also became the jurisdiction of university TLO (technology licensing office) hereafter in order to prevent dormancy patents due to a defense purpose of the big business side in partnerships, at the same time, considerable energy injection in an unknown domain becomes necessary even for the university side at incubation of spin-offs as academic start-ups in addition to licensing patents.

If so, what kind of jump and support will be necessary to fly over a wall between such basic research and technology commercialization?

As one of key concepts, a start-up is defined as a decision making system about risk control to undertake transformation of an idea into an enterprise. And, a biotech cluster is defined as a structure enabling spin-off-leap of discontinuity for mainly academic start-ups in an R & D process from basic research of life science to industrialization.

An analysis framework with this paper is Quantum Leap. In other words, at university-industry cooperation, the course of a jump of discontinuity by academic spin-off for an opportunity of dynamic specialty partnership between basic research and industrialization must be more productive, instead of the applied research shift of whole basic research insisted on among a part of Japan's university researchers. But, even so, we have still to make clear the mechanism for improving the success probability of a jump of discontinuity.

This study purpose is to examine the reasons of jump increase of discontinuity by the academic spin-offs and the uniqueness of support mechanism for them, behind the fact of biotech start-up increase, by focusing on Hokkaido biotech cluster.

## Present Conditions of Hokkaido Biotech Cluster

### Strategy of Networking

For a purpose of economic revitalization of Hokkaido region (North Island in Japan) based on technology industrialization, Hokkaido Bureau of Economy, Trade & Industry (HBETI) has started a conception of "Hokkaido super cluster promotion strategy" focusing on information technology and biotechnology as core technologies since

2001.

As to biotech industry of both core technologies under this grand design, “Hokkaido biotech 21st century social gathering” comprising of government-university-industry members devised four master strategies on the acquisition of competitive advantage, autonomous growth, chain accumulation, and expansion as industry on October 3, 2001.

Among 5 action programs on the basis of those 4 master strategies, such 3 programs has already realized as firstly a next generation post-genome research building (including open space laboratories on such as the sugar chain, protein and lipid researches) in Hokkaido University in September, 2003, secondly a biotech start-up incubator in April, 2002, and a government-university-industry cooperative research building (including experimental animal breeding facilities and clean rooms) in March, 2004 both at Hokkaido Center of NIAIST(National Institute of Advanced Industrial Science and Technology), and finally a biotech venture fund formation by local venture capital firms. Still remaining and attention calling programs are a promotion of R&D projects with regional comparative advantage (e.g. sugar chain) and creation of a global group of biotech start-ups.

Besides, Hokkaido was specially emphasized as one of the areas necessary to be promoted for the cluster formation of biotech industry in addition to Kanto (Tokyo area) / Kansai (Osaka area) in national government’s “BT (biotech) strategy general rules” of December, 2002. “Hokkaido bio / health-care promotion summit” by each head of 6 public institutions in the region (Hokkaido Government, Sapporo City, HBETI, Hokkaido Regional Development Bureau, Hokkaido Center of NIAIST, and National Agricultural Research Center for Hokkaido Region) was held and agreed on the support for companies and researchers within the region in November, 2003.

The founding number of academic start-ups increased into 23(24, as of June, 2004.). In addition, biotech companies in the region won some domestic and foreign biotech-related business awards. Furthermore, each specialized human networks such as next generation post-genome network, Hokkaido forum of biotech industry cluster and so on are also established and are supporting the biotech cluster strategy complementarily.

#### **Growth of the Biotech Cluster**

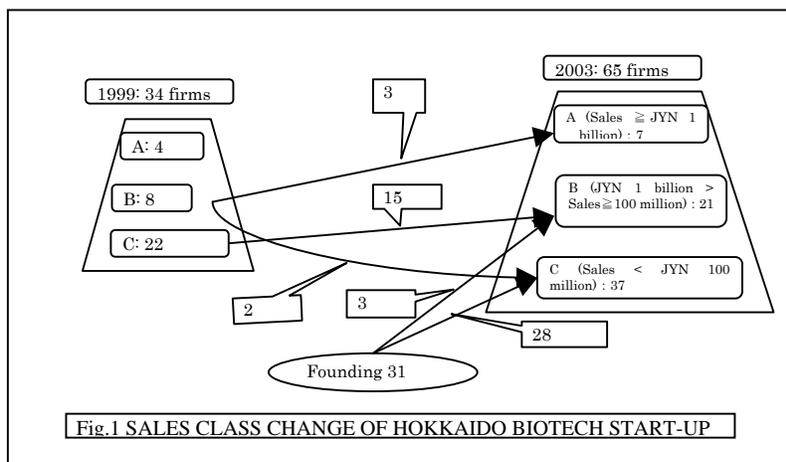

According to “Hokkaido Biotech Report 2004: Company Data Edition” by HBETI, which surveyed a 74 biotech company located their head or branch offices in the region during August-November in 2003, and received a 65 company response (answer rate 87.8%), the increase rate of medical care / medicine (in five years, 2.3 times) is the highest, although the weight of agriculture / food is still high in agriculture / food 43%, medical care / medicine 35%, environment 13%, and the other 9%, as for the type of industry distribution by the number of company. By the distribution ratio according to scale, the sample has small and medium-sized business 57(distribution ratio 87.7%), big business 6(9.2%), and public incorporated body 2(3.1%). In addition to the increase in 65 companies from 34 companies between 1999 and 2003, a pyramid formation comprising of 3 type groups in an industrial cluster (a precedence company group, a growth-stage company group, and a founding-stage company group) is highlighted, and a shift to a stable development process can be considered.

The average capital amount of a small and medium-sized business is JYN 179 million. The sales of 1999, JYN 10,544 million doubled into JYN 23,475 million in 2003. This is due to the existence of abundant agriculture, forestry, and marine resources, a natural characteristic as the climates with coolness and low humidity, the accumulation of technology / know-how, the density of universities / research institutes of biotech research, and the start of their connection of each other for the formation of biotech industry. In particular, the expanding businesses are the seed development / functional foods in a field of agriculture / food, and the synthetic DNA and antibody making in a field of medical care / supplies.

The R&D investment amount of 2003 is JYN 2,887 million, and the ratio of R&D expenses to sales is 12.3%, more than an average level 8.9% of medical supplies industry in “2003 Science and technology survey” by Ministry of Public Management, Home Affairs, Posts and Telecommunications. In addition, the R&D Investment amount by a 57 small and medium-sized business of 2003 holds total 88.3% for JYN 2,550 million, and 49 companies of them are biotech start-ups as the R&D oriented small and medium-sized firms. Such biotech start-ups mainly consist of the academic spin-offs and the entry companies from the other industries / regions.

Otherwise, as to the employment, the number of biotech company employee in the region of 2003 is 805 people. R&D worker rate to all employees exceeds 40%. And 42(71.2%) of new hired persons 59 get each job in R&D section. Among 65 companies, 49 companies (75.4%) plan new hiring, and 39 companies equal to 79.6% of

such planning companies conceive the appointment in a R&D section in future. In addition, at plural answers 78 by new hiring plan sections, 39(50.0%) response to R&D, 16(20.5%) sales, 9(11.5%) business planning, 6(7.7%) control, 4(5.1%) management, and remaining 4(5.1%) the others. In this way, by reflecting R&D orientation at the dawn stage of biotech start-ups, new hiring mainly concentrates on R&D section.

When biotech companies were classified by sales stratum, 7 companies in class A (more than JYN 1 billion) with an average JYN 2,248 million, belong to the precedence group where 6 increase the sales. 21 of an average of JYN 327 million belong to class B (from more than 100 JYN million to less than JYN 1 billion) as the growth stage group, where the growth of 14 is remarkable. The other 37 of class C (less than JYN 100 million) belong to the founding-stage group, with an average of JYN 24 million. In class C, while 8 companies of each entry in 1999 face the initial sales only after the third quarter, 20 among 23 companies which entered in the 2000-2002 saw the sales already in 1 or 2 quarters. Thus the know-how and business model for overcoming the Death Valley (initial deficit period) are built in a recent biotech start-ups. In the whole 3 classes, the growth of the cluster can be observed for the results as the class down 2, class up 18, and founding 31 since 1999. In addition, as there are already 3 companies which could start first business year from class B, the know-how from past experience is built in to the business model that can improve growth speed from start.

A number increase of company, a weight increase tendency of medicine industry, and their R&D inclination in the biotech cluster reflect considerable degree a number increase tendency of academic spin-off. Among existing 18 companies of 23 academic spin-offs in investigation, 2003 sales of 16 answering company totals increased by the last year 114.2% for JYN 1,106 million, and the employment increased by 18.1% for 98 employees. The sales in the academic spin-off entirety seems almost equivalent to the scale of one class A company. In particular the sales grew rapidly with 8.4 times in three years.

TABLE 1: TREND OF ACADEMIC SPIN-OFFS

Year	1999	2000	2001	2002	2003
Firms(Number)	2	5	6	15	23
Sales(JYN Million)	X	147	348	544	1,165

#### Increase of Academic Spin-offs

As a characteristic of academic start-ups, by inspecting precedents and letting the business model evolve, the number of companies is increasing those which are planning a steady growth while making a balance between a daily profit and a R&D investment. This decision-making method seems to give good influence on the sales stability from their business start and on the reliable growth. In addition, 74% of start-up locations are Sapporo-city, and

most of their associated universities concentrate on Hokkaido University.

TABLE 2: CHARACTERISTICS OF ACADEMIC SPIN-OFFS

Firm Location	Firm Number	Affiliated University	Firm Number ( Plural Answers)
Sapporo	17	Hokkaido University	14
Iwamizawa	1	Otaru University of Commerce	5
Kuriyama	1	Hokkaido Tokai University	3
Muroran	1	Sapporo Medical University	1
Asahikawa	1	Kitami Institute of Technology	1
Shirataki	1	Muroran Institute of Technology	1
Obihiro	1	Asahikawa Medical College	1
		Obihiro University of Agriculture and Veterinary Medicine	1

Furthermore, for not only each other's competition but also cooperation, a private organization "Hokkaido biotech business network forum (a popular name: Dosanko-bio)" is established for a purpose of mutual supplement, cooperative market development, and exchange of business founding experience among the regional academic spin-offs. Thus a positive and autonomous movement for a self proliferation already begins.

## Incubation by Basic Research Institutions

### Hokkaido TLO

#### (1) Researchers' Interest in Commercialization

According to "Hokkaido Biotech Report 2004: Researcher Data Edition" by HBETI, while there is a bias possibility due to a low answer rate 25.5% (248 biotech researchers) of the region, main responses are university-industry cooperation 72.6%, research / education 71.0%, and academic research 65.3%, as return methods of research seeds to society, and greatly separate not-in-mind 0.4%. Above all, a ratio of university-industry cooperation was higher than that of research / education along a traditional value system of a researcher. According to the patent-filing experienced researchers through a cooperative research (141 plural answers), big business partners mainly so far had monopolized such patents, in the partner companies 72.3%, researcher oneself 32.6%, TLO / JSTA(Japan Science and Technology Agency) 27.0 %, and a ratio of the other 2.8% as a formal filing person, and only articles belonged to researchers. As a result, such risk was high that a patent with a potential of small market scale was over without any practice regardless of precious research results, as a dormancy and defense patent. As to 82 people having replied also to the investigation of 2002 about founding willingness of academic start-ups, while during 2002-2004 positive opinions increase in total as a already founding from 0% to 9.8%, a wish to found within 1 year from 6.1% to 7.3%, and a wish to found within 2-5 years from 18.3% to 13.4% (becoming less but still high), at the same time a negative opinion also increases as not-interest from 14.6% to 18.3%.

In this way, their intention of fruit return to society lifts it for the research financial funds, and then they do not welcome the past situation that all results including patents except articles belong to partner companies. Otherwise, it can always imagine a struggling figure facing a dilemma between the time to devote her to both participate in realization and watch embodiment of research results and the research time itself. In other words, it is a general image of a basic researcher who has a strong intention on industrialization of own research results to prevent from a monopolistic intention of big business partners, but, on the other hand, is simultaneously reluctant to involve with it because of the reduction possibility of research time.

#### (2) Management Team

Hokkaido TLO was established as "Wide area model TLO" on December 6, 1999, based on the decision of Hokkaido academic consortium (a representative board of universities in the region), and was approved in the tenth in the whole country based on "Universities technology transfer promotion act" by national government on December 24, 1999. At a March 2004 point in time, it has a capital JYN 60 million (university teachers 60%,

companies 40%), and a number of stockholder 350 (university teachers 10%, companies 40%). It can enjoy economic effects such as a coverage of technology transfer operating expenses within less than two thirds by a relevant government grant, a free use of an office in Hokkaido University since April, 2001, a free hiring of two (each full-time / part-time) patent-marketing-advisers dispatched from Japan Institute of Invention and Innovation (JIII) and an appointment of national university professors for directors (Hokkaido University 3, Kitami Institute of Technology 1).

Ten executives (academic 6, industry 4) come from Open University / Hokkaido University (emeritus) 1 as president, Hokkaido University and Hokuyo Bank each one as vice presidents, Hokkaido University (economy / engineering) 2, Kitami Institute of Technology 1, one private company 1, Hokuyo Bank 1, Hokkaido Electric Power 1 as directors and Hokkaido Institute of Technology 1 as an auditor. Additionally there is an advisor from Hokkaido Electric Power. As to 11 officers, it accepts business experienced persons from super-cluster supporting organizations, as 2 patent marketing / technology advisors from JIII, a supporter for academic spin-offs from Hokuyo Bank, each one manager for general affairs and for project control from Hokkaido Electric Power, a technology transfer supporter from Hokkaido Railway, and a manager for corporate governance of TLO from Hokkaido Government, except other four by TLO self-hiring for operations.

### (3) Services

As main services it has the technology transfer (licensing), the spin-off support (incubation), the consulting, and the marketing and match making.

As the consulting track records, it includes so far the technology coaching 1, receiving contract researches 5 (local public entities and food / hygiene companies), introduction of researchers and research seeds 51, and technology references / consulting 27. As the outputs of the marketing and match making, it has each sponsorship of government-university-industry cooperative technology transfer forums, university-industry interchange conferences (Muroran Institute of Technology & Hokkaido Institute of Technology), and TLO marketing fairs, and has exhibited it at small and medium-sized business fairs in Sapporo, and Japan-Singapore international patent licensing fair in Singapore.

#### 1) Technology Transfer Service

Domestic patent filing number is total 109 at a point of time in February 27, 2004, and it breaks down into life science 47, nanotech & materials 26, information & communication 11, environmental protection 9, production technology 8, energy 4, social infrastructure 3, and other 1. Recently the largest number 26 patents are filed in 2003.

The domestic filing is a speed of 21 patents yearly average. In addition, among related universities, Hokkaido University occupies 71% of the domestic filing patents. As the foreign patent filing number, it is 31 totals, and 8 of them are filed in 2003. As concrete outcomes, the right acquisitions include three issued patents and a new design for practical use in total. As the technology transfer number, it is 26 totals (10 within 2003), and a breakdown includes enforcement consent contract number 20(14 to regional companies) and right transfer 6(3 to regional companies). In addition, the member registration number became totaled 122.

TABLE 3: TREND OF HOKKAIDO TLO PATENT FILING NUMBER

FY	Domestic Patent Filing Number	International Patent Filing Number
1999	3	0
2000	23	1
2001	34	10
2002	23	12
2003	26	8
the total	109	31

TABLE 4: PATENT FILING DISTRIBUTION BY RESEARCH INSTITUTE

Research Institute	Domestic Patent Filing Number	International Patent Filing Number
Hokkaido University	78	21
Sapporo Medical University	13	6
Kitami Institute of Technology	8	1
Muroran Institute of Technology	3	1
Rakuno Gakuen University	3	1
Hokkaido Tokai University	1	0
Hokkaido Institute of Technology	1	0
Tomakomai National College of Technology	1	1
Hakodate National College of Technology	1	0

## 2) Spin-off Support Service

Hokkaido TLO has strengthened support to academic spin-offs for industrialization of research results since 2002, in addition to conventional licensing as technology transfer. By utilizing “Academic spin-off support service” by Ministry of Economy, Trade and Industry(METI), it supports them with the management consulting by such expert dispatching as the management consultants, certified public accountants, and licensed tax accountants, with finding competitive funds, with training of intellectual property right management, and with dispatching skilled executives into start-up boards (as directors or advisers).

### i) Expert dispatch support

#### a) Academic start-up management supporting project (for business plan)

-FY 2001(Feb-Mar, 2002) result:

Projects 9(Hokkaido University 5, Kitami Institute of Technology 3, Chitose Institute of Science and Technology 1)

Experts 4(a licensed tax accountant, a certified public accountant, a management consultant, and a business firm biotech expert)

Dispatch frequency 28.

- FY 2002 result:

Projects 15

Experts 8(licensed tax accountant 2, certified public accountant 2, and management consultant, patent attorney, business firm biotech expert, and liaison expert each one)

Dispatch frequency 79.

#### b) Patent attorney dispatch supporting project (for patent filing)

- FY 2001 result:

Dispatch frequency 32(Hokkaido University 15, Kitami Institute of Technology 8, Sapporo Medical University 4, Muroran Institute of Technology 2, and the others 3 )

- FY 2002 result:

Dispatch frequency 41(Hokkaido University 25, Kitami Institute of Technology 7, Sapporo Medical University 5, Rakuno Gakuen University 1, Muroran Institute of Technology 1, and the others 2)

### ii) Outside fund raising

#### a) METI Academic Start-up Creation & Scale-up R&D Projects (matching fund)

- FY 2002 adoption 1 (3 years) “Tailor-made cell treatment”(Hokkaido University, Sapporo Medical University, another regional universities 6, and region outside company 1)

- FY 2002 revised adoption 2 (1 year) one of them is “New immunity suppression medicine”(Sapporo Medical University, and region outside company 1)

- FY 2003 adoption 1 (1 year)

#### b) METI Regional Renaissance Consortium R&D Project

- FY 2002 adoption 1 (2 years)

#### c) Minister of Education, Culture, Sports, Science and Technology (MECSST) Academic Start-up Creation Support Project

- FY 2002 adoption 1 (3 years) “Eating suppression peptide” (Hokkaido University)
- d) MECSST Protein 3000 Project
- FY 2002 adoption 2 (5 years)
- “Patent filing support of transcription / translation-related research results” (Hokkaido University, Dept. of Mathematics) and “Patent filing support of signal transmission in a cell research results” (Hokkaido University, Graduate School of Pharmaceutical Sciences)
- iii) Cases of academic start-up founding support
- a) Eye Ambitious Co.  
Establishment: March, 2004  
Business:
- Development of a test / diagnosis kit of eye diseases
  - Development of some specific health foods / treatment medicines, using some functional materials of the plant / marine products of north origin
- Management Team:
- President: Visiting professor of Yokohama City University School of Medicine  
-2 Directors: Professor of Hokkaido University Graduate School of Medicine, and Staff of Hokkaido University Institute for Genetic Medicine  
-Auditor: Certified Public Accountant
- b) Oncolex Co.  
Establishment: August, 2003  
Business:
- Establishment of an advanced treatment method for intractable cancer / endarteritis obliterans
- Management Team:
- President: Venture capitalist at Global Investment
  - Directors2: Professor of Hokkaido University, Institute for Genetic Medicine, and Professor of Hokkaido University Graduate School of Medicine
- c) Bioimmulance Co.  
Establishment: April 2003  
Business:
- Establishment of advanced immunity treatments for intractable diseases as cancer, allergy, & autoimmune disease
- Management Team:
- President: Former assistant at Hokkaido University, Institute for Genetic Medicine  
Directors 4: President of Amino Up Chemical, Professor of Hokkaido University, Institute for Genetic Medicine, Professor of Hokkaido University Graduate School of Medicine, and Executive Officer of Hokkaido TLO
- d) Plant Selective Laboratory Co. Ltd.  
Establishment: March 2003  
Business:
- Development of the onion including the ingredients assumed as effective against habit diseases
  - Development of high functional vegetables harvested in Hokkaido
- President: Graduate student of Hokkaido University, Graduate School of Agriculture
- e) A-HITBio Co.Ltd.  
Establishment: February 2003  
Business:
- Development / sale of the health food having a calcium absorption promotion effect
- Management Team:
- President: Graduate from Hokkaido University, Graduate School of Agriculture  
Technological Advisors 3:  
President of Hokkaido TLO (Emeritus Professor of Hokkaido University), Professors of Hokkaido University, Graduate School of Agriculture

Thus Hokkaido TLO assists the academic spin-offs with the necessary information, consulting expert dispatching, outside fund matching, and board executive dispatching, and practically promotes their start-ups.

#### **Hokkaido Center of NIAIST**

##### (1) Goal of start-up support system

As a background of its enriching of the support system, in recent years, there can be observed on the activation of regional academic spin-offs, the confirmation at “Hokkaido biotech 21st century social gathering” on the necessity of government-university-industry cooperation for formation of Hokkaido biotech industrial cluster, and the special policy emphasis on Hokkaido Center as biotech research center in nationwide NIAIST. As an aim, this center is to contribute to the cluster formation of Hokkaido biotech industry and new industry creation by self R&D of the biotech field, and by the support for both industrialization by entrepreneurs on the base of technology seeds of NIAIST and by entrepreneurs of academic spin-offs utilizing technology potential of NIAIST.

Two support targets consist of the biotech start-ups (less than 5 years since start) as an outcome creation type, aiming at the offer of the product / service with advanced and original technology / know-how, and of the internal or external biotech researchers / engineers as an outcome practical use type, aiming at exploitation of technological potential of NIAIST. The support contents can be classified into an offer of research environment, a support of R&D, a business support, and various seminars. Above all, as a highlight, at first, “Hokkaido biotech start-up incubation center” was established as a first regional incubator for R&D type biotech start-ups in February, 2002. Additionally a start-up support team, start-up advisers, and an incubator service board were arranged. Thirdly, an open space laboratory was completed, as a necessary environment for biotech business by comprising the R&D and experimental animal facilities, and the GMP clean rooms in March, 2004.

##### (2) Characteristic of support system

NIAIST's support system for start-up consists of the improving and innovative systems.

###### 1) Improving System

Following four measures are highlighted as 2002 introduction by NIAIST.

###### a) Start-up support appointment system:

To employ outside talented persons with technology seeds and founding willingness within a time limit as the regular staff and to offer them the R&D opportunities for start-ups (at maximum 3 years and R&D budget of JYN 40 million).

###### b) Licensing type cooperative research system:

To do R&D support by a matching fund system to inside and outside talented persons aiming at founding.

###### c) Set-up of start-up support factory:

To prepare and lend the facilities necessary to R&D and prototyping for commercialization by the start-ups and their supporting engineers, based on “Small and medium-sized business measures costs” by NIAIST.

###### d) Foundation of start-up adviser group:

To do general support such as a law, finance, patents, and management to be necessary for start-up business, by foundation of advisor group of lawyers, certified public accountants, and patent attorneys.

###### 2) Innovative System: “Start-up development research center”

By a project adoption of “Development of strategic research center” by technology promotion adjustment grant (5 years) of MECSSST, NIAIST established “Start-up development research center” on October 15, 2002.

A purpose of the plan is the establishment of the Japanese way of start-up creation system on the basis of technology seeds of university-public research institutes. Three main points of the plan are the construction of business models with the competitive edge based on technological seeds and intellectual property of research institutions, the R&D necessary in start-up (establishment of a technology development team of R&D for start-up, and enforcement of full-scale R&D from basic research to industrialization), and the support for start-up founders (appointment of a founder as the staff by NIAIST, and support by the adviser group who cover a full range of expertise on technological start-up).

The center's mission is to complete a practical system for accelerating the creation of high-tech start-ups including biotech and generalize a Japanese model of start-up creation. In addition, it also aims at changing the mind sets of researchers into studying for herself while being conscious of the social return of findings (market-mechanism orientation), and at revolutionizing NIAIST into a platform of hi-tech start-up creation. As an

organized highlight of the center, at first, within the start-up development strategy taskforce, technology development team constructs the business model based on intellectual property owned by university-public research institution and develops practically creation techniques of high-tech start-ups by under top-down management of start-up advisers as specially invited experts on business plan (start-up equal to technology development). Types of target start-ups are classified into the outcome exploitation type, business creation type, and human resources utilization type. Next, the start-up support office offers one stop service for the bottom-up founding proposals from researchers, by cooperating with associated sections. As the kinds of service, there are the start-up support appointment system, licensing type cooperative research system (an offer of R&D money to business planners based on NIAIST technologies and to research units cooperating with start-ups) and approval as NIAIST start-ups (transfer of intellectual property, grant of exclusive enforcement rights, exemption of enforcement charges, moving into incubators, and reduction of the facility fees). In the third, the start-up strategy research office builds a general model of high-tech start-up creation, by investigating the start-up creation process that the start-up development strategy taskforce studies. In addition, it plans and operates various training and seminars for human development and consciousness change. And to the fourth, the development strategy planning office builds the action programs of the center, and coordinates between inside and outside conditions of NIAIST.

As concrete functions of a start-up development strategy research center in Hokkaido Center, there can be at first a research on the start-up creation system on the basis of technology seeds of public and basic research institutes, next an experimental trial of start-ups through the restoration of technology seeds from research results, grasp of social needs, building of business model, and additional necessary research for founding, in the third an indirect support as the introduction of venture capital and of professionals in such as patents, law, accounting and management, in the fourth a training of business creators and entrepreneurial mind as human resource management, and in the fifth an information offer as the research result spread from a start-up development strategy research center, and the introduction of start-ups and products.

### (3) Track Records

As to start-up incubation track records by Hokkaido center, it established a start-up support team and an incubator service board as the staff, with the establishment of a biotech start-up incubation center. In addition, it arranged a business creator of a start-up development research center while cooperating with that plan of head quarter. In the second, as facilities, the start-up incubating space / open space laboratories were constructed and the biotech related common use research instruments were provided by a start-up support factory project. In the third, by targeting for specific start-ups and entrepreneurs, it applied them the start-up support appointment system and NIAIST start-up approvals.

TABLE 5: ACTIVITY RESULTS

Time	Event
April 2002	“Biotech start-up incubator” was established and the start-up support team and the start-up incubation board were formed in Hokkaido Center of NIAIST.
June 2002	Incubation space for start-ups was prepared.
August 2002	2 companies of Medical Image Lab Co. and Gene Techno Science Co. were approved of NIAIST start-ups (Outcome Creation Types).
August 2002	The person of present Bioimmulance CEO was hired as a start-up part-time service staff by “The start-up support appointment system”.
September 2002	Biotech related common use research instruments were prepared by “The start-up support factory project”.
January 2003	The construction of government-university-industry cooperative open space laboratory was started.
April 2003	Bioimmulance Co. was approved as “NIAIST start-up (Outcome Creation Type)”.
June 2003	The business creator of “Start-up development research center” was posted in Hokkaido Center of NIAIST.
March 2004	The open space lab was completed.

As the future deployment of biotech start-up incubation center, there can be at first the increase of start-up founding based on technological seeds of NIAIST, secondary the creation of new products and start-ups by cooperation on technology and know-how between university and NIAIST, thirdly the support to academic spin-offs by the offer of technology and research environment of NIAIST, and fourthly the reinforcement of a incubational function with the regional economic policy. Concretely three start-ups were already founded in the start-up

incubator, and in the future, new industrialization is expected by utilizing the open space laboratory.

## **Pioneering Cases of Academic Biotech Spin-Offs**

Here we will examine 2 cases of biotech start-ups of path finding not only in Hokkaido but also in the nation, both spun-off from Hokkaido University and relating with Otaru University of Commerce, and one of them is also involving with NIAIST.

### **Genetic Lab Co.**

This company was established on September 1, 2000. It has the capital JYN 38.75 million and the employee number 48 as of March, 2004. In addition to the main office and a research facility, it has a pathology diagnosis and special test laboratory. The business contents consist of the pathology diagnosis, the clinical, clinical trial, and genetic tests, the receiving contracted researches, and the out-sourcing service of drug discovery. As for the company goal, it aims at becoming a global biotech start-up founded in Hokkaido, by progressing with Hokkaido University.

#### **(1) Platform Technology**

The DNA array analysis technology of platform technology is consisted of the contracted expression analysis by using Affymetrix's gene chip, manufacturing / analysis service of custom DNA array, and data analysis service for selecting validated genes and for final forecasting and evaluation of them. At drug discovery as a main project, at first, it is aiming at development of drug discovery technology as a merger between DNA array technology and information technology, and is building an information database on gene expression. For example, it has achieved a convalescence correct answer rate of 97% by the analysis of gene expression / convalescence data of B-cell lymphoma, by the comprehensive expression analysis and database building on clinical specimen 1000 examples of cancer organizations through a cooperative research with Hokkaido University Graduate School of Medicine. Next, at a compound / drug evaluation by DNA array, it is developing new drug discovery method "reverse screening system" with a research grant from METI's "2002-2003 New industry creation technology development assistance project", while predicting the operating mechanism, efficacy, toxicity of a drug candidate compound by the changing patterns of gene expression after having administered it to culture organizations and animals.

#### **(2) Core Business**

A pathology analysis center is positioned in the regular service to help financially the technology development and company's own original projects, and is located in the neighborhood of an attached hospital of Hokkaido University School of Medicine. The center's 1<sup>st</sup> lab is in charge of clinical test of pathology and 2<sup>nd</sup> lab is in charge of special test for clinical trial test and R&D.

Furthermore, at the clinical test of pathology, critical factors include the introduction of the latest machinery, precision management of a test-diagnosis, and quality improvement of contracted test service by medical specialists and cell inspectors authorized from each academic association of pathology and clinical cytology. Otherwise, at special test, it is emphasized on the supplement to the conventional microscope observation with technological introduction of the DNA array and image analysis developed originally.

#### **(3) Management System**

As top management, chairman is a professor of Hokkaido University Graduate School of Medicine, CEO is a researcher having track records of a DNA array research at domestic and foreign companies, and COO&CFO is an expert of finance, legal affairs, and management with track records at domestic and foreign companies, also having a qualification of U.S.A. certified public accountant. Among 4 directors, three people are medical experts, each a visiting professor at Hokkaido University, Advanced Science and Technology Cooperative Research Center, a chief of a private pathology research institute and a professor of Hokkaido University, Institute for Genetic Medicine. One remainder is President of a local venture capital. A counselor is president of a trading company of biotech-related materials, and an auditor is head of an accounts office.

Among adviser board members, the pathology adviser is an emeritus professor of Juntendo University, and 3 technology advisers consist of a professor of Hokkaido University, Institute for Genetic Medicine, a professor of Hokkaido University Graduate School of Pharmacy, and a professor of Okazaki Cooperative Research Organization, Natl. Inst. for Basic Biology. The other advisor is an associate professor of Otaru University of Commerce, Business

Creation Center (but, as for the management system, large reorganization occurred to directors and advisers, aiming at IPO after spring, 2004).

Its platform technology is DNA array analysis and was supported by national grant. Its pathology analysis service financially facilitates its R&D on platform technology.

#### **Gene Techno Science Co.**

Gene Techno Science was spun-off from Hokkaido University, Institute for Genetic Medicine and was founded on March 1, 2001. It has capital JYN 35 million, is located in and supported by the biotech start-up incubator facility at Hokkaido Center of NIAIST. Then it can use the open space laboratory since April, 2004 and has a cooperative researcher as a research follow of NIAIST. Its main business is the manufacturing of disease-related gene expression profiling for identifying drug-target candidates.

##### **(1) Development and Business Strategies**

As a R&D plan for next about 5 years, it is planning to concentrate on a search of a disease-affiliated gene to have an influence on the condition of a patient / progress of a disease, instead of a search of the competition intensive cause genes. Concretely it aims at the identification of disease-related genes through a genetic search to change greatly of a quantity of appearance every stage, by sampling them every disease progress stages. Afterwards, it tries to manufacture some antibodies obstructing a function of the proteins which the gene makes, some transgenic animals, and some recombinant proteins, and to develop some viral vectors absorbing the genes.

##### **(2) NIAIST Tenant and Contracted Projects**

By “NIAIST start-up approval (Outcome Creation Type)” in August, 2002, and a cooperative research with a NIAIST fellow and special researcher, on the base of cloning related to the natural killer cells owned by NIAIST, the company is developing some new gene-therapy vectors targeting on cancers and autoimmune diseases. In the second, it analyzes the gene expression profile of new drug candidate before and after of dosage, by targeting on some urinary organs and retina disease models. The third R&D target is the aging medical care, then a cooperative project; “Manufacturing of a failure of muscular coordination model due to cerebellum function imperfection” is continued with Hokkaido University, Institute for Genetic Medicine by a 2002 grant of creative technology R&D by METI. In addition, it has also another project; “A new gene search on a disease model for drug discovery development” with a cooperative R&D grant by Hokkaido Small and medium-sized business General Support Center. Otherwise, as own company’s original business, it promotes such projects as a gene expression profile analysis in a habit disease model, a manufacturing of transgenic animals, and a development of a kit for diagnoses.

##### **(3) Management System**

Among four directors except representative directors, two people are professors of Hokkaido University, Institute for Genetic Medicine. And auditor is a professor of Otaru University of Commerce. In addition, a local venture capitalist took up his post as a director with an investment in May, 2004. Furthermore, led by this company based on genetic technology, “the bio-informatics Sapporo consortium” is formed and trying to respond to various technologies and to save R&D cost, by comprising of another companies in the antibody manufacturing, DNA chip development, manufacturing of some small and medium-size disease animal models, and expert service on reactions of drugs working.

In this way and, according to 2 pioneering cases of academic biotech start-ups, the promotion of commercialization is tried on the basis of continual basic research at Hokkaido University, with the supports by Hokkaido TLO, Otaru University of Commerce, NIAIST, Hokkaido Government, or local venture capital. Above all, in the first example, it builds a robust business model supporting a long payback period of R&D, by a routine business as pathology analysis service through the cooperation with an attached hospital of Hokkaido University School of Medicine. At the second case, similarly on the basis of basic research of Hokkaido University, it settled in a NIAIST incubator, enjoys its resources, facilities, and service, and makes easy to overcome “Death valley” as a long initial deficit period. Furthermore, both spin-offs receive faculty member of Otaru University of Commerce and a local venture capitalist as their management staff. It is said relatively easy for them to hire the excellent researchers at even local area. But with a long distance from large-scale pharmaceuticals companies or financial centers, Hokkaido seems to have a relative disadvantage for drawing a strategy of business model, and for information exchange with financial market, by comparing with Tokyo or Osaka.

## Conclusion

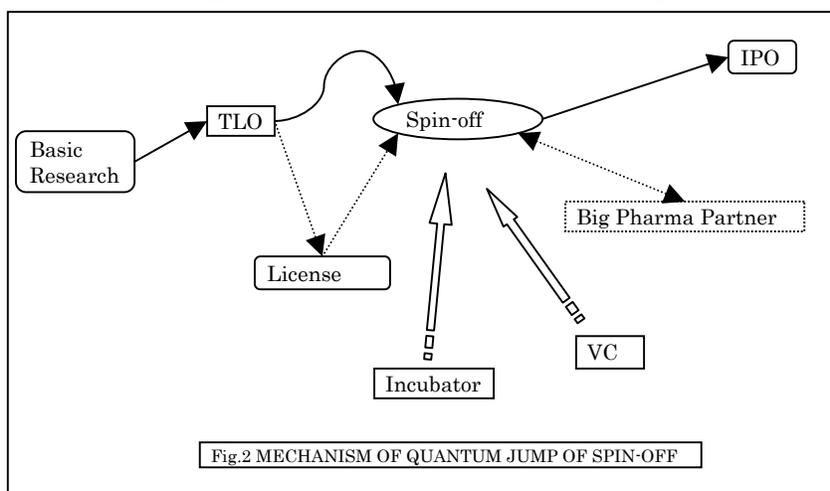

As number of academic spin-offs, amount money of research and development, and employment mainly for research staff are stably increasing, Hokkaido biotech cluster is expected to become the main biotech cluster next to Tokyo and Osaka areas in the country.

In addition, in Hokkaido TLO in charge of technology transfer as an aggregate of many universities of Hokkaido, it recently gives the expert dispatch and outside fund supply to the potential entrepreneurs toward the increase of academic spin-offs in addition to licensing. Because, for academic start-up incubation, the information and contacts of the industry, financial circles, and government are also necessary in addition to the academic world, TLO receives for some of executives and officers the skilled and talented persons from the local government, public utilities companies, financial institutions, and industry, and constantly exchanges the information of technological seeds, needs, finance, and human resources.

NIAIST (National Institute of Advanced Industrial Science and Technology) as a public research institute has also begun to strategically study a process to develop start-up creation as a kind of technology development like a nationwide project; "Start-up development research center". Specifically it provides the potential entrepreneurs with a fixed period of an employment guarantee (an appointment), matching funds, cooperative R&D opportunities, facility use opportunity as the start-up incubator or open space laboratory, and adviser service of business support experts. In this way, NIAIST has really started an experiment of start-up creation while cooperating with local universities or TLO.

Pioneering biomedical spin-offs from universities need a special type of business model, start-up incubator, and management board to overcome a deep death-valley. Then for example, a regular income from clinical test service, human and financial resources from Hokkaido TLO, a moving into a NIAIST start-up incubator, and a director position by a local venture capitalist can contribute to the income stability for R&D, a cost saving, an investment fund financing, and an expansion of acquaintances.

An academic start-up is also included in an area of MOT (Management of Technology) in addition to a licensing. An academic start-up can be considered as a real option which includes the information phases of technological seeds, needs, and finance, when we examine it from the viewpoint of MOT. In other words, a partnership with large-scale pharmaceuticals firms becomes still more important from a meaning of flexibility keeping, if it survives an initial tough time and aims at IPO in future, while maintaining a practical use relation of basic research results at a university. With that purpose, the building of business model possible to attract needs of large-scale pharmaceuticals firms as partners, and the information analysis / risk management of finance will become necessary in addition to having the skilled eyes on basic research findings.

If, even in MOT, we examine a academic spin-off as business of science to aim at industrialization of basic

research findings, it is desirable to maintain such structure makes possible to understand both the advanced basic research trend and the practical problems at a clinical stage, as an advisor for it without an active university researcher retiring from a university, in order to keep its competitive position. At the industrialization of a basic research idea as the business of science, it is possible to divide an innovation process of an idea into an improvement idea near to the applied research possible to comparatively easily make a business, and into a creative basic research idea to need a considerable breakthrough until a practical use. In the case of an improvement idea, it is possible to promote comparatively straight through a development process, but in the case of a creative basic research idea, it becomes necessary to build a development process originally, in addition to the expert group with the skilled eyes. In other words if a development process of an improvement idea is “flow shop”, a development process of a creative idea is “project”, and it needs in future to form structure of “job shop” or matrix organization by letting an expert group gather and dissolve in adaptation to circumstances. In this way, by including many types of development process for industrialization of an idea, with coverage through job shop from project to flow shop, it becomes important to manage each optimal portfolio of options with a risk and return.

Above all, by development of a creative idea to make use of basic research findings, a correspondence of discontinuity leap on the basis of Poisson process will be needed, instead of development of a steady state on the basis of gBm (geometric Brownian motion). At the time, by starting from an evaluation by a skilled expert on the idea, it is also necessary to have an intermediary between basic research and development and a temporary project by various expert groups. A formula of the innovation leading to a mutation and evolution becomes required for the finding, evaluation, and industrialization of an accidental discovery. At first a device to make their success probability improve is pursued if leapfrog ideas of the number of 20% cover 80% of an income.

For increase and continuity of a discontinuity jump of creative innovation from the viewpoint of ROA (Real Option Analysis), it is suitable to have both a skilled eye equivalent to gamma of Greeks as a risk-hedge index and a formula to evaluate a jump idea on the basis of Poisson distribution instead of uncertainty modeling of on the basis of gBm. In addition, if a real-option design on a R&D management process raise expansion-NPV, it will become possible to send a more go-signals on the higher risk projects that were hesitated conventionally. Furthermore, ROA can be a guideline to show the most suitable alternatives from the viewpoint of end payoff, depending on deployment of project, even in situation of information asymmetry about time.

In the future, ROA will need to build the more suitable competitive strategy, by integrating with game theory to consider a rival behavior. And, in addition to a quantitative technique, the know-how and skills of a project leader and a support by an expert group will be also necessary.

# **The Influence of Global Forces and Trends on International Market Selection: A Study of New Zealand Exporters**

*Greg Walton

*Victoria University of Wellington, New Zealand*

## **Abstract**

**This study investigates relationships between exporter awareness and understanding of the forces and trends of a wider global market environment and international market selection (IMS). Using a sample of 152 New Zealand exporters, our findings indicate that exporters make IMS decisions conscious of the influences of the dynamic international marketplace they are obliged to compete in. It was surmised exporters chose new markets less conscious of the wider environment than they needed to be. The results of our study also suggest that product-specific foreign market information is more important than broad and macro information when making IMS decisions where they consider the business environment is more uncertain or risky than they are used to. There are implications about our understanding of contemporary exporting practise, the provision of information to experienced and ‘new to export’ exporters and management education providers.**

## **Introduction**

Changes in the global marketplace have influenced international marketing management practice, perspectives and approaches to global marketing decision-making, as well as the managerial perceptions of marketing (Schlegelmilch and Sinkovics, 1998; Andersen and Strandskov 1998; Douglas and Craig, 1999; Etemad and Wright, 1999; Lazer and Shaw, 1999; Walton, 2002). Walton and Ashill (2001) and Walton (2002) contend IMS literature (especially IMS model building) that precedes the most recent studies, were developed in isolation of the prevailing globalisation forces at the time they were developed. Axinn and Matthyssens (2001) assert that conventional theories and models that once attempted to explain export behaviour no longer do because of the vast changes occurring in the global marketplace. Walton (2002) suggests that theory development and commercial practice need to be generated in response, and be responsive to, the prevailing external environment. We contend if awareness and an understanding of the influence and impact of this wider environment upon business exists amongst exporters, this would influence IMS criteria selection. This is the subject of this study.

International Marketing (IM) and International Business (IB) literature falls short of empirical studies that address the relationships between global market change, and understandings of this by exporters, and their IMS decision-making. Although approaches to selecting new overseas country markets have contributed various managerial models and frameworks of decision-making to the IM and IB literature, we suggest that these conventional approaches that have developed over time (e.g., Cavusgil 1985; Cavusgil and Li 2000; Solloway 1992; Root 1994; Hoffman and Novak 1996; Brewer 2000; Koch 2001; Fletcher and Brown, 2002) have been developed in isolation of the rapidly changing global market environment that prevailed at the time they were conceived (Walton and Ashill 2001). The very nature of change and identifiable global phenomena requires marketing academics and practitioners to rethink many of our accepted assumptions and paradigms and to develop contemporary approaches to IM strategy development (Lazer and Shaw 1999; Walton 2002). For example, the relevance of psychic distance phenomena, country of origin and iterative approaches to IMS, entry and development to help explain export behaviour, must now be re-evaluated.

Our paper is organized into five sections. We begin by first reviewing literature pertaining to changes in the global marketing environment, IMS models and frameworks and developing research constructs. The second section discusses our research model and hypotheses. We follow this with a description of the cross-sectional survey that was used to collect data and the results from our study. In the final section, we attempt to explain the results and

discuss the theoretical and managerial implications of the research findings for international marketing management practice. We present a future research agenda.

## Literature and Construct Development

Rosenzweig and Shaner (2000) in Fletcher and Brown (2002, p. 240) state “A number of major changes in recent years - ranging from deregulation of industry, to newly emerging markets, to the revolution in information technology, have changed the pattern of internationalization.” The competitive nature of today’s business environment requires that foreign markets be systematically investigated (Craig and Douglas 2000; Brewer 2001). Lazer and Shaw (1999) and Walton (2002) summarise a number of external environmental factors characterised as powerful drivers of change in the international marketplace. They suggest these factors are forcing companies to reshape and question their current thinking, commercial practice and approaches to IM strategy development. These environmental factors or ‘forces’ include increasing global competition (Lazer and Shaw 1999, Douglas and Craig 1999, Rundh, 2001); trade liberalisation (Lazer and Shaw 1999, DeRosa 2000); structural changes in the way markets operate and are regulated (Lazer and Shaw 1999, Lowengart and Mizrahi 2000); growth in consumer convergence making country markets as the unit of analysis less relevant (Levitt 1983, Czinkota and Ursic 1984, Bell 1995, de Chernatony et al 1995, Schlegelmilch and Sinkovics 1998, Ohmae 2000); the diffusion and rapid adoption of information technology (IT) and e-commerce technologies by both exporters and those foreign companies whom import goods and services (Vlahos 1995, Molloy et al 1995, Hamill 1997, Hamill and Gregory 1997, Schlegelmilch and Sinkovics 1998, Lazer and Shaw 1999, Douglas and Craig 1999, Cummings et al 1999, Heintze et al 2000); increasing regional integration (Solberg 1997, Rugman 1998; Lazer and Shaw 1999; Fletcher and Brown 2002) e.g. Closer Economic Relations (between Australia and New Zealand, ASEAN, North American Free Trade Agreement, Expanded European Union (10 new members 7/04’); the occurrence of unexpected events or ‘wildcards’ making environments more difficult to predict (Trade NZ 1996, Petersen 1997, Cornish 2003); and the state of global and local/regional economies that affect export firms directly (Weber 1996; Lazer and Shaw 1999). This research seeks to test the global forces of Walton (2002) by applying them to the IMS decision only. Collectively these drivers of change in the global marketplace become the first construct of this study.

These changes have a number of potentially significant implications for an export firm’s approach to international business growth (Andersen and Strandskov 1998; Lazer and Shaw 1999; Axinn and Matthyssens (2001), Craig and Douglas 2001; Walton 2002) let alone the specific decision about IMS. Because of the impact of various forces and trends in the current global environment Craig and Douglas (2000) suggest the competitive nature of the business environment today requires foreign markets to be systematically investigated. IMS is a fundamental first step after the firm has validated the necessity to further diversify its international market (Walton, 2001). Andersen and Strandskov (1998) suggest IMS decisions are influenced by the global market environment in which firms operate and their understanding of this environment. Although some studies have examined the importance of IMS screening criteria (Woods and Goolsby 1987; Hart et al. 1994; Terpstra and Yu 1998; Brewer 2001; Wood and Robertson 2000; Mohamad et al. 2001), there has been no empirical examination of the relationship between the impact of the global market environment on export market selection decisions. Numerous approaches and frameworks to select a new overseas market are cited in the exporting literature (Cavusgil 1985, Solloway and Ashill 1995, Hoffman 1997, Andersen and Strandskov 1998, Brewer 2000, Koch 2001, Fletcher and Brown 2002). In order to enable a firm to arrive at a portfolio of attractive overseas markets (Fletcher and Brown 2002), the screening process in IMS evaluates each market against a selection of pre-determined and weighted criteria. These criterion are typically classified as either general (macro) IMS screening criteria such as culture, social, political, economic, demographic and geographical issues (Douglas and Craig 1983, Root 1994, Russow and Okoroafo 1996, Wood and Robertson 1999; Koch 2000, Rahman 2000, Walton 2002) or product-specific (micro) criteria such as those that are related to specific product demand/estimation (Root 1994, Brewer 2000, Wood and Robertson 2000, Mohamad et al 2001; Walton 2002). The relationship between IMS criteria selection (the second construct) and exporters’ awareness and understandings of the wider global environment is a key objective of this research.

## Research Model and Hypotheses

In an uncertain environment, firms may find themselves facing new, challenging, risky and confusing situations and their existing knowledge base is inadequate to cope with the changing marketplace (Daft et al 1988, Axinn and Matthyssens (2001). We might expect both large and SMEs with greater export experience to have a greater awareness of construct one. That is, awareness of and the impact of a range of global forces and trends and what impact this identifiable phenomena may have on their IMS process and export activities.

Following Andersen and Standskov (1998), Dow (2000), Walton and Ashill (2000), Douglas and Craig (1999) and Walton (2002), our conceptualisation suggests relationships exist between the forces that shape the wider global market environment and the selection and importance of particular IMS criteria. Given the uncertainty associated with change in the global market environment, we suggest that exporters will perceive all IMS (general and product-specific) criteria to be more important where the awareness, influence and impact of the global market environment is perceived to be high. Thus our first hypothesis becomes

H1: There will be a positive relationship between global market environmental impact on export market selection decisions and the importance of all IMS screening criteria in selecting a new overseas country market when the impact of the global market environment is perceived to be high.

As noted earlier (Douglas and Craig (1999), Lazer and Shaw 1999 and Walton (2002), we further suggest that changing global forces (increasing trade liberalisation, the growth of information technology/e-commerce, regional integration, consumer convergence, 'wildcards'...) have possibly overcome conventional notions of geographical barriers and psychological distance. The effect of current global environmental forces and trends may have reduced the relevance of general (macro) screening categories of socio-cultural, economic, political, demographic, and geographical criteria. Given the hypothesised effect of the global market environment on the importance of IMS criteria, we suggest that general (macro) IMS criteria have become less important in international market selection decisions relative to product specific (micro) criteria. Along with Mohamad et al (2002), this study seeks to replicate in part, Wood and Robertson's (1999) empirical study of American manufacturers to see if New Zealand exporters also value product specific criteria over broad macro criteria (the subject of numerous past studies). Thus:

H2: Product-specific (micro) IMS screening criteria will be more important than general (macro) IMS screening criteria in selecting a new overseas country market when the impact of the global market environment is perceived to be high.

The final hypothesis pertains to export manager behavioural differences in high experience and low experienced, and large and small exporting firms. We surmise larger and experienced export firms are more strategic in that company growth will come from further internationalising their business. This is reflected in the greater proportion of their revenue that comes from export activity compared to smaller and less commercially and export experienced firms. Resource allocate to export activity (market research, market investment etc) will be greater where the strategic decision is made about the importance of internationalisation to growth. We are mindful that a significant anomaly exists with this summation however. That is, the emergence of 'born global' companies whom not only are new and thus developing commercial experience but whom also need to internationalise sooner than conventional IM literature that has explained internationalisation processes in the past. Specifically, we expect that large exporting firms will place greater importance on all IMS screening criteria than SME exporting firms when making export market selection decisions. Similarly, more experienced exporting firms will place greater importance on IMS screening criteria than smaller exporting firms and use export information sources more frequently. Thus:

H3: The relationships in Hypotheses 1 and 2 will have higher correlations in high experienced and large export firms than low experienced and small export firms.

## Research Methodology

### Sample

To collect the data for the study, a total of 957 questionnaires were distributed to a random cross-sectional sample of New Zealand senior managers spanning ANZSIC industry wide categories. Representative industries included manufacturing, agriculture, forestry and fishing, energy, construction, retail and wholesale, transportation and financial and business services. These industries were chosen because their external environments were viewed as dynamic in terms of foreign competition and technological discontinuities, thus engendering greater environmental scanning.

Before the main data collection began, semi structured interviews were conducted with 8 senior exporting decision-makers and a questionnaire was developed and pre-tested with a sample of 40 exporting firms drawn from the seven industries. Once minor refinements were made to the questionnaire, it was sent and a self-addressed research envelope were mailed to the senior decision-making responsible for exporting in each firm - the manager who makes all or most of the international marketing management decisions for the firm.

Overall, a total of 152 useable questionnaires were returned yielding a net response rate of 17.9%. The majority of respondents were from manufacturing (50%) and agriculture and fishing (28%). The median number of staff (full-time equivalent) was 11. The average 'years of exporting' was 14.8 years and the average annual export sales revenue was NZ\$13 million. A random sub-sample of non-responding companies we contacted by telephone in order to identify possible differences between respondents and non-respondents. This analysis of non-responding firms indicated that non-response bias was not a problem. Early and late respondents were also compared on all variables of interest, using traditional t-tests, and following Armstrong and Overton's (1977) recommendations. As responses were recorded as they were received, a comparison between late and early respondents could be carried out. Chi-square values were then calculated to assess the differences between early and late respondents. The analysis revealed that no significant differences existed between early and late respondents in terms of the dependent and independent variables.

### Measurement

In designing the survey instrument, the relevant writings in the IB and IM literature (Douglas and Craig, 1983; Sengenberger et al. 1990; McAuley 1993; Sarkar and Cavusgil 1996; Lazer and Shaw 1999; Wood and Robertson 2000; Walton 2001; Koch 2001; Mohamad et al 2001; Fletcher et al, 2002; Walton 2002) were canvassed. Multiple item indicators were employed from this literature (see appendix). Three main areas of information were sought from respondents: (a) general company characteristics such as business activity, number of years exporting and number of full-time employees, (b) the perception of the impact of the global market environment on export market selection and entry decisions, and (c) the relative importance of a range of IMS screening criteria when making a decision to enter a new overseas country market.

For the Global Environment construct the impact of the global market environment on export market selection decisions was measured with nine items characterising contemporary forces/trends of globalisation. These forces were refined and modified from the work and insights of Schlegemilch and Sinkovics (1998), Douglas and Craig (1999), Lazer and Shaw (1999), Ohmae (1999), Axinn and Matthyssens (2001), and Walton (2002). Responses to the questionnaire items were elicited on a five-point semantic differential scale ranging from "1 = no impact (this global environmental factor does not require any reorientation or modification to existing export marketing plans and strategies)" to "5 = very significant impact (this global environmental factor requires major reorientation or modification to existing export market plans and strategies."

For the IMS construct and referring to the work of Douglas and Craig (1983), Koch (2001), Root (1994), Sarkar and Cavusgil (1996), Wood and Robertson (2000) and Walton (2002) 87 variables were used to measure seven different IMS dimensions - economic, market potential, market access/legal, infrastructure, culture, political and physical demographic. Responses to these items were also elicited on a five-point Likert scale ranging from "1 = not important" to "5 = extremely important". Additionally, a "don't know/no opinion" response category was provided for each information variable. Following Brewer (2001), Wood and Robertson (2000) and Mohamad et al (2001), these IMS criteria variables were subsequently used to derive measures for general (macro) and product-specific (micro) IMS criteria.

No cases were deleted from the sample because of problems with excessive missing data with three of the dependent variables (Cohen, 1988; Hair et al., 1998). Frequency analysis of all these items indicated no problems of floor or ceiling effects in the measurements.

The model constructs were subjected to factor analysis to ascertain the dimensionality of the scales. Items (Global Forces and Trends illustrated in Table I) that cross-loaded at or below the level of 0.30, or which did not load on any factor at above level of 0.30 were eliminated from the analysis (Cooper and Schindler, 1998; Hair et al 1998). Eigenvalues was used to identify the key measurement in each construct (Churchill 1999). Three items (Factor 2) were dropped from the nine-item measure measuring the impact of the global market environment on export market selection decisions as it didn't explain sufficient variance (see Factor 2 in Table I), leaving six items (Factor 1). A cronbach's alpha of .81 was reported for the 6-item measure.

Confirmatory factor analysis of the 87 items measuring IMS criteria revealed thirteen sub-dimensions. These 13 dimensions were subsequently collapsed into two overall groupings – general (macro) IMS criteria and product-specific (micro) IMS criteria. Both factors accounted for 62.1 % of the variance explained and produced acceptable reliability coefficients.

The study used the number of years exporting as an indicator of exporting experience. The classification of exporting firms into less experienced and more experienced firms was based on a median value of 10 years. Exporters with more than 10 years of exporting experience were classified as experienced. Seventy-six (50% of exporting firms) firms fell into this category, the remaining 76 fell into the less experienced category.

The classification of exporting firms into small and large firms was based on a value of 20 full-time employees. According to the definition provided by the New Zealand Ministry of Economic Development, a small and medium size enterprise (SME) is defined as an enterprise employing 19 or fewer full time equivalent employees (FTEs) (Ministry of Economic Development 2004). Exporting firms with 20 employees or more were thus classified as large firms. Fifty-nine (39.1%) of exporting firms fell into this category, whereas the other 92 (60.9%) exporting firms fell into the small and medium size exporting firm category.

TABLE I: CONVERGENT AND DISCRIMINATE VALIDITY OF THE MODEL CONSTRUCTS

## Results and Discussion

Before we summarise and discuss the results pertaining to the hypotheses, we want to discuss the analysis of the 9 global environmental forces and trends that form the first construct of this study. Table I combines both the descriptive and factor analysis of this construct. Hypothesis I predicted there would be a positive relationship between global market environmental impact on export market selection decisions and the importance of all IMS screening criteria. Table II reports this relationship where we can see the relationship is positive and thus the hypothesis is supported. The highest correlation ( $r = 0.52$ ) is between the impact of the global market environment and tariff/non-tariff information, a factor in the micro or product specific category rather than a factor in the macro or broadly based IMS category. This is an expected result. It suggests this sample of exporters place salience on

practical costs of product entry into a new market. The amount of any tariff imposed or the costs of compliance (non tariff barriers) may be a factor in exporter price competitiveness in a new market. Exporters clearly need to know their price competitiveness before committing to enter, supply and compete in any new market.

TABLE II: CORRELATIONS BETWEEN GLOBAL ENVIRONMENTAL IMPACT AND IMPORTANCE OF IMS INFORMATION

IMS Screening Criteria	Global market environment impact (Correlation coefficient)
Legal Tariff/non-tariff	0.52**
Politics	0.38**
Demographic	0.37**
Market Potential-specific product/service demand and competitor activities	0.35**
Culture differences	0.35**
Generic Macro Financial Health of a foreign Country	0.30**
Infrastructure Distribution logistics	0.26**
Generic Macro Propensity to Spend	0.25**
Infrastructure – Business Partner	0.23**
Culture unity	0.21*
Other legal	0.20*
Geographic	0.19*
Infrastructure Communication	0.17*
<b>All General (macro)</b>	<b>0.35**</b>
<b>All Product-specific (micro)</b>	<b>0.43**#</b>

\* significant at the 0.05 level \*\* significant at the 0.01 level

# Product-specific information is statistically greater than general (macro) information (p<0.05)

Hypotheses 2 predicted that product-specific (micro) IMS screening criteria would be more highly valued by exporting firms than general (macro) IMS criteria when the impact of the global market environment requires a major reorientation or modification to existing export market plans and strategies. Table II shows that product-specific foreign market information has a higher correlation than general foreign market information. The difference between all general (0.35) and all micro criteria (0.43) is statistically significant at the 0.01 level. This finding indicates that product-specific foreign market information is valued more highly by both low and high experienced exporting firms (Woods and Goolsby 1987; Hart et al. 1994; Terpstra and Yu 1998; Brewer 2001; Wood and Robertson 2000; Mohamad et al. 2001). And the importance of product-specific criteria is statistically greater for high experienced firms compared to low experienced firms. There is no literature that relates IMS criteria with export experience, thus this is a new finding. This is possibly also a function of increasing managerial experience. If broader/macro categories of criteria like socio/cultural, political, economic criteria could be proven to determine specific product demand then these criteria would still explain exporter IMS criteria choice. The results don't suggest this to be valid. The results are suggesting exporters want market information that allows them to compare markets against one another under specific product criteria. Our results suggest exporters discern that a buoyant economy as measured by GDP growth, literacy rates, cost of capital, established infrastructure (or not) does not necessarily correlate to specific product demand. So they would prefer to measure markets against product criteria specific to their own product.

A firm's ability to obtain and use information is likely to depend largely on resource availability (Samiee and Walters 1990), and thus on firm size. Denis and Depeltau (1985), Walters and Samiee (1990), Hart et al (1994) and Yeoh (2000) suggest that the positive relationship between firm size and information search activity can be argued from an economies of scale perspective in that large firms have slack resources to devote to information gathering activities. In contrast, Piercy (1981) and Yeoh (2000) suggest small firms have limited schema and seek less information than their large counterparts.

Hypothesis 3 predicted that the relationships in hypotheses 1 and 2 would have higher correlations for experienced (10 years or more exporting) and large exporting firms (20 or more full-time employees) than in less experienced and SME exporting firms.

Table III reports the correlations between the recognition of high\global market impact, and firm size & export experience by IMS screening criteria. A number of patterns emerge from Table III. A prominent finding from Table III is that experienced large and SME exporting firms and, inexperienced SMEs show consistently stronger correlations than do low experienced and large exporting firms. Highly export experienced New Zealand firms placed greater importance on a wider range of IMS criteria compared with local market or 'new to export' firms. This is a function of managerial experience and resource based theory. This part of hypothesis 3 is proven. With 7 statistically relevant criteria sighted by new to export SMEs (compared to 11 from experienced exporting SMEs) this may also be a reflection of 'born global' firms. That is, firms that need to rapidly internationalise because of exposures in their local market require more complex IMS information. 'Born global' firms have adopted an orientation to (international) commerce because of exposures (limited growth, saturated market...) they face in staying local. They recognise inherent risks of internationalising and accept a need for greater due diligence including information searches for better IM decision-making. Many 'born global' firms are SMEs.

TABLE III: CORRELATIONS BETWEEN RECOGNITION OF HIGH GLOBAL MARKET IMPACT AND FIRM SIZE/EXPERIENCE, BY IMS CRITERIA

IMS Dimension	Large firms (Correlation coefficient) <sup>a</sup>		Significant difference between high and low experience large exporting firms	Small and medium size firms (Correlation coefficient) <sup>a</sup>		Significant difference between high and low experience SME exporting firms

<sup>a</sup> Correlation coefficients significant at the 0.05 level or above

\*\* Coefficient is significantly greater for more experienced exporting firms (z-score, p<0.05)

\* Coefficient is statistically greater for more experienced exporting firms (z-scores, 0.05 < p < 0.10)

# Product-specific information is statistically greater than general (macro) information (p<0.05)

Export managers in highly export experienced and exporting SMEs place greater importance on a wider range of IMS screening criteria when making export market selection decisions. This is partially supported by Terpstra and Yu 1998; Brewer 2001; Wood and Robertson 2000; Mohamad et al. 2001) but these studies did not set out to relate SME export behaviour to the breadth of IMS criteria so firm support of these studies can not adequately

be made. SMEs placed more importance on conventional general IMS criteria like Political stability, demographic data, and cultural differences than LMSs. We surmise larger firms would only place significance on conventional general and macro criteria if they perceived this criteria were determinants of specific product demand. The authors also suggest larger and especially experienced exporting firms already know more precisely what their IMS information needs are. Their learned knowledge (past experience) has refined their information search to a minimum. Yet paradoxically, experienced large exporting firms are less resource constrained and could develop more complex information searches more than resource challenged SMEs. SMEs have more to lose thus place greater importance on more information even if this is not specific to their IMS decision-making. These findings also don't support Piercy (1981) and Yeoh's (2000) work whom suggest 'small firms have limited schema and seek less information.' We surmise SMEs possibly think general and macro criteria are determinants of marketing success in new markets whereas larger firms and less experienced firms do not think so. We surmise less experienced firms especially larger firms simply have less understanding of the relationship between new market success and some IMS criteria. Again, this was a surprising from large non-export experienced firms. No specific previous studies support this point making this finding new.

SME exporting firms reported higher importance to product-specific (micro) and general (macro) screening criteria than LMEs. This is a significant difference. Except for the "availability and quality of a business partner" in a potential new market, this result suggests SME's (although small and maybe inexperienced), still recognise the importance of IMS criteria that clearly measures revenue potential and the cost to generate this than do LMEs. Of most interest is that highly experienced (larger and SME) firms value specific product related criteria (legal issues like tariff/non-tariff and the protection of IP, and the availability of good partners for manufacture and or distribution and supply/servicing) deemed important for IMS. We would expect experienced exporters to better understand market entry and development comes from establishing good networks and supply relationships with in-market partners. We surmise, New Zealand exporters have strengthened the link between their commercial goals (revenue and profitability) and matching this to specific investment necessary to select and enter a new market to achieve those goals. It is no longer sufficient that broad (and dubious) determinants of demand (socio/cultural, political, demographic...) translates into specific product demand. Product specific or product demand estimation data that more directly enables product sales forecasts and translates to revenue and profit objectives have become more important criteria to compare new markets for selection and entry. The health of an economy as measured by broad macro data like GDP growth, GDP/capita, literacy levels, population growth rates, cost of capital, inflation rates etc does not automatically translate into specific product demand. Thus micro specific product demand measures need to be employed. This is a function of export experience and adoption of contemporary commercial practise. Our results suggest that large and inexperienced firms are not aware (as there are no significant relationships) of the link between global forces and trends, and any IMS criteria. We would have expected LMEs to also value highly an understanding of the downstream distribution chain like SMEs do. But they didn't and this is curious. This is disturbing.

The pattern emerging from Table III is one of greater commercial awareness displayed by SMEs than we might have also expected from all larger firms. SME literature seeks to explain SME behaviour based on resource, commercial experience and managerial orientation and that SME behaviour is less rigorous than larger firms. These results however, suggest commercial prudence does exist with SMEs. It also exists in export experienced large firms. We might also have expected the same prudence from inexperienced large firms but these results suggest otherwise.

## **Discussion and Implications**

Internationalising is fraught with risk. The purpose of this study was to examine the international market selection behaviour of New Zealand exporters. Specifically, to identify whether an awareness of powerful global forces and trends exists, and further, if it did exist whether this awareness influenced IMS criteria when making international market selection decisions. This research also sought to discover whether these relationships differed by level of exporting experience and firm size.

Lack of international experience increases firm risk perceptions of international business (Collis and Montgomery 1996). Indeed the exporting literature suggests that firms with limited international experience often perceive exporting to be more risky than those further along the internationalisation path. Local NZ literature supports these findings and assertions (Hassan and Shaw (2002), Simmons (2002), Ministry of Economic Development (2002), Chetty and Campbell-Hunt (2003).

A key outcome of this research is the cognisance New Zealand exporting firms have with their wider global marketplace. The authors' selection of 9 global forces and trends that formed the first construct of this study are in themselves not new to readers. The list is not all inclusive. The authors considered these 9 forces and trends have significant impact on the operational behaviour and internationalisation of firms. Since this research the authors would add one more element to this list – 'the (pervasive) nature of global broadcast (western) media.' Collectively these forces and trends have not been researched let alone researched to identify correlations with IMS decisions. Other IMS studies have sought to explain export/IMS behaviour but have not been researched in the light of the wider global environment. Therefore an important outcome of this work is a new understanding that IM decisions are not made in isolation of the international market environment exporters are obliged to compete. Managerial implications of this finding include the

1. Recognition by exporters that the contemporary international environment is changing in more significant ways than ever before. This is manifest by readily identifiable forces and trends (construct 1). The recognition also that the impact of this phenomena results in more competition, greater flows and availability of substitute products, more discerning customers and more complex distribution structures than ever before. And to make the best IMS decisions (let alone be internationally competitive) firms need to be constantly developing their market intelligence gathering systems and monitor and respond to global and industry specific forces and trends.
2. Recognition that exporters themselves have adopted a more thorough orientation to internationalisation than previous research has concluded. That is, the importance of environmental scanning as a management discipline is better acknowledged than previously thought. This should be commended. This point does not at all mean exporters operational activity is in line with best practices but the point is that exporters prudence in IMS at least, is more rigorous than we first thought.
3. Market intelligence systems of exporting firms and export service providers like quasi-government agencies need to change to reflect new commercial goals (market demand, accurate forecasting of product sales and revenue & profit). Product specific intelligence and data needs to be the focus rather than the broad and macro information of conventional IM literature. This shift may also explain the research results that suggest quasi government agencies are not providing the information (experienced) exporters want. They respond by developing personal links with market players and more documented information from elsewhere.
4. Crown/quasi government agencies need to clearly determine what information services they provide to exporters. Clearly 'new to export' firms require more and different information than experienced exporters. Government off shore offices need to be tuned for the market intelligence, information and research needs by firm and by industry, and what forces and trends are driving change here. Crown agencies also need to be clear what services they provide by firm/sector size and export experience.
5. Management and marketing education also needs to be shaped along these lines training managers in contemporary IM studies that reflect a dynamic international environment.

Larger firms often possess more resources, achieve higher levels of scale economies, and tend to be associated with lower levels of perceived risk in export market activities in comparison with smaller firms (Bonaccorsi 1992). This statement however, does not explain the fact that there are no correlations at all between awareness of the impact of global forces and trends, and IMS criteria selection in large but inexperienced firms. The smaller firms in this study (Tables III) appeared to be more concerned than larger (especially non-export experienced) firms with changes in the global marketplace. Katsikeas and Morgan (1994) suggest less experienced exporters may need to consider the extent to which a change in the global market environment would influence their internationalisation plans (IMS) and their strategic decision-making. In doing so, they recognise they need to become better informed about global forces and trends and the impact these may have if they expect to compete effectively. This might be a conclusion of this study. We surmise, at least for less experienced SMEs, that that have

realised they have to cope and compete in a rapidly changing environment with their limited resources and are thus more concerned with mitigating risk and loss by making better sense of the export environment by understanding it and the links this has on their success. We would like to suggest the same is true for all LMEs however, this assertion is not supported by our results especially for 'new to export' LMEs. All SMEs have responded prudently by requiring a greater amount of conventional macro and micro product specific information. This appears to be valid in this study of IMS behaviour. The result also reveals that exporters (large and small) who have extensive exporting knowledge also place more importance on their knowledge of the wider environment they are obliged to operate in. They are more knowledgeable about how changes in the global market may influence their international marketing decisions. We commend this. These findings have implications for export firms who are still in early stages of their international business and who have limited experience as an exporter. Again this is a function of increasing managerial experience. The implications of this revelation reinforce the changing emphasis towards new IMS criteria and that past or conventional studies of IMS criteria no longer explain exporter behaviour. This is especially applicable to explain 'born global' or new to export behaviour. These results appear to reflect what are new market performance measures as exporters decide which markets hold greatest appeal.

These findings reflect a more rigorous evaluation of export market information by export managers of experienced large and all SME firms. The first question exporters are addressing now is whether there is fundamental primary or derived demand for their products in the country markets being investigated and whether these markets are accessible in terms of laws (tariff and non tariff barriers) and regulations/compliance (product content, safety, ingredients/components, sanitary, phytosanitary, packaging, animal welfare...) and an understanding of the commercial infrastructure (distribution, communications and partners/distributors). This is all product-specific. In other words, when the impact of the global environment is perceived to be more disruptive for export market selection decisions, there is little point in the export manager seeking out detailed information pertaining to the political, economic and socio-cultural environment of the country if product-specific information such as market potential and access information relegates the country to be of little or no potential.

## **Conclusions**

This study has attempted to provide the academic community with a new understanding of IMS export behaviour. An empirical study of a sample of New Zealand exporters has sought to shed new light about some linkages of knowledge and awareness of the wider international marketplace and relationships with one internationalisation decision – the IMS process.

Our study also seeks to provide a methodological contribution by deriving and validating scale to measure awareness of and impact of contemporary globalisation forces upon exporters. Given that this study was based on a sample of New Zealand exporters, the authors might expect the measurement scale derived in this study should contribute to future research studies of the New Zealand exporting sector. There are implications for both marketing management practise and academia.

## **Limitations and Future Research**

Given the methodology employed in this study was a quantitative technique, future research might take two forms

1. Further empirical work studying the extent of the relationships uncovered in this study. The extent of influence the first construct in this study (9 global forces and trends and whether there are more that take precedence eg pervasive broadcast media) changes over a time. Whether studies of this nature are becoming more important to understand export behaviour with implications both for management practice and Crown/quasi government agencies, academic study and teaching of IM and IB curriculum. Further quantitative studies could easily be industry based eg high technology or design or processed foods sectors.
2. Qualitative research with appropriate research objectives might seek to develop new theory in understanding contemporary managerial behaviour regarding their IMS decision-making and the relationships to pervasive and

changing global market forces. This may enable the development of new theoretical models that explain contemporary management practice in international marketing.

An obvious limitation is that our sample represents one country and findings could vary by country from which exporters operate. Cross-country comparison and replication studies may be useful in the future.

# The Market Reaction of Top Management Turnover: Evidence from China

*Changling Li  
Renhui Fu  
Yihui Wang  
Xiamen University, PR China*

## Abstract

**This paper aims to analyze the market reaction of top management turnover in China. The authors find that on the whole the market has an insignificantly negative reaction to the top management changes. Specifically, the market reaction to top management turnover in small firms and normal top management changes is significantly negative, while to forced top management turnover, the reaction is significantly positive, and there is no significant market reaction to top management turnover caused by other factors and interactions of them.**

## Introduction

As the soul of enterprises, top management is one of the key factors influencing the performance of firms. With the development of Chinese stock market, more and more managerial turnovers happened, and this phenomenon is increasingly attracting attention from both researchers and investors.

The research of top management turnover aims to solve problems in the following two aspects: On the one hand, it tries to study the relation between managerial changes and corporate governance, which is called the research of factors influencing top management changes. On the other hand, it tries to know more about the influences of managerial turnovers to the corporation, including the impact on firm performance, corporate internal governance and stock price during the period of turnover etc., which is called the research of the effect of top management turnover. The relation of them is, in our opinion, just like that of two sides of one mirror. Both of them are depending on and supplementing each other. Some researches are involved in both of them (for example, Warner & Watts, 1988).

As a key part of the effect research of top management turnover, the research of the market reaction to administrative turnover mainly analyzes the changes of stock prices in a short period following the turnover, i.e., the stock market's reaction to the announcement of managerial turnover, which could be divided into three kinds according to the overall impacts of executive succession on organizational performance. Some researchers believe that administrative change will improve performance (Bonnier & Bruner 1986, Furtado & Rozeff 1987, Weisbach 1988, Denis & Denis 1995, Fidrmuc & Fidrmuc 2003, Gaullagher & Nadarajah 2003) The basis for this is maybe "Common sense" or "Great person" theory, which argues that individuals can control outcomes of an organization. A new chief executive can avoid some mistakes of the predecessor and thereby improve organizational performance. Some researchers regard successions as scapegoating rituals and consider that on average they make no difference to the stock price (Brown, 1982; Borstadt, 1985; Klein, Kim, Mahajan, 1985; Reinganum, 1985; Warner, Watts & Wruck, 1988; Zajac, 1990; Jagannathan, 1996). Leadership has little bearing on organizational performance. The change in manager is an attempt to appease fans rather than improve performance. A chief executive only possesses unilateral control over little resource in large companies. Other researchers conclude that executive succession negatively affects performance (Grusky, 1963; Carroll, 1984; Furtado, 1986). They argue that changes in leadership may precipitate a slide in performance because of tensions, instabilities and loose relation between the corporate strategy and corporate structure produced by that. This slide in performance would then increase the likelihood that the leadership would change again, and the cycle would begin anew.

There are lots of papers concerning the top management turnover for firms listed in NYSE and AMEX market. However, as far as we know, there are only a few papers about this for listed companies in China. For the research of top management turnover, Zhu & Lin (2003) finds that the stock market reacts negatively to the

announcement of managerial changes on the whole. Specifically, the market has an insignificant reaction to the top management turnover in firms with good performance while significantly negative reaction to those with bad performance (Zhu & Lin, 2003). Zhang (2002) holds that the market reacts positively to the outside turnover in bad-performed firms. Other relevant conclusion shows that management changes in fund firms caused by reasons other than bad performance will depress the stock price of firms.

This paper aims to explore what effect the administrative changes will have on the listed companies' stock price in China, and thus provides some general implication for the signal of managerial changes. In addition, this paper has some differences in research method as followed compared with the former research. First, it enlarges the scope of top management from CEO, chairman and president to other management such as vice chairman, vice president, CFO etc.. The reason is that those managers also play important roles or maybe leading parts in the future in the operation of corporate and it would be really a pity if we know nothing about the changes of them. Secondly, the authors classify the announcement of administrative changes into three kinds, i.e. two-way turnover, departure and promotion of top management. This classification is also different from the former research. Two-way change involves two people for a given position, one leaving, and the other being appointed. The departure of top management is that the ex-executive leaves the office and no one is appointed to take his or her position at the same time and the promotion of top management is that a new manager is appointed and the ex-executive does not leave the firm but still remains his or her power in some capacity or is promoted to another executive position. The reason for the classification is that the stock market reacts differently to management appointment and management dismissal. We can better know the market's reaction to these three kinds of management changes and compare the difference between them if we can classify them. Finally, this paper excludes those samples that multiple officers change simultaneously and only examine the turnovers involved with only one manager. The reason is that, generally speaking, the market reaction to turnovers of multiple officers is larger than that of single officer. For example, the turnover of the total management team including CEO definitely has larger influence on stock price than the turnover of only CEO does in the same firm. Therefore, we would not know the exact size of market reaction of one officer change if we do not differentiate those two kinds of samples.

The remainder of the paper is organized as follows. In the next section, i.e. section 2, we describe the design of the research. In section 3, the empirical result will be discussed. Section 4 is conclusion.

## **Research Design**

### **Basic Assumption for the Research**

As one of the basic theorems of corporate finance, the market value of a firm is thought to be equal to the sum of future net cash flows discounted back to present. Hence, a firm's value depends on the stream of its future earnings. So, the effects of management changes on stock price could be analyzed through their influence to the firm's future earnings. If the management turnover is thought to be beneficial to increase the firm's future earnings, the investors and then the stock market will give a positive evaluation to the change and thus, the stock price will increase, vice versa. If a managerial shift is not expected to alter the prospect of the firm, the stock price will be not affected. Therefore, the short-run change in the stock price of a firm reflects the changes in the firm's management policies and practices. The market's assessment of the managerial shift will be reflected in the stock's market price. And therefore, we can analyze the effect of administrative succession by studying the behavior of the stock prices around the time the change is announced.

However, there is an underlying hypothesis for this conclusion, i.e., the efficient market hypothesis. The hypothesis argues that the stock market is efficient and could reflect all public information relative to the firm's future earnings. Fortunately, current researches about the market efficiency of China's mainland support this hypothesis. Generally their results are that the stock market is a weak efficient market (Song & Jin, 1995). There are also some researches arguing that it is inconclusive (Wu, 1996). And some advance that stock market in China is not a semi-strong efficient market (Shen, 1996). One market is assumed to be a weak efficient market if it reflects all past relative information. If this survives, it could meet the requirement of our research. Even if it does not, we can

relieve this insufficient-reflection problem by analyzing a relatively long time window, which gives enough time to the market to absorb this signal.

Another problem that may affect the market reaction is the double effect of the announcement of managerial changes, which includes information effect and real effect (Warner et al., 1988; Jensen & Warner, 1988; Bonnier & Burner, 1989). The information effect could be negative if the change suggests that the performance was worse than the market had realized. The real effect would be positive if the change is in stockholders' interest. The combination of real and information effects would produce a wide range of results depending on the magnitude of the individual effects. The subject of this research is the real effect of announcements. However, both effects would be included if the trading data before and after the turnover is taken as the research sample. How to eliminate the information effect and focus on the true effect is the difficult problem for the market reaction research of top management turnover. The solution for this problem is to classify the samples into two kinds according to firm performance prior to the turnover, i.e. firms with bad performance and firms with good performance. For the former kind of firms, the market has taken the information about their awful situation and thus the information effect would be small even if it does exist and even if investors think firm performance would be worse. And for those well-performed firms, information effect could not be avoided and the changes of stock price would be larger if it does exist. Through the comparison of the results of those two kinds of firms, the authors could decide whether the information exists. The authors would mainly focus on the former kind of firms to find the market reaction of administrative turnover if information effect does exist and do not consider the factor of firm performance in the research of other factors influencing the market reaction if it does not exist or is insignificant.

#### **The Scope of Data Collection**

The research subjects of this paper are the top management turnovers of listed companies in Shanghai Stock Exchange and Shenzhen Stock Exchange occurred in 2001 and in 2002, which include the changes of chairman, vice chairman, president, vice president, Chief Financial Officer, Chief Economic Officer etc. and do not include the changes of board directors. The reason for no consideration of directors is that they play very limited role in the operation of firms only through several times of board conferences in one year. The source of the announcements of top management turnover is the website of Asia Securities and Jucao Information and the trading data involved in the research comes from CSMAR (China Securities Market).

Principles of sample selection are listed in the below.

Firstly, the research does not consider the top management turnovers caused by the changes of ownership structure since such turnovers have no direct relation with managers' performance and hence in our opinion it belongs to the research of merger and does not belong to the scope of corporate governance.

Secondly, this paper also does not take into account those samples that have announcements maybe influencing the changes of stock prices such as earning announcement prior to 20 days and after 3 days of the top management turnover announcement. The reason is that those non-turnover announcements are noises in our research and they will affect the exactness of the measurement of administrative changes' effect were they not excluded from the sample.

Thirdly, the turnovers of top management must be long-term but not short-term in our sample, otherwise the effect of long-term appointment would be reduced since generally speaking, the market has more significant reaction to long-term appointment than to short-term appointment.

Fourthly, we only account for the first one when there are two turnover announcements of relevant positions such as appointment of president first and then the nomination of CFO. The reason is that the market could anticipate the second turnover of relevant position when the first turnover occurred and then has a reaction to the latter one in advance and thus the magnitude of the market reaction for the latter would be reduced when it is announced.

Fifthly, the sample firms must have been public for at least one year since the research need trading data of one year before turnovers.

Finally, the sample announcements could have only one position's change, i.e. the announcements involved with two or more positions would be excluded from our sample. The reason is that we would not know the size of the market reaction of one position if we do not partition those two kinds of announcements since the market

reaction of the announcements concerned with two or more positions is for those two or more managers' changes but not for one.

### Sample Description

According to the above-mentioned principles, the authors select 274 samples, and classify the samples according to the posts concerned as in Table 1. These 274 samples are used in the analysis of all factors and their interaction and we use 94 samples of two-way turnovers of chairman and president to make daily return analysis. The classification of top management turnovers sample is presented in Table 1.

TABLE 1: THE CLASSIFICATION OF TOP MANAGEMENT TURNOVERS

	Chairman	President	Vice Chairman	Vice president	CFO	Others	Total
Two way turnover	33	61	2	22	24	1	143
New appointment	9	2	17	43	13	3	87
Dismissals	10	4	5	18	5	2	44
Total	52	67	24	83	42	6	274
Percentage	18.98%	24.45%	8.76%	30.29%	15.33%	2.19%	100.00%

Notes: Others mainly include Chief Engineer, Chief Economist etc.

## Empirical Result

### General Analysis

Through the analysis of the abnormal return in the period (-2, +2) for all turnovers, the author finds that in general the market has insignificant negative reaction to all those three kinds of top management turnovers. (See Table 2).

TABLE 2: THE GENERAL RESULT OF MARKET REACTION OF TOP MANAGEMENT TURNOVER

The type of turnover	Paired turnover	New appointment	Dismissals
Mean	-0.00067	-0.004	-0.0087
T value	-0.15143	-0.86776	-1.19446
Number of the sample	143	87	44

During the sample collection, the author found an interesting example of announcements that the board of directors did not approve the resignation of its chairman. For the announcement, the CAR (cumulative abnormal return) of (-2, +2) is -0.22004, which means that the liquid stockholders lose 36, 036, 000 RMB and the total stockholders lose 100, 902, 000 RMB according to the mean value of liquid stock and total stock in the turnover period of (-2, +2). What worth saying is that the firm's CAR adjusted by industry half year before the turnover is -0.0395, lower than the mean return of the industry. From this we can find that the market could sense that the firm faced the adjustment of management and there is operational risk and thus the market lowers its stock price.

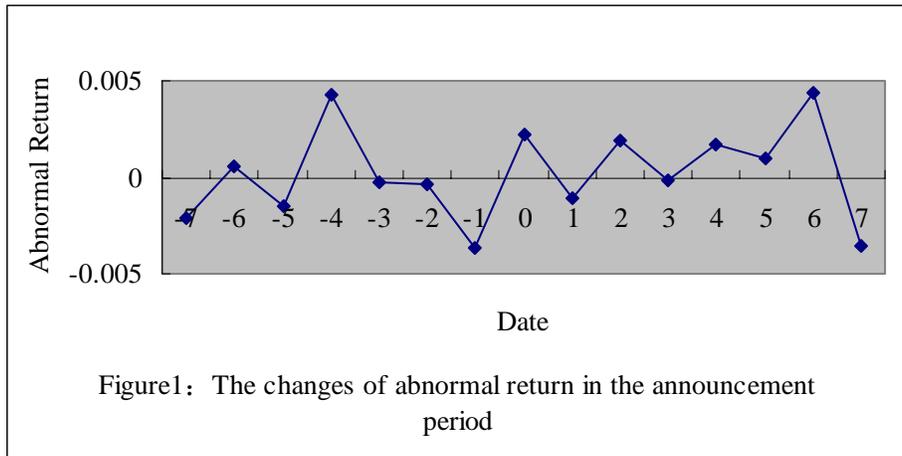

To further approve former conclusion, the authors do daily analysis of (-7, +7). Two-way turnovers are considered as the sample and 5 samples out of 94 are deleted for the following reasons: First, only the former one could be considered if the time distance between chairman turnover and president turnover in one firm is less than half year. Secondly, the source of the successor is not clear.

The stock's abnormal return in the period of top management turnover is presented in Table 3 and the changes of abnormal return in the announcement period is described in Fig. 1. According to Table 3 and Fig. 1, we could further approve that the top management turnover has an insignificantly negative market reaction. Three days before and after the announcement, the cumulative market reaction is insignificantly positive.

**Analysis of Factors**

As we know, most signals are the mixture of many different factors. The announcement of top management changes is not an exception. Due to many factors underlying the announcement possibly affecting the effects of announcement of management changes, we must examine them in order to know more about this. The influence of factors to the market reaction to top management turnover is showed in Table 4.

TABLE 4: THE INFLUENCE OF FACTORS TO THE MARKET REACTION OF TOP MANAGEMENT TURNOVER

Factors		Parameter	Position					Total
			Chairman	President	Vice Chairman	Vice president	CFO

Note:

1. \*means it is significant at 10% level.
2. Others mainly include Chief Engineer, Chief Economist etc. we do not make an independent analysis due to their small sample.
3. The research excludes those with unclear source of successor or with unclear reason for dismissal in the analysis of those two factors.

### The Power of Position and Title

Some senior management positions have more power than others to lead the firm and affect changes through mechanisms of internal control. Job title may be a proxy for this power, therefore consistent with the internal control hypothesis. We anticipate an association between changes in more powerful titles and the benefits from management

change. This anticipation is implicit in the studies of Waner et al., Reinganum, and Borstadt, who partition event returns by various titles. It is also implicit in the exclusive focus on CEO changes in the studies of Beatty and Zajac (1987), Coughlan & Schmidt (1985), Weisbach (1988), and Lubatkin et al. (1986).

There is no straightforward theory about which titles are associated with greater power. In the spirit of the earlier research, we partition the samples by which kind of titles contained in the turnover, i.e. chairman, president or other managers. No difference among returns for those categories would reject the hypothesis that the power of the position is associated with the magnitude of event returns. Lower returns for the more-power position category would be consistent with Warner et al.'s information content hypothesis that the position is more powerful than the others and that a change here signals that the company must be performing more poorly than previously perceived. Higher returns would be associated with the higher-position category if the position is more powerful than the others and personnel changes in this category were perceived by investors to represent a more material and positive redirection of the firm than represented by changes in lower positions.

According to Table 4, we find that the power of position almost has no effect to the market reaction to administrative changes and the magnitude of the market reaction to chairman and president turnover is not larger than to other positions' turnover, which is consistent with most research results about this (Beatty & Zajac 1987, Coughlan & Schmidt 1985, Weisbach 1988, Lubatkin et al. 1986) and also means that internal control hypothesis and information content hypothesis are not supported in our research.

#### **Firm Performance**

Many empirical studies (Weisbach 1988, Warner et al. 1988, Coughlan & Schmidt 1985) conclude that there is a statistically significant reverse relation between a firm's share performance and the likelihood of a subsequent change of its top management. From this, we could expect that stock market would show more positive reaction to management turnover for distressed firms than that for firms with good performance. The reason is that the hiring of new personnel is linked to favorably conceived real changes within the firm such as shifts in the investment set, shifts in the production function, or new efforts to minimize costs and maximize returns, which are all good to the improvement of firms and thus are better news for distressed firms than for normal firms. In addition, if announcements do not seem to convey bad news such as information about future poor performance, investors would think that management turnovers are board's efforts to increase firm's performance, which is consistent with the wealth-maximizing behavior on the part of investors.

The paper takes the difference between the mean monthly return and the industry's mean monthly return half year before the announcement as the indicator of firm performance. Through the analysis of the abnormal return of (-2, +2) we find that firm performance also has no significant influence to the market reaction of top management turnover, which is consistent with Davison, Worrell & Cheng (1990).

In addition, the market reaction is insignificantly negative except the vice president turnover under poor performance. It means that the information effect does not exist in Chinese stock market. Therefore, the paper will not consider the double effect problem and will take all samples into consideration whether their firm performance is good or bad.

#### **Source of Successor**

Concerning the origin of the successor, inside or outside of the firm, detailed analyses about this are present in many past empirical researches about the stock market's reaction to the administrative changes announcement (Dalton & Kesner, 1983; Reinganum, 1985; Furtado & Rozeff, 1987; Bonnier & Burner, 1989; Parrino, 1997). In general, those studies found that the effects of announcement to the market for internal appointments are quite different from that for external appointments. The reasons are as followed.

First of all, external successions often bring about much larger and significant changes to the firm than internal successions. Many researches provided empirical evidence to this. Helmich & Brown (1972) found that insider successions in the office of president tend to exhibit less organizational change than outsider succession. Helmich (1974) indicated that companies experiencing insider succession tend to be more stable and conservative in the policy of expansion than those after outsider succession. Carlson (1961) argued that insiders are chosen to maintain the current system and provide stability. Outsiders are brought in to promote change and creativity, and are often more prominent.

Secondly, outsiders do not have the firm-specific human capital of insiders (Furtado & Rozeff, 1987). Past working experience enables an insider manager much knowledge about the enterprise that is very useful for the development of the firm, such as the enterprise of the firm's products, customers, competitors, and employees, as well as an informal network providing information and support. Hence, an insider candidate has priority to an outsider in this aspect as one top manager.

Thirdly, the boards of directors know more about insiders than outsiders (Bonnier & Burner, 1989). The firm can acquire information about internal candidates at lower cost (Furtado & Rozeff, 1987). So, in the common situation, the boards of directors maybe prefer to choose insiders to manage the firm rather than outsiders due to more familiarity to them.

In the fourth place, internal promotion gives incentives to junior managers. The firm may prefer to promote rather than hire externally as part of its incentive system to encourage junior executives (Lazear & Rosen, 1981). Otherwise, managers of lower rank maybe fell hopeless when they find the board prefers to promote an outsider to the top position as their direct boss and then lower their passion for work.

Finally, the appointment of outsider may signal that the current situation is so bad that a more qualified manager had to be brought in from outside the firm (Bonnier & Burner, 1989). The firm maybe tries to refrain from doing so in order to avoid such unfavorable phenomenon.

In this research, we classify the sample into two categories according to the source of the successor and find that the market has insignificant reaction to the successor source and has insignificant negative reaction to internal turnover while insignificant positive reaction to external turnover. External turnover has insignificantly smaller market reaction than internal turnover, which is opposite to research result for US security market (for example, Dalton & Kesner, 1983; Reinganum, 1985; Furtado & Rozeff, 1987; Bonnier & Burner, 1989; Parrino, 1997).

#### **Firm Size**

Reinganum (1985) suggests that small firms may have less complex control structures than large firms and therefore the effect of a change in one management position will be more meaningful in a small firm than a large firm. If that is true, and if there are benefits to management change, we would expect that the announcement day excess returns should be inversely related to firm size.

This research uses the ratio between the total market value and the media of that as the indicator of firm size and classify as large firms if the ratio is larger than 1, vice versa. After the comparison between the sample of large firms and the sample of small firms, we find that the market reaction of top management turnover in small firms is significantly negative while insignificantly positive for large firms, which is consistent with Lubatkin et al. (1986)'s research and is opposite to Reinganum (1985)'s research. The reason is maybe that the internal control system in large firms is beneficial to strengthen the role of top management. The research also finds that the magnitude for the market reaction of small firms is larger than that of larger firms, which is same to Reinganum (1985)'s finding.

#### **The Disposition of Predecessors: Normal Turnover/Forced Turnover**

As we can image, a top manager leaves his office due to normal retirement or forced departure will send a quite different signal to investors. For normal retirement, investors maybe think the firm operates normally and will continue its current way of management and no large change will be expected to occur in it. For forced departure, however, investors maybe conclude that the firm is performing so bad that it has to change the top management and would expect that the firm will take large efforts to transform the operation of the firm and the performance will increase for that.

Regarding the dismissals of predecessors, Denis & Denis (1995) document that forced top management changes as proceeded by the large and significant operating performance declines and followed by significant improvement in operating performance and normal retirements are not followed by significant changes but small increase in operating performance. If it is true, we would also expect significantly positive abnormal return after forced designations and insignificant abnormal return after normal retirement.

According to dismissal reason, the research classifies the sample into two categories. One is a normal turnover, i.e. the turnovers that are not caused by the efforts of the board to improve efficiency, mainly caused by ages, health, promotion and reassignment etc. The other is forced turnovers, i.e. the managerial changes resulted by

the efforts of the board to improve administrative efficiency, mainly including dismissals of undue managers, sudden changes of the total management team etc.

After the partition of the sample by dismissal reason, we find that the market reaction of normal turnover is significantly negative while that of forced turnover is significantly positive and the magnitude of the market reaction of forced turnover is larger than that of normal turnover, which is consistent with Denis & Denis (1995)'s finding. However, regarding the performance after the normal turnover, our finding is that the performance continues to be negative opposite to small improvement after normal retirement found by Denis & Denis (1995). The conclusions about the dismissal reason do not change after considering those samples with unclear reason of dismissal.

For the reasons that caused those phenomena, we think it is maybe that the market could distinguish between forced turnovers and normal turnovers and gives a positive evaluation to the former since they are part of efforts of board to improve performance while significantly negative reaction to the normal changes maybe because investors think the successors will worse than the predecessors and then firm performance will decline after the changes.

#### Interactions among Variables

Those factors not only play critical roles individually in explaining the market's reaction to the announcement of top managerial changes, but also jointly offer extraordinary explanation to the explanation. Let me explain them one by one in the discussion below. The result of interactions among variables on the market reaction of top management turnover is described in Table 5.

TABLE 5: THE INFLUENCE OF INTERACTIONS AMONG VARIABLES ON THE MARKET REACTION OF TOP MANAGEMENT TURNOVER

Source of successor	Parameter	Firm size		Reason of dismissal		Firm performance		Industry	
		Small	Large	Normal	Forced	Bad	Good	Low similarity	High similarity
Internal	Mean	-0.007	-0.002	-0.015	0.0203	-8.00E-04	-0.003	-0.005427	-0.00103
	T value	-1.415	-0.353	-2.353*	3.0361*	-0.144	-0.686	-1.150233	-0.16604

External	Mean	-0.007	0.0101	-0.015	0.044	-0.008	0.0077	0.0011	-0.002
	T value	-0.914	1.0153	-2.094*	3.1095*	-0.777	1.0721	0.1693	-0.112
	Number of the sample	41	31	31	11	34	38	51	21

Note:

1. \*means it is significant at 10% level.
2. We exclude those with unclear source of successor or with unclear reason for disposal in the analysis of those two factors.

#### Firm Size and Source of Successor

With respect to the joint effects of origin and size, Dalton & Kesner (1983) argued that insider successions in large firms are more preferable and frequent than that in small firms and outside successions are more often occurred in small firms than in large firms. Reinganum (1985) provides empirical evidence that paired appointment has a significantly positive effect on the firm's stock price, otherwise insignificant. Furtado & Rozeff (1987) indicated that external appointments among large firms are greeted far less favorably by the capital market than internal promotions. In short, they think stock market prefers insider succession for large firms and outsider succession for small firms relatively. There are several reasons, we think, accounting for the above conclusion.

Firstly, more difficulties are expected to meet for radical changes of corporate policies in large firms than in small firms due to large firms' complexity, which are often brought by outside succession (Dalton & Kesner, 1983).

Secondly, large firms often have more options with respect to inside/outside succession due to their strength of training and opportunities of promotion, and they often prefer inside candidates for their familiarity with internal operations (Dalton & Kesner, 1983). By contrast, for small firms, it is radically different. Compared with large firms, it may be more costly to maintain the inventory of executives for small firms. And in smaller firms firm-specific human capital may be less important than general managerial capital. And what we should pay attention to is that general and firm-specific capital is the main factor in selecting internal/outside candidates. So, according to this, more outside successions will occur in small firms, vice versa.

In the last place, the selection of top management is influenced by internal power structure in large firms, which often makes insiders have the priority in the competition with outsiders (Dalton & Kesner, 1983).

After the analysis of the interaction between firm size and origin of successor, we find that there is no significant difference among market reactions of different source of successor and different firm size, and also the market has a negative response to managerial changes in small firms and to internal changes in large firms, which is inconsistent with Reinganum (1985) and Furtado & Rozeff (1987)'s conclusion that the market prefers outside turnover for small firms and inside turnover for large firms.

To further prove such difference, we redefine the firm size and take those firms with relevant value of total market value less than 0.5 as small firms (about the smallest 10% of the sample) and those with relevant value more than 7 as large firms (about top 20% of the sample). The result is presented in Table 6. We find that internal turnover in large firms has a significantly positive reaction, otherwise insignificant, which illustrates that for particularly large firms internal turnovers are beneficial and for small firms no significant benefits are brought about by outside turnover maybe due to incomplete internal structure and limited role for outside talent caused by that.

TABLE 6: THE INFLUENCE OF INTERACTIONS AMONG VARIABLES ON THE MARKET REACTION OF TOP MANAGEMENT TURNOVER (SUPPLEMENT)

Source of successor	Parameter	Firm size		Firm Performance	Parameter Normal	Reason of dismissal	
		Small*	Large*1			Normal	Forced
Internal	Mean	0.00194	0.01614	Bad	Mean	-0.0169	0.03864
	T value	0.11617	1.89107*		T value	-3.0807*	3.3642*
	Number of the sample	11	23		Number of the sample	54	32
External	Mean	-0.01	0.01012	Good	Mean	-0.0106	0.01278
	T value	-0.5843	0.30576		T value	-1.9886*	2.78942*
	Number of the sample	10	7		Number of the sample	65	30

Note:

1. \*means it is significant at 10% level.
2. Small firms\* are defined here as those firms with relevant value of total market value lower than 0.5 and large firms \* are defined here as those firms with relevant value of total market value higher than 7.

#### Reason of Dismissals and Source of Successor

According to former analysis, we assume that normal internal turnover's market reaction is insignificant while forced outside turnover's market reaction is significant. However, after the interactive analysis of those two factors, I find that the market responds significantly negatively to normal turnovers while significantly positively to forced turnover and thus does not support the assumption.

#### Firm Performance and Source of Successor

As we can picture, there is more possibility that outside succession happen when the firm is bad performed and internal successions occur when firm performance is good. Therefore, we assume that outside turnover at bad performance has a significant reaction while internal turnover at good performance has an insignificant reaction. However, our finding does not support it. We find that both interactions are insignificant and only the market

reaction to outside succession at good performance is positive. This means that this assumption is also not supported by the research.

#### **Industry and Source of Successor**

According to the research by Parrino (1997), the homogeneity of the industry that a firm belongs to also correlates with the market's effect on the administrative changes. He argued that intra-industry CEO appointments are less costly due to less difference of firm-specific human capital between insiders and outsiders, and performance measures are more precise in homogeneous industry. And also, he got the result that the likelihood of turnover, forced turnover, and outside succession, together with the likelihood that a fired CEO is replaced by an executive from another firm in the same industry increase with the similarity of industry homogeneity. Based on this, we would expect that the incidence of external appointments will increase and the market's reaction to external succession will be more favorable with the increase of the homogeneity of industry.

Also following the research of Parrino (1997), we divide the industries into two categories, one is those with high similarity, including clothing, public service, excavation, houses, banking, farming, trading and information service, the other is those industries with low similarity, including industries other than the former ones. After making interactive analysis, we find the factor of difference industry has no significant influence on the market reaction to top management turnovers. Outside turnovers in the firms of industries with lower similarity has an insignificantly positive market reaction while others' market reaction is insignificantly negative, which is opposite to the assumption. The reasons for that, we believe is the intrinsic problems of the operation of Chinese stock market. According to our long-term observation, Chinese stock market rises and falls almost simultaneously and the difference of the stock price' changes in different industries is very small and insignificant since the macroeconomic policies play a leading role and the factors influencing the future earnings of firms only play a secondary role in the changes of stock price.

#### **Firm Performance and Reasons of Dismissals**

Due to intrinsic features of dismissal reasons, we expect the market has a significantly positive reaction for forced turnovers at poor performance while insignificant reaction for normal turnovers at good performance. The interactive analysis finds that the market reaction to forced turnovers is better than to normal turnovers for firms with bad performance and the market reaction to normal turnovers is relatively small although significant for firms with good performance. Such finding is consistent with the assumption.

## **Conclusion**

According to the discussion above, we get the conclusion that, generally speaking, the market reaction of top management turnover is insignificantly negative, which is consistent with Zhu & Lin (2003)'s finding and supports the second hypothesis, i.e. Scapegoat Rituals theory and also partly supports the third hypothesis of Bad Cycle theory due to their negative reaction.

After analyzing the factors influencing the market reaction to top management turnover, we find that performance of the firm; title and source of the successor have almost no influence to the market reaction. For firm size, only small firms' administrative turnovers have significantly negative market reaction and the market responds insignificantly positive to administrative turnovers in larger firms, the reason of which is possibly the relatively better mechanism of internal control in large firms strengthening the function of top management. What makes most significant influence to the market is the dismissal of top management. The market responds significantly negative to normal turnovers and significantly positive to forced turnovers with larger intensity.

For interactions among these factors, we find that the interactions between firm performance and origin of successor, industry and origin are insignificant. Firm performance and dismissal reason have a significant interaction. The market reaction to forced turnovers is better than the reaction to normal turnovers for firms with bad performance, while the market reaction to normal turnovers is relatively small although significant for firms with good performance, which is almost consistent with the assumption. The market prefers internal turnovers of large firms while there is no evidence for preference of the market to outside turnovers of small firms, neither is there any support found for larger magnitude of the market reaction to forced outside turnover than to normal internal turnover.

What is worthy mentioning is that the paper does not calculate the data to classify the industry according to the method of Parrino, but directly use Parrino's classification in the analysis of industry, which may result in unsteadiness of the conclusion about industry of the paper.

# **The Role of Source/Target Characteristics in the Application of Recommendations: A Taiwan Study on Buying Centers**

*Che-Jen Su*  
*Fu-Jen Catholic University, Taiwan*

## **Abstract**

The author follows interpersonal viewpoint and presents the results of a more complete study of the framework components. Responses in Taiwan are collected and used from a survey of 208 purchase decisions in a structural equation model linking source/target characteristics, the manifest influence, and the choice of recommendations. Support is found for hypothesized effects of expert power and the source's organizational level on recommendations. The use of recommendations and the target's dependence on the source are also effective in changing a target's behaviors and opinions in buying centers. However, some source/target related factors, which includes the source's organizational reasons to influence, the target's status and his or her dependence on the source, appeared to have unexpected but significant effects on this influence strategy. These findings provide implications for the impact that structural changes within dyadic relationship can have on the choice of recommendations.

## **Introduction**

The use of recommendations has been an important means or strategy to influence others in modern business environments. However, considerable research on recommendations applied in marketing topics has centered on inter-organizational contexts or marketing channels (e.g., Boyle et al., 1992; Frazier & Summers, 1984, 1986; Kale, 1989; Shamdasani et al., 2001), rare in it has been investigations trying to generalize these findings to intra-organizational contexts, such as those in purchasing committees (e.g., Farrell & Schroder, 1999; Venkatesh et al., 1995).

Moreover, previous research on influence dynamics in buying centers just defined all the members except the source in the decision unit as a single target (e.g., Dawes et al., 1998; Kohli, 1989; Venkatesh et al., 1995). Extending the findings from the group level to the individual level may lead to a locus problem or fallacies (Frankfort-Nachmias & Nachmias, 1992). Consequently, our insight into the personal effect of recommendations is limited, and we have little knowledge of the relative importance of the determinants from an individual source or target. These potential problems could be solved by incorporating some aspects from the studies on social influence, because the 80s has seen substantially increased attention devoted to interpersonal influence processes in organizations (Schriesheim & Hinkin, 1990).

The purpose of our study was to integrate the constructs derived from the literature into a single framework to test their relative effects on the use of recommendations, and analyze how recommendations impact other members in local buying centers. This paper concludes with a discussion of results, managerial implications, and suggestions for future research.

## **The Way Recommendations Work: Model and Relationships**

The proposed framework simultaneously encompasses the elements of influential issues advanced by Farrell and Schroder (1999), Kipnis et al. (1980), Rao et al. (1995), and Venkatesh et al. (1995) and thereby identifies the principal factors that constitute the potential antecedents of recommendations and their consequence. Implicit in our framework is the belief that the use of recommendations by influencers is explained by some target and source characteristics. The key constructs used in our model were defined to develop the context used in this study. They are manifest influence as the dependent variable, recommendations as the mediator variable, dependence on the source and target status as the target-related factors, and organizational goals, expert power, and organizational level

as the source-related factors.

As shown in Fig. 1, the major premise is that target and source characteristics have both direct and indirect effects on the use of recommendations and manifest influence in organizational buying decision-making. This model extends current thinking on the effectiveness of recommendations. First, it explicitly includes the perspectives from the standpoints of buying centers and social influence. Second, because interpersonal influence in the process of organizational buying decision-making gets involved with dyadic relationships, the effects of target and source characteristics are explicitly addressed. Finally, the notion that recommendations are a fundamentally useful tactic is elaborated upon and contingencies that moderate the emerging of recommendations are discussed.

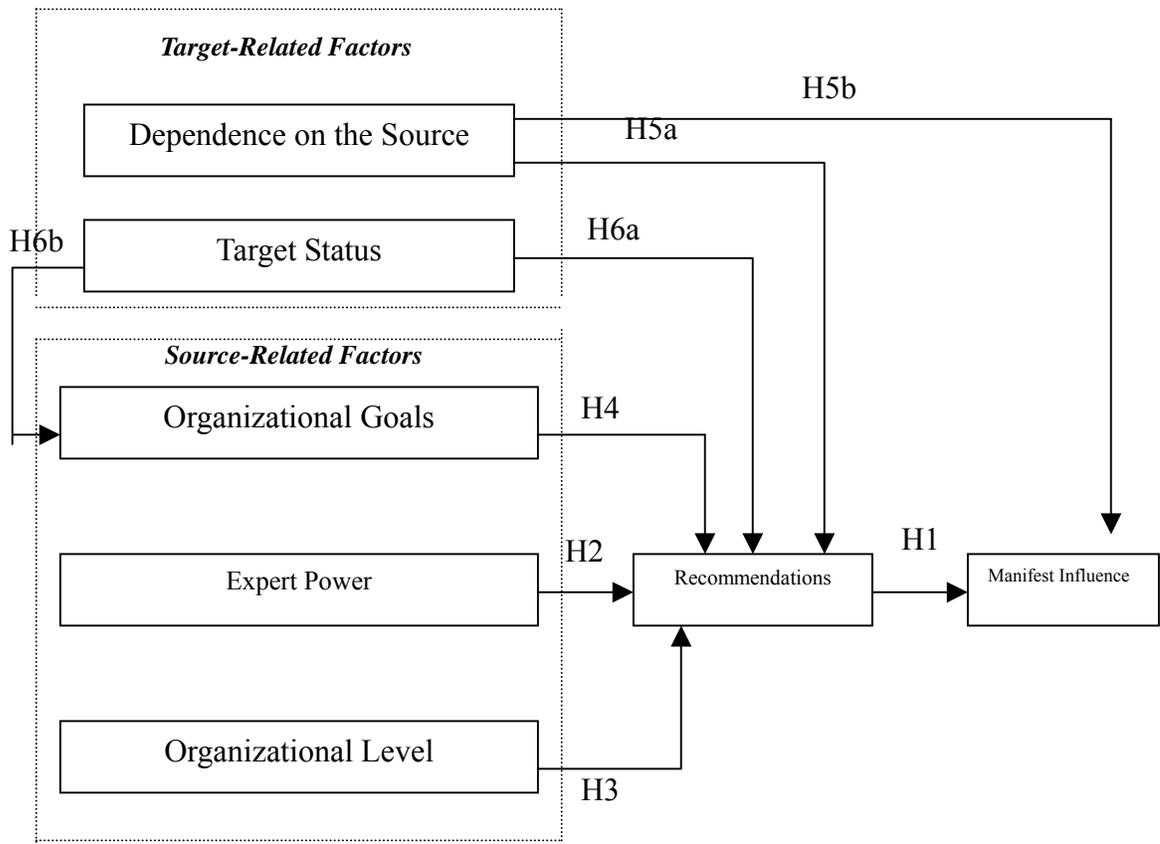

FIG. 1 HYPOTHESIZED MODEL OF RECOMMENDATIONS

## Methodology

### Sampling and Data Collection Procedures

Our sample was generated from a list of the members of the Chinese Association of Purchasing Management (CAPM) in Taiwan. Most of the potential informants were purchasing agents and from several dozen firms and nonprofit organizations in various sectors. This ensured that they were actively involved in organizational buying decisions, and more likely to be knowledgeable about the information needed.

We mailed a survey questionnaire to the offices of 395 potential informants with personalized letters explaining that the purpose of this study was to discuss purchasing-related issues. The initial mailing was followed two weeks later by a reminder and a second copy of the questionnaire. This procedure was repeated two weeks after

the first run. A total of 208 informants completed the questionnaire (52.7% response rate). The estimation procedure applied here was maximum likelihood estimation (MLE), and the sample size approximated a “critical sample size” of 200 (Hoelter, 1983). More than one half of the employing organizations were from manufacturing and financial service. The informants included in the analyses had been purchasing agents for an average of 5.8 years. Of the responding informants, 58% were male and 42% were female.

To ensure the interaction in a buying center to emerge and deliberation in the decisions-making, we selected a product or service purchased that was (1) more than US\$14,300, (2) with strategic importance for the organization to win a competitive advantage, (3) an infrequent purchase, (4) available from various suppliers and criteria, without an obvious choice in the involved members, and (5) decided on the final evaluation and selection phase of the purchasing process within the past 18 months (Dawes et al., 1998; Venkatesh et al., 1995). Additionally, to ensure variance in the influence attempt direction, the informants were divided into three even groups with each group directed to follow the same direction of influence attempts (i.e., upward, downward, and lateral).

#### **Development and Validation of Measures**

The measure of manifest influence was suggested by Kohli and Zaltman (1988) with minor adaptations to conform to the interpersonal context. Scales for recommendations were developed with the reference to the ideas of some previous research (Boyle et al., 1992; Frazier & Summers, 1984, 1986; Venkatesh et al., 1995). Expert power was adapted from the scales developed by Kohli (1989) and Venkatesh et al. (1995). Organizational goals were measured with scales suggested by Yukl and Falbe (1990) with adaptations. The literature review suggested the measures of organizational level (Rao et al., 1995) and target status (Kipnis et al., 1980). The scales developed by Ross, Jr. et al. (1997), with minor adaptations, were applied for target’s dependence on the source.

Analyses were conducted in order to create a refined set of valid measures before estimating the integrated model and testing the hypothesized effects. Although the hypothesized model in this research included only limited factors of broader taxonomies, the excluded factors were supposed to be taken in consideration to meet the validity testing requirement. With a systematically sampled data set of 50 informants from the same population, we examined the factor structure of the items by combining items assessing a specific taxonomy as a single model, such as six influence strategies (i.e., requests, information exchange, recommendations, promises, threats, and legalistic pleas), six bases of power (i.e., referent power, information power, expert power, reward power, coercive power, and legitimate power), and two individual goals (i.e., organizational goals and personal goals). Exploratory factor analysis (EFA) was applied with oblique rotation to the combinations and two independent constructs (i.e., manifest influence and dependence on the source) respectively to find and eliminate items that failed to load strongly (i.e., less than .35) on a single factor and weakly on other factors. Results showed that all of the factors’ eigenvalues were greater than 1.0 and other important statistics are presented in Table 1.

TABLE 1: SUMMARY OF EFA RESULTS

EFA model	No. of theoretical Factor	No. of item after deleted (No. of deleted item)	% of accumulated variance accounted for
Dependence on the source	1	4 (2)	41.54
Base of power	6	23 (5)	74.91
Individual goals	2	8 (0)	63.57
Influence strategies	6	24 (9)	73.64
Manifest influence	1	7 (2)	59.29

The reliability of each of the measures was assessed by computing its Cronbach’s alpha, and the outcomes were acceptable (alpha values range from .62 to .97, and are above the low standard of .35 thus). After the formal survey process, items were deleted from their perspective constructs if doing so increased the scale reliability. The final values of Cronbach’s alpha, higher than those from the pretest results, range from .72 to .97. Next, the items were confirmatory factor analyzed (CFA) using the LISREL model again to check their construct validity.

All models produced p-values of chi-square <.01 and the author might conclude that significant differences

exist between the actual model and proposed model. However, we should examine other measures as the number of indicators increased (Hair et al., 1998). Table 2 presents the summary of important indexes from the CFA solution. Results indicated that all standardized factor loadings to the single latent variables ranged from .5 to .95 with p-values <.01. Most of the models had values of goodness-of-fit index (GFI), normed fit index (NFI), and adjusted goodness-of-fit index (AGFI) >.9. Their values of root mean square residual (RMRS) were marginally acceptable.

TABLE 2: IMPORTANT INDEXES OF CFA RESULTS

CFA model	GFI	RMRS	NFI	AGFI	Non-Normed Index Delta 2
Dependence on the source	.89	.06	.90	.84	.91
Base of power	.90	.06	.92	.85	.97
Individual goals	.99	.03	.99	.94	.99
Influence strategies	.88	.06	.91	.83	.96
Manifest influence	.98	.01	.97	.94	.97

## Analysis and Results

### Model Estimation

An overall measurement model of legalistic pleas with 7 constructs and 22 indicators was analyzed using LISREL with MLE estimation. The fit statistics for the hypothesized model indicated the degree to which the model fit the data: p-value of chi-square <.01. We also examined other measures as the number of indicators increased (Hair et al., 1998). The values of the measures (GFI =.89, RMSR =.07, NFI =.86, AGFI =.85, and non-normed index delta 2 =.96) indicated that the model was at a marginal acceptance level (Bagozzi & Yi, 1988; Grandzol & Gershon, 1998; Tamimi, 1998). As seen in Table 3, the standardized factor loadings for all multiple-item constructs were positive and high (which range from .57 to .91) with p-values <.01, which indicated the convergence of the items to their responding underlying constructs.

TABLE 3 ASSESSMENT OF MEASUREMENT OF THE LISREL MODEL

Construct●	Indicator	Standardized factor loading
Dependence on the source  <i>Cronbach's alpha=.80</i>	1.S/he is essential to fulfill my task or achieve my goal.	.78□
	2.S/he is important to my present as well as future task-fulfilling or goal-achieving.	.78***
	3.I am quite dependent on him or her.	.64***
	4.S/he offers a unique set of benefits to my task-fulfilling or goal-achieving.	.57***
Expert power  <i>Cronbach's alpha=.88</i>	1.I felt s/he was knowledgeable about the company's needs with respect to the product to be procured	.77□
	2.I felt s/he was competent to make an assessment of the various options.	.88***
	3.I felt s/he knew exactly how the product would be used.	.75***
	4.I felt s/he had the expertise to make the best decision.	.79***
Organizational goals  <i>Cronbach's alpha=.82</i>	1. Asked you to do a new task or work on a new project or account.	.91□
	2. Asked you to do a task faster or better.	.72***

Recommendations	1. Made it clear that by following his or her recommendation(s), our business would benefit.	.66□
<b>Cronbach's alpha=.86</b>	2. Made it explicit, when making a suggestion, that it was intended for the good of our operation.	.74***
	3. Provided a clear picture of the anticipated positive impact on our operations his or her recommended course of action will have.	.78***
	4. Outlined the logic and/or evidence for expecting success from the specific action(s) suggested by him or her.	.73***
	5. Indicated that a better decision would be made by following his or her suggestion(s).	.72***
		.80***
Manifest influence	1. How much impact did s/he have on your thinking?	.77□
<b>Cronbach's alpha=.90</b>	2. To what extent did s/he influence the criteria used for making your final decision?	.82***
	3. How much effect did his or her involvement in the purchase process have on how you rated various options?	.73***
	4. To what extent did s/he influence you into adopting certain positions about the various options?	.66***
	5. To what extent did his or her participation influence your decision eventually reached?	.79***

\*:  $P < .10$ , \*\*:  $P < .05$ , \*\*\*:  $P < .01$ .

### Empirical Support

After model estimation, we applied one-tailed tests of significance to determine the significance of each cause-effect relationship. Table 4 provides the structural parameter estimates (standardized coefficients) of the hypothesized model. As predicted by H1, the use of recommendations has a moderately significant and positive effect on the source's manifest influence on the target (standardized coefficient = .35,  $p < .05$ ). In weak support of H2 and H3, a source with expert power or lower level in the organization tends to exercise recommendations to change the target's opinions and behaviors (H2 = .14,  $p < .1$ ; H3 = -.11,  $p < .1$ ). Counter to H4, organizational goals were found negatively related to the frequency with which recommendations are used (standardized coefficient = -.56,  $p < .05$ ).

The roles of a target's dependence on the source and his/her status with the organization were partly supported by our results. As predicted, the former was found to have a positive effect on manifest influence (H5b = .36,  $p < .01$ ), and the latter appears to relate negatively with organizational goals to influence others (H6b = -.30,  $p < .01$ ). Counter to H5a, however, a target's dependence on the source might be likely to enhance his or her frequency of recommendations to win compliance (H5a = .35,  $p < .01$ ). Against our speculation, a target's status may decrease the use of recommendations (H6a = -.35,  $p < .01$ ). To summarize, in general, the model estimated can explain most of the dynamics of recommendations used in our contexts.

TABLE 4: ESTIMATED EFFECTS WITHIN HYPOTHESIZED MODEL

Hypothesis	Effect	Coefficient	t-value	Empirical Support
H1 (+)	Recommendations→ Manifest Influence	.35	2.21**	Yes
H2 (+)	Expert Power →Recommendations	.14	1.93*	Yes
H3 (-)	Organizational Level →Recommendations	-.11	-1.65*	Yes
H4 (+)	Organizational Goals →Recommendations	-.56	-6.97**	Significantly Negative
H5a(-)	Dependence on the Source →Recommendations	.35	4.45***	Significantly Positive
H5b(+)	Dependence on the Source →Manifest Influence	.36	3.85***	Yes
H6a(+)	Target Status →Recommendations	-.35	-3.93***	Significantly Negative
H6b(-)	Target Status →Organizational Goals	-.30	-4.12***	Yes

\*:  $P < .1$  (one tailed), \*\*:  $P < .05$  (one tailed), \*\*\*:  $P < .01$  (one tailed).

## Discussion and Conclusion

Our findings suggest that legalistic pleas are substantially effective in bringing about changes in purchase decision-related opinions and behaviors of buying center members. In addition, results regarding the antecedents of recommendations concluded that target characteristics may not demonstrate clear effects on the choice of influence strategies but only facilitate compliance-winning. This dependence-influence relationship responds to the implications of previous research (cf. Brown et al., 1983; Bucklin, 1973; El-Ansary, 1975; Etgar, 1976; Skinner & Guiltinan, 1985). As we previously speculated, sources make greater use of recommendations that respond to expert power and their lower levels within organizations.

One finding against our hypothesis is that the target's status appears to have a negative effect on the choice of recommendations. This outcome implies that there may be no linear relationship between target's status and the rationality of influence strategies suggested by Kipnis et al. (1980). Our findings were also counter to the reasoning stating that when the target relied less on the source or when the source seek to improve the target's performance, assign work to the target, initiate change, or promote new ideas, the source would apply indirect and reasonable influence strategies such as recommendations.

In summary, the current study yielded results that appear partly consistent with theories and behavioral research in buying centers and social influence. This study provides some important insights into the effective application of recommendations as an influence strategy by individual buying center members.

## Limitations and Remarks

Our study is not without limitations that need to be acknowledged and remedied in future research. First, there are substantial differences in the measurement of influence strategies among studies (Yukl & Tracey, 1992). This has been a serious problem for researchers in making comparisons with previous findings and designing advanced research based on literature reviews. Thus, to integrate more research findings and prospects from various disciplines, a commonly accepted typology for influence tactics or strategies for empirical research should be developed and refined in the future.

Specifically, we applied retrospective, lateral, and self-reported data from targets, which could account for some of the difference between the source's and the target's reports on influence. Previous research suggested that descriptions of a source's influence attempt by targets may be insensitive to subtle forms of influence that are successful only if the target is not aware they are being used (cf. Yukl & Tracey, 1992). Furthermore, manifest influence described by the source in a decision-making process might be named as "perceived influence" (cf. Beatty & Talpade, 1994). Incorporating opinions of the source in the future could provide an unbiased report of actual behavior and dynamics, thus identifying the inconsistencies between a source's intentions and the target's perceptions (cf. Farrell & Schroder, 1999; Venkatesh et al., 1995). Ideally, research with experimental designs is needed to verify the effects of legalistic pleas on the consequences.

Finally, additional research is needed to expand the present model and explain the linkages among legitimating and several consequences (cf. Rao et al., 1995; Wayne et al., 1997; Wayne & Ferris, 1990). Despite these limitations, this study furthered the level of understanding of how legalistic pleas are perceived and used.

# **The Role of Risk Perceptions and Market Turbulence in the Internationalization of Foreign Companies to Africa**

## **Lessons from Finnish Firms in the Republic of South Africa**

*Evariste Habiyakare*

*Åbo Akademi University, Finland*

*Richard Afriyie Owusu*

*Swedish School of Economics and Business Administration, Finland*

### **Abstract**

This paper discusses the internationalization behavior of foreign firms in Africa based on their perception of risk and the way they manage market change and turbulence. The empirical lessons are based on fourteen qualitative interviews with seven companies carried out in Finland and South Africa. The study suggests that changes in the external and internal environment leading to a lower risk perception and increased positive expectations may lead companies towards more direct investment in African countries. The companies surveyed have increased their involvement in the South African market since the end of apartheid. The country is viewed as being advanced in many areas and as having a big untapped potential. However, a turbulent business situation caused by a high level of regulatory intervention and an undeveloped economy in some sectors is causing uncertainty for foreign companies.

### **Introduction**

Internationalization researchers have long asserted that the internationalization behaviour of companies is driven mainly by risk aversion and the perception of expectations, mediated by experiential knowledge and resources acquired by the firm. According to the Uppsala Internationalization Model firms will avoid markets that they consider risky and psychically distant. However, their behaviour is dynamic and they will consider moving into such markets as their perception changes and as they acquire more knowledge of the market [Johanson and Vahlne, 1990]. The variety of modes of internationalization used by firms lie on a continuum from very little involvement where the foreign company exports its products indirectly and avoids any direct involvement in the destination market to FDI where it establishes a jointly or fully-owned subsidiary in the destination market and undertakes market development strategies there [Johanson and Vahlne, 1990; Beamish, 1988]. Between the two extremes lie various operation modes like licensing, franchising, management contracts, and project operations. The amount of FDI a country receives is said to depend on its policies and on the national and international business environment [Lall, 2003; Borensztein et al, 1998]. For African countries, economic development could be hastened by FDI in which foreign firms establish subsidiaries for market development and production. While total foreign direct investments [FDI] to emerging, transitional and developing countries in general increased heavily from the mid-1990s, FDI to Africa decreased or stagnated [UNCTAD, 2001]. This happened despite the implementation of political and economic liberalization since the mid-1980s in many African countries [UNCTAD, 1999; World Bank, 2002]. Furthermore, this was despite the finding of the World Bank to the effect that “the least known fact about FDI in Africa is that the profitability of foreign affiliates of Transnational Corporations in Africa has been high, and that in recent years it has been higher than most other host regions of the world” [UNCTAD, 1999: 17].” Even though, a 21% increase in FDI for Africa to \$15 billion was recorded for 2003 compared with 2002, total foreign investment in Africa is still only about 2% of the world total [UNCTAD, 2004]. It is, however, noteworthy that the increase in investment for Africa in 2003 happened at the same time as total FDI to developed countries decreased by 25%. A major reason for the relatively low level of FDI to Africa is the perception of the continent as risky and unstable, and therefore the low positive expectations for the medium to long-term by the international business community. According to the World Bank [2003] investors were choosing mainly high-return projects due to the perception of risk and low positive expectations. In other words, most of the investment went to areas that brought high levels of

profit – mainly in oil drilling and mining. Relatively very few foreign companies have gone into market development within the local African market in either business-to-business or business-to-consumer areas.

The South African economy has been an exception in many areas. It is by far the most developed economy on the continent with a far higher per-capita income than the average of the rest of the continent [UNDP, 2004]. Some of its modern economic sectors are comparable to those of the developed countries. Particularly, its mining sector is among the most advanced and productive in the world. The sector depends on a varied range of minerals and boasts of some of the world's most important mining companies like the Anglo Platinum Ltd. Therefore, it is potentially a very important market for foreign mining companies, suppliers, sub-contractors and machinery developers. However, until recently, South Africa's economy was considered as risky as those of many African countries. Political changes leading to the end of apartheid and the establishment of majority rule have changed the business environment. Whereas the country was previously facing political and economic sanctions and was banned to any self-respecting foreign company, it has now gained respect and is open for business. Many new firms, as well as those that had previously divested, have entered the market. In many business circles the country is now considered an emerging market even in non-mining sectors, at par with economies like Brazil, South Korea and those of Eastern Europe.

One of the important characteristics of the South African market is the drastic difference between its modern "first world", and its traditional "third world" economy. The "first world" economy consists of technologically advanced companies that use modern business and management practices. The "third world" economy is driven by more traditional business practices, low level of education, and low level of modern business and technical skills, among others. One of the major cornerstones of the policies of the post-apartheid government is to integrate the two parts of the economy. The new government seeks to redress the severe social and economic injustices meted out to the non-white population during the apartheid era by insisting on affirmative action in employment, contracts and business ownership [Michie and Padayachee, ed., 1997; [www.info.gov.za/aboutsa/economy.htm](http://www.info.gov.za/aboutsa/economy.htm). Accessed 17.12.2004]. This has created a sense of turbulence in the business environment for foreign companies.

## **Problem Area, Aims, and Justifications**

The extant internationalization literature proposes that the internationalization decisions of firms are based on a complex calculation governed by risk aversion and expectations [Johansson and Vahlne, 1977; Johanson and Vahlne, 1990], by the costs of producing within the company compared to externalizing [Andersen, Erik and Gatignon, Hubert, 1986], by rational economic analyses of ownership, location and internalization advantages in which the firm locates in foreign markets where its advantages can best be exploited [Dunning, 2000], or based on a network strategy where the firm uses its business relationships to move to lucrative markets [Johanson and Mattsson, 1995]. While the propositions above are applicable to all markets, contextual studies have concentrated on studies of developed markets. Even though research interest in emerging and transitional markets has recently been expanding, very little of the contextual research deals with African business issues, and internationalization of foreign business in Africa is still under-researched. Arnold and Quelch [1998] stress the potentials of all emerging and developing markets and suggest that firms should move in early to gain a first-mover advantage. Awuah [1997] studied how the capabilities of local firms sub-contracting to a multinational located in Ghana developed through their market relationships. He found that the both the local firms and the foreign investor benefited from the relationships. Owusu [2002] suggested that project marketing by industrial firms that were not ready to invest in the African market could provide them a valuable knowledge of the African market and relationships that they could build on later for greater involvement there. Boateng and Glaister [2002] studied the performance of joint ventures (JVs) between foreign investors and local companies in West Africa. They found that the success was constrained by lack of capital in the African market, the capabilities of the JV partners, and the level of mutual goals and motives. Some of these problems were a result of the national policy environments

The aim of this paper is to discuss the internationalization behavior of foreign firms in African markets as a result of their perception of risk and the way they manage market change and turbulence. More specifically, in the

case of South Africa, we investigate how the changes that occurred in the country impacted on the internationalization decisions of companies and how the companies have dealt with the apparently turbulent political, economic and social situation in the country. The general empirical lessons are based on a fourteen qualitative interviews with seven companies carried out in Finland and South Africa. One illustrative case of a Finnish business-to-business firm in South Africa is used to discuss and illustrate the evidence and implications.

The discussion should contribute to the general knowledge of international business and investment in African economies as well as ways of managing market change and turbulence. The evidence and implications of this paper provide insight into similar situations that exist in other African countries and may allow researchers and foreign companies to better understand the South African market in particular and the markets of many other African countries.

## Methodology

This paper is based on qualitative methodology. The ontology of this study emphasizes the importance of the subjective meanings and of social, political and symbolic action in the process through which humans construct and reconstruct their reality. The epistemology of this work is interpretive as it adopts the position that knowledge of reality is a social construction by human actors [See Remenyi et al, 1998].

## Structure

First a conceptual framework of the role of risk, expectations and market change in the process of internationalization as well how companies manage them is presented. A summary of the internationalization process of the seven companies is presented followed by a brief case illustration of one firm. Finally, implications are drawn based on the lessons from all the interviews described in the foregoing.

## Conceptual Framework

### Risk, Expectations and Gradual Commitment in Internationalization

Internationalization is defined as a process of gradually increasing international involvement by the firm. The Uppsala Internationalization Model assumes risk avoidance and caution in the foreign market operations of firms. Firms internationalize more as their expectations of specific markets outweigh their risk perceptions. Furthermore, firms will start their international operations with modes like exports that require less resource commitment and that provide greater control and only much later establish subsidiaries and production facilities in the foreign market [Johansson and Vahlne, 1977; Johanson and Vahlne, 1990]. Calof and Beamish [1995] see internationalization as a process of adapting the firm's operations (i.e structure, strategy<sup>1</sup> and resources) to the international environment. The core elements in this definition lie in its economic and behavioural components. It also implies that internationalisation is a dynamic and evolutionary process [Covillo and McAuley 1999]. One part of the internationalisation consists of the firm's foreign business operations. It refers to international market development from the point at which a company made the decision to operate outside the domestic market. Furthermore, it refers to the growth of business, in terms of growing sales volume, growing turnover and growing profit in the foreign-market entered [Vincze 2004: 52]. This growth leads to increased complexity that may be associated with the adaptation process.

Table 1 classifies the internationalization modes on the basis of the extent of commitment to the foreign market they require. The most committed operation mode is foreign direct investment. The IMF [2003: 5] defines Foreign Direct Investments [FDI] as investment that involves "*a lasting interest in an enterprise resident in another country*". FDI includes not only the flow of new funds from abroad but also the reinvested earnings of the multinationals already doing business in the country and the sale of non-financial assets to the foreign subsidiary by the parent company. In this study FDI does not only relate to capital flows, as the financial markets around the globe are well connected. A subsidiary may raise funds locally whilst the headquarters may only provide management and

technical expertise. The important thing is that the foreign company commits itself much more to the destination market and has an interest in developing the market to its benefit.

TABLE 1: INTERNATIONALIZATION MODES

Level of Commitment	Low Commitment	Moderate Commitment. (Contractual Modes)	High Commitment	Full Commitment
Operation Mode	Export	Licensing, franchising, management contracts, project marketing	Joint venture, strategic alliance, formalized networks	Fully-owned subsidiary

Fig. 1 shows that the level of internationalization is measured in this paper by the extent of foreign business operations, which is due to the foreign business strategy of the company. The foreign business strategy is influenced by the perceived risks and expectations held for a particular market. The international business environment as well as the destination country environment influence expectations and perceived risks. Changes in expectations and perceived risks affect the strategy and the foreign business operations of firms. Events are important variables that affect the international and destination country environments. Strategy refers in this paper to the principal policies, goals and the decisions of the choice of products, operation modes and geographical markets a company subscribes to [Hirvensalo, 1996:27].

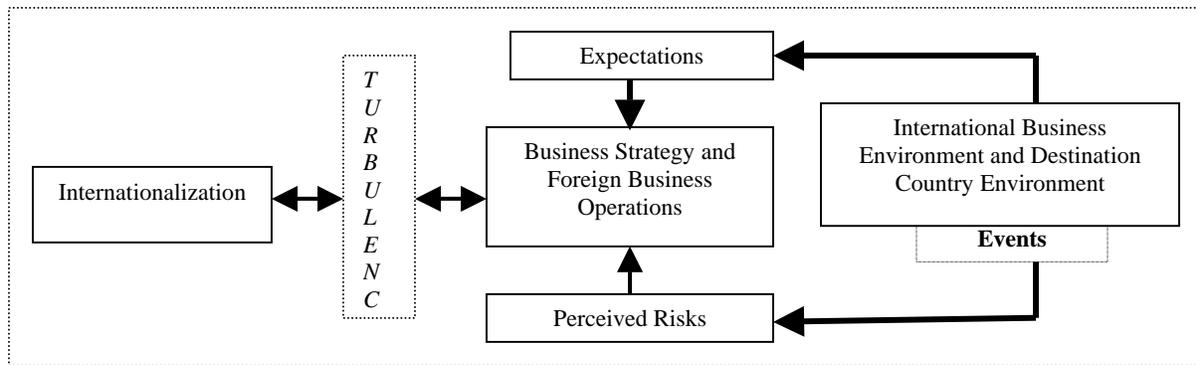

FIG. 1: A MODEL OF FACTORS INFLUENCING INTERNATIONALIZATION.

#### Events Embedded in Time in Foreign Market Expansion

In the history of each nation, there have been events or happenings that could be directly related to the foreign market expansion of foreign firms. In this case an event is defined as

*“an outcome of acts or changes caused either by human beings, political systems or by nature within or outside the business environment”* [Törnroos & Hedaa, 1997].

Events will have a meaning in the minds of the actors once noticed by them. Events could be caused by or exacerbated by politicians, political parties, labour organisations, institutions, and international bodies. From the business point of view, the outcome of events may help the managers to assess whether to enter a market, increase their business activities or to reduce them or even withdraw (in an extreme case) given the signals/stimulus and interpretation that follow an event.

For foreign market entry and expansion in developing, emerging or transitional markets, there are different socio-political and business events that occur at different periods of time within a country or between different market actors who have “histories, surroundings and values as well as future expectations and goals” [Törnroos & Hedaa, 1997]. The period of time and events connected to that specific time might dictate the types of operation

strategies to adopt during the market expansion. Looking at the foreign market expansion process, the interplay of time and events may act as a trigger for the corporate internationalization decision.

In an African context the general perception of risk and turbulence of the African market is the background for the low level of FDI in Africa. The perception of risk and low expectations is very dynamic and reacts to a myriad of local and international events. The United Nations Conference on Trade and Development (UNCTAD) recently stated that the recent conflicts in Sudan and the Ivory Coast were scaring investors from Africa as a whole [news.bbc.co.uk, accessed 26.11.04]. In the case of South Africa, the end of apartheid was a massive change that started a new period in which the country became attractive for international firms which may, however, consider the situation turbulent due to the continuing great social, economic and political changes.

In this paper expectations and risks are perceptions of the interviewees. The authors do not make any attempt to measure these factors in any objective way by themselves. However, the events that cause changes in the international business environment as well as policy actions and other events of the destination country are studied by the authors in addition to the narrations of the interviewees.

## **Networks in Internationalization Strategy**

Business networks are here defined broadly to include both formalized and non-formalized cooperative relationships including loose cooperative relationships, strategic alliances, joint ventures and acquisitions. According to the IMP Network Theory, internationalization is no longer solely influenced by internal variables of the focal firm, but its network relationships to external entities and also by external market variables [Johanson and Mattsson, 1995; Axelsson and Johanson, 1992]. It is argued that interaction in networks can also enhance the foreign market knowledge of the firm, which in turn determines the consequent decision to commit resources to a certain market. Thus, business takes place in a network setting where different business actors are linked to each other through direct or indirect relationships. The crux of the approach is that companies can internationalize by using their network relationships, and by establishing new relationships. They will exchange resources with others to receive complementary resources. Therefore, in markets like Africa that they consider to have a high level of risk, or where they have inadequate knowledge, but that have good expectations, they can achieve successful market entry by cooperating with other parties who provide complementary resources [Owusu, 2002].

## **Summary**

In this paper a perception of risk is seen as implying a low level of positive expectations for the market. It is assumed in line with the Uppsala Internationalization Model that a perception of a high level of risk reduces the level of internationalization. However, changes in the market environment in terms of positive local or international policy or environmental changes will lead to reactions by international companies who will commit more to the market. The policy or environmental changes may be defined as critical events. Companies entering or expanding their operations may use networks with local or international firms to manage the situation.

## **The Study Context**

South Africa is rich in natural resources. The discovery of diamonds in 1867 and gold in 1886 constituted the beginning of a century of growth, at a pace that was among the fastest in the world. This process was fuelled by a combination of a high rate of capital formation and low wages for a majority of the population. After World War II, the manufacturing sector gradually became the most important contributor to GDP. Unlike its counterparts in the rest of Africa, South Africa's manufacturing industry is the largest sector of the national economy. However, the country was considered a pariah state due to its apartheid policies and economic sanctions imposed on it scared self-respecting companies from establishing there. Exports became the only possibility for many foreign companies. At the same time the sanctions forced the apartheid economy to be self-reliant. Therefore, after the lifting of sanctions

the apartheid economy was not battered but resilient, especially in the mining sector. The economy and the population of the country have grown since the end of apartheid [[www.info.gov.za/aboutsa/economy.htm](http://www.info.gov.za/aboutsa/economy.htm), Accessed 17.12.2004]. At the same time, the cessation of sanctions against South Africa in the 1990s exposed local companies to international competition. This happened through privatisation of state firms and through the opening of the markets to foreign competition and the rise of new ownership in some cases [[www.info.gov.za/aboutsa/economy.htm](http://www.info.gov.za/aboutsa/economy.htm), Accessed 17.12.2004]. Competition on the local market is strong and the customers for industrial products are becoming more and more global players. This is putting pressure on both local and foreign suppliers to compete with high quality, low prices and other means as in the western markets. According to our interviewees, the unpredictability of the institutional changes, brain drain, inflation and exchange rate fluctuations combined with latent socio-political problems in connection with newly-heightened expectations, unemployment, high crime rates in some areas and the HIV epidemic are some factors that reflect some problems in the country's business environment (Source: interviews with managers done for this study). An important fact for the mutual economic development between South Africa and the rest of the continent is that currently South African firms are among the most important investors in the rest of sub-Saharan Africa. 15% of South Africa's exports go to the rest of Africa against 4.2% of imports giving the former a large balance of trade which is the largest of all regions.

## **Data Collection**

The empirical data has been collected through qualitative research undertaken with seven companies in Finland and South Africa. A total of fourteen interviews of about 1-2 hours each were made with managers and other relevant people in South Africa and in Finland during two separate time periods in 2002 and 2004. In addition to interviews, secondary material from the companies and desk research have been used. Seven companies were studied and they can be classified into 4 different groups: mining, pulp and paper, process technologies, and project consulting. The data has been interpreted and analysed through a multiple-step qualitative process of data reduction, data display and conclusion-drawing by the authors [see Miles and Huberman, 1994; Ghauri, 2004].

### **Case Analysis**

Based on the aims and conceptual framework outlined above, the case data for all the seven companies is summarized in Table 2 and discussed in this section.

All the companies are in the business-to-business field. Metso Minerals, Outokumpu and Tamrock-Sandvik deal in crushing equipment and other processes for the mining industry. Larox deals in pressure filters which are used in the mining, food and pharmaceutical industries. Metso Automation deals in systems for the pulp and paper, and other process industries. Raflatac is specialized in making labels for several industries. Jaakko Pöyry is a consultant in the pulp and paper, forestry and other industries. In addition, all the companies provide services related to their products and prefer to be on the ground and establish close relationships with their customers. All of them had been interested in the South African market but only exported to it through agents before the end of apartheid in 1990. The interviewees agreed that the most significant changes in the South African context have been the political move from apartheid to majority rule. President Mandela going out of prison, his call to put the past behind, and the lifting of all United Nations sanctions were important events. They became confident that their investments would be profitable. Their trust in the economy increased further after the democratic elections in 1994. However, the exact type of commitment and investment strategy pursued was dependent on the type of industry of the firm and its general internationalization strategy.

TABLE 2: A SUMMARY OF THE INTERNATIONALIZATION PROCESS OF THE SEVEN INTERVIEWED COMPANIES.

Company	Metso Minerals	Outokumpu	Tamrock –Sandvik	Metso Automation	Larox	Raflatac	Jaakko Pöyry
Type of operation before end of apartheid (before 1990)	Exports through an agent. Subsidiary Nordberg, purchased just before end of apartheid, was present in RSA.	Exports through agents before 1990	Tamrock had 4-5 agents in RSA	Exports through agents before 1990.	Exports through agents before 1990	Exports through agents before 1990	Installation and servicing of paper mills. Exclusivity with the biggest customer from 1970 until 1990.
Types of changes influencing their operations: RSA or international event or policy?	End of apartheid Cessation of UN-sanctions New government guarantees foreign investments Liberalization of the market Expanding demand.						
Direction of changes in expectations and risks	Expectation towards positive development and low risks Mainly positive expectations since 1990.						
Type of changes in strategy as a result of changes	Decided to increase commitment in RSA RSA seen as base to expand to the rest of Africa						
New operation modes: moving to higher commitment modes?	The SA operation was bought back. Rauma acquired Svedala in 2001 Assembly, sales, marketing distribution and servicing. Local production. Acquisition of one foundry to control ownership and minimize risks. Investment in R&D in RSA	Moved from exporting from Finland to assembling, sales, marketing, distribution and manufacturing in the RSA. Agreement with subcontractors Cooperative arrangements with some competitors Established a wholly owned subsidiary after 1990	Holy OS & 72 stocks branches in Africa. Organic growth Assembling and manufacturing. Project Marketing. Investment in R&D. Investment with 50-50 equity loan participation. Customer driven strategies	Wholly-owned subsidiary and spare parts workshops, assembling and manufacturing. Project marketing. Customer relationship and service based strategy. Intense partnership with customers	Wholly owned subsidiary, with workshops. Marketing, sales distribution and servicing. Project marketing, Join ventures on some projects with locals firms Branch office to start doing tests and product demonstrations to build trust	Sales, distribution and some manufacturing. Acquired a small local manufacturing plant and restructured it Established own subsidiary in 1999. Greenfield investment. Customer driven strategies	Building up local capabilities to reduce the involvement of expensive expatriates. Schooling and training programs. Increased network of offices in the region. Used RSA sub contractors. Mostly the heavy engineering side came from Finland Own RSA company 1990. Agreement to serve other customers as well
Level of perceived current uncertainty and risk.	Low	Low	Low	Low	Low	Low	Low

All the companies moved relatively fast to expand their commitment to the RSA market after the end of apartheid. Metso Minerals, Outokumpu and Tamrock-Sandvik followed almost similar paths. They invested relatively fast in alliances or fully -owned subsidiaries for sales, servicing and production operations in the RSA market. Due to the nature of their industry and the relative size of the RSA market, Larox, Metso Automation and Raflatac established own subsidiaries dealing mostly with marketing and service operations. For Larox and Metso, the core products are still made in Finland and marketed by their subsidiaries in RSA. Recently, Raflatac has established a small R&D laboratory in RSA and has started to supply the market from its production unit in Malaysia, which the company considers advantageous in both distance and cost benefits compared with Finland. As a consultant and project marketer, Jaakko Pöyry's investment in a country usually varies from an upgraded project office during the period of a project contract to a resident representative or market observation when projects have been completed. Therefore, its investment differs from the other six companies, being only in offices and computers as well as staff training. It faced a lack of local skills in the pulp and paper industry and was forced to depend on Finnish expatriates. This was expensive and the company later opted for a strategy of training local engineers and participation in sponsoring technical training in forestry management and pulp and paper technology.

#### **An Illustrative Case: Metso Mineral's Market Development in South Africa**

Metso Corporation is a multinational engineering company that designs, develops and produces systems, automation solutions, machinery and equipment for process industries. One of the corporation's four major divisions, Metso Minerals, covers the production and marketing of rock and mineral processing solutions for quarries, mines and civil engineering contractors. The segment also covers the cover compaction and paving as well as metal recycling equipments. Metso Minerals' specialty is the supply of complete crushing plants.

As a country with a large mining industry South Africa had always been a potential market for Rauma (which later changed name to Metso in 1999 after several acquisitions). However, the period of apartheid and the sanctions later imposed meant that Rauma could only export some mining equipment and machinery to the country's mines. Rauma acquired Nordberg and Svedala during the period of sanctions and sold the South African portion of business of the acquired Nordberg to its employees with a negotiated arrangement to buy it back later once the sanctions were lifted. As soon as United Nations sanctions ended, the company decided to buy back the South African operation and to establish a subsidiary in the country. At that time, Nordberg's equipment held the Number One position in South Africa. The market was also seen as a springboard for the wider African market, which is presently mainly served from there.

The company considers the internal South African market to be advanced and competitive. The customers (both local and international mining giants) know exactly what products they are looking for and are therefore knowledgeable negotiators. They are often financially solid companies who pose very little financial risks. Competition is strong and comes from both indigenous companies and foreign suppliers based in the country. Crushers being very expensive equipment, customers want to be sure they get dependable and durable products. The interviewee's view of the market and the commitment of his company could be summarized in the statement below: " South Africa as a market place is one of the best markets we are serving. There is a high level of knowledge of metallurgy and all linkage skills and services are available - the steel foundry, bronze foundry, etc. Therefore we have a ware parts supplier factory, so anything that our equipment need are made and served in the country.

The local factory has a role as a supplier of global components and components to other assembly lines in the group and to service the local and African market.

#### **Political and Economic Challenges, Risks and Problem Associated with Operation in the RSA**

According to all the interviewees, the main challenges come from trusting that investors would get a good return on their investment and especially that there is no risk for nationalization. Further economic and business challenges are the limited number of new customers; the large number of competitors; the exchange rate fluctuations and the inflation rate that tend to make products more expensive; the lack of skills especially due to the brain drain from the country; the lack of training of the majority of the population; government policies with regard to labour relations; the reserve bank requirements which may make it sometimes difficult to transfer money out of the country to other foreign suppliers; reverse engineering (pirate copies of products); and parallel importing. With regard to labour relations and the requirement for employing the formerly disadvantaged groups, many of the interviewees considered this a cause of difficulties for management as they believe that there is currently an inadequate number of

skilled people available within the former disadvantaged groups (like the black majority). The other challenges derive from the requirement by the government to use local contractors owned by the former disadvantaged groups. The giant customers, like the Anglo-Platinum require their suppliers manufacturing in the RSA to show and to produce plans of how they are using companies owned by the formerly disadvantaged groups. This may prove problematic for high tech companies like most of the Finnish firms who would feel compelled to use “inappropriate partners”. They believe that the quality requirement may suffer. In addition, most of the interviewees cited crime and HIV as social problems. On the general political level the interviewees considered it crucial that the ruling party and the president are trusted well enough.

## **Future Prospects**

According to the interviewees, there is a great deal of investment opportunities and there is a wide range, especially if one were to find partners from the former disadvantaged groups from within the country. According to them RSA is a growing economy with a lot of raw materials and mining related industries, and a big business capacity to fill to raise the standards of its “third world” sub-economy. Also the consumer market is growing because of the general improvement of the black population economically and socially, so consumer products are also a growing market. Regarding further investments, some interviewees cited ambiguity in the interpretation of some legislation as holding back investments. The biggest problem they faced in 2004 was the strengthening of the currency against the weakening US dollars. That put most of their projects on hold.

## **Implications and Conclusion**

Positive political, economic and market changes have moved companies into greater involvement in the South African market. The present study shows that companies will respond positively to changes that reduce the level of risk perception. Companies see great potential in the country’s market, as well as problems that are due to the characteristics of the economy. They will continue to react positively, but are, on the other hand, apprehensive and watching developments especially regarding the regulatory environment and the effect of the “third world” or “traditional” sector. Furthermore, RSA is seen as a beachhead for the remaining African market. Therefore, positive developments in the neighbouring countries could positively influence the level of investment of many foreign firms. However, UNCTAD’s [1999] study showed that the perceptions of Africa held by the international business community is much worse than the real situation on the continent. This makes foreign business leaders more pessimistic of Africa than other parts of the world with similar problems. The present authors believe that even though business leaders are getting better informed and are, therefore, getting more objective, the general picture of Africa portrayed by the Western mass media may make it difficult to convince shareholders. As the World Bank [2002] found, investments in Africa as a whole went mainly to high-return projects due to the perception of risk and low positive expectations. Therefore the rather positive result of this study may not allow for making a positive general conclusion for the whole of Africa.

The present study looks only at the behaviour of seven different Finnish firms in a few business-to-business fields. It is therefore recommended that the present study be replicated for different industries in order to analyse characteristics of each industry. The study could also be replicated for other African countries. It would also be of interest to compare the investment behaviour and motivations of non-Finnish firms in RSA. The other possibility would be to use the same approach to investigate behaviour of Finnish firms going to different emerging markets outside Africa.

*Case Western Reserve University, USA*

## Abstract

This research studies global and regional carrying capacities using system techniques. Food production and consumption, water supply and demand, energy, soil, and land are important factors determining a region's carrying capacity. Focusing on food and water issues, we use scenario analysis and multi-objective optimization with dynamic constraints to gain a better understanding of potential problems in self-sustainability and to propose possible policy solutions. Mathematical models are used to simulate population, economic conditions, agriculture, water supply and demand, carrying capacity and world food trade; scenarios are developed and multi-criteria goal programming is used to aid decision making. Our case study involves the food security relationship between China and Sub-Saharan Africa. The results show quantifiable relationship between policy and sustainability of each region. There is a quantitative impact of food demand pattern and production systems of China on Sub-Saharan Africa sustainability. Suggested policies are also developed to solve the present problem.

## Introduction

There were 840 million undernourished people in the world during 1990-1992. This number in the last estimates in 1998-2000 has only reduced by 20 million to 820 million. The reduction has not been only small but also uneven throughout the world. Between those period, that number in China has been sharply fell by 74 million while it increased by over 90 million in almost all other developing countries. [23]

Poverty and the imbalance of food production and demand among the regions of the world cause the food insecurity within certain regions, such as Sub-Saharan Africa. The number of food-insecure and malnourished people in most countries in this region has been increasing in recent years. This is a result of continuously high population growth rates, low agricultural productivity, environmental degradation, AIDS epidemics and weak science and technology infrastructure in the region.

China, located half way across the globe, is another country suffered with insufficient arable land, poorly distributed water resource across the country and overly high population. The country managed to reduce the size of malnourished people recently. However, data show that it relies on importing food to sustain itself. [5] Its import demand and capacity due to the region's economic growth may affect the world food stocks and prices. If there is a relationship between the two regions or any other regions through the world food trades, Sub-Saharan Africa's food-insecure number may be affected by heavily import demand of China. Since the region obviously lacks the ability to support itself in terms of food production and the available income to import enough food for its rapid growing population.

## Methodology and Modeling

The research focuses on using system techniques on global and regional carrying capacities. Mathematical models in a state space form are used to simulate the important factors to carrying capacities such as projected population, economic condition, agriculture, water resource supply and demand, and world food trade. A general state space form of the model can be represented as follows.

$$x(t + 1) = g(x(t), u(t), p(t), t)$$

$$y(t) = h(x(t), u(t), p(t), t), \quad t = 0, 1, \dots, N$$

given the initial state  $x(0)$ ,  $u(0)$ , and parameter  $p(t)$ ,  $\forall t \in [0, 1, \dots, N]$ ,

where

$x(t)$  is the state vector at the  $t^{\text{th}}$  indexed time period,  $x \in \mathfrak{R}^n \times \mathfrak{R}^R$ ,

$y(t)$  is the decision vector at the  $t^{\text{th}}$  indexed time period,  $u \in \mathfrak{R}^m \times R$ ,

$N$  is the number of the stages, and

$R$  is the number of regions.

More details can be found in [12] for the models on population, economy, food, water, and carrying capacity based on the state space form. The models need state variables and numerical values of the initial conditions and input parameters which can be seen from [12] and [25]. For accuracy purposes, some updates of those parameters will be needed. The relationships of models within a region are summarized in Fig. 2.1 whereas the relationship between regions of the world is shown in Fig. 2.2.

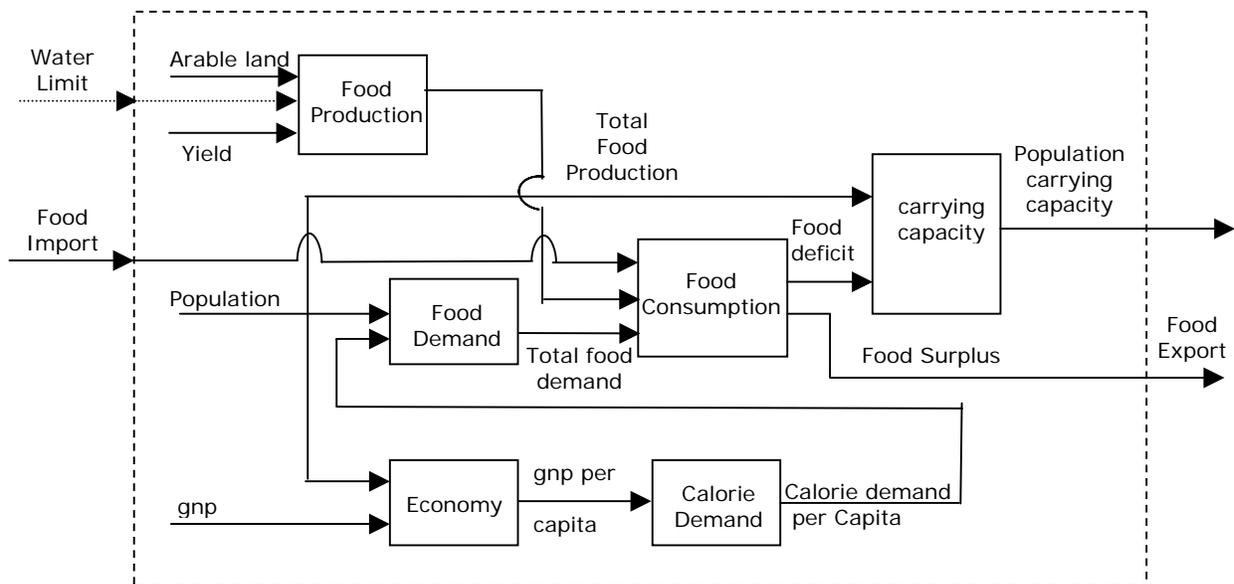

FIG. 2.1: REGIONAL MODEL DIAGRAM

[12] and [25] analyze a number of interesting possible outcomes to understand the problem better in many aspects by using the “what if” analyses which are done by creating the scenarios and conducting the scenario analyses. Goal programming optimization models are then developed to minimize food deficit of all regions since the food deficit is directly related to the region’s carrying capacity. We used several approaches to solve the goal programming problem. Resulting in this paper, the preemptive goal programming method is used. The goals will be given in the next section.

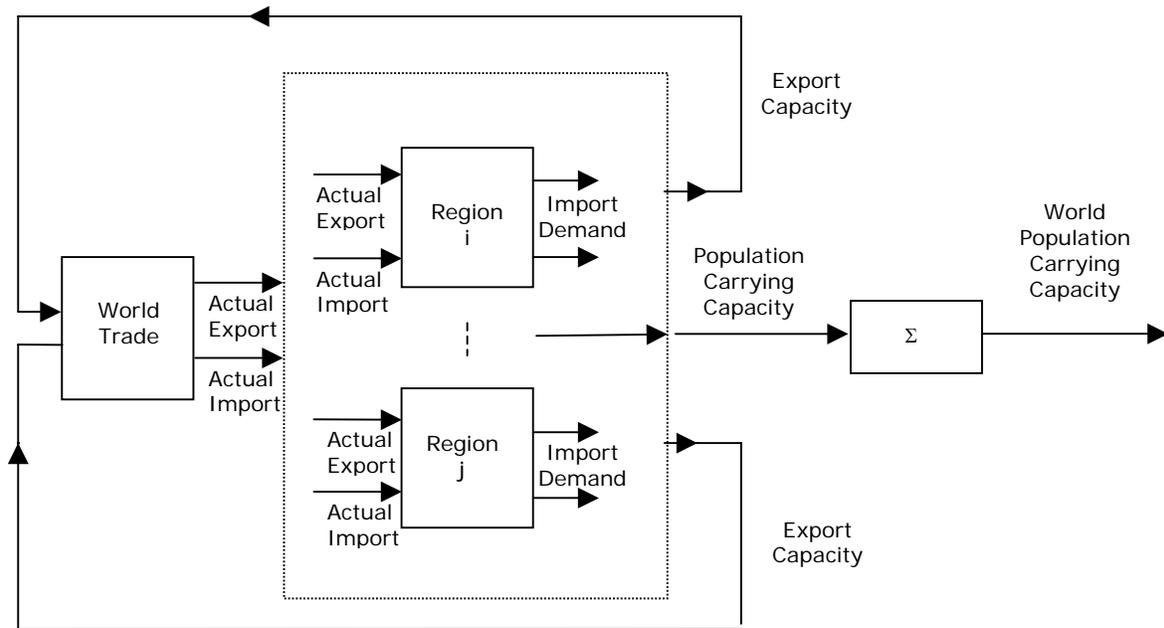

FIG. 2.2: REGIONAL RELATIONSHIP DIAGRAM

The generalization of optimization model is shown in the left side of Fig. 2.3 (P1) where the descriptions of the variables are defined as follows.

- $f_{i,t}$  be the food deficit of region  $i$  at period  $t$  ( objective function),
- $f_{i,t}^g$  be the goal region  $i$  at period  $t$ ,
- $x_{i,t}$  be the food import of region  $i$  at period  $t$ ,
- $k_{i,t}$  be the total food stock of region  $i$  at period  $t$ ,
- $l_{i,t}$  be the food stock target of region  $i$  at period  $t$ ,
- $m_{i,t}$  be the total food demand for region  $i$  at period  $t$ ,
- $n_{i,t}$  be the total food consumption for region  $i$  at period  $t$ ,
- $p_{i,t}$  be the total food production for region  $i$  at period  $t$ ,
- $q_{i,t}$  be the total food import for region  $i$  at period  $t$ ,
- $U_t$  be the world export capacity,
- $D_{i,t}$  be the food import demand of region  $i$  at period  $t$ ,
- $k$  be the food stock target efficiency,
- $R$  be the total number of regions, and
- $t$  be the period (year).

First attempt to solve the NLP directly using FMINCON in MATLAB toolbox failed since nonlinear optimizer in MATLAB is unstable. Since the problem is relatively large but the only nonlinear constraints are complementary slackness equations, we can handle the nonlinear part by using

$$n_{i,t} \leq s_{i,t} + q_{i,t}$$

$$n_{i,t} \leq m_{i,t}$$

and adding a term to the objective function to maximize  $n_i(t)$  so as to ensure that at least one of the above constraints is active. For example,  $-w_i n_i(t)$  is added to the objective function where  $w_i$  is a proper weight that will drive  $n_i(t)$  toward its upper bound defined by the above two constraints. The conversion of “max” constraints can be done similarly. The summary of the modification can be shown on the right side of Fig. 2.3 (P2).

The LP relaxation problem is theoretically easier to solve than the original NLP problem especially when the number of variables and constraints are numerous. The most difficult part for the LP relaxation problem is to determine the value of  $w_i$ . Generally, it is almost impossible to search for the proper value. Moreover, the value of  $w_i$  is sensitive to the input parameters and the initial conditions hence there is the need of human-machine interactions every time those figures change.

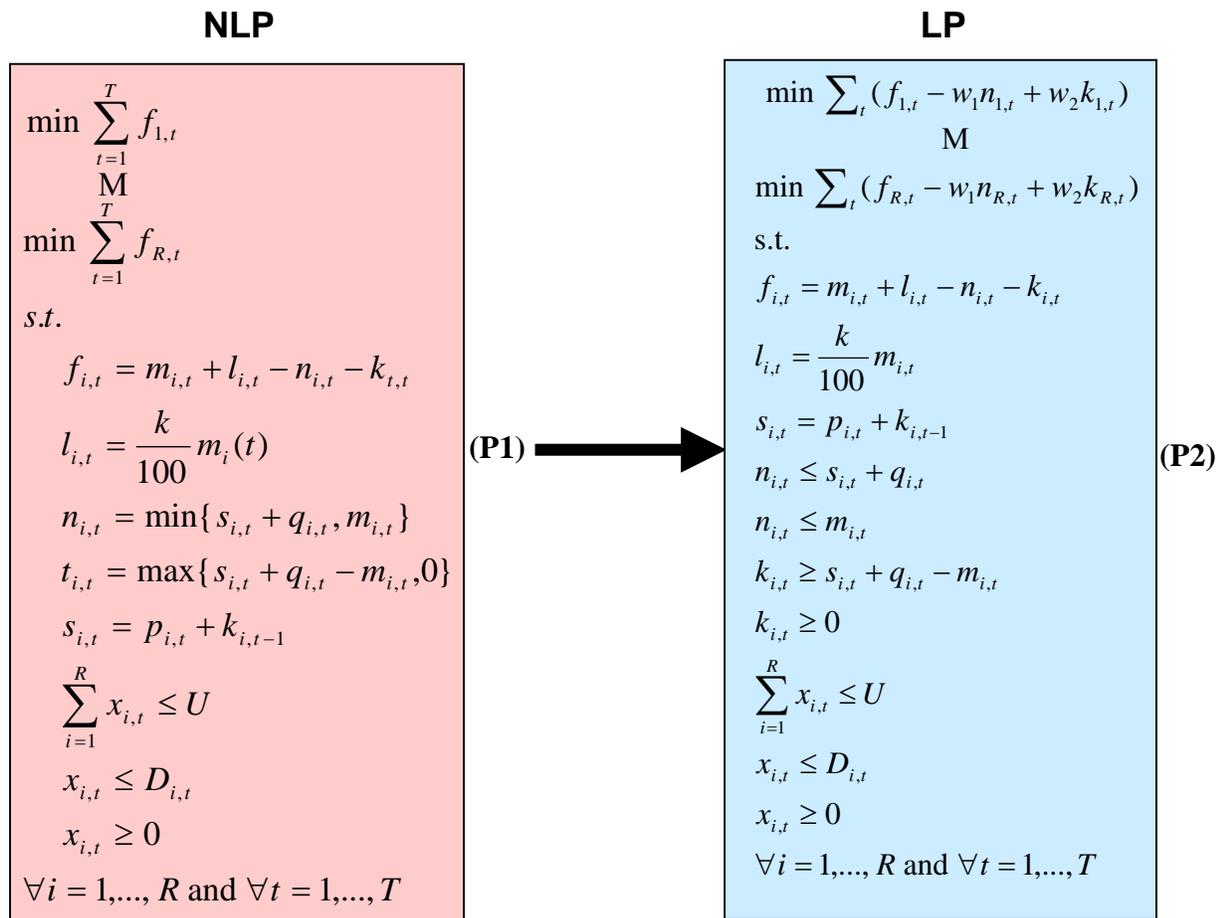

FIG. 2.3: OPTIMIZATION MODEL AND ITS LP RELAXATION

## Scenarios and Goals

We have to create different scenarios to analyze interesting outcomes to understand the problems better in many aspects. The first set of the scenarios are adopted to see the effects on food production and demand inside the regions. Note that the period of studying is 50 years.

- **Case 1** China BaU. China's meat sector demand and total feed grain follow the current trend until they reach developed countries' level then stay at that level through out the period.
- **Case 2** China Developed. China's meat sector demand and total feed grain follow the trend until they reach Developed countries' level at the end of the period.
- **Case 3** China Pessimistic. China's meat sector demand and total feed grain stay constant through out the period.

Since, we assume the relationship between the regions' grain via world food trade, the second set of the scenarios are conducted as follows.

- **Category A** Proportional Distribution. Global grain export capacity proportionally distributed between grain deficit countries
- **Category B** China First Priority. China has access to global export capacity first then other grain deficit countries will get equal share
- **Category C** Sub-Saharan Africa Least Priority.

As for the goal, the actual goal has to be meaningfully set by a policy maker of the country. For observation purpose, we first attempt to set the goal of each country's food deficit at zero. Since the food deficit of each region in the scenario analysis [12] is higher than zero, this is obviously an unachievable goal for some of the period (otherwise we will not have a food deficit). Hence, the weights for underachievement is then set to be zero since we actually would like to see food deficit being less than the goal, and therefore there is no need to minimize underachievement. Weight for overachievement of China's is higher than others for the second sub-scenario where China has first priority. Likewise, in the last sub-scenario where Sub-Saharan Africa has the least priority, its weight is lower than those of other regions. Using FMINCON in the optimization toolbox in MATLAB, we write a code to solve this goal programming.

The Goal of having the food deficit of each region brought down to zero ( $f_{i,t}^g = 0$ ) is not achievable so we attempt to solve the goal programming having the goal (food deficit) in each region according to the 1997 World Food Summit [23] to reduce the world hunger in half at the year 2015. We add the goal of the year 2050 to be half of that in the year 2015 and assume the food deficit to be linearly related to the number of underfed in a region. Thus, for each region  $i$ , and period  $t$ , the goals can be written as,

$$f_{i,t}^g = \frac{85-t}{70} f_{i,15}, \quad \forall i, \quad 16 < t < 50$$

$$f_{i,t}^g = \frac{30-t}{30} f_{i,0}, \quad \forall i, \quad 1 < t < 15$$

where

$$f_{i,0}^t \text{ is given for all } i$$

## Results and Discussion

To give better decision making information to the policy maker, we also run the BaU scenario of China's first priority with 10 percent increase in China's food production, and 10 percent decrease in China's food demand. Fig. 4.1 shows the food deficit of China and its goal. We can see that even with the additional 10 percent of food production and the 10 percent reduction in food demand, China's food deficit is still 800 million tons over the goal. Consider the expected Chinese grain demand per capita in 2050 of over 1 ton per capita, almost half of China's 2050 population will be starved. If China's government tries to manage the farm feed livestock to remain at the current

percentage, we can see a dramatic improvement in the goal attainment attempt. If nothing else is done, the world's food production will finally keep up with China's food demand in the year 2047. In the case that China increases its food production by 10 percent, it will be on the same track as the goal except during the years 2009-2042 when the total food demand is still higher than the total food production. If the food production cannot be increased but food demand can be reduced by 10 percent, its food deficit will be lower, and hence closer to the goal. It is only during period 2016-2037 that the food deficit will not meet the goal. If the Chinese Government can keep the farm feed percentage stable, reduce the food demand by 10 percent and add 10 percent to the food production, the goal of reducing half of the hungry in 2015 and another half in 2050 will be met.

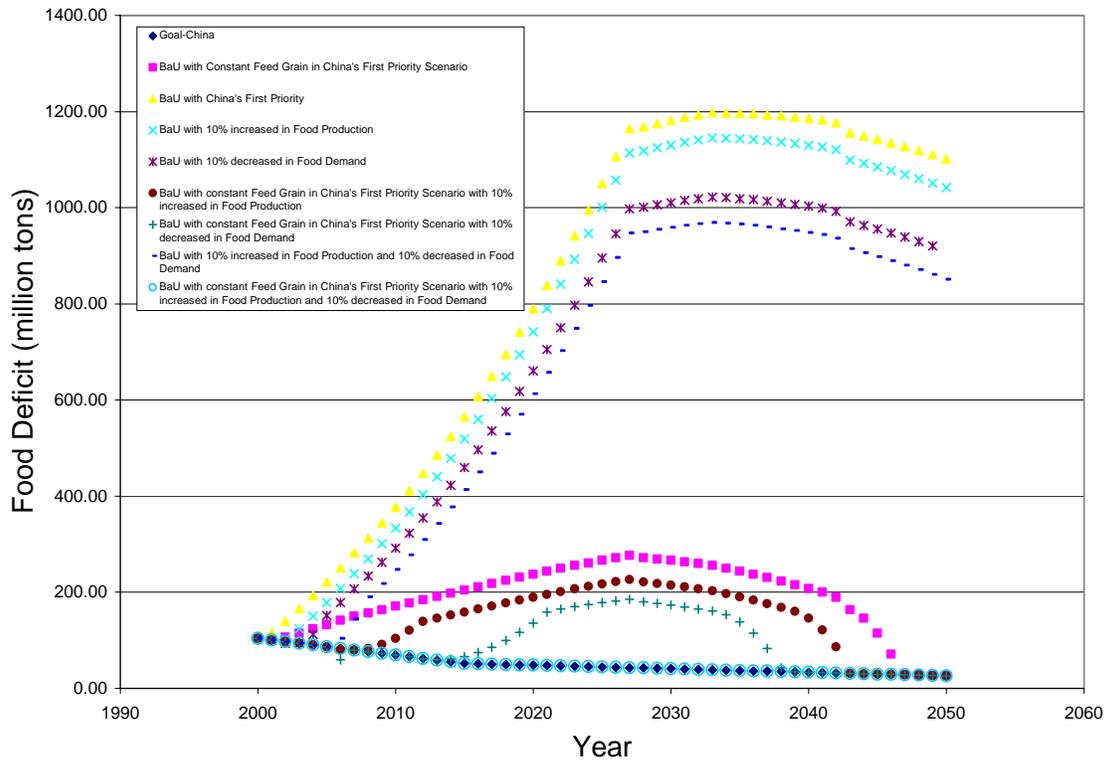

FIG. 4.1: COMPARISON BETWEEN GOAL AND CHINA'S FOOD DEFICITS IN SEVERAL POLICY UNDER BAU SCENARIO WITH CHINA FIRST PRIORITY TO EXPORT GRAIN

Fig. 4.2 shows Sub-Saharan Africa's food deficits and goals in China's BaU Growth Scenarios and China's first priority to world's export grain. The region suffers with about 196 million hungry people even with a relatively small amount of food deficit, a result of low food demand per capita. The region's number of undernourished will increase and will not be affected by China's policies other than the feed grain management policy. If the region cannot increase its own food production, the number of hungry people will continue to grow unless all China's proposed policies are fully operational. In that case, the number of underfed people will be reduced according to goal until the year 2008 where its undernourished population starts to climb to roughly 330 million (which is equivalent around 78 million tons of the food deficit) in 2027. This number will start to decline in the year 2028 when the proportion of China's animal product demand hits the developed countries' level. Nevertheless, the region's food deficit will not come back to the current level until the year 2038 and will not meet the goal (of ~\$60 million) until 2043. It can stay on track of the goal for only 4 years and the region's food deficit will be higher again until the

end of the analysis year. What the region really needs is not the impact of other region's good policies but a good policy of its own to take care of its chronic problems.

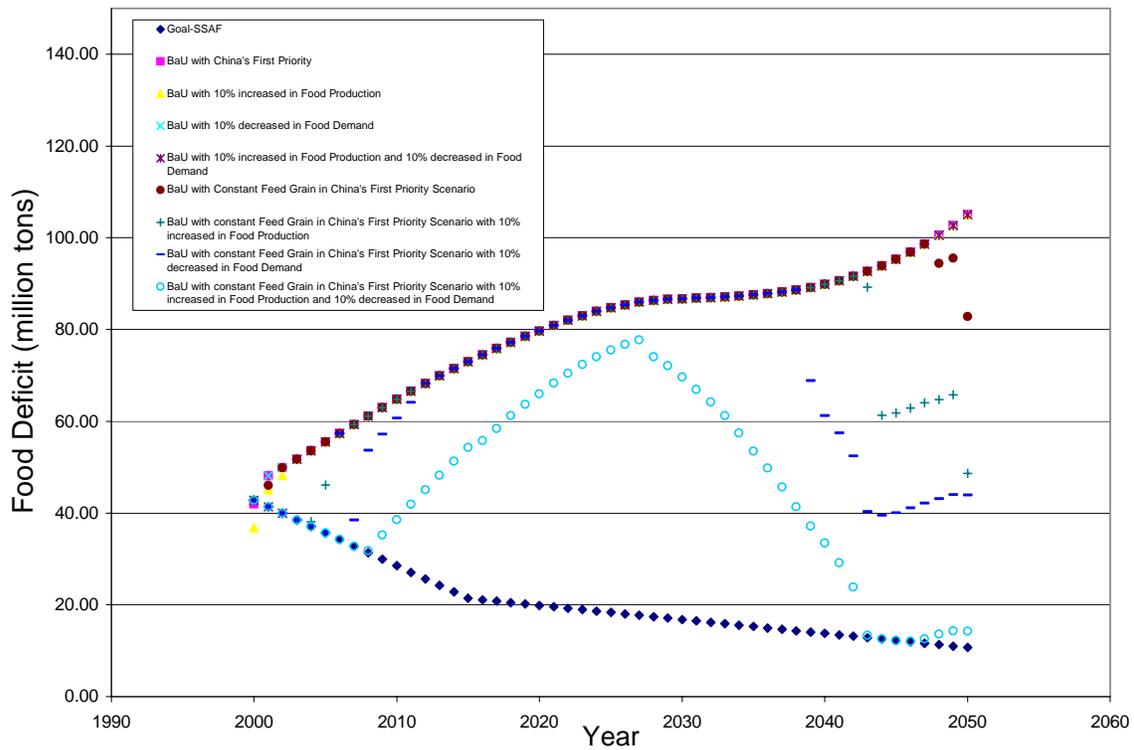

FIG. 4.2: COMPARISON BETWEEN GOAL AND SUB-SAHARAN'S FOOD DEFICITS IN SEVERAL POLICY UNDER BAU SCENARIO WITH CHINA FIRST PRIORITY TO EXPORT GRAIN

### Conclusion and Policy Suggestion

Rising demand of food and declining food productions are two main factors of China's ability to sustain itself, the question that has been the focus of investigations during the past decade. Both factors results from the combination of extremely high population, limited and declining amount of cultivated land, stabilizing yield growth rate, intensive water shortage, and blooming economy giving rise to diet changes, among others. We can see from Figure 4.1 that feed grain percentage may have the biggest impact of China's sustainability. Hence, if China remains the feed grain percentage and reduces 10 percent of its current trend food demand, China will be able to reduce the number of undernourished people in half (or 60 million people) in the next decade. If the increase only 10 percent of its food production is met, China will be able to reduce another half (or 30 million people) of that number. The two figures in the last section also show the effect of China's policies on Sub-Saharan Africa's sustainability. However, even with China's best policy, that number of Sub-Saharan Africa will not be reduced but instead will be doubled to approximately 330 million people in the next 20 years. This is the result of the over highly population growth in the region as well as the small food production and poverty due to AIDS epidemics and civil wars.

# **Human Resource Management in the Malaysian Malay Businesses: The Knowledge Management Perspectives**

*Mohmad Yazam Sharif  
Faridahwati Mohd Shamsuddin  
Universiti Utara Malaysia, Malaysia*

## **Abstract**

This paper aims to present some initial findings on the practices of human resource management (HRM) in the Malaysian Malay businesses. The Malays form 51 percent of the major ethnic groups in modern Malaysia with agrarian background. Malays are basically Muslims by religion and generally are perceived as staunch practitioners of the Islamic faith both in rituals as well as worldly affairs. As business people, they are still new and are still learning. 100 Malay entrepreneurs were surveyed. It was found that generally the entrepreneurs had employed a brand of HRM and business management, which they believed were in line with the Islamic principles. To them Islam encourages the seeking of knowledge which contributes to the welfare of human beings. Based on this perception, it can be said that some modern Malaysian Malays had made conscious efforts to manage their knowledge of people management as to them, managing people is managing business.

## **Introduction**

In modern Malaysia, the three dominant ethnic groups are the Malays, the Chinese and the Indians. Prior to 1969, the Malays were basically small time farmers and fishermen, the Chinese were mainly business owners and entrepreneurs while the Indians were mainly labourers in rubber estates. In terms of origins, the Malays were also the earlier settlers of South-east Asia including Malaysia. Consequently, the Malays opened up various states or regions in Malaysia and established ruling clans or sultanates to rule the land (The Chinese and Indians were brought into Malaysia from China and India consecutively by the British in the 19<sup>th</sup> and 20<sup>th</sup> centuries when they were ruling Malaysia as part of their colony). The descendants of these sultanates are still in existence to this day but the sultans are just ceremonial heads. The real political power of modern day Malaysia lies with the parliamentarians or members of parliament (MPs) elected by the people through the democratic election process every five years. The dominant political party then set up the Malaysian Cabinet headed by the Prime Minister. The ruling party in Malaysia since the country achieved its independence in 1957 is the same party known as the National Front (NF). The NF is not a 'single' party but a consortium of several parties representing various ethnic groups in Malaysia. However, the dominant parties within the consortium are the Malay party (called UMNO), the Chinese party (called the MCA) and the Indian Party (called the MIC)(Khuo, 2001). It is interesting to note that the Prime Minister of Malaysia since 1957 has always come from the Malay ethnic group in the following running order – Tunku Rahman, Razak, Hussein Onn, Dr Mahathir and Abdullah Badawi (the present Prime Minister) (Ismail, 2004).

In 1969, the Malaysian government had realized that within Malaysia's growing economy, there was an economic imbalance between the major ethnic groups namely the Malays, Chinese and Indians. If this issue was not addressed, the country might be facing some major social problems in subsequent years. The economic structure of Malaysia then was that the Chinese were deemed to be wealthy as they were dominating the business and commercial sectors with some Indians and foreign companies while the Malays and majority of the Indians were poor as they were based in the agricultural sector, a sector deemed to be a low income sector. The government came up an affirmative action plan known as the New Economic Policy (NEP)(1970 – 1990), designed to restructure Malaysia's economy so that Malays and Indians could move into the more lucrative business sectors (Gunawan et al., 1980; Khuo, 2001; Mohmad Yazam & Wan Shakizah, 2002). The focus of this paper is on the Malay entrepreneurs. They are basically Muslims by faith. In the Malaysian constitution, a Malay is defined as someone who subscribes to Islam as his/her religion, speaks the Malay language and adheres to the Malay culture. In Islam,

venturing into business is encouraged as the Quran mentions that nine out of ten opportunities are to be found in business. (Ismail & Muhammad, 2000). However, the Malays as a community lacks the business culture as they by tradition were small time farmers and fishermen (Muhammad Ali, 2003). When the government decided to implement the NEP, the Malays were shocked. Yet the government persisted and provided a lot of assistance in terms of financial aids and developmental courses in entrepreneurship and business management. Some researchers said the Malays were the 'most helped' groups in the world in this respect (Mazilan, 2003; Searle, 1998).

This paper aims to assess those Malay entrepreneurs in Malaysia with regard to their way of managing people and business. Since their emergence in business had started only some thirty five years ago, their attention would be expected to focus on developing skilled employees (managers, supervisors, administrators and other supporting staff) to help their business growth. The paper also tries to determine whether Islam plays any role in the Malay entrepreneurs' efforts to develop their businesses.

## **The Malaysian Malay Entrepreneurs – Their Characteristics**

The Malays are natives to Southeast Asia, but they can be found all over the world. According to the Malay International Secretariat, based in Shah Alam, Malaysia, there are 350 million Malays in the world (cited in Asiapac, 2004). The Malay diasporas of 20 million had spread to Suriname (South America), South Africa, Madagascar, Sri Lanka and the Australasias (the Pacific Isles). Most Malays, particularly those in Southeast Asia, remain proud of their nature and traditions in these modern times. Over time, many researchers (Abang Azahari, 1991; Asma, 1996; 2002; Barcelona & Valida, 1992; Clifford, 1897; Gunawan et al., 1980; Mahathir, 1986; Shahrudin, 1986; 1988; Sloane, 1999; Swettenham, 1984; Winstedt, 1981) had tried to explain the behaviours and identify characteristics of who the Malays are.

Asma (1996; 2002), for example, states that the Malays share some common denominator with other Asians in the values they hold such as respect for their elders, collectivistic orientation (emphasizing more on group needs rather than individual needs), the focus on harmonious relationships, a concern for face saving and a deep religious orientation (p.xiv). What differentiates the Malays from most Asian ethnic groups is their religious orientation. The Malaysian Malays are basically Muslims and they adhere to the Islamic faith.

## **The Malays and the Islamic Business Principles**

Even though some Malays could have been involved in business during the glorious days of the Malacca Empire in the 15<sup>th</sup> century, their involvement might be on a small scale (Ismail & Muhammad, 2000). Malays did not have a business culture as they were mainly farmers and fishermen (Khou, 2001; Muhammad Ali, 2003). When the British ruled Malaya (as Malaysia was then known) as part of the British Empire during the 19<sup>th</sup> century and most of 20<sup>th</sup> century, they practised the 'divide and rule' system where the locals (including the Malays) were left undisturbed (ibid). It was only after 1969, 14 years after Malaysia had obtained its independences from the British, did the Malaysian government came up with the 20-year New Economic Policy (NEP) (1970 – 1990) to help create a Malay or Bumiputera business community (Abang Azahari, 1991; Gunawan et al., 1980). The government set up many agencies to implement the NEP. In early 1990s, it was found that there were 10 ministries, 94 agencies and 1,137 government-owned companies which were involved directly or indirectly in assisting the creation of the Malay business community (Barcelona & Valida, 1992). The government plans to create the Malay business community were based on a mixture of western business management as well as some Korean and Japanese management (Mahathir, 1986). However, these plans were always implemented by taking into consideration that the Malays are Muslims (ibid). While building the business culture, the Malays were constantly reminded by the government that they must conduct their business in a fair, efficient and trustworthy (FET) manner (Ismail & Muhammad, 2000). The FET became the slogan of the government when Dr Mahathir became Malaysia's Prime Minister in the early 1980s as it reflected the Islamic values for running good government and also managing businesses. Apart from these values, in Islam, work (whether working for people or conducting businesses) is regarded as a form of worship to God (Asma, 1996). In carrying out their duties to God, Muslim entrepreneurs should be aware that they are

responsible to the customers for the products they sell and they are also responsible for their employees (ibid). In addition, Muslim entrepreneurs are also forbidden from indulging in business activities related to usury like interest-based loans and insurance (Ismail & Muhammad, 2000).

## **The Malay Businesses and Human Resource Management**

With the implementation of NEP, the Malays began to learn about the world of business and began to venture into various fields such as retailing, wholesaling, contracting, property development and manufacturing (Muhammad Ali, 2003). In terms of modern management, the Malay entrepreneurs picked the importance of strategic management, financial management and human resource management (ibid). They learnt the importance of quality management and continuous learning (kaizen) from the Japanese and they learnt the importance of networking and supply chain management from the local Malaysian Chinese (Ismail & Muhammad, 2000; Low, 2001; Mohamad Yazam & Wan Shakizah, 2002). However, generally the Malay entrepreneurs found that the foundation of their business growth lies with their employees as employees are organizations' greatest assets (Mohamad Yazam & Wan Shakizah, 2002). There are various interpretations of how people management or human resource management can be carried out (Mondy & Noe, 2005; Pickford, 2003; Price, 2000; Selvaraj & Devi, 2002). Mondy & Noe (2005), for example, state that human resource management (HRM) functions must be linked to an organization's business strategy to make it work. They categorize the HRM functions into six areas – staffing, human resource development (HRD), compensation, industrial or employee relations, occupational safety and health and human resource research (ibid). The HRD functions are further sub-divided into training and development, performance management, career management, culture management and change management (ibid). Mondy & Noe's (2005) model of HRM seems to reflect what the Malay entrepreneurs should be doing.

## **Human Resource Management and Knowledge Management in Malay Businesses**

As employees are seen to be the most important assets of organizations by many employers (including the Malay entrepreneurs), the need to manage the knowledge (or knowledge management) of people management becomes important (Evans, 2003). Knowledge management should be on the human resource agenda (ibid). Several researchers (Davenport, 1997; Housel & Bell, 2001) have tried to explain the meaning of knowledge management. Sayed & Cheng (2004), for example, define knowledge management as a series of processes that manage the creation, dissemination and utilization of knowledge as well as measurement of performance. They added that the aim of knowledge management is to put together and organize knowledge to create a substance of value in knowledge (ibid). Bukowitz & Williams (1999) further added that knowledge management is the process by which the organization generates wealth from its intellectual or knowledge-based assets. Both definitions bring forward the contention that managing people is the foundation of managing a business. Efforts put on finding out the best ways of managing people would further develop the business.

## **Research Questions**

What are the Human Resource Management (HRM) practices in the Malaysian Malay businesses? Malaysian Malays as a community is still new to the business world. They were introduced to business as part of the Malaysian government's initiatives through the New Economic Policy (NEP) (1971-1990). Various educational and training programmes were implemented by the government to educate the Malays about business and finance their ventures through the setting up of several agencies over time (Muhammad Ali, 2003). At the same time, the government was sensitive to the fact that the Malays are Muslims who adhere strongly to the Islamic faith even though the degree of adherence may differ among them. But has religion (that is Islam) played any role in determining the HRM practices among Malay businesses?

## The Conceptual Framework

The conceptual framework for the study comprised the demographic factors as the independent variables, manager's perceptions of knowledge management as the moderating variable and the human resource management (HRM) practices as the dependent variables as portrayed in Fig. 1.

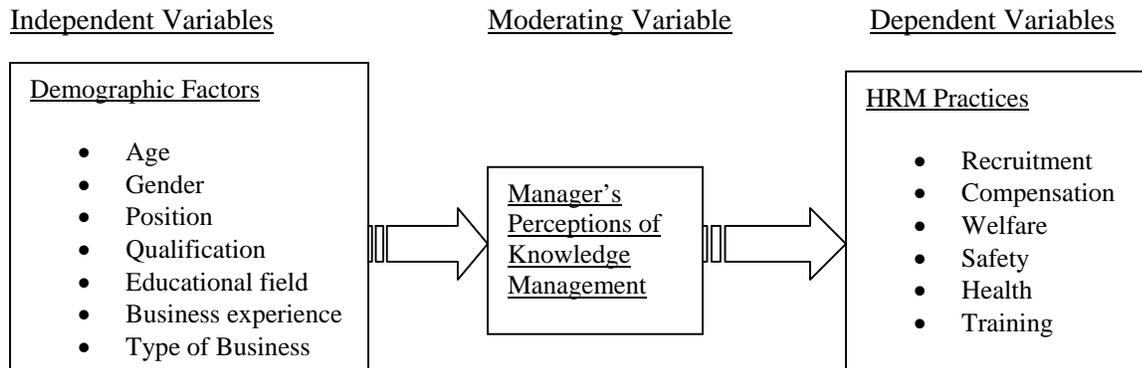

FIG. 1 FACTORS INFLUENCING THE HUMAN RESOURCE MANAGEMENT PRACTICES

## Methodology

### Research Design

Since the study was meant to cover the whole of Malaysia, the survey design was considered suitable to be undertaken. In terms of cost, survey is inexpensive (Gall et al., 2003).

### Sample and Unit of Analysis

A Malaysian-based business association called "PERDASANA" was selected from one of Malaysia's websites: [www.perdasana.org.my](http://www.perdasana.org.my). It was established five years ago and focused its activities affecting small to big businesses. It has 500 firms as its members coming from eleven state branches – Penang, Kuala Lumpur, Selangor, Perak, Johor, Trengganu, Kelantan, Kedah, Negeri Sembilan, Malacca and Labuan. From the 500 individual members, 150 individuals (30 per cent) were selected from the Perdasana website directory using a simple random sampling method. Sekaran (2000) views that the sampling figure is acceptable.

The unit of analysis would be the individual respondents who were members of the business association known as Perdasana.

### The Questionnaire

The survey questionnaire comprised three parts. Part I has eight questions on demographic factors. Part II has six statements on knowledge management perceptions while Part III has nineteen statements on human resource management (HRM) practices. Part II and Part III used the Likert scale of 1 to 5 where 1 represents strongly disagree and 5 represents strongly agree.

### The Reliability Test on Statements in Part II and Part III of the Questionnaire

The Cronbach Alpha reliability test was used. The reliability test values showed 0.75 for Part II and 0.78 consecutively. The overall test value was 0.765. These figures indicate that the questions posed were acceptable.

### Response Rate of the Survey

The study managed to get a response rate of 67 per cent. The usually norm for a survey in Malaysia is between 20 to 30 per cent.

### Analysis Tool

The data gathered were analyzed with the assistance of the SPSS software package version 12.

## Results and Discussion

This section discusses three aspects – the respondents’ demographic factors, the respondents’ perceptions of knowledge management and lastly the respondents’ human resource management (HRM) practices in their respective organizations. These were initial findings showing some descriptive statistics. For this paper, no attempts were made yet to show the relationships between the demographic factors, the respondents’ perceptions on knowledge management and human resource management (HRM) practices.

### Respondent’s Position

Out of the 100 respondents, 22 per cent were organizational chairmen, 21 per cent were managing directors cum CEOs, 17 per cent were CEOs, 13 per cent were human resource managers, 10 per cent were departmental officers and the rest were managers of diversified functions (Table 1). Generally the respondents were found to be senior officials of the organizations surveyed.

TABLE 1: RESPONDENT’S POSITION

Position	Frequency	%
Chairman	22	22
Managing Director/CEO	21	21
CEO	17	17
General Manager	10	10
Finance Manager	1	1
Marketing Manager	1	1
HR Manager	13	13
Administration Manager	1	1
IT Manager	1	1
Production Manager	2	2
Factory Manager	1	1
Officer	10	10
Total	100	100

### Respondent’s Age and Sex

As most of the respondents were senior officials, the age of respondents reflected this. 39 per cent of the respondents were between 41 to 45 years old; 15 per cent were between 46 to 50 and 12 per cent were between 56 to 60 (Table 2). Overall 81 per cent were between the age of 41 and 65. In terms of gender, 72 per cent of the respondents were males while 28 per cent were females (Table2).

TABLE 2: RESPONDENT’S AGE AND SEX

Age Group	Frequency	%
30 & below	4	4
31 to 35	8	8
36 to 40	7	7
41 to 45	39	39
46 to 50	15	15
51 to 55	8	8
56 to 60	12	12
61 to 65	7	7
Total	100	100
Gender		
Male	72	72
Female	28	28
Total	100	100

### Respondent's Educational Level and Field of Study

It was found that the majority of the respondents were highly qualified professionals. 74 per cent had first degrees, 14 per cent had masters degrees, 9 per cent had diplomas and 1 per cent had a doctorate (Table 3). In terms of their fields of study, 55 per cent studied business, management or economics while 14 per cent had qualifications in the technical or engineering fields (Table 3). Only 5 per cent had qualifications in Islamic studies.

TABLE 3: RESPONDENT'S EDUCATIONAL LEVEL & FIELD OF STUDY

<b>Qualification</b>	Frequency	%
School Certificate	2	2
Diploma	9	9
First Degree	74	74
Masters	14	14
PhD	1	1
Total	100	100
<b>Field of Study</b>		
Islamic Studies	5	5
Business, Management or Economics	55	55
Accounting	3	3
Agriculture	5	5
Technical or Engineering	14	14
Medicine	7	7
Law	8	8
Islamic Law	2	2
Dentistry	1	1
Total	100	100

### Respondent's Business Experience

Majority of the respondents were found to be experienced entrepreneurs. 37 per cent had between 11 to 15 years of experience, 29 per cent had between 16 to 20 years, 12 per cent had between 21 to 25 years, 7 had between 26 to 30 years while 3 per cent had between 31 and 35 years (Table 4). Only 4 per cent had below 5 years experience.

TABLE 4: RESPONDENT'S BUSINESS EXPERIENCE

<b>Years of Experience</b>	Frequency	%
5 years & below	4	4
6 to 10 years	8	8
11 to 15 years	37	37
16 to 20 years	29	29
21 to 25 years	12	12
26 to 30 years	7	7
31 to 35 years	3	3
Total	100	100

### Respondent's Business Type

It was found that the respondents were involved in various types of businesses. The main business types were manufacturing (32 per cent), contracting (10 per cent), property development (10 per cent), legal firms (8 per cent), medical clinics (7 per cent), hotel/chalet (7 per cent), restaurant (6 per cent), wholesaling (5 per cent) and retailing (5 per cent) (Table 5).

TABLE 5: RESPONDENT'S BUSINESS TYPE

Business Type	Frequency	%
Retailing	5	5
Wholesaling	5	5
Restaurant	6	6
Hotel or chalet	7	7
Contracting	10	10
Property development	10	10
Manufacturing	32	32
Land transport	4	4
Water transport	1	1
Air transport	1	1
Legal firm	8	8
Medical clinic	7	7
Dental clinic	1	1
Import Export	1	1
Private hospital	2	2
Total	100	100

#### Manager's Perceptions on Knowledge Management

The links between the respondents' background and the respondents' HRM practices were expected to be moderated by their perceptions on what they understood by knowledge management. The 'need to manage knowledge' would shape the respondents' way of practicing business management including HRM (Davenport, 1997; Evans, 2003).

Authors had agreed that knowledge management comprised at least six components – knowledge management concept, knowledge acquisition, knowledge codification, knowledge dissemination, knowledge sharing and knowledge application (Davenport, 1997; Evans, 2003; Housel & Bell, 2001). In this study, the mean scores on the knowledge management components showed that the respondents viewed their importance according to the following order – knowledge sharing (4.8500), knowledge dissemination (4.8000), knowledge application (4.7600), knowledge management concept (4.7500), knowledge acquisition (4.7000) and knowledge codification (3.4800)(Table 6). Except for knowledge codification, overall the respondents seemed to be quite aware of the idea of knowledge management.

TABLE 6: MANAGER'S PERCEPTIONS ON KNOWLEDGE MANAGEMENT (MEAN SCORES)

Manager's Perceptions on	Mean	Std Deviation	N
Knowledge management	4.7500	0.43519	100
Knowledge acquisition	4.7000	0.46057	100
Knowledge codification	3.4800	1.20168	100
Knowledge dissemination	4.8000	0.40202	100
Knowledge sharing	4.8500	0.35887	100
Knowledge application	4.7600	0.45216	100

#### Human Resource Management (HRM) Practices and Business Management

The focus of this study was on the Malaysian Malay businesses. As mentioned earlier, the Malays in Malaysia were basically Muslims and they adhere to the Islamic principles in the practice of worldly affairs, religious affairs, politics and businesses (Ismail, 2004; Ismail & Muhammad, 2000). The general Islamic principle in all affairs is to act in moderation as well as to foster goodwill and develop relationships among humans (ibid). People management or HRM is highly regarded whether in business or social activities (Ismail, 2004). Ideally, to Muslims, the fundamental to business management is human resource management. To manage people and business effectively, Islam encourages Muslims to have positive attitude towards knowledge and knowledge seeking (Ismail & Muhammad, 2000). Overall, the Malays were taught since they were young that in Islam, doing business, practising

good HRM and seeking knowledge are part of worship to God (Asma, 1996; 2002). But idealism and practice may be quite different.

In this study, 18 variables related to human resource management (HRM) practices (such as recruitment, compensation, welfare, safety, health and training) were developed and used in the survey. The mean scores on HRM practices showed that the respondents viewed their importance in the following order – trustworthy staff (5.0000), availability of praying rooms in the workplace (4.9900), experienced staff (4.9300), employee safety (4.8900), employee welfare (4.8600), employee health (4.8000), conduct business as one form of worship to God (4.7700), conduct HRM as one form of worship to God (4.7200), financial management and HRM are equally important in business (4.6900), always using Islamic loans for business (4.6700), people management is really business management (4.6300), practising HRM according to Islamic principles (4.4400), always using Islamic insurance for business (3.9600), skilful staff (3.5600), seeking employees’ opinions when making business decisions (3.0800), people management is less important than financial management (2.2200) and employee rewards (2.1900)(Table 7).

TABLE 7: RESPONDENTS’ HRM PRACTICES (MEAN SCORES)

HRM Practices	Mean	Std Deviation	N
Getting Trustworthy staff	5.0000	0.00000	100
Making available praying rooms at workplaces	4.9900	0.10000	100
Allowing male Muslims to perform Friday prayers	4.9900	0.10000	100
Getting Experienced staff	4.9300	0.25643	100
Ensuring Employee safety	4.8900	0.31447	100
Ensuring Employee welfare	4.8600	0.34874	100
Ensuring Employee health	4.8000	0.47140	100
View business as one form of worship to God	4.7700	0.48938	100
View HRM as one form of worship to God	4.7200	0.53333	100
Finance & HRM equally important	4.6900	0.69187	100
Always using Islamic loans for business	4.6700	0.72551	100
People management is really business management	4.6300	0.91734	100
HRM practices follow Islamic principles	4.4400	0.85658	100
Always using Islamic insurance for business	3.9600	1.26267	100
Getting skilful staff	3.5600	1.25786	100
Getting employees’ opinions when making business decisions	3.0800	1.22829	100
Managing people less important than finance	2.2200	1.05964	100
Employee rewards not important in business	2.1900	1.01200	100

## Conclusion

Generally there are many limitations to the study such as restricted sample and a weak instrument. In spite of these limitations, the study had found out that at least within the sample, most respondents had indicated that they had put high importance in managing the knowledge of managing their employees as the foundation to manage their businesses. Employees who are trustworthy, skilled and knowledgeable can contribute significantly to their employers and they are then subsequently reasonably rewarded. In addition, they believed in business, managing people is equally important as managing its financial matters. Within the context of current and future business environment which are becoming more competitive and more complex, the entrepreneurs surveyed also recognize the need for having more friends and networks. Thus based on their responses (in Table 7) they believed by practising their brand of knowledge management in managing people, they are not losing employees but gaining friends if their employees choose to leave them for other employment. By implication, they are the mentors while their former employees are their mentees. The outcome of this form of mentor-mentee relationship can likely result in a win-win situation for their businesses (Hiltrop & Udall, 1995; Lewicki et al., 2003). To them, managing people is managing business in the long run. This philosophy is in line with the Islamic business principles which emphasized that businesses should be conducted in moderation. Profits are no doubt important in any business but preserving human relationships (with employees and also customers) are equally important in ensuring that businesses can be sustained over time (Ismail & Muhammad, 2000).

# Privatization in the First Ten Years of the Transition Country: The Case of Kyrgyzstan

*Jyldyz Aknazarova*  
*Osh State University, Kyrgyzstan*

## Abstract

This paper focuses on analysis of privatization in the first ten years of the Kyrgyz Republic from 1991 to 2001. Since independence declared in 1991 Kyrgyzstan has undertaken significant economic and structural reforms of its economy. In 1994 the International Monetary Fund ranked Kyrgyzstan fourth among former Soviet Union countries in the pace of economic reform, but positive results have not been forthcoming. Privatization is presented as a process of transferring assets from public sector to the private sector. Privatization process began in December 1991 with the adoption of the Privatization and Denationalization Law and the creation of the State Property Fund as the Agency to design and implement the program. In late 1992, a new parliamentary “Concept Note” reoriented the program toward rapid sale of small enterprises and ownership transition in larger enterprises by vouchers and other special payments. By the end 1993, about 4,428 state enterprises, including 33 percent of total fixed enterprise assets, were fully privatized. By mid-1994, almost all services and 82 percent of assets in trade enterprises, 40 percent of assets in industry, and 68 percent of construction assets were in private hands.<sup>1</sup> Analysis of privatization over the 1991-2001 period of the transition country has shown the achievement in destroying the state monopoly, in retail and services, introducing competition, eliminating centralized economic controls, and restructuring and moving to a free market economy. It did not bring decisive changes in ownership within the Kyrgyz economy because the lack of management skills turned even profitable companies into losers whose assets were subsequently sold or plundered. The world privatization experience has shown that successful implementation of privatization creates an environment for stabilization and structural reforms. Over the longer term, there is a clear need to assist the Kyrgyz Republic to ensure that privatized enterprises have the opportunity to remain viable, to grow, and respond to their shareholders. Without attention to corporate governance and increased corruption, privatized enterprises could miss opportunities, expose their reputations to greater risk, and find themselves at a competitive disadvantage. Ultimately they will become less attractive to foreign partners and investors inside and outside the country. This, in its turn, will allow the country creating favorable conditions to attract foreign investments and encouraging a greater degree of entrepreneurship.

## Introduction

After the collapse of the Soviet Union in 1991, the Kyrgyz Republic declared its independence. The collapse of the Soviet Union gave rise to different political circumstances as well as to the new economic conditions for this country. Kyrgyzstan has decided establish a competitive market economy by accepting privatization centered. Most privatization (and almost all privatization in industry) was accomplished by creation of joint-stock companies, transferring enterprise shares to labor groups within them. Almost no public bidding for enterprise shares occurred, and the state maintained significant shares in enterprises after their conversion to joint-stock companies. Also, because the sale of shares was prohibited, shareholders wishing to leave the company had to return their holdings to the labor collective. The 1994 Law on privatization remedied this situation by providing for competitive bidding for shares in small enterprises (with fewer than 100 employees) as well as long-term privatization of medium-sized (with 100 to 1,000 employees) and large enterprises by competitive cash bidding among individuals. The new law also provided for the auctioning of all enterprise shares remaining in state hands, over undetermined period of time. In 1994 and early 1995, voucher privatization moved toward its goals quickly. By the end of 1994, an estimated 65 per cent of industrial output came from non-state enterprises.

However, privatization was not the final step in economic success in the Kyrgyz Republic. After privatization many enterprises needed drastic restructuring – in management and technology to function in a market environment. Many managers have no idea how to plan their activities in market economy. Nothing is being done to renew main production funds. No measures are undertaken to improve financial situation of enterprises. All these result in low profits, big losses, marketing and financial problems.

### Privatization Process in the Kyrgyz Republic over the 1991-2001 Period

As the author mentioned before the Kyrgyz Republic started the privatization process to transfer publicly owned enterprises to private hands after the collapse of the Soviet Union in 1991. The Kyrgyz Republic, like other transitional economies, pursued its own strategy in privatization.

In 1992, the Kyrgyz Republic embarked a broad program of stabilization and structural reform, including price liberalization, mass privatization and liberalization of the trade regime. Most prices were liberalized with the removal of all direct and indirect price controls, and as for trade policy, all non-tariff barriers to exports and imports were removed. A mass privatization program has placed approximately 1,000 primarily medium-sized and large enterprises and several thousand small businesses under private control. In Kyrgyzstan, the mass privatization was conducted in the following way: the whole adult population was given privatization coupons on a free and equal base, with further rights to purchase apartments or exchange them for shares of state owned enterprises. The coupons were easy to trade. But the market prices of the coupons were very low. The price of 100 coupons was 1.22-1.35 soms, one coupon being approximately 0.0008 US\$. Thus the distributed coupons equaled 0.625 US\$ per capita in the Kyrgyz Republic. As a result, the coupons were not considered seriously by their owners. The mass privatization without clear legal boundaries in the early 1990s resulted in mass corruption in which high-ranking officials and influential politicians (including the opposition) snatched up the most lucrative properties and businesses.<sup>2</sup>

This method was widely used in the Czech Republic, Romania, Poland, Russia and Byelorussia. Unlike other ways, it does not require financing, and it does not gain budget revenues. The main peculiarity of this method is that the privatization process is quick and socially acceptable by the population. But the weak point of it should be admitted: that is the fact that the real situation of enterprises after privatization remains the same with all its related problems: difficult financial situations, low profitability, out-dated technology, and insolvency.

The privatization process in the Kyrgyz Republic can be divided into three distinct phases, which are 1991-1994, 1995-1997, and 1998-2001. For each period, the number of privatized firms can be seen in Table 1 with respect to the sectors of Kyrgyz economy.

TABLE 1: PRIVATIZATION OF STATE OWNED ENTERPRISES IN KYRGYZSTAN, 1991-2001

Sectors	1990*	1991		1995		1998		1991

Source: State property Fund, Bishkek, Kyrgyzstan, 2002

#### Phase 1 1991-1994

This phase focused on establishing the legal framework and institutional infrastructure required to enable ownership of private property (other than land) and private enterprise. Land reform began with 17,000 peasant farms and new agricultural cooperatives being formed from a number of state and collective farms.

This period also saw two principal approaches to the privatization of companies:

1. A small-scale privatization program. The end of 1993 had sold more than 3,400 small-scale enterprises in retail trade, catering and services via cash auctions.
2. A mass privatization program (MPP). The Kyrgyz mass privatization program was designed to encourage ownership by outside investors in order to stimulate restructuring of enterprises. Enterprise managers have,

however, not only effectively maintained control of the majority of privatized firms, but have been able to increase their holdings since privatization. This is the result of the purchase of majority positions by enterprise managers directly from the state during the privatization process, or from other investors during the several years following privatization.

Special payments were issued, the amount each citizen received depending on employment records. The vouchers could be used to buy public housing or partial payment for the privatization of medium-scale or large enterprises. The percentage of equity of such enterprises reserved for sale for vouchers was determined on an individual basis, but could not be less than 24%.

Negative aspects of this phase:

This voucher program turned out to be an inefficient and restrictive instrument of mass privatization because:

- Vouchers were not tradable and therefore had no market value
- Vouchers distributed only a small percentage of the equity of individual enterprises and offered no opportunity for change in control and management
- Vouchers were time-limited and most of them were not even used

Positive aspects of this phase of privatization:

- Destroyed state monopoly in retail and services
- Introduced competition
- Eliminated deficit

Despite these positive aspects, they did not bring any decisive changes in ownership and control structures within the economy.

#### **Phase 2 1995-1997**

This phase began with the adaptation of a new privatization strategy, which brought about important changes. With some key exceptions, all medium and large scale enterprises (MLE) became immediately available for privatization. Private investors, Kyrgyz or foreign, were allowed to own up to 100% of the equity of the MLE.

The MPP vouchers, most of them still unused, were replaced by privatization coupons. Coupons could be used to purchase equity in state enterprises at coupon auctions where typically up to 25% of an enterprise's equity was offered. Coupons could also be used to buy the stated-owned dwelling in which the coupon holder lived. Coupons were transferable, and both Kyrgyz nationals and foreigners – including institutional investors – could trade freely in them.

In addition to the coupon auctions, individual privatization, cash auctions (which typically took place following an enterprise's coupon auction) and investment projects were the main methods of privatization used during this stage. Phase 2 also saw the creation of the Enterprise Restructuring and Resolution Agency (ERRA) in May 1994 under the World Bank- supported Privatization and Enterprise Sector Adjustment Credit (PESAC) to deal with 29 large loss-making enterprises. This group of companies needed either radical restructuring or liquidation. Diagnostic studies were conducted on each of the enterprises, and liquidation was begun in those determined to be unsalvageable. The ERRA shut down production at these enterprises, instituted "care and maintenance programs", and placed the bulk of their employees on paid leave. Within the group judged to be salvageable, there was restructuring to relieve the companies from the burden of old debts and non-core assets. Some received rehabilitation assistance in the form of loans from the PESAC program and have successfully resumed operations. One completely resuscitated after controlling blocks of shares were offered for sale by tender to strategic investors.

All told, phase 2 encompassed the complete or partial privatization of an additional 1,000 enterprises. Disposition of the 4,4 billion privatization coupons which were printed during this period has been as follows: 41.26% were used at auctions by individuals and companies; 9.82% were used at auctions by investment funds; 0.20% were used to purchase apartments; 0.72% were used to purchase property; 27.55% were distributed but remain uninvested; and 20.45% had yet to be distributed (as October 10, 1996).

The main objective of this stage of privatization was transformation of medium size and large enterprises in industry, transportation and construction. They were privatized in the following manner:

- 5% of the equity distributed to the employees
- 25% sold for coupons in auctions

- 70 % sold to individuals or corporate investors at cash auctions.

All these figures demonstrate there is a serious problem of “coupon overhang”, which can be attributed to the following reasons:

1. The MPP vouchers were time-limited and a proportion of the population lost their entitlement to convert them into coupons because they did not do so prior to their expiration date.
2. The general population had little confidence in the values of the privatization coupons. At a current market price of 1.22 – 1.35 soms for a bill comprising 100 coupons, each coupon is worth approximately 0.0008 US\$ making the distributed coupons equal to only 0.625 US\$ per person in the Kyrgyz Republic.
3. While the Government’s motives for retaining a portion of the coupon issued are not known to the author, it is known that the government has periodically sold small groups of coupons into the market. At their current market price, 20% of the coupons, which remain in Government hands, are worth approximately \$0.75million. However, each time a group of coupons is sold, the market price has fallen and effectively diluted the value of the outstanding coupons held by Kyrgyz citizens. This auction effectively transferred part of the value of the Kyrgyz Republic’s assets back into the hands of the State.
4. A significant amount of the coupons in circulation remain uninvested. Thus, portions of those companies to be sold in phase 3 of the privatization program (see below) must be offered to the general public in exchange for the outstanding coupons; otherwise the uninvested coupons will be useless. This phase also focused on restructuring large objects of monopolized sectors of the economy, privatizing non productive spheres, and restructuring and rehabilitation work with heavily indebted enterprises by units of the State Property Fund. Phase 3 is distinguished from phase 2 by the nature of the companies involved, which are predominantly large scale enterprises in mining, construction, transport and tourism, public utilities and infrastructure. Also 100 MLE that had been partially privatized, but in which the government continues to retain significant share holdings.

### **Phase 3 1998-2001**

The current stage of privatization lays emphasis on restructuring monopolies in the basic and strategic sectors of the economy – telecommunications, civil aviation, printing and publishing, electricity generation and distribution, coal mining, natural gas import and distribution, engineering, antimony production, natural gas import and distribution. Because of the size and diversity of these largest properties, there will be specific arrangements in every case. Each of the entities will be subject to thorough feasibility study.

Despite a high rate of privatization in SMEs sector, the State still retains important stakes in number sizeable industrial enterprises, often characterized by high levels of indebtedness, lack of working capital and inadequate management and marketing skills. Good corporate governance is still to be developed, and its role fully comprehended.

Privatization of the Large State monopolies (Kyrgyz Air, Kyrgyz Telecom, four distribution companies established as a result of the break-up of Kyrgyz Energo, the State –owned energy company, and Kyrgyz Gas) which has been on the agenda for the last few years, is deemed critical for the success of the medium term program of the Government. These enterprises account for a relatively large share of economic activity, and their poor performance places a significant drag on potential output growth. Moreover, the sale of these assets would make an important contribution to external debt reduction. Successful privatization of these enterprises will be essential to boost investor confidence in Kyrgyzstan.

Thus, the Center of International Private Entrepreneurship conducted the research on economic reforms in 32 countries, including all the main developing countries, as well as the former socialist countries of Central and Eastern Europe. The research has shown that those countries, which successfully implemented privatization programs – Thailand, Malaysia, Singapore, Mexico, Argentina and Jamaica, have succeeded much in their reforms. But successful implementation of privatization programs does not necessarily result in successful economic reforms. The main point here is that successful privatization creates an environment for stabilization and structural reforms.

Although some degree of macroeconomic stability has been achieved by the government, the macroeconomic reality of the Kyrgyz Republic has yet to be improved to the levels necessary so that privatization and restructuring would be considered as a positive impact on the economic reforms.

### Why is Privatization an Important Element for Economic Reforms?

Privatization can improve the economy and create favorable conditions for local and foreign investors, which are obligatory conditions of economic reforms at present. In other words, privatization is profitable for state and private sectors and consumers, not only for those enterprises being privatized.

Privatization will be successful if accompanied by reforms targeted to create more open and competitive markets. Despite economic difficulties, which are temporary, privatization is a huge step toward economic growth and lasting prosperity.

To draw foreign investment, notwithstanding the fact that in the direct perspective, privatization and implementation of economic reforms have a destabilizing impact, effective privatization programs can stabilize the monetary situation and economy of a country in the long perspective.

Macroeconomic stability, better tax administration, a substantially improved financial system and much less interference of the bureaucracy in the affairs of the private sector are a key factor in drawing foreign investments, which bring many advantages to countries receiving investments, that is sharing technology, increasing employment and developing exports. These three aims are crucial for the economic growth and development.

The climate for foreign investments in the Kyrgyz Republic at the enterprise level is not ideal. Despite the adaptation of a foreign investment law that guarantees the rights of the foreign investor, enterprises have limited experience and interest in investment by foreigners. Owners frequently overestimate the value of their companies, not understanding the relatively high level of investment risk perceived by foreigners and the investment alternatives available to them in other markets, particularly as the “global market place” continues its expansion. Local managers and owners fear a loss of control and are reluctant to disclose enterprise information essential for investor analysis. They are also unwilling to undertake the restructuring methods set by foreigners as conditions for investments. There has been an important decline in foreign direct investment inflows to Kyrgyzstan over 1993-2001 periods (see Table 2).

TABLE 2: FDI INFLOWS (NET) KYRGYZSTAN

COUNTRY	1993-2001		2001		Percentage of

Net FDI declined in 1998-2000 reflecting the completion of the Kumtor gold mine project. The Kumtor gold mine has the seventh largest gold reserves in the world, with underground reserves of an estimated 200 tons. It is run by the Kumtor Gold Company, a Kyrgyz-Canadian joint venture. The joint venture produced about 21 tons of gold in 2001, and is a major earner for the country, contributing roughly 6 per cent of GDP each year. The gold mine also is also the hard currency earner in the country and accounts for about 40 per cent of all export earnings. The total project cost is US\$370 million, the single largest private foreign investment. However, the enabling domestic economic environment will limit the potential for foreign investment inflows and for successful enterprise restructuring and performance.

Canadian companies are the main investors in Kyrgyzstan comprising 38.1 per cent of the total cumulative investment during 1995-2001. The second largest foreign investor is the United States, with about 14 per cent of the cumulative investment (see Table 3), followed by Turkey with 12 percent of the total cumulative investment. The United Kingdom, Germany, Republic of Korea, Switzerland, Russian Federation, Netherlands, and Italy are other large investors in the country.

TABLE 3: KYRGYZSTAN: SOURCES OF FDI, 1995-2001

Investment in manufacturing, transport and telecommunication, and the construction sectors continues to be low with a substantial invested in the trade and services sector.

Both foreign investors and local managers bemoan the loss of tax holidays available under the old foreign investments law. Without the inclusion of compensatory investment incentives in the Tax Code, government officials continue to grant tax concessions and privileges in an effort to remain competitive in attracting foreign investment vis-a-vis neighboring countries. A comprehensive Tax Code enacted in 1996 was updated in 1999. Amendments provide a uniform tax system, including income, profits, excise, customs, land and vehicular tariffs. However, tax system is burdensome, sometimes involving complex and time consuming accounting. Payroll taxes such as social fund payments, which are used for the national pension system, among other things, are also complex. The tax administration system is corrupt and abusive. On the one hand, it is observed that legitimate businesses have little incentive to offer bribes, tax inspectors have a reputation of deliberately finding and sometimes creating problems so that they can negotiate financial payments for not revealing what they have discovered. On other hand, it is believed that many businesses do not pay taxes – hiding income and exaggerating expenses – but the corruption of the tax inspectors means that it is possible for these illegitimate businesses to pay less in bribes than they should in taxes.

Although the Kyrgyz Republic has entered into international trade agreements with its neighbors, enterprises report various difficulties in transporting goods across borders. Vehicles face frequent and extensive delays at border crossings and Custom Union countries often do not recognize duty-free entry of machinery and equipment in transit to the Kyrgyz Republic through their countries, or they require payment of VAT before goods are released. Companies complain of arbitrary enforcement and interpretation of rules at borders and claims of improper documentation. Transparent complaints and appeal procedures are lacking.

Weaknesses in the legal and judicial systems also hamper investment. Foreign investors as well as domestic investors demand control of enterprises in part due to the difficulties in adjudicating claims in the Kyrgyz Republic.

While most major pieces of commercial legislation are now in place, enforcement of judges' decisions is difficult and a workable system of appeals non-existent. Courts suffer from a lack of transparency, poor procedural processes and the absence of qualified judges and other legal professionals. In other words, the court system is weak and corrupt, the courts do not enforce legal rights, and inconsistent interpretation of laws is not unusual. Despite the legal provisions, there are no effective means of guaranteeing property and contractual rights. This is the result of poor training and low compensation. An honest court system is essential for encouraging and supporting restructuring of enterprises, as legal protection of the rights of creditors and other collateral holders, the enforcement of liquidation and bankruptcy rules and guarantee of property rights are strong incentives for managers to put their houses in order.

Despite the adaptation of a licensing law in 1997, the system of enterprise licensing, in particular the lack of appropriate procedures for exacting penalties for violations or of a transparent appeals process, remains a source of harassment for firms. Clearly, Kyrgyzstan presents a difficult business environment. Major administrative obstacles to investment are inconsistent implementation and interpretation of laws and regulations, excessive intervention of control agencies, unnecessary licenses and permits, corruption and unofficial payments, and insufficient institutional capacity of governmental agencies. Abuses in the administration of licenses, frequent changes in government practice and criteria, and the recent proliferation of licensing requirements can provide significant power to officials to thwart the rational flow of business.

The securities markets in the Kyrgyz Republic have played a limited role in fostering ownership change. Trading on the stock exchange is strictly regulated, but almost all trading takes place "off-market", in an unregulated environment fraught with potential risk, and the largest infrastructure companies most likely to attract investors' interest have yet to be privatized. As a result, exchange liquidity is particularly low. For most people who became shareholders during the mass privatization program, opportunities to sell securities are limited.

Why has privatization implementation appeared to be difficult and contradictory?

Here four groups of reasons could be pointed out, which slow down the process of privatization:

- (1) First, the policy of the opposition, which resists the process of privatization, presents a non-homogeneous environment, not supporting the policy of the government;
- (2) Second, the private sector is not strong. Therefore, an inadequate level of financial markets, and laws, as well as finance and poor credit and securities mechanisms badly effect privatization of large enterprises, the main way of which is share sales;
- (3) Third, technical difficulties and large material expenses of privatization are common in developing former socialist countries, including the Kyrgyz Republic, with lack of both finance and highly qualified specialists to fulfill targeted projects;
- (4) Fourth, conflicts in the aims and conditions of privatization itself.

For instance, in the Czech Republic, privatization received more support than in Poland and Hungary (where the process was considered as an encouragement of foreign investments). In other words, the Czech public was much more interested in privatization than was the public in Poland, since people had the choice of how to use their vouchers<sup>3</sup>. The bureaucracy, which comprises heads of former state owned enterprises, have too much impact by adapting forms of privatization to their own interests, or, as commonly said, they turn privatization into 'personal privatization'- "prihvatization" (derived "prihvatit" – take away, Russian).

The experience of privatization in the developing countries, for instance, in Thailand, Indonesia, Singapore, enables us to make a number of general conclusions concerning privatization:

- Introduction of competition in sectors, being monopolized by state owned enterprises in the past, enables large enterprises to be more effective and provide services of better quality;
- Private pension funds will assist in easing privatization processes since they strengthen capital market and enable individual shareholders to manage their shares and participate in programs. Elements of this experience were used in the Czech Republic and Poland;

- Privatization programs are implemented faster if the state does not make attempts to reconstruct enterprises before putting them on sale. Private investors, as a rule, can take more effective measures of reconstruction. Delay of privatization causes doubts towards the government and decreases public support of privatization. Delay of privatization is costly for the state as well, which can cause or prolong misbalance on a macroeconomic level.

#### **Privatization Methods**

In the world experience, there are six methods of carrying out privatization programs:

- Public, open share sales;
- Closed, share sales to fixed buyers;
- New private investments to state enterprises and formations on this basis of (joint private ventures);
- Direct Sales of state assets (mainly through auctions);
- Purchase of state enterprise by its managers and employees, using a loan;
- Growth of state enterprise or establishment of Holding Companies with affiliated offices.

These methods are spreading in highly developed countries as well as in developing countries. For example, Chile privatized the “Compania Telefonos de Chile” as a part of a political scheme in which the transfer of companies that had been in State hands to private sector companies was being sought. The development of this industry in Chile has been so successful that at present it is now among the countries that are interested in “exporting” their know-how and investing in foreign countries. In telecommunications sector of Argentina, 60% of the stock was sold to international operators and the remaining 40% was divided among the workers belonging to the telephone cooperatives and the public in general. In general terms, we can say that the efforts of these privatizations in telecommunication sector have been very positive. The industries have quickly demonstrated improved services and technological advancement to the benefit of their users. However, privatization is often adopted because it is seen as a method to quickly convert to a market economy. Nowhere has this been demonstrated better than in the former socialist countries of Central and Eastern Europe and the former Soviet Union. These newly independent countries have undertaken the most extensive privatization programs in the world, adopting almost every method of privatization available. Both the scope of transaction activity and public participation has been impressive. Hungary, the Czech Republic, and Poland lead this region in terms of implementing and carrying out successful privatization transactions. In each of these countries, private sector now controls the majority of the economy<sup>4</sup>. Privatization process is very complex in transitional economies. Because any attempt to organize public offerings in these economies as a way to privatize the bulk of the economy faces insurmountable practical problems. There are some restrictions of selling public-owned enterprises to private hands. At the aggregate level, the stock of private savings is far too small to purchase the assets of the industrial sector at anything faintly resembling market prices. On the supply, however, the governments in reforming economies had an enormous number of assets to sell, and, in order to avoid rapid asset dissipation by theft, the transfer had to be undertaken rather quickly. Governments could still of course seek to use auction or public tender methods to sell a few selected firms, either to domestic purchasers or to foreigners. This happened in most countries, especially those of Central Europe where progress in reform as a whole was more advanced. Foreign owners would clearly be outsiders to the existing managerial structures, and could be expected to introduce some form of Western governance apparatus on the enterprise. Sales to domestic customers could be either to insiders or outsiders, and given to virtual absence of substantial private stocks of savings, managers and workers, either together or separately, would be the most obvious buyers. Only Hungary (and perhaps East Germany) has been willing or able to sell an appreciable share of former state owned assets to foreigners. Some governments, notably in Romania and Kyrgyzstan, have instead encouraged the emergence of insider owned firms with ownership centered upon trusts controlled by managers and or workers. These management and employee buyouts have also been an important element in the Kyrgyz Privatization. The methods used in the privatization of state enterprises for the period 1991-2002 in Kyrgyzstan can be seen in Table 5.

TABLE 5: PRIVATIZATION METHODS AND PERCENTAGE DISTRIBUTION OF ENTERPRISES: 1991-2001

Privatization Methods	(I)		(A)		(S)								(O)		Total	
		%			(a)	%	(b)	%	(c)	%	(d)	%		%		%

Note: (I), (A), (S) and (O) are the capital letters of the main sectors, such as industry, agriculture, total service sector, and other branches, respectively and small letters represent subsectors of the total service sector, such as (a) represents public services, (b) represents construction, (c) represents trade, and (d) represents construction, (c) represents trade, and (d) represents transportation sector.

Source: State Property Fund, Bishkek, Kyrgyzstan, 2002.

It is seen in Table 5 that the most widespread form of privatization is the formation of joint-stock companies, which is 24 per cent of all privatized enterprises in the economy. This is followed by sales to private persons and to employees of the enterprises, accounted for 23 per cent for both of two methods. The third method is sale through competitive bidding, accounted for 17 per cent. This is followed by sale through auction, which is 7.4 per cent. Limited liability accounts for 3.1 per cent, leasing for later purchase is 1.9 per cent, and free distribution is 0.5 per cent of all privatized enterprises.

Direct sale to private individuals began in 1993 and sale through competitive bidders first appeared in 1994. These forms of privatization of small and medium sized enterprises are more accessible for purchasers. Large enterprises were also converted into state/joint stock companies in order to be able to be purchased. It was thought that this form would become one of the most dynamic structures of the mixed economy<sup>5</sup>

On the other hand, in terms of the sectors of economy, the following methods are used in privatization process. In industry the predominant form is the formation of joint-stock companies; in agriculture direct sales to employees of enterprises and secondly the formation of joint-stock companies, in consumer services direct sales to private individuals through competing bidding. In construction, the predominant form is the formation of joint-stock companies, in trade sector sales through competing bidding which is 30.2 and secondly is direct sales to employees of enterprises. In transportation, the formation of joint-stock companies is the predominant form. In the other branches of the economy, it is direct sales to private individuals and direct sales to employees of enterprises.

## Conclusion

The world experience of privatization has shown that privatization, if well implemented, will have a positive impact on economic development and democracy. Also privatization of state owned enterprises is good and profitable for consumers, too. An enterprise forced to struggle with competitors and gaining a new investment capital, new system of management, technology, as a rule, provide better and more qualitative and cheaper service. The efficient and effective governance of the whole process is a key element of ensuring quality of life of citizens and global competitive position of a country. The ability and competence of state institutions is a crucial importance to a country's socio-economic reforms.

The Kyrgyz Republic has made good progress in privatization compared to other types of reforms performed in the country. However, privatization program could have been even stronger. The degree of nepotism involved in the sale of companies needs to be reduced. The pace of privatization could be quickened and the quality improved if:

- (1) Defined prices for international securities are on more realistic levels and time frames are longer.
- (2) Government sells more companies on an “as-is” basis, and the object of restructuring (state debts, financial statements of enterprises) is prepared according to international standards, and the legal status of enterprises is clarified.
- (3) Created a local worker ownership of privatized wealth.
- (4) Built a rule of law and culture of honesty.
- (5) Corruption is reduced.
- (6) The policy of privatization is clearly defined and procedures followed more strictly and transparently.
- (7) Created an adequate institutional framework that would include strong mechanisms of corporate governance, including rules to protect minority shareholders, rules against insider deals and conflicts of interest, and adequate accounting, auditing, and disclosure standards.
- (8) Developed infrastructure.

Over the longer term, there is a clear need to assist the Kyrgyz Republic to ensure that privatized enterprises have the opportunity to remain viable, to grow, and respond to their shareholders. Without attention to corporate governance and increased corruption, privatized enterprises could miss opportunities, expose their reputations to greater risk, and find themselves at a competitive disadvantage. Ultimately they will become less attractive to foreign partners and investors inside and outside the country. This, in its turn, will allow the country creating favorable conditions to attract foreign investments and encouraging a greater degree of entrepreneurship.

# Currency and Stock Market Correlation

*Yunke He*

*Okanagan University College, Canada*

## Abstract

This paper examines the correlation between the foreign exchange rate and stock index movements in six countries over a 31-year time period. The time series of daily data is used to derive the correlation coefficients for each country. The results show that strong positive or negative correlation exists for the entire 31-year time horizon and also on the yearly basis. Furthermore, the yearly correlation becomes relatively stable in three European countries but is unstable in other three countries; investors in the developed markets can achieve high equity returns while their currencies appreciate. The findings contradict some of the previous empirical studies and have important implications in international investing. Currency and stock markets forecasts should be integrated, and currency and stock management in a portfolio should also be integrated.

## Introduction

The commonly used performance attribution analysis in international investing considers the currency market return as a component of the international equity market return (Reilly & Brown, 2003). The implication is that currency return enhances or reduces international equity return.

However, such a causal relationship between the two is plausible. The foreign exchange rate, which measures currency return, is determined by the relative economic growth in two countries, according to the asset market approach. As we know, relative economic growth is reflected by the equity market return. Therefore, currency return may be determined by the equity market return, not the other way around; or perhaps there is a two-way relationship.

Osborne (1959) describes the random character of stock market prices as “Brownian motion” in his influential article. Murphy (2001) shows that, like common stocks, exchange rates are random because the flow of information about significant economic events that affect flexible exchange rates is random. Their analyses are entirely statistical and are not related to any fundamental economic determinants.

This paper is neither intended to deal with the controversies surrounding the causality between the stock and currency markets, nor with the randomness of the two markets.

In practice, most international equity managers are bottom-up stock pickers who do not pay heed to currencies but whose returns are heavily influenced by their unintentional currency bets (Bensman, 1996). If currency and stock markets are not correlated or weakly correlated, the international equity managers’ ignoring of the currency selection may be acceptable. However, if the two markets show relatively strong correlation, positive or negative, the international equity managers may have to reconsider their strategy. This raises a question whether currency and stock markets are strongly correlated

According to Solnik (1996), all studies point toward a very low correlation between stock returns and exchange rate movement. He also reports very weak correlation between monthly returns on equity and individual exchange rate among eight countries during 1973-1993. There are only a couple of exceptions: -0.29 for the Canadian stock market and its currency exchange rate per US dollar; and 0.23 for the Dutch stock market and its currency exchange rate per US dollar.

In contrast, Eaker, Grant and Woodard (2000) show that currency movements (primarily depreciation) have a dramatic impact on individual country returns in their study on nine emerging markets for the period of 1976-1997. Investors earn some of the best overall rates of return in countries whose currency is experiencing a rapid depreciation.

This paper reexamines the correlation issue and tries to answer three research questions. First, is there a strong or weak correlation between the currency and stock markets over a long time period? Second, are these correlation coefficients increasing or decreasing over time? Or they are simply unstable and trendless? Finally, what are the implications of the empirical results?

## Methodology

The correlation coefficients of the currency and stock markets are examined for six countries over the time period between 1973 – 2003 (subject to the data availability of Australia). The six countries are Australia, Canada, France, Germany, Japan, and United Kingdom. These countries cover four major continents and therefore have a broad representation in terms of geographical regions and currency blocs. These countries are under the floating exchange rate regime during the time period and are therefore meaningful to the study.

The stock index in each country is measured in its local currency. The exchange rate is expressed in its local currency per US dollar, considering the US dollar is the most influential currency to these countries during the study period. Therefore a positive correlation indicates that the local stock index benefits from a depreciation of the local currency vis-à-vis the US dollar. A negative correlation means that the local stock index is negatively affected by a depreciation of the local currency vis-à-vis the US dollar. To avoid the controversy of the causality between the currency and stock markets, we may also interpret the results as follows: a positive correlation indicates that the local currency depreciates vis-à-vis the US dollar as the local stock index increases; a negative correlation means that the local currency appreciates vis-à-vis the US dollar as the local stock index increases. In any case, the higher (positive or negative) the correlation is, the stronger the effect is.

First, the correlation coefficients are derived for each country using the daily time series data between 1973-2003 from Datastream. The only exception is Australia for which daily data are only available between 1992-2003. Then daily exchange rate and stock index are plotted in a scatter for a 31-year time period for each country, which not only provides an intuitive result, but also helps to confirm the validity or invalidity of each correlation coefficient in six countries.

Second, the yearly correlation coefficients are derived using the daily time series data between 1973-2003. The results are six sets of correlation time series. Then each time series is plotted in a scatter, which provides an intuition on stability or instability of the yearly correlation.

Finally, the trends are analyzed based on the scatters, and conclusions are drawn on implications of the study in international investing.

## Major Findings

The daily data of stock index and exchange rate are used to derive the single correlation coefficient for each country for the entire 31-year study period. In general, there exists a fairly strong correlation (either positive or negative) between the currency and stock markets in these countries over the period, as shown in Table 1. Canada has the strongest positive correlation coefficient of 0.8352, while Japan has the strongest negative correlation coefficient of -0.7985. The exception is France, which shows a very weak correlation of 0.1502.

TABLE 1: CORRELATION COEFFICIENTS BETWEEN THE CURRENCY AND STOCK MARKETS (1973-2003)

Country	Australia	Canada	France	Germany	Japan	UK
Correlation	0.7303	0.8352	0.1502	- 0.3446	- 0.7985	0.4642

These results contradict the findings by Solnik (1996) and others, which conclude that all studies point toward a very low correlation between stock returns and exchange rate movement.

Recall that the exchange rate is expressed in its local currency per US dollar. Then the negative correlation coefficients in Table 1 mean that better equity returns and currency appreciation can coexist. In their study on nine

emerging markets for the period of 1976-1997, Eaker, Grant and Woodard (2000) show that currency movements (primarily depreciation) have a dramatic impact on individual country returns and investors earn some of the best overall rates of return in countries whose currency was experiencing a rapid depreciation. In comparison, the results in table 1 show that investors in the developed markets can achieve high equity returns in countries whose currency appreciates, the examples are Japan and Germany.

The daily data are also used to derive yearly correlation coefficients for each of the six countries. As shown in Table 2, the yearly correlation coefficients between the currency and stock markets for each country display unstable patterns over a 31-year time period. For example, the range of correlation coefficients for Canada is between  $-0.8084$  (in 2003) and  $+0.8501$ (in 1978).

TABLE 2: YEARLY CORRELATION COEFFICIENTS BETWEEN CURRENCY AND STOCK MARKETS (1973-2003)

Year	Australia *	Canada	France	Germany	Japan	UK
1973		-0.1007	-0.5593	0.7410	0.1719	-0.3757

2003	-0.7757	-0.8084	-0.6592	-0.6973	-0.7450	-0.6111

\* Data are not available from 1971 to 1991.

Also as shown in Table 2, the correlation coefficients are not consistent across countries in the same year, i.e. there is a mix of positive and negative correlation coefficients among six countries in the same year. For example, in 1992 the correlation coefficients for six countries are -0.8233, -0.7735, 0.6158, 0.6674, 0.1188, and 0.7150 respectively. The range is fairly wide. These results again contradict the findings by Solnik and others, which conclude that all studies point toward a very low correlation between stock returns and exchange rate movement. However, there are two exceptions: all six countries have positive correlation coefficients in 2002 and all six correlation coefficients are negative in 2003.

Each country is examined as follows:

**Australia**

The correlation coefficient between currency and stock markets is 0.7303 based on the daily data during 1992-2003 (data are not available between 1973-1991). Recall that the foreign exchange rate is expressed in Australian dollar per US dollar. Therefore a correlation coefficient of 0.7303 seems to indicate a strong positive correlation between the depreciation (appreciation) of the Australian dollar and the increase (decrease) of its stock index. Also recall that the causality of currency and stock markets is not of our interest in this study.

To provide intuition, the pairs of the daily data are plotted in Fig.1. The horizontal axis denotes the Australian stock index and the vertical axis the exchange rate of the Australian dollar per US dollar. While an upward pattern is evident, the scatter does not show a clear linear pattern. Therefore it would be too simplistic to conclude a strong positive correlation between the currency depreciation (appreciation) and the increase (decrease) of the stock index based on the correlation coefficient of 0.7303. A further analysis is required.

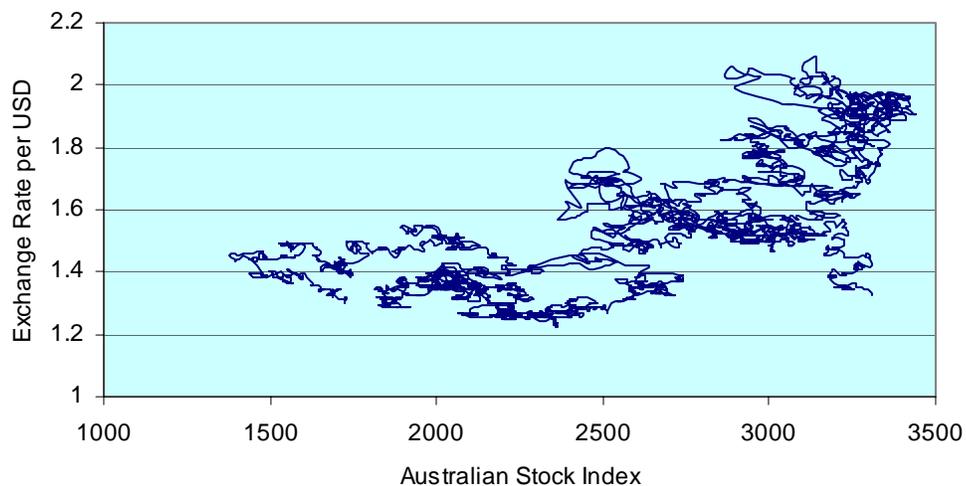

FIG. 1: AUSTRALIA'S FOREIGN EXCHANGE RATE AND STOCK INDEX (1992-2003)

Fig.2 illustrates the yearly correlation coefficients between the currency and stock markets. The horizontal axis denotes the time period in year and the vertical axis the correlation between the foreign exchange rate and the stock index (or simply FX-SI). For most of the 12 years, the correlation is fairly high (either positive or negative) and the range of the correlation is [-0.8233, +0.7757]. The yearly correlation is unstable not only in magnitude but also in direction (6 positive and 6 negative) during the entire study period. Therefore, on the yearly basis, there exists a strong positive or negative correlation between the depreciation (appreciation) of the Australian dollar and the increase (decrease) of its stock index.

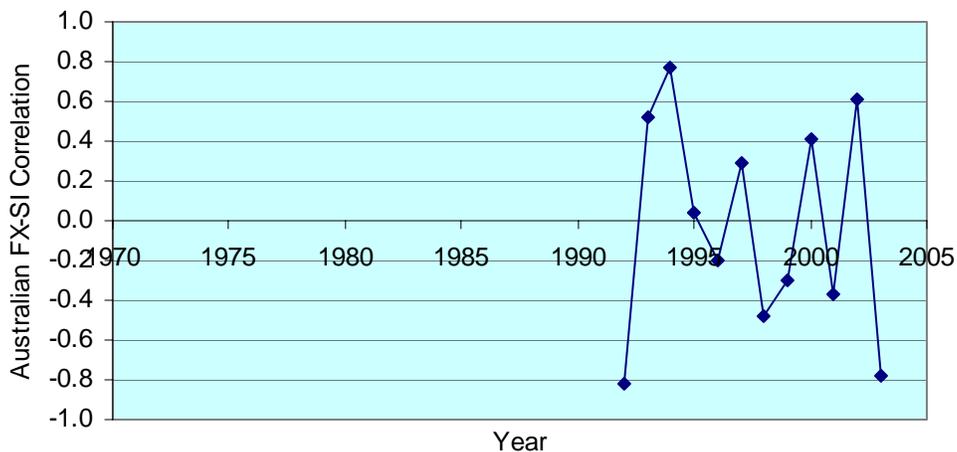

FIG. 2: AUSTRALIA'S YEARLY CORRELATION COEFFICIENTS BETWEEN ITS EXCHANGE RATE AND STOCK INDEX (1992-2003)

**Canada**

The correlation coefficient between currency and stock markets is 0.8352 based on the daily data during 1973-2003. It seems to indicate a strong positive correlation between the depreciation (appreciation) of the Canadian dollar and the increase (decrease) of its stock index. Solnik (1996) notices Canada as an exception and attributes to the dominant role of the United States for the Canadian Economy. The problem is that the same attribution analysis does not apply to Australia, which also has a high positive correlation coefficient.

The pairs of the daily data are plotted in Fig.3. While an upward pattern is evident, the plot does not show a clear linear pattern. Therefore it would be too simplistic to conclude a strong positive correlation between the currency depreciation (appreciation) and the increase (decrease) of the stock index based on the correlation coefficient of 0.8352.

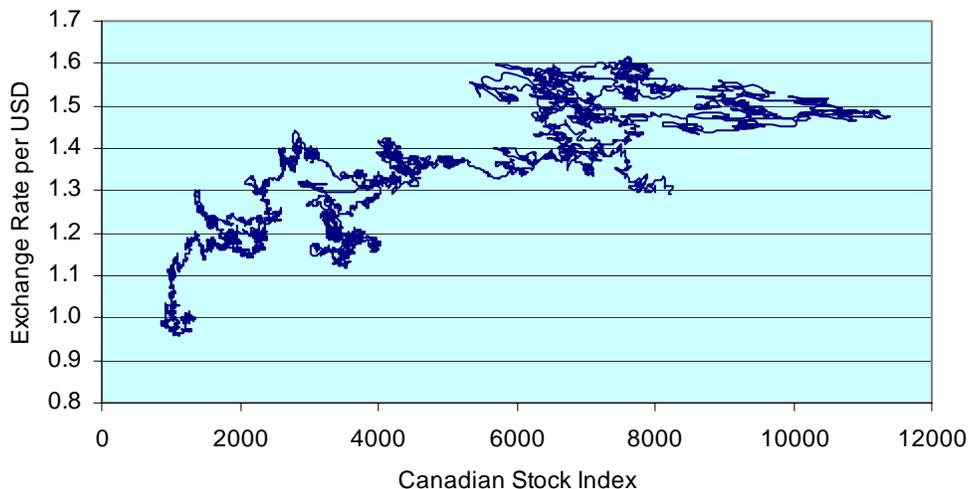

FIG. 3: CANADA'S FOREIGN EXCHANGE RATE AND STOCK INDEX (1973-2003)

Fig. 4 illustrates the yearly correlation coefficients between currency and stock markets. For most of the 31 years, the correlation is fairly high (either positive or negative) and the range of the correlation is  $[-0.8084, +0.8501]$ . The yearly correlation is unstable not only in magnitude but also in direction. Therefore, on the yearly basis, there exists a strong positive or negative correlation between the depreciation (appreciation) of the Canadian dollar and the increase (decrease) of its stock index.

An interesting fact is that the number of negative yearly coefficients is greater than the number of positive yearly coefficients (20 vs. 11). Therefore it is more likely to observe a negative than a positive correlation between the currency depreciation (appreciation) and the increase (decrease) of the stock index. This challenges the common wisdom that the depreciation of domestic currency benefits domestic economy, hence the stock market. It is more so in this situation because there is a very close tie between the Canadian and the US economies and the US constitutes more than 70% of Canada's export markets.

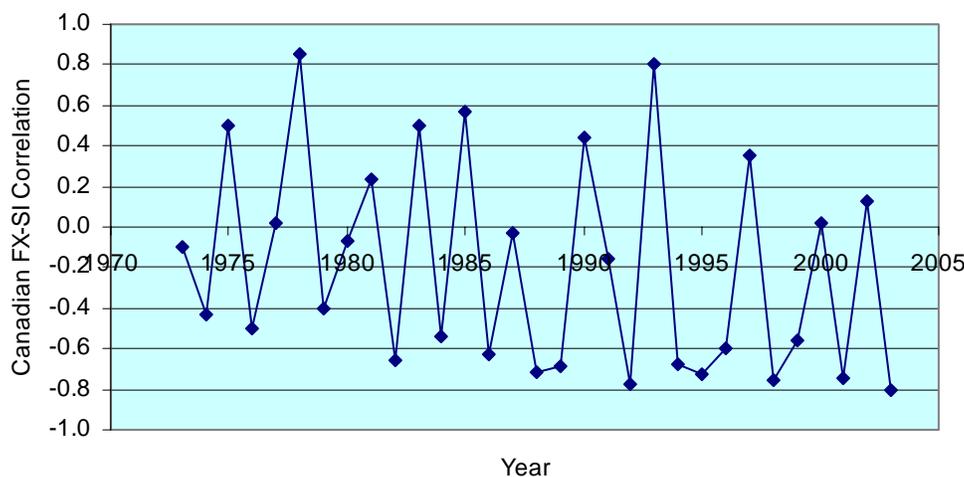

FIG. 4: CANADA'S YEARLY CORRELATION COEFFICIENTS BETWEEN ITS EXCHANGE RATE AND STOCK INDEX (1973-2003)

### France

The correlation coefficient between currency and stock markets is 0.3110 based on the daily data during 1973-2003. It seems to indicate a weak positive correlation between the depreciation (appreciation) of the French currency and the increase (decrease) of its stock index.

The pairs of the daily data are plotted in Fig.5. Overall, the plot shows a non-linear pattern and therefore the correlation coefficient of 0.3110 does not meaningfully explain the relationship between currency and stock markets. However, an upward sloped linear pattern exists when the stock index value is approximately above 500, which represents a large part of the plot. This indicates a convergence from an unstable to a relatively stable pattern.

Fig.6 illustrates the yearly correlation coefficients between currency and stock markets. For most of the 31 years, the correlation is fairly high (either positive or negative) and the range of the correlation is  $[-0.8084, +0.8501]$ . Therefore, on the yearly basis, there exists a strong positive or negative correlation between the depreciation (appreciation) of the French currency and the increase (decrease) of its stock index.

An interesting fact is that there are only two negative yearly coefficients between 1987-2003. Therefore it is likely to observe a positive correlation between the currency depreciation (appreciation) and the increase (decrease) of the stock index during this time period. This confirms that the correlation coefficients converge from an unstable to a relatively stable pattern with a positive slope over time, as shown in Fig.5. This also agrees with the common wisdom that the depreciation of domestic currency benefits domestic economy, hence the stock market.

The yearly correlation coefficients provide more meaningful information regarding the relationship between the currency and stock index markets when there is a non-linear pattern over the study period.

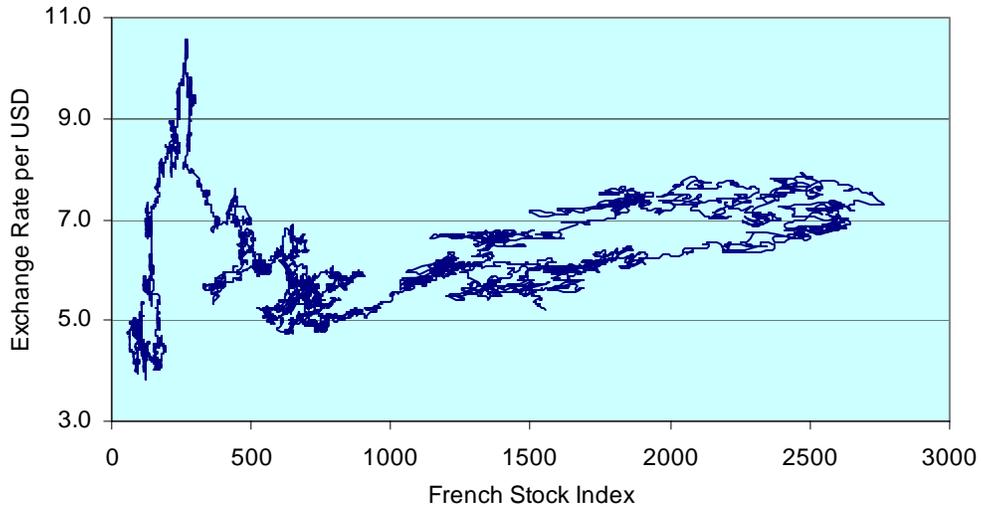

FIG. 5: FRANCE'S FOREIGN EXCHANGE RATE AND STOCK INDEX (1973-2003)

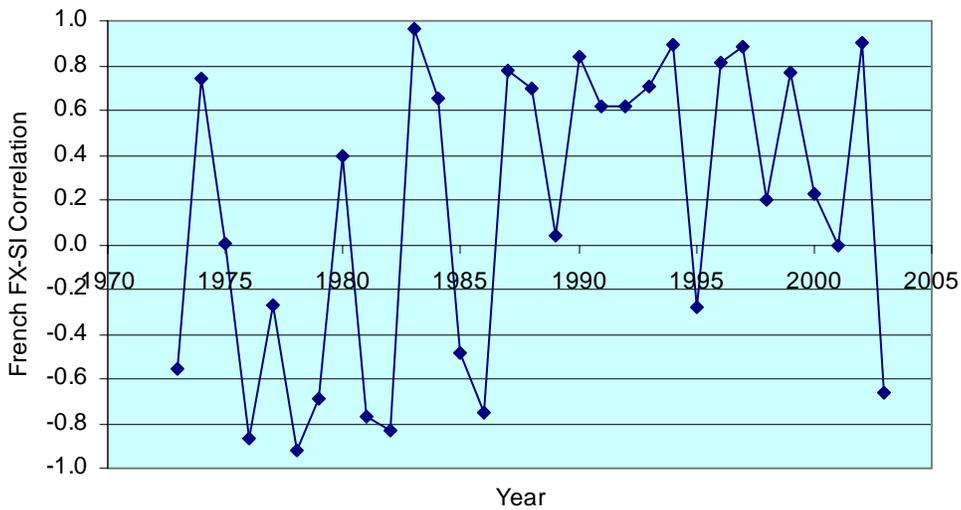

FIG. 6: FRANCE'S YEARLY CORRELATION COEFFICIENTS BETWEEN ITS EXCHANGE RATE AND STOCK INDEX (1973-2003)

**Germany**

The correlation coefficient between currency and stock markets is  $-0.3446$  based on the daily data during 1973-2003. It seems to indicate a negative relationship between the depreciation (appreciation) of the German currency and the increase (decrease) of the German stock index.

The pairs of the daily data are plotted in Fig.7. Overall, the plot shows a non-linear pattern and therefore the correlation coefficient of  $-0.3446$  does not meaningfully explain the relationship between currency and stock markets. However, an upward sloped linear pattern exists when the stock index value is approximately above 300, which represents a large part of the plot. This indicates a convergence from an unstable to a relatively stable pattern. In fact, there is a similarity between Fig.7 (Germany) and Fig.5 (France).

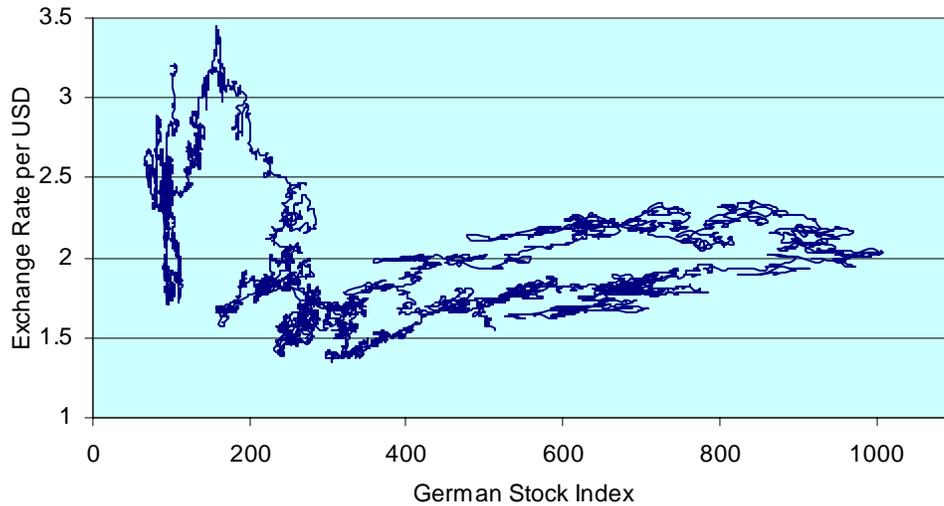

FIG. 7: GERMANY'S FOREIGN EXCHANGE RATE AND STOCK INDEX (1973-2003)

Fig.8 illustrates the yearly correlation coefficients between currency and stock markets. For most of the 31 years, the correlation is high (either positive or negative) and the range of the correlation is  $[-0.9247, +0.9177]$ . The number of positive yearly coefficients within the range of 0.2 and 1.0 is greater than the number of negative yearly coefficients within the range of  $-0.2$  and  $-1.0$  (21 vs. 6).

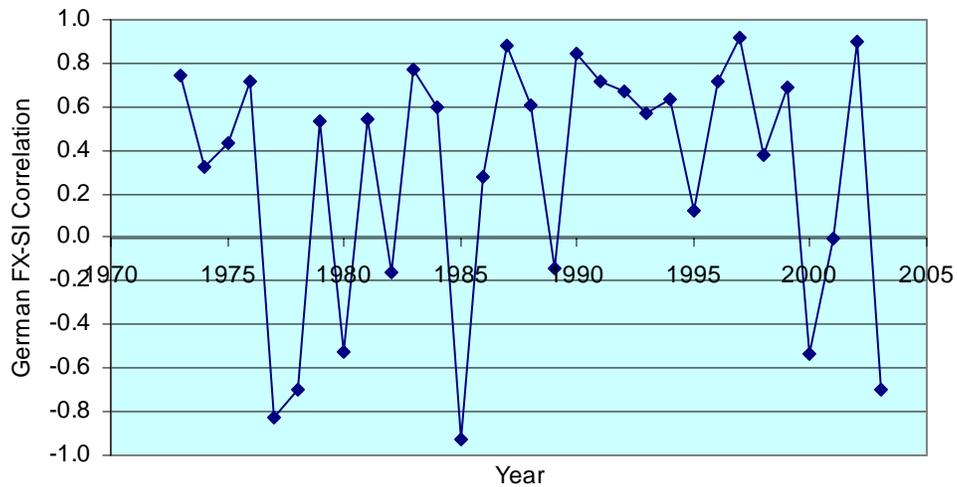

FIG. 8: GERMANY'S YEARLY CORRELATION COEFFICIENTS BETWEEN ITS EXCHANGE RATE AND STOCK INDEX (1973-2003)

Therefore, on the yearly basis it is much more likely to observe a positive than a negative correlation between the depreciation (appreciation) of the German currency and the increase (decrease) of its stock index over this time period. This agrees with the common wisdom that the depreciation of domestic currency benefits domestic economy, hence the stock market.

An interesting fact is that there are only two negative yearly coefficients between 1986-2003. This confirms that the correlation coefficients converge from an unstable to a relatively stable pattern over time, as shown in Fig.7.

**Japan**

The correlation coefficient between currency and stock markets is  $-0.7985$  based on the daily data during 1973-2003. It seems to indicate a strong negative correlation between the depreciation (appreciation) of the Japanese currency and the increase (decrease) of its stock index.

The pairs of the daily data are plotted in Fig. 9. Overall, the plot shows a non-linear pattern and therefore the correlation coefficient of  $-0.7985$  does not meaningfully explain the relationship between currency and stock markets. However, a slightly upward sloped linear pattern exists when the stock index value is approximately above 300, which represents a large part of the plot. This indicates a convergence from an unstable to a relatively stable pattern.

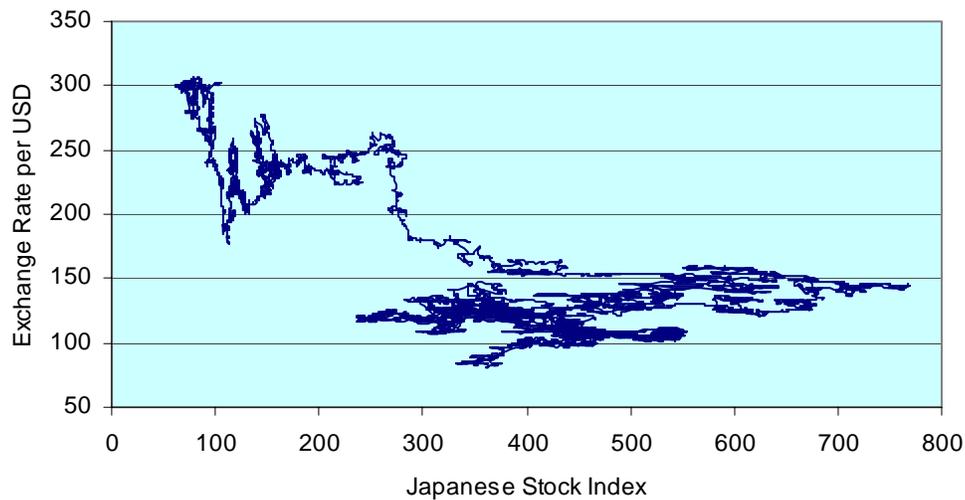

FIG. 9: JAPAN'S FOREIGN EXCHANGE RATE AND STOCK INDEX (1973-2003)

Fig.10 illustrates the yearly correlation coefficients between currency and stock markets. For most of the 31 years, the correlation is high (either positive or negative) and the range of the correlation is  $[-0.8973, +0.8862]$ . The number of positive yearly coefficients within the range of 0.2 and 1.0 is less than the number of negative yearly coefficients within the range of  $-0.2$  and  $-1.0$  (9 vs. 16). Therefore, on the yearly basis it is more likely to observe a negative than a positive correlation between the depreciation (appreciation) of the Japanese currency and the increase (decrease) of its stock index. Once again, this challenges the common wisdom that the depreciation of domestic currency benefits domestic economy, hence the stock market.

However, the yearly correlation is unstable during the entire study period and does not confirm the convergence from an unstable to a relatively stable pattern shown in Fig.9.

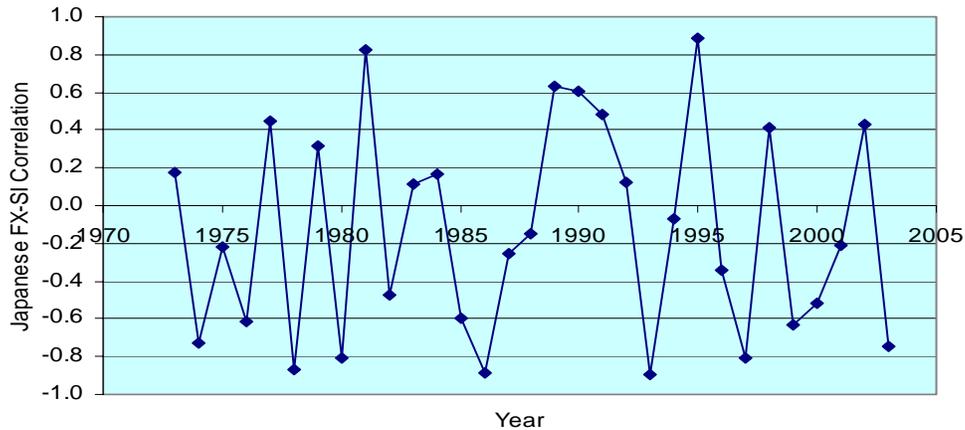

FIG. 10: JAPAN'S YEARLY CORRELATION COEFFICIENTS BETWEEN ITS EXCHANGE RATE AND STOCK INDEX (1973-2003)

**United Kingdom**

The correlation coefficient between currency and stock markets is 0.4642 based on the daily data during 1973-2003. It seems to indicate a fairly positive correlation between the depreciation (appreciation) of the British currency and the increase (decrease) of its stock index during the study period.

The pairs of the daily data are plotted in Fig.11. Overall, the plot shows a non-linear pattern and therefore the correlation coefficient of 0.4642 does not meaningfully explain the relationship between currency and stock markets. However, a slightly upward sloped linear pattern exists when the stock index value is approximately above 1000, which represents a large part of the plot. This indicates a convergence from an unstable to a relatively stable pattern. In fact, there is a similarity among Fig.11 (UK), Fig.7 (Germany) and Fig.5 (France).

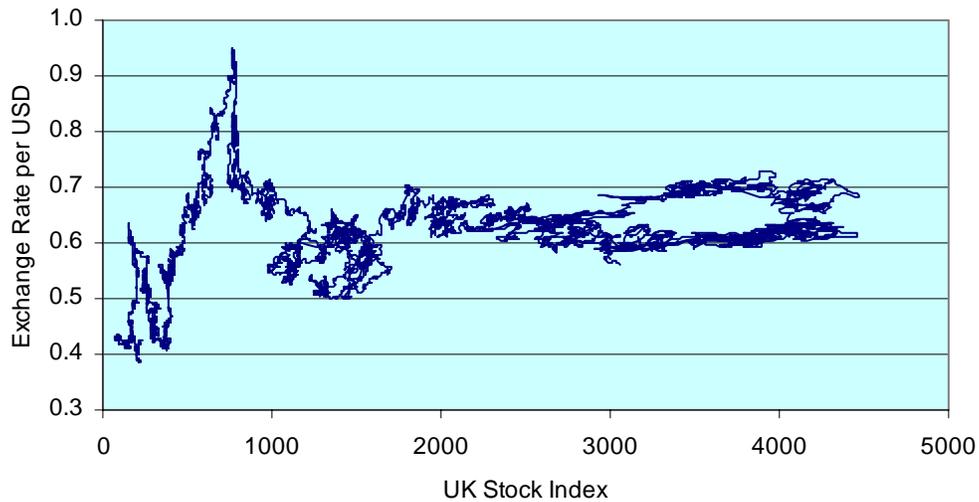

FIG. 11: UK'S FOREIGN EXCHANGE RATE AND STOCK INDEX (1973-2003)

Fig.12 illustrates the yearly correlation coefficients between currency and stock markets. For most of the 31 years, the correlation is high (either positive or negative) and the range of the correlation is [-0.7993, +0.9553].

The number of positive yearly coefficients is greater than the number of negative yearly coefficients (21 vs. 10). Therefore, on the yearly basis it is more likely to observe a positive than a negative correlation between the depreciation (appreciation) of the British currency and the increase (decrease) of its stock index.

An interesting fact is that there are only two negative yearly coefficients between 1987-2003. This confirms that the correlation coefficients converge from an unstable to a relatively stable pattern over time, as shown in Fig.11. This also agrees with the common wisdom that the depreciation of domestic currency benefits domestic economy, hence the stock market.

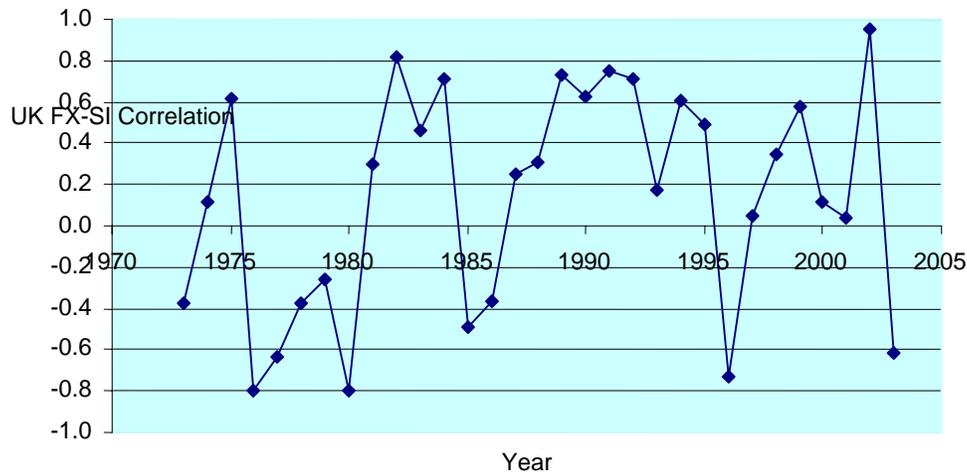

FIG. 12: UK'S YEARLY CORRELATION COEFFICIENTS BETWEEN ITS EXCHANGE RATE AND STOCK INDEX (1973-2003)

## Conclusions

Using the daily time series data between 1973-2003, this paper examines the correlation between the foreign exchange and stock index movements in Australia, Canada, France, Germany, Japan, and United Kingdom. The six countries have a broad representation of geographical regions and currency blocs, and they are under the floating exchange rate regime during the time period. The stock index in each country is measured in its local currency. The exchange rate is expressed in its local currency per US dollar, considering the US dollar is the most influential currency to these countries during the study period.

The objective is to answer three research problems. First, is there a strong or weak correlation between the currency and stock markets over a long time period? Second, are these correlation coefficients increasing or decreasing over time? Or they are simply unstable and trendless? Finally, what are the implications of the empirical results?

The results show that strong or weak correlation (either positive or negative) exists among six countries for the entire 31-year time horizon. Australia and Canada show strong positive correlation coefficients, United Kingdom and France have moderate and weak positive coefficients respectively, and Japan and Germany have strong and moderate negative coefficients respectively. On the yearly basis, a range of correlation from strong negative to strong positive is observed in all six countries. For example, the widest range of correlation coefficients of [-0.9247, +0.9177] occurs in Germany, and the "narrowest" range of [-0.8084, +0.8501] in Canada.

The results also show that the yearly correlation coefficients converge from an unstable to a relatively stable pattern over time in France, Germany and the United Kingdom. This relative stable pattern of positive correlation coefficients agrees with the common wisdom that the depreciation of domestic currency benefits

domestic economy, hence the stock market. Interestingly, these three countries are European countries and belong to the same currency bloc. On the other hand, the yearly correlation does not display any trend or convergence and is unstable over time in Australia, Canada and Japan. A further study is required to explain such difference.

The findings contradict some of the previous empirical studies, which state a very low correlation between stock return and exchange movement. The findings are also distinct from a previous empirical study on emerging markets, which shows investors earn some of the best overall rates of return in countries whose currency is experiencing a rapid depreciation. In comparison, our study shows that investors in the developed markets can achieve high equity returns while their currencies appreciate.

Therefore the findings have important implications in international investing. If currency and stock markets are not correlated or weakly correlated, international equity managers may consider currency and equity selection separately. However, if the two markets show a relatively strong correlation, managers may have to reconsider their strategy. Specifically, currency and stock market forecasts should be integrated and currency and stock management in a portfolio should also be integrated.

Currency issues make the management of global portfolios more complex, but not necessarily more difficult than managing domestic portfolios. Particular care is needed when the portfolio uses separate managers for domestic and foreign asset classes as well as for currency management.

## **FDI: Regional Dimensions and their Implications (A Case of Slovakia)**

*Dusan Soltes  
Comenius University in Bratislava, Slovak Republic*

### **Abstract**

The paper deals with some important aspects of the regional dimension of the FDI especially from the point of view of the experiences from the Slovak Republic. In this context the following main regional aspects are analyzed: regional development strategy, visibility, certainty, commitment, financial and other incentives, the role of local/regional actors and of strategic investors. The paper presents some results of the Joint Research project of the Faculty of Management of the Comenius University of Bratislava and the University of Pittsburgh under the framework of NISPA/NAASPA Project funded by the USAID.

### **Introduction**

One of the most important questions for any investor in the final stage of the whole investment process - except of course of FDI coming through privatization where such a question is irrelevant - the key question is where to place particular FDI. That is also that part of the whole pro-investment strategy we call as a regional dimension of the whole pro-investment strategy. It is quite clear that the country offering more investment sites, more industrial parks, more locations for harboring FDI, has also more chances that the potential investment will finally come to that country. To be offering future investment sites in the form of the so-called and literally "green fields" being lost somewhere in an almost inaccessible countryside is definitely not the most attractive approach of the host country regarding the regional dimension of the FDI. It is quite evident that a country offering e.g. eight industrial parks has lesser chances than a country offering tens or hundreds of various specialized categories of industrial parks all over the country, etc. As pointed out by C. Mitchell-Weaver (1) in his Research Notes: "... FDI promotion is increasingly the central focus of regional development process across Europe." In general also on the basis of his recommendations we could identify following eight main factors regarding the regional FDI attraction:

- Regional development strategy
- Regional visibility
- Regional certainty
- Regional commitment
- Regional financial and other incentives
- Coordination of local (regional) actors
- Role of pilot and/or strategic investor in a region
- FDI and "learning" regions.

In the next parts of this paper we are going to deal with the regional dimension in FDI from the above eight factors as being applied and/or also not in the Slovak Republic as one of the latest new members of the EU that by itself being one of the most successful regions in the world regarding record high FDI inflows. That all in spite of the fact that at the same time it is one of the most expensive regions for FDI and thus clearly demonstrating that low costs, cheap labor, etc. are not so important for foreign investors as it is so widely believed.

### **Regional Development Strategy**

In view of the above, it is of utmost importance; the countries have a well-defined and officially approved national strategy for the regional development. The experience of the existing EU member states has clearly demonstrated that in addition to various other important aspects (regional agencies, regional projects, co-funding, etc.) of such

a national strategy, one of the most important places belongs to the proper definition of a region as such. On the basis of that then it is necessary to determine their total number and thus also an ability to draw the particular funds from the Regional policy of the EU. In this connection it would be beneficial also for the Slovak Republic to be able to learn more from the experiences of some small current member states of the EU. Thanks to their good regional policy they have managed to attract not only funding from the EU but also record high FDI inflows. In principle there is often a logical sequence between them. First, especially in the case of poorer countries like is also Slovakia, it is important to be able to the full amount obtain the funds from the EU as such funds can create suitable infrastructure for the later inflows of FDI. Hence, as the first task in this respect it is important to make as much of the territory of the country to be eligible for funding from the EU regional policy. It is then e.g. no surprise that for example Ireland and Portugal have during their membership in the EU, already several times changed their regional structure just in order to attract as much as possible of the regional funding from the EU.

In this sense it seems to be not very wise to make Bratislava region bigger than are the official limits of the city itself. The more neighboring districts are incorporated into the Bratislava region the bigger territory of the Slovak Republic is going to be excluded from the regional funding through the EU. We have to realize that formally the capital of Slovakia is well above the required 75% of the average of the EU GDP per capita with its average to be close to 100% of that average. Hence, if some neighboring and less developed districts are attached to Bratislava they are still not lowering that average below those required 75%.

The second important indicator in this respect is the number and the size of regions. According to the EU regional practice, an average region in the Union has about 1.5 million citizens. According to this EU practice, it looks like that the Slovak Republic instead of current small 8 regions has to have only about 3 regions and the City of Bratislava as a national capital. Such regions are generally considered as big enough to be able to be self sufficient and effectively self-governable. From the point of view of FDI such regions are also from all various aspects more attractive than some mini regions without necessary and adequate administrative capacities, economic power, development strategy, institutions, etc. In view of this, the regional policy of any EU member state including Slovakia has to be pragmatically subordinated to the requirements of the EU regional policy than to political and power ambitions of regional politicians. The experiences of Ireland, Portugal and Spain are clearly demonstrating that a poorer EU member could develop the necessary regional infrastructure for FDI inflows only on the basis of the EU regional and cohesion funding. That is also the case of Slovakia.

## **Regional “Visibility”**

Every region that has any ambitions to become a focus of foreign investors’ attention and of FDI inflows has to have a kind of suitable and needed regional visibility. Especially in the case of such a country like Slovakia - that by itself has not been very visible and still being often mixed up with Slovenia, Yugoslavia or with the former Czecho-Slovakia. Hence, it is of utmost importance to present and promote the whole country also through its individual regions. There are several well known and verified ways and means how to promote regional structure and dimension of the country among the chief investor groups:

- One is of having its own regional representative offices abroad. It does not mean that every individual region has to have its own office e.g. in Brussels as the "capital" of the EU, in other major cities of the EU or in the world. But it could be organized also on the joint basis for all or several of Slovak regions. Especially, if individual regions do not have enough experiences or staff for such a promotion and representation. If such a region promoting staff is not able to comprehend an inquiry in a foreign language than it is better not having such a regional "visibility".
- An another important vehicle for the increasing a regional visibility of the Slovak regions is again a better functioning of the official Slovak diplomatic missions i.e. embassies, trade missions, consulates, etc. It is especially concerning those that are in or close to the major potential sources of FDI inflows like member states of the EU, the USA, Canada, some Arab countries, "tigers" from the South East Asia, etc. Again less various embassies that are mostly hoisting only the national flag and their replacement by regional sections attached to some embassies of the above preferred sources of FDI would be much cheaper and more efficient than is the

existing vast but to the large extent, from the economic point of view, useless structure of the Slovak diplomatic missions.

- An important potential for increasing a regional visibility could be the existing network of various honorary consulates, etc. Mostly they do not have any specific mission regarding regional aspects of the economic dimension of the country they are serving for. Especially e.g. in the USA, more promotion of the regional dimension of the Slovak Republic could among our countrymen increase their awareness and interest in helping the development of the regions of "their ancestors". Again experiences with the Irish community in the USA and their role in making of the Republic of Ireland a current economic "tiger" also through massive FDI inflows from the USA could serve as an example and inspiration also for the Slovak Republic and its regions.
- The experiences of many successful countries in attracting FDI inflows have shown that one of the most efficient vehicles for achieving regional visibility is through the promotion of regional attractive tourist destinations like in case of Spain, Portugal but also Austria, Switzerland, etc. In this connection we made two fact finding missions to the High Tatras as the most famous tourist destination in Slovakia. One in summer and one in winter and the results have been quite shocking ones. In comparison with the recent years there has been still less and less tourists and especially those from the so-called Western countries. Except of few citizens of the former GDR there were only very few of them from other EU countries. What was even more shocking it was the fact that even Slovak visitors were in a very short supply. But the reason is quite clear, since 1970 World championship in Nordic Skiing, there was no substantial improvement and/or innovation in the originally created infrastructure and services, etc. but an enormous increase in prices and various fees, etc.
- However, the cheapest and in many respects the most efficient approach how to increase visibility of the Slovak regions is again as in many other areas through Internet and World Wide Web. More adequate representation and presentation of the Slovak regions e.g. on the web site of SARIO could have more positive impact and effect regarding the visibility of the particular regions than utilization of any other of the above mentioned ways and means. This is at the same time also the cheapest and at the same time most efficient way of promotion and accessible anywhere in the world. If not only the biggest TNC are able through e-commerce currently carry out the multi- billion business and trade operations then on the much smaller scale of the visibility of the Slovak regions it has to be feasible as well.

In general, the issue of visibility of Slovak regions needs just some more coordinated effort of the ministries concerned as e.g. those being responsible for regional development, interior, foreign affairs in close cooperation with regional authorities themselves and SARIO. Through above but also other ways and means it would be possible to achieve also for the Slovak regions the same effect that has been a long years practice for many regions in the EU. After all it would not be nothing new, just practical implementation of the EU strategy on "the Europe of Regions" also in the conditions of the Slovak Republic. For such an implementation it is definitely not needed to wait until the country will become also an official member of the EU.

## **Regional Certainty**

It is of utmost importance that all information a potential foreign investor will obtain through the above regional visibility program will not remain only on the level of information. The regions themselves must be in every respect prepared for accommodating any potential foreign investor i.e. to offer them a kind of regional certainty. In brief it means that they have to become very soon assured and/or convinced they have chosen the right region for their FDI. First of all it means that the particular region has to be easily accessible. Accessibility definitely should not mean a six-hour drive on the roads of a mediocre quality, as it is currently needed between Bratislava and Kosice for a distance of less than 400 km. For example in terms of the U.S. investors such a distance means definitely not more than four hours of "drive" on a perfect divided highway. Unfortunately, during a winter period it could be almost out of any use, or it would take a whole night travel by "an express" train moving with a travel speed of about 60-70 km per hour. Currently, it is a case of connection between Bratislava and the Eastern regions of the country. Under such transport connection it could easily happen the first such a trip of a potential foreign investor will be also the last one.

In this connection it is perhaps worth to mention that Slovakia although being a small country has - with the maximal interstate distance of only about 500 km - inherited from the former federation and thanks also its former strategic position closer to the USSR and further from the former NATO eastern border an almost ideal network of six (!) regional airports. All six of them i.e. Piešťany, Trenčín, Žilina, Sliac, Poprad, Košice have been meeting also standards for international air transport. Hence it is quite feasible that a foreign investor could reach the potential investment sites anywhere in the country in less than three hours if it were a combination of an air and car transports. What is already a reasonable comfort acceptable according any international standards. Of course it does not mean that to all these various airports should exist regular flights but some kind of charter or air taxi flights should be available what unfortunately is not a case right now.

In addition, when finally a potential foreign investor is already in the particular region it is again necessary to provide for him a one-stop full-time service through the particular regional pro-investment agency. It is not acceptable that a potential foreign investor with a map and compass would start to look for the particular investment site. Hence, in view of the necessity to achieve the particular regional certainty, it is necessary to build up and develop a network of regional offices of the pro-investment agency that professionally but also by language proficiency will be able to offer to potential foreign investor an one-stop and full-time service. In this connection it is perhaps again worth to make a comparison between the Slovak Republic and its V4 partners. The Czech Republic has in its eight regions altogether 14 CzechInvest regional offices. In addition there are about 100 industrial parks all over the country and in principle each of them is ready to accommodate a new foreign investor. One could say that in the regions of the Czech Republic altogether 114 entities are prepared to take "care" for new foreign investors. In Hungary are, in addition to about 150 industrial parks, existing altogether 16 ITDH regional offices spread evenly in a country that has about the same West-to-East length as Slovakia. Again just for comparison, the Slovak Republic has been until recently nominally offering altogether six industrial parks. In addition, five SARIO regional offices are not covering even each of eight regions and are spread quite unevenly across the country. There are left rather big "white" spots of uncovered regions especially in the most problematic Eastern and Northern regions of the country. Under such conditions, unfortunately, the regional certainty of Slovak regions has still been more a question of the distant future than of the current reality. So far neither their accessibility nor readiness to accommodate foreign investors has not yet corresponded neither to the needs of the country nor foreign investors.

## **Regional Commitment**

The regional commitment means that the region is able to demonstrate that it is not only interested in "luring in" a potential foreign investor and benefit from the particular investment but that it is ready also to make some advanced "investments" of its own. As again quite properly pointed out by C. Mitchell-Weaver, the region has to demonstrate towards potential foreign investor a kind of a due hospitality irrespective if finally that investor will decide to invest in the region or not. In this connection it is again important a proper use of various psychological factors how to convince the potential investor that his/her investments are going to be beneficial not only for the particular region but that it will be again one of the success stories of the so-called win-win situation i.e. that the benefits will be equal for both sides.

In this connection, it is of utmost importance to demonstrate to the potential foreign investors that in addition to the business side of the deal, there are many various other benefits for them regarding the living conditions, social opportunities, recreation and sport facilities, cultural life, etc. It is important to realize that foreign investors are not only businessmen but also people who will have to live in the region for some longer period (we have still to remember that FDI mean a long term relation). They have their families, kids needing schooling; they have their cultural, sport or other hobbies, interests, etc. In this respect e.g. most of foreign investors in this respect appreciate our network of regional theatres, spas, national parks, wild life, winter sports facilities, etc. But on the other hand, in the most of Slovak regions outside Bratislava or Košice they have problems with schooling of their children in schools with instructions in foreign languages, adequate housing, availability of shopping malls, quality of regional roads and especially a very low knowledge of foreign languages for basic business but also general daily

communications. In this respect unfortunately the Slovak republic is considered as the country with the worst command of foreign languages among all V4 countries.

It is then of utmost importance, that already during the first fact finding mission, the agenda for a potential foreign investor is not only around and about the amount of investments and when they start to flow into the region. An equal attention has to be paid also to above various aspects of living in the region. In this respect many regions of Slovakia have often much more to offer than it is generally known but it has also to be offered and very actively and convincingly also to potential foreign investors. In this respect as a good example could serve all the activities as taken recently by the Zilina authorities when trying to convince the Hyundai investor to invest in their region. It is just pity that they could not offer also a ready-made industrial park.

In summary, the commitment of the region means that the region is not only interested in getting the particular FDI but is also well aware of the necessity to offer to potential foreign investors a good standard of working and living conditions for them and their families. As we know, FDI it is not a short term, ad hoc affair but according to the particular definition a long-term commitment and relation from the both sides. As such it requires also suitable working and living conditions for all those who will accompany the particular FDI in the region from the investor's country, company, etc. Especially, important is also a regional commitment in the case of the so called "green-field" investment when in difference e.g. to FDI coming through privatization it is necessary to help and assist foreign investor in the whole range of administrative and other related matters, permissions, etc. as needed for any kind of construction. After all it is well known that in this country just for constructing an ordinary family house it is necessary to obtain over fifty various permissions, seals, signatures, etc. The registration of a new company i.e. also in case of FDI could last even more than three months and again is an indicator that the particular region would be too much committed to having that investment in the region not only de iure but also de facto.

Hence it is clear that without a real regional commitment of all involved, it is almost impossible to get into regions any significant and especially not "value adding" FDI through also other ways and means than a kind of lucrative privatization deal. In this case, no interventions from the central levels could solve the problem, the most of administrative and other actions have to be carried out directly in the regions and through the real commitment towards FDI inflows from the side of the whole regional administration!

#### **Regional Financial and other Incentives**

To the above regional commitment are also very closely related various regional financial incentives. In principle, the regional commitment is nothing else or more than a standard courtesy and hospitality extended towards somebody from whom we expect in this particular case FDI represented mostly by investor's own capital.

If such a commitment is considered as a kind of the common standard, then every region that wants to succeed in luring in FDI must offer also something in addition. In most cases and also countries it is called as "a regional investment package" i.e. a package of various benefits that are ready and expecting any potential investor who decides to invest in the particular region.

In this connection it is important to have such a package ready i.e. not start with its compiling when already a potential investor is in the country. It means such a package must be available in advance and in the form easily accessible to investor while he was just searching for a suitable place for his FDI. The best place for such a modern "advertisement" is Internet as it is e.g. in case of various regional incentive packages in the case of CzechInvest Prague. Such a regional incentive package has to have some structure and some differences from a region to another region. In order to have a really comprehensive set of regional financial incentives it is necessary to have at disposal:

- A thorough analysis of all regions
- Categorization of them according to certain criteria of eligibility for some kind of regional incentives depending upon the EU rules and regulations for regional assistance
- The same is needed regarding the national schema of various incentives e.g. tax reductions, for creating new jobs, for re-qualification, etc.
- Schemas of various regional incentives being available from the regional government
- Different local incentives including such as local taxes, various fees, price and methods of a land acquisition, etc.

On the basis of all the above it is only possible to prepare the so-called a regional map of the country with all those various particular regional and local incentive schemas that clearly state to any potential foreign investors what they could expect if they decide to invest in one or other region or particular locality. Such a modern GIS - Geographic Information System placed on Internet with the regional map and corresponding "investment incentives packages" brings often more benefits than a network of various and expensive representative offices with not always the best prepared representatives. According to C. Mitchell-Weaver in compiling such regional incentive packages and their regional maps it is necessary to take into account the following main categories of potential incentives as applied in the world and as long as allowed by the particular national or supranational i.e. for example the EU legislations:

- Corporate tax rates cuts. Since 1<sup>st</sup> January 2004 it is in the Slovak Republic on the very attractive level of 19 per cent only i.e. lower than in all neighboring countries
- Tax holidays
- Additional subsidies for job creation
- Extra subsidies for re-training
- Allowances or cuts on import duties for some kind of modern innovative technologies
- Lower investment requirements in order to become eligible for some kind of financial incentives
- Eligibility for incentives for all investors
- Reducing various export requirements
- Elimination and/or reduction of various reinvesting requirements
- Subsidies to costs of industrial parks construction
- Various local incentives, cuts in fees and taxes

In addition to the above various direct financial incentives, it is necessary to add and also suitably present various other regional and/or local incentives, benefits or just simply conditions effecting various kinds of businesses like:

- Cheap and qualified labor
- Regional or local research and development facilities like universities, colleges, various other similar institutions,
- Local availability of some natural resources including such very "natural" like water, a character of soil, clear air, etc.
- Meteorological conditions like summer and winter temperatures, direction and strength of winds, rainfall capacity, etc.
- Already existing production facilities
- Strategic foreign investors in the region
- Various other investors and producers
- Service agencies
- Central, regional and local government and administration bodies.

In general, in addition to the naturally expected regional commitment it is necessary to prepare for any potential foreign investors all necessary information and guidance to such an extent that they could help them to decide right for the particular region as the most beneficial for their investment needs even before visiting that region personally.. The more information is available regarding the particular region e.g. on Internet, the better it is for the decision of potential investor. On the other hand, the role of various incentives has not to be overestimated. As recently published in a report prepared by the business consultancy McKinley (Financial Times, 15 October 2003): "Incentives were not the most important factors driving location decisions of multinational companies, suggesting that most of the FDI would have been attracted without the incentives". Very often, incentives are reducing benefits for the host country mainly because the price of them, as we have already quoted in connection with incentives for car makers in Slovakia is so high that it is hard to compensate it by potential benefits is very difficult if not impossible at all. For example in Brazil, the subsidies led to over capacity and reduced productivity in the car industry. Hence from this examples also Slovakia should take a lesson and not to overestimate the role of

incentives as well as the role of car making industry. Any one-sidedness is dangerous and in final consequences harmful for national interests of the particular host country.

#### **Coordination of Local (regional) Actors**

One of the most important preconditions for the success of the region in attracting FDI inflows is to achieve a thorough coordination of all players and activities involved in the particular investment related "business". As again properly pointed out by our project team member C. Mitchell-Weaver, first of all, it is necessary to prevent in this respect any potential confusion of the potential and/or real foreign investor by any disharmony in promoting regional interests vis-à-vis the FDI inflows. All the conduct, contacts and information as provided to the potential foreign investor have to be well-coordinated and coming from one source.

There should not be any rivalry and/or competition between various regional players involved. Of course it is also desirable for every regional and/or local administration if the potential foreign investor settles down right in their territory but it is much more important to have him in the region as such. Especially, it is important in case of some first pilot foreign investors who are often just coming as a kind of the front liner or reconnaissance unit for bigger and more powerful strategic investor.

The common objective of all regional and local players has to be enhancing all regional and local capabilities, comparative advantages, etc. They always have to be presented not as a single, isolated ones but always as a part of already existing and/or soon-to-be created regional network that is able to take first class care for any potential investors regarding e.g. legal services, suppliers, construction firms, various types of "partnerships", matching programs, etc. From the very beginning it has to be clear to every investor that in "this region" he is welcome that he is not seen as a competitor to local business "mafia" (of course this does not mean any reference to any mafia as known from criminal movies but to rather closed circle of local businesses that do not like any new competitors in their territory of operations, as they exist anywhere in the world) but their long expected partner. It is also important that from the very first day being in the region, the foreign investor will have at hand, at his/her disposal own regional and/or local guide or advisor who will be permanently available for his needs.

It is of utmost importance, especially during the first most complex period of various preparatory activities, a company establishment, an introduction to all relevant local players and potential partners, establishing of initial contacts and especially in all the paper work that never and nowhere is an easy and simple job. It is of utmost importance that at least such a regional or local guide is well familiar with all regional and local specialties and peculiarities and has also all necessary contacts wherever needed. Last but definitely not least what unfortunately is not so uncommon in this country, a local guide and/or advisor is speaking the language of the particular foreign investor.

All involved local and regional players have to realize that foreign investor is not a tourist who just happened to come into the region for one or two weeks and afterwards will leave either for good or at least till the next year. As a rule, a foreign investor is never coming just like that. As we have already also mentioned, foreign investors are neither explorers nor researcher, etc. If they are coming to some region they are coming intentionally on the basis of some references, recommendations, their own intentions or on the basis of very good and impressive information they have gathered from some reliable source e.g. like Internet, etc. In view of that they are always coming in search of the best or at least relatively the most favorable business conditions or environment in the particular region. The well coordinated and properly organized first visit to the region could definitely very positively effect the final decision of the particular foreign investor in favor of the given region. It has to be also realized, that such a visit to a region is as a rule not a single one but a part to several similar places or even countries in the wider region hence it is of utmost important what will be the initial impression of a potential investor. Normally, such visits are not repeated, usually the first such visit is also the last one before the final decision. Although, the first or initial visits are important for bringing potential foreign investor into the region, the regional care should not cease just by the fact that the investor has decided to invest in the region.

The so-called "aftercare" for foreign investor is almost as important as the one extended to him/her before such a decision. It is necessary to help foreign investors as much as it is necessary in order they could start their intended business activities as soon as it is in the local and/or regional condition possible. The sooner it will be possible, the better it is for the particular region regarding new jobs, opportunities for local suppliers, partners, consumers, etc. and last but not least also for collection of particular taxes, etc.

In view of all these, it is not so important who is in charge of all this coordination of local and regional players. Most important is that it should be coordinated neither on a part time basis nor it should rely on a kind of some local patriotism or enthusiasm. All these activities have to be conducted according to the highest possible professional standards. Equally as foreign investor - at least a serious one - is intending to come to the region with some solid amount of his own funds and for some longer period of time, it is also from the other side necessary to put everything into the hands of real professionals. However, they should not be professionals in public relations but professional specialists in accommodating FDI. It is therefore of utmost importance that the particular host region has its own regional pro-investment agency. It is not so important if it is an integral part of some national pro-investment agency like SARIO or PAIZ or CzechInvest, etc. or an agency of the regional or local government or of some big regional company or some industrial or other park, etc..

But it is always of utmost importance that such an agency operating in the region is able to provide either by itself or in cooperation with some other partners good, high quality services to any potential and/or to already for the particular region decided foreign investor. What is in this connection also important, such a regional agency has to have also a reliable and sufficient source of funding. As a rule, usually the initial phases of attracting, "luring" foreign investor into the particular region are more costly than profitable. It is a logical consequence of the general understanding that such services for foreign investors are not subject of invoicing or any charges or fees.

#### **Role of Pilot and/or Strategic Investor in a Region**

One of the crucial and at the same time also the most complex roles of the regional dimension in FDI inflows is to acquire for the particular region the first foreign investor. As also a popular saying goes that "every beginning is difficult" then it is absolutely true regarding the first foreign investor. In this connection is often mentioned also the term of a pilot investor or a strategic investor. Although we would not like to open any terminological discussion regarding these important concepts it is worth to mention at least some distinction between them as in the investment practice they are often not interpreted quite correctly. In any case, both types of foreign investors are important for the future success of any regional strategy regarding FDI inflows.

Especially it is of utmost importance for any region just starting with its effort to attract foreign investors into its territory. Unfortunately, it is also the case of the most of regions in the Slovak Republic especially those being 100 or more kilometers from Bratislava. In this connection very often it is stressed that it is necessary to find a strategic investor for the particular region. In general it is quite mistakenly supposed that only such a strategic investor in the region could secure for the particular region any sustainable development. Although, according to many aspects such an approach could be almost an ideal one, the reality is often slightly different. As also experiences from other countries are showing, mostly it is very difficult to acquire as the first or so-called pilot investor the one that could fulfill also the role of the strategic investor. At least in that sense that it is the big, strong foreign investor being able to play for the particular region its role as "a locomotive" for any further sustainable economic development. In the most of the Slovak regions there has existed an idea that such a role could be played only by some big and strong TNC like are already in the Slovak Republic e.g. U.S. Steel, Volkswagen, Peugeot-Citroen, etc.

However, it has to be quite clear that as yet the Slovak Republic has not been ready and prepared to play a role of a host country for many of such big TNC as strategic foreign investors. In this connection it is necessary to state, that it is so because the country is small and has only rather limited internal market for such big investors. After all even the ten or more times bigger internal and much more solvent market would not create big difference in this respect. After all, successful countries in this respect that could serve as models also for the Slovak Republic are also not at all bigger in this respect than the Slovak Republic. But all of them like Singapore, Hong Kong, Ireland, etc. have something in common and what has so far been missing in the case of the Slovak Republic. What is in this connection the most important it is the fact that the country and especially its regions are not yet ready to play an adequate role in hosting such investment giants. There are several reasons for that:

- The country has not yet been sufficiently physically integrated into any regional integration grouping that would fully function as some kind of free trade area or customs union
- Although on the 1<sup>st</sup> May 2004 the Slovak Republic has become an integral part of the common market of the EU, it has been more from the legislative side of that than from the real physical dimension of such a common market (see e.g. limitations in a free movement of labor, still existing border controls, unconvertible currency,

etc.). As an example for such an unfavorable situation could be Greece. The country has been a part of the EU common market for almost 30 years but so far could not fully benefit of that. However, in that case it has been so mainly for some natural reasons of its geographic isolation among its neighbors as none of the Greek borders is an internal but all are external borders of the EU. Although this kind of geographic isolation is not the case of the Slovak Republic, its poor physical integration with other EU member states is not helping much in this respect. The only highway connection is still only with the Czech Republic and that one could hardly serve as a substitution for missing highways in all other directions towards potential markets including those in the East from the country. Moreover, if that highway has not have and for long will not have sufficient continuation on the territory of the Slovak Republic

- As the Slovak Republic has been permanently criticized by the EU for its insufficient preparations in using the regional, cohesion and other funds of the EU, it is not possible to expect that the country itself will be able to remove very soon and quickly the problems with its own regions and their pertaining underdevelopment including insufficient infrastructure, etc.
- Another natural obstacle for new big strategic investors to settle in the Slovak Republic is its poor foreign trade performance. All successful FDI host (big or small) countries are also big and successful trading (exporting) nations like Hong Kong, China, Ireland, Singapore, etc.
- Hence, if Slovakia would like to become similarly successful host nation for big TNCs then it must radically change the role of its diplomacy towards its economic dimension and make adequate and deep revision of the whole structure and staffing of its diplomatic missions. After all, after becoming a member of the EU there will be even less "classical" diplomatic work for its diplomatic missions, as under the Common foreign and security policy the most of traditional diplomatic tasks will be handled on the share basis with other members of the EU. Hence, the Slovak diplomats should mostly be re-oriented towards the promotion of nation's trade and investments interests! According to the latest available information on the British Foreign Service, more than a half of its staff is on the full time basis promoting British economic interests.

Achieving any substantial qualitative changes in all these existing obstacles will take a rather long period of time even after this year accession to the EU. We have still to remember experiences of the so far least advanced or so-called still "cohesion" members of the EU i.e. Ireland, Spain, Portugal, Greece. It took them about 20 years since acceding to the EU while their macroeconomic performance has substantially improved and became with exception of Greece also attractive destinations for FDI inflows. In this context according to their model it is necessary to adjust accordingly also the future regional strategy regarding strategic investors. Instead of "dreaming" about big strategic TNC playing this role e.g. in the car making industry it would be more realistic (and also cheaper regarding offered incentives) to focus more on luring in some other perhaps also smaller foreign investors from other sectors. After all no one among small and most successful hosts of FDI we refer to so frequently have based their success on a car making industry. There is no car making industry e.g. in the absolutely most successful "cohesion" country i.e. in Ireland. The same is also the case of other most successful destinations for the record high FDI inflows among the small countries i.e. Hong Kong, Singapore or Belgium or Luxembourg.

Hence, also in the case of the Slovak Republic it is almost for sure that 2 maximum 3 car producers are the utmost what could be expected from this sector regarding "strategic" FDI inflows. Similarly as Ireland, Hong Kong or Singapore also the Slovak Republic has to orient its regional strategy towards attracting into its regions more producers of various computer and other modern electronics related components than more mechanical mass production of cars. Moreover, for such very high costs into various incentives as we have presented them above. To the east from the Slovak borders and future external border of the EU there has been a large market exactly for that kind of high tech oriented production. The countries of the former Soviet Union are just expecting the real computer and e-business boom Therefore, this kind of FDI and related production could help Slovakia also in modernizing its production basis, manpower qualification, etc.

In summary it would be most beneficial for the regional dimension of the Slovak Republic if the main focus for attracting big strategic investors from machinery and/or car making sectors would shift to some other and smaller strategic investors from the area of high tech production that could gradually cover more and more regions in the Slovak Republic. One of the ways - well functioning and verified also in the world - would be to prepare

particular more specialized and value adding parks like technological, high tech, innovation, etc. To build such "light construction" parks is always much easier and investment less demanding than to prepare facilities for car making industry. According to very serious estimates based on the comparative analyses of the particular foreign experiences, just for the value of incentives to car makers i.e. 14 billion SKK, it would be possible to create in the high tech oriented productions or in small businesses at least ten times more jobs i.e. about 60-70 thousand of fine qualified jobs. Moreover such productions are less energy and materials demanding and much more environment friendly. Until the particular transport and infrastructure network will be building up, they should be located where the most natural conditions are for them i.e. along the existing border with the EU and from there gradually through classical spill-over also to other regions along the already existing highways and motorways. Slovakia has again to learn from experiences of other countries e.g. Hungary. Its initial FDI sites have been along the highway Budapest - Vienna. As that initial highway has started to spread to other directions from Budapest towards Miskolc in the East, towards Kecskemet in the South-East and Balaton in the South-West so also FDI followed in the same directions. As Hungarian experts pointed out in this connection, there has not yet been any spread of FDI from Budapest towards the former big heavy industrial center of Salgotarian. The main reason has been that in that direction there has not been any suitable road connection.

Again by an unwanted paradox about the same direction is also the most straight connection from Budapest to Slovakia and also to its - among the Hungarian tourists - most popular ski resorts around Donovaly, etc. But Slovakia that otherwise is so much interested in luring into the country FDI but also foreign tourists has not yet been able to build an adequate road connection in that promising direction. Although, Budapest with its almost 2 million potential tourists is from its northern outskirts just about 30-70 km from the Slovak border. Moreover, as we know Budapest and its area is the main concentration of FDI sites in the country including numerous industrial parks, etc. And we also know that FDI have strong tendency for an overflowing and spillover effects irrespective of national borders, etc. But, Slovakia has, also in this respect so far, done nothing to lure those overflowing investments from Budapest to flow also to the North. But...A very similar situation is already also in the East of Hungary and Slovakia. On the Hungarian side the highway linking Vienna-Budapest has already been extended up to Miskolc i.e. several kilometers from the Slovakian border. From that border is again only 25 km to Kosice that has not yet managed to attract in addition to U.S. Steel no other major FDI. Again if Slovakia would build a piece of highway from Kosice to the particular border, the spill over and overflow effect from Miskolc area. But... again one of the easiest, cheapest and fastest ways how to link the Eastern Slovakia region with its capital of Bratislava would be just to build a highway connection towards Miskolc and then use the existing highway up to Hungarian-Austrian border and make an highway exit to Bratislava, but... Otherwise, all these connections in a couple of months will be on the territory of the EU. In summary, for Slovakia it would need to co-build only three short highway connections from the existing Miskolc-Budapest-Gyor-Vienna highway to Bratislava, to Komarno/Sturovo, Kosice. By those very short connections, three most southern regions of Slovakia would be linked to an existing trans-European highway and also ready for a spillover effects of FDI located on that highway also to the North i.e. Slovakia. The same effect could be achieved also regarding Hungarian tourists for Slovak ski resorts, spas, etc.

Otherwise, however, also those Southern Slovak regions will remain - although for different reasons - but equally "free" from any foreign investors like it is in many regions of Greece. The Slovak Republic should not just wait until those connections will be finished thanks also to potential funding from the EU. In the meantime the country and especially its regions have, in their pro-investment strategy; to focus on whatever potential (but serious!) pilot foreign investors would be interested in investing in the country or in any of its regions. According to that make also all necessary preparations and highway connections. That would be much more realistic approach than "dreaming" about big strategic investors from the car making industry.

Every, whatever small but serious foreign investor being ready to invest in any of the country's regions has to be fully supported as in addition to the particular investments it means one perhaps even bigger benefit. Through those, initially perhaps just very small FDI, the particular region will get its "spot" on the global map of FDI sites. Such a spot or place on that map means that it has already managed to attract an attention of foreign investors. If such an initial investment becomes a successful and long-term relation then such a pilot investor is a kind of guaranty also for other potential foreign investors to follow that example as well. This is also what C. Mitchell-Weaver had in mind when suggesting lowering a minimum amount of FDI for becoming eligible for one or other

kind of incentives, etc. First pilot investor is like a icebreaker i.e. cleaning and opening the way for future investors-followers. The small country has always to remember that even in the largest economy in the world with the largest and the most powerful TNCs i.e. in the USA, the decisive parts (more than 80%) of the GDP and of new jobs have permanently been created by small and medium companies.

#### **FDI Inflows and "Learning" Regions**

It is a well-known and many times verified fact that the whole globalization and regional integration are very dynamic processes. The same and even more is true also regarding their individual components including FDI. What was, just ten years ago, quite an innovative approach like e.g. preparation of industrial parks or "maquiladoras" as one of the most efficient means and tools how to attract foreign investors into the particular country or regions, nowadays has been seen as a rather old fashioned and out-of-touch approach. The same could be said about various kinds of incentives that has been at present offered by so many countries that they almost absolutely lost their innovative attractiveness or comparative advantage and have become just a kind of an inevitable standard. Or the privatization just quite recently has been seen as one of the most efficient ways for attracting FDI inflows into the particular country. But after just several years it has been discovered that through such a process, some significant amounts of investments could come and improve the particular statistics and image of the country. But on the other hand it has become evident that through such FDI inflows most of expected benefits like new technologies, new jobs, new markets, etc. never come.

As most of these potential benefits and expectations from FDI have a very strong regional dimension and are basically implemented on the regional levels it is of utmost importance to upgrade the regions in their relation to FDI inflows into the category of so called "learning regions".

A learning region in difference to an "ordinary" region means that it is a region being aware of the dynamics and speed in the FDI global and regional trends and is able to adjust its pro-investment policy accordingly. For example in connection with IP it means that such a region will not only be preparing such a park in a classical form as being known from - so to say with some exaggeration - the last 20<sup>th</sup> century but according to the trends of the contemporary 21<sup>st</sup> century i.e. IPs with value adding orientations like are a research, development, innovations, high tech orientation, etc.

From the practical point of view it means that the regions in their pro-investment strategies have to combine their efforts with a large circle of other suitable partners in that area as are local and/or regional universities and colleges, research, innovation and development centers in order to discover all the potential of the so called "knowledge assets" of the particular region and/or neighboring regions.

An another important feature of a learning region is that in addition to the above regional "knowledge assets" it is able also to promote and create all necessary preconditions for the industrial clusters. It means that producers from industries belonging together will be creating particular industrial clusters like production of computer chips will create a necessary basis for a cluster with various other producers using those chips for their lines of productions.

In addition to the above clustering, an another important feature of a learning region is the concept of "growth poles". These poles are in fact regional centers that could help in and support the overall growth of the region. They are in different ways supporting regional production, employment, qualification of labor, income, standard of living, regional demand and thus moving the whole region towards sustainable development and an overall growth

Among the most important characteristics of a learning region is also its ability to learn not only internally through the above internal regional capacities but also externally i.e. on an inter-regional basis. Instead of often existing or prevailing rivalry among or between regions there has to be inter-regional cooperation in learning together. In this type of learning, one of the most important roles could be played by regional pro-investment centers as well as regional pro-investment agencies. It is given mainly by the fact that individual regions and their main players often for various other duties and responsibilities do not have enough time and capacity to follow the latest developments and innovations in FDI global and regional trends. It is then the responsibility of those specialized regional agencies to monitor and disseminate the latest know how in the particular area. In this respect a close and regular monitoring of the latest global and regional trends in FDI and their application to the regional pro-investment strategies is one of the most efficient ways how to support and develop the regional dimension of FDI. One typical

example where is also one of the main deficiencies of the whole pro-investment strategy in the Slovak Republic and especially on its regional level is the lack of learning from the closest partners within the V4 countries. If we look at the V4 regional map we could find out that the Slovak Republic has been the most surrounded member country of that regional grouping not only geographically but also regarding concentration of FDI sites on the other side of its common border with its V4 partners.

For example very close to the Slovak border in the north with Poland are located three important Special Economic Zones (SEZ):

- Euro-Park Mielec SEZ
- SEZ Krakow Technology Park
- Katowice SEZ

All three of them could serve as good examples or models for neighboring regions on the other side of the border in the Slovak Republic like:

- an active cooperation with and involvement of local universities into FDI inflows support
- some of the SEZ sub-zones are directly operated in close cooperation with the particular regional universities
- having specialization like Krakow Technology Park in green field industrial projects
- Euro-Park Mielec has been created as a prototype of the future Euro-cross-border FDI park
- All three have been launched gradually since 1995 and over the years have gathered a lot of practical experiences.

On the southern border of the Slovak Republic with Hungary - as we have already mentioned - is another high concentration of FDI as that territory accommodates almost 80% of all FDI inflows in the country. Especially it is so along the famous highway Miskolc - Budapest - Gyor - Vienna running only few kilometers from the Slovak border.

About the same situation is also along the common border of the Slovak Republic with the Czech Republic. There are again not far from the border itself traditional centers of FDI inflows in the Czech Republic like Ostrava region, Brno region and region of the Southern Moravia as the whole with numerous IP, technological parks, innovation parks, etc.

But in spite of all these three huge concentrations of FDI inflows in three closest neighboring countries one could hardly find any attempt on the Slovak side to utilize this situation also for the benefits of the own country. Until now there has not been registered any attempt e.g. to build a "mirror" IP or other kind of parks on the Slovak side of the border and thus to try to lure FDI also to the other side of the common borders. And that this is no any revolutionary idea on a specific cross-border cooperation in the field of FDI we could again bring a lot of examples from various parts of the world that we have already mentioned also in this study like are SEZ on the China side of the border with Hong Kong. And it was so long before the former colony returned to its homeland. Various industrial and other parks exist also on the Malaysian and Indonesian sides of their common border with Singapore. And most probably it is again no accident that the main original concentration of FDI sites in the Republic of Ireland has always been along its short and otherwise not the most peaceful border with the Ulster as a part of the UK. But positive examples in this respect we could find also on Hungarian and Czech borders with Austria. For example on the Hungarian and Austrian border has been already for years operational the Szentgotthard - Helingenkretz Industrial Park that is symbolically located on the both sides of the common border with its own special customs office and border crossing. A similar common IP exists also on the Austrian and Czech border. One could only wonder why has not been so far made a single similar attempt on the Slovak border with its V4 neighbors? That alone remains one of the biggest mysteries of the whole pro-investment strategy of the Slovak Republic and of course not only for this author. Such a quite logical solution i.e. building "mirror" IPs on the Slovak side of the common borders with other V4 countries could help not only to improve inflows of FDI into the country but also to improve its image. As an example could serve experiences from China, Malaysia or Indonesia that built their first IPs on the borders with their neighbors as already years ago they knew that FDI do not know and do not recognize any geographic, political or ideological borders. They simply go or better overflow or spill over across any border just in order to find better conditions for their returns. Building "mirror" IPs on common borders of Slovakia with its

neighbors is for an OECD member country and soon-to-become member of the EU much better presentation and image making factor than to serve as a source of cheap "gastarbeiters" i.e. guest workers not only for Austria but currently already also for all other V4 countries.

# Empirical Study for the Effect of Stock Policy on Banker Stocks in Chinese Markets

*Kong Shuhong*

*University of International Business and Economics, China*

## Abstract

The paper studies the relationship between stock policy announcements and banker stocks in Chinese stock markets. The investigations are carried out through modeling the daily changes of stock returns of banker stocks on the windows of stock policy events, in order to test the news effects of stock policy on the conditional mean and the variance of the changes on the days of stock policy announcements. It is found that a significant positive effect had occurred to banker stocks, which explained a significant effect by using policy events to manipulate the stocks. The banker stocks' cumulative abnormal return can reach 10%—15% within the stock policy event window. The research reveals that Chinese markets, unlike west markets, are sub-efficiency markets with serious banker stocks manipulation by means of varied stock policy.

## Introduction

Chinese Stock market has long been called policy market where policy has a significant impact on stock and investor's behavior. Xiaobin J and Limin T (2001) proved by statistics that during 1992 to 2000 policy was the main factor that led to the abnormal fluctuation of the stock market and contributed 46% of the total impact. Xiangjun L's empirical study (2001) show that among the 52 abnormal fluctuations of the Shanghai market during 1992 to 2000 the policy factor led to 30 fluctuations, about 60% of the total impact. Other studies, e.g. Shigui Z (1998), Chengwei Z (1998) also found a strong correlation between the policy and fluctuation of the stock price.

Banker stock is another major phenomenon in Chinese stock market. To be objective, banker stocks are inevitable, and meanwhile manipulation of small capital stocks to profit is common in all stock markets. However, the prevalence of banker stocks in China today has been profoundly grounded and rooted. It can be mainly attributed to the influence of the administration policy on the stock markets, which renders the market mechanism failing to give its full play. As a reflection, the market approaches the equilibrium via administrative measures rather than market mechanism. There tends to be strong correlation between the policy changes and the banker stock behavior. However, it's quite difficult to study the banker stock behavior in Chinese stock market not only due to the complexity of the issue itself but also to the difficulty in collecting information and data generated by wire-pulling. The paper is to start from the relation between policy information and banker stock and to find its impact on efficiency of Chinese stock market.

The author is going to study the following aspects: empirical study on abnormal returns, cumulative abnormal returns and trade volume of banker stock in the window of policy information announcements. The study is aimed to unveil to what extent the manipulation of banker stock depends on the announcement of policy information, i.e. whether the policy market is conducive to manipulation of banker stock.

The empirical results show, in Chinese stock markets there is full of banker stocks (see Table 2) and there is close relationship between policy events and manipulation of banker stocks. It is seen from Table 2, in the whole of 1180 A-stocks in Chinese markets there are 113 typical banker stocks. So about 1/10 of Chinese stocks are typical banker stocks. On the other hand, policy events have significant impact on banker stock abnormal return and cumulative abnormal return in both the Shanghai and Shenzhen market. Maximum banker stock abnormal return of about 2% were reached on date  $t=1$  or  $t=2$  of the policy event in both the markets. Banker stock cumulative abnormal return in both the markets can reach 10%—15% within the event window. And the cumulative abnormal return begin to rise 5—10 days before the policy event and rise the rapidest 1 or 2 days after the event. A maximum is reached 13 days after the event and then have a small drop. This is a characteristic very different from west efficient markets in which event effect is significant only on the event announcement day and quickly goes to quiet. The empirical study results for banker stock abnormal trade volume change and cumulative abnormal trade volume

change shows that there is a greatly fluctuated trade volume in the policy event window, especially in the case of policy good news. It is an evidence of that the manipulation of banker stocks was greater than normal stocks. The research reveals that Chinese markets, unlike west markets, are sub-efficiency markets with serious banker stocks manipulation by means of varied stock policy.

The author believes that the research has significance of two aspects. On the one hand, theoretically speaking, Chinese stock markets are parts of world finance markets and the study for their operate rules, efficiency characteristics, price-making mechanism, policy effect must be helpful for the development of theory on capital-asset-pricing and theory on capital market efficiency. Because banker stock is a special phenomenon in developing markets and it has great influence on the markets, studying its behavior rules will be helpful to detect the market operate mechanism. On the other hand, practically speaking, with the economy and finance globalization and China join into WTO, Chinese stock markets will be open to world soon. World investors will come into the giant market. The research of Chinese market characteristics and price-making mechanism, especially banker stocks and policy effect, will be helpful to investors for their information collecting and investing decisions.

The rest of the paper is organized as follows: Section 2 discusses data employed and methodology issues, Section 3 discusses study model and presents empirical results, and Section 4 concludes the paper. All tables and figures are in appendix after references.

## Data and Methodology

Data for empirical study are daily data for all stocks listed on the Shanghai and Shenzhen stock markets, including stock code, stock name, trade volume, trade value, open price, close price, maximum price and minimum price.

The data spanned between January, 1999 to December, 2001<sup>1</sup>. The reason is that the policy change and banker stock manipulation during that period is quite typical and the time span is relatively new. Stock market after 2002 is quite dull and banker stocks are inactive.

Original data are adjusted as follows: eliminate trade record for investor's new stock issuance application; re-impose rights to stock dividend based on the ex-rights day; eliminate transaction data for non-stock securities (such as bond, fund).

Methodology: events analysis is used to study abnormal return and abnormal trade volume change in the events window. Steps are as follows: define events and events window; select samples; calculate normal, abnormal return and change of trade volume; select model to estimate change of normal return and normal trade volume; calculate abnormal return, normal return and the difference between abnormal trade volume and normal trade volume; formulate test results and explanation.

Events selection: relevant major policies during January 1999 and December 2001. In order to avoid overlapping of time events (a series of relevant policies were formulated in a specific time interval), the policy that has the biggest impact is chosen in that time interval. According to search results of China Securities Journal, the 7 items in Table 1 are deemed as the representative big events.

TABLE 1: BIG POLICY EVENTS DURING THE SAMPLES INTERVAL

Number	Time	Policy
1	1999.5.19	Cumulative of various market good policies <sup>2</sup> □ good news
2	1999.9.9	Permission of market entrance for 3 types of companies <sup>3</sup> □ good news
3	2000.2.14	Permission of mortgage loans for securities companies and distribution of newly issued stocks to secondary market investors. Good news.
4	2000.8.22	Supervision of State Council and CSRC on financial institutions, bad news
5	2001.1.10	On Strengthening market supervision by premier Zhu, Investigation by CSRC on Yi An Technologies; bad news

In Table 1 the events show a surging stock market at the turn of the century where the banker stocks were active and major policies were frequently formulated, among which the market entrance of 3 types of companies, the

investigation of Yi An Technologies and the decrease of State Stocks Holding were the major policies that impacted the market greatly.

Events window: the first transaction day after the occurrence of events is  $t=0$ . Take  $t = -15$  to  $t = +15$  as event window, that is, the 31 days of 15 days before and after the occurrence of the event is the length of the window. In addition, take 30 transaction days before the event window as pre-estimate window.

Sample Selection: according to characteristic of banker stocks, the major criteria to judge whether a stock is a banker stock is the existence of three stages of low price buy, rapid price pulling and high price selling. This process is the key for the bankers to profit. Moreover, the characteristic is easy to identify. Based on performance of all the listed stocks (funds and bonds are eliminated) during Jan, 1999 to Dec, 2001 in the Shanghai and Shenzhen Market, the 113 banker stocks are sampled (see Table 2).

The banker stocks in Table 2 are typical banker stocks listed on the two markets. In the table the numbers in the brackets are stock price in the specific time, to the nearest 0.5 Yuan for the facilitation of understanding the trend.

The banker stocks in Table 2 selection criteria is: in a reasonable time period, an obvious three-stage change or up and down two-stage change, a 100% change of price, a stable low price buy period before manipulation and the price changed down to the level before manipulation after the whole process. This is a typical banker stock. According to the criteria, there are over 110 stocks having a manipulation interval of 7 or 8 months, a maximum of 30 months, price change for 200% to 300%, maximum to 500% to 600%, including the well known banker stock such as Yi An Technologies and Century Zhong Tian, which were all in tally with the reality of Chinese stock market, e.g. common and abnormal profit for banker stock.

Individual stocks that have ex-rights for many times during the study period were possibly intervened by bankers (manipulation by themes). Because of lack of characteristics for banker stock price change and inability to determine whether it is a reasonable market behavior or market manipulation, the stocks were not listed as banker stocks. In addition, newly listed stocks after 2000 were most going upward a bit and then move downward for a time were not listed as banker stocks because of the absence of low price buy and the low magnitude of moving upward despite they were most intervened by bankers (maybe during the application period).

Some stocks in Table 2 might experience banker situation more than once such as the stock 600729 and the time interval is more than 1 year. Some stocks experience long upward phase (more than half an year), which is the result of complex banker practice (mixing manipulation of up, fluctuate and sell).

TABLE 2: TYPICAL BANKER STOCK MANIPULATION FROM JAN.1999 TO DEC.2001  
IN CHINESE MARKET (PARTLY<sup>4</sup>)

Code	Up	Fluctuation	Down	Interval(month)
600001	99/3/1---99/7/15 (7.5)---(13)		99/7/15---00/1/4 (13)---(7.5)	10
600009	99/3/3---99/6/24 (9)---(14.5)		99/6/24---00/1/28 (14.5)---(9.5)	11
600052	99/5/19---00.4/19 (7)---(20.5)		00/4/19---01/12/15 (20.5)---(6.5)	30
600055	00/1/18---00/11/7 (10.5)---(25)		00/11/7---01/11/7 (25)---(14)	23
600056	99/5/19---00/7/10 (11)---(33)		00/7/10---01/12/15 (33)---(11)	30
600058	99/5/17---00/12/1 (7.5)---(32)		00/12/1---01/12/15 (32)---(11)	30
600073	99/11/26---00/2/18 (7)---(31)		00/2/18---00/10/8 (31)---(15)	10
600076	99/12/1---00/6/2 (11.5)---(28)		00/6/2---01/12/15 (28)---(10)	25

600077	99/5/18---99/8/15 (15)---(32)	99/8/15---99/11/10 (32)---(20)	99/11/10---01/11/1 (20)---(12)	29
600102	00/5/16---00/11/1 (7)---(24)		00/11/1---01/12/15 (24)---(7)	19
600126	00/1/10---00/8/8 (6)---(13)		00/8/8---01/10/10 (13)---(7)	21
600128	00/1/15---00/4/20 (12)---(33)	00/4/20---01/2/20 (33)---(15)	01/2/20---01/12/15 (15)---(9)	23
600135	99/5/19---99/7/15 (10)---(26)	7/15--12/20--00/3/8 (26)---(26)---(41)	00/3/8---01/12/15 (41)---(19)	30
600136	99/5/17---00/6/26 (10)---(26)		00/6/26---01/12/15 (26)---(12)	30
600138	99/5/19---99/8/21 (9)---(21.5)	8/21-12/16-00/2/18 (21.5)--(13)--(33)	00/2---00/9---01/11 (33)---(16)---(11)	30
600146	01/2/21---01/6/22 (10)---(24)		01/6/22---01/12/15 (24)---(13)	11
600161	00/10/20---01/1/19 (20)---(32)		01/1/19---01/12/15 (32)---(18)	14
600165	00/10/5---01/5/16 (11)---(29)		01/5/16---01/12/15 (29)---(13)	14
600173	01/2/19---01/6/12 (10)---(17)		01/6/12---01/12/15 (17)---(8)	10

## Model for Empirical Study and Result

Model for empirical study and result for abnormal return, cumulative abnormal return and abnormal trade volume change, cumulative abnormal trade volume change of banker stocks in the window of policy declaration are as follows:

Return  $F_{it}$  and trade volume change  $G_{it}$  can be given by the following model:

$$F_{it} = \ln Q_{it} - \ln Q_{i,t-1}, F_{it} = \mu_i + \zeta_{it}, E(\zeta_{it}) = 0, Var(\zeta_{it}) = \sigma_i^2 \quad (1)$$

$$G_{it} = \ln R_{it} - \ln R_{i,t-1}, G_{it} = \nu_i + \xi_{it}, E(\xi_{it}) = 0, Var(\xi_{it}) = \varepsilon_i^2 \quad (2)$$

Where  $t$  is per trading date,  $i$  is alternative event number,  $Q_{it}$  is the actual stock price on date  $t$  for event  $i$ ,  $R_{it}$  is actual stock transaction volume on date for event  $i$ . Estimated value of  $CF_i$ ,  $CG_i$  can be obtained by regression of

$\mu_i$  and  $V_i$  in the estimate period, and abnormal return  $AF_{it}$  and abnormal trade volume change  $AG_{it}$  on date  $t$  for event  $i$  can be further obtained:

$$AF_{it} = F_{it} - CF_{it}, \quad AG_{it} = G_{it} - CG_{it} \quad (3)$$

Cumulative abnormal return  $CAF_{it}$  and cumulative abnormal trade volume change  $CAG_{it}$  are following:

$$CAF_{it} = \sum_{s=-15}^t AF_{is}, \quad CAG_{it} = \sum_{s=-15}^t AG_{is} \quad (4)$$

In order to make the banker stock characteristics obvious, the abnormal return and abnormal trade volume change are compared to average abnormal return and average abnormal trade volume change in the event window. Take the Shanghai market index and Shenzhen Component index as the substitute of market portfolio price, and the trade volume of the two markets as trade volume of market portfolio, according to (1), (2). (3), (4) the abnormal return  $SF_{it}$  abnormal trade volume change  $SG_{it}$ , cumulative abnormal return  $CSF_{it}$ , cumulative abnormal trade volume change  $CSG_{it}$  for the market portfolio in the event window can be calculated.

Abnormal return  $ZF_{it}$  and abnormal trade volume change  $ZG_{it}$  for the banker stock can be calculated accordingly:

$$ZF_{it} = AF_{it} - SF_{it}, \quad ZG_{it} = AG_{it} - SG_{it} \quad (5)$$

Cumulative abnormal return  $CZF_{it}$  and cumulative trade volume change  $CZG_{it}$  for banker stocks are following:

$$CZF_{it} = CAF_{it} - CSF_{it}, \quad CZG_{it} = CAG_{it} - CSG_{it} \quad (6)$$

Set the number of big events  $N$  and classified into good news and bad news to calculate average abnormal return  $\overline{ZF}_t$ , average abnormal trade volume change  $\overline{ZG}_t$ , average cumulative abnormal return  $\overline{CZF}_t$ , and average abnormal trade volume change  $\overline{CZG}_t$  for the banker stock:

$$\overline{ZF}_t = \frac{1}{N} \sum_{i=1}^N ZF_{it}, \quad \overline{ZG}_t = \frac{1}{N} \sum_{i=1}^N ZG_{it} \quad (7)$$

$$\overline{CZF}_t = \frac{1}{N} \sum_{i=1}^N CZF_{it}, \quad \overline{CZG}_t = \frac{1}{N} \sum_{i=1}^N CZG_{it} \quad (8)$$

At last, take  $\{\overline{ZF}_t\}$ ,  $\{\overline{ZG}_t\}$ ,  $\{\overline{CZF}_t\}$ ,  $\{\overline{CZG}_t\}$  as sample for test in order to determine the impact of policy on banker stock (for the 110 stocks listed in Table 2).

Original hypothesis  $H_0$ : the major policy has no impact on the banker stock in the event window ( $\overline{ZF}_t = 0$ , or  $\overline{ZG}_t = 0$ , or  $\overline{CZF}_t = 0$ , or  $\overline{CZG}_t = 0$ )

Alternative hypothesis  $H_1$ :  $\overline{ZF}_t \neq 0$ , or  $\overline{ZG}_t \neq 0$ , or  $\overline{CZF}_t \neq 0$ , or  $\overline{CZG}_t \neq 0$

All the calculations are done by Eview and Excel. Results are in Table 3-6 and Fig. 1- 8.

## Result Analysis for Empirical Study

The following conclusions can be drawn from Empirical test results (Table 3 - 6 and Fig. 1- 8):

It is can be seen from Table 3 and Table 4 that policy events (good news) have significant impact on banker stocks abnormal return and cumulative abnormal return in both the Shanghai and Shenzhen market. Banker stocks' abnormal returns on dates  $t = -7, -5, -2, 1, 2, 4, 8$  of the event are significantly positive in Shanghai market, among which data  $t = 1$  has a maximum of 2.05%(see Table 3). Banker stocks' abnormal returns on dates  $t = -14, 1, 2, 4, 7$  in Shenzhen market are significantly positive, among which date  $t = 2$  has the maximum of about 2.4%, while data  $t = -15$  is significantly negative (see Table 4). Maximum return is reached on date  $t = 1$  or  $t = 2$  of the policy event in both the market, which shows the obvious impact of the policy event on the banker stocks. That is to say, banker stocks' reaction to policy events is significantly different to other normal stocks. A significant positive effect has occurred to banker stocks, which shows a significant effect by using policy events to manipulate the stocks.

As to cumulative abnormal returns, Fig. 1 and Fig. 3 show a similar trend for both the Shanghai and Shenzhen market, that is, it begin to rise 5-10 days before the policy event and rise the rapidest 1 or 2 days after the event. A maximum is reached 13 days after the event and then has a small drop. Compared to return shift effective reaction of the event, let-out of policy information in advance is serious. The banker uses both the capital advantage and the information advantage to manipulate the stocks in advance. When the policy information finally arrives at the market, large amount of general investors swarm into the market and results the continuous price rise till the end of the event window. The market correction is quite weak, which is related to bankers' manipulation. It is can be seen from Fig. 1 and Fig. 3 that the banker stocks' cumulative abnormal return in both the markets can reach 10%—15% within the event window (This is the banker stocks' return shift).

Policy events' (bad news) impact on banker stocks' abnormal return and cumulative abnormal return in both the markets also show the manipulation characteristics of banker stocks. From Table 5 and Table 6, on the perspective of daily abnormal return, both the markets show no daily significant non-zero abnormal return at the 5% significance level, which seemingly show no significant impact of policy bad news over banker stocks. Since bad policy news have resulted a general drop of normal return, it demonstrates that banker stocks don't drop faster than

other stocks during the overall drop caused by the policy bad news. Considering the banker stocks' price are generally higher than their fair value, it is reasonable to believe a faster drop for the banker stocks in the policy bad news situation, so this is the evidence shows the bankers' manipulation. The figure of cumulative abnormal return has also explained from this point. Figure for cumulative abnormal return Fig. 5 and Fig. 7 are both close to return shift figure for efficient market, that is, it maintains at a stable level before occurrence of the event, shift downward shortly after the event, and then maintains at a close level. Because of the impact of policy bad news, a rapid decrease of banker stocks is disadvantageous to bankers. Therefore, bankers are trying to maintain a stability of banker stocks before and after the event, and an unavoidable shift (downward) occurs shortly after the event.

Therefore, the empirical study for banker stocks' abnormal return and cumulative abnormal return in the policy events window shows policy good news are conducive to banker manipulation and policy bad news don't resulted in a faster drop by banker stocks than normal stocks. And in the policy events window banker stocks have rather great cumulative abnormal return in both Shanghai and Shenzhen markets. This means that Chinese markets, unlike west markets, are sub-efficiency markets with serious banker stocks manipulation by means of varied stock policy.

Meanwhile, the empirical study results for abnormal trade volume change and cumulative abnormal trade volume change don't explain rules but gives some characteristic of banker stocks manipulation. Within the policy good news (see Table 3 and Table 4), significant abnormal trade volume change on dates  $t = -14, -7, 0, 2, 9, 10$  are non-zero in Shanghai market, while values on dates  $t = 0, 10$  are significantly negative, significant negative for two days and positive for other days. Significant abnormal trade volume on dates  $t = -15, -13, -12, -3, 0, 1, 2, 8$  are non-zero in Shenzhen market, while the values on dates  $t = -12, -3, 0$  are significantly negative. Cumulative abnormal trade volume change for both markets does not show an obvious upward or downward trend (see Fig. 2 and Fig. 4). In the policy bad news window, from Table 5 and Table 6, Shanghai market shows significant non-zero abnormal trade volume change on dates  $t = -15, -13, -11, -10, -4, 7, 11, 12, 13$  while Shenzhen market shows significant non-zero abnormal trade volume change on dates  $t = -15, -14, -9, -5, -3, -2, 4, 9, 12$ , among which values on dates  $t = -15, 7, 11$  in Shanghai market are negative and values on dates  $t = -15, -9, -3, 12$  in Shenzhen market are significantly negative. Also, like the case of good news, the cumulative abnormal trade volume change in both markets don't show obvious upward or downward trend (see Fig. 6 and Fig. 8).

Therefore, conclusions for the empirical study of banker stock abnormal trade volume change and cumulative abnormal trade volume change can be drawn as follows: first, policy event resulted in significant fluctuation of abnormal trade volume of banker stocks for Chinese stock market, among which there are positive change and significantly negative change, and the fluctuation of trade volume change caused by policy good news is greater than policy bad news, which shows that manipulation of banker stocks is greater than normal stocks and thus has a greatly fluctuated trade volume in the policy event window, especially in the case of policy good news. Secondly, on the date of policy good news declaration  $t = 0$ , abnormal trade volume of banker stocks in both markets enjoy a significant drop of -23% in Shanghai market and -54% in Shenzhen market. On the following two days  $t = 1 \square 2$  the values rise greatly, which could be explained that the bankers and the general investors are on-watching the market on the event day, thus results the trade volume dropped significantly and rise dramatically during the subsequent two days. Relating to the fact that banker stocks' abnormal return reaches a significant positive maximum on date  $t = 1$ , it can be categorized as another aspect of sub-efficiency characteristics in Chinese markets: both the bankers and the general investors are more prone to focus on banker manipulation and policy impact. Third, abnormal return and abnormal trade volume change for banker stocks in the event window in both markets shows strong similarity, which demonstrate a high degree of correlation between Shanghai and Shenzhen market.

## Abstract

This paper finds that significant variation in FDI spillover effects on local industry is obscured through the aggregation common in most studies. Breaking Chinese industrial data for 2001 down by category of ownership of foreign investor, local firm, and by host industry, we find evidence of greater positive spillovers from FDI in technology-intensive industries than in labour-intensive industries. We then find that overseas Chinese affiliates from Hong Kong, Macau and Taiwan (HMT) generate spillovers to locally-owned enterprises (LOEs) in labour-intensive industries, in contrast with western affiliates, which positively impact on the performance of LOEs in technology-intensive industries. Chinese state owned enterprises (SOEs) benefit from the presence of both HMT affiliates in labour-intensive industries and of western affiliates in technology-intensive industries. Other LOEs (OLOEs), however, benefit only from HMT affiliates' presence in labour-intensive industries. These findings support host policies offering generous incentive packages to attract foreign investors in high technology industries.

## Introduction

The past two decades have witnessed a striking transformation in the Chinese economy: from a centrally-planned to an essentially market-oriented system, and away from an inward-orientated industrialization strategy to opening-up policies aimed at integration with the global economy. Accompanying the progressive marketization and internationalization of the economy in this period, has been an unprecedented expansion in inward foreign direct investment (FDI) into China by multinational enterprises (MNEs). Indeed, in 2003 China overtook the USA and became the largest recipient of FDI (UNCTAD, 2004). This growth in inward FDI is widely believed to be a key component of China's economic miracle. However, simply measuring the direct effects of inward FDI on Chinese industrial productivity will underestimate the overall contribution of foreign investment if spillover effects are significant (Murphy, 1992; O'Malley, 1994; Buckwalter, 1995). Therefore this study examines the spillover effects that arise from FDI in Chinese manufacturing.

There is little controversy within existing theoretical research on the causes of spillovers, but a considerable amount of debate within empirical work to date, largely because the evidence on spillovers remains stubbornly inconclusive (Blomstrom and Kokko, 1997). Part of the problem may be that existing studies typically treat foreign affiliates (FAs), of whatever home origin, and locally-owned enterprises (LOEs), of whatever type of domestic ownership, as a whole. They also pay no regard to the characteristics of the industry in which these firms operate. Such studies, therefore, look at the aggregate impact of overall inward FDI on all LOEs, across all manufacturing industries. More recent research (e.g., Buckley, Clegg and Wang, 2005a) has started to unpack these overall results, to allow for relationships within the aggregate data that can vary with category of foreign investors and by group of local spillover recipients.

In a commentary article on the perspective paper of Meyer (2004), Ramamurti (2004) calls for future research in the area of spillovers to follow Buckley, Clegg and Wang (2002) and Gillespie, Riddle, Sayre and Aturges (1999) in investigating the impact of diasporas on economic development in poor countries. By way of a response, this study aims to offer a step forward in breaking down the general relationship between FDI and LOEs' performance. We group the whole of Chinese manufacturing into labour-intensive and technology-intensive industries; FAs into those originating in Hong Kong, Macau and Taiwan (hereafter, HMT) versus those originating

from western countries; and the LOEs recipients of spillovers into state-owned enterprises (SOEs) and other locally-owned enterprises (OLOEs). These classifications form the basic analytical framework of this study.

These distinctions are particularly crucial in the context of China. First, it is generally agreed that China's comparative advantage is its relatively low labour costs compared with developed countries and with other emerging economies (Cheng & Kwan, 2000). This has been a leading motive for MNEs to invest in labour-intensive activities in China (Fung et al., 2002). Second, the two major groups of foreign investors in China – firms from HMT and from western countries – differ enormously, in terms of both motivation and investment behaviour (Huang, 2004). This contrast means that FAs in these two ownership groups can be expected to impact differently on LOEs. Third, SOEs and OLOEs are two very heterogeneous ownership types dominating Chinese manufacturing industry. They diverge substantially in many respects. These include the structure of property rights, technological capability, learning incentives and government support, among others (Wang, 2003). These dissimilarities suggest that the two types of firms may have different absorptive capacities, and furthermore that these will vary by industry. Therefore, the richness and diversity of FDI into China, and of its potential impacts, provides a unique opportunity to explore the complexity of FDI spillovers, within the environment of an economy undergoing transition.

In this paper we pursue the idea that the spillover effects of FDI may be not as uniform as many studies suggest. In examining the productivity impacts of foreign ownership on China's domestic industry, the paper is marked out from existing studies in the following three respects. First, by allowing the results to vary between labour- and technology-intensive industries, we expect to see the extent to which spillover effects vary with industrial technology intensity. Second, we employ alternative measures of foreign presence, and use these to investigate more deeply the influence of the source of FDI. This procedure enables us to distinguish effects that are specific to the type of country of foreign ownership, and to compare these with the overall effects of foreign ownership. Third, we allow the results to vary with respect to different types of domestic ownership. So doing enables us to observe the distribution of spillovers between differently-owned LOEs. Fourth and most important, we combine the above three dimensions by organizing the groups of foreign and locally-owned firms within different industry categories. This systematic approach provides an opportunity to uncover 'who benefits from whom' in which types of Chinese manufacturing industry. It is this task that constitutes the central aim of this study.

If significant between-group effects are captured through the above procedures, it would imply that studies conducted only at aggregate level are deficient. It is quite possible that in aggregate analysis 'good' and 'bad' nations, industries and ownerships of LOEs may offset one another, leading to the washing out of important effects. We expect that our breakdown will reveal sub-relationships in the data that up to now have remained hidden within the aggregate relationships reported in most studies. In this way, we aim to complement and deepen the state of knowledge on spillover effects in Chinese industry, which in the main has been confined to general conclusions.

The next section of this article sets the theoretical scene, together with a brief review of the relevant empirical literature. A description of the variables, the models adopted and data employed, follows in Section 3. The penultimate section discusses the econometric results. The last section concludes.

## Literature Review

### Theory on Spillovers

The theory of spillovers associated with inward FDI is well established, and little controversy remains. It is generally agreed that spillovers are generated by non-market transactions involving foreign MNEs' resources, in particular when knowledge is spread to local host country competitors without a contractual relationship (Meyer, 2004). Spillovers are reflected in improved productivity, or other benefits, in LOEs (Buckley, Clegg and Wang, 2005a). Görg and Greenaway (2002) mention imitation, the acquisition of skills, competition and exports as channels through which developing host countries may achieve productivity gains via intra-industry spillovers.

Despite general agreement over the theoretical basis and mechanisms of spillovers, to date theorists have not gone so far as to explore fully when precisely these spillovers might be large, small and nonexistent (Caves, 1999). However, there are good reasons for believing that spillovers should be large for certain groups of LOEs in

particular industries, and, that these further link to the country group of FAs. These hypotheses can only be tested by breaking down the aggregate data.

#### **Spillovers in Labour- and Technology-Intensive Industries**

Conventional theory on MNEs and FDI suggests that knowledge-based assets constitute the firm-specific advantages owned by MNEs, that these motivate investment across borders. Accordingly, Markusen (1995) notes that MNEs can be identified with a high ratio of intangible assets to market value. In industries characterized with rapidly changing technologies these assets are likely to be related to new products and processes. In line with these arguments, mainstream theoretical perspectives, such as the OLI paradigm (Dunning, 1993) suggests that MNEs operate predominantly in technology-intensive industries.

The emergence of MNEs in non-R&D intensive industries in recent years however (since the 1980s) has led to recognition that an absolute advantage, for instance in technology or product differentiation, is not always the crucial factor driving FDI (Giddy and Young, 1982). Labour-intensive industries are a good example of those in which MNEs' competitiveness may spring from marketing skills or organizational advantages. These non-technological assets are capable of underpinning the exploitation of comparative advantages in host countries (Luo, 1999)<sup>i</sup>. The possession of ownership advantages of this type, taken together with favourable location-specific factors abroad, may enable even small and low-technology firms to undertake FDI (Giddy and Young, 1982). This view is corroborated by evidence on the dramatic growth in FDI from Japan in the 1970s, and the emergence of MNEs from newly developed Asian economies, such as Hong Kong and Taiwan.

However, it is within host countries' technology intensive industries that we observe a concentration of conventionally technologically advanced MNEs. This is the origin of the view that LOEs in high technology industries are more prone to benefit from FDI technological spillovers than their counterparts in labour-intensive industries. Indeed, numerous studies find that technology plays a key role in generating spillovers in the form of improved productivity. This accounts for the interchangeable use of the terms 'productivity' and 'technology' spillover in much of the literature (Kokko, 1992). Notwithstanding the link between the use of technology and spillover benefits, there are reasons to expect a larger technology gap between FAs and LOEs in technology-intensive industries than in labour-intensive industries. The larger this gap, then the less likely are spillovers to materialize from MNEs' presence (Perez, 1997).

It follows that the scope for large spillovers should be smaller in labour-intensive industries than in technology-intensive industries. Yet LOEs in labour-intensive industries should still gain from the presence of foreign firms. The technology gap between FAs and LOEs should be smaller in labour-intensive industries than in technology-intensive industries. According to many studies this smaller technology gap should facilitate spillovers<sup>ii</sup>. In traditional industries, MNEs are more likely to base their competitiveness on organizational skills and marketing skills, such as experience in organizing labour-intensive production and the ability to specialize across international borders. Even so, it remains to be tested whether or not non technology-related spillovers are indeed smaller than technology-related spillovers.

#### **Spillovers and Home Origin of FDI**

The above hypothesized relationships may vary depending on the source country of FDI. This assertion has its basis in Dunning's eclectic paradigm (Dunning, 1988, 1993). The Paradigm posits that the pattern of FDI varies with the country of origin of the investing firm. MNEs in a particular country often possess some specific advantages emanating from the nature of their domestic market (Tatoglu and Glaster, 1998). Lecraw (1993) argues that the rationale for, and behaviour of, FDI should be heterogeneous across source countries because the degree of similarity between home and host market structures tends to differ with investors' geographic origins. In his 'single diamond' view, Porter (1990) alleges that the strong global competitiveness generated by the core competences of a MNE, results from the characteristics of the MNE's home base. The technological profile of an innovative affiliate will reflect the distinctive specialised technological capacities of its parent's home country.

A salient feature of inward FDI in China is that the investing countries can be identified in two distinct groups: overseas Chinese (Hong Kong, Macau and Taiwan, hereafter, HMT) and western countries (notably, the USA, European Union and Japan). It is argued that investors from these two sources possess different types of ownership advantages and business strategies, leading to heterogeneity in investment behaviour; for instance, in respect of the scale of investment, the extent of cooperative operation, productivity, and in the ability to transfer

technology (Huang, 2004). MNEs from western countries have state-of-the-art technology from heavy investment in R&D. This confers ownership advantages that enable them to compete successfully in technology-intensive industries with other firms in the market (Buckley, Clegg and Wang, 2002). This contrasts with HMT MNEs whose ownership advantages are thought to lie in skills of using standard technology and in experience of organizing labour-intensive production for re-export (Shi, 1998). We therefore expect that HMT firms are more competitive in labour rather than in technology-intensive industries.

We argue that the contrasting technological capabilities and business strategies of these two groups of FAs are key determinants of spillovers. Furthermore, the effects of country of origin on spillovers might manifest themselves differentially across industries, possibly linked to the incidence of LOEs of contrasting ownership. With their state-of-the-art technology and local market-orientation, there is greater scope for western MNEs to generate technological spillovers to LOEs in technology-intensive industries of Chinese manufacturing (Buckley, Clegg and Wang, 2002). On the other hand, the nature of the ownership advantages of HMT firms, and their industrial concentration within the standardised goods market segments of industries, suggests that the generation of any technological spillovers should be less *pro rata* than for western capital, or slower in its realization. Yet it is perfectly possible that HMT firms generate more non-technology related spillovers. Based on data for Lithuania, Smarzynska (2002) finds that productivity spillover effects are larger when foreign investors are domestic market, rather than export, oriented. It would be interesting to see if this finding also holds true for China, where western and HMT affiliates are typically identified, respectively as local market oriented and export oriented.

#### **Spillovers and its Distributional Effects among LOEs**

The literature suggests that the extent of spillovers depends on the actions of both foreign and locally-owned firms, and is not quasi-automatic (Meyer, 2004). The magnitude of spillover benefits that LOEs can derive from foreign presence depends largely on their own technological capabilities and initiatives (Liu et al., 2000). Thus, spillover benefits materialise if LOEs develop capabilities to decode, interpret and apply knowledge (Meyer, 2004). When domestic competitors cannot reverse engineer and profitably adapt MNEs' core technologies, they are unable to appropriate benefits from FDI spillovers. Therefore, positive spillovers are expected to only be available to LOEs that have developed superior absorptive capacity. This implies that aggregate studies may underestimate the true significance of such effects (Görg and Strobl, 2001). The perspective of absorptive capacity implies that future researchers should move beyond merely seeking a straightforward and direct nexus between foreign presence and LOEs' productivity, and begin investigating the 'black box' that contains the acknowledged, but unobserved, mediators of the relationship.

In terms of ownership, the potential beneficiaries of inward FDI in local Chinese industry broadly comprise state-owned enterprises (SOEs) and other locally-owned enterprises (OLOEs). The latter include collectively and privately-owned enterprises, among others. It is well recognized that differences in the structure of property rights between SOEs and OLOEs cause them to behave differently, leading to the underperformance of SOEs (Fan 1998; Perotti et al. 1999). While SOEs are the technologically better equipped of the two, OLOEs are more agile and responsive to profit opportunities, making them competitive, especially in the market for labour-intensive goods. By identifying SOEs and OLOEs separately we are able to explore the FDI-spillovers relationship within differing institutional settings, and therefore gain insights specifically into the Chinese context. This level of detail is expected to yield both conceptual richness and policy relevance.

The above discussion leads to the following hypotheses:

**Hypothesis 1:** The magnitude of the effect of overall foreign capital on the performance of LOEs is greater in technology-intensive industries than in labour-intensive industries.

**Hypothesis 2:** The magnitude of the effect of HMT capital is greater than that of the effect of western capital in labour-intensive industries on (a) all domestic firms; (b) SOEs; (c) OLOEs.

**Hypothesis 3:** The magnitude of the effect of western capital is greater than that of the effect of HMT capital in technology-intensive industries on (a) all domestic firms; (b) SOEs; (c) OLOEs.

**Hypothesis 4:** The magnitude of spillovers absorbed by OLOEs is greater than that of spillovers by SOEs in labour-intensive industries.

**Hypothesis 5:** The magnitude of spillovers absorbed by SOEs is greater than that of spillovers by OLOEs in technology-intensive industries.

**Hypothesis 6:** The magnitude of spillovers absorbed by OLOEs from HMT capital is greater than that of spillovers by SOEs from the same source in labour-intensive industries.

**Hypothesis 7:** The magnitude of spillovers absorbed by SOEs from western capital is greater than that of spillovers absorbed by OLOEs from the same source in technology intensive industries.

## Data and Methodology

We follow the standard approach prevailing in the study of spillovers, in which an augmented Cobb-Douglas production function is implemented (e.g., Aitken and Harrison, 1999). In this function, the output of LOEs is assumed to be a function of inputs, which include measures of foreign presence in the host industry and other regressors as controls. We interpret the coefficient estimates on the foreign presence regressor as evidence in support of spillovers from inward FDI to domestic firms' output.

$$Y_{(d,s,ol)} = C + \beta_1 K_{(d,s,ol)} + \beta_2 L_{(d,s,ol)} + \beta_3 INTERM_{(d,s,ol)} + \beta_4 MGT_{(d,s,ol)} + \beta_5 SFARE_{(d,s,ol)} + \beta_6 SIZE_{(d,s,ol)} + \beta_7 FP_{(i,-1)} + \varepsilon_i \quad (i = overall, htm, w) \quad (1)$$

Where  $d$  denotes domestic,  $s$  SOEs and  $ol$  other LOEs.  $Y$  is sales by LOEs and  $FP$  represents the level of presence of FAs, proxied by the share of foreign capital input in host industry. Görg and Strobl (2001) suggest that it is preferable to use alternative measures, rather than a single measure of foreign presence, when evaluating spillover effects. Following Buckley, Clegg and Wang (2002), we measure  $FP$  in three dimensions in this study: the capital share accounted for by all FAs in each industry ( $FP_{overall}$ ); the capital share accounted for by FAs originating from HMT in each industry ( $FP_{htm}$ ); the capital share accounted for by FAs originating from western countries in each industry ( $FP_w$ ). For all  $FP$  variables, a one-year lag is adopted to allow time for spillover effects to become observable. The adoption of a lag structure for the FDI variable ( $FP_{(i,-1)}$ ) also helps to address the question of causality with respect to spillovers<sup>iii</sup> (Haskel, Pereira and Slaughter, 2002). We expect that  $FP_i$  exerts a positive and significant impact on sales by LOEs ( $Y$ ).

$K$  and  $L$  are routine capital and labour, proxied by total received capital and total number of employees in each industry;  $INTERM$  is intermediate inputs, proxied by the difference between total sales and value-added in each industry;  $MGT$ ,  $SFARE$  and  $SIZE$  variables are management input, sales promotion input, and firm size economies of scale proxied by, respectively, management cost<sup>iv</sup> per employee, sales fare per worker, and net fixed assets per firm, by industry. Combined with the selection of  $FP$  variables, according to theory these control variables account for total factor productivity. The employment of these control variables increases our confidence in the robustness of the findings, through controlling for influences other than foreign presence.

In Equation (1) the data are transformed into natural logarithms, therefore Equation (1) should be taken as being linear in the logarithmic data. Ordinary least squares (OLS) regression is employed throughout. The model is estimated for different categories of locally-owned firms, with data aggregated across firms at the three-digit industry level. Given that small, medium, and large-sized firms, and industrial branches, are sampled together in our cross-sectional dataset, heteroscedasticity is expected to be widespread, and this was confirmed in preliminary specifications. Consequently, where the White-based F-statistic showed below the 5 percent level of significance, all variance-covariance matrices have been estimated according to White's (1980) method.

Equation (1) is a multi-equation model, and therefore forms the basis for the estimation of several regressions. This allows our investigation to explore variation by industry, by nationality of the foreign investor, and by ownership of LOEs, so corresponding to each of the hypotheses set out in Section 2.

Our empirical analysis is based on the Annual Industrial Report of China for 2001, compiled by the State Statistical Bureau of the People's Republic of China. Industry data is preferred because spillovers are commonly hypothesized to arise along industry or regional lines (Haskel, Pereira and Slaughter, 2002). In addition, there is considerable variation in the foreign presence variable at the industry level. There are 196 industries altogether, but our sample is reduced to 158 industries. This is because this study must be restricted on theoretical grounds to include only those industries where free entry and exit exist, in order to avoid biased results. Industries for which data are imperfect are also excluded.

In carrying out the empirical analysis, we divide the full sample into two sub-samples of equal size, according to the level of capital-labour ratio. The low capital-labour ratio group is labelled as 'labour-intensive industries' and the high capital-labour group as 'technology-intensive industries', with each consisting of 79 industries. The significant F test statistic of 90.366 justifies this classification of labour- versus technology- intensive industries at the 1 per cent level of significance<sup>v</sup>. This classification forms the basis of our analysis, as it allows us to examine the extent to which the magnitude of spillovers relates to the nature of industries under study. Indeed, all our hypotheses in section 2 are set out against categories of industries.

## Results

Table 1 displays the correlation matrix and descriptive statistics for the main independent and dependent variables. As can be seen, most of the correlations are small, accounting for little common variance, and therefore are not of present concern. The high correlation between  $K_d$  and  $L_d$  demonstrates the high capital-labour substitution effect within Chinese industry.

TABLE 1: DESCRIPTIVE STATISTICS AND CORRELATION MATRIX FOR SELECTED VARIABLES

Variables	Mean	S.D.	2	3	4	5	6	7	8	9	10
1. $K_d$	3.70	1.54	0.93	0.26	0.48	-0.32	-0.38	0.23	0.96	0.94	0.84
2. $L_d$	2.37	1.41		-0.01	0.29	-0.28	-0.33	0.25	0.94	0.83	0.89
3. $MGT$	-0.25	0.50			0.52	0.18	-0.01	-0.31	0.19	0.44	-0.05
4. $SIZE$	-1.08	1.08				-0.31	-0.21	-0.07	0.40	0.57	0.13
5. $FP_{overall}$	-1.53	1.04					0.24	0.32	-0.19	-0.28	-0.05
6. $FP_{hmt}$	-1.29	0.64						-0.62	-0.33	-0.41	-0.20
7. $FP_w$	-1.06	0.56							0.26	0.14	0.28
8. $Y_d$	4.87	1.47								0.91	0.89
9. $Y_s$	3.63	1.84									0.69
10. $Y_{ol}$	4.23	1.33									

Tables 2-4 report results estimated from the various regressions originating from Model (1). As indicated by the adjusted R squared and Ramsey tests, the augmented Cobb-Douglas production function fits the data very well. The F statistics reveal that the null hypothesis that the regression coefficients are jointly equal to zero can be rejected at the 1 per cent level for all regressions. This compares favourably to other spillover studies employing the same approach. Considering that this is a cross-sectional study, the models perform quite well. Because the

coefficients for *INTERM* and *SFARE* are consistently insignificant throughout almost all the regressions, these two variables are dropped in the presentation of the results.

Notes: (1) Figures in parentheses are t statistics (two-tailed tests); \*, \*\*, and \*\*\* denote significance at the 10%, 5% and 1% levels respectively. (2) Log Likelihood Ratio values are shown in Ramsey RESET.

The estimation of equation (1) for the full sample, without any distinction by ownership of LOEs, is reported in Table 2. The results in regressions (2.1) and (2.4) show that overall foreign presence ( $FP_{overall}$ ) has a positive and statistically significant impact on sales by LOEs in both labour- and technology-intensive industries. However, the coefficient for  $FP_{overall}$  is larger for the technology-intensive industries than for the labour-intensive industries, with a higher level of statistical significance. In order to formally evaluate the difference between the magnitudes of the coefficients for  $FP_{overall}$  in both regressions, the data for the two groups of industries were pooled, and a dummy variable test was conducted. The test confirms that although  $FP_{overall}$  is significant in both models, the difference in the size of the coefficients is indeed statistically significant. Our results thus lend support to our Hypothesis 1. From this we can infer that it is not simply the presence of FAs that generate spillovers, but also the technology intensity of these foreign firms. This finding supports the view that it is the low-cost access to leading-edge technologies of foreign firms that has produced a productivity-enhancing effect on LOEs (Feinberg and Majumdar, 2001). The difference that we observe may result from adjustment costs being higher in more labour-intensive, low-technology industries. The organizational ownership advantages of FAs may stimulate the adoption of new organizational structures in LOEs, but this process is likely to require radical (rather than incremental) organizational change, as radical change is frequently required in the case of firms in newly liberalised economies.

Breaking down the data further by ownership of foreign- and locally-owned firms, however, reveals sub-relationships that up until now have remained hidden in the aggregate relationship. Focusing on labour-intensive industries alone, we find that  $FP_{hmt}$  is significant in regressions (2.2) and (4.2) in tables 2 and 4, respectively, but not in regression (3.2) in Table 3. These results contrast with the insignificant  $FP_w$  in regressions (2.3), (3.3) and (4.3) in the same panel of these tables. These results indicate that the positive spillover effects in labour intensive industries are more closely associated with the presence of firms from HMT rather than western countries. This finding substantiates our Hypothesis 2 (a, c), but not (b).

These findings signal that spillover effects may be neither as uniform, nor as high, as many studies suggest when data are disaggregated. The assumed superiority of technology in FAs seems to matter less when these firms operate in labour-intensive industries. In these industries, foreign firms' advantages, such as the ability to adapt mature technologies to more labor-intensive contexts, and to local raw materials and marketing skills that enable the delivery of timely and uniform quality products to western markets, are more likely to be a source of spillovers. HMT firms, which are built on these types of advantage (Wells, 1993), therefore, appear to demonstrate a greater impact on LOEs than their western counterparts. In addition, there are reasons to expect a smaller technology gap between foreign and local firms in labour-intensive industries than in technology intensive industries, and this should facilitate spillovers (Perez, 1997).

Turning to technology-intensive industries, we found that the significance of  $FP_{hmt}$  no longer holds, as shown in (2.5), (3.5) and (4.5) in tables 2-4 throughout<sup>vi</sup>. In contrast,  $FP_w$  becomes significant in (2.6), (3.6), though not in (4.6). These results suggest that compared with HMT firms, western affiliates in technology-intensive

industries generate more spillovers to LOEs in general, and to SOEs in particular, but not to OLOEs. Our Hypotheses 3 (a) and (b) are supported, but (c) is not. Again, the distribution of spillovers appears to hinge on the nature of the ownership advantages of foreign firms and of the industries involved. The ownership of non-technology related advantages leads HMT firms to generate limited spillovers in technology intensive industries, compared with technologically advanced western firms. These mirror our findings for the labour intensive industries. It is particularly worth noting, however, that  $FP_w$  is significant in (3.6), consistent with Buckley, Clegg and Wang (2005b) in which it is found that Chinese SOEs have particularly benefited from joint ventures with foreign (western) affiliates in (technology intensive) Chinese electronics industry. The insignificant  $FP_w$  coefficient in (4.6) also suggests that relatively large-sized western firms do not interact with smaller LOEs in technology intensive industries. A possible reason is that they operate within different market segments of the industry.

We now focus on how spillovers are associated with the different ownership categories of LOEs, as shown in Tables 3 and 4. It emerged that  $FP_{overall}$  is statistically insignificant in (3.1) but significant in (4.1). These results suggest that in China's labour-intensive industries OLOEs benefit more from the presence of FAs as a whole than SOEs, providing strong support for Hypothesis 4. While it may be correct to attribute the limited spillovers enjoyed by SOEs to their generally low level of competitiveness, absorptive capability and motivation to learn as compared with OLOEs (Buckley, Clegg and Wang, 2002), there is industry specific reason. As pointed out above, the ownership advantages of FAs in labour-intensive industries are characteristically organizational in nature. This coincides with the typical weakness of Chinese SOEs: intrinsic rigidity in governance structure inherited from the central planning regime. In comparative terms, SOEs' advantages lie more in technology and less in organization. The mismatch of ownership advantages between FAs and SOEs provides a good reason why SOEs are less likely to benefit from foreign presence in labour intensive industries.

A different story, however, emerges in technology-intensive industries, as shown in the bottom section of Tables 3 and 4. Overall foreign presence ( $FP_{overall}$ ) is significant in regressions (3.4), but not in (4.4), implying that SOEs reap greater spillover benefits than OLOEs in technology intensive industries. Our data thus substantiate Hypothesis 5. Although Chinese SOEs have long been criticized for weaknesses such as low a motivation to learn, they are nevertheless technologically better equipped than OLOEs, conducting the bulk of R&D in Chinese-owned industry. This advantage in technology mitigates their organizational weaknesses, enabling SOEs to better exploit new technological opportunities generated by FDI. This result might also signal a positive role for international joint ventures between western MNEs and Chinese SOEs in capital and technology intensive industries, benefiting the Chinese parent and its affiliates. A large number of high-technology western MNEs hold joint ventures with SOEs (for example, Volkswagen (China), and the local secondary affiliates of Motorola (China)). These close and highly productive partnerships may be responsible for a sort of 'crowding in' effect.

Both SOEs and OLOEs seem to benefit from the presence of HMT affiliates ( $FP_{hmt}$ ) in labour-intensive industries, as shown in (3.2) and (4.2) of tables 3 and 4, though  $FP_{hmt}$  in the regression (3.2) fails to reach significance. These results underscore the concentration of HMT capital in labour intensive industries, and which confers greater spillover benefits to OLOEs than to SOEs. This finding corroborates Hypothesis 6. The result for SOEs, though insignificant, contrasts sharply with Buckley, Clegg and Wang (2002), which employed data on China for 1995 and revealed a negative link between SOEs' productivity and the presence of HMT affiliates. The explanation may lie in the progressive Chinese reform process, which (since the early 1980s) has resulted in the bankruptcy and exit of numerous inefficient Chinese SOEs in labour intensive industries. The SOEs that survive are the more competitive firms with superior absorptive capacity, and so better able to benefit from spillovers from HMT firms.

Western capital ( $FP_w$ ) yields greater positive spillovers for SOEs than OLOEs in technology intensive industries, according to regressions (3.6) and (4.6). Thus, Hypothesis 7 receives substantial support. This differential impact on LOEs' productivity highlights western affiliates' ownership advantages in proprietary technology, which is best suited to the more technologically advanced firms and sectors. The interaction between western firms and

SOEs can be said to produce a ‘crowding in’ effect in the form of improved performance in SOEs. In contrast, the mismatch between the ownership advantage of western firms and the abilities of OLOEs limits the scope for spillover benefits.

TABLE 5: HYPOTHESES AND THE ESTIMATED RESULTS

## Conclusions

Governments of developing and transition economies pay special attention to the impact of FDI, using this as a criterion for measuring the success of their FDI policy. Such governments often favour inward FDI in technology-intensive industries over labour-intensive industries, believing that this will bring in new technologies and know-how and therefore more spillovers to enhance the competitiveness of LOEs. In this paper, we leave aside the issue of whether this perception is true, and instead test whether the magnitude of spillovers is associated with the degree of technology (labour) intensity of the host industry involved.

Overall, we find evidence consistent with the existence of greater positive spillovers from inward FDI in technology-intensive compared with labour-intensive industries. This finding agrees broadly with the conventional hypothesis that FDI by MNEs is based on technological ownership advantages. It also justifies the policies of governments of developing countries, such as China, which have in recent years offered generous incentives packages to attract foreign investors to high technology industries.

Our study confirms that distinguishing between different categories of foreign investor, as theory predicts, is an essential step in analyzing the impact of inward FDI. We find that HMT affiliates generate more spillovers to LOEs than western affiliates in labour-intensive industries. In marked contrast, in technology-intensive industries, the presence of western affiliates exerts a larger impact on the performance of LOEs than does that of HMT affiliates. From these findings we conclude that foreign affiliates’ technology intensity is a key driver of LOEs’ growth.

The procedure of drawing a clear distinction between different categories of ownership in domestically-owned Chinese firms is also supported by our results. We find that in general both SOEs and OLOEs seem to benefit more from inward FDI in technology intensive industries than in labour intensive industries. Our results indicate, however, that SOEs benefit from the presence of HMT affiliates in labour-intensive industries, and from the presence of western affiliates in technology-intensive industries. In contrast, OLOEs seem only to benefit from the presence of HMT affiliates in labour-intensive industries.

In terms of methodology our study represents a step forward in understanding the determinants of spillovers from inward FDI. New insight has been gained from the breaking down of industries into labour intensive and technology intensive groups, of foreign ownership into HMT and western categories, and of locally-owned firms into SOEs and OLOEs. The paper presents a clue as to the true diversity of issues that arise within the complex area of spillovers.

## End Notes

<sup>i</sup> Makino, et al. (2002) argue that access to natural country-specific endowments such as pooled low-cost labour markets in a less developed country does not necessarily require the investing firms to possess firm-specific advantages in labour intensive production capabilities because such endowments are available for any firms located in the same country.

<sup>ii</sup> Some studies find that foreign presence lowers the average dispersion of a sector's productivity, and that this effect is more significant in sectors with simpler technology (Haddad and Harrison 1993; Blomström, 1986). The implication is that the presence of FAs forces LOEs to become more productive in sectors where best practice technology lies within their capability (Blomström and Kokko, 1998).

---

<sup>iii</sup> The cross-sectional association between FDI and industry productivity may be a result of MNEs entering industries with higher productivity, rather than of productivity being raised by FDI (Meyer, 2004).

<sup>iv</sup> This measure of managerial input is recorded in the Chinese statistical source, and refers to the salaries of managers plus other fees that facilitate transactions.

<sup>v</sup> Most research does not test for the validity of pooling. However, this does not mean that the assumption that parameter values are the same for all industries is justified. Pooling might be especially problematic in a case like the present one, where the analytical framework is based on the proposition that there may be structural differences between labour- and technology-intensive industries.

<sup>vi</sup>  $FP_{hmt}$  even turns out to be negative in regressions (3.5) and (4.5), though not statistically significant. This surprising result mirrors Hu and Jefferson (2002) which finds that the presence of HMT capital depresses the productivity of SOEs.

# An Analysis of B-share Discounts in the Chinese Stock Market

Feng Lou  
Licheng Feng  
Guijun Lin

University of International Business and Economics, China

## Abstract

In contrast to most of other countries, Chinese foreign class B shares are traded at a discount rather than a premium relative to the prices of domestic A shares. This is called “Chinese discount puzzle”. In this paper, in light of Fama & French’s method of dynamic portfolios, we categorize all the listed companies that issued both A shares and B shares in Shanghai securities market into 9 portfolios ascendingly according to factor  $F$ . And the portfolios are reshuffled each month. In this way, with an extensive social investigation, the factor analysis and various panel data models, we reveal that the capital and investment restrictions, the supply factor, the relative liquidity and the behavioral factor are the main reasons for the B-share price discounts. Particularly, the method of dynamic portfolios is firstly used to analyze the stock discount or premium phenomena in this field.

## Introduction

Since the 1980s, with rapid development of economic globalization, the international economies more and more depend on each other and many newly-developing countries open their securities markets to foreign investors. However, taking into consideration of the safety of national economy and capital market, many of the countries impose restrictions on investments or ownership: on the one hand, they take measures to restrain national capital from flowing out; on the other hand, they control the investments of foreign capital. Both of the restrictions induce some degree of segmentation between the newly-developing countries and international capital market. Usually, in the emerging capital markets, their stock markets are segmented to two classes: restricted shares which could only be held and traded by domestic investors and unrestricted shares that could be purchased and possessed by both domestic and foreign investors. Although restricted and unrestricted shareholders have the same rights and entitlements, it has been observed in most markets that the unrestricted shares are traded at a premium relative to restricted shares, as the following Table 1 shows:

TABLE 1: THE RATIOS OF UNRESTRICTED STOCK PREMIUM OF TEN COUNTRIES (REGIONS)

Country	Premium (%)	Country	Premium (%)
Indonesia	32.9	Swiss	18.7
Malaysian	29.2	Mexico	1.4
Singapore	32.4	Norway	6.7
Philippines	32.6	China Taiwan	7.0
Thailand	24.8	China	-24.6

Resource: Bailey, Chung and Kang (1999)“foreign ownership restrictions and equity price premiums”

From Table 1, we can find that: in the markets of Swiss, Mexico, Norway, Indonesia, Singapore, et .the prices of the unrestricted stocks are generally higher than those of the restricted stocks; that means “premium phenomena ” appears. Besides, the premium degree of the unrestricted stocks in mature markets such as Swiss, Mexico, Norway, is lower than that of the newly-developing countries such as Indonesia, Malaysian, Philippines and Thailand. Particularly, compared with other stock markets with similar ownership segmentations, only Chinese stock market has substantial and persistent price discounts on unrestricted shares (B-share) relative to restricted shares (A-share). Then, how to explain the particular phenomena of China? What factors induce B-share discounts

of Chinese stock? Are there any serious defects in the policies of Chinese securities? On February 19, 2001, the Chinese Securities Regulatory Commission announced that Chinese residents would be allowed to own B-share classes of stocks, which triggered a dramatic decline of B-share discounts from 76.8 percent down to 36.7 percent (as shown in table 2). Then, do the factors leading to the B-share discounts change? Understanding and clarifying the changes and factors are very useful and important for us to develop our stock market and capital market correctly and healthfully.

## **Disentangling Competing Hypotheses of the B-share Price Discount**

The China's B-share price discount puzzle is a challenge for scholars in this field. Over the years there have been various explanations for B-share discounts in the Chinese stock market, which we outline as follows:

Bailey (1994) was the first to uncover the discount puzzle with only preliminary data at the start of the market for the period from March 1992 to March 1993. Over the years, he attributes it to the lower cost of capital for A-share stocks which is caused by the lack of alternatives to low-yielding bank accounts that was driving domestic Chinese savings into stock investments. Brennan and Cao (1997), Chakavarty, Sarkar and Wu (1998) show that it is the asymmetry in market information that induced the substantial price discount of B-share in the Chinese stock market. They thought compared with domestic investors, the foreign investors have less information about the value of domestic assets due to language barriers and different accounting systems and so on, consequently, they demand a risk premium to compensate for their disadvantage in information relative to domestic investors. Another explanation for the Chinese B-share discounts is the liquidity hypothesis. Amihud and Mendelson (1986) argue that relatively illiquid stocks have a higher expected return and lower price to compensate increased trading costs. Chen, Lee, and Rui (2001) find that the relative illiquidity of B-share may be the primary reason for the price disparity in Chinese stock market. Some scholars think the reason for Chinese B-share discounts is the differential demand elasticity hypothesis. Stulz and Wasserfallen (1995) suggest that an investment home bias for foreign investors combined with a high demand for limited local country investments may lead to price and demand imbalance among share classes. Sun and Tong (2000) propose that with the existence of the H-share and red-chip markets, B-share market have good alternatives so that foreign investors' demand for B-share can be quite elastic. Gordon and Li (1999) postulate that legal restrictions create a segmented market and limit investment opportunities, and so domestic investors have an inelastic demand for equity due to insufficient supply. Consequently, domestic investors push up A-share prices, which induce B-share price discounts. Another explanation is the differential risk attitude hypothesis. Bailey and Jagtiani (1994) and Ma (1996) show that the price difference may be due to the investors' attitudes toward risks. In their arguments, Chinese markets are highly speculative, and domestic investors may be highly risk tolerant and are to earn money in the short run. To sum up, the explanations for the Chinese B-share discounts are inconclusive, and the phenomenon remains a puzzle. Bailey, Chung and Kang (1999) conclude that the B-share price discount in China is "strange" and "difficult to explain".

All the scholars discuss the reasons for Chinese B-share discounts from different views and draw some useful and constructive conclusions, however, we don't think they have found the real factors leading to Chinese B-share discounts, that is why we continue to study this phenomenon. Although our main conclusions are partially similar to Gordon and Li (1999), Gordon and Li (1999) just explained the phenomenon qualitatively rather than quantitatively.

## **The Shanghai Stock Exchanges and the CSRC's Opening of the B-shares in 2001**

The Shanghai Stock Exchange (SHSE) was established on December 19, 1990, as of December 2003, 726 companies issued A shares and 54 companies issued B shares on the SHSE, with a total capitalization value of RMB 2,614 billion. To enhance the liquidity of the B-share markets, the Chinese Securities Regulatory Commission announced the "Notices on issues related to individual domestic residents investing in foreign currency stocks listed on the domestic stock markets" on February 19, 2001. The markets responded very enthusiastically. In the three months after the announcement, the domestic B-share brokerage accounts on the SHSE increased from 152,000 to 577,000, the Shanghai SE B shares index increased by 178% between February 19, 2001 and June 1, 2001, and the Shanghai

SE A-share index increased by 10.9% for the same period. Figure 1 shows the impact of the event on the B-share price discounts.

Notes: the discount is the average of the 38 B-share price discounts per month; the period is from January 1997 to December 2003

Fig.1 presents the distribution of the B-share price discounts on the Shanghai Stock markets during January 1997 to December 2003. We can find that the B-share price discounts have a dramatic decline after February 2001 when the individual domestic residents are allowed to hold and purchase the B-share stocks. With T-Test procedure, we compared the average B-share price discounts between the two periods. As in following Table 2:

TABLE 2: THE COMPARISON OF B-SHARE PRICE DISCOUNTS IN SHANGHAI STOCK MARKET BEFORE AND AFTER 2001

Variable	N	Mean	Std Dev	Std Err	Minimum	Maximum
DisB2001	50	0.7669	0.0558	0.0079	0.6593	0.8658
DisA2001	34	0.3672	0.0456	0.0078	0.2792	0.498
T-Tests						
Variable	Method	Variances	DF	t Value	Pr >  t	
DisB2001	Pooled Equal	82	-34.61	<.0001		
DisA2001	Satterthwaite Unequal	79.2	-35.96	<.0001		

Notes: the B-share price discounts from January 1997 to December 2000 are compared with those from January 2001 to December 2003

Table 2 shows that in these two periods, the average B-share discount changed prominently from 0.7669 to 0.3672 and the difference is 0.3997. However, the variances of the B-share discounts in these two periods are almost equal. This proves that the volatility is not changed obviously after 2001. Although the average B-share discount from January 1997 to December 2000 is higher than that from January 2001 to December 2003. Since the discounts are different, then, what are the main factors leading to the Chinese B-share price discounts?

## Potential Determinants of B-share Price Discounts

The B-share price discount is defined as the ratio of the difference between the A-share price and the B-share price to the A-share price, the formula is defined as follows:  $DIS_{i,t} = (P_{Ai,t} - P_{Bi,t}) / P_{Ai,t}$ .

$\beta ba_i$  represents relative risk, it is the ratio of B-share beta to A-share beta, which is calculated according to the standard market model as the systematic risk measure. By the asset pricing theory, the higher is the risk, and the lower is the price. So the coefficient of the variable will be expected positive.

$Changeba_i$  is the ratio of the turnover of B-share to that of A-share for stock  $i$ , as a proxy for the relative liquidity. The turnover is defined as the ratio of the number of shares traded to the number of shares tradable. We will expect to observe a negative relationship between the discount and relative turnover by the liquidity hypothesis.

$Tradeba_i$  is ratio of the number of B shares traded to the number of A-shares traded for stock  $i$ , as another proxy for relative liquidity, according to the liquidity hypothesis, the variable has negative relationship with the discount.

$NFT_i$  one proxy of the behavioral factors, is the ratio of non-tradable shares to total shares. It is the unique system to divide stocks into tradable stock and non-tradable stock in Chinese stock market. According to the different investment rational hypothesis, compared with domestic investors, the foreign investors pay more attention to the ratio of the non-tradable shares to total shares, the higher is the ratio, the lower is the price of B-share price, so we can expect the positive relationship between the B-share discounts and the variable.

$SIZE_i$  stands for the size of a firm for stock  $i$ , which is defined as  $SIZE_i = P_A \times S_A + P_B \times S_B$ , according to the asymmetry information hypothesis, due to language barriers, different accounting standards, and lack of reliable information, it is more difficult for foreign investors than domestic investors to acquire and assess information about the local economy and firms. And companies of larger scales have more influence, thus it's easier for foreign investors to acquire and assess the information about them. So, we can expect the negative relationship between the variable and the B-share price discount.

$RAB_i$  is the ratio of tradable A-shares to tradable B-shares, which is defined as  $RAB_i = S_A / S_B \cdot S_A$  is the supply of A-shares, which means tradable A-shares, and  $S_B$  is the supply of B shares, which means tradable B-shares for stock  $i$ . According to the differential demand elasticity hypothesis, the more supply of A-shares relative to B-shares leads to the less B-share discounts. So the coefficient of  $RAB_i$  is expected negative.

All the above variables are chosen according to some representative hypotheses and their models which are put forward by foreign scholars to explain international segmentation markets; however, are they suitable for Chinese stock market? Are they the main factors to explain B-share price discounts? How to find and demonstrate what factors induce Chinese B-share price discounts?

To answer these questions correctly, in August 2004, we went to Shanghai city to make a social investigation. We interviewed many large-scale financial institutions, Stock Exchanges and research departments and we conversed with the exchange brokers, securities analysts and scholars about the puzzle of "Chinese B-share price discounts". Almost all of them considered that the main reason for Chinese B-share price discounts is the capital and investment restriction, to be specific, because Chinese government forbids domestic investors to purchase and invest foreign assets freely. And with the existence of the major non-tradable shares (about average 66 percent of the total shares in Chinese stock markets), the tradable shares are very scarce in the Chinese stock market that is an enormous capital market. On the other hand, there are few available assets for the domestic residents to invest, so the domestic residents have to accept the A-share stocks with higher risks and lower returns compared with foreign investors who can invest in many other countries and in various kinds of assets freely.

Although some domestic residents are allowed to hold and purchase the B-shares from February 19,2001, it is limited to individuals rather than corporations. So, the B-share prices still remain at a discount after prominently declining in response to the event (that is, the lifting of ownership restrictions).

## Factor Analysis and Dynamic Portfolio

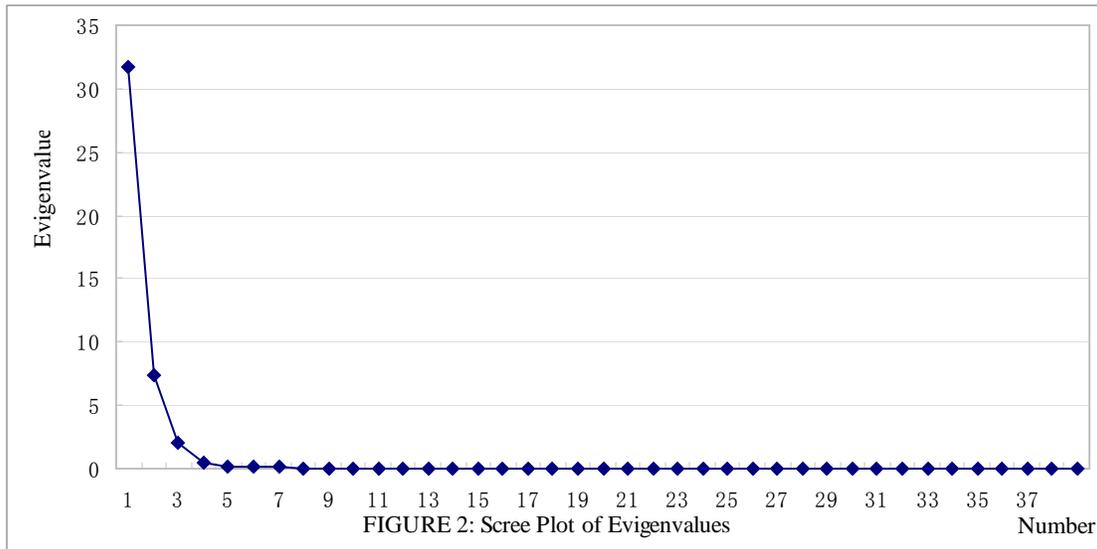

In order to find out how many main factors induce the discounts, we conduct factor analysis of the B-share price discounts by the program of SAS8.2; the results are as following Table 3 and Fig. 2:

TABLE 3: THE FACTOR ANALYSIS OF B-SHARE PRICE DISCOUNTS IN SHANGHAI STOCK MARKET

Factor	Eigenvalue	Difference	Proportion	Cumulative
1	31.6774267	24.362187	0.89051	0.89051
2	7.31524	5.253473	1.0312	0.9051
3	2.0617607	1.5587881	0.0589	0.9640
4	0.5029726	0.3019455	0.0144	0.9783
5	0.2010271	0.0798214	0.0057	0.9841
6	0.1212057	0.0260347	0.0035	0.9876
7	0.0951710	0.0264595	0.0027	0.9903
λ	λ	λ	λ	λ
37	0.0002964	0.0001295	0.0000	1.0000
38	0.0001669	0.0001045	0.0000	1.0000

Notes: the data come from CCERTM, 38 companies that issue both A-shares and B-shares, and the period is from January 1997 to December 2003, 84 months in total.

Table 3 shows us the results of factor analysis with the program of principal component analysis. Eigenvalue is the characteristic value of correlation matrix of the specimen. With  $\hat{\lambda}_1 = 31.67743$ ,  $\hat{\lambda}_2 = 7.31524$ ,  $\hat{\lambda}_3 = 2.06176$  both of them are larger than 0.7; Difference is the difference of the two characteristic values; Proportion is the ratio of the variance of common factor to total factor, the variance of the first common factor is equal to 89.015 percent, this means the first common factor can explain 89.051 percent of the discounts; the cumulative variance of the first and the second and the third common factor is 96.4 percent, this means the cumulative variance can explain 96.4 percent of the discounts. So, we choose the three or four main factors to explain Chinese B-share price discounts. Figure 2 is the Scree Plot of Egenvalues from which we can find that if we choose more than three factors, the descent of the characteristic value is slow, so, according to the rule of Scree graph, the number of the main factors leading to B-share price discounts is three or four.

Notes: the data come from CCERTM, 38 companies that issue both A-shares and B-shares, and the period is from January 1997 to December 2003, 84 months in total.

To precisely analyze the influence of *SIZE*, *RAB*, *NFT*, *NE*, *TRADEBA*, *CHANGEBA*,  $\beta$ *BA* and *COR* on B-share discounts, in the light of Fama & French's method of dynamic portfolio, we categorize all the listed companies which issued both A-shares and B-shares in Shanghai stock market before 1997 into 9 portfolios ascendingly according to factor *F* (*F* represents one of *SIZE*, *RAB*, *NFT*, *NE*, *TRADEBA*, *CHANGEBA*,  $\beta$ *BA* and *COR*). The numbers of stocks in each portfolio are almost same. And the portfolios are reshuffled each month. In this way, we work out the time series data of the discounts (the stocks are equally weighted) and other variables for each portfolio. Then, we count the averages of the variables of each portfolio. The statistical results are showed in Table 4:

TABLE 4: THE AVERAGE OF VARIABLES ACCORDING TO FACTOR *F*

Portfolio	<i>F</i> is <i>Size</i>		<i>F</i> is <i>Rab</i>		<i>F</i> is <i>nft</i>	
	<i>dis</i>	<i>Size</i>	<i>dis</i>	<i>Rab</i>	<i>dis</i>	<i>nft</i>

8	0.7217	2.6671	0.6307	0.6759	0.6742	1.2264
9-large	0.7120	4.0252	0.6098	1.1549	0.7094	1.6476

Notes: the period is from January 1997 to December 2003, 84 months and 38 double-listed companies in total in Shanghai Securities market

According to the data of dynamic portfolio in Table 4, we count the correlative matrix of the variables to better understand the relations among the variables. The results are as follows in Table 5:

TABLE 5: THE CORRELATIONS OF THE VARIABLES

	<i>dis</i>	<i>Size</i>	<i>Rab</i>	<i>nft</i>	<i>Tradeba</i>	<i>Changeba</i>	$\beta ba$	<i>D</i>
<i>Size</i>	-0.1046							
<i>Rab</i>	-0.3395	0.1033						
<i>nft</i>	0.4213	0.1721	-0.6186					
<i>Tradeba</i>	-0.4421	0.2645	-0.1667	0.0061				
<i>Changeba</i>	-0.5386	0.2583	0.2509	-0.2417	0.7550			
$\beta ba$	0.1746	0.1185	0.0001	0.0953	-0.1450	-0.1987		
<i>D</i>	0.9549	-0.0601	-0.1534	0.2585	-0.5092	-0.4803	0.1343	1.000

Notes: table 5 is based on the data of all the portfolios, 4536 groups of data in total. Additionally, figure 1 shows us that the B-share price discounts are changed prominently after February 2001. So, we should insert a dummy variable *D* (*D* = 1 for the period from January 1997 to December 2000 and *D* = 0 for the period from January 2001 to December 2003)

Table 5 reports the bivariate correlations among the discount and *Size*, as well as *Rab*, *nft*, *Tradeba*, *Changeba*,  $\beta ba$  and *D*. The overall results suggest that the discount is highly correlated with the variable *D* (the correlation coefficient  $\rho = 0.9549$ ) and are unlikely to be affected by the variable *Size* (the correlation coefficient  $\rho = -0.1046$ ). And the correlation coefficient for *Tradeba* and *Changeba* is positive and significant (the correlation coefficient  $\rho = 0.7550$ ), which may be leading to multicollinearity in the following penal data models, and the correlation coefficients for *Tradeba* and *nft*,  $\beta ba$  and *Rab* are not different from zero. In addition, all the coefficients accord with the economic explanations.

## Panel Data Models

To find out the two or three main factors inducing Chinese B-share price discounts, we employ a panel data analysis following Chen, Lee and Rui (2001). This approach allows us to analyze the cross-sectional and time-series factors that influence the B-share price discounts to differentiate the empirical implications of the hypotheses. We estimate a multivariate regression model using maximum likelihood with a heteroscedasticity-consistent covariance matrix of the residuals to adjust standard errors with firm fixed effects. With the data of the above dynamic portfolios, we estimate the following panel data model:

$$Dis_{it} = \alpha_0 + \alpha_1 Size_{it} + \alpha_2 Rab_{it} + \alpha_3 nft_{it} + \alpha_4 Tradeba_{it} + \alpha_5 Changeba_{it} + \alpha_6 \beta ba_{it} + \alpha_7 D_{it} + \varepsilon_{it} \quad (1)$$

The results are as follows in Table 6.

TABLE 6: THE RESULTS OF PANEL REGRESSIONS

Model	$C_{it}$	$Size_{it}$	$Rab_{it}$	$nft_{it}$	$Tradeba_{it}$	$Changeba_{it}$	$\beta ba_{it}$	$D_{it}$	Adj. $R^2$

Notes: the sample is from 38 double-listed companies in Shanghai securities market, the period is from January 1997 to December 2003; 4536 groups of data in total

\*\*\*-Significance at the 1% level; \*\*-Significance at the 5% level; \*-Significance at the 10% level

Table 5 presents the results of the panel regressions for EQ. (1) above. The seven different specifications are reported with coefficient estimates and associates heteroscedasticity-consistent  $t$ -statistics, adjusted  $R^2$ . We investigate different combinations of the explanatory variables in model (8)-(24). Model (7) confirms that the single variable  $D_{it}$  has more significant influence on the B-share discounts with a coefficient of 0.346( $t$ -statistics of 57.69). The adjusted  $R^2$  is 0.9115. In all different combinations of the explanatory variables, in model (21) the combinations of  $D_{it}$ ,  $Rab_{it}$ ,  $nft_{it}$  and  $Changeba_{it}$  have the most convincing explanation for the discounts with coefficients of 0.319( $t$ -statistics of 66.71), -0.101( $t$ -statistics of -8.687), 0.268( $t$ -statistics of 6.778) and -0.0179( $t$ -statistics of -4.4601) respectively. The adjusted  $R^2$  increases to 0.9588. Although model (23) and (24) have higher adjusted  $R^2$ , the coefficients of  $Tradeba_{it}$  in the two models are positive, which are contradicted with the economic phenomena. Consequently, we choose model (21) as the best function to explain the B-share discount. From model (21), we can find that the coefficient of the dummy variable  $D_{it}$  is 0.319, which is significant; this means that after the B-shares was opened to domestic investors, the average of the B-share discount dropped by 0.319(the rate of B-share discount dropped by 41.6%). The dummy variable  $D_{it}$  describes the impact of the opening of B-shares on the discounts. Furthermore, the opening event reflects the lifting of the restriction on capital

and investment. In other words, it is the lifting of the restriction on capital and investment that induces the significant decline in the B-share price discounts. So, we believe that the restriction on capital and investment is one of the major factors influencing the B-share discounts. Additionally, the coefficient of  $Rab_{it}$ , which represents the difference in demand, is -0.101. This shows that the larger  $Rab_{it}$  is, that is, the higher the ratio of tradable A-shares to tradable B-shares is, the lower B-share discount is. This is similar to the conclusion of Chan and Kwok 1999. The coefficients of  $nft_{it}$  and  $Changeba_{it}$ , which represent the difference of behavioral factor and relative liquidity respectively, are 0.268 and -0.0179. This indicates that for stock  $i$ , the ratio of non-tradable shares to total shares is negatively related to the foreign investors' recognition; and the ratio of the turnover of B-share is positively related to that of A-share for stock  $i$ . These agree with the conclusion of Jose A Scheinkman and Wei (2004). In a word, the variables of  $Rab_{it}$ ,  $nft_{it}$ ,  $Changeba_{it}$  and the dummy variable  $D_{it}$  are considered as the four major factors leading to B-share discounts. So, the function of B-share discounts is defined as follows:

$$Dis_{it} = 0.408 - 0.101Rab_{it} + 0.268nft_{it} - 0.0179Changeba_{it} + 0.319D_{it} + \varepsilon_{it}$$

$$\bar{R}^2 = 0.9588, AIC = -3.733914, DW = 1.82658, \zeta_1(4) = 1.78(0.65), \zeta_2(8) = 3.64(0.88),$$

$$ARCH(1) = 0.043(0.83), ARCH(2) = 1.63(0.54), JB = 6.85(0.69), RESET(2) = 3.89(0.16)$$

This model can be tested by Breusch-Godfrey Serial Correlation LM Test, ARCH LM Test, Ramsey Reset test, Cusum test and Chow test, and all of them show that the model is stable and suitable.

## Conclusions

In this paper, in light of Fama & French's method of dynamic portfolio, we categorize all the listed companies that issued both A-shares and B-shares in Shanghai securities market according to factor  $F$ . And based on some hypotheses and theories proposed by foreign scholars, with an extensive social investigation, factor analysis and various panel data models, we reveal that the capital and investment restrictions, the supply factor, the relative liquidity and the behavioral factor are the main reasons for the B-share price discounts in China. In this paper, the method of dynamic portfolio is firstly used to analyze the stock discount or premium phenomena in this field.

# The Impact of Interest Rates on Tax Incentive Policy and Inducement of Foreign Investment

*Sang-Hoon Kim*  
*Montclair State University, USA.*

## Abstract

Many countries often provide tax incentives (the reduction of the corporate tax rate or a tax exemption) to induce foreign corporate investments. Such a tax incentive policy improves both the profit and risk aspects of foreign investments. Kim et al derived a mathematical model [9] for the variance of a project's NPV. The model can be used to evaluate the impact not only of different levels of tax incentives but also of cash flow components (such as depreciation) on a project's profit and risk. The objective of this paper is to conduct a sensitivity analysis to examine the effectiveness of tax incentive policy under different interest rate levels. The main finding of the analysis is that a tax incentive (a lowering of the tax rate) policy is more sensitive (effective) under high interest rates than low interest rates.

## Introduction

Many foreign countries use tax incentives (lowering tax rates or tax exemption) to induce foreign corporate investments. Such a tax incentive policy affects both the profit and risk aspects of foreign investments of multinational firms. Kim et al [9] derived a mathematical model for the variance of a project's NPV ( $\text{Var}(\text{NPV})$ ). The model can be used to evaluate the effectiveness (sensitivity) of a tax incentive policy on the profit and risk aspects of investment projects.

Using the model, Kim et al [7] showed that:

1. At a very low corporate tax rate, the probability that a project's NPV is profitable ( $P(\text{NPV}>0)$ ) is not very sensitive to an additional tax incentive (additional tax reduction). Therefore, countries with low corporate tax rates such as Hong Kong where the corporate tax rate is 15%, an additional tax incentive (additional tax reduction) to multinational firms does not provide any meaningful incentive to induce foreign investments.
2. However, when corporate tax rates are high, the probability that  $P(\text{NPV}>0)$  is very sensitive to changes in the corporate tax rate. This implies that countries such as the U.S.A. which impose relatively high corporate tax rates can significantly deteriorate the profit prospect of foreign investments of multinational firms if they raise tax rates even by a very small amount. It also implies that when corporate tax rates are high, tax incentives (lowering tax rates to multinational firm) can be a very effective policy in inducing foreign investment.

The interest rate which is used for the NPV is one of the most important variables which affect the profit and risk aspects of investment projects. Consequently, the result derived by Kim et al can be affected depending on the level of interest rates. If interest rates affect the result derived, it will be useful information not only for the multinational firms evaluating the benefits of a tax incentive policy but also for governments designing an effective tax incentive policy to induce foreign investment. The objective of this paper is to examine how the level of interest rates can affect the effectiveness of a tax incentive policy.

The next section briefly reviews the mathematical model which was derived by Kim et al [9]. Section III covers the sensitivity analysis showing how changes in interest rates can affect the effectiveness of a tax incentive policy on the profit and risk aspects of a typical investment project. Section IV contains the conclusion.

## Review of the Model

When assessing an investment project based on the NPV method, the profit and risk aspects are combined. For example, the expected NPV (the profit aspect) is adjusted using a risk-adjusted discount rate which can be derived using the capital asset pricing model (CAPM). Since the  $E(\text{NPV})$  so computed does not provide any information

about the risk aspect of the project such as the probability that the project is profitable ( $E(NPV) \geq 0$ )), it is possible to accept a highly risky project without a proper evaluation of its risk aspect. However, if the first two moments  $E(NPV)$  and  $Var(NPV)$  of the NPV are available, a complete probability distribution of all possible NPVs can be derived. It should be noted that once the first two moments are known, even when the underlying probability distribution of the NPVs is unknown, the probability distribution still can be derived using Tchebycheff's inequality. Kim et al.[9] derived  $E(NPV)$  and  $Var(NPV)$  as follows:

Under the NPV method, the expected NPV is found such that

$$E(NPV) = \sum_{t=1}^n \frac{E(C_t)}{(1+r_f)^t} - C_0 \quad (1)$$

where  $E(C_t)$  = the expected periodic cash flow at period  $t$ ,  $C_0$  = the initial investment,  $r_f$  = the risk-free discount rate,  $n$  = the project's useful life. To make a separate assessment of both the profit and risk aspects of investment projects, the expected cash flows need to be discounted by the risk-free interest rate rather than by a risk-adjusted discount rate because the main concern is to find the expected NPV without considering the risk aspect.

As shown by Hillier [5], the variance of the NPV can be written as

$$Var(NPV) = \sum_{p=1}^n \sum_{q=1}^n \frac{1}{(1+r_f)^{p+q}} r_{pq} \sigma_p \sigma_q \quad (2)$$

where  $r_{pq}$  = the inter-temporal correlation coefficient between cash flows of  $p^{th}$  and  $q^{th}$  periods,  $n$  = the project's useful life, and  $\sigma_p$  ( $\sigma_q$ ) = the standard deviation of the periodic cash flow for period  $p$  ( $q$ ). The inter-temporal correlation coefficients,  $r_{pq}$ , are considered the most difficult parameters to be estimated especially in the case of lengthy multi-period investment projects due to the large number of  $r_{pq}$  that must be estimated.

Numerous papers [1][2][3][4][5][10][11] have been published regarding the estimation of the inter-temporal correlation coefficients. All these methods, however, have difficulties because the assumptions are not realistic or the information required is not easily available.

According to equation (2),  $Var(NPV)$  is a function of the four variables:  $n$ ,  $r_f$ ,  $\sigma_p$ , and  $r_{pq}$ . Since  $\sigma_p$  and  $r_{pq}$  are affected by cash flow components, it is necessary to derive models for  $\sigma_p$  and  $r_{pq}$  based on cash flow components. Kim et al [9] showed how to derive the estimation model based on cash flow components.

The periodic cash flows ( $C_t$ ) which are composed of cash flow components can be expressed as:

$$C_t = A_t \left( \sum_{i=1}^k C_{ti} - \sum_{i=k+1}^m C_{ti} \right) + D_t T_t \quad \text{for } t=0,1,..n \quad (3)$$

where the subscript  $t$  represents  $t^{th}$  period,  $A_t = (1 - T_t)$  = the corporate after-tax earnings rate,  $C_{ti} = i^{th}$  component cash flow which represents cash inflow when  $i \leq k$  and cash outflow when  $i > k$ ,  $m$  = total number of component cash flows,  $k$  = total number of component cash inflows, and  $D_t =$  depreciation. The component cash flows ( $C_{ti}$ ) include items such as sales revenue, any cash savings, service revenue, royalties, material cost, wages, advertising cost, and so forth.

Then, it can be shown that

$$E(C_t) = A_t \left[ \left( \sum_{i=1}^k E(C_{ti}) - \sum_{i=k+1}^m E(C_{ti}) \right) \right] + D_t T_t \quad \text{for } t= 1,..n \quad (4)$$

$$Var(C_t) = A_t^2 \left( \sum_{i=1}^m \sigma_{ti}^2 + 2 \sum_{i=1}^k \sum_{j=i+1}^k \tau_{ij} \sigma_{ti} \sigma_{tj} - 2 \sum_{i=1}^k \sum_{j=k+1}^m \tau_{ij} \sigma_{ti} \sigma_{tj} + 2 \sum_{i=k+1}^m \sum_{j=i+1}^m \tau_{ij} \sigma_{ti} \sigma_{tj} \right) \quad \text{for } t= 1,..n \quad (5)$$

where  $E(C_{ti})$  = the expected  $i^{th}$  component cash flow of the  $t^{th}$  period,  $\tau_{ij}$  = the correlation coefficient between the  $i^{th}$  and the  $j^{th}$  component cash flows,  $\sigma_{ti}$  ( $\sigma_{tj}$ ) = the standard deviation of the  $i^{th}$  ( $j^{th}$ ) component cash flow for period  $t$ , and all other notations are the same as defined before.

Kim et al derived the inter-temporal correlation coefficient between  $p$ th and  $q$ th periods as follows:

$$r_{pq} = \frac{1}{\sigma_p \sigma_q} \{ A_p A_q [ \sum_{i=1}^m \sum_{j=1}^m E_{ij} - 2 \sum_{i=1}^k \sum_{j=k+1}^m (E_{ij} + E_{ji}) ] + A_p D_q T_q [ \sum_{i=1}^k E(C_{pi}) - \sum_{i=k+1}^m E(C_{pi}) ] + E(C_q) [ D_p T_p - E(C_p) ] \} \quad (6)$$

where  $E_{ij} = \tau_{piqj} \sigma_{pi} \sigma_{qj} + E(C_{pi}) E(C_{qj})$ ,  $\tau_{piqj}$  = the inter-temporal correlation coefficient between  $i^{\text{th}}$  cash flow component of  $p^{\text{th}}$  period and  $j^{\text{th}}$  cash flow component of  $q^{\text{th}}$  period, and all other notations are the same as defined before with the exception that the subscripts  $p$  and  $q$  are used for periods  $p$  and  $q$ .

According to equations (5) and (6), the variance of the cash flows and the inter-temporal correlation coefficients are a function of six of the following variables:  $A_t$ ,  $D_t$ ,  $E(C_{ti})$ ,  $\sigma_{ti}$ ,  $r_{ij}$ , and  $\tau_{piqj}$ .

The first three variables are the information required to estimate the expected periodic cash flows which are essential for the  $E(\text{NPV})$ . Without these variables, project evaluation itself is not possible. Regarding the fourth and fifth variables ( $\sigma_{ti}$ ,  $r_{ij}$ ), Hillier [5,6] showed estimation methods by extending the PERT (Program Evaluation and Review Technique) which was originally developed by Malcolm et al. [12]. Also, Kim and Elsaid [8] extended Hillier's estimation method. Since Hillier [5,6] and Kim and Elsaid [8] already showed how these two variables can be derived, the only additional variables which need to be estimated are  $\tau_{piqj}$ .

Depending on the project, the total number of  $\tau_{piqj}$  can be significant. However, it should be noted that the two variables,  $\tau_{ij}$  and  $\tau_{piqj}$  are closely related. The former represents correlation coefficients between two cash flow components and the latter represents the inter-temporal correlation coefficient between two cash flow components of two different periods.

The correlation coefficients which represent the relationship between two cash flow components are expected to remain relatively the same during the project life. On the other hand, the inter-temporal correlation coefficients,  $\tau_{piqj}$ , decay away as the time lag (the difference between  $p$  and  $q$ ) increases. For example, consider the impact of an advertisement in a certain period on sales of later periods.

Therefore, a practically feasible approach is to estimate  $\tau_{piqj}$  based on a constant annual decay rate, just as a constant annual dividend growth rate is assumed for the valuation of common stock. It is practically impossible to estimate all possible future dividends without making a certain assumption regarding the dividend growth rate. Just as the constant dividend growth model is modified depending on the nature of the growth rate of different stocks, the estimation model based on a constant decay rate can also be adjusted depending on the nature of the decay rate of different projects.

Let  $\delta$  = the constant annual decay rate for the  $\tau_{ij}$ . Then, one possible way at which the inter-temporal correlation coefficient between two components of two different periods can decay away is:

$$\tau_{piqj} = \delta^{q-p} \tau_{ij} \quad (7)$$

where  $q \geq p$ .

The decay rate which can range  $0 \leq \delta \leq 1$  may not be constant and is impossible to be accurately estimated. However, it should be noted that equation (6) makes it possible to perform sensitivity analysis to observe the impact of a possible range of the decay rate on the  $r_{pq}$ ,  $\text{Var}(\text{NPV})$ , and the probability distribution of the project's NPV.

Since the main concern of this paper is to examine the impact of changes in level of interest rates on tax incentive policy, it will be assumed that the first five variables and a reasonable decay rate are provided.

## Numerical Example

A typical investment project which provides positive expected NPVs under a wide range of discount rates was prepared to examine the effectiveness of tax incentive policy under different level of interest rates. Suppose that a multi-national firm (Associated Automobile Company (AAC)) is planning to produce a new energy saving auto part containing computer chips which was developed by the company. The device can be installed in new as well as in used cars. To produce this device, equipment worth \$3.5 million will be needed. Technological advances will limit the project's life to ten years. The equipment will be depreciated on a straight-line basis over the ten year life of the project.

Suppose that AAC's management has made three estimates (optimistic, most likely, and pessimistic estimates) for each cash-flow component for the next ten years, as shown in Table 1.

TABLE 1: OPTIMISTIC, MOST LIKELY, AND PESSIMISTIC ESTIMATES OF CASH FLOW COMPONENTS (000'S)

	Year ⇒	1	2	3	4	5	6	7	8	9	10
X <sub>1</sub>	Optimistic	5,000	7,000	5,000	7,000	5,000	7,000	5,000	7,000	5,000	7,000
	Most likely	4,165	5,831	4,165	5,831	4,165	5,831	4,165	5,831	4,165	5,831

	Pessimistic	530	537	550	570	577	570	550	530	503	477

Key: optimistic (most likely, pessimistic) = optimistic (most likely, pessimistic) estimate, X<sub>1</sub> = new car market sales, sales, X<sub>2</sub> = used car market sales, X<sub>3</sub> = royalties, X<sub>4</sub> = labor costs of X<sub>1</sub>, X<sub>5</sub> = labor cost of X<sub>2</sub>, X<sub>6</sub> = material cost of X<sub>1</sub>, X<sub>7</sub> = material cost of X<sub>2</sub>, X<sub>8</sub> = advertising and sales promotion, X<sub>9</sub> = other selling and delivery expenses, and X<sub>10</sub> = general and administrative expenses.

There are three cash inflow and six cash outflow components: X<sub>1</sub> ( new car market sales), X<sub>2</sub> ( used car market sales ), X<sub>3</sub> ( royalties from licensing agreements with foreign car manufacturers), X<sub>4</sub> (labor cost of X<sub>1</sub>), X<sub>5</sub> (labor cost of X<sub>2</sub>), X<sub>6</sub> (material cost of X<sub>1</sub>), X<sub>7</sub> (material cost of X<sub>2</sub>), X<sub>8</sub> (advertising and sales promotion), X<sub>9</sub> (other selling and delivery expenses), and X<sub>10</sub> (general and administrative expenses).

Given the estimates of the cash flow components, the project's  $E(C_t)$ ,  $\text{Var}(C_t)$  and  $r_{pq}$  can be measured as follows:

- a. For the estimation of expected values and standard deviations for the random cash flow components (X<sub>1</sub> - X<sub>10</sub>), the method suggested by Wagle [13] and Hillier [6], can be used. According to the method, the two parameters can be estimated as follows:

$$E(X) = \frac{1}{6} [X_{\text{pes}} + 4X_{\text{most}} + X_{\text{opt}}] \quad (8)$$

$$\text{Var}(X) = \left[ \frac{1}{6} (X_{\text{opt}} - X_{\text{pes}}) \right]^2 \quad (9)$$

where  $X_{\text{pes}}$  = pessimistic estimate,  $X_{\text{most}}$  = most likely estimate, and  $X_{\text{opt}}$  = optimistic estimate. The expected values and standard deviations of cash flow components which are shown in Table 2 were computed using the three estimates in Table 1 and equations (8) and (9).

TABLE 2: EXPECTED VALUES AND STANDARD DEVIATIONS OF CASH FLOW COMPONENT (000's)

Period Variable	1	2	3	4	5	6	7	8	9	10
$E(X_1)$	4,032	5,518	7,727	9,616	9,616	7,769	5,518	5,476	3,863	1,932

$E(X_{10})$	718	890	1,104	1,320	1,428	1,320	1,083	1,080	884	667
$\sigma_{10}$	42	77	121	163	185	163	116	120	83	41

Key:  $E(X_i)$  = expected value of the  $i$ th cash flow component,  $X_1$  = new car market sales,  $X_2$  = used car market sales,  $X_3$  = royalties,  $X_4$  = labor,  $X_5$  = labor cost of  $X_1$ ,  $X_6$  = material cost of  $X_1$ ,  $X_7$  = material cost of  $X_2$ ,  $X_8$  = advertising and sales promotion,  $X_9$  = other selling and delivery expenses, and  $X_{10}$  = general and administrative expenses

- b. The original PERT method proposed by Malcolm et al. [12] does not provide any estimation procedure for the correlation coefficients ( $\tau_{ij}$ ). Hillier [5,6] and Kim and Elsaid [8] showed how to derive the correlation coefficients between an investment project's cash flow components for the PERT technique based on the regression slope parameter. Therefore, rather than repeating the lengthy estimation method proposed by Kim and Elsaid [8], this paper assumes that  $\tau_{ij}$  are already estimated. Table 3 depicts the assigned  $\tau_{ij}$ .

TABLE 3: CORRELATION COEFFICIENT MATRIX FOR COMPONENT CASH FLOW

- c. The expected values (E(C<sub>t</sub>)) and variances (Var(C<sub>t</sub>)) of each periodic cash flow were computed using the data in Tables 2 and 3, equation(4) and (5), and eleven different tax rates (0 to 50% in 5% increments). Table 4 shows the computed values of the expected values and standard deviations of each periodic cash flows under different tax rates.

- d. The inter-temporal correlation coefficients,  $r_{pq}$ s were computed using equation (6), the first two moments of the cash flow components (the data in Table 2), and the different tax rates. For the computations, a decay rate of .6 was used for  $\tau_{piqj}$  such that:  $\tau_{piqj} = (0.6)^{q-p}\tau_{ij}$  where  $q > p$ . It should be noted that different tax rates do not affect the inter-temporal correlation coefficients. Table 5 shows the computed periodic inter-temporal correlation coefficients.

TABLE 5: PERIODIC INTER-TEMPORAL CORRELATION COEFFICIENT MATRIX WHEN THE DECAY RATE = .60

Period	1	2	3	4	5	6	7	8	9	10
1	1.00

9	.02	.03	.05	.08	.13	.22	.36	.59	1.00	
10	.01	.02	.03	.05	.08	.13	.22	.36	.60	1.00

Tables 6, 7, and 8 show  $E(NPV)$ s,  $\sigma_{NPV}$ s, and  $P(NPV > 0)$  under 18 different interest rates (0 to 17%). For the computation of the  $E(NPV)$  and  $\sigma_{NPV}$ , equations (1) and (2) were used respectively. The  $P(NPV > 0)$ , the probability that the project can be profitable - was computed as follows:

When the distribution of the NPV is assumed to be approximately normal, the first two moments,  $E(NPV)$  and  $Var(NPV)$ , are necessary and sufficient information for the probability distribution of the NPV. The probability of any possible NPV such as  $P(NPV \geq X)$  can be evaluated, where  $X =$  any possible NPV of interest. If the probability distribution of the NPV is unknown, Tchebycheff's inequality can be used to evaluate the possible range of NPV such that

$$P[E(NPV) + h\sigma_{NPV} \leq NPV \leq E(NPV) - h\sigma_{NPV}] \leq \frac{1}{h^2} \quad (10)$$

for all  $h$  regardless of the probability distribution of the NPV, where  $h$  represents any real number. For the computation of the probability, Tchebycheff's inequality was used. Let  $h = E(NPV)/\sigma_{NPV}$  and assuming that the underlying probability distribution of the NPV is approximately symmetric with respect to the  $E(NPV)$ , it can be easily shown that:

$$P(NPV \geq 0) \geq 1 - \left(\frac{\sigma_{NPV}}{E(NPV)}\right)^2 (1/2) \quad (11)$$

As can be seen from tables (6) and (7), both the NPV and the  $\sigma_{NPV}$  decrease as either interest rates or tax rates increase. However, the decreases in the  $E(NPV)$ s and  $\sigma_{NPV}$ s are not in the same proportion.

As a result, the impact of changes in tax and interest rates on the P(NPV > 0)s are different. To summarize the findings shown in Tables 6, 7, and 8, the following five figures were prepared.

Figures 1 and 2 show how under different tax rates the E(NPV),  $\sigma_{NPV}$ , and P(NPV > 0) decline when the interest rate (discount rate) is not unusually low or high. To represent this, a discount rate of 8% was used. Figures 3 to 5 show how the three variables (E(NPV),  $\sigma_{NPV}$ , and P(NPV > 0)) decline when the interest rate is unusually low or high. For the unusually low and high interest rates, 2% and 17% were used.

Figure 2 shows that when the interest rate is not unusually low or high, the P(NPV > 0), the probability that the project can be profitable, declines at a slowly increasing rate as the corporate tax rate rises. However, Figure 5 shows that when the interest rate is unusually low, the P(NPV > 0) is not very sensitive to changes in corporate tax rates. Figure 5 also shows that when the interest rate is unusually high, the decline of P(NPV > 0) accelerates as the corporate tax rate rises.

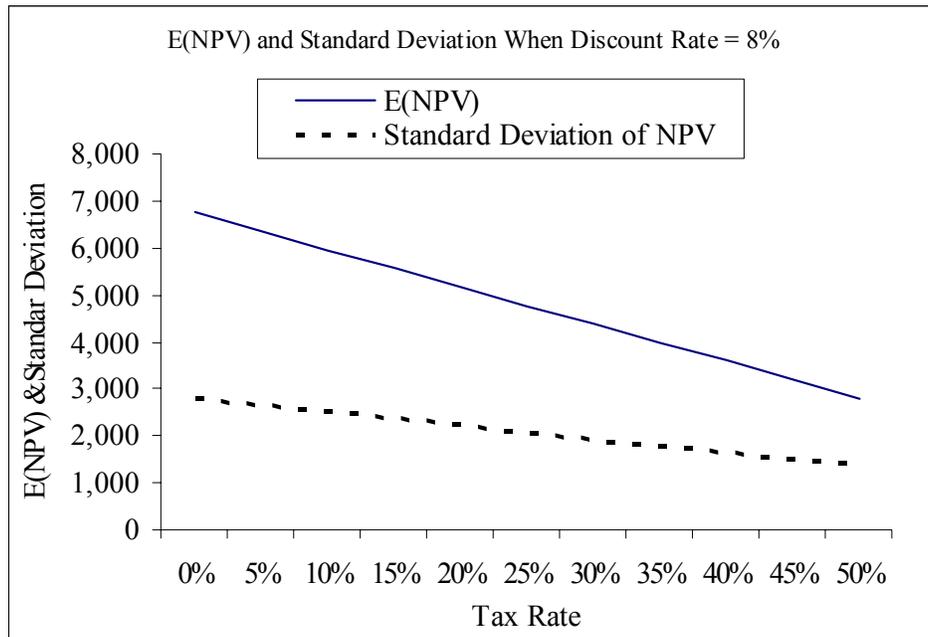

FIG. 1: THE  $E(NPV)$  AND  $\sigma_{NPV}$  UNDER DIFFERENT TAX RATES

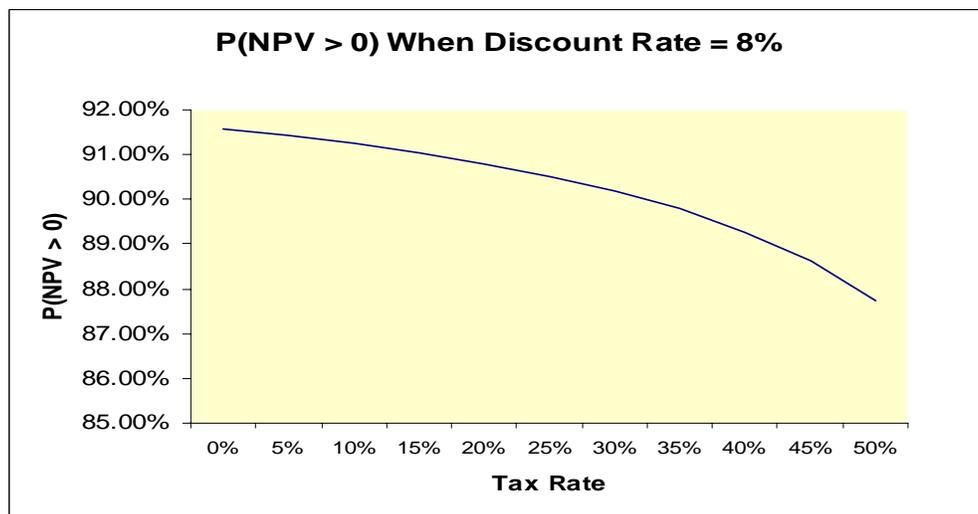

FIG. 2: THE  $P(NPV > 0)$  UNDER DIFFERENT TAX RATES

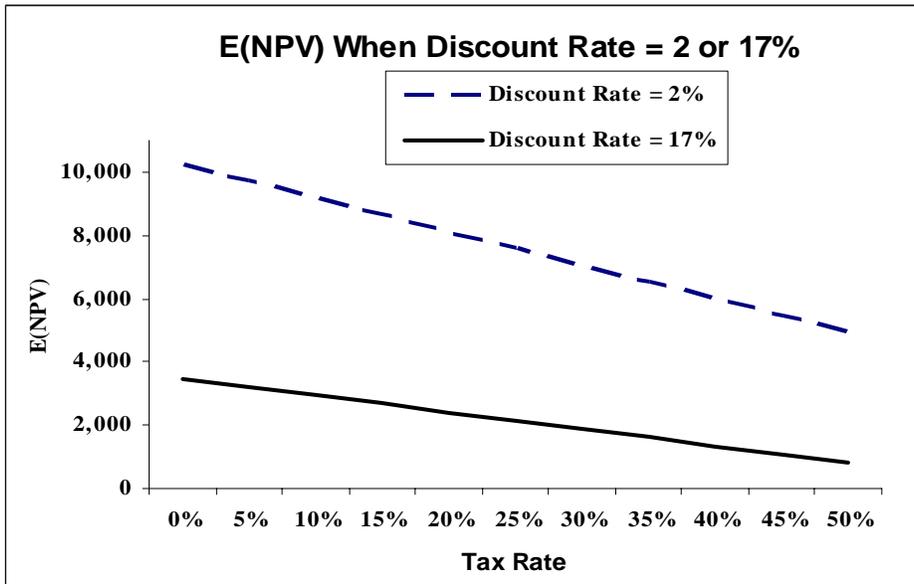

FIG. 3: THE E(NPV) UNDER DIFFERENT TAX RATES

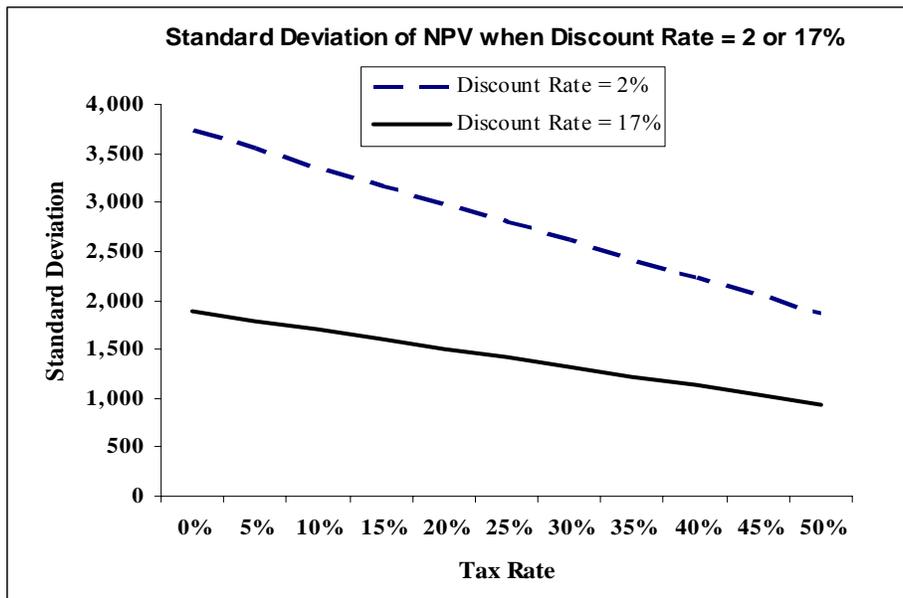

FIG. 4: STANDARD DEVIATION OF THE NPV

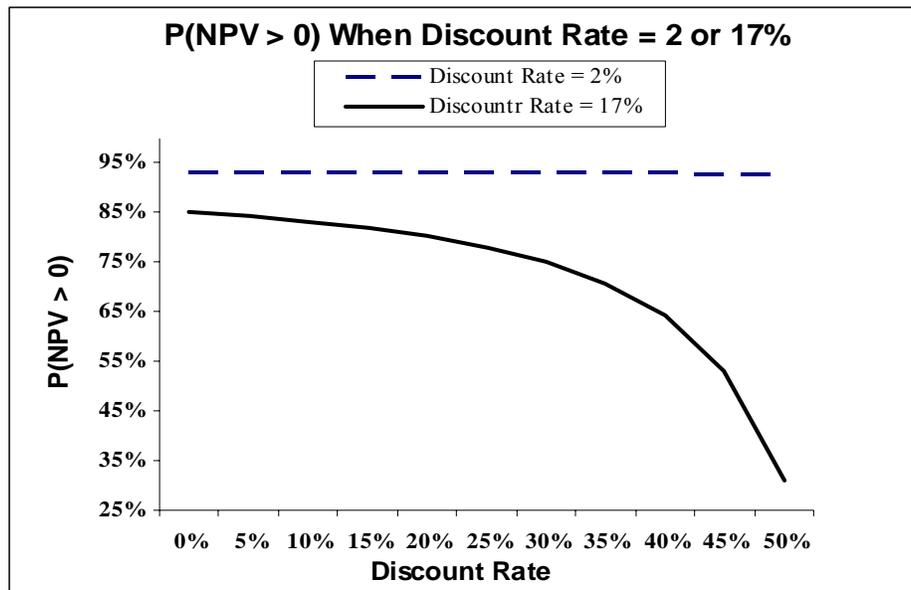

FIG. 5: THE P(NPV > 0) UNDER DIFFERENT TAX RATES

## Conclusion

The analysis has several important implications:

First, the expected profit (the net present value) alone is not enough information to make a sound investment decision. For example, even when the average tax rate is as high as 50%, the expected profit (NPV) from the project is \$943,000 when the interest rate is 17%. However, at the 50% tax rate, the P(NPV>0) is only 31.01%, implying that it is highly probable that the NPV can be less than zero. Traditionally, both profit and risk aspects are combined by using the risk-adjusted discount rate. The risk-adjusted NPV alone provides incomplete information, which can lead to the acceptance of highly risky projects. Consideration of both the profit and risk aspects is very important in evaluating risky investment projects.

Second, at very low tax rates, the P(NPV>0) is not so sensitive to changes in the tax rate under a wide range of interest rates, implying that when the corporate tax rate is very low, such as in Hong Kong where the corporate tax rate is 15%, additional reduction of the tax rate will not provide any meaningful incentive to induce foreign investment.

Third, in general, unless interest rates are unusually low, the P(NPV ≥ 0) is sensitive at higher tax rates. Therefore, for countries which impose a high corporate tax rate, tax reduction can provide a meaningful incentive to induce foreign investments.

Fourth, when interest rates are unusually low, the P(NPV > 0) is not very sensitive to changes in corporate tax rates, implying that a tax incentive policy (an additional tax reduction) cannot significantly improve the profit prospect. This also implies that under a very low interest rate, an additional tax reduction is not a good incentive policy because of the insignificant improvement of a project's profit and risk. On the other hand, when interest rates are unusually high, the P(NPV > 0) is very sensitive to changes in corporate tax rates, implying that a tax incentive policy is very effective. This also implies that under high interest and corporate tax rates, any additional increase in the corporate tax rate can significantly deteriorate corporate profit and risk.

The implications revealed by the analysis will be useful not only to U.S. companies making foreign investments but also to those foreign governments providing various investment tax incentives. Also, the research

results can provide useful information to U.S. federal and local governments, which often use various tax incentives to induce corporate investments.

Other cash flow components, especially those which can be controlled by government such as depreciation methods, can also affect the profit and risk aspects of investments. Therefore, it is possible that the results derived can be somewhat different depending on the size of the other variables. However, it should be noted that it is always possible to conduct a sensitivity analysis based on mathematical models of the first two moments. Furthermore, the sensitivity analysis is useful not only for the evaluation of the appropriateness of a change in a government investment incentive policy, but also for a company's accept/reject decision for a project.

## Abstract

In the 1950s and 1960s, it was widely believed that developing countries could create industrial bases only by substituting domestic manufactured goods for imports. From the mid-1960s onward, it became increasingly apparent that there was another possible path to industrialization via. Exports of manufactured goods primarily do advanced nations after forming trade associations such as SAARC, ASEAN etc. Moreover, the countries developed in this manner-a group that the World Bank now refers to as the high performance Asian economies- achieved a spectacular growth, in some cases at more than 10 percent per year. This paper analyses the pros and cons of the forming trade unions among the SAARC nations and how this union could be made more effective to combat any major economic turmoil and exigencies. The implications of "East Asian Miracle" is being viewed differently and different observers place very different interpretations on the role of the government policies, including trade policy, in fostering economic growth. To some observers the success of Asian economies demonstrates the effectiveness of sophisticated government intervention and there are some economists who believe that trade, industrial policy and trade unions made little difference either way. This paper attempts to analyze the relative importance of forming trade unions on the macro-economic development of member nation vis-à-vis their respective industrial policies.

## Introduction

In order to face the adverse impact of the WTO regime, the likely outcome of the discriminatory adherence to prescribed rules by developed economies, the developing countries specially in SAARC region are going ahead with the objective of creating economic and trading alliances and collaborations for mutual prosperity and growth. The globalization and liberalization efforts of SAARC countries have opened up an increase scope for trade co-operation not only among the member nations but also with the rest of the world, particularly with Europe. Development co-operation between the EU and the countries of SAARC is a prerequisite for transitional economies like India and EU for their trade expansions. But the declining trend of intra-trade among SAARC countries and the rising one with the developed economies, it is understood as a matter of grave concern to understand the trade composition of SAARC countries with that of EU, keeping an eye on the issues and policies related to foreign direct investments adopted by SAARC countries. Hence, an attempt has been made in this paper to study the trade synchronization between two blocks in the framework of globalization. This paper analyses India's trade with SAARC as a trade block and with EU block. The process of economic integration in SAARC region gathered momentum with the implementation of the South Asian Preferential Trade Agreement (SAFTA) in 1995 under the brand framework of South Asian Association for Regional Cooperation (SAARC). SAFTA has, however come to be viewed as an interim platform in the move towards economic integration in South Asia. In 1996, South Asian Government committed themselves to the creation of South Asian Free Trade Area (SAFTA). Although it was decided at the ninth SAARC summit to establish SAFTA by 2002, this has proved too ambitious as a target.

Theory and evidence from regional integration arrangements suggest that measures that reduce trade costs among partner countries may provide an important stimulus not only to trade, but also to foreign direct investment (FDI). Specific regional integration initiatives can influence the level and pattern of FDI flows between member countries, as well as, between member countries and outsiders. The SAARC integration initiatives have taken place in the context of a significant liberalization process in all member countries. This paper explores to analyze the

related issues, documenting the nature and type of intra-SAARC investment flows and presents the result of some preliminary studies on the emerging trade and investment linkages within the SAARC region.

### **Foreign Trade as Catalysts for Economic Growth and Development:**

In addition to sustained growth of domestic consumption, robust growth of exports is a widely accepted factor favoring growth and development in less developed countries. Though export performance may be importantly influenced by international economic conditions, a country's own trade policies, particularly its policies towards imports, can also be crucial to its export performance. In a dynamic world, linkages among export growth, foreign direct investment, accumulation of productive resources and technical know-how and macroeconomic growth and development matter importantly. Exports can be substantially hindered (if not absolutely hobbled) by a country's own policies towards imports. Protection enforced through measures such as tariffs, quantitative restrictions, and non-border measures such as industrial or qualitative standards for goods and services applied mainly to imports restrict the ability of domestic producers to sell their goods abroad. Many research findings prove that protection is equivalent to a tax on exports. Thus, in order to sell goods and services abroad successfully, a country must allow its inhabitants to buy goods abroad freely, leaving adjustments in exchange rates and domestic relative prices to ensure balance of payments equilibrium mainly to market forces. "Open" economies benefit from not only traditional, static gains from trade but also "dynamic" gains from trade. In response to greater integration with the world economy under liberal trade policies, producers and consumers allocate resources more efficiently. Producers in particular tend to adopt technologies that are appropriate to not only domestic economic circumstances but also economic circumstances prevailing internationally. These tendencies help to ensure that the greatest potential output is attained from available domestic resources, maximizing a country's growth, economic development, and economic well being. Growth and economic development are of course, related to a number of dynamic factors, among the most important of which are growth in inputs of skilled and unskilled labor, physical capital and technology (including knowledge and managerial know-how) to production. Long-term growth of labor input is frequently considered given by nature, but may be importantly subject to economic policies impinging on employment and education, as well as population growth. Growth rates of physical capital and technology inputs are more often considered subject to changes in economic policies. Traditionally, domestic investment has been a particular focal point of economic theories.

Foreign equity participation in industrial and other commercial projects has come to be viewed as especially important if not crucial for the growth prospects of less developed countries in the modern global economy, frequently with reference to the experience of developing Asian countries, such as Hong Kong and Singapore, Malaysia and Thailand, and most recently China, that have benefited from large inflows of foreign direct investment. Today, foreign direct investment is widely viewed among the major forces propelling the "globalization" of the world economy -- that is, the increasing specialization of production and trade through global networks of production and distribution, pioneered and operated by multinational enterprises (WTO 1996). Moreover although advanced industrial countries dominate the global picture, developing countries accounted for one-third of the global stock of inward foreign direct investment in 1997, compared to just one-fifth of the global stock at the beginning of the decade. Indeed, notwithstanding the South East Asian financial crisis, FDI flows have steadily emerged during the 1990s, including in 1997, as a larger and more stable component of total foreign financing for developing countries than either official development assistance or foreign portfolio investment (UNCTAD 1998).

FDI stock levels as a share of GDP have historically been exceedingly low in South East Asian countries and remain the lowest of all developing country regions at 0.7 percent of GDP in 2002 (refer the box, below). This reflects both low-extra-regional as well intra-regional investment flows.

## FDI AS % OF GDP

Source: World Development Report Indicators 2004, The World Bank

There is substantial scope of regional cooperation in areas such as building a world trading system responsive to region's development needs. The Cancun Ministerial Conference has demonstrated the importance of coordinated positions by developing countries in achieving their objectives. South East Asian countries have played a key role in evolving and strengthening the coalitions of developing countries. The failure of Cancun also provides an opportunity for the WTO membership to seek a redressal of the emerging asymmetries in the world trading system before they move forward. Drawing from the World Trade and Development Report 2003 by RIS, the report proposes an agenda for reform of the world trading system that developing countries in general and South East Asian countries in particular may take up in the interest of building a development-friendly world trading system. The main elements of this agenda include developments assessment of the multilateral trading system by an independent commission, reform of the decision-making process, broad based and more representative secretariat, setting up of a WTO watch dog of developing countries, strengthening the provision of technical assistance, emphasis on outstanding implementation issues rather than expansion of negotiating agenda, proactive framework agreements on special and differential treatment, movement of natural persons and on transfer of technologies.

In neoclassical economic theory, foreign direct investment mainly involves the movement of productive capital from one country to another. When productive capital moves from capital-abundant countries to capital-scarce countries, it promotes greater world production and economic welfare in the same manner as expansion of international trade in goods under trade liberalization, and, accordingly, foreign direct investment is viewed as a substitute for international trade in goods (Mundell 1957). In this vein, high tariffs and other barriers to trade can induce foreign direct investment, but with little beneficial impact on domestic resource allocation and economic welfare in highly distorted host countries because typically the foreign direct investment is geared to servicing only small, "inward-looking" markets. In the global economy today, foreign direct investment is more often viewed from a "new trade theory" perspective emphasizing firm-level decisions to marshal proprietary assets and organize production processes across national boundaries in either horizontal multi-plant modes or vertically integrated modes. From this perspective, foreign direct investment is frequently viewed as instrumental in promoting foreign trade, particularly in host countries that maintain relatively open economies, stable macroeconomic conditions, limited restrictions on foreign exchange transactions (and repatriation of investment earnings), and protection for private property rights. Specifically, under such favorable conditions, foreign direct investment by multinational firms tends to foster export-oriented production following underlying comparative advantage factors, such as the relative abundance of low-wage labor in developing countries. It also accords well with the "flying geese" theory of foreign direct investment in populous developing Asia (Akamatsu 1962a,b). According to the flying geese theory, foreign direct investment disperses production technology and know-how from a high-wage source country to one or more lower-wage host countries. This dispersion of technology and know-how ultimately influences trade patterns as the primary location of production is gradually transferred off-shore by the high-wage source country to the lower-wage "follower" countries (similar to the pattern formed by flying geese). With its emphasis on differential wage levels between countries and creation of overseas "export platforms" by multinational firms, the flying geese theory of foreign direct investment in Asia provides an added explanation for the remarkable performance of East Asian exports. The flying geese theory also points to the nature of the problem faced by many, now, higher-income developing countries in East Asia, namely, the challenge of smoothly adjusting to new products and technologies as the comparative advantage of more advanced Asian countries gradually shifts to not only more physical capital-

intensive but also more human-capital-intensive and technology-intensive products that are more in line with higher average wage levels.

### **Regional Economic Cooperation and Development:**

Although South Asia was fairly late in embracing the concept of regional cooperation in trade, it was quick to set itself an ambitious agenda. The proposal to set up a South Asian Preferential Trade Agreement (SAPTA) was accepted by all seven member states of the South Asia Association for Regional Cooperation (SAARC) in 1993 and, with the ratification of the first round of tariff concessions, SAPTA came into formal operation in December 1995. In 1996, SAARC member countries agreed in principle to go a step further and attempt to enact a South Asian Free Trade Agreement (SAFTA) by 2000, but not later than 2005. In subsequent developments, the date for establishing SAFTA was inexplicably brought forward to 2001 at the "10th Heads of State Summit" held in Colombo in July 1998. However, reflecting the concerns of some of the smaller economies in the region, the Group of Eminent Persons (GEP) Report recommended a more gradual phase-in of SAFTA with a target date of 2008. At last, the SAARC region seems to be heading towards a Free Trade Area, SAFTA, that is an initial step in the evolution of the South Asia Association for Regional Cooperation as a regional trade bloc and an economic union. There is much speculation about its favorable effect on intra-regional trade. Regional economic integration is more about finding an engine of growth rather than trade. Countries — developed as well as developing — have started looking at regional economic integration as a means of strengthening their international competitiveness and as an engine of economic growth in recent years. By removing strong trade policy barriers to intra-regional trade, SAFTA would lead to expansion of intra-regional trade. By conservative estimates, it may help in trebling of the proportion of intra-regional trade, making it look more respectable compared to a marginal 4-5 per cent as of now. By making it possible to trade directly rather than through third countries, it would also lead to savings of substantial value for the region. However, expansion of mutual trade, saving of freight costs etc., should be seen as the spill-over rather than the real gains from the creation of SAFTA. The new-found interest in regional trade arrangements (RTAs) the world over is about exploiting the potential of efficiency-seeking restructuring of the industry to take advantage on a pan-regional basis rather than promotion of trade. These efficiencies lead to generation of income and hence could be valuable drivers of growth. It is true that these trades will lead to industrial restructuring, if one goes by the results of limited experiences with trade liberalization in the region. The Indo-Sri Lanka bilateral FTA for instance, even within a short period of less than three years of implementation, has led to a lot of dynamism in the intra-regional investments. Similarly, India-Nepal FTA of 1996 spurred some Indian companies to shift production of common consumer goods of every day use such as toothpaste for the north-Indian market to Nepal. As a result these items emerged as some of the most important items of Nepal's exports to India. Thus, SAFTA may help in evolving a horizontal specialization across the region to enable the most optimal utilization of the synergies of the member countries for their mutual advantage. Sri Lanka may well emerge as the region's hub for rubber-based industries, Bangladesh for energy-intensive industries and Bhutan, forest-based industries, and so on. The other lesson that comes out of recent experiences of regional economic integration in South Asia, as elsewhere, is that relatively smaller and poorer countries benefit more from RTAs. India-Sri Lanka FTA has brought down the trade surplus of India with the country from 8.6:1 to 4.9:1 in just two years. Therefore, RTAs lead to convergence in the levels of development. Regional economic integration will also make member countries, especially the smaller ones, more attractive destinations for third country investments by obviating the constraint of small domestic market.

### **Conclusion**

Therefore, an agreement to form SAFTA taken by the leaders of the region is a step in the right direction. However, to exploit its full potential for efficiency-seeking restructuring of regional economic integration, they would need to do further work to complement SAFTA by a customs union and then gradually move towards an economic union. The regional economic integration in South Asia could generate billions of dollars of new income, employment, trade and could help the region in its fight against poverty.

Both theory and evidence from regional integration arrangements suggest that measures that reduce trade costs among partner countries may provide an important stimulus not only to trade, but also to foreign direct investment (FDI). Also, specific regional integration initiatives can influence the level and pattern of FDI flows between member countries, as well as between member countries and outsiders. The SAARC integration initiatives have taken place in the context of a significant (non-discriminatory) liberalization process in all member countries. This has involved both trade and investment liberalization, and the adoption of a pro-FDI stance. Though significant trade and investment barriers remain in place in many countries, the regional economies are today far more open than they were until the late 1980s. The investigation here reveals that non-Asian emerging-market countries have made appreciable progress in closing the "trade policy gap" with other non-South Asian developing countries. During the last decade, SAARC countries have widely reduced their average levels of tariff protection and also, very importantly, their average levels of NTB protection. However, the South Asian economies remain among the world's most highly tariff-protected economies. Finally, regionalism in South East Asia, not unlike regionalism in other areas of the world today, poses important contradictions for the pursuit of more open policies towards foreign trade and investment in developing SAARC countries.

# The Determinants of Foreign Direct Investment in Pakistan

*Anjum Aqeel*  
*University of Karachi, Pakistan*  
*Mohammed Nishat*  
*Institute of Business Administration, Pakistan*

## Abstract

The paper empirically identifies the determinants of growth in foreign direct investment (FDI) in Pakistan over the period 1961 to 2003. Our main interest is to study how different variables or indicators reflecting trade, fiscal and financial sector liberalization attract FDI in Pakistan. The study uses the Cointegration and error-correction techniques to identify the variables in explaining the FDI in Pakistan. The study considers the tariff rate, exchange rate, tax rate, credit to private sector and index of general share price variables if they explain the inflow of foreign direct investment. Also included wages and per capita GDP to test for relative demand for labor and market size hypotheses. All variables indicated correct signs and are statistically significant except for wage rate and share price index. The study clearly emphasizes the role of these policy variables in attracting FDI and determining its growth in both short and long run in Pakistan. The study also indicates a positive and significant impact of reforms on FDI in Pakistan.

## Introduction

The significance of foreign direct investment (FDI) flows is well documented in literature for both the developing and developed countries. Over the last decade foreign direct investment have grown at least twice as rapidly as trade Meyer [30]. As there is shortage of capital in the developing countries, which need capital for their development process, the marginal productivity of capital is higher in these countries. On the other hand investors in the developed world seek high returns for their capital. Hence there is a mutual benefit in the international movement of capital.

The ongoing process of integration of the world economy and liberalization of the economies in many developing countries have led to a fierce competition for inward FDI amongst these countries. The controls and restrictions over the entry and operations of foreign firms in these countries are now being replaced by selective policies aimed at FDI inflows, like incentives, both fiscal and in kind. The selective policies not only improve the fundamentals of the economy but they aim at attracting more foreign investments in the country.

Accordingly during early 1980s, the government in Pakistan has initiated market-based economic reform policies. These reforms began to take hold in 1988, and since then the government has gradually liberalized its trade and investment regime by providing generous trade and fiscal incentives to foreign investors through number of tax concessions, credit facilities, and tariff reduction and have also eased foreign exchange controls Khan [23]. In the 1990s, the government further liberalized the policy and opened the sectors of agriculture, telecommunications, energy and insurance to FDI. But, due to rapid political changes and inconsistency in policies the level of FDI remained low compared to other developing countries. Nevertheless, the time series data on FDI inflows and stocks has shown remarkable progress over time particularly during the reform period of the 90's (see Table 1).

TABLE 1: FDI IN PAKISTAN

	Averages				2000	2001	2002	2003
	1970'S	1980'S	1990'S					
FDI Inflows in Million \$	18.00	88.83	500.27	305.10	385.40	823.00	1405.33	
FDI Stock as % of GDP		3.06	8.93	11.31	9.68	9.99	10.66	
FDI Inflows as % OF GFCF	8.89	16.54	54.93	3.62	5.01	10.32	15.42	

SOURCE: UNCTAD data on line

Extensive empirical literature on determinants of inward FDI emphasizes the economic conditions or fundamentals of the host countries relative to the home countries of FDI as determinants of FDI flows. This literature is in line with Dunning's eclectic paradigm [13], which suggests that it is the locational advantages of the host countries e.g., market size and income levels, skills, infrastructure and political and macroeconomic stability that determines cross-country pattern of FDI. Following this approach Nishat and Anjum [34] have estimated that political stability, peaceful law and order situation, level of technical labour force and mineral resources and liberal policies of the government attracted foreign investors in Pakistan.

However, it has been argued that the location specific advantages sought by foreign investors are changing in the globalised more open economies of today. Accordingly, in his path breaking work Dunning [14] finds out that FDI from more advanced industrialised countries depends on government policies, transparent governance and supportive infrastructure of the host country. However, very few studies exist that have empirically estimated the impact of selective government policies aimed at FDI.

The present study adds to the existing literature by empirically examining the response of FDI to selective policies, namely tax and tariff policy, fiscal incentives offered and exchange rate policies in Pakistan. More specifically, the objective of this study is to find out the effectiveness of these policies during the reform period. From this study we would be able to see which specific government policy is attracting or distracting FDI in Pakistan. This study would be of interest to policy makers in many developing countries where structural reforms are being implemented.

The rest of the paper is organized that section 2 reviews the literature and describes the theoretical framework. Section 3 describes the econometric model and data followed by estimation and interpretation of results in section 4. The summary and concluding remarks are provided in section 5.

## **Literature Review and Theoretical Framework**

An extensive set of determinants has been analyzed in the literature on the determinants of FDI. Numerous empirical studies (Agarwal, [1]; Gastanaga et. al., [19]; Chakrabarti, [11]; and Moosa, [32]) on the determinants of FDI lead us to select a set of explanatory variables that are widely used and found to be significant determinants of FDI. For example Markusen and Maskus, [29]; Lim, [25]; Love and Lage-Hidalgo, [27]; Lipsey, [26] and Moosa [32] highlight how the domestic market size and differences in factor costs can relate to the location of FDI. To foreign investors who operate in industries characterized by relatively large economies of scale, the importance of the market size and its growth is magnified. This is because they can exploit scales economies only after the market attains a certain threshold size. The most widely used measures of market size are GDP, GDP/capita and growth in GDP. The signs of these coefficients are usually positive.

Discussing the labor cost which is one of the major components of the cost function, it is mentioned that high nominal wage, other things being equal, deters FDI. This must be particularly true for the firms, which engage in labor-intensive production activities. Therefore, conventionally, the expected sign for this variable is negative. The studies that find no significant or a negative relationship of wage and FDI are: Kravis and Lipsey, [24]; Wheeler and Mody, [42]; Lucas, [28]; Wang and Swain, [41]; and Barrell and Pain, [4]. Nonetheless, there are other researchers who have found out that higher wages do not always deter FDI in all industries and have shown a positive relationship between labor costs and FDI (Moore, [31]; and Love and Lave-Hidalgo, [27]). Because higher wages indicate higher productivity, hi-tech research oriented industries in which the quality of labor matters, prefer high-quality labor to cheap labor with low productivity.

Recently, a few researchers have also studied the impact of specific policy variables on FDI in the host countries. These policy variables include openness of trade, tariff, taxes and exchange rate. Gastanaga, Nugent, and Pashamova [19] and Asiedu [3] focus on policy reforms in developing countries as determinants of foreign direct investment inflows. They find corporate tax rates and degree of openness to foreign direct investment to be significant determinants of FDI. Similarly many recent models highlight the effect of tariffs on FDI within the context of horizontal and vertical specialization within MNEs (Ethier, [17] [16]; Brainard, [7]; Carr, Markusen, and Maskus, [10]).

The horizontal FDI can be associated with market seeking behaviour and is motivated by lower trade costs. Hence high tariff barriers induce firms to engage in horizontal FDI, and thus, replace exports with production abroad by foreign affiliates. This “tariff jumping” theory implies a positive relationship between import duty and FDI. While a typical vertical FDI can be characterized by individual affiliates specializing in different stages of production of the output. The semi-finished products, in turn, are exported to other affiliates for further processing. By fragmenting the production process, parent firms and affiliates take advantage of factor price differentials across countries. The MNEs, which set up vertical production networks may be encouraged to invest in a country with relatively low tariff barriers due to lower cost of their imported intermediate products. Therefore, the expected sign of import duty variable is negative in this case. With the decline in tariff rate due to trade liberalization in the developing countries, imports have increased by MNC’s. For Pakistan, Khan [23] confirms that imports have increased by MNC’s as trade is being liberalized as a result of the recent structural reforms.

For foreign investors the fiscal incentives and taxation structure is very important. The tax rate affects the profitability of investment projects. Therefore foreign investors seek locations where taxes are low. Various tax break regimes are often offered to multinationals as an incentive to attract FDI inflows. Empirical studies indicated a negative relationship between taxes and the location of businesses (Newman and Sullivan, [33]; Gastanaga et al ./[ 19]; Billington, [5]; Shah and Ahmed, [38]; and Bora [6]. On the other hand Carlton, [9] Hines and Rice, [21] and Hines [20] found no support on the impact of taxes on FDI. Interestingly, Swensen [39] empirically finds a significant positive effect of taxes on inward FDI.

Likewise the effect of exchange rate movements on FDI flows is a fairly well studied topic, although the direction and magnitude of influence is far from certain. Froot and Stein [18] claimed that a depreciation of the host currency should increase FDI into the host country, and conversely an appreciation of the host currency should decrease FDI. Similarly, Love and Hidalgo [27], also acknowledge that the lagged variable of exchange rate is positive which indicates that a depreciation of the peso encourages US direct investment in Mexico after some time. Contrary to Froot and Stein, [18] and Campa [8] while analyzing foreign firms in the US puts forth the hypothesis that an appreciation of the host currency will in fact increase FDI into the host country that suggests that an appreciation of the host currency increases expectations of future profitability in terms of the home currency.

## Econometric Model Specification and Data

In the light of above discussion following model is formulated to determine the impact of various types of selective government polices and other variables to attract FDI in Pakistan.

$$FDI_t = f(GDP_t, WAGE_t, TARIF_t, TAX_t, CREDIT_t, EX_t, INDEX_t, DUM1_t, DUM2_t)$$

where	<i>FDI</i>	=	<i>Growth in FDI inflows(deflated by GDP deflator)</i>
	<i>GDP</i>	=	<i>Log of GDP/Capita</i>
	<i>WAGE</i>	=	<i>Log of Average Annual wages of factory workers in perennial industries (deflated by GDP deflator)</i>
	<i>TARIF</i>	=	<i>Ratio of custom duties to total value of imports</i>
	<i>TAX</i>	=	<i>Share of corporate tax in total taxes</i>
	<i>CREDIT</i>	=	<i>Share of credit of the private sector in total credit to public and private sectors</i>
	<i>EX</i>	=	<i>Average Annual Exchange Rate as rupees / \$</i>
	<i>INDEX</i>	=	<i>Log of General Share Price Index</i>
	<i>DUM1</i>	=	<i>1 for the period 1972 to 2003, 0 otherwise</i>
	<i>DUM2</i>	=	<i>1 for the period 1989 to 2003, 0 otherwise</i>

We expect that the coefficient of GDP would be positive because foreign investors are only interested where there is a big market of their product. The coefficient for WAGE would be negative as there is low level of skilled labour force in Pakistan and only labour intensive FDI would be forthcoming as wages are low. It has been

observed that as trade is being liberalized and tariffs are being eliminated on the import of machinery, FDI has increased in Pakistan. Therefore, we expect a negative relationship between FDI and TARIF. As credit to foreign investors is an investment incentive, we expect a positive sign for coefficient of CREDIT. The coefficient for exchange rate (EX) is ambiguous in many studies. As it could be positive if foreign investors are considering it as lower cost of capital and negative if they are expecting a higher return on their investments. In case if the sign of INDEX is negative it indicates that the government pursues policies to attract FDI when capital market is sluggish. However, a positive sign for INDEX suggests that the foreign investors are concerned with the investment climate of the country.

The data used in the empirical investigation covers annual data for the period from 1961 to 2003. The data of FDI is collected from various issues of “Assets, Liabilities and Foreign Investment” published by State Bank of Pakistan. The exchange rate is extracted from the electronic data of “International Financial Statistics”. The data of all the other variables are from “50 Years of Pakistan” and various issues of “Pakistan Statistical Year Book” published by Federal Bureau of Statistics, Government of Pakistan.

## Estimation and Empirical Results

To investigate the nature of any long-run relationship between FDI inflows and the variables suggested in our model, we now proceed to examine whether the series are cointegrated, implying that any deviations from any long run equilibrium relationship that exists between them will themselves be stationary. Unless series are cointegrated, there is no equilibrium relationship between variables and inference is worthless. Our justification for employing the techniques of co-integration in this instance amount to two related reasons; First, discovering that variables are co-integrated, allows for the use of error-correction models which allow for the separation out of long run and short run impacts; see Alogoskoufis and Smith, [2]. Second, the presence of co-integration between two variables ensures that an OLS regression in levels yields consistent parameter estimates Engle and Granger, [15]. This would in effect signify whether there is a stable long run relationship between the variables. An empirical work by Dickey, Jansen and Thornton, [12] indicates that Johansen's [22] maximum likelihood estimator of a vector autoregressive (VAR) model is superior. Testing for cointegration using a single equation model is problematic if more than one cointegrating relationship is present.

### Unit Root Test

To test for cointegration, we first verify that all the above-mentioned variables that we expect to be cointegrated with growth in FDI flows are each individually I(1). In this section we perform unit root tests for stationarity on the levels and the first differences of all eight variables. The Phillips Perron [37] unit-root test both with and without trend show the existence of unit roots (Table2), and therefore non-stationarity in the levels of some variables (TARIF, TAX, CREDIT, IINDEX, GDP and WAGE). However, the first differences of these six variables are stationary at 1% significance level. Hence we conclude that these variables are integrated of order 1. The FDI is stationary at the level, and is therefore an I(0) variable. The variable EX is stationary in levels with out trend and stationary at first difference with trend.

TABLE 2: PHILLIPS-PERRON UNIT ROOT TEST

	With No Trend		With Trend	
	Level	First Difference	Level	First Difference
FDI	-6.25*	-	-6.27*	-
TARIF	-1.30	-5.53*	-2.30	-5.53*
TAX	-1.20	-7.68*	-3.06	-7.85*
CREDIT	-2.69	-6.81*	-2.75	-6.69*
EX	5.39*	-	1.06	-5.82*
INDEX	-0.10	-6.50*	-2.23	-6.47*
GDP	-0.79	-10.17*	-4.02	-10.51*
WAGE	-1.36	-6.47*	-2.63	-6.44*

\* Significant at 1 percent

### Estimation of a Cointegrating Vector

In order to identify a cointegration relation among the variables mentioned in the previous subsection, we employ the Johansen cointegration test. Before undertaking the cointegration tests, we first specify the relevant order of lags ( $p$ ) of the vector autoregressions (VAR) model.

Since the sample size is relatively small, we select 1 for the order of the VAR (Pesaran and Pesaran, [36]). The results of rank and trace statistics obtained from the Johansen- Juselius (JJ) method using the assumption of linear deterministic trend in the data are presented in Table 3. The trace and the rank tests suggest  $r = 1$  at 5 and 10 percent significance levels respectively. Therefore, our annual data appear to support the proposition that in Pakistan there exist a long-run relation between growth of FDI and its determinants.

TABLE 3: JOHANSEN'S COINTEGRATION TEST RESULTS

Null	Alternative Trace	Alternative Rank	Trace Test Statistic	Rank Test Statistics
$r=0$	$r \geq 1$	$r=1$	160.97**	<b>48.42***</b>
$r \leq 1$	$r \geq 2$	$R=2$	112.55	39.837
$r \leq 2$	$r \geq 3$	$r=3$	72.71	23.391
$r \leq 3$	$r \geq 4$	$r=4$	49.32	21.48
$r \leq 4$	$r \geq 5$	$r=5$	27.84	12.89
$r \leq 5$	$r \geq 6$	$r=6$	14.95	9.25
$r \leq 6$	$r \geq 7$	$r=7$	5.70	5.09
$r \leq 7$	$r \geq 8$	$r=8$	0.61	0.61

### Estimation of an Error-Correction Model

After confirming the long run relationship among the variables, we can proceed to model the short run adjustment behaviour of the variables as further confirmation of our results. Following Love and Lage-Hidalgo, [27] we can choose to estimate the short run VAR in error correction form (VECM). The VECM model is intended to describe the short-term dynamics of growth of FDI inflows in Pakistan. This type of model explains the immediate short-term changes in dependent variable by means of deviations from a particular equilibrium relationship between the dependent variable and the explanatory variables. The common approach is to reformulate the long run relationship to include lagged values of first differences in the relevant variables with the error correction term explicitly included.

So now we use deviations from the cointegration relation estimated in the previous section as the error-correction term when building the ECM. Two error correction models with and without dummies are estimated to distinguish the behavior of foreign direct investment during non-reform and reform periods. In particular, two dummies are used to reflect the changes in the government measures, which could have affected the growth of FDI. One DUM1 reflects the structural break reflecting a massive devaluation of rupee of about 58% in 1972, it takes the value of 1 for 1972 and onwards and the other DUM2 which reflects the liberalization measures taken under the structural reforms of 1988, takes the value of 1 for 1989 and onwards. The results of estimation of the ECMs are shown in Table 4. The lags of the explanatory variables are chosen in according to Akaike Information Criteria and indicate lags upto two periods.

TABLE 4: VECTOR ERROR CORRECTION MODELS

	Model 1		Model 2	
Error Correction:	D(FDICG)		D(FDICG)	
CointEq1	-1.36*	(-4.34)	-1.87*	(-9.85)

### Interpretation of Empirical Results

The analysis of the results of these two ECM models presented in Table 4 suggest that model 2 has more explanatory power with adjusted  $R^2 = 0.84$ , and satisfies the relevant diagnostic checks for serial correlation, functional form, non-normality and heteroscedasticity and thus has the desirable properties for OLS estimation. The results of model 2 indicate that the error correction coefficient, estimated at  $-1.87$  is statistically significant at the 1 per cent level, has the correct sign, and suggests a good speed of convergence to equilibrium. As indicated all the variables except the average wage and index of general share prices are statistically significant and have the expected signs. Furthermore, the lagged dependent variable included in the error-correction model has positive sign and is statistically significant. This means that the short-run dynamics of inward FDI are influenced by the previous development of FDI influx by means of the “agglomeration” or “clustering effect”. Thus our results give some evidence that reducing import tariffs and corporate tax rate would positively affect the growth of FDI. Moreover, the coefficient of exchange rate is positive implying that when rupee appreciates, FDI increases as investors see it as a good sign for the economy and expect high returns. However, DUM1 is positive and significant which also indicates that devaluation had decreased the cost of assets in Pakistan and attracted foreign investment or perhaps since the data on FDI is in rupees, there is just a nominal jump in the data. Additionally, encouraging private sector through its generous credit policy would accelerate the growth of FDI. More importantly, the statistical significance of our dummy DUM2 reinforces our results that the liberalization measures taken to attract FDI have positive impacts on the growth of FDI in Pakistan.

## Summary and Concluding Remarks

The paper empirically identifies the determinants of growth in foreign direct investment (FDI) in Pakistan over the period 1961 to 2003. Our main interest is to study how different variables or indicators reflecting trade, fiscal and financial sector liberalization attract FDI in Pakistan. The study uses the Cointegration and error-correction techniques to identify the variables in explaining the FDI in Pakistan. The study considers the tariff rate, exchange rate, tax rate, credit to private sector and index of general share price variables if they explain the inflow of foreign direct investment. Also included are wages and per capita GDP to test for relative demand for labor and market size hypotheses. All variables indicated correct signs and are statistically significant except for wage rate and share price index. The study clearly emphasizes the role of these policy variables in attracting FDI and determining its growth in both short and long run in Pakistan. The study also indicates a positive and significant impact of reforms on FDI in Pakistan.

## Abstract

In an effort to improve market transparency, more information regarding quotes and orders has been disclosed by Korean Stock Exchange in last 5 years. This paper studies the effects of four events aimed to improve transparency: two for market opening by single-price call auction, and two for regular trading hours operated by continuous auction. We select 20 stocks before and after each event, 10 largest stocks in market capitalizations, and another 10 stocks based on trading volumes, before and after each event to investigate how liquidity, depth, and investors trading behavior were affected by these events. We find that market liquidity and depth were generally improved as more information on quotes and orders were disclosed but not by statistically significant margin. Smaller number of orders were cancelled and it took less time to for traders to cancel orders after the Exchange adopted actions to improve transparency, which implies that traders have adjusted their trading patterns as the market became transparent.

## Introduction

Market transparency generally refers to the ability of market participants to observe the information in the trading process including bid and ask prices and outstanding orders. Among many aspects of the institutional design of financial market, transparency is arguably the most controversial issue, which draws academic interest as well as serious regulatory concerns, and provides little consensus as to its overall effect on the market.

Some academicians, including Glosten (1999) have shared beneficial view of transparency in that increased transparency should ameliorates the adverse selection problem by a greater commonality of information, and thereby prices become more efficient and spreads should be smaller. However, others, most notably Madhavan, Porter and Weaver (2000) argue that higher transparency does not improves market quality since liquidity providers are less willing to offer free options to other traders, which consequently results in widened spreads and reduction in asset values. Regulators' views on the effect of market transparency are also equally split. US Securities and Exchange Commission (SEC, 1994) and the UK Office of Fair Trading (Carsberg, 1994) have called for increased transparency as a way to improve market quality. The Securities Investment Board (SIB, 1994) opposes higher transparency contending that increased transparency will reduce liquidity as market maker positions must be publicly disclosed.

Theoretical works including Baruch (2003), Pagano and Roell (1996) show that market transparency has substantially different effects depending on specific trading mechanisms of the financial markets such as call versus continuous auction, presence of market makers, to name a few. As clearly pointed out by Glosten (1999), studying the effect of market transparency, particularly subjecting theories to empirical test is even more daunting task as changes in transparency regimes are infrequent and, hardly ever exogenous. Madhavan, Porter and Weaver (2000) and Boehmer, Saar and Yu (2003) empirically examine transparency regime changes associated with public disclosure of limit order books in Toronto Stock Exchange (TSE) and New York Stock Exchange (NYSE) respectively.<sup>1</sup> They show very different results on the effect of higher transparency: the former shows detrimental effect of increased transparency on liquidity with both higher transaction costs and volatility while the latter demonstrates improved liquidity and positive cumulative abnormal returns after the implementation of OpenBook

which forces specialists' publicly disclose their limit order books. Bloomfield and O'Hara (1999) and Flood et al. (1999) adopt experimental methods<sup>ii</sup> to overcome the limit on empirical testing on market transparency, but both articles show that increased transparency produces quite different effect on the market quality depending on the specifics of market design.

Korea Stock Exchange (KSE) offers interesting venue to investigate the effect of market transparency in two important respects. First, it adopts two different trading mechanisms, single-price call auction for opening and closing the market, and continuous call auctions during regular trading hours. Second, since 1988, KSE continuously improves market transparency by disclosing more quote and order related information. This paper focuses on four events regarding transparency regime changes, two on market opening call auction system, and remaining two on continuous auction mechanism. We select 20 stocks before and after each event, 10 largest stocks in market capitalizations, and another 10 most actively traded stocks based on trading volumes, before and after each event to investigate how liquidity, depth, and investors trading behavior were affected by these events. We find that higher transparency improves market liquidity and depth but not by statistically significant margin. Smaller number of orders were cancelled and it took less time to for traders to cancel orders after KSE adopted measures to improve transparency, which implies that traders have adjusted their trading strategies s as the market became more transparent.

The rest of this paper proceeds as follows. Section 2 provides details of trading mechanisms and transparency regime changes that will be analyzed in this paper. Section 3 presents the data used in the investigation, and the results of our empirical testing. Section 4 concludes.

## Trading Mechanisms and Transparency Regime of Korea Stock Exchange

Korea Stock Exchange uses two different trading mechanisms, single price call auction and continuous auction systems without any help from market makers. Call auction mechanism is used for opening and closing the market, and it is also adopted when trading is resumed after temporary halt during regular hours. Traders are allowed to submit their limit orders from 8:30 in the morning, and market opens at 9:00am as accumulated orders are cleared at a single price that maximizes equilibrium trading volume. After market opens, trading mechanism switches to continuous auction mechanism, and as traders submit their orders, limit order book is built, and tradings are executed continuously through KSE's electronic order submitting and clearing system.

In order to improve market transparency, KSE continuously expand the range of information on order and quote related information since 1988. This paper analyzes the effect of market transparency regime changes in four events, two on market opening call auction system, and remaining two on continuous auction mechanism.<sup>iii</sup>

### Continuous Auction System

Event	Date	Changes
Even #1	Mar. 6, 2000	5 best ask and bid quotes and corresponding order for each quote, and total outstanding orders are disclosed.
Event #2	Jan. 2, 2002	Order and quote information are expanded from 5 to 10 best ask and bid quotes and corresponding order for each quote, but information on total outstanding orders is not disclosed

### Call Auction System

Event	Date	Changes
Even #3	Sep. 30, 2002	Projected opening price and trading volume, and best ask and bid prices with corresponding orders at these quotes
Event #4	Oct. 6, 2003	Order and quote information to be disclosed is expanded to 3 best bid and ask prices and corresponding orders at each quote.

In the following section, we analyze how these transparency regime changes<sup>iv</sup> affect liquidity, market depth and trading strategies.

## Data and Empirical Analysis

### Data and Empirical Methodology

As of each event date, we select 10 stocks ranked by market capitalization, and another 10 most actively traded stocks measured by trading volume. List of stocks for event date is given in Table 1. In order to measure liquidity, depth, order cancellation and market order, we proceed to build limit order book for sample stock from the scratch for 10 days before and after each event, which requires full set of order and quote data and transaction record from 8:30 in the morning when orders are first submitted until closing of the market.<sup>v</sup> Order and quote data contains very detailed information in real time including bid and ask prices, orders submitted for each quote, and time of order submission and cancellation. By matching this order and quote data with transaction record, we can build complete limit order book for each sample stock.

We analyze the effect of transparency regime change on liquidity by six different measures of spread. Dollar spread is the difference between best ask and bid prices, and effective spread is measured by the difference between the mid-point of the dollar spread and the transaction price. We calculate weighted average dollar spread with weights measured by trading volume for each minute. This measure of spread has the advantage of reflecting difference in intra day trading activities. Percentage spreads are calculated by dividing each measure of spread with mid-point of the dollar spread. If higher transparency has positive effect on liquidity, then these measures of liquidity will shrink by statistically significant margin.

TABLE 1: SAMPLE STOCKS

	Event #1		Event #2		Event #3		Event #4	
	Volume	Mkt. Cap.	Volume	Mkt. Cap.	Volume	Mkt. Cap.	Volume	Mkt. Cap.
1	Hundai Electronics	Samsung Electronics	Hynix Semiconductor	Samsung Electronics	Hynix Semiconductor	Samsung Electronics	Hyundai Engineering & Construction	Samsung Electronics
2	Daewoo	SK Telecom	Mirae Corporation	SK Telecom	Kabool Ltd	SK Telecom	KDS	SK Telecom
3	HanBit Bank	Korea Electric Power Corporation	ChoHung Bank	KT Corporation	Gara Telecom	KT Corporation	Kirin Corporation	KT Corporation
4	Hansol CSN	POSCO	Anam Semiconductor	Kookmin Bank	Kemongsa	Kookmin Bank	Daeyoung Packaging	Korea Electric Power Corporation
5	Samsung Heavy Industries	Samsung Electro-mechanics	Hyundai Engineering & Construction	Korea Electric Power Corporation	Korea Development Leasing Corporation	Korea Electric Power Corporation	COSMO Chemical	Kookmin Bank
6	KEP Electronics	LG Information & communication	Korea Exchange Bank	POSCO	KDS	POSCO	Hynix Semiconductor	POSCO
7	Samsung Corporation	Kookmin Bank	Shinsung ENG Corporation	Hyundai Motor	Shinwon	Hyundai Motor	Hyundai Autonet	LG Electronics
8	Hyundai Engineering & Construction	Hyundai Motor	SK Securities	Shinhan Financial Group	Mirae Corporation	LG Electronics	Cecrop Corporation	Hyundai Motor
9	Youngwon Corporation	LG Chemistry	Dongyang Steel Pipe	LG Electronics	Hyundai Corporation	Shinhan Financial Group	KG Chemical	Samsung SDI
10	Daewoo Heavy industries & machinery	LG Electronics	KwangDong Pham	KT&G Corporation	Hyundai Engineering & Construction	Samsung SDI	Korean Ginseng Products Co.	Shinhan Financial Group

We proceed to analyze the effect of transparency regime change on market depth. For each buy and sell side of limit order book, we derive outstanding orders at the best price, 3, 5, 10 best prices, each of which is divided by total outstanding orders for each buy and sell side. Sell (Buy) depth denotes the difference between order-weighted ask (bid) prices and best ask (bid) price, and percentage of sell (buy) depth is measured by the ratio between sell (buy) depth and best ask (bid) price. Depth denotes the summation of sell and buy depths.

To investigate the effect of market transparency on market participants trading strategies, we check order cancellations and market orders.<sup>vi</sup> For both call and continuous auctions, total number of order cancellation, total sizes of cancelled orders, average time that elapses between order submission and cancellation, average cancellation distance measured by the difference between quote of the cancelled order and mid-point of the spread, and average percentage cancellation distance derived by dividing cancellation distance with mid-point of the spread are derived. We proceed to investigate the total number market buy (sell) orders and total sizes of market buy (sell) orders. To check the relative importance of market order, we divide total number market buy (sell) orders with total number of order executions, and derive the ratio between total sizes of market buy (sell) orders and total sizes of order executed.

### Empirical Results

#### Continuous Auctions

Table 2 summarizes the effect of transparency regime changes on liquidity of 10 largest stocks in market capitalization. After event #1 in which order and quote information disclosure was expanded from 3 best bid and ask prices to 5, there is slight improvement in liquidity with narrower dollar and effective spreads although their changes are not statistically significant. However, after event #2 both spreads are widened while percentage spreads become narrower though not by statistically significant margin. Unlike event #1, event #2 does not necessarily improve market transparency as the information on 10 best bid and ask prices and quotes is publicly disclosed while that on total outstanding order becomes unavailable to traders. Weighted average spreads also show similarly pattern of change after each event as other dollar and effective spreads.

TABLE 2: LIQUIDITY OF 10 STOCKS RANKED BY MARKET CAPITALIZATION: CONTINUOUS AUCTION

	#1 (00.3.6)				#2 (02.1.2)			
	-10	+10	diff	t-stat	-10	+10	diff	t-stat
<b>spread</b>	1,618.94	1,336.03	282.9	0.15	147.97	154.25	-6.289	-0.08
<b>%spread</b>	0.258761	0.244365	0.014396	0.41	0.178780	0.173677	0.005103	0.16
<b>e-spread</b>	725.32	593.70	131.62	0.16	75.44	77.90	-2.452	-0.06
<b>%e-spread</b>	0.132733	0.125028	0.007705	0.46	0.091904	0.088622	0.003281	0.21
<b>w-spread</b>	6.8171	5.9239	0.8932	0.11	0.4693	0.4743	-0.005	-0.02
<b>%w-spread</b>	0.000987	0.000938	0.000048	0.35	0.000577	0.000538	0.000038	0.31

-10 and +10 refer to 10 days before and after the event respectively. Spread denotes dollar spread, and e-spread and w-spread refer to effective spread, and weighted average spread respectively. Percentage spreads are calculated by dividing each spread with mid-point of the spread.

Table 3 reports changes in market depth after event #1 and #2. Event #1 causes improvement in market depth of sell side although not statistically significant margin as more sell orders tend cluster around the best, 3, 5, and 10 best ask prices in both absolute order sizes and percentage of total buy orders, which is consistent with the narrower sell depth. But buy side of orders demonstrates different picture in that total order sizes increase for the best, 3, 5, and 10 best bid prices in absolute amount while their portions in total sell buy orders decrease. Increase in buy depth although not by statistically significant margin means that market depth is not improved after event #1. Market depth after event #2 has mixed results but depth in sell side slightly improves while that in buy side deteriorates marginally as noticed by narrower sell depth and wider buy depth.

Changes in trading strategies are investigated by order cancellation and market orders, and the results are given in Table 4. We cannot find any noticeable changes in order cancellation except that average time between order submission and cancellation increases by statistically significant margin after event #1. We can notice that event #1 causes less use of market orders while traders submit more market order after event #2.

Table 5 reports changes in liquidity for 10 most actively traded stock after event #1 and #2. We cannot find improvement in liquidity as absolute sizes of dollar and effective spreads widen while percentage spreads decrease after each event. We can conjecture slight deterioration in liquidity after event #2 as weighted average spread in both absolute size and percentage of mid-point of the spread increase.

We find marginal deterioration in market depth for 10 most actively traded stocks after each event particularly noticed by worsening of both sell and buy depths after event #1 as is shown in Table 6. That means, tendency for orders to cluster around best bid and ask prices are generally, but not by statistically significant margin, weakened.

Table 7 reports order cancellation and market order 10 most actively traded stocks. We cannot find any changes in order cancellation after event #1, but they increase slightly after event #2. Traders use market order less frequently to submit sell orders after event #1, but market orders are used more actively after event #2 although not by statistically significant margin.

Best ask refers to the total orders at best ask price, and % of best ask is derived by dividing best ask with total sell orders. 3 best ask refers the combined outstanding orders for 3 best ask prices. Sell depth denotes the difference between order-weighted ask prices and best ask price, and % of sell depth is the ratio between sell depth and best ask price. Other variables are defined in the similar way. Depth denotes the summation of sell and buy depths.

# of cancellation and size of cancellation refer to total number of order cancellation and total sizes of cancelled orders respectively. Cancellation time and cancellation distance denote average time that elapses between order submission and cancellation and average cancellation distance measured by the difference between quote of the cancelled order and mid-point of the spread. Cancellation weight is defined as average percentage cancellation distance derived by dividing cancellation distance with mid-point of the spread are derived. For each buy and sell side, # of MO and size of MO refer total number market buy orders and total sizes of market orders respectively. % of MO is derived by dividing total number market orders with total number of order executions, and % of MO size is the ratio between total sizes of market buy (sell) orders and total sizes of order executed.

One generally expected effect of increased transparency is decrease in volatility based on following conjecture: information asymmetry among market participants is likely to be eased up as more quote and order related information is disclosed, and uninformed traders is able to partially infer private information possessed by informed traders, which consequently will reduce market volatility. As is reported in <Table 8>, this conjecture turns out to be correct after volatility measured by average standard deviation of stock returns decreases by statistically significant margin after event #1. In case of event #2 in which transparency is not necessarily improved, volatility is reduced for 10 largest stocks in market capitalization by statistically significant margin while we find slight decrease in volatility for most actively traded stocks.

### Call Auctions

In this section, analysis is conducted on the effect of transparency regime changes on opening call auction. We investigate event #3 after which KSE starts to disclose projected opening price and trading volumes, and best ask and bid quotes, and event #4 when 3 best bid and ask prices and corresponding orders are known to the public in addition to the information disclosed after event #3. As in previous section, we look into liquidity, market depth, order cancellation and market order for 10 stocks ranked by market capitalization and another 10 most actively traded stocks.

Tables 9-11 reports the effect of higher transparency on 10 largest stocks based on market capitalization. We find contrasting effect of increased transparency on liquidity after event #3 and #4 reported in Table 9 in that liquidity has improved after event #3 as dollar and effective spreads shrink while event #4 causes widened spreads and deterioration of liquidity although neither of them are statistically significant.

Table 10 shows change in market depth after each event. Both buy and sell sides of market depth worsen slightly after event #3, but we find general improvement after event #4 particularly on buy side not by statistically significant margin.

As is demonstrated in Table 11, number of order cancellation and total sizes of cancelled orders increase substantially after each event by statistically significant margin, which implies that traders adjust their order submission strategies as market transparency improves.

## Conclusion

Market transparency lies at the crux of security market design, and academicians, practitioners and policy makers do not share consensus view on the effect of increased market transparency. More information regarding quotes and orders has been disclosed by Korean Stock Exchange in last 5 years, which provides rare venue to test the effect of higher transparency on the quality of the market. This paper empirically studies the effects of four events aimed to improve transparency: two for market opening by single-price call auction, and two for regular trading hours operated by continuous auction. We investigate how liquidity, depth, and investors trading behavior were affected by these events. We find that market liquidity and depth were generally improved as more information on quotes and orders were disclosed but not by statistically significant margin. Smaller number of orders were cancelled and it took less time for traders to cancel orders after KSE adopted actions to improve transparency, which implies that traders have adjusted their trading patterns as the market became transparent. This study is limited to four events on transparency regime changes, and more comprehensive investigation on other events and longer data period will be likely shed more light on the issues on market transparency.

## End Notes

Special thanks to Korea Stock Exchange for providing the data for this research.

---

<sup>i</sup> Major difference between order and quote disclosure policy adopted by TSE and NYSE and that of KSE is that KSE provides most of order and quote related information free to most of the market participants while TSE and NYSE charges fee for these information and offers it to qualified market participants.

<sup>ii</sup> Experimental designs of two papers share little in common to test the effect of transparency under different trading mechanisms.

<sup>iii</sup> There have six other occasions at which KSE implemented measures for higher transparency, but due to lack of data during the periods when these changes were made, this paper focuses on four most recent events.

---

<sup>iv</sup> Since information on total outstanding order is not disclosed after Event #4, it is not necessarily classified as the improvement in market transparency.

<sup>v</sup> The size of data set containing order, and quote and transaction is simply astronomical, which limit our analysis to focus on 20 stocks for each event. Boehmer, Saar and Yu (2003) uses TAQ data set for similar research for the analysis of NYSE's OpenBook. We greatly appreciate KSE for providing the data.

<sup>vi</sup> Boehmer, Saar and Yu (2003) reports significant effect on trading strategies caused by OpenBook as specialists participation in trading reduces and general traders actively use the information from OpenBook.

# **Microfinance and Financial Development Paradigms in the Globalization Era: Lessons from the Qinghai Community Development Project in China and the BASIX Project in India**

*Jean-Claude Maswana  
Kyoto University, Japan*

## **Abstract**

The objective of this paper is to highlight improvements in effectiveness of MFIs that have resulted—or could result—from the use of information and communication technologies. On the basis of an analysis of the Qinghai Community Development Project (China) and the BASIX Project (India), the overall conclusion is that MFIs operating under the financial-market paradigm should find it more convenient to adopt new information and communication technologies than those, which operate under the directed-credit paradigm. In order for MFIs to reach a greater degree of self-sufficiency and to extend their scope, governments need to respond to security and regulatory concerns that arise as new technologies are adopted, and to provide—in conjunction with donors—the requisite training to MFI operators.

## **Introduction**

Current debate regarding micro-financial institutions (MFIs) focuses on two issues: the financial development paradigms behind such institutions and the impact of information technology on MFI operations. For several decades, most development specialists supported the use of directed and subsidized credit—the directed-credit paradigm (DCP)—in pursuit of a variety of development objectives, including easing of poverty, boosting of production, and stimulation of investment (Vogel & Adams, 1999). The results of many of these credit programs were not terribly laudable, however, and a new paradigm gradually emerged during the 1980s that avoided subsidized credit and focused instead on building stronger and more efficient financial markets—the financial-market paradigm (FMP).

After a decade of FMP-associated policies, it was concluded that the FMP approach to microfinance yielded disappointing results which were primarily associated with market imperfections, notably the so-called asymmetric information problem (Stiglitz & Weiss, 1981). Since market imperfections are the primary problem addressed by directed credit, there is an emerging view in favor of re-implementation of DCP-associated policies. In spite of the pertinence of the debate on the preferred financial-development paradigm, however, its resurgence has drawn attention away from the unprecedented challenges facing MFIs as a result of the ongoing process of globalization. Although new technology is critically important for reducing transaction costs of financial services so that transaction volume can grow more rapidly, the potential effects of technology on MFIs have not been addressed and have yet to be fully understood. Furthermore, since the consequences of globalization are marked by considerable ambivalence stemming from whether an MFI was designed under the DCP or the FMP, there is some sense of urgency in defining effective policies for bringing about needed reforms.

The objective of this paper is to highlight the significance of financial development policies (as derived from the aforementioned paradigms) in terms of their success in advancing the process of micro-financial reform, and to point to improvements in effectiveness of MFIs that have resulted—or could result—from a greater degree of adoption of information and communication technology (ICT). To this end, the paper addresses the following questions: How well can MFIs designed under each of the two financial development paradigms respond to ongoing global changes and challenges? Specifically, how does each embrace ICT and to what extent? Are we more likely to find information technology in DCP- or FMP-oriented MFIs? How can information technology and other globalization-related factors aid in bringing about greater financial efficiency in MFIs? What policy initiatives have been adopted or are being considered?

The paper argues that MFIs operating under the FMP are much more inclined to adopt ICT than those,

which evolve under the DCP. For instance, there are significant differences between DCP and FMP policies in terms of their consequences for the design and assimilation of information technology. In the case of the FMP, which concentrates on the efficiency of MFIs, the development of an automated system is of high priority. Under the DCP, on the other hand, the focus is on gathering of information for the evaluation of the impact of credit, with lesser importance placed on the use of technology (such as ATMs and debit cards).

In section 2 of the paper, the two paradigms will be compared and contrasted with respect to four general characteristics in which they tend to differ. This will be followed in section 3 by an overview of selected information technologies commonly used in the banking industry. Section 4 will illustrate how two existing MFIs have dealt with efficiency and outreach issues (namely, the Qinghai Community Development Project in China and the BASIX Project in India). The paper will conclude with concrete proposals for reform.

## Overview of the Evolution of Financial Development Paradigms

In this section the two financial development paradigms are compared and contrasted and their recent evolution is discussed, with particular attention to the role of the state in the financial-development process. Although the two paradigms differ in many respects, the present discussion focuses on only four of the differences between them:

- The definition of the primary problem that is the focus of the paradigm
- The developmental role assigned to financial markets
- The attitude toward users of financial services
- The design of associated information systems

As summarized in Table 1, there are fundamental differences between the two paradigms with respect to these four elements. In the case of the DCP, market imperfections are the primary problem addressed by the use of directed credit, the idea being that directed credit will overcome these imperfections and will result in loan allocations that are more efficient than those resulting from unfettered market operations. In contrast to this approach, the FMP stresses transaction costs as the dominant problem in financial markets. Policy changes that help to reduce these costs and encourage cost-reducing innovations are the major solutions advocated by FMP supporters to address this problem.

TABLE 1: DIFFERENCES BETWEEN THE DIRECTED CREDIT AND FINANCIAL MARKET PARADIGMS

	<b>Directed Credit</b>	<b>Financial Market</b>
<b>Primary problem addressed</b>	Market imperfections	High transaction costs
<b>Role of financial institutions</b>	-Aid the poor -Stimulate production -Counteract distortions -Implement plans	Provide financial intermediation
<b>Users</b>	Beneficiaries (borrowers)	Valued clients (borrowers and depositors)
<b>Characteristics of information systems</b>	-Dense -Vertical -Aimed at planners	-Less dense -Horizontal -Aimed at managers

Source: Adapted from Vogel and Adams (1999)

The role assigned to financial institutions under the two paradigms is likewise fundamentally different. Under the DCP, financial institutions are encouraged to aid the poor and to stimulate production and investment.

Under the FMP, they are expected to focus primarily on providing financial intermediation by mobilizing deposits from households and firms with surpluses and in turn allocating these funds to creditworthy borrowers.

Differences between the types of information systems which tend to be implemented in connection with the two paradigms are also substantial. Under the DCP, large amounts of information on the characteristics of borrowers and loans are typically collected for the purpose of satisfying the mandates of providers of external funds. This may include collection of additional information for credit-impact studies, mainly for use in demonstrating the extent to which the objectives of directed credit were achieved. In such systems, vertical flows of information dominate over horizontal flows. Information systems associated with the FMP, on the other hand, are used primarily for internal management, screening of clients, recovery of loaned funds, and measurement of overall performance. Under the FMP, information systems are directed more toward the internal operations of financial institutions, and are used mainly by managers of such institutions. Accordingly, there is a greater degree of horizontal circulation of information under the FMP than under the DCP.

Far from realizing their intended goals, the directed-credit programs implemented in most countries have overwhelmingly failed to help the poor, stimulate production, and offset distortions. In an effort to avoid the disappointing results experienced under the directed-credit approach to microfinance, a new class of policies emerged in the 1970s with focus on the financial intermediary function. The success of financial market policies, however, also fell far short of ambitions, at least in terms of their impact on the poor.

In recent years there have been increasing calls for a comeback of market-friendly state intervention. Even in countries where this has been tried, however, a wide gap between potential supply and *legitimate demand* persists. This gap is a reflection of two different sets of circumstances. First, because of market failure, financial markets do not necessarily clear, even if a state of equilibrium prevails; such an outcome derives largely from adverse selection and moral hazards. That is, any resulting degree of *credit rationing* implies that demand exceeds supply even at equilibrium interest rates (Stiglitz and Weiss, 1981). Second, given the obstacles faced by the market, it may clear at very high interest rates, thereby leaving many attractive opportunities untapped.

According to Claudio Gonzalez-Vega (1998), the gap between potential supply and legitimate demand cannot be narrowed (i.e., the lending frontier cannot be expanded by an outward shift in potential supply), unless additional innovations in lending and depositing technology are implemented.

Another possibility for narrowing the gap between supply and demand is to improve the efficiency of financial markets via financial restraint policies. This would entail governmental action which is intended to affect the incentive structure in an otherwise private, profit-oriented financial sector. The difference between restraint policies and the methods employed in early DCP programs is that instead of imposing economic constraints, the government would create rent opportunities that induce private agents to engage in socially beneficial actions that otherwise would not have been undertaken in competitive markets under “laissez-faire.” The government would only create the rent opportunities; which would then be pursued by profit-maximizing firms. Private information would be utilized in making allocation decisions, and the most efficient firms/banks would profit and grow the most. (Hellmann et al. 1994)

Financial-restraint intervention on the part of the government would not be sufficient to deal with some of the critical issues facing MFIs:

- Collection of complete, reliable information about clients
- Management and mitigation of risk
- Minimization of transaction costs
- Detection of errors and fraud
- Interaction with clients over a large geographical area

Various conditions, including the general absence of written records or formal credit histories and the greater heterogeneity in production and marketing conditions in microfinancial environment, combine to render the gathering and analysis of information on client creditworthiness rather costly and generally unreliable. Also, the virtual absence of insurance and hedging instruments makes it very difficult to mitigate the higher risks surrounding MFIs. Because of poor physical infrastructure and the limited capacity of public institutions, the high costs of incurring risk must be borne by both clients and intermediaries. Another problem, which is common among MFIs, is

the considerable potential for errors and fraud, given the huge numbers of financial transactions that are made and the wide area over which they take place. Finally, loan officers often have to travel long distances in order to conduct face-to-face meetings with clients.

In view of these issues, some MFIs are using new information and communication technologies to improve their operations. Use of these technologies may reduce operating costs, as they allow for introduction of a single point of entry for all the data surrounding “electronic transactions” which seamlessly links the flow of information from the villages to the branch offices, and ultimately to the main office.

## **Information Technologies Used in the Banking Industry**

In recent years, many micro initiatives have increasingly embraced the adoption of new information and communication technologies, such as smart cards, hand-helds, and modified ATMs, to expand their customer base, extend their reach into underserved areas, and lower their transaction costs. In doing so, they are strengthening their efficiency and extending the availability of microfinance.

The following is a list of some of the information technologies that have been incorporated into MFI operations or could readily be adopted by MFIs:

**a. ATM:**

An automated teller machine (ATM) can automatically process deposits, withdrawals, bank transfers, and account transfers, as well as provide ancillary services such as the sale of postage stamps. Recently, ATMs have contributed to the development of efficient networks of bank branches by supplementing or replacing existing branches.

**b. Smart Card:**

A smart card is a plastic card, which is embedded with a computer chip that stores data and allows the user to make certain kinds of transactions, such as the storage of info regarding the amount of money that has been deposited in an account for later use. The data stored on the card, which are associated with either value or information or both, are processed by the card’s computer chip and can be accessed via a reader that is part of a computer system.

**c. Firm Banking and Home Banking:**

Firm banking and home banking are a means of providing financial services by responding to requests for account balances, as well as making funds transfers and other transactions, via telecommunications lines that link a customer’s computer or a dedicated computer terminal to the bank’s computer.

**d. Call Center:**

Call centers are designed to efficiently offer telephone banking and other inbound services, and telemarketing and other outbound services.

**e. Internet and Mobile Banking:**

Internet banking enables a customer to use a personal computer or any other terminal to connect to the Internet, access a bank’s system, and perform such functions as obtaining account balances, transferring funds, and asking for advice.

The difference between Internet banking and the existing forms of firm banking and home banking lies in the fact that the customer’s terminal and the bank’s system are connected through the Internet. In mobile banking, a customer procures these services by using a mobile-phone handset equipped with a Web browser and the mobile-phone user’s Internet connection service.

**f. Debit Card:**

A debit card is a bank card that enables a consumer to pay for purchases of goods or services by having funds transferred from their bank account on demand at the time of purchase.

Of the above six technologies, the ATM is the one which has spread throughout most of the world and the one which is most convenient and accessible to MFIs. Moreover, ATMs are capable of providing audio instruction to users in their local language, thus enabling illiterate customers to access the services that they provide. Combined with a touch-screen interface, customers are able to deposit and withdraw funds without filling out a deposit slip or withdrawal form. Additionally, ATMs facilitate money transfers and can accommodate overseas remittances.

Accompanying the ATM trend, Internet technologies have now penetrated all aspects of the financial

services industry, both retail and wholesale, back office and front office, information and transactions. Although precise cost estimates for serving customers via the Internet are not available, there is no doubt that the Internet has the potential to reduce the costs of financial transactions. Miller (2000) notes that banks have analyzed the savings that are possible through telephone transactions, as compared with other means. For example, if a teller-based transaction costs, say, 150 currency units, the same transaction made at an ATM runs only about 15 currency units. This cost is reduced even further, to 10 currency units, via an Internet connection, which is less than 7 percent of the cost of a teller-based transaction.

Furthermore, use of ICTs can reinforce MFIs' integration into the financial system by linking them to formal banking systems such as commercial banks or even central banks. Thus the contributions of ICTs is not limited to the tracking of disbursements and repayments, but also in allowing for more macro-level analysis of lending patterns, cash flows, and repayments. The ICT software features online disbursements of funds, as well as transfers of data to managing banks, savings/credit account modules, and financial accounting systems. It can link the main office to branch offices, and also has built-in accounting and evaluation capabilities. Thus use of this technology is a significant timesaver for loan officers while also ensuring more accurate accounting and record keeping. Because all the requisite information can be stored on a smart card, field officers can make decisions on the spot, reducing the number of visits needed to complete a transaction.

Of course, the challenge is to find a technology that makes it possible to produce quality financial services at reasonable cost to the micro-client and in a profitable manner for the MFI (Gonzalez-Vega, 1997b). Successful implementation of the new technologies will occur only if the structure of organizational incentives is such as to promote sustainability. More importantly, achieving these potential gains is contingent on a number of factors, including provision of electronic security to accompany the technologies and acquisition of the skills, which are needed for their use.

Considering the fact that the ICT industry has expanded relatively freely of the kind of governmental regulation that has plagued other industries, it would seem that the use of technological tools is more likely to be compatible with the operation of MFIs that operate under the FMP than those with a DCP orientation, and that the former would be much better prepared to accommodate such tools. If this is indeed the case, such a trend should be borne out by field studies.

## **Lessons from the field: QCDP in China and BASIX in India**

A description of two existing microfinance initiatives, one designed under the DCP and the other designed under the FMP, is presented in this section, including a discussion of the respective approaches of these programs to the utilization of ICT.

### **1. Qinghai Community Development Project, Qinghai, China**

In the 1990s, the Australian Agency for International Development (AusAID) funded the Qinghai Microcredit Program (China), which was a component of the Qinghai Community Development Project (QCDP) that was undertaken in the years 1994–1998. Lack of access to credit had been identified as a major constraint on the improvement of household incomes and living standards, and the Qinghai Microcredit Program was aimed at enhancing the program's development impact and sustainability.

One of the aims of another component of the QCDP was to assist poor households to participate in farming and non-farming income-generation activities by improving their savings and access to credit. The scheme was a logical progression of the creation of a cash economy in a population that had traditionally had little opportunity to save. Credit provision was one of the three core components designed to increase the income-earning opportunities of poor villagers.

The project established savings groups (consisting of 4 to 7 members) in the poorest villages, thus enabling the targeted households to elevate their income and their standard of living through new income-generating activities such as the purchase of pigs and sheep or the growing of new crops. The project also made micro-credit accessible to women and minority groups. By early 1998, over 11,000 households had joined savings and credit groups, with an average loan size of RMB493 (Donaghue and Zotalis, 2002) which represents approximately \$US60.

For the sake of expanding the population served by the project, in April of 1998 the project operators and donors opted to transfer management of the revolving micro-credit fund to the Agricultural Bank of China (ABC), with a separate management board and AusAID representation to monitor performance. Ever since that time, the ABC Haidong Prefecture has run the program through a micro-credit office in Pingan City, together with 12 branches (located within business offices of the ABC) and 148 village-level credit-extension intermediaries (AusAID, 2000).

Subsequent assessments by AusAID have shown that, while the project has established the basis for a sustainable microfinance program in Qinghai (in addition to a number of other positive outcomes), much remains to be done in areas such as portfolio management, development and implementation of information systems, and client targeting to give Qinghai a realistic chance of sustainability while maintaining a focus on aiding the poor (Donaghue and Zotalis, 2002). Hendricks (2003) observes that although the QCDP was genuinely intent on establishing a sound, long-term, sustainable microfinance model, the efforts made through this project were insufficient on several fronts. Its internal monitoring and governance structure was not adequately institutionalized. Momentum built by the project during its lifetime had created neither the necessary infrastructure nor a sound enough governance base to bridge the aforementioned sustainability gap and enable it to operate at the standards which would be needed to attract an ongoing, secure infusion of external capital investment.

The evaluation of the Qinghai Project by AusAID clearly illustrates the DCP orientation of the program. The project was carefully designed as a private initiative, but donations constituted the major source of funding. To reinforce its efficiency, the Qinghai Microcredit Project did not adopt ICTs; instead, the QCDP utilized the facilities of an established financial institution (the ABC) and employed village collection agents on a commission basis. This approach was designed to reduce the cost of providing services to widely dispersed populations. Since the ABC is a state-owned bank, for the sake of program evaluation by planners it was preferable for the QCDP to establish a close relationship with the ABC.

It is important to note that in China, microfinance programs are usually required to operate in partnership with organizations that are licensed by the People's Bank of China, a requirement that creates opportunities as well as challenges (Hendricks, 2003). According to Xiaoling (2004), the Chinese government not only evaluates the performance of MFIs but also intervenes whenever reforms are needed. For example, in order to realize the targets set for poverty reduction by the year 2000, the government stepped in to provide financial support of MFIs in the form of direct government funding as well as provision of low-interest, government-subsidized loans aimed at poverty reduction and strengthening of policy-based micro-credit businesses operated jointly by governmental bodies and financial institutions (such as the ABC).

In light of the QCDP case, it can be seen that MFIs designed under DCP prefer a vertical technological approach as a result of its donor and state preference for evaluation of the extent to which the goals of programs have been achieved. ICT assimilation is indirectly realized through a formal, state-owned institution. This approach, which stems primarily from a government mandate that microfinance projects of this type be justified by donors and state agencies, rather than from a perceived need on the part of the MFI itself. This is in line with the DCP, which focuses on gathering of information for purposes of evaluation of the impact of credit and places lesser importance on the use of technologies to promote institutional efficiency.

## **2. BAXIS Project**

In contrast to the QCDP, the BASIX Project in India was designed as a completely private initiative with the idea of promoting a large number of sustainable livelihoods—including those that would benefit the rural poor and women—through the provision of financial services and technical assistance in an integrated manner. This is one of the largest and fastest-growing MFIs in India. The BASIX group works with more than 100,000 rural poor households and provides a range of financial services, including credit, savings, insurance, and technical assistance and support services. BASIX operates in 10 states in India, covering in excess of 10,000 villages, in order to provide financial services in the remotest of places, where formal financial services are otherwise unavailable. (BASIX, 2004)

BASIX has been striving to enhance its technological capabilities by, for instance, experimenting with hand-helds and smart-card technology to automate the loan process and keep track of repayments, in order to reduce

labor and cash-handling costs. BASIX's Mobile Portfolio Management System also helps to minimize accounting errors. Since it was not commercially viable to meet the credit needs of the poor by employing its initial lending methodology, BASIX came up with a novel concept called eBASIX STEMS™ (STEMS stands for “single terminal enabling multiple services”) for providing microfinance services through rural ICT kiosks that had already been set up by various state governments and corporate entities in India. Hence the mobile computing solution was developed in order to provide better service, reduce transaction costs for customers, and increase the credibility of the entire microfinance system in the eyes of rural folks.

BASIX did not stop at instituting the eBASIX STEMS™ but went on to introduce the ITSL (Information Technology Solutions for Livelihoods) component in order to provide ICT solutions that would broaden and deepen the outreach of the BASIX project, reduce transaction costs, and further enhance the accuracy of transactions and the flexibility of operations related to microfinance and livelihood-support services. According to the BASIX-ITSL introductory document (2004), the specific objectives of the ITSL project for BASIX are, among others:

- To bring professional microfinance services to the doorstep of the rural-poor in a cost-effective manner.
- To build self-sustainable MFIs by ensuring that good portfolio-management tools are available to all field staff
- To reduce transaction costs by minimizing duplication of effort and by cutting down on the necessity of travel on the part of field staff
- To build a transparent system by providing customer-account-related information on demand in the field.
- To provide technical assistance and support services by providing quick access to information through the Internet

Each of the above objectives shows that a single piece of information is more useful and often makes sense only in the context of its amalgamation with other information. Moreover, each piece of information can be used many times at no additional cost, which serves to improve productivity of MFIs by concentrating use of a great deal of information in one or at most a few persons.

The BASIX project clearly focuses on the adoption of ICT in its struggle for efficiency. The technological approach also illustrates that management-information technology is used primarily to monitor risk and improve performance, not for reporting to donors. Since the FMP concentrates on the efficiency of MFIs, development of an automated system is of high priority for them. Another attractive feature of BASIX is that, in contrast to the QCDP, it allows users to access and share information. It is encouraging that BASIX has managed to overcome or at least neutralize the difficult challenges presented by the assimilation of information technologies in a developing country such as India.

## **Policy Implications and Conclusion**

The paper has reviewed the major financial-development paradigms and their distinctive features in terms of the major problems they face, the role of financial institutions, and the users of services and information systems. Despite the refutation of the DCP in the 1970s, there have been calls for a revised version of the DCP, which focuses on financial restraint policies. In the meantime, globalization via ICT has brought new opportunities for MFIs.

The DCP and the FMP policies have significant differences in terms of their consequences for the design and assimilation of information technology. In the case of the FMP, which concentrates on the efficiency of the MFI and its interaction with a general type of customer, the development of an automated system is of high priority and is relatively easy to undertake. Under the DCP, on the other hand, the focus is on gathering of information, which is intended mainly for use by planners in evaluating the impact of credit. There is also lesser importance placed on the use of technology (such as ATMs and debit cards), and the different screening and project-supervision methods used by MFIs under DCP tend to be seen as critical factors.

Market imperfections, notably the asymmetric information problem, are said to hamper the efficiency of MFIs, regardless of the underlying paradigms on which they are based. Nevertheless, perhaps the most interesting implication of our discussion stems from the finding that MFIs diverge in their responses to ICT: The case studies presented in section 3 reveal that MFIs operating under the FMP are much more inclined to adopt ICT than are those

that evolve under the DCP. As evidenced by the BASIX project, MFIs operating under the FMP look to new technologies to lower the costs of delivering traditional payment and credit services to unbanked households. These initiatives are largely private-sector efforts. In the case of the QCDP, on the other hand, partnership with a state-owned bank was considered to be the preferred way to deliver the combined services to the targeted beneficiaries.

Based on international experience over the past twenty years, appropriate pricing of loans to cover the underlying risks is a precondition for sustainable development of micro-credit businesses. Thus far, MFIs have not offered all the services that they could, given the existing technologies and the available resources. It appears that the best choice is for MFIs to exploit the situation created by the rapid process of globalization.

The challenges that lie ahead for MFIs in the global era can be viewed in terms of further contributions that could be made by ICTs in reducing operating costs while extending outreach. As prices of technological tools such as ATMs, smart cards, and voice recognition continue to fall, more MFIs will be able to take advantage of the benefits they offer. New technologies and applications which are aimed at increasing the reach and efficiency of MFIs are constantly being developed. Improvements in automated systems will make operations more secure, increase transparency (and thus scalability), reduce the need for repetitive tasks, and provide data-mining capabilities that will allow MFIs to compete effectively and better manage their operations. ICTs are helping MFIs to finally meet the unmet demand for micro-credit throughout the developing world.

Furthermore, donors need to include technological tools as part of the project package. For donors, ICTs offer enormous opportunities for providing supervision at a distance and analytical support in real time. The state may be able to play a role in incorporating information technology into the operation of MFIs by providing Internet access in rural areas, investing in physical infrastructure and/or merely creating rent opportunities for the private sector. As asserted in section 2, the essence of this approach is that the government would only create the rent opportunities, but would leave it to private agents to engage in actions that would capture the benefits. Governmental measures should also include appropriate security and regulation.

Another possibility for governmental intervention lies in helping to underwrite the cost of acquiring skills associated with the adoption of information technology. The reprogramming of machines and the handling of the massive amounts of information that become available with the use of information technology require large numbers of workers who are skilled in these tasks, and very specialized knowledge is needed by these workers (for further discussion on the skilling effects of computers, see Krueger, 1993). In developing countries, the government and the donors should take the lead in providing the requisite training to MFI operators.

To get the best out of ICT, MFIs should focus on creating strong network support, aligning ICT with micro-business needs, turning raw data into useful information, and integrating disparate IT technologies and systems. The global trend in the banking industry calls for rapid adoption of ICT. Such a move seems to be much more difficult for MFIs designed under the DCP. Those institutions will have to shift their focus from social to financial considerations, from outreach to financial efficiency, and from pro-poor to pro-users in general. To be successful, such a transition should include appropriate pricing of loans to cover the underlying risks and adoption of stricter criteria for creditworthiness. Unless, ICT is also used to equip the poor with the ability to improve their labor returns, it goes without saying that such a maneuver is likely to hit the poor the hardest.

# Modeling the Volatility of Stock Return: Case Study in Jakarta Stock Exchange

*Nevi Danila*

*Malangkucecwara School of Economics, Indonesia*

## Abstract

**This study examines the stock return volatility in Jakarta Stock Exchange. We find that there is no evidence of volatility clustering in return of stock volatility when CSPI is used as proxy of the market. On the other hand, the clustering volatility is present when LQ 45 index is used as proxy of the market. However, the volatility is low persistent. It indicates that the stock market is illiquid. It is proved by the market capitalization that is much smaller compare to other ASEAN capital markets. It might be due to the long recovery of Indonesia economy, lack of law enforcement, poor performance of mutual funds, poor corporate governance of the public companies, and poor capital market education of investors.**

## Introduction

Researchers engaged in forecasting financial time series such as stock prices, inflation rates, foreign exchange rates have observed that their ability to forecast such variables varies considerably from one time period to another. For some time periods the forecast errors are relatively small, for other times they are relatively large. It indicates that the financial markets are very volatile, and sensitive to rumors, political upheavals, changes in government monetary, fiscal policies, and the like. This would suggest that the variance of forecast errors is not constant but varies from period to period, that is, there is some kind of autocorrelation in the variance of forecast errors (Gujarati, p. 437, 1995). Engle (1982) has successfully proposed the autoregressive conditional heteroscedasticity (ARCH) model to characterize the volatility of daily or lower frequency financial asset returns.

Moreover, the importance of forecasting the financial market volatility for investors/managers is to select portfolio, to analyze asset management as well as to assess the primary and derivative assets. Recently there are many approaches to model the volatility; some of them are motivated by theory, while the others are simply empirical suggestions. The most interesting of these approaches are the asymmetric or leverage volatility model, in which good news and bad news have different predictability for future volatility (Engle and Ng, 1993).

Motivated by Engle and Ng research, this paper has an objective to model stock prices/return volatility for several stocks in “Jakarta Stock Exchange”, and to study the impact of good news and bad news on the volatility. As we all know that Indonesia is one of the emerging markets in this world, and the macroeconomic condition and political events directly influence the volatility of the stock return in capital market Modeling the volatility of stock price will be useful for potential investors especially the domestic investors since the potential domestic investors is substantial.

This paper is organized as follows. In section II, the theory of volatility is described, and then few models of predicting the volatility are explained in section III. Section IV, preliminary analysis of daily returns is provided for LQ 45 index and Composite Stock Price Index (CSPI). Section V focuses on the modeling the volatility of stock returns and the impact of good news and bad news on the volatility of daily returns will be discussed in section VI. Moreover, we will investigate more whether the news impact is asymmetric. Finally, concluding remarks are presented in section VII.

## Volatility

The volatility of stock,  $\sigma$ , is a measure of our uncertainty about the returns provided by the stock. The high volatility of prices of speculative assets such as corporate stocks has often seemed puzzling to market observers. Stock prices often double or fall in half in a space of a few years, when there seems to be no concrete reason why stock prices should have changed at all. Sometimes speculative prices change dramatically in a matter of days or even hours.

Such evidence would seem to suggest that the source of market volatility is something loosely called “market psychology”, the changing public expectation, attitudes and theory about the market. The volatility of a stock price can be defined as the standard deviation of the return provided by stock in one year when the return is expressed using continuous compounding. The volatility is also the standard deviation of the natural logarithm of the stock price at the end of one year. To estimate the volatility of a stock price is usually observed at fixed intervals of time (e.g., every day, week, or month).

Suppose that the value of the market variable at the end of day  $i$  is  $S_i$ . The variable  $r_i$  is defined as the continuously compounded return during day  $i$  (between the end of day  $i - 1$  and the end of day  $i$ ):

$$r_i = \ln \frac{S_i}{S_{i-1}}$$

An unbiased estimate of the variance rate per day,  $\sigma_n^2$ , using the most recent  $m$  observations on the  $r_i$  is:

$$\sigma_n^2 = \frac{1}{m-1} \sum_{i=1}^m (r_{n-i} - \bar{r})^2$$

where  $\bar{r}$  is the mean of the  $r_i$ 's:

$$\bar{r} = \frac{1}{m} \sum_{i=1}^m r_{n-i} \quad (\text{Hull, 2000})$$

## Models of Predictable Volatility

As we mentioned above, there are several reasons that we may want to model and forecast volatility. First, we may need to analyze the risk of holding an asset or the value of an option. Second, forecast confidence intervals may be time varying, so that more accurate intervals can be obtained by modeling the variance of the errors. Third, more efficient estimators can be obtained if heteroscedasticity in the error is handled properly. ARCH models are specifically designed to model and forecast conditional variances. The variance of the dependent variable is modeled as a function of past values of the dependent variable and independent or exogenous variables.

In the standard GARCH (1,1) specification:

$$(1) \quad y_t = x_t \gamma + \varepsilon_t$$

$$(2) \quad \sigma_t^2 = \omega + \alpha \varepsilon_{t-1}^2 + \beta \sigma_{t-1}^2$$

the mean equation given in (1) is written as a function of exogenous variables with an error term. Since  $\sigma_t^2$  is the one-period ahead forecast variance based on past information, it is called the conditional variance. The conditional variance equation specified in (2) is a function of three terms:

- The mean:  $\omega$
- News about volatility from the previous period, measured as the lag of the squared residual from the mean equation:  $\varepsilon_{t-1}^2$  (the ARCH term)
- Last period's forecast variance:  $\sigma_{t-1}^2$  (the GARCH term) (E-views user's guide, 1998)

While  $\omega = \gamma \nu$ , where  $\gamma$  is weight assigned to  $\nu$ ,  $\alpha$  is the weight assigned to  $\varepsilon_{t-1}^2$ , and  $\beta$  is the weight assigned to  $\sigma_{t-1}^2$ . For stable GARCH (1,1) process we require  $\alpha + \beta < 1$ . When the parameter  $\omega$  is zero, the GARCH (1,1) reduces to EWMA (Exponentially weighted moving average). In conditions where the best fit value of  $\omega$  turns out to be negative the GARCH (1,1) model is not stable and it makes sense to switch to the EWMA model (Hull, 2000). Empirically, the family of GARCH models has been very successful. Bollerslev et al (in Engle and Ng, 1993) states that the GARCH (1,1) is preferred in most cases.

Despite the success of the ARCH and GARCH models, there are some important features of the data that cannot be captured by the models. The most interesting feature not addressed by these models is the leverage or asymmetric effect. Two models that allow for asymmetric shocks to volatility are Threshold ARCH (TARCH) introduced by Zakoian (1990) and Exponential GARCH (EGARCH) model proposed by Nelson (1991). The specification for the conditional variance of TARCH is

$$\sigma_t^2 = \omega + \alpha \varepsilon_{t-1}^2 + \gamma \varepsilon_{t-1}^2 d_{t-1} + \beta \sigma_{t-1}^2$$

where  $d_t = 1$  if  $\varepsilon_t < 0$ , and 0 otherwise.

In this model, good news ( $\varepsilon_t < 0$ ), and bad news ( $\varepsilon_t > 0$ ), have differential effects on the conditional variance; good news has an impact of  $\alpha$ , while bad news has an impact of  $\alpha + \gamma$ . If  $\gamma > 0$  we say that the leverage effect exists. If  $\gamma \neq 0$ , the news impact is asymmetric. For the EGARCH model, the specification for the conditional variance is

$$\log(\sigma_t^2) = \omega + \beta \log(\sigma_{t-1}^2) + \alpha \left| \frac{\varepsilon_{t-1}}{\sigma_{t-1}} \right| + \gamma \frac{\varepsilon_{t-1}}{\sigma_{t-1}}$$

the log of the conditional variance implies that the leverage effect is exponential, rather than quadratic, and that forecasts of the conditional variance are guaranteed to be nonnegative. The presence of leverage effects can be tested by hypothesis that  $\gamma < 0$ . The impact is asymmetric if  $\gamma \neq 0$ .

In addition to the models described above, we examine the asymmetric volatility response to news using the sign bias, the negative size bias, and the positive size bias diagnostic test proposed by Engle and Ng (1993) and Beller and Nofsinger (1998). These tests examine whether we can predict the squared standardized residuals on a constant and dummy variables that indicates when the previous period's residual negative, the large and small previous period's negative return shocks, and the large and small previous period's positive return shocks. In other words, this test examines the impact of positive and negative return shocks volatility not predicted by the model. If these variables can predict the squared standardized residual, then the variance model is misspecified.

The sign bias test considers the variable  $S_{t-1}^-$ , a dummy variable that takes a value of 1 when  $\varepsilon_{t-1}$  is negative and 0 otherwise. The negative size bias test utilizes the variable  $S_{t-1}^- \varepsilon_{t-1}$ , and the positive size bias test utilizes the variable  $S_{t-1}^+ \varepsilon_{t-1}$  where  $S_{t-1}^+$  is defined as 1 minus  $S_{t-1}^-$ . These tests are conducted jointly in an OLS regression equation of the following form:

$$z_t^2 = a + b_1(S_t^-) + b_2(S_t^- \varepsilon_{t-1}) + b_3(S_t^+ \varepsilon_{t-1}) + v_t$$

The differences of the news impact of the models have important implications for portfolio selection and asset management. Since predictable market volatility is related to market risk premium, the two models imply very different market risk premiums, and hence different risk premiums for individual stocks under a conditional version of the capital asset-pricing model. The differences also have implication for option pricing since the return volatility is a major factor in determining option prices. A significant difference in predicted volatility after the arrival of some major news leads to a significant difference in the current option price; consequently the dynamic hedging strategies would be very different (Engle and Ng, 1993).

## Preliminary Analysis of Daily Returns of LQ 45 Index and CSPI

We choose LQ 45<sup>i</sup> index and CSPI to represent the behavior of stock return in Jakarta Stock Exchange. The daily return<sup>ii</sup> of the stocks is obtained from 4th of January 2000 to 30th of November 2001 (470 samples). The daily returns are calculated by taking the first difference of the natural log of the successive daily values of the index, that is,

$$r_t = \ln P_t - \ln P_{t-1}$$

Table 1 below describes the summary statistics LQ 45 index and CSPI.

TABLE 1: SUMMARY STATISTICS OF DAILY RETURN SERIES

	<b>LQ45</b>	<b>CSPI</b>
<b>Mean</b>	-0.139318	15.50879
<b>Median</b>	-0.040000	0.739600
<b>Maximum</b>	6.250000	3138.240
<b>Minimum</b>	-9.290000	0.000000
<b>Std. Dev.</b>	1.825836	204.4373
<b>Skewness</b>	-0.319714	15.20528
<b>Kurtosis</b>	4.807032	232.3020
<b>Jarque-Bera</b>	71.80066	1045562.
<b>Probability</b>	0.0000	0.0000

The average return of LQ 45 is negative, and positive for CSPI. The distribution of LQ 45 is also negatively skewed. It implies that large negative returns occur more often than large positive return. While for the CSPI, the distribution has a positive skewness. It means CSPI has more positive returns than negative returns. Moreover, a large value of Jarque-Bera test statistics confirms the non-normality of the return series. The return volatility, proxied by squared returns, is depicted in figure 1 below. We can see that the clustering of volatility presents only for LQ45 stock return. However, CSPI return is quite stable, the spike appears only around middle of April 2001. We suspect that the ARCH effect will be captured in LQ45 index. To investigate the dynamic behavior of daily return volatility formally, we employ GARCH model in the following section.

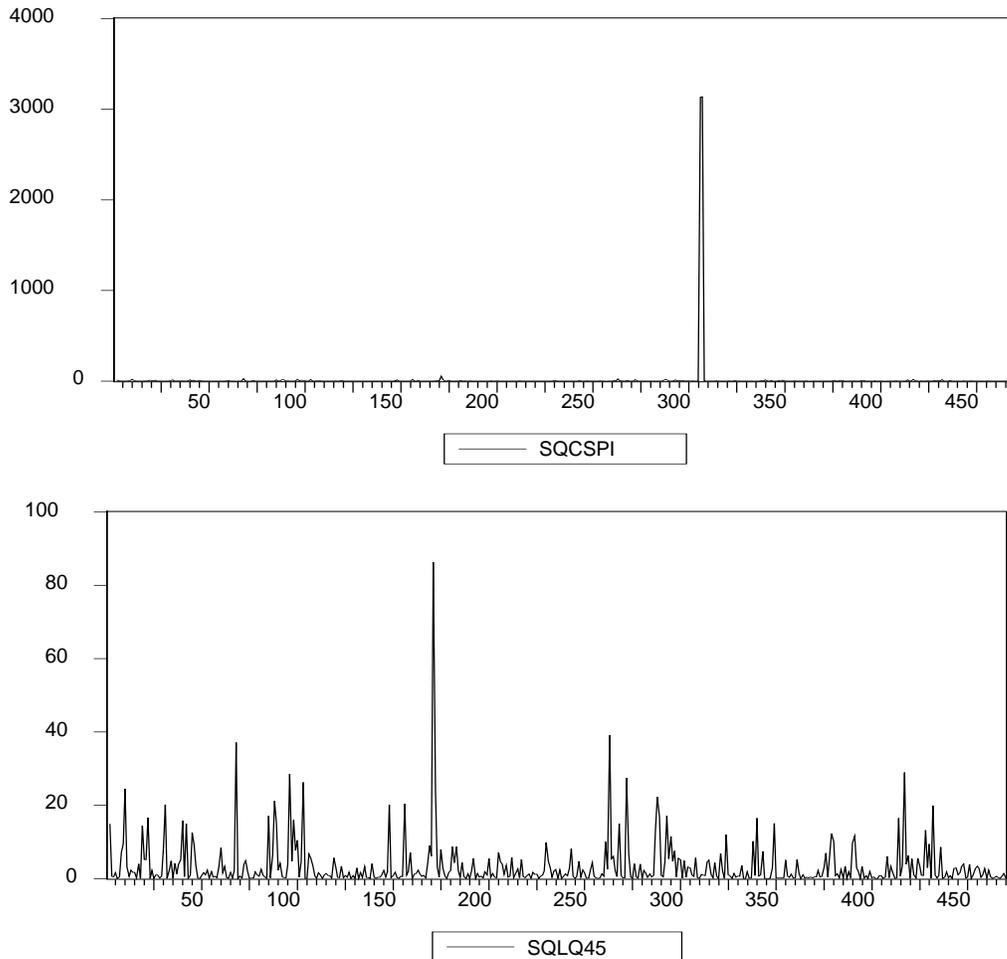

FIG. 1: RETURN VOLATILITY OF STOCKS

### The Dynamics Behavior of Daily Return Volatility

In this section, we will explore modeling the volatility of the daily stock returns in detail. As first step, univariate ARCH and GARCH models may be estimated and then compared to the more advanced specifications to determine if the enhanced models provide a better fit of the data. Where we need to select the best ARCH/GARCH model from the set of models reliably estimated, we use the Akaike Information Criterion (AIC) and Schwarz Criterion (SC) statistics. The model selection criteria is to choose the model with the lower AIC and SB test score (McKenzie and Brooks, 2000).

The results of several GARCH models are presented in the table 2 – table 5 below. The conditional distribution is not normal<sup>iii</sup>, however, the standard error is still robust since the quasi-maximum likelihood procedure in Bollerslev and Woolridge (1992) is employed. The  $Q^2$  (36) reported in the table is the Ljung-Box Portmanteau statistic to test no serial correlation up to lag 36 for the squared standardized residuals of the estimated GARCH models. The Ljung-Box statistics shows that there is no serial correlation up to lag 36 for all series. Accordingly, it indicates that the GARCH model has successfully captured all the ARCH effects.

We can notice from table 2 to table 5 that the p-values of ARCH ( $\alpha$ ) and GARCH ( $\beta$ ) terms are not significant for all estimated GARCH models<sup>iv</sup>. Moreover, as mentioned in previous paragraph, to choose the best ARCH/GARCH model, we have to select the smallest value of AIC and SC; the GARCH (1,2) model is the best model for CSPI returns. It indicates that there are no ARCH effects of CSPI returns. In other word, there is no indication of clustering volatility in CSPI returns. Figure 1 above confirmed this result.

TABLE 2: GARCH (1,1) ESTIMATES FOR RETURNS AT VARIOUS STOCKS

Index	$\omega$ (p-value)	$\alpha$ (p-value)	$\beta$ (p-value)	$\alpha + \beta$	JB (p-value)	$Q^2$ (36) (p-value)	AIC (SC)
LQ45	1.2701 (0.0058)	0.2098 (0.0110)	0.4192 (0.0094)	0.6290	43.63 (0.00)	30.146 (0.7430)	4.0138 (4.0492)

On the other hand, the ARCH ( $\alpha$ ) and GARCH ( $\beta$ ) terms are significant in model GARCH (1,1) for LQ45 index returns. In other words, LQ45 index returns volatility can be described by GARCH model successfully<sup>v</sup>. However, only ARCH ( $\alpha$ ) is significant for the rest of GARCH models estimated. Referring to the AIC and SB, the GARCH (1,1) is the best model for LQ45 returns since it has the smallest value. Nevertheless, the volatility is quite low persistent since  $\alpha + \beta$  is faraway from 1 (0.6290)<sup>vi</sup>.

This finding is different from previous study on developed capital market<sup>vii</sup>. They find that the market is volatile. Our study on CSPI and LQ 45 index reveals that there is no clustering volatility or we can say that the volatility is quite low persistent<sup>viii</sup>. It indicates that there is no significant selling and buying in the capital market; in other words, the Indonesian capital market is not liquid. The market capitalization is \$ 40.7 millions or Rp. 345.7 trillions at the end of July 2003<sup>ix</sup>. This size of market is not interesting for international investment managers to invest. Only few stocks are liquid, and most of them are sleeping stocks. Furthermore, Jakarta Stock Exchange is the smallest capital market in ASEAN (Investor, 2003).

As Indonesian Capital Market Blueprint suggest that the worsening of economic conditions due to the crisis has had an impact on the degradation in the performance of the Indonesian capital market. It brings losses to investors, i.e. they take their funds out of the Indonesian capital market. Up till now, the Indonesian capital market development in some cases is very much influenced by foreign investors<sup>x</sup>. Foreign investors dominate around 45 – 55% of the transactions. Generally, the foreign investors are the main players. The local players do not enter the market when the market is bearish, they will do so only if the foreign players buy the stocks. Recent political events, combined with the signs of economic recovery will contribute to restoring investors' confidence in the Indonesian capital market. Further, the monetary crisis has also caused a delay in the development of capital market infrastructure. The development of capital market infrastructure to meet international standards requires substantial investments. Reinebach (1998) also suggest that with the Asian flu still raging and bond spreads widened dramatically across the globe, investing in emerging markets has become a more complicated task. Furthermore, he said investors have become more aware of the differences among the various nations, and are thus better equipped to distinguish between the good and the bad. A country with the one of the worst stories to tell in Asia is Indonesia, which has been plagued by a weak currency and spreads as wide as 1,400 basis points over the Treasury.

The chairman of stock exchange also confirms this condition; “year 2000 was another tough and challenging year for Indonesian Capital Market. Some market indicators reflected the condition”. Moreover, during the year 2001, Indonesian economy was still susceptible to various domestic political event and social instability. The political escalation intensified and soon followed by a series of social responses, which was significantly affecting the performance of Indonesian Capital Market, such as the transfer of leadership from Abdurrahman Wahid to Megawati Soekarnoputri by the end of July, and the WTC tragedy.

Beside macro economic condition, other factors causing the decline in performance of the Indonesian capital market is the poor implementation of good governance in the management of companies, particularly the public companies. Lack of law instrument and law enforcement, and the minimum incentive<sup>xi</sup> cause the decreasing

of investors' confidence toward the Indonesian capital market. Furthermore, the mutual fund plays the important role as underwriter, broker and investment manager in capital market. If mutual fund does not do the job very well as underwriter, then the companies that enter the market will be the poor quality one. The chairman of Jakarta Stock Exchange also comments that not only the poor performance of mutual funds and securities issuers, but also the behavior of local investors affects the poor performance of capital market. This poor performance of local investors is due to the lack of capital market education.

Now let's turn to the news impact on volatility by using EGARCH and TARCH.

#### Asymmetric ARCH Models

As we discussed in the previous section, there are some important features of the data that cannot be captured by the models. The most interesting feature not addressed by ARCH models is the leverage or asymmetric effect. Two models that allow for asymmetric shocks to volatility are Threshold ARCH (TARCH) and Exponential GARCH (EGARCH) model. Since the ARCH effect is only captured in LQ 45 index, we investigate more the asymmetric effect on this data.

TABLE 6: EGARCH (1,1) FOR ESTIMATES NEWS IMPACT ON RETURNS VOLATILITY

Index	$\omega$ (p – value)	$\alpha$ (p – value)	$\beta$ (p – value)	$\gamma$ (p-value)	JB (p-value)	$Q^2$ (36) (p-value)
LQ 45	0.1090 (0.3942)	0.2450 (0.0185)	0.7381 (0.0000)	-0.1126 (0.1450)	30.137 (0.0000)	27.825 (0.8330)

TABLE 7: TARCH (1,1) FOR ESTIMATES NEWS IMPACT ON RETURNS VOLATILITY

Index	$\omega$ (p – value)	$\alpha$ (p – value)	$\beta$ (p – value)	$\gamma$ (p-value)	JB (p-value)	$Q^2$ (36) (p-value)
LQ 45	1.0212 (0.0183)	0.0639 (0.3198)	0.5300 (0.0011)	0.1933 (0.1749)	34.152 (0.0000)	28.480 (0.810)

Again the conditional distribution is not normal (as shown in table 6 and 7), however, the standard error is still robust since the quasi-maximum likelihood procedure in Bollerslev and Woolridge (1992) is employed. The Ljung-Box statistics shows that there is no serial correlation up to lag 36 for all series. Thus, the Asymmetric GARCH models have successfully captured all the ARCH effects. As noted in section III, that the leverage effect or asymmetry effect exists if  $\gamma$  is not equal to zero. From table 6 and 7 above reveals that there is no evidence of leverage effect for LQ 45 index at 5% significant value. Even, the ARCH effect does not exist when TARCH (1,1) model is used.

Following Engle and Ng (1993) and Nofsinger (1998), diagnostic test is conducted in our study by using the sign and size bias. The sign bias tests examines whether negative and positive innovations affect variance unaccounted for by the model. Table 8 below presents the result of diagnostic test. We are using the standardized residual of GARCH (1,1) model since it is the best-estimated model for LQ 45 index<sup>xii</sup>.

TABLE 8: STANDARDIZED RESIDUAL ANALYSIS OF GARCH (1,1)<sup>xiii</sup>

Index	Sign bias (p-value)	Negative size bias (p-value)	Positive size bias (p-value)	Joint Test (p-value)	Q-stat (36) (p-value)
LQ 45	-0.2057 (0.4366)	-0.1445 (0.4115)	-0.2358 (0.2377)	0.7629 (0.5152)	30.753 (0.716)

From the table above, we can notice that the sign bias, negative size bias, and positive as bias are not significant partially and simultaneously. It indicates that there is no asymmetry effect on volatility, i.e. the value of  $\varepsilon_{t-1}$  (regardless of the size positive or negative) does not influence current volatility. These results confirm the EGARCH (1,1) and TARCH (1,1) models above; no asymmetric effect on volatility of LQ 45 index. It means the bad news and good new have the same impact on volatility in the capital market. This finding is different from other findings for developed capital market that says the negative return shocks cause more volatility than positive ones. It may be due to the long recovery Indonesian macro economic and the microstructure of the capital market that makes the market is illiquid, and the behavior of the local investors is much influenced by the foreign investors who dominates the market

## Conclusion

There is no evidence of volatility clustering in return of stock volatility when CSPI is used as proxy of the market. On the other hand, the clustering volatility is present when LQ 45 index is used as proxy of the market. However, the volatility is low persistent. It indicates that the stock market is illiquid. It is proved by the market capitalization that is much smaller compare to other ASEAN capital markets. It might be due to the long recovery of Indonesia economy, lack of law enforcement, poor performance of mutual funds, poor corporate governance of the public companies, and poor capital market education of investors.

## End Notes

- 
- <sup>i</sup> LQ 45 consists of the most 45 liquid stocks in Jakarta stock Exchange.
- <sup>ii</sup> Daily closing price
- <sup>iii</sup> The significant of Jarque-Bera statistic (JB) indicates that conditional distribution is not normal.
- <sup>iv</sup> The GARCH term ( $\beta$ ) is significant at 5% level for CSPI returns only in model GARCH (2,1).
- <sup>v</sup> The p-value is small and significant.
- <sup>vi</sup> According to Engle and Ng (1993), the model with low persistence is where  $\alpha+\beta= 0.8$ . While in this case the sum of  $\alpha$  and  $\beta$  is even less than 0.8.
- <sup>vii</sup> See Mian and Adam (2001), Beller and Nofsinger (1998), Engle and Ng (1993), Kearns and Pagan (1993). There are many researches in this area that is too many to mention.
- <sup>viii</sup> It is only for LQ 45 index, which are the stocks are already selected for the most liquid stocks in the market and it is reviewed every six months.
- <sup>ix</sup> It is around Rp. 260 trillions and Rp. 240 trillions in year 2000 and 2001 respectively. The Mutual fund will run well if the average transaction is around Rp. 1 trillion per day, whereas the mutual fund has important role in capital market.
- <sup>x</sup> Foreign investors dominated the exchange up to 1997; however, the foreign investors were still around 40% up to 1999 and dropped to around 20% and less up till first quarter 2002. The trading volume and value plunged drastically from 1999 to 2000. Thus, we can conclude that the main player in the exchange is foreign investor.
- <sup>xi</sup> Capital loss and no dividend
- <sup>xii</sup> Again, we only use LQ 45 index since it is the index that captures the ARCH effect.
- <sup>xiii</sup> OLS regression equation is used to conduct the analysis. After checking all the classical assumptions, we conclude that the estimator is BLUE (best linear unbiased estimator).

# Foreign Direct Investment, a Form of Technology Transfer Case: Manufacturing Industry in the City of Chihuahua, Mexico

*Juan Ollivier*  
*Universidad A. de Chihuahua, Mexico*

## Abstract

The purpose of this paper is to show a technology transfer path from foreign companies that arrived through a Foreign Direct Investment (FDI) to such a developing country as Mexico. The process technology gap that exists between Transnational Corporations (TNC's) and local companies was measured; the training effort both types of companies make was then measured, and the annual training investment industry in the City makes was finally estimated. The research was based on a random stratified sample of 145 companies settled down in the City of Chihuahua, the capital of a northern State of Mexico, where twin plants ("maquiladoras") have a strong presence in manufacturing industry. As a conclusion, it was possible to make a technology transfer estimate through worker training, which may be considered a positive externality from the TNC to the host country.

## Introduction

One of the biggest challenges in today's global changes is to identify the implications of the increasing presence of Transnational Corporations (TNC's) in developing countries. TNC's presence, both led and measured through the Foreign Direct Investment (FDI), causes multiple effects, not only economic effects but also cultural ones. One of the most important expressions of modern cultures is technology, which is transferred in an informal but effective way to the host country in two basic ways: employing local people and supplying local goods and services.

In the case of manufacturing industry, people the TNC's hire are trained in the process technology that is originally developed by the company and adapted to local conditions. Also, in order to increase productivity, process technology is gradually changed, improved and maintained at its latest edition level.

The problem essentially is the not very so known role and its consequent misevaluated technology transfer from the TNC to the host country, particularly through worker training, which considered an important, structured form of learning. Another important learning source, which is different from training because it is informal and less structured – thus more difficult to measure – is the accumulated experience obtained from the daily operation, also named "learning curve".

The objective of this research is to show that worker training is a way to transfer technology, even when it is not explicitly wanted, from foreign companies that arrive through an FDI to such a developing country as Mexico. In order to achieve this goal, the following specific objectives were set:

1. To measure the technological gap in the productive process between TNC's and local companies.
2. To measure the training effort and investment both TNC's and local companies make.
3. To estimate the technology transferred through the amount invested on training.

The main assumptions on which this work is based are:

- a) In order to face the increasing international competence, TNC's are impelled to improve their productivity adapting and developing technology for their productive processes.
- b) The technological change rate implies to permanently train personnel.
- c) Given that in host countries, which are generally non-industrialized, technical education is lagged (compared to industrialized countries), TNC's are the most important source of new technologies.

This work justification is basically the potential benefits for:

- Local companies, who can get aware of their technology lag, in a world where technology and its consequent competitiveness is the main way to survive and grow.

- Governments that design and implement policies and strategies on technological and economic matters.
- Academicians interested on the role of technology in the society and its link to the economic world.

## Literature Review

The concept of *technology* is taken from Perrow's definition [2]: *the activities aimed to transform inputs on products*, which corresponds to a systemic point of view towards a production unit, and is close to the concept of the variable (construct) "Process technology" used in this work. From an economic point of view, technology is the factor that allows increasing productivity while maintaining the other production, labor and capital [14] factors constant.

Regarding technology transfer the FDI makes, Cohen [2] considers this type of transfer non-conventional and an attempt to expand the dynamics of technology transfer in developing countries, from the mere diffusion of technology to the globalization of technology application. The UNCTAD [16] considers that the FDI has a key role in technology transfer, development and mastery in developing countries. On the other hand, Solow and Abramovitz [1] showed the importance of technology in the long-range economic growth of any country. Likewise, Young, Verdoor and Kaldor [14], show the contribution of technological development to the Gross Domestic Product (GDP).

Concerning the speed of technology transfer to the host country, a model that better explains an innovation diffusion rate agrees with the S-shaped curve Mansfield [7] presents. According to this diffusion model, the speed to adopt a new technology increases with its *profitability* and decreases with the *investment* amount it requires. As an interesting analogy of this model, the author says its has a lot in common with the models used by epidemiologists to represent contagious diseases spreading.

Regarding the training activity, within the field of human resource management theories, this work takes elements of the school that considers this resource the most valuable asset of an organization. We can find in this school the new point of view that considers the organization in a continuous learning process [12], like intelligent organizations, the points of view of intellectual capital development, and the Balanced Scorecard (BSC) [5] that considers learning and personnel development as the basis for all long-range successful organizations.

In order to measure the training effort made by companies, the international indicator adopted by the American Society of Training and Development (ASTD) [3] is taken into account; it expresses the annual training investment as a payroll percentage.

## Method

The investigation was based on a random stratified sample [15] made up with 145 companies settled down in the City of Chihuahua, the capital of a northern State of Mexico, where manufacturing industry has the a strong presence through twin-plant ("maquiladora") companies that employ approximately 50,000 workers.
